The FRISKSP program runs two problems for each attenuation relationship evaluated. The first evaluates potential accelerations, which may be generated within the return period of interest. The second problem normalizes potential accelerations to a 7.5 magnitude based on published empirical relationships because most liquefaction and settlement analyses are based on this standard magnitude. The acceleration is normalized to account for changes in duration for the same acceleration because larger, more distant earthquakes will produce ground motions with a longer duration (i.e. more cycles and more distress) than smaller, closer earthquakes. Where the design earthquake is smaller than a 7.5 magnitude, the normalized acceleration will be smaller than the design

acceleration to account for the shorter duration of shaking from the design earthquake compared to the same acceleration from the larger 7.5 magnitude earthquake. The empirical relationship used for magnitude weighting in our analysis is from Youd and Idriss (1997). The average, magnitude-weighted acceleration was found to be 0.49g for the design basis earthquake (see **Table D-III**).

1.1.5 Deaggregation of Fault Hazard

A probabilistic analysis evaluates a range of magnitudes from 5.0 to the maximum magnitude for each fault. However, the dominant magnitude which statistically generates the peak acceleration within a limited time period (e.g. 475 years) is typically less than the maximum magnitude for a given fault. We have, therefore, performed a deaggregation of fault hazard analysis with the PROBOUT Sub-Program of FRISKSP to evaluate what dominate magnitude-distance combination produces the design basis accelerations (DBA). We utilized the unweighted acceleration from Boore et al. (1997) of 0.715g (DBA) for our deaggregation analyses. Review of the magnitude-distance contributions to hazard indicates that the dominant magnitude which generates the DBA acceleration is 6.5 as shown graphically in **Figure D-4**.

1.1.6 Summary

The peak design basis ground acceleration value used in our liquefaction analysis was 0.71g from a 6.5 magnitude earthquake based on our probabilistic evaluation of the site.

Although research on earthquakes during the last forty years has greatly enhanced the level of understanding of earthquake faulting in California, the record is much too short to constrain behavior of all faults in Southern California and the attenuation characteristics of all areas relative to each future potential earthquakes. Predicted accelerations should, therefore, be considered **rough estimates** rather than precise facts and ground motions from future earthquakes may exceed the predicted accelerations. Neither the **Time, Location, nor Magnitude** of an earthquake can be accurately predicted at this time.

The proposed development is located in Southern California, which is in a geologically and seismically active region where large magnitude, potentially

destructive earthquakes are common. Therefore, it is reasonable to assume that moderate or large magnitude earthquakes will affect the site during the life of a given structure. The current standards for construction provided in the California Building Code based on the 1997 Uniform Building Code are designed to safeguard against major failures and loss of life, but are not intended to limit damage, maintain functions or provide for easy repair. Per SEAOC, conformance to these recommendations does not constitute any kind of guarantee or assurance that significant structural damage will not occur in the event of a maximum level of earthquake ground motion. However, it is reasonable to expect that a well-planned and constructed structure will not collapse in a major earthquake and that protection of life is reasonably provided, but not with complete assurance.

1.2 Ground Failure

Ground failure is a general term describing seismically induced, secondary permanent ground deformation caused by strong ground motion. This includes liquefaction, lateral spreading, seismic settlement of poorly consolidated materials (dynamic densification), differential materials response, slope failures, sympathetic movement on weak bedding planes or non-causative faults, shattered ridge effects and ground lurching.

Seismic hazards map for the Newhall Quadrangle (dated 2/1/98) indicates that the alluvial portions of Tentative Tract 53425 are in designated zones of required investigation to evaluate the potential for liquefaction and lateral spreading. The potential for liquefaction and seismic settlement has been evaluated in **Appendix C** of this report. Recommended measures to mitigate potential liquefaction and seismic settlements are provided in the earthworks recommendations and foundation and settlement considerations of this report. Historic high ground water levels were assumed at a conservative depth of 5 feet below existing topography based on historical water well records available at the County of Los Angeles.

Differential materials response refers to the different responses various materials display when subjected to seismic waves. Where materials with different densities or strengths are in contact, differential response to the seismic energy may cause distress along the contact. The combination of dynamic compaction and differential settlement along with differential materials response is a source of future potential hazard along cut/fill and bedrock/alluvium contacts. It is, therefore, recommended that **lots** underlain by

APPENDIX D

transitions between different material types (ex. bedrock to fill, bedrock to alluvium, etc.) be **over-excavated 5 feet** to minimize potential adverse impacts.

Earthquake-induced slope failures include activation and reactivation of landslides, rock falls, debris flows and surficial failures. Review of the SHMA map for the Newhall Quadrangle indicates that much of the slope areas on the site are within designated areas requiring investigation to evaluate potential earthquake-induced landslides. Landslides and surficial failures have been mapped by this firm in the vicinity of the proposed development. Existing landslides which could potentially impact the proposed development have been evaluated and appropriate mitigation recommended as presented in this report. The stability of natural and constructed slopes which could potentially affect the proposed development has been evaluated and appropriate mitigation recommended. The potential for earthquake-induced slope failures to adversely impact the proposed development is considered negligible, provided that our Recommendations and those of the Supervising Civil Engineer are incorporated into the proposed design and implemented during construction.

The specific location of future potential sympathetic movement along weak planes such as inclined clay beds cannot be reliably predicted on a site specific basis at this time. Over-excavation of clay-rich bedding planes of the Saugus Formation and subsequent placement of a certified fill cap has been recommended to mitigate potential hazards from expansive material. This certified fill will also reduce potential hazards from potential secondary seismogenic movement along bedding planes.

Development is not proposed on ridgelines, therefore, potential hazards from shattered ridge affects are considered negligible.

Appendix E

APPENDIX E

RECOMMENDED EARTHWORK SPECIFICATIONS

The following specifications are recommended to provide a basis for quality control during the placement of compacted fill or backfill as applicable.

1. Areas that are to receive compacted fill shall be observed by Allan E. Seward Engineering Geology, Inc. (AES) prior to the placement of fill.

2. All drainage devices shall be properly installed and observed by AES and/or owner's representative(s) prior to placement of backfill.

3. Fill soils shall consist of imported soils or on-site soils free of organics, cobbles, and deleterious material provided each material is approved by AESEGI. AESEGI shall evaluate and/or test the import material for its conformance with the report recommendations prior to its delivery to the site. The contractor shall notify AESEGI 72 hours prior to importing material to the site.

4. Fill shall be placed in controlled layers (lifts), the thickness of which is compatible with the type of compaction equipment used. The fill materials shall be brought to optimum moisture content or above, thoroughly mixed during spreading to obtain a near uniform moisture condition and uniform blend of materials, and then placed in layers with a thickness (loose) not exceeding 8 inches. Each layer shall be compacted to a minimum compaction of 90% relative to the maximum dry density determined per the latest ASTM D1557 test. Density testing shall be performed by AESEGI to verify relative compaction. The contractor shall provide proper access and level areas for testing.

5. Rocks or rock fragments less than eight (8) inches in the largest dimension may be utilized in the fill, provided they are not placed in concentrated pockets, except rocks larger than four (4) inches shall not be placed within three (3) feet of finish grade.

   Rocks greater than eight (8) inches in largest dimension shall be taken offsite, or placed in accordance with the recommendation of the Soils Engineer in areas designated as suitable for rock disposal.

6. Where space limitations do not allow for conventional fill compaction operations, special backfill materials and procedures may be required. Pea gravel or other select

APPENDIX E

fill can be used in areas of limited space. A sand and portland cement slurry (2 sacks per cubic-yard mix) shall be used in limited space areas for shallow backfill near final pad grade, and pea gravel shall be placed in deeper backfill near drainage systems.

7. AES shall observe the placement of fill and conduct in-place field density tests on the compacted fill to check for adequate moisture content and the required relative compaction. Where less than specified relative compaction is indicated, additional compacting effort shall be applied and the soil moisture conditioned as necessary until adequate relative compaction is attained.

8. The Contractor shall comply with the minimum relative compaction out to the finish slope face of fill slopes, buttresses, and stabilization fills as set forth in the specifications for compacted fill. This may be achieved by overbuilding the slope and cutting back as necessary.

9. Any abandoned underground structures such as cesspools, cisterns, mining shafts, tunnels, septic tanks, wells, pipelines or others not discovered prior to grading are to be removed or treated to the satisfaction of the Soils Engineer and/or the controlling agency for the project.

10. The Contractor shall have suitable and sufficient equipment during a particular operation to handle the volume of fill being placed. When necessary, fill placement equipment shall be shut down temporarily in order to permit proper compaction of fills, correction of deficient areas, or to facilitate required field testing.

11. The Contractor shall be responsible for the satisfactory completion of all earthwork in accordance with the project plans and specifications.

12. Final reports shall be submitted after completion of earthwork and after the Soils Engineer and Engineering Geologist have finished their observations of the work. No additional excavation or filling shall be performed without prior notification to the Soils Engineer and/or Engineering Geologist.

13. Whenever the words "supervision", "inspection" or "control" are used, they shall mean observation of the work and/or testing of the compacted fill by AESEGI to assess whether substantial compliance with plans, specifications and design concepts has been achieved, and does not include direction of the actual work of the contractor or the contractor's workmen.

APPENDIX E

RECOMMENDED SPECIFICATIONS FOR PLACEMENT OF TRENCH BACKFILL

1. Trench excavations to receive backfill shall be free of trash, debris or other unsatisfactory materials prior to backfill placement, and shall be observed by Allan E. Seward Engineering Geology, Inc. (AESEGI) representative.

2. Except as stipulated herein, soils obtained from the excavation may be used as backfill if they are essentially free of organics and deleterious materials.

   Rocks generated from the trench excavation not exceeding three (3) inches in largest dimension may be used as backfill material. However, such material may not be placed within 12 inches of the top of the pipeline. No more than 30 percent of the backfill volume shall contain particles larger than 1 ½ inches in diameter, and rocks shall be well mixed with finer soil.

3. Soils (other than aggregates) with a Sand Equivalent (SE) greater than or equal to 30, as determined by ASTM D 2419 Standard Test Method or at the discretion of the engineer or representative in the field, may be used for bedding and shading material in the pipe zone areas. These soils are considered satisfactory for compaction by jetting procedures.

