The Honorable Board of Supervisors
County of Los Angeles
383 Kenneth Hahn Hall of Administration
500 West Temple Street
Los Angeles, California 90012

Dear Supervisors:

WATER RESOURCES CORE SERVICE AREA
ADOPT RESOLUTIONS TO SECURE FINANCING UNDER
THE CLEAN WATER STATE REVOLVING FUND FOR
THE RORY M. SHAW WETLANDS PARK PROJECT
(SUPERVISORIAL DISTRICT 3)
(3-VOTES)

SUBJECT

Public Works is seeking Board approval to adopt resolutions authorizing the Chief Engineer of Los Angeles County Flood Control District or his designee to finance construction costs and apply for financial assistance under the California State Water Resources Control Board's Clean Water State Revolving Fund for the Rory M. Shaw Wetlands Park Project.

IT IS RECOMMENDED THAT THE BOARD ACTING AS THE GOVERNING BODY OF THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT:

1. Find that the recommended actions are within the scope of the previously approved 2025 Addendum prepared by the Los Angeles County Flood Control District to the previously certified Program Environmental Impact Report for the Sun Valley Watershed Management Plan for the reasons stated in this Board letter and in the record of the proposed activities.

2. Adopt resolutions authorizing the Chief Engineer of Los Angeles County Flood Control District or his designee to finance the construction costs and apply for a loan from the California State Water Resources Control Board's Clean Water State Revolving Fund Program for the Rory M. Shaw Wetlands Park Project.

3. Adopt resolutions acknowledging the intent to reimburse expenses paid by the Clean Water State Revolving Fund and comply with applicable Treasury and Internal Revenue Service regulations.

4. Delegate authority to the Chief Engineer of Los Angeles County Flood Control District or his designee to accept funds in the amount not to exceed $132.2 million for the Rory M. Shaw Wetlands Park Project; to negotiate and execute all necessary contracts, agreements, reports, certifications, and amendments, including extensions of time, minor changes in project scope, and alterations in the financing amount not exceeding 10 percent, subject to approval of such documents as to form by County Counsel; and to sign and submit requests for disbursement of State funds and Flood Control District fund revenues to payment of financing.

PURPOSE/JUSTIFICATION OF RECOMMENDED ACTION

The purpose of the recommended actions is to find that they are within the scope of the previously approved Addendum (Enclosure A), to the previously certified Program Environmental Impact Report (Program EIR) (Enclosure B), for the Sun Valley Watershed Management Plan prepared pursuant to the California Environmental Quality Act, and to authorize the Los Angeles County Flood Control District (District) to apply for and execute agreements and amendments required to secure loan financing from the Clean Water State Revolving Fund (CWSRF) administered by the State Water Resources Control Board (SWRCB) for the approved Rory M. Shaw Wetlands Park Project. The approved project will convert a 46-acre former inert debris landfill into a multi-benefit park that will reduce localized flooding, treat captured stormwater, and deliver the treated stormwater to Sun Valley Park for groundwater recharge and/or deliver back to the Los Angeles River. The project will consist of a new detention pond and wetland and will provide the disadvantaged Sun Valley community with up to 15 acres of open space for recreational amenities.

The SWRCB offers financial assistance to support flood control projects and programs, including projects implemented by the District. It requires the governing board of any agency applying for financial assistance to adopt a resolution authorizing the application, acceptance, and execution of financial assistance-related documents. The authorized resolution enables execution of the financial assistance agreement.

Implementation of Strategic Plan Goals

These recommendations support the County Strategic Plan: North Star 2, Foster Vibrant and Resilient Communities, Focus Area D, Sustainability, Strategies i and iv, Climate Health and Environmental Justice, by supporting the environment and improving the quality of life for its residents by infrastructure improvements and education to disadvantaged communities. The recommended actions also support goals in the Our County Sustainability Plan and the Board's 2021 Motion for Equity in Infrastructure.

FISCAL IMPACT/FINANCING

There will be no impact to the County General Fund.

The reasonably expected maximum principal amount of the project funds is $132.2 million. Once the application is approved and the CWSRF loan is secured, Public Works would be reimbursed by the SWRCB as the work progresses.

Once the project is completed, the requested CWSRF financing agreement in the amount of $132.2

million will be repaid by the District over 30 years at an annual interest rate set at 50 percent of the State of California's average general obligation bond rate, which is currently 2.2 percent. The interest rate is adjusted annually and has fluctuated from 0.8 to 3.0 percent over the past 15 years.

Funding for the loan repayment will be included in the Flood Control District Fund (B07 – Other Charges) through the annual budget process.

Public Works will return to the Board for approval of any necessary budget adjustments and to advertise the project for construction.

FACTS AND PROVISIONS/LEGAL REQUIREMENTS

The SWRCB requires that all governing boards dedicate an authorized representative to file the financing application and execute an agreement. All governing boards must also formally establish a dedicated source of revenue to repay the financing. Securing CWSRF financing will provide the necessary capital investment to implement the project, which will assist the District's goal to mitigate flood risk and increase water conservation, recreational opportunities, and wildlife habitat in the Sun Valley Watershed. The enclosed resolutions (Enclosure C) were approved as to form by County Counsel.

ENVIRONMENTAL DOCUMENTATION

On June 29, 2004, the Board, on behalf of the District, acting as lead agency, certified the final Program EIR for the Sun Valley Watershed Management Plan. The currently recommended actions are within the scope of the 2025 Addendum, which was prepared by the District and certified by the Board on October 21, 2025, when the project was approved. The 2013 Addendum was prepared to address detention pond storage adjustments, wetlands adjustments, the addition of a storm drain system, transfer pipeline, changes in aboveground components, and landscaping. The 2020 Addendum was prepared to address minor changes to the drain project, which included a new storm drain system along Tujunga Avenue, Penrose Street, and Goss Street in the City of Los Angeles. The 2025 Addendum evaluates both the project and drain project and included the modifications to the aesthetics and security, hauling of excess materials offsite, crushing activities, and addition of a passive methane treatment system. Since the adoption of the 2013 and 2020 Addenda, the project and drain project have been further modified. The District reviewed the modifications and determined that these updates are not substantial and considered minor technical changes to the 2004 Program EIR. The addendum (Enclosure A) analyzed the project description and components among all the projects to make the determination. In addition, the following appendices were technical studies performed to support the conclusions made by the addendum in Appendix A: Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum; Appendix B: Biological Resources; Appendix C: Geotechnical, Geologic, and Environmental Assessment; Appendix D: Bird Strike Hazards Memorandum; Appendix E: Noise Technical Memorandum; Appendix F: Trip Generation Analysis, Transportation Consistency Analysis, and Vehicle Miles Traveled Assessment; and Appendix G: Mitigation Monitoring Reporting Program for the Sun Valley Watershed Management Plan.

Upon the Board's approval of the recommended actions, Public Works will file a Notice of Determination with the Registrar-Recorder/County Clerk and with the State Clearinghouse in the Office of Land Use and Climate Innovation pursuant to California Public Resources Code Section 21152 and will post the notice to its website in accordance with Section 21092.2.

The previously certified Program EIR, the adopted Mitigation Monitoring and Reporting Program, the 2025 Addendum, and the two prior addenda are available for viewing at https://pw.lacounty.gov/core-service-areas/water-resources/sun-valley-watershed/resources/. The location of the documents and other materials constituting the record of the proceedings upon which the Board's decision in this matter is based in Los Angeles County Public Works, Stormwater Planning Division, 900 South Fremont Avenue, 11th Floor, Alhambra, California 91803.

IMPACT ON CURRENT SERVICES (OR PROJECTS)

These actions would aid the District's existing financial resources to expedite the delivery of the project, which will enhance the environment and quality of life for residents of Los Angeles County, including increased stormwater capture and groundwater recharge, recreational opportunities, and improved wildlife habitat.

CONCLUSION

Please return one adopted copy of this Board letter and signed originals of each resolution to Public Works, Stormwater Planning Division.

Respectfully submitted,

MARK PESTRELLA, PE

Director

LOS ANGELES COUNTY PUBLIC WORKS

LEAD AGENCY: LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

ADDENDUM TO A PROGRAM ENVIRONMENTAL IMPACT REPORT

SUN VALLEY WATERSHED MANAGEMENT PLAN

SUBJECT:	Preparation of an Addendum to a Program Environmental Impact Report (PEIR) in compliance with California Environmental Quality Act (CEQA), Section 15164.
PROJECT:	This Addendum evaluates two separate but related projects that were originally identified in the Sun Valley Watershed Management Plan (SVWMP) – construction and operation of the Rory M. Shaw Wetlands Park and installation of the Sun Valley Watershed Upper Storm Drain System Phases 2 – 4 (Upper Storm Drain System). Note that the Rory M. Shaw Wetlands Park project was originally named the Strathern Pit project in PEIR prepared in support of the SVWMP. An Addendum to the PEIR that evaluated changes in this project was adopted in 2013. In the 2013 Addendum and this document, this project is referred to as the Rory M. Shaw Wetlands Park. Additionally in this document, prior versions of this project are referred to as the 2004 Approved Wetlands Park project (when discussing this project as it was described and evaluated in the 2004 PEIR) and the 2013 Approved Wetlands Park project (when discussing this project as it was described and evaluated in the 2013 Addendum). **Rory M. Shaw Wetlands Park** The Rory M. Shaw Wetlands Park project includes conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The currently proposed Rory M. Shaw Wetlands Park project would capture stormwater runoff collected from upstream drainage areas to alleviate flooding in the Sun Valley community. The proposed design would provide a water conservation benefit through the reuse of stormwater. Runoff would be temporarily stored in a detention pond, routed through wetlands for natural treatment of pollutants, and pumped into existing underground infiltration basins at the adjacent Sun Valley Park. As currently proposed, this project would provide up to 15 acres of recreational open space. The proposed detention pond would have a footprint of approximately 21 acres and a maximum depth of 50 feet, with a total storage capacity of 385 acre-feet. The proposed wetlands would provide sustainable habitat for various plant and animal species, and a natural water treatment system for removing pollutants from the collected stormwater runoff. The treated stormwater would be pumped to the existing adjacent Sun Valley Park infiltration basins for groundwater recharge. Construction activities for the Rory M. Shaw Wetlands Park project are divided into three phases: Phase 1, Site Investigations and Demolition; Phase 2, Crushing and Grading; and Phase 3, Above Ground Improvements. Phase 1 was completed in 2017. Phase 2 would include the following construction components: mobilization, demolition, site preparation, grading and deep dynamic compaction (DDC), hauling and/or transporting materials by conveyor belt to the adjacent AMH Recycling facility located at 11253 Vinedale Street, concrete crushing, and drainage/utility installation. Phase 3 would include construction of the detention pond and wetlands, installation of the passive methane system, trenching

	and utility installation, recreational components, and landscaping. The proposed revisions to the Rory M. Shaw Wetlands Park project include DDC activities over the detention pond footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; and an on-site crushing component. Additionally, although the project site boundary has not changed, the aboveground components of this project have been slightly altered in location. As an interim measure prior to initiation of Phase 2, the County plans to install perimeter fencing and landscaping at the project site. This work will include replacing existing chain link fencing with an 8-foot-tall tubular fence; amending soil and installing landscaping to include shrubs and up to ninety 24-inch box trees around the perimeter of the site; and installing an irrigation system. These actions are a separate project aimed to secure the property and improve site aesthetics and were addressed in a California Environmental Quality Act (CEQA) Notice of Exemption filed in August 2024. **Upper Storm Drain System** The currently proposed Upper Storm Drain System Phases 2 – 4 project includes installation of storm drain lines below existing roads in the Sun Valley area. The system would collect stormwater runoff from the northern portions of the Sun Valley watershed and convey the stormwater to the proposed Rory M. Shaw Wetlands Park where water would be temporarily stored in a detention pond, routed through engineered wetlands for pollutant removal, and used for groundwater recharge in the existing infiltration basins at Sun Valley Park. The Upper Storm Drain System project is located in the Sun Valley Community within the City of Los Angeles, approximately 14 miles northwest of downtown Los Angeles in the northeastern portion of San Fernando Valley. The first phase of the Upper Storm Drain System was completed in 2021. Phases 2 – 4 involve installation of approximately 28,200 linear feet of storm drain lines below existing roads in the Sun Valley area as well as installation of catch basins, connector pipes, and other drainage structures. The construction of storm drains/pipelines would typically require a construction zone that ranges from 20 to 50 feet in width and from 200 to 500 feet in length to accommodate the activities of removing surface pavement, digging a trench, construction shoring, installing the pipe, back-filling, compacting the fill material, and reconstructing/paving the surface area. All excavated areas would be resurfaced, the public roads would be returned to their existing conditions upon completion of storm drain construction, and no trees will be removed. It is anticipated that the construction zone would advance linearly along the route at an average rate of 200 to 500 feet per day. Individual locations along the storm drain system alignment would be directly impacted by the construction activities for a duration of one to five days under typical conditions.
MODIFICATIONS:	The Rory M. Shaw Wetlands Park and the Upper Storm Drain System projects were evaluated in the 2004 SVWMP Program EIR and in an EIR Addendum adopted in 2013. In addition, the Upper Storm Drain System project was evaluated in an EIR Addendum adopted in 2020. Both the Rory M. Shaw Wetlands Park and the Upper Storm Drain System projects are proposed to be modified from the projects described in the 2013 and 2020 Addenda. The following sections and Tables 1 and 2 provide a summary comparison of the individual components of each project as they were described and evaluated in the 2004 PEIR and the applicable subsequent CEQA documents, as well as the modifications that are reflected in these currently proposed projects.

Table 1: Rory M. Shaw Wetlands Park Project Modifications

Project Component	*2004 Approved Wetlands Park Project*	*2013 Approved Wetlands Park Project*	*Currently Proposed Wetlands Park Project*
Site Preparation	Not described	Not described	Vegetation clearing and grading across the 46-acre site, including regrading of the existing berm and stockpiles, removal of perimeter fencing and landscaping that is planned to be installed at the site as a separate project intended to improve aesthetics and security.
Hauling	Not included	Not included	Approximately 550,000 cubic yards of materials would be hauled off-site to existing offsite disposal facilities.
Off-Site Components	Not Included	Not Included	Some materials excavated from the project site may be transported via conveyor belt to the adjacent AMH Recycling facility for processing. This would not involve any ground disturbing activities at the AMH Recycling facility.
Crushing	Not Included	Not Included	Crushing activities are anticipated to last approximately 4 years. Crushing would be accomplished with two sets of crushing equipment.
Detention Pond	Terraced side slopes with five levels with the deepest part approximately 50 feet below street level. The bottom portion of basin would be operated as a wetland (500 to 700 acre-feet of storage).	Surface area of 21 acres, depth of 50 feet, and up to 400 acre-feet of storage. Raw water pump station within the detention pond.	Surface area of 21 acres, depth of 50 feet, and up to 385 acre-feet of storage. Raw water pump station within the detention pond.
Wetland		10 acres of wetlands in the northern and western portion of the project site.	10 acres of wetlands concentrated to the east side of the site.
Storm Drain System	Not included	4.5-mile storm drain system that would capture and convey runoff from the 929-acre tributary area and deliver it to the detention pond within the 2013 Approved Wetlands Park project.	Described separately as the Upper Storm Drain System
Transfer Pipeline	Infiltration option would require a 14,000-foot-long	1,200 feet of transfer pipeline to convey the treated runoff from the	Same as 2013 Approved Project

Table 1: Rory M. Shaw Wetlands Park Project Modifications

Project Component	*2004 Approved Wetlands Park Project*	*2013 Approved Wetlands Park Project*	*Currently Proposed Wetlands Park Project*
	pipeline and a 100- to 150-horsepower. pump to transport the water to the Tujunga Spreading Grounds, where the water would be used for groundwater recharge.	wetlands to the adjacent Sun Valley Park for groundwater recharge.	
Recycled Water Line	Not included	2.75-mile recycled water line would connect the existing recycled water line at the LADWP Valley Generating Steam Plant and terminate at the 2013 Approved Wetlands Park project.	Not included
Aboveground Components	Alternatives range from 7 to 14 acres	15 acres, includes 160 parking stalls, restroom, tot lot, tennis courts, amphitheater, open space play area, basketball courts, picnic area, exercise station, trails, and wet well pump station near the southerly bathrooms.	15 acres, conceptual design includes approximately 160 parking stalls, soccer field, picnic area, picnic pavilion, amphitheater, two restroom buildings, tot lot, tennis courts, open space area, basketball courts, trails, and wet well pump station near the southerly bathrooms.
Deep Dynamic Compaction	Not included	Not included	The proposed DDC activities are intended to achieve sufficient compaction to minimize chances of differential settlement on the site. DDC uses principles of transforming potential energy to kinetic energy to densify ground through utilization of weights, supported by a crane, and free fall impact to the ground to increase the density of soil.
Passive Methane Treatment System	Not Included	Not Included	The proposed passive methane treatment would be located along the northern and western property line and along the southern boundary of the existing concrete pad. The proposed passive methane treatment would consist of 31 wells designed to prevent methane gas intrusion into the proposed aboveground structures and eight probes would be located along the

Table 1: Rory M. Shaw Wetlands Park Project Modifications

Project Component	*2004 Approved Wetlands Park Project*	*2013 Approved Wetlands Park Project*	*Currently Proposed Wetlands Park Project*
			southern boundary of the existing concrete pad which can be later converted to collector pipes if needed. It is anticipated that the wells would be drilled to a depth of approximately 45 feet.
Landscaping	Not described, although, concept design identifies landscaping.	Includes approximately 432 new trees and 109,505 new shrubs. Landscaping is proposed throughout the project site and surrounding the detention ponds and wetland areas.	Same as 2013 Approved Wetlands Park Project

Table 2. Upper Storm Drain System Project Modifications

Project Component	***2004 Storm Drain***	***2013 Upper Storm Drain***	***2020 Upper Storm Drain System***	***Currently Proposed Project***
Overall Description	The 2004 Program EIR identified that storm drains would be constructed underground within existing roadways in the project area, to 1) collect stormwater and convey it to the various project components while minimizing flooding in the streets, and 2) supplement the flood control capacities of other project components (retention facilities) in the southern watershed. Approximate alignments of the storm drains, including the Upper Storm Drain System, are shown in Figure 3-17 of the 2004 PEIR. The EIR did not include information about phasing for specific storm drain networks.	Construction of a 4.5-mile storm drain system to capture and convey runoff from the 929-acre tributary area and deliver it to the detention pond within the Rory M. Shaw wetlands park. The storm drain will be sized to convey a maximum flow rate of 990 cubic feet per second, however, the design capacity of the storm drain will be limited by the capacity of the detention pond (400 acre-feet). The storm drain will be constructed along Glenoaks Boulevard and Tuxford Street. From the intersection of Tuxford Street and San Fernando Road, the storm drain will connect to Tujunga Avenue and Penrose Street following a revised route from that proposed in the PEIR. This revised route shortened the total length of the storm drain compared to the original	Four phases of construction of 28,600 linear feet of RCP, catch basins, connector pipes, and other drainage structures and a 2.5-foot by 10.5-foot reinforced concrete box to direct overflow from the detention basin within the Rory M. Shaw Wetlands Park to outlet onto Project 39. Phase 1 involved construction of approximately 3,600 linear feet of RCP, catch basins, connector pipes, and other drainage structures along Tujunga Avenue, Penrose Steet, and Gross Street.	The overall description remains the same as described in the 2020 EIR Addendum except that the total length of RCP for Phases 2 – 4 is reduced to 28,200 linear feet. Details of changes to individual phases are presented in the following rows. Phase 1 was completed in 2021 and is not evaluated in this Addendum.

Table 2. Upper Storm Drain System Project Modifications

Project Component	*2004 Storm Drain*	*2013 Upper Storm Drain*	*2020 Upper Storm Drain System*	*Currently Proposed Project*
		plans presented in the 2004 PEIR.		
Phase 2	Phasing was not described in the 2004 PEIR	Phasing was not described in the 2013 Addendum	Involves the construction approximately 12,600 linear feet of RCP main line storm drains, 3,200 linear feet of RCP storm drain laterals, catch basins, connector pipes, and other drainage structures primarily along San Fernando Road, Tuxford Street, Glenoaks Boulevard, and Sheldon Street. The storm drain will extend into the existing Tuxford Drain, which is located at the intersection of Tuxford Street and San Fernando Road. Construction was estimated to require 280 days.	Storm drain lines would be constructed as described in the 2020 Addendum, except that the main line length would be 12,000 linear feet, which is 600 linear feet less than what was anticipated in the 2020 Addendum. Construction duration is estimated to be 840 days with two crews, which is 560 days more than was expected in the 2020 Addendum.
Phase 3	Phasing was not described in the 2004 PEIR	Phasing was not described in the 2013 Addendum	Construction of RCP, catch basins, connector pipes, and other drainage structures primarily along San Fernando Road and Sheldon Street. The storm drain will extend into the existing Tuxford Drain. The approximate length of the work of Phase 3 is 6,500 feet (main line) and 600	Storm drain lines would be constructed as described in the 2020 Addendum. The tunnel in the vicinity of existing Metro railroad tracks would be 40 feet shorter than described in the 2020 Addendum, for a total length of 71 linear feet. Construction duration is expected to be

Table 2. Upper Storm Drain System Project Modifications

Project Component	*2004 Storm Drain*	*2013 Upper Storm Drain*	*2020 Upper Storm Drain System*	*Currently Proposed Project*
			feet of laterals. This phase also includes tunneling approximately 112 linear feet of 48-inch RCP in the vicinity of existing Metro railroad tracks. Construction duration was expected to be approximately 160 days	approximately 330 days, which is 170 days longer than anticipated in the 2020 Addendum.
Phase 4	Phasing was not described in the 2004 PEIR	Phasing was not described in the 2013 Addendum	Construction of a 66-inch RCP and a 2.5-foot by 10.5-foot reinforced concrete box to direct overflow from the detention basin within the Rory M. Shaw Wetlands Park to outlet onto Project 39, which is an existing storm drain line below Vineland Avenue that continues south. Construction would primarily take place on Vineland Avenue, Tujunga Avenue and Saticoy Street. The approximate length of the work of Phase 4 is 5,900 feet. Construction duration was expected to be approximately 155 days	This phase would be implemented as described in the 2020 Addendum except that construction duration is expected to be approximately 620 days, which is 465 days longer than anticipated in the 2020 Addendum.

Table 3 Upper Storm Drain System Segments

Roadway Name	Segment	Linear Feet	Adjacent Land Uses
Phase 2			
San Fernando Road	Penrose Street to Tuxford Drain (at Tuxford Street)	1500	Southern Pacific Railroad, industrial
Penrose Street	San Fernando Road to 250 feet west of San Fernando Road (to connect to Phase 1)	250	Industrial
Tuxford Street	Tuxford Drain (at San Fernando Road) to Glenoaks Boulevard	3900	Industrial, including gravel processing plant
Glenoaks Boulevard	Tuxford Street to Sheldon Street	5800	Public/institutional, industrial, including Vulcan Landfill
Sheldon Street	Glenoaks Boulevard to Wentworth Street	1800	Industrial, including Sheldon Pit
Bradley Avenue	Tuxford Street to 160 feet northwest of Tuxford Street	160	Industrial, including gravel processing plant
Norris Avenue	Tuxford Street to Pendleton Street	1450	Industrial
De Garmo Avenue	Tuxford Street to Randall Street	715	Industrial
La Tuna Canyon	Glenoaks Boulevard to Tuxford Street	150	Industrial
Randall Street	Glenoaks Boulevard to 150 feet east of Glenoaks Boulevard	150	Industrial
Pendleton Street	Glenoaks Boulevard to 215 feet east of Glenoaks Boulevard	215	Industrial
Peoria Street	Glenoaks Boulevard to 415 feet east of Glenoaks Boulevard	415	Industrial, including Vulcan Landfill
Phase 3			
San Fernando Road	Existing Tuxford Drain to Sheldon Street	5800	Industrial, including gravel processing plant, and railroad
Sheldon Street	San Fernando Road to 500 feet east of San Fernando Road	500	Industrial, including gravel processing plant
Phase 4			
Tujunga Avenue	430 feet north of Strathern Street (at Rory M. Shaw Wetlands Park) to Saticoy Street	3100	Residential, industrial
Saticoy Street	Vineland Avenue to Tujunga Avenue	2700	Residential, commercial
Vineland Avenue	Saticoy Street to 200 feet south of Saticoy Street (connecting to existing Project 39)	200	Residential, commercial

Table 4 Upper Storm Drain System Storm Drain Locations and Sizes

Phase and Roadway Name	Segment	Storm Drain Pipe Size	Other Drainage Elements
Phase 2			
San Fernando Road	Penrose Street to Tuxford Drain (at Tuxford Street)	96" RCP	Catch basins; connector pipes
Penrose Street	San Fernando Road to 250 feet west of San Fernando Road (to connect to Phase 1)	96" RCP	Catch basins; connector pipes
Tuxford Street	Tuxford Drain (at San Fernado Road) to Glenoaks Boulevard	96" RCP; 84" RCP; 72" RCP	Catch basins; connector pipes
Glenoaks Boulevard	Tuxford Street to Sheldon Street	72" RCP; 66" RCP; 48" RCP	Catch basins; connector pipes
Sheldon Street	Glenoaks Boulevard to Wentworth Street	48" RCP	Catch basins; connector pipes
Bradley Avenue	Tuxford Street to 160 feet northwest of Tuxford Street	30" RCP	Catch basins; connector pipes
Norris Avenue	Tuxford Street to Pendleton Street	42" RCP	Catch basins; connector pipes

Saticoy Street	Vineland Avenue to Tujunga Avenue	2.5'H x 10.5'W RCB; 66" RCP	Catch basins; connector pipes
Vineland Avenue	Saticoy Street to 200 feet south of Saticoy Street (connecting to existing Project 39)	30" RCP	Catch basins; connector pipes

LOCATION:	The Rory M. Shaw Wetlands Park project and the Upper Storm Drain System project are both located in the Sun Valley Community within the City of Los Angeles, approximately 14 miles northwest of downtown Los Angeles in the northeastern portion of San Fernando Valley (Figure 1, Project Location). **Rory M. Shaw Wetlands Park** This project site is bounded by Strathern Street and single-family residential uses to the south; Tujunga Avenue, a truck stop, industrial uses, and the Gol Soccer Complex to the west; Roscoe Boulevard and recycling facilities to the north; and Fair Avenue, Sun Valley Park, and single-family residential uses to the east (Figure 2, Rory M. Shaw Wetlands Park Project Vicinity). The project site boundaries for the Rory M. Shaw Wetlands Park project are the same as described in the 2004 PEIR and the 2013 Addendum. **Upper Storm Drain System** This project site is located along Glenoaks Boulevard, San Fernando Road, Tuxford Street, and Tujunga Avenue. The Upper Storm Drain System project would be constructed primarily to the north of the Rory M. Shaw Wetlands Park project (Figure 3, Upper Storm Drain System Project Site). Phase 2 would be installed northeast of the park (Penrose Street, San Fernando Road, Tuxford Street, Norris Avenue, Bradley Avenue, De Garmo Avenue, Glenoaks Boulevard, Peoria Street, Pendleton Street, and Randall Street), Phase 3 would be constructed northwest of the park (Sheldon Street and San Fernando Road), and Phase 4 would be located south of the park (Tujunga Avenue and Saticoy Street).
PROJECT DESCRIPTION:	This section provides an overview of the SVWMP and descriptions of the 2004 Approved Wetlands Park project, the 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project, the 2004 Approved Storm Drains project, the 2013 Approved Storm Drains project, the 2020 Approved Upper Storm Drain System project, and the currently proposed Upper Storm Drain System Phases 2 – 4 project. **Overview** The 2004 PEIR (certified on June 29, 2004) evaluated the SVWMP, which consists of multiple projects, each designed to manage stormwater runoff and reduce flooding. The County of Los Angeles Board of Supervisors, acting as the governing body of the Los Angeles County Flood Control District (District) adopted the SVWMP in 2004 to solve the chronic local flooding problem in the Sun Valley Watershed of the San Fernando Valley. The Sun Valley watershed is located in northeastern San Fernando Valley within the eastern portion of the San Fernando Valley Groundwater Basin. It is bound to the north by the San Gabriel Mountains, to the east by the Verdugo Mountains, to the west by the Simi Hills and to the south by the Santa Monica Mountains. The Sun Valley Watershed is a highly urbanized watershed that drains into the Los Angeles River, which is located approximately 2 miles from the southern end of the watershed. Other surface water features in the vicinity include the Tujunga Wash and the Hansen Dam/Lake. The SVWMP covers 4.4 square miles in the communities of North Hollywood and Sun Valley, in the northeast portion of the City of Los Angeles. The SVWMP is a long-range plan that provides a blueprint for a multi-purpose flood control program in the area. The SVWMP acknowledges that rainfall is a significant component of the water supply in the semi-arid region. The District began working towards a multi-purpose solution to area flooding in November 1998. The District held regular meetings and engaged over 65 stakeholders comprised of Federal, State, and local agencies, and nonprofit and community groups interested in the

	Sun Valley Watershed area. By 2004 the District, with input from the stakeholders, had developed the SVWMP and held several town hall meetings to present and discuss the SVWMP with the community. The community and stakeholders have been very supportive of the SVWMP and are eager for plan implementation. The SVWMP identified 18 best management practice projects that focused on flood protection, increased water conservation, improved water quality, increased habitat restoration, and enhanced recreational opportunities for underserved areas. The majority of the components would involve construction and operation of stormwater storage and/or infiltration facilities. The collected stormwater would be treated prior to groundwater recharge or reuse (irrigation or gravel washwater). Where appropriate, stormwater storage facilities would be designed to provide recreational facilities and/or wildlife habitat areas. In addition, catch basins and storm drains are proposed to collect and convey runoff and reduce flows carried on street surfaces. Prior to adoption and implementation of the SVWMP, there were no major storm drain systems within the watershed and flooding issues were a community concern even during minor low intensity rain events. The District has implemented two components identified in the SVWMP, but many areas still do not have storm drain systems. During rain events, stormwater flows in the Sun Valley area are conveyed along street surfaces and collected at several of the major intersections in the area. Flood depths could range from two to three feet in moderate rainfall events, which would impede pedestrian and vehicle traffic. Although storm drains can be highly effective at quickly and efficiently conveying stormwater away from people and properties, they do not provide any water quality treatment and only divert polluted urban runoff into rivers and the ocean. The SVWMP addressed this by including several water quality treatment improvements in addition to stormwater detention and conveyance improvements. Overall, the SVWMP is expected to reduce flooding, reduce the pollutant load in downstream surface waters, increase groundwater recharge, and reduce demands for potable water by reusing treated stormwater for non-potable purposes, such as for landscape irrigation. The District is currently planning to implement two of the projects identified in the SVWMP – the Upper Storm Drain System project Phases 2 – 4 and the Rory M. Shaw Wetlands Park project. The Upper Storm Drain System Phases 2 – 4 project would construct approximately 28,200 linear feet of storm drains beneath existing public roads. The District implemented Phase 1 of the Upper Storm Drain System in 2021. This system would collect and convey stormwater to the planned Rory M. Shaw Wetlands Park project. The Rory M. Shaw Wetlands Park project (which was named the Strathern Pit project in the SVWMP) would convert a 46-acre property to a multi-benefit stormwater detention, wetlands, and recreation facility that would provide for stormwater detention, water quality treatment, groundwater recharge, and recreation open space for an underserved community. The District is applying for funding for construction of the Rory M. Shaw Wetlands Park project from the State Water Resources Control Board State Revolving Fund. Local funding and other funding sources would be used for construction of the Upper Storm Drain System Phases 2 – 4 project. Both projects are evaluated in this Addendum to provide for a comprehensive understanding of these interrelated projects. The stormwater collected in the Upper Storm Drain System Phases 2 – 4 project would be conveyed to the Rory M. Shaw Wetlands Park project, routed to the detention pond within that site and then to the wetlands within that site for water quality treatment. The stormwater would then be conveyed to existing groundwater infiltration basins within the adjacent Sun Valley Park. Thus, these two projects would work together to alleviate localized flooding, provide water quality treatment, and increase groundwater recharge.

	Rory M. Shaw Wetlands Park
	2004 Approved Wetlands Park Project The 2004 Approved Wetlands Park project as described in the 2004 PEIR proposed to convert an existing 46-acre construction debris landfill located in the northeast corner of Tujunga Avenue and Strathern Street into a stormwater retention and treatment area and park. The primary objective of the 2004 Approved Wetlands Park project was to capture stormwater runoff collected from the upstream industrial drainage area to alleviate flooding in the vicinity of the Tuxford Avenue and San Fernando Road intersection. It was also designed to provide a water conservation benefit through the reuse of stormwater for industrial purposes, or off-site infiltration to the Tujunga Spreading Grounds for groundwater recharge. The 2004 Approved Wetlands Park project would also provide up to 30 acres of green space, including wildlife habitat and park land for the community. Stormwater collection and conveyance to the pit would involve catch basins and storm drains in the surrounding streets. The existing landfill surface was planned to be modified to create terraced side slopes with five levels. The deepest part of the pit would be approximately 50 feet below street level. The bottom portion of the basin was planned to be operated as a wetland designed in alignment with Environmental Protection Agency guidelines for stormwater treatment wetlands. The terraced areas above the wetland would be dry most of the time and would be available for recreational and/or habitat uses. During dry weather periods (May - October), water levels in the wetland would be maintained by repeated circulation. Most of the wetland area would be in shallow ponds. During this recirculation mode, no water would leave the project site. The basin was planned to be lined with impervious material (geotextiles), and no on-site infiltration of stormwater would occur at this site. During large storms, the area above the wetland would store stormwater. Stormwater captured in the basin would be circulated through the wetland, which would be designed to remove some of the pollutants. Stormwater from a 50-year storm (about 500 to 700 acre-feet of stormwater depending on the project alternative as described in the 2004 PEIR) would be fully treated by the wetland over a period of four months. Stormwater would then be transferred off site for infiltration (at the Tujunga Spreading Grounds) or reuse (Vulcan Gravel Processing Plant). The remaining open space at the site could be used for recreational and habitat purposes. The 2004 Approved Wetlands Park project included excavation and grading activities for construction of a park, detention pond and wetlands, storm drains to collect surface water from the streets, a pump station, flood control appurtenances, and recreational facilities such as a restroom and concessions building. 2013 Wetlands Park Approved Project An Addendum to the 2004 PEIR was prepared to evaluate modifications to the 2004 Approved Wetlands Park project and adopted on October 8, 2013. The 2013 Addendum addressed two primary changes: an alternative storm drain alignment that was part of the Storm Drain Project of the SVWMP and a new recycled water line. It also addressed minor changes in the project design, including omitting the terraced design of the detention pond and wetlands, and adding details regarding the recreational amenities. Further, the name of this project was changed from the Strathern Pit project to the Rory M. Shaw Wetlands Park project. The other project components related to the 46-acre park, recreational open space, wetlands, etc. remained the same in the 2013 Approved Wetlands Park project. In 2005, the Los Angeles Department of Water and Power (LADWP), a responsible agency, certified the Integrated Resources PEIR, which

	identified a proposed recycled water line along the same storm drain system. On October 8, 2013, Los Angeles County Flood Control District and LADWP entered into a project partnership agreement for the inclusion of a recycled water line in the design and construction of the storm drain system from Sheldon Street to the project site. The 2004 PEIR did not consider the recycled water line component, and thus, the 2013 Addendum was prepared to refine the scope of the project description to discuss the alternative storm drain alignment and include the recycled water line. The 2004 Approved Wetlands Park project included construction of a 4.5-mile storm drain system that would capture and convey runoff from the 929-acre tributary area and deliver it to the detention pond within the project site. The modifications as described in the 2013 Addendum included a revised route from that evaluated in the 2004 PEIR. Specifically, this revision provided that if the detention pond reached its storage capacity, the outlet from the storm drain to the detention pond would be closed so as to prevent the detention pond from overflowing. Accordingly, the storm drain would be large enough to convey a maximum flow rate of 990 cubic feet per second, and the design capacity of the detention pond was 400 acre-feet. The storm drain was planned to be constructed along Glenoaks Boulevard and Tuxford Street. From the intersection of Tuxford Street and San Fernando Road, the storm drain would connect to Tujunga Avenue at Penrose Street following a revised route from that evaluated in the 2004 PEIR. The modifications also included a 1,200-feet transfer pipeline that would convey the treated runoff from the wetlands to the adjacent Sun Valley Park for groundwater recharge. In addition, the modifications to the approved 2004 Approved Wetlands Park project as analyzed in the 2013 Addendum included a 2.75-mile recycled water line that would connect to an existing recycled water line located at the Los Angeles Department of Water and Power Valley Generating Steam Plant and terminate downstream at the project site to supply the park facilities with Title 22 recycled water for year-round irrigation. As evaluated in the 2013 Addendum, the recycled water line would be constructed within the trench for the storm drain along Glenoaks Boulevard and Tuxford Street. The recycled water line would separate from the storm drain at Tuxford Street at San Fernando Road. The recycled water line would follow an independent alignment along San Fernando Road and Penrose Street and rejoin the trench for the storm drain at Penrose Street and Tujunga Avenue. Alternatively, the 2013 Addendum identified that the storm drain might be constructed along the San Fernando Road and Penrose Street route to Tujunga Avenue as proposed in the 2004 PEIR. The recycled water line would then be entirely within the trench of the storm drain route. Since the 2013 Addendum, Phase 1 of this project, which consists of site investigations and demolition of existing structures on-site, was completed in 2017. Following adoption of the 2013 Addendum, several phases of additional subsurface exploration were conducted as part of the site investigations. These included supplemental soil borings in 2014 and preparation of a geotechnical report in 2019. The Strathern Landfill was closed at the time of various investigations, but the concrete batch plant was in operation and was not made accessible for investigation until 2013. Additionally, the structures that comprised part of the concrete batch plant could not be demolished until Over and Over Ready Mix vacated the project site in 2017. Supplemental soil borings were drilled in 2014, with supplemental drilling occurring in June 2014 (in accordance with 2004 PEIR Mitigation Measure G-1). A subsurface environmental site assessment was prepared to collect geotechnical data and subsurface environmental data from grading along the boundary of the proposed

	detention pond and wetland area. The 2014 subsurface environmental site assessment findings found that the former Newberry Landfill is composed of decomposable waste and occupies the northern portion of the project site. There was a discovery of organic landfill material on-site. As such, construction activities were paused, and none of the stormwater collection systems and recreational components have been constructed. Currently Proposed Rory M. Shaw Wetlands Park The concept for the currently proposed Rory M. Shaw Wetlands Park project was revised based on the findings of the 2014 soil borings and a 2019 geotechnical report prepared for the project site (in accordance with 2004 PEIR Mitigation Measure G-1). The project revisions were necessary to address the findings that excavation along the northern boundary is not considered to be feasible, the detention pond proposed for the west-southwest area of the project site requires use of DDC to protect against settlement over time, the site is not suitable for development without remedial grading, and excavation of inert landfill debris, and the legacy of organic landfill material requires a passive methane system that can be converted into an active system be incorporated into the design. The preliminary site design is presented in Figure 4, Rory M. Shaw Wetlands Park Conceptual Plan and the changes in this currently proposed project are summarized in Table 1. The District's goals for the Rory M. Shaw Wetlands Park project are as follows: • Provide flood control and mitigate flood risks by capturing stormwater runoff collected from the upstream drainage area, which primarily supports industrial land uses, to alleviate flooding in the southern portion of the Sun Valley watershed. • Support local water quality enhancements and reduce stormwater pollution by routing stormwater runoff collected from the industrial area upstream of the site through wetlands to provide natural treatment • Boost the local water supply by conveying treated stormwater to infiltration basins at an adjacent park for groundwater recharge • Provide wildlife habitat • Provide active and passive recreation uses for the Sun Valley community
	Upper Storm Drain System
	2004 Storm Drains Project The Storm Drains Project component of the SVWMP as evaluated in the 2004 PEIR involved constructing storm drains underground within multiple existing roadways, potentially in the vicinity of existing utility lines for water, sewer, gas, oil, and communications. Depending on the segment, adjacent surface land uses include residential, commercial, and/or industrial. As evaluated in the PEIR, the SVWMP anticipated construction of up to 13.6 miles of storm drains depending on the PEIR project alternative chosen, with the Upper Storm Drain System being one component of the overall storm drains project described in the SVWMP and evaluated in the 2004 PEIR. The storm drains were intended to collect stormwater and convey it to other SVWMP components to minimize flooding in the streets and supplement the flood control capacities of other project components (retention facilities) in the southern watershed. The PEIR evaluated four SVWMP project alternatives, each of which included installation of storm drains to collect stormwater from the street surfaces and convey it below the streets

into the stormwater storage/infiltration facilities identified in the SVWMP. In Alternatives 2 and 4, the storm drains would connect to existing drains located at the southern end of the watershed, which drain to the Los Angeles River.

The size and length of the storm drains varied between the four project alternatives evaluated in the 2004 PEIR. Main storm drain lines were expected to range from 30 to 96 inch diameter RCP; lateral drains were expected to range from 24 to 36 inch diameter RCP; RCBs were expected to range in size between 5 feet by 5 feet and 10 feet by 10 feet; and the total length of RCBs was expected to range between 5,400 to 13,350 feet.

2013 Approved Project

As discussed previously, an Addendum to the 2004 PEIR was prepared for the modifications to the 2004 Approved Wetlands Park project, which included consideration of the Upper Storm Drain System, and was adopted on October 8, 2013. One of the two primary changes evaluated in the 2013 Addendum was an alternative storm drain alignment.

The Upper Storm Drain System was evaluated in the 2013 Addendum as a component of the 2013 Approved Wetlands Park project. The 2013 Addendum describes this system as a 4.75-mile storm drain system that would capture and convey runoff from the 929-acre tributary area and deliver it to the detention pond within the 2013 Approved Wetlands Park project. In the 2013 Addendum, the detention pond was anticipated to have a storage capacity of 400 acre-feet. The Upper Storm Drain System evaluated in the 2013 Addendum also included installation of storm drains that would convey stormwater that exceeds the detention pond storage capacity south of the Wetlands Park and into existing storm drain project No. 39, which conveys stormwater further south.

The 2013 Addendum identified two potential alignments for the Upper Storm Drain System, one that was evaluated in the 2004 PEIR and an alternative alignment that is 0.4-mile shorter than the alignment evaluated in the 2004 PEIR. In both cases, the storm drains would be routed along Glenoaks Boulevard, Tuxford Street, Penrose Street, San Fernando Road, Tujunga Avenue, and Sherman Way.

2020 Approved Project

Following adoption of the 2013 Addendum, the Upper Storm Drains component of the SVWMP was further modified, and another Addendum was prepared to evaluate those changes. This second Addendum was adopted in 2020. The 2020 Addendum primarily focused on Phase 1 of the Upper Storm Drain System, but also address Phases 2 – 4.

The storm drain system evaluated in the 2020 addendum included approximately 13 miles of RCP beneath roadways to convey runoff into planned stormwater retention facilities and collector storm drains. The system also included construction of catch basins, connector pipes, and other drainage elements. Construction was expected to occur along Tujunga Avenue, Penrose Street, Goss Street, San Fernando Road, Tuxford Street, Glenoaks Boulevard, Sheldon Street, Vineland Avenue, and Saticoy Street.

Currently Proposed Upper Storm Drain System Phases 2 –4

Phase 1 of the Upper Storm Drain System was completed in 2021, in accordance with the project description updates evaluated in the 2013 and 2020 Addenda. The currently proposed Upper Storm Drain System Phases 2 – 4 project largely retains the same pipeline locations and alignments as the 2020 Approved Upper Storm Drain System project. The

	total storm drain length in Phase 2 has slightly decreased, the tunnel in Phase 3 has slightly decreased, and the construction periods for all three phases have increased. These changes are summarized in Table 2. The length of each storm drain segment is identified in Table 3, and the size of each storm drain segment is identified in Table 4. The District's goals for the proposed Upper Storm Drain System Phases 2 – 4 project are as follows: • Provide flood control and mitigate flood risks by capturing stormwater runoff from individual streets in the upper Sun Valley watershed. • Convey stormwater to the detention pond and wetlands in the planned Rory M. Shaw Wetlands Park to alleviate flooding, provide water quality treatment, and contribute to groundwater recharge. • Convey stormwater to an existing collector storm drain south of the park to provide additional flood control.

DATE OF PROJECT APPROVAL:	The original PEIR was certified June 29, 2004. In accordance with Sections 15162 and 15164(b) of State CEQA Guidelines, an Addendum to the 2004 PEIR was prepared to address modifications to the 2004 Approved Wetlands Park project and the Upper Storm Drain System project. That Addendum was adopted on October 8, 2013. The 2013 Addendum found that the changes to both projects were minor and did not result in new significant impacts or an increase in the severity of a previously identified impact, and there was no substantial new information that led to the identification of new or more severe impacts. Therefore, it was determined an Addendum would be the required CEQA document because the changes did not meet any of the requirements under Section 15162 of the State CEQA Guidelines. Additional revisions to the Upper Storm Drain System project were addressed in the 2020 Addendum, adopted on November 10, 2020. The 2020 Addendum found that the changes to this project did not constitute a substantial change or result in new significant impacts or an increase in the severity of a previously identified impact, and that there was no substantial new information that led to the identification of new or more severe impacts. Therefore, it was determined an Addendum would be the required CEQA document because the changes did not meet any of the requirements under Section 15162 of the State CEQA Guidelines.
PUBLIC AGENCY APPROVING PROJECT:	Los Angeles County Flood Control District
BACKGROUND INFORMATION:	The SVWMP is composed of multiple components located throughout the 4.4 square miles area of the Sun Valley Watershed in the communities of the City of Los Angeles, North Hollywood, and Sun Valley. The objectives of the SVWMP are to reduce local flooding, increase water conservation, increase recreational opportunities, increase wildlife habitat, improve water quality, provide additional environmental benefits of energy conservation, air quality improvement and solid waste management, and increase multiple agency cooperation. The Los Angeles County Flood Control District (District) is the Lead Agency for this project under CEQA. The Los Angeles County Board of Supervisors, as the District's governing body, certified the SVWMP Program Environmental Impact Report (referred herein as "2004 PEIR") on June 29, 2004, and adopted the SVWMP. In 2013, an Addendum to the 2004 PEIR was prepared to consider modifications to the 2004 Approved Wetlands Park project, including the Upper Storm Drain System (also referred to as the "2004 Storm Drains project"). The project described in the 2013 Addendum is referred to as the "2013 Approved Storm Drains project." The 2013 Addendum considered refinements to the 2004 Approved Wetlands Park project (which was renamed to the Rory M. Shaw Wetlands Park) and refinements to the Upper Storm Drain System relative to the 2004 Storm Drains project scope. Based on supplemental soil borings in 2014, (taken in accordance with 2004 PEIR Mitigation Measure W-4), geotechnical and subsurface environmental data found that the former Newberry Landfill located at the Rory M. Shaw Wetlands Park project site is composed of decomposable waste and occupies the northern portion of the project site. Moreover, there was a discovery of organic landfill material on-site. As discussed below, the Rory M. Shaw Wetlands Park project required a re-design to address the organic landfill material and construction activities were paused, and none of the stormwater collection systems and recreational components within the Rory M. Shaw Wetlands Park project site have been constructed. A 2019 geotechnical report prepared for Los Angeles County Public Works (in accordance with 2004 PEIR Mitigation Measure G-1) summarized the findings of geotechnical evaluations and environmental assessments beginning in 2009 through August 2019.

	Based on the 2019 geotechnical report, excavation along the northern boundary is not considered to be feasible, the detention pond proposed for the west-southwest area of the project site requires use of DDC to protect against settlement over time, the site is not suitable for development without remedial grading and excavation of inert landfill debris, and the legacy of organic landfill material requires that a passive methane system that can be converted into an active system be incorporated into the design. Thus, the concept for the currently proposed Rory M. Shaw Wetlands Park project was revised. Since the adoption of the 2013 Addendum, modifications to the 2013 Approved Wetlands Park project have been proposed, as described previously. Minor modifications to the Upper Storm Drain System project have also been proposed since certification of the 2004 PEIR. These include minor changes to the storm drain alignments, which involves different road segments than originally anticipated and provides for a small decrease in the total linear feet of storm drain pipelines. Phase 1 of the Upper Storm Drain System project was completed in 2021, in accordance with the project description updates evaluated in the 2013 and 2020 Addenda.
SUPPORTING INFORMATION:	This Addendum to the 2004 PEIR is necessary to address modifications to the 2013 Approved Wetlands Park project and the 2020 Approved Upper Storm Drain System project. An analysis of the project modifications was conducted to assess whether the impacts of the currently proposed projects are consistent with the 2004 PEIR, the 2013 Addendum, and the 2020 Addendum with respect to criteria of the State CEQA Guidelines currently in effect. The analysis of whether the currently proposed projects would result in new environmental impacts or would substantially increase the severity of the impacts identified in the 2004 PEIR is presented here. A detailed Project Description for both projects is presented in Attachment 1. In addition, because the changes in the Rory M. Shaw Wetlands Park project are more substantial than the changes in the Upper Storm Drain System project, a separate memorandum evaluating the impacts associated with the Rory M. Shaw Wetlands Park project was prepared and is included as Attachment 2, The Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum. Included within Attachment 2 are Appendices A through G: • Appendix A: Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum • Appendix B: Biological Resources • Appendix C: Geotechnical, Geologic, and Environmental Assessment • Appendix D: Bird-Aircraft Strike Hazards Report • Appendix E: Noise Technical Memorandum • Appendix F: Trip Generation Analysis, Transportation Consistency Analysis, and VMT Assessment • Appendix G: MMRP for the Sun Valley Watershed Management Plan Because the analysis in Appendix A only addresses the Rory M. Shaw Wetlands Park project and was prepared in 2022, updated modeling of the air pollutant and greenhouse gas emissions from construction of both the Rory M. Shaw Wetlands Park project and the Upper Storm Drain System project was prepared. The modeling data and analysis is presented in Attachment 3.

ANALYSIS:	New Environmental Effects or Substantial Increase in the Severity of Previously Identified Significant Effects (State CEQA Guidelines Section 15162(a)(1)) As demonstrated below, the currently proposed projects propose minor changes to the 2004 Approved Project, 2013 Approved Project, and 2020 Approved Project that would not result in new significant impacts, substantial increases in previously identified significant impacts, or the requirement for new mitigation measures or alternatives to be studied. • Aesthetics: **Rory M. Shaw Wetlands Park** The Rory M. Shaw Wetlands Park project site is located in a highly developed urban environment. There are no significant scenic vistas within the project site's vicinity that would have the potential to be obstructed by this project. The 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project considered introduction of recreational features and landscaping, similar to that of the current project design, which would contribute to improve the overall appearance of the area. The 2004 PEIR found that the 2004 Approved Wetlands Park project would have less than significant aesthetics impacts. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the aesthetics analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, aesthetics was not discussed in the 2013 Addendum. The currently proposed Rory M. Shaw Wetlands Park project also incorporates a passive methane system and utilities, which were not previously described as part of the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. These components would consist of design features below the ground surface level and include vertical turbines adjacent to the north and south buildings on site. The currently proposed project would be consistent with applicable design guidelines and requirements necessary for implementation, which would ensure site design would meet specific aesthetic consistency requirements and thereby result in a coordinated design and enhance the overall visual identity of the project site. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in new significant impacts to aesthetics during operations, nor would it result in substantial increases in the severity of impacts as evaluated in the 2004 PEIR and 2013 Addendum. Additionally, this project would be consistent with specific lighting standards, including designs to minimize light pollution, trespass, and illumination from the project site onto surrounding parcels. Such standards would require new lighting to be designed to direct light downward. Therefore, the currently proposed Rory M. Shaw Wetlands Park project would result in limited lighting-related impacts and would be consistent with adjacent urban uses that incorporate general nighttime and security lighting. As such, this project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum. **Upper Storm Drain System** The Upper Storm Drain System project site includes segments of San Fernando Road, Tuxford Street, Glenoaks Boulevard, Sheldon Street, Vineland Avenue, Tujunga Avenue, and Saticoy Street, all of which are located in a highly developed urban environment. The project location has not changed since adoption of the 2020 Addendum. The currently proposed Upper Storm Drain System project consists of construction of underground storm drain lines and

associated infrastructure. All roadways would be restored to their existing conditions on completion of project construction. No new permanent light sources would be installed. Each of the three phases of this project are located within the project area analyzed in the 2004 PEIR and are not located within the viewshed of a scenic vista. The currently proposed Upper Storm Drain System project would not result in new significant impacts to aesthetics during operations, nor would it result in substantial increases in the severity of impacts. As such, this project would not result in any new or different impacts from those previously identified in the 2004 PEIR, 2013 Addendum, or 2020 Addendum.

- Agriculture and Forestry Resources:

Rory M. Shaw Wetlands Park

The currently proposed Rory M. Shaw Wetlands Park project would be constructed in the same location as the previously identified and evaluated 2004 Approved Wetlands Park project. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, this project site is located in an urbanized area and is not occupied by existing agricultural operations. The 2004 PEIR determined that based on past and existing land uses, the project site does not have the capacity to support agricultural operations, does not support an existing Williamson Act contract, does not contain any forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or land zoned for Timberland Production (as defined by Government Code section 51104(g)), and the construction and operation of 2004 Approved Wetlands Park project would not result in the conversion of farmland to a non-agriculture use. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the agricultural resources analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, agricultural resources were not discussed in the 2013 Addendum. The site is zoned Light Industrial and is not located in an area designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance by the California Department of Conservation (DOC 2024). Additionally, the proposed use under this currently proposed project would not change from the proposed use described as part of the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. The currently proposed Rory M. Shaw Wetlands Park project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The Upper Storm Drain System project would be constructed in the same location as was evaluated in the 2004 PEIR, 2013 Addendum, and 2020 Addendum. Construction of the drainage improvements under the currently proposed Upper Storm Drain System project would all take place within the right-of-way of existing roadways, including Tujunga Avenue, Penrose Street, San Fernando Road, Tuxford Street, Glenoaks Boulevard, Sheldon Street, and Saticoy Street, as well as several minor roadways that intersect with Tuxford Street and Glenoaks Boulevard.

The 2004 PEIR determined that based on past and existing land uses, the project site does not have the capacity to support agricultural operations, does not support an existing Williamson Act contract, does not contain any forest

land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or land zoned for Timberland Production (as defined by Government Code section 51104(g)), and the construction and operation of storm drains would not result in the conversion of farmland to a non-agricultural use. The land adjacent to the project site is zoned for industrial and low-density residential land uses. None of the area within or adjacent to the project site is zoned for agricultural use or designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance by the California Department of Conservation (DOC 2024). As such, the currently proposed Upper Storm Drain System project would not result in any new or different impacts from those previously identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Air Quality:

  Both currently proposed projects are located in the Los Angeles-South Coast Air Basin. This air basin is designated Nonattainment-Extreme with respect to the federal Clean Air Act standards for ozone, Nonattainment-Serious for the federal Clean Air Act 2006 standard for fine particulate matter ($PM_{2.5}$), Nonattainment-Moderate for the federal Clean Air Act 2012 standard for $PM_{2.5}$, and Maintenance-Serios for the federal Clean Air Act standard for coarse particulate matter (PM_{10}). This air basin is also designated nonattainment for the California Clean Air Act standards for ozone, $PM_{2.5}$, and PM_{10}.

  Rory M. Shaw Wetlands Park

  The 2004 Approved Wetlands Park project did not include the development of housing or employment centers and would not induce population or employment growth. Therefore, the 2004 PEIR determined the 2004 Approved Wetlands Park project would not conflict with or obstruct with the implementation of the Air Quality Management Plan (AQMP). Consistent with the 2004 PEIR, the currently proposed Rory M. Shaw Wetlands Park project does not propose a land use change that is new or different from what was previously planned and approved, nor would it lead to new air quality impacts; thus, it would not have the potential to conflict with the AQMP.

  Construction emissions for the currently proposed Rory M. Shaw Wetlands Park project would not exceed the South Coast Air Quality Management District's (SCAQMD's) daily thresholds except for oxides of nitrogen (NO_X) which was already determined in the 2004 Approved Wetlands Park project. Additionally, as discussed in Attachment 3, the currently proposed Rory M. Shaw Wetlands Park project would result in higher peak daily carbon monoxide (CO) emissions than was estimated in the 2004 PEIR but CO emissions would still not exceed the SCAQMD's daily thresholds. Therefore, construction of this project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity. Once project construction is complete, traffic associated with maintenance and operation would be consistent with that expected under the 2004 PEIR. Specifically, the 2004 PEIR identified maintenance requirements to include sediment removal, landscaping, maintenance of pumps and other equipment/facilities, and inspections. These maintenance activities may require vehicle travel to and from the site by several personnel several times a year, consistent with the assumptions used in the 2004 PEIR. Because the currently proposed Rory M. Shaw Wetlands Park project would not result in any new long-term operational activities, there would

	be no potential air quality impacts associated with operational air pollutant emissions. Similar to the 2004 PEIR, this project would result in construction emissions that would be temporary and well below the SCAQMD thresholds with the implementation of **Mitigation Measures A-1 through A-14** (See Appendix G - Sections 2.1 and 3.1 of Attachment 2, Programmatic Mitigation Monitoring and Reporting Program for the Sun Valley Watershed Management Plan [MMRP]). Since certification of the 2004 PEIR, revisions to SCAQMD Rule 403 and the California Code of Regulations (CCR) (Title 13, CCR, Sections 2449 and 2485) have been made. These changes include updates to the definition of a large operation in Rule 403 from a property containing 100 acres of disturbed surface area to 50 or more acres and changes the daily earthmoving volume from 10,000 cubic yards to 5,000 cubic yards. In addition, the CCR has changed the idling time limits from 10 minutes for all vehicles to 5 minutes for diesel trucks and buses. **Mitigation Measure A-10** references SCAQMD Rule 403, thus, the currently proposed Rory M. Shaw Wetlands Park project would be required to comply with these changes. Similarly, **Mitigation Measure A-11** would align with the new regulation's specifications upon implementation. Overall, these revisions do not change the conclusions regarding the air quality impacts of this currently proposed Rory M. Shaw Wetlands Park project. Since adoption of the 2004 PEIR, SCAQMD has implemented localized significance thresholds (LSTs) that Lead Agencies may apply to their project to evaluate localized impacts to nearby sensitive receptors during construction. As demonstrated in Attachment 3, construction activities for the Rory M. Shaw Wetlands Park project would not exceed SCAQMD daily LSTs for nitrogen dioxide (NO_2), CO, and PM_{10} however, the emissions would exceed the $PM_{2.5}$ site-specific LSTs; therefore, site-specific construction impacts during construction of this project would be potentially significant. However, **Mitigation Measure A-14** from the 2004 PEIR, which applies to this project, requires use of Tier 4 construction equipment for the construction of the Rory M. Shaw Wetlands Park project. With the incorporation of Mitigation Measure A-14, the impacts would be less than significant. The currently proposed Rory M. Shaw Wetlands Park project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity. As described in the 2004 PEIR, surface retention basins and other facilities that have standing water for a period of time may create odors if improperly operated and maintained. The 2004 Approved Wetlands Park project was planned to include permanent pools within a larger detention basin and constructed wetlands on site. These facilities were considered to have low and very low potential for creating odor. The detention pond included in the currently proposed Rory M. Shaw Wetlands Park project would be managed by providing circulation, aeration, etc. as necessary to maintain the aesthetics of the park. Similarly, water in the wetlands would not be stagnant because water would be continuously circulated and aerated using pumps. Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the currently proposed project component. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, and asphalt pavement application. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered less than significant. As such, the currently proposed Rory M. Shaw

Wetlands Park project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The 2004 PEIR determined the 2004 Storm Drains project would not conflict with or obstruct with the implementation of the AQMP. The currently proposed Upper Storm Drain System project does not include any housing; construction employment could be reasonably served by the existing population, as such it would not result in population growth and employment that was not accounted for in regional plans, nor would it result in new air quality impacts. Accordingly, it would not conflict with the AQMP.

Air pollutant emissions during construction of the Upper Storm Drain System project would not exceed the SCAQMD's daily thresholds, nor would they exceed the emissions estimates presented in the 2004 PEIR, 2013 Addendum, and 2020 Addendum. Specifically, as shown in the air quality modeling results provided in Attachment 3, construction activities for the Upper Storm Drain System project would not exceed the SCAQMD daily LSTs for NO_2, CO, PM_{10} and $PM_{2.5}$ emissions; therefore, site-specific construction impacts during construction of this project would be less than significant. The currently proposed Upper Storm Drain System project would not lead to new impacts or a substantial increase in the severity of the previously identified significant air quality impacts.

The currently proposed Upper Storm Drain System project would involve the construction of storm drains that would be below ground and not result in operational odors. Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the currently proposed project component. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, and asphalt pavement application. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered less than significant. Therefore, the currently proposed Upper Storm Drain System project would not lead to new impacts or a substantial increase in the severity of the previously identified significant impacts.

Combined Projects

The two projects evaluated in this Addendum would have some overlapping phases; however, as demonstrated in Attachment 3, construction of the combined projects would not exceed the previous regional estimates for each project from the 2004 PEIR nor from the 2013 and 2020 Addenda. Construction emissions from the combined projects would not exceed the SCAQMD's daily thresholds except for NOx. However, the 2004 PEIR already discussed that construction of the SVWMP projects would generate NO_x emissions in excess of SCAQMD's daily threshold for NOx. Additionally, the currently proposed projects would result in higher peak daily CO emissions than estimated in the 2004 PEIR but CO emissions would not exceed the SCAQMD's daily thresholds. Therefore, the currently proposed projects would not lead to new impacts or a substantial increase in the severity of the previously identified significant impacts.

Air pollutant emissions during construction of both projects would also not exceed the SCAQMD's site-specific LSTs because Tier 4 equipment would be used pursuant to Mitigation Measure A-14. Accordingly, when construction of the currently proposed Rory M. Shaw Wetlands Park projects overlaps with construction of the currently proposed Upper Storm Drain System project, no new significant impacts would occur and no previously identified significant impacts would substantially increase in severity.

Overlapping construction of the combined projects would result in potential odors from construction equipment and materials; however, those odors would disperse rapidly from each project site and would not occur at a sufficient magnitude to affect a substantial number of people. The wetlands component of the Rory M. Shaw Wetlands Park project would also be properly managed to limit potential odors. As such, the combined projects would not result in odors that would impact a substantial number of people. Therefore, no new significant impacts and no substantial increase in severity of previously identified significant impacts would occur during concurrent construction and operation of the combined projects.

- Biological Resources:

Rory M. Shaw Wetlands Park

As described in the 2013 Addendum, construction of the 2013 Approved Wetlands Park project would result in potentially significant impacts to high value vegetation types and associated wildlife, bird species protected under the Migratory Bird Treaty Act, and sensitive plant species. **Mitigation Measures B-2, B-4, and B-5** (See Appendix G - Sections 1.1 and 2.2 of Attachment 2, MMRP) were identified in the 2004 PEIR to reduce the identified impacts to a level below significant. The remaining impacts related to biological resources were determined to be less than significant and no mitigation was required. The currently proposed Rory M. Shaw Wetlands Park project would not result in new significant impacts to biological resources, nor would it result in substantial increases in the severity of previously identified significant impacts or the need for new mitigation measures.

The 2013 Addendum notes that biological studies of this project site were conducted as required by 2004 PEIR **Mitigation Measure B-2** and no high value native vegetation or habitats, including special status wildlife, wetlands, or riparian vegetation was identified. Under existing conditions, the project site is an undeveloped gravel pit and former landfill. The project site does not support any riparian habitat or sensitive natural communities. Therefore, the currently proposed Rory M. Shaw Wetlands Park project would result in no impacts to riparian habitat and sensitive natural communities. Thus, this project would not cause any new or more severe impacts to riparian habitat or sensitive natural community impacts than was previously identified. The Rory M. Shaw Wetlands Park project would result in the construction of man-made wetlands designed for stormwater and urban runoff treatment. As described in the 2004 PEIR, the proposed man-made wetlands would be designed as free water surface wetlands according to Environmental Protection Agency's guidelines for stormwater treatment. Most of the wetland area would be in shallow ponds and water would be circulated continuously using a small pump to provide a constant flow of water to maintain the wetland vegetation.

All portions of the project site contain suitable nesting habitat for a variety of avian species. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project requires mitigation of impacts to nesting birds. Migratory nongame native bird species are protected under the federal Migratory Bird Treaty Act (MBTA). Additionally, Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests. In order to avoid impacts on nesting bird species it is recommended that project construction be conducted outside of the recognized nesting bird season (February 15 through September 15). If work cannot be avoided during the nesting bird season, implementation of **Mitigation Measure B-5** (See Appendix G - Section 2.2 of Attachment 2, MMRP) as addressed in the 2004 PEIR and 2013 Addendum would reduce this impact to a less than significant level, and no new mitigation measures would be required. Once operational, the Rory M. Shaw Wetlands Park project would similarly be required to comply with federal and state law regarding nesting birds, such as avoiding maintenance work during the nesting bird season where feasible and conducting nesting bird surveys prior to conducting maintenance work within the nesting season.

The District has obtained a Protected Tree Removal Permit from the City of Los Angeles, which specifies a 4:1 on-site replacement for lost trees. The final planting plan for this project will be required to demonstrate compliance with this replacement standard. Two coast live oak trees were removed from the project site during vegetation clearance activities and the removal was monitored by a certified arborist. The currently proposed Rory M. Shaw Wetlands Park project would include removal of remaining trees as well as new trees planted as part of the County's plans to install perimeter fencing and landscaping, which would occur as a separate interim project prior to initiation of Phase 2, as noted previously and addressed in a CEQA Notice of Exemption filed in August 2024. The currently proposed Rory M. Shaw Wetlands Park project would also include planting of approximately 430 new trees and 109,505 new shrubs. Landscaping is proposed throughout the project site and surrounding the detention pond and wetland areas.

As recognized in the 2004 PEIR and 2013 Addendum, no habitat conservation plans or natural community conservation plans have been implemented or are planned for the project area, and the project site does not provide "a functional connection between two or more habitat patches that would otherwise be fragmented or isolated from one another" (Los Angeles County Flood Control District 2004). Therefore, this project would have no impacts associated with wildlife movement or conservation plans, consistent with the findings of the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The 2004 PEIR indicated that storm drains would be constructed underground within existing paved roadways and would only affect low-value and/or disturbed habitats (i.e., ruderal, developed, and/or non-native grassland), and no tree removal was expected to be necessary for implementation of the Storm Drains component of the SVWMP, Therefore, the Storm Drain component of the SVWMP was not expected to adversely impact biological resources.

Consistent with the 2004 PEIR, 2013 Addendum, and 2020 Addendum, the currently proposed Upper Storm Drain System project would involve

construction of storm drains and associated infrastructure below the surface of existing paved roadways, including Tujunga Avenue, Penrose Street, San Fernando Road, Tuxford Street, Glenoaks Boulevard, Sheldon Street, and Saticoy Street, as well as several minor roadways that intersect with Tuxford Street and Glenoaks Boulevard. These roadways and adjacent areas do not support habitat for most sensitive plant and wildlife species. However, similar to the previous discussion of the Rory M. Shaw Wetlands Park project, implementation of the Upper Storm Drain System project could result in disturbance to bird species that are protected under the MBTA and/or Sections 3503, 3503.5, and 3513 of the California Fish and Game Code. Compliance with **Mitigation Measure B-5** (See Appendix G - Section 2.2 of Attachment 2, MMRP) would ensure that impacts on nesting bird species would be avoided or reduced to a less than significant level.

As recognized in the 2004 PEIR and 2013 Addendum, no habitat conservation plans or natural community conservation plans have been implemented or are planned for the project area and the project site does not provide "a functional connection between two or more habitat patches that would otherwise be fragmented or isolated from one another" (Los Angeles County Flood Control District 2004). Therefore, the Upper Storm Drain System project would not result in any impacts associated with wildlife movement or conservation plans, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Cultural Resources:

Rory M. Shaw Wetlands Park

Cultural investigations conducted as part of the 2013 Addendum, in accordance with **Mitigation Measure C-5** (See Appendix G - Section 1.2 of Attachment 2, MMRP) in the 2004 PEIR, identified four structures that were over 50 years old within the project site. The evaluation of the structures concluded that none met the historic eligibility requirements under any of the four California Register Historical Resources criteria and that there were no historic resources present, as defined by CEQA. Those structures were demolished under Phase 1 of this project, which was completed in 2017.

An additional cultural resources investigation was completed in support of this current Addendum. The investigation found that there are no historic resources present within the Rory M. Shaw Wetlands Park project site (Dudek 2024). Thus, construction of phases 2 and 3 would not impact historical resources. No operational impacts to historic resources would occur.

Impacts to archeological resources under this currently proposed project would be similar to those of the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. The cultural resources investigation completed in support of this current Addendum found that there are no archaeological resources present within the Rory M. Shaw Wetlands Park project site (Dudek 2024). Potential ground disturbing activities associated with this project include over excavation of the project site (including inert landfill material), rough grading of the project site, grading of the existing berm and stockpiles, and construction of underground utilities, all of which would occur within previously disturbed areas. As with the 2013 Approved Wetlands Park Project, this project would have a detention pond footprint of approximately 21 acres and a maximum depth of 50 feet. Moreover, the

project would be required to incorporate all applicable geotechnical analysis and requirements as part of construction (in accordance with 2004 PEIR **Mitigation Measure G-1** [See Appendix G - Section 1.3 of Attachment 2, MMRP]). As such, construction of the Rory M. Shaw Wetlands Park would result in excavation and grading activities that could potentially encounter and damage buried archaeological resources or unknown cultural resources. The same mitigation measures provided in the 2004 PEIR would reduce these impacts to below a level of significance (**Mitigation Measures C-2 and C-3** [See Appendix G - Section 3.3 of Attachment 2, MMRP]). The changes in configuration proposed in the aboveground components for the Rory M. Shaw Wetlands Park project would not alter the potential for operational impacts to cultural resources.

Impacts to human remains under this currently proposed project would be similar to those of the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. Potential ground disturbing activities associated with the project include over excavation of the project site, rough grading of the project site, grading of the existing berm and stockpiles, excavation of inert landfill material, and construction of underground utilities. As with the 2013 Approved Wetlands Park project, there is a potential for human remains to be encountered during implementation of this currently proposed project. The same mitigation measure provided in the 2004 PEIR would reduce these impacts to below a level of significance (**Mitigation Measure C-4** [See Appendix G - Section 3.3 of Attachment 2, MMRP]). In conclusion, the Rory M. Shaw Wetlands Park project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The 2004 PEIR found that the 2004 Storm Drains project would not result in adverse effects to cultural resources. Similarly, the cultural resources investigations conducted as part of the 2013 Addendum found no historic or archaeological resources within the Upper Storm Drain System project site. However, the cultural resources investigation completed in support of this current Addendum found that San Fernando Road had been identified as a historic resource under an evaluation conducted for an unrelated project in 2012. This road was found to be historic because it served as a major transportation and trade route prior to the construction of Interstate-5 and was instrumental in the development of the City of Los Angeles and San Fernando Valley. Implementation of the currently proposed Upper Storm Drain System project would include construction of a storm drain within a 0.95-mile segment of San Fernando Road. The project would not alter the alignment of the road and the road would be returned to its pre-construction condition. Thus, the project would not affect the resource's integrity, nor would it result in a substantial adverse change in the significance of the resource (Dudek 2024).

The cultural resources investigation completed in support of this current Addendum found that there are no archaeological resources present within the Upper Storm Drain System project site (Dudek 2024). Impacts to archeological resources under this currently proposed project would be similar to those of the 2004 Storm Drains project, 2013 Approved Storm Drains project, and 2020 Approved Upper Storm Drain System project. Ground disturbing activities associated with this project include pavement removal, trenching, and construction of underground utilities, all of which would occur within existing

paved roads. During project implementation, buried archaeological resources or unknown cultural resources could be encountered and/or damaged during these ground disturbing activities. The same mitigation measure provided in the 2004 PEIR would reduce this impact to below a level of significance (**Mitigation Measure C-3** [See Appendix G - Section 3.3 of Attachment 2, MMRP]). The minor reductions in the length of the storm drain lines and tunnel compared to the 2020 Approved Upper Storm Drain System project would slightly lessen the extent of trenching needed to construct this currently proposed project, thus there would be a slight reduction in the potential for archaeological resources or unknown cultural resources to be encountered. The Upper Storm Drain System project would have no potential to adversely affect archaeological resources or other cultural resources during operation because all roads would be returned to their existing conditions and no further ground disturbing activities would occur.

Impacts to human remains under this currently proposed project would also be similar to those of the 2004 Storm Drains project, 2013 Approved Storm Drain project, and 2020 Approved Upper Storm Drain System project. Human remains could be encountered during the ground disturbing activities associated with this project, which include pavement removal, trenching, and construction of underground utilities. The same mitigation measure provided in the 2004 PEIR would reduce these impacts to below a level of significance (**Mitigation Measure C-4** [See Appendix G - Section 3.3 of Attachment 2, MMRP]). The minor reductions in the length of the storm drain lines and tunnel compared to the 2020 Approved Upper Storm Drain System project would slightly lessen the extent of trenching needed to construct this currently proposed project, thus there would be a slight reduction in the potential for archaeological resources or unknown cultural resources to be encountered. The Upper Storm Drain System project would have no potential to adversely affect human remains during operation because all roads would be returned to their existing conditions and no further ground disturbing activities would occur.

In conclusion, the Upper Storm Drain System project would not result in any new or different impacts from those previously identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Energy:

Rory M. Shaw Wetlands Park

Since certification of the 2004 PEIR and the 2013 Addendum, updates have been made to the State CEQA Guidelines. The revised State CEQA Guidelines added a new impact category "Energy" to Appendix G by incorporating the changes to Section 15126.2(b). As such, energy was not addressed in the 2004 PEIR or the 2013 Addendum.

The electricity used for construction activities would be temporary and minimal; therefore, construction of the Rory M. Shaw Wetlands Park project would not result in wasteful, inefficient, or unnecessary consumption of electricity. Impacts would be less than significant. Project operation would require electricity for the 15 acres of park space and ancillary electronic equipment, pump station associated with the wetland and detention pond and necessary lighting. The increase in electricity demand at the project site would be negligible relative to the electricity use in LADWP's service area. Therefore, the

	project's electricity consumption would not be considered inefficient or wasteful, and impacts would be less than significant. Natural gas is not anticipated to be required during construction or operation, and impacts would be less than significant. Petroleum would be consumed throughout construction. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction. Transportation of construction materials and construction workers would also result in petroleum consumption. Heavy-duty construction equipment, vendor trucks, and haul trucks would use diesel fuel. Construction contractors for the Rory M. Shaw Wetlands Park project would be subject to CARB's In-Use Off-Road Diesel Vehicle Regulation that applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The regulation (1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; (2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System) and labeled; (3) restricts the addition of older vehicles into fleets starting on January 1, 2014; and (4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits). The District and/or construction contractor must either show that its fleet average index was less than or equal to the calculated fleet average target rate or that the fleet has met the Best Achievable Control Technology requirements. Construction workers would likely travel to and from the project area in gasoline-powered vehicles. Overall, the project would not be unusual as compared to overall local and regional demand for energy resources and would not involve characteristics that require equipment that would be less energy efficient than at comparable construction sites in the region or state. Therefore, because petroleum use during construction would be temporary and would not be wasteful or inefficient, impacts would be less than significant. During operations, most of the fuel consumption resulting from the proposed Rory M. Shaw Wetlands Park project would involve the use of motor vehicles traveling to and from the project site for periodic maintenance and to use the recreation facilities. Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of the vehicle miles traveled because of project operation. As compared to the petroleum consumption in Los Angeles County per year, this currently proposed project would not result in wasteful, inefficient, or unnecessary consumption of petroleum, and impacts would be less than significant. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, this currently proposed project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR, Part 6). Part 6 of Title 24 establishes energy efficiency standards for residential and non-residential buildings constructed in California in order to reduce energy demand and consumption. The proposed Rory M. Shaw Wetlands Park project would not conflict with the various local plans that would reduce energy use, including the County's Community Climate Action Plan. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Upper Storm Drain System

As noted previously, energy was not addressed in the 2004 PEIR, 2013 Addendum, or 2020 Addendum.

The electricity used for construction of the proposed Upper Storm Drain System project would be temporary and minimal; therefore, construction would not result in wasteful, inefficient, or unnecessary consumption of electricity. Impacts would be less than significant. Project operation would not require electricity. Therefore, electricity consumption of this project would not be considered inefficient or wasteful, and impacts would be less than significant.

Natural gas is not anticipated to be required during construction or operation, and impacts would be less than significant.

Petroleum would be consumed throughout construction. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction. Transportation of construction materials and construction workers would also result in petroleum consumption. Heavy-duty construction equipment, vendor trucks, and haul trucks would use diesel fuel. Construction contractors for this project would be subject to CARB's In-Use Off-Road Diesel Vehicle Regulation, as discussed in the Rory M. Shaw Wetlands Park analysis presented above. Construction workers would likely travel to and from the project area in gasoline-powered vehicles. Overall, the project would not be unusual as compared to overall local and regional demand for energy resources and would not involve characteristics that require equipment that would be less energy efficient than at comparable construction sites in the region or state. Therefore, because petroleum use during construction would be temporary and would not be wasteful or inefficient, impacts would be less than significant.

During operations, fuel consumption resulting from the proposed Upper Storm Drain System project would involve the use of motor vehicles traveling to and from the project site for periodic maintenance. Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of the vehicle miles traveled during project operation. As compared to the petroleum consumption in Los Angeles County per year, this project would not result in wasteful, inefficient, or unnecessary consumption of petroleum, and impacts would be less than significant.

The Upper Storm Drain System does not include construction of new structures that would have ongoing energy demands. This project would not conflict with the various local plans that would reduce energy use, including the County's Community Climate Action Plan. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. In conclusion, the currently proposed Upper Storm Drain System project would not result in any new or different impacts from those previously identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Geology and Soils:

Rory M. Shaw Wetlands Park

The 2004 PEIR determined that no active or potentially active faults are known to pass directly beneath the Rory M. Shaw Wetlands Park project site and the

	site is not located within an Alquist-Priolo Fault Zone. However, the project site is located in the seismically active Southern California region and could be subject to moderate to strong ground motion in the event of an earthquake on one of the many active faults in Southern California. The 2004 PEIR found that the 2004 Approved Wetlands Park project would not involve construction of habitable structures and would not result in any change in seismic risk at the project site. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the geology and soils analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, this topic was not discussed in the 2013 Addendum. The currently proposed Rory M. Shaw Wetlands Park project does not involve changes in the location of the project or the land use of the project site and it would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury or death involving the rupture of a known earthquake fault. As explained in the 2004 PEIR, the 2004 Approved Wetlands Park project would result in less than significant impacts related to seismic ground shaking, surface fault rupture, liquefaction, expansive soils, and subsidence. Implementation of mitigation measures would be required for impacts related to landslides/slope-instability and soil erosion. The 2013 Addendum determined that the project revisions evaluated at that time would result in no changes to the impacts identified in the 2004 PEIR. Therefore, impacts related to the 2013 Approved Wetlands Park project were determined to be less than significant with implementation of mitigation measures (2004 PEIR **Mitigation Measure G-1** [See Appendix G - Section 1.3 of Attachment 2, MMRP]). As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, construction best management practices would continue to apply to the Rory M. Shaw Wetlands Park project and would minimize the potential for adverse effects related to soil erosion and water quality during construction. Specific control measures identified in **Mitigation Measure W-1** (See Appendix G - Sections 2.3 and 3.5 of Attachment 2, MMRP) of the 2004 PEIR would also apply to this currently proposed project, including implementation of a stormwater pollution prevention plan (SWPPP) as required in compliance with the National Pollution Discharge and Elimination System (NPDES) program. Design and operation of the currently proposed Rory M. Shaw Wetlands Park project would be subject to the same or similar drainage standards that were identified for the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. Similar to the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, this currently proposed project would reduce soil erosion potential on the project site by increasing the vegetative cover and modifying the site topography to retain runoff onsite. Therefore, impacts would remain less than significant, with mitigation incorporated. Based on the analysis within the 2019 geotechnical report (See Attachment 2, Appendix C), any potential risk of seismically induced landslides and liquefaction would be substantially mitigated with implementation of the Rory M. Shaw Wetlands Park project. Further, this currently proposed project would comply with applicable provisions of the California Building Code, thus minimizing the potential for damage to structures on the site related to unstable or expansive soils.

	The project site does not currently support septic tank systems and no use of alternative wastewater disposal systems is proposed. Thus, the Rory M. Shaw Wetlands Park project would have no impact associated with such systems. Potential ground disturbing activities associated with this project include over excavation of the project site (including inert landfill material), rough grading of the project site, grading of the existing berm and stockpiles, DDC activities over the detention pond footprint, and construction of underground utilities. As with the 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project would have a detention pond footprint of approximately 21 acres and a maximum depth of 50 feet. The utilities would be constructed within previously disturbed areas. Due to the level of previous development and disturbance that has occurred on the project site, the potential for encountering paleontological resources during project construction is considered low. Therefore, this project would have a less than significant impact on paleontological resources. In conclusion, the Rory M. Shaw Wetlands Park project would not result in any new or different impacts related to geology and soils compared to those previously identified in the 2004 PEIR and 2013 Addendum. **Upper Storm Drain System** The 2004 PEIR found that the 2004 Storm Drains project would have no impacts or less than significant impact with respect to geology, soils, and seismicity. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the geology and soils analysis in the 2004 PEIR were necessary for the 2013 Approved Storm Drain project, and thus, this topic was not discussed in the 2013 Addendum. Similarly, the 2020 Addendum found that no changes to the geology and soils analysis in the 2004 PEIR were necessary for the 2020 Upper Storm Drain System project. The currently proposed Upper Storm Drain System project involves the installation of a storm drain system under existing paved public streets. The 2004 PEIR determined that no active or potentially active faults are known to pass directly beneath the project site and the site is not located within an Alquist-Priolo Fault Zone. However, the project site is located in the seismically active Southern California region and could be subject to moderate to strong ground motion in the event of an earthquake on one of the many active faults in Southern California. The 2004 PEIR found that the 2004 Approved Storm Drains project would not involve construction of habitable structures and would not result in any change in seismic risk at the project site. The currently proposed Upper Storm Drain System project does not involve changes in the location or design of the project, thus, this project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury or death involving the rupture of a known earthquake fault. The 2004 PEIR found that the 2004 Approved Storm Drains project would result in less than significant impacts related to seismic ground shaking, surface fault rupture, landslides/slope-instability, liquefaction, expansive soils, and subsidence. The 2004 PEIR acknowledged that storm drain infrastructure could become damaged during a seismic event and that “failure of storm drains and underground tanks could result in release of water to the immediate

vicinity, but would not create dangerous conditions to nearby residences since the structures are buried" (Los Angeles County Flood Control District 2004).

The 2004 PEIR found that soil disturbance during project construction would increase the potential for wind and water erosion and that these impacts would be controlled with the development and implementation of a SWPPP in compliance with the NPDES program, as required under **Mitigation Measure W-1** (See Appendix G - Sections 2.3 and 3.5 of Attachment 2, MMRP). Design and operation of the currently proposed Upper Storm Drain System project would be subject to the same or similar drainage standards that were identified for the 2004 Approved Storm Drains project, 2013 Approved Storm Drains project, and 2020 Approved Upper Storm Drain System project.

Potential ground disturbing activities associated with the proposed Upper Storm Drain System project include pavement removal and trenching. Trench depth would vary with the size of the storm drain RCP needed in each particular location. The maximum trench depth is expected to be approximately 30 feet. The 2004 PEIR found that the potential for encountering paleontological resources during project construction is considered low due to the level of previous development and disturbance that has occurred on the project site and the geology of the area. This currently proposed project does not alter the location of the project, and no new information has been developed since preparation of the 2004 PEIR that indicates a higher level of paleontological sensitivity in the project area. Therefore, the currently proposed Upper Storm Drain System project would have a less than significant impact on paleontological resources.

In conclusion, the Upper Storm Drain System project would not result in any new or different impacts related to geology and soils compared to those previously identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Greenhouse Gas Emissions:

Rory M. Shaw Wetlands Park

At the time the 2004 PEIR was certified, there was no legislation or regulatory guidance with respect to CEQA analysis of greenhouse gases (GHG) and climate change. The passage of Assembly Bill (AB) 32 on September 27, 2006, the adoption of the California Air Resources Board's (CARB) implementing Climate Change Scoping Plan (CARB's Scoping Plan) in December 2008, and the adoption of State CEQA Guidelines specific to GHG analysis all occurred subsequent to certification of the 2004 PEIR. Therefore, the 2004 PEIR did not evaluate the impacts of the 2004 Strathern Pit Project on greenhouse gas emissions because the State CEQA Guidelines did not require analysis of project impacts related to global climate change. The 2013 Addendum conducted a quantitative analysis to model project greenhouse gas emissions and determined they would not exceed SCAQMD's 2008 interim significance threshold.

Construction of the currently proposed Rory M. Shaw Wetlands Park project would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road vendor and haul trucks, and worker vehicles. As with project-generated construction criteria air pollutant emissions, GHG emissions generated during proposed construction activities

would be short term, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions.

The 2004 PEIR identified that maintenance requirements of the 2004 Strathern Pit Project would include sediment removal from retention facilities, separation systems, and catch basins, landscaping, maintenance of equipment such as pumps, and inspections. Each of these maintenance activities would require several personnel several times a year at the Rory M. Shaw Wetlands Park site, requiring minor vehicle and employee travel. Sediment removal from retention basins may require minor earthwork. These activities would result in minor vehicle and equipment GHG emissions. As previously mentioned, GHG impacts were not addressed in the 2004 PEIR and the 2013 Addendum's analysis found GHG impacts to be less than significant. Operational activities associated with the currently proposed Rory M. Shaw Wetlands Park project would occur in a similar scale and intensity to what was previously analyzed in the 2013 Addendum.

GHG emissions from maintenance and operation of the Rory M. Shaw Wetlands Park project would remain below the SCAQMD's interim GHG threshold, as shown in Attachment 3. As such, GHG impacts would remain less than significant for this project.

The Rory M. Shaw Wetlands Park project would not conflict with the County's Climate Action Plan strategies for achieving the GHG targets for 2030, 2035, and 2045. The County's Climate Action Plan is also in alignment with the State's 2022 Scoping Plan. The project would not conflict with the Connect SoCal 2024 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) or with other applicable plans, policies, or regulations adopted for the purpose of reducing the emissions of GHGs. As such, impacts would remain less than significant. In conclusion, the currently proposed Rory M. Shaw Wetlands Park project would not result in any new or different impacts from those previously identified in the 2013 Addendum.

Upper Storm Drain System

As noted previously, GHG was not addressed in the 2004 PEIR, while the quantitative analysis in the 2013 Addendum demonstrated that the GHG emissions from implementation of the 2013 Approved Storm Drains project would not exceed SCAQMD's 2008 interim GHG significance threshold. The 2020 Addendum for the Upper Storm Drain System included additional GHG emissions modeling and analysis. At the time the 2020 Addendum was prepared, no project-level numerical significance thresholds for GHG emissions that would be applicable to the project had yet been adopted, however at that time, SCAQMD recommended a threshold of 3,000 MT CO2e per year for all land use projects. The 2020 Addendum evaluated whether the Upper Storm Drain System would exceed that threshold, and whether it would conflict with plans, policies, and regulations intended to reduce GHG emissions. Specifically, the 2020 Addendum considered this project's consistency with Executive Orders S-3-05 and B-30-15, AB 32 Scoping Plan, and the Southern California Association of Governments SCS.

The 2020 Addendum identified the annual GHG emissions during construction of each of the four phases of the Upper Storm Drain System, as determined by CalEEMod modeling, and amortized those emissions over the lifetime of the project, which was anticipated to be 30 years. The 2020 Addendum found the

	construction GHG emissions to be approximately 39.57 tons of CO2e per year, and that project operations would consist of periodic maintenance, which would not result in daily GHG emissions. The 2020 Addendum concluded that this project would not exceed SCAQMD's recommended GHG emissions threshold. The 2020 Addendum also found that given the limited activity involved in project operation for periodic maintenance, this project would not generate significant long-term GHG emissions, would not contribute cumulatively to impacts associated with GHG emissions, and would not conflict with any applicable plans, policies, or regulations intended to reduce GHG emissions. As demonstrated in Attachment 3, GHG emissions during construction of the currently proposed Upper Storm Drain System project would remain below the SCAQMD's interim GHG threshold. As such, GHG impacts would remain less than significant for this currently proposed project. Similar to the Rory M. Shaw Wetlands Park, the Upper Storm Drain System project would also not conflict with applicable GHG reduction plans. The currently proposed Upper Storm Drain System project would not result in any new or different impacts from those previously identified in the 2013 Addendum or 2020 Addendum. **Combined Projects** The GHG emissions from construction of both of the currently proposed projects would fall below the SCAQMD's interim GHG thresholds. Emissions from construction and operation of both projects would not conflict with the County's Climate Action Plan which is in alignment with the State's Scoping Plan. The combined projects would also not conflict with the Connect SoCal 2024 RTP/SCS. The combined projects would not generate GHG emissions that would be significant and would not conflict with an applicable GHG reduction plan. As such, impacts from overlapping construction and operation of the Rory M. Shaw Wetlands Park project and the Upper Storm Drain System project would remain less than significant and the combined projects would not result in any new or different GHG impacts from those previously identified in the 2013 Addendum and 2020 Addendum. • <u>Hazards and Hazardous Materials:</u> **Rory M. Shaw Wetlands Park** The 2004 PEIR found that the 2004 Approved Wetlands Park project site was not included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and therefore would not create a significant hazard to the public or the environment from construction and/or operation of a project on a known hazardous material site as defined in Government Code Section 65962.5. The currently proposed Rory M. Shaw Wetlands Park project does not involve changes in the location of the project and there is no new information showing that the project site is a hazardous material site as defined in Government Code Section 65962.5 (DTSC 2024, SWRCB 2024). Thus, this project would result in no impacts associated with development and use of a hazardous material site as defined in Government Code Section 65962.5, consistent with the findings of the 2004 PEIR and 2013 Addendum.

	The 2004 PEIR found that there was no known soil contamination at the 2004 Approved Wetlands Park project site, but that the highly urbanized setting and presence of industrial land uses indicated there was potential for contaminated soils to be present. If contaminated soils are encountered during project construction, implementation of **Mitigation Measure H-1** (See Appendix G - Section 3.4 of Attachment 2, MMRP) would be required to ensure contaminated soils are disposed of in compliance with applicable regulations. The new components of the currently proposed Rory M. Shaw Wetlands Park project include the installation of a passive methane system and the use of DDC methods over the detention pond footprint. The Geotechnical, Geologic, and Environmental Assessments (Attachment 2, Appendix C) determined that due to the methane concentrations at the project site, a passive methane system conforming with the standards of the City of Los Angeles Ordinance No. 175790 would be installed, which has now been included as part of the currently proposed Rory M. Shaw Wetlands Park project. The passive methane system would also be designed and engineered to mitigate potential intrusion of volatile organic compounds in accordance with Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code (LAMC). Conformance with the LAMC would ensure that installation and operation of the passive methane system would not create hazardous conditions to which users of the park or people residing or working in the vicinity would be exposed. DDC does not involve the use of any hazardous materials that are not already commonly used in construction projects. Thus, these new project components would not cause any new impacts or increase the severity of impacts that were identified in the 2004 PEIR or 2013 Addendum. The 2004 PEIR found that project operation would require stormwater disinfection, periodic removal and disposal of sediments from stormwater facilities, and herbicide use for landscaped areas. The operational analysis presented for hazards and hazardous materials in the 2004 PEIR would still apply to the currently proposed Rory M. Shaw Wetlands Park project because the proposed changes in configuration of the aboveground components would not alter the operational activities or the types of potentially hazardous materials that are required for operation. The proposed passive methane system would be operated consistent with LAMC to ensure that vapor intrusion would not represent a material environmental concern to future users of the site. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, operation of the currently proposed Rory M. Shaw Wetlands Park project would involve very little transport, storage, use, or disposal of hazardous materials associated with janitorial, maintenance, and repair activities (i.e., commercial cleaners, lubricants, or paints). Use of these materials would be limited, and transport, storage, use, and disposal of these materials would be subject to applicable federal, state, and local health and safety requirements. Impacts would, therefore, remain less than significant. Furthermore, compliance with existing regulations would ensure any potential of significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment would be less than significant. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the Rory M. Shaw Wetlands Park would include surface water features that have the potential to attract wildlife. The surface water features of this currently proposed project are not substantially different from those included in the 2004 Approved Wetlands Park project and 2013

	Approved Wetlands Park project. Further, since the proposed facility is less than one mile of the Hollywood Burbank Airport and 3 miles away from Whiteman Airport, **Mitigation Measure H-2** (See Appendix G - Section 1.4 of Attachment 2, MMRP) is required as part of this currently proposed project to reduce impacts in accordance with Federal Aviation Administration (FAA) recommendations. Given the greater distance of the project site from Whiteman Airport (approximately 3 miles) and the lower flight activity, changes in abundance or movement patterns of bird species resulting from the currently proposed Rory M. Shaw Wetlands Park project are of less concern at Whiteman Airport than at Hollywood Burbank Airport. A Bird-Aircraft Strike Hazards Report (See Attachment 2, Appendix D) was prepared to discuss the potential hazards to aircraft by this currently proposed project. The bird airstrike hazard at Hollywood Burbank Airport was analyzed both by attractants on the airfield and by attractants at off-airport locations in the vicinity (within 5 miles of both the airport and the project site). The currently proposed Rory M. Shaw Wetlands Park project could potentially affect bird aircraft strike risk for aircraft using Hollywood Burbank Airport by (1) increasing the abundance and/or diversity of bird species in the vicinity of the airport that pose a strike hazard to aircraft; and (2) by creating an attractant that induces existing or new birds to cross aircraft approach and departure paths to access or leave the project site. It is unlikely that the Rory M. Shaw Wetlands Park project would substantially increase diversity of bird species in the vicinity of Hollywood Burbank Airport. Existing conditions have not resulted in documented strikes on aircraft over the 30-year period from 1990 to 2019. Moreover, this project would likely result in human use and disturbance of the project site throughout the year. This human presence and activity would further limit the attractiveness of the project site to large numbers of birds. In summary, the currently proposed Rory M. Shaw Wetlands Park project is not expected to substantially increase the likelihood that birds would collide with aircraft or would cross approach or departure paths of aircraft using Hollywood Burbank Airport (See Attachment 2, Appendix D). The lack of bird-attracting features providing different habitat south and east of the project site, combined with the dominant approach and departure paths at Hollywood Burbank Airport that provide extensive separation from the project site, among other evidence provided in Appendix D, support this conclusion. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in new significant environmental effects or a substantial increase in the severity of a previously identified significant effect relative to hazards and hazardous materials. No new mitigation is required. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the Rory M. Shaw Wetlands Park project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. The 2004 PEIR determined lane and/or road closures may be necessary for installation of project facilities. Restricted access to the vicinity of project sites would be addressed by advanced notification of local emergency service providers. The currently proposed project does not involve long-term or substantial changes in access to any property and would not contribute to a significant increase in the potential for hazards within the area. The project site is not located in a state responsibility area or in a state-designated fire hazard severity zone. As such, the project site is not expected to be susceptible to wildfires and is not located within or near a wildfire hazard area or a state responsibility area.

In conclusion, the currently proposed Rory M. Shaw Wetlands Park project would not result in any new or different impacts associated with hazards and hazardous materials compared to those previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

Similar to the Rory M. Shaw Wetlands Park project, the 2004 PEIR and 2013 Addendum found that no portion of the Upper Storm Drain System project site is known to contain contaminated soils or be included on a list of hazardous material sites as defined in Government Code Section 65962.5. The currently proposed Upper Storm Drain System project does not involve changes in the location of the project and there is no new information showing that this project would intersect with a hazardous material site as defined in Government Code Section 65962.5 (DTSC 2024, SWRCB 2024); thus this project would not result in impacts associated with development at such a site. The 2020 Addendum discussed two sites identified as a hazardous material sites under Government Code Section 65962.5. Those sites are each more than 0.25-miles away from the road segments under which the Upper Storm Drain System would be installed, thus this project would not be affected by those known hazardous materials sites and would not disturb any of the hazardous materials present at those sites.

The 2004 PEIR found that there was no known soil contamination at any of the road segments included in the Upper Storm Drain System, but that there was potential for contaminated soils to be present given the highly urbanized setting and presence of industrial land uses. Similarly, the 2020 Addendum found that the surrounding industrial land uses, the soil of former landfills and potentially hazardous waste from nearby facilities pose a potential impact to the Upper Storm Drain System project. If contaminated soils are encountered during project construction, **Mitigation Measure H-1** (See Appendix G - Sections 1.4 and 3.4 of Attachment 2, MMRP) requires that such soils must be removed and disposed of in compliance with applicable regulations. Therefore, impacts would be less than significant, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

Operation of the currently proposed Upper Storm Drain System project would be the same as was assumed for the Storm Drains project in the 2004 PEIR, and as evaluated for the Upper Storm Drain System in the 2013 Addendum and 2020 Addendum. The currently proposed project differs from the project evaluated in the 2020 Addendum only due to an extension of the construction schedule and a slight decrease in the linear feet of storm drains to be installed. Consistent with the findings of the 2020 Addendum, project operation would include periodic removal and disposal of sediments from catch basins, management of stormwater facilities to avoid creating mosquito-breeding conditions, and potential herbicide use for landscaped areas. The 2004 PEIR found that impacts associated with periodic removal and disposal of sediments and herbicide use would be less than significant and no mitigation was required. The changes in the storm drain project since certification of the 2004 PEIR would not alter these operational characteristics and impacts would remain less than significant.

With respect to potential mosquito breeding and associated public health impacts such as West Nile Virus, **Mitigation Measure H-3** (See Appendix G - Sections 1.4 and 3.4 of Attachment 2, MMRP) from the 2004 PEIR requires

the District to coordinate with the Greater Los Angeles Vector Control District in identifying and implementing appropriate measures to ensure this potential impact is reduced to a less-than-significant level.

In conclusion, the currently proposed Upper Storm Drain System project would not result in any new or different impacts related to hazards and hazardous materials compared to those previously identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Hydrology and Water Quality:

Rory M. Shaw Wetlands Park

The project site for the currently proposed Rory M. Shaw Wetlands Park project remains the same as the project site identified for the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project; as such, the same hydrologic conditions that were analyzed and discussed in the 2004 PEIR and 2013 Addendum would apply to this project. Relative to the 2013 Approved Wetlands Park project, the new and revised components of this project include DDC activities over the detention pond and wetlands footprints; the hauling of excess materials to existing offsite disposal facilities; addition of a passive methane treatment system; on-site crushing activities; and relocating the 10 acres of created wetlands from the northern and western portion of the site to the east side of the site. Additionally, the recycled water line component identified in the 2013 Addendum has been omitted from this currently proposed project, and the storm drain component evaluated in the 2013 Addendum is addressed in this addendum as a separate project. DDC activities are required to achieve sufficient compaction to minimize chances of differential settlement on the site and ensure that water from the detention pond would not infiltrate and percolate through the inert debris landfill. In addition, minor changes to the conceptual plan for the aboveground recreational amenities, as shown in Figure 4, have been made, which consist of replacing the exercise station with a soccer field and adding a picnic pavilion. The design of the currently proposed Rory M. Shaw Wetlands Park project has not changed such that the existing or future hydrologic conditions of the site would be substantially altered.

The Rory M. Shaw Wetlands Park project site and the adjacent section of Tujunga Avenue are mapped as being within a 100-year flood zone. The Initial Study prepared for the 2004 PEIR found that none of the SVWMP projects would expose people or structures to flooding hazards. That Initial Study also found that impacts associated placing structures within a 100-year flood hazard area would be less than significant because the new structures and modifications to existing facilities included in the SVWMP are intended to reduce stormwater runoff and flooding and would be designed to collect, retain, and infiltrate or reuse stormwater runoff. These structures and facilities were expected to impede and/or redirect flood flows in a controlled manner. Thus, the SVWMP was found to have a beneficial impact with respect to flooding (Los Angeles County Flood Control District 2004).

The currently proposed Rory M. Shaw Wetlands Park is located at the same site as the 2004 Approved Wetlands Park and has substantially the same design and function with respect to its effect on flooding and stormwater management in the project vicinity as the 2004 Approved Wetlands Park. Thus, this currently proposed project would not result in new significant impacts to hydrology and

	water quality and would not result in substantial increases in the severity of previously identified significant impacts or the need to provide new mitigation measures. Specific control measures identified in **Mitigation Measure W-1** (See Appendix G - Sections 2.3 and 3.5 of Attachment 2, MMRP) of the 2004 PEIR, which requires the development and implementation of an SWPPP that includes specific measures to ensure compliance with the Los Angeles Regional Water Quality Control Board standards, would apply to the currently proposed Rory M. Shaw Wetlands Park project. In addition, implementation of **Mitigation Measure H-1** (See Appendix G - Sections 1.4 and 3.4 of Attachment 2, MMRP), would be required to ensure contaminated soils are disposed of in compliance with applicable regulations at the project site to reduce potential impacts to groundwater quality. Groundwater impacts require implementation of **Mitigation Measure W-4** (See Appendix G - Sections 1.5 and 4.4 of Attachment 2, MMRP) to ensure impacts remain less than significant. The currently proposed Rory M. Shaw Wetlands Park project would result in similar operational characteristics as the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project and would implement **Mitigation Measure W-4** to reduce impacts to less than significant. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, this currently proposed project would convey the treated runoff from the wetlands to the existing infiltration basins in the adjacent Sun Valley Park. The changes in configuration proposed in the aboveground components for the Rory M. Shaw Wetlands Park project would not alter the ability of this project to contribute to attainment of the watershed management goals described in the 2004 PEIR. Further, since this project is proposed for the purposes of flood protection, increased water conservation, improved water quality, increased habitat restoration, and enhanced recreational opportunities, cumulative impacts to water quality would be less than significant. Similar to the 2004 Approved Wetlands Park project described in the 2004 PEIR, the currently proposed Rory M. Shaw Wetlands Park project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park that would provide flood control, water conservation, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. Similar to the 2004 Approved Wetlands Park project described in the 2004 PEIR, the currently proposed Rory M. Shaw Wetlands Park project would result in the construction of permeable surfaces and impermeable surfaces. Neither the 2004 Approved Wetlands Park project, 2013 Approved Wetlands Park project, nor this currently proposed project involve groundwater extraction. The Rory M. Shaw Wetlands Park project would not deplete groundwater supplies or interfere with groundwater recharge. Consistent with the 2004 PEIR, the project would add a beneficial impact with respect to groundwater supply through increased groundwater recharge by conveying treated stormwater to the existing infiltration basins in the adjacent Sun Valley Park. The Rory M. Shaw Wetlands Park project site is located within a 100-year floodplain; however, it does not include any housing. The project site is also located approximately 15 miles inland from the Pacific Ocean, and therefore

there is no risk of tsunami in the area. No mudflow hazards have been identified for the project area. Hansen Dam and Lake are located approximately four miles north of the project site. The project site would be subject to inundation in case of failure of Hansen Dam or a seiche at Hansen Lake. The currently proposed Rory M. Shaw Wetlands Park project would not result in exposure of people or structures to a significant risk from Hansen Dam/Lake. Impacts would be less than significant.

In conclusion, the Rory M. Shaw Wetlands Park project would not result in any new or different impacts related to hydrology and water quality from those previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The proposed Upper Storm Drain System project provides for collection and conveyance of stormwater through the construction of new storm drains. The project site for the currently proposed Upper Storm Drain System project remains generally consistent with the project site identified for the 2004 Storm Drains project, the 2013 Approved Storm Drain project, and the 2020 Approved Upper Storm Drain System project; as such, the same hydrologic conditions that were analyzed and discussed for the 2004 Storm Drains project, the 2013 Approved Storm Drain project, and the 2020 Approved Upper Storm Drain System project would apply to this currently proposed project. Relative to the 2020 Approved Upper Storm Drain System project, the revised project components include a reduction in the length of the storm drain lines and tunnel and a longer construction schedule.