4. No jetting will be permitted in utility trenches within the top 2 feet of the subgrade of concrete slabs-on-grade.

5. Trench backfill other than bedding and shading shall be compacted by mechanical methods as tamping sheepsfoot, vibrating or pneumatic rollers or other mechanical tampers to achieve the density specified herein. The backfill materials shall be brought to optimum moisture content or above, thoroughly mixed during spreading to obtain a near uniform moisture condition and uniform blend of materials, and then placed in horizontal layers with a thickness (loose) not exceeding 8 inches. Trench backfills shall be compacted to a minimum compaction of 90 percent relative to the maximum dry density determined per the latest ASTM D1557 test.

6. The contractor shall select the equipment and process to be used to achieve the specified density without damage to the pipeline, the adjacent ground, existing improvements or completed work.

APPENDIX E

7. Observations and field tests shall be carried on during construction by AES to confirm that the required degree of compaction has been obtained. Where compaction is less than that specified, additional compaction effort shall be made with adjustment of the moisture content as necessary until the specified compaction is obtained. Field density tests may be omitted at the discretion of the engineer or his representative in the field.

8. Whenever, in the opinion of AES or the Owner's Representative(s), an unstable condition is being created, either by cutting or filling, the work shall not proceed until an investigation has been made and the excavation plan revised, if deemed necessary.

9. Fill material shall not be placed, spread, or rolled during unfavorable weather conditions. When the work is interrupted by heavy rain, fill operations shall not be resumed until field tests by AES indicate the moisture content and density of the fill are as specified.

10. Whenever the words "supervision", "inspection", or "control" are used, they shall mean observation of the work and/or testing of the compacted fill by AESEGI to assess whether substantial compliance with plans, specifications and design concepts has been achieved.

APPENDIX E

DRAINAGE AND EROSION CONTROL RECOMMENDATIONS

Slopes and pads on this project were designed to direct surficial runoff away from structures and reduce water-induced surficial erosion/sloughing. Permanent erosion control measures should be initiated immediately following completion of grading. All constructed slopes will undergo some erosion when subjected to sustained water influx. To maintain appropriate long-term drainage and erosion control, the following points should be considered in slope protection, landscaping, irrigation and modifications to slopes, pads and structures:

1. All interceptor ditches, drainage terraces, down-drains and any other drainage devices should be maintained and kept clear of debris. A qualified Engineer should review any proposed additions or revisions to these systems, to evaluate their impact on slope erosion.

2. Retaining walls should have adequate freeboard to provide a catchment area for minor slope erosion. Periodic inspection, and if necessary, cleanout of deposited soil and debris should be performed; particularly during and after periods of rainfall.

3. The future developers should be made aware of the **potential problems**, which may develop **when drainage is altered** through landscaping and/or construction of retaining walls, and paved walkways. Ponded water, water directed over slope faces, leaking irrigation systems, **overwatering** or other conditions which could lead to excessive soil moisture, **must be avoided**.

4. Slope surficial soils may be subject to water-induced mass erosion. Therefore, a suitable proportion of slope planting should have root systems, which will develop well below three feet. We suggest consideration of drought-resistant shrubs and low trees for this purpose. Intervening areas can then be planted with lightweight surface plants with shallower root systems. All plants should be lightweight and require low moisture. Any loose slough generated during the process of planting should be properly removed from the slope face(s).

5. Construction delays, climate/weather conditions, and plant growth rates may be such that additional short-term, nonplant erosion control measures may be needed; examples would be matting, netting, plastic sheets, deep (5-feet) staking, etc.

APPENDIX E

6. Major erosion can be initiated by seemingly insignificant events; rodent burrowing, human trespass (footprints, etc.), small concentrations of uncontrolled surface/subsurface water; or poor compaction of utility trench backfill on slopes.

7. High and/or fluctuating water content in slope materials is a major factor in slope erosion and/or slope failures. Therefore, all possible precautions should be taken to maintain a moderate and uniform soil moisture. Slope irrigation systems should be properly operated and maintained and system controls should be placed under strict control.

MINIMUM FOUNDATION AND SLAB RECOMMENDATIONS FOR EXPANSIVE SOILS
(ONE-, TWO-, AND THREE-STORY BUILDINGS)

Minimum Residential Footing Recommendations

Expansion Classification (UBC)	Expansion Index (UBC)	Footing Depths (inches)				Continuous Footing Reinforcement
		One and Two Stories		Three Stories		
		Perimeter	Interior	Perimeter	Interior	
Very Low	0 to 20	18	12	24	18	Per structural requirements
Low	21 to 50	18	12	24	18	One # 4 Rebar Top and Bottom
Medium	51 to 90	24	18	30	24	One # 4 Rebar Top and Bottom
High	91 to 130	30	18	36	30	Two # 4 Rebars Top and Bottom

- Minimum footing widths: 12 inches (one-story); 15 inches (two-story); 18 inches (three-story); 24 inches for individual columns.
- All footing depths are measured below lowest adjacent final grade.
- The base of the garage door grade beam should be at the same elevation as that of the adjoining footings.
- Garage slabs should be isolated from stem wall footings with a minimum 3/8" felt expansion joint.
- Isolated exterior structural column footings should be tied back to the main foundation system in at least two (2) orthogonal directions (conventional foundations only).

Minimum Residential Slab Recommendations

Expansion Classification (UBC)	Expansion Index (UBC)	*Slab Subgrade* Presoaking	*Slab Reinforcement*		*Minimum* Slab Thickness (Ref: PCA)
			Option 1	Option 2	
Very Low	0 to 20	None	#3 Rebar at 24" each way	6-#6 gauge, 10"x10" welded wire mesh or equivalent	4 inches
Low	21 to 50	120 percent of optimum moisture content[1] to 18 inches depth	#3 Rebar at 18" each way		
Medium	51 to 90	130 percent of optimum moisture content to 18 inches depth	#4 Rebar at 18" each way	#6-#6 gauge, 6"x6" welded wire mesh or equivalent	5 inches
High	91 to 130	140 percent of optimum moisture content to 24 inches depth	#4 Rebar at 14" each way		6 inches

- Concrete for floor slabs should conform to the requirements contained in Chapter 19 of the 1997 edition of the Uniform Building Code.

Minimum Residential Slab Recommendations continued on back of this page

[1] Optimum moisture content as determined by ASTM D1557 Test Method on subgrade soils.

MINIMUM FOUNDATION AND SLAB RECOMMENDATIONS FOR EXPANSIVE SOILS
(ONE-, TWO-, AND THREE-STORY BUILDINGS)

Minimum Residential Slab Recommendations (continued from front side of this page)

- Sand base should have a Sand Equivalent of 30 or greater (e.g., washed concrete sand).
- Interior area slabs, except garages may be tied to the footings as directed by the Structural Engineer. For Medium and High Expansion Potential subgrades, dowels of No. 3 bars should be placed at 36 inches on centers in the footings and bent 3 feet into the slab.
- It has been observed that welded wire-fabric reinforcement seldom stays at the design height within concrete slabs. We recommend the use of No. 3 reinforcing bars instead of 6x6-10/10 WWF and No. 4 reinforcing bars instead of 6x6-6/6 WWF at the center spacings indicated above.
- Vapor barrier for slabs-on-grade: A sheet of 10-mil visqueen sandwiched between two, 2-inch layers of compacted sand. The vapor barrier must be properly lapped and/or sealed, and sealed around all plumbing structures and other openings. Care should be taken to avoid punctures in the vapor barrier resulting from sharp objects in the subgrade and/or structures. Equivalents are acceptable.
- To reduce moisture intrusion beneath slabs on grade, utility trenches should be backfilled with lean concrete or concrete slurry at foundation perimeters. The plug shall be under the full width of the footing and be extended along a minimum of 24-inch of trench length below the slab.
- Materials from foundation and/or utility trench excavations should not be spread on slab-on-grade areas unless it is compacted and tested.
- Foundation excavations should be observed by a representative of this firm prior to placement of forms, reinforcement, or concrete, to verify that the excavations are embedded to the recommended depth into the recommended material. The excavations should be moisture-conditioned and free of all loose or sloughed material prior to placement of concrete.
- Foundations and floor slabs supported on subsoils with an expansion index greater than 130 should be individually engineered based on actual details of the foundation system.

Post-Tensioned Slabs

As an alternative to conventional foundations, buildings may be supported on post-tensioned slabs, to be designed by a structural engineer in consultation with the geotechnical engineer. In addition, a post-tensioned slab is also recommended for VERY HIGH expansion potential soils (Expansion Index greater than 130), if encountered. Post-tensioned slabs should have footings embedded a minimum of 12 inches below the lowest adjacent grade. The slabs should be designed so that they can be deformed approximately 1 inch vertically over a width of 30 feet without distress in the event of shrinkage or swelling of the supporting soils. The slab should be underlain by a vapor barrier sandwiched between two, 2-inch layers of compacted sand.

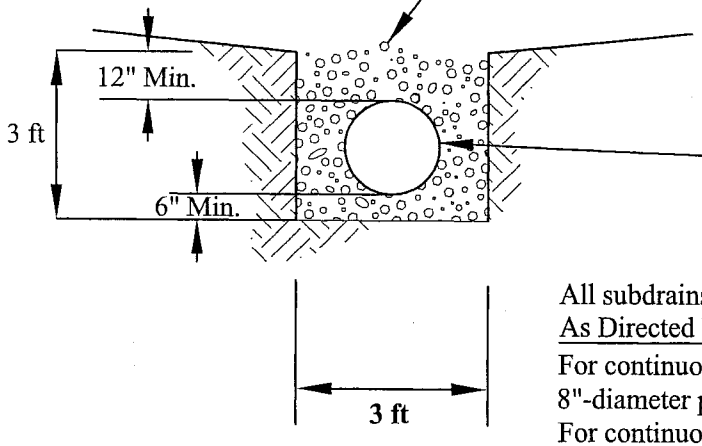
See enlargement
below (typ.)



9 cubic feet per linear foot of perforated pipe of Class 2 Permeable material as specified in Sec. 68-1.025 of the State of California, Dept. of Transportation Standard Spec.

All subdrains to be PVC pipe (SDR 35 or Schedule 40)
As Directed by the Soils Engineer:
For continuous run in excess of 500 ft, use 8"-diameter pipe
For continuous run in excess of 1500 ft, use 10"-diameter pipe

Notes:

Downstream 20 feet minimum of pipe at outlet shall be non-perforated.
Drain pipe perforations shall be 1/4" diameter open holes in two rows along the bottom quarter of pipe.
Center to center spacing between perforations in each row shall not exceed 12 inches.
Subdrain perforations positioned down.
Remove all unsuitable material before placing any fill.
Upslope end of pipe should be capped with an approved cap*.
Minimum 2% gradient.

* Endpoints and long runs should be surveyed

Not to scale

APPENDIX F

SLOPE STABILITY ANALYSES

Introduction

Analyses were performed to evaluate the stability of proposed cut and fill slopes, critical natural slopes proposed to remain adjacent to the development and landslide areas which may impact the proposed development. The stability analyses utilized cross sections constructed to illustrate critical structural geometries and maximum slope heights for each analyzed slope. Our evaluation included gross and surficial stability and static and pseudostatic (i.e. with an imposed pseudostatic simulated load) conditions were considered for gross stability. Based on our analyses, the need for stabilization measures was explored and dimensional design of these measures was performed, as needed, in a step-by-step fashion utilizing computer-based numerical slope stability analyses. The results of our stability analyses are summarized in Table F1 along with slope parameters and recommended mitigations. Slope stability diagrams graphically illustrating the results of our analyses for each cross section are attached for review.

Summary of Slope Conditions Analyzed

Natural slopes evaluated for this investigation include ridgelines and riverbank areas proposed to remain above the Santa Clara River. Cross Sections 3-3', 5-5', 6-6' and 7-7', illustrate the anticipated conditions at critical ridgeline areas. Cross Sections 13-13', 16-16' through 18-18', and 23-23' illustrate the anticipated critical conditions where development is proposed along the Santa Clara riverbank. Cross Section 21-21' illustrates the anticipated conditions where the development is proposed above a natural slope area within the proposed park site.

Calculated factors of safety and recommended mitigation measures are presented in **Table F1** for review. For general description of the geologic/geotechnical conditions, see Section 9.2.11 within the text portion of the report. A 20-foot Building Setback, based on geologic and geotechnical judgment is recommended for Lots 388 through 393, adjacent to the steep natural riverbank slope located below proposed cut-slope CS-10.

The three dimensional geometry of critical cut-slopes are illustrated on Cross Sections 1-1', 2-2', 4-4', 8-8', 9-9', 11-11' through 15-15', 17-17', 18-18', 22-22', 23-23', 28-28', through 31-31'. The results of our stability analyses of these cross sections are presented in **Table F1**. Mitigation measures including buttresses and stability fills have been recommended as

APPENDIX F

needed to provide factors of safety which meet City of Santa Clarita standards as summarized in
Table F1.

The highest proposed fill slope is 80 feet in height as illustrated on Cross Section 20-20'. This fill slope calculates as grossly stable per City of Santa Clarita standards.

Fourteen (14) landslides have been mapped on the subject site. The three-dimensional geometry of the anticipated conditions are illustrated on Cross Sections 4-4', 8-8', 9-9', 10-10', 23-23', 24-24', 27-27'and 28-28'. Stability analyses have been performed on Landslides Qls-5b and Qls-6 (Cross Sections 9-9' and 10-10') only. The results of our stability analyses of these cross sections are presented in **Table F1**. Mitigation measures including complete removal, buttress fills, partial removal and placement into a Restricted Use Area are discussed in the Landslide Summary (**Table 1**) located after the References.

Surficial stability analysis of fill slopes utilizing the "infinite slope" method for this site was performed and is included at the end of Table F1. All permanent cut-slopes exposing terrace deposits or alluvium should be constructed as Stability Fills.

Geometry and Groundwater

As shown on the respective cross sections, the analyzed geometries of cut-slopes and natural slopes included removal of vegetation, topsoil, artificial fill, alluvium, landslide debris and bedrock materials and adding certified compacted fill to achieve the proposed grades, or remedial grades as needed on portions of the slopes. Analyses included cross-bedding and potential adverse bedding with dips ranging from neutral to **17 degrees** depending on geologic data obtained near each cross section listed in **Table F1**.

Review of ground water data in the vicinity and trench and boring log data indicates that the proposed cut-slopes in bedrock are above historic high ground water levels. Perched ground water was observed within the terrace deposits and Saugus formation bedrock within our Bucket Auger Borings BA-1 through BA-6, BA-8, BA-12 and BA-13 at the elevated portions of the site. Where appropriate, ground water was modeled in the slope stability analyses. Where rapid drawdown conditions were expectable adjacent to planned debris basins, those conditions were included in the analyses. Backdrains are proposed for all Stability Fill/Buttress slopes.

APPENDIX F

Shear Strength Parameters

A total of 19 direct shear strength tests were performed for this project. Individual Direct Shear test results are presented in **Appendix B**. Data used in our analyses are summarized in the below table:

Table F2 - Summary of Design Shear Strength Values

MATERIAL	PEAK		RESIDUAL		UNIT WT.
	COHESION (psf)	PHI ϕ	COHESION (psf)	PHI ϕ	(PCF)
Landslide Debris (Qls)	100	26°	100	26°	125
Landslide Plane (Qls)	300	8.5°	300	8.5°	130
Bedrock (TQs), Along Siltstone Bedding	500	21°	450	19°	130
Bedrock (TQs), Along Claystone Bedding[1]	450	16°	250	14.5°	130
Bedrock (TQs), Cross-Bedding	500	43°	400	38°	130
Compacted Fill (Cef)	250	29°	250	29°	130
Alluvium (Qal)	50	28°	50	28°	120
Terrace Deposits (Qt)	50	34°	50	34°	120

During our subsurface investigation for the project we encountered an in-place claystone bedding plane within Bucket-Auger Boring BA-7 located within the CLWA property just north of Landslide Qls-5a. This in-place claystone bedding unit is the basal landslide plane for Landslides Qls-5a, Qls-5b, Qls-6 and possibly Qls-9. This claystone bedding plane was hand sampled using industry standard brass rings oriented perpendicular to the bedding plane and sheared down-dip in our laboratory to obtain shear strength values. Projection of this claystone bedding plane unit and review of the Tentative Tract Map design elevations indicates that this unit does not encounter or project into the vicinity of proposed cut-slopes for this project. North of Landslide Qls-9 this claystone unit is interpreted to be above the proposed grade indicated on the Tentative Map. Based on our subsurface borings and test pits, the site is predominantly coarse-grained. However, the conservative residual shear strength along Saugus Formation siltstone bedding is used in our slope stability evaluation of the site.

In our analyses, residual shear strengths of bedrock and recent alluvium were used for static gross stability while peak strengths were used for pseudostatic gross stability. The weighted

[1] This bedding plane strength was not used in the analyses, as discussed (see text).

APPENDIX F

average of peak shear strengths of new compacted fill materials was used for slope stability analyses.

The following attachments are located within this Appendix.

Slope Stability Analyses Results — Table F1

46	FILL SLOPE	~	Surficial Stability of Infinite Fill Slope with Surficial Saturation	1.65	~	Surficially stable as designed

The above results for static conditions are based upon site-specific shear strength characteristics tabulated in Table F2. These shear strengths were developed based on the direct shear test results presented on Table B2 of "Summary of Shear Strength Test Data"in Appendix B. Residual shear strength values were used for all existing natural materials under static load. Peak shear strength values were used for bedrock, terrace deposits, landslide debris and recent alluvium for pseudostatic loads and for planned compacted fill under both static and pseudostatic loads.

Janbus Empirical Coef is being used for the case of c & phi both > 0
A Critical Failure Surface Searching Method, Using A Random
Technique For Generating Sliding Block Surfaces, Has Been
Specified.
400 Trial Surfaces Have Been Generated.
2 Boxes Specified For Generation Of Central Block Base
Length Of Line Segments For Active And Passive Portions Of
Sliding Block Is 60.0

RUN #7

Box No.	X-Left (ft)	Y-Left (ft)	X-Right (ft)	Y-Right (ft)	Height (ft)
1	220.00	237.27	240.00	241.52	15.00
2	280.00	250.13	320.00	258.63	15.00

Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	218.23	247.57
2	227.53	240.69
3	287.23	254.44
4	289.16	288.82

Factor Of Safety For The Preceding Specified Surface = 3.443
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	231.10	251.43
2	235.00	247.68
3	308.81	249.00
4	311.05	295.59

Factor Of Safety For The Preceding Specified Surface = 8.358
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	224.61	249.48
2	236.69	239.43
3	281.09	249.79
4	282.95	284.76

Factor Of Safety For The Preceding Specified Surface = 5.608
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	214.48	246.44
2	226.51	235.09
3	289.18	249.21
4	289.68	289.17

Factor Of Safety For The Preceding Specified Surface = 5.396
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	210.34	245.20
2	233.98	242.09
3	310.75	258.77
4	310.92	295.56

Factor Of Safety For The Preceding Specified Surface = 4.124
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	219.51	247.95
2	226.47	241.26
3	290.97	257.42
4	291.09	290.09

Factor Of Safety For The Preceding Specified Surface = 7.550
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

RUN # 7

Point No.	X-Surf (ft)	Y-Surf (ft)
1	201.03	242.41
2	223.13	236.58
3	304.61	254.12
4	304.69	294.25

Factor Of Safety For The Preceding Specified Surface = 4.574

Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Examined. They Are Ordered - Most Critical First.