The Upper Storm Drain System would result in a reduction of polluted stormwater runoff entering the Los Angeles River, and therefore as described in the 2004 PEIR, 2013 Addendum, and 2020 Addendum, the project is expected to have a beneficial impact on surface water quality. The project is located in an urban area with commercial, industrial, and residential uses. As such, the stormwater run-off may contain pollutants that must be filtered out before the water can be reused or fed back into the watershed. The storm drain lines constructed north of Penrose Street would convey stormwater to the Rory M. Shaw Wetlands Park project, where the stormwater would be detained in the detention pond and routed through wetlands for treatment before being conveyed to the adjacent Sun Valley Park groundwater infiltration basins. As described in the SVWMP, 2004 PEIR, 2013 Addendum, and 2020 Addendum, this would provide appropriate water quality treatment for the stormwater to ensure protection of groundwater quality. The storm drain lines constructed south of the Rory M. Shaw Wetlands Park would convey any stormwater that exceeds the storage capacity of the detention pond to the existing storm drain project No. 39, which conveys stormwater further south to other stormwater treatment facilities.

Water quality impacts during construction would be less than significant with implementation of **Mitigation Measure W-1** from the 2004 PEIR, which requires development and implementation of a SWPPP that includes specific measures to ensure compliance with the Los Angeles Regional Water Quality Control Board standards.

Construction and operation of the Upper Storm Drain System does not involve groundwater extraction. Therefore, this project would not deplete groundwater supplies or interfere with groundwater recharge. Consistent with the 2004

PEIR, 2013 Addendum, and 2020 Addendum, the currently proposed Upper Storm Drain System project would add a beneficial impact with respect to groundwater supply by providing for groundwater recharge. No adverse impacts on aquifer volume or the local groundwater table level would occur.

In conclusion, the currently proposed Upper Storm Drain System project would not result in any new or different impacts related to hydrology and water quality from those previously identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Land Use and Planning:

Rory M. Shaw Wetlands Park

The issue of Land Use and Planning was excluded from detailed analysis in the 2004 PEIR because the analysis in the Initial Study prepared to support that EIR showed that the SVWMP, including the 2004 Approved Wetlands Park project, would have no impacts related to physically dividing an existing community or conflicting with land use plans, policies, and regulations regarding environmental impacts. The Initial Study prepared in support of the 2013 Addendum found that the 2013 Approved Wetlands Park project would also have no impacts related to land use and planning. The project site for the currently proposed Rory M. Shaw Wetlands Park project remains the same as the project site identified for the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project and there have not been any substantial changes in the land use conditions in the vicinity (HistoricAerial.com 2024). Therefore, the same land use and planning conditions that were analyzed and discussed for the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project would apply to this currently proposed project. Further, the project design has not changed such that the existing or future land use conditions in the project vicinity would be substantially altered.

The currently proposed Rory M. Shaw Wetlands Park project would not involve the construction of roads or large structures that would disrupt or divide the physical arrangement of an established community. The conversion of an existing 46-acre construction debris landfill would not conflict with applicable land use plans, policies, or regulations. In conclusion, the Rory M. Shaw Wetlands Park project would result in no impacts from a land use or planning perspective, consistent with the findings of the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

As noted previously, the issue of Land Use and Planning was excluded from detailed analysis in the 2004 PEIR because the analysis in the Initial Study prepared to support that EIR showed that the SVWMP, including the 2004 Storm Drains project, would have no impacts related to physically dividing an existing community or conflicting with land use plans, policies, and regulations regarding environmental impacts. The 2013 Addendum and 2020 Addendum also found that the 2013 Approved Storm Drain project and 2020 Approved Upper Storm Drain System project would have no impacts related to land use and planning.

The project site for the currently proposed Upper Storm Drain System project is consistent with the project site identified for the 2004 Storm Drains project, 2013 Approved Storm Drain project and 2020 Approved Upper Storm Drain

System project, and there have not been any substantial changes in the land use conditions in the vicinity (HistoricAerials.com 2024). Therefore, the same land use and planning conditions that were analyzed and discussed for the 2004 Storm Drains project, 2013 Approved Storm Drain project and 2020 Approved Upper Storm Drain System project would apply to this currently proposed project. Relative to the 2020 Approved Upper Storm Drain System project, the revised project components include a reduction in the length of the storm drain lines and tunnel and a longer construction schedule. The design of the currently proposed Upper Storm Drain System project has not changed such that the existing or future land use conditions in the project vicinity would be substantially altered.

The currently proposed Upper Storm Drain System project would not involve the construction of roads or large structures that would disrupt or divide the physical arrangement of an established community. The construction of storm drains and associated stormwater management infrastructure beneath existing paved public roads would not conflict with applicable land use plans, policies, or regulations. In conclusion, the currently proposed Upper Storm Drain System project would result in no impacts from a land use or planning perspective, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Mineral Resources:

Rory M. Shaw Wetlands Park

The Rory M. Shaw Wetlands Park project site remains the same as the project site identified for the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project and there have not been any substantial changes in the mineral resource conditions in the vicinity. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the project site is located within the MRZ-2 zone, which indicates an area where adequate information determined significant mineral deposits are present. Although the project site was previously used as a gravel pit. The gravel resources at the project site were exhausted and gravel extraction operations were terminated prior to the District's acquisition of the site for the project. Therefore, implementation of the currently proposed Rory M. Shaw Wetlands Park project would not result in the conversion of an active gravel extraction site and would not result in the loss of availability of a known mineral resource. Further, the project design has not changed such that the existing mineral resources conditions in the project vicinity would be substantially altered.

This project would not result in the loss of availability of a known mineral resource or locally important mineral resources recovery site. Therefore, the currently proposed Rory M. Shaw Wetlands Park project would result in no impacts to mineral resources, consistent with the findings of the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The Upper Storm Drain System project site is consistent with the project site identified for the 2004 Storm Drains project, 2013 Approved Storm Drain project and 2020 Approved Upper Storm Drain System project, and there have not been any substantial changes in the mineral resource conditions in the vicinity. Relative to the 2020 Approved Upper Storm Drain System project, the

revised project components include a reduction in the length of the storm drain lines and tunnel and a longer construction schedule.

The currently proposed Upper Storm Drain System project would be located under existing paved roads. No mineral extraction activities currently occur within the project site and no active mining areas or areas containing significant mineral resources would be affected by this project. Therefore, the Upper Storm Drain System would result in no impacts to mineral resources, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Noise:

Rory M. Shaw Wetlands Park

The Rory M. Shaw Wetlands Park project site remains the same as the project site identified for the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project and there have not been any substantial changes in the noise conditions in the vicinity. Further, as demonstrated in the following discussion, the changes in the Rory M. Shaw Wetlands Park project design and construction activities would not result in substantial changes in the existing or future noise conditions in the project vicinity and the noise impacts of this currently proposed project would be consistent with the findings of the 2004 PEIR. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the noise analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, noise was not discussed in the 2013 Addendum.

Noise-sensitive receptors in the vicinity of the Rory M. Shaw Wetlands Park project include residential land uses to the south, southwest, and east of the project site; Sun Valley Park to the east; a soccer complex to the west; and Arminta Street Elementary School located approximately 0.2 miles west of the site. The 2004 Approved Wetlands Park project was determined to have potentially significant noise impacts for all phases of project construction. With implementation of **Mitigation Measures N-1 through N-4** (See Appendix G - Sections 2.4 and 3.6 of Attachment 2, MMRP), construction-related noise impacts were determined to be less than significant. Noise sources during construction of the currently proposed Rory M. Shaw Wetlands Park project include the DDC activities, construction crew and vendor vehicles, haul trucks, on-site rock crushing, and construction of the above-ground improvements (the detention pond, wetlands, installation of the passive methane treatment system, trenching for utilities, and the recreational amenities). As discussed in detail in Attachment 2 and summarized here, the noise levels at nearby sensitive receptors during each of these construction activities would remain well below the worst-case construction noise level estimated in the 2004 PEIR, which was 81 decibels (dB). The average and maximum noise levels at nearby sensitive receptors for each activity are:

- DDC: Average noise levels ranging from 57 to 31 dB; maximum noise levels ranging from 64 to 39 dB.
- Traffic/Haul Trucks: Noise increase of less than 1 dB.
- Rock-Crushing: Average noise levels of 71 dB and maximum noise levels of 72 dB.

- Above-Ground Improvements: Average noise levels ranging from 74 to 40 dB; maximum noise levels ranging from 76 to 44 dB.

Thus, the new and revised components under the currently proposed Rory M. Shaw Wetlands Park project would not result in new significant impacts and would not increase the severity of the construction noise impacts as identified in the 2004 PEIR. No new mitigation measures (beyond those contained in the 2004 PEIR) would be necessary.

Construction of the Rory M. Shaw Wetlands Park project also has the potential to create vibration at nearby structures. Vibration impacts were not addressed in the 2004 PEIR or 2013 Addendum. The nearest sensitive structures are residences located on the south side of Strathern Street, which are located approximately 210 feet from potential construction activities. To address the effects of ground-borne vibration, the California Department of Transportation (Caltrans) has published guidance relating to structural vibration impacts, which finds that modern industrial/commercial buildings and new residential structures can be exposed to continuous ground-borne vibration levels of 0.5 inches per second without experiencing structural damage, and older residences can be exposed to continuous ground-borne vibration levels of 0.3 inches per second (Caltrans 2013). As shown in Attachment 2, the highest estimated vibration levels from DDC activities at the nearest sensitive receptor is 0.13 peak particle velocity (PPV, as measured in inches per second), which is well below the recommended Caltrans significance threshold of 0.5 inches per second. Thus, ground borne vibration from the proposed DDC activities, on-site crushing activities, and above-ground improvements would not result in new significant impacts. In addition, construction of the currently proposed Rory M. Shaw Wetlands Park project is estimated to result in approximately 70 additional one-way truck trips per day on the local roadways, which would be negligible based upon the existing traffic volumes, as discussed in Attachment 2. Therefore, vibration related to project-related construction vehicles on local roadways would not result in new significant impacts.

The 2004 PEIR found that noise sources during operation of the 2004 Approved Wetlands Park project would be limited to traffic, including worker vehicles travelling to the site for maintenance and inspection, as well as visitor vehicles associated with use of the recreational facilities. The noise impact of this additional traffic was found to be less than significant. The revisions to the project design since certification of the 2004 PEIR would not substantially increase maintenance and inspection activities or the amount of visitor vehicles accessing the site. Additionally, the new passive methane treatment system component of the Rory M. Shaw Wetlands Park project would be entirely passive, consisting of pipes and vents. No fans, pumps or motors would be used as part of the passive methane treatment system. Thus, this system would not generate any mechanical noise or vibration, and operation of the passive methane treatment system would not result in new significant impacts related to noise and vibration.

The project site is located within the vicinity of two airports: the Hollywood Burbank Airport and Whiteman Airport, located approximately one mile to the southeast and approximately 3 miles to the northwest respectively. However, the proposed Rory M. Shaw Wetlands Park project does not involve construction of housing or employment centers and therefore would not result in exposure of people or structures to a significant noise related to an airport.

	In conclusion, the currently proposed Rory M. Shaw Wetlands Park project would not result in new or substantially more severe noise effects relative to the noise impacts identified in the 2004 PEIR and 2013 Addendum. **Upper Storm Drain System** The Upper Storm Drain System project site is consistent with project site identified for the 2004 Storm Drains project, 2013 Approved Storm Drain project and 2020 Approved Upper Storm Drain System project and there have not been any substantial changes in the noise conditions in the vicinity. Further, as demonstrated in the following discussion, the changes in the Upper Storm Drain System project construction activities would not result in substantial changes in the existing or future noise conditions in the project vicinity and the noise impacts of this currently proposed project would be consistent with the findings of the 2004 PEIR and 2020 Addendum. As noted previously, the Initial Study prepared in support of the 2013 Addendum determined that no changes to the noise analysis in the 2004 PEIR were necessary for the 2013 Approved Project, and thus, noise was not discussed in the 2013 Addendum. The land uses surrounding phases 2 and 3 of the Upper Storm Drain System project are predominantly industrial. Noise-sensitive receptors near phases 2 and 3 include a public/institutional building (the County of Los Angeles Department of Public Social Services) on the east side of Glenoaks Boulevard, a medical office building on the northwest corner of the intersection of Sheldon Avenue and San Fernando Road, a hotel on San Fernando Road approximately 0.2 miles north of Sheldon Avenue, and residences north of Sheldon Avenue between Ilex Avenue and El Dorado Avenue (which is approximately 0.1 miles west of San Fernando Road). The noise-sensitive receptors in the vicinity of phase 4 include a soccer complex immediately west of the northern end of this phase and residential and commercial uses along Tujunga Avenue, Saticoy Street, and Vineland Avenue. In addition, Table 5 identifies schools that are within 0.5 miles of the Upper Storm Drain System project site. The 2004 PEIR found that the 2004 Storm Drains project could result in noise levels of up to 92 dB at the nearest sensitive receptors, which were assumed to be located within 50 feet of the construction activity. The 2004 PEIR concluded that the 2004 Storm Drains project could result in significant noise impacts and identified mitigation measures to reduce this impact to a less-than-significant level. The 2004 PEIR noted that “While noisy, construction impacts related to storm drain installation are very temporary at any one location. These linear construction zones are expected to progress at an average rate of 200 to 500 feet per day. Under typical conditions, any particular location would be directly impacted by the construction activities for one to five days” (Los Angeles County Flood Control District 2004).

Table 5: Schools Within 0.5 Miles of Upper Storm Drain System		
School Name and Address	***Distance and Direction from Project Site***	***Nearest Phase***
Fenton Academy (elementary) 8926 Sunland Boulevard	0.37 miles southeast of the intersection of Glenoaks Boulevard and Tuxford Street	Phase 2
ACRMA 21 (high school) 11933 Allegheny Street	Approximately 500 feet west of the intersection of San Fernando Road and Allegheny Street	Phase 3
Sun Valley High School 9171 Telfair Avenue	0.3 miles west of the intersection of San Fernando Road and Sheldon Street	Phase 3
Fernangeles Elementary School 12001 Art Street	0.3 miles west of the intersection of San Fernando Road and Art Street	Phase 3
Sun Valley Magnet School 7330 Bakman Avenue	0.27 miles south of Saticoy Street	Phase 4
ISANA Cardinal Academy 7301 Fair Avenue	0.27 miles south of Saticoy Street	Phase 4
Arminta Street Elementary School 11530 Strathern Street	0.2 miles east of the intersection of Tujunga Avenue and Strathern Street	Phase 4
Camellia Avenue Elementary School 7451 Camellia Avenue	0.25 miles southwest of the intersection of Tujunga Avenue and Saticoy Street	Phase 4
Roscoe Elementary School 10765 Strathern Street	0.5 miles east of the intersection of Strathern Street and Fair Avenue	Phase 4

The 2020 Addendum noted that detailed construction plans for the Storm Drains project were not available at the time the 2004 PEIR was prepared, and thus the 2004 PEIR analysis was based on estimates of the two noisiest pieces of equipment that would be operating concurrently. The 2020 Addendum included a more detailed project-specific analysis based on the storm drain alignments for the 2020 Approved Upper Storm Drain System project.

The 2020 Addendum found that sensitive receptors nearest the project site would be exposed to maximum noise levels ranging between 86.8 and 84.6 dB. The City's maximum allowable noise level during construction is 75 dB. Thus the 2020 Addendum concluded that this project would result in significant noise impacts and would require implementation of **Mitigation Measures N-1 through N-4** (See Appendix G - Sections 2.4 and 3.6 of Attachment 2, MMRP) from the 2004 PEIR. These measures establish the

	allowed hours of construction consistent with the City of Los Angeles Noise Ordinance, require that mufflers or other noise reduction devices be used for all mobile construction equipment, require that the construction contractor for each phase develop a site-specific noise mitigation plan which would reduce noise levels to 75 dBA at the nearest residences, and 67 dBA at any nearby school sites during project construction. The 2020 Addendum concluded that implementation of these measures would reduce the noise impacts of the 2020 Approved Upper Storm Drain System project to a less-than-significant level by ensuring that sensitive receptors are not exposed to noise levels that exceed the City's standards. The proposed revisions to the Upper Storm Strain System, which include a shorter length for some of the project components and a longer construction period, would not require changes in the types or numbers of construction equipment operating at one time and therefore the maximum potential noise exposure level for nearby sensitive receptors during construction would not increase. Thus, with implementation of the identified mitigation measures, the currently proposed Upper Storm Drain System project would result in less than significant noise impacts during construction, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum. Construction of the currently proposed Upper Storm Drain System project also has the potential to create vibration at nearby structures. The nearest sensitive structures are older residences located off of Sheldon Street, which could be exposed to vibration during construction of Phase 2. These structures are located approximately 50 feet from potential construction activities. As stated in the Rory M. Shaw Wetlands Park noise discussion, Caltrans has found that modern industrial/commercial buildings and new residential structures can be exposed to continuous ground-borne vibration levels of 0.5 inches per second without experiencing structural damage, and older residences can be exposed to continuous ground-borne vibration levels of 0.3 inches per second. The 2020 Addendum found that vibratory rollers would be the most significant piece of construction equipment to be used on-site during backfill and paving activities, which have the potential to create a groundborne vibration level of approximately 0.210 PPV at a reference distance of 25 feet. At a distance of 50 feet, which is the distance to the nearest vibration-sensitive receptor, the vibration level would be approximately 0.074 PPV. Thus, the currently proposed Upper Storm Drain System project would not create significant levels of vibration at nearby structures, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum. The 2004 PEIR found that operation and maintenance of facilities included in the SVWMP was expected to have minimal adverse noise impacts. During operation of the Upper Storm Drain System project, noise would be generated by worker vehicles traveling to various segments of the storm drain system for maintenance and inspection, which may occur up to several times a year for each segment. The 2004 PEIR identified the following daily traffic volumes on area roadways at that time (Los Angeles County Flood Control District 2004, Tables 4.11-2, 4.11-3, 4.11-5, and 4.11-11): • Sheldon Street at Glenoaks Boulevard – 15,000 • San Fernando Road at Sheldon Street – 25,000 • Glenoaks Boulevard at Sheldon Street – 24,000 • Glenoaks Boulevard at Tuxford Street – 22,000

- Tuxford Street at San Fernando Road – 33,000
- San Fernando Road at Tuxford Street – 20,000
- Bradley Avenue at Tuxford Street – 8,000
- Tujunga Avenue at Strathern Street – 15,000

It generally requires a doubling of traffic volumes to increase noise levels by 3 dB (Caltrans 2013). In general, periodic maintenance and inspection of the storm drain system would require between 1 and 5 vehicles. Thus, the traffic associated with storm drain system maintenance and inspection would increase noise levels by less than 1 dB and noise impacts related to the increase in traffic associated with operation would be less than significant, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

In conclusion, the Upper Storm Drain System project would not result in any new significant noise impact or more severe impacts than those identified in the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Population and Housing:

Rory M. Shaw Wetlands Park

The issue of Population and Housing was excluded from detailed analysis in the 2004 PEIR because the analysis in the Initial Study prepared to support that EIR showed that the SVWMP, including the 2004 Approved Wetlands Park project, would have no impacts related to directly or indirectly inducing population growth, displacing housing, or displacing people. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the population and housing analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, population and housing was not discussed in the 2013 Addendum. Consistent with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project does not involve the construction of new homes, would not construct new, potentially growth-inducing infrastructure such as roads or potable water or wastewater systems, and would not displace any people or housing. The Rory M. Shaw Wetlands Park would have no impacts associated with population and housing. Further, since this project would not contribute to cumulative population, employment, or housing growth, no cumulative impacts would occur. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in new significant environmental effects or a substantial increase in the severity of a significant effect identified in the 2004 PEIR and 2013 Addendum relative to population and housing.

Upper Storm Drain System

As stated previously, the issue of Population and Housing was excluded from detailed analysis in the 2004 PEIR because the analysis in the Initial Study prepared to support that EIR showed that the SVWMP, including the 2004 Storm Drains project, would have no impacts related to directly or indirectly inducing population growth, displacing housing, or displacing people. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the population and housing analysis in the 2004 PEIR were necessary for

the 2013 Approved Storm Drain Project, and thus, population and housing was not discussed in the 2013 Addendum. The 2020 Addendum also found that the 2020 Approved Upper Storm Drain System project would have no impacts related to population and housing. The currently proposed Upper Storm Drain System project would not involve construction of new homes or businesses and does not include construction of potentially growth-inducing, infrastructure. Therefore, the Upper Storm Drain System project would not induce substantial population growth. In addition, no individuals would be displaced by this project. The currently proposed Upper Storm Drain System project would have no impact relating to population and housing, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Public Services:

  Rory M. Shaw Wetlands Park

  The 2004 PEIR found that implementation of the 2004 Approved Wetlands Park project could result in temporary impacts to public services during construction that would be reduced to less-than-significant levels with implementation of mitigation measures and would not have any impacts to public services during operation. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the public services analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, public services were not discussed in the 2013 Addendum.

  As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project would not involve construction of housing or other structures that would result in an increase in population; therefore, operational impacts to public services would be less than significant. The project would contribute to providing additional recreation opportunities to the surrounding area. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, construction activities for the currently proposed Rory M. Shaw Wetlands Park project could result in temporary lane closures and impact fire and police protection services. Therefore, **Mitigation Measures P-1 through P-4** (See Appendix G - Section 2.5 of Attachment 2, MMRP) continue to be required. These measures address potential public services impacts during construction by requiring consultation and coordination with local emergency service providers prior to the start of construction, ensuring that all applicable state and local codes and ordinances are adhered to, communication and coordination with local police to minimize impacts regarding project-related lane and/or road closures, and detours by implementing traffic control measures such as “No Parking” signs as needed. In addition, the currently proposed Rory M. Shaw Wetlands Park project would continue to require implementation of **Mitigation Measures P-5 through P-11** (See Appendix G - Sections 2.5 and 3.7 of Attachment 2, MMRP) as identified in the 2004 PEIR to reduce potential construction impacts to schools. These measures cover a wide variety of safety and traffic related impacts during construction, including ensuring bus access; safe and convenient pedestrian routes; communication with school administrators for notice relating to pedestrian and vehicular traffic; installation of traffic controls for safety; haul routes during school sessions, construction worker vehicle parking, and use of fencing and other barriers to reduce hazards around construction areas. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in any new or

different impacts related to public services from those previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The 2004 PEIR and 2020 Addendum found that implementation of the 2004 Storm Drains project and the 2020 Approved Upper Storm Drain System project could result in temporary impacts to public services during construction that would be reduced to less-than-significant levels with implementation of mitigation measures and would not have any impacts to public services during operation. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the public services analysis in the 2004 PEIR were necessary for the 2013 Approved Project, and thus, public services were not discussed in the 2013 Addendum.

Consistent with the 2004 Storm Drains project, 2013 Approved Storm Drain project, and 2020 Approved Upper Storm Drain System project, the currently proposed Upper Storm Drain Project does not involve construction of housing or other structures that would result in a substantial increase in the demand for fire protection, emergency medical services, police protection, schools, or road maintenance. Further, none of the infrastructure that would be constructed as part of this project would increase fire hazards or need for emergency medical or law enforcement services in the area.

However, as discussed in the 2004 PEIR and 2020 Addendum, construction of the Upper Storm Drain System project could require temporary road or lane closures, which could require emergency responders to use less direct routes that may increase response times. Additionally, construction activities could temporarily affect fire vehicles access to streets, hydrants, or structures adjacent or proximate to the construction zone. Similarly, road or lane closures could temporarily cause students and school busses to take alternate routes or experience delays. These impacts would be reduced to a less-than-significant level with implementation of **Mitigation Measures P-1 through P-11,** as summarized in the Rory M. Shaw Wetlands Park public services discussion.

The storm drains would be constructed beneath the surface of existing paved roads. All roads would be restored upon completion of that segment of storm drain construction and at the completion of any maintenance and repair efforts. Thus, the currently proposed Upper Storm Drain System project would have no impacts to road maintenance, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

In conclusion, the Upper Storm Drain System project would not result in any new or different public services impacts from those previously identified in the 2004 PEIR 2013 Addendum, and 2020 Addendum.

- Recreation:

Rory M. Shaw Wetlands Park

The 2004 PEIR found that implementation of the 2004 Approved Wetlands Park project would have no direct impacts to existing recreational facilities and would not increase the use of existing recreational facilities that may lead to deterioration of such facilities, and thus would have no impacts to recreation. The Initial Study prepared in support of the 2013 Addendum determined that

no changes to the recreation analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, this topic was not discussed in the 2013 Addendum.

The currently proposed Rory M. Shaw Wetlands Park project would be of a similar size, design, and land use intensity as the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. The project site does not currently contain any recreational facilities, and thus, as with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the Rory M. Shaw Wetlands Park project would not have temporary construction impacts on an existing on-site recreational facility. Similar to the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the proposed project would provide new recreational and open space facilities and operation of this project would not adversely affect any existing recreational and open space facilities.

As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project does not involve the construction of new homes and does not involve new, potentially growth-inducing infrastructure such as roads or potable water or wastewater systems. The Rory M. Shaw Wetlands Park project would not result in increased use of existing recreational facilities. However, the proposed project would result in new on-site recreational facilities, the impacts of which are discussed throughout this Addendum. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in any significant impacts to recreation, consistent with the findings of the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

The 2004 PEIR and 2020 Addendum found that implementation of the 2004 Storm Drains project and 2020 Approved Upper Storm Drain System project would have no direct impacts to existing recreational facilities and would not increase the use of existing recreational facilities that may lead to deterioration of such facilities, and thus would have no impacts to recreation. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the recreation analysis in the 2004 PEIR were necessary for the 2013 Approved Project, and thus, this topic was not discussed in the 2013 Addendum.

The Upper Storm Drain System project does not involve construction of new recreational facilities, modifications to existing recreational facilities, or construction of new residences or other facilities and infrastructure that could lead to increased use of existing recreational facilities due to population growth. This currently proposed project involves the construction of new drainage system components. Therefore, there is no impact to existing recreational facilities. As such, the currently proposed Upper Storm Drain System project would not result in any new or different impacts from those previously identified in the 2004 PEIR, 2013 Addendum, or 2020 Addendum.

- <u>Transportation:</u>

Rory M. Shaw Wetlands Park

The 2004 PEIR analysis of transportation impacts focused on the degree to which construction and operation of each project component could affect the

volume to capacity (V/C) ratio, which is a measure of roadway congestion and traffic flow. Since certification of the 2004 PEIR and adoption of the 2013 Addendum, changes in CEQA and updates to the CEQA Guidelines now preclude the use of roadway congestion and traffic flow metrics to identify environmental effects. Instead, transportation impacts are evaluated in terms of vehicle miles traveled (VMT), as well as consideration of non-passenger vehicle modes of transportation such as walking, bicycling, and public transit. However, individual components of the SVWMP are still bound by the 2004 PEIR mitigation measures that address V/C ratio related impacts.

The 2004 PEIR found that implementation of the 2004 Approved Wetlands Park project would have significant transportation impacts during construction but less than significant impacts during operation. The 2004 PEIR identified that mitigation measure implementation would reduce construction impacts to a less-than-significant level. The 2013 Addendum determined that the 2013 Approved Wetlands Park project would result in slightly reduced impacts compared to the analysis presented in the 2004 PEIR.

As discussed in Appendix F to Attachment 2, the currently proposed Rory M. Shaw Wetlands Park project would generate less daily and peak hour traffic volumes than previously analyzed, and thus, would not create additional traffic impacts than those disclosed in the 2004 PEIR. However, a mitigation measure would still be required as the V/C ratios and level of service (LOS) on affected segments of Tujunga Avenue, Vineland Avenue, and Sunland Boulevard would remain at LOS E or F without the project, and this currently proposed project would contribute additional V/C to those LOS E or F roadway segments. As such, **Mitigation Measure T-1** (See Appendix G - Section 2.6 of Attachment 2, MMRP), as described in the 2004 PEIR would be required for the Rory M. Shaw Wetlands Park project. This measure requires preparation and implementation of a construction traffic management plan that addresses haul routes, time of travel restrictions to minimize effects during peak periods, temporary traffic controls, and construction worker parking. The operational and maintenance traffic associated with the currently proposed Rory M. Shaw Wetlands Park project is anticipated to be nominal and would be consistent with the operational phase of the 2004 Approved Wetlands Park project analyzed in the 2004 PEIR.

As discussed in Appendix F to Attachment 2, Phase 2 of the currently proposed Rory M. Shaw Wetlands Park project would have the highest vehicle-trip generation for passenger-cars/light-duty trucks of workers only (heavy trucks are not required to be included per the Governor's Office of Land Use and Climate Innovation guidance for VMT analysis) for the DDC activities, haul excess material, and concrete crushing components because these construction phases would overlap each other based on their start and end dates. At the time the 2004 PEIR was certified and the 2013 Addendum was adopted, there was no requirement to evaluate a project's increase in VMT. In 2018, the CEQA Guidelines were updated to replace the requirement to evaluate congestion-based impacts related to V/C ratios and LOS with the requirement to evaluated VMT. The VMT generated by construction-related trips are temporary and construction would not generate permanent trips, therefore the VMT from construction is not required to be quantified. While worker and vendor trips during construction would generate VMT, once construction is completed, the construction-related traffic would cease and VMT would return to pre-construction conditions. Therefore, since construction-related traffic is temporary and the peak phase of Phase 2 and Phase 3 construction would generate less than 110 daily trips (of passenger-cars/light-

duty trucks) per the County's VMT screening criteria, the currently proposed Rory M. Shaw Wetlands Park project would not conflict or be inconsistent with the state's CEQA Guidelines Sections 15064.3(b)(1) and 15064.3(b)(3), and impacts to VMT would be less than significant. The Rory M. Shaw Wetlands Park project can be classified as a unique land use since the County's guidelines do not provide specific guidance for VMT analysis of a park-type land use. The currently proposed Rory M. Shaw Wetlands Park project is anticipated to reduce the distance that the residents may currently be traveling to access local parks and recreational facilities, thus reducing VMT generated by those residents. As a result, this proposed project would not cause an increase in VMT and therefore its impact would be less than significant.

Implementation of the currently proposed Rory M. Shaw Wetlands Park project would not increase hazards due to a design feature or incompatible use. The project would not alter any roadways or intersections in the vicinity or introduce land uses that involve the operation of vehicle types that are not currently using local roadways. As such, the proposed project would not result in new significant impacts related to substantially increased hazards due to a geometric design feature or incompatible uses and would not result in substantial increases in the severity of previously identified significant impacts.

The currently proposed Rory M. Shaw Wetlands Park project would also comply or conform with the provisions of all applicable codes and ordinances related to emergency access. Therefore, the currently proposed project would provide adequate emergency access and would not interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant.

In conclusion, the currently proposed Rory M. Shaw Wetlands Park project would not result in any new significant impacts related to transportation compared to those previously identified in the 2004 PEIR or 2013 Addendum.

Upper Storm Drain System

The 2004 PEIR and 2020 Addendum found that implementation of the 2004 Storm Drains project and 2020 Approved Upper Storm Drain System project would have significant transportation impacts during construction but less than significant impacts during operation. The 2004 PEIR identified that mitigation measure implementation would reduce construction impacts to a less-than-significant level. The 2013 Addendum determined that the 2013 Approved Storm Drain Project would result in slightly reduced impacts compared to the analysis presented in the 2004 PEIR.

The construction activities evaluated for the 2004 Storm Drains project included the construction of storm drains/pipelines on numerous streets within the SVWMP area. The 2004 PEIR addressed the transportation impacts that would occur during storm drain/pipeline construction.

The 2004 PEIR and 2020 Addendum note that "construction of storm drains would typically require a construction zone that ranges from 20 to 50 feet in width and from 200 to 500 feet in length to accommodate the activities of digging a trench, installing the pipe, back-filling, compacting the fill material, and reconstructing/paving the surface area. It is anticipated that the construction zone would advance linearly along the route at an average rate of 200 to 500 feet per day. Any particular location would be directly impacted by

the construction activities for a duration of one to five days under typical conditions" (Los Angeles County Flood Control District 2004, 2020).

The 2004 PEIR concluded that since the precise locations of the pipelines and the exact width of the construction zones had not yet been established, the specific impacts could not be identified for each affected roadway. The 2004 PEIR outlines a list of potential impacts that would typically occur during storm drain construction, such as traffic disruptions and lane blockages on the affected public streets, temporary elimination of on-street parking, blocked access to adjacent land uses, disruption to pedestrian and bicycle traffic, increased safety risks to all modes of transportation, and disruption to and delays in public transit services.

The 2004 PEIR included **Mitigation Measures T-2 through T-7** which require: a construction traffic control plan and/or detour plan, advance notification to affected property owners, alternative pedestrian and bicycle access/circulation routes, coordination with emergency service providers, coordination with public transit agencies, and as necessary a transportation permit from Caltrans for transportation of heavy construction equipment. With implementation of the identified mitigation measures, impacts of the currently proposed Upper Storm Drain System project would be less than significant. Thus, the Upper Storm Drain System project would not result in any new or greater transportation impacts than those previously identified in the 2004 PEIR, 2013 Addendum, or 2020 Addendum.

- Tribal Cultural Resources:

Rory M. Shaw Wetlands Park

Since certification of the 2004 PEIR and the 2013 Addendum, updates to the State CEQA Guidelines have added a requirement to evaluate a project's potential effects on tribal cultural resources. Assembly Bill 52 (Public Resources Code sections 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3) is applicable to projects that have prepared either a negative declaration, mitigated negative declaration, or environmental impact report on or after July 1, 2015. The NOP for the 2004 PEIR was filed on November 12, 2002, and predates compliance with AB 52. Moreover, the currently proposed Rory M. Shaw Wetlands Park project does not include additional locations not previously addressed in the 2004 PEIR nor does this currently proposed project include new disturbances to previously investigated sites. The provisions of AB 52, including the Native American Consultation process, established since preparation of the PEIR do not apply to Addendums. Furthermore, since no tribal cultural resource issues were raised at the time the 2004 PEIR was certified, CEQA documents tiering from the 2004 PEIR are not required to address tribal cultural resource issues (*Citizens for Responsible Equitable Environmental Development v. City of San Diego (2011) 196 Cal.App.4th 515*).

Cultural investigations conducted as part of the 2013 Addendum, in accordance with **Mitigation Measure C-5** (See Appendix G - Section 1.2 of Attachment 2, MMRP) in the 2004 PEIR, identified four structures that were over 50 years old within the Rory M. Shaw Wetlands Park project site (see discussion of Cultural Resources, above). Evaluation of those structures concluded that none met the historic eligibility requirements under any of the four California Register Historical Resources criteria and that there were no

historic resources present, as defined by CEQA. Those structures were demolished under Phase 1 of the 2013 Approved Wetlands Park project, which was completed in 2017.

An additional cultural resources investigation was completed in support of this current EIR Addendum. The investigation found that there are no historic resources present within the Rory M. Shaw Wetlands Park project site (Dudek 2024). Thus, construction of this currently proposed project under phases 2 and 3 would not impact historical resources

Potential ground disturbing activities associated with the currently proposed Rory M. Shaw Wetlands Park project would result in excavation and grading activities that could potentially encounter buried unknown tribal cultural resources. Thus, the 2012 Supplemental Cultural Resources Survey, prepared in support of the 2013 Addendum, recommended implementation of **Mitigation Measure C-2**, which requires that the pit be monitored for cultural resources during the first day of subsurface work. Implementation of **Mitigation Measure C-2** (See Appendix G - Section 3.3 of Attachment 2, MMRP) would reduce potential impacts to unknown tribal cultural resources to a less-than-significant level. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in any new significant impacts that were not previously identified in the 2004 PEIR and 2013 Addendum.

Upper Storm Drain System

As discussed in the Cultural Resources analysis, there are no known historic resources within the currently proposed Upper Storm Drain System project site (Dudek 2024). Similar to the Rory M. Shaw Wetlands Park, this currently proposed project does not include additional locations not previously addressed in the 2004 PEIR nor does this project include new disturbances to previously investigated sites. Construction of the Upper Storm Drain System project would involve ground disturbance in the form of pavement removal and trenching, during which buried unknown tribal cultural resources could be encountered. **Mitigation Measure C-2** from the 2013 Addendum does not apply to the Upper Storm Drain System, however, implementation of **Mitigation Measure C-3** would be required. This measure requires that a qualified archaeologist evaluate any previously unknown cultural resources encountered during construction. Compliance with **Mitigation Measure C-3** would reduce potential impacts on unknown tribal cultural resources. As such, the currently proposed Upper Storm Drain System project would not result in any new significant impacts that were not previously identified in the 2004 PEIR and 2013 Addendum. The 2020 Addendum does not address tribal cultural resources.

- Utilities and Service Systems:

Rory M. Shaw Wetlands Park

The 2004 PEIR found that implementation of the 2004 Approved Wetlands Park project could result in impacts to utilities during construction if existing utility lines are disturbed and found that this impact would be reduced to a less-than-significant level with implementation of mitigation measures. The 2004 PEIR found that the 2004 Approved Wetlands Park project would not have any operational impacts to existing sewer or wastewater systems; would not require new or expanded water supply sources; and would have a minimal,

	and thus less than significant, increased demand for electricity and solid waste disposal. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the utilities analysis in the 2004 PEIR were necessary for the 2013 Approved Wetlands Park project, and thus, this topic was not discussed in the 2013 Addendum. New components associated with the currently proposed Rory M. Shaw Wetlands Park project include DDC over the detention basin footprint; the hauling of excess materials to existing offsite disposal facilities; addition of a passive methane treatment system; and an on-site crushing component. All of the components, with the exception of the passive methane treatment, would occur during construction only and would cease upon completion of construction of this project. Hauling, on-site crushing, DDC, and construction of the passive methane treatment system would not result in water quality impacts and would be short-term in nature. As described in the 2004 PEIR, the 2004 Approved Wetlands Park project would involve excavation within the street rights-of-way, which may affect existing utilities and would involve installation of on-site utilities, including water lines, irrigation lines, sewer lines, and storm drain lines. Therefore, implementation of **Mitigation Measures U-1, U-2, and U-3** (See Appendix G - Sections 1.6, 2.7, and 3.8 of Attachment 2, MMRP) would be required to minimize interference with existing utility lines and interruption of service. These measures require identification of existing and proposed buried facilities for relocation or avoidance; notifying residents and businesses of service disruptions; and excavating around utilities, including use of hand excavation where necessary, particularly to locate buried gas and electric utilities, to avoid damage and interference with utilities. The changes in configuration proposed in the aboveground components for the currently proposed Rory M. Shaw Wetlands Park project would not alter the impacts related to utilities and service systems. Stormwater runoff collected under the 2004 Approved Wetlands Park project, 2013 Approved Wetlands Park project, and this currently proposed project would be treated at the project site, then a pipeline would carry the treated runoff from the wetlands to the Sun Valley Park for groundwater recharge. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project's wetlands would result in a negligible demand for potable water. A potable water connection would be required to provide a backup water supply for the proposed irrigation system as well as for the water fountains and restrooms within the recreational component of the project. No new or expanded water supply sources would be required. Further, the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, and the currently proposed Rory M. Shaw Wetlands Park project would capture stormwater runoff for groundwater recharge. The 2004 PEIR identified that operation of the pumps at the project site required to transport collected stormwater to the Sun Valley Park would result in a minor increase in electricity demand. The currently proposed Rory M. Shaw Wetlands Park project would not require an increased use in electricity compared to the 2004 Approved Wetlands Park project. The solid waste generated by the proposed recreational components of this currently proposed project would be consistent with that analyzed as part of the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project. Therefore, impacts to utilities and service systems would remain less than significant under the currently proposed Rory M. Shaw Wetlands Park project.

	The Rory M. Shaw Wetlands Park project would help facilitate the capture of substantial amounts of stormwater runoff and the use of captured stormwater for groundwater recharge, which would be used to augment the local water supply. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in new significant environmental effects or a substantial increase in the severity of a previously identified significant effect related to utilities and service systems. To address construction waste generated by the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the 2004 PEIR and 2013 Addendum required implementation of **Mitigation Measure U-4** (See Appendix G - Section 2.7 of Attachment 2, MMRP), which requires that contractors identify and implement programs to minimize solid waste generated during construction, particularly to include recycling of asphalt and concrete paving materials and balancing soil cuts and fills to the extent feasible, to reduce impacts associated with solid waste and landfill capacity. Additionally, the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project were required to implement **Mitigation Measure U-5** (See Appendix G - Section 2.7 of Attachment 2, MMRP) which requires notifying the City of Los Angeles Bureau of Sanitation of the construction schedule and planned lane or road closures to ensure temporary change to collection routes of solid waste would be less than significant. The currently proposed Rory M. Shaw Wetlands Park project is not expected to substantially change the amount of solid waste generated during construction, and therefore, would not change the impact conclusions related to solid waste capacity. Furthermore, similar to the 2004 Approved Wetlands Park project, solid waste generated during operation of the Rory M. Shaw Wetlands Park project would be limited to sediments removed periodically from the stormwater collection facilities during maintenance and waste generated by users of the recreational facilities. Sediments would be disposed of in conformity with applicable regulations, and trash and recycling receptacles would be provided within the recreations portion of the site. Further, the solid waste generated by the proposed recreational components of the currently proposed Rory M. Shaw Wetlands Park project would be consistent with the volume of solid waste evaluated in the 2004 PEIR and 2013 Addendum. As such, complying with existing mitigation measures under the 2004 PEIR would ensure no new or increased solid waste impacts would occur compared with those previously identified. In conclusion, the currently proposed Rory M. Shaw Wetlands Park project would result in less than significant impacts associated with utilities and service systems, consistent with the findings of the 2004 PEIR and 2013 Addendum. **Upper Storm Drain System** The 2004 PEIR and 2020 Addendum found that implementation of the 2004 Storm Drains project and the 2020 Approved Upper Storm Drain System project could result in impacts to utilities during construction if existing utility lines are disturbed and found that this impact would be reduced to a less-than-significant level with implementation of mitigation measures. The 2004 PEIR and 2020 Addendum also found that the 2004 Storm Drains project and 2020 Approved Upper Storm Drain System project would not have any operational impacts to existing sewer or wastewater systems; would not require new or expanded water supply sources; and would have a minimal, and thus less than significant, increased demand for electricity and solid waste disposal. The Initial Study prepared in support of the 2013 Addendum determined that no changes to the utilities analysis in the 2004 PEIR were necessary for the 2013

Approved Storm Drain Project, and thus, this topic was not discussed in the 2013 Addendum.

Utilities that may be affected by construction of the Upper Storm Drain System project include water, sewer, electricity, gas, oil, telephone, cable, and railroad signal cables or conduits within Southern California Regional Rail Authority rail rights-of-way. Implementation of **Mitigation Measures U-1 through U-5** (see Appendix G - Sections 1.6, 2.7, and 3.8 of Attachment 2, MMRP), would minimize interference with existing lines and interruption of service, thus, impacts would be less than significant. These measures require identification of existing and proposed buried facilities for relocation or avoidance; notifying residents and businesses of service disruptions; excavating around utilities, including use of hand excavation where necessary, particularly to locate buried gas and electric utilities, to avoid damage and interference with utilities; implementation of programs to minimize solid waste generated during construction; and notifying the City of Los Angeles Bureau of Sanitation of the construction schedule and planned lane or road closures.

Similar to the 2004 Storm Drains project, 2013 Approved Storm Drain project, and 2020 Approved Upper Storm Drain System project, the currently proposed Upper Storm Drain System project would construct reinforced pipes, catch basins, and other drainage structures to collect and transfer stormwater runoff to minimize flooding and other issues related to stormwater run-off. By conveying stormwater to the planned Rory M. Shaw Wetlands Park, where the stormwater would be detained, treated, and conveyed to existing infiltration basins, the Upper Storm Drain System would contribute to increasing water supply for the community. No new or expanded entitlements are necessary as part of this currently proposed project, as it would not require the use of water, but rather would improve the overall storm drain system in the Sun Valley Watershed, the environmental effects of which are evaluated throughout this addendum. In conclusion, impacts to utilities and service systems from the currently proposed Upper Storm Drain System project would be less than significant, consistent with the findings of the 2004 PEIR, 2013 Addendum, and 2020 Addendum.

- Wildfire:

Rory M. Shaw Wetlands Park

Since certification of the 2004 PEIR and adoption of the 2013 Addendum, updates to the State CEQA Guidelines require more extensive wildfire analysis for projects located in or near State Responsibility Areas for firefighting or lands classified as Very High Fire Hazard Severity Zones (14 CCR 15000 et seq., as amended December 28, 2018). Wildfire hazards were not addressed in the 2004 PEIR or the 2013 Addendum. The Rory M. Shaw Wetlands Park project site is not located in a state responsibility area or in a state-designated fire hazard severity zone. The nearest state responsibility area is located approximately 17 miles to the west at the intersection of Ventura County and Los Angeles County Line, and the nearest very high fire hazard severity zone is located approximately 0.9 miles north of the project site, in the Verdugo Mountains (CalFire 2024). As such, the project site is not expected to be susceptible to wildfires and is not located within or near a wildfire hazard area or a state responsibility area. Development and operation of the Rory M. Shaw Wetlands Park project would not, therefore, expose people to significant risks related to wildfire hazards, nor would it exacerbate wildfire risks in the area.

	While there are new guidelines for the evaluation of development projects and wildfire risk, this currently proposed project would not result in significant effects under the new guidelines, as demonstrated below. The project site is not located within a designated Fire Hazard Severity Zone and is approximately 0.9 miles south of a Very High Fire Hazard Severity Zone. The project site and surrounding area is characterized as developed, and therefore has a lower potential to facilitate the spread of wildfires compared to vegetated areas. The currently proposed Rory M. Shaw Wetlands Park project would also comply or conform with the provisions of all applicable codes and ordinances related to emergency access. The project site and immediately surrounding area do not contain slopes that could help exacerbate the spread of wildfire. The areas upslope of the project site are developed with existing manufacturing uses. As such, the surrounding areas do not contain extensive amounts of vegetation or wildfire fuel. Therefore, it is not anticipated that the currently proposed Rory M. Shaw Wetlands Park project, due to slope, prevailing winds, and other factors, would exacerbate wildfire risks or expose people to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. No impact would occur. As with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the proposed project would not require the installation or maintenance of roads, fuel breaks, power lines, or other utilities that would exacerbate fire risk. No impact would occur. Under the existing conditions, the project site is undeveloped and potentially susceptible to landslides; construction of this currently proposed project would ensure modification of the gravel pit does not result in slope instability. Further, as with the 2004 Approved Wetlands Park project and 2013 Approved Wetlands Park project, the currently proposed Rory M. Shaw Wetlands Park project is intended to provide stormwater management and flood control improvements and would reduce runoff that contributes to flooding. The proposed project would not expose people or structures to downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. As such, the currently proposed Rory M. Shaw Wetlands Park project would not result in any new significant impacts that were not previously identified in the 2004 PEIR and 2013 Addendum. **Upper Storm Drain System** As noted previously, updates to the State CEQA Guidelines require more extensive wildfire analysis than was required under either the 2004 PEIR, 2013 Addendum, or 2020 Addendum for projects located in or near State Responsibility Areas for firefighting or lands classified as Very High Fire Hazard Severity Zones (14 CCR 15000 et seq., as amended December 28, 2018). Wildfire hazards were not addressed in the 2004 PEIR, 2013 Addendum, or 2020 Addendum. The currently proposed Upper Storm Drain System project is not located within a designated Fire Hazard Severity Zone and the surrounding area is characterized as developed, and therefore has a lower potential to facilitate the spread of wildfires compared to vegetated areas. The currently proposed Upper Storm Drain System project would also comply or conform with the provisions of all applicable codes and ordinances related to emergency access. The project site and immediately surrounding area do not contain slopes which

	could help exacerbate the spread of wildfire. The land uses surrounding phases 2 and 3 of the Upper Storm Drain System project are predominantly industrial while the land uses surrounding phase 4 are predominantly residential. As such, the surrounding areas do not contain extensive amounts of vegetation or wildfire fuel. Therefore, it is not anticipated that the currently proposed Upper Storm Drain System project, due to slope, prevailing winds, and other factors, would exacerbate wildfire risks or expose people to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. No new or greater impacts than were previously evaluated would occur, and no new mitigation is required. The Upper Storm Drain System is intended to provide stormwater management that would improve flood control in the area and would reduce runoff that contributes to flooding. The currently proposed Upper Storm Drain System project would not expose people or structures to downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. As such, the Upper Storm Drain System project would not result in any new significant impacts that were not previously identified in the 2004 PEIR, 2013 Addendum, or 2020 Addendum.
	<u>Changes in Circumstance/New Information (State CEQA Guidelines Section 15162(a)(2)(3))</u> Since the certification of the 2004 PEIR and adoption of the 2013 Addendum and 2020 Addendum, no substantial changes related to each of the environmental topic areas have occurred. Similarly, the project site boundaries for both the Rory M. Shaw Wetlands Park and the Upper Storm Drain System are the same as described in the 2004 PEIR, 2013 Addendum, and 2020 Addendum. No topographical changes or other landform alterations have occurred that would fundamentally change the approach or conclusions of the environmental impact analysis in the 2004 PEIR, 2013 Addendum, and 2020 Addendum. While there have been changes in regulations that require consideration of environmental resource topics that were not evaluated in all or some of the prior documents, the analysis in this Addendum demonstrates that both the Rory M. Shaw Wetlands Park and the Upper Storm Drain System projects would not result in any significant impacts with respect to those topics. There are no other changes in regulations or design standards that have been implemented since certification of the 2004 PEIR and adoption of the 2013 Addendum and 2020 Addendum that would alter the conclusions or the environmental analysis. As such, there are no substantial changes with respect to circumstances under which the currently proposed Rory M. Shaw Wetlands Park and the Upper Storm Drain System projects would be undertaken, and there is no new information of substantial importance that has become available that would change the impact conclusions of the 2004 PEIR. The analysis in this Addendum includes consideration of the environmental resources and individual impact analysis questions in the most recent version of the Appendix G checklist, since it has been prepared after the CEQA Guidelines were amended in 2009 and 2018 (see below) in the interest of providing the public and decision makers with as much information on the environmental consequences as possible. However, the revisions to the analysis requirements presented in the checklist do not have an appreciable effect on the analysis or the impact conclusions for this project. In 2009 the California Natural Resources Agency adopted new guidelines requiring lead agencies to analyze GHGs under section 15064.4. As such, GHG impacts were not addressed in the 2004 PEIR. The 2013 Addendum's analysis found GHG impacts to be less than significant. In addition, other revisions incorporating the requirements of Senate Bill 743, which created a new process for analyzing transportation impacts under CEQA, were adopted in 2018. Under the new transportation guidelines, LOS, or automobile delay, will no longer be considered an environmental impact under CEQA. Rather, VMT is used to

assess the significance of transportation impacts. The new guidelines were implemented statewide on July 1, 2020. Additionally, since the certification of the 2004 PEIR, revisions to SCAQMD Rule 403 and the California Code of Regulations (CCR) (Title 13, CCR, Sections 2449 and 2485) have been made. These changes include updates to definitions and implementation of existing regulations referenced in **Mitigation Measures A-10 and A-11.** Compliance with the updated regulations referenced in the mitigation measures would be required upon implementation.

Another update involves incorporating the findings of a court case (*California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369), which specifies that CEQA generally requires analysis of the effects of a project on the environment, as opposed to the effects of the environment on a project (State CEQA Guidelines Section 15126.2).

Lastly, the Southern California Association of Governments has adopted a new Regional Transportation Plan since certification of the 2004 PEIR. This does not change the determinations made in the certified 2004 PEIR, as the growth projections for the City of Los Angeles have continued to increase and both the Rory M. Shaw Wetlands Park and the Upper Storm Drain System projects would not contribute to any ongoing population growth for the City of Los Angeles. The intent of the SVWMP is to provide flood control benefits through multipurpose solutions to areas that have already been developed with residential, commercial, and industrial uses. The 2004 PEIR found that implementation of the SVWMP would not include construction of new homes, businesses, or potentially growth-inducing infrastructure such as roads or potable water or wastewater systems. While some elements of the SVWMP, including the Rory M. Shaw Wetlands Park project, would increase groundwater infiltration and therefore the volume of available groundwater, this was not considered growth inducing because the plan does not propose construction of new potable water treatment or distribution systems. The 2013 Addendum and 2020 Addendum confirmed that the 2013 Approved Project and 2020 Approved Project were not considered growth-inducing, consistent with the finding of the 2004 PEIR.

Previously Adopted Applicable Mitigation Measures

Rory M. Shaw Wetlands Park

The following adopted mitigation measures, included within the 2004 PEIR and carried over in the 2013 Addendum and 2020 Addendum, are applicable to the currently proposed Rory M. Shaw Wetlands Park project. See Appendix G of Attachment 2, MMRP for the SVWMP.

FINDING:	The currently proposed Rory M. Shaw Wetlands Park project and the currently proposed Upper Storm Drain System project would not result in new or substantially more severe significant impacts due to modifications, altered circumstances, or substantially important new information and would not require additional mitigation measures. As such, consistent with Public Resources Code Section 21166 and State CEQA Guidelines Section 15162 and 15163, the currently proposed Rory M. Shaw Wetlands Park and the Upper Storm Drain System projects would not result in additional or more severe significant impacts that would require preparation of a subsequent EIR or supplement to the 2004 PEIR and preparation of an Addendum is the appropriate CEQA document, consistent with State CEQA Guidelines, Section 15164.
ADDENDUM PREPARATION:	This Addendum to the SVWMP PEIR was prepared by the following staff at the District and at Dudek, the District's environmental consultant. **District:** Darian Wong, Environmental Engineering Specialist **Dudek:** Katherine Waugh, Senior Project Manager Jason Reynolds, Principal Jessica Booth, CEQA Analyst Elena Nuno, Air Quality Specialist

Project Description

Sun Valley Watershed Management Plan - Rory M. Shaw Wetlands Park and Upper Storm Drain System Phases 2 through 4

Background

The County of Los Angeles Board of Supervisors, acting as the governing body of the Los Angeles County Flood Control District (District) adopted the Sun Valley Watershed Management Plan (SVWMP) in 2004 to solve the chronic local flooding problem in the Sun Valley Watershed of the San Fernando Valley.

The Sun Valley watershed is located in northeastern San Fernando Valley within the eastern portion of the San Fernando Valley Groundwater Basin. It is bound to the north by the San Gabriel Mountains, to the east by the Verdugo Mountains, to the west by the Simi Hills and to the south by the Santa Monica Mountains. The Sun Valley Watershed is a highly urbanized watershed that drains into the Los Angeles River, which is located approximately two miles from the southern end of the watershed. Other surface water features in the vicinity include the Tujunga Wash and the Hansen Dam/Lake.

The SVWMP covers 4.4 square miles in the communities of North Hollywood and Sun Valley, in the northeast portion of the City of Los Angeles. The SVWMP is a long-range plan that provides a blueprint for a multi-purpose flood control program in the area. The SVWMP acknowledges that rainfall is a significant component of the water supply in the semi-arid region.

The District began working towards a multi-purpose solution to area flooding in November 1998. The District held regular meetings and engaged over 65 stakeholders comprised of Federal, State, and local agencies, and nonprofit and community groups interested in the Sun Valley Watershed area. By 2004 the District, with input from the stakeholders, had developed the SVWMP and held several town hall meetings to present and discuss the SVWMP with the community. The community and stakeholders have been very supportive of the SVWMP and are eager for plan implementation.

The SVWMP identified 18 projects that focused on flood protection, increased water conservation, improved water quality, increased habitat restoration, and enhanced recreational opportunities for underserved areas.

Prior to adoption and implementation of the SVWMP, there were no major storm drain systems within the watershed and flooding issues were a community concern even during minor low intensity rain events. As discussed further in the Proposed Project section, the District has implemented two components identified in the SVWMP, but many areas still do not have storm drain systems. During rain events, stormwater flows in the Sun Valley area are conveyed along street surfaces and collected at several of the major intersections in the area. Flood depths can range from two to three feet in moderate rainfall events, which can impede pedestrian and vehicle traffic.

Although storm drains can be highly effective at quickly and efficiently conveying stormwater away from people and properties, they do not provide any water quality treatment and only divert polluted urban runoff into rivers and the ocean. The SVWMP addressed this by including several water quality treatment improvements in addition to stormwater detention and conveyance improvements. Overall, the SVWMP is expected to reduce flooding, reduce

the pollutant load in downstream surface waters, increase groundwater recharge, and reduce demands for potable water by reusing treated stormwater for non-potable purposes, such as for landscape irrigation.

Introduction

The District is currently planning to implement two of the projects identified in the SVWMP – the Upper Storm Drain System project Phases 2 through 4 and the Rory M. Shaw Wetlands Park project. The Upper Storm Drain System Phases 2 through 4 project would construct approximately 28,200 linear feet of storm drains beneath existing public roads. The District implemented Phase 1 of the Upper Storm Drain System in 2021. This system would collect and convey stormwater to the planned Rory M. Shaw Wetlands Park project. The Rory M. Shaw Wetlands Park project (which was named the Strathern Pit project in the SVWMP) would convert a 46-acre property a multi-benefit stormwater detention, wetlands, and recreation facility that would provide for stormwater detention, water quality treatment, groundwater recharge, and recreation open space for an underserved community.

The District is applying for funding for construction of the Rory M. Shaw Wetlands Park project from the State Water Resources Control Board State Revolving Fund. Local funding and other funding sources would be used for construction of the Upper Storm Drain System Phases 2 through 4 project. Both projects are described in this section to provide for a comprehensive understanding of these interrelated projects. As noted previously and described further in Project Overview and Project Components sections, the stormwater collected in the Upper Storm Drain System Phases 2 through 4 project would be conveyed to the Rory M. Shaw Wetlands Park project, routed to the detention pond within that site and then to the wetlands within that site for water quality treatment. The stormwater would then be conveyed to existing groundwater infiltration basins within the adjacent Sun Valley Park. Thus these two projects would work together to alleviate localized flooding, provide water quality treatment, and increase groundwater recharge.

Proposed Projects

Project Purpose and Objectives

Rory M. Shaw Wetlands Park Project: The District's goals for the Rory M. Shaw Wetlands Park project are as follows:

- Provide flood control and mitigate flood risks by capturing stormwater runoff collected from the upstream drainage area, which primarily supports industrial land uses, to alleviate flooding in the southern portion of the Sun Valley watershed.
- Support local water quality enhancements and reduce stormwater pollution by routing stormwater runoff collected from the industrial area upstream of the site through wetlands to provide natural treatment
- Boost the local water supply by conveying treated stormwater to infiltration basins at an adjacent park for groundwater recharge
- Provide wildlife habitat
- Provide active and passive recreation uses for the Sun Valley community

Upper Storm Drain System Phases 2 through 4 Project: The District's goals for the proposed Upper Storm Drain System Phases 2 through 4 project are as follows:

- Provide flood control and mitigate flood risks by capturing stormwater runoff from individual streets in the upper Sun Valley watershed.
- Convey stormwater to the detention pond and wetlands in the planned Rory M. Shaw Wetlands Park to alleviate flooding, provide water quality treatment, and contribute to groundwater recharge.
- Convey stormwater to an existing collector storm drain south of the park to provide additional flood control.

Project Location

Rory M. Shaw Wetlands Park Project Site: As shown in Figure 1, Project Location, and Figure 2, Rory M. Shaw Wetlands Park Project Site and Vicinity, the Rory M. Shaw Wetlands Park project site is located at 8175 Fair Avenue in Sun Valley, CA. The community of Sun Valley is located in the northwest portion of the City of Los Angeles, within the City's San Fernando Valley Planning Area and Sun Valley – La Tuna Canyon Community Plan Area. This project site is bordered by Roscoe Road, Fair Avenue, Tujunga Avenue, and Strathern Street.

Upper Storm Drain System Phases 2 through 4 Project Site: As shown in Figure 1, Project Location, and Figure 3, Upper Storm Drain System Project Site, the Upper Storm Drain System Phases 2 through 4 project site is located between Sheldon Street in the north and Saticoy Street in the south. In the northern portion of this project site, the improvements would extend between the intersection of San Fernando Road and Sheldon Street in the west and the intersection of Sheldon Street and Wentworth Road in the east. In the southern portion of this project site, the improvements would extend between Tujunga Avenue in the west and Vineland Avenue in the east.

Project Site Characteristics

Rory M. Shaw Wetlands Park Project Site: As shown in Figure 2 the Rory M. Shaw Wetlands Park project site is located on two undeveloped parcels at the northeast corner of Tujunga Avenue and Strathern Street with a combined total size of 46 acres. The site is an exhausted gravel pit, known as Strathern Pit, that was converted to a landfill for inert construction debris including concrete, asphalt, rock, dirt and brick. The landfill operations ceased in 2009. The site consists mostly of concrete, dirt, rocks, and other construction debris waste. An unpaved access road runs through the site, starting just north of the intersection of Tujunga Avenue and Strathern Road, running northeast through the center of the site, and then curving back to Tujunga Avenue at the property's northern border. Strathern Pit was owned and operated by Los Angeles By-Products under a City of Los Angeles Department of Environmental Affairs solid waste facilities permit (Number 19-AR-1016). At the time the 2004 EIR was prepared, the landfill had a surface area of 12 acres and a maximum depth of approximately 80 feet (Los Angeles County 2004).

Upper Storm Drain System Phases 2 through 4 Project Site: As shown in Figure 3, the Upper Storm Drain System Phases 2 through 4 project is located within existing paved public roads. The major roads included in the project site consist of San Fernando Road, Penrose Street, Tuxford Street, Glenoaks Boulevard, Sheldon Street, Vineland Avenue, Saticoy Street, and Tujunga Avenue. Local roads included in the project site consist of Bradley Avenue, Norris Avenue, De Garmo Avenue, La Tuna Canyon, Randall Street, Pendelton Street, and Peoria Street. Each of these streets is paved and have paved shoulders with curbs and adjacent sidewalks.

Surrounding Land Uses

As shown in Figures 2 and 3 and described in more detail below, both project sites are primarily surrounded by industrial, commercial, and residential uses.

Rory M. Shaw Wetlands Park Project Site: This project site is surrounded by residential neighborhoods; industrial, commercial, and retail uses; and recreational parks/sport fields. Industrial land uses are present to the north while residential land uses are present to the east and south. Sun Valley Park, a City of Los Angeles park, is located to the east across Fair Avenue. A small neighborhood of primarily single-family homes is located north of Sun Valley Park while an apartment complex is located south of the park. Interstate 5 is located approximately 2,000 feet north.

A metal recycling facility, SA Recycling, is located immediately north of the northwest corner of the project site and an inert materials recycling facility, AHM Recycling is located immediately north of the northeast corner of the project site. AHM Recycling uses the inert materials to create recycled aggregate and fill materials. A closed sanitary landfill (Penrose Landfill) is located to the west across Tujunga Avenue. Penrose Landfill was officially closed in 1997 and was being used as a remote-control raceway and a practice golf center at the time the 2004 EIR was prepared. Regulatory oversight of this landfill was the responsibility of the City of Los Angeles Environmental Affairs Department (Los Angeles County 2004). The property is currently used for heavy duty truck parking.

South of the project site are numerous residential neighborhoods and single-family dwelling units. The Gol Soccer complex is located immediately west of the southwest corner of the site. Arminta Street Elementary School and Early Education Center is approximately 1,200 feet southwest and the Sun Valley Branch Library is approximately 1,000 feet southeast.

Upper Storm Drain System Phases 2 through 4 Project Site: This project site consists of several major and local paved roadways. As shown in Table 1, Upper Storm Drain System Road Segments, the predominant land use adjacent to the roadway segments included in the project is industrial; there are also areas of residential and commercial uses adjacent to the affected roadway segments.

Table 1 Upper Storm Drain System Roadway Segments

Roadway Name	Segment	Linear Feet	Adjacent Land Uses
Phase 2			
San Fernando Road	Penrose Street to Tuxford Drain (at Tuxford Street)	1500	Southern Pacific Railroad, industrial
Penrose Street	San Fernando Road to 250 feet west of San Fernando Road (to connect to Phase 1)	250	Industrial
Tuxford Street	Tuxford Drain (at San Fernando Road) to Glenoaks Boulevard	3900	Industrial, including gravel processing plant
Glenoaks Boulevard	Tuxford Street to Sheldon Street	5800	Public/institutional, industrial, including Vulcan Landfill
Sheldon Street	Glenoaks Boulevard to Wentworth Street	1800	Industrial, including Sheldon Pit
Bradley Avenue	Tuxford Street to 160 feet northwest of Tuxford Street	160	Industrial, including gravel processing plant

Table 1 Upper Storm Drain System Roadway Segments

Roadway Name	Segment	Linear Feet	Adjacent Land Uses
Norris Avenue	Tuxford Street to Pendleton Street	1450	Industrial
De Garmo Avenue	Tuxford Street to Randall Street	715	Industrial
La Tuna Canyon	Glenoaks Boulevard to Tuxford Street	150	Industrial
Randall Street	Glenoaks Boulevard to 150 feet east of Glenoaks Boulevard	150	Industrial
Pendleton Street	Glenoaks Boulevard to 215 feet east of Glenoaks Boulevard	215	Industrial
Peoria Street	Glenoaks Boulevard to 415 feet east of Glenoaks Boulevard	415	Industrial, including Vulcan Landfill
Phase 3			
San Fernando Road	Existing Tuxford Drain to Sheldon Street	5800	Industrial, including gravel processing plant, and railroad
Sheldon Street	San Fernando Road to 500 feet east of San Fernando Road	500	Industrial, including gravel processing plant
Phase 4			
Tujunga Avenue	430 feet north of Strathern Street (at Rory M. Shaw Wetlands Park) to Saticoy Street	3100	Residential, industrial
Saticoy Street	Vineland Avenue to Tujunga Avenue	2700	Residential, commercial
Vineland Avenue	Saticoy Street to 200 feet south of Saticoy Street (connecting to existing Project 39)	200	Residential, commercial

Project Overview

Rory M. Shaw Wetlands Park Project: The project would redevelop the 46-acre Strathern Pit site that was previously used as a landfill into a wetlands park that provides stormwater detention, water quality treatment, wildlife habitat, and passive and active recreation facilities. The preliminary site design is presented in Figure 4, Rory M. Shaw Wetlands Park Conceptual Plan, and includes the following:

- A 21-acre detention pond with a capacity of up to 385 acre-feet that would hold runoff from the upstream tributary area
- 10 acres of wetlands that would act as a natural water treatment system by removing pollutants from the stormwater
- 15 acres of recreational space that would include athletic fields, restrooms, and other amenities
- Installation of a raw water pump station within the detention pond and 1,200 feet of transfer pipeline to convey the treated runoff from the wetlands to the adjacent Sun Valley Park for groundwater recharge

Upper Storm Drain System Phases 2 through 4 Project: The Upper Storm Drain System Project is a key element in controlling stormwater and flooding in the Sun Valley area. As anticipated under the SVWMP, the Upper Storm Drain System Project Phases 2 through 4 includes approximately 28,200 linear feet of reinforced concrete pipes (RCP) and connector pipes, as well as catch basins and other drainage elements in the community of Sun Valley. All proposed storm drains would be constructed beneath existing public roads which would be returned to their existing conditions upon completion of storm drain construction. The Upper Storm Drain System would alleviate flooding conditions in the southern portion of the watershed by providing the infrastructure to collect and convey stormwater to the planned Rory M. Shaw Wetlands Park, which would include a detention pond with the capacity to detain up to 385 acre-feet of stormwater, engineered wetlands to naturally remove pollutants from the captured stormwater, and a pipeline to convey treated stormwater to existing infiltration basins at Sun Valley Park for groundwater recharge. The Upper Storm Drain System will also include a 2.5-foot by 10.5-foot reinforced concrete box to direct overflow from the detention basin within the Rory M. Shaw Wetlands Park to a storm drain line connecting to Project 39, which is an existing storm drain line underneath Vineland Avenue that conveys stormwater south to other existing stormwater management facilities in the southern portion of the Sun Valley watershed. This would allow the detention pond to empty in preparation of an upcoming storm or convey any stormwater that exceeds detention capacity.

Related Projects: Four components of the SVWMP have already been implemented. Two projects located on Elmer Avenue, which is located approximately 1,500 feet south of the Rory M. Shaw Wetlands Park project site, were completed under the direction of the Council for Watershed Health. These involved creating a model "green street" by incorporating stormwater best management practices on both public and private property and converting a blighted alleyway to an active paseo with a bioswale that captures and infiltrates stormwater runoff. The two SVWMP projects completed by the District are shown in Figure 5, Local Stormwater Improvements, and summarized in Table 2, Completed SVWMP Components.

Table 2 Completed SVWMP Components

SVWMP Component	Location	Summary Description	Year Completed
Sun Valley Park Drain and Infiltration System		Renovated an existing park to include stormwater improvements that alleviate localized flooding in the 21-acre residential area tributary to the project. Included a storm drain system, water quality treatment system that incorporates vegetated swales and native landscaping to remove suspended solids and heavy metals, and two underground infiltration chambers where the water is naturally filtered and recharged into the groundwater aquifer. Provides an estimated water conservation benefit of 30 acre-feet per year. The infiltration chambers are buried beneath the soccer and baseball fields to	2006

Table 2 Completed SVWMP Components

SVWMP Component	Location	Summary Description	Year Completed
		maintain the park's functionality. Also included enhancements to the park's recreational amenities, such as new soccer and baseball fields, bleachers, sports lighting, and interpretive signage.	
Tuxford Green Multi Use Site	Tuxford Street at San Fernando Road	Installation of catch basins, storm drains, underground cistern, landscaping and benches. Collects runoff from a 2.2 square mile area; conveys stormwater under the intersection to a culvert, where the flows continue downstream. Diverts some storm water to an underground cistern where it is treated for pollutant removal and used for irrigation. Includes native plant landscaping and benches for pedestrians.	2007

Project Components

Rory M. Shaw Wetlands Park Project

As noted previously, the preliminary site design for the Rory M. Shaw Wetlands Park project is presented in Figure 4. The elements of the conceptual design are described in this section.

Detention Pond

The detention pond would capture stormwater runoff from the upstream tributary area and then deliver the runoff to the 10 acres of wetlands for treatment. This project component would serve to reduce downstream flooding by detaining up to 385 acre-feet of stormwater onsite. The detention pond would be formed using deep dynamic compaction (DDC) intended to achieve sufficient compaction to minimize chances of differential settlement on the site.

Stormwater would be collected and conveyed to the pond by catch basins and storm drains in the surrounding streets, as constructed under the Upper Storm Drain System Phases 2 through 4 Project. The detention pond is expected to be located centrally and within the southwestern corner of the project site. A concrete access road would be constructed off Tujunga Avenue and lead into the detention pond area. A raw water pump station, valve, and vaults are proposed in the lower eastern corner of the detention pond.

Wetlands

The proposed wetlands would take the storm water runoff from the detention ponds and use natural water treatment capabilities (such as filtration through vegetation, soil, and associated microorganisms) to remove pollutants. Most of the wetland area would be in shallow ponds and water would be circulated continuously using a small pump to provide a constant flow of water to maintain the wetland vegetation This component of the project would improve water quality and groundwater recharge.

Stormwater from a 50-year storm would be fully treated by the wetlands over a period of four months. The treated runoff would be pumped to existing underground infiltration basins in the adjacent Sun Valley Park, providing recharge into the groundwater basin. The water conservation benefit is expected to be 590 acre-feet per year. In addition to water quality improvements, the constructed wetlands would also enhance native vegetation and create opportunities for wildlife habitat. The edges of the wetland areas would be sloped to discourage wildlife movement between the turf areas and water features.

The wetlands are expected to be located in the center and southeast corner of the project site. During dry weather periods (May through October), water levels in the wetland would be maintained by repeated circulation, with no water leaving the project site. The wetlands would be underlain with 20 feet of engineered fill to prevent percolation and onsite infiltration.

Utilities

The proposed project involves the installation of on-site utilities, including electrical and communication lines, water lines, irrigation lines, sewer lines, and storm drain lines. A new 12-inch on-site storm drain is proposed along the northern boundary of the detention basin. The project also proposes construction of an 8-foot by 8-foot reinforced concrete box (RCB) with a junction box within Tujunga Avenue, a 12-inch-diameter high-density polyethylene (HDPE) treated water force main from the project site to Fair Avenue onto Cantara Street, and an 8-inch diameter sewer line at Fair Avenue and Strathern Street. The 8-foot by 8-foot RCB would connect to the raw water gravity main line from Tujunga Avenue into the detention basin. The 12-inch HDPE water force main would carry flows into the existing underground infiltration basins at Sun Valley Park.

Recreational Space

The project will provide 15 acres of open space recreation to a community that is currently underserved for recreational opportunities. As shown in Figure 4, conceptual plans for recreational elements include athletic fields, restrooms and other amenities.

Lighting

Security lighting would be provided in select locations. No lighting would be provided for the recreational space and amenities.

Parking

Parking would be constructed to accommodate park visitors. Conceptual plans anticipate approximately 160 parking stalls within the northern and eastern portions of the project site.

Park Operations

The regular park hours of operation would be from dawn to dusk, 7 days a week.

Landscaping

The project would plant approximately 430 new trees and more than 100,000 shrubs. Landscaping is proposed throughout the project site, including within and surrounding the wetland areas and surrounding the detention pond. New trees would include shade trees for the parking lot, native shade trees for other paved areas and trails, accent trees, shrubs and groundcover, native grasses, and turf.

Existing vegetation would be removed. For every tree removed, the District would plant at least one replacement tree in compliance with the District's Water Branch Tree Removal and Replacement Program.

Upper Storm Drain System Phase 2 through 4 Project

The project includes construction of approximately 28,200 linear feet of RCP, catch basins, connector pipes, and other drainage structures, including a 2.5-foot by 10.5-foot reinforced concrete box to direct overflow from the detention basin within the Rory M. Shaw Wetlands Park to outlet into Project 39, which is an existing storm drain line underneath Vineland Avenue that conveys stormwater south to other existing stormwater management facilities in the southern portion of the Sun Valley watershed. The construction phases would consist of:

- **Phase 2:** Construction of approximately 12,000 linear feet of RCP main line storm drains and 3,200 linear feet of RCP storm drain laterals, catch basins, connector pipes, and other drainage structures primarily along San Fernando Road, Tuxford Street, Glenoaks Boulevard, and Sheldon Street. The storm drain would extend into the existing Tuxford Drain, which is located at the intersection of Tuxford Street and San Fernando Road. Construction is estimated to require 840 days.

- **Phase 3:** Construction of approximately 6,500 linear feet of main line storm drains and 600 linear feet of lateral storm drains. The storm drains would be constructed of RCP. Catch basins, connector pipes, and other drainage structures would also be constructed. This phase would occur primarily along San Fernando Road and Sheldon Street, and the storm drain would extend into the existing Tuxford Drain, which is located at the intersection of Tuxford Street and San Fernando Road. This phase also includes tunneling approximately 71 linear feet of 48-inch RCP in the vicinity of the existing Metro railroad tracks near this intersection. Construction duration is expected to be approximately 330 days with a single construction crew.

- **Phase 4:** Construction of 5,900 linear feet of a 66-inch RCP and a 2.5-foot by 10.5-foot reinforced concrete box along Saticoy Street from Vineland Avenue to approximately 150 feet north of Tujunga Avenue. This box would direct overflow from the detention basin within the Rory M. Shaw Wetlands Park to outlet onto Project 39. Construction would primarily take place on Vineland Avenue, Tujunga Avenue and Saticoy Street. Construction duration is expected to be approximately 620 days with a single construction crew.

Table 3, Upper Storm Drain System Storm Drain Locations and Sizes, identifies the size of the storm drain line proposed for each roadway segment.

Table 3 Upper Storm Drain System Storm Drain Locations and Sizes

Phase and Roadway Name	Segment	Storm Drain Pipe Size	Other Drainage Elements
Phase 2			
San Fernando Road	Penrose Street to Tuxford Drain (at Tuxford Street)	96" RCP	Catch basins; connector pipes
Penrose Street	San Fernando Road to 250 feet west of San Fernando Road (to connect to Phase 1)	96" RCP	Catch basins; connector pipes
Tuxford Street	Tuxford Drain (at San Fernado Road) to Glenoaks Boulevard	96" RCP; 84" RCP; 72" RCP	Catch basins; connector pipes
Glenoaks Boulevard	Tuxford Street to Sheldon Street	72" RCP; 66" RCP; 48" RCP	Catch basins; connector pipes
Sheldon Street	Glenoaks Boulevard to Wentworth Street	48" RCP	Catch basins; connector pipes
Bradley Avenue	Tuxford Street to 160 feet northwest of Tuxford Street	30" RCP	Catch basins; connector pipes
Norris Avenue	Tuxford Street to Pendleton Street	42" RCP	Catch basins; connector pipes
De Garmo Avenue	Tuxford Street to Randall Street	30" RCP	Catch basins; connector pipes
La Tuna Canyon	Glenoaks Boulevard to Tuxford Street	24" RCP (Lateral)	Catch basins; connector pipes
Randall Street	Glenoaks Boulevard to 150 feet east of Glenoaks Boulevard	24" RCP (Lateral)	Catch basins; connector pipes
Pendleton Street	Glenoaks Boulevard to 215 feet east of Glenoaks Boulevard	36" RCP (Lateral)	Catch basins; connector pipes
Peoria Street	Glenoaks Boulevard to 415 feet east of Glenoaks Boulevard	48" RCP	Catch basins; connector pipes
Phase 3			
San Fernando Road	Existing Tuxford Drain to Sheldon Street	60" RCP; 48" RCP	320' of 24" RCP Lateral installed at San Fernando Rd (South); 270' of 24" RCP Lateral at San Fernando Rd (North); Catch basins; connector pipes
Sheldon Street	San Fernando Road to 500 feet east of San Fernando Road	48" RCP	Catch basins; connector pipes
Phase 4			
Tujunga Avenue	430 feet north of Strathern Street (at Rory M. Shaw Wetlands Park to Saticoy Street	66" RCP	Catch basins; connector pipes

Table 3 Upper Storm Drain System Storm Drain Locations and Sizes

Phase and Roadway Name	Segment	Storm Drain Pipe Size	Other Drainage Elements
Saticoy Street	Vineland Avenue to Tujunga Avenue	2.5'H x 10.5'W RCB; 66" RCP	Catch basins; connector pipes
Vineland Avenue	Saticoy Street to 200 feet south of Saticoy Street (connecting to existing Project 39)	30" RCP	Catch basins; connector pipes

Project Construction

Rory M. Shaw Wetlands Park Project

Phasing

The Rory M. Shaw Wetlands Park project includes three construction phases, one of which has already been completed:

1. Phase 1: Site Investigations and Demolition (completed in 2017)
2. Phase 2: Crushing and Grading (2026 - 2030)
3. Phase 3: includes above ground improvements (2030– 2032)

Phase 2 would include the following construction components: mobilization, demolition, site preparation, grading and DDC, hauling and/or transporting materials by conveyor belt to the adjacent AMH Recycling facility located at 11253 Vinedale Street, onsite concrete crushing, and drainage/utility installation. Phase 3 would include construction of the detention pond and wetlands, installation of the passive methane system, trenching and utility installation, recreational components, and landscaping. All staging and stockpiling would occur onsite.

Construction Activities and Methods

Phase 1 of construction included the clearing and surveying the project site. As an interim measure prior to initiation of Phase 2, the County plans to install perimeter fencing and landscaping. This work will include replacing existing chain link fencing with an 8-foot-tall tubular fence; amending soil and installing landscaping to include shrubs and up to ninety 24-inch box trees around the perimeter of the site; and installing an irrigation system. These actions are a separate project aimed to secure the property and improve site aesthetics and were addressed in a California Environmental Quality Act (CEQA) Notice of Exemption filed in August 2024.

Phase 2 of the Rory M. Shaw Wetland Park Project includes DDC activities intended to achieve sufficient compaction to minimize chances of differential settlement on the site. DDC uses principles of transforming potential energy to kinetic energy to densify the ground through utilization of weights, supported by a crane, and free fall impact to the ground to increase the density of soil. Proposed DDC activities would require the use of a Manitowoc 1015 Crawler Crane or equivalent, a specially built crane for DDC operations with automated safety controls and 27-ton steel

weight, mechanics service truck, an excavator or dozer, and water truck for dust control. The DDC activities would last approximately 4 years.

The excess materials may be hauled to several different waste management facilities depending on availability at the time of construction. These facilities include, but are not limited to, Sunshine Canyon Landfill, Waste Management Azusa Landfill Reclamation, NuWay Landfill and Kincaid Pit. Approximately 550,000 cubic yards of materials would be hauled to these facilities. Alternatively, some or all of the excess materials may be transferred to the adjacent AMH Recycling facility north of the project site. AHM Recycling is a concrete and asphalt recycler that uses the inert materials to produce reclaimed aggregate and fill materials. Proposed hauling, earthwork, and rough grading activities are anticipated to last four years, beginning in June 2026 and ending in December 2030.

All stockpiling and staging would occur onsite. Crushing would occur onsite. Crushing activities are anticipated to last approximately 4 years and would be accomplished with two sets of crushing equipment. There would also be 1,200 feet of transfer pipeline installed to convey the treated runoff from the wetlands to the adjacent Sun Valley Park for groundwater recharge.

A passive methane treatment system would be installed along the northern and western property line and along the southern boundary of the existing concrete pad. Methane controls are required to prevent any surface and shallow venting consistent with the provisions of City of Los Angeles Municipal Ordinance No. 175790, Methane Seepage Regulations. These regulations require the installation of a methane mitigation system to prevent potential intrusion of residual gas into a proposed development's structure, which in this case would be the restrooms that would be constructed to support the recreational facilities. The methane treatment system would consist of 31 wells designed to prevent methane gas intrusion into the proposed above ground structures and eight probes would be located along the southern boundary of the existing concrete pad. These could be converted to collector pipes if needed. It is anticipated that the wells would be drilled to a depth of approximately 45 feet.

As required by the EPA and the Regional Water Quality Control Board, the construction contractors will develop and implement a Stormwater Pollution Prevention Plan (SWPPP). This plan is required as part of the NPDES Permit for discharge of stormwater associated with construction activities greater than 1 acre in area. Incorporation of stormwater best management practices in the SWPPP would reduce the potential for soil erosion and release of other pollutants during construction.

All construction activities would occur between 7 AM and 5:30 PM Monday through Friday and thus no nighttime artificial lighting would be required. Workdays would involve a maximum of 8 hours of construction. Construction activities and equipment operation, including DDC and crushing activities, would generate low to negligible vibration levels.

Upper Storm Drain System Phases 2 through 4

Phasing

The Upper Storm Drain System Phases 2 through 4 project includes three construction phases. As noted previously, Phase 1 was completed in 2021:

1. Phase 2: Construction of storm drains, storm drain laterals, catch basins, connector pipes, and other drainage structures primarily along San Fernando Road, Tuxford Street, Glenoaks Boulevard, and Sheldon Street (2028 – 2031).

2. Phase 3: Construction of storm drains, lateral storm drains, catch basins, connector pipes, and other drainage structures primarily along San Fernando Road and Sheldon Street (2026 - 2027).

3. Phase 4: Construction of storm drains and reinforced concrete box primarily along Vineland Avenue, Tujunga Avenue and Saticoy Street (2031– 2034).

Construction Activities and Methods

The construction of storm drains/pipelines would typically require a construction zone that ranges from 20 to 50 feet in width and from 200 to 500 feet in length to accommodate the activities of removing surface pavement, digging a trench, installing the pipe, back-filling, compacting the fill material, and reconstructing/paving the surface area. All trenching would occur within the existing right-of-way and no property takes are proposed as part of the project. Construction activities and equipment operation would generate low to negligible vibration levels.

It is anticipated that the construction zone would advance linearly along the route at an average rate of 200 to 500 feet per day. Individual locations along the storm drain system alignment would be directly impacted by the construction activities for a duration of one to five days under typical conditions.

All construction staging and stockpiling would occur within the Rory M. Shaw Wetlands Park project site and nearby District facilities. Materials removed during trenching will be reused onsite to the extent feasible, consistent with the District's efforts to comply with the California Integrated Waste Management Act of 1989. Any materials that are contaminated by hazardous materials will be removed and sent to an appropriate disposal facility.

Construction activities would not require any tree removal or building demolition. All construction activities would occur between 7 AM and 5:30 PM Monday through Friday. No nighttime artificial lighting would be required. Workdays would involve a maximum of 8 hours of construction activity.

The following memorandum presents the summary of the CEQA Consistency Memorandum conducted for the proposed Rory M. Shaw Wetlands Park Project.

1 Introduction

1.1 Overview

The Los Angeles County Flood Control District (District), as lead agency, certified the Sun Valley Watershed Management Plan Program Environmental Impact Report (referred herein as "2004 PEIR") on June 29, 2004 and adopted the Sun Valley Watershed Management Plan (SVWMP). The SVWMP identified 18 Best Management Practice projects that focus on flood protection, increased water conservation, improved water quality, increased habitat restoration, and enhanced recreational opportunities. The District has completed construction of 4 of the 18 projects identified in the SVWMP. Efforts are currently underway for implementation of a fifth proposed project, the Rory M. Shaw Wetlands Park Project (herein referred to as "currently proposed project").

In 2013, an addendum to the 2004 PEIR was prepared for modifications to the 2004 Strathern Pit Project (also referred to as the "2004 Project" in this technical memorandum). The 2013 Addendum considered the Strathern Wetlands Park Project[1] which refined the 2004 Strathern Pit Project scope, discussed an alternative storm drain alignment (this was part of the Storm Drain Project from the 2004 PEIR), and included a recycled water line in the project description. The 2013 Addendum concluded that the modifications to the Strathern Pit Project would not result in any new significant effects on the environment that were not identified in the 2004 PEIR. As such, the 2013 Addendum, which analyzed the modifications to the Strathern Pit Project were included in an Addendum which was certified by the Los Angeles County Board of Supervisors (Board) on October 8, 2013. The project described in the 2013 Addendum is referred to as the "2013 Approved Project" in this memorandum.

Since the adoption of the 2013 Addendum, modifications to the 2013 Approved Project (referred to herein as "currently proposed project") have been proposed and are addressed in this memorandum. The Storm Drain Project component of the 2004 PEIR, which was included in the 2013 Approved Project, is not included under the currently proposed project description.[2] Additionally, the recycled water line described in the 2013 Approved Project would be completely removed from the scope in the currently proposed project. New components associated with the currently proposed project include deep dynamic compaction over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing. Section 2, Project Description describes components of the 2004 Project, 2013 Approved Project and the currently proposed project. Please refer to Section 2 for detailed discussion of the project components.

This technical memorandum assesses whether environmental impacts from the currently proposed project are consistent with the 2004 and 2013 Approved Projects. It should be noted that due to removal of the Storm Drain Project and recycled water line, which were described in the 2013 Addendum, the currently proposed project would largely be compared to the 2004 Project described in the 2004 PEIR. As such, the District has reviewed the currently proposed project and determined that the currently proposed project requires no subsequent EIR pursuant to State CEQA Guidelines Section 15162, which provides that when an EIR has been certified for an adopted project, no subsequent EIR shall be prepared for that project when the lead agency determines, on the basis of substantial evidence in light of the whole record, that there are no new significant environmental effects due to a change in the project or circumstances, and there is no new information of substantial importance as identified in the State CEQA Guidelines Section 15162(a)(3). See Section 5, Conclusion and Recommendations, of this memorandum.

1.2 Purpose and Methodology

1.2.1 Purpose

The purpose of this memorandum is to assess whether the impacts of the currently proposed project are consistent with the certified 2004 PEIR and the 2013 Addendum and whether any additional documentation is required under the California Environmental Quality Act (CEQA). This memorandum does not constitute an Initial Study nor is an Initial Study necessary under CEQA. An Initial Study is prepared to determine if the project may have a significant effect on the environment (State CEQA Guidelines Section 15063(a)). The Strathern Pit Project has already been

[1] The Strathern Pit Project underwent a name change to the Rory M. Shaw Wetlands Park Project with the certification of the 2013 Addendum.

[2] This is part of the 2020 Addendum for the Sun Valley Watershed Upper Storm Drain System Project.

subjected to environmental review and the impacts have been disclosed. This memorandum does not evaluate the potential for significant effects of the currently proposed project on the environment, rather it compares impacts already disclosed about the Strathern Pit Project that could result from the modifications in the currently proposed project to determine whether an addendum, subsequent EIR, or supplemental EIR is required.

The California Code of Regulations, Title 14, Section 15000 et seq. (State CEQA Guidelines) discuss a lead agency's responsibilities in handling new information when changes to a project are proposed after an EIR is certified. Section 15164(a) of the State CEQA Guidelines states that:

> *"The lead agency or responsible agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred."*

Section 15162 of the State CEQA Guidelines provides that preparation of a subsequent EIR is required only under the following circumstances:

> (a) When an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:
>
> (1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
>
> (2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
>
> (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the Negative Declaration was adopted, shows any of the following:
>
> (A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;
>
> (B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;
>
> (C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
>
> (D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on

the environment, but the project proponents decline to adopt the mitigation measure or alternative.

Per Section 15163 of the State CEQA Guidelines, a supplemental EIR can be prepared when a subsequent EIR is required per Section 15162 but only minor additions or changes would be necessary to make the previous EIR adequately apply to the project in the changed situation.

Based on the requirements of Section 15162 of the State CEQA Guidelines, Dudek conducted technical environmental analyses to determine whether the currently proposed project would result in:

- New or Substantially More Severe Significant Impacts due to Project Modifications
- New or Substantially More Severe Significant Impacts due to Altered Circumstances
- New or Substantially More Severe Significant Impacts due to New Information
- New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects

The environmental analysis is contained in Section 4 and the conclusions are provided in Section 5 of this memorandum. In addition, stand-alone memoranda has been prepared for the currently proposed project have been included as appendices: Appendix A, Air Quality Greenhouse Gas Emissions and Energy Technical Memorandum; Appendix B, Biological Resources; Appendix C, Geotechnical, Geologic, and Environmental Assessments; Appendix D, Bird-Aircraft Strike Hazards Report; Appendix E, Noise Technical Memorandum; and Appendix F, Trip Generation Analysis, Transportation Consistency Analysis, and VMT (vehicle miles traveled) Assessment.

1.3 Project Setting and Surrounding Uses

1.3.1 Project Setting

The 46-acre project site is located in the community of Sun Valley within the City of Los Angeles (City), Los Angeles County, California. The project site is within the Sun Valley Watershed, a highly urbanized watershed that drains into the Los Angeles River. The Sun Valley Watershed is located approximately 14 miles northwest of downtown Los Angeles in the northeastern portion of San Fernando Valley, near the intersection of Interstate (I-) 5 and State Highway 170. Generally, the Sun Valley Watershed is approximately bordered by Tujunga Wash and Hansen Spreading Grounds on the west, Burbank-Glendale-Pasadena Airport on the east, Hansen Dam on the north, and Burbank Boulevard on the south. The watershed is approximately 2,800 acres (4.4 square miles) in size and is approximately 6 miles in length from north to south. Specifically, the project site is bounded by Strathern Street and single-family residential uses to the south; Tujunga Avenue, a truck stop, and industrial uses to the west; Roscoe Boulevard and recycling facilities to the north; and Fair Avenue, Sun Valley Park, and single-family residential uses to the east (Figure 1, Project Location).

The project site and surrounding areas were quarried for sand and gravel in the early- to mid-1900s with many of the pits subsequently converted to landfills. Strathern Pit, which occupies approximately 34.7-acres of the project site was permitted by the City of Los Angeles as an inert debris landfill in 1992. The project site is occupied with an exhausted gravel pit previously used as a landfill for inert materials. It was owned and operated by Los Angeles By-Products under a City of Los Angeles Department of Environmental Affairs solid waste facilities permit (Number 19-AR-1016). In October 2008, Los Angeles County Flood Control District became the property owner of the site, and

the site ceased all landfill operations. A concrete plant occupied the northwestern portion of the project site, operated by Over and Over Ready Mix, Inc. since the mid-1950s. Structures included various metal sheds, a single-story office building, a steel structure, and the batching plant structure. The majority of the structures were dismantled when Over and Over Ready Mix vacated the project site in 2016.

1.3.2 Surrounding Land Uses

Surrounding land uses to the east of the project site across Fair Avenue and south across Strathern Street are primarily residential. Sun Valley Park, a City of Los Angeles park, is located to the east across Fair Avenue. The Tujunga Pit which was converted to the former Newberry Landfill in the 1950s is located to the northwest of the project site, at the corner of Fair Avenue and Roscoe Boulevard. The former Newberry Landfill is now occupied by AMH Recycling, a full-service inert material recycler and recycled aggregate producer. Adjacent to AMH Recycling and northeast of the project site is SA Recycling, a metal recycling facility. A closed sanitary landfill (Penrose Landfill) is located to the west across Tujunga Avenue. Penrose Landfill was officially closed in 1997 and is currently being used as a truck stop and private soccer complex. Regulatory oversight of this landfill is the responsibility of the City of Los Angeles Environmental Affairs Department. Additionally, the former Tuxford landfill is located northwest of the project site (Figure 2, Surrounding Land Uses).

2 Project Background

2.1 2004 Project

Background

The 2004 PEIR (certified on June 29, 2004) evaluated the SVWMP, which consists of multiple projects, each designed to manage stormwater runoff and reduce flooding. The majority of the components would involve construction and operation of stormwater storage and/or infiltration facilities. The collected stormwater would be treated prior to groundwater recharge or reuse (irrigation or gravel washwater). Where appropriate, stormwater storage facilities would be designed to provide recreational facilities and/or wildlife habitat areas. In addition, catch basins and storm drains are proposed to collect and convey runoff and reduce flows carried on street surfaces.

The SVWMP's Findings of Fact and Statement of Overriding Considerations determined that the following impacts would be significant and unavoidable:

- Construction NO_x emissions from Cal Mat Pit, Parking Lot on Sherman, Power Line Easement, Sheldon Pit, Storm Drains, Strathern Pit, Street Storage, and Vulcan Gravel Processing Plan
- Construction impacts on special status species whose presence is not known but could not be excluded from New Park on Wentworth; and
- Construction impacts on sensitive species whose presence is not known but could not be excluded from Cal Mat Pit, Sheldon Pit, Strathern Pit, and Vulcan Gravel Processing Plant.

Additionally, the SVWMP's Findings of Fact and Statement of Overriding Considerations found that the significant adverse effects of the SVWMP were outweighed by the specific considerations of the SVWMP.

One of the 18 projects analyzed in the 2004 PEIR was Strathern Pit, an inert landfill, located at the northeast corner of Strathern Street and Tujunga Avenue in the City of Los Angeles. The Strathern Pit Project would convert a former 46-acre inert landfill into a multipurpose wetlands park. As stated above, the 2004 Strathern Pit Project underwent a name change to the Rory M. Shaw Wetlands Park Project after certification of the 2004 PEIR.

Description

The Strathern Pit Project as described in the 2004 PEIR proposes to convert an existing 46-acre construction debris landfill located in the northeast corner of Tujunga Avenue and Strathern Street into a stormwater retention and treatment area and park (Figure 3, 2004 Project). The primary objective of the Strathern Pit Project is to capture stormwater runoff collected from the upstream industrial drainage area to alleviate flooding in the vicinity of the Tuxford Avenue and San Fernando Road intersection. It is also designed to provide a water conservation benefit through the reuse of stormwater for industrial purposes, or off-site infiltration to the Tujunga Spreading Grounds for groundwater recharge. The Strathern Pit Project would also provide up to 30 acres of green space, including wildlife habitat and park land for the community.

Stormwater collection and conveyance to the pit would involve catch basins and storm drains in the surrounding streets. The existing landfill surface would be modified to create terraced side slopes with five levels. The deepest part of the pit would be approximately 50 feet below street level. The bottom portion of the basin would be operated as a wetland designed in alignment with Environmental Protection Agency guidelines for stormwater treatment wetlands. The terraced areas above the wetland would be dry most of the time and would be available for recreational and/or habitat uses. During dry weather periods (May - October), water levels in the wetland would be maintained by repeated circulation. Most of the wetland area would be in shallow ponds. During this recirculation mode, no water would leave the project site. The basin would be lined with impervious material (geotextiles), and no on-site infiltration of stormwater would occur at this site.

During large storms, the area above the wetland would store stormwater. Stormwater captured in the basin would be circulated through the wetland, which would be designed to remove some of the pollutants. Stormwater from a 50-year storm (about 500 to 700 acre-feet of stormwater depending on the project alternative) would be fully treated by the wetland over a period of four months. Stormwater would then be transferred off site for infiltration (at the Tujunga Spreading Grounds) or reuse (Vulcan Gravel Processing Plant).

The remaining open space at the site could be used for recreational and habitat purposes. The Strathern Pit Project includes excavation and grading activities for construction of a park, detention pond and wetlands, storm drains to collect surface water from the streets, a pump station, flood control appurtenances, and recreational facilities such as a restroom and concessions building.

2.2 2013 Approved Project

Background

In accordance with Sections 15162 and 15164(b) of State CEQA Guidelines, an Addendum to the 2004 PEIR was prepared for the modifications to the 2004 Strathern Pit Project and certified on October 8, 2013. The 2013 Addendum addressed two primary changes: an alternative storm drain alignment that was part of the Storm Drain Project of the 2004 PEIR and a new recycled water line. The other project components related to the 46-acre park,

recreational open space, wetlands, etc. remained the same in the 2013 Addendum. In 2005, the Los Angeles Department of Water and Power (LADWP), a responsible agency, certified the Integrated Resources PEIR, which identified a proposed recycled water line along the same storm drain system. On October 8, 2013, Los Angeles County Flood Control District and LADWP entered into a project partnership agreement for the inclusion of a recycled water line in the design and construction of the storm drain system from Sheldon Street to the project site. The 2004 PEIR did not consider the recycled water line component, and thus, the 2013 Addendum was prepared to refine the scope of the project description to discuss the alternative storm drain alignment and include the recycled water line.

Description

The 2013 Addendum addressed two primary changes to the certified 2004 PEIR: an alternative storm drain alignment and a new recycled water line (Figure 4, 2013 Addendum Modifications). The description under Section 2.1, 2004 Project would remain the same with the addition of the two new components.

Alternative Storm Drain System

The 2004 Strathern Project, included construction of a 4.5-mile storm drain system that would capture and convey runoff from the 929-acre tributary area and deliver it to the detention pond within the project site. The modifications as described in the 2013 Project included a revised route from that proposed in the 2004 PEIR. If the detention pond reached its storage capacity, the outlet from the storm drain to the detention pond would be closed so as to prevent the detention pond from overflowing. Accordingly, the storm drain would be large enough to convey a maximum flow rate of 990 cubic feet per second, and the design capacity of the detention pond is 400 acre-feet. The storm drain would be constructed along Glenoaks Boulevard and Tuxford Street. From the intersection of Tuxford Street and San Fernando Road, the storm drain would connect to Tujunga Avenue at Penrose Street following a revised route from that proposed in the 2004 PEIR. The modifications also included a 1,200-feet transfer pipeline that would convey the treated runoff from the wetlands to the adjacent Sun Valley Park for groundwater recharge.

Recycled Water Line

In addition, the modifications to the approved 2004 Strathern Pit Project as analyzed in the 2013 Addendum, would include a 2.75-mile recycled water line that would connect to an existing recycled water line located at the Los Angeles Department of Water and Power Valley Generating Steam Plant and terminate downstream at the project site to supply the park facilities with Title 22 recycled water for year-round irrigation.

The recycled water line would be constructed within the trench for the storm drain along Glenoaks Boulevard and Tuxford Street. The recycled water line would separate from the storm drain at Tuxford Street at San Fernando Road. The recycled water line would follow an independent alignment along San Fernando Road and Penrose Street and rejoin the trench for the storm drain at Penrose Street and Tujunga Avenue. Alternatively, the storm drain may be constructed along the San Fernando Road and Penrose Street route to Tujunga Avenue as proposed in the 2004 PEIR. The recycled water line would then be entirely within the trench of the storm drain route.

2.3 Currently Proposed Project

Background

The Storm Drain Project of the 2004 PEIR, which was included as part of the 2013 Addendum, is not included in the currently proposed project. On November 10, 2020, an Addendum for the Storm Drain Project of the 2004 PEIR was certified by the Board of Supervisors with a recommendation for project approval. The 2020 Addendum analyzed the Storm Drain Project as a separate and independent project. The intent of the Storm Drain Project is to address an area within the District that is prone to flooding because there are no major storm drain systems within the watershed. These flooding issues are a community concern even during minor, low intensity rain events. The recycled water line contemplated in the 2013 Addendum is no longer included as part of the currently proposed project.

Since the 2013 Addendum, Phase I of the currently proposed project, which consists of site investigations and demolition of existing structures on-site, was completed in 2017. Following the approval of the 2013 Addendum, and as discussed in greater detail below, several phases of additional subsurface exploration were conducted as part of the site investigations. These include supplemental soil borings in 2014 and preparation of a Geotechnical Report in 2019. The Strathern Landfill was closed at the time of various investigations, but the concrete batch plant was in operation and was not made accessible for investigation until 2013. Additionally, the structures part of the concrete batch plant could not be demolished until Over and Over Ready Mix vacated the project site in 2017.

Supplemental soil borings were drilled in 2014, with supplemental drilling occurring in June 2014 (in accordance with 2004 PEIR Mitigation Measure G-1). A Subsurface Environmental Site Assessment was prepared to collect geotechnical data and subsurface environmental data from grading along the boundary of the proposed detention pond and wetland area. The 2014 Subsurface Environmental Site Assessment Findings found that the former Newberry Landfill is composed of decomposable waste and occupies the northern portion of the project site. There was a discovery of organic landfill material on-site. As discussed below, the currently proposed project required a re-design to address the organic landfill material. Thus, further construction activities were paused, and none of the stormwater collection systems and recreational components have been constructed.

A 2019 Geotechnical Report prepared for Los Angeles County Public Works (in accordance with 2004 PEIR Mitigation Measure G-1) summarized the findings of geotechnical evaluations and environmental assessments beginning in 2009 through August 2019 for the currently proposed project. Based on the 2019 Geotechnical Report, excavation along the northern boundary is not considered to be feasible, the detention pond proposed for the west-southwest area of the project site recommends deep dynamic compaction (DDC) to protect against settlement over time, the site is not suitable for development without remedial grading and excavation of inert landfill debris, and the legacy of organic landfill material requires a passive methane system that can be converted into an active system should be incorporated into the design. Thus, the concept for the Rory M. Shaw Wetlands Project was revised (Figure 5, Rory M. Shaw Wetlands Project Concept).

Description

Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The currently proposed project would not include the storm drain, which was approved as a separate, stand-alone project in 2020, and the recycled water line component identified in the 2013 Addendum. The project site boundaries for the currently proposed project are the same as described in the 2004 PEIR and the 2013 Addendum.

As with the 2004 and 2013 Projects, the currently proposed project would capture stormwater runoff collected from upstream drainage areas to alleviate flooding in the Sun Valley community. The proposed design would provide a water conservation benefit through the reuse of stormwater. Runoff would be temporarily stored in a detention pond, routed through wetlands for natural treatment of pollutants, and pumped into existing underground infiltration basins at the adjacent Sun Valley Park. The currently proposed project would provide up to 15 acres of recreational open space. The proposed detention pond would have a footprint of approximately 21 acres and a maximum depth of 50 feet, with a total storage capacity of 385 acre-feet. The proposed wetland would provide sustainable habitat for various plant and animal species, and a natural water treatment system for removing pollutants from the collected stormwater runoff. The treated stormwater would be pumped to the existing adjacent Sun Valley Park infiltration basins for groundwater recharge.

New Components

New components associated with the currently proposed project include DDC over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing. Additionally, although the project site boundary has not changed, the aboveground components of the currently proposed project have been slightly altered in location (as previously shown in Figure 5).