* * Safety Factors Are Calculated By The Modified Janbu Method * *

Failure Surface Specified By 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	216.86	247.16
2	221.44	244.83
3	292.32	259.82
4	332.50	300.00

 A Critical Failure Surface Searching Method, Using A Random
 Technique For Generating Circular Surfaces, Has Been Specified.
 Janbus Empirical Coef. is being used for the case of  c & phi both > 0
1200 Trial Surfaces Have Been Generated.
 400 Surfaces Initiate From Each Of  3 Points Equally Spaced
 Along The Ground Surface Between  X =  38.00 ft.
                                and  X =  42.00 ft.
 Each Surface Terminates Between   X = 225.00 ft.
                                and  X = 300.00 ft.
```

RUN #35

Unless Further Limitations Were Imposed, The Minimum Elevation
At Which A Surface Extends Is Y = 50.00 ft.
5.00 ft. Line Segments Define Each Trial Failure Surface.
Restrictions Have Been Imposed Upon The Angle Of Initiation.
The Angle Has Been Restricted Between The Angles Of -5.0
And 24.0 deg.
Following Are Displayed The Ten Most Critical Of The Trial
Failure Surfaces Examined. They Are Ordered - Most Critical
First.

1	130.0	135.0	250.0	29.0	.00	.0	1
2	115.0	120.0	50.0	28.0	.00	.0	1
3	130.0	135.0	400.0	38.0	.00	.0	1

ANISOTROPIC STRENGTH PARAMETERS
1 soil type(s)
Soil Type 3 Is Anisotropic
Number Of Direction Ranges Specified = 3

Direction Range No.	Counterclockwise Direction Limit (deg)	Cohesion Intercept (psf)	Friction Angle (deg)
1	8.5	400.0	38.0
2	9.5	450.0	19.0
3	90.0	400.0	38.0

1 PIEZOMETRIC SURFACE(S) HAVE BEEN SPECIFIED
Unit Weight of Water = 62.40
Piezometric Surface No. 1 Specified by 5 Coordinate Points

Point No.	X-Water (ft)	Y-Water (ft)
1	.00	42.00
2	130.00	44.00
3	156.00	47.00
4	177.00	54.00
5	280.00	68.00

A Critical Failure Surface Searching Method, Using A Random
Technique For Generating Circular Surfaces, Has Been Specified.
Janbus Empirical Coef. is being used for the case of c & phi both > 0
1200 Trial Surfaces Have Been Generated.
400 Surfaces Initiate From Each Of 3 Points Equally Spaced
Along The Ground Surface Between X = 125.00 ft.
and X = 135.00 ft.

RUN #36

Each Surface Terminates Between X = 206.00 ft.
and X = 250.00 ft.
Unless Further Limitations Were Imposed, The Minimum Elevation
At Which A Surface Extends Is Y = 35.00 ft.
20.00 ft. Line Segments Define Each Trial Failure Surface.
Restrictions Have Been Imposed Upon The Angle Of Initiation.
The Angle Has Been Restricted Between The Angles Of -5.0
And 24.0 deg.
Following Are Displayed The Ten Most Critical Of The Trial
Failure Surfaces Examined. They Are Ordered - Most Critical
First.
* * Safety Factors Are Calculated By The Modified Janbu Method * *
Failure Surface Specified By 6 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)

 2 Boxes Specified For Generation Of Central Block Base
 Length Of Line Segments For Active And Passive Portions Of
```

RUN #42

Sliding Block Is 150.0

Box No.	X-Left (ft)	Y-Left (ft)	X-Right (ft)	Y-Right (ft)	Height (ft)
1	220.00	108.50	260.00	117.00	20.00
2	350.00	136.13	400.00	146.76	20.00

Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	226.29	120.62
2	229.65	117.27
3	396.12	153.19
4	396.50	206.09

Factor Of Safety For The Preceding Specified Surface = 2.968
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	229.49	122.17
2	238.13	116.27
3	383.38	137.56
4	384.93	199.07

Factor Of Safety For The Preceding Specified Surface = 6.138
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	244.77	129.54
2	250.00	124.51
3	386.01	134.11
4	389.26	201.69

Factor Of Safety For The Preceding Specified Surface = 6.454
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	222.35	120.00
2	229.88	112.60
3	389.38	140.47
4	391.54	203.08

Factor Of Safety For The Preceding Specified Surface = 5.067
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	197.10	120.00
2	246.31	108.17
3	379.64	145.56
4	379.97	196.05

Factor Of Safety For The Preceding Specified Surface = 4.612
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined
By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)
1	229.64	122.24
2	241.59	117.29
3	396.49	138.84
4	399.19	207.03

Factor Of Safety For The Preceding Specified Surface = 5.404
Factor Of Safety Calculation Has Gone Through Ten Iterations
The Trial Failure Surface In Question Is Defined

RUN #42

By The Following 4 Coordinate Points

Point No.	X-Surf (ft)	Y-Surf (ft)

ALLAN E. SEWARD ENGINEERING GEOLOGY AND SOILS, INC.

Baylor Gibson — Spreadsheet Written 14-Mar-02

CLIENT Newhall Land — PROJECT NAME River Park

PROJECT ANALYSIS DATE: 20-May-02 — PROJECT NUMBER: 02-1571-4

OBJECTIVE: To determine the surficial stability of the given slope.

GIVEN: This 2H: 1V slope consists of certified engineered general fill.

Slope inclination, i, deg =	26.57	Fill Angle of Internal Friction, Φ', deg. =	29
Fill Total Density, γ_t, pcf =	130	Fill Cohesion, c, psf =	250
Fill Bouyant Density, γ_b, pcf =	67.6	Depth of Interest, d, ft =	4

REFERENCE: Lambe and Whitman, *Soil Mechanics* , John Wiley and Sons, Inc., 1969

ANALYSIS: per Figures 24.1, 24.2 and 24.3 of Lambe and Whitman,

for a 4 ft deep slice of the given slope with unit width and length,

$N' = \gamma_b \, ad \cos i$

$T = \gamma_t \, ad \sin i$

$$FS = \frac{c + N' \tan \Phi'}{T}$$

FS = 1.65

Review of Tentative Tract Map (Revised June 11, 2003)

Project: Tentative Tract 53425
River Park
City of Santa Clarita,
California

References: At end of text

Gentlemen:

This report presents our opinions on the existing geologic and geotechnical conditions on TT 53245 relative to the revised map dated June 11, 2003 and their effects on the proposed development. This report supplements and updates our April 4, 2003 report for TT 53425, hereinafter called "Previous Report", and the conclusions and recommendations presented therein are still applicable except where they are superseded in this report.

1.0 SCOPE OF WORK FOR REVISED TT 53425 (06/11/03)

1. Geologic/Geotechnical Review of revised Tentative Tract Map 53425 dated June 11, 2003.

2. Coordination with the Supervising Civil Engineer, Psomas.

3. Review of the geologic and geotechnical review sheet dated June 18, 2003 prepared for the City of Santa Clarita Transportation and Engineering Services by their reviewing

geologic and geotechnical consultant Arroyo Geotechnical. This review sheet is presented after the text portion of this report.

4. Geologic and geotechnical engineering analyses and preparation of Conclusions and Recommendations based on the existing site conditions and future use intended.

5. Geologic Preparation of the Revised Geologic/Geotechnical Maps, Revised Recommendations and Removal Maps, Revised Geologic Legend, Geotechnical Cross Sections (slope stability analysis), revised Cross Sections and this report.

2.0 BACKGROUND

Geologic and geotechnical aspects of the February 25, 2003 Tentative Map for TT 53425 were previously addressed in our report dated April 4, 2003. This report was reviewed and approved from a geologic and geotechnical standpoint within the City of Santa Clarita Transportation and Engineering Services review sheet dated June 18, 2003. This review sheet was prepared by Arroyo Geotechnical, the City of Santa Clarita geologic and geotechnical reviewing consultant, and is included after the text portion of this report. A revised Tentative Tract Map dated June 11, 2003 has been prepared by Psomas and is attached as the base map for our 100-Scale and 200-Scale Geologic/Geotechnical Maps (Sheets 1 through 4 of 5) as well as our Removal Map (**Plate I**).

3.0 REVISIONS TTM 53425

We have reviewed the latest revised Tentative Tract Map dated June 11, 2003. Lot locations and numbering designations have been revised relative to the original February 25, 2003 Tentative Tract Map design. A total of 439 Single Family Residential Lots, 5 Apartment Lots, 3 Recreation Lots, 2 Commercial Lots, 1 Private Street Lot, 67 Home Owners Association Lots and 28 Lots dedicated to the City of Santa Clarita. The 28 Lots dedicated to the City consist of 1 Park Site, 10 River Trail Lots, 2 Bridge Lots, 1 Water Quality Basin Lot, 8 Maintained Slope Lots and 6 Open Space Lots. In general only minor revisions to the proposed grades and cut-slopes are proposed relative to the original February 25, 2003 Tentative Map. Since relatively minor revisions to the cut-slopes greater than 25 feet in height are proposed, cut-slope designations have remained the same (CS-1 through CS-19). In general the cut-slope locations and orientations, gradients, slope heights, have remained the same with the exception of proposed cut-slopes CS-6 and CS-7. A discussion of these Cut-Slopes is presented in Section 8.1 Stability of Proposed Slopes and Proposed Grades as

well as presented within the Summary of Cut-Slopes Table 1. The proposed bridge abutments for Newhall Ranch Road spanning the Santa Clara River are now included on the Tentative Map.

4.0 FIELD EXPLORATION

Additional field mapping was performed in the vicinity of the proposed bridge abutments and we have revised our Geologic/Geotechnical maps (Sheets 1-4 of 5) and Removal Map (**Plate I**) accordingly.

5.0 GEOLOGY

For specific details on the existing site geologic and geotechnical conditions see our previous report dated April 4, 2003.

6.0 GENERALLIZED GEOLOGIC/GEOTECHNICAL SUBSURFACE CONDITIONS AND SOIL PROPERTIES

The specific details of the site geologic/geotechnical subsurface conditions and soil properties are addressed within our previous report dated 4/4/03.

7.0 GENERAL CONSLUSIONS AND RECOMMENDATIONS

7.1 Feasibility of Development

Tentative Tract 53425 is feasible for development from the standpoint of geology/geotechnical conditions provided our recommendations are followed and implemented during construction. The conclusions and recommendations presented within our 4/4/03 report are still applicable, except where they are superceded in this report.

8.0 GENERAL DESIGN CONSIDERATIONS & RECOMMENDATIONS

8.1 Stability of Proposed Slopes

Since relatively minor revisions to the proposed cut-slopes greater than 25± feet in height are indicated on the revised Tentative Tract Map, cut-slope designations have remained

the same (CS-1 through CS-19). We have revised Cross Sections 8-8', 9-9' and 22-22' (see **Plate II**) based on the new revised design grades presented on the Tentative Tract Map. The tentative tract map indicates designated Cut-Slopes, CS-6 and CS-7 within area A1 have been revised relative to the original 2/25/03 Tentative Tract Map. The revisions to these slopes are discussed below. We have revised our Summary of Landslides Table 1 and Summary of Cut-Slopes Table 2 relative to the revised Lot number designations.

Proposed Cut-Slope CS-6 was originally designed (2/25/03) to be a maximum 30 feet high south and west facing slope with a 2:1 gradient. This slope has been lowered 5 feet to 25 feet in height and the west-facing portion of the slope has been eliminated. Slope stability analysis performed on Cross Section 8-8' for Cut-Slope CS-6 within our previous 4/4/03 report indicate that a 30 feet high slope satisfies the City of Santa Clarita Factor of Safety requirement, therefore the current design (25 feet high) proposed Cut-Slope CS-6 is still considered to be grossly stable as designed. A Stability Fill is recommended for this slope due to the anticipated water seepage from the adjacent Castaic Lake Water Agency water pipeline located within Newhall Ranch Road.

Proposed Cut –Slope CS-7 has been lowered approximately 5 feet to 25 feet in height and has minor changes in orientation relative to the original 2/25/03 Tentative Map design. Previously performed slope stability analysis on Cross Sections 8-8' and 22-22' for the previous design indicate that this slope satisfies the City of Santa Clarita Factor of Safety requirement for slope stability. However, a Stability Fill is recommended for this slope due to anticipated seepage and surficial stability due to the adjacent CLWA pipelines located within Newhall Ranch Road.

8.2 Proposed Removals

Only minor vertical grade changes (0 to 5 feet) are indicated on the revised Tentative Tract Map, therefore our previous removal recommendations still apply. Due to the addition of the proposed bridge abutments for Newhall Ranch Road spanning the Santa Clara River, we have revised our Removal limits. For details, see the Removal Map **Plate I.**

9.0 LIMITATIONS

This report has been prepared for the exclusive use of Newhall Land and their design consultants for the specific site discussed herein. This report should not be considered transferable. Prior to use by others, we should be notified, as additional work may be required to update this report.

In the event that any modifications in the design or location of the proposed development, as discussed herein, are planned, the conclusions and recommendations contained in this report will require a written review by this firm with respect to the planned modifications.

In performing these professional services, we have used the degree of care and skill ordinarily exercised, under similar circumstances, by reputable engineering geologists and geotechnical engineers practicing in this or similar localities.

The analyses and interpretations presented in this report have been based on the results of pertinent field and laboratory soil investigations. It should be recognized that subsurface conditions can vary in time and laterally and with depth at a given site. Our conclusions and recommendations are based on the data available and our interpretation of the data based on our experience and background. Hence, our **conclusions** and **recommendations** are **professional opinions** and are **not meant** to be a control of nature; therefore, **no warranty** is herein **expressed** or **implied**.

It should be noted that faulting is normally confined to the area immediately adjacent to a known fault, or within a few feet of the last fault movement. Regardless of what criteria is used however, absolute assurance against future fault displacement or strong ground motion cannot be obtained in tectonically active areas. New faults can form, as the orientation and magnitude of deformational forces in the earth's crust change with time. Therefore, the location of new breaks or ground motions during a seismic event cannot be located or anticipated.

This report may not be duplicated without the written consent of this firm.

This opportunity to be of service is appreciated. Please contact us if you would like to discuss this report further.

SUMMARY OF LANDSLIDES

LANDSLIDE NO.	SHEET NO.	MITIGATION
1	2 of 5	It is recommended that this landslide be **completely removed** and reconstructed to its approximate original configuration using Certified Engineered Fill utilizing a keyway and backdrains designed by the soils engineer. The design of this keyway will be based on the configuration of the future removal. It is anticipated that the removal depth will range up to 35 feet. In areas to receive fill the removal bottoms should be surveyed in order to document the removal for future reference.
2 and 3	2 of 5	These landslides are located partially within existing cut-slopes and will be subject to periodic maintenance. These landslides are located in an area where they do not impact the proposed development and are safe for the use intended. At the completion of grading, these landslides will be designated as **Restricted Use Areas** on the Final Map.
4	2 of 5	Located in the vicinity of Lots 83 and 84 within a proposed fill area. It is recommended that this landslide be **completely removed** under the continuous observation of the Project Engineering Geologist. It is anticipated that the removal depth will range up to 25 feet below native grade. In areas to receive fill, the removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading.
5a	3 of 5	This landslide is located north of Newhall Ranch Road and was buttressed during the grading and construction of the CLWA facility and associated water line. This landslide is located in an area where it does not impact the proposed development and is safe for the use intended. At the completion of grading, this landslide will be designated as a **Restricted Use Area** on the **Final Map**.

SUMMARY OF LANDSLIDES

LANDSLIDE NO.	SHEET NO.	MITIGATION
5b	3 of 54	This large landslide is located south of Newhall Ranch Road. Stability calculations performed at Cross Section 9-9' indicate this landslide at the proposed Tentative Map grading configuration does not satisfy the City of Santa Clarita requirements for factor of safety. Due to the large size of this landslide, mitigation options are provided. Option 1 - construct a designed buttress utilizing a 150-foot wide by 45-foot deep keyway (at the toe). Option 2 – Construct a designed shear keyway located within the landslide mass. This shear keyway would be based on additional subsurface exploration and analysis. Option 3 – redesign such that proposed structures are not proposed on this landslide (avoidance). At the completion of grading, this landslide would be designated as a **Restricted Use Area** on the Final Map. Option 4 – completely remove the landslide and replace it with certified engineered fill. In areas to receive fill, the removal bottoms should be surveyed in order to document the removal for future reference. If complete removal is performed, it is anticipated that removals will range up to 106 feet deep.
6	3 of 5	This landslide is located east of Landslide Qls-5b. Stability evaluation on Cross Section 10-10' indicates that previous grading for Newhall Ranch Road is grossly stable but the landslide mass south of Newhall Ranch Road does not satisfy the City of Santa Clarita factor of safety requirement. This area will be subject to deformation and settlement in the event that the landslide moves. A park trail with grading is currently proposed. It is recommended that grading be performed such that the existing topography is only minimally altered. It is recommended that this trail not be paved and that minimal watering be performed. At the completion of grading, this landslide would be designated as a **Restricted Use Area** on the **Final Map**.
7	2 of 5	This landslide is located in the vicinity of Lot 130 in a proposed fill area. It is recommended that this landslide be **completely removed** under the continuous observation of the Project Engineering Geologist. The removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading. It is anticipated that the removal will range up to 24 feet.

SUMMARY OF LANDSLIDES

LANDSLIDE NO.	SHEET NO.	MITIGATION
8	3 of 5	This landslide is located beneath proposed Santa Clarita Parkway mostly within a proposed fill area. It is recommended that this landslide be **completely removed** under the continuous observation of the Project Engineering Geologist. The removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading. It is anticipated that the removal will range up to 24 feet.
9	3 of 5	This landslide is located in a proposed cut and proposed fill area. It is recommended that this landslide be **completely removed** under the continuous observation of the Project Engineering Geologist. The removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading. It is anticipated that the removal will range up to 45 feet.
10	3 of 5	This landslide is located in a proposed cut and proposed fill area. It is recommended that this landslide be **completely removed** under the continuous observation of the Project Engineering Geologist. The removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading. It is anticipated that the removal will range up to 35 feet.
11	3 of 5	This landslide is located in proposed cut and proposed fill areas in the vicinity of proposed cut-slopes CS-13 and CS-14. Slope stability analysis on cross section 23-23' indicates this slope/area does not satisfy the city of Santa Clarita factor of safety requirement for slope stability. A remedial buttress fill utilizing a 150 feet wide keyway is required to obtain slope stability factor of safety requirement. Prior to construction of the remedial buttress, it is recommended that this landslide be **completely removed.** It is anticipated that the removal will range up to 40 feet. In areas to receive fill, the removal bottoms should be surveyed in order to document the removal for future reference.
12	3 of 4	It is recommended that the portions of this landslide located beneath the proposed bike trail be **completely removed** during the grading operations and replaced with Certified Engineered Fill. It is anticipated that the removal will range up to 24 feet. At the completion of grading, the remaining portion of this landslide will be designated as a **Restricted Use Area** on the **Final Map.**

SUMMARY OF LANDSLIDES

LANDSLIDE NO.	SHEET NO.	MITIGATION
13	4 of 5	This landslide is located in the vicinity between proposed cut-slopes CS-16 and CS-19. A portion of this landslide is located in an area where grading is proposed. It is recommended that the portion of this landslide within the graded area be **removed** under the continuous observation of the Project Engineering Geologist prior to placing certified engineered fill. It is anticipated that the removal will range up to 35 feet. In areas to receive fill, the removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading.
14	4 of 5	This landslide is located in the vicinity of proposed Cut-Slope CS-19. It is recommended that this landslide be **completely removed** under the continuous observation of the Project Engineering Geologist. The removal bottoms should be surveyed in order to document the removal for future reference and/or later additional grading. It is anticipated that the removal will range up to 24 feet.

SUMMARY OF CUT-SLOPES

Proposed Cut-Slope CS-1

Location: Sheet 2 of 5 – Vicinity of Lot 525 within Area D

Direction Slope Faces: Semicircular facing west to southwest to south

Slope Parameters: 120± feet high with a 2:1 gradient

Cross Sections: 1-1', 2-2'

Anticipated Geologic Conditions: West facing portion - TQs bedrock anticipated to be dipping 4 - 15° towards the south which is neutral to the proposed slope face; Southwesterly facing portion – TQs bedding anticipated to be oriented such that the bedding planes are dipping out of the proposed slope face. Slope stability analysis of this slope indicates this slope has a safety factor greater than the City of Santa Clarita requirements for slope stability and therefore **grossly stable as designed.**

Mitigation Measures: **Not required**

Proposed Cut-Slope CS-2

Location: Sheet 2 of 5 – Vicinity of Lot 524 within Area D

Direction Slope Faces: Southwest

Slope Parameters: 60± feet high with a 2:1 gradient

Cross Sections: 4-4', 28-28'

Anticipated Geologic Conditions: The eastern portion of the slope is anticipated to expose landslide (Qls-1) material within the proposed cut-slope face; **grossly unstable** due to fractured and broken nature of the landslide material. The western portion of the slope is anticipated to expose Saugus Formation bedrock bedding planes dipping out of the proposed slope face. Slope stability analysis performed on Cross Sections 4-4' and 28-28' indicate this slope has a safety factor greater than the City of Santa Clarita requirements for slope stability and therefore **grossly stable as designed.**

Mitigation Measures: It is recommended that this landslide be **completely removed** from the proposed cut-slope face and replaced using Certified Engineered Fill utilizing a keyway and backdrains designed by the soils engineer. The design of this keyway will be based on the configuration of the future removal. It is anticipated that the removal depth will range up to 35 feet. In areas to receive fill the removal bottoms should be surveyed in order to document the removal for future reference. A Restricted Use Area has been recommended in order to permanently limit groundwater levels to those found to be necessary for stability. Within this Restricted Use Area, it is recommended that no permanent piped water be allowed above elevation 1250 on the existing natural ridge north of Lot 513.