3 Project Description

3.1 Project Construction

Construction activities are divided into three phases: Phase 1, Site Investigations and Demolition; Phase 2, Crushing and Grading; and Phase 3, Above Ground Improvements. Phase 1 was completed in 2017. The following sections describe Phases 2 and 3 associated with the currently proposed project. Neither the 2004 PEIR nor the 2013 Addendum identified specific construction start and end dates for the Strathern Pit Project. However, earlier start dates typically represent a worst-case scenario for construction impacts because equipment and vehicle emission factors are reduced over time due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. As such, impacts are generally reduced as construction start dates are moved out. Therefore, while the assumed construction schedule scenario used in modeling for the analysis may have changed since the time of the 2004 PEIR and 2013 Addendum, this has not led to new impacts.

3.1.1 Phase 2

Mobilization

Mobilization would involve the setup and staging of the construction trailer and equipment needed for the earthmoving, crushing, concrete demolition, and transportation process for the project site. DDC equipment would also need to be mobilized during the compaction operations.

Demolition

As shown in Figure 6, Demolition Plan, the currently proposed project would include the demolition of existing utilities, including gas, water, electricity, and telecommunication lines. Existing sewer laterals and water service lines would be abandoned. Concrete vaults and existing above ground conduits/pipes, a portion of a concrete slab on the western portion of the project site, existing poles, metal fencing and chain-link fencing surrounding the project site, any concrete block walls, bollards, and concrete ramps and footings would be removed. Additionally, the currently proposed project involves the removal of approximately 48 perimeter trees. All existing structures associated with the 2005 Tujunga Avenue Washout Repair that are within the currently proposed project site would be protected-in-place. Existing active monitoring wells would be protected-in-place.

Hauling

The project site has excess material or inert debris that will be hauled away from the site. The inert debris consists of broken concrete, brick, reinforcing steel, etc. The material would be removed mechanically from its current placement and loaded onto hauling trucks. The hauling trucks would be either weighed before entering the site and after exiting the site or at the disposal site. The excess materials may also be hauled to several different waste management facilities depending on availability at the time of construction. These facilities include Sunshine Canyon Landfill, Waste Management Azusa Landfill Reclamation, NuWay Landfill and Kincaid Pit. For the purposes of this analysis, it was assumed that all excess material would be hauled to the farthest location (Kincaid Pit, 36 miles to the southeast) to conservatively estimate emissions associated with haul truck travel during construction. It should be noted that the use of all identified facilities for haul material, for all or a portion of the haul material, was analyzed for all CEQA impact areas. Approximately 550,000 cubic yards (cy) of materials would be hauled off-site to the landfill.

Over Excavation

Figure 7, Over Excavation Grading Plan, identifies the limits of the excavation and grading work, limits of the stockpiles in the location of the proposed detention pond, approximate limits of the former Newberry Landfill fill cap along the northern boundary, and approximate limits of earthen berm on the eastern portion of the site. Under the currently proposed project, 1,327,017 square feet (30.46) acres is proposed for over excavation and 685,753 square feet (15.74 acres) is proposed for site grading.

Phase “A” involves the over excavation of the southeastern corner of the site under the future pump station wet well. The excavated material would be sorted and stockpiled into roughly two classes: haul offsite, and competent material to be crushed and used for base, bedding and general use. The area needed for the material stockpiles, sorting and staging areas is approximately 200,000 square feet. A set aside area would be located in the northwestern portion of the project site. Phase “B” involves the over excavation of the large detention pond which will generally be about 2/3 the total size in the southern segment south of the stockpile staging area. Upon completion of over excavation to the desired grade, compaction work may begin. Phase “C “involves the over excavation of the remaining approximately upper 1/3 of the large detention pond. Construction in this area would require rearranging the stockpiling staging area. The stockpiling staging area would be shifted to the east to allow the remaining portion of the over excavation of the detention pond to be completed. The total over excavation volumes are approximately 2,007,603 cy of cut and 1,211,879 cy of fill.

Deep Dynamic Compaction

First, DDC equipment would be mobilized and set up. The process to compact the bottom of detention pond would be by the use of a weighted disc lifted by a crane and then dropped. The voids would then be backfilled with crushed on-site material with loaders. The proposed DDC activities are intended to achieve sufficient compaction to minimize chances of differential settlement on the site. The DDC method is not required but is the recommended approach at this time. As such, this memorandum will analyze the DDC construction activities to determine whether the potential environmental effects have been adequately addressed in the previous CEQA documentation. DDC uses principles of transforming potential energy to kinetic energy to densify ground through utilization of weights, supported by a crane. Proposed DDC activities would require the use of a Manitowoc 1015 Crawler Crane or equivalent, a specially built crane for DDC operations with automated safety controls and 27-ton steel weight, mechanics service truck, an excavator or dozer, and water truck for dust control. The DDC activities would last approximately 4 years. Total DDC volume is estimated to be approximately 43,330 cy of fill.

Rough Grading

Once the over excavation and compaction operations are completed, rough grading of the project site would begin. Figure 8, Rough Grading Plan, shows the limits of the rough grading areas. Inert landfill material that was excavated would either be hauled off site or be processed and crushed to the desired size and stockpiled. The processed material would then be moved into the rough grading shape of the final site improvements. As the material is placed into final position, it would be compacted using heavy equipment by rolling over the material several times. Total rough grading volumes are estimated to be approximately 68,471 cy of cut and 287,030 cy of fill.

Off-Site Components

The adjacent Penrose truck stop located at 8271 Tujunga Avenue (70 feet from the project site) would be utilized during Phase 2 of construction for stockpiling, staging, and/or crushing. The site is approximately 10 acres. The intended use area would be in the northeast corner of this property. If this off-site location is used, it is anticipated to be used for the whole duration of Phase 2.

Crushing Activities

Crushing activities are anticipated to last approximately 4 years. Two sets of crushing equipment are expected to be used. Each set would consist of a jaw crusher and impact crusher with a post-crushing screener. All excavated material would be pre-sorted to remove any trash or oversized pieces. Next, the material would be processed by the crushing equipment. Material would be processed by the jaw crusher, followed by the impact crusher, followed by the post-crushing screener. Any material that is not crushed to specification would be recirculated into the crushing equipment for re-processing.

Utilities

A brick and mortar bulkhead would be constructed to seal an existing 96-inch diameter congregated metal pipe (CMP) conveyor tunnel located near Tujunga Avenue, using masonry or cast in place concrete construction. Additionally, subdrains, storm drain pipes, geotextile vapor barriers, survey monuments and settlement monuments would be installed.

3.1.2 Phase 3

Detention Pond

The detention pond is proposed for construction on the western portion of the project site. The detention pond is approximately 21 acres in size and 50 feet in depth. A raw water pump station, valve, and vaults are proposed in the lower eastern corner of the detention pond. The edges of the detention pond would be sloped to discourage wildlife movement between the turf areas and water features. A concrete access road would allow access from Tujunga Avenue towards the detention basin.

Wetlands

Two wetland areas totaling 10 acres are proposed within the project site. One is located in the southeast corner, just below the proposed pump station and wet well, another is located just above it. The edges of the wetland areas would be sloped to discourage wildlife movement between the turf areas and water features.

Utilities

The currently proposed project involves the installation of on-site utilities, including electrical and communication lines, water lines, irrigation lines, sewer lines, and storm drain lines. A new 12-inch on-site storm drain is proposed along the northern boundary of the detention basin. The currently proposed project involves construction of an 8-foot by 8-foot reinforced concrete box (RCB) with junction box within Tujunga Avenue, a 12-inch-diameter high-density polyethylene (HDPE) treated water force main from the project site to Fair Avenue onto Cantara Street, an 8-inch diameter sewer at Fair Avenue and Strathern Street. The 8-foot by 8-foot RCB would connect to the raw water gravity main line from Tujunga Avenue into the detention basin. The 12-inch HDPE water force main would carry flows into the existing underground infiltration galleries at Sun Valley Park.

Passive Methane System

Proposed above ground improvements associated with the currently proposed project would include a new passive methane treatment system, a component not included in the 2004 and 2013 proposed projects. Methane controls are required to prevent any surface and shallowing venting consistent with the provisions of local City of Los Angeles Municipal Ordinance No. 175790, Methane Seepage Regulations. These regulations require the installation of a methane mitigation system to prevent any potential intrusion of any residual gas into a proposed development's structure, in this case the north and south restroom facilities. In lieu of an active methane mitigation system, the site development would follow the provisions of the City of Los Angeles Municipal Code Section 91.7104.3.4, Enclosed Room or Space within Building, of the methane seepage regulations for enclosed spaces having less than 2,000 square feet. Beneath the north and south restroom facilities, a HDPE geomembrane would line the bottom of the facilities and passive vent pipe would run horizontally beneath the facilities. Additionally, a vertical pipe would be secured to the building with a ventilator turbine at the top (Figure 9, Methane Mitigation System). Screen vents would be located on the front and back sides of both buildings. Further, the proposed passive landfill gas (LFG) venting system plan would be located along the northern and western property line and along the southern boundary of the existing concrete pad. The proposed passive LFG system would consist of 31 wells designed to prevent methane gas intrusion into the proposed aboveground structures and eight probes would be located along the southern boundary of the existing concrete pad which can be later converted to collector pipes if-needed (Figure

10, Passive LFG Venting System Plan). It is anticipated that the wells would be drilled to a depth of approximately 45 feet. It is noted that the exact number of the wells is based on preliminary design and may be slightly different upon further design; however, a slight change in the number of wells would not alter the conclusions of this memorandum.

Recreational Components

Above-ground improvements would include the development of recreational offerings throughout the site, totaling approximately 15 acres. A 127-stall parking facility would line the northern boundary. The soccer field, a picnic area, and picnic pavilion would be located in the northwest portion of the project site. An amphitheater and restroom would be east of the soccer field and south of the 127-stall parking lot. The rest of the recreational facilities would be located along the eastern portion of the site, including the tot lot and tennis courts, basketball courts, and open play area. Restrooms and a 30-stall parking lot would also be developed in the southeastern portion of the site. Additionally, this component includes the development of trails.

Landscaping

The currently proposed project would include approximately 432 new trees and 109,505 new shrubs. Landscaping is proposed throughout the project site and surrounding the detention ponds and wetland areas.

3.2 Currently Proposed Project Operations

The currently proposed project would have no substantial changes in operations when compared to the 2013 Approved Project. It should be noted, however, that the 2013 Approved Project included three wetland areas and the currently proposed project would include two wetland areas. No change to the total area of wetlands planned and evaluated within the 2013 Addendum would occur.

Stormwater Detention Pond System

Stormwater runoff from the Sun Valley watershed would enter the detention pond via the 8-foot by 8-foot RCB from Tujunga Avenue. Low flows (less than 60 cubic feet per second [cfs]) would be diverted via a 36-inch deep diversion trough location in the RCB to a 36-inch RCP. The diverted flow would go to a priority floatable/sediment treatment unit for removal of sediments, floatables, oil and other constituents. This treated runoff then flows to a diversion structure with three sluice gates connected to three 24-inch RCP outlet pipes. Each of these pipes discharge to one of the three detention pond lower chambers.

Flows higher than 60 cfs would flow beyond the diversion channel and flow directly to the detention pond via the 8-foot by 8-foot RCB. There would still be flow going through the on-site treatment unit, but this would be a minor flow compared to the larger flows bypassing the system. These larger flows would fill the three detention pond lower chambers as necessary depending on the duration of the large rain event. When the incoming flows drop to approximately 60 cfs all flows would be diverted to the on-site treatment system.

There are three outlets located in each of the three detention pond lower chambers. Each is in a sump at the edge of the chamber floor with a bottom elevation of 754 feet (6 feet below the pond bottom). Chambers 1 & 3 drain directly to the pump station wet well. Chamber 2 drains via a 36-inch pipe into the wet well. Pond overflow would drain via an overflow pipe and sluice gate.

Pump Stations

Due to the unique configuration of the detention pond, the location of the pump station would be at the pond bottom. The submersible pumps would require regular maintenance as suggested by the pump manufacturer. There would be two back up pumps. Most rags and other debris would be settled out prior to entering the pump station wet well. The valve vault would be located in the access road above the pump station. There are no other components in the wet well that would require regular maintenance. The raw water pump station would be fitted with 1 set of 4 pumps (two operational, two standby).

Raw water would flow from the detention pond into the raw water wet well containing the 4 pumps, pumping flows up the pond side slope to the valve vault. Valves and diversion boxes would allow the raw water to be pumped to any one of the two wetlands. These raw water pumps would operate continuously during the wet season and only be off during detention pond maintenance.

The treated water pumps would be located in the treated water wet well near the southerly restroom which would receive treated water from the wetlands. There are three pumps (one duty pump, two standby), pumping flows to the Sun Valley infiltration system via the 12-inch HDPE forcemain. This forcemain would connect to a new discharge manhole and flow by gravity via an 18-inch reinforced concrete pipe (RCP) and connect to an existing 48-inch RCP directly upstream of Special Diversion Structure #3. From there, all flow would be by gravity to the infiltration basins.

Wetlands Treatment System

There would be a total of two wetlands operating in series with a total footprint of approximately 10 acres. The wetlands would be planted with plant types that would optimize the treatment of the raw storm water. In normal operation, raw water would be pumped to the upper wetland, and then would flow by gravity into the lower wetland via an 18-inch polyvinyl chloride (PVC). The raw water pump station forcemain system is designed so that it can discharge to either pond.

After the initial “first flush” event of the rainy season, the pollutant levels in the runoff are at their highest levels. Accordingly, at that time, the ponds should be operated to maximize the detention time which would maximize pollutant removal. Ideally after the first flush, if there is no need to pump the detention pond down rapidly, flows should be pumped to the wetlands systems at a consistent rate. After the first flush has passed, raw water flow rates can be increased through the wetlands to maximize detention pond drawdown.

Wetlands Operation

Other than on-site runoff and rainfall, the raw water going to the wetlands would be supplied by the raw water pumps. Considering the volume of the detention pond and the depth of the wetland, these wetlands pumps would operate continuously to treat 2 to 5 cfs through the wetlands at all times without much consideration to wet weather vs. dry weather operation. Depending on the flow rate required and the wetland elevation, either one or two pumps would operate. At high detention pond levels, only one pump is necessary to provide the 5 cfs flow to the wetlands. At low detention pond levels, two pumps would be required to supply the 5 cfs wetlands flow.

If there is no available water from the detention pond, the wetlands would be supplemented by a separate potable water line. If recycled water becomes available in the future, this potable water line to the wetlands could be converted for use for recycled water.

In addition, the two wetlands drains would be operated as appropriate to accommodate the draining and filling operations during maintenance. The wetlands can be drained by opening the drain sluice gates to drain the ponds into the respective weir box. This water would likely be very silty and should not be returned to another wetland or pumped to the infiltration basin. Accordingly, this drainage can be pumped using a portable pump either directly to the detention pond (or using one of the drains that drain to the detention pond) or by using a vactor truck.

3.3 Comparison of 2004, 2013, and Currently Proposed Project

A summary of the 2004 Strathern Pit Project and 2013 Approved Project components and the currently proposed project components are provided in Table 1.

Table 1. Comparison of 2004, 2013, and Currently Proposed Project

Project Component[1]	2004 Strathern Pit Project	2013 Approved Project	Currently Proposed Project
Hauling	Not included	Not included	Approximately 550,000 cubic yards of materials would be hauled off-site.
Off-Site Components	Not Included	Not Included	The adjacent Penrose truck stop located at 8271 Avenue would be utilized during Phase 2 of construction for stockpiling, staging, and/or crushing. The site is approximately 10 acres.
Crushing	Not Included	Not Included	Crushing activities are anticipated to last approximately 4 years. Crushing would be accomplished with two sets of crushing equipment.
Detention Pond	Terraced side slopes with five levels with the deepest part approximately 50 feet below street level. The bottom portion of basin would be operated as a wetland (500 to 700 acre-feet of storage)	21-acres with up to 400 acre-feet of storage. Raw water pump station within the detention pond.	21-acres with up to 385 acre-feet of storage. Raw water pump station within the detention pond.
Wetland		10-acres of wetlands in the northern and western portion of the project site.	10-acres of wetlands concentrated to the east side of the site (see Figure 5).
Storm Drain System	Not included	4.5-mile storm drain system that would capture and convey runoff from the 929-acre tributary area and deliver it to the detention pond within the Strathern Wetlands Park	Not included [2]
Transfer Pipeline	Infiltration option would require a 14,000-foot-long pipeline and a 100- to 150-horsepower pump to transport the water to the Tujunga Spreading Grounds, where the water would be used for groundwater recharge.	1,200 feet transfer pipeline to convey the treated runoff from the wetlands to the adjacent Sun Valley Park for groundwater recharge	Same as 2013 Approved Project

Table 1. Comparison of 2004, 2013, and Currently Proposed Project

Project Component[1]	2004 Strathern Pit Project	2013 Approved Project	Currently Proposed Project
Recycled Water Line	Not included	2.75-mile recycled water line would connect the existing recycled water line at the LADWP Valley Generating Steam Plant and terminate at the Strathern Wetland Park Project	Not included
Aboveground Components	Alternatives range from 7 to 14 acres	15 acres, includes 160 parking stalls, restroom, tot lot, tennis courts, amphitheater, open space play area, basketball courts, picnic area, exercise station, trails, and wet well pump station near the southerly bathrooms.	15-acres, includes 160 parking stalls, soccer field, picnic area, picnic pavilion, amphitheater, two restroom buildings, tot lot, tennis courts, open space area, basketball courts, trails, and wet well pump station near the southerly bathrooms (Figure 5 for Current Concept).
Deep Dynamic Compaction	Not included	Not included	The proposed DDC activities are intended to achieve sufficient compaction to minimize chances of differential settlement on the site. DDC uses principles of transforming potential energy to kinetic energy to densify ground through utilization of weights, supported by a crane, and free fall impact to the ground to increase the density of soil.

Table 1. Comparison of 2004, 2013, and Currently Proposed Project

Project Component[1]	2004 Strathern Pit Project	2013 Approved Project	Currently Proposed Project
Passive Methane Treatment System	Not Included	Not Included	The proposed passive methane treatment would be located along the northern and western property line and along the southern boundary of the existing concrete pad. The proposed passive methane treatment would consist of 31 wells designed to prevent methane gas intrusion into the proposed aboveground structures and eight probes would be located along the southern boundary of the existing concrete pad which can be later converted to collector pipes if-needed. It is anticipated that the wells would be drilled to a depth of approximately 45 feet. (See Section 3.1.2).
Landscaping	Not described, although, concept design identifies landscaping.	Includes approximately 432 new trees and 109,505 new shrubs. Landscaping is proposed throughout the project site and surrounding the detention ponds and wetland areas.	Same as 2013 Approved Project

1 Conversion of an existing 46-acre construction debris landfill located in the northeast corner of Tujunga Avenue and Strathern Street into a stormwater detention and treatment area and park.
2 This is part of the 2020 Addendum for the Sun Valley Watershed Upper Storm Drain System Project.

3.4 Summary of Environmental Effects, Previously Adopted Mitigation Measures, and Level of Significance after Previously Adopted Mitigation for the Currently Proposed Project

3.4.1 Impacts Determined to be Below the Level of Significance

The certified EIR identified that the following potential environmental impacts of the approved 2004 Strathern Pit Project would result in no impact or in less than significant or would be beneficial and therefore do not require the imposition of mitigation measures. However, although not required under CEQA, mitigation measures have been incorporated into the project for some of these impacts to further reduce already less than significant impacts. See

also Appendix G, Programmatic Mitigation Monitoring and Reporting Program for the Sun Valley Watershed Management Plan, included as part of this memorandum for a list of previously approved mitigation measures.

- Air Quality (construction coarse particulate matter [PM_{10}] emissions)
  - **Mitigation Measure A-1:** Clean dirt from construction vehicle tires and undercarriages when leaving the construction site and before entering local roadways.
  - **Mitigation Measure A-2:** During earth-moving activities, water the construction area as necessary, but at least twice per day.
  - **Mitigation Measure A-3:** Water temporary open storage plies once per hour or install temporary covers
  - **Mitigation Measure A-4:** Water unpaved roadways three times per day or apply non-toxic soil stabilizers.
  - **Mitigation Measure A-5:** Limit construction vehicle speed on the project site to 15 miles per hour (mph) or less.
  - **Mitigation Measure A-6:** Cover dirt in trucks during on-road hauling.
  - **Mitigation Measure A-7:** Cease earth-moving activities on days when gusts exceed 25 mph or apply water to soil not more than 15 minutes prior to moving such soil.
  - **Mitigation Measure A-8:** Sweep Streets near the construction area at the end of the day if visible soil material is present.
  - **Mitigation Measure A-9:** For applicable construction areas, establish a vegetative groundcover as soon as feasible after active operations have ceased. Groundcover will be of sufficient density to expose less than 30 percent of unestablished ground within 90 days of planting.
  - **Mitigation Measure A-10:** Per SCAQMD Rule 403(f), large construction operations (greater than 100 acres of disturbed area or daily earth-moving or throughput volume of 10,000 cubic yards three times during the most recent 365-day period) will either 1) implement fugitive dust suppression measures as specified in Tables 1 and 2 of Rule 403, or 2) prepare a fugitive dust emissions control plan and obtain approval from SCAQMD.
- Air Quality (operations)
- Biological Resources (enhanced vegetation and habitat in project area)
- Cultural Resources (prehistorical and paleontological resources; historical resources - Stonehurst Park, Valley Steam Plant, Roscoe Elementary School, Power Line Easement, and Strathern Pit)
- Cultural Resources (archaeological resources)
  - **Mitigation Measure C-3:** If previously unknown cultural resources are discovered in the course of excavation for project construction at any project site, the construction inspector shall have the authority and responsibility to halt construction until a qualified archaeologist can evaluate the significance and distribution of the materials and identify future activities needed. If the cultural material discovered is determined to be of potential archaeological significance, the investigation and future activities shall be conducted in consultation with culturally affiliated Native American or other parties, as necessary.
  - **Mitigation Measure C-4**: If human remains are discovered in the course of excavation for project construction, the Los Angeles County Coroner shall be contacted and provisions of State CEQA Guidelines Section 15064.5 would be followed.
- Geology and Soils (seismic ground shaking and surface rupture; expansive soils; subsidence)

- Hazardous Materials (bird/wildlife aircraft strike)
    - **Mitigation Measure H-2:** During the detailed design phase of Sheldon Pit, Cal Mat Pit, and Strathern Pit, FAA Western Pacific Regional Office, Burbank Airport, and Whiteman Airport will be notified of the proposed land use change.
- Hazardous Materials (public safety)
- Hydrology (increased runoff – flooding; dams; increased runoff – water quality; groundwater infiltration of San Fernando Basin landfill materials)
- Hydrology (groundwater contamination)
    - **Mitigation Measure W-2:** LACDPW will prepare an annual vadose zone, surface water, and groundwater quality monitoring report to present the results of the Phase 1 projects to the Stakeholders. LACDPW will work with the Stakeholders to evaluate the effectiveness of the stormwater treatment devices and determine the necessity of additional stormwater treatment prior to subsequent infiltration or for use in wetlands designed to provide wildlife habitat. Where indicated based on water quality concerns, additional stormwater treatment will be installed or infiltration will be discontinued at the relevant site. For sites with constructed wetlands that support wildlife habitat, modifications necessary based on water quality concerns will be designed to retain wetland vegetation or manage the wetlands in accordance with wildlife agency agreements or consultations.
- Noise (operational noise)
- Public Services (fire protection, emergency medical services, or police services)
- Recreation (construction at parks; beneficial impacts on recreational resources)
- Traffic (operational)
- Solid Waste (construction waste)
    - **Mitigation Measure U-4**: The plans and specifications for the proposed project will state that the construction contractor is required to identify and implement programs for minimizing solid waste generated during construction. These programs will include, at a minimum, recycling of asphalt and concrete paving materials, and balance of graded soil on site to the maximum extent feasible.
- Solid Waste (modifications to solid waste collection routes)
    - **Mitigation Measure U-5:** Prior to construction, the City of Los Angeles Bureau of Sanitation will be notified of the construction schedule and planned lane or road closures so that solid waste collection routes and access in the area may be modified accordingly.
- Solid Waste (operational)
- Utilities (operational)

3.4.2 Impacts Determined to be Less Than Significant with Previously Adopted Mitigation

The following impacts related to biological resources, cultural resources, geology, hazardous materials, hydrology, noise, public services, traffic, and utilities were determined to be potentially significant absent mitigation. The mitigation measures identified below were provided for the approved 2004 Strathern Pit Project to reduce these impacts to a less than significant level. Note that Mitigation Measures B-2, B-4, C-5, G-1, and W-5 have already been implemented since approval of the 2004 PEIR and 2013 Addendum.

- Biological Resources (sensitive habitats at Cal Mat Pit, Sheldon Pit, Strathern Pit, and Vulcan Gravel Processing Plant)
    - **Mitigation Measure B-2**: Prior to construction of Vulcan Gravel Processing Plant, Sheldon Pit, Cal Mat Pit, and Strathern Pit, the sites will be surveyed in accordance with agency protocols at the appropriate time of the year for the presence or absence of high-value native vegetation and habitats, including special status vegetation and wetland or riparian vegetation, If high value vegetation/habitat types are identified, the proposed facilities will be designed and/or sited to avoid or minimize disturbance and loss of the vegetation and habitats during construction. However, depending on the location of sensitive resources at the sites, if any, project design that avoids the biological resources while still meeting the flood control objective of the project component may be infeasible. For example, the large size of the stormwater retention infiltration basins proposed for the gravel pit sites might preclude complete avoidance of sensitive biological resources. Therefore, if avoidance is not feasible, the following will be implemented:
        a) If a high value vegetation type will be unavoidably impacted by project construction, the vegetation and associated topsoil will be removed, salvaged or mulched, and stockpiled separately. Following the completion of project construction, the stockpiled topsoil will be replaced and stockpiled vegetation will be replanted tor replaced if mulched) on the site of origin or on another adjacent location as appropriate, under the direction of a qualified biologist. Retention and reapplication of stockpiled topsoil and vegetation will be supplemented with on-site restoration and/or rehabilitation of the same vegetation type at a ratio of 1:1, at minimum, as appropriate and biologically feasible; or
        b) If post-construction restoration and/or rehabilitation locations cannot be identified onsite, then appropriate and biologically feasible locations identified within other component sites shall be expanded to accommodate additional restoration to meet the 1:1 ratio, at minimum: or
        c) If appropriate and biologically feasible restoration and/or rehabilitation for the impacted high value vegetation type cannot cumulatively be identified within the project component sites, and conditions on the site(s) are appropriate and biologically feasible for a different high-value vegetation type on the site, restoration and/or rehabilitation of this vegetation type may be substituted at a ratio of 1:1, at minimum.
        d) Each acre of created wetlands that requires maintenance (e.g., sediment removal), and will be used to mitigate impacts to existing wetlands in (a) through (c) above, used for mitigation at a ratio of 2:1.
        e) The post-construction native vegetation restoration will be conducted under the direction of a qualified biologist. Where possible, restoration and/or rehabilitation will be consistent with, or a supplement to, any approved Reclamation Plan approved for any of these component sites.
        f) If wetland or riparian vegetation within the waters of the United States will be unavoidably impacted by project construction, USACE will be consulted regarding permits required under Clean Water Act Section 404. All necessary federal and state approvals (including coordination with CDFG and additional CEQA review) will be obtained prior to the implementation of construction activities. The acreage of created wetlands that would be disturbed for maintenance purposes (e.g., sediment removal) will be discounted from the total acreage necessary to mitigate impacts to existing wetlands.

- Biological Resources (nesting birds at Vulcan Gravel Processing Plant, Sheldon Pit, Cal Mat Pit, Strathern Pit, and New Park on Wentworth)
    - **Mitigation Measure B-5:** If feasible, project activities with the potential to disturb native and non-native vegetation and man-made nesting structure shall take place outside of the breeding season, (which generally runs from March 1 to August 31 and as early as February 1 for some raptors) for birds protected by the Migratory Bird Treaty Act.

      If project activities must occur during the breeding season of birds covered by the Migratory Bird Treaty Act, then beginning 30 days prior to construction, weekly bird surveys shall be arranged. The surveys shall continue on a weekly basis with the last survey being conducted no more than 3 days prior to the initiation of clearance/construction work at the site. If a bird covered by the Migratory Bird Treaty Act is detected on the site, then the nesting activity will be monitored to ensure that construction activities do not occur within 300 feet of the nest (500 feet for raptors) until the juvenile birds have fledged and no further nesting attempts are initiated.
- Cultural Resources (archeological resources at Cal Mat Pit, Roscoe Elementary School, Sheldon Pit, Stonehurst Park, Strathern Pit and Valley Steam plant)
    - **Mitigation Measure C-2**: On the first day of subsurface work, if any, at Strathern Pit, Cal Mat Pit and Sheldon Pit, a professional monitor qualified in historical archaeology shall be present to assess whether further monitoring might be warranted.
- Cultural Resources (historical resources at Strathern Pit, Cal Mat Pit, and Sheldon Pit)
    - **Mitigation Measure C-5**: During the design phase of Strathern Pit, Cal Mat Pit, and Sheldon Pit, the LACDPW will conduct on-site surveys to determine presence of original machinery, refuse and/or structures that date from the period of concern. If any are found, LACDPW will evaluate whether they are a historical resource using the criteria described in Section 15064.5(a) of the State CEQA Guidelines. If any equipment and/or structures at Strathern Pit, Sheldon Pit, or Cal Mats Pit are determined to be a historical resource, LACDPW will:
        - Incorporate the artifact into design of the project component, or
        - Remove and relocate the artifact to in appropriate location (i.e., museum, public library. or school), or
        - Document with photographs and engineering drawings
- Geology (slope instability at Strathern Pit, Cal Mat Pit, and Sheldon Pit)
    - **Mitigation Measure G-1**: During detailed design of Cal Mat Pit, Sheldon Pit, and Strathern Pit components, LACDPW will incorporate the recommendations of the geotechnical analysis, which will include optimum slope design for stability and safety, soil compaction or recompaction requirements, surface cover, and potentially other slope stabilizing measures.
- Soils (construction – soil erosion)
    - **Mitigation Measure W-1:** The construction contractor will develop and implement a Storm Water Pollution Prevention Plan (SWPPP) for all project components (except Onsite BMPs and Tree Planting and Mulching) that involve constructing, clearing, grading or excavation on areas over 1 acre in size. The following are possible measures to be incorporated into site-specific SWPPPs. Additional sample measures and guidelines for developing SWPPPs are available in California Stormwater Quality Association's Stormwater Best Management Practice Handbook – Construction (CASQA, 2003).

Measures to reduce fugitive dust generated during construction (see Mitigation Measures A-1 through A-10) will also minimize the potential for soil erosion.

- Install perimeter silt fences of hay bales.
- Stabilize soils through hydroseeding and use of soil stabilizers.
- Install temporary sedimentation basins.
- Conduct earth moving activities during the dry season (April through October), as feasible.
- Designate storage areas for construction materials, equipment and maintenance supplies (e.g., fuels, lubricants, paints, solvents. adhesives) to keep these materials out of the rain and minimize contact with stormwater.
- Conduct regular inspections to ensure compliance with the SWPPP.

- Hazardous Materials (soil contamination)
  - **Mitigation Measure H-1**: During the detailed design phase of each project component (except Onsite BMPs, Tree Planting & Mulching, and Storm Drains), a Phase I Environmental Site Assessment (ESA) will be conducted to determine the site-specific potential for soil contamination. The Phase I ESA will be conducted in accordance with the latest version of the American Society of Testing and Material (ASTM) 1527 "Standard Practice for Environmental Site Assessments: Phase I Environmental Assessment Process." This document outlines the customary practice for performing ESA's in the United States. Phase I ESA will consist of a review of site-specific documents and historical map to determine past uses of the site, a site visit visually inspect the property for signs of potential environmental contamination, and investigation of state and federal environmental regulatory databases (including those maintained by Regional Water Quality Control Board and Department of Toxic Substances Control) to identify recognized hazardous materials usage or spills. For project sites with infiltration, the boundary of the Phase I ESA. will include parcels located within 500 feet of the project site boundary to identify active or abandoned landfills or other land uses with the potential for contaminated soils which would be incompatible with infiltration (to be cross referenced with Mitigation Measure W4; see Section 4.7.7 [of the 2004 PEIR]). If the Phase I ESA concludes that there is no substantial potential for soil contamination, no further action would be required. For project sites with infiltration, the boundary of the Phase I ESA will include adjacent parcels to identify active or abandoned landfills (to be cross-referenced with Mitigation Measure W-5; see Section 4.7.7 [of the 2004 PEIR]). If the Phase I ESA indicates that there is potential for soil to be contaminated, additional investigation (including soil sampling and analysis) will be conducted to determine the presence and extent of the contamination. If the proposed project would involve disturbance of soil in the contaminated area, soil would be removed and disposed of in compliance with applicable regulations at approved disposal sites.

- Hazards (public health impacts related to mosquito habitat)
  - **Mitigation Measure H-3:** LACDPW, or subsequent operator of the project component (if different), will consult and coordinate with the Greater Los Angeles Vector Control District (GLAVCD) during the detailed design, implementation, and operation phases of the following project components: Sheldon Pit, Strathern Pit, Cal Mat Pit, Power Line Easement, Valley Steam Plant, and Vulcan Gravel Processing Plant. Consultation and coordination with GLAVCD shall include the following actions:
    - Consult with GLAVCD during the detailed design phase to incorporate design elements intended to minimize the mosquito production potential of the project component(s).

  - Regularly consult GLAVCD to identify mosquito management problems, mosquito monitoring and abatement procedures, and opportunities to adjust water and vegetation management practices to reduce mosquito production. Mosquito control measures to be used by GLAVCD could include mosquito fish stocking, and application of Bti, Methoprene, and/or Agnique MMF, as appropriate.

- Hydrology (construction – surface water quality related to soil erosion)
  - **Mitigation Measure W-1:** (listed above)
- Hydrology (groundwater impacts related to soil contamination)
  - **Mitigation Measure H-1**: (listed above)
- Hydrology (inundation of landfill materials)
  - **Mitigation Measure W-4:** If the site-specific Phase I ESA (see Mitigation Measure H-1) indicates that an active or closed landfill (either municipal solid waste or inert construction waste) is located within 500 feet from the project site boundary, a site-specific geotechnical study will be conducted to: 1) characterize the extent and composition of landfill materials; 2) determine whether the landfill materials are releasing methane; 3) and estimate the potential mounding effect from the proposed stormwater infiltration. The results of the geotechnical study will be incorporated into the project design to minimize the potential for project infiltration to result in interaction between infiltrated stormwater and landfill materials or to impact landfill gas releases, if any. Potential design modifications include siting the infiltration facilities away from the landfill and/or partially lining the facilities to direct infiltration away from the landfill. For sites with stormwater infiltration within 500 feet of an active or closed landfill, a groundwater monitoring program will then be developed and implemented to ensure that infiltration does not result in interaction between infiltrated stormwater and landfill materials or impact landfill gas releases. Infiltration would cease at any site where groundwater levels rose to within 10 feet of landfill materials.
- Hydrology (use of Tujunga Spreading Grounds for stormwater collected at Strathern Pit)
  - **Mitigation Measure W-5:** As part of detailed design of the Strathern Pit component (Alternatives 1, 2, and 4), LACDPW will coordinate with Los Angeles Bureau of Sanitation, LADWP, and ULARA Watermaster's office to evaluate the feasibility of using the Tujunga Spreading Grounds for stormwater infiltration. The evaluation will determine the amount of stormwater that can be infiltrated by the proposed project without adverse effects on landfill methane migration.
- Noise (construction noise)
  - **Mitigation Measures N-1:** Construction activities will be limited to the hours allowed by the City of Los Angeles Noise Ordinance (i.e., between 7 a.m. and 9 p.m. on weekdays and between 8 a.m. and 6 p.m. on Saturdays and national holidays) unless written permission has been obtained from the City of Los Angeles Board of Police Commissioners per Section 41.40 of the Los Angeles Municipal Code.
  - **Mitigation Measures N-2:** All mobile construction equipment will be equipped with properly operating mufflers or other noise reduction devices.

  The following noise mitigation measures (N-3 and N-4) will be implemented during project construction (except Onsite BMPs, Tree Planting and Mulching, and Storm Drains):

    - **Mitigation Measures N-3:** For discrete project component sites, businesses and residences immediately adjacent to the construction site will be notified prior to the start of construction, e.g., via flyers. A toll-free number for noise complaints will be included in this notification.

  - **Mitigation Measures N-4:** Prior to the start of construction of the project components, the construction contractor will develop a site-specific noise mitigation plan based on an updated estimate of construction equipment and schedule for each project component. The objective of the mitigation plans will be to reduce noise levels to 75 dBA at the nearest residence and 67 dBA at school sites during project construction. The mitigation plans will identify potential mitigation measures, including installation of sound walls, sound curtains, and other temporary noise barriers; selection of quieter construction procedures and/or equipment; and noise monitoring to verify adherence to the identified mitigation measures. Additional mitigation measures for construction at school sites (i.e., Roscoe Elementary School, Stonehurst Elementary School, and Sun Valley Elementary School) will include the following: scheduling the noisier phases of construction on Saturdays, school vacation periods, and/or after regular class hours but before 9 p.m. as feasible; and maintaining ongoing communications with the schools' administrators to address any construction noise related issues. Coordination with St. Patrick's School will also be conducted prior to the installation of storm drains near this location.

- Public Services (construction – police and fire protection services from temporary lane and/or road closures)
  - **Mitigation Measure P-1:** Prior to the start of construction, the fire stations serving the project area will be consulted to review phasing, road/lane closure, and detour plans and to determine fire and emergency medical response requirements.
  - **Mitigation Measure P-2:** The project will comply with all state and local codes and ordinances, and the guidelines found in the Fire Protection and Fire Prevention Plan, and Safety Plan located in the City of Los Angeles General Plan (C.P.C. 19708)
  - **Mitigation Measure P-3:** Prior to the start of construction, the North Hollywood Community Police Station and/or Foothill Community Police Station will be informed, as appropriate, of project-related lane and/or road closures and detour plans.
  - **Mitigation Measure P-4:** Investigate and implement traffic control measures capable of reducing temporary adverse effects to police and emergency vehicles response during project construction. Such measures may include the use of flagmen and posting "No Parking" signs along the affected area.
- Public Services (construction impact on school access)
  - **Mitigation Measure P-5**: Ensure that school buses have access to Sun Valley Middle School, Stonehurst Elementary School, Roscoe Elementary School, and St. Patrick's School during construction.
  - **Mitigation Measure P-6**: Ensure that safe and convenient pedestrian routes to Stonehurt, Roscoe, Sun Valley, and St. Patrick's School are maintained.
  - **Mitigation Measure P-7**: Maintain ongoing communication with the administrators of the schools and provide sufficient notice to forewarn children and parents when existing pedestrian and vehicular rouges to school will be affected.
  - **Mitigation Measure P-8**: Install appropriate traffic controls (e.g., signs and signals) as needed to ensure pedestrian and vehicular safety.
  - **Mitigation Measure P-9**: As feasible, haul routes will not be routed past the schools except when school is not in session.
  - **Mitigation Measure P-10**: Construction or worker vehicles will not be parked or staged on streets adjacent to the schools

  - **Mitigation Measure P-11**: All construction areas on or adjacent to schools, including trench areas, operating equipment areas and equipment staging and stockpile areas, will be secured through fencing or other barriers to prevent trespassing and reduce hazards to children and other pedestrians.
- Public Services (construction impacts on school commuting routes)
  - **Mitigation Measure P-12**: The Project Manager or designee will notify LAUSD Transportation Branch and the St. Patrick's School of the expected start and ending dates for various portions of the project that may affect traffic through the areas and any potential impact on existing school bus routes.
- Traffic (construction – construction vehicles and equipment))
  - **Mitigation Measure T-1**: A construction traffic management plan shall be developed for each project site that will include but not be limited to such measures as designated haul routes for construction-related traffic (e.g., construction equipment, pickup and dump trucks, and other material delivery trucks), travel time restrictions for construction-related traffic to avoid weekday peak periods on selected roadways, designated site access locations, driveway turning restrictions, temporary traffic controls and/or flaggers, and designated parking/staging locations for workers and equipment.
- Traffic (construction activities in right-of-way)
  - **Mitigation Measure T-2**: A construction area traffic control plan and/or detour plan shall be prepared for each location where construction activities would encroach into the right-of-way of a public roadway. The plan would include, but not be limited to such features as warning signs, lights, barricades, cones, lane closures, and restricted hours during which lane closures would not be allowed; e.g., 6:00 to 9:00 a.m. and 1.00 to 6:00 p.m., or as directed by the affected public agency (City of Los Angeles Department of Transportation for most locations).
  - **Mitigation Measure T-3**: Provide advance notification to affected property owners, businesses, residents, etc. of possible driveway blockages or other access obstructions and implement alternate access and parking provisions where necessary.
  - **Mitigation Measure T-4**: Provide alternative pedestrian and bicycle access/circulation routes where existing facilities such as sidewalks, crosswalks, and bike lanes would be obstructed.
  - **Mitigation Measure T-5**: Coordinate with emergency service providers (police, fire, and ambulance/paramedic agencies) prior to construction to provide information regarding lane closures, construction schedules, driveway blockages, etc. and to develop a plan to maintain or accommodate essential emergency access routes; e.g., plating over excavations, use of detours, etc.
  - **Mitigation Measure T-6**: Coordinate with public transit agencies (e.g., MTA) to provide information regarding lane closures, bus stop disruptions, etc. and to designate alternate pick-up/drop-off locations if appropriate.
  - **Mitigation Measure T-7**: As necessary, obtain a transportation permit from Caltrans for transportation of heavy construction equipment and or materials which requires the use of oversized-transport vehicles on State highways.
- Utilities (construction – interference in right-of-way)
  - **Mitigation Measure U-1**: During the preliminary design phase of each project component, the utility service providers will be consulted to identify existing and proposed buried facilities in affected roadways to determine which utilities require relocation and which can be avoided. If relocation is required, the appropriate utility service provider will be consulted to sequence construction activities to avoid or minimize interruptions in service.

- **Mitigation Measure U-2**: If utility service disruption is necessary, residents and businesses in the project area will be notified a minimum of two to four days prior to service disruption through local newspapers, direct mailings to affected parties, or public posting of notices.
- **Mitigation Measure U-3**: The contractor will be required to excavate around utilities, including hand excavation as necessary, to avoid damage and to minimize interference with sage operation and use. Hand tools must be used to expose the exact location of buried gas or electric utilities.

3.4.3 Impacts Determined to be Significant and Unavoidable

Even with implementation of previously adopted mitigation measures, the analysis in the 2004 PEIR determined that the approved 2004 Strathern Pit Project would result in significant and unavoidable adverse impacts related to air quality and biological resources.

- Air quality (construction NO_x emissions for Cal Mat Pit, Parking Lot on Sherman, Power Line Easement, Sheldon Pit, Storm Drains, Strathern Pit, Street Storage, and Vulcan Gravel Processing Plant)
  - **Mitigation Measure A-11:** Prohibit all vehicles from idling in excess of 10 minutes, both on and off-site.
  - **Mitigation Measure A-12:** Maintain construction equipment in proper tune.
  - **Mitigation Measure A-13:** Encourage contractors to establish trip reduction plans. The goal of these plans will be to achieve a 1.5 average vehicle ridership (AVR) for construction employees.
  - **Mitigation Measure A-14:** Select construction equipment with low pollutant emissions and high energy efficiency. Factors to consider include model year and alternative fuels (e.g., compressed natural gas, biodiesel, emulsified diesel, methanol, propane, and butane).
- Biological Resources (construction impacts on sensitive species from Cal Mat Pit, Sheldon Pit, Strathern Pit, and Vulcan Gravel Processing Plant)
  - **Mitigation Measure B-4:** Prior to construction of Vulcan Gravel Processing Plant, Sheldon Pit, Cal Mat Pit, and Strathern Pit components, onsite field surveys will be conducted at the appropriate time of the year (approximately mid-April to mid-June) to confirm the potential for special status plant and wildlife species to occur on these sites:
    - Plants - southern tarplant, San Fernando Valley spineflower, slender-horned spineflower, Los Angeles sunflower, Nevin's barberry, Plummer's mariposa lily, mesa horkelia, and Davidson's bush mallow.
    - Wildlife - silvery legless lizard and southwestern pond turtle, orange-throated whiptail, San Diego horned lizard, least Bell's vireo, coastal California gnatcatcher, and San Diego black-tailed jackrabbit

If the potential is confirmed for one or more special status species to occur, a qualified biologist will conduct focused surveys for those species in accordance with appropriate survey protocols at the appropriate time of the year. If any special status species are identified during the focused surveys, the proposed facilities will be designed and/or sited to avoid or minimize disturbance and loss of the species during construction. However, depending on the location of sensitive resources at the sites, if any, project redesign that avoids the biological resources while still meeting the flood control objective of the project component may be infeasible. Therefore, if avoidance is not feasible, restoration and/or rehabilitation as described in Mitigation Measure B-2 will be implemented.

Additionally, if impacts on a federal or state-listed threatened or endangered species cannot be avoided, USFWS and/or CDFG will be consulted regarding permits required under FESA and/or CESA. All necessary federal and state

approvals shall be obtained prior to the implementation of construction activities that would impact a federal or state-listed threatened or endangered species.

4 CEQA Consistency Analysis

As previously discussed in Section 1.2, Purpose and Methodology, the purpose of this memorandum is to assess whether the impacts of the currently proposed project are consistent with the certified 2004 PEIR and the 2013 Addendum and whether any additional documentation is required under the California Environmental Quality Act (CEQA).

The 2004 PEIR analyzed the following issue areas: Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Hazards and Hazardous Materials, Hydrology, Noise, Public Services, Recreation, Traffic and Transportation, Utilities and Service Systems. The 2013 Addendum indicated minor technical environmental changes to the 2004 PEIR with regards to Air Quality, Biological Resources, Cultural Resources, Greenhouse Gases, and Traffic were necessary. The 2013 Addendum determined the remaining issue areas would be unaffected. The 2013 Addendum determined no additional mitigation measures were required, and thus, all mitigation measures presented in this section were approved as part of the 2004 PEIR.

The 2013 Addendum did not discuss the following resource areas - Geology and Soils, Hazards and Hazardous Materials, Hydrology, Noise, Public Services, Recreation, Utilities and Service Systems. As such, this memorandum will refer only to the 2004 PEIR for these issue areas. The Air Quality, Biological Resources, Cultural Resources, Greenhouse Gases, and Traffic sections reference both the 2004 PEIR and the minor technical changes included in the 2013 Addendum, as applicable. Additionally, new supplemental analysis, including an Air Quality Technical Memorandum, Biological Resources and Habitat Assessment, Geotechnical, Geologic, and Environmental Assessments, Noise and Vibration Memorandum, Bird-Aircraft Strike Hazard Report, and Trip Generation Analysis, Transportation Consistency Analysis, and VMT Assessment Memorandum, have been prepared for the currently proposed project and included as appendices.

Since certification of the 2004 PEIR and 2013 Addendum, the State adopted updates to the State CEQA Guidelines to add efficiency and clarity to aspects of the Guidelines and to incorporate recent case law and legislation that had not yet been reflected in the text of the guidelines. The recently adopted updates also include revisions to Appendix G of the State CEQA Guidelines, which consists of environmental checklist questions that are used by many lead agencies as the framework for environmental documents prepared pursuant to CEQA.

The revised State CEQA Guidelines were adopted on December 28, 2018. As such, the environmental checklist questions used in the 2004 PEIR and 2013 Addendum were based on the version of the State CEQA Guidelines and Appendix G that was in place when the NOP and the Draft EIR were released for public review in 2004. The 2013 Addendum checklist was also based on the 2004 PEIR CEQA Guidelines, however, the 2013 Addendum conducted a quantitative analysis to model project greenhouse gas emissions per the 2008 interim significant threshold of the South Coast Air Quality Management District (SCAQMD). Section 15007(c) of the State CEQA Guidelines states that "If a document meets the content requirements in effect when the document is sent out for public review, the document shall not need to be revised to conform to any new content requirements in Guideline amendments taking effect before the document is finally approved." Because the 2004 PEIR was released for public review prior to adoption of the Guideline amendments, the analysis for the currently proposed project does not need to be updated to conform with the revised Guidelines. Furthermore, the 2004 PEIR was also finalized and

certified prior to adoption of the Guidelines amendments. As such, changes pertaining to the State CEQA Guidelines updates do not need to be addressed in this memorandum. The recent adoption of these updates does not constitute substantial changes with respect to the circumstances under which the currently proposed project will be undertaken, nor does it constitute new information of substantial importance that would change the impact conclusions in the certified 2004 PEIR and 2013 Addendum.

Nevertheless, since this memorandum is prepared after the CEQA amendments went into effect and in the interest of providing the public and decision makers as much information on the environmental consequences as possible, this document includes discussions for informational purposes only relative to energy, tribal cultural resources, and/or wildfire in accordance with the revisions to the State CEQA Guidelines and Appendix G that are now in effect in 2021. These discussions are provided in Section 4.6, Section 4.18, and Section 4.20, respectively.

4.1 Aesthetics

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
Except as provided in Public Resources Code Section 21099, would the project:					
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☐	☒
b) Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☐	☐	☒

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☐	☒

This issue area was dismissed from further analysis in the 2004 PEIR because the analysis in the Initial Study showed that the SVWMP, including the 2004 Strathern Pit Project, would have no impact or a less than significant impact to aesthetics. The 2013 Addendum determined no changes would occur when compared to the 2004 PEIR in regard to aesthetics, and thus, aesthetics was not discussed in the 2013 Addendum.

This section evaluates whether aesthetics impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined impacts to aesthetics would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to scenic vistas
- Less than significant related to scenic resources; visual character or quality; and light or glare

Environmental Analysis

a) Would the project have a substantial adverse effect on a scenic vista?

As described in the 2004 PEIR, Strathern Pit is an exhausted gravel pit currently used as non-operating inert construction debris landfill. The project site is within the Sun Valley Watershed, a highly urbanized watershed that drains into the Los Angeles River. Specifically, the project site is bounded by Strathern Street and single-family residential uses to the south; Tujunga Avenue, a truck stop, and industrial uses to the west; Roscoe Boulevard and recycling facilities to the north; and Fair Avenue, Sun Valley Park, and single-family residential uses to the east

(Figure 1, Project Location). There are no significant scenic vistas within the project site's vicinity, which would have the potential to be obstructed by the currently proposed project. Furthermore, the currently proposed project would not result in the construction of any structures that would obstruct scenic vistas. As such, no impact would occur. Therefore, the currently proposed project would be consistent with the 2004 PEIR and 2013 Addendum and the currently proposed project would not result in new or substantially increased impacts to scenic vistas beyond those previously discussed.

b) Would the project substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No officially designated state scenic highways are located in the vicinity of the project site. As analyzed in the 2004 PEIR, the project site is located in an urbanized area with no significant visual resources. The currently proposed project would not change the location of the project site. As such, the currently proposed project would not impact scenic resources within a state scenic highway. No new or different scenic resource impacts would occur than those previously discussed in the 2004 PEIR.

c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

The project site is located in a highly developed urban environment. During construction of the currently proposed project, construction equipment associated with Phase 2 and Phase 3 would temporarily alter the visual character of the project site. However, construction impacts would be short and localized. The 2004 PEIR considered potential impacts associated with construction equipment to be less than significant. Furthermore, the 2013 Addendum determined no change to the impacts analyzed in the 2004 PEIR. As such, the currently proposed project would not result in new significant impacts to aesthetics as it relates to construction, nor would it result in substantial increases in the severity of impacts.

The 2004 Strathern Pit Project and 2013 Approved Project considered introduction of recreational features and landscaping, similar to that of the currently proposed project, which would contribute to improve the overall appearance of the area. The currently proposed project also incorporates a passive methane system and utilities, which were not previously described as part of the 2004 Strathern Pit Project and 2013 Approved Project. These components would consist of design features below the ground surface level and include vertical turbines adjacent to the north and south buildings on site. The currently proposed project would be consistent with applicable design guidelines and requirements necessary for implementation, which would ensure site design would meet specific aesthetic consistency requirements and thereby result in a coordinated design and enhance the overall visual identity of the project site. As such, the currently proposed project would not result in new significant impacts to aesthetics during operations, nor would it result in substantial increases in the severity of impacts.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

The 2004 PEIR determined no significant impacts would occur as a result of new sources of substantial lighting or glare. As mentioned previously, the currently proposed project would be constructed in accordance with applicable design guidelines and requirements necessary for aesthetic consistency and thereby result in a coordinated design

and enhance the overall visual identity of the project site. Additionally, the currently proposed project would be consistent with specific lighting standards, including designs to minimize light pollution, trespass, and illumination from the project site onto surrounding parcels. Such standards would require new lighting to be designed to direct light downward. Therefore, the currently proposed project would result in limited lighting-related impacts and be consistent with adjacent urban uses that incorporate general nighttime and security lighting. Construction of the currently proposed project would not result in new substantial sources of lighting or glare to the project site's vicinity. Although, some new lighting may be introduced differently as compared to the 2004 Strathern Pit Project and 2013 Addendum, no new or different light or glare impacts would occur.

Changes in Circumstance/New Information

Since the certification of the 2004 PEIR and 2013 Addendum, no substantial changes in the aesthetic or visual environment in the project area have occurred. Similarly, no topographical changes or other landform alterations have occurred that would fundamentally change the approach or conclusions of the aesthetics analysis in the 2013 Addendum. Additionally, there are no changes in regulations or design standards that have been implemented since certification of the 2004 PEIR and 2013 Addendum that would alter the conclusions or the analysis in the category of aesthetics. As such, there are no substantial changes with respect to circumstances under which the currently proposed project would be undertaken, and there is no new information of substantial importance that has become available relative to aesthetics that would change the impact conclusions in the 2004 PEIR.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

No new mitigation measures are required.

4.2 Agricultural Resources

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
II. AGRICULTURE AND FORESTRY RESOURCES – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:					
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☐	☒

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☐	☒

This issue area examined in the Initial Study was dismissed from further analysis in the 2004 PEIR because the analysis in the Initial Study showed that the SVWMP, including the 2004 Strathern Pit Project, would have no impact or a less than significant impact for agricultural resources. The 2013 Addendum determined no changes to the 2004 PEIR with regard to agricultural resources, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether agricultural resources impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to

ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined impacts to agricultural resources would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to Prime Farmland, Unique Farmland, or Farmland of Statewide Importance; and the conversion of Farmland to a non-agricultural use
- Less than significant related to conflict with existing agricultural zoning or Williamson Act contract

Environmental Analysis

a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

The 2004 PEIR determined impacts related to agricultural resources would be less than significant during construction and operation of the 2004 Strathern Pit Project and that no mitigation measures were required. The 2013 Addendum determined that there were no changes to the impacts identified in the 2004 PEIR analysis. As such, impacts related to the 2013 Approved Project were determined be less than significant, and no mitigation measures were required.

The currently proposed project would be constructed in the same location as the previously identified and evaluated 2004 Strathern Pit Project. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project site is located in an urbanized area and is not occupied by existing agricultural operations. The project site is zoned Light Industrial and is not located in an area designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Additionally, the proposed use under the currently proposed project would not change from the proposed use described as part of the 2004 Strathern Pit Project and 2013 Approved Project. The previous CEQA documentation determined that based on past and existing land uses, the project site does not have the capacity to support agricultural operations. As such, the currently proposed project would not result in new significant impacts to agricultural resources, nor would it result in substantial increases in the severity of previously identified significant impacts.

b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

The project site is not located in an area designated as Farmland and is zoned Light Industrial. Additionally, the proposed use under the currently proposed project would not change from the proposed use described as part of the 2004 Strathern Pit Project and 2013 Approved Project. The previous CEQA documentation determined that based on past and existing land uses, the project site does not have the capacity to support agricultural operations and does not support an existing Williamson Act contract. As such, the currently proposed project would not result in new significant impacts to agricultural resources, nor would it result in substantial increases in the severity of previously identified significant impacts.

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

The currently proposed project would not change the location of the project site. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project site is located in an urbanized area and does not contain any forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or land zoned for Timberland Production (as defined by Government Code section 51104(g)). Therefore, the currently proposed project would result in no new or different forest land impacts than those previously identified in the 2004 PEIR and 2013 Addendum.

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

As discussed above, the project site is not zoned for or contain forest land. Therefore, the currently proposed project would result in no new or different forest land impacts than those previously identified in the 2004 PEIR and 2013 Addendum.

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

The project site is not located in an area designated as Farmland and is zoned Light Industrial. Additionally, the proposed use under the currently proposed project would not change from the proposed use described as part of the 2004 Strathern Pit Project and 2013 Approved Project. The previous CEQA documentation determined that based on past and existing land uses, the project site does not have the capacity to support agricultural operations. Thus, the construction and operations of the currently proposed project would not result in the conversion of farmland to a non-agriculture use. Therefore, the currently proposed project would result in no new or different forest land impacts than those previously identified in the 2004 PEIR and 2013 Addendum.

Changes in Circumstance/New Information

Since the approval of the 2004 PEIR and the 2013 Addendum, no substantial changes related to agricultural resources have occurred in the project area. Additionally, there are no changes in zoning regulations or regulations related to forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526, or timberland zoned Timberland Production (as defined by Government Code section 51104(g)). As such, there are no substantial changes with respect to circumstances under which the currently proposed project will be undertaken, and there is no new information of substantial importance that has become available relative to agricultural resources that would change the impact conclusions in the 2004 PEIR and 2013 Addendum.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures.

No new mitigation measures are required.

4.3 Air Quality

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
III. AIR QUALITY – Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:					
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☐	☐	☒
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☐	☐	☒
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☐	☐	☒
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☐	☐	☒

Section 4.1 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on air quality. The 2013 Addendum determined minor technical changes to the 2004 PEIR for air quality were necessary for the 2013 Approved Project, however, no new mitigation was required.

This section evaluates whether air quality impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013

Addendum. Additionally, new supplemental information, included in the Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum, completed by Dudek and dated February 2022, has been prepared for the currently proposed project and is included as Appendix A.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to air quality would be:

- Significant and unavoidable impacts related to construction NO_x emissions for Cal Mat Pit, Parking Lot on Sherman, Power Line Easement, Sheldon Pit, Storm Drains, Strathern Pit, Street Storage, and Vulcan Gravel Processing Plant
- Less than significant with mitigation incorporated related to PM_{10} emissions during construction (earth moving activities); Operational impacts on air quality

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to air quality would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to conflict with the applicable air quality plan
- Less than significant with mitigation incorporated related to objectionable odors

Environmental Analysis

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

The project site is located within the South Coast Air Basin (SCAB), under the jurisdiction of the South Coast Air Quality Management District (SCAQMD), which is principally responsible for air pollution control, and works directly with the Southern California Association of Governments (SCAG), county transportation commissions, local governments, as well as state and federal agencies to reduce emissions from stationary, mobile, and indirect sources to meet state and federal ambient air quality standards. SCAQMD has adopted a series of Air Quality Management Plans (AQMPs) to meet the state and federal ambient air quality standards. AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy. In March 2017, the AQMD released the Final 2016 AQMP, which continues to evaluate currently integrated strategies and control measures to meet the National Ambient Air Quality Standards (NAAQS), as well as explore new and innovative methods to reach its goals.

Criteria for determining consistency with the AQMP are defined in Chapter 12, Section 12.2 and Section 12.3 of the SCAQMD's CEQA Air Quality Handbook (1993). These indicators are discussed below:

- Consistency Criterion No. 1: The proposed project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

- Consistency Criterion No. 2: The project will not exceed the assumptions in the AQMP based on the years of project build-out phase.

The violations that Consistency Criterion No. 1 refer to are the California Ambient Air Quality Standards (CAAQS) and NAAQS. CAAQS and NAAQS violations would occur if localized significance thresholds (LSTs) or regional significance thresholds were exceeded (further discussed in Threshold c, below). In addition, the AQMP demonstrates that the applicable ambient air quality standards can be achieved within the timeframes required under federal law. Growth projections from local general plans adopted by cities in the district are provided to the Southern California Association of Governments (SCAG), which develops regional growth forecasts, which are then used to develop future air quality forecasts for the AQMP. Development consistent with the growth projections in the General Plan is considered to be consistent with the AQMP. The 2004 Strathern Pit Project did not include the development of housing or employment centers and would not induce population or employment growth. Therefore, the 2004 PEIR determined the Strathern Pit Project would not conflict with or obstruct with the implementation of the AQMP.

Consistent with the 2004 PEIR, the currently proposed project does propose a land use change new or different from what was planned and thus would not have the potential to conflict with the AQMP. As such, the currently proposed project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

As demonstrated in Appendix A, the currently proposed project would not result in any new impacts in the category of air quality, nor would it result in a substantial increase in the severity of a previously identified significant effect in the category of air quality.

Construction Emissions

The CalEEMod Version 2020.4.0 was used to estimate emissions from construction of the currently proposed project. Construction emissions can vary substantially from day to day, depending on the level of activity; the specific type of operation; and, for particulate matter, the prevailing weather conditions. Therefore, such emission levels can only be approximately estimated.

The currently proposed project's construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and volatile organic compound (VOC) off-gassing from application of asphalt and paint) and off-site sources (i.e., on-road vendor trucks and worker vehicle trips). Internal combustion engines used by construction equipment, trucks, and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and fine particulate matter ($PM_{2.5}$). PM_{10} and $PM_{2.5}$ emissions would also be generated by entrained dust, which results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil. The currently proposed project would be required to comply with the SCAQMD Rule 403 to control dust emissions generated during any dust-generating activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering of the active dust areas two times per day, with additional watering depending on weather conditions. The currently proposed project would involve application of architectural coating (e.g., paint and other finishes) for painting the project. The contractor is required to procure architectural coatings from a supplier that complies with the requirements of the SCAQMD's Rule 1113 (Architectural Coatings). As such, Table 2 presents the estimated maximum daily construction emissions generated during construction of the currently proposed project. Implementation of Mitigation Measures A-1 through A-14 from the 2004 PEIR were captured in the emissions estimates when reductions were quantifiable. Details of the emission calculations are provided in Attachment A of Appendix A.

Table 2. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds Per Day					
2004 Project						
Approved Project Maximum[1]	27	161	113	14	14	14
Currently proposed project

2031	7.31	7.14	16.21	0.03	0.51	0.38
Currently proposed project Maximum	**7.31**	**142.75**	**233.86**	**0.44**	**13.72**	**6.03**
SCAQMD Threshold	75	100	550	150	150	55
Threshold Exceeded?	**No**	**Yes**	**No**	**No**	**No**	**No**
2004 Project Exceeded?	**No**	**No**	**Yes**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.
See Attachment A for complete results.
[1] Source: 2004 PEIR – Table 4.1-5B Strathern Pit Site

As shown in Table 2, the currently proposed project's construction emissions would not exceed the SCAQMD's daily thresholds except for NO_x. However, the 2004 Project also exceeded the SCAQMD's daily threshold for NO_x. Additionally, the currently proposed project would result in higher peak daily CO emissions than estimated in the 2004 Project EIR but CO emissions would not exceed the SCAQMD's daily thresholds. Therefore, the currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

Operational Emissions

Once project construction is complete, no operational activities associated with the currently proposed project would occur (no routine daily equipment operation or vehicle trips would be required beyond what was previously

analyzed in the 2004 PEIR and 2013 Addendum projects). Because the currently proposed project would not result in any new long-term operational activities, there would be no potential air quality impacts associated with operational air pollutant emissions.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

As described in the 2004 PEIR, schools are considered sensitive receptors to air pollution and construction emissions would result in temporary degradation of ambient air quality at nearby schools. Because construction emissions would be temporary and well below the SCAQMD thresholds (as indicated above in Table 2), less than significant impacts on sensitive receptors are anticipated with the incorporation of Mitigation Measures A-1 through A-14.

Sensitive receptors nearby the currently proposed project site include residential uses to the north, south, and east. Similar to the 2004 PEIR, the currently proposed project would result in construction emissions that would be temporary and well below the SCAQMD thresholds (as indicated above in Table 2) with the implementation of Mitigation Measures A-1 through A-114. Once construction is complete, no operational activities associated with the currently proposed project would occur (no routine daily equipment operation or vehicle trips would be required beyond what was previously analyzed in the 2004 PEIR and 2013 Addendum). Because the currently proposed project would not result in any long-term operational activities, there would be no potential impacts to sensitive receptors associated with operational air pollutant emissions. As such, the currently proposed project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

As described in the 2004 PEIR, surface retention basins and other facilities that have standing water for a period of time may create odors if improperly operated and maintained. Algae blooms and their eventual die-off can create objectionable odors. The 2004 PEIR further demonstrated types of facilities and their potential for creating odor. It was determined Strathern Pit would include permanent lakes and wetlands on site. As such, each type of facility was considered to have a low and very low potential for creating odor. Lakes proposed as part of the new parks would be managed by providing circulation, aeration, etc. as necessary to maintain the aesthetics of the park. Similarly, water in the wetlands will not be stagnant because it will be continuously circulated and therefore aerated using pumps. The currently proposed project would include detention ponds and wetland areas as depicted in Figure 5. As such, the currently proposed project would not result in any new or different impacts from those previously identified in the 2004 PEIR and 2013 Addendum.

Changes in Circumstance/New Information

The analysis in this memo relies on the most recent version of the Appendix G thresholds, since this memo is prepared after the CEQA amendments went into effect and in the interest of providing the public and decision makers with as much information on the environmental consequences as possible. However, the revisions to the thresholds were minimal, as shown above, and do not have an appreciable effect on the analysis or the impact conclusions for this project. The revisions primarily involved combining the previous Thresholds B and C into a single threshold and expanding Threshold D to address "other emissions," rather than just odors. As further substantiated in Appendix A of this memorandum, there are no substantial changes with respect to the circumstances under which the project will

be undertaken, and there is no new information of substantial importance that has become available relative to air quality that has changed the impact conclusions in the 2004 PEIR.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure A-1:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-2:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-3:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-4:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-5:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-6:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-7:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-8:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-9:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-10:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-11:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-12:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-13:** See Section 3.4 of this memorandum.
- **Mitigation Measure A-14**: See Section 3.4 of this memorandum.

4.4 Biological Resources

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
IV. BIOLOGICAL RESOURCES – Would the project:					
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☐	☒
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☐	☒
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☐	☒

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☐	☐	☒
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☐	☒

Section 4.2 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on biological resources. After completion of the 2004 PEIR, additional technical studies were conducted at the project site in compliance with the 2004 PEIR Mitigation Measures B-2 and B-4. The first study was conducted in 2012 and is included in the 2013 Addendum. The second study was completed in 2019 and is included in Appendix B. Additionally, a protected tree survey and report was completed in 2019 and is included in Appendix B. The results of these studies are described below. The 2013 Addendum determined minor technical changes to the 2004 PEIR for biological resources were necessary for the 2013 Approved Project, however, no new mitigation was required.

This section evaluates whether biological resource impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to biological resources would be:

- Significant and unavoidable related to construction impacts on special status species whose presence is not known but could be excluded from New Park on Wentworth; construction impacts on sensitive species whose presence is not known but could not be excluded from Cal Mat Pit, Sheldon Pit, Strathern Pit, and Vulcan Gravel Processing Plant
- Less than significant with mitigation incorporated related to construction impacts on existing coastal sage scrub vegetation at New Park on Wentworth; construction impacts on sensitive habitat types whose presence could not be determined at Cal Mat Pit, Sheldon Pit, Strathern Pit, and Vulcan Gravel Processing Plant; construction impacts to nesting birds present at the Vulcan Gravel Processing Plant, Sheldon Pit, Cal Mat Pit, Strathern Pit, and New Park on Wentworth
- Less than significant related to construction of proposed facilities on limited biological resources (low-value and/or disturbed habitats) present at: Parking Lot on Sherman, Power Line Easement, Roscoe Elementary School, Stonehurst Elementary School, Stonehurst Park, Storm Drains, Sun Valley Middle School, Street Storage, Tree Planting and Mulching, Tuxford Green, and Valley Steam Plant
- Beneficial by providing additional or enhanced vegetation and habitats in the project area

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to biological resources would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- Less than significant related to the movement of migratory fish or wildlife species; conflict with local policies such as a tree preservation policy; and conflict with an adopted Habitat Conservation Plan

Environmental Analysis

a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

As described in the 2013 Addendum, the 2013 Approved Project would result in potentially significant impacts to high value vegetation types and associated wildlife, bird species protected under the Migratory Bird Treaty Act, and sensitive plant species. Mitigation Measures B-2, B-4, and B-5 were identified in the 2004 PEIR to reduce the identified impacts to a level below significant. The remaining impacts related to biological resources were determined to be less than significant and no mitigation was required. The currently proposed project would not result in new significant impacts to biological resources, nor would it result in substantial increases in the severity of previously identified significant impacts or the need for new mitigation measures, for the reasons described below.

Special-Status Species

Plants

As analyzed in Appendix B, the currently proposed project site is surrounded by urban lands and is isolated from additional native habitat. Additionally, the site is highly disturbed and has a long history of use as an inert landfill. Most of the site is composed of disturbed, xeric lands supporting ruderal vegetation. No waters or wetlands potentially under the jurisdiction of the U.S. Army Corps of Engineers, California Regional Water Quality Control Board, or CDFW were observed within the project site during the 2019 habitat assessment (Appendix B). There are four small pockets of disturbed California sagebrush- California buckwheat scrub and one small area of disturbed Thick-Leaved Yerba-Santa Scrub. However, given the level of disturbance on the site and the relative low-quality habitat provided by these small isolated native habitat areas it was determined that the site does not provide suitable habitat for special-status plant species beyond the occurrence of Southern California black walnut. Given that Mitigation Measure B-2 from the 2004 PEIR has been implemented and no significant impacts to sensitive-status plant species would occur, no new mitigation would be required. As such, the currently proposed project would not result in new significant impacts special status plant species, nor would it result in substantial increases in the severity of previously identified significant impacts.

Wildlife

In accordance with Mitigation Measure B-4 of the 2004 PEIR, a Biological Resources and Habitat Assessment was conducted at the project site in 2019, which included field surveys for sensitive wildlife species (see Appendix B). Of the 36 special-status species evaluated, one species (burrowing owl [*Athene cunicularia*]) was identified as having a low/moderate potential to occur within the project site and study area based on the presence and condition of suitable habitat. The remaining 35 species were determined to have a less than reasonable potential or no potential to occur on the project site based on a lack of suitable habitat. No burrowing owl or sign of burrowing owl was observed during the habitat assessment; however, the project site supports habitat suitable for burrowing owls and contains ground squirrel burrows and debris piles that could be utilized by burrowing owls for burrows and perches. Nonetheless, the currently proposed project would implement Mitigation Measure B-4, which requires if the potential is confirmed for one or more special status species to occur, a qualified biologist will conduct focused surveys for those species in accordance with appropriate survey protocols at the appropriate time of the year. This would ensure that construction of the currently proposed project would not impact special status wildlife species. Once operational, there would not be potential for development activities to directly or indirectly impact special status wildlife species. Therefore, the Mitigation Measures B-4 identified in the 2004 PEIR would reduce potentially significant impacts to wildlife associated with the currently proposed project, and no new mitigation measures would be required. Based on the results on the 2019 survey, focused surveys would only be required for burrowing owl. As such, the currently proposed project would not result in new significant impacts to special status wildlife species, nor would it result in substantial increases in the severity of previously identified significant impacts.

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Under existing conditions, the project site is an undeveloped gravel pit and former landfill. As described in the Appendix B, the project site lacks suitable riparian habitat. Therefore, the currently proposed project would result in less than significant impacts to riparian habitat and sensitive natural communities. No new of different riparian habitat or sensitive natural community impacts would occur than those previously identified.

c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Under existing conditions, the project site is an undeveloped gravel pit and former landfill. Furthermore, the 2019 survey concluded that no waters or wetlands potentially under the jurisdiction of the U.S. Army Corps of Engineers, California Regional Water Quality Control Board, or California Department of Fish and Wildlife were observed within the project site during the habitat assessment. The currently proposed project would result in the construction of man-made wetlands; however, the proposed use would be designed for stormwater treatment and capture urban runoff. As described in the 2004 PEIR, the proposed wetlands would be designed as free water surface wetlands according to EPA's guidelines for stormwater treatment. Most of the wetland area will be in shallow ponds and water would be circulated continuously using a small pump to provide a constant flow of water to maintain the wetland vegetation. Therefore, the currently proposed project would not result in new or different impacts than previously identified.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

All portions of the project site contain suitable nesting habitat for a variety of avian species, including, but not limited to, those species observed during the site visit (see Appendix B). Construction activities associated with the currently proposed project could impact nesting bird habitat. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project requires impacts to nesting birds be mitigated. Migratory nongame native bird species are protected under the federal MBTA. Additionally, Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests. In order to avoid impacts on nesting bird species it is recommended that the construction of the project be conducted outside of the recognized nesting bird season (February 15 through September 15). If work cannot be avoided during the nesting bird season, then the currently proposed project would comply with Mitigation Measure B-5 as addressed in the 2004 PEIR and 2013 Addendum, and no new mitigation measures would be required. Once operational, the currently proposed project would similarly be required to comply with federal and state law regarding nesting birds. As such, the currently proposed project would not result in new or different impacts to biological resources as previously analyzed, nor would it result in substantial increases in the severity of previously identified significant impacts.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

LACPW has obtained a Protected Tree Removal Permit from the City for two trees (coast live oak) on the project site. The 2019 protected tree report and survey (included as Appendix B),) also identified a Southern California black walnut tree, but the City of Los Angeles Urban Forestry Division determined only the 2 coast live oak trees were of protected status.

One of the permit's conditions specifies a 4:1 on-site replacement for the lost trees and will be incorporated in the final planting plan for the project. The two coast live oak trees were removed from the project site during vegetation clearance activities and the removal was monitored by a certified arborist, as documented in Notice of Completion: Contractor Vegetation Clearing letter report (dated March 17, 2021) included in Appendix B. As such, the currently

proposed project would not result in new significant impacts to trees, nor would it result in substantial increases in the severity of previously identified significant impacts.

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The project site is located in an urban area that is currently developed with commercial, industrial, and residential uses. Similar with the 2004 PEIR, no habitat conservation plans or natural community conservation plans have been implemented or are planned for the project area. Therefore, the currently proposed project would not conflict with any approved conservation plans. No new or different impacts would occur.

Changes in Circumstance/New Information

Mitigation Measures B-2 has already been implemented to determine the presence of high-value native vegetation and habitats, including special status vegetation and wetland or riparian vegetation. The 2012 and 2019 survey results confirmed that no impacts to sensitive vegetation would occur. The project site and project area remain similar to the existing conditions evaluated at the time of the 2013 Addendum and 2019 biological surveys. No new regulations or design standards have been implemented that would alter the conclusions or the analysis for the 2004 Strathern Pit Project and 2013 Approved Project in the category of biological resources. The Biological Resources and Habitat Assessment (Appendix B) conducted wildlife field surveys for the currently proposed project in accordance with Mitigation Measure B-4. Although the wildlife field surveys were conducted, B-4 indicates that if the potential is confirmed for one or more special status species to occur, a qualified biologist will conduct focused surveys for those species in accordance with appropriate survey protocols at the appropriate time of the year. The 2019 survey concluded the project site supports habitat suitable for burrowing owls and contains ground squirrel burrows and debris piles that could be utilized by burrowing owls for burrows and perches. preconstruction presence/absence survey for burrowing owl should be conducted no less than 14 days prior to ground disturbance, with a second survey conducted within 24 hours of ground disturbance to avoid impacts on burrowing owl. Due to the potential for burrowing owl to occur, the currently proposed project would still be required to implement B-4. As such, there are no substantial changes with respect to the circumstances under which the project will be undertaken, and there is no new information of substantial importance that has become available relative to these issue areas that would change the impact conclusions in the 2004 PEIR and 2013 Addendum.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure B-4:** See Section 3.4 of this memorandum.

- **Mitigation Measure B-5:** See Section 3.4 of this memorandum.

4.5 Cultural Resources

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
V. CULTURAL RESOURCES – Would the project:					
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☐	☐	☐	☐	☒
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☐	☐	☐	☐	☒
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☐	☐	☒

Section 4.3 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on cultural resources. The 2013 Addendum determined minor technical changes to the 2004 PEIR for cultural resources were necessary for the 2013 Approved Project, however, no new mitigation was required. The minor technical change that occurred between the completion of the 2004 PEIR and the 2013 Addendum was the completion of a Supplemental Cultural Resources Survey for the Strathern Wetlands Project located in the Sun Valley District of Los Angeles (ICF 2012) conducted in compliance with the 2004 PEIR Mitigation Measure C-5. The Supplemental Cultural Resources Survey identified four structures that are over 50 years old on the project site; none of the structures were eligible under any of the four California Register of Historical Resources criteria and were not historic for CEQA purposes.

This section evaluates whether cultural resource impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to cultural resources would be:

- Less than significant with mitigation incorporated for archaeological resources during construction at New Park on Wentworth, Onsite BMPs, Parking Lot on Sherman, Power Line Easement, Stonehurst Elementary School, Storm Drains, Street Storage, Sun Valley Middle School, Sun Valley Park, Tree Planting and Mulching, Tuxford Green, Vulcan Gravel Processing Plant; construction impacts on archaeological resources potentially present at Cal Mat Pit, Roscoe Elementary School, Sheldon Pit, Stonehurst Park, Strathern Pit, and Valley Steam plant; construction impacts on unknown but potentially historical resources (machinery, refuse, or structures related to gravel mining operations) at Strathern Pit, Cal Mat Pit, and Sheldon Pit
- Less than significant on prehistoric and paleontological resources; historical resources at Stonehurst Park, Valley Steam Plant, Roscoe Elementary School, Power Line Easement, and Strathern Pit

Environmental Analysis

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

Cultural investigations conducted as part of the 2013 Addendum, in accordance with Mitigation Measure C-5 in the 2004 PEIR, identified four structures that are over 50 years old within the project site. The evaluation of the structures concluded that there was not any historic eligibility under any of the four California Register Historical Resources criteria and that there are no historic resources. Since the currently proposed project is proposed within the same project site, construction of the currently proposed project under Phases 2 and 3 would not impact historical resources. No operational impacts would occur. Further, since cumulative impacts related to cultural resource impacts would be site-specific and the project site does not contain historical resources, cumulative impacts would not occur. As such, the currently proposed project would not result in new or different significant impacts to historical resources, nor would it result in substantial increases in the severity of previously identified significant impacts.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Impacts to archeological resources under the currently proposed project would be similar to those of the 2004 Strathern Pit Project and 2013 Approved Project. Potential ground disturbing activities associated with the currently proposed project include over excavation of the project site (including inert landfill material), rough grading of the project site, and construction of underground utilities. As with the 2013 Approved Project, the currently proposed project would have a detention pond footprint of approximately 21 acres and a maximum depth of 50 feet. Moreover, the currently proposed project would be required to incorporate all applicable geotechnical analysis and requirements as part of construction (in accordance with 2004 PEIR Mitigation Measure G-1). As such, the currently proposed project would result in excavation and grading activities that could potentially encounter buried archaeological resources or unknown cultural resources. Installation of utilities would be within previously disturbed areas. Additionally, the DDC activities associated with the currently proposed project could damage unknown cultural resources. Therefore, the same mitigation measures provided in the 2004 PEIR would reduce these impacts to below a level of significance (Mitigation Measure C-2 and C-3). The changes in configuration proposed in the aboveground

components for the currently proposed project would not alter the potential for operational impacts to cultural resources, since these would be site-specific rather than beyond the project site. Further, since cumulative impacts related to archaeological resources would be site-specific and mitigation measures are available to reduce impacts associated with the currently proposed project, cumulative impacts would not occur. As such, the currently proposed project would not result in new significant impacts to archaeological resources, nor would it result in substantial increases in the severity of previously identified significant impacts.

c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Impacts to human remains under the currently proposed project would be similar to those of the 2004 Strathern Pit Project and 2013 Approved Project. Potential ground disturbing activities associated with the currently proposed project include over excavation of the project site, rough grading of the project site, excavation of inert landfill material, and construction of underground utilities. As with the 2013 Approved Project, the currently proposed project could potentially encounter human remains. Therefore, the same mitigation measure provided in the 2004 PEIR would reduce these impacts to below a level of significance (Mitigation Measure C-4). The changes in configuration proposed in the aboveground components for the currently proposed project would not alter the potential for operational impacts to cultural resources, since these would be site-specific and not affectaffecteffect potential resources beyond the project site. Further, since cumulative impacts related to cultural resources would be site-specific and mitigation measures are available to reduce impacts associated with the currently proposed project, cumulative impacts would not occur. As such, the currently proposed project would not result in new significant impacts to human remains, nor would it result in substantial increases in the severity of previously identified significant impacts.

Changes in Circumstance/New Information

Mitigation Measures C-5 has already been implemented for the treatment of historic resources and determined there were no historically significant original machinery, refuse and/or structures on the project site. No other changes to the site have occurred that would alter the conclusions or the analysis for the 2004 Strathern Pit Project and 2013 Approved Project in the categories of archeological resources and human remains. No new regulations or design standards have been implemented since the 2013 Addendum that would alter the conclusions or the analysis for the 2004 Strathern Pit Project and 2013 Approved Project in the category of cultural resources. One of the revisions to Appendix G of the State CEQA Guidelines involved moving the discussion of paleontological resources from the cultural resources checklist questions to the geology and soil checklist questions (14 CCR 15000 et seq., as amended December 28, 2018). Although the 2004 PEIR discussed paleontological resources under cultural resources, this memorandum will discuss paleontological resources under Section 4.7, Geology and Soils. There is no new information of substantial importance that has become available relative to this issue area that would change the impact conclusions in the 2004 PEIR and 2013 Addendum.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure C-2:** See Section 3.4 of this memorandum.
- **Mitigation Measure C-3:** See Section 3.4 of this memorandum.
- **Mitigation Measure C-4:** See Section 3.4 of this memorandum.
- **Mitigation Measure C-5:** See Section 3.4 of this memorandum.

4.6 Energy

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
VI. Energy – Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

Since certification of the 2004 PEIR and the 2013 Addendum, updates have been made to the State CEQA Guidelines. Revisions to the State CEQA Guidelines involve incorporation of a new subdivision (b) of Section 15126.2, Consideration and Discussion of Significant Environmental Impacts (amended December 28, 2018). The Natural Resources Agency added subdivision (b) to Section 15126.2 to remove any question about whether such an analysis is required. The revised State CEQA Guidelines also added a new impact category – "Energy" – to Appendix G by incorporating the changes to Section 15126.2(b) discussed. As such, energy was not addressed in the 2004 PEIR or the 2013 Addendum; however, additional information regarding energy is provided herein for informational purposes. Information in this section is based on the Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum, completed by Dudek and dated February 2022, included as Appendix A.

a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Construction

Electricity Use

Temporary electric power for as-necessary lighting and electronic equipment would be provided by LADWP. The amount of electricity used during construction would be minimal, as demand would primarily stem from electrically powered hand tools, trailers, and site lighting. The electricity used for construction activities would be temporary

and minimal; therefore, currently proposed project construction would not result in wasteful, inefficient, or unnecessary consumption of electricity. Impacts would be less than significant.

Natural Gas

Natural gas is not anticipated to be required during construction. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed under the subsection "Petroleum." Any minor amounts of natural gas that may be consumed as a result of project construction would be temporary and negligible and would not have an adverse effect; therefore, construction would not result in wasteful, inefficient, or unnecessary consumption of natural gas. Impacts would be less than significant.

Petroleum

Petroleum would be consumed throughout construction. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction. Transportation of construction materials and construction workers would also result in petroleum consumption. Heavy-duty construction equipment, vendor trucks, and haul trucks would use diesel fuel. Construction workers would likely travel to and from the project area in gasoline-powered vehicles. Construction of Phase 2 is expected to take approximately 4 years, beginning in 2022 and ending in 2027. Construction of Phase 3 would start in 2027 and end in 2031 lasting approximately an additional 4 years.

Fuel consumption from construction equipment was estimated by converting the total carbon dioxide (CO_2) emissions from each construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton (MT) CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per MT CO_2 per gallon (The Climate Registry 2021).

The estimated diesel fuel usage from construction equipment, haul trucks, and vendor trucks, as well as estimated gasoline fuel usage from worker vehicles is shown in Table 3.

Table 3. Construction Petroleum Demand

Project	Off-road Equipment (diesel)	Haul Trucks (diesel)	Vendor Trucks (diesel)	Worker Vehicles (gasoline)
	Gallons			
Mobilization	4,821	0	159.38	603
Demolition	24,711	155	491.35	666
Site Preparation	2,105	0	109.19	197
Deep Dynamic Compaction	500,242	0	6,471.07	12,803
Haul Excess Material	329,496	298,603	6,471.11	12,803
Crush Concrete	559,416	0	3,570.93	5,975
Drainage	609	0	152.46	274
Clean Up	2,453	0	0	91
Detention Pond (Site Preparation)	7,765	0	0	368
Detention Pond (Grading)	14,800	0	279.14	479
Wetlands (Site Preparation)	17,183	0	0	794
Wetlands (Grading)	45,744	0	846.12	1,438
Passive Methane System construction	3,281	0	0	154
Trenching for Utilities	9,020	0	0	662
Recreational Components (Building Construction)	18,948	0	991.93	3,050
Recreational Components (Paving)	6,499	0	0	350
Recreational Components (Architectural Coating)	688	0	0	350
Total	**1,547,781**	**298,758**	**19,543**	**41,057**

See Appendix A for complete results

In summary, construction of the currently proposed project over 8 years is conservatively anticipated to consume 41,057 gallons of gasoline and 1,866,082 gallons of diesel. Averaged over 8 years, it is anticipated that the project would consume on average 5,132 gallons of gasoline and 233,260 gallons of diesel per year.

For disclosure only, by comparison, California as a whole consumes approximately 29 billion gallons of petroleum per year. Countywide total petroleum use by on-road vehicles only (i.e., not including construction off-road equipment) is expected to be 1.4 billion gallons per year in 2020 (CARB 2020). Based on these assumptions, the project would require a fraction of the petroleum that would be consumed in California and Countywide over the course of the construction period. Therefore, impacts to energy resources during construction would be less than significant.

Operation

Electricity Use

Project operation would require electricity for the 15 acres of park space and ancillary electronic equipment, pump station associated with the wetland and detention pond and necessary lighting. CalEEMod was used to estimate project emissions from electricity uses (see Appendix A). The currently proposed project is anticipated to require approximately 631,320 kilowatt-hours of electricity pear year. Electricity is supplied to the project site by LADWP. Annual retail sales of electricity in LADWP's service area was estimated to be approximately 22 billion kWh in 2019 (CEC 2021). The increase in electricity consumption that would be associated with the currently proposed project represents approximately 0.003% of LADWP's total electricity sales in 2019. As such, the increase in electricity demand at the project site would be negligible relative to the electricity use in LADWP's service area. Therefore, electricity consumption of the currently proposed project would not be considered inefficient or wasteful, and impacts would be less than significant.

Natural Gas

Natural gas is not anticipated to be required during operation. Fuels used for operation would primarily consist of diesel and gasoline, which are discussed under the subsection "Petroleum." Any minor amounts of natural gas that may be consumed as a result of project operation would be temporary and negligible and would not have an adverse effect; therefore, construction would not result in wasteful, inefficient, or unnecessary consumption of natural gas. Impacts would be less than significant.

Petroleum

During operations, the majority of fuel consumption resulting from the currently proposed project would involve the use of motor vehicles traveling to and from the project site for periodic maintenance. Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of the vehicle miles traveled as a result of project operation. Based on the 8.78 Kilograms CO_2 per gallon of gasoline, the currently proposed project is anticipated to require 39,000 gallons of petroleum annually during operation (Climate Registry 2021). By comparison, approximately 1.4 billion gallons of petroleum are consumed in Los Angeles County per year (CARB 2020). As such, project operations would not result in wasteful, inefficient, or unnecessary consumption of petroleum, and impacts would be less than significant.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

As with the approved project, the currently proposed project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR, Part 6). Part 6 of Title 24 establishes energy efficiency standards for residential and non-residential buildings constructed in California in order to reduce energy demand and consumption. As such, the currently proposed project would comply with the California code requirements for energy efficiency.

Additionally, as discussed in Section 4.8 (Greenhouse Gas Emissions) of this memorandum, the currently proposed project would not conflict with the various local plans that would reduce energy use, including the County's Community Climate Action Plan. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Based on the analysis above, the currently proposed project would not have a significant impact relative to energy consumption. As such, the currently proposed project would not lead to new significant impacts in the category of energy, and no previously identified significant impacts would substantially increase in severity.

4.7 Geology and Soils

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
VII. GEOLOGY AND SOILS – Would the project:					
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:					
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	☐	☒
ii) Strong seismic ground shaking?	☐	☐	☐	☐	☒
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☐	☐	☒
iv) Landslides?	☐	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☐	☐	☒
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☐	☐	☒

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☐	☐	☒
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	☐	☐	☒

Section 4.4 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on geology and soils. The 2013 Addendum determined no changes to the 2004 PEIR with regards to geology and soils were necessary for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum. Additionally, new supplemental information, included in the Geotechnical, Geologic, and Environmental Assessments report, prepared by Los Angeles County Public Works Geotechnical and Materials Engineering Division dated August 15, 2019, has been prepared for the currently proposed project and is included as Appendix C.

This section evaluates whether geology and soil impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to geology and soils would be:

- Less than significant with mitigation incorporated relate dot slope instability at Cal Mat Pit, Sheldon Pit, and Strathern Pit; liquefaction potential from proposed stormwater infiltration at Sheldon Pit, Cal Mat Pit, and the Power Line Easement; construction impacts on soil erosion
- Less than significant related to seismic ground shaking and surface rupture
- No impacts related to expansive soils lll;;;;n
- Beneficial with respect to subsidence

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to geology and soils would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to septic tanks

Environmental Analysis

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

According to Appendix C of this memorandum, no active or potentially active faults are known to pass directly beneath the project site and the site is not located within an Alquist-Priolo Fault Zone. However, the project site is located in the seismically active Southern California region and could be subject to moderate to strong ground motion in the event of an earthquake on one of the many active faults in Southern California. Faults that could produce significant ground shaking at the site include the Verdugo, Hollywood, Raymond, and more. The San Fernando Fault, within an Alquist-Priolo Earthquake Fault Zone, is the closest active fault and is located approximately 3.5 miles north of the site. The currently proposed project does not involve changes in the location of the project, or the design of the project such that the existing or proposed geologic conditions of the site would be substantially altered. As such, the currently proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury or death involving the rupture of a known earthquake fault. No new or different impacts would occur and would not result in substantial increases in the severity of previously identified significant impacts.

ii) Strong seismic ground shaking;

iii) Seismic-related ground failure, including liquefaction; and

iv) Landslides

As explained in the 2004 PEIR, the 2004 Strathern Pit Project would result in less than significant impacts to seismic ground shaking, surface fault rupture, liquefaction, expansive soils, and subsidence. Implementation of mitigation measures would be required for impacts related to landslides/slope-instability and soil erosion. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant with implementation of mitigation

measures. The currently proposed project does not involve changes in the location of the project, or the design of the project such that the existing or proposed geologic conditions of the site would be substantially altered. As such, the currently proposed project would not result in new or different significant impacts to geology and soils and would not result in substantial increases in the severity of previously identified significant impacts or the need to provide new mitigation measures.

As previously shown in Table 1, Comparison of the 2004, 2013, and Currently Proposed Project, new components associated with the currently proposed project include hauling, off-site staging, crushing, deep dynamic compaction, and passive methane treatment. The currently proposed project would, as is the case with the 2004 Strathern Pit Project and 2013 Approved Project, be required to incorporate all applicable geotechnical analysis and requirements as part of construction (in accordance with 2004 PEIR Mitigation Measure G-1). The hauling of excess materials off-site would not result in any new or substantial impacts related to geology and soils, due to the site-specific nature of these types of impacts. The off-site staging and crushing would not involve the construction of permanent structures which could be impacted by geologic hazards. DDC over the detention basin footprint would pre-consolidate structural fill and unstable soils and would not alter the findings from the previously certified 2004 PEIR and 2013 Addendum. Additionally, the proposed passive methane system would not exacerbate existing geologic hazards because the currently proposed project does not involve subterranean activities that could exacerbate risks of fault rupture, such as high-pressure fracking-related deep wastewater disposal, steam injection, or other water flooding operations into subsurface layers. Further, the currently proposed project would comply with provisions of the California Building Code, thus minimizing the potential for damage to structures on the site related to unstable or expansive soils. As such, there are no substantial changes with respect to circumstances under which the currently proposed project will be undertaken, and there is no new information of substantial importance that has become available relative to geology and soils that would change the impact conclusions in the 2004 PEIR and 2013 Addendum. The mitigation measures identified below were provided for the 2004 Strathern Pit Project and 2013 Approved Project to reduce landslide/slope instability and slope erosion impacts to a less than significant level. No operational impacts would occur. The changes in configuration proposed in the aboveground components for the currently proposed project would not alter existing geotechnical conditions. Further, since cumulative impacts related to geology and soils would be site-specific, cumulative impacts would not occur. As such, the currently proposed project would not result in new or different significant impacts to geological resources, nor would it result in substantial increases in the severity of previously identified significant impacts.

b) Would the project result in substantial soil erosion or the loss of topsoil?

The currently proposed project would include Phases 2 and 3 of construction as described in Section 3.1. As with the 2004 Strathern Pit Project and 2013 Approved Project, the construction best management practices, would continue to apply to the currently proposed project and would minimize the potential for adverse effects related to soil erosion and water quality during construction. Specific control measures identified in Mitigation Measure W-1 of the 2004 PEIR would also apply to the currently proposed project, which would implement a stormwater pollution prevention plan (SWPPP) as required in compliance with the National Pollution Discharge and Elimination System (NPDES) program. Design and operation of the currently proposed project would be subject to the same or similar drainage standards that were identified for the 2004 Strathern Pit Project and 2013 Approved Project. Similar to the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would reduce soil erosion potential on the project site by increasing the vegetative cover and modifying the site topography to retain runoff onsite. Therefore, impacts would remain less than significant, with mitigation incorporated. As such, the currently

proposed project would not result in new or different significant environmental effects or a substantial increase in the severity of a previously significant effect related to soil erosion.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

The currently proposed project does not involve changes in the location of the project, or the design of the project such that the existing or proposed geologic conditions of the site would be substantially altered. Based on the analysis within Appendix C of this memorandum, areas adjacent to the Strathern Pit inert debris landfill are subject to seismically-induced landsliding. However, the 2019 geotechnical report determined any potential risk would be substantially mitigated with the implementation of the currently proposed project.

Liquefaction is a geologic phenomenon that generally requires shallow groundwater and near-surface granular soils that are at least in part within the groundwater table saturation zone. As determined in Appendix C, the project site is not located within an area susceptible to liquefaction. Groundwater depths are anticipated to be greater than 300 feet and the thickness of the inert construction debris within the landfill and the depth of the groundwater preclude liquefaction from occurring and the risk for liquefaction ground related effect is considered to be nil (Appendix C).

Further, the currently proposed project would comply with provisions of the California Building Code, thus minimizing the potential for damage to structures on the site related to unstable or expansive soils. As such, there are no substantial changes with respect to circumstances under which the currently proposed project will be undertaken, and there is no new information of substantial importance that has become available relative to geology and soils that would change the impact conclusions in the 2004 PEIR and 2013 Addendum. The mitigation measures identified below were provided for the 2004 Strathern Pit Project and 2013 Approved Project to reduce impacts to a less than significant level. As such, the currently proposed project would utilize the previously approved mitigation to reduce potential impacts to a less than significant level. Furthermore, no operational impacts would occur. The changes in configuration proposed in the aboveground components for the currently proposed project would not alter existing geotechnical conditions. Further, since cumulative impacts related to geology and soils would be site-specific, cumulative impacts would not occur. As such, the currently proposed project would not result in new of different significant impacts to geological resources, nor would it result in substantial increases in the severity of previously identified significant impacts.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

The currently proposed project does not involve changes in the location of the project, or the design of the project such that the existing or proposed geologic conditions of the site would be substantially altered. As previously stated above, the currently proposed project would comply with provisions of the California Building Code and, therefore, minimize the potential for damage to structures on the site related to unstable or expansive soils. As such, there are no substantial changes with respect to circumstances under which the currently proposed project will be undertaken, and there is no new information of substantial importance that has become available relative to geology and soils that would change the impact conclusions in the 2004 PEIR and 2013 Addendum. The mitigation measures identified below were included within the 2004 Strathern Pit Project and 2013 Approved Project to

reduce landslide/slope instability and slope erosion impacts to a less than significant level. As such, the currently proposed project would utilize the previously approved mitigation to reduce potential impacts to a less than significant level.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The project site is not currently supported by existing septic tank systems nor were there plans identified in the 2004 PEIR or 2013 Addendum that would utilize alternative wastewater disposal systems. The currently proposed project does not involve changes in the location of the project, or the design of the project such that the existing or proposed geologic conditions of the site would be substantially altered. As such, the currently proposed project does not plan for the use of septic tanks or alternative wastewater disposal systems and impacts related to the incapability for project site soil to adequately support such systems would not occur. Therefore, no new or different impacts would occur than those previously identified.

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potential ground disturbing activities associated with the currently proposed project include over excavation of the project site (including inert landfill material), rough grading of the project site, and construction of underground utilities. As with the 2013 Approved Project, the currently proposed project would have a detention pond footprint of approximately 21 acres and a maximum depth of 50 feet. The utilities would be within previously disturbed areas. Due to the level of previous development and disturbance that has occurred on the project site, the potential for encountering paleontological resources during project construction is considered low. Therefore, the currently proposed project would have a less than significant impact on paleontological resources. The changes in configuration proposed in the aboveground components for the currently proposed project would not alter the potential for operational impact to paleontological resources, since these would be site-specific. Further, since cumulative impacts related to geology and soils would be site-specific, cumulative impacts would not occur. As such, the project modifications would not result in new significant environmental effects or a substantial increase in the severity of previously identified significant effects in the category of paleontological resources.

Changes in Circumstance/New Information

No changes to geologic features have occurred, and no new regulations or design standards have been implemented that would alter the conclusions or the analysis for the 2004 PEIR and 2013 Addendum in the category of geology and soils. One of the revisions to Appendix G of the State CEQA Guidelines involved moving the discussion of paleontological resources from the cultural resources checklist questions to the geology and soil checklist questions (14 CCR 15000 et seq., as amended December 28, 2018). Although the 2004 PEIR and 2013 Addendum discuss paleontological resources under Section 4.5, Cultural Resources, the discussion of paleontological resources has been provided under Section 4.7, Geology and Soils, and thus, has been adequately analyzed.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information

requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure G-1:** See Section 3.4 of this memorandum.
- **Mitigation Measure W-1**: See Section 3.4 of this memorandum.

4.8 Greenhouse Gas Emissions

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
VIII. GREENHOUSE GAS EMISSIONS – Would the project:					
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☐	☐	☒
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☐	☐	☒

At the time the 2004 PEIR was certified, there was no legislation or regulatory guidance with respect to CEQA analysis of greenhouse gases (GHG) and climate change. The passage of AB 32 on September 27, 2006, the adoption of the California Air Resources Board's (CARB) implementing Climate Change Scoping Plan (CARB's Scoping Plan) in December 2008, and the adoption of State CEQA Guidelines specific to GHG analysis all occurred subsequent to certification of the 2004 PEIR. Therefore, the 2004 PEIR did not evaluate the impacts of the 2004 Strathern Pit Project on greenhouse gas emissions because the State CEQA Guidelines did not include project impacts on global climate change. The 2013 Addendum conducted a quantitative analysis to model project greenhouse gas emissions and determined they would not exceed the 2008 interim significant threshold of the SCAQMD.

This section evaluates whether greenhouse gas emission impacts associated with the currently proposed project were analyzed in the 2013 Addendum, if the currently proposed project proposes changes or new circumstances

involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum. Additionally, new supplemental information, included in Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum, completed by Dudek and dated February 2022, has been prepared for the currently proposed project and is included as Appendix A.

Environmental Analysis

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Emissions

Construction of the currently proposed project would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road vendor and haul trucks, and worker vehicles. The CalEEMod was used to estimate GHG emissions during construction consistent with the assumptions presented in Section 3.2.2. On-site sources of GHG emissions include off-road equipment and off-site sources include on-road vehicles (vendor trucks, haul trucks and worker vehicles). Table 4 presents construction GHG emissions for the project from on-site and off-site emission sources.

Table 4. Estimated Annual Construction GHG Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2022	7.75	<0.01	<0.01	7.78
2023	2,694.37	0.66	0.08	2,734.11
2024	5,134.26	1.28	0.16	5,215.07
2025	5,092.88	1.27	0.16	5,172.46
2026	5,071.13	1.27	0.16	5,149.79
2027	602.08	0.17	0.01	608.64
2028	625.22	0.19	<0.01	630.54
2029	208.45	0.06	<0.01	210.15
2030	194.57	<0.01	<0.01	195.32
2031	79.40	<0.01	<0.01	79.52
			Total	20,003.38
			Amortized emissions over 30 years (metric tons per year)	666.78

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Attachment A for complete results

As shown in Table 4, the estimated total GHG emissions would be approximately 20,003 MT CO_2e. Amortized over 30 years, construction GHG emissions would be approximately 667 MT CO_2e per year. In addition, as with project-generated construction criteria air pollutant emissions, GHG emissions generated during proposed construction

activities would be short term, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions.

Operational Emissions

The 2004 PEIR identified maintenance requirements of proposed facilities include sediment removal from retention facilities, separation systems, and catch basins, landscaping, maintenance of equipment such as pumps, and inspections. Each of these maintenance activities would require several personnel several times a year at each site, requiring minor vehicle and employee travel. Sediment removal from retention basins may require minor earthwork. Several project components require operation of pumps, which are expected to be electric-powered. These activities would result in minor vehicle and equipment GHG emissions. As previously mentioned, GHG impacts were not addressed in the 2004 PEIR and the 2013 Addendum's analysis found GHG impacts to be less than significant.

Operational activities associated with the currently proposed project would occur in a similar scale and intensity to what was previously analyzed in the 2013 Addendum. As shown in Table 4, amortized project-generated construction emissions would not exceed the 3,000 SCAQMD threshold. As such, impacts would remain less than significant for the currently proposed project. The currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

b) Would the project generate conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

The following impact analysis is included in Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum, completed by Dudek and dated February 2022 (included as Appendix A).

Consistency with County's Community Climate Action Plan (CCAP)

The County's CCAP includes 26 local community actions to reduce GHG emissions from the County's GHG sources. The community actions are grouped into five strategy areas, listed below. Following each strategy area, a qualitative analysis as to how each strategy relates to the currently proposed project is provided. The currently proposed project would become operational outside of the applicable timeline to tier from the County's CCAP; therefore, consistency with the County's was not utilized to determine significance of GHG impacts, and this discussion is provided for disclosure purposes.

1. **Green Building and Energy.** The currently proposed project would be designed to meet the standards for Cal Green and Title 24 at the time of construction. By meeting the standards the project would be consistent with the Green Building and Energy strategies of the CCAP.

2. **Land Use and Transportation.** Per the parking requirements of Cal Green, a percentage of the total number of parking stalls would include electrical vehicle charging stations.

3. **Water Conservation and Wastewater.** The currently proposed project would comply with Title 24 and Cal Green requirements to reduce water and wastewater consumption and production.

4. **Waste Reduction, Reuse, and Recycling.** The currently proposed project would be required to reduce construction waste. These measures would support the CCAP's actions for waste reduction.

5. **Land Conservation and Tree Planting.** The currently proposed project would expand open space within the County and result in a net increase in the number of tress at the project site.

Therefore, the currently proposed project would be consistent with the County's CCAP.

Consistency with the Southern California Association of Governments 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy

SCAG's 2016 RTP/SCS is a regional growth-management strategy that targets per capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region. The 2016 RTP/SCS incorporates local land use projections and circulation networks in city and county general plans. The 2016 RTP/SCS is not directly applicable to the project because the purpose of the 2016 RTP/SCS is to provide direction and guidance by making the best transportation and land use choices for future development. The currently proposed project would not conflict with implementation of the strategies identified in the 2016 RTP/SCS that would reduce GHG emissions.

Consistency with the CARB Scoping Plan, SB 32, and EO S-3-05

The currently proposed project would not impede the attainment of the GHG reduction goals for 2030 or 2050 identified in Executive Order S-3-05 and Senate Bill (SB) 32. Executive Order S-3-05 establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. While there are no established protocols or thresholds of significance for that future year analysis, CARB forecasts that compliance with the current Scoping Plan puts the state on a trajectory of meeting these long-term GHG goals, although the specific path to compliance is unknown (Appendix A).

CARB has expressed optimism with regard to both the 2030 and 2050 goals. It states in the First Update to the Climate Change Scoping Plan that "California is on track to meet the near-term 2020 GHG emissions limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (Appendix A). With regard to the 2050 target for reducing GHG emissions to 80% below 1990 levels, the First Update to the Climate Change Scoping Plan states that the level of reduction is achievable in California (Appendix A). CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, SB 32, and Executive Order S-3-05. This is confirmed in the *Second Update*, which states (Appendix A):

> The Proposed Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while also identifying new, technologically feasibility and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Proposed Plan is developed to be consistent with requirements set forth in AB 32, SB 32, and AB 197.

The currently proposed project's consistency with the State's Scoping Plan would assist in meeting the City's contribution to GHG emission reduction targets in California. With respect to future GHG targets under SB 32 and Executive Order S-3-05, CARB has also made clear its legal interpretation that it has the requisite authority to adopt whatever regulations are necessary, beyond the AB 32 horizon year of 2020, to meet the SB 32 40% reduction

target by 2030 and the Executive Order S-3-05 80% reduction target by 2050. This legal interpretation by an expert agency provides evidence that future regulations will be adopted to continue the trajectory toward meeting these future GHG targets.

Based on the above considerations, the currently proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. As such, impacts would remain less than significant for the currently proposed project. The currently proposed project would not lead to new or different impacts, and no previously identified significant impacts would substantially increase in severity.

Changes in Circumstance/New Information

Since certification of the 2004 PEIR, updates to the State CEQA Guidelines have gone into effect. Specifically, in 2009 the California Natural Resources Agency adopted new guidelines requiring lead agencies to analyze GHGs under section 15064.4 As such, GHG impacts were not addressed in the 2004 PEIR. The 2013 Addendum's analysis found GHG impacts to be less than significant. As demonstrated in Appendix A, the currently proposed project would not result in any new impacts in the category of GHG emissions, nor would it result in a substantial increase in the severity of a previously identified significant effect in the category of GHG emissions. Furthermore, the analysis in Appendix A takes into account new information and changes in circumstances that could have affected the analysis, such as an updated version of the CalEEMod, updates in GHG-related regulations, updates in energy efficiency standards, and the addition of energy thresholds to Appendix G in the State CEQA Guidelines.

Conclusion

As further substantiated in Appendix A, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

No new mitigation measures are required.

Section 4.5 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on hazards and hazardous materials. The 2013 Addendum determined no changes to the 2004 PEIR with regards to hazards and hazardous materials were necessary for the 2013 Addendum, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether hazards and hazardous material impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum. Additionally, new supplemental information, included in the Geotechnical, Geologic, and Environmental Assessments, has been prepared for the currently proposed project (included as Appendix C) as well as the Rory M. Shaw Wetlands Park Project Bird-Aircraft Strike Hazard Report (included as Appendix D).

2004 PEIR Conclusions

The 2004 PEIR determined impacts to hazards and hazardous materials would be:

- Less than significant with mitigation incorporated related to a substantial increase in waterfowl populations and would not result in a substantial increase in the potential for bird/wildlife aircraft strike hazard at nearby airports; potential soil contamination; public health impacts related to potential increase in mosquito habitat
- Less than significant related to hazardous materials (sodium hypochlorite for stormwater disinfection and disposal of potentially contaminated sediments during maintenance of stormwater facilities), potential removal of railroad ties at Valley Steam Plant, and disposal of potentially hazardous sediments during maintenance of stormwater facilities; operational impacts to public safety

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to hazards and hazardous materials would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to proximity to a private airstrip; and risk of wildland fires
- Less than significant related to safety hazard within an airport land use plan

Environmental Analysis

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

As described in the 2004 PEIR, the 2004 Strathern Pit Project would result in potentially significant impacts in the category of hazards and hazardous materials. The mitigation measures shown below are required to reduce identified impacts to a level below significance. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project would be less than significant with implementation of mitigation measures.

Construction

The analysis in the 2004 PEIR described and analyzed hazardous materials that may be used, handled, or transported during construction of the 2004 Strathern Pit Project and potential hazards that may exist on the project site. The project modifications would not substantially alter the types of hazardous materials or the quantity of hazardous materials. The DDC construction activities would not result in the use, transport, or disposal of hazardous materials. Any currently proposed project-related hazardous materials and hazardous wastes must be transported to and/or from the site in compliance with any applicable State and federal requirements, including the U.S. Department of Transportation regulations listed in the Code of Federal Regulations (Title 49, Hazardous Materials Transportation Act); California Department of Transportation (Caltrans) standards; California Occupational Safety and Health Administration (CalOSHA) standards; and RCRA (Code of Federal Regulations, Title 40, Part 263).

As described in the 2004 PEIR, the project site contains contaminated soils due to past leaking underground storage tanks. If contaminated soils are encountered during project construction, Mitigation Measure H-1, would be required to ensure contaminated soils are disposed of in compliance with applicable regulations at the project site. Additionally, the Geotechnical, Geologic, and Environmental Assessments determined that due to the methane concentrations at the

project site, a passive methane system conforming with the provisions of the City of Los Angeles Ordinance No. 175790 would be installed, which has now been included as part of the currently proposed project (Appendix C). The passive methane system would also be designed and engineered to mitigate potential VOC intrusion in accordance with to Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code (LAMC). As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to construction-related hazards and hazardous materials.

Operation

The operational analysis presented for hazards and hazardous materials in the 2004 PEIR would still apply to the currently proposed project. The changes in configuration proposed in the aboveground components for the currently proposed project would not alter the types of potentially hazardous materials that are required for operation. The proposed passive methane system would be operated in accordance with LAMC to ensure that vapor intrusion would not represent a material environmental concern to future users of the site. As with the 2004 Strathern Pit Project and 2013 Approved Project, operation of the currently proposed project would involve very little transport, storage, use, or disposal of hazardous materials associated with janitorial, maintenance, and repair activities (i.e., commercial cleaners, lubricants, or paints). Use of these materials would be limited, and transport, storage, use, and disposal of these materials would be subject to federal, state, and local health and safety requirements. Impacts would, therefore, remain less than significant. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to operational hazards and hazardous materials.

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

The handling, transport, use, and disposal of hazardous materials are highly regulated, and compliance with such regulations is mandatory. Any currently proposed project-related hazardous materials and hazardous wastes must be transported to and/or from the site in compliance with any applicable State and federal requirements, including the U.S. Department of Transportation regulations listed in the Code of Federal Regulations (Title 49, Hazardous Materials Transportation Act); California Department of Transportation (Caltrans) standards; California Occupational Safety and Health Administration (CalOSHA) standards; and RCRA (Code of Federal Regulations, Title 40, Part 263). Compliance with existing regulations would ensure any potential of significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment would be less than significant. The currently proposed project does not involve a change in project location or a change in the hazardous materials that would be required for construction or operations. As such, the currently proposed project would not result in new significant impacts related to hazards and hazardous materials and would not result in substantial increases in the severity of previously identified significant impacts.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

California Code of Regulations (CCR) Section 15186(a) establishes a requirement for certain school projects, as well as certain projects near kindergarten through grade 12 (K-12) schools, to ensure that potential health impacts resulting from exposure to hazardous materials, wastes, and substances will be carefully examined and disclosed

in a negative declaration or EIR, and that the lead agency will consult with other agencies in this regard. Arminta Street Elementary and Roscoe Elementary are the two closest schools to the project site, approximately 890 feet to the southwest and 0.4 miles to the east respectively. As described previously described, any currently proposed project-related hazardous materials and hazardous wastes must be transported to and/or from the site in compliance with any applicable State and federal requirements, including the U.S. Department of Transportation regulations listed in the Code of Federal Regulations (Title 49, Hazardous Materials Transportation Act); California Department of Transportation (Caltrans) standards; California Occupational Safety and Health Administration (CalOSHA) standards; and RCRA (Code of Federal Regulations, Title 40, Part 263). Compliance with existing regulations would ensure any potential emission of hazardous materials would be reduced to a less than significant level. As such, the currently proposed project would not result in new significant impacts related to hazards and hazardous materials and would not result in substantial increases in the severity of previously identified significant impacts.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

The project site is not located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 (EnvirStor 2021). The currently proposed project does not involve changes in the location of the project, or the design of the project such that the existing or proposed conditions of the site would be substantially altered. As described in the 2004 PEIR, the project site contains contaminated soils due to past leaking underground storage tanks. If contaminated soils are encountered during project construction, Mitigation Measure H-1, would be required to ensure contaminated soils are disposed of in compliance with applicable regulations at the project site. Additionally, the Geotechnical, Geologic, and Environmental Assessments determined that due to the methane concentrations at the project site, a passive methane system conforming with the provisions of the City of Los Angeles Ordinance No. 175790 would be installed, which has now been included as part of the currently proposed project (Appendix C). The passive methane system would also be designed and engineered to mitigate potential VOC intrusion consistent with Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code (LAMC). As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to hazards and hazardous materials. As such, the currently proposed project would not result in new significant impacts related to hazards and hazardous materials and would not result in substantial increases in the severity of previously identified significant impacts.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

There are two airports within the vicinity of the project site: the Hollywood Burbank Airport and Whiteman Airport, located approximately one mile to the southeast and approximately 3 miles to the northwest respectively. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would include surface water features that have the potential to attract wildlife. The surface water features of the currently proposed project are not substantially different from those included in the 2004 Strathern Pit Project and 2013 Approved Project. Further, since the proposed facility is less than one mile of the Hollywood Burbank Airport and 3 miles away from Whiteman Airport, Mitigation Measure H-2 is required as part of the currently proposed project to reduce impacts in accordance with Federal Aviation Administration (FAA) recommendations. Given the greater distance of the

project site from Whiteman Airport (approximately 3 miles) and the lower flight activity, changes in abundance or movement patterns of bird species resulting from the currently proposed project are of less concern at Whiteman Airport than at Hollywood Burbank Airport.

Appendix D to this memorandum was prepared to discuss the potential hazards to aircraft by the currently proposed project. The bird airstrike hazard at Hollywood Burbank Airport is analyzed both by attractants on the airfield and by attractants at off-airport locations in the vicinity (within 5 miles of both the airport and the project site). As described in Appendix D, Hollywood Burbank Airport has an approved Wildlife Hazard Management Plan that is implemented to manage and minimize bird airstrike hazard on the airport and to a lesser extent outside the airport. Appendix D further outlines existing hazards due to on-airport bird attractants, bird attractants in the vicinity of the project site (i.e., Hansen Dam and Hansen Spreading Area), bird occurrence on and near the airport, and typical flight operations at the airport. The currently proposed project could potentially affect bird aircraft strike risk for aircraft using Hollywood Burbank Airport by 1) increasing the abundance and/or diversity of bird species in the vicinity of the airport that pose a strike hazard to aircraft; and 2) by creating an attractant that induces existing or new birds to cross aircraft approach and departure paths to access or leave the project site. The following analysis, detailed below, demonstrates that the currently proposed project will not create a significant impact related to bird aircraft strike risk for aircraft using Hollywood Burbank Airport.

The currently proposed project would introduce potential habitat for a range of bird species, including turf for foraging and loafing; trees and shrubs for roosting and nesting; and water for foraging, roosting, or nesting. This increased potential habitat is expected to attract new bird species that do not currently use the project site and may increase overall abundance of birds in the project site's vicinity. This is consistent with the findings of the 2004 PEIR. However, none of the habitat provided at the site would be unique to the region. Therefore, it is unlikely that the currently proposed project would substantially increase diversity of bird species in the vicinity of Hollywood Burbank Airport. Nonetheless, the increase in potential habitat is expected to increase bird abundance in the project area, and those birds may travel across the airport's vicinity. As further described in Appendix D, existing conditions have not resulted in documented strikes on aircraft over the 30-year period from 1990 to 2019. Moreover, the currently proposed project will likely result in intensive human use and disturbance throughout the year. This human presence and activity will further limit the attractiveness of the project site to large numbers of birds.

As further described in Appendix D, the primary way by which the currently proposed project could affect aircraft strike hazard is to provide foraging and/or loafing/roosting habitat for bird species that would induce them to move across approach and departure paths for aircraft at Hollywood Burbank Airport. In summary, the currently proposed project is not expected to substantially increase the likelihood that bird species of concern for collision with aircraft will cross approach or departure paths of aircraft using Hollywood Burbank Airport (Appendix D). The lack of bird-attracting features providing different habitat south and east of the project site, combined with the dominant approach and departure paths at Hollywood Burbank Airport that provide extensive separation from the project site, among other evidence provided in Appendix D, support this conclusion.

As such, and as outlined in detail in Appendix D, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to hazards and hazardous materials. No new mitigation is required. Appendix D identifies optional design details to further reduce or eliminate potential increases in wildlife-aircraft collision risk related to the implementation and operation of the currently proposed project. As stated in Appendix D, the implementation of these design

recommendations, in whole or in part, are at the County's discretion and are not required to reduce the currently proposed project's impact under CEQA.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. The 2004 PEIR determined lane and/or road closures may be necessary for installation of project facilities. Restricted access to the vicinity of project sites would be addressed by advanced notification of local emergency service providers. The currently proposed project does not involve long-term or substantial changes in access to any property and would not contribute to a significant increase in the potential for hazards within the area. Therefore, the project-related impacts on emergency response plans or emergency evacuation plans are anticipated to be less than significant. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to construction-related hazards and hazardous materials.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?

The project site is not located in a state responsibility area or in a state-designated fire hazard severity zone. The nearest state responsibility area is located approximately 17 miles to the west at the intersection of Ventura County and Los Angeles County Line, and the nearest very high fire hazard severity zone is located approximately 0.9 miles north of the project site, in the Verdugo Mountains (CAL FIRE 2019). As such, the project site is not expected to be susceptible to wildfires and is not located within or near a wildfire hazard area or a state responsibility area. Development of the currently proposed project would not, therefore, expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires. As such, no new or different wildland fire impacts would occur than those previously identified.

Changes in Circumstance/New Information

No changes to the general land use and character of the project area have occurred since the 2013 Addendum. Since approval of the 2013 Approved Project, updates to the State CEQA Guidelines have gone into effect. One of the revisions to Appendix G of the State CEQA Guidelines involves a more extensive wildfire analysis for projects located in or near state responsibility areas for firefighting or lands classified as very high fire hazard severity zones (14 CCR 15000 et seq., as amended December 28, 2018). Wildfire hazards were not addressed in the EIR; however, additional information regarding wildfire hazards are provided in Section 3.20, Wildfire, based on the updates to the State CEQA Guidelines. Aside from the State CEQA Guidelines updates, no new regulations or design standards have been implemented that would alter the conclusions of the hazards and hazardous materials analysis. Additionally, as discussed in the paragraphs above, site assessments revealed the need for a passive methane mitigation system, which has since been incorporated as the currently proposed project. The environmental impacts resulting from the passive methane mitigation system are discussed throughout this memorandum.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure H-1**: See Section 3.4 of this memorandum.
- **Mitigation Measure H-2**: See Section 3.4 of this memorandum.
- **Mitigation Measure H-3**: See Section 3.4 of this memorandum.

4.10 Hydrology and Water Quality

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination

Section 4.6 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on hydrology and water quality. The 2013 Addendum determined no changes to the 2004 PEIR with regards to hydrology and water quality were necessary for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether hydrology and water quality impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to hydrology (drainage and flooding) would be:

- Less than significant impacts with mitigation incorporated regarding construction impacts on surface water quality related to soil erosion
- Less than significant related to dam safety
- Beneficial related to local and downstream flooding

The 2004 PEIR determined impacts to hydrology (surface water) would be:

- Beneficial related to water quality of the Los Angeles River by reducing the amount of runoff and stormwater pollutants
- Less than significant impacts on water quality

The 2004 PEIR determined impacts to hydrology (groundwater) would be:

- Less than significant with mitigation incorporated related to groundwater quality from pollutants in stormwater; groundwater levels and Project infiltration is not expected to inundate landfill materials at Bradley Landfill; Tujunga Spreading Grounds for infiltration of stormwater collected at Strathern Pit
- Less than significant related to groundwater flows in the San Fernando Basin

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to hydrology and water quality would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to depletion of groundwater supplies; polluted runoff; placement of housing within a 100-year flood hazard area; failure of a levee or dam; and significant risk involving a seiche, tsunami or mudflow
- Less than significant related to altering an existing drainage pattern resulting in erosion or flooding; and impediment of flood flows

Environmental Analysis

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

As discussed in 2004 PEIR, the 2004 Strathern Pit Project would result in potentially significant impacts to hydrology and water quality. Implementation of mitigation measures are required to reduce hydrology and water quality impacts to less than significant. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project would be less than significant with implementation of mitigation measures. The hydrology and water quality mitigation measures shown below are required for the currently proposed project to reduce identified impacts to a level below significance. The currently proposed project does not involve changes in the location of the project.

As previously shown in Table 1, Comparison of the 2004, 2013, and Currently Proposed Project, new components associated with the currently proposed project include DDC over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing. DDC activities are required to ensure that water from detention ponds, wetlands, and other surface runoff will not infiltrate and percolate through the inert debris landfill. The design of the currently proposed project has not changed such that the existing or proposed hydrologic conditions of the site would be substantially altered. As such, the currently proposed project would not result in new significant impacts to hydrology and water quality and would not result in substantial increases in the severity of previously identified significant impacts or the need to provide new mitigation measures, for the reasons described below.

Construction

The currently proposed project would include Phases 2 and 3 of construction as described in Section 3.1. As with the 2004 Strathern Pit Project and 2013 Approved Project, the construction best management practices, would continue to apply to the currently proposed project and would minimize the potential for adverse effects to water quality during construction. Specific control measures identified in Mitigation Measure W-1 of the 2004 PEIR would also apply to the currently proposed project. In addition, Mitigation Measure H-1, would be required to ensure contaminated soils are disposed of in compliance with applicable regulations at the project site to reduce potential impacts to groundwater quality. Therefore, construction impacts would remain less than significant, with mitigation incorporated. As such, the currently proposed project would not result in new significant environmental effects or a substantial increase in the severity of a previously significant effect in the category of construction effects to hydrology and water quality.

Operation

Design and operation of the currently proposed project would be subject to the same or similar drainage standards that were identified for the 2004 Strathern Pit Project and 2013 Approved Project. The 2004 Strathern Pit Project and 2013 Addendum would reduce soil erosion potential on the project site by increasing the vegetative cover and modifying the site topography to retain runoff onsite. Additionally, stormwater collected at the project site would be treated on site through constructed wetlands. If infiltrated groundwater interacted with landfill materials, impacts to groundwater quality would be potentially significant.

Therefore, groundwater impacts require Mitigation Measure W-4 to be less than significant. The currently proposed project would result in similar operational characteristics as the 2004 Strathern Pit Project and 2013 Approved Project and would implement Mitigation Measure W-4 to reduce impacts to less than significant. As with the 2004

Strathern Pit Project and 2013 Approved Project, the currently proposed project would convey the treated runoff from the wetlands to the existing infiltration basins in the adjacent Sun Valley Park. The changes in configuration proposed in the aboveground components for the currently proposed project would not alter the proposed watershed management goals described in the 2004 PEIR. Further, since the currently proposed project is proposed for the purposes of flood protection, increased water conservation, improved water quality, increased habitat restoration, and enhanced recreational opportunities, cumulative impacts to water quality would be less than significant. As such, the currently proposed project would not result in new significant environmental effects or a substantial increase in the severity of a previously identified significant effect in the category of operational effects to hydrology and water quality.

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

The project site boundaries for the currently proposed project are the same as those described in the 2004 PEIR and the 2013 Addendum. Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, water conservation, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The currently proposed project would not include the storm drain and recycled water line components identified in the 2013 Addendum.

The currently proposed project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Consistent with the 2004 PEIR, the currently proposed project would add a beneficial impact with respect to groundwater supply through increased groundwater recharge. No adverse impacts on aquifer volume or the local groundwater table level would occur. Impacts would be less than significant. No new or different impacts would occur.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in substantial erosion or siltation on or off site;

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

iv) impede or redirect flood flows?

The project site for the currently proposed project remains the same as the project site identified for the 2004 Strathern Pit Project and 2013 Approved Project; as such, the same hydrologic conditions that were analyzed and discussed for the 2004 Strathern Pit Project and 2013 Approved Project would apply to the currently proposed project.

Design and operation of the currently proposed project would be subject to the same or similar drainage standards that were identified for the 2004 Strathern Pit Project and 2013 Approved Project. The 2004 Strathern Pit Project and 2013 Approved Project would reduce soil erosion potential on the project site by increasing the vegetative cover and modifying the site topography to retain runoff onsite. Additionally, stormwater collected at the project site would be treated on site through constructed wetlands. If infiltrated groundwater interacted with landfill materials, impacts to groundwater quality would be potentially significant. Therefore, groundwater impacts require Mitigation Measure W-4 to be less than significant. The currently proposed project would result in similar operational characteristics as the 2004 Strathern Pit Project and 2013 Approved Project and would implement Mitigation Measure W-4 to reduce impacts to less than significant. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would convey the treated runoff from the wetlands to the existing infiltration basins in the adjacent Sun Valley Park.

As with the 2004 and 2013 Approved Projects, the currently proposed project would capture stormwater runoff collected from upstream drainage areas to alleviate flooding in the Sun Valley community. The proposed design would provide a water conservation benefit through increased groundwater recharge of stormwater. Runoff would be temporarily stored in a detention pond, routed through a wetlands for natural treatment of pollutants, and pumped into existing underground infiltration basins at the adjacent Sun Valley Park. The currently proposed project would provide up to 46 acres of recreational open space. The proposed detention pond would have a footprint of approximately 21 acres and a maximum depth of 50 feet, with a total storage capacity of 385 acre-feet. The proposed wetland would provide a sustainable habitat for various plant and animal species, and a natural water treatment system for removing pollutants from the collected stormwater runoff. The treated stormwater would be pumped to the existing Sun Valley Park infiltration basins for groundwater recharge.

The changes in configuration proposed in the aboveground components for the currently proposed project would not alter the proposed watershed management goals described in the 2004 PEIR. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project is proposed to improve flood control in the Sun Valley Watershed. Further, since the currently proposed project is proposed for the purposes of flood protection, increased water conservation, improved water quality, increased habitat restoration, and enhanced recreational opportunities, cumulative impacts to water quality would be less than significant. As such, the currently proposed project would not result in new significant environmental effects or a substantial increase in the severity of a previously identified significant effect in the category of operational effects to hydrology and water quality.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

The project site is located within a 100-year floodplain; however, the currently proposed project does not construct any housing. Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. As such, implementation of the currently proposed project is expected to reduce runoff water and flooding and is expected to have a beneficial impact with respect to flooding. Impacts would be less than significant.

The project site is located approximately 15 miles inland from the Pacific Ocean, and therefore there is no risk of tsunami in the area. No mudflow hazards have been identified for the project area. Hansen Dam and Lake are located immediately north of the project site. The project site would be subject to inundation in case of failure of

Hansen Dam or a seiche at Hansen Lake. However, the currently proposed project does not involve construction of housing or employment centers and therefore would not result in exposure of people or structures to a significant risk from Hansen Dam/Lake. Impacts would be less than significant.

As such, the currently proposed project would not result in new significant environmental effects or a substantial increase in the severity of a previously identified significant effect to hydrology and water quality.

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would result in the construction of permeable surfaces and impermeable surfaces. Neither the 2004 Project nor the currently proposed project involve the extraction of groundwater. As mentioned above, the currently proposed project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Consistent with the 2004 PEIR, the currently proposed project would add a beneficial impact with respect to groundwater supply. No adverse impacts on aquifer volume or the local groundwater table level would occur. Furthermore, the currently proposed project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan. Impacts would be less than significant. No new or different impacts would occur.

Changes in Circumstance/New Information

The project area remain urbanized and mostly paved with no natural drainages. No new regulations or design standards have been implemented that would alter the conclusions or the analysis for the 2004 Strathern Pit Project and 2013 Approved Project in the category of hydrology and water quality.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure W-1:** See Section 3.4 of this memorandum.
- **Mitigation Measure W-4:** See Section 3.4 of this memorandum.
- **Mitigation Measure W-5:** See Section 3.4 of this memorandum.
- **Mitigation Measure H-1**: See Section 3.4 of this memorandum.

4.11 Land Use and Planning

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XI. LAND USE AND PLANNING – Would the project:					
a) Physically divide an established community?	☐	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☐	☐	☒

This issue area examined in the Initial Study was dismissed from further analysis in the 2004 PEIR because the analysis in the Initial Study showed that the SVWMP, including the 2004 Strathern Pit Project, would have no impact or a less than significant impact for land use and planning. The 2013 Addendum determined no changes to the 2004 PEIR in regard to land use and planning for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether land use and planning impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined impacts related to land use and planning would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to dividing an established community; conflict with an applicable land use plan; and conflict with an applicable habitat conservation plan

Environmental Analysis

a) Would the project physically divide an established community?

Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The currently proposed project would not include the storm drain and recycled water line components identified in the 2013 Addendum. The 2004 PEIR determined the 2004 Strathern Pit Project would result in less than significant impacts in the category of land use and planning, and thus, no mitigation measures were required. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant and no mitigation measures were required. The currently proposed project would not involve the construction of roads or large structures that would disrupt the physical arrangement of an established community. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to land use and planning.

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

As compared to the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would not change the land use of the project site. The 2004 Strathern Pit Project and 2013 Approved Project considered introduction of recreational features and landscaping, similar to that of the currently proposed project. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would introduce similar uses once operational, and thus, no changes to the impacts related to land use would occur. The proposed conversion of an existing 46-acre construction debris landfill would not conflict with applicable land use plan, policy, or regulations. Further, land use conflicts are typically site-specific and not cumulative in nature; in other words, despite the number of cumulative projects in a given area, they would not necessarily compound to create cumulative land use conflicts. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to land use and planning.

Changes in Circumstance/New Information

No changes in land uses in the project area have occurred that would change the land use analysis and conclusions originally presented in the 2004 PEIR. The Sun Valley-La Tuna Canyon Community Plan Area was last updated in 1999.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

No new mitigation measures are required.

4.12 Mineral Resources

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XII. MINERAL RESOURCES – Would the project:					
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?		☐	☐	☐	☒
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?		☐	☐	☐	☒

This issue area examined in the Initial Study was dismissed from further analysis in the 2004 PEIR because the SVWMP, including the 2004 Strathern Pit Project, would have no impact or a less than significant impact for mineral resources. The 2013 Addendum determined no changes to the 2004 PEIR in regard to mineral resources for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether mineral resource impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined impacts related to mineral resources would result in potentially significant impacts.

Environmental Analysis

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

The 2004 PEIR determined impacts related to mineral resources would be less than significant during construction and operation of the 2004 Strathern Pit Project and no mitigation measures were required. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant and no mitigation measures were required. The currently proposed project would not change the location of the project site. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project site is located within the MRZ-2 zone, which indicates an area where adequate information determined significant mineral deposits are present. Although the project was previously used as a gravel pit, the Strathern Pit has exhausted gravel pits where gravel extraction operations have ceased. Therefore, implementation of the currently proposed project would not result in the conversion of an active gravel extraction site. The currently proposed project would not result in the loss of availability of a known mineral resource. Potential ground disturbing activities associated with the currently proposed project include over excavation of the project site (including inert landfill material), rough grading of the project site, and construction of underground utilities. As with the 2013 Approved Project, the currently proposed project would have a detention pond footprint of approximately 21 acres and a maximum depth of 50 feet. Additionally, the proposed use of the site as a stormwater detention and treatment area and recreational facility identified under the currently proposed project would not change from the uses proposed under the 2004 Strathern Pit Project and 2013 Approved Project. Further, since cumulative impacts related to mineral resources would be site-specific, cumulative impacts would not occur. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to mineral resources.

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project site is located within the MRZ-2 zone, which indicates an area where adequate information determined significant mineral deposits are present. Although the project was previously used as a gravel pit, the gravel extraction operations ceased in 1972. Therefore, implementation of the currently proposed project would not result in the conversion of an active gravel extraction site. The currently proposed project would not result in the loss of availability of a known mineral resource or locally important mineral resources recovery site. Additionally, the proposed use of the site as a stormwater detention and treatment area and recreational facility identified under the currently proposed project would not change from the uses proposed under the 2004 Strathern Pit Project and 2013 Approved Project. Further, since cumulative impacts related to mineral resources would be site-specific, cumulative impacts would not occur. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to mineral resources.

Changes in Circumstance/New Information

Since the approval of the 2013 Addendum, no substantial changes related to mineral resources have occurred in the project area. Additionally, there are no changes in zoning regulations or regulations related to mineral resources have occurred.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

No new mitigation measures are required.

4.13 Noise

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XIII. NOISE – Would the project result in:					
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☐	☐	☒
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☐	☐	☒

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☐	☒

Section 4.8 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on noise. The 2013 Addendum determined no changes to the 2004 PEIR with regards to noise were necessary for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether noise impacts associated with the currently proposed project was analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum. Additionally, new supplemental information, included in the Noise Technical Memorandum, completed by Dudek and dated February 2022, has been prepared for the currently proposed project and is included as Appendix E.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to noise would be:

- Less than significant impacts with mitigation incorporated related to construction noise on sensitive receptors
- Less than significant related to operational noise

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to noise would not result

in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to the vicinity of a private airstrip that would expose people residing or working to excessive noise

Environmental Analysis

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction

The 2004 Project was determined to have potentially significant noise impacts for all phases of project construction. With implementation of Mitigation Measures N-1 through N-4, construction-related noise impacts were determined to be less than significant. Nearby noise-sensitive land uses consist of the following: residences to the east of the project site across Fair Avenue and to the south across Strathern Street; Sun Valley Park, a City of Los Angeles park located to the east across Fair Avenue; a soccer complex to the west across Tujunga Avenue; and an elementary school (Arminta Street Elementary School) to the southwest, south of Strathern Street and west of Goll Avenue. Potential noise impacts associated with the currently proposed project are limited to the DDC activities, construction crew and vendor vehicles, haul trucks, and the passive methane treatment system. Each of these is addressed below.

DDC Activities

Noise from the DDC activities was assessed for the nearest noise-sensitive land uses listed above. For each of these receivers, noise levels from DDC activities was estimated for the times during construction when the equipment would operate at the work areas nearest to the receivers, farthest from the receivers, as well as the approximate middle portion of the project site. The detailed input and output data of the DDC noise analysis are provided in Appendix E, and the results are summarized in Table 5.

Table 5. DDC Activities Noise Summary

	Nearest Receptors – Residences to the South		Soccer Complex to the West		Sun Valley Park and Residences to the East		School to the Southwest	
Case Description	L_{eq} (dBA)	L_{max} (dBA)	L_{eq} (dBA)	L_{max} (dBA)	L_{eq} (dBA)	L_{max} (dBA)	L_{eq} (dBA)	L_{max} (dBA)

Deep Dynamic Compaction Noise Total – Nearest Work Area	57	63	57	64	46	53	35	43
Deep Dynamic Compaction Noise Total – Mid-Work Area	51	58	53	60	48	55	33	41
Deep Dynamic Compaction Noise Total – Furthest Work Area	48	54	50	56	48	54	31	39

Source: Appendix E

As summarized in Table 5, DDC activities would be highest (57 dBA L_{eq}) at the residences south of the project site and at the soccer complex, during the times when work would occur near the southern and southwesterly project boundaries, respectively. Brief maximum noise levels would be 63 to 64 dBA L_{max} during these times. At the elementary school, approximately 1,000 feet southwest of the project site, noise levels would be approximately 35 dBA L_{eq}, with maximum noise levels of approximately 43 dBA L_{max}. When DDC activities take place at locations on-site that are further from the nearest boundaries, the noise levels from these activities would be lower. As shown in Table 5, estimated noise levels from DDC activities would be well below the worst-case construction noise level estimated for the proposed project in the 2004 PEIR, which was 81 dBA. Additionally, the estimated noise levels would be lower than the ambient noise levels cited in the 2004 PEIR from previous noise monitoring, which ranged from 64 to 72 dBA L_{eq}. Therefore, the proposed DDC activities would not result in a substantial noise increase. Furthermore, the DDC activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. At the nearest school, the noise associated with the DDC activities would be well below the Los Angeles Unified School District's (LAUSD) 67 dBA noise standard. Thus, noise from the proposed DDC activities would not result in new significant impacts. No new mitigation measures (beyond those contained in the 2004 PEIR) would be necessary.

Construction Vehicles

Based upon information provided by Public Works, during construction the highest average daily number of worker round-trips would be 74, occurring during multiple phases including DDC activities. The highest average daily number of vendor round-trips would be 12, occurring during demolition; and the highest number of average daily haul truck round-trips would be 75, occurring during the hauling of excess material. Based upon Table 4.11-11 of the 2004 PEIR, the nearest roadways from the project site (Tujunga Avenue and Strathern Street) have average daily traffic volumes of 15,000 and 12,000, respectively. The incremental increase in local traffic from the project would be less than 1 percent on both Tujunga Avenue and Strathern Street. Based upon the fundamentals of acoustics, a doubling (a 100 % increase) would be needed to result in a 3 decibel increase in noise levels, which is the level corresponding to an audible change to the typical human listener (Caltrans 2013a). The resultant traffic noise increase would be less than 1 dB, and thus would not result in an audible change, on an hourly or daily basis. If an accelerated work schedule is enacted, approximately 120 truck trips per day are anticipated.

Therefore, noise related to project-related construction vehicles on local roadways would not result in new significant impacts.

Off-Site Stockpiling, Staging, and Rock Crushing

Noise from the off-site stockpiling, staging and rock crushing was assessed for the nearest noise-sensitive land uses (residences to the west of the off-site location, approximately 1,100 feet away). Other noise-sensitive receivers would be even further from these activities and therefore, potential noise impacts would be lower. The detailed input and output data of the off-site construction noise analysis are provided in Attachment B of Appendix E, and the results are summarized in Table 6. As summarized in Table 6, off-site construction activities would be approximately 67 dBA L_{eq} at the nearest residences, west of the project site, predominantly when rock crushing takes place. Brief maximum noise levels would be 68 dBA L_{max} during these times.

Table 6. Off-Site Activities Noise Summary

Case Description	Equipment Type	Nearest Receptors – Residents to the West	
		L_{eq} (dBA)	L_{max} (dBA)
Off-site stockpiling, staging, and rock-crushing	Scraper	52	56
	Front End Loader	47	51
	Backhoe	46	50
	Rock Crushers (2)	67	68
	Generator	43	44
	Combined Noise Level	**67**	**68**

Source: Appendix E

As shown in Table 6, estimated noise levels from off-site stockpiling, staging and rock crushing activities would be below the worst-case construction noise levels estimated for the 2004 Strathern Pit Project. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the Strathern Pit project component from the two noisiest pieces of equipment (trucks). Furthermore, the off-site construction activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. Thus, noise from the proposed off-site construction activities associated with the currently proposed project would not result in new significant impacts. No new mitigation measures beyond those contained in the 2004 PEIR and as included below would be necessary.

On-Site Rock Crushing

Noise from the on-site rock crushing[3] was assessed for the nearest noise-sensitive land uses (the same receivers assessed for the DDC activities noise). Other noise-sensitive receivers would be even further from these activities

[3] Although the exact location of the rock crushing equipment is not known at this time, the current plans indicate that rock crushing would take place in the central portion of the project site in the early stages of construction; in Stage 3, rock crushing equipment would be moved to the north. The analysis used the worst-case distances (with the rock crushing equipment located in the approximate center of the project site).

and therefore, potential noise impacts would be lower. The detailed input and output data of the off-site construction noise analysis are provided in Attachment C of Appendix E, and the results are summarized in Table 7. As summarized in Table 7, on-site construction activities would be approximately 71 dBA Leq at the nearest receivers (residences to the south and the soccer complex to the west). Brief maximum noise levels would be 72 dBA Lmax.

Table 7. On-Site Rock Crushing Activities Noise Summary

Case Description	Residences to the South		Soccer Complex to the West		Sun Valley Park and Residences to the East		School to the Southwest	
	Leq (dBA)	Lmax (dBA)	Leq (dBA)	Lmax (dBA)	Leq (dBA)	Lmax (dBA)	Leq (dBA)	Lmax (dBA)
On-Site Rock Crushing	71	72	71	72	69	70	64	65

Source: Appendix E

As shown in Table 7, estimated noise levels from on-site rock crushing activities would be below the worst-case construction noise levels estimated for the proposed project in the 2004 PEIR. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the 2004 Strathern Pit Project component from the two noisiest pieces of equipment (trucks). Furthermore, the off-site construction activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. Thus, noise from the proposed on-site rock-crushing activities would not result in new significant impacts. No new mitigation measures (beyond those contained in the 2004 PEIR and as included below) would be necessary.

Above-Ground Improvements

Noise from the construction activities associated with Phase 3 of the currently proposed project was assessed for the nearest noise-sensitive land uses (residences to the south of the project site, on the south side of Strathern Street), as well as the soccer complex to the west, Sun Valley Park and residences to the east, and the elementary school to the southwest, similarly to the DDC activities noise analysis. The detailed input and output data of Phase 3 analysis are provided in Attachment D of Appendix E, and the results are summarized in Table 8.

Table 8. Phase 3 Construction Activities Noise Summary

Case Description	Residences to the South		Soccer Complex to the West		Sun Valley Park and Residences to the East		School to the Southwest	
	Leq (dBA)	Lmax (dBA)	Leq (dBA)	Lmax (dBA)	Leq (dBA)	Lmax (dBA)	Leq (dBA)	Lmax (dBA)

Source: Appendix E

As summarized in Table 8, Phase 3 construction activities for wetlands would result in maximum noise levels of 74 dBA L_{eq} and 73 dBA L_{eq} at the residences south of the project site and at Sun Valley Park and residences to the east. Brief maximum noise levels would be 76 to 75 dBA L_{max} during these times. When Phase 3 activities take place at locations on-site that are further from the nearest boundaries, the noise levels from these activities would result in lower decibels. At the elementary school, approximately 1,000 feet southwest of the project site, noise levels would be approximately 40 to 55 dBA L_{eq}, with maximum noise levels of approximately 57 dBA L_{max}. As shown in Table 8, estimated noise levels from Phase 3 activities would be below the worst-case construction noise levels estimated for the 2004 Strathern Pit Project. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the 2004 Strathern Pit Project component from the two noisiest pieces of equipment (trucks). Furthermore, the Phase 3 activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. At the nearest school, the noise associated with the Phase 3 activities would be well below the LAUSD's 67 dBA noise standard. Thus, noise from the proposed aboveground construction activities would not result in new significant impacts. No new mitigation measures (beyond those contained in the 2004 PEIR and as included below) would be necessary.

Operations

Passive Methane Treatment System

Based upon documents provided for the Passive Methane Treatment System (Psomas 2019; SCS Engineers 2020), the proposed system would be entirely passive, consisting of pipes and vents. No fans, pumps or motors would be used as part of the system. Thus, no mechanical noise would be produced by the Passive Methane Treatment System. Operation of the Passive Methane Treatment System would not result in new significant impacts related to noise. No new mitigation measures are required.

b) Would the project result in the generation of excessive groundborne vibration or groundborne noise levels?

Construction

DDC Activities

Ground borne vibration levels were estimated for the proposed DDC activities for the nearest noise-sensitive land uses listed above using the Federal Transit Administration (FTA) methodology for construction. The detailed input and output data of the DDC vibration analysis are provided in Appendix E and the results are summarized in Table 9. As summarized in Table 9, ground borne vibration during DDC activities would be highest (0.1288 inches per second) at the residences south of the project site, during the times when work would occur near the southern project boundary. Worst case vibration levels at the soccer complex to the west of the project site would be slightly less, at 0.0883 inches per second; at the Sun Valley Park and the residences to the east the worst-case vibration levels would be less as well, at 0.0212 inches per second; and at the elementary school to the southwest, worst-case vibration levels of 0.0124 inches per second are estimated. When DDC activities take place at locations on-site that are further from the nearest boundaries, the vibration levels from these activities would be lower. In all cases the estimated vibration levels from DDC activities would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). Thus, ground borne vibration from the proposed DDC activities would not result in new significant impacts.

Table 9. DDC Activities Vibration Levels

Equipment	Nearest Receptors (Residences to the South)	Soccer Complex to the West	Sun Valley Park and Residences to the East	School to the Southwest
	PPV_{equip} (inches/sec)			
Nearest DDC Work Area	(210 feet away)	(270 feet away)	(700 feet away)	(1,000 feet away)
DDC Drop	0.1288	0.0883	0.0212	0.0124
Crane (used Lg. Bulldozer)	0.0034	0.0024	0.0006	0.0003
Flat Bed Truck	0.0027	0.0019	0.0005	0.0003
Dozer	0.0032	0.0023	0.0006	0.0003

Source: Appendix E
PPVequip = PPVref x (25/D)^1.5

Construction Vehicles

As discussed above for noise from project-related on-road construction vehicles, the increase in local traffic would be negligible. Traffic, including heavy trucks traveling on a highway or local roadway, rarely generates vibration levels high enough to cause structural or cosmetic damage. Heavy trucks traveling over potholes or other discontinuities in the pavement can result in vibration levels high enough to result in annoyance (Caltrans 2013b); however, these types of issues may be resolved by smoothing the roadway surface. The currently proposed project is estimated to result in approximately 75 additional truck one-way trips per day on the local roadways, or approximately 120 truck one-way trips per day if an accelerated work schedule is utilized, which would be negligible

based upon the existing traffic volumes. Therefore, vibration related to project-related construction vehicles on local roadways would not result in new significant impacts.

Off-Site Stockpiling, Staging, and Rock Crushing

Ground borne vibration levels were estimated for the proposed off-site construction activities for the nearest sensitive land uses (residences to the west of the project site, approximately 1,100 feet away) using the FTA methodology for construction. The detailed input and output data of the off-site construction vibration analysis are provided in Attachment B of Appendix E, and the results are summarized in Table 10.

As summarized in Table 10, ground borne vibration levels from off-site construction would be quite low (0.0007 inches per second) at the nearest vibration-sensitive uses, because of the large distance from the proposed off-site work area to the residences to the west. As shown in Table 10, estimated vibration levels from DDC activities would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). Thus, ground borne vibration from the proposed off-site construction activities would not result in new significant impacts.

Table 10. Off-Site Construction Activities Vibration Summary

	Nearest Receptors (Residences to the West) (1,100 feet away)

Source: Appendix E

On-Site Rock Crushing

Ground borne vibration levels were estimated for the proposed on-site rock-crushing activities for the nearest sensitive land uses (the same receivers assessed for the DDC activities vibration). The detailed input and output data of the off-site construction vibration analysis are provided in Attachment C of Appendix E, and the results are summarized in Table 11. As summarized in Table 11, ground borne vibration levels from on-site construction would be quite low (0.0013 inches per second or less) at the nearest vibration-sensitive uses, because of the large distances from the proposed crushing activities to the receivers. As shown in Table 11, estimated vibration levels from on-site rock crushing would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). Thus, ground borne vibration from the proposed on-site crushing activities would not result in new significant impacts.

Source: Appendix E
PPVequip = PPVref x (25/D)^1.5

As summarized in Table 12, ground borne vibration during Phase 3 activities would be highest (0.0037 inches per second) at the residences south of the project site, during detention pond and wetlands site preparation and grading activities. Worst-case vibration levels at the soccer complex to the west of the project site; at the Sun Valley Park and the residences to the east would be lower. As shown in Table 12, estimated vibration levels from Phase 3 construction activities would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). Thus, ground borne vibration from the proposed Phase 3 activities would not result in new significant impacts.

Operations

Passive Methane Treatment System

Based upon documents provided for the Passive Methane Treatment System (Psomas 2019; SCS Engineers 2020), the proposed system would be entirely passive, consisting of pipes and vents. No fans, pumps or motors would be used as part of the system. Thus, no mechanical noise would be produced by the Passive Methane Treatment System. Operation of the Passive Methane Treatment System would not result in new significant impacts related to vibration.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The project site is located within the vicinity of two airports: the Hollywood Burbank Airport and Whiteman Airport, located approximately one mile to the southeast and approximately 3 miles to the northwest respectively. However, the currently proposed project does not involve construction of housing or employment centers and therefore would not result in exposure of people or structures to a significant noise. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to hazards and hazardous materials.

Changes in Circumstance/New Information

Since certification of the 2004 PEIR and the 2013 Addendum, updates to the State CEQA Guidelines have gone into effect. One of the updates involves incorporating the findings of a court case (*California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369), which specifies that CEQA generally requires analysis of the effects of a project on the environment, as opposed to the effects of the environment on a project (State CEQA Guidelines Section 15126.2). As such, some of the analysis in the noise section of the EIR is no longer applicable under the revised State CEQA Guidelines. Specifically, noise from the proposed on-site uses experienced by on-site visitors to the project site would no longer be considered impacts on the environment. Nevertheless, these evaluations have been retained in this memorandum for informational purposes. Because no significant, unavoidable impacts were identified for these categories, impact determinations would not change as a result of the CEQA revisions that have occurred since certification of the 2004 PEIR.

Aside from updates to the State CEQA Guidelines, no new regulations have been adopted or updated that would affect the noise analysis or conclusions originally presented in the 2004 PEIR.

Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The Storm Drain Project component of the 2004 PEIR, which was included in the 2013 Approved Project, is not included under the currently proposed project description. Additionally, the recycled water line described in the 2013 Approved Project would be completely removed in the currently proposed project. The currently proposed project would also include new components: DDC over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measures N-1:** See Section 3.4 of this memorandum.
- **Mitigation Measures N-2:** See Section 3.4 of this memorandum.
- **Mitigation Measures N-3:** See Section 3.4 of this memorandum.
- **Mitigation Measures N-4:** See Section 3.4 of this memorandum.

4.14 Population and Housing

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XIV. POPULATION AND HOUSING – Would the project:					
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☐	☒
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☐	☒

This issue area examined in the Initial Study was dismissed from further analysis in the 2004 PEIR because the analysis in the Initial Study showed that the SVWMP, including the 2004 Strathern Pit Project, would have no impact or a less than significant impact for population and housing. The 2013 Addendum determined no changes to the 2004 PEIR in regard to population and housing for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether population and housing impacts associated with the currently proposed project were analyzed in the 2004 PEIR and the 2013 Addendum, if the currently proposed project proposes changes or

new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined impacts related to population and housing would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to substantial population growth; displacement of housing; and displacement of people

Environmental Analysis

a) Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The 2004 PEIR determined impacts related to population and housing would be less than significant during construction and operation of the 2004 Strathern Pit Project and no mitigation measures were required. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant and no mitigation measures were required. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project does not involve the construction of new homes and does not involve new, potentially growth-inducing infrastructure such as roads or potable water or wastewater systems. Construction and operational impacts associated with population and housing would be less than significant. Further, since the currently proposed project would not contribute to cumulative population, employment, or housing growth, no cumulative impacts would occur. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to population and housing.

b) Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

The 2004 PEIR determined impacts related to population and housing would be less than significant during construction and operation of the 2004 Strathern Pit Project and no mitigation measures were required. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant and no mitigation measures were required. No housing or people are currently located on the project site, and thus, no housing or people would be displaced as result of the currently proposed project. Construction and operational impacts associated with population and housing would be less than significant. Further, since the currently proposed project would not contribute to cumulative population, employment, or housing growth, no cumulative impacts would occur. Therefore, the currently proposed project would not displace a substantial number of people or housing. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to population and housing.

Changes in Circumstance/New Information

Since the 2004 PEIR was certified, no change with respect to population and housing have occurred on the project site that would change the analysis and conclusions presented in the 2004 PEIR. Southern California Association of Governments (SCAG) has adopted a new Regional Transportation Plan since the certified of the 2004 PEIR. This does not change the determinations made in the certified 2004 PEIR, as the growth projections for the City of Los Angeles have continued to increase and the currently proposed project would continue to be within the growth projects for the City of Los Angeles.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

No new mitigation measures are required.

4.15 Public Services

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XV. PUBLIC SERVICES					
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:					
Fire protection?	☐	☐	☐	☐	☒
Police protection?	☐	☐	☐	☐	☒
Schools?	☐	☐	☐	☐	☒
Parks?	☐	☐	☐	☐	☒
Other public facilities?	☐	☐	☐	☐	☒

Section 4.9 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on public services. The 2013 Addendum determined no changes to the 2004 PEIR with regards to public services were necessary for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether public service impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to public services would be:

- Less than significant impacts with mitigation incorporated related to construction and police and fire protection services from temporary lane and/or road closures; construction and school access and student safety (Stonehurst Elementary School, Sun Valley Middle School, Roscoe Elementary School, and Patrick's School); school commuting routes
- Less than significant related to operational impacts on fire and police services

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to public services would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to fire protection; police protection; and other facilities
- Less than significant related to parks

Environmental Analysis

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire protection?

Police protection?

Schools?

Parks?

Other public facilities?

As described in the 2004 PEIR, the 2004 Strathern Pit Project would result in potentially significant impacts in the category of public services. The mitigation measures shown below are required to reduce identified impacts to a level below significance. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant with implementation of mitigation measures.

As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would not involve construction of housing or other structure that would result in an increase in population; therefore, operational impacts to public services would have less than significant impacts. The 2004 Strathern Pit Project and 2013 Approved Project considered introduction of recreational features and landscaping, similar to that of the currently proposed project. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would contribute to providing additional recreation opportunities to the surrounding area. Because the types of uses and the proposed land use intensities under the currently proposed project would be similar to those of the 2004 Strathern Pit Project and 2013 Approved Project, impacts to fire protection, police protection, schools, and library services would be generally the same. The currently proposed project would result in new construction activities, including hauling, off-site staging, crushing, deep dynamic compaction, and passive methane treatment. These minor adjustments would not affect fire, police, or school services because they would not introduce new population, employment, or housing, necessitating the need for additional public services. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would involve the construction of underground utilities, which could result in temporary lane closures and impact fire and police protection services. Therefore, Mitigation Measures P-1 through P-4 continue to be required. In addition, the 2004 Strathern Pit Project and 2013 Approved Project and the currently proposed project would continue to require implementation of Mitigation Measure P-5 through P-12 to reduce potential construction impacts to schools. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered public facilities, and operational impacts would remain less than significant. Cumulative impacts on public services would result when projects collectively increase demand on services such that additional facilities or services must be constructed or provided; however, the currently proposed project provides additional recreational opportunities and would not increase demand on public services. Therefore, the currently proposed project would not result in new significant environmental effects or a substantial increase in the severity of previously identified significant effects related to public services.

Changes in Circumstance/New Information

No changes have occurred (such as closure of a nearby public facility serving the project site) that would change the public services analysis and conclusions originally presented in the 2004 PEIR as modified by the 2013 Addendum. Furthermore, no new regulations have been adopted or updated that would affect the public services analysis or conclusions originally presented in the 2004 PEIR.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure P-1**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-2**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-3**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-4**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-5**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-6**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-7**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-8**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-9**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-10**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-11**: See Section 3.4 of this memorandum.
- **Mitigation Measure P-12**: See Section 3.4 of this memorandum.

4.16 Recreation

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XVI. RECREATION					
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☐	☒

Section 4.10 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on recreation. The 2013 Addendum determined no changes to the 2004 PEIR for recreation were necessary for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether recreation impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to recreation would be:

- Less than significant related to physical deterioration of existing parks and recreational facilities
- Beneficial by providing new recreational facilities and open space

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to recreation would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- Less than significant related to physical deterioration of parks and recreational facilities

Environmental Analysis

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The 2004 PEIR determined impacts related to recreation would be less than significant during construction and operation of the 2004 Strathern Pit Project and no mitigation measures were required. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project were determined to be less than significant and no mitigation measures were required.

The currently proposed project would be of a similar size, design, and land use intensity as the 2004 Strathern Pit Project and 2013 Approved Project. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would not have temporary construction impacts of an existing on-site recreational facility. Similar to the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project would provide new recreational and open space facilities and would not have operational impacts. The construction of such recreational facilities was adequately analyzed in the 2004 PEIR and 2013 Addendum and were determined to not adversely impact the environment. Cumulative impacts on recreation would result when projects collectively increase demand on recreational facilities such that additional facilities or services must be constructed or provided; however, the currently proposed project provides additional recreational opportunities and would not increase demand. As such, the currently proposed project would not result in new significant impacts to recreation and would not result in substantial increases in the severity of previously identified significant impacts.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project does not involve the construction of new homes and does not involve new, potentially growth-inducing infrastructure such as roads or potable water or wastewater systems. Thus, and further discussed in Section 4.14 of this memorandum, unplanned population growth is not anticipated. Therefore, the currently proposed project would not result in the expansion of recreational facilities. However, the currently proposed project would result in new on-site recreational facilities, the impacts of which discussed throughout this memorandum. As such, the currently proposed project would not result in new significant impacts to recreation and would not result in substantial increases in the severity of previously identified significant impacts.

Changes in Circumstance/New Information

No changes have occurred (such as closure of a recreational facility serving the project site) that would change the recreation analysis and conclusions originally presented in the 2004 PEIR. No new regulations have been adopted or updated that would affect the recreation analysis or conclusions originally presented in the 2004 PEIR.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures.

As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

No new mitigation measures are required.

4.17 Transportation

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XVII. TRANSPORTATION – Would the project:					
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☐	☐	☐	☐	☒
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	☐	☐	☐	☐	☒
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☐	☐	☒
d) Result in inadequate emergency access?	☐	☐	☐	☐	☒

Section 4.11 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on traffic and transportation. The 2013 Addendum determined minor technical changes to the 2004 PEIR for traffic were necessary for the 2013 Approved Project; however, no new mitigation was required.

This section evaluates whether traffic and transportation impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum. Additionally, new supplemental information, included in the Trip Generation and Transportation Consistency Analysis, and VMT analysis consistent with Senate Bill (SB) 743, completed by Dudek and dated February 2022, has been prepared for the currently proposed project and is included as Appendix F.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to traffic and transportation would be:

- Less than significant with mitigation incorporated related to construction within roadways and temporary modifications to the existing solid waste collection routes; temporary impacts on traffic from construction vehicles and equipment; temporary impacts on traffic from construction activities in street rights-of-way (Storm Drains, Street Storage, catch basins, etc.)
- Less than significant related to operational levels of service

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to transportation would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to change in air traffic patterns resulting in safety risk; hazardous design feature; and conflict with alternative transportation policies
- Less than significant related to inadequate emergency access and parking

Environmental Analysis

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

Construction

The 2013 Addendum concluded that the project modifications would not result in any new significant effect on the environment that were not identified in the 2004 PEIR. The 2004 PEIR determined street segments of Tujunga Avenue (forecast to carry 20% of project traffic), Vineland Avenue (forecast to carry 80% of project traffic), and Sunland Boulevard (forecast to carry 80% of project traffic), are forecast to operate with unsatisfactory levels of service (LOS), at either LOS E or F, in one or both peak hours.

As further analyzed in Appendix F, construction traffic from Phase 2 would generate higher volumes of daily and peak hour traffic than Phase 3. Phase 2 of the currently proposed project would generate a total of 169 daily trips, 48 AM peak hour trips (31 inbound and 17 outbound), and 48 PM peak hour trips (17 inbound and 31 outbound). The previously analyzed 2004 Strathern Pit Project was estimated to generate a total of 240 daily trips, 66 AM peak hour trips (45 inbound and 21 outbound), and 66 PM peak hour trips (21 inbound and 45 outbound). When the

currently proposed project is compared to the previously analyzed project, the currently proposed project would generate 71 *less* daily trips, 18 *less* AM peak hour trips, and 18 *less* PM peak hour trips.

Since the currently proposed project would generate less daily and peak hour traffic volumes than previously analyzed, the currently proposed project would not create additional traffic impacts than those disclosed in the 2004 PEIR. However, a mitigation measure would still be required as the volume to capacity (V/C) ratios and LOS at those three roadway segments would remain at LOS E or F without the project, and the currently proposed project would contribute additional V/C to those LOS E or F roadway segments. As such, Mitigation Measure T-1, as described in the 2004 PEIR would be required for the currently proposed project.

Operational

The operational and maintenance traffic associated with the currently proposed project is anticipated to be nominal and would be consistent with the operational phase of the 2004 Strathern Pit Project analyzed in the 2004 PEIR.

Appendix F contains Table 4.11-52, Operation Traffic – Strathern Pit, from the 2004 PEIR. Since the operational (permanent) phase of the currently proposed project would remain the same as analyzed in the 2004 PEIR, the operation trip generation estimates would also remain the same at approximately 180 daily trips, 46 AM peak hour trips (33 inbound and 13 outbound), and 40 PM peak hour trips (14 inbound and 26 outbound).

Based on Table 4.11-53 of the 2004 PEIR (see Appendix F), the currently proposed project would not create a significant impact to roadway segment level of service (LOS). Therefore, no mitigation measure is required for the operational phase, and the currently proposed project would not result in a significant impact.

As such, the currently proposed project would not result in new significant impacts related to conflicts with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities and would not result in substantial increases in the severity of previously identified significant impacts or the need to provide new mitigation measures.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

As required by SB 743, the Governor's Office of Planning and Research (OPR) approved the addition of new Section 15064.3, "Determining the Significance of Transportation Impacts" to the State's CEQA Guidelines, compliance with which was required beginning July 1, 2020. Consistent with SB 743, CEQA requires that transportation impacts be analyzed under the VMT metric, and the level of service (LOS) or delay metric is no longer to be considered under CEQA. LACPW adopted their (updated) Transportation Impact Analysis Guidelines in July 2020 which provides guidance on the analysis of VMT, screening thresholds, and significance criteria. LACPW's screening and impact criteria are only meant to serve as guidance to determine the potential for VMT-related impacts, further detailed in Appendix F to this memorandum.

Construction

Phase 2 of the currently proposed project would have the highest vehicle-trip generation for passenger-cars/light-duty trucks of workers only (heavy trucks are not required to be included per OPR) for the Deep Dynamic Compaction, Haul Excess Material, and Crush Concrete components because these construction phases would overlap each other based on their start and end dates. The VMT generated by construction-related trips are temporary and would not generate

permanent trips, therefore the VMT from construction is not required to be quantified. While worker and vendor trips would generate VMT, once construction is completed, the construction-related traffic would cease and VMT would return to pre-construction conditions. Therefore, since construction-related traffic is temporary and the peak phase of Phase 2 and Phase 3 construction would generate less than 110 daily trips (of passenger-cars/light-duty trucks) per the County's VMT screening criteria, the proposed project would not conflict or be inconsistent with the State's CEQA Guidelines Sections 15064.3(b)(1) and 15064.3(b)(3), and impacts to VMT would be less than significant.

Operational

The project, a wetlands park, can be classified as unique land use since the County's guidelines do not provide specific guidance for VMT analysis of park-type use. Based on the analysis within Appendix F, it was determined that the project's VMT impact should be determined using the absolute metric of total VMT. The County's transportation guidelines recommend using the Southern California Association of Governments (SCAG) Travel Demand Forecasting Model to be run under with and without project conditions to estimate the total or net daily VMT generated by a project. However, because the proposed project is a park use which is anticipated to be a local serving use and not a regional facility, the SCAG model would not be effective in estimating the project generated VMT. Therefore, a qualitative analysis based on a needs assessment report was completed for the project's VMT analysis.

The project site is located on land owned by the Los Angeles County Flood Control District within the Sun Valley community of the City of Los Angeles. There are 1.2 park acres per 1,000 population in the area around currently proposed project as compared to the County's average for park acres per 1,000 population is 3.3 acres (Appendix F). Park accessibility (i.e. percentage of population living within one-half mile of a park) for this area is approximately 29% compared to the County average of 49%. The Sun Valley Park and Recreation Center located across the proposed project provides only 0.55 park acres per 1,000 population compared to the County average of 3.3 park acres per 1,000 population. Hence, there is a deficiency of park acres within the community of Sun Valley even though the currently proposed project is located across an existing recreational facility.

Parks are classified based on the size, use and physical characteristics of the land and meet local needs and offer opportunities for daily recreation (Appendix F). The local park system comprises of community parks, neighborhood parks, pocket parks, and park nodes. Based on the size of the park (15 acres of recreational offerings) of the overall 46-acre wetlands park, the currently proposed project would be classified as a Community Park (Appendix F). The currently proposed park would be similar to a local community park that serves residents within a 1- to 2-mile radius in contrast to a regional park that typically caters to a service radius of 20 miles (Appendix F). Because park need is a function of distance to parks and there is an existing high need for parks in the study area, therefore, the currently proposed project is anticipated to reduce the distance that the residents may currently be traveling to access local parks and recreational facilities.

The addition of 15 acres of recreational open space in the 46-acre wetlands park would add a new recreational amenity for a majority of existing residents to the southwest, south, and southeast of the project site and within the Sun Valley community, who would otherwise drive their vehicles to another park to use recreational facilities. Those residents would also be able to walk or ride their bicycles to the project site and utilize its recreational trails, thus reducing VMT generated by those residents. As a result, the currently proposed project would not cause an increase in VMT and therefore its impact would be less than significant.

As such, the currently proposed project would not result in new significant impacts related to consistency with CEQA Guidelines section 15064.3, subdivision (b) and would not result in substantial increases in the severity of previously identified significant impacts or the need to provide new mitigation measures.

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Implementation of the currently proposed project would not increase hazards due to a design feature or incompatible use. Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The currently proposed project would not include the storm drain and recycled water line components identified in the 2013 Addendum. Construction and operations would not interfere with access on Fair Avenue and Tujunga Avenue. As such, the currently proposed project would not result in new significant impacts related to substantially increased hazards due to a geometric design feature or incompatible uses and would not result in substantial increases in the severity of previously identified significant impacts.

d) Would the project result in inadequate emergency access?

The currently proposed project, including the access driveways, would be reviewed and approved by the City of Los Angeles and the Los Angeles Fire Department. The currently proposed project would also comply with the provisions of all applicable codes and ordinances for emergency access. Therefore, the currently proposed project would provide for emergency access and would not interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant. As such, the currently proposed project would not result in new significant impacts related to inadequate emergency access and would not result in substantial increases in the severity of previously identified significant impacts.

Changes in Circumstance/New Information

The Trip Generation and Transportation Consistency Analysis, and VMT Assessment (Appendix F) conducted for the currently proposed project reflects current roadway conditions and traffic volumes, current traffic analysis methodologies (such as VMT), and trip generation rates, all of which have undergone updates or changes since the time of the 2004 PEIR. As such, updates have been made to account for changes in circumstance and new information, and these updates did not result in identification of new significant impacts or an increase in severity of previously identified significant impacts, as described above and further demonstrated in Appendix F

Since certification of the 2004 PEIR, updates to the State CEQA Guidelines have gone into effect. One of the revisions incorporates the requirements of SB 743, which created a new process for analyzing transportation impacts under CEQA. Under the new transportation guidelines, LOS, or automobile delay, will no longer be considered an environmental impact under CEQA. Rather, VMT was used to assess the significance of transportation impacts. The new guidelines were implemented statewide on July 1, 2020. The traffic and transportation analysis in the certified EIR relies on LOS to characterize impacts, since use of VMT was not yet mandatory, and the approved CEQA documentation was circulated for review well before the updated State CEQA Guidelines were approved. Use of VMT is now mandatory under CEQA, and the County has adopted VMT guidelines

and significance criteria. LOS was used in this analysis for the currently proposed project, a VMT assessment for both construction and operations of the currently proposed project was conducted (as discussed above).

No other new regulations, plans, or policies have been adopted or updated that would affect the analysis or conclusions related to traffic or transportation facilities that were originally presented in the 2004 PEIR and 2013 Addendum.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. Under the County's VMT screening criteria, the currently proposed project would screen out of further VMT analysis for generating less than 110 daily trips (during construction). As shown in the VMT analysis, the operation and maintenance of the project within a high park need area per County's park needs assessment is anticipated to reduce the distance that the residents may currently be traveling to access local parks and recreational facilities. Therefore, the currently proposed project would not generate significant amount of VMT and would not conflict or be inconsistent with CEQA Guidelines Sections 15064.3(b)(1) and 15064.3(b)(3), and impacts would also be less than significant. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measure

The following mitigation measure, included within the 2004 PEIR and 2013 Addendum, is applicable to the currently proposed project:

- **Mitigation Measure T-1**: See Section 3.4 of this memorandum.

4.18 Tribal Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XVIII. TRIBAL CULTURAL RESOURCES				
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☐	☐	☒	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☐	☐	☒	☐

Since certification of the 2004 PEIR and the 2013 Addendum, updates to the State CEQA Guidelines have gone into effect. One of the revisions to Appendix G of the State CEQA Guidelines was made in 2016 that incorporated threshold questions for tribal cultural resources. The tribal cultural resources section was added to Appendix G after passage of Assembly Bill 52, which required an updated to the State CEQA Guidelines to ensure that the topic of tribal cultural resources was addressed in CEQA documents. Regarding the topic of tribal cultural resources, Assembly Bill 52 is applicable to projects that have a Notice of Preparation (NOP) filed on or after July 1, 2015. The NOP for the Sun Valley Watershed Management Plan was filed on November 12, 2002. Moreover, the currently proposed project does not include additional locations not previously addressed in the 2004 PEIR nor does the currently proposed project include new disturbances to previously investigated sites. As such, the provisions of Assembly Bill 52, including the Native American Consultation process established since preparation of the PEIR, do not apply to the currently proposed project. As such, since no TCR issues were raised at the time the 2004 PEIR was certified, CEQA documents tiering from this EIR are not required to address TCR issues (*Citizens for Responsible Equitable Environmental Development v. City of San Diego (2011) 196 Cal.App.4th 515*). Therefore, no further analysis is required. Nonetheless, information regarding tribal cultural resources from the 2012 Cultural Resources Report (ICF 2012) is provided here for purposes to inform the following analysis on the potential occurrence of tribal cultural resources on the project site.

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

Cultural investigations conducted as part of the 2013 Addendum, in accordance with Mitigation Measure C-5 in the 2004 PEIR, identified four structures that are over 50 years old within the project site. The evaluation of the structures concluded that there was not any historic eligibility under any of the four California Register Historical Resources criteria and that there are no historic resources. Since the currently proposed project is proposed within the same project site, construction of the currently proposed project under Phases 2 and 3 would not impact significant tribal cultural resources that are listed or eligible for listing in a local register for historical resources. No operational impacts would occur. Further, since cumulative impacts related to tribal cultural resource impacts would be site-specific and the project site does not contain historical resources, cumulative impacts would not occur. As such, the currently proposed project would not result in new significant impacts to historical resources, nor would it result in substantial increases in the severity of previously identified significant impacts or the need for new mitigation measures. As such, the currently proposed project would not result in less than significant impacts to tribal cultural resources.

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? (In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.)

According to both the 2003 Cultural Resources Technical Report (Greenwood and Associates 2004) and the 2012 Cultural Resources Report (ICF 2012), the project area lies within Gabrielino and Fernandeño ethnographic territories. The terms Gabrielino and Fernandeño refer to Native American groups historically associated with the San Gabriel and San Fernando Missions. Gabrielino and Fernandeño territory is not well defined, but is generally believed to incorporate the watersheds of the Los Angeles, San Gabriel, and Santa Ana Rivers. It includes the entire Los Angeles Basin, the coast between Aliso Creek and Topanga Creek, and the islands of San Clemente, San Nicholas, and Santa Catalina. The ancestors of the Gabrielinos and Fernandeño likely arrived in the Los Angeles Basin around 2500 B.P. as part of the Kroeber (1925) referred to as the "Shoshonean Wedge." By 1 B.P., permanent villages were built in the lowlands along rivers and streams. Over 50 villages may have been occupied simultaneously, with populations between 50 and 200 people per village (Bean and Smith 1978).

The currently proposed project area was dug as the Strathern Pit in the 1890s to provide material for local construction projects. The integrity of the pit and its settings has been substantially altered by landfill operations. As with the 2013 Approved Project, the currently proposed project would have a detention pond footprint of approximately 21 acres and a maximum depth of 50 feet. Potential ground disturbing activities associated with the currently proposed project include over excavation of the project site (including inert landfill material), rough grading of the project site, excavation of inert landfill material, and construction of underground utilities. As such, the currently proposed project would result in excavation and grading activities that could potentially encounter buried

unknown tribal cultural resources. Thus, the 2012 Supplemental Cultural Resources Survey, prepared for the 2013 Addendum, recommended that the pit be monitored for cultural resources during the first day of subsurface work (see Mitigation Measure C-2 in Section 3.5, Cultural Resources, of this memorandum). Mitigation Measure C-2 would reduce potential impacts on unknown tribal cultural resources. Further, as previously mentioned, Assembly Bill 52, which requires tribal cultural consultation, is not applicable to the currently proposed project. As such, the provisions of Assembly Bill 52 do not apply to the currently proposed project. For these reasons, the project would not impact resources determined to be significant pursuant to criteria set forth in subsection (c) of Public Resources Code Section 5024.1.

4.19 Utilities and Service Systems

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
XIX. UTILITIES AND SERVICE SYSTEMS – Would the project:					
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☐	☐	☒
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☐	☐	☒

	New or Substantially More Severe Significant Impacts due to Project Modifications	New or Substantially More Severe Significant Impacts due to Altered Circumstances	New or Substantially More Severe Significant Impacts due to New Information	New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects	No Change to Impact Determination
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☐	☐	☒
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☐	☐	☒
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☐	☐	☒

Section 4.12 of the 2004 PEIR evaluated the impacts of the SVWMP, including the 2004 Strathern Pit Project, on utilities and service systems. The 2013 Addendum determined no changes to the 2004 PEIR for utilities and service systems were necessary for the 2013 Approved Project, and thus, was not discussed in the 2013 Addendum.

This section evaluates whether utility and service system impacts associated with the currently proposed project were analyzed in the 2004 PEIR and 2013 Addendum, if the currently proposed project proposes changes or new circumstances involving new or more severe impacts, if the currently proposed project offers substantially new information requiring new analysis or verification, and whether previously adopted mitigation measures continue to ensure that impacts are reduced to below significance as feasible in accordance with the certified 2004 PEIR and 2013 Addendum.

2004 PEIR Conclusions

The 2004 PEIR determined impacts to utilities and service systems would be:

- Less than significant with mitigation incorporated related to construction waste generated; generation of electricity consumption (operation of pumps, irrigation systems, and park buildings, if any), water (backup to the stormwater reuse irrigation system or for park buildings), and sewage (park buildings); potential interference with existing utilities within street rights-of-way from construction of Storm Drains, Street Storage, catch basins, etc.; operational impacts on power line towers from stormwater infiltration at Valley Steam Plant and Plant Line Easement
- Less than significant related to generation of solid waste (sediments removed periodically from the stormwater collection facilities during maintenance)

Appendix B of the 2004 PEIR, Notice of Preparation and Comments Received, includes an Initial Environmental Study prepared in November 2002. The Lead Agency determined some impacts related to utilities and service systems would not result in potentially significant impacts, and thus, were not further analyzed in the 2004 PEIR. The following impact determinations are from the 2002 Initial Study:

- No impact related to exceedance of wastewater treatment; sufficient water supplies; adequate capacity of wastewater treatment providers; and compliance with solid waste regulations
- Less than significant related to sufficient capacity for landfills

Environmental Analysis

a) Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

As described in the 2004 PEIR, the 2004 Strathern Pit Project would result in potentially significant impacts during construction. Implementation of mitigation measures are required to reduce utilities and service system impacts to less than significant. The 2013 Addendum determined no changes to the impacts determined in the 2004 PEIR analysis. Therefore, impacts related to the 2013 Approved Project would be less than significant with implementation of mitigation measures.

Construction

As previously shown in Table 1, Comparison of the 2004, 2013, and currently proposed project, new components associated with the currently proposed project include DDC over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing. All of the components, with the exception of the passive methane treatment would occur during construction only and would cease upon operations of the currently proposed project. Hauling, off-site staging, crushing, stockpiling, DDC, and construction of the passive methane treatment system would not result in water quality impacts and would be short-term in nature. Additionally, construction of the currently proposed project would not produce solid-waste during the short-term and would be minimal. As described in the 2004 PEIR, the 2004 Strathern Pit Project would involve excavation within the street rights-of-way, which may affect existing utilities. Therefore, Mitigation Measures U-1, U-2, and U-3 would minimize interference with existing lines and interruption of service. Similarly, the currently proposed project would involve installation of on-site utilities,

including water lines, irrigation lines, sewer lines, and storm drain lines. Thus, mitigation measures would be incorporated to ensure impacts are reduced to less than significant.

Operational

As described in the 2004 PEIR, the 2004 Strathern Pit Project would have less than significant impacts related to wastewater and water supply systems, electricity and solid waste generation. The 2004 Strathern Pit Project and 2013 Approved Project considered introduction of recreational features and landscaping, similar to that of the currently proposed project. The changes in configuration proposed in the aboveground components for the currently proposed project would not alter the impacts related to utilities and service systems. Stormwater runoff collected under the 2004 Strathern Pit Project and 2013 Approved Project, and currently proposed project would be treated at the project site, then a pipeline would carry the treated runoff from the wetlands to the Sun Valley Park for groundwater recharge. As with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project's wetlands would result in a nominal change in circumstance as it relates to potable water connection as a backup irrigation system. Potable water would be required for the proposed irrigation system, water fountains, and restrooms. No new or expanded water supply sources would be required. Further, the 2004 Strathern Pit Project and 2013 Approved Project, and currently proposed project would capture stormwater runoff for groundwater recharge. Operation of the pumps at the project site required to transport collected stormwater to the Sun Valley Park would result in a minor increase in electricity demand. This would not change under the currently proposed project. The solid waste generated by the proposed recreational components of the currently proposed project would be consistent with that analyzed as part of the 2004 Strathern Pit Project and 2013 Approved Project. Therefore, impacts to utilities and service systems would remain less than significant under the currently proposed project. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect in the category of utilities and service systems.

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

Similar to the 2004 Strathern Pit Project, the currently proposed project would include landscaping and tree planting throughout the project site. As mentioned above, the currently proposed project would result in a nominal change in circumstances as it relates to potable water connection. As described in the 2004 PEIR, water conservation is one of the objectives of the Sun Valley Watershed Management Plan. The currently proposed project would help facilitate the capture of substantial amounts of stormwater runoff, which would be used to augment the local water supply. The currently proposed project would continue to facilitate the capture of stormwater to groundwater recharge. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect in the category of utilities and service systems.

c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

As described in the 2004 PEIR, the 2004 Strathern Pit Project would not have operational impacts on sewer and wastewater. Similar to the Strathern Pit Project described in the 2004 PEIR, the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands

park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The currently proposed project would not include the storm drain and recycled water line components identified in the 2013 Addendum. Therefore, impacts to utilities and service systems would remain less than significant under the currently proposed project. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect in the category of utilities and service systems.

d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Construction waste generated by the 2004 Strathern Pit Project and 2013 Approved Project would implement Mitigation Measure U-4 to reduce impacts to solid waste. Additionally, the 2004 Strathern Pit Project and 2013 Approved Project was required to implement Mitigation Measure U-5 to ensure temporary change to collection routes of solid waste would be less than significant. The currently proposed project is not expected to substantially change the amount of solid waste generated during construction, and therefore, would not change the impact conclusions related to solid waste capacity. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect in the category of utilities and service systems.

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Construction waste generated by the 2004 Strathern Pit Project and 2013 Approved Project would implement Mitigation Measure U-4 to reduce impacts to solid waste. The currently proposed project is not expected to substantially change the amount of solid waste generated during construction, and therefore, would not change the impact conclusions. Furthermore, similar to the 2004 Strathern Pit Project, solid waste generated during operation of the currently proposed project would be limited to sediments removed periodically from the stormwater collection facilities during maintenance. Sediments would be disposed of in compliance with applicable regulations. As such, complying with existing mitigation measures under the 2004 PEIR would ensure no new or different solid waste impacts would occur than those previously identified.

Changes in Circumstance/New Information

No changes have occurred to the City of Los Angeles' utilities and service systems since certification of the 2013 Addendum that would change or otherwise affect the analysis and conclusions originally presented in the 2013 Addendum. Furthermore, no new regulations, plans, or policies have been adopted or updated that would affect the analysis or conclusions related to utilities and service systems that was originally presented in the 2013 Addendum.

Conclusion

As demonstrated above, the currently proposed project would not involve new or substantially more severe significant impacts due to modifications or altered circumstances; involve substantially important new information requiring new analysis or verification; nor require additional mitigation measures. As such, consistent with CEQA Guidelines Section 15162, no subsequent EIR is required.

Previously Adopted Applicable Mitigation Measures

The following mitigation measures, included within the 2004 PEIR and 2013 Addendum, are applicable to the currently proposed project:

- **Mitigation Measure U-1**: See Section 3.4 of this memorandum.
- **Mitigation Measure U-2**: See Section 3.4 of this memorandum.
- **Mitigation Measure U-3**: See Section 3.4 of this memorandum.
- **Mitigation Measure U-4**: See Section 3.4 of this memorandum.
- **Mitigation Measure U-5**: See Section 3.4 of this memorandum.

4.20 Wildfire

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
XX. WILDFIRE – If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

Since certification of the 2004 PEIR and the 2013 Addendum, updates to the State CEQA Guidelines have gone into effect. One of the revisions to Appendix G of the State CEQA Guidelines involves a more extensive wildfire

analysis for projects located in or near state responsibility areas for firefighting or lands classified as very high fire hazard severity zones (14 CCR 15000 et seq., as amended December 28, 2018). Wildfire hazards were not addressed in the 2004 PEIR or the 2013 Addendum; however, additional information regarding wildfire hazards is provided here for informational purposes. The project site is not located in a state responsibility area or in a state-designated fire hazard severity zone. The nearest state responsibility area is located approximately 17 miles to the west at the intersection of Ventura County and Los Angeles County Line, and the nearest very high fire hazard severity zone is located approximately 0.9 miles north of the project site, in the Verdugo Mountains (CAL FIRE 2019). As such, the project site is not expected to be susceptible to wildfires and is not located within or near a wildfire hazard area or a state responsibility area. Development of the currently proposed project would not, therefore, expose people to significant risks related to wildfire hazards, nor would it exacerbate wildfire risks in the area. While there are new guidelines for the evaluation of development projects and wildfire risk, the currently proposed project would not result in significant effects under the new guidelines, as demonstrated herein.

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

According to the California Department of Forestry and Fire Protection's Fire Hazard Severity Zone maps, the project site is not located in a Very High Fire Hazard Zone (CAL FIRE 2020). The currently proposed project would not change the location of the project site, as described in the 2004 PEIR and 2013 Addendum. The project site is not located within a designated Fire Hazard Severity Zone and is approximately 0.9 miles south of a Very High Fire Hazard Severity Zone. The project site and surrounding area is characterized as developed, which would not facilitate the spread of wildfires compared to vegetated areas. Additionally, the currently proposed project, including the access driveways, would be reviewed and approved by the City of Los Angeles and the Los Angeles Fire Department. The currently proposed project would also comply with the provisions of all applicable codes and ordinances for emergency access. Therefore, the currently proposed project would provide for emergency access and would not interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant.

b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

The project site is not located within a Fire Hazard Severity Zone and is approximately 0.9 miles south of a Very High Fire Hazard Severity Zone (CAL FIRE 2020). As previously stated, the currently proposed project would not change the location of the project site, as described in the 2004 PEIR and 2013 Addendum. The project site is located within a highly urbanized setting and the land uses surrounding the project site are predominantly residential uses. To the north of the project site is the base of the Verdugo Mountains, which is a Very High Fire Hazard Severity Zone. However, the currently proposed project involves the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements. This is consistent with the description of the 2004 Strathern Pit Project and 2013 Approved Project. As a result, no incising of hillslopes or degradation of slope stability would occur because of project construction. The project site and immediately surrounding area do not contain slopes typical of exacerbating wildfire risks. The areas upslope of the project site are developed with existing manufacturing uses. As such, the surrounding areas do not contain extensive amounts of vegetation or wildland fuel. Additionally, there is existing pavement within the areas between the project site and Very High Fire Hazard Severity Zones to the north, which would provide a fire break between the project site and any wildland fuels.

Therefore, it is not anticipated that the currently proposed project, due to slope, prevailing winds, and other factors, would exacerbate wildfire risks or expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. No impact would occur.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

As previously discussed, the project site is not located within a Fire Hazard Severity Zone and is approximately 0.9 miles south of a Very High Fire Hazard Severity Zone (CAL FIRE 2020). As previously stated, the currently proposed project would not change the location of the project site, as described in the 2004 PEIR and 2013 Addendum. The proposed project involves the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements. This is consistent with the description of the 2004 Strathern Pit Project and 2013 Approved Project. As with the 2004 Strathern Pit Project and 2013 Addendum, the currently proposed project would not require the installation or maintenance of roads, fuel breaks, power lines, or other utilities that would exacerbate fire risk. No impact would occur.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

As previously discussed, the project site is not located within a Fire Hazard Severity Zone and is approximately 0.9 miles south of a Very High Fire Hazard Severity Zone (CAL FIRE 2020). As previously stated, the currently proposed project would not change the location of the project site, as described in the 2004 PEIR and 2013 Addendum. The project site is currently undeveloped. Project construction involves the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements. This is consistent with the description of the 2004 Strathern Pit Project and 2013 Approved Project. Under the existing conditions, the project site is undeveloped and potentially susceptible to landslides; construction of the currently proposed project would ensure modification of the gravel pit does not result in slope instability. Further, as with the 2004 Strathern Pit Project and 2013 Approved Project, the currently proposed project is proposed for flood control purposes and would reduce runoff that contributes to flooding. The currently proposed project would not expose people or structures to downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. No impact would occur.

5 Conclusions and Recommendations

5.1 Conclusions

As previously shown in Table 1, Comparison of the 2004, 2013, and Currently Proposed Project, new components associated with the currently proposed project include deep dynamic compaction over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing. Additionally, the currently proposed project excludes the storm drain system and recycled water line components identified and evaluated in the 2013 Addendum.

Because most aspects of the 2004 Strathern Pit Project and 2013 Approved Project are consistent with the currently proposed project, all of the impact conclusions presented in the prior CEQA documents would not change. All applicable mitigation measures included in the 2004 PEIR for these topics still apply to the currently proposed project. No new mitigation is required. As such, the District has reviewed the currently proposed project and determined that the currently proposed project requires no further environmental review pursuant to State CEQA Guidelines Section 15162, which provides that when an EIR has been certified for an adopted project, no subsequent EIR shall be prepared for that project when the lead agency determines, on the basis of substantial evidence in light of the whole record, that there are no new significant environmental effects due to a change in the project or circumstances, and there is no new information of substantial importance as identified in the State CEQA Guidelines Section 15162(a)(3). As a result, this memorandum determined that the following resource areas, which are analyzed herein, do not require further analysis.

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials
- Hydrology/Water Quality
- Land Use/Planning
- Mineral Resources
- Noise
- Population/Housing
- Public Services
- Recreation
- Traffic and Transportation
- Tribal Cultural Resources
- Utilities/Service Systems
- Wildfire

5.2 Recommendations

As previously discussed in Section 1.2, the purpose of this memorandum is to assess whether the impacts of the currently proposed project are consistent with the certified 2004 PEIR and the 2013 Addendum and whether any additional documentation is required under CEQA.

As addressed in this memorandum, although the currently proposed project proposes minor changes to the 2004 Project and 2013 Approved Project since certification of the 2004 PEIR and 2013 Addendum, these changes would not result in new significant impacts, substantial increases in previously identified significant impacts, or the requirement for new mitigation measures or alternatives to be studied.

Given the consistency between the currently proposed project and the previously approved 2004 Strathern Pit Project and 2013 Approved Project, Dudek recommends that an addendum to the previously certified CEQA documents is the appropriate document to address and evaluate the environmental effects of the currently proposed project. Pursuant to State CEQA Guidelines Section 15164, a lead agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred. Furthermore, an addendum need not be circulated for public review but can be included in or attached to the final EIR or adopted negative declaration.

Air Quality Greenhouse Gas Emissions and Energy Technical Memorandum

621 CHAPALA STREET
SANTA BARBARA, CALIFORNIA 93101
T 805.963.0651 F 805.963.2074

MEMORANDUM

To:	Janea Russell, Principal Civil Engineering Assistant, Los Angeles County Public Works
From:	Nicholas Lorenzen, Air Quality Technical Specialist, Dudek
Subject:	Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum for the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum
Date:	February 2022
Attachments:	A – CalEEMod Emissions Outputs

Introduction

Dudek is pleased to submit this air quality, greenhouse gas (GHG) emissions, and energy assessment to assist Los Angeles County Public Works (Public Works) with environmental planning requirements for project modifications to the Rory M. Shaw Wetlands Project. The Rory M. Shaw Wetlands Park Project is located in the City of Los Angeles community of Sun Valley within the City of Los Angeles, California.

The Los Angeles County Flood Control District adopted the Sun Valley Watershed Management Plan (SVWMP) and certified the SVWMP Program Environmental Impact Report (2004 PEIR) on June 29, 2004. In 2013, an addendum to the 2004 PEIR was prepared to address minor changes for two components (Strathern Pit component and a portion of the Storm Drain component) of the SVWMP and a proposed recycled waterline. The addendum concluded that the project modifications would not result in any new significant effect on the environment that were not identified in the 2004 PEIR. The Strathern Pit project (also known as the Strathern Wetlands Park Project) underwent a name change to the Rory M. Shaw Wetlands Park Project after the certification of the 2004 PEIR. Since the certification of the 2013 Addendum, the Rory M. Shaw Project (currently proposed project) has been further modified. New components associated with the currently proposed project include off-site staging, crushing, hauling of excess material, deep dynamic compaction, and the installation of a passive methane treatment system. Additionally, the currently proposed project excludes the storm drain system and recycled water line components of the 2013 Addendum.

The purpose of this memorandum is to evaluate whether the currently proposed project would result in new significant effects or an increase in the severity of previously identified significant effects in the categories of air quality, greenhouse gas (GHG) emissions, and energy. This memorandum also discusses changes with respect to circumstances under which the project will be undertaken and new information that has become available relative to air quality, GHG emissions, and energy that could change the impact conclusions in the 2004 PEIR.

1 Project Description

Similar to the Strathern Pit Project described in the 2004 PEIR (2004 Project), the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. Additionally, the currently proposed Project would include deep dynamic compaction (DDC) over the detention basin footprint, the hauling of excess materials offsite, and the addition of a passive methane treatment system.

The project site boundaries for the currently proposed project are the same as described in the 2013 Addendum. The inert landfill is located at the northeast corner of Tujunga Avenue and Strathern Street and consists mostly of concrete, dirt, rocks, and other construction debris waste.

Similar to the 2004 Project, the currently proposed project would capture stormwater runoff collected from upstream industrial drainage areas to alleviate flooding in the Sun Valley community. The proposed design would provide a water conservation benefit through the reuse of stormwater. Runoff would be temporarily stored in a detention pond, routed through a wetlands for natural treatment of pollutants, and pumped into existing underground infiltration basins at the adjacent Sun Valley Park. The currently proposed project would provide up to 46 acres of recreational open space, including park land and wildlife habitat for the community. The proposed detention pond would have a footprint of approximately 21 acres and a maximum depth of 50 feet, with a total storage capacity of 385 acre-feet.

The proposed wetlands would provide a sustainable habitat for various plant and animal species, and a natural water treatment system for removing pollutants from the collected stormwater runoff. The treated stormwater would be pumped to the existing Sun Valley Park infiltration basins for groundwater recharge.

The first phase of the currently proposed project, Site Investigations and Demolition, was completed in 2017. The currently proposed project would include demolition, including clearing and grubbing, hauling of excess materials, over excavation and grading and the methane mitigation system, as described below:

Proposed Deep Dynamic Compaction and Hauling

The proposed DDC activities are intended towards achieving sufficient compaction to minimize chances of differential settlement on the site. The DDC method is not required but is the recommended approach at this time. As such, this memorandum will analyze the DDC construction activities to ensure the potential environmental effects have been adequately addressed in the previous CEQA documentation. DDC uses principles of transforming potential energy to kinetic energy to densify ground through utilization of weights, supported by a crane, and free fall impact to the ground to increase the density of soil. Proposed DDC activities would require the use of a Manitowoc 1015 Crawler Crane or equivalent, a specially built crane for DDC operations with automated safety controls and 27-ton steel weight, mechanics service truck, an excavator or dozer, and water truck for dust control. The DDC activities would last approximately 4 years.

The excess materials may also be hauled to several different waste management facilities depending on availability at the time of construction. These facilities include Sunshine Canyon Landfill, Waste Management Azusa Landfill

Reclamation, NuWay Landfill and Kincaid Pit. For the purposes of this analysis, it was assumed that all excess material would be hauled to the farthest location (Kincaid Pit, 36 miles to the southeast) to conservatively estimate emissions associated with haul truck travel during construction. Approximately 550,000 cubic yards of materials would be hauled to these facilities. Proposed hauling, earthwork, and rough grading activities are anticipated to last four years, beginning in July 2023 and ending in December 2027.

Proposed Passive Methane System

Proposed above ground improvements would include a new passive methane treatment system, a component not included in the 2004 Project. Methane controls are required to prevent any surface and shallowing venting consistent with the provisions of local City of Los Angeles Municipal Ordinance No. 175790, Methane Seepage Regulations. These regulations require the installation of a methane mitigation system to prevent any potential intrusion of any residual gas into a proposed development's structure, in this case the north and south restroom facilities. The proposed passive methane treatment would be located along the northern and western property line and along the southern boundary of the existing concrete pad. The proposed passive methane treatment would consist of approximately 31 wells designed to prevent methane gas intrusion into the proposed aboveground structures and eight probes would be located along the southern boundary of the existing concrete pad which can be later converted to collector pipes if-needed.

Detention Pond

The detention pond is proposed for construction on the western portion of the project site. The detention pond is approximately 21 acres in size and 50 feet in depth. A raw water pump station, valve, and vaults are proposed in the lower eastern corner of the detention pond. The edges of the detention pond would be sloped to discourage wildlife movement between the turf areas and water features. A concrete access road would allow access from Tujunga Avenue towards the detention basin.

Wetlands

Two wetland areas totaling 10 acres are proposed within the project site. One is located in the southeast corner, just below the proposed pump station and wet well, another is located just above it. The edges of the wetland areas would be sloped to discourage wildlife movement between the turf areas and water features.

Utilities

The currently proposed project involves the installation of on-site utilities, including electrical and communication lines, water lines, irrigation lines, sewer lines, and storm drain lines. A new 12-inch on-site storm drain is proposed along the northern boundary of the detention basin. The currently proposed project involves construction of an 8-foot by 8-foot reinforced concrete box (RCB) with junction box within Tujunga Avenue, a 12-inch-diameter high-density polyethylene (HDPE) treated water force main from the project site to Fair Avenue onto Cantara Street, an 8-inch diameter sewer at Fair Avenue and Strathern Street. The 8-foot by 8-foot RCB would connect to the raw water gravity main line from Tujunga Avenue into the detention basin. The 12-inch HDPE water force main would carry flows into the existing underground infiltration galleries at Sun Valley Park.

Recreational Components

Above-ground improvements would include the development of recreational offerings throughout the site, totaling approximately 15 acres. A 127-stall parking facility would line the northern boundary. The soccer field, a picnic area, and picnic pavilion would be located in the northwest portion of the project site. An amphitheater and restroom would be west of the soccer field and south of the 127-stall parking lot. The rest of the recreational facilities would be located along the eastern portion of the site, including the tot lot and tennis courts, basketball courts, and open play area. Restrooms and a 30-stall parking lot would also be developed in the southeastern portion of the site. Additionally, this component includes the development of trails.

2 General Analysis and Methodology

The project is located within the South Coast Air Basin (SCAB) and is within the jurisdictional boundaries of the South Coast Air Quality Management District (SCAQMD), which has jurisdiction over the County where the project is located. The California Emissions Estimator Model (CalEEMod) Version 2020.4.0 was used to estimate emissions from construction of the project (CAPCOA 2021). CalEEMod is a statewide computer model developed in cooperation with air districts throughout the state to quantify criteria air pollutant and GHG emissions associated with construction activities and operation of a variety of land use projects, such as residential, commercial, and industrial facilities. CalEEMod input parameters, including the land use type used to represent the project and its size, construction schedule, and anticipated use of construction equipment, were based on information provided by Public Works or default model assumptions if project specifics were unavailable. Construction duration of the entire project (rough grading and above-ground improvements) was assumed to commence in December 2022 through November 2031.

Air Quality

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. Criteria air pollutants that are evaluated include reactive organic gases (ROGs, also referred to as volatile organic compounds (VOCs)), oxides of nitrogen (NO_x), carbon monoxide (CO), sulfur oxides (SO_x), particulate matter with an aerodynamic diameter less than or equal to 10 microns in size (coarse particulate matter, or PM_{10}), and particulate matter with an aerodynamic diameter less than or equal to 2.5 microns in size (fine particulate matter, or $PM_{2.5}$). ROGs and NO_x are important because they are precursors to ozone (O_3). Criteria air pollutant emissions associated with construction of the project were estimated for the following emission sources: operation of off-road construction equipment, paving, architectural coating, on-road vendor (material delivery) trucks, and worker vehicles.

Greenhouse Gases

GHGs are gases that absorb infrared radiation in the atmosphere. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature. Global climate change concerns are focused on whether human activities are leading to an enhancement of the greenhouse effect. Principal GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), O_3, and water vapor. If the atmospheric concentrations of GHGs rise, the average temperature of the lower atmosphere will gradually increase. Globally, climate change has the potential to impact numerous environmental resources though uncertain impacts related to future air temperatures and

precipitation patterns. Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. Climate change is already affecting California: average temperatures have increased, leading to more extreme hot days and fewer cold nights; shifts in the water cycle have been observed, with less winter precipitation falling as snow, and both snowmelt and rainwater running off earlier in the year; sea levels have risen; and wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (CNRA 2018).

The effect each GHG has on climate change is measured as a combination of the mass of its emissions and the potential of a gas or aerosol to trap heat in the atmosphere, known as its global warming potential (GWP), which varies among GHGs. Total GHG emissions are expressed as a function of how much warming would be caused by the same mass of CO_2. Thus, GHG emissions are typically measured in terms of metric tons (MT) of CO_2 equivalent (CO_2e). The CO_2e for a gas is derived by multiplying the mass of the gas by the associated GWP, such that MT of CO_2e = (MT of a GHG) × (GWP of the GHG). CalEEMod assumes that the GWP for CH_4 is 25, which means that emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2, and the GWP for N_2O is 298. This information is based on the Intergovernmental Panel on Climate Change's Fourth Assessment Report (IPCC 2007). GHG emissions associated with construction of the project were estimated for the following emission sources: operation of off-road construction equipment, on-road vendor trucks, and worker vehicles.

Energy

Electricity

Los Angeles Department of Water and Power (LADWP) provides electricity to the project site. LADWP provides electric services to 1.5 million customers, located in the City of Los Angeles and in the Owens Valley. According to LADWP, customers consumed approximately 21.6 billion kilowatt-hours of electricity in 2019 (CEC 2021). The amount of electricity used during project construction would be minimal because typical demand would stem from electrically powered hand tools, trailers, and site lighting. As such, construction electricity demand is qualitatively addressed.

Natural Gas

The Southern California Gas Company (SoCalGas) provides the City of Los Angeles with natural gas service. SoCalGas' service territory encompasses approximately 20,000 square miles and more than 500 communities. In the California Energy Demand mid-energy demand scenario, natural gas demand is projected to have an annual growth rate of 0.03% in SoCalGas' service territory. By 2020, natural gas demand is anticipated to be approximately 7,876 million therms per year in SoCalGas' service area (CEC 2017). The total capacity of natural gas available to SoCalGas in 2020 is estimated to be 3.8 billion cubic feet per day (California Gas and Electric Utilities 2018). This amount is approximately equivalent to 3.88 billion thousand British thermal units (kBTU) per day or 38.8 million therms per day. Over the course of a year, the available capacity would therefore be 14.2 billion therms per year, which is well above the existing and future anticipated natural gas demand in SoCalGas' service area. Natural gas is not anticipated to be required during construction of the project; therefore, construction natural gas demand is qualitatively addressed.

Petroleum

According to the United States Energy Information Administration (EIA), California used approximately 683 million barrels of petroleum in 2017, with the majority (585 million barrels) used for the transportation sector (EIA 2019). This total annual consumption equates to a daily use of approximately 1.9 million barrels of petroleum. There are 42 U.S. gallons in a barrel, so California consumes approximately 78.6 million gallons of petroleum per day, adding up to an annual consumption of 28.7 billion gallons of petroleum. In California, petroleum fuels refined from crude oil are the dominant source of energy for transportation sources. Petroleum usage in California includes petroleum products such as motor gasoline, distillate fuel, liquefied petroleum gases, and jet fuel.

Potential impacts were assessed through projected traffic trip generation and trip distances during operation, as indicated in Attachment A. Fuel consumption from vehicle trips is estimated by converting the total CO_2 emissions anticipated to be generated by operational vehicle trips to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. (The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon (The Climate Registry 2021)). Of the vehicles that would travel to and from the project site during operations, 93% were assumed to be gasoline powered and 7% were assumed to be diesel powered.

3 Air Quality Assessment

The 2004 PEIR's assessment of criteria air pollutant emissions from construction activities was documented in Section 4.1.3.1 (Construction Impacts). Based upon the analysis, potentially significant air quality impacts would occur for all phases of the project. With implementation of mitigation measures, A-1 through A-14 (detailed in Section 4.1.4, Mitigation Measures), construction-related air quality impacts were determined to be significant and unavoidable. The 2004 PEIR's assessment of operational air quality impacts determined that criteria air pollutant emissions from project operation would be less than significant; therefore, no mitigation was proposed for operational air quality impact. The 2013 Addendum found no new air quality impacts.

3.1 Thresholds of Significance

The significance criteria used to evaluate impacts to air quality in the certified 2004 PEIR were based on the version of the CEQA Guidelines, Appendix G, that was in place at the time of the 2004 PEIR. These criteria are listed below.

A significant impact related to air quality would occur if the project would:

A. Conflict with or obstruct implementation or the applicable air quality plan.

B. Violate any ambient air quality standards or contribute substantially to an existing air quality violation.

C. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

D. Expose sensitive receptors to substantial pollutants concentrations.

E. Create objectionable odors affecting a substantial number of people.

Since the time of the 2004 PEIR, updates to the CEQA Guidelines have gone into effect. These updates included revisions to the air quality significance threshold questions in Appendix G of the CEQA Guidelines. The thresholds that are currently in place are listed below.

A significant impact related to air quality would occur if the project would:

A. Conflict with or obstruct implementation of the applicable air quality plan.
B. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
C. Expose sensitive receptors to substantial pollutant concentrations.
D. Result in other emissions (such as those leading to odors) that would adversely affect a substantial number of people.

The analysis in this memo relies on the most recent version of the Appendix G thresholds, since this memo is prepared after the CEQA amendments went into effect and in the interest of providing the public and decision makers with as much information on the environmental consequences as possible. However, the revisions to the thresholds were minimal, as shown above, and do not have an appreciable effect on the analysis or the impact conclusions for this project. The revisions primarily involved combining the previous Thresholds B and C into a single threshold and expanding Threshold D to address "other emissions," rather than just odors.

Appendix G of the CEQA Guidelines indicates that, where available, the significance criteria established by the applicable air quality management district or pollution control district may be relied upon to determine whether a project would have a significant impact on air quality. The County uses SCAQMD's thresholds to evaluate proposed development projects and to assess the significance of quantifiable impacts. The potential air quality impacts of a project are, therefore, evaluated according to the thresholds adopted by the SCAQMD in connection with its CEQA Air Quality Handbook, Air Quality Analysis Guidance Handbook, and SCAQMD guidance. These thresholds have not changed since the time of the 2004 PEIR. The approach and significance criteria used for each of the thresholds listed above is described as follows:

Threshold A: The evaluation of whether the currently proposed project would conflict with or obstruct implementation of the applicable air quality plan is based on the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993), Chapter 12, Sections 12.2 and 12.3, which sets forth a number of criteria for this evaluation. The first criterion assesses if a project would result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the air quality management plan (AQMP). The second criterion is if a project would exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

Threshold B: To evaluate the potential for the currently proposed project to result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard, this analysis applies the SCAQMD's construction and operational criteria pollutants mass daily thresholds, as shown in Table 1. Project-related air quality impacts estimated in this environmental analysis would be considered significant if any of the applicable significance thresholds presented in Table 1 would be exceeded.

A project would potentially result in a cumulatively considerable net increase in O_3, which is a nonattainment pollutant, if the project's construction or operational emissions would exceed the SCAQMD VOC or NO_x thresholds. These emissions-based thresholds for O_3 precursors are intended to serve as a surrogate for an "ozone significance threshold" (i.e., the potential for adverse O_3 impacts to occur). This approach is used because O_3 is not emitted directly, and the effects of an individual project's emissions of O_3 precursors (VOC and NO_x) on O_3 levels in ambient air cannot be reliably or meaningfully determined through air quality models or other quantitative methods for an individual project.

Table 1. SCAQMD Air Quality Significance Thresholds

Criteria Pollutants Mass Daily Thresholds		
Pollutant	**Construction (pounds per day)**	**Operation (pounds per day)**
VOCs	75	55
NO_x	100	55
CO	550	550
SO_x	150	150
PM_{10}	150	150
$PM_{2.5}$	55	55
Lead[a]	3	3
TACs and Odor Thresholds		
TACs[b]	Maximum incremental cancer risk ≥10 in 1 million Cancer Burden >0.5 excess cancer cases (in areas ≥1 in 1 million) Chronic and acute hazard index ≥1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
Ambient Air Quality Standards for Criteria Pollutants[c]		
NO_2 1-hour average NO_2 annual arithmetic mean	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.030 ppm (state) and 0.0534 ppm (federal)	
CO 1-hour average CO 8-hour average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
SO_2 1-hour average SO_2 24-hour average	0.25 ppm (state) and 0.075 ppm (federal – 99th percentile) 0.04 ppm (state)	
PM_{10} 24-hour average PM_{10} annual average	10.4 µg/m³ (construction)[d] 2.5 µg/m³ (operation) 1.0 µg/m³	
$PM_{2.5}$ 24-hour average	10.4 µg/m³ (construction)[d] 2.5 µg/m³ (operation)	

Source: SCAQMD 2019.
Notes: SCAQMD = South Coast Air Quality Management District; VOC = volatile organic compounds; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; TAC = toxic air contaminant; NO_2 = nitrogen dioxide; SO_2 = sulfur dioxides; ppm = parts per million; µg/m³ = micrograms per cubic meter.
[a] The phase-out of leaded gasoline started in 1976. Since gasoline no longer contains lead, the currently proposed project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.
[b] TACs include carcinogens and non-carcinogens.
[c] Ambient air quality standards for criteria pollutants based on SCAQMD Rule 1303, Table A-2, unless otherwise stated.

[d] Ambient air quality threshold based on SCAQMD Rule 403.