SUMMARY OF CUT-SLOPES

Proposed Cut-Slope CS-3

Location: Sheet 2 of 5 - Lot 524 just westerly of the existing water tank
Direction Slope Faces: South
Slope Parameters: 55± feet high with a 2:1 gradient
Cross Sections: 29-29'
Anticipated Geologic Conditions: TQs bedding anticipated to be dipping out of the proposed slope face. Slope stability analysis indicates this slope has a safety factor greater than the City of Santa Clarita requirements for slope stability. **Grossly stable as designed.**
Mitigation Measures: **No mitigation required.**

Proposed Cut-Slope CS-4

Location: Sheet 2 of 5 - Northeast of Lot 524 just westerly of the existing water tank
Direction Slope Faces: Westerly
Slope Parameters: 35± feet high with a 2:1 gradient
Cross Sections: None
Anticipated Geologic Conditions: TQs bedrock is anticipated to be oriented neutral to the proposed cut-slope face. **Grossly stable**
Mitigation Measures: **No mitigation required.** A Restricted Use Area has been recommended in order to permanently limit groundwater levels to those found to be necessary for stability. Within this Restricted Use Area it is recommended that no permanent piped water be allowed above elevation 1250 on the existing natural ridge north of Lot 513.

Proposed Cut-Slope CS-5

Location: Sheet 2 of 5 – Vicinity of Lots 60-73 within Area A1
Direction Slope Faces: Southerly
Slope Parameters: 25± feet high with a 2:1 gradient
Cross Sections: None; see section 8-8' for cut-slope CS-6 for similar configuration
Anticipated Geologic Conditions: TQs bedrock anticipated to be dipping out of the proposed slope face. Slope stability analysis on cross section 8-8', which depicts similar geologic conditions, indicates this slope satisfies the City of Santa Clarita factor of safety requirement for slope stability. However, due to anticipated seepage from the existing adjacent CLWA pipelines, this slope may be subject to surficial instability. **Grossly stable but surficially unstable**
Mitigation Measures: **Stability fill required** utilizing a 20 feet wide keyway for the south facing portion of the slope.

SUMMARY OF CUT-SLOPES

Proposed Cut-Slope CS-6

Location: Sheet 2 of 5 – Vicinity of Lots 158-176 within Area A1
Direction Slope Faces: South
Slope Parameters: 25± feet high with a 2:1 gradient
Cross Sections: 8-8'
Anticipated Geologic Conditions:

- West facing portion - TQs bedrock anticipated to be oriented neutral to the proposed cut-slope face with the exception of a small portion of the slope which may expose landslide (Qls-5b) material. The portion of the slope exposing the TQs bedrock is anticipated to be **grossly stable**; the portion of the slope exposing the landslide material will be **grossly unstable**.
- South facing portion - TQs bedrock anticipated to be dipping out of the proposed slope face. Slope stability analysis performed on the previous design (4/4/03) indicates this slope will satisfy the City of Santa Clarita factor of safety requirement for slope stability. However, due to potential seepage from the existing adjacent CLWA pipelines, this slope may be subject to surficial instability. **Grossly stable but surficially unstable**

Mitigation Measures: All landslide material exposed within the slope will require complete removal and replacement with certified engineered fill. **Stability fill required** utilizing a 20 feet wide keyway for the south-facing portion of the proposed cut-slope. See landslide summary (Table 1) for mitigation options for landslide Qls-5b.

Proposed Cut-Slope CS-7

Location: Sheet 2 of 5 – Vicinity of Lots 181-194 within Area A1
Direction Slope Faces: Southeast
Slope Parameters: 25± feet high with a 2:1 gradient
Cross Sections: 8-8', 22-22'
Anticipated Geologic Conditions: TQs bedrock anticipated to be dipping out of the proposed cut-slope face with the exception of a small portion of the slope, which may expose landslide (Qls-5b) material. Slope stability analysis performed for the previous design of this cut-slope, at 30 feet high, indicates this slope will satisfy the City of Santa Clarita factor of safety requirement for slope stability. However, due to anticipated seepage from the existing adjacent CLWA pipelines, this slope may be subject to surficial instability. **Grossly stable but surficially unstable**
Mitigation Measures: All landslide material exposed within the slope will require complete removal and replacement with certified engineered fill. **Stability fill**

SUMMARY OF CUT-SLOPES

required utilizing a 20 feet wide keyway for the remaining portion of the proposed cut-slope exposing TQs material. See landslide summary (Table 1) for mitigation options for landslide Qls-5b.

Proposed Cut-Slope CS-8

Location: Sheet 3 of 5 – Vicinity of Lots 276 and 277 Area A2
Direction Slope Faces: Semicircular – south to east to northeast
Slope Parameters: 35± feet high with a 2:1 gradient
Cross Sections: 30-30'
Anticipated Geologic Conditions: Anticipated to expose Quaternary Terrace Deposits over TQs bedrock dipping up to 12 degrees out of the south to southeast facing portion of the proposed slope face and oriented neutral to the east facing portion of the proposed slope face. Quaternary Terrace Deposits are subject to surficial instability due to their friable nature. Slope stability analysis of this slope indicates this slope satisfies the City of Santa Clarita factor of safety requirement for slope stability. **Grossly stable but surficially unstable**
Mitigation Measures: **Stability fill required** utilizing a 25 feet wide keyway.

Proposed Cut-Slope CS-9

Location: Sheet 3 of 5 – Vicinity of Santa Clarita Parkway and Lot 260 Area A2
Direction Slope Faces: Westerly
Slope Parameters: 32± feet high with a 2:1 gradient
Cross Sections: None
Anticipated Geologic Conditions: Anticipated to expose crudely bedded horizontally oriented Quaternary Terrace Deposits. Quaternary Terrace Deposits are subject to surficial instability due to their friable nature. **Grossly stable but surficially unstable**
Mitigation Measures: **Stability fill required.**

Proposed Cut-Slope CS-10

Location: Sheet 3 of 5 – Lots 388 – 397 Area B
Direction Slope Faces: Southeast
Slope Parameters: 50± feet high with a 2:1 gradient
Cross Sections: 16-16', 17-17', 18-18' & 19-19'
Anticipated Geologic Conditions: Anticipated to expose Quaternary Terrace Deposits over TQs bedrock dipping neutral to 3 degrees out of the proposed slope face. Quaternary Terrace Deposits are subject to surficial instability due to their

SUMMARY OF CUT-SLOPES

friable nature. Slope stability analysis of this slope performed on Cross Sections 16-16', 17-17' and 18-18' indicates this slope satisfies the City of Santa Clarita factor of safety requirement for slope stability. **Grossly stable but surficially unstable**
Mitigation Measures: **Stability fill required.**

Proposed Cut-Slope CS-11

Location: Sheet 3 of 5 – South of Lots 466 and 467 within Area B
Direction Slope Faces: Southeast
Slope Parameters: 70± feet high with a 2:1 gradient
Cross Sections: 11-11'
Anticipated Geologic Conditions: Anticipated to expose TQs bedrock dipping out of the proposed slope face. Slope stability analysis of this slope indicates this slope does not satisfy the City of Santa Clarita factor of safety requirement for slope stability. **Grossly unstable.**
Mitigation Measures: **Buttress fill required** utilizing an 80 feet wide keyway.

Proposed Cut-Slope CS-12

Location: Sheet 3 of 5 – Vicinity of Lots 403-420 within Area B
Direction Slope Faces: South to southeast
Slope Parameters: 30± feet high with a 2:1 gradient
Cross Sections: 11-11', 27-27'
Anticipated Geologic Conditions: Anticipated to expose landslide (Qls-9) material within the proposed slope face in the vicinity of Lots 407-414 and TQs bedrock dipping out of the proposed slope face in the vicinity of Lots 415-420. Subsurface exploration indicates that perched ground water conditions exist in this vicinity. Slope stability analyses performed on Cross Section 11-11' indicate that this slope satisfies the City of Santa Clarita factor of safety requirement for slope stability. Thus, proposed cut-slope CS-12 is considered to be **grossly stable but surficially unstable** due to anticipated surficial instability due to the anticipated elevated ground water conditions.
Mitigation Measures: **Remove landslide Qls-9** and replace with certified engineered fill. The remaining bedrock portions will require a Stability fill utilizing a 20 feet wide keyway.

Proposed Cut-Slope CS-13

Location: Sheet 4 of 5 – Vicinity of Lots 475 and 420- 429 – Area B
Direction Slope Faces: South to southeast

SUMMARY OF CUT-SLOPES

Slope Parameters: 50± feet high with a 2:1 to 3:1 gradient
Cross Sections: 11-11', 14-14' & 23-23'
Anticipated Geologic Conditions: Anticipated to expose TQs Bedrock dipping out of the proposed cut-slope face. Landslide Qls-11 material is anticipated to be exposed within the eastern portion of the slope. Subsurface exploration indicates perched ground water conditions exist in this vicinity. Slope stability analysis indicates the western portion of this slope satisfies the City of Santa Clarita factor of safety requirement and is considered grossly stable as designed, but potentially **surficially unstable** due to expected surficial instability due to the anticipated perched ground water conditions. Slope stability analysis performed on the eastern portion of this slope indicates this portion of the slope does not satisfy the factor of safety requirement for slope stability. This portion of the slope is considered **grossly unstable** as designed.
Mitigation Measures: Remove entire landslide Qls-11. **Stability fill required** utilizing a 20 to 30 feet wide keyway is proposed for the western portion of this slope. The eastern portion requires **buttress fill** utilizing a 150 feet wide and 24 feet deep keyway constructed at the toe of proposed cut-slope CS-14 in the vicinity of the proposed bike trail. This designed keyway and backcut at the toe of proposed cut-slope CS-14 encompasses the eastern portion of cut-slope CS-13.

Proposed Cut-Slope CS-14

Location: Sheet 4 of 5 – East of Lot 475 adjacent to the Pedestrian/Bike Trail easement.
Direction Slope Faces: Southeast
Slope Parameters: 25± feet high with a 2:1 gradient
Cross Sections: 23-23'
Anticipated Geologic Conditions: Anticipated to expose landslide Qls-11 material within the proposed cut-slope face. The underlying geologic structure of the Saugus Formation bedrock is dipping towards the proposed cut-slope face. Perched groundwater conditions were encountered within bucket auger boring BA-6. Slope stability analysis of this slope indicates this slope does not satisfy the City of Santa Clarita factor of safety requirement for slope stability. **Grossly unstable.**
Mitigation Measures: Remove entire landslide Qls-11 and construct a **Buttress fill** utilizing a 150 feet wide keyway starting from the toe of proposed cut-slope CS-14. This buttress fill encompasses portions of proposed cut-slope CS-13.