Threshold C: The assessment of the currently proposed project's potential to expose sensitive receptors to substantial pollutant concentrations includes a localized significance threshold (LST) analysis, as recommended by the SCAQMD, to evaluate the potential for localized air quality impacts to affect sensitive receptors in the immediate vicinity of the currently proposed project during construction and operation. For project sites of 5 acres or less, the SCAQMD LST Methodology (SCAQMD 2008a) includes lookup tables that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance criteria (i.e., the emissions would not cause an exceedance of the applicable concentration limits for NO_2, CO, PM_{10}, and $PM_{2.5}$) without performing project-specific dispersion modeling.

The LST significance thresholds for NO_2 and CO represent the allowable increase in concentrations above background levels in the vicinity of a project that would not cause or contribute to an exceedance of the relevant ambient air quality standards, while the threshold for PM_{10} represents compliance with Rule 403 (Fugitive Dust). The LST significance threshold for $PM_{2.5}$ is intended to ensure that construction emissions do not contribute substantially to existing exceedances of the $PM_{2.5}$ ambient air quality standards. The allowable emission rates depend on the following parameters:

- Source receptor area (SRA) in which the project is located
- Size of the project site
- Distance between the project site and the nearest sensitive receptor (e.g., residences, schools, hospitals)

The Project site is within SRA, 7 (East San Fernando Valley). The SCAQMD provides guidance for applying California Emissions Estimator Model (CalEEMod) to the LSTs. LST pollutant screening level concentration data is currently published for 1-, 2-, and 5-acre sites for varying distances. The maximum number of acres disturbed on the peak day was estimated using the "Fact Sheet for Applying CalEEMod to Localized Significance Thresholds" (SCAQMD 2011), which provides estimated acres per 8-hour day for crawler tractors, graders, rubber tired dozers, and scrapers. The currently proposed project would disturb approximately 3.5 acres based on the most intense construction equipment load. LSTs for a 3.5-acre site were interpolated based on the LSTs for 2-acre site and 5-acre site.

The nearest sensitive receptors are Sun Valley Park and single-family residences approximately 40 feet from the project's eastern and southern boundary respectively. Because the nearest sensitive receptor is located approximately 40 feet from the project site, the LST receptor distance was assumed to be 82 feet (25 meters), which is the closest available distance provided by the SCAQMD look up tables. 82 feet is also the shortest receptor distance available in the SCAQMD look up tables.

The construction LST values from the SCAQMD lookup tables for Source Receptor Area (SRA) 7, East San Fernando Valley, for a 3.5-acre construction site and a receptor distance of 25 meters are shown in Table 2.

Table 2. Localized Significance Thresholds for Source Receptor Area 7 (East San Fernando Valley)

Source: SCAQMD 2008a.
Notes: NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
LST thresholds were determined based on the values for 3.5-acre site at a distance of 25 meters from the nearest sensitive receptor.

In addition to the construction LST assessment, the analysis of the potential for the currently proposed project to expose sensitive receptors to substantial pollutant concentrations also evaluates potential health effects associated with CO hotspots, toxic air contaminants (TACs), and criteria air pollutants.

Threshold D: The potential for a project to result in other emissions, specifically an odor impact (CEQA Guidelines, Appendix G, Threshold 4), is based on a project's land-use types and anticipated construction activity, and the potential for a project to create an odor nuisance pursuant to SCAQMD Rule 402.

3.2 Impact Analysis

3.2.1 Would the project conflict with or obstruct implementation of the applicable air quality plan?

The project site is located within the SCAB, which includes the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties and all of Orange County, and is within the jurisdictional boundaries of SCAQMD, which is the local agency responsible for administration and enforcement of air quality regulations for the area. The SCAQMD has established criteria for determining consistency with the 2016 AQMP in Chapter 12, Sections 12.2 and 12.3, of the SCAQMD *CEQA Air Quality Handbook* (SCAQMD 1993). The criteria are:

- **Consistency Criterion No. 1**: The proposed project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP.
- **Consistency Criterion No. 2**: The proposed project will not exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

Consistency Criterion No. 1

As demonstrated in the analysis under Threshold 3.2.2, the currently proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new air quality violations. Therefore, the currently proposed project would not result in a delay in attainment of the national ambient air quality standards (NAAQS) and California ambient air quality standards (CAAQS) specified in the AQMP. As such, the currently proposed project would not conflict with Consistency Criterion No. 1 of the SCAQMD *CEQA Air Quality Handbook*.

Consistency Criterion No. 2

While striving to achieve the NAAQS for O_3 and $PM_{2.5}$ through a variety of air quality control measures, the 2016 AQMP also accommodates planned growth in the SCAB. Projects are considered consistent with, and would not conflict with or obstruct implementation of, the AQMP if the growth in socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP (per Consistency Criterion No. 2 of the SCAQMD *CEQA Air Quality Handbook*). The future emissions forecasts in the AQMP are primarily based on demographic and economic growth projections provided by the Southern California Association of Governments (SCAG). Thus, demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by SCAG for their 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) were used to estimate future emissions in the 2016 AQMP (SCAQMD 2017). On September 3rd 2020 SCAG adopted the Connect SoCal, also known as the 2020-2045 RTP/SCS (SCAG 2020). However, the AQMP that is currently in place relies on data from the 2016 RTP/SCS and has not been updated with data from the 2020 RTP/SCS. As such, this analysis references the current AQMP and the 2016 RTP/SCS.

The currently proposed project would be of a similar size, design, and land use intensity as the 2004 Project. The population growth associated with the currently proposed project would be consistent with the projected growth for the City of Los Angeles. The currently proposed project would not stimulate population growth or a population concentration or employment above what is assumed in local and regional land use plans, or in projections made by regional planning authorities, and would not result in an increase in the number of residences or jobs within the county.

Summary

As previously described, the currently proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, and would not, therefore, conflict with Consistency Criterion No. 1. Additionally, the currently proposed project would be consistent with the City of Los Angeles's General Plan, would not require a rezone, and would not create additional jobs or residences. As such, the currently proposed project would be consistent with the demographic growth forecasts in the SCAG 2016–2040 RTP/SCS (SCAG 2016). Therefore, the currently proposed project would also be consistent with the SCAQMD 2016 AQMP and the currently proposed project would not, therefore, conflict with Consistency Criterion No. 2. Based on these considerations, impacts related to the currently proposed project's potential to conflict with or obstruct implementation of the applicable air quality plan would remain less than significant. As such, the currently proposed project would not result in new significant environmental effects or in a substantial increase in the severity of a previously identified significant effect relative to consistency with an applicable air quality plan. Impacts would be less than significant for the currently proposed project. No new significant impacts would occur compared to the 2004 Project, and no previously identified significant impacts would substantially increase in severity.

3.2.2 Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard?

Construction assumptions, including timing, phasing, equipment type and quantity, as well as worker and vendor truck trips, were based on information provided by Public Works. Default values provided by CalEEMod were used

where detailed project information was not available. For purposes of estimating the currently proposed project GHG emissions, it is assumed that construction of the project would commence in December 2022 and would end in November 2031. The start date of December 2022, represented the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. The analysis contained herein is based on the following assumptions: the duration of phases is approximate:

- Phase 2
    - Mobilization – 4 months (December 2022 – April 2023)
    - Demolition – 2 months (April 2023 – June 2023)
    - Site Preparation – 1 month (June 2023 – July 2023)
    - Grading and Deep Dynamic Compaction – 3.5 years (July 2023 – January 2027)
    - Haul Excess Material – 3.5 years (July 2023 – January 2027)
    - Crush Concrete – 3.5 years (July 2023 – January 2027)
    - Drainage – 2 months (January 2027 – March 2027)
    - Clean up – 1 month (March 2027 – April 2027)
- Phase 3
    - Detention Pond (Site Preparation) – 2 months (May 2027 - July 2027)
    - Detention Pond (Grading) – 2 months (July 2027 – September 2027)
    - Wetlands (Site Preparation) – 8 months (October 2027 – May 2028)
    - Wetlands (Grading) – 8 months (May 2028 – January 2029)
    - Passive Methane Capture System – 3 months (January 2029 – April 2029)
    - Trenching for Utilities – 7 months (April 2029 – November 2029)
    - Recreational Amenities (building construction) – 7 months (November 2029 – June 2030)
    - Recreational Amenities (Paving) – 2.5 months (June 2031 – September 2031)
    - Recreational Amenities (Arch Coating) – 2.5 months (September 2031 – November 2031)

Estimated average workers and the construction equipment mix used for estimating the construction emissions of the project is based on CalEEMod defaults and is shown in Table 2, Construction Scenario Assumptions. For worker and vendor trips, the default CalEEMod assumptions for one-way trips were rounded up to the nearest even number to account for whole round-trips. For this analysis, it was generally assumed that heavy construction equipment would operate 5 days a week (22 days per month) during project construction. Grading activities are anticipated to require approximately 550,000 cubic yards of export which are captured in Haul Excess Material phase denoted in Table 3.

Notes: See Attachment A.

The CalEEMod Version 2020.4.0 was used to estimate emissions from construction of the currently proposed project. Construction emissions can vary substantially from day to day, depending on the level of activity; the specific type of operation; and, for particulate matter, the prevailing weather conditions. Therefore, such emission levels can only be approximately estimated.

Proposed construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, minimal soil disturbance, and VOC off-gassing from application of asphalt and paint) and off-site sources (i.e., on-road vendor trucks and worker vehicle trips). Internal combustion engines used by construction equipment, trucks, and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$. PM_{10} and $PM_{2.5}$ emissions would also be generated by entrained dust, which results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil. The currently proposed project would be required to comply with the SCAQMD Rule 403 to control dust emissions generated during any dust-generating activities. Additionally, the project would comply with SCAQMD Rule 1157 during concrete crushing activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering of the active dust areas two times per day, with additional watering depending on weather conditions. The currently proposed project would involve application of architectural coating (e.g., paint and other finishes) for painting the currently proposed project. The contractor is required to procure architectural coatings from a supplier that complies with the requirements of the SCAQMD's Rule 1113 (Architectural Coatings). Mitigation measures A1 – A14 from the 2004 PEIR were also captured in the emissions estimates when reductions were quantifiable. Table 4 presents the estimated maximum daily construction emissions generated during construction of the currently proposed project. Details of the emission calculations are provided in Attachment A.

Table 4. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Year	VOC	NOx	CO	SOx	PM10	PM2.5
	Pounds per day

Threshold Exceeded?	**No**	**Yes**	**No**	**No**	**No**	**No**
2004 Project Exceeded?	**No**	**No**	**Yes**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.
See Attachment A for complete results.
[1] **Source:** 2004 PEIR – Table 4.1-5B Strathern Pit Site

As shown in Table 4, the currently proposed project's construction emissions would not exceed the SCAQMD's daily thresholds except for NO_x. However, the 2004 Project EIR also exceed the SCAQMD's daily threshold for NO_x. Additionally, the currently proposed project would result in higher peak daily CO emissions than estimated in the 2004 Project EIR but CO emissions would not exceed the SCAQMD's daily thresholds. Therefore, the currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

Operational Emissions

The 2004 PEIR identified maintenance requirements of proposed facilities include sediment removal from retention facilities, separation systems, and catch basins, landscaping, maintenance of equipment such as pumps, and inspections. Each of these maintenance activities would require several personnel several times a year at each site, requiring minor vehicle and employee travel. Sediment removal from retention basins may require minor earthwork. Several project components require operation of pumps, which are expected to be electric-powered. These activities would result in minor vehicle and equipment tailpipe emissions. Dust emissions

related to earthwork may occur, but sediment removal from project facilities would likely occur under moist conditions.

The 2004 PEIR determined that operation and maintenance of specific facilities included as part of the Watershed Management Plan are expected to have minimal adverse impact on air quality and impacts were found to be less than significant in the 2004 PEIR. Operational activities associated with the currently proposed project would occur in a similar scale and intensity to what was previously analyzed in the 2004 PEIR. Therefore, the currently proposed project would not lead to new impacts, and no previously identified less than significant impacts would substantially increase in severity.

3.2.3 Expose sensitive receptors to substantial pollutant concentrations.

Localized Significance Thresholds Analysis

Sensitive receptors are those more susceptible to the effects of air pollution than the population at large. The SCAQMD considers that sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993). The nearest sensitive receptors that could potentially be subject to air quality impacts associated with the project are residential uses approximately 40 feet east and south of the project site.

LST analysis has been prepared to determine potential impacts to nearby sensitive receptors during construction of the currently proposed project.

As indicated in Section 3.1, Thresholds of Significance, the SCAQMD recommends the evaluation of localized NO_2, CO, PM_{10}, and $PM_{2.5}$ impacts to sensitive receptors in the immediate vicinity of the project site that would occur as a result of construction activities. The impacts were analyzed using methods consistent with those in the SCAQMD's Final LST Methodology (2008). According to the Final LST Methodology, "off-site mobile emissions from the currently proposed project should not be included in the emissions compared to the LSTs" (SCAQMD 2008a). Hauling of construction materials associated with currently proposed project construction is not expected to cause substantial air quality impacts to sensitive receptors along off-site roadways. Emissions from the trucks would be relatively brief in nature and would cease once the trucks pass through the main streets.

Construction activities associated with the currently proposed project would result in temporary sources of on-site fugitive dust and construction equipment emissions. Off-site emissions from vendor trucks and worker vehicle trips are not included in the LST analysis. The maximum allowable daily emissions that would satisfy the SCAQMD LSTs for SRA 7 (previously shown in Table 2) are presented in Table 5 and compared with the maximum daily on-site construction emissions generated during the currently proposed project.

Table 5. Localized Significance Thresholds Analysis for Project Construction

Pollutant	Project Construction Emissions (Pounds per Day)	LST Criteria (Pounds per Day)	Exceeds LST?
NO_2	127.66	143	No
CO	229.28	1,110	No

PM_{10}	9.96	11	No
$PM_{2.5}$	4.83	6	No

Source: SCAQMD 2008a.
Notes: LST = localized significance threshold; NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = particulate matter; $PM_{2.5}$ = fine particulate matter.
See Attachment A for detailed results.
Localized significance thresholds are shown for 3.5-acre project site corresponding to a distance to a sensitive receptor of 25 meters.
These estimates reflect control of fugitive dust required by Rule 403.
Greatest on-site NO_x, CO, PM_{10}, and $PM_{2.5}$ emissions are associated with the overlap of the hauling and DDC phases.

As shown in Table 5, construction activities would not exceed the SCAQMD daily LSTs for NO_2, CO, PM_{10} and $PM_{2.5}$ emissions in excess of site-specific LSTs; therefore, site-specific construction impacts during construction of the currently proposed project would be less than significant. The currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

Health Effects of Carbon Monoxide

With regard to localized emissions from motor vehicle travel, congested roadways and intersections have the potential to generate localized high levels of CO. The currently proposed project would be associated with fewer vehicle trips than the 2004 Project, which was found to not result in a CO hotspot. As such, the currently proposed project's mobile source emissions would not have the potential to result in a CO exceedance at any study intersection. Based on a comparative assessment of the traffic volumes at each of the study area intersections, improved ambient CO concentrations, and cleaner vehicle emissions, localized operational emissions would be less than significant for the currently proposed project. No new significant impacts would occur, and no previously identified significant impacts would substantially increase in severity.

Health Effects of Toxic Air Contaminants

In addition to impacts from criteria pollutants, impacts may include emissions of pollutants identified by the state and federal government as TACs or hazardous air pollutants (HAPs). State law has established the framework for California's TAC identification and control program, which is generally more stringent than the federal program and aimed at TACs that are a problem in California. The state has formally identified more than 200 substances as TACs, including the federal HAPs, and is adopting appropriate control measures for sources of these TACs.

The following air toxic control measures (ATCMs) are required by state law to reduce diesel particulate matter (DPM) emissions (DPMs are considered TACs):

- Fleet owners of mobile construction equipment are subject to the CARB Regulation for In-Use Off-road Diesel Vehicles (Title 13 California Code of Regulations, Chapter 9, Section 2449), the purpose of which is to reduce DPM and criteria pollutant emissions from in-use (existing) off-road diesel-fueled vehicles.
- All commercial diesel vehicles are subject to Title 13, Section 2485 of the California Code of Regulations, limiting engine idling time. Idling of heavy-duty diesel construction equipment and trucks during loading and unloading is required to be limited to 5 minutes; electric auxiliary power units should be used whenever possible.

"Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 30-year exposure period would contract cancer based on the use of standard

Office of Environmental Health Hazard Assessment (OEHHA) risk-assessment methodology (OEHHA 2015). In addition, some TACs have non-carcinogenic effects. The greatest potential for TAC emissions during construction would be DPM emissions from heavy equipment operations and heavy-duty trucks during construction of the currently proposed project and the associated health impacts to sensitive receptors.

As described for the LST analysis, PM_{10} and $PM_{2.5}$ (representative of diesel particulate matter) exposure would be less than significant. According to the Office of Environmental Health Hazard Assessment, health risk assessments (which determine the exposure of sensitive receptors to toxic emissions) should be based on a 30-year exposure period for the maximally exposed individual resident; however, such assessments should also be limited to the period/duration of activities associated with the currently proposed project. The duration of the proposed construction activities would constitute a small percentage of the total 30-year exposure period. The construction period for the currently proposed project would be approximately 8 years, after which construction-related TAC emissions would cease. However, because of the nature of the currently proposed project, emissions would not be concentrated in any one work area for the entire construction duration. Project construction would not generally remain in a single location for more than a few weeks. Due to this relatively short period of exposure and minimal particulate emissions on-site, TACs generated during construction would not be expected to result in concentrations causing significant health risks.

Regarding operations, the currently proposed project would not result in stationary sources that would emit substantial air pollutants or TACs. Based on the above considerations, the currently proposed project would not expose sensitive receptors to substantial pollutant concentrations or health risk during construction or operations, and this impact would be less than significant for the currently proposed project. No new significant impacts would occur, and no previously identified significant impacts would substantially increase in severity.

Health Effects of Other Criteria Air Pollutants

Construction and operation of the currently proposed project would not result in emissions that would exceed the SCAQMD thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

Health effects associated with O_3 include respiratory symptoms, worsening of lung disease leading to premature death, and damage to lung tissue (CARB 2019a). VOCs and NO_x are precursors to O_3, for which the SCAB is designated as nonattainment with respect to the NAAQS and CAAQS. The health effects associated with O_3 are generally associated with reduced lung function. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SCAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O_3 CAAQS/NAAQS tend to occur between April and October when solar radiation is highest. The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of quantitative methods to assess this impact. Because construction and operation of the currently proposed project would not exceed SCAQMD thresholds for VOC or NO_x, implementation of the currently proposed project would not significantly contribute to regional O_3 concentrations or the associated health effects.

Health effects associated with NO_x and NO_2 include lung irritation and enhanced allergic responses (CARB 2019b). Because currently proposed project construction would not generate NO_x emissions that would exceed the SCAQMD mass daily thresholds and because the SCAB is designated as in attainment of the NAAQS and CAAQS for NO_2 and

the existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards, the currently proposed project would not contribute to exceedances of the NAAQS and CAAQS for NO_2 or result in significant health effects associated with NO_2 and NO_x.

Health effects associated with CO include chest pain in patients with heart disease, headache, light-headedness, and reduced mental alertness (CARB 2019c). CO tends to be a localized impact associated with congested intersections. The associated potential for the project to cause CO hotspots was discussed previously and was determined to be less than significant. Thus, the project's CO emissions would not result in significant health effects associated with this pollutant.

Health effects associated with particulate matter (or $PM_{2.5}$ and PM_{10}) include premature death and hospitalization, primarily for worsening of respiratory disease (CARB 2017). Construction and operation of the currently proposed project would not exceed thresholds for PM_{10} or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or obstruct the SCAB from coming into attainment for these pollutants. The currently proposed project would also not result in substantial DPM emissions during construction and operation, and therefore, would not result in significant health effects related to DPM exposure. Additionally, the project would implement construction dust control strategies and be required to comply with SCAQMD Rule 403, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, the currently proposed project would not result in significant health effects associated with PM_{10} or $PM_{2.5}$.

In summary, construction and operation of the currently proposed project would not result in exceedances of the SCAQMD significance thresholds for criteria pollutants, and potential health impacts associated with criteria air pollutants would be less than significant for the currently proposed project. No new significant impacts would occur, and no previously identified significant impacts would substantially increase in severity.

3.2.4 Result in other emissions (such as those leading to odors) that would adversely affect a substantial number of people

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public and generate citizen complaints. Other emissions that could affect a substantial number of people include emissions of hazardous building materials during demolition, such as asbestos and lead.

As discussed previously, construction impacts described in the certified 2004 PEIR are not anticipated to change under the currently proposed project. Construction-related odors for the currently proposed project would be the same or similar to those of the 2004 Project. As impacts related to construction odors were found to be less than significant in the certified 2004 PEIR, impacts associated with the currently proposed project would also be less than significant, and no new impacts would occur.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting operations, refineries, landfills, dairies, and fiberglass molding facilities (SCAQMD 1993). The project (under both its 2004 and currently proposed forms) would not include any such odor-generating land uses. No other sources of objectionable odors were identified in the 2004 PEIR for the 2004 Project. The project modifications would not involve a change in the land use mix of the project that would

introduce an odor-causing use. Additionally, operation of the currently proposed project would not involve other emissions that would affect a substantial number of people, aside from those discussed previously under the thresholds above. As such, impacts would remain less than significant for the currently proposed project. The currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

3.3 Mitigation Measures

The following mitigation measures from the 2004 PEIR were required for the project as originally proposed and will be required for the currently proposed project.

A-1 Clean dirt from construction vehicle tires and undercarriages when leaving the construction site and before entering local roadways.

A-2 During earth-moving activities, water the construction area as necessary, but at least twice per day

A-3 Water temporary open storage plies once per hour or install temporary covers

A-4 Water unpaved roadways three times per day or apply non-toxic soil stabilizers.

A-5 Limit construction vehicle speed on the project site to 15 miles per hour (mph) or less

A-6 Cover dirt in trucks during on-road hauling

A-7 Cease earth-moving activities on days when gusts exceed 25 mph or apply water to soil not more than 15 minutes prior to moving such soil

A-8 Sweep streets near the construction area at the end of the day if visible soil material is present.

A-9 For applicable construction areas, establish a vegetative groundcover as soon as feasible after active operations have ceased. Groundcover will be of sufficient density to expose less than 30 percent of unestablished ground within 90 days of planting

A-10 Per SCAQMD Rule 403(f), large construction operations will 1) implement fugitive dust suppression measures as specified in Tables 1 and 2 of Rule 403, or 2) prepare a fugitive dust emissions control plan and obtain approval from SCAQMD

A-11 Prohibit all vehicles from idling in excess of 10 minutes, both on and off-site.

A-12 Maintain construction equipment in proper tune.

A-13 Encourage contractors to establish trip reduction plans. The goal of these plans will be to achieve a 1.5 average vehicle ridership for construction employees.

A-14 Select construction equipment with low pollutant emissions and high energy efficiency. Factors to consider include model year and alternative fuels (e.g., compressed natural gas, biodiesel, emulsified diesel, methanol, propane, butane, and low sulfur diesel).

4 Greenhouse Gas Emissions Assessment

Since certification of the 2004 PEIR, updates to the CEQA Guidelines have gone into effect. Specifically, in 2009 the California Natural Resources Agency adopted new guidelines requiring lead agencies to analyze GHGs under section 15064.4. As such, GHG impacts were not addressed in the 2004 PEIR. The 2013 Addendum's analysis found GHG impacts to be less than significant.

4.1 Thresholds of Significance

The significance criteria used to evaluate the project impacts to greenhouse gases/climate change are based on Appendix G of the CEQA Guidelines. (These significance thresholds have not changed since the time of the 2013 Addendum.) According to Appendix G of the CEQA Guidelines, a significant impact related to greenhouse gas emissions would occur if the project would:

A. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

B. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established thresholds for assessing whether the GHG emissions of a project, such as the approved or currently proposed project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change. In addition, while GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008), GHG emissions impacts must also be evaluated at a project level under CEQA.

The CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures for GHGs. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). The State of California has not adopted emission-based thresholds for GHG emissions under CEQA. The Governor's Office of Planning and Research's Technical Advisory titled "CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review" states that "public agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact" (OPR 2008). Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,'

individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice." Section 15064.7(c) of the CEQA Guidelines specifies that "when adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

Status of Proposed SCAQMD Thresholds

In October 2008, the SCAQMD proposed recommended numeric CEQA significance thresholds for GHG emissions for lead agencies to use in assessing GHG impacts of residential and commercial development projects as presented in its *Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold* (SCAQMD 2008b). This guidance document, which builds on the previous guidance prepared by the CAPCOA, explored various approaches for establishing a significance threshold for GHG emissions. The draft interim CEQA thresholds guidance document was not adopted or approved by the Governing Board. However, in December 2008, the SCAQMD adopted an interim 10,000 MT CO_2e per-year screening level threshold for stationary source/industrial projects for which the SCAQMD is the lead agency (see SCAQMD Resolution No. 08-35, December 5, 2008).

The SCAQMD formed a GHG CEQA Significance Threshold Working Group to work with SCAQMD staff on developing GHG CEQA significance thresholds until statewide significance thresholds or guidelines are established. From December 2008 to September 2010, the SCAQMD hosted working group meetings and revised the draft threshold proposal several times, although it did not officially provide these proposals in a subsequent document. The SCAQMD has continued to consider adoption of significance thresholds for residential and general land use development projects. The most recent proposal, issued in September 2010, uses the following tiered approach to evaluate potential GHG impacts from various uses (SCAQMD 2010):

Tier 1 Determine if CEQA categorical exemptions are applicable. If not, move to Tier 2.

Tier 2 Consider whether or not the proposed project is consistent with a locally adopted GHG reduction plan that has gone through public hearing and CEQA review, that has an approved inventory, includes monitoring, etc. If not, move to Tier 3.

Tier 3 Consider whether the project generates GHG emissions in excess of screening thresholds for individual land uses. The 10,000 MT CO_2e per year threshold for industrial uses would be recommended for use by all lead agencies. Under option 1, separate screening thresholds are proposed for residential projects (3,500 MT CO_2e per year), commercial projects (1,400 MT CO_2e per year), and mixed-use projects (3,000 MT CO_2e per year). Under option 2, a single numerical screening threshold of 3,000 MT CO_2e per year would be used for all non-industrial projects. If the project generates emissions in excess of the applicable screening threshold, move to Tier 4.

Tier 4 Consider whether the project generates GHG emissions in excess of applicable performance standards for the project service population (population plus employment). The efficiency targets were established based on the goal of Assembly Bill (AB) 32 to reduce statewide GHG emissions to 1990 levels by 2020. The 2020 efficiency targets are 4.8 MT CO_2e per service population for project level analyses and 6.6 MT CO_2e per service population for plan level analyses. If the project generates emissions in excess of the applicable efficiency targets, move to Tier 5.

Tier 5 Consider the implementation of CEQA mitigation (including the purchase of GHG offsets) to reduce the project efficiency target to Tier 4 levels.

To determine the currently proposed project's potential to generate GHG emissions that would have a significant impact on the environment, the project's GHG emissions were compared to the non-industrial quantitative threshold of 3,000 MT CO_2e per year. Because the currently proposed project does not include operational sources of emissions, and because the currently proposed project does not conform to the standard land use types, the 3,000 MT CO_2e per year threshold, which was identified under Tier 3 Option 1, was applied herein. Per the SCAQMD guidance, construction emissions should be amortized over the operational life of the currently proposed project, which is assumed to be 30 years (SCAQMD 2008b). This impact analysis, therefore, compares amortized construction emissions to the proposed SCAQMD threshold of 3,000 MT CO_2e per year.

4.2 Impact Analysis

4.2.1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Emissions

Construction of the currently proposed project would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road vendor and haul trucks, and worker vehicles. The CalEEMod was used to estimate GHG emissions during construction consistent with the assumptions presented in Section 3.2.2. On-site sources of GHG emissions include off-road equipment and off-site sources include on-road vehicles (vendor trucks, haul trucks and worker vehicles). Table 6 presents construction GHG emissions for the currently proposed project from on-site and off-site emission sources.

Table 6. Estimated Annual Construction GHG Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2022	7.75	<0.01	<0.01	7.78
2023	2,694.37	0.66	0.08	2,734.11
2024	5,134.26	1.28	0.16	5,215.07
2025	5,092.88	1.27	0.16	5,172.46
2026	5,071.13	1.27	0.16	5,149.79
2027	602.08	0.17	0.01	608.64
2028	625.22	0.19	<0.01	630.54
2029	208.45	0.06	<0.01	210.15
2030	194.57	<0.01	<0.01	195.32
2031	79.40	<0.01	<0.01	79.52
			Total	**20,003.38**
Amortized emissions over 30 years (metric tons per year)				666.78

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Attachment A for complete results

As shown in Table 6, the estimated total GHG emissions in would be approximately 20,003 MT CO_2e. Amortized over 30 years, construction GHG emissions would be approximately 667 MT CO_2e per year. In addition, as with project-generated construction criteria air pollutant emissions, GHG emissions generated during proposed construction activities would be short term, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions.

Operational Emissions

The 2004 PEIR identified maintenance requirements of proposed facilities include sediment removal from retention facilities, separation systems, and catch basins, landscaping, maintenance of equipment such as pumps, and inspections. Each of these maintenance activities would require several personnel several times a year at each site, requiring minor vehicle and employee travel. Sediment removal from retention basins may require minor earthwork. Several project components require operation of pumps, which are expected to be electric-powered. These activities would result in minor vehicle and equipment GHG emissions. As previously mentioned, GHG impacts were not addressed in the 2004 PEIR and the 2013 Addendum's analysis found GHG impacts to be less than significant.

Operational activities associated with the currently proposed project would occur in a similar scale and intensity to what previously analyzed in the 2013 Addendum. As shown in Table 6, amortized project-generated construction emissions would not exceed the 3,000 SCAQMD threshold. As such, impacts would remain less than significant for the currently proposed project. The currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

4.2.2 Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Consistency with County's Community Climate Action Plan (CCAP)

The County's CCAP includes 26 local community actions to reduce GHG emissions from the County's GHG sources. The community actions are grouped into five strategy areas, listed below. Following each strategy area, a qualitative analysis as to how each strategy relates to the currently proposed project is provided. The currently proposed project would become operational outside of the applicable timeline to tier from the County's CCAP; therefore, consistency with the County's was not utilized to determine significance of GHG impacts, and this discussion is provided for disclosure purposes.

1. **Green Building and Energy.** The currently proposed project would be designed to meet the standards for Cal Green and Title 24 at the time of construction. By meeting the standards the project would be consistent with the Green Building and Energy strategies of the CCAP.
2. **Land Use and Transportation.** Per the parking requirements of Cal Green, a percentage of the total number of parking stalls would include electrical vehicle charging stations.
3. **Water Conservation and Wastewater.** The currently proposed project would comply with Title 24 and Cal Green requirements to reduce water and wastewater consumption and production.

4. **Waste Reduction, Reuse, and Recycling.** The currently proposed project would be required to reduce construction waste. These measures would support the CCAP's actions for waste reduction.

5. **Land Conservation and Tree Planting.** The currently proposed project would expand open space within the County and result in a net increase in the number of trees at the project site.

Therefore, the currently proposed project would be consistent with the County's CCAP.

Consistency with the Southern California Association of Governments 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy

SCAG's 2016 RTP/SCS is a regional growth-management strategy that targets per capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region. The 2016 RTP/SCS incorporates local land use projections and circulation networks in city and county general plans. The 2016 RTP/SCS is not directly applicable to the project because the purpose of the 2016 RTP/SCS is to provide direction and guidance by making the best transportation and land use choices for future development. The currently proposed project would not conflict with implementation of the strategies identified in the 2016 RTP/SCS that would reduce GHG emissions.

Consistency with the CARB Scoping Plan, SB 32, and EO S-3-05

The project would not impede the attainment of the GHG reduction goals for 2030 or 2050 identified in Executive Order S-3-05 and Senate Bill (SB) 32. Executive Order S-3-05 establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. While there are no established protocols or thresholds of significance for that future year analysis, CARB forecasts that compliance with the current Scoping Plan puts the state on a trajectory of meeting these long-term GHG goals, although the specific path to compliance is unknown (CARB 2014).

CARB has expressed optimism with regard to both the 2030 and 2050 goals. It states in the First Update to the Climate Change Scoping Plan that "California is on track to meet the near-term 2020 GHG emissions limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). With regard to the 2050 target for reducing GHG emissions to 80% below 1990 levels, the First Update to the Climate Change Scoping Plan states that the level of reduction is achievable in California (CARB 2014). CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, SB 32, and Executive Order S-3-05. This is confirmed in the *Second Update*, which states (CARB 2017):

> The Proposed Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while also identifying new, technologically feasibility and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Proposed Plan is developed to be consistent with requirements set forth in AB 32, SB 32, and AB 197.

The project's consistency with the State's Scoping Plan would assist in meeting the City's contribution to GHG emission reduction targets in California. With respect to future GHG targets under SB 32 and Executive Order S-3-05, CARB has also made clear its legal interpretation that it has the requisite authority to adopt whatever regulations are necessary, beyond the AB 32 horizon year of 2020, to meet the SB 32 40% reduction target by 2030 and the Executive Order S-3-05 80% reduction target by 2050. This legal interpretation by an expert agency provides evidence that future regulations will be adopted to continue the trajectory toward meeting these future GHG targets.

Based on the above considerations, the currently proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. As such, impacts would remain less than significant for the currently proposed project. The currently proposed project would not lead to new impacts, and no previously identified significant impacts would substantially increase in severity.

5 Energy Assessment

Since certification of the 2004 PEIR and 2013 Addendum, updates to the CEQA Guidelines have gone into effect. One of the updates involves the introduction of recommended thresholds for impacts associated with energy consumption. At the time of 2004 PEIR certification and 2013 Addendum, the CEQA Guidelines provided no specific thresholds for energy impacts.

The analysis in this memorandum relies on the most recent version of the Appendix G thresholds, since this memorandum is prepared after the CEQA amendments went into effect and in the interest of providing the public and decision makers with as much information on the environmental consequences as possible. As such, this memorandum includes an analysis of the currently proposed project's energy impacts, using the energy thresholds from the latest version of Appendix G of the CEQA Guidelines.

5.1 Thresholds of Significance

The significance criteria used to evaluate the project impacts to energy are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to energy would occur if the currently proposed project would:

A. Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

B. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

5.2 Impacts Analysis

5.2.1 Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Construction

Electricity Use

Temporary electric power for as-necessary lighting and electronic equipment would be provided by LADWP. The amount of electricity used during construction would be minimal, as demand would primarily stem from use of electrically powered hand tools, trailers and site lighting. The electricity used for construction activities would be temporary and minimal; therefore, currently proposed project construction would not result in wasteful, inefficient, or unnecessary consumption of electricity. Impacts would be less than significant.

Natural Gas

Natural gas is not anticipated to be required during construction. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed under the subsection "Petroleum." Any minor amounts of natural gas that may be consumed as a result of project construction would be temporary and negligible and would not have an adverse effect; therefore, construction would not result in wasteful, inefficient, or unnecessary consumption of natural gas. Impacts would be less than significant.

Petroleum

Petroleum would be consumed throughout construction. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction. Transportation of construction materials and construction workers would also result in petroleum consumption. Heavy-duty construction equipment, vendor trucks, and haul trucks would use diesel fuel. Construction workers would likely travel to and from the currently proposed project area in gasoline-powered vehicles. Construction of Phase 2 is expected to take approximately 4 years, beginning in 2022 and ending in 2027. Then construction of Phase 3 would start in 2027 and end in 2031 lasting approximately an additional 4 years.

Fuel consumption from construction equipment was estimated by converting the total carbon dioxide (CO_2) emissions from each construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton (MT) CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per MT CO_2 per gallon (The Climate Registry 2021).

The estimated diesel fuel usage from construction equipment, haul trucks, and vendor trucks, as well as estimated gasoline fuel usage from worker vehicles is shown in Table 7.

Table 7. Construction Petroleum Demand

Project	Off-road Equipment (diesel)	Haul Trucks (diesel)	Vendor Trucks (diesel)	Worker Vehicles (gasoline)
	Gallons			
Mobilization	4,821	0	159.38	603
Demolition	24,711	155	491.35	666
Site Preparation	2,105	0	109.19	197
Deep Dynamic Compaction	500,242	0	6,471.07	12,803
Haul Excess Material	329,496	298,603	6,471.11	12,803
Crush Concrete	559,416	0	3,570.93	5,975
Drainage	609	0	152.46	274
Clean Up	2,453	0	0	91
Detention Pond (Site Preparation)	7,765	0	0	368
Detention Pond (Grading)	14,800	0	279.14	479
Wetlands (Site Preparation)	17,183	0	0	794
Wetlands (Grading)	45,744	0	846.12	1,438
Passive Methane System construction	3,281	0	0	154
Trenching for Utilities	9,020	0	0	662
Recreational Components (Building Construction)	18,948	0	991.93	3,050
Recreational Components (Paving)	6,499	0	0	350
Recreational Components (Architectural Coating)	688	0	0	350
Total	**1,547,781**	**298,758**	**19,543**	**41,057**

Note: See Attachment A for complete results

In summary, construction of the currently proposed project over 8 years is conservatively anticipated to consume 41,057 gallons of gasoline and 1,866,082 gallons of diesel. Averaged over 8 years, it is anticipated that the project would consume on average 5,132 gallons of gasoline and 233,260 gallons of diesel per year.

For disclosure only, by comparison, California as a whole consumes approximately 29 billion gallons of petroleum per year. Countywide total petroleum use by on-road vehicles only (i.e., not including construction off-road equipment) is expected to be 1.4 billion gallons per year in 2020 (CARB 2020). Based on these assumptions, the project would require a fraction of the petroleum that would be consumed in California and Countywide over the course of the construction period. Therefore, impacts to energy resources during construction would be less than significant.

Operation

Electricity Use

Project operation would require electricity for the 15 acres of park space and ancillary electronic equipment, pump station associated with the wetland and detention pond and necessary lighting. CalEEMod was used to estimate project emissions from electricity uses (see Attachment A). The currently proposed project is anticipated to require approximately 631,320 kilowatt-hours of electricity pear year. Electricity is supplied to the project site by LADWP. Annual retail sales of electricity in LADWP's service area was estimated to be approximately 22 billion kWh in 2019 (CEC 2021). The increase in electricity consumption that would be associated with the proposed project represents approximately 0.003% of LADWP's total electricity sales in 2019. As such, the increase in electricity demand at the project site would be negligible relative to the electricity use in LADWP's service area. Therefore, electricity consumption of the proposed project would not be considered inefficient or wasteful, and impacts would be less than significant.

Natural Gas

Natural gas is not anticipated to be required during operation. Fuels used for operation would primarily consist of diesel and gasoline, which are discussed under the subsection "Petroleum." Any minor amounts of natural gas that may be consumed as a result of project operation would be temporary and negligible and would not have an adverse effect; therefore, construction would not result in wasteful, inefficient, or unnecessary consumption of natural gas. Impacts would be less than significant.

Petroleum

During operations, the majority of fuel consumption resulting from the proposed project would involve the use of motor vehicles traveling to and from the project site for periodic maintenance. Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of the vehicle miles traveled as a result of project operation. Based on the 8.78 Kilograms CO_2 per gallon of gasoline, the currently proposed project is anticipated to require 39,000 gallons of petroleum annually during operation (Climate Registry 2021). By comparison, approximately 1.4 billion gallons of petroleum are consumed in Los Angeles County per year (CARB 2020). As such, project operations would not result in wasteful, inefficient, or unnecessary consumption of petroleum, and impacts would be less than significant.

5.2.2 Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

As with the 2004 Project, the currently proposed project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR, Part 6). Part 6 of Title 24 establishes energy efficiency standards for residential and non-residential buildings constructed in California in order to reduce energy demand and consumption. As such, the currently proposed project would comply with the California code requirements for energy efficiency.

Additionally, as discussed in Section 4 (Greenhouse Gas Emissions), the currently proposed project would not conflict with the various local plans that would reduce energy use, including the County's CCAP. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Based on the analysis above, the currently proposed project would not have a significant impact relative to energy consumption. As such, the currently proposed project would not lead to new impacts in the category of energy, and no previously identified significant impacts would substantially increase in severity.

6 Conclusions

Criteria air pollutant emissions generated during construction and operation of the currently proposed project would not exceed SCAQMD's significance thresholds and would be less than the emissions that would be generated by the 2004 Project. Therefore, the currently proposed project would result in a less than significant impact. No new significant impacts would occur in the category of air quality, and no previously identified significant impacts would substantially increase in severity.

Estimated total GHG emissions generated during construction and operation of currently proposed project, including amortized construction emissions, would be less than those associated with the 2004 Project. As demonstrated herein, the currently proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Accordingly, potential cumulative GHG impacts for the currently proposed project would be less than significant. No new significant impacts would occur in the category of GHG emissions, and no previously identified significant impacts would substantially increase in severity.

Estimated energy demand generated during construction and operation of the currently proposed project in the form of electricity, natural gas, and petroleum consumption would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during currently proposed project construction or operation, as demonstrated herein. Additionally, the currently proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Impacts of the currently proposed project would be less than significant. No new significant impacts would occur in the category of energy, and no previously identified significant impacts would substantially increase in severity.

Attachment A

CalEEMod Emissions Outputs

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Rory M. Shaw Wetlands Park - Phase 2

South Coast AQMD Air District, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Non-Asphalt Surfaces	21.25	Acre	21.25	925,650.00	0
Parking Lot	160.00	Space	1.44	64,000.00	0
City Park	46.00	Acre	23.31	2,003,760.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	12			**Operational Year**	2026
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	390.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CalEEMod defaults.

Land Use - 46 acres in total

Construction Phase - Construction phasing information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

Off-road Equipment - Construction equipment information provided by County Public Works.

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment - Construction equipment information provided by County Public Works.

Trips and VMT - Construction trip information provided by County Public Works.

Grading - 550,000 CY of export

Vehicle Trips - Consistient with traffic

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Construction Off-road Equipment Mitigation - Compliance with Rule 403 and mitigation measures A1 - A14.

Fleet Mix - CalEEMod Defaults.

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Mobilize - 2022

Unmitigated Construction On-Site

Chapter 1
Introduction

This report contains the results of a biological resources habitat assessment conducted for the Rory M. Shaw Wetlands Park Project located in the community of Sun Valley, City of Los Angeles, Los Angeles County, California.

1.1 Project Location

The approximate 46.62-acre Rory M. Shaw Wetlands Park Project (project) is located in the community of Sun Valley within the City of Los Angeles, Los Angeles County, California. The project site is bounded by Strathern Street to the south, Tujunga Avenue to the west, industrial operations and a barren field to the north, and Fair Avenue to the east (Figure 1; see Appendix A for all figures).

The project site is located within un-sectioned lands in Township 2 North, Range 14 West, on the Burbank, California (USGS 1967a) and Van Nuys, California (USGS 1967b) U.S. Geological Survey (USGS) 7.5-minute quadrangle maps (Figure 2).

1.2 Project Description

The project is part of a collaborative effort by the Los Angeles County Flood Control District, the City of Los Angeles, and the Sun Valley Watershed Stakeholders Group to address major flooding problems in the community of Sun Valley. The project's objective is to retain stormwater runoff and reduce stormwater pollution while at the same time increasing water conservation efforts, creating recreational opportunities, and improving the quality of wildlife habitat.

Currently the 46.62-acre Rory M. Shaw Wetlands Park project site consists of an inert landfill comprising mostly concrete, dirt, rocks, and other solid waste. The project consists of converting the inert landfill into a multipurpose wetlands park featuring a 21-acre detention pond with the capacity to store runoff and reduce flooding in the surrounding area, a 10-acre natural stormwater treatment wetland, and 15 acres of open space to be used for recreational purposes.

Construction of the project will occur in three phases. Phase 1 consists of the site investigations and demolition of existing structures on-site. This was completed in 2017. Phase 2 will consist of the over-excavation and rough grading of the project site. Phase 3 consists of fine grading and all remaining above-ground improvements. Construction of the project is expected to take approximately 4 years for Phase 2 and 2 years for Phase 3.

Chapter 2
Methods

2.1 Terminology

Within this report, the term *project site* refers to the approximate 46.62-acre parcel where impacts will occur. The term *study area* refers to the 46.62-acre project site plus an additional 300-foot buffer. Special-status species referred to in this report include those wildlife and plants listed as threatened or endangered under federal or state Endangered Species Acts; plant species designated by the California Native Plant Society (CNPS) with a California Rare Plant Rank (CRPR) of 1A, 1B, 2A, 2B or other plants of local concern (CNPS 2019); and wildlife that are designated as a California Species of Special Concern (SSC), as defined by California Department of Fish and Wildlife (CDFW).

2.2 Literature Review

A literature review was conducted to evaluate the habitat suitability and environmental setting of the study area prior to the site visit and identity potential special-status species that may occur on site. The review included a review of the California Natural Diversity Database (CNDDB) (CDFW 2019a) and a review of the CNPS Inventory of Rare and Endangered Plants (CNPS 2019) for the Van Nuys, California (USGS 1967b) and surrounding 7.5-minute USGS quadrangles. The U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO 2006) and the latest mapping of U.S. Fish and Wildlife Service (USFWS) designated Critical Habitat was reviewed (USFWS 2019). In addition, the USFWS Information for Planning and Consulting (IPaC) database results for the project site were reviewed.

2.3 Habitat Assessment Methodology

ICF senior biologist Paul Schwartz conducted a habitat assessment for special-status plant and animal species within the study area on June 5, 2019. The habitat assessment was conducted between 9 a.m. and 12 p.m. Temperatures ranged from 66 to 71 degrees Fahrenheit. Winds were calm and cloud cover was overcast becoming clear. Visibility was good.

The entire project site was accessible and reviewed on foot or via binoculars during the site visit. The project site and buffer area was viewed on Google Earth (Google Earth 2019) at various scales using multiple historical imagery (August 1989–November 2018) prior to the habitat assessment.

All plant and wildlife species observed or otherwise detected during the habitat assessment were recorded in a field notebook. Common plant species observed were identified by visual characteristics and morphology in the field. Any unusual and less-familiar plants were identified in the office using taxonomic keys and guides. Taxonomic nomenclature for plants follows *The Jepson Manual Vascular Plants of California* (Baldwin et al. 2012). A complete list of all plant species observed during the site visits is found in Appendix B of this document.

Wildlife species were detected by sight, calls, tracks, scat, or other sign. Field guides were used to assist with identification of species during surveys and included the *National Geographic Field Guide*

to the Birds of North America (2002) for birds, *Western Reptiles and Amphibians* (Stebbins 2003) for reptiles, and *A Field Guide to the Mammals of North America* (Reid 2006) for mammals. A complete list of all animal species observed during the site visits is found in Section 3.5, *Wildlife,* of this report.

Vegetation within the project site was mapped during the habitat assessment on an aerial image of the site taken from Google Earth (Google Earth 2019) (1 inch = 300 feet scale). Where possible, community descriptions from the *Manual of California Vegetation* (Sawyer et al. 2009) were used.

2.4 Survey Limitations

Plant and animal observations were temporally limited due to the timing of the 2012 and 2019 surveys (early May and June). As such, it is important to note that additional species beyond those observed in this evaluation may use the study area but may not have been detected. For example, some species may not have been found because they were not present at the time of day or time of year that the field work was conducted. Some special survey methods may be required to determine the presence or absence of some species (e.g., nighttime surveys for bats). Therefore, the wildlife species observed and noted in this report and the plant species observed and noted in Appendix C are not intended to be complete lists of species present within the study area; rather they include only those species observed during the 2012 and 2019 site visits.

2.5 Regulatory Constraints

All applicable local, state, and federal laws and regulations, as well as court precedents enacted to protect and/or manage biological resources, were evaluated for their relevance and potential to constrain the proposed project. The analysis of constraints provided in this report is based on a combination of direct evaluation of the site, current regulatory information, and professional judgment.

The federal and state laws listed below represent some of the laws initially considered during all constraint analyses conducted by ICF. Note that many of these regulations may not be directly applicable to the project at hand; however, the applicability of each was considered to determine potential constraints to the project under consideration. For each law, applicable amendments to the original, resulting regulations empowered therein, and relevant judicial precedent were included.

2.5.1 Federal Regulations

The federal laws listed below were considered during evaluation of the biological resources on the project site. Note that this is not an exhaustive list of all federal laws that could be considered.

- Endangered Species Act of 1973 (including designated critical habitat for listed species).
- Environmental Quality Improvement Act of 1970.
- Federal Water Pollution Control Act (Clean Water Act).
- Fish and Wildlife Act of 1956.
- Migratory Bird Treaty Act.
- National Environmental Policy Act of 1969.

2.5.2 State Regulations

The following state laws and regulations were considered during evaluation of the biological resources on the project site. Note that this is not an exhaustive list of all state laws and regulations that could be considered.

- California Environmental Quality Act (CEQA) (Public Resources Code Sections 21000–21177, State CEQA Guidelines Sections 15000–15387).
- California Fish and Game Code (including codes for the state Endangered Species Act, those similar to the federal Migratory Bird Treaty Act [MBTA], those for lake or streambed alteration agreements, and those for navigation dredging permits).

2.5.3 Local Regulations

The following local regulation was considered during evaluation of the biological resources on the project site. Note that this is not an exhaustive list of all state laws and regulations that should be considered.

- City of Los Angeles Protected Tree Ordinance (Ordinance 177404). The ordinance protects the following trees that are 4 inches or more in diameter at 4.5 feet from the ground surface: coast live oak (*Quercus agrifolia*), valley oak (*Quercus lobata*), any other native oak tree indigenous to California excluding scrub oaks (except *Quercus dumosa*), western sycamore (*Platanus racemosa*), California bay (*Umbellaria californica*), and southern California black walnut (*Juglans californica* var. *californica*).

Chapter 3
Existing Conditions

The following describes the conditions and biological resources observed or potentially present on the project site and/or study area. Appendix B provides photographs depicting current 2019 site conditions. Appendix C lists all plant species observed on site in 2012 and 2019.

3.1 Environmental Setting

The project site consists largely of an inert landfill used to store cement, bricks, soil, rock, and other solid waste. Approximately 17.8 acres of the project site consists of solid waste debris piles supporting ruderal vegetation. An additional 6.5 acres of the site consists of a concrete pad, which formerly contained a concrete batch plant that has been demolished since the 2012 site visit. The perimeter of the project site is fenced off with chain link fencing. There are three access points for entering the project site, all of which are locked. The main access point is in the northwest corner of the project site off Tujunga Avenue. A secondary access point is in the southwest corner of the project site at the corner of Strathern Street and Tujunga Avenue. A third, less used access point is in the southeast corner of the site at the intersection of Strathern Street and Fair Avenue. There is one main access road within the project site that crosses from the northeast to the southwest corners and then traverses the southern edge before turning north and following the eastern edge back to the northeast corner of the project site.

The inside perimeter of the project site is raised in relation to the central portion, creating what would appear to be a basin. No drainages or water courses were observed in the project site. There are some erosion rills in the northern portion of the project site on the steep slope south of the demolished concrete batch plant. The majority of the site consists of disturbed/developed areas supporting ruderal or ornamental vegetation. There are a few relict areas of native habitat such as California sagebrush-buckwheat scrub and thick-leaved yerba santa scrub. There are also two large coast live oak (*Quercus agrifolia*) trees in the southern portion of the project site, and a small southern California black walnut in the northwest corner of the project site. Each land use or vegetation type is depicted on Figure 3, and detailed descriptions for each are provided in Section 3.2, *Vegetation/Land Uses*.

The project site is surrounded by residential communities and parks to the south and east, and recreational (golf driving range and soccer complex) and industrial uses to the west and north. There is some native landscaping (coastal sage scrub species) along the perimeter of the property to the west of the project site. However, the spacing, adjacency to Tujunga Avenue, and relative remoteness of the plantings in relation to other native habitat provides only marginal to low-quality habitat for native species.

3.2 Vegetation/Land Uses

The majority of the project site is heavily disturbed, consisting of debris piles supporting ruderal and ornamental vegetation and non-native grassland. Approximately 0.59 acre of the project site supports native habitat. Table 3.1 depicts the vegetation communities/land uses and acreages for

each community/land use mapped on the project site. Figure 3 depicts the location of each vegetation community/land use within the project site. Each vegetation community/land use is described below the table in detail. California sagebrush-California buckwheat scrub can be considered to be a sensitive vegetation community by CDFW. However, the high non-native cover associated with the community and the small, isolated, patchy nature of the community on the site significantly reduces the biological functions and value of the community compared to relatively undisturbed scrub that is contiguous with additional native habitat or scrub habitat.

Table 3-1. Vegetation Communities/Land Uses

Vegetation Community/Land Use	Project Site Acreage
California Sagebrush-California Buckwheat Scrub	0.48
Thick-leaved Yerba Santa Scrub*	0.06
Coast Live Oak*	0.05
Wild Oats Grassland	11.08
Ruderal	17.84
Ornamental	1.69
Disturbed*	8.91
Developed	6.51
Total	**46.62**

*Denotes a vegetation community that was not mapped in the 2012 assessment.

3.2.1 California Sagebrush-California Buckwheat Scrub

The project site supports approximately 0.48 acre of California Sagebrush-California Buckwheat Scrub consisting of four small isolated patches distributed throughout the project site. The California Sagebrush-California Buckwheat Scrub within the project site is dominated by California buckwheat (*Eriogonum fasciculatum*), with some individuals of California sagebrush (*Artemisia californica*) and California encelia (*Encelia californica*). Additional plants observed in association with this community include purple sage (*Salvia leucophylla*), deerweed (*Acmispon glaber*), white sage (*Salvia apiana*), and annual sunflower (*Helianthus annuus*). There is also a substantial cover (approximately 40-50 percent) of non-native or ruderal vegetation within this community consisting mostly of tree tobacco (*Nicotiana glauca*), red brome, rip-gut brome (*Bromus diandrus*), and Russian thistle (*Salsola tragus*). Portions of the California sagebrush-California buckwheat scrub in the southern portion of the project site have a substantial cover of scale broom (*Lepidosparteum junceum*) and golden aster (*Heterotheca sessiflora*).

3.2.2 Thick-leaved Yerba Santa Scrub

The project site supports 0.06 acre of Thick-leaved Yerba Santa Scrub dominated by yerba santa (*Eriodictyon crassifolium*). Additional plants in this community consist of wild oats (*Avena* sp.), rip-gut brome, red brome, smilo grass (*Stipa milacea* var. *miliacea*), London rocket, cheeseweed (*Malva parviflora*), long-beaked storksbill (*Erodium botrys*), and telegraph weed (*Heterotheca grandiflora*).

3.2.3 Coast Live Oak

Two coast live oak trees (*Quercus agrifolia*) are located in the southeastern portion of the project site within this plant community, which covers 0.05 acre. Both trees appear stunted; however, one is larger than the other. The diameter at breast height was greater than 4 inches for both trees.

3.2.4 Wild Oats Grassland

The project site supports approximately 11.08 acres of Wild Oats Grassland. This vegetation community is located throughout the outer portions of the project site. Plant species observed within this vegetation community consist of wild oats (*Avena* sp.), rip-gut brome, soft chess (*Bromus hordeaceus*), red brome, Bermuda grass (*Cynodon dactylon*), rye grass (*Festuca perennis*), smilo grass, barley (*Hordeum vulgare*), London rocket, bi-color lupine (*Lupinus bicolor*), cheeseweed, long-beaked storksbill, shortpod mustard, and telegraph weed.

3.2.5 Ruderal

The project site contains approximately 17.84 acres of ruderal vegetation associated with the debris piles. The debris piles consist of solid waste piles approximately 5 feet in height, which are arranged in lines (east to west) across the project site. The piles are composed of cement, bricks, soil, rock, and other inert solid waste. This area supports a high cover of native and non-native ruderal plant species consisting of red brome, rip-gut brome, smilo grass, wild oats, fountain grass (*Pennisetum seticeum*), tree tobacco, tocalote (*Centauria melitensis*), shortpod mustard (*Hirschfeldia incana*), London rocket (*Sisymbrium irio*), horseweed (*Erigeron canadensis*), Emory's baccharis (*Baccharis salicina*), annual sunflower, castor bean (*Ricinus communis*), deerweed, sourclover (*Melilotus indicus*), and shrubs and trees such as acacia (*Acacia* sp.), myoporum (*Myoporum* sp.), Mexican fan palm (*Washingtonia robusta*), peruvian pepper tree (*Schinus molle*), and laurel sumac (*Malosma laurina*).

3.2.6 Ornamental

The project site contains approximately 1.69 acres of ornamental vegetation, located chiefly on the site's southern and eastern boundaries. Ornamental vegetation observed consists of holly oak (*Quercus ilex*), Mexican fan palm, allepo pine (*Pinus halepensis*), acacia, myoporum, tree of heaven (*Ailanthis altissima*), and Peruvian pepper tree.

3.2.7 Disturbed

The project site contains approximately 8.91 acres of disturbed lands supporting a sparse cover of ruderal vegetation. The disturbed areas consist of the main access road that cuts diagonally across the center of the project site. Plant species present include tocalote, tree tobacco, Emory's baccharis, shortpod mustard, Russian thistle, London rocket, rip-gut brome, red brome, and annual sunflower.

3.2.8 Developed

The project site contains approximately 6.51 acres of developed lands. This area consists of the demolished concrete batch plant and the asphalt northern access road.

3.3 Soils

The USDA NRCS Soil Survey Geographic Database (2006) has mapped the following soil type within the project site and study area:

- Urban Land Sorrento-Hanford (s1026)

During the habitat assessment, soils generally appeared to be consistent with the mapping provided by the USDA NRCS. The Urban Land Sorrento-Hanford soil type is common within the vicinity of the project site and is mapped for the majority of Sun Valley.

3.4 Plants

Most of the vegetation on the project site is native and non-native ruderal species common to disturbed areas as listed above. There is approximately 0.59 acre of native habitat in the project site consisting of California sagebrush/California buckwheat scrub and thick-leaved yerba santa scrub (Table 3-1, Figure 3). The two coast live oak trees that were documented in the southeastern corner of the project site in 2012 remain. Additionally, a young southern California black walnut, which is designated as a CNPS CRPR 4.2 species, was observed and mapped in the project site in 2019. It is believed that the tree became established in the project site after the 2012 habitat assessment. The locations of the southern California black walnut and coast live oak trees are depicted on Figure 3.

No additional special-status plants were detected on the project site during the 2012 or 2019 site visits. Appendix C lists all plant species observed on the project site during the habitat assessment in 2012 and 2019. However, neither the 2012 or 2019 habitat assessment plant lists were meant to represent a full compendium of plant species present on the project site.

No USFWS designated critical habitat for federally threatened and/or endangered plant species is present within the study area (Appendix E).

3.4.1 Regulated Trees

Two relatively large coast live oak trees are located in the southeastern portion of the project site, and one southern California black walnut is located on the project site (Figure 3). The two oak trees meet the 4-inch in diameter at 4.5 feet from the ground surface threshold and so are subject to the requirements of the City of Los Angeles Protected Tree Ordinance. The southern California black walnut may meet the 4-inch in diameter at 4.5 feet from the ground surface threshold and should be verified by a certified arborist.

3.5 Wildlife

Wildlife species that were observed within the project site and study area during the 2012 and 2019 site visits include species common and expected in the general project vicinity. The majority of species detected were birds. The following species were observed during the 2012 and 2019 habitat assessment: killdeer (*Charadrius vociferous*), red tail hawk (*Buteo jamaicensis*), Eurasian collard dove (*Streptopelia decaocto*), Cassin's kingbird (*Tyrannus vociferans*), mourning dove (*Zenaida macroura*), Anna's hummingbird (*Calypte anna*), common raven (*Corvus corax*), bushtit (*Psaltriparus minimus*), northern mockingbird (*Mimus polyglottus*), house finch (*Carpodacus mexicanus*), Bewick's

wren (*Thryomanes bewickii*), lesser goldfinch (*Carduelis mexicana*), and barn owl (*Tyto alba*). The following birds were detected in 2012: rock pigeon (*Columba livia*), western kingbird (*Tyrannus verticalis*), American crow (*Corvus brachyrhynchos*), California towhee (*Pipilo crissalis*), European starling (*Sturnus vulgaris*), turkey vulture (*Cathartes aura*) and Cooper's hawk (*Accipiter cooperii*).

One reptile species, western fence lizard (*Sceloporus occidentalis*), was observed on the project site in 2012 and 2019.

California ground squirrel (*Spermophilus beecheyi*) was observed within the project site in 2012 and 2019. The following mammals or sign of presence were observed within the project site in 2012: desert cottontail (*Sylvilagus audubonii*) and coyote (*Canis latrans*).

No USFWS designated critical habitat for federally threatened and/or endangered wildlife species is present within the project site or study area.

3.6 Federal and State Jurisdictional Aquatic Resources

No waters or wetlands potentially under the jurisdiction of the U.S. Army Corps of Engineers, California Regional Water Quality Control Board, or CDFW were observed within the project site during the habitat assessment.

Chapter 4
Results of Habitat Assessments

4.1 Special-Status Plants

It was determined that 1 of the 55 special-status plant species evaluated occurs or has potential to occur on the site: southern California black walnut (CNPS 4.1). The site is surrounded by urban lands and is isolated from additional native habitat. Additionally, the site is highly disturbed and has a long history of use as an inert landfill. Most of the site is composed of disturbed, xeric lands supporting ruderal vegetation. There are four small pockets of disturbed California sagebrush-California buckwheat scrub and one small area of disturbed Thick-Leaved Yerba-Santa Scrub. However, given the level of disturbance on the site and the relative low-quality habitat provided by these small isolated native habitat areas it was determined that the site does not provide suitable habitat for special-status plant species beyond the occurrence of southern California black walnut. Appendix D provides the species evaluated, regulatory status, habitat requirements, and rationale for determination of potential to occur.

4.2 Special-Status Wildlife

Of the 36 special-status species evaluated, one species (burrowing owl [*Athene cunicularia*]) was identified as having a low/moderate potential to occur within the project site and study area based on the presence of suitable habitat. The remaining 35 species were determined to have a less-than-reasonable potential or no potential to occur on the project site based on a lack of suitable habitat.

No burrowing owl or sign of burrowing owl was observed during the habitat assessment; however, California ground squirrels and ground squirrel burrows were observed on the site, which are indicators of suitable burrowing owl habitat. As such, burrowing owl, designated as an SSC, was determined to have a low potential to use the site in a breeding capacity and a moderate potential to use the site for wintering. The site provides suitable grassland habitat; however, the urban location of the project site in combination with the essentially isolated nature of the habitat in relation to other large areas of suitable burrowing owl habitat limits the likelihood of the species to use the site for breeding. Based on the grassland habitat present on the project site and burrowing owls frequent use of sites in the Los Angeles basin for wintering it was determined that burrowing owl has a moderate potential to use the site in a wintering or movement capacity.

4.3 Nesting Birds

All portions of the project site/study area contain suitable nesting habitat for a variety of avian species, including, but not limited to, those species observed during the site visit.

Chapter 5
Recommendations

The following provides recommendations for addressing species-specific survey requirements. Where applicable, specific recommendations have been provided to ensure that impacts on special-status biological resources are deemed to be mitigated to a level considered less than significant pursuant to CEQA.

5.1 City of Los Angeles Protected Trees

The study area is located in the City of Los Angeles; as such, any protected tree on the project site would be regulated under the City of Los Angeles Protected Tree Ordinance. The two coast live oak trees would be regulated under the City ordinance as they meet the minimum size requirement of 4 inches in diameter at breast height at 4.5 feet from the ground surface. In addition, the Southern California black walnut tree would be regulated under the Protected Tree Ordinance if it meets the minimum size requirement. A certified arborist should measure the walnut tree to determine the size of the tree and if it meets the minimum size requirements to be regulated under the City ordinance. Trimming or removal of City of Los Angeles protected trees would require a permit from the City Department of Urban Forestry.

5.2 Burrowing Owl

Although no burrowing owls or burrowing owl sign was detected during assessment for this species, the project site supports habitat suitable for burrowing owls and contains ground squirrel burrows and debris piles that could be utilized by burrowing owls for burrows and perches. A preconstruction presence/absence survey for burrowing owl should be conducted by a qualified biologist pursuant to the March 7, 2012, California Department of Fish and Game's *Staff Report on Burrowing Owl Mitigation* (CDFG 2012) which calls for conducting a survey no less than 14 days prior to ground disturbance, with a second survey conducted within 24 hours of ground disturbance to avoid impacts on burrowing owl. If burrowing owls are detected during the preconstruction survey, appropriate disturbance avoidance buffers will be determined by the qualified biologist based on suggested buffers in the 2012 staff report and will be implemented around the use areas.

5.3 Nesting Birds

Migratory nongame native bird species are protected under the federal MBTA. Additionally, Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests. In order to avoid impacts on nesting bird species it is recommended that the construction of the project be conducted outside of the recognized nesting bird season (February 15 through September 15).

If work cannot be avoided during the nesting bird season, then prior to initiation of the project, a qualified biologist should conduct a preconstruction nesting bird survey within all areas of breeding/nesting habitat within and adjacent to the project site. If active nests are found, a qualified

biologist shall establish an appropriate buffer relative to the species, it's acclimation to disturbance, and construction work in the vicinity of the nest to ensure no take of the nest occurs. Once the qualified biologist determines the nest has fledged or is no longer active, the buffer can be removed.

Floral Compendium

Appendix C – Plants Observed

Common Name/Scientific Name	Observed in 2012	Observed in 2019[1]
Pine Family – Pinaceae		
Pine (*Pinus* sp.)*	2012	2019
Muskroot Family - Adoxaceae		
Elderberry (*Sambucus nigra*)	2012	2019
Sumac Family - Anacardiaceae		
Laurel Sumac (*Malosma laurina*)	2012	2019
Sugar bush (*Rhus ovata*)		2019
Peruvian Pepper Tree (*Schinus molle*) *	2012	2019
Brazillian Pepper Tree (*Schinus terebenthifolius*) *	2012	
Sunflower Family – Asteraceae		
Annual bur sage (*Ambrosia acanthicarpa*)	2012	2019
California sagebrush (*Artemisia californica*)	2012	2019
Mule fat (*Baccharis salicifoila*)	2012	2019
Emory's Baccharis (*Baccharis salicina*)	2012	
Italian thistle (*Carduus pycnocephalus*) *	2012	
Tocolote (*Centauria melitensis*) *	2012	2019
Sand Aster (*Corethrogyne filaginifolia*)	2012	
California ncelia (*Encelia californica*)	2012	2019
California brittlebush (*Encelia farinosa*)	2012	
Horseweed (*Erigeron canadensis*)	2012	2019
Golden yarrow (*Eriophyllum confertifolia*)	2012	
Treasure flower (*Gazania linearis*) *	2012	
Garland (*Glebionis coronaria*) *	2012	
Common sunflower (*Helianthis annuus*)	2012	2019
Bristly ox-tongue (*Helminthotheca echioides*) *	2012	
Telegraph weed (*Heterotheca grandiflora*)	2012	2019
Sessile golden-aster (*Heterotheca sessiflora*)	2012	2019
Prickly lettuce (*Lactuca serriola*) *	2012	2019
California broomsage (*Lepidospartum squamatum*)	2012	2019
Daggerleaf cottonrose (*Logfia gallica*) *	2012	
Cliff desert dandelion (*Malacothrix saxatilis*)	2012	2019
Ladies tobacco (*Pseudognaphalium californicum*)	2012	
Wright's cudweed (*Pseudognaphalium canescens*)	2012	2019
Common groundsel (*Senecio vulgaris*) *	2012	
Prickly sow-thistle (*Sonchus asper*) *		2019
Common sow thistle (*Sonchus oleraceous*) *	2012	
Wire lettuce (*Stephanomeria* sp.)	2012	
Common dandelion (*Taraxacum officinale*) *	2012	
Borage Family – Boraginaceae		
Pride of Madera (*Echium candicans*) *	2012	
Thick-leaved yerba santa (*Eriodictyon crassifolium* var. *crassifolium*)		2019

Mustard Family – Brassicaceae		
Shortpod mustard (*Hirschfeldia incana*) *	2012	2019
Lesser swine cress (*Lepidium didymium*) *	2012	
Radish (*Raphanus sativus*) *	2012	
London rockey (*Sisymbrium irio*) *	2012	2019
Goosefoot Family – Chenopodiaceae		
Australian saltbush (*Atriplex semibaccata*) *	2012	2019
Saltbush (*Atriplex* sp.)	2012	
Lambs quarters (*Chenopodium album*) *	2012	2019
Russian thistle (*Salsola tragus*) *	2012	
Morning Glory Family – Convolulaceae		
Island false bindweed (*Calystegia macrostegia*)	2012	2019
Field bindweed (*Convovulus arvensis*) *	2012	
Cucumber Family - Cucurbitaceae		
Wild cucumber (*Marah macrocarpa*)		2019
Spurge Family – Euphorbiaceae		
Spurge (*Euphorbia* sp.) *	2012	
Castor bean (*Ricinus communis*) *	2012	2019
Legume Family – Fabaceae		
Acacia (*Acacia* sp.) *		2019
Deerweed (*Acmispon glaber*)	2012	2019
Strigose bird's foot trefoil (*Acmispon strigosus*)	2012	
Miniature lupine (*Lupinus bicolor*)	2012	
Arroyo California Lupine (*Luinus succulentus*)	2012	2019
California burclover (*Medicago polymorpha*) *	2012	
Alfalfa (*Medicago sativa*) *	2012	
White sweetclover (*Melilotus albus*) *	2012	2019
Sourclover (*Melilotus indicus*) *	2012	2019
Oak Family – Fagaceae		
Coast live oak (*Quercus agrifolia*)	2012	2019
Holly oak (*Quercus ilex*) *	2012	2019
Geranium Family – Geraniaceae		
Longbeak storks bill (*Erodium botrys*) *	2012	
Redstem filaree (*Erodium cicutarium*) *	2012	2019
Greenstem filaree (*Erodium moschatum*) *	2012	
Walnut Family – Juglandiaceae		
Southern California black walnut (*Juglans californica* var. *californica*) *CDFW SCC		2019
Mint Family – Lamiaceae		
Purple sage (*Salvia leucophylla*)	2012	
Mallow Family – Malvaceae		
Bull mallow (*Malva nicaeenis*) *	2012	
Cheeseweed (*Malva parviflora*) *	2012	2019
Mrytle Family - Myrtaceae		
Eucalyptus (*Eucalyptus* sp.) *		2019
Evening Primrose Family – Onagraceae		

California suncup (*Eulobus californicus*)	2012	
Poppy Family – Papaveraceae		
California poppy (*Eschscholzia californica*)	2012	
Buckwheat Family – Polygonaceae		
California buckwheat (*Eriogonum fasciculatum*)	2012	2019
Figwort Family – Scrophulariaceae		
Myoporum (*Myoprum laetum*) *	2012	
Simarouba Family – Simaroubaceae		
Tree of Heaven (*Ailanthis altissima*) *	2012	2019
Nightshade Family – Solanaceae		
Sacred thorn apple (*Datura wrightii*)	2012	
Tree tobacco (*Nicotiana glauca*) *	2012	2019
American black nightshade (*Solanum americanum*) *	2012	
Chaparral nightshade (*Solanum xanti*)	2012	
Caltrop Family – Zygophyllaceae		
Puncture Vine (*Tribulus terrestris*) *	2012	
Century Plant Family - Agavaceae		
Agave (*Agave* sp.) *	2012	
Palm Family - Arecaceae		
Date palm (*Phoenix canariensis*) *		2019
Mexican fan palm (*Washingtonia robusta*) *	2012	2019
Grass Family - Poaceae		
Giant Reed (*Arundo donax*) *		2019
Slender wild oat (*Avena barbata*) *	2012	2019
Wild oat *(Avena fatua*) *	2012	2019
Rescuegrass (*Bromus catharticus*) *	2012	
Ripgut grass (*Bromus diandrus*) *	2012	2019
Soft chess (*Bromus hordeaceus*) *	2012	
Red brome (*Bromus madritensis* ssp. *rubens*) *	2012	2019
Bermuda grass (*Cynodon dactylon*) *	2012	2019
Rattail six-weeks grass (*Festuca myuros*) *	2012	
Rye grass (*Festuca perennis*) *	2012	
Common velvet grass (*Holcus lanatus*) *	2012	
Hare barley (*Hordeum murinum* ssp. *leporinum*) *	2012	
Barley (*Hordeum vulgare*) *	2012	
Goldentop grass (*Lamarckia aurea*) *	2012	
Fountaintop grass (*Pennisetum* sp.) *	2012	2019
Common Mediterranean grass (*Schismus barbatus*) *	2012	
Smilo grass (*Stipa miliacea* var. *miliacea*) *	2012	2019

1. Lists do not represent a full compendium of plant species that may occur in the project site.

* denotes a non-native species.

Appendix D

Special-Status Species Table

Appendix D
Special-Status Species Information

This appendix addresses all species with applicable special regulatory or management status whose general range includes the study area or whose habitat occurs within or near the study area and/or vicinity. Information provided includes: 1) definitions of terms to describe likelihood of occurrence, 2) a table of special-status codes and their meanings, and 3) a species information table listing the English and scientific names, current special-status, likelihood of occurrence within the project site, and specific notes relevant to likelihood of occurrence.

Conclusions provided in this report are limited to biology, and do not address regulatory or management issues. For interpretation of this information under applicable laws, regulations, and court precedent, see the relevant portion(s) of the report. Judgments regarding likelihood of occurrence are based on evaluation of available biological information regarding regional and local conditions, species biology, available evaluations of the study area and vicinity, and professional experience conducting field investigations across California over many years. Though professional, such judgments are necessarily subjective at least in part.

Specific factors substantially affect likelihood of occurrence for individual species on any particular study area. These factors are relevant at multiple scales, including regionally, locally, and within the study area. These factors include the presence or absence of other particular species (e.g., predators and prey), climate, ongoing disturbances, historical land use, and other past disturbances such as fire history, surface and subsurface hydrology, soil texture and chemistry, study area and habitat size and topology (i.e., shape and fragmentation), past population fluctuations of the species in response to random and nonrandom events, and many other factors, including many not readily visible. Note that some species, including some amphibians and many birds and bats, can occur in multiple roles. Thus, likelihood of occurrence, habitat use, and abundance may vary accordingly.

Finally, note that likelihood of occurrence for a given species refers to a time scale of a few years up to perhaps 10 years under current or assumed resources and conditions.

Terms for Likelihood of Occurrence in the Study Area

Confirmed Absent

If the likelihood of occurrence is *confirmed absent*, the species is confirmed to be absent on the study area as a formal and/or practical matter. Most often, this is a determination based on negative results of a focused survey for the species conducted in appropriate habitat at appropriate time(s) of year, using biologically sound methods and qualified personnel. In the remaining cases, it may be based on a simple study area examination, where it is easily determined that the species is absent because of the study area context. For example, a tidal marsh insect would not occur in a dry mountainside study area, or a disturbance-intolerant chaparral shrub would not occur in a long-standing, degraded grassland study area located far from chaparral. When a species is confirmed absent, the relevant fieldwork in all cases was conducted within a time frame sufficiently recent to conclude that the species remains absent, based on study area conditions and the species' known ecology. In most cases a specific, established survey protocol and/or guidelines have been followed.

Less than Reasonable

If the potential to occur is *less than reasonable*, the likelihood of occurrence, although remotely possible, is less than that required for any potentially applicable regulatory threshold. Further, the likelihood that the site is meaningfully valuable to any population(s) of this taxon is less than reasonable. The species may or may not include the study area within its current, general range. However, no appropriate, or adequately extensive, or effectively connected habitat is present. Neither the species nor any indication of its presence was detected. In some cases, based on the best available information, this likelihood may indicate that, the study area has a very high probability of being outside of the species' current range. In all of the above cases, the species may not be definitively ruled out but is strongly believed to be absent based on professional evaluation of all available evidence. In some cases, the species may occur on rare occasions and in low numbers, but with no more than brief, incidental use of the study area; that is, the site is also judged to lack any important function for the species. Certainly, there are no substantial populations directly utilizing the study area at any time of year. Further evaluation should not normally be required.

Low

If the potential to occur is *low*, occurrence of the species is reasonable but unlikely because of some combination of facts. For example, 1) the study area was the subject of unsuccessful searches conducted under relevant and reasonable circumstances, 2) potential habitat present is marginal or minimal in extent, 3) the best available information suggests the species is absent from the

study area, and/or 4) available information sheds no clear light on the species likelihood on the study area, but it is known to be rare at best in the vicinity. Neither the species nor any indication of its presence was detected. Although individuals may have been missed, it is unlikely that substantial populations are present. Further evaluation should usually not be required for individual species except, in most cases, for biologically threatened or endangered species. Note however, that where several non-listed species hold this status, a higher likelihood of occurrence for "one or more" will generally hold. This is due both to the increased number of species and the fact that an array of possibilities often correlates with greater site biodiversity and lower relevant (but not readily detected) disturbance levels.

Moderate

If the potential to occur is *moderate*, the study area is within the range of the species, and contains potentially appropriate habitat. Neither individuals nor diagnostic sign were detected. It is nevertheless reasonable that some individuals may have been overlooked. The best available information on the species with regard to the study area is either very uncertain, or may be equally weighted for and against occurrence. Depending upon local and special legal status, extent of habitat, and the nature and sensitivity of the project, focused surveys for the species may be warranted or presence may be assumed.

High

If the potential to occur is *high*, the study area is known to be within the range of the species, and contains potential habitat with a high likelihood of occupancy. Although no individuals or diagnostic sign were detected during current fieldwork by a qualified observer, the species is likely to be present to some degree given the best available information. Depending upon regulatory status, local rarity, public interest, extent of habitat on the study area, and the nature of potential project impacts, a substantial basis may exist for either conducting focused surveys for the species or for assuming presence.

Confirmed Present

If the likelihood of occurrence is *confirmed present*, a qualified biologist or other reliable source has confirmed the presence of the species and there is no specific evidence that the species has subsequently become absent. Depending on the species and other information available, it may or may not be possible to determine, without further studies, what portions of the study area are currently in use.

Sensitive Plant Species

U.S. Fish and Wildlife Service	California Department of Fish and Wildlife	California Native Plant Society California Rare Plant Ranks	Habitat Present/Absent
FE Federal Endangered	SE State Endangered	1A Plants presumed extirpated or extinct in California.	A Species is absent
FT Federal Threatened	ST State Threatened	1B Plants are rare throughout their range with many of them endemic to California.	P Species is present
PE Proposed Endangered	SR State Rare	2A Plants that are presumed extirpated in California, but more common elsewhere in their range.	HA Habitat absent
PT Proposed Threatened	SSC California Species of Concern	2B Plants that are rare, in California but common elsewhere in their range.	HP Habitat is present
FC Federal Candidate		3 Plants about which more information is needed.	
		4 Plants of limited distribution within California.	

Scientific Name	Common Name	Status	General Habitat Description	Habitat Present/ Absent	Rationale
Arenaria paludicola	Marsh sandwort	FE, SE, CRPR 1B.1	Sandy openings within freshwater marshes and swamps. 3-170 meters elevation. Blooms May-August. Last southern California record is from 1899.	HA	**Less than Reasonable.** The project site does not contain freshwater marsh and swamp habitat.

Astragalus brauntonii	Braunton's milk-vetch	FE, CRPR 1B.1	Recent burned or disturbed areas within chaparral, coastal scrub and valley and foothill grasslands. Usually associated with sandstone or carbonate substrates. 4-640 meters elevation. Blooms January-August.	HA	**Less than Reasonable.** The project site lacks chaparral and suitable valley and foothill grasslands. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the urban, isolated nature of the habitat and lack of suitable soils.
Astragalus pycnostachyus var. *lanosissimus*	Ventura Marsh milk-vetch	FE, SE, CRPR 1B.1	Coastal dunes, coastal scrub and the edges of fresh and brackish marshes. Below 35 meters elevation. Blooms June-October.	HA	**Less than Reasonable.** The project site lacks coastal dunes or fresh and/or brackish marshes. The project site contains small areas of buckwheat scrub habitat, however, this plant is not expected to occur due to the urban, xeric, isolated nature of the site.
Astragalus tener var. *titi*	Coastal dunes milk-vetch	FE, SE, CRPR 1B.1	Vernally mesic areas within sandy coastal bluff scrub, coastal dunes and mesic coastal prairie. Below 50 meters elevation. Blooms March-May.	HA	**Less than Reasonable.** The project site lacks sandy coastal bluff scrub, coastal dunes or coastal prairie habitat.
Atriplex coulteri	Coulter's saltbush	CRPR 1B.2	Alkaline or clay areas within coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland. Occurs below 460 meters elevation. Blooms March through October.	HA	**Less than Reasonable.** The project site lacks coastal bluff scrub, coastal dunes and suitable grassland habitats. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.

Atriplex pacifica	Southcoast saltscale	CRPR 1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, and playas. Occurs below 140 meters elevation. Blooms March through October.	HA	**Less than Reasonable.** The project site lacks coastal dunes, and playa habitat. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Atriplex parishii	Parish's saltscale	CRPR 1B.1	Alkaline meadows, vernal pools, chenopod scrub and playas. Usually on drying alkaline flats with fine soils. 25-1,900 meters elevation. Blooms June-October.	HA	**Less than Reasonable.** The project site lacks alkaline meadows, vernal pools, chenopod scrub and playa habitat.
Atriplex serenana var. *davidsonii*	Davidson's saltscale	CRPR 1B.2	Alkaline areas within coastal bluff scrub and coastal scrub. 10-200 meters elevation. Blooms April-October.	HA	**Less than Reasonable.** The project site lacks alkaline coastal bluff scrub and suitable coastal scrub.
Berberis nevinii	Nevin's barberry	FE, SE, CRPR 1B.1	Gravelly wash margins in alluvial scrub or coarse soils in chaparral 274-825 meters elevation. Blooms March through June. Identifiable year-round.	A	**Confirmed Absent.** The project site lacks wash habitat, alluvial scrub and chaparral. This perennial shrub was not observed during habitat assessments.

Calandrinia breweri	Brewer's calandrinia	CRPR 4.2	Sandy or loamy disturbed sites and burns within chaparral, and coastal scrub. Occurs below 1,220 meters elevation. Blooms January through June.	HA	**Less than Reasonable.** The project site lacks coastal bluff scrub, coastal dunes and suitable valley and foothill grasslands. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
California macrophylla	Round-leaved filaree	CRPR 1B.1	Clay soils in cismontane woodland and valley and foothill grassland communities. Occurs from 15 to 200 meters elevation. Blooms March-May.	HA	**Less than Reasonable.** The project site lacks clay soils, cismontane woodlands, and suitable grassland habitats.
Calochortus catalinae	Catalina mariposa lily	CRPR 4.2	Chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. Occurs below 700 meters elevation. Blooms February to June.	HA	**Less than Reasonable.** The project site lacks chaparral, cismontane woodlands, and suitable grassland habitats. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.

Calochortus clavatus var. *gracilis*	Slender mariposa lily	CRPR 1B.2	Chaparral, coastal scrub and valley and foothill grasslands. 320-1000 meters elevation. Blooms March-June.	HA	**Less than Reasonable.** The site lacks chaparral, and suitable grassland habitats. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Calochortus plummerae	Plummer's mariposa lily	CRPR 4.2	Sandy or rocky sites of granitic or alluvial material in valley and foothill grassland, coastal scrub, chaparral, cismontane woodland and lower coniferous forests. 100-1,700 meters elevation. Blooms May-July.	HA	**Less than Reasonable.** The site lacks suitable grasslands, chaparral, cismontane woodland and lower coniferous forests. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Calystegia felix	Lucky morning glory	CRPR 1B.1	Meadows and seeps and riparian scrub. Blooms Occurs from 30 to 215 meters elevation. Blooms March through September.	HA	**Less than Reasonable.** The site lacks meadows and seeps and riparian scrub.

Calystegia peirsonii	Peirson's morning-glory	CRPR 4.2	Chaparral, chenopod scrub, cismontane woodland, coastal scrub, lower montane coniferous forest, and valley and foothill grassland. Occurs from 30 to 1,500 meters elevation. Blooms April through June.	HA	**Less than Reasonable.** The site lacks chaparral, chenopod srub, cismontane woodland, suitable grassland habitat, and lower montane forest habitat. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Camissoniopsis lewesii	Lewis' evening primrose	CRPR 3	Coastal bluff scrub, cismontane woodland, coastal dunes, coastal scrub, and sandy or clay areas within valley and foothill grasslands. Below 300 meters elevation. Blooms May-June.	HA	**Less than Reasonable.** The project site lacks coastal bluff scrub, cismontane woodland, coastal dunes, and suitable grassland habitats. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Canbya candida	White pygmy-poppy	CRPR 4.2	Gravelly, sandy, granitic areas within Joshua tree woodland, Mojavean desert scrub, pinyon and juniper woodland. Occurs from 600 to 1,460 meters elevation. Blooms March through June.	HA	**Less than Reasonable.** The site lacks Joshua tree woodland, Mojavean desert scrub, pinyon and juniper woodlands.

Centromadia parryi ssp. *australis*	Southern tarplant	CRPR 1B.1	Margins of marshes and swamps, vernally mesic valley and fooothill grassland and vernal pools. Below 425 meters elevation. Blooms May-November.	HA	**Less than Reasonable.** The project site lacks marshes and swamps, and suitable mesic grassland and vernal pool habitat.
Cercocarpus betuloides var. *blancheae*	Island mountain-mahogany	CRPR 4.3	Closed-cone coniferous forest and chaparral. Occurs from 30 to 600 meters elevation. Blooms February through May.	HA	**Confirmed Absent.** The project site lacks closed-cone coniferous forest and chaparral habitats. This perennial shrub was not observed during habitat assessments.
Chloropyron maritimum ssp. *maritimum*	Salt marsh bird's beak	FE, SE, CRPR 1B.2	Coastal dunes and salt marshes. Below 30 meters elevation. Blooms May-October.	HA	**Less than Reasonable.** The site lacks coastal dunes and salt marshes.
Chorizanthe parryi var. *fernandina*	San Fernando Valley spineflower	PT, FE, CRPR 1B.1	Coastal scrub and valley and foothill grasslands. 150-1,220 meters elevation. Blooms April-July.	HA	**Less than Reasonable.** The site lacks suitable grassland habitat. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Convolvulus simulans	Small-flowered morning-glory	CRPR 4.2	Clay and serpentinite seeps within chaparral, coastal scrub, and valley and foothill grassland. Occurs from 30 to 740 meters elevation. Blooms March through July.	HA	**Less than Reasonable.** The site lacks chaparral and suitable coastal scrub and grassland habitat.

Deinandra minthornii	Santa Susana tarplant	SR, CRPR 1B.2	Rocky chaparral and coastal scrub. 280-760 meters elevation. Blooms July-November.	HA	**Less than Reasonable.** The site lacks rocky chaparral. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Dithyrea maritima	Beach spectaclepod	ST, CRPR 1B.1	Coastal dunes and sandy areas within coastal scrub.	HA	**Less than Reasonable.** The site lacks coastal dunes. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Dodecahema leptoceras	Slender-horned spineflower	FE, SE, CRPR 1B.1	Gravelly soils (arkose deposits) in openings of chamise chaparral or in sandy soils in openings of alluvial late seral stage scrub on floodplain terraces and benches that receive overbank deposits every 50 to 100 years. 200-760 meters elevation. Blooms April-June.	HA	**Less than Reasonable.** The site lacks alluvial late seral stage scrub on floodplain terraces and benches.

Dudleya blochmaniae ssp. *blochmaniae*	Blochman's dudleya	CRPR 1B.1	Coastal bluff scrub, chaparral, coastal scrub, and rocky and/or serpentine areas of valley and foothill grasslands. 5-450 meters elevation. Blooms April-June.	HA	**Less than Reasonable.** The site lacks coastal bluff scrub, chaparral, and suitable grassland habitats. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Dudleya cymosa ssp. *ovatifolia*	Santa Monica dudleya	FT, CRPR 1B.1	Chaparral and coastal scrub within volcanic or sedimentary/rocky substrates. 150-1,675 meters elevation. Blooms March-June.	HA	**Less than Reasonable.** The site lacks chaparral. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Dudleya multicaulis	Many-stemmed dudleya	CRPR 1B.2	Often on clay soils around granitic outcrops in chaparral, coastal sage scrub and grasslands.15-790 meters elevation. Blooms April-July.	HA	**Less than Reasonable.** The site lacks granitic outcrops in chaparral, and suitable grasslands. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.

Harpagonella palmeri	Palmer's grapplinghook	CRPR 4.2	Dry slopes and clay soils in valley grasslands, coastal sage scrub and chaparral communities. 20-955 meters elevation. Blooms March-May.	HA	**Less than Reasonable.** The site lacks dry slopes and clay soils in suitable grassland and chaparral habitat. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Helianthus nuttallii ssp. *parishii*	Los Angeles sunflower	CRPR 1A	Saltwater and freshwater marshes and swamps. 10-1,675 meters elevation. Blooms August-October.	HA	**Less than Reasonable.** The site lacks saltwater and freshwater marshes and swamps.
Heuchera caespitosa	Urn-flowered alumroot	CRPR 4.3	Rocky areas within cismontane woodland, lower montane coniferous forest, riparian forest (montane), and upper montane coniferous forest. Occurs from 1,125 to 2,650 meters elevation. Blooms May through August.	HA	**Less than Reasonable.** The site lacks cismontane woodland. Lower montane coniferous forest, riparian forest, and upper montane coniferous forest.
Hordeum intercedens	Vernal barley	CRPR 3.2	Coastal dunes, coastal scrub, saline flats and depressions within valley and foothill grassland, and vernal pools. Occurs from 5 to 1,000 meters elevation. Blooms March through August.	HA	**Less than Reasonable.** The site lacks suitable grassland habitat. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.

Horkelia cuneata ssp.*puberula*	Mesa horkelia	CRPR 1B.1	Sandy or gravelly soils in chaparral or rarely in cismontane woodlands or coastal scrub. 70-810 meters elevation. Blooms February-September.	HA	**Less than Reasonable.** The site lacks chaparral and cismontane woodlands. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Hulsea vestita ssp. *gabrielensis*	San Gabriel Mountains sunflower	CRPR 4.3	Rocky areas within lower montane coniferous forest, and upper montane coniferous forest. Occurs from 1,500 to 2,500 meters elevation. Blooms May-July.	HA	**Less than Reasonable.** The site lacks lower and upper coniferous forest habitat.
Juglans californica var. californica	Southern California black walnut	CRPR 4.2	Occurs within chaparral, cismontane woodland, coastal scrub, and riparian woodland. Occurs from 50 to 900 meters elevation. Blooms March through August.	P	**Confirmed Present.** One individual was observed in the northeast corner of the site.
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	CRPR 1B.1	Marshes, playas, vernal pools and grasslands. Usually associated with alkaline soils. Below 1,220 meters elevation. Blooms February-June.	HA	**Less than Reasonable.** The site lacks marshes, playas, vernal pools and suitable grasslands.

Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	CRPR 4.3	Dry soils in coastal sage scrub and chaparral. Below 885 meters elevation. Blooms January-July.	HA	**Less than Reasonable.** The site lacks chaprral. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Lilium humboldtii ssp. *ocellatum*	Ocellated Humboldt lily	CRPR 4.2	Openings within chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland. Occurs from 30 to 1,800 meters elevation. Blooms March-July (August).	HA	**Less than Reasonable.** The site lacks chaparral, cismontane woodland, lower montane coniferous forest, and riparian woodland. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Linanthus concinnus	San Gabriel linanthus	CRPR 1B.2	Rocky openings within chaparral, lower montane coniferous forest, and upper montane coniferous forest. Occurs from 1,520 to 2,800 meters elevation. Blooms April-July.	HA	**Less than Reasonable.** The site lacks chaparral, lower and upper montane coniferous forest.
Lupinus paynei	Payne's bush lupine	CRPR 1B.1	Sandy areas within coastal scrub, riparian scrub, and valley and foothill grassland. Occurs from 220 to 420 meters elevation. Blooms March-April (July).	HA	**Less than Reasonable.** The site lacks riparian scrub and suitable coastal scrub and grassland habitat.

Malacothamnus davidsonii	Davidson's bush-mallow	CRPR 1B.2	Chaparral, cismontane woodland, coastal scrub and riparian woodland. 185-855 meters elevation. Blooms June-January.	HA	**Less than Reasonable.** The site lacks chaparral, cismontane woodland, and riparian woodland. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Monardella hypoleuca ssp. *hypoleuca*	White-veined monardella	CRPR 1B.3	Chapparal and cismontane woodland. Occurs from 50 to 1,525 meters elevation. April-Aug (December).	HA	**Less than Reasonable.** The site lacks chaparral and cismontane woodlands.
Nama stenocarpum	Mud nama	CRPR 2B.2	Lake shores, river banks and seasonally wet places. 5-500 meters elevation. Blooms January-July.	HA	**Less than Reasonable.** The site lacks lake shores, river banks and seasonally wet places.
Nasturtium gambelii	Gambel's water cress	FE, ST, CRPR 1B.1	Freshwater and brackish marshes and swamps. 5-330 meters elevation. Blooms April-October.	HA	**Less than Reasonable.** The site lacks freshwater and brackish marshes and swamps
Navarretia prostrata	Prostrate vernal pool navarretia	CRPR 1B.1	Vernal pools, coastal scrub, meadows and seeps and alkaline valley and foothill grassland. 15-1,21- meters elevation. Blooms April-July.	HA	**Less than Reasonable.** The site lacks vernal pools, meadows and seeps and suitable grassland habitat. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.

Orcuttia californica	California Orcutt's grass	FE, SE, CRPR 1B.1	Vernal pools that stay ponded for longer than three weeks. 15-660 meters. Blooms April-August.	HA	**Less than Reasonable.** The site lacks vernal pools.
Phacelia hubbyi	Hubby's phacelia	CRPR 4.2	Gravelly and or rocky slopes within chaparral, coastal scrub, and valley and foothill grassland. Below 1,000 meters elevation. Blooms April-June.	HA	**Less than Reasonable.** The site lacks gravelly and rocky slopes within chaparral and suitable coastal scrub and grassland habitat.
Pseudognaphalium leucocephalum	White rabbit tobacco	CRPR 2B.2	Sandy areas within chaparral, cismontane woodland, coastal scrub, riparian woodland. Below 2,100 meters elevation. Blooms July-December.	HA	**Less than Reasonable.** The site lacks chaparral cismontane woodland, and riparian woodland. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Quercus dumosa	Nuttall's scrub oak	CRPR 1B.1	Sandy or clay loam areas within closed-cone coniferous forest, chaparral, or coastal scrub. Below 400 meters. Blooms February-April (August).	A	**Confirmed Absent.** The site lacks closed-cone coniferoud forest, chaparral and suitable coastal scrub habitat. This perennial shrub was not observed during habitat assessments.

Sidalcea neomexicana	Salt spring checkerbloom	CRPR 2B.2	Chaparral, coastal sage scrub, lower montane coniferous forest, Mojavean desert scrub and playas. 15-1,530 meters elevation. Blooms March-June.	HA	**Less than Reasonable.** The site lacks chaparral, lower montane coniferous forest, Mojavean desert scrub, and playas. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Spermolepis laterifolia	Western bristly scaleseed	CRPR 2A	Rocky or sandy areas within Sonoran desert scrub.	HA	**Less than Reasonable.** The site lacks Sonoran desert scrub.
Symphyotrichum defoliatum	San Bernardino aster	CRPR 1B.2	Cismontane woodland, coastal scrub, coniferous forest, meadows and seeps, marshes and swamps, and mesic grassland near water. Below 2,040 meters elevation. Blooms July-November.	HA	**Less than Reasonable.** The site lacks cismontane woodland, coniferous forest, meadows and seeps, marshes and swamps, and mesic grassland. The project site contains small areas of isolated coastal scrub habitat, however, this plant is not expected to occur due to the historical uses of the site, the level of disturbance, and that the urban site is isolated from known existing population areas.
Symphyotrichum greatae	Greata's aster	CRPR 1B.3	Broad-leaved upland forest, chaparral, cismontane woodland, lower cismontane coniferous forest and riparian woodland. 300-2010 meters elevation. Blooms June-October.	HA	**Less than Reasonable.** The site lacks broadleaved upland forest, chaparral, cismontane woodland, lower cismontane coniferous forest and riparian woodland.

Thelypteris puberula var. *sonorensis*	Sonoran maiden fern	CRPR 1B.2	Meadows, seeps, and streams. Occurs from 50 to 610 meters elevation. Blooms January-September.	HA	**Less than Reasonable.** The site lacks meadows, seeps and streams.

Sensitive Wildlife Species

U.S. Fish and Wildlife Service FE Federal Endangered FT Federal Threatened PE Proposed Endangered PT Proposed Threatened FC Federal Candidate	**California Department of Fish and Wildlife** SE State Endangered ST State Threatened SR State Rare SSC California Species of Special Concern SFP State Fully Protected WL Watch List	P Species is present HA Habitat Absent HP Habitat is, or may be present

Scientific Name	Common Name	Status	General Habitat Description	Habitat Present/ Absent	Rationale
Reptiles					
Anniella sp.	California legless lizard	SSC	Sandy or loose soils under sparse vegetation on beaches, within chaparral, pine-oak woodlands, sycamore and cottonwood woodland or oaks near stream terraces.	HA	**Confirmed Absent.** The site lacks beach, chaparral, pine-oak woodlands, sycamore and cottonwood woodland or oaks near stream terraces.
Anniella stebbinsi	Southern California legless lizard	SSC	Moist loose soils within coastal dunes, sandy washes, and alluvial fans.	HA	**Confirmed Absent.** The site lacks coastal dunes, sandy wash, and alluvial fan habitat.
Arizona elegans occidentalis	California glossy snake	SSC	Various scrub habitats, rocky washes, chaparral and coastal scrub habitat.	HA	**Less than Reasonable.** The site lacks rocky washes, chaparral and suitable coastal scrub habitat. The project site contains small areas of isolated coastal scrub habitat, however, this species is not expected to occur due to the historical uses of the site and the highly disturbed nature of the urban site.
Aspidoscelis tigris stejnegeri	Coastal whiptail	SSC	Arid chaparral, woodland, and riparian areas.	HA	**Less than Reasonable.** The site lacks chaparral, woodland, and riparian habiatat.

Emys marmorata	Western pond turtle	SSC	Inhabits permanent or nearly permanent waters. Requires basking sites (i.e., partially submebmerged logs, rocks or open banks).	HA	**Confirmed Absent.** The site lacks permanent water and is not located in the vicinity of any substantial open water habitat.
Phrynosoma blainvillii	Coast horned lizard	SSC	Sandy areas within valley and foothill hardwood and conifer woodlands, riparian areas, coastal scrub, chaparral and annual grasslands.	HA	**Less than Reasonable.** The site lacks hardwood and conifer woodlands, riparian areas, and chaparral habitats. The site contains small areas of coastal sage scrub habitat. However the species has a less than reasonable potential to occur given the isolated nature of the scrub habitat, the historical uses and disturbance of the site, the urban setting of the site, and the overall amount, quality and distribution of the coastal sage scrub habitat on site.
Thamnophis hammondii	Two-striped garter snake	SSC	Permanent streams with rocky beds that support riparian canopy.	HA	**Confirmed Absent.** The site lacks permanent streams and riparian areas.
Birds					
Agelaius tricolor	Tricolored blackbird	SSC	Breeds near fresh water within emergent wetland habitat supporting dense, tall stands of cattails and tule and sometimes willow.	HA	**Confirmed Absent.** The site lacks freshwater habitat and is not located in the vicinity of any substantial open water habitat. Open foraging fields are absent from the site and its vicinity.

Athene cunicularia	Burrowing owl	SSC	Uses large rodent burrows or other burrows in grasslands, prairies and agricultural areas.	HP	**Less than Reasonable for nesting. Low-Moderate Potential for wintering.** The species is not expected to nest on the site. However, the site supports a low to moderate potential for wintering on the site given the low growing nature of the ruderal and grassland vegetation, the presence of squirrels and squirrel burrows, and numerous perches despite the historical uses and urban setting of the site.
Buteo swainsonii	Swainson's hawk	ST	Large grasslands and open scrub habitat.	HA	**Less than Reasonable.** The site lacks suitable nesting and foraging habitat for the species.
Coccyzus americanus occidentalis	Western yellow billed cuckoo	FT, SE	Breeds and nests in extensive stands of cottonwood/willow riparian forest within large rivers with broad flood prone bottoms.	HA	**Confirmed Absent.** The site lacks extensive stands of cottonwood/willow riparian forest within large rivers with broad flood prone bottoms. .
Corturnicops noveboracensis	Yellow rail	SSC	Wet meadows and shallow marshes.	HA	**Confirmed Absent.** The site lacks wet meadow and shallow marsh habitat. This species is unexpected anywhere in southern California.
Empidonax traillii extimus	Southwestern willow flycatcher	FE SE	Restricted to riparian woodlands along streams and rivers with mature, dense stands of willows, cottonwoods or smaller spring fed or boggy areas with willows or alders.	HA	**Confirmed Absent.** The site lacks riparian woodlands along streams and rivers with mature, dense stands of willows, cottonwoods or smaller spring fed or boggy areas with willows or alders.

Polioptila californica californica	Coastal California gnatcatcher	FT, SSC	May be found in coastal sage scrub below 2,500 ft; prefers low, coastal sage scrub in arid washes, mesas, and low angle slopes.	HA	**Less than Reasonable.** The site contains small areas of coastal sage scrub habitat. However the species has a less than reasonable potential to occur given the isolated nature of the scrub habitat, the historical uses and disturbance of the site, the urban setting of the site, and the overall amount, quality and distribution of the coastal sage scrub habitat on site.
Riparia riparia	Bank swallow	ST	Nests on vertical banks along streams and rivers.	HA	**Confirmed Absent.** The site and surrounding area lacks vertical banks and stream/river habitat. This species has long been extirpated as a breeding bird in southern California.
Vireo bellii pusillus	least Bell's vireo	FE, SE	Prefers dense riparian habitats but can also be found in more open riparian habitats such as mule fat scrub.	HA	**Confirmed Absent.** The site and surrounding area lacks suitable riparian habitats.
Mammals					
Antrozous pallidus	Pallid bat	SSC	Arid regions with suitable roosting habitat adjacent to large bodies of water to forage over. Suitable roosting habitat consists of rocky outcrops, caves, tunnels, mines, eaves and tree hollows.	HA	**Less than Reasonable.** The site and vicinity lack the general roosting and foraging habitat required for this species.
Corynorhinus townsendii	Townsend's big-eared bat	SCC	Woodland and arid desert scrub habitats with suitable caves and other roosting habitat.	HA	**Less than Reasonable.** The site and vicinity lack woodland and desert scrub habitat. There is no roosting habitat on-site.
Eumops perotis californicus	Western mastiff bat	SSC	Many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral. Roosts in crevices in cliff faces, high buildings, trees & tunnels.	HA	**Less than Reasonable.** The site and vicinity lack the general roosting and foraging habitat required for this species.

Lasiurus xanthinus	Western yellow bat	SSC	Inhabits palm oasis and residential areas with palm trees. Roosts primarily in trees, especially in the dead fronds of palm trees. Forages over open water and among trees.	HA	**Less than Reasonable.** The site and vicinity lack the general roosting and foraging habitat required for this species.
Lepus californicus bennettii	San Diego black-tailed jackrabbit	SSC	Requires extensive open space, including grasslands and open sage scrub on flat ground.	HA	**Less than Reasonable.** This species is not expected due to the historical uses of the site and the urban, isolated nature of the site.
Macrotus californicus	California leaf-nosed bat	SSC	Low lying desert areas with caves, mines and/or old builings for roosting.	HA	**Confirmed Absent.** The site lacks suitable low lying desert habitat and suitable areas for roosting.
Microtus californicus stephensi	South coast marsh vole	SSC	Tidal marshes.	HA	**Confirmed Absent.** The site lacks tidal marshes.
Neotoma lepida intermedia	San Diego desert woodrat	SSC	Variety of shrub and desert habitats, typically with rock outcrops, boulders, cacti and/or areas of dense undergrowth.	HA	**Less than Reasonable.** The site lacks shrub and desert habitat and is not expected to occur on the site due to the limited undergrowth habitat, the history of disturbance on the site and the urban setting of the site.
Nyctinomops macrotis	Big free-tailed bat	SSC	Rocky areas with high cliffs in a variety of arid areas including pine-juniper woodlands, desert scrub, palm oasis, desert wash, desert riparian.	HA	**Less than Reasonable.** The site and vicinity lack woodland, desert scrub, palm oasis, desert wash and desert scrub habitat.
Onychomys torridus ramona	Southern grasshopper mouse	SSC	Inhabits arid areas, especially scrub habitat (i.e., coastal scrub and mixed chaparral, with friable soils).	HA.	**Less than Reasonable.** The site lacks mixed chaparral.and suitable coastal scrub habitat. The project site contains small areas of isolated coastal scrub habitat, however, this species is not expected to occur due to the historical uses of the site and the highly disturbed nature of the urban site.

Perognathus longimembris brevinasus	Los Angeles pocket mouse	SSC	Prefers sandy soils within coastal sage scrub. Less often found in gravelly washes, and rocky soils.	HA	**Less than Reasonable.** The site lacks sandy/gravelly washes and suitable coastal scrub habitat. The project site contains small areas of isolated coastal scrub habitat, however, this species is not expected to occur due to the historical uses of the site and the highly disturbed nature of the urban site.
Taxidea taxus	American badger	SSC	Open plains and fields, particularly in grasslands.	HA	**Confirmed Absent.** The site lacks open plains and expansive grasslands and is surrounded by urban areas.
Amphibians					
Anaxyrus californicus	Arroyo toad	FE, SSC,	Washes and arroyos with open water, sand and gravel beds for breeding and pools with sparse overstory vegetation.	HA	**Confirmed Absent.** The site lacks washes and arroyos with open water, sand and gravel beds for breeding and pools with sparse overstory vegetation. This species is only found in this habitat.
Rana muscosa	Southern mountain yellow-legged frog	FE, SSC, WL	Streams and small pools within ponderosa-pine, montane hardwood-conifer and montane riparain habitat types.	HA	**Confirmed Absent.** This species is only found in high-elevation mountain creeks.
Spea hammondii	Western spadefoot	SSC	Open habitats including low grasslands, open chaparral, and pine-oak wodlands, where soils are sandy or gravelly. Requires temporary rain pools that last at least three weeks. Pools must lack predators of eggs and tadpoles.	HA	**Confirmed Absent.** The site lacks open habitats including low grasslands, open chaparral, and pine-oak woodlands and temporary ponding areas.
Taricha torosa	Coast range newt	SSC	Moist areas within chaparral, oak woodland, and grasslands with ponding habitat.	HA	**Confirmed Absent.** The site lacks chaparral, oak woodland, and suitable grassland habitat. This species is typically found in foothills.
Fish					

Catostomus santaanae	Santa Ana sucker	FT, SSC	Inhabits shallow, cool, running waters. Historically known from Los Angeles, San Gabriel and the Santa Ana river systems.	HA	**Confirmed Absent.** The site lacks any waterways.
Gila orcuttii	Arroyo chub	SSC	Inhabits perennial or intermittent streams with permanent pools.	HA	**Confirmed Absent.** The site lacks any waterways.
Oncorhynchus mykiss irideus (Popoulation #10)	Southern steelhead	FE	Permanent streams in coastal basins.	HA	**Confirmed Absent.** The site lacks any waterways.
Rhinichthys osculus ssp. *3*	Santa Ana speckled dace	SSC	Found within the headwater streams of the Santa Ana and San Gabriel rivers.	HA	**Confirmed Absent.** The site lacks any waterways.

Appendix E
USFWS IPaC

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the [illegible] office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Los Angeles County, California

Local office

Carlsbad Fish And Wildlife Office

(760) 431-9440
(760) 431-5901

2177 Salk Avenue - Suite 250
Carlsbad, CA 92008-7385

http://www.fws.gov/carlsbad/

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information.
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Birds

NAME	STATUS

NOT FOR CONSULTATION

California Condor Gymnogyps californianus — Endangered
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/8193

Coastal California Gnatcatcher Polioptila californica californica — Threatened
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/8178

Least Bell's Vireo Vireo bellii pusillus — Endangered
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/5945

Flowering Plants

NAME	STATUS
Gambel's Watercress Rorippa gambellii No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4201	Endangered
Nevin's Barberry Berberis nevinii There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/3995	Endangered

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.

2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php
- Nationwide conservation measures for birds http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Costa's Hummingbird Calypte costae — Breeds Jan 15 to Jun 10
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9470

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to S[illegible]
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska
https://ecos.fws.gov/ecp/species/9656

Rufous Hummingbird Selasphorus rufus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8002

Song Sparrow Melospiza melodia — Breeds Feb 20 to Sep 5
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

Spotted Towhee Pipilo maculatus clementae — Breeds Apr 15 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/4243

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (■)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures and/or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occu in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of co ern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) th are of conc rn throughout their range anywhere within the USA (including Hawaii, the Pacific Islands uerto Rico and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in parti ia Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC specie in yo project area, but appear on your list either because of the Eagle Act requirements (for eagles) or for non eagles) potential susceptibilities in offshore areas from certain types of development or activities e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

NOT FOR CONSULTATION

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

NOT FOR CONSULTATION

This location overlaps the following wetlands:

FRESHWATER POND

PUSAx

A full description for each wetland code can be found at the National Wetlands Inventory website

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analyst, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tropical fish reefs) have also been excluded from the inventory. These habitats, because of their depth, are undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

1.0 INTRODUCTION

As requested by Stormwater Planning Division (SWPD), this report presents the findings of Geotechnical and Materials Engineering Division's (GMED) geotechnical evaluations and environmental assessments beginning in 2009 through the present for the proposed Rory M. Shaw Wetlands Park Project (Project). The Project is a key component of the comprehensive Sun Valley Watershed Management Plan (SVWMP), a project that seeks to address local flooding issues while improving the community by providing infrastructure in the Sun Valley community. Figure 1 shows the Project location within the SVWMP boundaries.

This report focuses on the 46-acre property located northeast of the intersection of Tujunga Avenue and Strathern Street. The property is proposed to be improved to provide a multi-purpose facility designed for capturing stormwater runoff, reducing stormwater pollution, increasing water conservation, and creating recreational opportunities and wildlife habitat. Stormwater captured and treated will be pumped to infiltration galleries constructed in 2002, located at the adjacent 17-acre Sun Valley Park (SVP).

2.0 BACKGROUND

The Project site lies within an area historically designated as a Rock and Gravel District by the City of Los Angeles (CLA). The property and surrounding areas were quarried for sand and gravel in the early- to mid-1900s with many of the pits subsequently converted to landfills. Strathern Pit, which occupies approximately 34.7 acres of the subject site, was permitted by the CLA as an inert debris landfill known as Strathern Inert Debris Landfill, in 1992. The Tujunga Pit, which occupied the northern portion of the property, was converted to a municipal landfill, known as the Newberry Landfill, during the 1950s and is considered a legacy landfill. The Project Vicinity Map illustrated on Figure 2 shows the various gravel pits that were converted to landfills.

Although the Sun Valley community is highly developed, it is not currently served by any comprehensive storm-drain system. As a result, even light rainfall can lead to moderate or severe flooding.

2.1. Watershed Management Plan

In 2004, the Project was identified as a major component of the SVWMP Plan (Figure 1), which called for transforming the former Strathern Inert Debris Landfill into a multi-purpose wetlands park focusing on stormwater detention, treatment, and infiltration. The Project is a partnership between the Los Angeles County Flood Control District (LACFCD), CLA, the CLA Bureau of Sanitation, and the Sun Valley Watershed Stakeholders Group.

2.2. Wetlands Park Project Objective

The objective of the Project is to convert the existing landfill area into a multi-purpose wetlands park, illustrated on Figure 3, which is primarily dedicated to stormwater detention, treatment, and reuse. The following lists the primary components of the Project:

- The detention pond will have a capacity to capture and divert up to 590 acre-feet of stormwater runoff collected from the upstream tributary area and reduce flooding in the surrounding areas.

- Wetlands will circulate the captured stormwater through a free water surface wetland treatment. The wetlands will serve as a natural water-treatment system for removing pollutants from the detained stormwater runoff.

- The treated stormwater will be pumped to the existing SVP infiltration galleries for groundwater recharge.

- The project will also include open space and recreational areas for public use.

3.0 PURPOSE

This report presents the results of our geotechnical investigations and environmental assessments conducted for the Project, dating from 2009 to the present. The objectives and purpose of the investigations and assessments varied as the Project developed. The section on Field Exploration (Section 9.0) discusses the purpose of each investigation in greater detail.

Primary objectives included:

- Evaluation of subsurface conditions.
- Verification of the maximum depth of landfill debris.
- Characterization of the contact between landfill debris and underlying alluvial soils.
- Characterization of decomposable landfill boundary within the Project site.
- Environmental assessments.
- Qualitative assessment of voids within the inert landfill debris.
- Qualitative assessment for the reuse and special handling requirements for on-site inert debris.

In addition to subsurface investigations, we conducted reviews of available documents from the Los Angeles Regional Water Quality Control Board (LARWQCB), CLA Geotechnical Engineering Design Division, CLA Local Enforcement Agency (LEA), and other publicly available data.

4.0 PROJECT COMPONENTS

4.1. Location and Property Identification

The Project site, located in the CLA, is located northeast of the intersection at Strathern Street and Tujunga Avenue in the community of Sun Valley. The site is bordered to the north by parcels owned by Los Angeles By-Products Company (LABPC), to the south by Strathern Street, to the west by Tujunga Avenue, and to the east by Fair Avenue (Figure 2). Addresses, Assessor Parcel Numbers (APN), and related property identification information are listed in Table 1, Property Identification.

Table 1: Property Identification

Reference Address	Land Use	APN	Coordinates	Site ID
8216 Tujunga Avenue 8175 Fair Avenue	Former concrete batch plant	2314-001-900 (formerly 2314-001-001, -002)	34°13'10.53"N 118°22'41.80"W	N/A
8230 Tujunga Avenue 11201 Strathern Street	Strathern Pit/ Inert Landfill	2314-001-901	34°13'03.80"N 118°22'37.45"W	Solid Waste Facility Permit 19-AR-1016 (566)
8250 Tujunga Avenue	Former Newberry Landfill/Tujunga Pit	2314-001-003 (portion of 2314-001-900, 2314-005-900, -903)	34°13'14.52"N 118°22'36.45"W 34°13'06.23"N 118°22'24.07"W	19-AR-5165/ N/A

4.2. Historical Land Use

Historical use of the Project site, including relevant information from adjacent properties are summarized in Table 2, Historical Overview of the Site. Historical information was extrapolated from available documentation and aerial photographs.

Table 2: Historical Overview of the Project Site

Year	Activity Overview
1902	Area is undeveloped open space
1928	Quarrying operations on the Northwest, Southwest, and possibly Northeast corner of Strathern Pit
1938	Quarrying covers nearly the entire site, various structures, and conveyors
1948	Newberry Landfill operations begin
1955	Newberry Landfill closes
1955	Foundation permit for concrete batch plant
1972	Gravel mining operations cease in Strathern Pit
1976	Site purchased by LABPC
1991	Strathern Pit permitted to receive inert debris
1991	LARWQCB establishes Waste Discharge Requirements (WDR) Order No. 91-086, which includes requirements for a Groundwater Monitoring and Reporting Program, MRP No. 7055
1992	Strathern Landfill permitted to begin accepting inert debris
1994	Concrete batch plant is expanded
2004	SVWMP is adopted
2005	Tujunga Avenue Roadway Failure
2006	SVP Infiltration System is constructed
2008	Tujunga Avenue Roadway Failure Repair completed
2009	Property ownership is transferred to LACFCD
2010	Public Works continues on-going Groundwater Monitoring Program
2016	Over and Over Ready-Mix Concrete vacates property

4.3. Strathern Pit (Inert Debris Landfill)

The inert debris landfill occupies a majority of the property, which consists of a large square-shaped pit that is generally covered with construction debris/rubble, shrubs, and weeds. The perimeter of the pit is at approximately the same grade as the surrounding roadways and at an elevation of approximately 820 feet above sea level (asl) in the northerly portion of the site, and 805 feet asl in the southerly portion of the site. Slopes descend into the inert debris landfill and range from 10 to 30 feet below street grade, with a 20-foot high soil berm that runs parallel to Fair Avenue.

Strathern Pit was first owned by Blue Diamond Materials and purchased by LABPC in 1976. According to the California Geological Survey (formerly Division of Mines and Geology), sand and gravel mining operations at the site began in 1929 and halted in 1972. LABPC received a permit to operate the site as an inert debris landfill from the Solid Waste Management Committee on July 31, 1992, and began operating on September 21, 1992. The landfill consisted of 34.7 acres with an estimated capacity of 6,907,000 cubic yards. The landfill ceased operation in February 2009, when possession of the property was transferred to LACFCD.

4.4. Former Concrete Batch Plant

A concrete plant occupied the northwestern portion of the property and was operated by Ready Mix, Over and Over Ready Mix, Inc., Owner Operator Ready Mix Concrete, and Over and Over Ready Mix Concrete. Batch plant operations were started in the mid-1950s. Structures on the concrete plant included various metal sheds, a single-story office building, a steel structure used primarily for truck maintenance, and the batching plant structures. The majority of the structures were dismantled when Over and Over Ready Mix Concrete vacated the property in 2016. A 2014 report provided by GMED, entitled "Subsurface Environmental Site Assessment and Geologic Evaluation, Concrete Batch Plant Property and Vicinity" provides a comprehensive evaluation of the subsurface conditions for this part of the Project.

4.5. Access Road

The primary access road into the Strathern Pit is located between the northerly property line and the northern side of the former concrete batch plant. The access road was used to access the landfill; it was constructed as a haul road to deposit debris at the landfill working face.

4.6. Fill Berm

A fill berm runs parallel to Fair Avenue along the eastern property boundary. The berm served to minimize visual and noise impacts from the operation of the landfill to the adjacent residential neighborhood.

4.7. Sun Valley Park

SVP, owned and operated by the CLA Department of Parks and Recreation, is located east of Fair Avenue. The park is a 17-acre recreation center consisting of open space, a public swimming pool, baseball fields, soccer fields, and tennis courts. The park is essentially flat, sloping gently to the south-southeast, and is situated at an elevation of approximately 813 feet asl. Based on aerial photographs, the park was constructed prior to the 1950s and is surrounded by residential development to the north and south. Infiltration galleries were constructed in 2006 and have recently been evaluated by GMED in a separate report.

5.0 STRATHERN INERT DEBRIS LANDFILL

5.1. Background

Strathern Inert Debris Landfill occupies a majority of the property. LABPC initially sought to convert Strathern Pit to a non-hazardous Class III sanitary landfill, with an estimated volume of 6.9 million cubic yards. Based on the 1988 Environmental Impact Report, the project was designed to mimic the features of the Bradley West gravel pit located nearby, which was granted a permit for a Class II landfill in 1978. The design proposed a clay liner on the pit bottom, leachate control, groundwater monitoring, side slope protection, a gas control and recovery system, and a surface runoff control system. In 1990, the Zoning Administration issued an approval with several requirements, including a condition to limit the use of the landfill site to disposal of inert construction debris only. Subsequent appeals by the operator requested removal of the condition for installing a clay liner, a leachate control and removal system, and establishing a groundwater monitoring program (Latham & Watkins, 1990). LABPC successfully appealed the removal of these items from the permit and the Zoning Administration concluded that these items could be eliminated because of the low potential for impact to groundwater by inert construction debris (CLA Board of Zoning Appeals, 1991).

5.2. Strathern Inert Debris Landfill Discharge Requirements

According to the 1991 LARWQCB WDR Order No. 91-086, the site was permitted to receive non-water soluble, non-decomposable materials including earth, rock, gravel, concrete, glass, bricks, broken asphalt, and inert aggregate mining wastes. The site was not permitted to receive hazardous, designated, or liquid wastes; nonhazardous solid waste, decomposable organic refuse such as ordinary household and commercial refuse, tin cans, metals, paper and paper products, cloth and clothing, wood and wood products, lawn clippings, sod, shrubbery, hair, hide, bones, dead animals, roofing paper, tar paper, unquenched ashes mixed with refuse, market refuse, or unclassified garbage; materials of a toxic nature such as insecticides, poisons, or radioactive materials; or asbestos or products containing asbestos.

The LARWQCB discharge requirements set forth the following measures to prevent the disposal of unauthorized waste from entering the site through a debris-load checking program: 1) all incoming loads required assessment that included inspecting them at a check stand and at the point of discharge; 2) at the check stand the driver would be questioned about the type of material to be disposed; and 3) a clerk would visually observe the load by using strategically located mirrors.

The Company's standard operations included posting a sign at the entrance indicating that no hazardous wastes would be accepted. Each driver was required to sign and date a certificate. Waste disposal vehicle could then proceed to the working face of the landfill where a landfill operator would verify the load for acceptable dumping waste.

5.3. Landfill Discharge Records

We reviewed Monthly Monitoring Reports submitted by LABPC to CLA Environmental Affairs Department and inspection reports completed and maintained by CLA LEA Inspectors dating from October 1992 to March 2009. These reports document data on volume received; number of working days in the month; average daily debris inflow; estimated remaining site life, and the number of loads rejected due to the debris load checking program. The reports also include monthly landfill maps that indicate areas where debris was placed. Inspection reports provide site observations, notes on any violations, and areas of concern and follow-ups which indicate "No violations or areas of concern" in the available records. Monthly Monitoring Reports and LEA Inspection Reports are included in Appendices A1 and A2, respectively.

Debris placement logistics were described as follows in the permit application: "After checking in, the vehicles were to proceed down the haul road and deposit the material at the working face." No compaction of the inert material was required since the depth of the fill was expected to compact the material. Because of the nature of the inert debris, daily cover was not required. Caterpillar D-8 and D-9 Dozers were listed as the primary equipment utilized for spreading the debris and providing some level of debris compaction. In the 2005 inspection report, it was noted that the inert debris was dumped and placed in approximately 10-foot thick layers with a 1- to 2-foot thick cap of granular soil. The dumped debris and soil were spread by a dozer and watered for dust control. The PSOMAS report (2008) described the fill material as consisting of large blocks of concrete and asphalt that was graded using a large grader and covered with soil. The report also pointed out that as a result, large voids are to be expected within the debris fill.

Existing grades at the time of permitting for the landfill are illustrated on Plate 1, indicating that mining activities at Strathern Pit were up to 145 feet deep. Figure 4 graphically illustrates the annual volume of debris received over the lifespan of the landfill based on values reported in Monthly Monitoring Reports (Appendix A1). Final values indicate that approximately 4.27 million cubic yards of inert debris were placed at Strathern Inert Debris Landfill prior to its closure in 2009.

6.0 TUJUNGA AVENUE WASHOUT

6.1. Background

During a 2005 rain event, floodwater from several days of severe rain undermined the pavement near the 8000 block of Tujunga Avenue. The failure enlarged as the water continued to undermine the roadway ultimately undermining a portion of the adjacent parking lot of the concrete batch plant. Eventually the slope was breached, creating a deep erosion gully that extended into the Strathern Inert Debris Landfill, see photographs in Appendix B1. As alluvial soils continued to be eroded from beneath the roadway, widening the affected area, a vehicle in the concrete batch plant's parking lot and the vehicle of CLA inspector, Mr. Rory M. Shaw, fell into the gully as the water flowed into the landfill. The washout extended across the entire width of Tujunga Avenue (approximately 60 feet) and extended approximately 200 feet along Tujunga Avenue, from approximately 1,050 to 1,250 feet north of the Strathern Street centerline to the concrete batch plant parking lot. At the time of the road failure, Strathern Inert Debris Landfill had been filled to about 40 feet below road grade. Soil and debris from the washout were deposited in a layer that was approximately 10 feet thick, fanning out over a distance of 300 feet from the mouth of the washout onto the landfill.

6.2. Slope Remediation

As reported by the CLA, emergency measures to prevent further erosion included cleanout of debris that flowed into the sinkhole and slope stabilization measures. Based on a 2005 CLA geotechnical report, the debris and loose soils were removed to expose the natural soil. The bottom and sides were covered with Controlled Low Strength Material (CLSM). As the emergency measures were being implemented and the operation approached the southern end of the washout, the large pieces of debris were removed but not all loose soil-type debris were able to be removed. To prevent further erosion, the bottom of the washout was lined with 2,000 pounds per square inch concrete along with velocity reducers, see photographs in Appendix B2.

Based on available CLA documents, slope remediation included the construction of a 1.5 horizontal to 1 vertical (1.5H:1V) fill slope to support the roadway and a 2H:1V fill slope to restore the slope below the concrete batch plant. It is our understanding that approved modification requests to the building code allowed for the construction of engineered fill on top of uncertified fill, construction of a retaining wall on compacted fill placed over the existing uncertified fill, and construction of gabions. It is our understanding restoration included backfilling with CLSM and suitable imported and onsite soils. Fill placed for the support of concrete pavement at the concrete batch plant driveway and parking area was certified as secondary structural fill since these areas were underlain by inert debris fill.

The following outlines each component of the slope remediation:

I. Granular compacted fill was placed over a slurry backfill to create a slope with a gradient of 1.5:1 (H:V). Chimney drains were constructed along the contact plane between the slurry and granular fills. To direct the water away from the fill slope, drainage was conveyed toward the roadway as it was before the washout occurred. The location and depth of the shear key was determined from a test pit investigation. Based on as-built drawings, the key was 5 feet in width and embedded 3 feet into natural soil and backfilled with imported soil.

II. For the 2:1 (H:V) slope stabilization, a 6-foot high gabion wall was constructed in slots at the toe of the slope in lieu of a shear key. Considering the depth of the debris fill, it was not feasible to build a shear key into native materials. The gabion wall was built by using broken concrete and available rocks to fill the wire cages.

III. Concrete and shotcrete side hill drains were constructed to collect the slope surface runoff and convey the flow to a down-drain v-ditch at the intersection of the two slopes. The down-drain v-ditch then discharged run-off to a dissipater.

IV. A 13-foot high pile-supported retaining wall was built along the toe of the slope using 30-inch diameter Cast in Drilled Hole concrete piles founded into native soils. The wall created a division line between the debris fill slope to the east and the fill slope to the west.

V. CLA Geotechnical Engineering Division performed earthwork observations and CLA Department of General Services performed testing services. Based on the compaction report prepared by CLA, import soils and crushed aggregate base (CAB) were tested prior to import. The fill soil was silty sand with clay with a soil classification of SM and the CAB was well-graded gravel with a soil classification of GW.

Design remediation features discussed above will be encountered during grading for the Project and the as-built drawings should be incorporated into proposed grading plans. The remediation should be protected-in-place to whatever level is practical during grading.

7.0 MUNICIPAL WASTE LANDFILLS

The site and the area north of the site were recognized as part of the Rock and Gravel District in the Sun Valley Community Plan as established by the CLA in 1977. Most of the pits resulting from the mining of rock and gravel were subsequently converted to landfills. Three former landfill sites are located near the project site and

are officially closed, refer to Figure 2. Newberry Landfill is mostly located on the adjacent parcels due north of the Project but encroaches onto the Project site along the northern portion of the property previously occupied by the concrete batch plant.

Penrose Landfill is located on the west side of Tujunga Avenue, across from the Project site. Tuxford Landfill is northwest of the subject property, west of Tujunga Avenue and just south of the Golden State Freeway.

An overview of the Newberry and Penrose Landfills is provided below because of their proximity to the Project. Tuxford Landfill is about ¾ of a mile northwest of the Project and will not impact the Project site.

7.1. Newberry Landfill

The Newberry Landfill is located south of Roscoe Boulevard, between Tujunga and Fair Avenues and due north of the Strathern Inert Debris Landfill, refer to Figure 2. Aerial photographs show that heavy quarrying occurred through 1938. Based on United States Geologic Survey (USGS) regional historic topographic maps, the Tujunga/Newberry Pit is estimated to have a maximum depth of approximately 85 feet prior to becoming a landfill. CLA records indicate that the landfill operated from 1948 through 1955. The bottom of the landfill pit was not lined, and the landfill received 4 to 5 feet of final soil cover to match surrounding street grades (Law Environmental, 1988). Additionally, there is limited documentation indicating that landfill gases were detected along the southerly perimeter of the Newberry Landfill within the Project limits. Because the Newberry Landfill ceased operations prior to January 1, 1982, it is considered a closed legacy landfill by CLA's Bureau of Sanitation. Based on the records that were recoverable, Newberry Landfill received noncombustible and combustible household wastes, including wood, glass, metals, and incinerator ash. Due to the requirements for daily covering of the wastes with soils, up to 20 percent of the total landfill volume may be daily-cover fill soils of unknown origin. By 1956, the covered Newberry Landfill is visible in aerial photos along with light industrial buildings on the southwestern boundary of the former pit/landfill, which appears to be consistent with concrete batch plant operations. The 1965 and 1976 aerial photographs show large stockpiles immediately west of Fair Avenue, which are believed to have been used to correct differential settlement (Law Environmental, 1988). The 1994 aerial photographs indicate area conditions consistent with those of the present. Current primary use of the area is for an automobile wrecking yard, a scrap metal yard, a concrete crushing operation, and truck/trailer storage. GMED's 2014 Subsurface Environmental Site Assessment (ESA) provides a comprehensive report of the Newberry Landfill and provides findings and recommendations that are relevant to the Project.

7.2. Penrose Landfill

The Penrose Landfill was used as a source of aggregate material when it was operated as a gravel pit beginning in the early 1950s. It is our understanding that while the quarry operations were ongoing, product was transferred to loading operations conducted at Strathern Pit. The conveyor system, used to transfer the product, crossed Tujunga Avenue through a tunnel located in the central-west portion of the Project site. A headwall and portion of this tunnel are still located on Project site. Following quarrying activities, the pit was converted to a 72-acre Class III landfill, receiving municipal refuse from 1960 through 1985, and was operated by LABPC. The elevation of the gravel pit bottom was estimated to have been about 620 feet above mean sea level (msl). The landfill reached its maximum permitted elevation of about 860 feet above msl in March 1985 and ceased accepting waste. Currently, it is our understanding that this site has been used as a remote-control model car raceway and golf driving range.

8.0 FIELD EXPLORATION

8.1. Overview

As the Project evolved, GMED conducted several phases of subsurface exploration. The Strathern Landfill was closed at the time of the various investigations, but the concrete batch plant was in operation and was not made accessible for investigation until 2013. All borings were logged under the supervision of an Engineering Geologist. Most samples collected were submitted for environmental testing to characterize landfill materials. An exploration summary is provided in Appendix C1. Boring and trench locations are shown on the Geotechnical Map, Plate 2, and boring and trench logs are provided in Appendices C2 and C3, respectively. Environmental testing results for Strathern Inert Debris Landfill and the Newberry Landfill are summarized in tables located in Appendix D. Laboratory reports with chains-of-custody can be found in Volume II.

The purpose of the field exploration was to verify the thickness of inert debris, provide an assessment of possible environmental impacts, evaluate debris content, and evaluate subsurface conditions outside of the inert landfill.

8.2. 2009 Subsurface Investigation

Geotechnical Borings B-1 through B-4 were drilled in April 2009 using a hollow stem CME-85 drill rig to a total depth of 31.5 feet below existing ground (beg). The borings were drilled to evaluate subsurface conditions outside the landfill pit along the perimeter of the property. Limited geotechnical testing was conducted, and the results are included in the Logs of Borings.

Borings B1 and B2 were drilled in June 2009 using a Sonic (vibratory) Drill Rig to characterize and determine the thickness of the landfill debris. The borings were excavated in areas where the landfill was anticipated to be at its greatest thickness. Boring B1 was drilled to a total depth of 155 feet beg and Boring B2 was drilled to a total depth of 147 feet beg. Native alluvium was identified at 139 feet beg and 135 feet beg at Borings B1 and B2, respectively. Environmental samples were collected from B1 for limited testing by a state-certified laboratory.

Test Pits TP-1 through TP-5 were excavated in June 2009 using a track-mounted excavator to expose and characterize near-surface landfill debris. Test pit depths ranged from 15 to 25 feet beg and were up to 25 feet in width. Environmental samples were collected and submitted for analysis by a state-certified laboratory.

8.3. 2011 Strathern Inert Debris Landfill Exploration

Borings B2-1 through B2-11 were drilled in September 2011 using a Sonic Drill Rig to establish the alluvium-landfill contact. The boring depths ranged from 10 to 107 feet beg.

8.4. 2013 Concrete Batch Plant Exploration

Borings B13-1 through B13-10 were drilled in October 2013 within the concrete batch plant perimeter using a Spider Limited Access Sonic drill rig. Site exploration within the concrete batch plant was limited to areas that could be safely explored without interrupting ongoing plant operations including cement truck traffic and the positioning of aggregate processing equipment such as hoppers, conveyors, and mixing equipment. Areas immediately adjacent to stockpiles were also avoided for safety reasons. Total depths ranged from 20 to 89 feet beg and samples were submitted for environmental analysis. Borings B13-6 and B13-10 were terminated before reaching their target depths due to exceedance of the Lower Explosive Limit (LEL), as monitored by a 4-gas meter. Decomposable landfill material was encountered and concluded to represent encroachment of the Newberry Landfill into the Project limits. The Newberry Landfill was listed as a recognized environmental concern in the Phase I ESA (Mactec, 2010), but was not anticipated to encroach into the Project limits. Environmental samples were collected and submitted for analysis by a state-certified laboratory.

8.5. 2014 Newberry Landfill Evaluation

During the 2013 exploration, decomposable waste was encountered within the Project boundaries. Supplemental subsurface exploration was undertaken in June 2014 to better delineate the lateral and vertical extent of the Newberry Landfill within the property limits and to evaluate the characteristics of the Newberry Landfill fill cap. Borings B-11 through B-20 were drilled within the concrete batch plant and along the entire northern property boundary. Site exploration within the concrete batch plant was limited to areas that could be safely explored without interrupting ongoing plant operations including cement truck traffic and the positioning of aggregate processing equipment such as hoppers, conveyors, and mixing equipment. Boring depths ranged from 75 to 110 feet beg. Borings B-14 through B-17 had to be terminated before reaching their target depths due to exceedance of the LEL, as monitored by a 4-gas meter. Environmental samples were collected and submitted for analysis by a state-certified laboratory.

8.6. 2014 Supplemental Exploration

As the Project evolved and improvement elevations began to be established, supplemental exploration was again undertaken in March and June 2014. A near-surface trenching program was undertaken to estimate the percentage of voids, evaluate the estimated percentage of non-reusable material, and to further evaluate potential environmental impacts within the inert debris of Strathern Landfill for evaluation of material handling and disposal considerations during construction.

Borings B-21 through B-33 were drilled in June 2014 using a Spider Limited Access Sonic Drill Rig. All borings were drilled to 100 feet beg. Drilling was monitored using a 4-gas meter and the LEL was not exceeded. Boring B-22 was terminated due to poor recovery. Environmental samples were collected and submitted for analysis by a state-certified laboratory.

Test Pits TP-6 through TP-28 were excavated up to 23 feet beg to qualitatively evaluate near-surface landfill conditions. The test pits were photographed, logged, and monitored using a 4-gas meter. Environmental samples were collected and submitted for analysis by a state-certified laboratory. Test pit logs describing and illustrating debris in-situ conditions are provided in Appendix C3, which includes a representative photograph of the test pit walls for visual reference.

8.7. 2018 Supplemental Exploration

Once a rough grading concept was provided by PSOMAS, GMED was requested to evaluate the margins of the Strathern Pit for perimeter grading and provide recommendations. Borings B34-18 through B53-18 were drilled in October 2018 using a Spider Limited Access Sonic Drill Rig. Borings were drilled as close to the perimeter as possible and where data gaps existed. Borings were drilled up to 10 feet into alluvium and varied in depth from 35 to 120 feet beg.

9.0 GEOLOGIC CONDITIONS

The Project site is located within the northeastern portion of the San Fernando Valley, which is bounded on the northeast by the San Gabriel Mountains, the northwest by the Santa Susana Mountains, the east by the Verdugo Mountains, the west by the Simi Hills, and the south by the Santa Monica Mountains. These features are located within the Transverse Ranges geomorphic province of California, which consists of a series of east/west-trending mountain ranges and sediment filled valleys. The San Fernando Valley is a broad, flat, alluvium-filled basin that trends roughly east to west. The valley is comprised of a broad alluvial flood plain composed of coalescing channels with deposits consisting of sedimentary, metamorphic, and granitic clasts originating from the surrounding mountains of the Western Transverse Ranges, refer to Figure 5 for the Regional Geologic Map.

9.1. Local Geologic Conditions

The Project site is located where coarse, sandy, and gravelly alluvium was deposited by braided streams originating in the San Gabriel Mountains. The Project site is located within an abandoned stream channel, which is visible on historic aerial photographs pre-dating development of the area. 1928 and 1938 historical aerial photographs, Figures 6 and 7, show a channel of the Tujunga Wash traversing the Project site. The onsite alluvial deposits consist primarily of medium- to coarse-grained sand, gravel, and boulders with localized deposits of silts and clays.

10.0 HYDROGEOLOGIC CONDITIONS

The Project site is located within the San Fernando Groundwater Basin, a 112,000-acre physiographic basin, which is part of the Upper Los Angeles River Area. The elevation of the floor of the valley varies between approximately 600 and 1,200 feet above msl. The Project is located within the eastern part of the San Fernando Groundwater Basin, which is generally an unconfined aquifer. Minor faults associated with the Verdugo Fault have been mapped to the north of the site where groundwater-bearing alluvial sediments were displaced. The Verdugo Fault trends northwest-southeast and is considered a groundwater barrier.

Groundwater extraction and recharge activities in the San Fernando groundwater basin are regulated by the Upper Los Angeles River Area Watermaster to ensure that existing and proposed activities protect groundwater quality and quantity in the basin. The groundwater gradient map for the Upper Los Angeles River Area indicates a southward-sloping groundwater surface, with a potentiometric surface of approximately 331 feet beg. The current land surface generally slopes to the south-southeast at a steeper gradient than the water table, which also slopes to the south-southeast, with some local variability due to local groundwater pumping. The groundwater elevation can fluctuate with seasonal pumping patterns and recharge.

10.1. Site Specific Groundwater Monitoring

Landfill activities operated under 1991 WDR Order No. 91-086 were documented by the LARWQCB. One of the provisions in the order was the development of a ground water monitoring network to "adequately ascertain if there is any impact to ground water quality as a result of the operation of the disposal site." Three programs overseen by Public Works provide a comprehensive assessment of potential groundwater impacts of the Strathern Pit for the Project and the Sun Valley Park infiltration system. The programs are monitored on a semi-annual basis and reports are submitted to SWPD.

Groundwater monitoring programs include: (A) Strathern Landfill Groundwater Monitoring and Reporting Program, which evaluates groundwater conditions at the former Strathern Inert Debris Landfill and complies with regulatory requirements from when the site was permitted as an inert landfill; (B) a baseline program at SVP, which evaluates potential long-term groundwater impacts from the infiltration units located in the park, which is a voluntary program and is anticipated to continue after the project is constructed; and (C) a vadose zone monitoring network that serves to evaluate the effectiveness of the treatment units in removing pollutants and aids in assessing for potential impacts to groundwater from the infiltration units at SVP.

Groundwater monitoring reports conclude that groundwater has not been impacted by the Strathern Inert Debris Landfill since the landfill contains inert construction debris and because the vertical separation between the base of the landfill and the potentiometric surface is greater than 300 feet. The following conclusions have been made regarding impacts to groundwater:

- Organic solvents detected in groundwater samples collected from the ongoing programs for the site appear to be from an offsite historical release to groundwater.

- Detection of Methyl tert-butyl ether (MTBE) in upgradient Monitoring Well 4928C suggests a release from an upgradient fuel site. MTBE is a contaminant associated with gasoline and is not considered a compound associated with the former landfill operations.

Table 3 lists the current monitoring wells being used for each monitoring program and Figure 8 shows the locations of the wells that are part of the ongoing monitoring programs.

Table 3: Monitoring Wells

Well ID	Relative Location	Depth to Groundwater* (in feet)	Groundwater Elevation* (feet above msl)
4928A	Down-gradient monitoring well	324.35	481.88
4928C	Up-gradient monitoring well	341.56	482.61
SVP-01	Down-gradient monitoring well	327.42	481.71
SVP-02	Down-gradient monitoring well	301.40	507,47
SVP-03	Up-gradient monitoring well	301.55	516.41
VSW01	Located west of Infiltration Gallery 1	N/A	N/A
VSW02	Located west of Infiltration Gallery 1	N/A	N/A
VSW03	Located west of Infiltration Gallery 1	N/A	N/A
VSE01	Located east of Infiltration Gallery 2	N/A	N/A
VSE02	Located east of Infiltration Gallery 2	N/A	N/A
VSE03	Located east of Infiltration Gallery 2	N/A	N/A

*TRC 2019

Based on statistical analysis conducted as part of the monitoring program discussed above, the inert landfill operations are not considered to be the source of the constituents detected in groundwater. Groundwater quality and groundwater level reporting supports that the inert landfill has not impacted groundwater (TRC 2017 and 2019). Continued monitoring after the Project is operational will provide further verification of these conclusions.

11.0 ENVIRONMENTAL ASSESSMENTS

11.1. Newberry Landfill

According to a 1988 Solid Waste Assessment Test report (LAW, 1988), Newberry Landfill was considered to be limited in terms of gas production. It was anticipated that the capability of landfill gas production would decrease over time as the availability of decomposable material also decreased.

11.2. Penrose Landfill

It is reported that an array of landfill gas extraction and collection systems has been in place at the former Penrose Landfill since the early 1980's. According to publicly available records, the landfill gas collection system at the Penrose Landfill consists of approximately 70 gas extraction wells and associated pipelines and was successful in preventing offsite migration of methane (Fugro, 1997) while in operation.

11.3. Phase I Environmental Site Assessment

Wood (formerly MACTEC) prepared a 2010 Phase I ESA for the Project under the direction of GMED, in accordance with American Society for Test and Materials (ASTM) E1527-05 Standard Practice for Environmental Site Assessments, Phase I ESA Process. This study included site reconnaissance and interviews with County and concrete plant representatives. The assessment revealed that the Newberry Landfill encroached onto the Project and indicated that there is one Underground Storage Tank abandoned in place within the limits of the former concrete batch plant. A copy of the complete report is available upon request.

11.4. Methane Evaluations

The Project site is partially located within the Methane Zone and partially the Methane Buffer Zone as designated by the CLA Methane Hazards Map, shown on Figure 9.

Leighton Consulting, Inc., conducted methane surveys for the Project site under the direction of GMED in 2012 and again in 2014. Copies of both the 2012 and 2014 reports are appended in the 2014 Subsurface ESA and Geological Evaluation report for the Concrete Batch Plant Property and Vicinity (GMED, 2014), and available on request. CLA Municipal Code Ordinance 175790, establishes methane mitigation requirements on passive and active systems for appropriate design levels.

11.5. Phase II Environmental Site Assessments

Several phases of ESAs were performed between 2009 and 2014 to evaluate the occurrence of potential environmental contaminants throughout the property limits. Exploration details, including depth of exploration and environmental sampling undertaken for each assessment performed, are summarized in Appendix C1.

11.6. Environmental Sampling

Subsurface materials were characterized from the borings and test pits excavated at the site. Samples collected were submitted for the environmental testing summarized below in Table 4. Generally, environmental samples were collected at 5-foot intervals and sampled per the protocol required by the respective Environmental Protection Agency method listed in Table 4. The samples were labeled, placed on ice in a cooler, and transferred for testing under chain-of-custody to American Environmental Testing Laboratory, Inc., a State of California certified laboratory. A photoionization detector was used to monitor samples for Volatile Organic Compounds (VOCs) and a 4-gas meter was used to monitor for oxygen, hydrogen sulfide, carbon monoxide, and LEL at the drill site.

Table 4: Overall Environmental Laboratory Testing Program

TEST	EPA METHOD
Title 22 Metals Including Mercury	6010B/7471A
Total Petroleum Hydrocarbons – Carbon Chain (TPH-CC)	8015B
Volatile Organic Compounds (VOCs) and Fuel Oxygenates	8260B
Polychlorinated Biphenyls (PCBs)	8082
Polynuclear Aromatic Hydrocarbons (PAHs)	8310
Organochlorine Pesticides	8081A
Asbestos	600R-93/116
Soluble Threshold Limit Concentration (STLC)	6010B
Toxicity Characteristic Leaching Procedure (TCLP)	6010B

Analytical results are summarized in Appendix D. Due to the volume of analytical results, complete laboratory analytical reports are included in a separate volume and are available upon request.

Soil cuttings generated during the assessments were placed in 55-gallon Department of Transportation-approved drums, properly labeled and inventoried, and temporarily stored onsite. Upon receipt of laboratory analyses, Ocean Blue Environmental Services was contracted to remove and properly dispose of the drummed materials.

12.0 ENVIRONMENTAL FINDINGS

GMED has thoroughly characterized the Strathern Inert Debris Landfill and the Newberry Landfill debris located on the Project site.

12.1. Strathern Inert Debris Landfill

Investigations confirmed that landfill debris generally consists of concrete, brick, brick tile, ceramic tile, asphalt, various types of metal debris, and soil. Analytical results indicate that debris may be reused onsite and special handling is not required.

12.2. Newberry Landfill

Analytical results indicate that the Undocumented Fill Cap and the landfill debris is impacted by hazardous levels of heavy metals and disturbance should be minimized. The landfill limits are delineated on the Geotechnical Map (Plate 2). Where possible, the concrete slab that overlies most of the former concrete batch plant should remain in place to act as an additional barrier to prevent the migration of surface water into the Undocumented Fill Cap and landfill debris, as well as to minimize disruption of any existing methane gas migration. Where it is necessary to remove portions of the concrete slab in the northerly portion of the site, a geotextile vapor barrier must be installed. This vapor barrier must be attached to the concrete slab so that the connection is vapor proof and extends to the future right of way, the property line, or 10 feet beyond the Newberry Fill Cap. Appropriate drainage controls should be taken to minimize infiltration around and under the concrete slab and the geotextile vapor barrier that will be left in place to create a semi-impervious layer. A passive methane venting system should be installed, per City Ordinance No. 175790. Additional venting recommendations may be required for the overall Project site. The Project contractor should implement proper health and safety measures based on the more detailed 2014 GMED report on the Newberry Landfill. Appropriate contaminated material handling and disposal procedures should be followed, as applicable.

13.0 SEISMIC HAZARDS

The site is located in a seismically active area, as is the majority of southern California, and the potential for strong ground motion at the site is considered significant. Primary seismic hazards associated with seismic activity, are ground surface rupture, ground shaking, seismically induced liquefaction, and various manifestations of liquefaction-related hazards, such as seismic settlement and lateral spreading.

A brief description of these hazards and the potential for their occurrences at the Project location are discussed below.

13.1. Faulting and Seismicity

No active or potentially active faults are known to pass directly beneath the Project site and the site is not located within an Alquist-Priolo Fault Zone. However, the Project is located in the seismically active southern California region and could be subject to moderate to strong ground motion in the event of an earthquake on one of the many active faults in southern California. Faults that could produce significant ground shaking at the site include the Verdugo, Hollywood, Raymond, and more. The Active Faults Map (Figure 10) shows the principal faults in the region.

The San Fernando Fault, within an Alquist-Priolo Earthquake Fault Zone, is the closest active fault and is located approximately 3.5 miles north of the site. The latest major activity on this fault was during the Mw 6.4 earthquake on February 9, 1971. The earthquake produced accelerations of about 0.4g at the site. The closest fault that is considered potentially active and not included in an Alquist-Priolo Earthquake Fault Zone is a trace of the Verdugo Fault, located approximately ¾ mile northeast of the site. Several blind thrust faults underlie the Los Angeles Basin at depth and are capable of generating future earthquakes. These faults are typically identified at depths greater than 3.0 kilometers and generally do not present a potential surface fault rupture hazard. The January 17, 1994, Mw 6.7 Northridge earthquake was the result of movement on a blind thrust fault. The maximum site acceleration and maximum shaking intensity that have occurred near the Project site were from the January 1994 Northridge earthquake.

13.2. Seismic Design Criteria

Structures should be designed to resist lateral forces generated by earthquake motions, in accordance with the current building code and applicable local agency design practices. Table 5 below summarizes site-specific design criteria obtained from the Structural Engineering Association of California Office of Statewide Health Planning and Development Seismic Design Maps, included in Appendix E. The short spectral response uses a period of 0.2 seconds. Design earthquake ground motions are defined as the earthquake ground motions that are two-thirds of the corresponding Maximum Considered Earthquake (MCE) ground motions. The values presented below are for risk-targeted MCE using the following site coordinates:

Latitude: 34.217 (34° 13' 1") Longitude: -118.377 (118° 22' 37")

Table 5: American Society of Civil Engineers 7-16 Seismic Design Parameters

Category	Coefficient	Code-Based
Site Class		D
Risk Category		II
Mapped Peak Ground Acceleration adjusted for Site Class Effects	PGA_M	0.952
Mapped Spectral Response Acceleration at 0.2 s Period	S_S	2.088
Mapped Spectral Response Acceleration at 1s Period	S_1	0.722
Seismic Design Category (S_1<0.75g)	SDC	null*
Short Period Site Coefficient at 0.2s Period	F_a	1
Long Period Site Coefficient at 1s Period	F_v	null*
Adjusted Spectral Response Acceleration at 0.2s Period	S_{MS}	2.088
Adjusted Spectral Response Acceleration at 1s Period	S_{M1}	null*
Design Spectral Response Acceleration at 0.2s Period	S_{DS}	1.392
Design Spectral Response Acceleration at 1s Period	S_{D1}	null*

Table 6 presents the mapped Maximum Considered Earthquake geometric mean (MCE_G) seismic design for projects located in Seismic Design Categories D through F, and the geometric mean Peak Ground Acceleration (PGA_M) adjusted for site class effects.

Table 6: Peak Ground Acceleration (PGA)

Parameter		Coefficient	Value
Mapped MCE_G PGA		PGA	0.865
Site Coefficient		F_{PGA}	1.1
Site Class Modified MCE_G PGA		PGA_M	0.952

A probabilistic seismic hazard analysis was performed for the site using the USGS 2014 Probabilistic Seismic Hazard Analysis (PSHA) Interactive Deaggregation online tool. The result of the deaggregation analysis are provided in the table below, deaggregation plots are included in Appendix F.

Table 7: PSHA Summary

Ground Motion Mean Recurrence Interval (MRI)				Predominant Earthquake Contributing to the MCE PGA	
Ground Motion	**Probability of Exceedance in 50 Years**	**Statistical Return Period (years)**	**Application**	**Hypocentral Distance from the Site (kilometers)**	**Magnitude (Mw)**
MCE	2 percent	2475	Evaluation of liquefaction and seismic settlement.	11.29	6.86
Design Earthquake (DE)	10 percent	475	Building Code guideline to maintain Life Safety during a MCE event.	13.84	6.69

13.3. Seismically Induced Landslides

Based on the State of California Seismic Hazard Map for the Van Nuys 7.5-Minute Quadrangle, areas adjacent to Strathern Inert Debris Landfill are subject to seismically-induced land sliding (refer to map in Appendix G). Any potential risk will be substantially mitigated when the Project is completed.

13.4. Liquefaction Potential

Liquefaction is an earthquake related phenomenon that generally requires shallow groundwater and near-surface granular soils that are at least in part within the groundwater table saturation zone. Upon seismic shaking, underlying soils lose internal strength due to increased pore pressure generated by cyclic loading. The loss in strength may result in seismic-induced settlement, lateral spreading, sand boils, ground fissures and similar ground effects. A review of State of California Seismic Hazard map for the Van Nuys 7.5-Minute Quadrangle (refer to Appendix G) indicates that the site is not located within an area susceptible to liquefaction. Additionally, groundwater depths are greater than 300 feet beg, as discussed in Section 10. The thickness of the inert construction debris within Strathern Inert Debris Landfill and the depth to groundwater preclude liquefaction from occurring and the risk for liquefaction ground related effects is considered to be nil.

14.0 SETTLEMENT EVALUATION

As discussed in previous sections, the subsurface conditions at this site consist predominantly of inert debris fill that is inherently heterogeneous, having a wide range of particle sizes with a potential for nested voids within the fill matrix. Based on our research, there are limited case histories and no industry-accepted standards for evaluating settlement of inert debris fill sites that exhibit this type of heterogeneity. Case histories documenting seismic settlements of unsaturated fills are limited to earthfill and rockfill dams, compacted soil fills, and municipal solid waste landfills. Laboratory testing has been used to estimate the seismic settlement of finer-grained compacted fills (Stewart, et al., 2002) and sands (Pyke, et al., 1975), but do not appear to be applicable for inert debris fills. Similarly, conventional methods for estimating seismic settlement of sands by Tokimatsu and Seed (1987) and Pradel (1998) are also not applicable for inert debris fills.

A settlement model was developed by Somasundaram, et al., (2013) that was based on partial filling of voids via fines migration and collapse of the nested fill matrix. This settlement model was developed based on the case study of a single inert debris landfill located in the City of Irwindale, California. The intent of the project was to convert this site into a single-story commercial or industrial use. The subsurface conditions at this location are the closest approximation to what can be found at Rory M. Shaw, based on a geotechnical investigation performed by Advanced Earth Sciences, Inc., dated April 12, 2013. The authors of this case study also performed the aforementioned geotechnical investigation.

The model estimates seismic settlements of unsaturated inert debris fills ranged from 0.4 to 1.1 percent of the total fill thickness. Furthermore, numerical modeling by Somasundaram, et al., (2013) predicts that surface manifestation of settlement may be reduced when an engineered fill cap overlies the inert debris fill. For an engineered fill cap that is 40 feet thick, surface manifestation of differential settlement was reduced by approximately 50 percent.

15.0 DESIGN METHODOLOGY

The County design team determined that the only structure requiring mitigation against settlement was the large detention pond proposed in the west-southwest area of the park. Other facilities and improvements proposed within the footprint of the existing inert debris landfill were not evaluated. Any facilities and improvements that may be adversely affected by settlement over time were recommended to be placed in native alluvium along the outer perimeter of the landfill.

Based on preliminary plans prepared by PSOMAS, the proposed bottom of the detention pond is at an elevation (EL) of 759 feet. Based on past topographic maps and aerial photos, the bottom of the pit varies from approximate ELs of 665 to 680 feet. This means that if no additional remedial grading is performed, the pond will be underlain by approximately 79 to 94 feet of debris fill. This translates to the pond potentially experiencing about 1 foot of total settlement and over 3 inches of differential settlement. To reduce the total settlement from the debris fill and the surface manifestation of settlement at the pond bottom, mitigation will be required in the form of remedial grading and/or ground improvement techniques. Using the model put forth by Somasundaram, et al., (2013), anticipated settlements for a no-mitigation scenario can be compared with a 40-foot thick zone of ground improvement. The analyses are summarized in the following table.

Table 8: Summary of Settlement Analyses

Thickness of Improved Zone Below Pond Bottom (ft)	Thickness of Debris Fill Left In Place (ft)	Total Settlement of Debris Fill, Lower Bound (in)*	Total Settlement of Debris Fill, Upper Bound (in)*	Surface Manifestation of Differential Settlement at Pond Bottom (in)**
0	75	3.6	10	3.2
0	60	2.9	7.9	2.5
40	35	1.7	4.6	1.5
40	20	1.0	2.6	0.8

*Calculated based on model by Somasundarum, et al., (2013) that predicts settlements ranging from 0.4 to 1.1 percent of debris fill thickness.

**Differential settlement over a horizontal distance of 30 feet, taken as half of the difference between the upper and lower bound total settlement.

Based on our analyses, a 40-foot thick zone of ground improvement should be provided to reduce settlement to manageable levels. Options for ground improvement may include remedial grading (e.g. debris fill removal and replacement with compacted engineered fill), deep dynamic compaction (DDC), or a combination of these methods. The following section will provide more information on these methods.

15.1. Ground Improvement

Various options were considered to densify the subsurface material and reduce the potential for differential settlement during and after seismic activity. Performing ground improvement on subsurface materials within the detention pond and backfilling with engineered fill will provide proper foundation support for the detention pond.

15.2. Feasibility Study: Ground Improvement Alternatives – November 2016

URS (now AECOM) conducted a feasibility study on two ground improvement options determined to be most suitable for the proposed improvements at the Project site:

- DDC
- CG

DDC has been documented to densify up to 30 feet beg in granular, noncohesive soils, per FHWA-SA-95-03. However, additional testing at the site was needed to establish DDC details and specifications. CG was not considered feasible due to the numerous voids throughout the inert debris fill and unknown volume of grout needed to fill the voids.

Several revisions have been made to the Project, with some elements eliminated from the design completely. Specifically, an impervious liner proposed beneath the detention pond was eliminated because the estimated settlement could not be accurately determined; therefore, a liner could not be designed. This was taken into consideration when developing the test program for DDC and CG at the site. Complete URS feasibility reports are included in Volume III.

15.3. DDC: Ground Improvement Test Program – January 2019

A pilot test program was developed by URS, with input from GMED, to assess the options discussed in the feasibility report and to determine which option or combination of options would provide the most effective ground improvement for the Project. Constructability and potential impacts at the Project site were also evaluated. The scope of work, test program, and results are discussed in the subsequent sections, and only results from the DDC test program are summarized. The complete URS report is provided in Volume III.

15.3.1. Scope of Work

The pilot test program consisted of the following tasks:

- Pre-DDC geophysical survey and vibration and noise monitoring
- DDC densification and ironing pass with vibration and noise monitoring
- Post-DDC geophysical survey and vibration monitoring
- Static load test

15.3.2. Pre-DDC Geophysical Survey and Vibration Monitoring

Baseline geophysical surveys included a series of Refraction Microtremors (ReMi) and Multi-Channel Analysis of Surface Waves (MASW) measurements in combination with seismic primary-wave (P-wave) and shear-wave (S-wave) cross-hole survey measurements to evaluate subsurface conditions prior to any ground improvement. Because of the proximity of the Project to a residential neighborhood, background-vibration monitoring was also undertaken prior to the start of the pilot test program to establish background vibration levels due to routine activities in the neighborhood. Details of the vibration/noise monitoring are summarized by URS in their report dated May 2, 2019. The report contains a separate instrumentation report prepared on April 23, 2018, by Southwest Geophysics, Inc., a subcontractor to URS, and is included in Appendix J.

Baseline geophysical survey results indicated high variability in the debris fill with average shear wave velocities ranging between 700 to 1300 feet per second, confirming that the material is heterogenous with a high probability of voids. Vibration surveys indicated unusual background activity in the neighborhood during off peak hours, which may be attributed to the industrial areas near the Project site.

15.3.3. DDC Test Sections

DDC involves dropping a large steel tamper by means of a crawler crane to densify the soil. The tamper ranges from 10 to 30 tons and is dropped from heights varying from 30 to 120 feet, depending on the site characteristics. The high energy impacts are applied in a pre-determined grid pattern over the designated improvement area. With each drop, the soil increases in density. The near-surface soil loosened by DDC is then compacted with a smaller tamper, this process is referred to as an ironing pass.

The pilot test program consisted of two DDC test locations, each with a different number of drops. DDC operations were performed by Hayward Baker, Inc. (HBI), a subcontractor to URS, and are summarized in the following table:

Table 9: DDC Criteria

Category	DDC (Densification Phase)		Ironing Pass*
	Test Area 2	Test Area 3	
Tamper Weight	27 tons	27 tons	10 tons
Tamper Drop Height	80 feet	80 feet	40 feet
Number of Drops per Location	4	6	2
Energy	120 ton-feet/square foot	180 ton-feet/square foot	16 ton-feet/square foot

*For Test Areas 2 and 3

The work was performed in two densification passes and one ironing pass, organized in a grid pattern with a 12-foot spacing. The ironing pass densifies the upper 10 feet where the 27-ton pounder weight left impact craters, a level pad was then created for post-DDC performance surveys.

15.3.4. Post-DDC Geophysical Survey

The primary purpose of the post-DDC geophysical survey was to evaluate the depth of improvement in comparison with baseline results because conventional means, such as cone penetration testing, are ineffective in a debris fill. ReMi traverses, MASW transects, seismic P-wave and S-wave cross-hole surveys, and near-field vibration monitoring were performed. Vibration monitoring was ongoing during the pilot test program. The information from both the geophysical survey and the vibration/noise monitoring was used to determine minimum setback criteria for sensitive areas from construction and to evaluate the impact to the surrounding neighborhood during construction.

Ground vibrations generated during the DDC process were closely monitored by four unmanned, far-field instrumentation system stations. In addition, two manned near-field instrumentation systems were implemented over the course of the pilot test program. If ground-vibration amplitudes are high enough, potential damage to adjacent structures can occur. Damage may be cosmetic or structural and/or disruptive to the operation of vibration-sensitive equipment. Table 10 shows the threshold criteria pertaining to structural damage potential. Table 11 shows the reference threshold criteria pertaining to human annoyance potential. The adopted criteria for the Project are based on a Caltrans study in 2013, which provides a screening tool to assess the effects of vibration.

Table 10: Guideline Vibration Damage Potential Threshold Criteria*

STRUCTURE AND CONDITIONS	MAXIMUM PEAK PARTICLE VELOCITY (PPV) (IN/SEC)	
	TRANSIENT ZONE	CONTINUOUS/FREQUENT INTERMITTENT SOURCES
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

*Caltrans 2013

Table 11: Guideline Vibration Annoyance Potential Criteria*

HUMAN RESPONSE	MAXIMUM PPV (IN/SEC)	
	TRANSIENT ZONE	CONTINUOUS/FREQUENT INTERMITTENT SOURCES
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strong perceptible	0.9	0.1
Severe	2.0	0.4

*Caltrans 2013

15.3.5. Static Load Test

A static load test was performed with a surcharge load constructed from on-site crushed concrete to simulate the hydrostatic pressure the debris fill and DDC area will be subjected to. The surcharge load had the following dimensions: 169-foot by 128-foot area by 22 feet in height with side gradients of 1.5H:1V and 2H:1V. Prior to placing the surcharge, shallow trenches were excavated for the installation of ten vibrating-wire settlement plates with data loggers, which were installed and monitored by HBI. A remote data connection was maintained by HBI for the 17-day duration of the settlement monitoring program, from October 23, 2017, to November 9, 2017. Settlement observed is summarized in the following table:

Table 12: Static Load Test Settlement

Date	Area	Maximum Settlement (in)
11/3/2017	2	1.5
11/8/2017	3	1.6
11/8/2017	Between 2 and 3*	1.69

*Straddles the space between Areas 2 and 3.

15.3.6. Conclusions

The main goal of the pilot test program was to determine the effectiveness of DDC and expected depth of improvement at the Project site. The Project site contains a high variance of voids due to random placement of the landfill material. An important note is that the pilot test program was performed at an approximate elevation of 798 feet above msl at the ground surface of the existing landfill, while the proposed bottom elevation of the excavation for the detention pond is at an elevation of 739 feet above msl. It is likely that fill material at greater depths will have a higher relative density due to the overburden pressure from the material above, however, that does not reduce the probability of voids existing at greater depth.

Based on results from the pilot test program, DDC performed with a minimum energy of 180 ton-feet per square foot followed by an ironing pass to achieve a lower bound S-wave velocity of 700 feet per second is recommended. The effectiveness of DDC was observed to be limited to the upper 20 feet of material. The following table indicates the minimum recommended criteria for DDC at the Project site.

Table 13: Recommended DDC Criteria*

DDC	Tamper Weight (ton)	27
	Drop Height (ft)	80
	No. of Drops	6
	Grid Spacing (ft)	12
Ironing Pass	Tamper Weight (ton)	10
	Drop Height (ft)	40
	No. of Drops	2
	Grid Spacing (ft)	12

*Minimum recommended values.

At a minimum, the following recommendations for DDC and monitoring should be followed:

- An 85-foot horizontal setback from residences or other structures is required.
- A baseline geophysical survey, using ReMi, should cover the entire planned treatment area prior to DDC operations. A post-DDC geophysical survey should be performed in the same manner to verify improvement of the subgrade. A general layout is shown on Figure 11.
- Any earthwork or other operations involving heavy equipment may cause vibrations that would affect results from the geophysical survey, other than ReMi. Therefore, operations must be temporarily halted until all geophysical work has been completed.
- A minimum lower bound S-wave velocity of 700 feet per second, based on average measured ReMi survey minus one standard deviation, may be used as *acceptance criteria* for the planned ground improvement.
- If the aforementioned acceptance criteria cannot be met, mitigation including further DDC and/or conventional over-excavation, replacement with crushed inert debris, and recompaction operation may be considered. Before the contractor proceeds, the choice of mitigation should be reviewed and approved by Los Angeles County Public Works (Agency).
- Subsequent fill placement/backfilling after DDC operations shall not commence until all the post-DDC geophysical survey and engineering evaluations have been completed and accepted by the Agency.
- A vibration and monitoring program should be developed and implemented prior to and during DDC operations. At a minimum, monitoring stations should be setup immediately adjacent to the minimum setback boundaries to ensure the operation is within the noise and vibration threshold (Table 10). A station should be placed near the corner of Strathern Street and Tujunga Avenue in proximity to the adjacent residential neighborhood located south of the Project site. Other station locations should be chosen and discussed with the Agency prior to the commencement of DDC.

16.0 EARTHWORK RECOMMENDATIONS

In its current condition, the site is not suitable for development without remedial grading. All earthwork and grading should be performed in accordance with applicable requirements of the California Occupational Safety and Health Act (Cal/OSHA) and applicable Los Angeles County Grading Codes Specifications in addition to the recommendations presented herein. Grading at the Project site should not be approached as conventional grading but rather as debris management. This site can be considered entirely heterogeneous. Therefore, the subsurface exploration information provided in this report from a geotechnical, geologic, and environmental aspect is not definitive of subsurface composition and/or potential contaminants. Instead, the information provides probable anticipated conditions.

16.1. Pre-Grade Meeting and Geotechnical Observation

Prior to commencement of grading, we recommend a meeting between the County inspector, grading contractor, geotechnical engineer, geologist, and civil engineer to discuss the proposed grading and construction logistics. GMED must be retained to provide soil engineering and engineering geologic services during site grading and foundation construction. This is to observe compliance with the design specifications and recommendations and to allow design changes in the event that subsurface conditions differ from those anticipated. If conditions are encountered that appear to be significantly different than those indicated in this report, GMED must be notified immediately, as design and construction revisions may be required.

16.2. Grading Limitations

Grading along the northern boundary of the property is considered an engineering challenge due to the regulatory requirements that may need to be met to conduct grading into a legacy landfill and potential complications for shoring design. Per design discussions with LARWQCB staff, it has been concluded that areas underlain by Newberry Landfill waste material shall not be disturbed and no excavation of this material will be conducted. The Geotechnical Map (Plate 2) delineates the areas underlain by Newberry Landfill materials and associated fill cap.

16.3. Site Preparation

Given the unique site conditions, some latitude may be given in following conventional geotechnical site preparation requirements, however, all efforts should be made to adhere to standard practices. Excavations should be performed to allow the site to receive the required amount of engineered fill. The exposed grade should be as uniform as possible, subject to geotechnical inspection and approval, overexcavated 1 foot as conditions permit, moistened to its optimum moisture content, and recompacted to 90 percent relative compaction as determined from ASTM D1557.

16.4. Excavation

Excavation in inert landfill areas may be difficult and slow. Contractors must independently evaluate the excavatibility of the subsurface materials encountered during Project construction and choose appropriate excavation equipment and methods.

The landfill debris is made up of varying percentages of concrete (rebar throughout much of the concrete), asphalt, brick, and smaller amounts of tile, masonry block, metal debris, soil, and other materials that are common in inert debris landfills. Due to the nature of these materials, conventional removals made by scrapers and bulldozers may not be possible throughout much of the site. For example, large excavators may be required to make the actual removals of landfill debris and to load large, mining-dump trucks to move the debris to crushing equipment and/or stockpiles.

During the excavation of landfill debris, unsuitable material may be encountered that require removal to an appropriate landfill or recycling operation. No State or Federal classified hazardous material was identified during subsurface exploration. However, hazardous material may be encountered that requires additional environmental laboratory testing to determine the nature of the material and its hazardous material status and handling/disposal requirements. It is estimated that up to 10 percent of the landfill debris may not be suitable for crushing and/or reuse as compacted fill.

Removal depths are shown on the PSOMAS over-excavation grading plan and in general, 20 feet of compacted fill is planned throughout the site. If the contractor wants to perform the removal of the landfill debris in a manner differing from the provided grading plan, the proposed change must be reviewed and approved by the Contractor's geotechnical consultant and also by the Agency. In areas of inert debris where scarification of the inert debris is not possible, an additional 1-foot of removal should be performed.

It will be necessary to practice good dust control measures throughout the excavation, stockpiling, crushing, and fill placement operations. The nature of the landfill debris may limit the use of conventional water trucks. Therefore, other methods of dust control operations may be necessary.

16.5. Special Requirements

Concrete debris at the site is heavily reinforced. Methods/equipment to remove steel bars from concrete pieces of various sizes will be required to recycle the concrete debris.

16.6. Engineering Fill

Due to the heterogenous nature of the inert landfill debris and soil cover, all suitable materials (concrete, asphalt, brick, tile, and soil [including boulders, cobbles, gravel, sand, and silt]) should be separated, screened, crushed, and mixed, as necessary, to manufacture as uniform an artificial fill as possible. The oversized materials should be crushed to a maximum size of 3 inches (greatest dimension). No more than 10 percent of the manufactured fill should be composed of brick. If overall brick quantities are greater than 10 percent of the total fill, the brick quantity greater than 10 percent must be hauled offsite to a landfill or recycler.

The actual method used to place the crushed and mixed material as compacted fill is to be determined by the Contractor. It is anticipated that conventional grading equipment (bulldozers, loaders, scrapers, mining trucks, etc.) may be used to place and compact the artificial fill. However, the Contractor must determine if excavation bottoms are suitable for the equipment the Contractor proposes to use. Fill should be placed, water conditioned to near optimum-moisture content, and compacted to 90 percent relative compaction. Engineered fill should be benched and keyed into suitable material for proper placement. Engineered fill beneath the proposed detention pond shall be keyed and benched into both inert landfill material and native material. A typical benching detail is shown on Figure 12. To reiterate, dust control during all operations (removals, fill preparation, fill placement, etc.) is required.

16.7. Settlement Monitoring

A ground settlement monitoring program should be implemented throughout the Project site to monitor settlement during grading operations and after the Project has been completed. Settlement monuments should be placed on the inert debris surface or on native material prior to placement of engineered fill. The monuments shall be surveyed on a regular basis and additional monuments may be placed during ongoing engineered fill activities. Proposed locations for settlement monuments at the Project site will be provided when final grading plans by PSOMAS become available.

16.8. Import Materials

If import materials are required to achieve the proposed grades, the proposed import soils should have an Expansion Index less than 51 (ASTM D4829). Import sources should be indicated to the geotechnical consultant prior to hauling the materials to the site so that appropriate testing and evaluation of the fill materials can be performed in advance. Chemical pH levels of crushed material may determine suitability of onsite material for vegetation growth. Import material that conforms to ASTM D5268-13 is recommended for the upper 2 to 4 feet of the landscaped areas for use as topsoil for surface vegetation.

17.0 SUMMARY OF FINDING AND CONCLUSIONS

17.1. Landfill Characteristics

Debris from two different landfills are located within the Project limits. Strathern Inert Debris Landfill is composed primarily of construction debris and was identified and characterized for most of the property acreage. Newberry Landfill is composed of decomposable waste and occupies the northern portion of the Project limits. The 2014 report prepared by GMED, titled "Subsurface Environmental Site Assessment and Geologic Evaluation Concrete Batch Plant Property and Vicinity Rory M. Shaw Wetlands Park Project," addresses conditions specifically within areas underlain by Newberry Landfill and should be considered part of this report for a comprehensive evaluation of the Project site.

17.2. Environmental Concerns

Laboratory testing of materials within the Strathern Inert Debris Landfill indicate that the debris was generally found to be free of hazardous waste. Special handling of these materials is not expected to be required during construction activities.

In contrast, laboratory testing of decomposable materials within Newberry Landfill indicate that the debris should be considered hazardous. The legacy landfill waste material should be left in place and left undisturbed. A passive mitigation methane system that can be converted into an active system should be incorporated into the design to address the potential for methane migration.

17.3. Grading Considerations

Excavation along the northern boundary is not considered to be feasible due to the presence of decomposable landfill materials (associated with the Newberry Landfill) within the subject property and within the adjacent property to the north.

Improvements associated with the 2005 roadway failure repair should be anticipated in areas along the mid-west perimeter.

The headwall and portion of a tunnel located beneath Tujunga Avenue, within the site right of way, will require removal and replacement with a wall and compacted fill.

Monitoring Wells 4928A and 4928C are located on the subject site, these two monitoring wells must be protected-in-place. Monitoring Wells 4928 and 4928B are also located on site and have been abandoned/decommissioned. If these wells are encountered during grading, they may require re-abandonment in compliance with current regulations.

Concrete, asphalt, brick, and tile may be crushed and reused as backfill. Brick must be limited to 10 percent of the fill by volume. The overall estimated percent of non-reusable materials is approximately 10 percent.

17.4. Settlement Mitigation

The use of an engineered fill cap in combination with ground improvement methods are recommended to prepare the site. DDC may be used to reduce large voids, while an engineered fill is expected to lessen surface manifestation of settlement in underlying materials that will be left in place. Given the extent of debris, approximately 150 feet in depth at its deepest near the center of the proposed detention pond basin, the two-fold mitigation system is not expected to eliminate potential settlement in its entirety. However, it is expected to minimize settlement effects to acceptable levels.

18.0 CONSTRUCTION CONSIDERATIONS

18.1. General

The Contractor shall be solely responsible for choosing the appropriate construction means, methods, and monitoring. Construction methods should consider proximity to improvements, utility lines, existing nearby structures and improvements, environmental concerns, subsurface materials composition, and any other concern from owners or agencies involved.

For this project, groundwater conditions are not expected to pose an issue. However, based on past erosional failures, it is essential to have adequate drainage to maintain a relatively dry and firm surface prior to and during any work at the site. Adequate drainage shall be maintained throughout the construction period. The Contractor shall be responsible for selecting, designing, constructing, maintaining, and monitoring a drainage control system and adapt operations to ensure the stability of the excavations in the event that heavy and or sustained rain occurs during construction.

18.2. Temporary Excavations

All temporary excavations shall be performed in accordance with all Cal/OSHA requirements, project plans, and specifications. Areas where the washout occurred in 2005 (refer to Section 6.0) may require special attention during construction activities.

It is the Contractor's responsibility to evaluate the temporary stability of the excavation plan to ensure stable conditions during ground improvement and grading operations. Heavy construction loads, such as those resulting from stockpiles and/or heavy machinery, should be kept away from excavations a minimum distance equivalent to the excavation height or 5 feet, whichever is greater, unless the excavation is shored, and aforementioned surcharges are considered in the design of the shoring system. Surface drainage should be directed away from construction areas to protect temporary cuts and slopes.

19.0 UTILITIES

The site may experience an unknown magnitude of settlement; therefore, utilities and pipelines should be designed to tolerate deformations due to total and differential settlement. Utilities constructed on landfills are subject to differential settlement that could cause damage to the pipe or reversal of grades. Flexible connections, double-walled piping, or other systems should be considered in the design of utilities and pipelines. Special detailing and design will be required where utility lines and pipes enter and exit the property. Regular annual inspections of the utilities where they transition from below grade and enter structures are recommended.

19.1. Pipe Bedding

Bedding material for proposed pipelines should be placed as recommended in Section 306-1.2.1 of the Standard Specifications for Public Works Construction (Greenbook). However, jetting should not be used for placement and densification of the bedding zone. On-site materials do not appear to be suitable for use as bedding. If loose or soft materials are encountered at pipeline invert depths, the material shall be overexcavated to a suitable bottom and backfilled sufficiently to provide a firm pad at the trench bottom.

19.2. Trench Backfill

Trench backfill should be placed as recommended in Section 306-1.3 of the Greenbook. All fill soils shall be placed in loose lifts, moisture conditioned 2 to 3 percent above optimum-moisture content, and compacted to a minimum of 90 percent relative compaction, as determined by ASTM D1557. Lift thickness will be dependent on the equipment used, as suggested in the latest edition of the Greenbook. All compaction shall be performed by mechanical means. Compaction by jetting is not allowed. The native soils encountered in the borings may be classified as Type C as defined in the California Code of Regulation Title 8, Division 1, Chapter 4, Subchapter 4, Article 6,

Appendix A. On-site fill may be suitable for backfill provided it is crushed to size and meets the criteria recommended in Section 306-1.3. Any on-site fill or imported fill that is proposed to be used as backfill shall be tested and verified by the geotechnical consultant engineer-of-record prior to placement.

20.0 MAINTENANCE RECOMMENDATIONS

Estimating the settlement behavior of a landfill is extremely difficult. We do not have complete knowledge of the long-term impacts of deformation of the existing landfill on the proposed development. Settlement mitigation recommendations are provided to reduce any settlement effects that may affect the performance of the proposed development. Continued inspection and maintenance of the structures and surrounding area will be critical to achieving a reasonable life for the Project.

21.0 DIFFERING SITE CONDITIONS

The analyses and recommendations contained in this report are based on the data obtained from our site reconnaissance, subsurface investigations, laboratory testing, and review of publicly available records and reports. Boring Logs indicate subsurface conditions only at specific locations and times drilled, and only to the depths penetrated. The logs do not necessarily reflect subsurface variations that could exist between such locations. If variations in subsurface conditions from those described in this report are noted during construction, the recommendations presented in this report shall be reevaluated.

22.0 LIMITATIONS

This report has been prepared for the exclusive use of SWPD for the specific site discussed herein and should not be considered transferable to other sites or projects. This study was conducted per generally accepted geotechnical practice for projects of this magnitude. Our findings, conclusions, and recommendations are based on results of site assessment, geotechnical sampling and testing, and our interpretation of the data. This report may not be duplicated without the written consent of Public Works.

SUBSURFACE ENVIRONMENTAL SITE ASSESSMENT AND GEOLOGICAL EVALUATION
CONCRETE BATCH PLANT PROPERTY AND VICINITY
RORY M. SHAW WETLANDS PARK PROJECT
PROJECT ID FCC0001001 (JOB NO. JX0011)

On December 9, 2014, we transmitted a report to your Division, which provided the results of the Subsurface Environmental Site Assessment for the subject project. Subsequent to this submittal, we forwarded that report to the Land Disposal Unit of the Los Angeles Regional Water Quality Control Board for their courtesy review. We received minor comments from the Board and incorporated their suggestions into the attached report. Please disregard the report dated December 9, 2014.

If you have any questions regarding this matter, please contact Karin Burger or Olga Cruz at Extension 4923. To provide feedback on our services, please access http://dpw.lacounty.gov/go/gmedsurvey to complete a Customer Service Survey.

1.0 INTRODUCTION

During October 2013 and June 2014, Geotechnical and Materials Engineering Division (GMED) performed an environmental site assessment (ESA) and a limited geotechnical investigation of subsurface conditions in the general location of the Over & Over Ready Mix, Inc. (O&O plant), concrete batch plant, located at the northwestern portion of the Rory M. Shaw Wetlands Park Project (Project) in the City of Los Angeles, Sun Valley Community. This report provides the findings, conclusions, and recommendations for the assessment and investigation that were performed to facilitate the design of the overall Project. Figure 1 provides a site location map and Figure 2 provides an aerial view of the site and adjacent areas. The environmental and geotechnical conditions of the remaining 26 acres of the Project will be addressed in a subsequent report.

2. 0 SITE DESCRIPTION

The Project site is located on the northeast corner of the intersection of Strathern Street at Tujunga Avenue in the Sun Valley Community. The property owned by the County of Los Angeles (County) consists of the former Strathern Inert Landfill with the O&O plant located on the north-northwestern portion of the property.

The area explored for this report is identified as 8216 Tujunga Avenue and is located in the north-northwestern section of the Project site (Figure 3). This site area is occupied by the O&O plant, whose lease agreement was transferred to the County following acquisition of the property and expires in March 2017. This portion of the site is improved with a 6- to 12-inch concrete pad covering most of the property, a small one-story office building, maintenance buildings, and moveable aggregate processing equipment such as hoppers, conveyers, and mixing equipment.

3.0 SURROUNDING LAND USES

As shown on Figure 2, the Project site consists of the closed Strathern Landfill and the O&O plant located along on the Project's northern boundary. The O&O plant and SA Recycling to the north overlie the former Tujunga Pit/Newberry Landfill. To the east, Fair Avenue borders the Project site, residential neighborhoods and Sun Valley Park are located immediately east of the roadway. To the south, Strathern Street borders the Project site and residential neighborhoods are located immediately south of the roadway. To the west, Tujunga Avenue borders the Project site and immediately west of the roadway is the former Penrose Landfill, which has been converted into a driving range.

Records regarding the quarrying activities, adjacent landfills, waste placement, waste composition, and topographical changes were scarce or incomplete. The following information was compiled from various reports for projects within the Project's vicinity, which are listed in Section 15.0 References of this report and are grouped by their position with respect to the Project site.

3.1 North – Tujunga Pit/Newberry Landfill

The entire area between Tujunga Avenue to Fair Avenue and immediately south of Roscoe Boulevard has been referred to as the Tujunga Pit/Newberry Landfill. Aerial photographs from 1928 show that most of the area west of Fair Avenue was located within the Tujunga Wash flood plain. It appears that there may have been limited agricultural use of the eastern portion of the future Newberry Landfill site. Aerial photographs show that heavy quarrying occurred in 1938 within the Tujunga Pit site, and by 1956, the covered Newberry Landfill was visible along with light industrial buildings on the southwestern boundary of the former pit/landfill, which appears to indicate concrete batch plant operations. The 1965 and 1976 aerial photographs show large stockpiles immediately west of Fair Avenue, presumably used to correct differential settlement (Law Environmental, 1988). The aerial photographs of 1994 indicated area conditions consistent with those of the present. Copies of selected aerial photographs are included in Appendix A.

Based on United States Geologic Survey (USGS) regional historic topographic maps, the Tujunga Pit/Newberry Landfill had a maximum depth of approximately 85 feet and appeared to have a relatively flat bottom. According to Law Environmental (1988), based on the 1953 landfill geometry, approximately 2.2 million cubic yards of capacity was not used, with an undocumented quantity of landfill material already in place by that time. Based on the records that were recoverable, Newberry Landfill received noncombustible and combustible household wastes including wood, glass, metals, and incinerator ash. Due to the requirements for daily covering of the wastes with soil, up to 20 percent of the total landfill volume may be daily-cover fill soils of unknown origin. City of Los Angeles (City) records indicate that the site operated from 1948 through May 1955, the bottom of the landfill pit was not lined, and the landfill received 4- to 5-feet of final soil cover to match surrounding street grades (Law Environmental, 1988). Additionally, there is limited documentation indicating that landfill gases have been detected along the southerly perimeter of the Newberry Landfill. Because the Newberry Landfill ceased operations prior to January 1, 1982, it is considered a closed legacy landfill by the City's Bureau of Sanitation. The O&O plant and SA Recycling, an auto wrecking company and a scrap metal yard, currently occupy the former Tujunga Pit/Newberry Landfill site.

3.2 West – Penrose Landfill

The Penrose Landfill was used as a source of aggregate material when it was operated as a gravel pit beginning in the early 1950s. Following quarrying activities, the pit was converted to a 72-acre Class III landfill operated by Los Angeles By-Products Company (LABPC), which received municipal refuse from about 1960 to 1985. The elevation of the gravel pit bottom was estimated to have been about 620 feet above sea level (asl). The landfill reached its maximum permitted elevation of about 860 feet asl in early 1985 and ceased accepting waste on March 25, 1985. A final closure plan was in place and approved by the end of 1994. An array of landfill gas extraction and collection systems are in-place at the landfill (Fugro 1997); however, the current operating status is unknown.

In 1991, a drilling program was initiated by LABPC to evaluate the thickness of the artificial fill cap overlying the top of the refuse. At the seven locations drilled, the fill cap ranged from about 5- to 17-feet thick (placed over refuse beginning in about 1985 to act as a surcharge fill). Additional exploration by LABPC in 1997 encountered a thin veneer of artificial fill (1-foot to 2.5-feet thick), a geosynthetic clay liner, closure cap material (1-foot to 2.5-feet thick), previous artificial fill of varying thickness, and sanitary landfill refuse (Fugro, 1997).

Penrose Landfill operated under a valid Class II-2 (old system) permit and received relatively dry, nonhazardous solid waste. Bulk hazardous, wet, or liquid wastes were prohibited and there is no evidence to indicate that these waste types were ever received. Based on existing waste receipt records for the last few years of operation at the Penrose Landfill, the waste stream consisted of about 30 percent commercial rubbish (from apartment complexes), 6 percent demolition debris, and 64 percent mixed loads including household, horticultural, dirt, and bulky items such as sofas, stoves, and refrigerators. The operators also disposed of litter collected from along Tujunga Street (Law Environmental 1988). Currently, this site is being used as a remote-control model car raceway and a practice golf center.

3.3 East – Sun Valley Park

The properties to the east of the Project site consisted of undeveloped land in the early 1900s. Prior to 1928, there were scattered developments consisting of single-family residences where Sun Valley Park is now located. Based on review of aerial photographs, Sun Valley Park was developed during the period from 1928 to 1938. Further development of the neighborhood surrounding Sun Valley Park after its construction consisted mostly of single-family residences.

4.0 PROJECT HISTORICAL BACKGROUND

The Project site consisted of vacant land through 1902. Quarrying activities appear to have started sometime prior to 1928, but according to the California Geological Survey, sand and gravel mining operations at the Project site officially began in 1929 and were halted in 1972, when the pit was completely excavated (County, 2006). The subject property was originally owned by Blue Diamond Materials from approximately 1929 to 1976, followed by acquisition of the property by LABPC, with the County assuming ownership of the property in 2010. By 1989, the Strathern Landfill had been permitted for use as an inert landfill and operated under a City of Los Angeles Department of Environmental Affairs solid waste facilities permit (Number 19-AR-1016). Landfill operations within the Strathern Landfill ceased after transfer of ownership to the County of Los Angeles. Appendix A contains aerial photographs of historical site conditions ranging from 1928 through 2005.

5.0 PROJECT DESIGN BACKGROUND

The original project design concept for this Project is presented in Figure 3 and consists of parking areas, a detention pond, wetland areas, and open space park land. From the Project's inception, the Phase I Detention Pond (Phase I) and the Phase II Wetland Area (Phase II) had been envisioned as independent design and construction phases of the Project. However, following review of the 60 percent Project plans and based on ensuing design discussions, grading of the area along the Phase I and Phase II interface became a critical construction concern. Site observations and the lack of subsurface information within the Phase II area raised questions about grading feasibility along the Phase I and Phase II interface, particularly with regard to subsurface material composition and stability concerns. The area that is the primary focus of this investigation is the Phase II area, along with the northerly parking areas and restroom/security office from the Original Project Design Concept (Figure 3). To address these concerns, authorization was received from the O&O plant to drill soils borings for an environmental and geotechnical subsurface investigation at the operating cement plant in 2013, with supplemental drilling occurring in June 2014. Based on these exploratory findings, which are discussed in Section 8.0 Field Explorations of this report, and to accommodate for revisions to the Project's schedule, Phase I and Phase II were merged into one construction phase and reconfigured as illustrated in the Current Preliminary Project Design Concept (Figure 4). Through a lease agreement with the County, the O&O plant is permitted to operate on the property through March 2017.

6.0 SCOPE OF WORK

The objective of the current investigation was to collect geotechnical data and subsurface environmental data for grading recommendations along the boundary of the originally proposed Phase I/Phase II interface. The findings of our 2013 boring event confirmed that the material along the Phase I/Phase II interface would not be stable. We concluded that to conduct the grading along the boundary substantial encroachment into the O&O plant footprint and laying back the materials would be required. More importantly, municipal waste associated with the former Newberry Landfill was identified in the bottoms of the borings that were drilled to a maximum depth of 80 feet below existing ground surface (begs), requiring further delineation to determine the extent of the landfill materials. Constructing Phase I independently of Phase II was deemed unfeasible because of the lease agreement and regulatory concerns for grading into municipal landfill materials. Subsequently, project administration concluded to merge the construction of Phase I and Phase II. The 2014 exploration program was designed to further define the extent of municipal waste within the Phase I/Phase II interface.

The objective of site characterization was to perform subsurface sampling and environmental testing of the Phase I area that was not previously explored to determine 1) the subsurface composition of materials underlying the area currently occupied by the O&O plant and vicinity, 2) the lateral and vertical extent of municipal wastes originating from the Newberry Landfill, 3) whether materials analyzed are impacted by contaminants, and 4) if subsurface materials are non-hazardous or hazardous.

7.0 CONCRETE BATCH PLANT SITE

7.1 Background

Review of building records on file with the City of Los Angeles Department of Building and Safety (LADBS) indicate that the property directly adjacent to the northern boundary of Strathern Pit has been operating as a concrete batch plant since at least 1955. A State of California Business Programs (CBP) search indicated that in 1955 Sun Valley Ready Mix operated on the property, and the business was dissolved in 1969. The CBP also indicated that Owner-Operator Ready-Mix Concrete, Inc., occupied the property beginning in August 1977, with Alfred Richard Borges listed as the company's agent. In 1982, the company requested building permits from the LADBS for constructing a truck repair shop and concrete batch silos, and in 1986 a Certificate of Occupancy was obtained for the truck repair shop. Additionally, a permit was obtained by the company in 1990 for the installment of a fuel

containment system. Based on the CBP search, the company name was suspended sometime after 1990, and in 2002 Over & Over Ready Mix, Inc. (abbreviated O&O plant in the report) was listed as the active owner, with Edward Borges listed as the company's agent.

7.2 Current Use

Currently, the Project site is leased and occupied by O&O plant for concrete manufacturing purposes. Generally, operations consist of crushing, sorting, and stock piling aggregate; mixing concrete; loading cement trucks; washing, maintenance, and fueling of cement trucks; and storage of cement trucks on site. Recent photographs of site operations are included in Appendix B.

7.3 Environmental Concerns

7.3.1 *Underground Storage Tanks*

A 2010 Phase I ESA report conducted by MACTEC (now Amec Foster Wheeler) indicated that there were two 10,000-gallon underground storage tanks (USTs) containing diesel fuel located on the concrete batch plant site until 1990. According to the report, existing documentation on file with the City of Los Angeles Fire Department (LAFD) indicates that one UST was removed and one UST was abandoned in place. Documentation is not clear on where the excavated and removed UST was located. However, the report indicates that the abandoned in-place UST is located beneath the slab of the existing garage/shop, although materials used to fill the UST for abandonment appear to be undocumented. Documentation of the UST closure from the LAFD was not available for our report and it is undetermined whether the UST closure was granted by LAFD for either of these two USTs. The State Water Resources Control Board's (SWRCB) GeoTracker website does indicate there being records of permitted or leaking, USTs on the O&O plant site.

Currently, there are six aboveground storage tanks located on the O&O plant site: one 10,000-gallon diesel tank; one 500-gallon diesel tank; one 5,000-gallon motor oil tank; one 5,000-gallon hydraulic oil tank; and one 500-gallon and one 275-gallon waste oil tanks (MACTEC, 2010).

Our research shows that this portion of the site has been continuously occupied by various structures associated with aggregate quarrying and concrete batch plant activities. Therefore, there is the potential for identifying additional USTs, cesspools, or pits that may be present beneath this and other portions of the site.

7.3.2 *Public Health Investigations*

The 2010 MACTEC Phase I ESA also indicates that the concrete batch plant site has been investigated by the County of Los Angeles Department of Public Health (DPH) on two occasions. In 1999, the first Notice of Violation (NOV) was issued for improper storage and management of containers, and in 2003 the second NOV was issued for improper oil disposal. The DPH file indicated that the first NOV was mitigated, but there was no information regarding mitigation of the second NOV.

An inspection report on file with DPH, dated March 23, 2002, indicated improper storage of containers noting that a large volume of waste oil was onsite and leaking in some cases with no spill controls in place. The inspection report also indicated that muriatic acid was improperly stored onsite and concrete waste was being discharged to the gutter on Tujunga Avenue. Furthermore, the report notes that truck repairs were taking place outdoors without spill controls or Best Management Practices, a diesel fuel pump was not covered, no diesel spill controls existed, and there were releases of oil and antifreeze on the site.

A second inspection report, dated May 6, 2008, was prompted by a complaint that metallic dyes were being dumped into Strathern Landfill; however, this did not result in an NOV.

7.4 Methane Gas

The Project site is partially located within the Methane and Methane Buffer Zone as determined by the City's Methane Hazards Map (Figure 5). An array of landfill gas extraction and collection systems has been in place at the former Penrose Landfill since the early 1980s. The landfill gas collection system at the Penrose Landfill consists of approximately 70 gas extraction wells and associated piping and has been successful in preventing the offsite migration of methane (Fugro 1997). According to a Solid Waste Assessment Test (SWAT) report, traces of landfill gas had been detected on occasion along the southern edge of the Newberry Landfill (Law Environmental, 1988). The report indicated that landfill gas preferentially migrates south due to the Landfill's relatively impermeable artificial fill cap and the presence of a short migration path towards the subgrade slope exposed along the northern edge of the Strathern Landfill. The SWAT report indicated that the quantity of landfill gas was expected to decrease over time as the availability of decomposable material also decreased.

7.4.1 *2012 Methane Survey*

Under our direction, an initial methane survey was conducted by Leighton Consulting, Inc., in August 2012, to evaluate conditions in areas where structures and pavement were proposed based on the original Phase I/Phase II Project concept (Figure 3). A total of four probes were installed for the 2012 survey, probe locations are shown on Plate 1. One nested methane probe was installed to depths of 40, 45, and 50 feet begs (SL-1-12); and three nested methane probes were installed to depths of 5, 10, and 20 feet begs. Methane levels were measured at 1,000 parts per million by volume (ppmv) (SL-1-12 and SL-2-12) in the vicinity of proposed restroom and pump house locations. Methane levels measured at two locations along the northerly property line were both greater than 450,000 ppmv (SL-3-12 and SL-4-12).

7.4.2 *2014 Methane Survey*

The methane survey was expanded and conducted by Leighton Consulting, Inc., under our direction in June 2014 to further evaluate methane concentrations along the northerly and westerly property boundaries located within and/or adjacent to the former Newberry and Penrose Landfills. Nested methane probes were installed at sixteen boring locations to depths of 5, 10, and 20 feet begs (Plate 1). Along the westerly boundary, methane concentrations ranged from 1,000 to 2,000 ppmv (SL-01-14 through SL-06-14); along the northerly boundary, methane concentrations ranged from 11,000 to 590,000 ppmv, with the greatest concentration measured in SL-12-14 from the 5-foot probe.

7.4.3 *Methane Survey Findings*

The 2012 report indicated that the detected methane concentrations would correspond to Site Design Level II methane mitigation requirements of Los Angeles Municipal Code Ordinance (LAMC) No. 175790. The 2014 report concluded that methane levels along the northerly property line are greater than 12,500 ppmv, which corresponds to Site Design Level V methane mitigation of LAMC Ordinance No. 175790. Leighton Consulting, Inc., recommends following Site Design Level II for the proposed restroom and pump house, which would lie outside of the former Newberry Landfill in an area where methane was measured below 1,000 ppmv. However, discussions with City officials are ongoing regarding this design issue as of the date of this report. Copies of the 2012 and 2014 Methane Survey Reports are included in Appendix C.

8.0 FIELD EXPLORATIONS

Our subsurface investigations consisted of drilling, logging, and collecting samples for environmental analysis from a combined total of 20 borings utilizing a Spider Limited Access Sonic Drill Rig operated by Cascade Drilling, LP. Sonic drilling uses a combination of rotation, down-pressure, and high-frequency vibration to penetrate the subsurface to provide a disturbed, continuous, 4-inch diameter sample collected in plastic bags at approximately 5-foot intervals, which were then cut open and logged by a State Certified Engineering Geologist. Total boring depths ranged from 20 feet to 110 feet begs. Groundwater was not encountered in any of the borings excavated. The logs of borings from these investigations are included in Appendix D.

8.1 2013 Exploration

In October 2013, we drilled ten borings (B13-1 to B13-10) within the O&O plant to obtain a preliminary understanding of subsurface conditions within the property footprint, boring locations are shown on Plate 1. Findings from the 2013 exploration confirmed the presence of Newberry Landfill materials, which consist primarily of decomposable materials (as discussed in Section 3.1), as opposed to the Strathern Landfill materials, which consist primarily of construction and demolition debris. During this subsurface investigation, Borings B13-1, B13-6, and B13-10 were terminated before reaching their target depths due to a four-gas meter indicating exceedance of the Lower Explosive Limit. This preliminary exploration concluded that the lateral and vertical extent of municipal waste within the O&O plant property was greater than anticipated during the original design concept phase.

8.2 2014 Exploration

Supplemental subsurface exploration was undertaken in June 2014 to better delineate the southerly boundary of the Newberry Landfill. We drilled ten borings (B11 to B20) in areas within the footprint of the O&O plant and along the northeast property boundary, see Plate 1 for boring locations. The site exploration within the O&O plant was limited to areas that could be safely explored without interrupting the ongoing operations of the O&O plant, which typically include cement truck traffic and the positioning of aggregate processing equipment such as hoppers, conveyors, and mixing equipment. Areas adjacent to stockpiles were also avoided, as their general configuration changed, except for stockpiles located along the southerly and southeastern perimeter of the O&O plant. Site photographs showing the stockpiles are contained in Appendix B.

8.3 Health and Safety Plan

A site-specific Health, Safety, and Emergency Contingency Plan was prepared prior to conducting the subsurface investigation. The plan is meant to aid Public Works' personnel in achieving and maintaining a safe work environment when conducting environmental investigations of sites where hazardous contamination is anticipated. The plan sets out safety procedures to deal with normal and unanticipated conditions that may be encountered. Monitoring requirements of environmental conditions and appropriate response levels are stated, including an emergency response to high levels of gaseous compounds. Response levels are set to require action before an environmental condition is reached that may be harmful to personnel. When information on a site indicates a significant environmental concern, or the stop work response level is reached, a more detailed health and safety plan is appropriate. Personnel working onsite were required to comply with 29 CFR 1910.120, HAZWOPER health and safety training. Additionally, a tailgate safety meeting was held each day drilling occurred.

9.0 ENVIRONMENTAL SAMPLING AND TESTING

A total of 20 soil borings were excavated using the sonic drilling method. Environmental samples were generally collected at 5-foot intervals using Environmental Protection Agency (EPA) Method 5035 and laboratory-supplied glass jars. The samples were labeled, placed in an ice cooler, and transferred for testing, under chain-of-custody documentation (Appendix E) to American Environmental Testing Laboratory, Inc., (AETL), a California Department of Health Services certified laboratory located in Burbank, California. A photoionization detector was used to monitor for the presence of volatile organic compounds emanating from the samples collected. Trip blanks and duplicate samples were collected in the field to comply with Quality Assurance/Quality Control procedures.

After completion of drilling and sampling, the borings were backfilled with bentonite slurry and the core sampler was decontaminated in between each sampling event. Soil cuttings generated during the assessment were placed in 55-gallon Department of Transportation-approved drums, properly labeled and inventoried, and stored onsite. Ocean Blue Environmental Services was then contracted to remove 24 drums and properly dispose of the drummed material. The soil cuttings were classified as hazardous based on laboratory analyses for Title 22 Metals. Waste Manifests for the drummed material are included in Appendix F.

Samples collected from all excavations were tested by the American Environmental Testing Laboratory (AETL) and analyzed for Title 22 Metals by EPA Method 6010B/7471A; Volatile Organic Compounds (VOCs) and Fuel Oxygenates by EPA Method 8260B; Polychlorinated Biphenyls (PCBs) by EPA Method 8082; Polynuclear Aromatic Hydrocarbons (PAHs) by EPA Method 8310 (excluding Borings B13-1 through B13-10); Total Petroleum Hydrocarbons (TPH) as gasoline, diesel, and heavy oils and grease by EPA Method 8015M; Organochlorine Pesticides by EPA Method 8081A; and Asbestos by EPA Method 600R-93/116. The analytical results are summarized in Tables 1 through 5, and the complete laboratory analytical reports, including chains-of-custody, are provided in Appendix E.

9.1 Environmental Testing Results

Refer to Table 6 for a generalized summary of the analytical results discussed below.

9.1.1 *Title 22 Metals*

Soils sampled from Borings B13-3, B13-5, B13-6, B13-8, B13-9, and B11 through B20 are impacted by Title 22 Metals; results are presented in Table 1. Total Threshold Limit Concentrations were exceeded six times in five samples: B13-3-11 for Chromium and Zinc; B12-10 for Copper; and B12-7, B12-12, and B19-60 for Lead. Seventy-four samples analyzed from B13-3, B13-5, B13-6, B13-8, B13-9, and B11 through B20 contained metals concentrations that exceeded ten times the Soluble Threshold Limit Concentration (STLC). Sixty samples from B11 through B20 were analyzed for leaching potential by STLC and the Toxicity Characteristic Leaching Procedure (TCLP) was performed in most cases where the STLC was exceeded. Out of 60 samples analyzed, the STLC was exceeded 37 times from 36 samples and the TCLP was not exceeded in any of the samples analyzed. Results of these analyses are summarized in Table 1A. (Note: Samples from Borings B13-3, B13-5, B13-6, B13-8, and B13-9 were not analyzed where concentrations exceeded ten times the STLC.)

9.1.2 *Volatile Organic Compounds and Fuel Oxygenates*

Low concentrations of 12 VOCs were detected in every boring at various sampling depths, except in Borings B13-4 and B13-7, and low concentrations of Fuel Oxygenates were detected in Borings B13-5, B13-9, B18, and B19. Soil samples where VOCs and Fuel Oxygenates were detected had concentrations that did not exceed the EPA Regional Screening Levels (RSLs) for either Residential Soil or Industrial Soil, with the exception of one sample. Most of the VOCs detected were above the Method Detection Limit (MDL) but below the Practical Quantitation Limit, which is termed as a "j-flag" by the laboratory. A single VOC exceeded the RSL was detected in sample B12-11: 1,2,3-Trichloropropane was detected at a concentration of

25.91 parts per billion (ppb), which exceeds the RSL for Residential Soil (5.1 ppb) but is less than the RSL for Industrial Soil (110 ppb). The duplicate for this sample, B12-11D, did not detect 1,2,3-Trichloropropane above the MDL. Results of these analyses are summarized in Table 2.

Relevant values were also compared to State Maximum Soil Screening Levels (MSSLs) utilizing Table 4-1 of the 2004 SWQCB Guidance Manual relative to distance above groundwater. Using these criteria with groundwater greater than 150 feet begs for gravelly soils, the Fuel Oxygenates detected did not exceed the MSSL values for Benzene (44 ppb), Toluene (2,000 ppb), Ethylbenzene (8,000 ppb), Xylenes (23,000 ppb), and Methyl tert-butyl ether (MTBE) (39 ppb). Results of these analyses are summarized in Table 2.

9.1.3 *Polynuclear Aromatic Hydrocarbons*

Low concentrations of Polynuclear Aromatic Hydrocarbons (PAHs) were detected in soil samples collected from Borings B11 through B20, soil samples from Borings B13-1 through B13-10 were not analyzed. Concentrations detected did not exceed the EPA RSLs for either Residential Soil or Industrial Soil. Results of these analyses are summarized in Table 3.

9.1.4 *Polychlorinated Biphenyl Compounds*

PCBs, consisting of Aroclor 1248, Aroclor 1254, and Aroclor 1260, were detected in soil samples collected from Borings B13-3, B13-5, B13-6, B13-8, B13-9, B13-10, and B11 through B20. Concentrations detected in one or more samples collected from Borings B13-6, B13-9, B13-10, and B12 through B20 exceeded the RSL for residential soils for one or more PCB compounds: Aroclor 1248 at 240 ppb, Aroclor 1254 at 110 ppb, and Aroclor 1260 at 240 ppb. Results of these analyses are summarized in Table 4.

9.1.5 *Total Petroleum Hydrocarbons*

TPH for carbon-chain C4-C12 were detected in soil samples from Borings B13-2, B13-3, B13-5, B13-6, B13-8, B13-9, B13-10, and B11 through B20, and TPH for carbon-chain C13-C22 were detected in soil samples from Borings B13-3 through B13-10 and B11 through B20. Additionally, TPH for carbon chain C23-C40 were detected in soil samples from Borings B13-3 through B13-10 and B11 through B20. These values were compared to State Maximum Soil Screening Levels (MSSLs) for TPH relative to distance above groundwater when groundwater is greater than 150 feet below grade (Table 4-1 – SWQCB Guidance Manual, 2004). Based on the comparisons, a single soil sample from Borings B12-11D and B13-10 exceeded

the MSSL, where concentrations of TPH C4-C12 were greater than 1,000 parts per million (ppm). In addition, a single soil sample from Borings B13-9, B15-9, and B16-8 exceeded the MSSL, where concentrations of TPH C13-C22 were greater than 10,000 ppm. Concentrations of TPH C23-C40 did not exceed the MSSL in any of the samples analyzed. Results of these analyses are summarized in Table 4.

9.1.6 *Organochlorine Pesticides*

Low concentrations of organochlorine pesticides were detected in soil samples collected from Borings B13-3, B13-5, B13-6, B13-8, B13-9, and B14 through B20. Concentrations detected did not exceed the EPA's RSLs for either Residential Soil or Industrial Soil. Results of these analyses are summarized in Table 5.

9.1.7 *Asbestos*

The chrysotile form of asbestos was detected in soil sample B14-12. Results of this analysis is contained in Appendix E.

10.0 DISTRIBUTION OF SUBSURFACE MATERIALS

Subsurface material composition within the explored area for this report can be segregated into the following five Geologic Units:

- Artificial Fill (af)
  - Newberry Landfill (af_{NL})
  - Newberry Landfill cap ($af_{NL(cap)}$)
  - Dump Fill (af_{D})
  - Repair Fill (af_{R})
- Quaternary Alluvium (Qal)

These Geologic Units are discussed in detail below. Additionally, the aerial extent of the Geologic Units is shown on the Geologic Map (Plate 1) and their subsurface distribution within the explored area is illustrated on Geologic Cross Sections (Plate 2).

10.1 Newberry Landfill (af_{NL})

This material consists primarily of noncombustible and combustible waste including organic materials, wood, glass, and metal; landfill origins are discussed in Section 3.1. Table 6 lists the distribution of materials and constituents detected within the overall portion of the Newberry Landfill and vicinity that was explored, which suggests that the contact between an artificial fill cap and the municipal waste correlates to the layer where PAHs, VOCs, and elevated Title 22 Metals such as Lead are first detected.

Based on this apparent correlation and in conjunction with logs for Borings B13-6, B13-8 through B13-10, and B11 through B20, it appears that the top of the municipal waste unit of the Newberry Landfill ranges from 17 to 41 feet begs; its thickness ranges from 33 to 67 feet begs which where explored; and its bottom depth ranges from 52 to 94 feet begs. These dimensions are illustrated on the Geologic Cross-Sections (Plate 2). Boring logs for B13-6, B13-8 through B13-10, and B11 through B20 also suggest the presence of intermittent fill layers, which most likely corresponds to the required daily cover placed on the municipal waste.

10.2 Newberry Landfill Artificial Fill Cap ($af_{NL(cap)}$)

Clayey sandy layers mixed with crushed concrete, asphalt, brick fragments, and household debris appear to comprise an artificial fill cap. As stated above and as summarized in Table 6, the layer where contaminants are first detected in conjunction with a change in material properties suggests that the vertical extent of the artificial fill cap overlying the municipal waste ranges from the surface to as deep as 41 feet begs, with an average fill cap thickness of 25.5 feet. Across the portion of the site that was investigated for this report, the landfill cap thickness, measured from the surface, appears to vary from 17- to 41-feet.