SUMMARY OF CUT-SLOPES

Proposed Cut-Slope CS-15

Location: Within the CLWA property north of Newhall Ranch Road Sheets 3 and 4 of 5

Direction Slope Faces: Southeast

Slope Parameters: 95± feet high with a 2:1 gradient

Cross Sections: 11-11', 12-12', 13-13' & 14-14'

Anticipated Geologic Conditions: Quaternary Terrace Deposits over TQs bedrock. The TQs bedrock is anticipated to be dipping out of the proposed cut-slope face. Subsurface exploration indicates perched ground water conditions exist in this vicinity. Slope stability analysis of this slope indicates this slope does not satisfy the City of Santa Clarita factor of safety requirement for slope stability. **Grossly unstable**

Mitigation Measures: **Buttress fill required** utilizing a designed keyway. This keyway is proposed to be 40 feet wide along the western portion and 95 feet wide along the eastern portion of the slope.

Proposed Cut-Slope CS-16

Location: Sheet 4 of 5 – North of Lot 521 in the vicinity of the proposed debris basin within Area C.

Direction Slope Faces: Southeast

Slope Parameters: 50± feet high with a 2:1 gradient

Cross Sections: 15-15', 20-20', & 31-31'

Anticipated Geologic Conditions: An anticlinal axial trace within the Saugus Formation bedrock is anticipated to be exposed within the northern portion of the proposed cut-slope face. South of the axial trace, the TQs bedrock is anticipated to be dipping out of the proposed slope face. North of the axial trace, the TQs bedrock is anticipated to be dipping into the proposed slope face. Local deformation including faulting and fracturing may be present within the core of the anticline axis and may be subject to surficial failures. Quaternary Terrace Deposits are also anticipated to be exposed within the proposed cut-slope and are also subject to surficial failures. Slope stability analysis utilizing rapid drawdown condition indicates this slope satisfies the City of Santa Clarita factor of safety requirement for slope stability and is **grossly stable but surficially unstable.**

Mitigation Measures: **Stability fill required** utilizing a 25 feet wide keyway.

SUMMARY OF CUT-SLOPES

Proposed Cut-Slope CS-17

Location: Sheet 4 of 5 – South of Newhall Ranch Road within open space Lot 515
Direction Slope Faces: Southeast
Slope Parameters: 65± feet high with a 2:1 gradient
Cross Sections: 15-15'
Anticipated Geologic Conditions: Anticipated to expose TQs bedrock dipping out of the proposed slope face as well as a fill over bedrock situation. Slope stability analysis of this slope indicates this slope does not satisfy the City of Santa Clarita factor of safety requirement for slope stability. **Grossly unstable.**
Mitigation Measures: **Buttress fill required** utilizing a 30 feet wide keyway.

Proposed Cut-Slope CS-18

Location: Sheet 4 of 5 – Vicinity of Lot 509 within Area C.
Direction Slope Faces: South
Slope Parameters: 28± feet high with a 2:1 gradient
Cross Sections: None
Anticipated Geologic Conditions: An anticlinal axial trace within the Saugus Formation bedrock is anticipated to be exposed within the western portion of the proposed cut-slope face. South of the axial trace, the TQs bedrock is anticipated to be dipping out of the proposed slope face. North of the axial trace, the TQs bedrock is anticipated to be dipping into the proposed slope face. Local deformation including faulting and fracturing may be present within the core of the anticline axis and may be subject to surficial failures. Quaternary Terrace Deposits are also anticipated to be exposed within the upper portion of the proposed cut-slope and are also subject to surficial failures. **Grossly stable but surficially unstable.**
Mitigation Measures: **Stability fill required** utilizing a 20 feet wide keyway.

Proposed Cut-Slope CS-19

Location: Sheet 4 of 5 –Lot 520 within Area C
Direction Slope Faces: South to southeast
Slope Parameters: 30± feet high with a 2:1 gradient
Cross Sections: 24-24'
Anticipated Geologic Conditions: Anticipated to expose Quaternary Terrace Deposits over TQs bedrock dipping into the proposed slope face. Quaternary Terrace Deposits are subject to surficial instability due to their friable nature. Landslide Qls-14 anticipated to be exposed within the lower portion of the proposed cut-slope. Potential minor faults and fractures may be present due to a mapped minor fault zone

SUMMARY OF CUT-SLOPES

located in this vicinity. Lower portion of the cut-slope **grossly unstable** due to the presence of landslide material and **surficially unstable** due to the Qt deposits and potential minor fault zone located in this vicinity.

Mitigation Measures: Remove landslide Qls-14 and construct a **Stability fill.**

Geology/Geotechnical Engineering Review Sheet

Project Address:	Vacant Land		
Tentative Tract:	53425 River Park	**Lots:**	524
Owner/Developer:	Newhall Land		
Geologist:	Allen E. Seward, Inc.	**Geology Report Dated:**	4/4/03
Soils Engineer:	Allen E. Seward, Inc.	**Soils Report Dated:**	4/4/03
Review Sheet No.:	1	**Review Date:**	6/18/03
City Representative:	Hoon Hahn		

Recommended Action: *Report approved from a geotechnical standpoint for environmental document*

The consultant has produced a comprehensive document related to this project. On several pages of Volume I it has been indicated that additional recommendations will be forthcoming at the grading plan stage. That is acceptable. In addition we offer several comments to be addressed at the grading plan stage. They are:

1. In several cross-sections it is called for slope toe protection at the edge of the Santa Clara River. Please provide recommendations and details.
2. On page 25 of Volume I it is stated fill slopes were analyzed under rapid draw down conditions. Where are the calculations?
3. The liquefaction evaluation, which has been provided, is for the uphill property. Describe the liquefaction potential for the Santa Clara River bed with high water conditions.
4. Page C-5 of Volume I stated no lateral spreading is expected, as there is no free-face toward which liquefied soils could move. If there is a liquefaction potential in the riverbed, doesn't that create a weakened free-face?

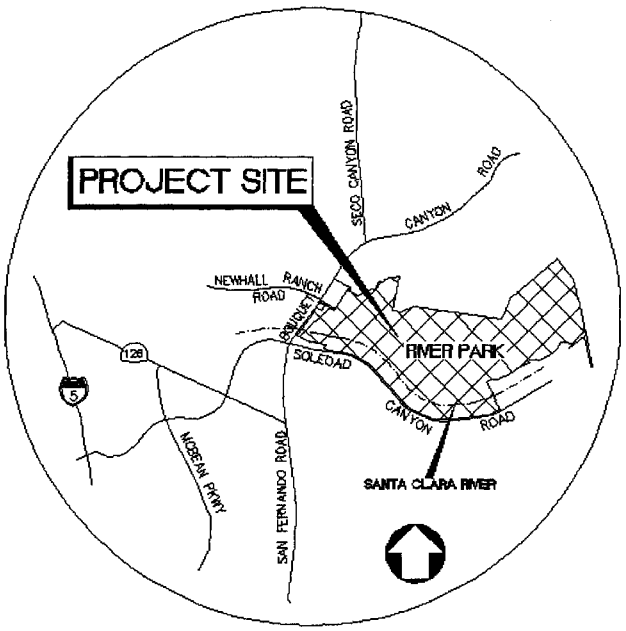
1 INTRODUCTION

1.1 PROJECT DESCRIPTION

1.1.1 Project Site

The Riverpark project lies in the center of the City of Santa Clarita, and within the watershed of an unnamed and roughly 835-acre tributary of the 1,634 square-mile Santa Clara River Basin Watershed (see Vicinity Map). The Santa Clara River flows through and adjacent to the project. The project site is located north of Soledad Canyon Road, east of Bouquet Canyon Road, and west of Golden Valley Road.



VICINITY MAP
NOT TO SCALE

The site is currently vacant except for a small portion that is being used by a contractor as a temporary storage yard with several temporary buildings. The proposed Riverpark project lies within the Valley Center Concept ("VCC") area of the City's General Plan, which specifically outlines the type and intensity of development in the core of the City of Santa Clarita. The proposed project consists of 744 apartment units, 439 single-family detached units, and a maximum of 40,000 square feet of retail commercial. Site preparation will include a cut and fill grading operation totaling 5.2 million cubic yards for both project development and construction of master-planned roadways (Newhall Ranch Road and Santa Clarita Parkway) within the project boundaries. Additional remedial grading is proposed. Earthwork is proposed to be balanced onsite. The project also includes buried bank stabilization, erosion protection, and the construction of the Newhall Ranch Road/Golden Valley Road Bridge over the Santa Clara River. The bridge would include abutments and bank stabilization on the north and south side of the bridge, as well as piers within the River. The project does not include the Santa Clarita Parkway Bridge, which is part of the City's General Plan and is expected to be constructed in the future; however, this latter bridge is included in the cumulative analysis because it is a City-planned improvement and much of its construction would occur within the project site boundaries.

1.1.2 Proposed Improvements

The proposed improvements on the project site that would provide flood and erosion control, and which would occur in and adjacent to the Santa Clara River, include buried bank stabilization, and erosion protection. The Newhall Ranch Road/Golden Valley Road Bridge over the Santa Clara River would also affect the hydraulics of the river.

At project buildout, runoff from the seven drainage areas would continue to flow through the site, but would be channeled through a storm system that would be constructed from the developed upland areas of the site down to the Santa Clara River. As required in the Los Angeles County Department of PublicWorks memorandum entitled, "Level of Flood Protection and Drainage Protection Standards," all on-site drainage systems carrying runoff from developed areas will be designed for the 25-year Design Storm (Urban Flood), while storm drains under major and secondary highways, open channels (main channels), debris carrying systems, and sumps will be designed for the 50-year Capital Flood. The City of Santa Clarita conforms to these Los Angeles County guidelines.

Runoff through the site would be controlled through a combination of grading, storm drainpipes, channels, catch basins, outlet structures, and bank stabilization along the river. The proposed drainage improvements are described below and their locations are illustrated in **Figure 1, Drainage Concept Map**, which also illustrates the post-development drainage patterns for the project site.