10.3 Dump Fill (af_D)

This material is derived from the cement plant operations. Residual materials from the crushing activities are visible along the face of the slopes surrounding the cement plant. The mantle along the face of the slopes consists primarily of a light-gray colored, loose, poorly graded, fine cement mixture that is capable of creating excessive dust. Some dump fill materials placed along the slopes also include inert and oversize debris that appears to have toppled from the stockpiles or was pushed off the edge of the slope. Dump fill associated with the O&O plant operations were encountered in Boring B13-3 to a depth of 34 feet. Laboratory analytical results of the dump fill sampled indicate the presence of petroleum hydrocarbons, including gasoline, diesel fuel, and grease along with some occurrences of PCBs that are most likely associated with activities related to O&O plant fueling and maintenance activities and possibly earlier quarrying activities.

10.4 Repair Fill (af_R)

The formation of a sinkhole during a heavy rain event in 2005 led to repairs that consisted slurry stabilization followed by slope reconstruction, which included retaining wall installation and fill placement. The Repair Fill Unit refers to the fill placed during slope reconstruction. Based on a 2005 City report, onsite soils were not considered usable for the slope repair because their granular nature would render

slopes susceptible to erosion, thus requiring import soils for slope re-construction. As-built records do not list the origin of the import soils used; however, the 2005 City report recommended the use of import silty sand with clay soils as repair material. The minimum soil parameter values were as follows: unit weight of 130 pcf, cohesion of 240 psf, and a friction angle of 30 degrees. Borings were not excavated within the limits of the Repair Fill for this report. Selected as-built plan sheets showing the approximate rebuilt areas and construction photographs are included in Appendix G for reference.

10.5 Quaternary Alluvium (Qal)

Alluvium is a naturally occurring water lain deposit, which consists of well graded sands and gravels, and is on the order of several hundred to several thousand feet thick in the Project area of the San Fernando Valley. The alluvium is Quaternary in age and locally the deposits consist primarily of interbedded layers of fine to coarse sand, which may contain intermittent silt and gravels ranging up to boulder sized. The deposits are predominantly light gray and range from medium gray to green-gray, yellow-brown, tan-gray, and gray-brown in color. Alluvial materials were encountered in Borings B13-1 through B13-5, B13-7 through B13-9, B11 through B13, and B18 through B20 within the O&O plant area. Depth to the top of the alluvium varied significantly throughout the area explored, ranging from 8-inches begs (Boring B13-2) to as deep as 94 feet begs (Boring B13). These deposits are exposed along the slope faces in several areas within the limits of the Strathern Landfill. Generally, the alluvial materials have not been impacted by contaminants; Table 6 lists the distribution of impacted materials with respect to alluvium.

10.6 Other Geologic Units

Other fill materials are shown on the geologic map for reference but are outside of the scope of this report, including Strathern Landfill (af_{SL}) material, undocumented fill of alluvial origin (af_A), and undocumented berm fill (af_B). The Strathern Landfill material consists primarily of inert construction and demolition debris intermixed with layers of daily soil cover. These landfill materials are not expected to decay and generate methane gas. Undocumented fill of alluvial origin consists of well graded sands and gravels and its occurrence appears to correlate with the perimeter of the former Strathern Pit boundary. Undocumented fill encountered along the berm on the eastern portion of the property is composed primarily of sands and clays presumably placed during construction of the berm adjacent to Fair Avenue extending to the southeast corner of the property. A separate report will provide additional data and discussion on these materials for this area of the Project.

11.0 GROUNDWATER

According to the Van Nuys and Burbank Seismic Hazard Zones Reports, historical high groundwater beneath the site ranged from approximately 135 to 150 feet begs (California Geological Survey, 1997 and 1998, respectively). In compliance with the Los Angeles Regional Water Quality Control Board (LARWQCB) Waste Discharge Requirements associated with the former Strathern Landfill permits, a Groundwater Monitoring and Reporting Program is on-going and is overseen by GMED. Groundwater Monitoring Wells 4928A, 4928B, and 4928C were installed on site in 1984: Well 4928A is located near the southeast corner of the site a top of casing (TOC) an elevation of 803.5 feet asl, Well 4928B was located in the north-central portion of the site but was abandoned in 2007, and Well 4928C is located near the northwest corner of the site at a TOC elevation of 821.4 feet asl. Over the last 20 years, groundwater has been measured at more than 200 feet begs for each well. As of May 2014, groundwater levels measured from Wells 4928A and 4928C were reported to be 502.8 feet asl and 503.3 feet asl, respectively, with an average depth to groundwater of approximately 307 feet begs. According to the most recent site-specific hydrologic report, the general direction of groundwater flow in the local basin is south to southeast (TRC, 2014). Table 7 summarizes groundwater monitoring results from October 2010 through May 2014.

12.0 FINDINGS AND CONCLUSIONS

The area investigated consists of dump fill emanating from the O&O plant, undocumented fill soils, and municipal waste overlying native alluvial materials, as delineated on the Geologic Map (Plate 1). A significant portion of the O&O plant was found to be underlain by the Newberry Landfill, which is illustrated on the Geologic Cross-Sections (Plate 2).

A total of 277 samples were collected and analyzed for potential contaminants during the 2013 and 2014 subsurface investigations. Table 6 lists the distribution of samples that were impacted by Heavy Metals such as lead, and by VOCs, TPH, PCBs, and PAHs. Based on the correlation of the distribution of chemical concentrations with materials identified in the soils borings, the extent of the municipal wastes could be determined, and is illustrated in the Geologic Cross-Sections (Plate 2).

An artificial fill cap overlying municipal waste in the Newberry Landfill was identified as a distinct unit, which has an average thickness of 25.5 feet. The artificial fill cap is impacted by TPH and PCBs. These impacts can be attributed to quarrying and gravel processing operations that have occurred at this location at least since 1928 and a cement batch plant that has been in operation at this location since 1955.

A total of 80 methane probes were installed at 20 points and tested to survey a large portion of the Project, focusing on the northern property boundary, as shown on the Geologic Map (Plate 1). Methane concentrations exceeding 12,000 ppmv were detected along the northern property boundary where the Newberry Landfill municipal waste was encountered. Survey points along Tujunga Avenue, from Strathern Street to the O&O plant, and points within the Strathern Landfill detected methane levels that were generally below 1,000 ppmv.

13.0 RECOMMENDATIONS

- All work proposed within the limits of the Newberry Landfill will require oversight by the LADBS' Environmental Affairs Division-Local Enforcement Agency Program, the LADBS Local Enforcement Agency Unit, and the Los Angeles Regional Water Quality Control Board (LARWQCB).

- Newberry Landfill (af_{NL}) materials delineated on the Geologic Cross-Sections should remain in-place to avoid special handling, excessive disposal costs, and potentially complicated regulatory oversight.

- Disturbance to the Artificial Fill Cap [$af_{NL(cap)}$] overlying the Newberry Landfill (af_{NL}), delineated on the Geologic Map, should be kept to a minimum. Specifically, where the Newberry Landfill Artificial Fill Cap [$af_{NL(cap)}$] is not capped with concrete, within the eastern portion of the study area, grading should be kept to a minimum.

- The 6- to 12-inch concrete slab that overlies most of the O&O plant should remain in place to act as an additional barrier to methane gas migration from the Newberry Landfill following vacation of the site by O&O Ready Mix Inc.

- Due to the surface area of the existing concrete, at a minimum, a passive venting system should be installed per City Ordinance No. 175790. Additional venting recommendations may be required for the overall Project site.

- Appropriate drainage controls and measures should be taken to minimize infiltration around and under the concrete slab that will be left in place to create a semi-impervious layer.

- When the 90 percent plans are available, a specific study on potential impacts to human health should be conducted specifically for the area investigated for this report.

- The project contractor should implement proper health and safety measures based on this report, and appropriate contaminated material handling and disposal procedures should be followed.

- All Dump Fill (af_D) that is to be re-used for engineered fill should be environmentally tested prior to reuse. Testing frequency should be determined when 90 percent plans are available.

14.0 LIMITATIONS

This report has been prepared for the exclusive use of the County of Los Angeles Department of Public Works or their agents for the specific site discussed herein and should not be considered transferable to other sites or projects. In the event that any modification in the design, configuration, or use of the site is implemented, the recommendations contained in this report are no longer valid.

This study was conducted according to generally accepted environmental assessment procedures and geotechnical engineering practice for projects of this magnitude.

The findings and recommendations in this report are based on the field and laboratory investigations combined with an extrapolation of soil conditions beyond boring locations and below boring depths. Our recommendations are professional opinions and are not meant to be a control of nature; therefore, no warranty is herein expressed or implied.

If you have questions regarding this report, please contact Karin Burger or Olga Cruz at Extension 4925. To provide feedback on our services, please access http://dpw.lacounty.gov/go/gmedsurvey to complete a Customer Service Survey.

Acronyms/Abbreviations:
ND = Not detected above the indicated laboratory detection limit (MDL)
J = Results indicate a detection above the MDL and below the practical quantitation limit (PQL)

Notes:
1: Value exceeds Total Threshold Limit Concentration: Chromium = 2,500 mg/kg; Copper = 2,500 mg/kg; Lead = 1,000 mg/kg; Zinc = 5,000 mg/kg
2: Value exceeds 10 times the Soluble Threshold Limit Concentration (STLC): Antimony = 150 mg/kg; Arsenic = 50 mg/kg; Cadmium = 10 mg/kg; Copper = 250 mg/kg; Lead = 50 mg/kg; Mercury = 2 mg/kg; Nickel = 200 mg/kg; Silver = 50 mg/kg; Zinc = 2,500 mg/kg

TABLE 1A

SOLUBLE THRESHOLD LIMIT CONCENTRATION AND TOXICITY CHARACTERISTIC LEACHING PROCEDURE

TABLE 1A
Soluble Threshold Limit Concentration (STLC) by EPA Method 6010B (in milligrams per liter)
and Toxicity Characteristic Leaching Procedure (TCLP) by EPA Method 1311 (in milligrams per liter)
Rory M. Shaw Wetlands Park Project

Sample ID	Sample Depth (in feet)	Sample Date	Antimony	Cadmium	Chromium	Copper	Lead	Nickel	Silver	Zinc
Samples collected during 2013 investigation Not Analyzed (B13-1 though B13-10)

Comparison Values:

Soluble Threshold Limit Concentration (STLC): Antimony = 15 mg/l; Cadmium = 1.0 mg/l; Chromium = 5 mg/l; Copper = 25 mg/l; Lead = 5 mg/l; Nickel = 20 mg/l; Silver = 5 mg/l; and Zinc = 250 mg/l

Toxicity Characteristic Leaching Procedure (TCLP): Cadmium = 1.0 mg/l; Chromium = 5 mg/l; Lead = 5 mg/l; Silver = 5 mg/l

TABLE 2

VOLATILE ORGANIC COMPOUNDS

Table 2
Volatile Organic Compounds by EPA Method 8260B (in micrograms per kilogram)

Acronyms/Abbreviations:
ND = Not detected above the indicated laboratory detection limit (MDL)
J = Results indicate a detection above the MDL and below the practical quantitation limit (PQL)
Comparison Values:
Regional Screening Levels in parts per billion (ppb): Residential Soil (Res); Industrial Soil (Ind):

Acetone = 6,100,000 ppb (Res); 67,000,000 ppb (Ind)
Benzene = 1,200 ppb (Res); 5,100 ppb (Ind)
2-Butanone (MEK) = Not Listed
n-Butylbenzene = 390,000 ppb (Res); 5,800,000 ppb (Ind)
sec-Butylbenzene = 780,000 ppb (Res); 12,000,000 ppb (Ind)
Carbon Disulfide = 77,000 ppb (Res); 350,000 ppb (Ind)
1,2-Dichlorobenzene = 180,000 ppb (Res); 930,000 ppb (Ind)
1,3-Dichlorobenzene = Not Listed
1,4-Dichlorobenzene = 2,600 ppb (Res); 11,000 ppb (Ind)
cis-1,2-Dichloroethene = 16,000 ppb (Res); 230,000 ppb (Ind)
Ethylbenzene = 5,800 ppb (Res); 26,000 ppb (Ind)
Isopropylbenzene = Not Listed
p-Isopropyltoluene = Not Listed
Naphthalene = Not Listed
n-Propylbenzene = Not Listed
Toluene (Methyl Benzene) = 490,000 ppb (Res); 2,700,000 ppb (Ind)
1,2,3-Trichloropropane = 0.1 ppb (Res); 110 ppb (Ind)
1,2,4-Trimethylbenzene = 5,800 ppb (Res); 124,000 ppb (Ind)
1,3,5-Trimethylbenzene = 78,000 ppb (Res); 1,200,000 ppb (Ind)
o-Xylene = 65,000 ppb (Res); 1,250,000 ppb (Ind)
m,p-Xylenes = 56,000 ppb (Res); 240,000 ppb (Ind)
Methyl-tert-butyl ether (MTBE) = 47,000 ppb (Res); 210,000 ppb (Ind)

Maximum Soil Screening Levels for Benzene, Ethylbenzene, Toluene, Xylene, and MTBE, in ppb, for Groundwater depth greater than 150 feet:

= 44 ppb
= 8,000 ppb
= 2,000 ppb
= 23,000 ppb
= 39 ppb

Acronyms/Abbreviations
ND = Not detected above the indicated laboratory detection limit (MDL)
J = Results indicate a detection above the MDL and below the practical quantitation limit (PQL)

TABLE 4

POLYCHLORINATED BIPHENYL COMPOUNDS AND TOTAL PETROLEUM HYDROCARBONS

Table 4
Polychlorinated Biphenyl Compounds (PCBs) by EPA Method 8082
Total Petroluem Hydrocarbon Chain by EPA Method 8015M
Rory M. Shaw Wetlands Park Project

Sample ID	Sample Depth (in feet)	Sample Date	Polychlorinated Biphenyl Compounds (micrograms per kilogram)									Total Petroleum Hydrocarbon Chain (milligrams per kilogram)		
			Aroclor-1016 (PCB-1016)	Aroclor-1221 (PCB-1221)	Aroclor-1232 (PCB-1232)	Aroclor-1242 (PCB-1242)	Aroclor-1248 (PCB-1248)	Aroclor-1254 (PCB-1254)	Aroclor-1260 (PCB-1260)	Aroclor-1262 (PCB-1262)	Aroclor-1268 (PCB-1268)	C4-C12	C13-C22	C23-C40

Acronyms/Abbreviations:
ND = Not detected above the indicated laboratorydetection limit (MDL)
J = Results indicate a detection above the MDL and below the practical quantitation limit (PQL)

Regional Screening Levels in parts per billion (ppb): Residential Soil (Res); Industrial Soil (Ind):
Aroclor-1248 (PCB-1248) = 240 ppb (Res); 1,000 ppb (Ind)
Aroclor-1254 (PCB-1254) = 110 ppb (Res); 1,000 ppb (Ind)
Aroclor-1260 (PCB-1260) = 240 ppb (Res); 1,000 ppb (Ind)

Maximum Soil Screening Levels for Total Petroleum Hydrocarbons for Groundwater depth greater than 150 feet:
C4-C12 = 1,000 mg/kg; C13-C22 = 10,000 mg/kg; C23-C40 = 50,000 mg/kg

TABLE 5

ORGANOCHLORINE PESTICIDES

TABLE 5
Organochlorine Pesticides by EPA Method 8081A (in micrograms per kilogram)
Rory M. Shaw Wetlands Park Project

Sample ID	Sample Depth (in feet)	Sample Date	Aldrin	Chlordane (Total)	Chlordane (alpha)	4,4'-DDD (DDD)	4,4'-DDE (DDE)	4,4'-DDT (DDT)	Dieldrin	Endosulfan 1	Endosulfan 11	Endosulfan sulfate	Endrin	Endrin aldehyde	Endrin ketone	Chlordane (gamma)	Heptachlor	Heptachlor epoxide	alpha-Hexachlorocyclohexane (Alpha-BHC)	beta-Hexachlorocyclohexane (Betta-BHC)	delta-Hexachlorocyclohexane (Delta-BHC)	gamma-Hexachlorocyclohexane (Gamma-BHC, Lindane)	Methoxychlor	Toxaphene

Notations:
1: Volatile Organic Compounds: Table notes only non j-flagged detection of VOCs.
2: Petroleum Hydrocarbons: Only noted when 1,000 parts per million was exceeded.
3: Title 22 Metals only noted when concentration exceeds 10 times Soluble Threshold Limit Concentration (STLC).
4: Dump fill originating from cement plant operations.
5: Fill cap consists predominantly of clayey sand mixed with pulverized concrete, asphalt and brick.
6: Newberry fill originates from former municipal Newberry Landfill.

Abbreviations:
NE = Not Encountered
TD = Total Depth

Attention: Ms. Karen Mendez, P.E.

Subject: Final Report - Instrumentation
Ground Improvement Test Program
Rory M. Shaw Wetlands Park Project
Sun Valley, Los Angeles County, California
URS Project No. 60446033

Dear Ms. Mendez:

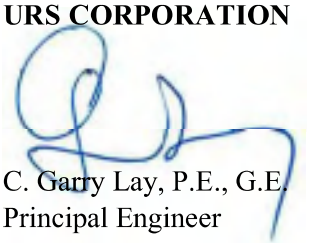
URS Corporation (URS) is pleased to present our instrumentation data collected during the Ground Improvement Test Program (Program) for the Rory M. Shaw Wetlands Park Project in the Sun Valley area of Los Angeles County, California. This report also provides our interpretation of the monitoring results and the associated recommendations for ground improvement construction for the subject project.

The subject report mainly focused on the potential noise and vibration impact due to ground improvement construction, and the available established tolerance threshold for the applications. The engineering performance evaluation based on the data collected from the subject Program, as well as the actual design and construction criteria to support project plan and specification development, will be addressed in a separate report. The information provided herein will be part of the geotechnical investigation report to be prepared by Geotechnical and Materials Engineering Division (GMED) of the Los Angeles County Department of Public Works (LACDPW).

URS prepared this report exclusively for the GMED of LACDPW for its use in project design development. If you have any questions regarding this report, or if we can be of further service, please contact us at 213-593-8100.

Sincerely,

URS CORPORATION



C. Garry Lay, P.E., G.E.
Principal Engineer
Manager of Geotechnical Engineering Department

SECTION 1 INTRODUCTION

1.1 GENERAL

This report presents the results of URS Corporation's (URS) pre-construction test program on ground improvement alternatives (Program) to Los Angeles County Department of Public Works (LACDPW)/Geotechnical and Materials Engineering Division (GMED) for the Rory M. Shaw Wetlands Park Project (Project), in the Sun Valley area of Los Angeles County, California. This report provides our instrumentation data collected during the Program, as well as our interpretation of the monitoring results and the associated recommendations for ground improvement construction for the Project.

The subject report mainly addressed the potential noise and vibration impact due to ground improvement construction; while the engineering evaluation for improvement performance based on the data collected during the Program will be presented in a separate report. The information provided herein will be part of the geotechnical investigation report to be prepared by LACDPW GMED, which will be Geotechnical Engineer-of-Record (GEOR) for the Project.

As subsurface conditions may vary at different locations, the conclusions and recommendations based on the subject Program should not deviate appreciably from those interpreted by GMED and provided to URS.

1.2 PROJECT DESCRIPTION

The Project's objective is to retain stormwater runoff while increasing water conservation, recreational opportunities, and wildlife habitat, as well as reducing stormwater pollution. Therefore, the LACDPW is proposing to convert the subject 46-acre property, which includes an inert landfill into a park area, wetlands areas, and a detention pond. The detention pond will provide the capacity to store a portion of the runoff collected from the upstream tributary area and will reduce flooding in the surrounding areas. The Project will also feature wetlands that will serve as a natural water treatment system for removing pollutants from the collected stormwater runoff. The treated flows will then be pumped to the adjacent Sun Valley Park into existing infiltration basins, providing recharge into the groundwater. In addition to water quality improvements, the constructed wetlands will also enhance native vegetation and create opportunities for wildlife habitat. The Project will provide open space and recreational areas with the proposed enhancements including trails, basketball and tennis courts, a tot lot, picnic tables, educational signage, and restrooms.

The site is located at the northeast corner of the intersection of Tujunga Avenue and Strathern Street in the City of Los Angeles, California, as shown on Vicinity Map, Figure 1. It's bordered on the north by metal reclamation, concrete crushing, and truck/trailer storage facilities, to the south by Strathern Street, to the west by Tujunga Avenue, and to the east by Fair Avenue. The site was a mining pit (Strathern Pit) with maximum depth of 130 to 140 feet below grade for sand and gravel between the 1940s and late 1970s. Strathern Pit was then converted to an inert debris landfill in the 1990s. Based on the desktop

study by GMED, it is believed that depths of the pit were generally uniform at the bottom with estimated side slope gradients of approximately ¾H:1V (horizontal to vertical) during the mining operation. Partial removal of the debris fills with associated re-grading at the site is planned to accommodate the proposed improvements for the Project.

The Project is subject to review by the Regional Water Quality Control Board (RWQCB). Based on the LACDPW's correspondence with these reviewing agencies, the site improvements should be constructed such that water from detention ponds, wetlands, and other surface runoff will not infiltrate and percolate through the inert debris landfill. The proposed improvement layout is presented on Plot Plan, Figure 2. Generally, the proposed detention ponds and wetlands are proposed to be constructed by over-excavating to the planned subgrade (25 feet below the proposed wetland and basin bottom elevation), performing ground improvement on the subsurface materials to minimum depth of 25 feet below the over-excavated bottom, and backfilling the exposed excavated and treated bottom with a minimum of 25-feet of mechanically stabilized earth (MSE) fill to provide proper foundation support in order to meet the requirements by RWQCB.

According to the feasibility study report by URS dated November 7, 2016, deep dynamic compaction (DDC) and compaction grouting (CG) were identified as the most feasible improvement options. The purpose for the Program is to evaluate constructability and potential impacts of the aforementioned techniques at the Project site and to collect field data for plan and specification development.

1.3 PURPOSE AND SCOPE OF WORK

The purpose of this report was to summarize the geophysical survey and instrumentation data collected before, during, and after the ground improvement construction activities to support the final design for the Program. Our work was performed in accordance with the As-needed Geotechnical Professional and Technical Services Agreement (PW 13689) between LACDPW/GMED and URS. The scope of services as outlined in our proposals submitted to GMED dated June 15 and July 3, 2017 were followed closely and generally included the following tasks:

- Pre-field activities including work plan preparation and coordination.
- Conducting geophysical baseline measurement at the test sections and performing background instrumentation.
- Performing vibration monitoring during pre-construction ground improvement test programs.
- Conducting geophysical survey:
  - Refraction microtremor (ReMi) measurements;
  - Multichannel analysis of surface waves (MASW) measurements; and
  - Cross-hole shear-wave (S-wave) and primary-wave (P-wave) measurement.
- Performing engineering analysis based on the vibration instrumentation data.
- Preparing instrumentation report to summarize field data, to compare the available tolerance criteria, and to provide minimum setback requirements for the ground improvement alternatives.

SECTION 2 GROUND IMPROVEMENT TEST PROGRAM

2.1 GENERAL

URS in conjunction with its subconsultant Southwest Geophysics, Inc. (SGI), and subcontractor Hayward Baker Inc. (HBI) developed the Program which consists of performing ground improvement using DDC (Test Area 2 and 3) and CG (Test Area 1) techniques at the test sections as shown on Figure 2, conducting geophysical surveys to gather pre-existing conditions and to then measure improvement after phases of construction, and implementing series of vibration/noise instrumentation at multiple monitoring locations within and away from the ground improvement operations as shown on Figure 2. The data collected during the field program were used to finalize the ground improvement design (i.e., ground improvement plans and specifications) for construction document/bid package, and to develop simple correlation for production quality control-quality assurance (QA-QC) procedures during construction. A series of ReMi and MASW measurements (i.e., surface wave measurement) were performed in combination of cross-hole S-wave and P-wave measurement (i.e., downhole measurements) taken before and after ground improvement operations. To capture the variance of subsurface conditions, multiple profiles of geophysical surface measurement were performed prior to, and after each pass of the ground improvement treatment. The data was used to evaluate the conditions and the improvement in the landfill debris. In addition, static load tests were performed by placing fill on the test areas to simulate the hydrostatic pressure in order to evaluate subgrade performance.

For vibration and noise monitoring, four stations for background and far-field instrumentation were established. In addition, two manned systems as near-field instrumentation were implemented during the course of ground improvement construction. The information was used to determine the minimum setback requirement to vibration/noise sensitive area for construction and evaluate the impact to the surrounding neighborhood.

2.2 GROUND IMPROVEMENT TEST SECTIONS

2.2.1 Deep Dynamic Compaction

DDC uses the principles of transforming potential energy to kinetic energy to densify the ground by utilizing a weights, supported and elevated by a crane, in free fall to impact the ground. The work is performed in phases (i.e., typically two densification passes and one ironing pass) which is organized in a coordinated grid pattern. The DDC test program consisted of two arrays of DDC locations to increase the densities of the existing subsurface materials performed by HBI. Localized heave may occur at ground surface for each location as weight penetrates ground. The major equipment used for DDC construction testing consisted of:

- Manitowoc 1015 Crawler Crane or equivalent, specially built crane for DDC operations with automated safety controls, with 27-ton steel weight.
- Mechanics service truck.
- Excavator or dozer.
- Water truck for dust control.

2.2.1.1 Densification Phase

The Manitowoc 1015 was positioned to access multiple DDC locations and elevated a 27-ton steel weight. The weight was elevated to a minimum height of 80 feet from initial existing grade (i.e., prior to penetration) for each location. In DDC Test Zone 2 the crane completed 4 drops per pass consisting of a primary 12 feet square and secondary 12 feet square drop location pattern. This shall achieve approximate energy of 120 ton-feet per square foot. In DDC Test Zone 3, the crane completed 6 drops per pass consisting of a primary 12 feet square and secondary 12 feet square drop location pattern. This shall achieve approximate energy of 180 ton-feet per square foot. An estimated impact energy intensity of 2,160 ton-feet per impact is required based on the depth requirements for the Project site. Based on FHWA-SA-95-037, this 2,160 ton-feet/impact can reach the treatment depth ranging from 32 to 40 feet, depending on the soil conditions (with the n value from 0.4 to 0.5).

With the same 2,160 ton-feet/impact intensity, the cumulate impaction energy of 120 and 180 ton*feet per square foot were applied to the DDC Test Zones A and B, respectively, in order to investigate how the rubble fill is being crushed and densified.

2.2.1.2 Ironing Pass

An ironing pass was then performed by HBI utilizing the Manitowoc 1015 to elevate a 10-ton steel weight. Weight was elevated to a minimum height of 40 feet from initial existing grade (i.e., prior to penetration) for each location on a 7-foot square pattern. The crane completed 2 drops per location. The ironing pass is required as top soil layer (with lack of confining pressure) got disturbed due to the heavy densification impact and tamping with lighter weight densified the upper 10 feet of soil.

2.2.2 Compaction Grouting

The intent of the CG test program is to fill voids within the rubble fill and possibly densify surrounding matrix soils. The use of compaction grouting (more recently referred to as low mobility grouting), induces radial displacement and stiffening of the surrounding soil at the point of injection. As the point of injection (casing tip) is withdrawn towards the ground surface, the material profile is densified until either a prescribed volume or pressure threshold is achieved, or more commonly, vertical surface heave occurs.

2.2.2.1 Ground Treatment Configuration

The CG test program consisted of installing 41 compaction grout casings to a depth of approximately 30 feet, grouting the lower 20 feet. A 9-foot square primary spacing with central secondary was performed. The primary sequence focused on filling voids, and the secondary focused on further void filling and possibly densification of non-rubble fill such as sand, gravel, and fines. The target improvement zone was between 10 and 30 feet below the working grade. An assumed replacement volume of 12 percent of the target treatment zone was anticipated.

2.2.2.2 Low Mobility Grout Mix Design

The grout mix proposed for the test program consisted of blended silty sand, at least 8 percent Type II/V cement by weight, and enough water to produce a slump of 0 to 4 inches (ASTM C-143) when measured at the grout header. The compaction grout sand was from a local source in Simi Valley (Tapo Rock and Sand) and was used on numerous compaction grouting projects for the LACDPW, City of Los Angeles, LADWP, Metro, and Caltrans.

2.2.2.3 Ground Movement Monitoring

Monitoring during grouting operations utilized a portable rotating horizontal laser with multiple laser receivers by HBI. The typical system used by HBI during CG operations was manufactured by Trimble - Spectra Precision Model LL500. The laser was located outside the zone of influence of the grouting on a stable wooden tripod. Laser receivers were mounted to poles and/or stands placed on grade at random locations within a horizontal radius equal to the depth of treatment. The laser receivers emitted an audible alarm when the sensor goes off plane by 1/32 to 1/16 inch. All receiver locations were determined by HBI as field conditions dictate.

SECTION 3 INSTRUMENTATION AND GEOPHYSICAL SURVEY

3.1 BACKGROUND INSTRUMENTATION

Prior to conducting the ground improvement activities, the background vibration levels were recorded at 4 stations by SGI from August 14, 2017 to August 22, 2017. The instrumentation locations are shown on Figure 2. The monitors were equipped with solar panels and modems and housed in a lock box. The instruments were programmed to communicate the vibration level results daily.

During the ground improvement activities, the vibration monitors installed at the locations described above were used to monitor and record and report the vibration levels from the construction activities. In the event potentially damaging vibration levels are measured, the instrument(s) can immediately transmit a warning signal via e-mail and text. The background and construction monitoring were performed continuously so that there was no need to demobilize and remobilize the instrumentation.

3.2 VIBRATION MONITORING

In addition to the four monitors described above, two additional monitors were placed 75 feet to the closest drop location and 279 feet away from furthest drop location, the DDC test areas as shown on Figure 2. The purpose of these monitors was to measure the near-field effects during the DDC activities (three days of manned observation). Peak particle velocities (PPV) versus frequency were measured. In addition, fast Fourier transform (FFT) was performed on the time-history records to generate spectral response (SR). Both the PPV and SR were evaluated for changes, which could signify an increase in density. As the subsurface soils are densified, less attenuation of the higher frequencies occurs. Accordingly, a shift in the SR should also occur. In addition, as the fill materials are densified the PPV should also increase and eventually stabilize when negligible increases in density occur. These two phenomena could potentially be an indicator of when the ground is adequately densified. This information together with the ReMi, MASW, and cross-hole data were used to determine the degree of subsurface soil densification.

3.3 GEOPHYSICAL SURVEY

The primary purpose of the geophysical survey is to evaluate soil density improvement after DDC and CG activities at portions of the project site. Specifically, ReMi traverses, MASW transects, seismic P-wave and S-wave cross-hole surveys, and near-field vibration monitoring were conducted on site. Background vibration monitoring was also conducted to monitor the noise levels of the construction activities. Table 1 summarized the geophysical survey performed for the Program. The following sections provide an overview of the methodologies and the results for the study.

Table 1 - GEOPHYSICAL SURVEY

GROUND IMPROVEMENT TEST SECTION	PHASE	DATE	SURVEY TYPE	NOTE
Area 1	Pre-construction	August 15, 2017	ReMi	
Area 1	Pre-construction	August 16, 2017	MASW	
Area 1	Pre-construction	September 1, 2017	Cross-hole	
Area 1	Ironing-pass construction	September 6, 2017	ReMi and MASW	
Area 1	Post-CG construction	October 6, 2017	ReMi	
Area 1	Post-CG construction	October 6, 2017	MASW	
Area 1	Post-CG construction	October 16, 2017	Cross-hole	
Area 2 and 3	Pre-construction	August 9, 2017	ReMi	
Area 2 and 3	Pre-construction	August 14, 2017	ReMi	
Area 2 and 3	Pre-construction	August 15, 2017	ReMi	
Area 2 and 3	Pre-construction	August 16, 2017	MASW	
Area 2 and 3	Pre-construction	August 31, 2017	Cross-hole	
Area 2 and 3	Post-DDC construction	September 21, 2017	ReMi	After secondary pass
Area 2 and 3	Post-DDC construction	September 22, 2017	ReMi and MASW	After secondary pass
Area 2 and 3	Post-DDC construction	September 25, 2017	MASW	After secondary pass
Area 2 and 3	Post-DDC ironing-pass construction	October 5, 2017	ReMi	

Notes:
- DDC: Deep dynamic compaction.
- CG: Compaction grouting.
- ReMi: Refraction microtremor measurement.
- MASW: Multichannel analysis of surface waves measurement.

3.3.1 ReMi Survey

The ReMi survey technique uses recorded surface waves (specifically Rayleigh waves) that are contained in the background noise to develop an S-wave velocity profile of the site. The depth of exploration is dependent on the length of the line and the frequency content of the background noise. The results of the ReMi method are displayed as a one-dimensional sounding, which represents the average condition across the length of the line. The ReMi method does not require an increase of material velocity with depth. Therefore, low velocity zones (velocity inversions) are detectable with ReMi.

Twenty-six ReMi lines, RL-1 through RL-26, with geophones spaced 4 to 5 feet apart for line lengths of 92 and 115 feet were performed in the study areas (see Figure 3). Data were collected before and after construction activities (see Table 1), and again after the ironing pass in each of the three study areas for a total of 78 lines. Fifteen records, 32 seconds long were collected with a 24-channel Geometrics Geode or Strataview digital seismograph and 4.5-Hz vertical component geophones.

Collected ReMi data were processed using SeisOpt® ReMiTM software (© Optim LLC, 2005), which uses the refraction microtremor method (Louie, 2001). The program generates phase-velocity dispersion

curves for each record and provides an interactive dispersion-modeling tool where the users determine the best fitting model. The result is a one- dimensional S-wave velocity model of the site with roughly 85 to 95 percent accuracy. Appendix A present the results for the ReMi study.

3.3.2 MASW Survey

Surface waves (specifically Rayleigh waves) were recorded along lines ML-1 through ML-6 for the different phases of the project (see Figure 3). The surface waves were generated by a hammer and plate (shot) and were recorded using a 24- channel Geometrics Geode or Strataview digital seismograph and 24 4.5-Hz vertical component geophones. The geophones were spaced 4 feet apart in the DDC areas and 3 feet apart in the CG area. Prior to the collection of surface-wave data, near-field and far-field effects were evaluated for several shot offset distances. The results indicated an offset of 24 feet was optimum for Area 1 and 28 feet for Areas 2 and 3.

Three records were collected at each shot location with a recording length of one second. The shot location and geophones were then moved (shifted) longitudinally along the profile direction and the line was reshot. The shift in Area 1 was 6 feet and the shift in Areas 2 and 3 was 8 feet.

The recorded data were processed using SurfSeis® (Kansas Geological Survey, 2012), a Multichannel Analysis of Surface Waves software program. One-dimensional (1- D) S-wave (S-wave) velocity (Vs) profiles were generated for each shot location, which correspond to the middle of the geophone array. A two-dimensional color gradient model was then created from the 1-D models using the SurfSeis® interpolation scheme. It should be emphasized that the 2-D profile represents the area between the midpoint of the first shot location and the midpoint of the last shot location. Appendix A present the results for the MASW study.

3.3.3 Seismic P-wave and Shear Wave Cross-Hole Survey

Seismic P-wave and shear wave cross-hole surveys were also performed in each study area in general accordance with ASTM D 4428. In Areas 2 and 3 the survey was conducted in three cased boreholes (drilled and cased by others) arranged in a triangle with the boreholes spaced approximately 10 feet apart. In Area 1 the survey was conducted in four cased bore- holes (drilled and cased by others) spaced approximately 10 feet apart and arranged inline across the central portion of the area (see Figures 3). A downhole hammer and two three-component downhole geophones were used to record P- and S-wave signals. The data were acquired using a Geometrics Geode digital seismograph. Data were collected at 3-foot intervals to depths up to 48 feet below the ground surface. Appendix A presents the results for the cross-hole study.

SECTION 4 VIBRATION MONITORING

4.1 FIELD INSTRUMENTATION

The first stage of the geophysical survey for the subject Project consist of the far-field and near-field vibration monitoring program to collect and evaluate the site conditions before the ground improvement construction impacted the project site and during the ground improvement construction. Four vibration monitoring units (VM-1 through VM-4) were deployed on August 7, 2017 to monitor background vibration levels of the project area as well as the vibration levels during the ground improvement construction. The locations of the four locations are shown in Figure 2. The instruments were programmed to monitor vibrations levels in a Histogram-Combo mode. The Histogram mode stores summary information and reports the PPV and corresponding frequency. The Combo mode stores a wave-form for a recorded event which for this project is defined as a vibration level exceeding 0.5 inches per second.

Two near-field vibration monitoring units (VM100 and VM200) were deployed in six different selected locations to monitor the near vibration levels of the DDC during actual construction. The instruments were programmed to collect complete time histories in three dimensions (transverse, longitudinal, and vertical) thorough the entire construction day.

4.2 FAR-FIELD VIBRATION MONITORING

The vibration monitoring continuously collected data for approximately 1 month between August 9th and September 11th. The data was filtered into four categories: weekday-business hours, weekday-off hours, weekend-business hours, and weekend-off hours. The four categories were chosen to determine various activity levels in the surrounding community and during the ground improvement test program. The locations of the far-field vibration monitoring instruments are shown in Figure 2.

The vibration monitor results indicated that a majority of the activities events in the surrounding community occurred during weekday-off hours. Zero events were recorded during weekend-business hours. During the construction period only 3 events were recorded during weekday-business hours. The results indicate increased activity level at or near the project site during the off hours. The construction site attracted unauthorized personnel to the Project site during off hours, which lead to increase activities as shown in the monitoring data and the results of losing VM-2 station due to theft during the monitoring observation period.

4.3 NEAR-FIELD VIBRATION MONITORING

Near field vibration monitoring was performed on two selected construction dates to measure the near field effects of the DDC. Two near-field monitoring devices were utilized and placed approximately 100 feet and 200 feet away from the DDC test area, locations are shown in Figure 2. The near-field monitors used are a Blastmate II and Minimate Plus, which are rugged vibration sound monitors that contains

geophones to collect data in histogram combo mode (monitor captured triggered waveforms and records in histogram mode). Data was collected continuously throughout the entire day while the drop sequences and locations were recorded. The devices collected full-time histories responses in three directions.

4.3.1 Peak Vector Sum Interpretation

The near-field vibration monitoring data was first analyzed based on the peak vector sum (PVS) for each drop. The PVS is the maximum principal velocity the near-field monitor recorded for a given drop event. The measured distance between the drop location and the near-field monitor were computed for each individual drop due to the sensitivity of vibration attenuation with respect to the distance between the drop location and the near-field monitor. Figure 4 shows the drop sequences for the typical DDC test area. The associated PVS based on the time stamp were assigned a distance based on the drop location distance from the near-field monitor. This collection of data was then filtered based on the timestamp to identify the drop sequences. All the first drops of a drop location (1-drop) were grouped together and this was performed for the subsequent drops up to 6-drops. The results and combined summary for the primary pass are shown in Figure 5 and Figure 6, respectively. The exercise was also performed once for the secondary pass and the results are shown in Figure 7 and Figure 8.

The data indicated that an increase in applied energy (increase in drop sequence) to the ground surface results in higher PVS. This is due to densification of the existing ground conditions resulting in a stiffer surface allowing for faster wave propagation. The results also show that the secondary pass generated significantly higher vibration.

4.3.2 Frequency Domain

The PVS analysis did not provide adequate information, which led us to perform a more thorough analysis of the time history responses to evaluate the energy applied by the DDC. Select time histories from location P42 (Primary pass location 42 in Area 3, shown in Figures 9 and 10, and S35 (Secondary pass location 35) in Area 2, shown in Figure 11 and Figure 12. These two locations were evaluated first due to the confidence in ability to identify the drop sequences and to be able to match the time-stamp between the recorded drops and the two near-field instruments. FFT were performed on the associated time-history records to generate spectral response (SR). The comparisons between primary pass and secondary pass response indicated significantly accelerations during the secondary pass. This is due to increased stiffness of the ground condition due to the improvement caused by the primary pass.

Location P42 and S35 selected time-history records were also evaluated for pseudo spectral acceleration (PSA), pseudo spectral velocity (PSV), spectral displacement (Sd), and spectral velocity (Sv) as shown in Figure 11 through Figure 14. These four responses provide a better insight to the response spectrum and provide a better understanding of the modal responses and energy transfer of the ground condition. Velocity is the ideal spectrum as it is directly related to applied energy and energy transfer from the DDC. The difference between pseudo responses and spectral responses are in the method of the spectrum integration. Pseudo responses simplify the response spectrum based on a single degree of freedom

(SDOF) characteristics and the pseudo spectral accelerations and pseudo spectral velocities are simply a function of the SDOF response and the natural frequency. The spectral acceleration and spectral velocity provide the maximum response of the equivalent SDOF.

The same process was repeated for selected secondary-pass responses closest to the near field sensor to evaluate higher responses. Figure 15 and Figure 16 summarize the responses from secondary pass location 19 (S19) which is 99 feet from the closest near-field monitor and indicated a PGA larger than 1.0 g. The intention was to evaluate and interpret the closest near field ground response time-histories to increase our understanding of the ground vibration attenuation. The results of this analysis provided sufficient attenuation relationship to generate a site-specific DDC attenuation relationship for the equipment used during the test program.

SECTION 5 CONCLUSION AND RECOMMENDATIONS

5.1 VIBRATION AND NOISE TOLERANCE CRITERIA

Due to the operation of construction equipment and the process of DDC, ground vibrations onsite will be generated. If the amplitudes of the ground vibration are high enough, the ground vibration has the potential to damage adjacent structures, cause cosmetic or structural damage, and/or disrupt the operation of vibration-sensitive equipment. Table 2 shows the threshold criteria pertaining to structural damage potential. The ground vibration can also be an annoyance to individuals who live or work close to the vibration-generating activities. Table 3 shows the threshold criteria pertaining to human annoyance potential. The effects of ground vibration are also dependent on the frequency of occurrence, for example, the generation differences between a continuously spinning machine and a pile driving machine. Due to the rate at which the DDC crane can lift and drop the weight, DDC is classified as a transient source. The adopted criteria for the subject Project are based on a Caltrans study in 2013 to provide a screening tool and to assess the vibration methods.

Table 2 – GUIDELINES VIBRATION DAMAGE POTENTIAL THRESHOLD CRITERIA

STRUCTURE AND CONDITIONS	MAXIMUM PPV (IN/SEC)	
	TRANSIENT SOURCES	CONTINUOUS /FREQUENT INTERMITTENT SOURCES
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Table 3 – GUIDELINES VIBRATION ANNOYANCE POTENTIAL CRITERIA

HUMAN RESPONSE	MAXIMUM PPV (IN/SEC)	
	TRANSIENT SOURCES	CONTINUOUS /FREQUENT INTERMITTENT SOURCES
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strong perceptible	0.9	0.1
Severe	2.0	0.4

5.2 CONSTRUCTION CONSIDERATION - DEEP DYNAMIC COMPACTION

5.2.1 Noise

Construction noise and subsequent traffic noise can have adverse effects on people's quality of life. Construction noise can have a contributing effect to the degradation of people's health and has the potential to disturb people's daily activities. Construction noise can affect people in a variety of ways, including physical effects, speech interference, activity interferences, and annoyances.

Noise abatement measures may be implemented to reduce the impact to the surrounding neighborhood. Noise can be mitigated through selection of field equipment, confining hours of operation, and installing noise shielding. Construction noise criteria limits are defined by city ordinances and for the subject project is defined by City of Los Angeles's Municipal Code, Chapter XI Noise Regulation. Construction noise generated from DC equipment noise restriction are limited to 75 dBA between 7:00 AM and 8:00 PM and 60 dBA between 8:00 PM and 7:00 AM including Sunday and legal holidays due to the surrounding single-family residential communities. For the subject project site, based on the equipment selected during the test program generating less than 75 dBA, noise is not considered a potential concern.

5.2.2 Vibration

The vibration monitoring program provided valuable data describing how ground vibration propagates from the DDC drop source. Through an analysis of the frequency content at two locations away from the drop source, an understanding of ground vibration attenuation was developed. As the wave propagates away from the drop source, vertical ground vibration attenuated significantly faster than transverse and longitudinal waves. The ground vibration diminished approximately 200 feet from the drop source.

The responses were compared to earthquake magnitude 1 to 4 to obtain a feel on the intensity generated by the DDC primary and secondary pass. The results indicated the instrument perceived, at a distances of approximately 100 feet, PGA similar to PGA generated from a magnitude 3 earthquake as shown in Figure 19 and Figure 20. Note that the DDC energy is significantly smaller and the duration of the impulse is significantly shorter than regular earthquakes and that the secondary passes are not generating energy levels as great as magnitude 3 earthquakes.

With the extensive data collection of time-history responses from various distances located between 75 and 279 feet, a site-specific attenuation relationship was generated. The formulation utilizes a log-log relationship similar to ground motion prediction equations as shown:

$$\ln R = c_1 \ln(X + c_2)$$

where the coefficient, c_1 and c_2, are derived based on the filtered data set. The interpreted data solved for PGA and PGV are shown in Figure 21 and 23, respectively. The data was isolated for each drop sequences for both PGA and PGV data set as shown in Figure 22 and Figure 24, respectively. This provides a better estimate of the ground vibration based and various scenarios of the anticipated DDC operation. The summary of the PGA and PGV response for the ground vibration estimation are shown in Figure 26 and Figure 28. The relationship estimates the PGV given a certain distance from the drop sources. The ground vibration was estimated for both primary and secondary passes allowing for a more

aggressive setback criteria during the production ground improvement program. The site-specific attenuation relationship can been then inverted to proxy for a setback requirement.

5.2.3 Minimum Setback Requirement

The minimum setback requirement is the extent in which DDC may be utilized within the project boundary before the ground vibration causes disturbances to the surrounding community. Due to cost effectiveness of the DDC, significant effort was placed in quantifying the minimum setback requirement from the subject project. The minimum setback requirement utilizes the developed site-specific attenuation relationship in conjunction with a set criterion. Based on the surrounding communities, a targeted PPV of 0.5 inch/sec is selected for this site. Utilizing the current grading plan and the elevation in which the ground improvement will be performed, the direct distances between the drop sources and the residential community is defined as the ground vibration route. A simple trigonometry triangle projection is used to transform the ground vibration direction into the setback requirement. Given the target PPV of 0.5 inch/sec, an 85-foot setback criteria is required, defined from the corner of the detention basin.

SECTION 7 UNCERTAINTIES AND LIMITATIONS

URS has conducted the test program in a limited area of the Project site for GMED and provided our support services to GMED, the Project's GEOR. The recommendations presented herein are based on the assumption that the subgrade conditions do not deviate appreciably from those interpreted by GMED and provided to URS.

We recommend that URS review the design plans to verify that the intent of the recommendations presented herein has been properly interpreted and incorporated into the contract documents. We further recommend that relevant construction be observed by a qualified Geotechnical Engineer to evaluate if the site conditions encountered are as anticipated, or to provide revised recommendations, if necessary. If variations or undesirable design conditions are encountered during construction, GEOR should be consulted for further recommendations.

Relevant geotechnical engineering and the geologic sciences are characterized by uncertainty. Professional judgments presented herein are based partly on our understanding of the proposed construction, and partly on our general experience. Our engineering work and judgments rendered meet current professional standards; we do not guarantee the performance of the Project in any respect.

- o0o -

It has been a pleasure to assist you with this Project. We look forward to being of further assistance as construction begins. Should you have any questions regarding this report, please contact us.

Very truly yours,

URS

Bird Strike Hazards Memorandum

MEMORANDUM

To:	Janea Russell, Los Angeles County Department of Public Works
From:	Michael Henry, Biologist Sabita Tewani, AICP, Transportation Planner
Subject:	Bird-Aircraft Strike Hazard Analysis for Rory M. Shaw Wetlands Park Project
Date:	December 14, 2021
cc:	Nicole Cobleigh, Dudek
Attachments:	Figure 1 – Project Location Figure 2 – Rory M. Shaw Wetlands Project Concept Figure 3 – Existing Potential Bird Attractants in the Project Vicinity

The following memorandum presents the summary of the Bird-Aircraft Strike Hazard Analysis conducted for the proposed Rory M. Shaw Wetlands Park Project.

1 Introduction

In 2018 Los Angeles County Public Works contacted Hollywood Burbank Airport (BHA), Whiteman Airport (WHP), and the Federal Aviation Administration (FAA) in compliance with the 2004 Programmatic Environmental Impact Report (PEIR) mitigation measure H-2, informing them of the Rory M. Shaw Wetlands Park Project and confirming points of contact for future discussions. BHA staff requested and attended a meeting with Los Angeles County Public Works staff to review the project status and background. After that meeting, Los Angeles County Public Works received a letter from BHA on September 9, 2019 (BHA 2019). That letter incorporated a memorandum prepared by Wood Environment and Infrastructure Solutions Inc. Among other topics, that memorandum described how the proposed Rory M. Shaw Wetlands Park Project (project) would potentially conflict with FAA guidelines and Airport Land Use Commission (ALUC) guidelines for airport land use planning and requested that the wetlands park be located outside the 10,000-foot and 5-mile buffer zones surrounding the airport. Barring that, the memo requested that a plan be prepared to address the following:

- "redesign and engineering of the detention structure and, preferably, the elimination of the open air wetland area altogether"
- "habitat management to include landscape plans that avoid feeding of birds or other wildlife"
- "roosting, breeding, or water access for bird species creating aircraft safety hazards"
- "exclusionary measures to passively deter birds from accessing the site"
- "active harassment and even potential lethal removal of any birds that still may occur"

Los Angeles County Public Works Aviation Division was informed of the details of the project in August 2020. Subsequently on November 2, 2020, the Airport Project Coordinator at Los Angeles County Public Works Aviation Division provided an email on behalf of WHP stating their opposition to the project based on incompatible land use within the separation criteria of the General Aviation WHP.

The information contained in the BHA letter and WHP email do not constitute "new information of substantial importance" under CEQA Guidelines Section 15162(a)(3). The currently proposed project is substantially similar to the 2004 and 2013 Projects in regard to the surface water features that might affect airport safety, and therefore, the conclusions of the 2004 PEIR (Less than Significant without mitigation) are applicable to the currently proposed project. This memorandum has been prepared in response to the issues raised in the letters from BHA and WHP related to FAA and County ALUC guidelines. This memorandum discusses the potential hazard to aircraft presented by the proposed Rory M Shaw Wetlands Park and identifies optional design details that could potentially reduce or eliminate increases in wildlife-aircraft collision risk related to the implementation and operation of the currently proposed project. Implementation of these design details, in whole or in part, are at the County's discretion and are not required to reduce a project impact to less than significant under CEQA.

2 Project Site Existing Conditions

2.1 Project Location

The project site is located at its nearest point approximately 4,000 feet northwest of BHA property and approximately 4,300 feet from the northern extent of Runway 15/33 (Figure 1, Project Location). The project is also approximately 3 miles southeast of WHP, which hosts a single runway.

2.2 General Conditions

The 46-acre project site is in the community of Sun Valley within the City of Los Angeles, Los Angeles County, California. This location is part of the highly urbanized Sun Valley Watershed, which drains into the Los Angeles River. Generally, the Sun Valley Watershed is approximately bordered by Tujunga Wash and Hansen Spreading Grounds on the west, BHA on the east, Hansen Dam on the north, and Burbank Boulevard on the south. The watershed is approximately 2,800 acres (4.4 square miles) in area and is approximately 6 miles in length from north to south. The project site itself is bounded by Strathern Street and single-family residential uses to the south; Tujunga Avenue, a truck stop, and industrial uses to the west; Roscoe Boulevard and recycling facilities to the north; and Fair Avenue, Sun Valley Park, and single-family residential uses to the east.

The project site and surrounding areas were quarried for sand and gravel in the early- to mid-1900s, with many of the pits subsequently converted to landfills. Strathern Pit, which occupies approximately 34.7 acres of the project site, was previously exhausted as a gravel pit, then permitted by the City of Los Angeles as an inert debris landfill in 1992, which operated until October 2008. The pit currently has a surface area of 30 acres and a maximum depth of approximately 160 feet. A concrete plant occupied the approximately 10-acre northwestern portion of the project site from the mid-1950s to 2016. Structures associated with the concrete plant included various metal sheds, a single-story office building, a steel structure, and the batching plant structure, most of which were dismantled in 2016 when the concrete plant ceased operations.

Surrounding land uses to the east of the project site across Fair Avenue and south across Strathern Street are primarily residential. Sun Valley Park, a City of Los Angeles park, is located to the east across Fair Avenue. The former Newberry Landfill, at the corner of Fair Avenue and Roscoe Boulevard to the northeast of the project site, is now occupied by AMH Recycling, a full-service inert material recycler and recycled aggregate producer. Adjacent to AMH Recycling and northwest of the project site is SA Recycling, a metal recycling facility. A closed sanitary landfill

(Penrose Landfill) is located to the west across Tujunga Avenue. Penrose Landfill was officially closed in 1997 and is currently being used as a truck stop and private soccer complex. Additionally, the former Tuxford Landfill is located northwest of the project site.

The substrate at the project site generally consists of concrete, exposed dirt, rocks, and miscellaneous inert solid waste. Most of the site consists of disturbed/developed areas that until recently supported ruderal or ornamental vegetation (Table 1). The 17.84 acres of debris piles approximately 5 feet in height were covered with native and non-native ruderal plant species. Most of the existing vegetation, including trees, were removed as part of annual maintenance activities in February 2021. Vegetation left on site includes mature street trees and woody tall ornamental shrubs along the Property line along Strathern Street to the south and Fair Avenue to the east. Approximately 48 of the perimeter trees along the Property line are to be removed during Phase 2 of the project.

Table 1. Vegetation Communities and Land Cover Types at the Project Site

Vegetation Community/Land Cover Type	Project Site Acreage
Ruderal	17.84
Wild Oats Grassland	11.08
Disturbed	8.91
Developed	6.51
Ornamental	1.69
California Sagebrush-California Buckwheat Scrub	0.48
Thick-leaved Yerba Santa Scrub	0.06
Coast Live Oak	0.05
Total	**46.62**

Note: Most site vegetation was removed in February 2021 as part of annual maintenance activities.
Source: ICF 2019.

Approximately 0.59 acres of the project site supported native habitat, specifically California sagebrush-buckwheat scrub and thick-leaved yerba santa scrub. Two coast live oak (*Quercus agrifolia*) trees were located in the southern portion of the project site and a small Southern California black walnut (*Juglans californica*) was located in the northwest corner of the project site. As noted above, most site vegetation was removed in February 2021.

The inside perimeter of the project site is raised in relation to the central portion, forming an apparent basin that could potentially trap water. No drainages or water courses were observed in the project site or evident on historic aerial photographs of the project site. There are some erosion rills in the northern portion of the project site on the steep slope south of the demolished concrete batch plant.

Wildlife observed at the project site in 2012 and 2019 surveys included 20 bird species and 3 mammal species (Table 2).

Table 2. Wildlife Species Observed at the Project Site

Species Name	Common Name	Species Grouping
Charadrius vociferous	killdeer	Shorebird
Corvus corax	common raven	Corvid
Corvus brachyrhynchos	American crow	Corvid
Buteo jamaicensis	red-tailed hawk	Raptor
Tyto alba	barn owl	Raptor
Accipiter cooperii	Cooper's hawk	Raptor
Cathartes aura	turkey vulture	Raptor
Calypte anna	Anna's hummingbird	Hummingbird
Zenaida macroura	mourning dove	Columbid
Streptopelia decaocto	Eurasian collared dove	Columbid
Columba livia	rock pigeon	Columbid
Tyrannus vociferans	Cassin's kingbird	Medium Perching Bird
Tyrannus verticalis	western kingbird	Medium Perching Bird
Mimus polyglottos	northern mockingbird	Medium Perching Bird
Psaltriparus minimus	bushtit	Small Perching Bird
Carpodacus mexicanus	house finch	Small Perching Bird
Thryomanes bewickii	Bewick's wren	Small Perching Bird
Carduelis mexicana	lesser goldfinch	Small Perching Bird
Pipilo crissalis	California towhee	Small Perching Bird
Sturnus vulgaris	European starling	Aerial Forager
Spermophilus beecheyi	California ground squirrel	Rodent
Sylvilagus audubonii	desert cottontail	Rabbit
Canis latrans	coyote	Canid

Source: ICF 2019.

Of these species, most pose little or no danger to aircraft because they are small in size, are not flocking species (aside from European starlings [*Sturnus vulgaris*]), fly close to the ground, and do not regularly travel substantial distances between habitat types (e.g., between water sources and foraging habitat). The four raptor species likely provide the greatest collision threat, with red-tailed hawk [*Buteo jamaicensis*] posing a moderate threat and turkey vulture [*Cathartes aura*] posing a high threat due to their circling behavior and large body sizes.

3 Proposed Project

3.1 Overview and Project Objectives

The project would involve the conversion of the 46-acre, non-operating inert construction debris landfill into a constructed wetlands park that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre three-part detention pond, two treatment wetlands totaling 10 acres, and 15 acres of recreational space (Figure 2, Rory M. Shaw Wetlands Project Concept).

The project would capture stormwater runoff collected from upstream drainage areas to alleviate flooding in the Sun Valley community. Runoff would be temporarily stored in a detention pond, routed through a wetlands complex for biological water treatment, and then pumped into existing underground infiltration basins at the adjacent Sun Valley Park.

The objectives of the project, as listed in the 2004 PEIR, are the following:

1) Reduce local flooding in the project area (primary objective);

2) Increase water conservation;

3) Increase recreational opportunities;

4) Increase wildlife habitat;

5) Improve water quality;

6) Provide additional environmental benefits (e.g., energy conservation, air quality improvement, solid waste management); and

7) Increase multiple agency participation.

3.2 Relevant Project Details

For a complete project description, refer to Section 2.3 of the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum. This section focuses on project details relevant to the subject matter of this memorandum.

3.2.1 Detention Pond

The proposed 21-acre detention pond is proposed for construction on the western portion of the project site and would be up to 50 feet deep with a total storage capacity of 385 acre-feet. The edges of the detention pond would be sloped to discourage wildlife movement between adjacent turf areas and water features. The detention pond would not be kept full during the dry season.

The detention pond would be fed by stormwater runoff from the Sun Valley watershed via the 8-foot by 8-foot reinforced box culvert from Tujunga Avenue. Low flows would be diverted to a priority floatable/sediment treatment unit for removal of sediments, floatables, oil, and other contaminants. This treated runoff would then be discharged to one of the three detention pond lower chambers.

Higher flows would bypass the priority treatment unit and flow directly to the detention pond, filling one or more of the three detention pond lower chambers as necessary depending on the duration of the large rain event. Raw water in the detention pond would be pumped up the pond side slope to the valve vault, where it could then be pumped to one of the two wetlands ponds described in Section 3.2.2. These underground raw water pumps would operate continuously during the wet season and only be off during detention pond maintenance.

3.2.2 Wetlands

Two wetland areas are proposed within the east side of the project site totaling a surface area of 10 acres. The southernmost wetland would be approximately 4 acres in area and 2–3 feet in depth. The northernmost wetland would be approximately 6 acres in surface area and 2–3 feet in depth. The edges of the wetland areas would be sloped to discourage wildlife movement between the turf areas and water features. The wetlands would be vegetated with plant types that will maximize biological treatment capability of the raw stormwater and minimize surface area for potentially hazardous waterbirds like Canada geese and ducks.

Other than on-site runoff and rainfall, the wetlands would mostly be supplied by the raw water pumps from the detention pond. Considering the volume and depth of the detention pond, these wetlands pumps would operate continuously to treat 2 to 5 cubic feet per second through the wetlands throughout the year. If there is no available water from the detention pond, the wetlands would be supplemented by a separate potable water line. If recycled water becomes available in the future, this potable water line to the wetlands could be converted for use for recycled water.

3.2.3 Recreational Components

Aboveground improvements would include the development of recreational offerings throughout the site, totaling approximately 15 acres. A 127-stall parking facility would line the northern boundary. The soccer field, a picnic area, and picnic pavilion would be located in the northwest portion of the project site. An amphitheater and restroom would be west of the soccer field and south of the 127-stall parking lot. The rest of the recreational facilities would be located along the eastern portion of the site, including the tot lot and tennis courts, basketball courts, and open play area. Restrooms and a 30-stall parking lot would also be developed in the southeastern portion of the site. Pedestrian trails would also be developed throughout the project site.

3.2.4 Landscaping

The currently proposed project would include approximately 432 new trees and 109,505 new shrubs. Landscaping is proposed throughout the project site and surrounding the detention ponds and wetland areas, but landscaping plans are only conceptual at this time.

4 Existing Bird Airstrike Hazard at Hollywood Burbank Airport

The bird airstrike hazard at BHA is affected both by attractants on the airfield and by attractants at off-airport locations in the vicinity (within 5 miles of both BHA and the project site). Information regarding wildlife hazards at and near the airport were drawn from the FAA Wildlife Strike Database (FAA 2021), and from information collected in 2011 and 2012 during preparation of the Wildlife Hazard Assessment for Bob Hope Airport (AMEC 2012).

4.1 On-Airport Bird Attractants

BHA maintains airport grounds and buildings to minimize attractiveness to birds and wildlife. The majority of the airport is developed with buildings and pavement and the areas of bare ground, weeds, and low herbaceous vegetation are regularly mowed to a height that minimizes foraging by seed-eating birds. Various hangars provide roosting habitat for pigeons and other species, but the site does not provide any attractants for waterfowl and provides minimal foraging

opportunities for raptors. BHA has an approved Wildlife Hazard Management Plan that is implemented to manage and minimize bird airstrike hazard on the airport and to a lesser extent outside the airport.

4.2 Bird Attractants in the Vicinity

Under existing conditions, several locations in the vicinity outside the BHA perimeter are known or potential bird attractants. These locations are summarized below, and focused discussion is provided for Hansen Dam (because of its substantial open water/marsh area).

The vicinity outside the BHA perimeter includes a variety of artificial lakes, detention ponds, groundwater recharge spreading areas, and channelized watercourses (Figure 3, Existing Potential Bird Attractants in the Project Vicinity). Primary among the watercourses are the Los Angeles River to the south and its tributary, Tujunga Wash, to the west. The Burbank Western Channel to the east of BHA is also tributary to the Los Angeles River. The Pacoima Wash to the west is tributary to Tujunga Wash. All of these drainages are channelized, with varying levels of intermittent or perennial flow. Permanent water can also be found in Hansen Lake to the northwest, created by a dam on Tujunga Wash. Below Hansen Dam, a series of settling ponds are seasonally inundated. Approximately 4.5 miles to the south, the two Hollywood Reservoirs are another permanent water source, as are the private Toluca Lake (3.1 miles) and the Jaws and Park Lakes on the Universal Studios lot (3.7 miles). There are several dams and debris basins along the base of the Verdugo Mountains, but these are ephemeral/intermittent water sources, appearing useful mainly for flood control or groundwater recharge. Waterfowl and other birds and wildlife utilize the permanent water sources, especially where vegetated.

City of Burbank Landfill No. 3, the only operating solid waste landfill in the vicinity, has the potential to be a major attractant of birds, especially gulls and ravens. Landfill No. 3 may have an operable propane cannon but the effectiveness of wildlife management at the landfill is not known. A variety of other waste facilities are located in the vicinity including transfer stations, composting sites, chipping and grinding facilities, and construction/ demolition/inert debris processing and fill. These locations are only marginally attractive to wildlife but may provide some roost sites and cover.

The largest parks in the BHA vicinity include Griffith Park and Brand Park to the southeast (4.0 miles and 4.3 miles, respectively), Hansen Dam Park to the northwest (3.5 miles), Valley Plaza Park to the west (1.8 miles), Verdugo Mountain Park to the northeast (1.0 miles), Stough Park to the east (2.8 miles), Weddington Park to the south (3.4 miles), and North Hollywood Park to the southwest (2.2 miles). There are also many "postage stamp" sized city parks in the vicinity, all of them providing some measure of habitat for wildlife. Most of these are typical city parks, with manicured landscaping and grassy fields and lacking pond or wetland features. Some have native vegetation, however, such as Hansen Dam, Verdugo Mountain, Brand, and Stough Parks. Cemeteries in the study area include Grandview Memorial Park to the southeast (4.4 miles), Forest Lawn Memorial Park/Mount Sinai Memorial Park to the southeast (3.5 miles), and Valhalla Cemetery immediately south of Runway 33. Valhalla is of particular concern, with large trees, fountains, and grassy open space in immediate proximity to departing aircraft to the south. Golf courses in the study area include De Bell Municipal Golf Course to the east (2.6 miles), Hansen Dam Golf Course to the northwest (3.2 miles), Weddington Golf & Tennis to the southwest (4.4 miles), and Lakeside Country Club to the south (3.3). Several other locations with turf fields include Los Angeles Valley College to the west (3.0 miles) and many public schoolyards scattered through the study area.

4.2.1 Hansen Dam Area

The Hansen Dam area includes a range of habitats associated with Tujunga Wash and associated alluvial deposits. This includes mature urban woodland, sports fields, a golf course, sage scrub, riparian woodland around the perimeter of Hansen Dam Lake, and the open water of the lake itself. Of primary concern is that this site periodically hosts large numbers of the waterfowl, gull, and starling/blackbird guilds. Generally, the fact that Hansen Dam is 4 to 5 miles from the airport ameliorates the threat. Also, although Runway 15 is "aimed" at the Hansen Dam area, few flights depart northbound from that runway, and few flights land southbound, thus reducing the number of BHA aircraft in the Hansen Dam vicinity. Nevertheless, the avian flight path between the Hansen Dam and Griffith Park hotspots crosses BHA. Southbound migrants departing the Hansen Dam area may also cross BHA and its aircraft flight paths.

4.2.2 Hansen Spreading Area

To the southwest of Hansen Dam are settling ponds, several largely unvegetated, diked ponds where water from Tujunga Wash is held to percolate into the ground. These features are seasonally dry but provide aquatic habitat for bird species when full.

4.3 Bird Occurrence On and Near Hollywood Burbank Airport

During bimonthly point count surveys conducted from April 2011 through March 2012 for the BHA Wildlife Hazard Assessment, a total of 8,036 birds were observed on the airport and 12,594 birds were observed just outside of airport property or locations in the airport vicinity (Table 3). Observations made at the Hansen Dam and Griffith Park "hotspot" areas are not included in Table 3. Although this data is approximately 10 years old as of the 2021 date of this report, environmental conditions at BHA and in the BHA off-site vicinity have not changed substantially, and the diversity or abundance of bird species are not expected to be substantially different. Although flight operations at BHA have changed since 2011-2012 (Section 4.5), those changes are not expected to have caused changes in bird occurrences in this area. The 2011-2012 dataset is more robust and verifiable than results from any other publicly available databases or citizen science databases (e.g., eBird, iNaturalist).

For points on the airport, observations included 154 raptors, 50 unidentified waterfowl (all in one observation), 431 gulls, and 1,011 corvids (crows or ravens). The remaining birds observed on and near BHA were smaller perching birds, columbids, and other miscellaneous small-to-medium sized birds.

For the points outside the airport, the most notable observation was the abundance of gulls associated with the landfill near Point 13. Because of this aggregation point, 3,971 gulls were recorded during the WHA surveys. Other species groups showed similar patterns to those observed on the airport, and no additional species of concern were noted.

Table 3. Abundance of Bird Species at BHA and Off-Site Vicinity, April 2011--March 2012

Guild and Species Name	Abundance			Percent of Abundance	Aircraft Strike Hazard Associated with Species (Estimated)*
	On-Airport	Vicinity	Total		
Waterfowl	50	1	51	0.2% of all birds	High
Unidentified waterfowl	50	1	51	100% of guild	High

Table 3. Abundance of Bird Species at BHA and Off-Site Vicinity, April 2011--March 2012

Guild and Species Name	Abundance			Percent of Abundance	Aircraft Strike Hazard Associated with Species (Estimated)*
	On-Airport	Vicinity	Total		
Raptors and Vultures	154	66	220	1.1% of all birds	Highly Variable
Red-tailed Hawk *Buteo jamaicensis*	56	30	86	39.1% of guild	Moderate
American Kestrel *Falco sparverius*	80	5	85	38.6% of guild	Low
Turkey Vulture *Cathartes aura*	12	10	22	10.0% of guild	High
Cooper's Hawk *Accipiter cooperii*	3	12	15	6.8% of guild	Moderate
Merlin *Falco columbarius*	1	2	3	1.4% of guild	Low
Swainson's Hawk *Buteo swainsonii*	0	3	3	1.4% of guild	Moderate

Budgerigar *Melopsittacus undulatus*	1	0	1	0.7% of guild	Moderate
Total (76 Species)	**8,036**	**12,594**	**20,630**	**100%**	**N/A**

Note:
* For those species ranked for hazard by the FAA (2013), their assigned ranking was used, and grouped into three categories (Relative Hazard Score of 25–100 = High; 10–24 = Moderate; 0–9 = Low). For those not included on that ranking, a hazard level was assigned based on similarity to the species included on the FAA ranking, or based on professional judgment.

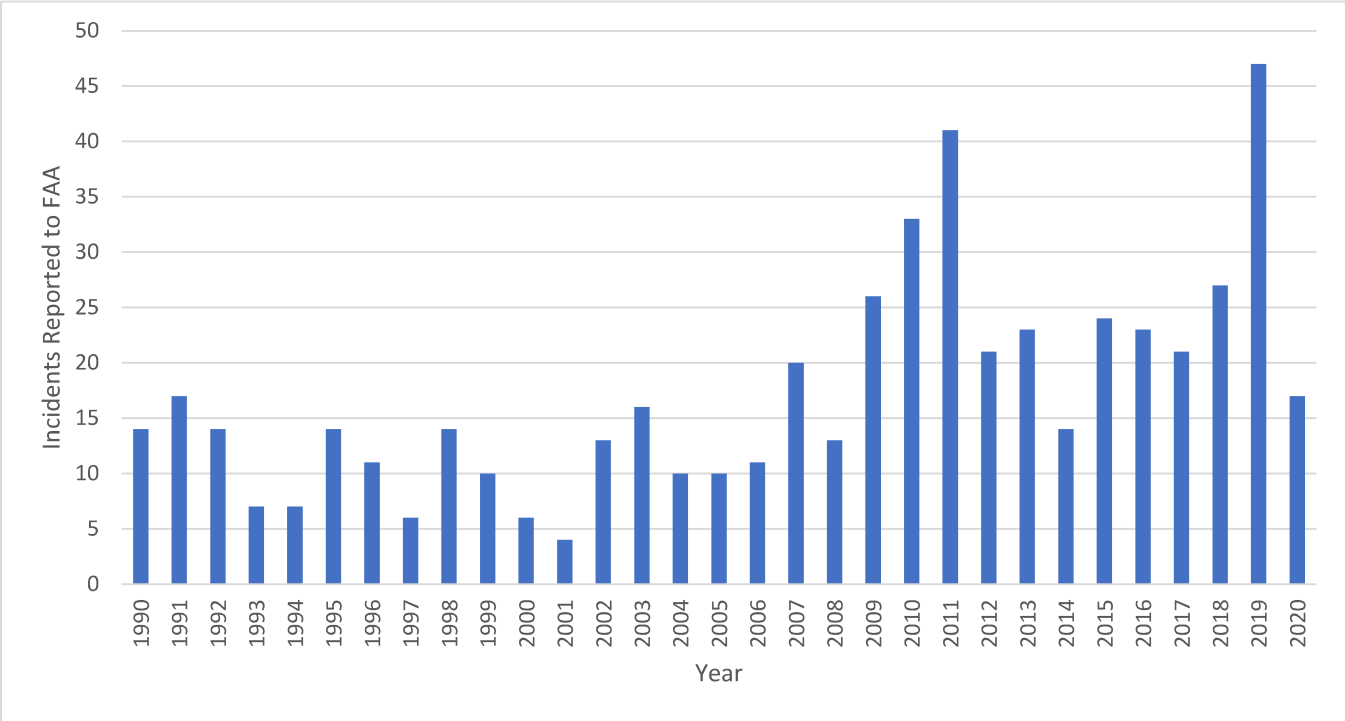
As noted above, bird counts conducted at "hotspots" further removed from the BHA were not included in Table 3. The Hansen Dam hotspot included Hansen Dam and Hansen Lake, the Hansen Spreading Grounds to the south, and three quarry locations in the vicinity of the spreading grounds. The five most numerous bird species observed during the general avian surveys at Hansen Dam hotspot were (1) house finches (*Carpodacus mexicanus*) (789 observed), (2) Brewer's blackbirds (*Euphagus cyanocephalus*) (641 observed), (3) northern shovelers (*Anas clypeata*) (582 observed), (4) American coots (*Fulica americana*) (432 observed), and (5) California gulls (*Larus californicus*) (429 observed). Of these, American coots, northern shovelers, and California gulls are of greatest concern for aircraft strike. California gulls were not recorded from April through June when most of these birds are on their distant breeding grounds. The gaps in the presence of northern shovelers (absent April–October) and American coots (unrecorded in May) also coincide with the times when most individuals have departed to remote breeding areas. The Hansen Dam area had the most diversity of species and the highest numbers of birds, followed by the spreading grounds. The three subsections located in quarries were generally fairly sterile, but these pits are of concern because they are known to host flocks of roosting gulls.

4.4 Wildlife-Aircraft Interactions Reported to the Federal Aviation Administration

The annual number of wildlife-aircraft interactions at BHA varies substantially. Over the 31 years from 1990–2020, a total of 534 wildlife-aircraft interactions were reported at BHA—an average annual rate of approximately 17 interactions. Some of these were confirmed strikes, whereas others were carcasses found on runways or elsewhere on the airfield that showed evidence of collision. The average number of incidents appears to increase in 2009, but incidents have not shown a consistent trend over the last decade, as shown in Figure 4. Of these 534 records, the one record of a waterfowl species in the FAA reporting system from this period is of a bufflehead carcass found on runway 15/33 in 2016 being guarded by a hawk. This may represent a collision that was unreported or could have been predated by the hawk. Other species such as gulls and coots also are included in FAA records for this period, though these species are associated with urban uses in this area such as developed parks and landfills. The number

of incidents is highly dependent on the level of activity at the airport, which was substantially reduced in 2020 due to the effects of COVID-19 quarantines and travel restrictions.

Figure 4. FAA Reported Wildlife-Aircraft Interactions at BHA, 1990–2020



Source: FAA 2021.

From 1990–2020, a total of 32 reports included notes on damage. Of those, 14 reported substantial damage, 11 reported minor damage, and 7 were uncertain about level of damage. The most recent report of substantial damage was from 2012. Notably, 11 of the 14 reports of substantial damage were prior to 2000. Only three reports of substantial damage are available from 2000–2020.

4.5 Typical Flight Operations at Hollywood Burbank Airport

Flight operations at BHA have been subject to restrictions and changes on an ongoing basis and will likely change in the future to accommodate community concerns about noise from overflight. For example, FAA is currently preparing an Environmental Assessment for proposed amendments to two of the departure procedures in use at BHA. As of 2021, the normal runway configuration for passenger aircraft is almost always Runway 8 for instrument landing system approaches, 15 for visual approaches, and 33 for departures. FAA restrictions prevent aircraft over 12,500 pounds from taking off on Runway 8. However, light aircraft do regularly depart from Runway 8. After takeoff, aircraft follow flight paths consistent with the routes shown in Table 4. Additionally, visual flight rules aircraft can land on other runways. However, due to higher terrain to the north, east, and south, straight-in approach procedures to Runways 15, 26, and 33 cannot be designed without exceeding maximum descent gradient criteria, in accordance with FAA Order 8260.58 and FAA Order 8260.3. Arrival routes are described in Table 5.

The runways are also very short (only about 6,000 feet), so jets larger than the B757 tend to avoid the field, with the B737 being the most frequent visitor to the field. Southwest, jetBlue, American, Ameriflight (cargo), Delta, Alaska, Spirit, and United are the commercial operators out of Burbank, along with heavy private jet traffic from Million Air and Atlantic.

Route Name	Notes	Diagram (if applicable)
ELMOO NINE	Runway 8 – climbing right turn to 123°; Runway 15 – climbing left turn to 113°; Runway 26 – climbing left turn to 113°; Runway 33 – climbing left turn to 123°	OROSZ TWO	Runways 8 and 15 – climbing right turn to 210° or as assigned by ATC; Runway 26 – climbing right turn to 290° or as assigned by ATC; Runway 33 – climbing left turn to 270° or as assigned by ATC Radar required	SLAPP TWO	Runways 8 and 15 – climbing right turn to 210° or as assigned by ATC; Runway 26 – climbing right turn to 290° or as assigned by ATC; Runway 33 – climbing left turn to 270° or as assigned by ATC Turbojet only, radar required.	
Table 4. Standard Instrument Departure Procedures for BHA

Route Name	Notes	Diagram (if applicable)
VVERA TWO	Runways 8 and 15 – climbing right turn to 210° or as assigned by ATC; Runway 26 – climbing right turn to 290° or as assigned by ATC; Runway 33 – climbing left turn to 270° or as assigned by ATC Turboprop aircraft only, radar required	VAN NUYS THREE	Runway 8 – climbing right turn to 213°; Runway 15 – climbing right turn to 213°; Runway 26 – climbing right turn to 293°; Runway 33 – climbing left turn to 273° Radar required	
Table 5. Arrival Routes for BHA

Route Name	Notes
Standard Terminal Arrivals (Visual)	
WEESL ONE	Runway 8 unless otherwise assigned, no turbojets
FERNANDO SEVEN	Runway 8 unless otherwise assigned
JANNY FIVE	Runway 8
ROKKR TWO	Runway 8 unless otherwise assigned
THRNE THREE	Runway assigned by ATC upon approach
Instrument Approach Procedures (Arrivals)	
ILS Y or LOC Y RWY 8	Runway 8 approach from west at night, glidepath at 2,753feet at 5.2NM from airport
ILS Z or LOC Z RWY 8	Runway 8 approach from west at night, glidepath at 2,753 feet at 5.2NM from airport
RNAV (RNP) Y RWY 8	Runway 8 approach from west at night for aircraft with operational VGSI systems, glidepath at 2,700 feet at 5.7NM from airport, authorization required
RNAV (GPS) Z RWY 8	Runway 8 approach from west at night for aircraft with operational VGSI systems, glidepath at 3,000 feet at 5.7NM from airport
VOR RWY 8	Runway 8 approach from west at night for aircraft with operational VGSI systems, glidepath at 3,100 feet at 5.5NM from airport
FOUR STACK VISUAL RWY 15	Runway 15 approach from north during daytime, radar required, only if greater than 5- mile visibility

The implementation of the various routes listed in Tables 4 and 5 is manifested in flight tracking data, as shown in Figures 5 through 7. These figures emphasize the dominant departure route south on Runway 15 using standard instrument departure procedures that direct a climbing right turn to 210° or 213°, as well as the dominant straight in arrival glide path for instrument landing system aircraft on Runway 8 and the visual flight rules approach for aircraft on Runway 15.

5 Existing Bird Airstrike Hazard at Whiteman Airport

The bird airstrike hazard at WHP is affected primarily by attractants at off-airport locations in the vicinity (within 2 miles of the airport). Information regarding wildlife hazards at and near the airport were drawn from the FAA Wildlife Strike Database (FAA 2021) and from information collected from the Wildlife Hazard Assessment prepared for WHP in 2014 (Mead & Hunt 2014).

5.1 On-Airport Bird Attractants

The most widely distributed vegetation at WHP is dry desert scrub, which provides minimal bird attractants. Landscaped areas associated with the airport terminal building include an assortment of ornamental trees and shrubs, as well as irrigated turf. WHP does not include any water features such as detention ponds or wetland areas, though there are such features located not far from WHP (e.g., Hansen Spreading Grounds, Hansen Lake).

Figure 5. Approach and Departure Flight Tracks at BHA, 2018 (FAA 2019)

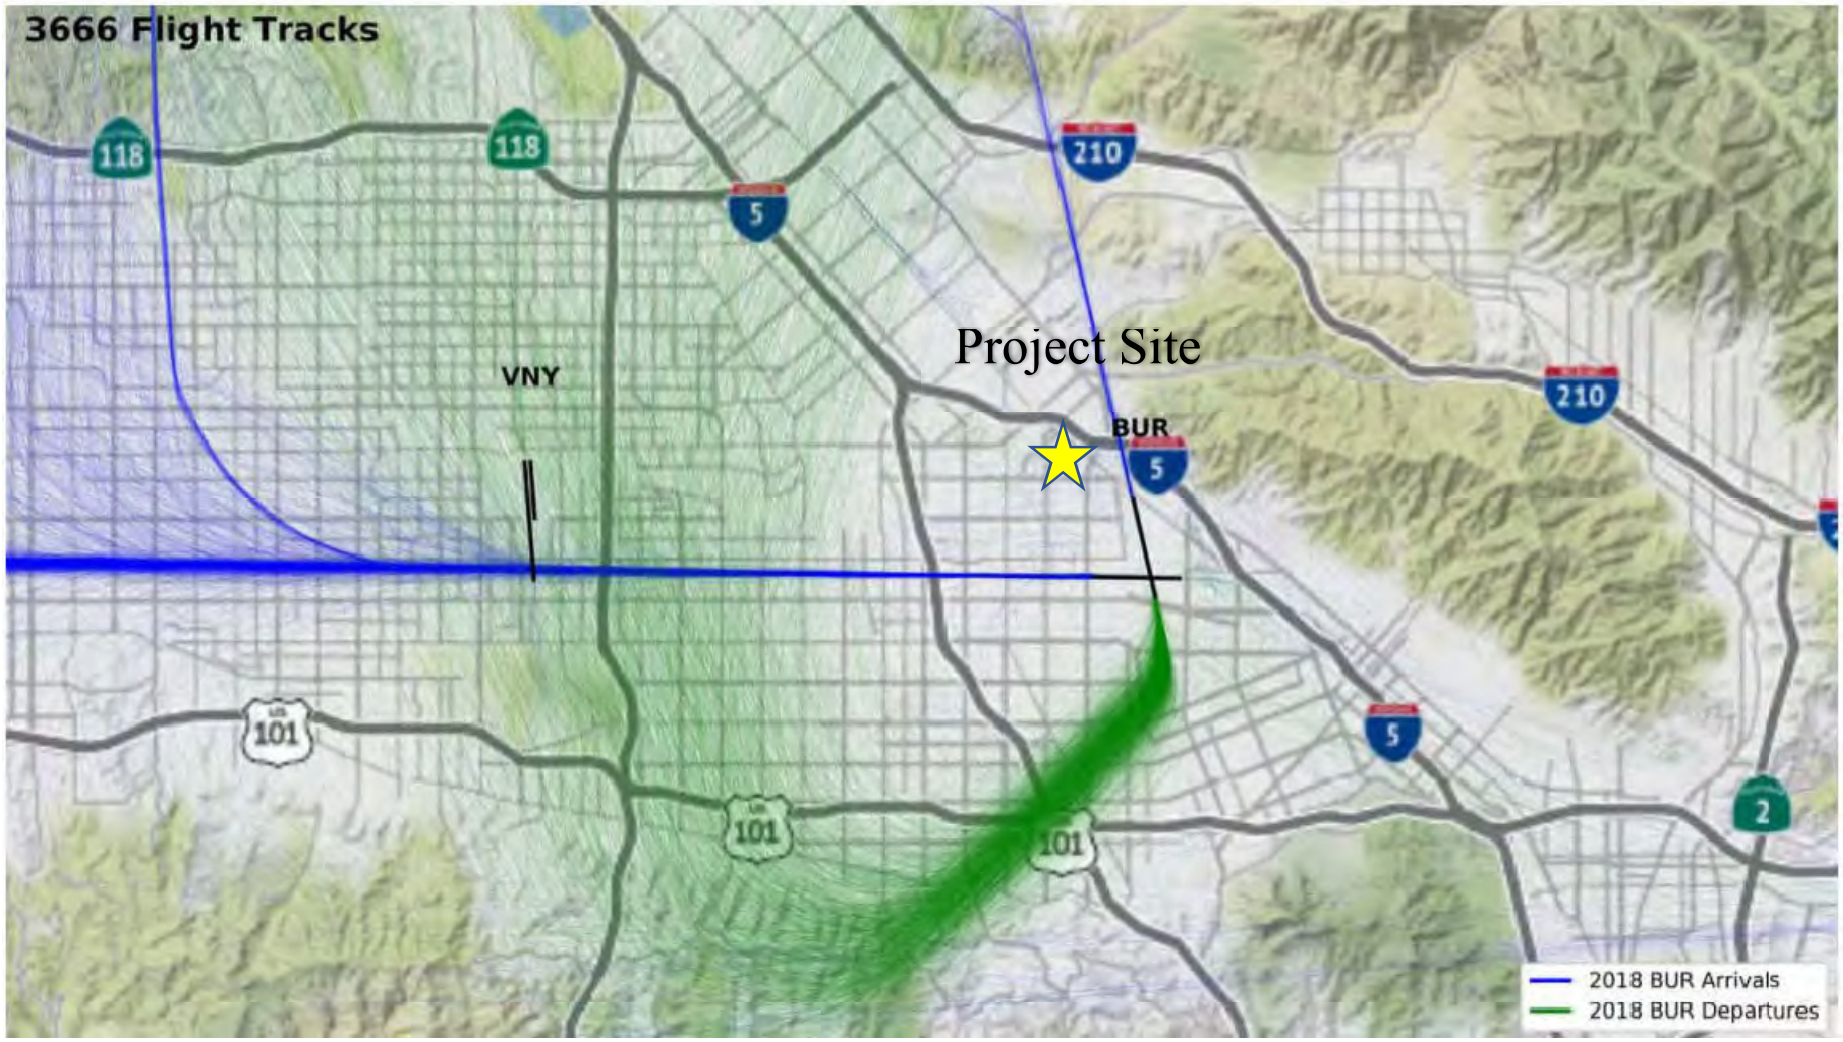

Figure 6. Departures at BHA, October 12–18, 2018 (FAA 2019)

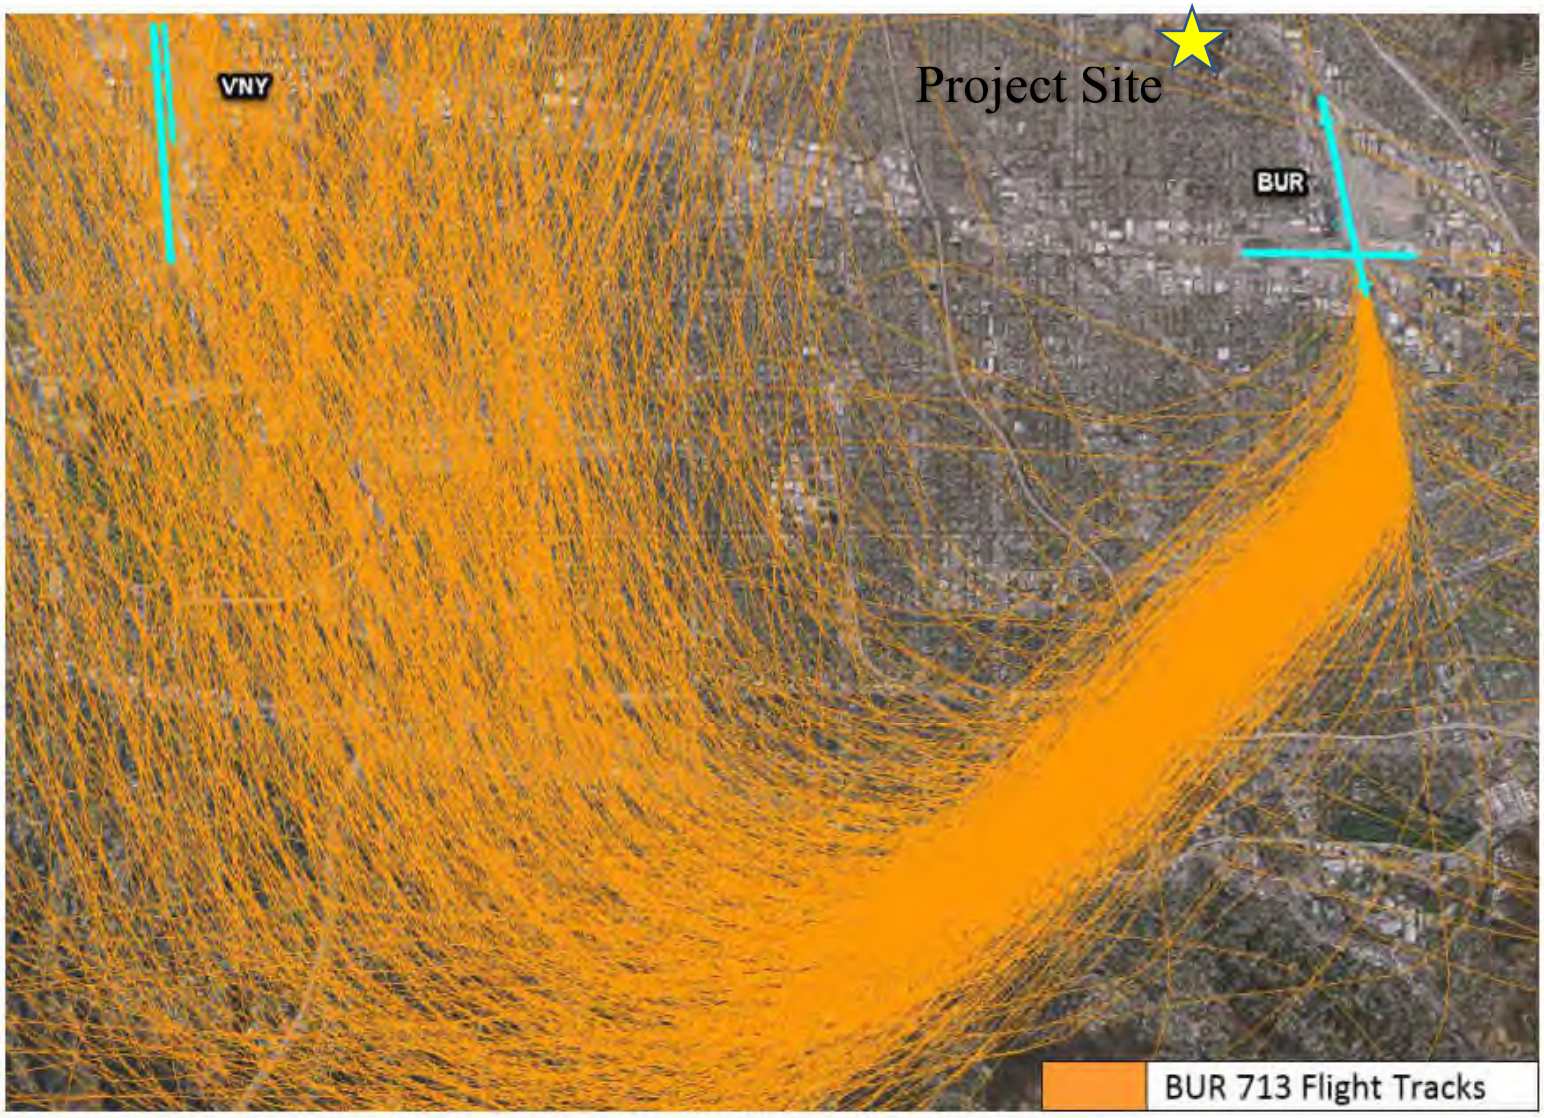

Figure 7. BHA Runway 33 Arrival Flight Tracks, 2018 (FAA 2019)

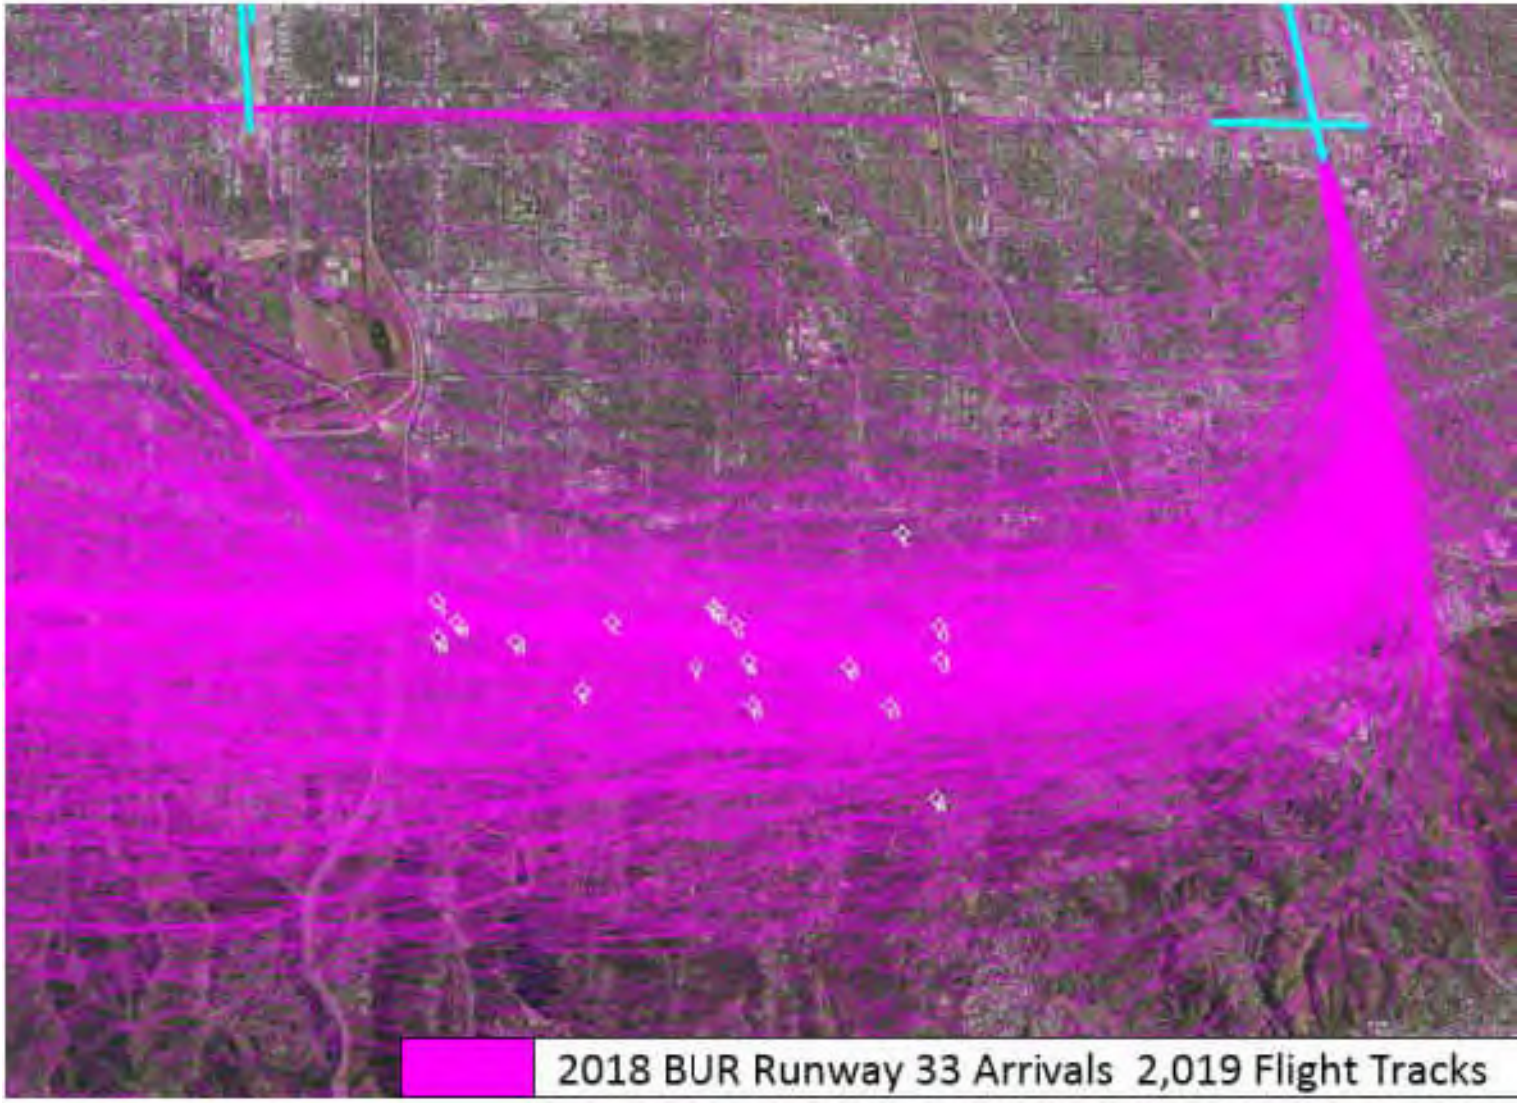

5.2 Bird Occurrence On and Near Whiteman Airport

Surveys were conducted at 11 locations on and near WHP (6 on site, 5 off site) from February 2013 to January 2014 (Mead & Hunt 2014). Data for which species were observed only off site were not available during preparation of this report. Although this data is approximately 8 years old as of the 2021 date of this report, environmental conditions at WHP and in the WHP off-site vicinity have not changed substantially, and the diversity or abundance of bird species are not expected to be substantially different. The 2013-2014 dataset is more robust and verifiable than results from any other publicly available databases or citizen science databases (e.g., eBird, iNaturalist). Survey results are summarized in Table 6.

Table 6. Abundance of Bird Species at WHP and Off-Site Vicinity, February 2013–January 2014

Guild and Species Name	Abundance	Percent of Abundance	Aircraft Strike Hazard Associated with Species (Estimated)*
Guild: Waterfowl	1,285	20.5% of all birds	High

Note:
* For those species ranked for hazard by the FAA (2013), their assigned ranking was used, and grouped into three categories (Relative Hazard Score of 25–100 = High; 10–24 = Moderate; 0–9 = Low). For those not included on that ranking, a hazard level was assigned based on similarity to the species included on the FAA ranking, or based on professional judgment.

Source: Mead & Hunt 2014.

5.3 Bird Attractants in the Vicinity

Much of the area to the northeast of WHP is undeveloped and part of the Angeles National Forest. The surrounding areas to the northwest, southwest, and southeast are characterized by dense urban development. As shown on Figure 3, several substantial attractants are within approximately 5,000 feet of WHP, including Hansen Lake, (Section 4.2.1), Hansen Dam Golf Course, and the Hansen Spreading Grounds (Section 4.2.2).

5.4 Wildlife-Aircraft Interactions Reported to the Federal Aviation Administration

From 1990 to 2020, 11 reports of bird strikes were reported to FAA from WHP. Of those, six were reported in a single year (2001). Three of the 11 strikes reported over that 30-year period indicated damage to the aircraft. Most of the strikes were on pigeons (7), while the remainder were other small- to medium-sized birds. No waterbirds, shorebirds, or raptors have been reported as bird strikes at WHP. However, reporting of strikes at General Aviation airports such as WHP is generally much lower than at airports like BHA that serve commercial traffic. Therefore, it is likely that strikes, especially those that cause little to no damage, are underreported at WHP.

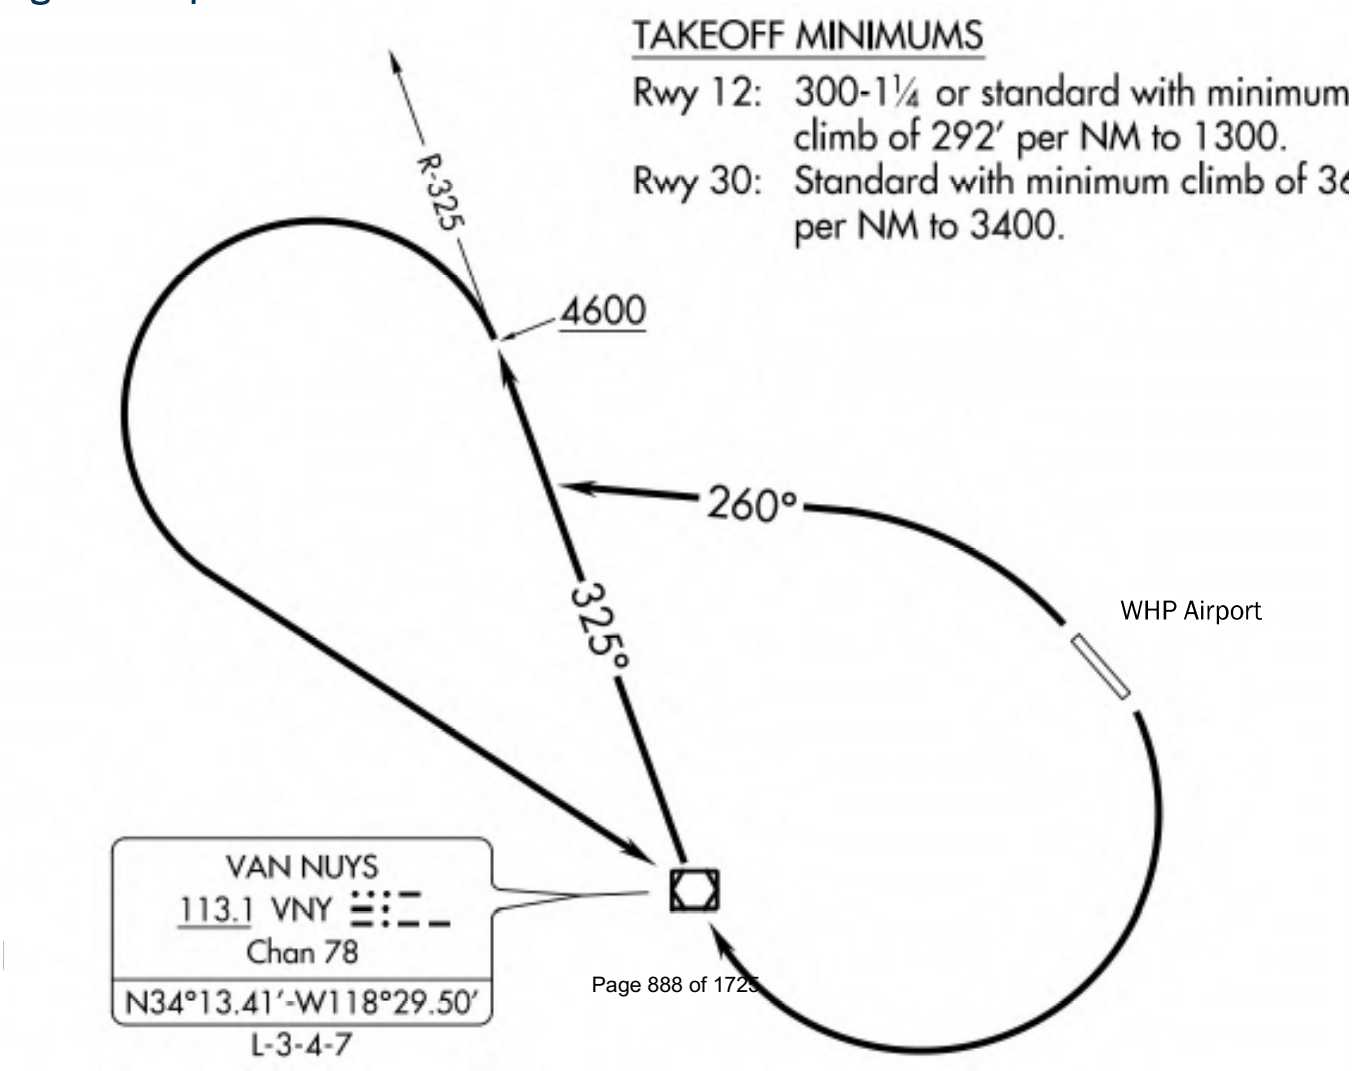
5.5 Typical Flight Operations at Whiteman Airport

WHP has a single two-way runway (12/30). Both directions are used for approaches and departures depending on wind conditions and local air traffic. Approach to Runway 12 is from the northwest and approach to Runway 30 is from the southeast.

Departures from WHP follow the pattern shown in Figure 8. Departures from Runway 12 make a small climbing left turn to a 260° heading, whereas departures from Runway 30 make a gradual climbing right turn to a 325° heading.

In 2018, WHP averaged 318 aircraft operations per day, with an even split between local general aviation (aircraft based at WHP) and transient general aviation (Airnav.com 2021).

Figure 8. Departure Routes for WHP



6 Potential Project Effects on Bird Aircraft Strike Risk at BHA or WHP

The project could potentially affect bird aircraft strike risk for aircraft using BHA or WHP in the following ways:

1. Increase abundance and/or diversity of bird species in the vicinity of BHA or WHP that pose a strike hazard to aircraft

2. Create an attractant that induces existing or new birds to cross approach and departure paths to access or leave the project site

The following discussion demonstrates that the above-referenced project effects will not result in a substantial potential for aircraft collisions with birds or other wildlife.

6.1 Increase Abundance and/or Diversity of Bird Species

The project would introduce potential habitat for a range of bird species, including turf for foraging and loafing; trees and shrubs for roosting and nesting; and water for foraging, roosting, or nesting. This increased potential habitat is expected to attract new bird species that do not currently use the project site, and may increase overall abundance of birds in the project vicinity. This is consistent with the findings of the 2004 PEIR for the project, which concluded that "With respect to birds, the water features proposed at Sheldon Pit, Strathern Pit, and Cal Mat Pit may attract waterfowl and other birds, potentially increasing the diversity of bird species in the project area". However, none of the habitat provided at the site would be unique to the region, as Hansen Dam and the associated land uses provide the primary habitat types that would be introduced by the project: open water, marsh/wetland, trees/shrubs, and turf. Therefore, it is unlikely that the project would substantially increase diversity of bird species in the vicinity of WHP and BHA.

Nonetheless, the increase in potential habitat is expected to increase bird abundance in the project area, and those birds may travel across the BHA and WHP vicinity. The primary concern for increasing bird abundance would be attracting migrating waterfowl such as ducks, grebes, and geese. The Pacific Flyway supports huge waterfowl migrations annually. The project site (as well as BHA and WHP) are positioned between the flyway and a major and principal arterial of the flyway. Since the region is arid, migrating and resident waterfowl are attracted to available water features, such as open ponds in parks and golf courses. When flying at altitudes used by aircraft, waterfowl can pose an elevated risk of aircraft damage and loss due to their relatively high body mass. Under existing conditions, waterfowl appear to be most abundant at Hansen Lake and Hansen Spreading Grounds. Although waterfowl are present in the vicinity under existing conditions, their presence has not resulted in documented strikes on aircraft from BHA or WHP over the 30-year period from 1990-2019 (Sections 4.4 and 5.4). Waterfowl presence is also highly seasonal, with the vast majority of species and individuals observed in the area between November and April (Mead & Hunt 2014), which if consistent would mostly limit increased population abundance to those five months. The project will also be located in an area underserved by parks, which likely will result in it being subject to intensive human use and disturbance throughout the year. This human presence and activity will further limit the attractiveness of the project site to large numbers of birds.

In conclusion, the impact conclusion in the 2004 PEIR remains valid: "due to the highly urbanized nature of the project area and the continuing influence of human activity, a substantial increase in waterfowl population is not anticipated." Although the additional wetland habitat provided by the project will likely increase the abundance of waterfowl or other waterbirds within the project site as compared to baseline conditions, the increase in abundance at the project site is unlikely to result in significantly increased risk of bird-aircraft strike hazard at vicinity airports.

6.2 New or Increased Movement Across Approach/Departure Paths

As shown in Figures 5 through 7, the vast majority of flights departing BHA travel south and then west from Runway 15 and do not cross over the airspace above the project site. Therefore, the primary way by which the project could affect aircraft strike hazard is to provide foraging and/or loafing/roosting habitat for bird species that would induce them to move across approach and departure paths for aircraft at BHA or WHP.

Species of concern would be migratory waterbirds that could use the detention ponds and wetlands for aquatic habitat and wetlands or turf areas for foraging. Because the project would include these various habitats, migratory birds may remain mostly on the project site and not travel back and forth to other locations. In general, birds that remain on the project site during their time in the region would pose minimal hazard to aircraft because they would not be repeatedly crossing approach/departure paths of aircraft at WHP or BHA. Migratory or itinerant birds that descend to occupy the project site would pose a threat during their initial movement and eventual departure from the project site. Those initial migratory/itinerant species movements to the project site would be seasonally limited and not repetitive, which lowers the risk to aircraft.

The scenario that provide greatest hazard to aircraft is if birds use the site for only part of their daily needs (e.g., only feeding, or only roosting/loafing, or only nesting). In those scenarios, birds may travel daily to and from another attractant such as Hansen Lake or Valhalla Cemetery, which could cause recurring flights across aircraft approach or departure paths. However, when following the departure routes listed in Table 4, aircraft at BHA climb at a minimum rate of approximately 450 to 600 feet elevation per nautical mile traveled. These climb rates are frequently exceeded, with climb rates of 900 feet elevation per nautical mile not unusual. Because of this, the chance for collision with birds transiting between local habitat locations (rather than migrating) becomes low to non-existent within 1 mile of the airport. For this reason, bird movement between the project site and Hansen Dam, or between the project site and the Hansen Spreading Grounds, is unlikely to substantially increase bird strike hazard for aircraft using BHA. Most of the attractants identified in the vicinity of BHA are to the north of the project site, and bird movements between the project and these sites would not cross approach or departure paths for BHA.

The one path that could present issues for BHA is bird movement between the project site and Valhalla Cemetery, 2 miles from the project site and immediately south of BHA Runway 15. Movements between these two locations would also potentially cross the approach path for Runway 8, which accommodates the majority of arriving flights. However, given the presence of turf areas within the proposed project and immediately adjacent to the east at Sun Valley Park that are similar to Valhalla Cemetery, it seems unlikely that birds would make frequent or extensive movements between the two locations because they would be able to access similar turf habitat without making that longer movement. Further, point count surveys conducted on and near BHA weekly for a full year in 2011–2012 included a point at Valhalla Cemetery, and waterfowl use of Valhalla Cemetery was not observed (Table 3). An incidental observation was made of one great blue heron at Valhalla Cemetery, and large wading birds such as that do pose high hazard to aircraft in a strike. However, the lack of observations of these larger species at Valhalla

Cemetery during point counts over that year suggests wading bird use of this area is low and attractants are not substantial.

Given the greater distance of the project from WHP (approximately 3 miles) and the lower flight activity, changes in abundance or movement patterns of bird species resulting from the Rory M. Shaw Wetlands Park are of less concern at WHP than at BHA. In addition, arriving and departing flights at WHP already travel directly over substantial bird attractants such as the Hansen Spreading Grounds and Hansen Dam. New flights of waterbirds or other birds to or from these attractants, if they occurred, would likely be pulling birds further from WHP and its flight paths.

In summary, the project is not expected to substantially increase the likelihood that bird species of concern for collision with aircraft will cross approach or departure paths of aircraft using BHA or WHP. The lack of bird-attracting features providing different habitat south and east of the project site, combined with the dominant approach and departure paths at BHA (Section 4.5) that provide extensive separation from the project site, among other evidence provided above, support this conclusion.

7 Design Details that Reduce the Attractiveness of the Project to Bird Species that Pose a Hazard to Aircraft

The following design details have been or will be incorporated into project design since the conceptual project design phase analyzed in the 2004 PEIR. These refinements and design details continue to reduce the attractiveness of various site elements to bird species that pose a threat to aircraft and ensure that the project impacts to airport safety from birds is less than significant, consistent with the 2004 PEIR. Any design details must be carefully balanced to not impair other project goals. Care also must be taken to avoid inducing birds to travel back and forth between habitat on the project site and other habitat elsewhere in the vicinity by eliminating one type of habitat while maintaining others (e.g., eliminating natural turf while retaining wetlands). These design details do not include harassment or lethal controls of birds on the project site. The frequency and intensity of harassment needed to substantially reduce bird occurrence would not be feasible or desirable on a public park site, and lethal control of bird species is also not desirable in this setting. Active harassment and lethal control measures would also be perceived as counter to one of the park goals of providing habitat for wildlife within the urban environment. For each of the design details presented below, alignment with project objectives is noted according to the objective numbers in Section 3.1.

7.1 Landscaping Details (Including Turf, Shrubs, and Trees)

Several bird species of concern for aircraft strikes are attracted to turf areas for foraging and loafing, including Canada geese, coots, gulls, and other waterbirds. To reduce the potential habitat value of turf areas to these species, the following design details may be considered; however, reducing the habitat value of turf areas could have the indirect effect of inducing waterfowl in the project site wetlands to fly to other turf areas in the vicinity. Therefore, any alterations to turf types or locations will be carefully considered to continue minimizing potential hazard to aircraft at BHA and WHP.

> *Design Detail 1:* Use artificial turf instead of natural turf – this is especially useful for sports fields, which are challenging to maintain in the arid Sun Valley area. Modern turf fields are durable and effective

replacements for natural turf, reduce water requirements, and reduce maintenance requirements associated with natural turf fields.

Aligns and interacts with Objective 2 (increase water conservation), Objective 3 (increase recreational opportunities), Objective 5 (improve water quality), and Objective 6 (provide additional environmental benefits).

Design Detail 2: Locate turf areas, especially natural turf, as far as feasible from water features. During the molting period when their flight capabilities are limited, resident waterbirds are more reluctant to move far from the safety of water. By placing new turf farther away, the site becomes less attractive to geese and other waterbirds for year-round use.

Aligns and interacts with Objective 3 (increase recreational opportunities) and Objective 5 (improve water quality).

Trees provide attractive nesting and roosting habitat for birds that pose a risk to aircraft, including raptors. While nesting and roosting passerines pose little hazard for aircraft except in larger flocks, a single raptor can have enough mass to cause substantial damage. Further, the foraging strategies of raptors, wherein they often circle on thermal air currents and gradually gain altitude, can put them in flight paths for extended periods. To minimize the attractiveness of trees on the project site to raptors, the following design measure to reduce prey abundance may be considered:

Design Detail 3: Limit presence of rodents and other raptor prey species on the project site through planting of turf species and other plants that are less preferable for burrowing species, targeted use of approved rodenticides, and maintenance of the project site.

Aligns and interacts with Objective 3 (increase recreational opportunities) and Objective 5 (improve water quality)

Landscaping adjacent to wetland and detention basins can substantially affect the attractiveness of the open water and wetland features for waterbirds and shorebirds. For example, the preferred habitat for Canada geese is a large, unobstructed lawn area close to open water.

Design Detail 4: Locate trees near the edges of water features; waterbirds such as geese and ducks require a long distance to take off and the trees can block that easy takeoff. Locating trees near wetland edges also increases real or perceived risk for bird species that could be preyed upon by perching raptors.

Aligns and interacts with Objective 4 (increase wildlife habitat) and Objective 6 (provide additional environmental benefits).

Within larger features like the proposed detention basin, this design detail would likely be less effective because the size of the feature would allow ample takeoff space even if trees were present. However, this would likely be effective surrounding the wetland feature because of less uninterrupted water surface.

7.2 Detention Pond Design Details

Various design details can be incorporated into the detention ponds to minimize attractiveness to hazardous wildlife species. Because the detention pond would be concrete lined on bottom and sides, measures to prevent growth of emergent vegetation are not needed. The design details that would apply include, but are not limited to the following:

> *Design Detail 5:* For the three-chambered design proposed, there should be at least a 0.5%–1% gradient from the first to second and second to third ponds, making sure that the outlet/control structure is at the absolute lowest point.
>
> Aligns and interacts with Objective 1 (reduce local flooding in the project area), Objective 2 (increase water conservation), and Objective 5 (improve water quality), and Objective 6 (provide additional environmental benefits).
>
> *Design Detail 6:* If an erosion mix is needed on the edges of the detention basin, use a vegetative mix that is not an attractive food source for waterfowl or other flocking birds (i.e., one that does not include high quantities of millet or clover).
>
> Aligns and interacts with Objective 1 (reduce local flooding in the project area), Objective 2 (increase water conservation), and Objective 5 (improve water quality), and Objective 6 (provide additional environmental benefits).

Fences can prevent geese and other waterbirds from walking from water to grazing areas. Vegetative cover such as shrubs or hedges also enhance the attractiveness and long-term effectiveness of barrier fences. Shrubs or hedges may block favored pathways of waterbirds or obstruct their line of sight, making the area less attractive because of the potential for attack from predators (Conover and Kania 1991). To be successful, a plant barrier must make waterbirds feel that if they are threatened, their ability to escape is reduced.

> *Design Detail 7:* Ensure that fences around water features have openings no larger than three inches, with height of at least 30 inches tall. The effectiveness of a barrier fence may be enhanced if landscaping modifications (e.g., Design Details 1, 4) are also used to prevent birds from being able to easily fly to and from the pond or wetland. Wrought iron fencing can be enhanced through attachment of finer materials such as woven wire, monofilament lines, stainless-steel wire, and other materials to reduce the size of openings. Fences are most effective during the pre-nesting period and during flightless periods in early summer when geese and other waterbirds have young or are molting.
>
> Aligns and interacts with Objective 5 (improve water quality), and Objective 6 (provide additional environmental benefits).

Installation of netting or overhead wires is not recommended for long-term use, because waterfowl and other birds can still see the open water and may come to investigate the area. The netting and wires also require frequent maintenance and can become an eyesore for the public.

7.3 Wetland Design Details

Islands are prime nesting sites for geese and other waterbirds, which prefer long, straight, uninterrupted shorelines well removed from heavy human traffic. These areas provide security and a good view of potential predators.

> *Design Detail 8:* Eliminate islands and peninsulas and modify uninterrupted shorelines with shrubs or boulders every 10 to 20 yards to reduce the wetland area's attractiveness to waterfowl and shorebirds. This technique should be used in combination with vegetation management of wetlands, because waterbirds may use shrubs or hedges as nesting sites if islands are not available.
>
> Aligns and interacts with Objective 1 (reduce local flooding in the project area), Objective 2 (increase water conservation), Objective 4 (increase wildlife habitat), Objective 5 (improve water quality), and Objective 6 (provide additional environmental benefits).
>
> *Design Detail 9:* Manipulate water levels to decrease habitat attractiveness. Increasing the water level in a wetland may flood preferred nesting areas such as islands and peninsulas. Conversely, reducing water levels (drawdowns) in wetlands may eliminate islands by joining them to the shore. Predators or humans may then gain access to the nesting areas, reducing the attractiveness of the site and thus successful nesting. These techniques are illegal if they are used during the nesting season with the intention to drown clutches of eggs.
>
> Aligns and interacts with Objective 1 (reduce local flooding in the project area), Objective 2 (increase water conservation), Objective 5 (improve water quality), and Objective 6 (provide additional environmental benefits).

7.4 Public Trail Design Details

The project design includes trails around wetland areas and detention ponds, which provides an opportunity for design that discourages accumulation of waterbirds and other hazardous wildlife.

> *Design Detail 10:* Prioritize placement of trails and walking paths near water. Geese and several other problem waterfowl prefer to rest or feed on grassy areas next to water. If jogging or walking paths are placed along a shoreline, waterbirds may be less likely to use the immediate area for feeding, nesting, or loafing. People should have easy access to all parts of the shoreline, and the walking path should be in place before the waterbirds become well established in the area.
>
> Aligns and interacts with Objective 3 (increase recreational opportunities), Objective 5 (improve water quality) and Objective 6 (provide additional environmental benefits).

Note that if citizens feed waterfowl or other wildlife on or near the paths, the effectiveness of this technique may be diminished or even reversed. This should be implemented in concert with public education and active prevention of feeding.

7.5 General Park Maintenance Details

Park maintenance is the most effective way to minimize attraction of gulls and other species that feed on human trash such as crows and ravens. Each of these species can pose threats to aircraft and are relatively common in the project vicinity.

> *Design Detail 11:* To prevent attraction of gulls and other species that feed on human trash, park maintenance should be sufficiently intensive and frequent to ensure that trash does not accumulate near picnic grounds or other places where people gather.
>
> Aligns and interacts with Objective 3 (increase recreational opportunities), Objective 4 (increase wildlife habitat), Objective 5 (improve water quality), Objective 6 (provide additional environmental benefits), and Objective 7 (increase multiple agency participation).

7.6 Public Education Details

If people are seen feeding wildlife within the park, park staff should take the opportunity to educate them on the risks the birds pose to aircraft in the vicinity, as well as the risks that human feeding poses to the birds. The following design detail will provide passive public education for when park staff are not present.

> *Design Detail 12.* Install signage discouraging feeding of birds and wildlife and explaining the reasons why (risk to aircraft, unhealthy for the birds, bird waste accumulation, etc.).
>
> Aligns and interacts with Objective 3 (increase recreational opportunities, Objective 5 (improve water quality), Objective 6 (provide additional environmental benefits), and Objective 7 (increase multiple agency participation).

MEMORANDUM

To:	Janea Russell, Principal Civil Engineering Assistant, Los Angeles County Public Works
From:	Michael Greene, Noise Technical Specialist, Dudek
Subject:	Noise Technical Memorandum for the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum
Date:	February 2022
Attachments:	A – Deep Dynamic Compaction Noise /Ground Borne Vibration Modeling Input/Output B – Off-Site Stockpiling, Staging, and Rock Crushing Noise / Ground Borne Vibration Modeling Input/Output C – On-Site Rock Crushing Noise / Ground Borne Vibration Modeling Input/Output D – Phase 3 Noise / Ground Borne Vibration Modeling Input/Output

The following memorandum presents the summary of the Noise Analysis conducted for the proposed Rory M. Shaw Wetlands Park Project.

1 Introduction

Dudek is pleased to submit this supplemental noise technical memorandum, to assist the Los Angeles County Public Works with environmental planning requirements to comply with the California Environmental Quality Act (CEQA), tiering from the previously certified 2004 Sun Valley Watershed Management Plan Program Environmental Impact Report. The currently proposed project is located in the City of Los Angeles community of Sun Valley within the City of Los Angeles, Los Angeles County (County), California.

The Los Angeles County Flood Control District adopted the Sun Valley Watershed Management Plan (SVWMP) and certified the SVWMP Program Environmental Impact Report (2004 PEIR) on June 29, 2004. In 2013, an addendum to the 2004 PEIR was prepared for two of the components (Strathern Pit component and a portion of the Storm Drain component) to address minor changes to the project. The addendum concluded that the project modifications would not result in any new significant effect on the environment that were not identified in the 2004 PEIR. The Strathern Pit project underwent a name change to the Rory M. Shaw Wetlands Park Project after the certification of the 2004 PEIR. Since the certification of the 2013 Addendum, the Rory M. Shaw Project (currently proposed project) has been further modified. New components associated with the currently proposed project occurring during Phase 2 construction include hauling, off-site staging, crushing, deep dynamic compaction, and passive methane treatment.

Additionally, the details of Phase 3 (Above-Ground Improvements) construction activities are analyzed in this Memorandum in further detail than previously assessed. Potential noise/vibration impacts resulting from an accelerated work schedule, and operations and maintenance activities, is addressed qualitatively. The currently proposed project excludes the storm drain system and recycled water line components of the 2013 Addendum.

The purpose of this memorandum is to evaluate whether the currently proposed project would result in new significant effects or an increase in the severity of previously identified significant effects related to noise. This memorandum also discusses changes with respect to circumstances under which the project will be undertaken and new information that has become available relative to noise that could change the impact conclusions in the 2004 PEIR and 2013 Addendum.

2 Project Setting and Project Description

Project Setting

The 46-acre project site is located in the community of Sun Valley within the City of Los Angeles, Los Angeles County, California. The project site is within the Sun Valley Watershed, a highly urbanized watershed that drains into the Los Angeles River. The Sun Valley Watershed is located approximately 14 miles northwest of downtown Los Angeles in the northeastern portion of San Fernando Valley, near the intersection of Interstate (I-) 5 and State Highway 170. Generally, the Sun Valley Watershed is approximately bordered by Tujunga Wash and Hansen Spreading Grounds on the west, Burbank-Glendale-Pasadena Airport on the east, Hansen Dam on the north, and Burbank Boulevard on the south. The watershed is approximately 2,800 acres (4.4 square miles) in size and is approximately 6 miles in length from north to south. Specifically, the project site is bounded by Strathern Street and single-family residential uses to the south; Tujunga Avenue, a truck stop, and industrial uses to the west; Roscoe Boulevard and recycling facilities to the north; and Fair Avenue, Sun Valley Park, and single-family residential uses to the east (Figure 1, Project Location).

The project site and surrounding areas were quarried for sand and gravel in the early- to mid-1900s with many of the pits subsequently converted to landfills. Strathern Pit, which occupies approximately 34.7-acres of the project site was permitted by the City of Los Angeles as an inert debris landfill in 1992. The project site is occupied with an exhausted gravel pit previously used as a landfill for inert materials. It was owned and operated by Los Angeles By-Products under a City of Los Angeles Department of Environmental Affairs solid waste facilities permit (Number 19-AR-1016). In October 2008, Los Angeles County Flood Control District became the property owners of the site and the site ceased all landfill operations.

Project Description

Similar to the Strathern Pit Project described in the 2004 PEIR (2004 project), the currently proposed project would involve the conversion of a 46-acre, non-operating inert construction debris landfill into a constructed wetlands park, that would provide flood control, habitat, recreation, and water quality enhancements to the Sun Valley community, including a 21-acre detention pond, 10 acres of wetlands, and 15 acres of recreational space. The Storm Drain Project component of the 2004 PEIR, which was included in the 2013 Project, is not included under the currently proposed project description.[1] Additionally, the recycled water line described in the 2013 Project would be completely removed in the currently proposed project.

[1] This is part of the 2020 Addendum for the Sun Valley Watershed Upper Storm Drain System Project.

The project site boundaries for the currently proposed project are the same as described in the 2013 Addendum. The inert landfill is located at the northeast corner of Tujunga Avenue and Strathern Street and consists mostly of concrete, dirt, rocks, and other construction debris waste.

Similar to the 2004 Project, the currently proposed project would capture stormwater runoff collected from upstream industrial drainage areas to alleviate flooding in the vicinity of the Tuxford Avenue and San Fernando Road intersection. The proposed design would provide a water conservation benefit through the reuse of stormwater. Runoff would be temporarily stored in a detention pond, routed through a wetlands for natural treatment of pollutants, and pumped into existing underground infiltration basins at the adjacent Sun Valley Park. The currently proposed project would provide up to 46 acres of recreational open space, including park land and wildlife habitat for the community. The proposed detention pond would have a footprint of approximately 21 acres and a maximum depth of 50 feet, with a total storage capacity of 385 acre-feet.

The proposed wetland would provide a sustainable habitat for various plant and animal species, and a natural water treatment system for removing pollutants from the collected stormwater runoff. The treated stormwater would be pumped to the existing Sun Valley Park infiltration basins for groundwater recharge.

The first phase of the currently proposed project, Site Investigations and Demolition, was completed in 2017. The currently proposed project would include DDC activities, on-site rock crushing and stockpiling, off-site stockpiling, staging, and rock crushing, hauling of excess materials, and the methane mitigation system, as described below:

Proposed Deep Dynamic Compaction and Hauling

The proposed DDC activities are intended towards achieving sufficient compaction to minimize chances of differential settlement on the site. The DDC method is not required, but is the recommended approach at this time. As such, this memorandum will analyze the DDC construction activities to ensure the potential environmental effects have been adequately addressed in the previous CEQA documentation. DDC uses principles of transforming potential energy to kinetic energy to densify ground through utilization of weights, supported by a crane, and free fall impact to the ground to increase the density of soil. Proposed DDC activities would require the use of a Manitowoc 1015 Crawler Crane or equivalent, a specially built crane for DDC operations with automated safety controls and 27-ton steel weight, mechanics service truck, an excavator or dozer, and water truck for dust control. The DDC activities would last approximately 4 years. The excess materials may also be hauled to several different waste management facilities depending on availability at the time of construction. These facilities include Sunshine Canyon Landfill, Waste Management Azusa Landfill Reclamation, NuWay Landfill and Kincaid Pit. For the purposes of this analysis, it was assumed that all excess material would be hauled to the farthest location (Kincaid Pit, 36 miles to the southeast) to conservatively estimate emissions associated with haul truck travel during construction. Approximately 550,000 cubic yards of materials would be hauled to these facilities. Proposed hauling, earthwork, and rough grading activities are anticipated to last four years, beginning in July 2023 and ending in December 2027.

Proposed On-Site Rock Crushing

On-site rock crushing is anticipated during Phase 2. Crushing would be accomplished with two sets of crushing equipment.

Proposed Off-Site Stockpiling, Staging, and Rock Crushing

The adjacent Penrose truck stop located at 8271 Tujunga Avenue would be utilized during Phase 2 of construction for stockpiling, staging, and/or crushing. The site is approximately 10 acres in size. The off-site location would be utilized for approximately 4 years.

Proposed Passive Methane System

Proposed above ground improvements would include a new passive methane treatment system, a component not included in the 2004 Project. Methane controls are required to prevent any surface and shallowing venting consistent with the provisions of local City of Los Angeles Municipal Ordinance No. 175790, Methane Seepage Regulations. These regulations require the installation of a methane mitigation system to prevent any potential intrusion of any residual gas into a proposed development's structure, in this case the north and south restroom facilities. The proposed passive methane treatment would be located along the northern and western property line and along the southern boundary of the existing concrete pad. The proposed passive methane treatment would consist of approximately 31 wells designed to prevent methane gas intrusion into the proposed aboveground structures and eight probes would be located along the southern boundary of the existing concrete pad which can be later converted to collector pipes if-needed. It is noted that the exact number of the wells is based on preliminary design and as such the number may be slightly different upon further design; however, a slight change in the number of wells would not alter the conclusions of this memorandum.

3 Noise and Vibration Terminology

Sound Pressure Levels and Decibels

The amplitude of a sound determines its loudness. Loudness of sound increases with increasing amplitude. Sound pressure amplitude is measured in units of micronewton per square meter, also called micropascal. One micropascal is approximately one-hundred billionth (0.00000000001) of normal atmospheric pressure. The pressure of a very loud sound may be 200 million micropascals, or 10 million times the pressure of the weakest audible sound. Because expressing sound levels in terms of micropascal would be very cumbersome, sound pressure level in logarithmic units is used instead to describe the ratio of actual sound pressure to a reference pressure squared. These units are called Bels. To provide a finer resolution, a Bel is subdivided into 10 decibels (dB).

A-Weighted Sound Level

Sound pressure level alone is not a reliable indicator of loudness. The frequency, or pitch, of a sound also has a substantial effect on how humans will respond. Although the intensity (energy per unit area) of the sound is a purely physical quantity, the loudness, or human response, is determined by the characteristics of the human ear.

Human hearing is limited not only in the range of audible frequencies, but also in the way it perceives the sound in that range. In general, the healthy human ear is most sensitive to sounds between 1,000 and 5,000 hertz[2], and it perceives a sound within that range as more intense than a sound of higher or lower frequency with the same magnitude. To approximate the frequency response of the human ear, a series of sound level adjustments is usually applied to the sound measured by a sound level meter. The adjustments (referred to as a weighting network) are frequency-dependent.

The A-scale weighting network approximates the frequency response of the average young ear when listening to ordinary sounds. When people make judgments about the relative loudness or annoyance of a sound, their judgments correlate well with the A-scale sound levels of those sounds. Other weighting networks have been devised to address high noise levels or other special situations (e.g., B-scale, C-scale, D-scale), but these scales are rarely used in conjunction with most environmental noise. Noise levels are typically reported in terms of A-weighted sound levels. All sound levels discussed in this report are A-weighted decibels (dBA). Examples of typical noise levels for common indoor and outdoor activities are depicted in Table 1.

Table 1. Typical Sound Levels in the Environment and Industry

Common Outdoor Activities	Noise Level (dB)	Common Indoor Activities
	110	Rock band
Jet fly over at 300 meters (1,000 feet)	100	
Gas lawn mower at 1 meter (3 feet)	90	
Diesel truck at 15 meters (50 feet), at 80 kilometers per hour (50 miles per hour)	80	Food blender at 1 meter (3 feet); garbage disposal at 1 meter (3 feet)

[2] The SI (International System of Units) unit of frequency, equal to cycles per second; thus, a vibration of 1,000 hertz is equivalent to 1,000 cycles per second.

Table 1. Typical Sound Levels in the Environment and Industry

Common Outdoor Activities	Noise Level (dB)	Common Indoor Activities
Noisy urban area, daytime; gas lawn mower at 30 meters (100 feet)	70	Vacuum cleaner at 3 meters (10 feet)
Commercial area; heavy traffic at 90 meters (300 feet)	60	Normal speech at 1 meter (3 feet)
Quite urban, daytime	50	Large business office; dishwasher next room
Quite urban, nighttime	40	Theater; large conference room (background)
Quite suburban, nighttime	30	Library
Quite rural, nighttime	20	Bedroom at night; concert hall (background)
	10	Broadcast/Recording studio
Lowest threshold of human hearing	0	Lowest threshold of human hearing

Source: Caltrans 2013a.

Under controlled conditions in an acoustics laboratory, the trained, healthy human ear is able to discern changes in sound levels of 1 dBA when exposed to steady, single-frequency signals in the mid-frequency range. Outside such controlled conditions, the trained ear can detect changes of 2 dBA in normal environmental noise. It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of 3 dBA. A change of 5 dBA is readily perceptible, and a change of 10 dBA is perceived as twice or half as loud. A doubling of sound energy results in a 3 dBA increase in sound, which means that a doubling of sound energy (e.g., doubling the volume of traffic on a road) would result in a barely perceptible change in sound level.

Noise Descriptors

Additional units of measure (i.e., noise metrics) have been developed to evaluate the long-term characteristics of sound. The equivalent sound level (L_{eq}) is also referred to as the time-average sound level. It is the equivalent steady-state sound level that in a stated period of time would contain the same acoustical energy as the time-varying sound level during the same time period. The 1-hour A-weighted equivalent sound level, $L_{eq(h)}$, is the energy average of the A-weighted sound levels occurring during a 1-hour period, and is the primary basis for the City of Los Angeles noise ordinance criteria for stationary sources. Additional noise metrics include the L_{max}, L_{min} (the maximum and minimum instantaneous noise levels, respectively) and L_n. The L_n noise metric represents the noise level equaled or exceeded "n" percent of the time. For example, L_{10} is the level equaled or exceeded 10% of the time.

People are generally more sensitive and annoyed by noise occurring during the evening and nighttime hours. Thus, another noise descriptor used in community noise assessments - the community noise equivalent level (CNEL) was introduced. The CNEL scale represents a time-weighted, 24-hour average noise level based on the A-weighted sound level. The CNEL accounts for the increased noise sensitivity during the evening hours (7 p.m. to 10 p.m.) and nighttime hours (10 p.m. to 7 a.m.) by adding 5 dBA and 10 dBA, respectively, to the average sound levels occurring during the evening and nighttime hours. The CNEL noise metric (or a similar noise metric the Day Night Level (L_{dn}[3]) is the basis for the City's standards for mobile source noise such as traffic and aircraft noise.

[3] L_{dn} (also known as DNL) is comparable to CNEL, except that there is no evening component: the period from 7 a.m. to 10 p.m. is classified as daytime, and no adjustment to the noise levels is made during these hours; the period from 10 p.m. to 7 a.m. is classified as nighttime and 10 decibels is added to the hourly L_{eq}s occurring during these hours.

Sound Propagation

Sound propagation (i.e., the passage of sound from a noise source to a receiver) is influenced by geometric spreading, ground absorption, atmospheric effects, and shielding by natural and/or built features.

Sound levels attenuate (or diminish) at a rate of approximately 6 dBA per doubling of distance from an outdoor point source due to the geometric spreading of the sound waves. Atmospheric conditions such as humidity, temperature, and wind gradients can also temporarily either increase or decrease sound levels. In general, the greater the distance the receiver is from the source, the greater the potential for variation in sound levels due to atmospheric effects. Additional sound attenuation can result from built features such as intervening walls and buildings, and by natural features such as hills and dense woods.

Ground Borne Vibration Fundamentals

Ground borne vibration is a small, rapidly fluctuating motion transmitted through the ground, and can be described in terms of displacement, velocity, or acceleration. Displacement is the distance that a point on a surface moves away from its original static position; vibration velocity is the instantaneous speed that a point on a surface moves; and acceleration is the velocity's rate of change. Each of these descriptors can be used to correlate vibration to environmental effects such as human response and building damage.

In contrast to airborne noise, ground borne vibration is not a common environmental problem. Some common sources of ground borne vibration are construction activities such as blasting, pile driving, and operating heavy earth-moving equipment. Trains and similar rail vehicles can also produce vibration. It is unusual for vibration from sources such as buses and trucks to be perceptible, because these vehicles travel on rubber tires and have relatively soft suspensions.

In quantifying vibration, the peak particle velocity (ppv) is most frequently used to describe vibration impacts and is typically measured in inches per second (in/sec). Vibration levels may also be presented and discussed in terms of dB relative to one microinch per second (abbreviated as VdB). A comparison of common ground borne vibration levels, in terms of VdB, is shown in Figure 2. As shown in Figure 2, the threshold of perception is approximately 65 VdB. Typical background vibration levels are between 50 and 60 VdB, and the level for minor cosmetic damage to fragile buildings or blasting generally begins at 100 VdB, which is equivalent to approximately 0.42 inches per second in terms of PPV (FTA 2018).

The strength of ground borne vibration attenuates fairly rapidly over distance. Some soil types transmit vibration quite efficiently; other types (primarily sandy soils) do not. Typically, ground borne vibration generated by humans attenuates rapidly with distance from the source of the vibration. Manmade vibration problems are usually confined to relatively short distances (approximately 500 to 600 feet or less) from the source (FTA 2018).

The calculation to determine PPV at a given distance is as follows:

$$PPV_{equip} = PPV_{ref}*(25/D)^{1.5}$$

Where:
PPV_{equip} = the peak particle velocity in inches per second of the equipment adjusted for distance
PPV_{ref} = the reference vibration level in inches per second at 25 feet
D = the distance from the equipment to the receiver

Common Groundborne Vibration Levels

Rory M. Shaw Wetlands Park Project Supplemental Noise and Vibration Memorandum

DUDEK

4 Purpose and Methodology

Purpose

The purpose of this memorandum is to assess whether the noise impacts of the currently proposed project are consistent with the approved 2004 PEIR and the 2013 Addendum and whether any additional documentation is required under CEQA. CEQA Guidelines Section 15152(f)(3) provides that significant environmental effects have been adequately addressed in a previous program EIR if the lead agency determines that such effects:

> *"Have been mitigated or avoided as a result of the prior environmental impact report and findings adopted in connection with that prior environmental report; or*
>
> *Have been examined at a sufficient level of detail in the prior environmental impact report to enable those effects to be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the approval of the later project."*

Methodology

Deep Dynamic Compaction

The currently proposed project would include Deep Dynamic Compaction (DDC). This process constitutes the only on-site construction activity during Phase 2 with potential impacts which could differ from the findings of the prior noise analyses. For analysis of DDC activity noise, a spreadsheet model based upon the Federal Highway Administration's Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate noise levels at nearby noise-sensitive land uses. Input variables for the RCNM consist of the receiver/land use types, the equipment type and number of each (e.g., one crane, one dozer, etc.), the duty cycle for each piece of equipment (i.e., percentage of hours the equipment typically works per day), and the distance from the sensitive noise receptor. The RCNM has default duty-cycle values for the various pieces of equipment, which were derived from an extensive study of typical construction activity patterns. Those default duty-cycle values were used for this noise analysis. The construction equipment assumptions for the DDC activities as described in Section 2 were used for the RCNM construction noise model. The model also accounts for acoustical shielding provided by the over excavation work. As shown in the grading plans (Sheets GR-3, GR-4 and GR-8) (Psomas 2019a), DDC work would take place at an elevation of 739 feet, whereas the elevation at the project's right-of-way is approximately 795 feet. Acoustical shielding was calculated using the horizontal and vertical distances from nearby noise-sensitive land uses to the near, far, and middle portions of the DDC activity areas using standard equations for barrier insertion loss (Beranek 1992).

Potential ground borne vibration impacts were assessed using the guidance and methodology for construction activities of the Federal Transit Administration's *Transit Noise and Vibration Impacts Guidance Manual* (FTA 2018), as well as source material (reference levels) for DDC activities from others (i.e., Woodward-Clyde 1995, URS 2019).

Project-Related Construction Vehicles (On-Road)

Potential impacts from off-site construction vehicles (worker and vendor vehicles, and haul trucks) as estimated based upon information provided by Los Angeles County Public Works and the California Emissions Estimator Model (CalEEMod) Version 2020.4.0 were assessed by comparing the estimated number of these vehicles to the existing

daily traffic volumes, as provided in the 2004 PEIR Traffic and Transportation Section (Section 4.11). Based upon the fundamentals of acoustics, a doubling (a 100 % increase) would be needed to result in a 3 decibel increase in noise levels, which is the level corresponding to an audible change to the typical human listener (Caltrans 2013a).

On-Site Rock Crushing, Off-Site Stockpiling, Staging, and Rock Crushing and Phase 3 Construction Activities

The analysis of on-site rock crushing, off-site stockpiling, staging and rock crushing noise as well as noise from Phase 3 (Above-Ground Improvements) activities used a similar method as described above for DDC noise; a spreadsheet model based upon the Federal Highway Administration's Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate noise levels at nearby noise-sensitive land uses. The analyses used information provided by the Los Angeles County Public Works regarding type and number of equipment. Potential ground borne vibration impacts were assessed using the guidance and methodology for construction activities of the Federal Transit Administration's *Transit Noise and Vibration Impacts Guidance Manual* (FTA 2018).

Passive Methane Treatment System Operation

Potential impacts associated with operation of the proposed Passive Methane Treatment System were assessed by reviewing the details (plans and reports) associated with the system.

5 Impacts Analysis

The 2004 PEIR's assessment of on-site construction activities noise was documented in Section 4.8.4.1 (Construction Impacts). Based upon the analysis, potentially significant noise impacts would occur for all phases of the project except Tree Planting and Mulching. With implementation of mitigation measures N-1 through N-4 (detailed in Section 6, Mitigation Measures), construction-related noise impacts were determined to be less than significant. The 2004 PEIR's assessment of noise from on-site operation was documented in Section 4.8.4.2 (Operational Impacts). Based upon the analysis, it was determined that noise from project operation would be less than significant; therefore, no mitigation was proposed for operational noise. The 2013 Addendum determined no changes to the 2004 PEIR with regards to noise were necessary for the 2013 Project, and thus, was not discussed in the 2013 Addendum.

Potential noise and vibration impacts associated with the currently proposed project are limited to the DDC activities, construction crew and vendor vehicles, haul trucks, and the Passive Methane Treatment System. Each of these is addressed below.

5.1 DDC Activities

Noise

Noise from the DDC activities was assessed for the nearest noise-sensitive land uses (residences to the south of the project site approximately 210 feet away, on the south side of Strathern Street), as well as the soccer complex to the west approximately 270 feet away, Sun Valley Park and residences to the east approximately 700 feet away, and the elementary school to the southwest approximately 1,000 feet away. For each of these receivers, noise levels from DDC activities was estimated for the times during construction when the equipment would operate at the work areas nearest to the receivers, farthest from the receivers, as well as the approximate middle portion of

the project site. The detailed input and output data of the DDC noise analysis are provided in Attachment A, and the results are summarized in Table 2. As summarized in Table 2, DDC activities would be highest (57 dBA L_{eq}) at the residences south of the project site and at the soccer complex, during the times when work would occur near the southern and southwesterly project boundaries, respectively. Brief maximum noise levels would be 63 to 64 dBA L_{max} during these times. At the elementary school, noise levels would be approximately 35 dBA L_{eq}, with maximum noise levels of approximately 43 dBA L_{max}. When DDC activities take place at locations on-site that are further from the nearest boundaries, the noise levels from these activities would be lower. As shown in Table 2, estimated noise levels from DDC activities would be well below the worst-case construction noise levels estimated for the proposed project in the 2004 PEIR. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the Strathern Pit project component from the two noisiest pieces of equipment (trucks). Additionally, the estimated noise levels would be lower than the ambient noise levels cited in the 2004 PEIR from previous noise monitoring, which ranged from 64 to 72 dBA L_{eq}. Therefore, the proposed DDC activities would not result in a substantial noise increase. Furthermore, the DDC activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. At the nearest school, the noise associated with the DDC activities would be well below the LAUSD's 67 dBA noise standard. **Thus, noise from the proposed DDC activities would not result in new significant impacts. No additional mitigation measures (beyond those contained in the 2004 PEIR and as included below in Section 5) would be necessary.**

Table 2. DDC Activities Noise Summary

Case Description	Residences to the South		Soccer Complex to the West		Sun Valley Park and Residences to the East		School to the Southwest	
	L_{eq} (dBA)	L_{max} (dBA)	L_{eq} (dBA)	L_{max} (dBA)	L_{eq} (dBA)	L_{max} (dBA)	L_{eq} (dBA)	L_{max} (dBA)
Deep Dynamic Compaction Noise Total - Nearest Work Area	57	63	57	64	46	53	35	43
Deep Dynamic Compaction Noise Total - Mid-Work Area	51	58	53	60	48	55	33	41
Deep Dynamic Compaction Noise Total - Furthest Work Area	48	54	50	56	48	54	31	39

Source: Attachment A

Ground Borne Vibration

Similarly to the noise assessment, ground borne vibration levels were estimated for the proposed DDC activities for the nearest noise-sensitive land uses (residences to the south of the project site, on the south side of Strathern Street), as well as the soccer complex to the west, Sun Valley Park and residences to the east, and the elementary school to the southwest using the FTA methodology for construction (see Section 4). The detailed input and output data of the DDC vibration analysis are provided in Attachment A, and the results are summarized in Table 3. As summarized in Table 3, ground borne vibration during DDC activities would be highest (0.1288 inches per second)

at the residences south of the project site, during the times when work would occur near the southern project boundary. Worst-case vibration levels at the soccer complex to the west of the project site would be slightly less, at 0.0883 inches per second; at the Sun Valley Park and the residences to the east the worst-case vibration levels would be less as well, at 0.0212 inches per second; and at the elementary school to the southwest, worst-case vibration levels of 0.0124 inches per second are estimated. When DDC activities take place at locations on-site that are further from the nearest boundaries, the vibration levels from these activities would be lower. As shown in Table 3, estimated vibration levels from DDC activities would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). **Thus, ground borne vibration from the proposed DDC activities would not result in new significant impacts. No additional mitigation measures are required.**

Table 3. DDC Activities Vibration Summary

Equipment	Residences to the South	Soccer Complex to the West	Sun Valley Park and Residences to the East	School to the Southwest
	PPV_{equip} (inches/sec)			
Nearest DDC Work Area	(210 feet away)	(270 feet away)	(700 feet away)	(1,000 feet away)
DDC Drop	0.1288	0.0883	0.0212	0.0124
Crane (used Lg. Bulldozer)	0.0034	0.0024	0.0006	0.0003

Dozer	0.0032	0.0023	0.0006	0.0003

Source: Attachment A
PPVequip = PPVref x (25/D)^1.5

5.2 Project-Related Construction Vehicles (On-Road)

Noise

Based upon information provided by the Los Angeles County Public Works, during construction the highest average daily number of worker round-trips would be 74, occurring during multiple phases including DDC activities. The highest average daily number of vendor one-way trips would be 12, occurring during demolition; and the highest number of average daily haul truck one-way-trips would be 75, occurring during the hauling of excess materials. Based upon Table 4.11-11 of the 2004 PEIR, the nearest roadways from the project site (Tujunga Avenue and Strathern Street) have average daily traffic volumes of 15,000 and 12,000, respectively. The incremental increase in local traffic from the project would be less than 1% on both Tujunga Avenue and Strathern Street. Based upon the fundamentals of acoustics, a doubling (a 100 % increase) would be needed to result in a 3 decibel increase in noise levels, which is the level corresponding to an audible change to the typical human listener (Caltrans 2013a). The resultant traffic noise increase would be less than 1 dB, and thus would not result in an audible change on an hourly or daily basis.

If an accelerated work schedule is enacted, approximately 120 truck trips per day are anticipated. Although this would represent an increase compared to the non-accelerated schedule, the number of worker and truck trips would still be relatively low compared to existing traffic volumes and would amount to an incremental increase of 1% or less on both Tujunga Avenue and Strathern Street. As described above, a 100 % increase would be needed

to result in an audible change to the typical human listener. The resultant traffic noise increase would be less than 1 dB and would not result in an audible change on an hourly or daily basis.

Therefore, noise related to project-related construction vehicles on local roadways would not result in new significant impacts. No additional mitigation measures are required.

Ground Borne Vibration

As discussed above for noise from project-related on-road construction vehicles, the increase in local traffic would be negligible. Traffic, including heavy trucks traveling on a highway or local roadway, rarely generates vibration levels high enough to cause structural or cosmetic damage. Heavy trucks traveling over potholes or other discontinuities in the pavement can result in vibration levels high enough to result in annoyance (Caltrans 2013b); however, these types of issues may be resolved by smoothing the roadway surface. The proposed project is estimated to result in approximately 75 additional truck one-way trips per day on the local roadways, or approximately 120 truck one-way trips per day if an accelerated work schedule is utilized, which would be negligible based upon the existing traffic volumes. **Therefore, vibration related to project-related construction vehicles on local roadways would not result in new significant impacts. No additional mitigation measures are required.**

5.3 Off-Site Stockpiling, Staging, and Rock Crushing

Noise

Noise from the off-site stockpiling, staging and rock crushing was assessed for the nearest noise-sensitive land uses (residences to the west of the off-site location, approximately 1,100 feet away). Other noise-sensitive receivers would be even further from these activities and therefore, potential noise impacts would be lower. The detailed input and output data of the off-site construction noise analysis are provided in Attachment B, and the results are summarized in Table 4. As summarized in Table 4, off-site construction activities would be approximately 67 dBA L_{eq} at the nearest residences, west of the project site, predominantly when rock crushing takes place. Brief maximum noise levels would be 68 dBA L_{max} during these times. As shown in Table 4, estimated noise levels from off-site stockpiling, staging and rock crushing activities would be below the worst-case construction noise levels estimated for the 2004 Strathern Pit project. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the Strathern Pit project component from the two noisiest pieces of equipment (trucks). Furthermore, the off-site construction activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. **Thus, noise from the proposed off-site construction activities would not result in new significant impacts. No additional mitigation measures (beyond those contained in the 2004 PEIR and as included below in Section 6) would be necessary.**

Table 4. Off-Site Activities Noise Summary

Case Description	Equipment Type	Nearest Receptors - Residences to the West	
		L_{eq} (dBA)	L_{max} (dBA)
Off-site stockpiling, staging and rock-crushing	Scraper	52	56

	Backhoe	46	50
	Rock Crushers (2)	67	68
	Generator	43	44
	Combined Noise Level	67	68

Source: Attachment B

Ground Borne Vibration

Similarly to the noise assessment, ground borne vibration levels were estimated for the proposed off-site construction activities for the nearest sensitive land uses (residences to the west of the project site, approximately 1,100 feet away) using the FTA methodology for construction (see Section 4). The detailed input and output data of the off-site construction vibration analysis are provided in Attachment B, and the results are summarized in Table 5. As summarized in Table 5, ground borne vibration levels from off-site construction would be quite low (0.0007 inches per second) at the nearest vibration-sensitive uses, because of the large distance from the proposed off-site work area to the residences to the west. As shown in Table 5, estimated vibration levels from DDC activities would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). **Thus, ground borne vibration from the proposed off-site construction activities would not result in new significant impacts. No additional mitigation measures are required.**

5.4 On-Site Rock Crushing

Noise

Noise from the on-site rock crushing[4] was assessed for the nearest noise-sensitive land uses (the same receivers assessed for the DDC activities noise). Other noise-sensitive receivers would be even further from these activities and therefore, potential noise impacts would be lower. The detailed input and output data of the on-site construction noise analysis are provided in Attachment C, and the results are summarized in Table 6. As summarized in Table 6, on-site construction activities would be approximately 71 dBA L_{eq} at the nearest receivers (residences to the south and the soccer complex to the west). Brief maximum noise levels would be 72 dBA L_{max}. As shown in Table 6, estimated noise levels from on-site rock crushing activities would be below the worst-case construction noise levels estimated for the proposed project in the 2004 PEIR. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the Strathern Pit project component from the two noisiest pieces of equipment (trucks). Furthermore, the on-site construction activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. **Thus, noise from the proposed on-site rock-crushing activities would not result in new significant impacts. No additional mitigation measures (beyond those contained in the 2004 PEIR and as included below in Section 6) would be necessary.**

Table 6. On-Site Rock Crushing Activities Noise Summary

On-Site Rock Crushing	71	72	71	72	69	70	64	65

Source: Attachment C

Ground Borne Vibration

Similarly to the noise assessment, ground borne vibration levels were estimated for the proposed on-site rock-crushing activities for the nearest sensitive land uses (the same receivers assessed for the DDC activities vibration). The detailed input and output data of the on-site construction vibration analysis are provided in Attachment C, and the results are summarized in Table 7. As summarized in Table 7, ground borne vibration levels from on-site construction would be quite low (0.0013 inches per second or less) at the nearest vibration-sensitive uses, because of the large distances from the proposed crushing activities to the receivers. As shown in Table 7, estimated vibration levels from on-site rock crushing would be well below the recommended FTA significance threshold of 0.5

[4] Although the exact location of the rock crushing equipment is not known at this time, the current plans indicate that rock crushing would take place in the central portion of the project site in the early stages of construction; in Stage 3, rock crushing equipment would be moved to the north. The analysis used the worst-case distances (with the rock crushing equipment located in the approximate center of the project site).

inches per second (URS 2019). **Thus, ground borne vibration from the proposed on-site crushing activities would not result in new significant impacts. No additional mitigation measures are required.**

5.5 Phase 3 (Above-Ground Improvements)

Noise

Noise from the construction activities associated with Phase 3 was assessed for the nearest noise-sensitive land uses (residences to the south of the project site, on the south side of Strathern Street), as well as the soccer complex to the west, Sun Valley Park and residences to the east, and the elementary school to the southwest, similarly to the DDC activities noise analysis. The detailed input and output data of the Phase 3 noise analysis are provided in Attachment D, and the results are summarized in Table 8. As summarized in Table 8, Phase 3 activities would be highest (74 dBA L_{eq} and 73 dBA L_{eq}) at the residences south of the project site and at Sun Valley Park and residences to the east, wetlands grading would occur at the nearest respective boundaries. Brief maximum noise levels would be 76 to 75 dBA L_{max} during these times. When Phase 3 activities take place at locations on-site that are further from the nearest boundaries, the noise levels from these activities would be lower. At the elementary school, approximately 1,000 feet southwest of the project site, noise levels would be approximately 40 to 55 dBA L_{eq}, with maximum noise levels of approximately 57 dBA L_{max}. As shown in Table 8, estimated noise levels from Phase 3 activities would be below the worst-case construction noise levels estimated for the proposed project in the 2004 PEIR. Table 4.8-6 (Estimated Un-Mitigated Construction Noise by Project Component) of the 2004 PEIR listed a noise level of 81 dBA L_{eq} at the nearest sensitive receptor for the Strathern Pit project component from the two noisiest pieces of equipment (trucks). Furthermore, the Phase 3 activities noise would not exceed the City of Los Angeles construction noise standard of 75 dBA L_{eq}, and the work would take place within the permitted hours of 7 a.m. and 9 p.m. on weekdays, 8 a.m. to 6 p.m. on Saturdays, and would not occur on Sundays or national holidays. At the nearest school, the noise associated with the Phase 3 activities would be well below the LAUSD's 67 dBA noise standard. **Thus, noise from the proposed Phase 3 activities would not result in new significant impacts. No additional mitigation measures (beyond those contained in the 2004 PEIR and as included below in Section 6) would be necessary.**

Ground Borne Vibration

Similarly to the noise assessment, ground borne vibration levels were estimated for the proposed Phase 3 activities for the nearest noise-sensitive land uses (residences to the south of the project site, on the south side of Strathern Street), as well as the soccer complex to the west, Sun Valley Park and residences to the east, and the elementary school to the southwest using the FTA methodology for construction (see Section 4). The detailed input and output data of the Phase 3 vibration analysis are provided in Attachment D, and the results are summarized in Table 9. As summarized in Table 9, ground borne vibration during Phase 3 activities would be highest (0.0037 inches per second) at the residences south of the project site, during detention pond and wetlands site preparation and grading activities. Worst-case vibration levels at the soccer complex to the west of the project site; at the Sun Valley Park and the residences to the east would be lower. As shown in Table 9, estimated vibration levels from Phase 3 construction activities would be well below the recommended FTA significance threshold of 0.5 inches per second (URS 2019). **Thus, ground borne vibration from the proposed Phase 3 activities would not result in new significant impacts. No additional mitigation measures are required.**

Table 9. Phase 3 Construction Activities Vibration Summary

5.6 Passive Methane Treatment System Operation

Noise

Based upon documents provided for the Passive Methane Treatment System (Psomas 2019b, SCS Engineers 2020), the proposed system would be entirely passive, consisting of pipes and vents. No fans, pumps or motors would be used as part of the system. Thus, no mechanical noise would be produced by the Passive Methane Treatment System. **Operation of the Passive Methane Treatment System would not result in new significant impacts. No additional mitigation measures are required.**

Ground Borne Vibration

As discussed above, the proposed system would be entirely passive, consisting of pipes and vents. No fans, pumps or motors would be used as part of the system. **Thus, operation of the Passive Methane Treatment System would not result in new significant impacts. No additional mitigation measures are required.**

5.7 CEQA Guidelines Section 15162

Pursuant to the requirements of Section 15162 of the State CEQA Guidelines, the following conditions would require recirculation of an EIR (i.e., a Subsequent EIR):

- New or Substantially More Severe Significant Impacts due to Project Modifications
- New or Substantially More Severe Significant Impacts due to Altered Circumstances
- New or Substantially More Severe Significant Impacts due to New Information
- New or Previously Infeasible Mitigation or Alternatives would Reduce Significant Effects

Based upon the noise and vibration analyses as described previously, the currently proposed project would not result in new or substantially more severe impacts due to project modifications, altered circumstances, or new information. The noise and vibration levels from the proposed DDC activities were assessed and were found to not result in new significant impacts. No additional mitigation measures (beyond those contained in the 2004 PEIR and as included below in Section 6) would be necessary. Additionally, noise and vibration from project-related construction vehicles, off-site stockpiling, staging and rock crushing, on-site stockpiling, staging and rock crushing, above-ground improvements (i.e., Phase 3) activities, and the passive methane treatment system were analyzed and were found to not result in new significant impacts. No new mitigation measures would be necessary, and no previously infeasible mitigation or alternatives would be necessary to reduce significant effects.

Since certification of the 2004 PEIR and the 2013 Addendum, updates to the State CEQA Guidelines have gone into effect. One of the updates involves incorporating the findings of a court case (California Building Industry Association v. Bay Area Air Quality Management District. (2015) 62 Cal.4th 369), which specifies that CEQA generally requires analysis of the effects of a project on the environment, as opposed to the effects of the environment on a project (State CEQA Guidelines Section 15126.2). As such, some of the analysis in the noise section of the EIR is no longer applicable under the revised State CEQA Guidelines. Specifically, noise from the proposed on-site uses experienced by on-site visitors to the project site would no longer be considered impacts on the environment. Because no significant, unavoidable impacts were identified for these categories, impact determinations would not change as a result of the CEQA revisions that have occurred since certification of the 2004 PEIR.

Aside from updates to the State CEQA Guidelines, no new regulations have been adopted or updated that would affect the noise analysis or conclusions originally presented in the 2004 PEIR.

Therefore, the currently proposed project does not meet any of the conditions for recirculation under Section 15162 of the State CEQA Guidelines with regards to noise or groundborne vibration.

6 Mitigation Measures

Construction

The following mitigation measures from the 2004 PEIR were required for the project as originally proposed and will continue to be required for the currently proposed project.

N-1 Construction activities will be limited to the hours allowed by the City of Los Angeles Noise Ordinance (i.e., between 7 a.m. and 9 p.m. on weekdays and between 8 a.m. and 6 p.m. on Saturdays and national holidays) unless written permission has been obtained from the City of Los Angeles Board of Police Commissioners per Section 41.40 of the Los Angeles Municipal Code.

N-2 All mobile construction equipment will be equipped with properly operating mufflers or other noise reduction devices.

N-3 For discrete project component sites, businesses and residences immediately adjacent to the construction site will be notified prior to the start of construction, e.g., via flyers. A toll-free number for noise complaints will be included in this notification.

N-4 Prior to the start of construction of the project components, the construction contractor will develop a site-specific noise mitigation plan based on an updated estimate of construction equipment and schedule for each project component. The objective of the mitigation plans will be to reduce noise levels to 75 dBA at the nearest residence and 67 dBA at school sites during project construction. The mitigation plans will identify potential mitigation measures, including installation of sound walls, sound curtains, and other temporary noise barriers; selection of quieter construction procedures and /or equipment, and noise monitoring to verify adherence to the identified mitigation measures. Additional mitigation measures for construction at school sites (i.e., Roscoe Elementary School, Stonehurst Elementary School, and Sun Valley Elementary School) will include the following: scheduling the noisier phases of construction on Saturdays,

school vacation periods, and/or after regular class hours but before 9 p.m. as feasible; and maintaining ongoing communications with the schools' administrators to address any construction noise related issues. Coordination with St. Patrick's School will also be conducted prior to the installation of storm drains near this location.

Operation

The noise analysis for the 2004 PEIR, determined that operational noise would be less than significant; therefore, no mitigation measures were necessary or proposed for operational noise. The 2013 Addendum determined no changes to the 2004 PEIR with regards to noise were necessary for the 2013 Project, and thus, was not discussed in the 2013 Addendum. Long-term operational activities associated with the currently proposed project would be similar (e.g., maintenance, visitors) to those described in the 2004 PEIR. Therefore, no new or different operational impacts would occur above and beyond those identified in the 2004 PEIR. **Under the currently proposed project (and specifically with regard to operation of the Passive Methane Treatment System), no operational mitigation measures are required.**

Rory M. Shaw Wetlands Park - DDC Vibration Calculations

Calculate Groundborne Vibration using FTA Noise and Vibration Manual guidar

Back-Calculation from 85 foot reference distance to 25 foot reference distance

Input			Ouput
Equipment	**PPV_{ref} (inches/sec)**	**D (feet)**	**PPV_{equip} (inches/sec)**
DDC Drop	0.5	25	3.1346

PPVequip = PPVref x (85/D)^1.5

Comparison: Back-Calculation from 230 foot reference distance to 25 foot refer

Input			Ouput
Equipment	**PPV_{ref} (inches/sec)**	**D (feet)**	**PPV_{equip} (inches/sec)**
DDC Drop	0.1	25	2.7905

PPVequip = PPVref x (230/D)^1.5

Conclusion: Good to see that these two independent tests do not differ dramatically. Use slightly more conservative URS figure; also, more current and site-specific

Trip Generation Analysis and Transportation Consistency Analysis

605 THIRD STREET
ENCINITAS, CALIFORNIA 92024
T 760.942.5147 F 760.632.0164

MEMORANDUM

To:	Janea Russell, Los Angeles County Department of Public Works
From:	Dennis Pascua, Transportation Services Manager Sabita Tewani, AICP, Transportation Planner
Subject:	Trip Generation, Transportation Consistency Analysis, and VMT Assessment for Rory M. Shaw Wetlands Park Project
Date:	February 2022
Attachments:	A – Table 4.11-36, Construction Traffic – Strathern Pit; and, Table 4.11-37, Construction Traffic Impacts – Streets in the Vicinity of Strathern Pit (from PEIR) B – Chapter 4.11.6, Mitigation Measures (Transportation) (from PEIR) C – Table 4.11-52, Operation Traffic – Strathern Pit; and, Table 4.11-53, Operation Traffic Impacts – Streets in the Vicinity of Strathern Pit (from PEIR) D – Excerpts from LA County Parks and Recreation Needs Assessment Report for the City of LA Sun Valley-La Tuna Canyon

The following memorandum presents a trip generation analysis and vehicle miles traveled (VMT) assessment per Senate Bill (SB) 743 of the (temporary) peak construction periods of Phases 2 and 3 (Phase 1 has already been completed) of the proposed Rory M. Shaw Wetlands Park project (currently proposed project).

1 Introduction

This analysis compares the currently proposed project's trip generation estimates with those reported and analyzed for the Strathern Pit project (now, known as the Rory M. Shaw Wetlands Park project) in the *Sun Valley Watershed Management Plan (SVWMP), Program Environmental Impact Report* (referred herein as "2004 PEIR"), herein referred to as the 2004 Project. Additionally, per SB 743 and California Environmental Quality Act (CEQA), this memorandum also includes a VMT assessment of the currently proposed project.

Furthermore, in 2013, an addendum to the 2004 PEIR was prepared for two of the components (Strathern Pit component and a portion of the Storm Drain component) to address minor changes to the project. The certified addendum, concluded that the 2013 project modifications, herein referred to as the 2013 Project, which were approved at the time of certification of the 2013 Addendum on October 8, 2013, would not result in any new significant effects on the environment that were not identified for the 2004 Project.

The Strathern Pit project (also known as the Strathern Wetlands Park Project) underwent a name change to the Rory M. Shaw Wetlands Park Project after the certification of the PEIR[1]. In addition, a consistency analysis of Phases

[1] The Los Angeles County Flood Control District, as lead agency, certified the Sun Valley Watershed Management Plan Program Environmental Impact Report on June 29, 2004 and adopted the Sun Valley Watershed Management Plan.

2 and 3 of the currently proposed project compared to the previously approved Strathern Pit project in the certified 2004 PEIR and 2013 Addendum, was conducted in terms of potential construction-related traffic impacts and required mitigation measures as required per CEQA Sections 15162 and 15164. Additionally, the analysis also includes a VMT analysis subsequent to the adoption of SB 743 and CEQA Section 15064.3 that updated the metric of transportation impact from level of service (LOS) and automobile delay to VMT. Under the new guidelines, VMT has been adopted as the most appropriate measure of transportation impacts under CEQA and the guidelines are in effect statewide since July 1, 2020. However, as shown in the analysis, the current project would have a less than significant VMT impact and not require any new mitigation measures.

From a trip generation perspective, the (permanent) operational and maintenance traffic associated with the currently proposed project is anticipated to be the same as (i.e., unchanged from) the operational phase of the Strathern Pit project analyzed in the 2004 Project. Therefore, additional transportation analysis of the currently proposed project's operations phase will not be required. Additionally, no traffic impacts were identified in the 2013 Addendum because the short-term construction duration (less than 10 days) of the 1,200 feet transfer pipeline of the revised alignment of the stormwater drain was determined to have less than significant impacts to traffic.

2 Project Description

Since the approval of the 2013 Project and certification of the 2013 Addendum, the boundary of the Rory M. Shaw Project has not changed however some of the aboveground components of the currently proposed project have been slightly altered in location. The currently proposed project would include the following new components: Deep Dynamic Compaction (DDC) over the detention basin footprint; the hauling of excess materials offsite; addition of a passive methane treatment system; a crushing component; and off-site staging, stockpiling, and crushing. Additionally, the currently proposed project excludes the storm drain system and recycled water line components of the 2013 Approved Project. Below are the components of the currently proposed project split into their Phase 2 and Phase 3 construction periods:

2.1 Phase 2

Based on the assumed construction schedule scenario used in modeling for the air quality, greenhouse gas, and noise analyses, the construction of Phase 2 would start in December 2022 and end in April 2027, and contain the following components:

- **Mobilization**: Mobilization would involve the movement to and from the site of earthmoving, crushing, concrete demolition, transportation, and other supporting equipment required to enable construction at the project site. Deep Dynamic Compaction (DDC) equipment would also need to be mobilized during the compaction operations.

- **Demolition**: This component would include the demolition of existing utilities, including gas, water, electricity, and telecommunication lines. Existing sewer laterals and water service lines would be abandoned. Concrete vaults and existing above ground conduits/pipes, a portion of a concrete slab on the western portion of the project site, existing poles, metal fencing and chain-link fencing surrounding the project site, any concrete block walls, bollards, and concrete ramps and footings would be removed. Additionally, the currently proposed project involves the removal of approximately 48 perimeter trees.

- **Hauling**: The project site has excess material or inert debris that will be hauled away from the site. The inert debris consists of broken concrete, brick, reinforcing steel, etc. The material would be removed mechanically from its current placement and loaded onto hauling trucks. For purposes of this analysis, it is assumed that excess materials would be hauled to Sunshine Canyon Landfill, located approximately 12 miles northwest of the project site at Sunshine Road, Sylmar, CA 91342. The excess materials may also be hauled to Waste Management's Azusa Landfill Reclamation facility, located approximately 36 miles southeast of the project site at 1211 West Gladstone Street, Azusa, CA 91702; the Kincaid Pit located approximately 36 miles to the southeast of the project site at 6570 North Irwindale Avenue, Irwindale, CA 91702; or, the NuWay Landfill located approximately 36 miles southeast of the project site at 13620 Live Oak Lane, Irwindale, CA 91706.

- **Over Excavation**: This component identifies the limits of the excavation and grading work, limits of the stockpiles in the location of the proposed detention pond, approximate limits of the former Newberry Landfill fill cap along the northern boundary, and approximate limits of earthen berm on the eastern portion of the site. Under the currently proposed project, 1,327,017 square feet (30.46) acres is proposed for over excavation and 685,753 square feet (15.74 acres) is proposed for site grading.

- **Deep Dynamic Compaction**: DDC is the process to compact the bottom of detention pond by the use of a weighted disc lifted by a crane and then dropped. The voids would then be backfilled with crushed on-site material with loaders.

- **Rough Grading**: Once the over excavation and compaction operations are completed, rough grading of the project site would begin. Inert landfill material that was excavated would either be hauled off site or be processed and crushed to the desired size and stockpiled. The processed material would then be moved into the rough grading shape of the final site improvements. As the material is placed into final position, it would be compacted using heavy equipment by rolling over the material several times.

- **Off-Site Components**: The adjacent Penrose truck stop located at 8271 Tujunga Avenue (70 feet from the project site) would be utilized during Phase 2 of construction for stockpiling, staging, and/or crushing. The site is approximately 10 acres. The intended use area would be in the northeast corner of this property. If this off-site location is used, it is anticipated to be used for the whole duration of Phase 2.

- **Utilities**: A brick and mortar bulkhead would be constructed to seal an existing 96-inch diameter congregated metal pipe (CMP) conveyor tunnel located near Tujunga Avenue, using masonry or cast in place concrete construction.

2.2 Phase 3

Based on the assumed construction schedule scenario used in modeling for the air quality, greenhouse gas, and noise analyses, the construction of Phase 3 would start in May 2027 and end in November 2031, and contain the following components:

- **Detention Pond**: The detention pond is proposed for construction on the western portion of the project site and is approximately 21 acres in size and 50 feet in depth. A raw water pump station, valve, and vaults are proposed in the lower eastern corner of the detention pond.

- **Wetlands**: Two wetland areas totaling 10 acres are proposed within the project site. One is located in the southeast corner, just below the proposed pump station and wet well, another is located just above it.

- **Utilities**: This component involves the installation of on-site utilities, including electrical and communication lines, water lines, irrigation lines, sewer lines, and storm drain lines. A new 12-inch on-site storm drain is proposed along the northern boundary of the detention basin. The currently proposed project involves construction of an 8-foot by 8-foot reinforced concrete box (RCB) with junction box within Tujunga Avenue, a 12-inch-diameter high-density polyethylene (HDPE) treated water force main from the project site to Fair Avenue onto Cantara Street, an 8-inch diameter sewer at Fair Avenue and Strathern Street.

- **Passive Methane System**: Proposed above ground improvements include a new passive methane treatment system, a component not included in the 2004 and 2013 Approved Projects. Beneath the north and south restroom facilities, a HDPE geomembrane would line the bottom of the facilities and passive vent pipe would run horizontally beneath the facilities. Additionally, a vertical pipe would be secured to the building with a ventilator turbine at the top. Further, the proposed passive landfill gas (LFG) venting system plan would be located along the northern and western property line and along the southern boundary of the existing concrete pad. The proposed passive LFG system would consist of 31 wells designed to prevent methane gas intrusion into the proposed aboveground structures and eight probes would be located along the southern boundary of the existing concrete pad which can be later converted to collector pipes if-needed.

- **Recreational Components**: Above-ground improvements would include the development of recreational offerings throughout the site, totaling approximately 15 acres. A 127-stall parking facility would line the northern boundary. The soccer field, a picnic area, and picnic pavilion would be located in the northwest portion of the project site. An amphitheater and restroom would be west of the soccer field and south of the 127-stall parking lot. The rest of the recreational facilities would be located along the eastern portion of the site, including the tot lot and tennis courts, basketball courts, and open play area. Restrooms and a 30-stall parking lot would also be developed in the southeastern portion of the site. Additionally, this component includes the development of trails.

- **Landscaping**: The currently proposed project would include approximately 432 new trees and 109,505 new shrubs. Landscaping is proposed throughout the project site and surrounding the detention ponds and wetland areas.

As previously noted, from a trip generation perspective, the operational and maintenance traffic associated with the currently proposed project is anticipated to be the same (i.e., unchanged from) the operational phase of the Strathern Pit project analyzed in the 2004 PEIR.

3 Phase 2 Construction Traffic Impacts

3.1 Trip Generation

The trip generation estimates of Phase 2 of the currently proposed project's peak construction phases (i.e., phases that overlap and generate the highest volume of construction traffic) are based on daily traffic volumes of construction workers, vendor trucks, and haul trucks generated for the air quality analysis of the currently proposed

project, through the CalEEMod air quality analysis software. Table 1 below shows the eight phases of construction, from Mobilization to Clean Up.

Table 1. Schedule of Phase 2 Construction Phases

Construction Phase	Start Date	End Date	Estimated Days
Mobilize	12/15/2022	4/14/2023	87
Demolition, including Clearing and Grubbing	4/17/2023	6/16/2023	45
Site Preparation	6/19/2023	7/14/2023	20
Deep Dynamic Compaction – Backfill to Rough Grade	7/17/2023	1/15/2027	915
Haul Excess Material	7/17/2023	1/15/2027	915
Over Excavation – Crush Concrete	7/17/2023	1/15/2027	915
Drainage	1/18/2027	3/19/2027	45
Clean Up	3/15/2027	4/12/2027	21

Source: Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum for the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum, Dudek, January 2022.

Note: Shaded rows are individual construction phases that would overlap each other based on their Start and End Dates.

Based on the table, the peak construction phases would be Deep Dynamic Compaction – Backfill to Rough Grade, Haul Excess Material, and Over Excavation – Crush Concrete (all shaded). These three phases would occur over the same period, from July 17, 2023 to January 15, 2027, which equates to 915 working days.

Table 2 presents the CalEEMod output for the total average daily trips (inbound and outbound) for construction workers and vendor trucks, as well as, the total number of haul truck trips (inbound and outbound) generated for the 915 day duration of those three overlapping construction phases (all shaded).

Table 2. Phase 2 Construction Workers, Vendor, and Haul Truck Trips

Construction Phase	Average Daily Trips		Total Haul Truck Trips
	Workers	Vendor Trucks[a]	
Mobilize	14	2	0
Demolition, including Clearing and Grubbing	30	12	30
Site Preparation	20	6	0
Deep Dynamic Compaction – Backfill to Rough Grade	30	8	0
Haul Excess Material	30	8	68,750[b]
Over Excavation – Crush Concrete	14	4	0
Drainage	14	4	0
Clean Up	10	0	0

Source: Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum for the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum, Dudek, January 2022.

Note: Shaded rows are individual construction phases that would overlap each other based on their Start and End Dates.

[a] Vendor Trucks includes materials delivery trucks and water trucks.

[b] 68,750 total haul truck trips ÷ 915 day phase = 75 haul truck trips per day, or 38 inbound trucks and 37 outbound trucks.

Based on the table, the Phase 2 peak construction phases, Deep Dynamic Compaction, Haul Excess Material, and Crush Concrete, would generate 74 daily worker trips, or 37 construction workers (37 inbound and 37 outbound), 20 daily vendor truck trips, or 10 trucks (10 inbound and 10 outbound), and 75 daily haul truck trips, or 38 trucks (38 inbound and 37 outbound). The daily haul truck trip estimate is based on dividing 68,750 truck trips over 915 days.

Table 3 provides the Phase 2 daily, and AM and PM peak hour trip generation estimates of the currently proposed project based on the CalEEMod data presented above. The AM and PM peak hours are defined as the highest hour of traffic volumes, based on four consecutive 15 minute intervals, at an intersection during a two hour peak commute period where the AM peak commute period is from 7:00 a.m. to 9:00 a.m; and, the PM peak commute period is from 4:00 p.m. to 6:00 p.m. The specific AM and PM peak hours may vary between intersections. The AM and PM peak hour trip estimates for the construction were based on similar assumptions made for the 2004 Project where approximately 50% of the workers would arrive to the site, and 10% would depart the site during the AM peak hour; and, approximately 10% of the workers would arrive to the site, and 50% would depart the site during the PM peak hour. For the vendor and haul trucks, it was assumed that half of the trucks would arrive/depart during the peak hours (25% during the AM peak hour, and 25% during the PM peak hour), while the other half would arrive/depart during the middle of the day.

Table 3 also presents construction trip generation estimates for the Strathern Pit project reported in the 2004 PEIR. These estimates are referenced from Table 4.11-36, Construction Traffic – Strathern Pit in the 2004 PEIR, and a copy of that table is provided in Attachment 1.

Based on the table, Phase 2 of the currently proposed project would generate a total of 169 daily trips, 48 AM peak hour trips (31 inbound and 17 outbound), and 48 PM peak hour trips (17 inbound and 31 outbound). The previously analyzed project for the Strathern Pit (approved project) was estimated to generate a total of 240 daily trips, 66 AM peak hour trips (45 inbound and 21 outbound), and 66 PM peak hour trips (21 inbound and 45 outbound). When Phase 2 of the currently proposed project is compared to the approved project, the currently proposed project would generate 71 *less* daily trips, 18 *less* AM peak hour trips, and 18 *less* PM peak hour trips.

Table 3. Phase 2 Trip Generation Analysis

Trip Generator	Size/Units (per day)	Daily	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
CONSTRUCTION TRAFFIC – RORY M. SHAW WETLANDS PARK (CURRENTLY PROPOSED PROJECT)								
Workers	37 workers	74	18	4	22	4	18	22
Vendor Trucks	10 trucks	20	3	3	6	3	3	6
Haul Trucks	38 trucks	75	10	10	20	10	10	20
	Total	**169**	**31**	**17**	**48**	**17**	**31**	**48**
CONSTRUCTION TRAFFIC – STRATHERN PIT (FROM PEIR)[a]								
Workers	60 workers	120	30	6	36	6	30	36
Trucks	60 trucks	120	15	15	30	15	15	30
	Total	**240**	**45**	**21**	**66**	**21**	**45**	**66**
Difference (Currently Proposed Project – PEIR)		***-71***	***-14***	***-4***	***-18***	***-4***	***-14***	***-18***

[a] From Table 4.11-36, Construction Traffic – Strathern Pit, Sun Valley Watershed Management Plan, Final Program EIR, May 2004.

3.2 Impact Assessment

Attachment 1 also contains Table 4.11-37 which reports the construction traffic impacts of the previously analyzed Strathern Pit in the 2004 PEIR. Per that table, street segments of Tujunga Avenue (forecast to carry 20% of project traffic), Vineland Avenue (forecast to carry 80% of project traffic), and Sunland Boulevard (forecast to carry 80% of project traffic), are forecast to operate with unsatisfactory levels of service (LOS), at either LOS E or F, in one or both peak hours. Since Phase 2 of the currently proposed project would generate less daily and peak hour traffic volumes than previously analyzed, the currently proposed project would not create additional traffic impacts than those disclosed for the 2004 Project. As shown in Table 3, the 2004 PEIR originally analyzed 120 daily truck trips and 120 daily trips from workers and light-duty vehicles. Therefore, an accelerated work schedule of approximately 120 daily truck trips would still result in a "no change to impact determination" as it would be consistent with the analysis in the 2004 PEIR. However, a mitigation measure, T-1 Construction Traffic Management Plan, would also still be required for Phase 2 for increased traffic during project construction along the streets of Tujunga Avenue, Vineland Avenue and Sunland Boulevard, as identified in the 2004 PEIR as significantly impacted streets during construction. Therefore, with the incorporation of T-1 Construction Traffic Management Plan, the current project's impact during the construction of Phase 2 would be less than significant.

4 Phase 3 Construction Traffic Impacts

4.1 Trip Generation

The trip generation estimates for Phase 3 of the currently proposed project's peak construction phases (i.e., phases that overlap, if any, and generate the highest volume of construction traffic) are based on nine phases of construction, from Detention Pond Site Preparation to Recreational Amenities Architectural Coating shown in Table 4.

Table 4. Schedule of Phase 3 Construction Phases

Construction Phase	Start Date	End Date	Estimated Duration
Detention Pond (Site Preparation)	5/12/2027	7/15/2027	47
Detention Pond (Grading)	7/16/2027	9/30/2027	55
Wetlands (Site Preparation)	10/1/2027	5/25/2028	170
Wetlands (Grading)	5/26/2028	1/18/2029	170
Passive Methane	1/19/2029	4/16/2029	62
Trenching for Utilities	4/17/2029	11/26/2029	160
Recreational Amenities (Building Construction)	11/27/2029	6/21/2030	150
Recreational Amenities (Paving)	6/22/2031	9/5/2031	55
Recreational Amenities (Architectural Coating)	9/6/2031	11/21/2031	55

Source: Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum for the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum, Dudek, January 2022.

Based on the table, none of the nine construction phases would overlap. Table 5 presents the CalEEMod output for the total average daily trips (inbound and outbound) for construction workers and vendor trucks, as well as, the total number of haul truck trips (inbound and outbound) generated for each of the nine construction phases.

Table 5. Phase 3 Construction Workers, Vendor, and Haul Truck Trips

Construction Phase	Average Daily Trips		Total Haul Truck Trips
	Workers	Vendor Trucks[a]	
Detention Pond (Site Preparation)	18	0	0
Detention Pond (Grading)	20	6	0
Wetlands (Site Preparation)	18	0	0
Wetlands (Grading)	20	6	0
Passive Methane	6	0	0
Trenching for Utilities	10	0	0
Recreational Amenities (Building Construction)	50	10	0
Recreational Amenities (Paving)	16	0	0
Recreational Amenities (Architectural Coating)	16	0	0

Source: Air Quality, Greenhouse Gas Emissions, and Energy Technical Memorandum for the Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum, Dudek, January 2022.
[a] Vendor Trucks includes materials delivery trucks and water trucks.

Based on the table, the Phase 3 peak construction phase, Recreational Amenities (Building Construction), would generate 50 daily worker trips, or 25 construction workers (25 inbound and 25 outbound), 10 daily vendor truck trips (5 inbound and 5 outbound), and zero daily haul truck trips.

Table 6 provides the Phase 3 daily, and AM and PM peak hour trip generation estimates of the currently proposed project based on the CalEEMod data presented above. The AM and PM peak hour trip estimates for the construction were based on similar assumptions made for the 2004 Project where approximately 50% of the workers would arrive to the site, and 10% would depart the site during the AM peak hour; and, approximately 10% of the workers would arrive to the site, and 50% would depart the site during the PM peak hour. For the vendor trucks, it was assumed that half of the trucks would arrive/depart during the peak hours (25% during the AM peak hour, and 25% during the PM peak hour), while the other half would arrive/depart during the middle of the day.

Table 6 also presents construction trip generation estimates for the Strathern Pit project reported in the 2004 PEIR. These estimates are referenced from Table 4.11-36, Construction Traffic – Strathern Pit in the 2004 PEIR, and a copy of that table is provided in Attachment 1.

Table 6. Phase 3 Trip Generation Analysis

Trip Generator	Size/Units (per day)	Daily	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
CONSTRUCTION TRAFFIC – RORY M. SHAW WETLANDS PARK (CURRENTLY PROPOSED PROJECT)								
Workers	25 workers	50	13	3	16	3	13	16
Vendor Trucks	5 trucks	10	1	1	2	1	1	2
Haul Trucks	0 trucks	0	0	0	0	0	0	0
Total		**60**	**14**	**4**	**18**	**4**	**14**	**18**
CONSTRUCTION TRAFFIC – STRATHERN PIT (FROM PEIR)[a]								
Workers	60 workers	120	30	6	36	6	30	36
Trucks	60 trucks	120	15	15	30	15	15	30
Total		**240**	**45**	**21**	**66**	**21**	**45**	**66**
Difference (Currently Proposed Project – PEIR)		***-180***	***-31***	***-17***	***-48***	***-17***	***-31***	***-48***

[a] From Table 4.11-36, Construction Traffic – Strathern Pit, Sun Valley Watershed Management Plan, Final Program EIR, May 2004.

Based on the table, Phase 3 of the currently proposed project would generate a total of 60 daily trips, 18 AM peak hour trips (14 inbound and 4 outbound), and 18 PM peak hour trips (4 inbound and 14 outbound). When Phase 3 of the currently proposed project is compared to the approved project, the currently proposed project would generate 180 *less* daily trips, 48 *less* AM peak hour trips, and 48 *less* PM peak hour trips.

4.2 Impact Assessment

Attachment 1 also contains Table 4.11-37 which reports the construction traffic impacts of the previously analyzed Strathern Pit in the 2004 PEIR. Per that table, street segments of Tujunga Avenue (forecast to carry 20% of project traffic), Vineland Avenue (forecast to carry 80% of project traffic), and Sunland Boulevard (forecast to carry 80% of project traffic), are forecast to operate with unsatisfactory levels of service (LOS), at either LOS E or F, in one or both peak hours. Since Phase 3 of the currently proposed project would also generate less daily and peak hour traffic volumes than previously analyzed, the currently proposed project would not create additional traffic impacts than those disclosed for the 2004 Project. However, a mitigation measure, T-1 Construction Traffic Management Plan, would also still be required for Phase 3 for increased traffic during project construction. Therefore, with the incorporation of T-1 Construction Traffic Management Plan, the current project's impact during the construction of Phase 3 would be less than significant.

5 Operational Traffic Impacts

As previously noted, from a trip generation perspective, the (permanent) operational and maintenance traffic associated with the currently proposed project is anticipated to be the same (i.e., unchanged from) the operational phase of the Strathern Pit project analyzed in the 2004 PEIR (approved project).

5.1 Trip Generation

Attachment 3 contains Table 4.11-52, Operation Traffic – Strathern Pit, from the 2004 PEIR. Since the operational (permanent) phase of the currently proposed project would remain the same as analyzed in the 2004 PEIR, the

operational trip generation estimates would also remain the same at approximately 180 daily trips, 46 AM peak hour trips (33 inbound and 13 outbound), and 40 PM peak hour trips (14 inbound and 26 outbound).

5.2 Impact Assessment

Attachment 3 also contains Table 4.11-53, Operation Traffic Impacts – Streets in the Vicinity of Strathern Pit, from the 2004 PEIR. Based on that table the approved project would not create a significant impact to roadway segment LOS. Therefore, the currently proposed project would also not create a significant impact to roadway segment LOS, and no mitigation measure is required for the operational phase.

6 Vehicle Miles Traveled

As required by SB 743, the Governor's Office of Planning and Research (OPR) approved the addition of new Section 15064.3, "Determining the Significance of Transportation Impacts" to the State's CEQA Guidelines, compliance with which was required beginning July 1, 2020. The updated CEQA Guidelines state that "generally, vehicle miles traveled (VMT) is the most appropriate measure of transportation impacts" and define VMT as "the amount and distance of automobile travel attributable to a project." It should be noted that "automobile" refers to on-road passenger vehicles, specifically cars and light trucks. OPR has clarified in their Technical Advisory (December 2018) and recent informational presentations that heavy-duty truck VMT is not required to be included in the estimation of a project's VMT. Consistent with SB 743, CEQA requires that transportation impacts be analyzed under the VMT metric, and the level of service (LOS) or delay metric is no longer to be considered under CEQA.

Los Angeles County Public Works (LACPW) adopted their (updated) Transportation Impact Analysis Guidelines in July 2020 which provides guidance on the analysis of VMT, screening thresholds, and significance criteria. LACPW provides the following guidance regarding screening and impact criteria to address the potential for VMT-related impacts. The following screening criteria and impact criteria are only meant to serve as guidance to determine if a project generates a significant transportation impact.

Screening Criteria[2]

1. Non-Retail Project Trip Generation Screening Criteria

If the answer is no to the question below, further analysis is not required, and a less than significant determination can be made.

- Does the development project generate a net increase of 110 or more daily vehicle trips?

A project's daily vehicle trip generation should be estimated using the most recent edition of the Institute of Transportation Engineers (ITE) Trip Generation Manual or trip generation study as approved by LACPW.

2. Retail Project Site Plan Screening Criteria

[2] From LACPW Transportation Impact Analysis Guidelines, July 2020, Section 3. – CEQA Transportation Impact Analysis Process, Section 3.1.2 – Screening Criteria

A project that contains a local serving retail use is assumed to have less than significant VMT impacts for the retail portion of the project. If the answer to the following question is no, a less than significant determination can be made for the portion of the project that contains retail uses.

- Does the project contain retail uses that exceed 50,000 square feet of gross floor area?

However, if the retail project is part of a mixed-use project, then the remaining portion of the project may be subject to further analysis in accordance with other screening criteria in Section 3.1. Projects that include retail uses in excess of the Retail Project Site Plan Screening Criteria need to evaluate the entirety of the project's VMT.

3. Proximity to Transit Based Screening Criteria

If a project is located near a major transit stop or high-quality transit corridor, the following question should be considered:

- Is the project located within a one-half mile radius of a major transit stop or an existing stop along a high-quality transit corridor?

If the answer to the question above is yes, then the following subsequent questions should be considered:

- Does the project have a Floor Area Ratio less than 0.75?
- Does the project provide more parking than required by the County Code?
- Is the project inconsistent with the SCAG RTP/SCS?
- Does the project replace residential units set aside for lower income households with a smaller number of market-rate residential units?

If the answer to all four questions is no, further analysis is not required, and a less than significant determination can be made.

4. Residential Land Use Based Screening Criteria

Independent of the screening criteria for non-retail and retail projects, certain projects that further the State's affordable housing goals are presumed to have less than significant impact on VMT. If the project requires a discretionary action and the answer is yes to the question below, further analysis is not required, and a less than significant determination can be made.

- Are 100% of the units, excluding manager's units, set aside for lower income households?

6.1 Project Screening

The updated CEQA Guidelines do not establish a significance threshold, however, recommend a threshold of significance for land use development (residential, office, and other land uses) and transportation projects. It should be noted that there is no significance threshold for construction or maintenance projects.

The currently proposed project would involve construction that would generate temporary construction-related traffic and nominal operations traffic; these would be categorized under Section 15064.3(b)(3) "qualitative

analysis". Section 15064.3(b)(3) recognizes that lead agencies may not be able to quantitatively estimate VMT for every project type. For many projects, a qualitative analysis of construction traffic may be appropriate.

Therefore, as described below the VMT generated by the construction of Phases 2 and 3 of the currently proposed project would be short-term and temporary and would generate less than 110 (temporary) daily trips from automobiles (i.e., passenger-cars and/or light trucks), and thus, would not require a detailed analysis and would be presumed to have a less than significant impact. However, the operation of the currently proposed project would generate more than 110 daily trips (it would generate 180 daily trips) and would not meet the County's screening criteria outlined above, and hence would require further VMT analysis to determine its impact significance to VMT.

6.2 Project Impact Analysis

Construction Impacts

Vehicle-trip generation (for passenger-cars/light-duty trucks of workers only; heavy trucks are not required to be included per OPR) as a result of the phase of the highest volume of project construction traffic has been summarized in Table 6 for Phase 3 Recreational Amenities (Building Construction). The VMT generated by construction-related trips are temporary and would not generate permanent trips, therefore the VMT from construction is not required to be quantified. Furthermore, the daily traffic generated by the passenger-cars/light-duty trucks of workers is approximately 74 daily trips for Phase 2, and 50 daily trips for Phase 3. While worker and vendor trips would generate VMT, once construction is completed, the construction-related traffic would cease and VMT would return to pre-construction conditions. Therefore, since construction-related traffic is temporary and the peak phase of Phase 2 and Phase 3 construction would generate less than 110 daily trips (of passenger-cars/light-duty trucks), the proposed project would not conflict or be inconsistent with CEQA Guidelines Sections 15064.3(b)(1) and 15064.3(b)(3), and impacts to VMT would be ***less than significant***.

Operational Impacts

The project, a wetlands park, can be classified as unique land use since the County's guidelines do not provide specific guidance for VMT analysis of park-type use. Based on discussion with the County staff, it was determined that the project's VMT impact should be determined using the absolute metric of total VMT. The County's transportation guidelines recommend using the Southern California Association of Governments (SCAG) Travel Demand Forecasting Model to be run under with and without project conditions to estimate the total or net daily VMT generated by a project. However, because the proposed project is a park use which is anticipated to be a local serving use and not a regional facility, the SCAG model would not be effective in estimating the project generated VMT. Therefore, a qualitative analysis based on a needs assessment report that supports the need for providing a park in proximity of residents was deemed to be the appropriate method for the project's VMT analysis.

The project site is located on land owned by the Los Angeles County Flood Control District within the Sun Valley community of the City of Los Angeles. Based on the LA County Parks and Recreation Needs Assessment Report for the City of LA Sun Valley-La Tuna Canyon Study Area Profile (for Study Area ID#120), there are 1.2 park acres per 1,000 population in the area around the currently proposed project site. As a comparison, the County's average for park acres per 1,000 population is 3.3 acres. Per the Parks and Recreation Element included in the Los Angeles County General Plan 2035 (Adopted October 6, 2015) this ratio is 4 park acers per 1,000 population. Park

accessibility (i.e. percentage of population living within one-half mile of a park[3]) for this area is approximately 29% compared to the County average of 49%. This report also includes an assessment of park pressure, which is measured by how much park is available to residents in the area around each park. The Sun Valley Park and Recreation Center located across the street from the currently proposed project site provides only 0.55 park acres per 1,000 population compared to the County average of 3.3 park acres per 1,000 population. Hence, there is a deficiency of park acres within the community of Sun Valley even though the currently proposed project is located across an existing recreational facility.

Park need is a sum of park acre need, distance to parks and population density and is calculated using the following weighting:

Park Need = (20% x Park Acre Need) + (20% x Distance to Parks) + (60% x Population Density)

Based on the above equation, the County has calculated a high need for parks in the study area that the currently proposed project is located within (i.e. community of Sun Valley-La Tuna Canyon). Relevant excerpts from the County's needs assessment report are included as Attachment 4.

Per Parks and Recreation Element, parks are classified based on the size, use and physical characteristics of the land and meet local needs and offer opportunities for daily recreation. The local park system comprises of community parks, neighborhood parks, pocket parks, and park nodes. Based on the size of the park (15 acres of recreational offerings[4]) of the overall 46-acre wetlands park, the proposed project would be classified as a Community Park[5]. As explained by definition and proposed recreational improvements, the proposed park would be similar to a local community park that serves residents within a 1 to 2 mile radius in contrast to a regional park that typically caters to a service radius of 20 miles. Because park need is a function of distance to parks and there is an existing high need for parks in the study area (see Attachment 4, figure illustrated on Appendix A Park Needs Assessment Framework: Countywide Assessment), therefore, the currently proposed project is anticipated to reduce the distance that the residents may currently be traveling to access local parks and recreational facilities.

The addition of 15 acres of recreational open space in the 46-acre wetlands park would add a new recreational amenity for a majority of existing residents to the southwest, south, and southeast of the project site and within the Sun Valley community, who would otherwise drive their vehicles to another park to use recreational facilities. Those

[3] Based on email correspondence dated September 7, 2021, the City of Los Angeles Parks and Recreation Department staff indicated that the City's goal is to have park facilities accessible within one-half mile (i.e. walking distance) for all residents.

[4] The Rory M. Shaw Wetlands Park Project CEQA Consistency Memorandum, Dudek 2021: Above-ground improvements would include the development of recreational offerings throughout the site, totaling approximately 15 acres. A 127-stall parking facility would line the northern boundary. The soccer field, a picnic area, and picnic pavilion would be located in the northwest portion of the project site. An amphitheater and restroom would be east of the soccer field and south of the 127-stall parking lot. The rest of the recreational facilities would be located along the eastern portion of the site, including the tot lot and tennis courts, basketball courts, and open play area. Restrooms and a 30-stall parking lot would also be developed in the southeastern portion of the site. Additionally, this component includes the development of trails.

[5] Parks and Recreation Element, LA County General Plan: Community parks are typically 10 to 20 acres and serve several neighborhoods within a 1 to 2 mile radius of the park. Community parks that are located in residential neighborhoods serve both the needs of the community park service radius and neighborhood park service radius. Community parks provide opportunities for a wide variety of active and passive recreation activities. The amenities programmed into a community park are focused on meeting the needs of several neighborhoods or large sections of the community. They allow for group activities and recreational opportunities that may not be feasible in neighborhood parks. Amenities for community parks can include informal open play areas, children's play apparatus, group picnic areas with overhead shelters, barbecues, lighted sports fields, basketball courts and tennis courts, public restrooms, concession buildings, maintenance buildings, onsite parking and information kiosks.

residents would also be able to walk or ride their bicycles to the project and utilize its recreational trails, thus reducing VMT generated by those residents.

As a result, the currently proposed project would not cause an increase in VMT and therefore its impact would be less than significant.

7 Mitigation Measure

As provided in Chapter 4.11.6, Mitigation Measures (Transportation) in the 2004 PEIR, the previously approved and applicable mitigation measure T-1 would still be required for the construction phases of Phases 2 and 3 of the currently proposed project:

T-1 A construction traffic management plan (TMP) shall be developed for each project site that will include but not be limited to such measures as designated haul routes for construction-related traffic (e.g., construction equipment, pickup and dump trucks, and other material delivery trucks), travel time restrictions for construction-related traffic to avoid weekday peak periods on selected roadways, designated site access locations, driveway turning restrictions, temporary traffic controls and/or flaggers, and designated parking/staging locations for workers and equipment.

As concluded for the 2004 Project, the implementation of the previous mitigation measure (T-1) would reduce the project's traffic/transportation impacts to a less than significant level. It should be noted that the construction TMP is already completed and is titled *Sun Valley Watershed Storm Drain Project and Rory M. Shaw Wetlands Park Project Transportation Management Plan*, November 4, 2021.

In regard to VMT, as assessed above, no significant impacts related to VMT were found. Therefore, no mitigation measures are required for VMT.

8 Conclusions

Based on the trip generation analysis presented above for the peak, overlapping construction phases of Phase 2 of the currently proposed project, would generate a total of 169 daily trips, 48 AM peak hour trips (31 inbound and 17 outbound), and 48 PM peak hour trips (17 inbound and 31 outbound). When the currently proposed project is compared to the approved project in the 2004 PEIR, the currently proposed project would generate 71 *less* daily trips, 18 *less* AM peak hour trips, and 18 *less* PM peak hour trips.

Phase 3 of the currently proposed project would generate a total of 60 daily trips, 18 AM peak hour trips (14 inbound and 4 outbound), and 18 PM peak hour trips (4 inbound and 14 outbound). When Phase 3 of the currently proposed project is compared to the approved project, the currently proposed project would generate 180 *less* daily trips, 48 *less* AM peak hour trips, and 48 *less* PM peak hour trips.

However, mitigation measure T-1 from the 2004 PEIR (below) would still be required for Phases 2 and 3 of the currently proposed project for increased traffic during project construction along the streets of Tujunga Avenue, Vineland Avenue and Sunland Boulevard. These streets were identified in the 2004 PEIR as significantly impacted streets during construction. Therefore, with the incorporation of T-1 Construction Traffic Management Plan, the currently proposed project's impact during the construction of Phase 2 would be less than significant.

T-1 A construction traffic management plan shall be developed for each project site that will include but not be limited to such measures as designated haul routes for construction-related traffic (e.g., construction equipment, pickup and dump trucks, and other material delivery trucks), travel time restrictions for construction-related traffic to avoid weekday peak periods on selected roadways, site access locations, driveway turning restrictions, temporary traffic controls and/or flaggers, and designated parking/staging locations for workers and equipment.

Since the operational (permanent) phase of the currently proposed project would remain the same as analyzed in the 2004 PEIR, the operation trip generation estimates would also remain the same at approximately 180 daily trips, 46 AM peak hour trips (33 inbound and 13 outbound), and 40 PM peak hour trips (14 inbound and 26 outbound).

While worker and vendor trips would generate VMT, once construction is completed, the construction-related traffic would cease and VMT would return to pre-construction conditions. Therefore, since construction-related traffic is temporary and the peak phase of construction would generate less than 110 daily trips (of passenger-cars/light-duty trucks), the currently proposed project would not conflict or be inconsistent with CEQA Guidelines Sections 15064.3(b)(1) and 15064.3(b)(3), and impacts to VMT would be ***less than significant.*** As shown in the VMT analysis, the operation and maintenance of the project within a high park need area per County's park needs assessment, is anticipated to reduce the distance that the residents may currently be traveling to access local parks and recreational facilities. Therefore, the currently proposed project would not generate significant amount of VMT and would not conflict or be inconsistent with CEQA Guidelines Sections 15064.3(b)(1) and 15064.3(b)(3), and impacts would also be ***less than significant***.

Attachment A

Table 4.11-36, Construction Traffic – Strathern Pit; and, Table 4.11-37, Construction Traffic Impacts – Streets in the Vicinity of Strathern Pit (from PEIR)

The impacts of the construction generated traffic on the study area roadways are summarized in **Table 4.11-35**. As shown, the construction project would result in a less than significant traffic impact.

Table 4.11-35
Construction Traffic Impacts - Streets in the Vicinity of Cal Mat Pit

Street/ Location	No. of Lanes	Daily Traffic Volume	Peak Hour Traffic		V/C Ratio & LOS	
			AM	PM	AM Peak	PM Peak
Stonehurst Ave (30%)						
Baseline Conditions	2	8,000	370n/510s	530n/400s	0.64-B	0.66-B
With Project Traffic		8,140	395n/524s	544n/425s	0.66-B	0.68-B
Peoria St (70%)						
Baseline Conditions	2	7,000	340e/390w	400e/320w	0.49-A	0.50-A

With Project Traffic		22,240	773n/1341s	1151n/973s	0.81-D	0.72-C

Strathern Pit. The construction activities at the Strathern Pit would involve the installation of a retention area and the construction of a pipeline in Strathern Street, Tujunga Avenue, Penrose Street, San Fernando Road, and possibly Tuxford Street. In addition, landscaping and park amenities would be installed.

The estimated volumes of traffic that would be generated by the proposed construction activities are shown in **Table 4.11-36**.

Table 4.11-36
Construction Traffic – Strathern Pit

Construction Feature/ Activity	Daily Traffic	Peak Hour Traffic			
		AM Peak Hour		PM Peak Hour	
		In	Out	In	Out
Retention Area*					
Trucks	80	10	10	10	10
Autos/Light-Duty Vehicles	80	20	4	4	20
Pipeline*					
Trucks	40	5	5	5	5
Autos/Light-Duty Vehicles	40	10	2	2	10
Landscaping/Park Construction

With Project Traffic		33,190	947n/1416s	1346n/1567s	**0.89-D**	**0.98-E**

NOTE: **Bold** values in the V/C ratio & LOS column indicate a significant traffic impact.

Parking Lot on Sherman. The construction activities at the Parking Lot on Sherman would involve the construction of underground storage tanks/infiltration devices and catch basins and pipelines would be installed in Sherman Way and Vineland Avenue. This would be followed by repaving and landscaping.

The estimated volumes of traffic that would be generated by the proposed construction activities are shown in **Table 4.11-38**.

Attachment B

Chapter 4.11.6, Mitigation Measures (Transportation) (from PEIR)

Table 4.11-54
Operation Traffic – Power Line Easement

Proposed Use: Park	Daily Traffic	AM Peak Hour			PM Peak Hour		
		Total	In	Out	Total	In	Out
Trip Generation Rates (vehicle trips per acre)	9.32	2.41	71%	29%	2.09	35%	65%
Generated Traffic (16 Acres)	150	39	28	11	34	12	22

The impacts of the site-generated traffic on the study area roadways are summarized in **Table 4.11-55**. As shown, the project would result in a less than significant traffic impact.

Table 4.11-55
Operation Traffic Impacts - Streets in the Vicinity of the Power Line Easement

Storm Drains. As no recreational facilities are proposed for this component, there would be no additional traffic during operation other than minor maintenance-related traffic.

Onsite BMPs. As no additional recreational facilities are proposed for this component, there would be no site-generated traffic during operation other than minor maintenance-related traffic.

4.11.6 Mitigation Measures

The following mitigation measure will be implemented to mitigate the significant impacts associated with construction traffic at all project components except Onsite BMPs and Tree Planting & Mulching. The implementation of the mitigation measures would reduce the project's traffic/transportation impacts to a less than significant level.

T-1 A construction traffic management plan shall be developed for each project site that will include but not be limited to such measures as designated haul routes for construction-related traffic (e.g., construction equipment, pickup and dump trucks, and other material delivery trucks), travel time restrictions for construction-related traffic to avoid weekday peak periods on selected roadways, designated site access locations, driveway turning restrictions, temporary traffic controls and/or flaggers, and designated parking/staging locations for workers and equipment.

The following measures will be implemented to mitigate the significant impacts associated with construction activities in the right-of-way of public streets for pipelines, catch basins, culverts, etc. The implementation of the following mitigation measures would reduce the project's traffic/transportation impacts to a less than significant level.

T-2 A construction area traffic control plan and/or detour plan shall be prepared for each location where construction activities would encroach into the right-of-way of a public roadway. The plan would include, but not be limited to such features as warning signs, lights, barricades, cones, lane closures, and restricted hours during which lane closures would not be allowed; e.g., 6:00 to 9:00 a.m. and 3:00 to 6:00 p.m., or as directed by the affected public agency (City of Los Angeles Department of Transportation for most locations).

T-3 Provide advance notification to affected property owners, businesses, residents, etc. of possible driveway blockages or other access obstructions and implement alternate access and parking provisions where necessary.

T-4 Provide alternative pedestrian and bicycle access/circulation routes where existing facilities such as sidewalks, crosswalks, and bike lanes would be obstructed.

T-5 Coordinate with emergency service providers (police, fire, and ambulance/paramedic agencies) prior to construction to provide information regarding lane closures, construction schedules, driveway blockages, etc. and to develop a plan to maintain or accommodate essential emergency access routes; e.g., plating over excavations, use of detours, etc.

T-6 Coordinate with public transit agencies (e.g., MTA) to provide information regarding lane closures, bus stop disruptions, etc. and to designate alternate pick-up/drop-off locations if appropriate.

T-7 As necessary, obtain a transportation permit from Caltrans for transportation of heavy construction equipment and/or materials which requires the use of oversized-transport vehicles on State highways.

4.11.7 Future Analyses

None required.

Attachment C

Table 4.11-52, Operation Traffic – Strathern Pit; and, Table 4.11-53, Operation Traffic Impacts – Streets in the Vicinity of Strathern Pit (from PEIR)

Strathern Pit. A park of up to 19 acres is proposed for the Strathern Pit site. The estimated volumes of traffic that would be generated on a typical day are shown in **Table 4.11-52**.

Table 4.11-52
Operation Traffic – Strathern Pit

Proposed Use: Park	Daily Traffic	AM Peak Hour			PM Peak Hour		
		Total	In	Out	Total	In	Out
Trip Generation Rates (vehicle trips per acre)	9.32	2.41	71%	29%	2.09	35%	65%
Generated Traffic (19 Acres)	180	46	33	13	40	14	26

The impacts of the site-generated traffic on the study area roadways are summarized in **Table 4.11-53**. As shown, the project would result in a less than significant traffic impact.

Table 4.11-53
Operation Traffic Impacts - Streets in the Vicinity of Strathern Pit