Project facilities are described below:

- *Storm Drains*
  Storm drains (pipes and reinforced concrete boxes) designed for either the 25-year or 50-year Capital storm would consist of both privately (Homeowner's Associations, Assessment Districts etc.)- and publicly (City of Santa Clarita and County of Los Angeles)-maintained systems. The minimum publicly-maintained mainline pipe size would be 18-inch connector pipes for clear flows.

- *Open Channels*
  Small open channels would consist of rectangular and trapezoidal concrete channels and would be designed for either the 25-year or 50-year Capital storm, depending on the source of the runoff. The channels sized for the 50-year Capital storm will have greater capacity than those sized for the 25-year storm.

- *Low Flow Pipes and Outlets*
  To reduce pollution impacts from the low flow runoff, a series of pipes and outlets will be provided to intercept first flush runoff from paved project areas. Pollutants expected to be generated on the project site, their potential water quality impacts, and water quality control are addressed in the Water Quality Technical Report.

- *Catch Basins*
  Catch basins would be provided to intercept flows beyond the 10- and 25-year storms and at strategic locations to minimize flooding at street intersections and at sump locations.

- *Debris Basins*
  To reduce debris being discharged through and from the site, debris basins are proposed to intercept flows from undeveloped upland areas prior to their discharge into the on-site storm system.

- *Energy Dissipaters*
  To reduce storm flow velocities and to prevent erosion at stormwater discharge points into the river, energy dissipaters consisting of either rip-rap or larger standard impact type energy dissipaters would be constructed wherever necessary at storm system outlets into the river. These energy dissipaters would slow the rate of flow of runoff into the river in order to prevent erosion of the stream channel.

- *Bank Stabilization*
  The project would include bank stabilization along the Santa Clara River totaling approximately 6,000 linear feet for residential, park and commercial project development (not including approximately 1,500 feet of toe protection [e.g. A-Jacks™, soil cement or equivalent]), and approximately 3,000 linear feet to allow for the construction of Newhall Ranch Road.

- The Newhall Ranch Road/Golden Valley Road bridge, including bridge abutments (on both the north and south side), and piers is also analyzed.

Improvements along the Santa Clara River were analyzed and approved in the Natural River Management Plan (NRMP). Differences between the project improvements and those permitted under the NRMP are illustrated in **Figure 2, Bank Stabilization.**

1.3 DEFINITIONS

The following are definitions to several acronyms and terms, which will be frequently used in this section of the Flood Technical Report.

100-year storm	Precipitation event corresponding to a flood that has a 1/100, or one percent, chance of occurring in any given year.
ACOE	Army Corps of Engineers
Burned and Bulked	

Runoff (Qbb)	Runoff from burned areas that are laden with burned vegetation, fines, rocks, mud and other debris.
Capital Flood (Qcap)	The runoff resulting from a theoretical storm based on Los Angeles County Department of Public Works methodology. The "model" storm is derived from 50-year frequency rainfall values, which occur in a time sequence patterned after actual major extra-tropical storms occurring in the Los Angeles Region. The calculations of runoff are also based on the soil types and amount of impervious surfaces in a watershed area, and on the assumption that undeveloped portions of the watershed are burned, resulting in significant amounts of debris and sediment being added to the runoff.
CDFG	California Department of Fish and Game
Clear Runoff (Qc)	Runoff that is absent of fines (finely crushed or powdered material), mud, rocks, vegetation, and other debris.
Coefficient of Runoff	Variable in the rational and modified rational method runoff formula, which is dependent upon soil type, rainfall intensity, and the percent of imperviousness.
CWA	Federal Clean Water Act
Detention Basin	Physical flood control structure that captures storm flows and temporarily stores these flows in man-made surface depressions and, therefore, not available for producing surface runoff during storm events. See also Water Quality Detention Basins.
Depression Storage	Upstream runoff that is captured by and settles in a natural or manmade depression and does not continue downstream.
Erosion	The wearing away of land surfaces by water, wind, and ice
First Flush	First flush is defined in Los Angeles County as the runoff volume generated from 0.75-inches of rainfall in a 24 hour period.
Floodplain	Nearly level land situated on either or both sides of a channel that is subject to flooding during infrequent events.
Impervious	A description of a substance that will not permit water to flow through it.
Infiltration	The penetration of water through the ground surface into sub-surface soil or the penetration of water from the soil into sewer or other pipes through defective joints, connections, or manhole walls.

Interception	That portion of precipitation intercepted by vegetation. Intercepted precipitation is disposed of by drip, stem flow, or evaporation (or sometimes sublimation, in the case of snow, sleet, hail, or freezing rain).
LACDPW	Los Angeles County Department of Public Works
Peak Flow	Peak runoff rate measured in cubic feet per second (cfs).
Percolation	The downward flow or filtering of water through pores or spaces in rock or soil.
Q	Runoff rates measured in cubic feet per second.
Q50bb	Peak runoff from a 50-year rainfall intensity storm from undeveloped areas that is laden with burned vegetation, fines, rocks, and other debris.
Q50c	Peak runoff from a 50-year rainfall intensity storm from developed areas or from undeveloped areas that are not assumed to be burned or bulked.
Runoff	The portion of rainfall, melted snow, or irrigation water that flows across the ground surface rather than filtrating into the soil.
RWQCBLAR	Regional Water Quality Control Board, Los Angeles Region
Sedimentation	Deposition of waterborne sediments due to a decrease in water velocity and a corresponding reduction in the size and amount of sediment, which can be carried by the flowing water.
Sump	An area from which there is no surface flow outlet.
SWRCB	State Water Resources Control Board
Transpiration	The process by which water vapor is lost to the atmosphere from living plants.
Velocity	The rate or speed at which surface runoff water flows either over land or through a channel, measured in feet per second (fps).
Watershed	All land and water within the confines of a drainage divide.
Waters of the U.S.	Although the definition may change in 2003 to exclude non-navigable, isolated water bodies, in 1986 (U.S. Federal Register), Waters of the U.S. was defined as follows:

All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; all interstate waters including interstate wetlands; all other waters, such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation, or destruction of which could affect interstate or foreign commerce including any such waters: (1) which are or could be used by interstate or foreign travelers for recreational or other purposes; or (2) from which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) which are used or could be used for industrial purposes by industries in interstate commerce. Also included are all impoundments of waters otherwise defined as waters of the United States under the definition; tributaries of waters identified above; the territorial seas; and wetlands adjacent to waters (other than the waters that are themselves wetlands) identified above.[1]

By United States Army Corps of Engineers definition, "Waters of the United States" are defined by the "ordinary high water mark," which can be identified by physical characteristics, such as channel scouring, bank "shelving," areas cleared of terrestrial vegetation, litter and debris, or other indications that may be appropriate.

Wetlands[2] Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

2 METHODOLOGY

Three development scenarios are addressed in this report:

1. Existing,
2. Existing With Project, and
3. Cumulative Buildout.

Brief summaries of hydrologic and hydraulic methodology are presented in this section to provide the reader with background information and understanding of the methodology used to calculate pre- and post-development runoff quantities, the capacities of proposed improvements, and the effects of development on the Santa Clara River.

2.1 HYDROLOGY BACKGROUND AND METHODOLOGY

2.1.1 City of Santa Clarita and Los Angeles County Criteria

The City of Santa Clarita and the Flood Control Division of the Los Angeles County Department of Public Works (LACDPW) regulates storm runoff,. The LACDPW issued a memorandum in 1986 entitled "Level of Flood Protection and Drainage Protection Standards" for development projects in Los Angeles County. The memorandum established Los Angeles County policy on levels of flood protection and requires that the following facilities be designed for the Capital Flood: all facilities not under State of California jurisdiction that intercept flood waters from natural drainage courses, all areas mapped as floodways, all facilities that are constructed to drain natural depressions or sumps, and all culverts under major and secondary highways. All facilities in developed areas that are not covered by the Capital Flood protection conditions must be designed for the Urban Flood, or runoff from a 25-year frequency design storm. Because the project would also intercept flood flows from natural areas, its storm drainage facilities that accept these flows must be sized and designed for the Capital Flood.

In addition to meeting this required level of flood protection, all development in the Santa Clara River watershed must meet standards adopted by the LACDPW for the Santa Clara River and its major tributaries in the County Sedimentation Manual (pp. 2-2 to 2-6). Further, properties owned by The Newhall Land & Farming Company (including the Riverpark project site) adjacent to the Santa Clara River that include improvements along and across a segment of the river must also meet standards outlined in the EIS/EIR for the Natural River Management Plan, which addresses potential impacts associated with such development .

2.1.2 Explanation of the County Capital Flood

In 1931, the Los Angeles County Flood Control District (LACFCD) (now the Flood Control Division of the County's Department of Public Works) began development of a Comprehensive Plan of flood control facilities to collect and convey flows from the mountainous canyons, the alluvial fans, and the urbanized coastal plain.

The major needs in designing the system were: the reduction of damage due to high canyon flows, the conveyance of large volumes of water in a major storm, and the ability to meet future flood control needs. The design of the flood protection system for the County is based upon the Department of Public Works' Capital Flood hydrology.

The Department's 50-year Capital Flood (or Qcap) hydrology is based on a "design," or theoretical storm event that is derived from 50-year frequency rainfall values and is patterned after actual major extra-tropical storms observed in the Los Angeles region. The 50-year frequency design storm is assumed to occur over a period of four days, with the maximum rainfall falling on the fourth day.

Analysis of recorded major storms reveals that, during the twenty-four-hour period of maximum rainfall, rainfall intensity typically increases during the first 70 to 90 percent of the period and decreases in the remaining time. Furthermore, approximately 80 percent of the amount of the twenty-four-hour rainfall occurs within the same 70 to 90 percent of the period. In developing

the Capital Flood (or Qcap), the 50-year frequency design storm is assumed to fall on saturated soils. In converting rainfall to runoff, rainfall that is not lost due to the hydrologic processes of interception, evaporation, transpiration, depression storage, infiltration, or percolation is assumed to be surface runoff. The effect of snowfall or snow melt on rainfall-runoff relationships is a consideration in only a very limited portion of the County (i.e., the higher elevations) where snowfall accumulates in winter.

Another assumption made in developing a Capital Flood design flow rate is that natural portions of the watershed have been burned by fire. When a watershed burns, the soil infiltration rate decreases due to the loss of vegetation and physical changes in the soil. The County has run field infiltrometer tests in order to quantify the effect that burning has on the coefficient of runoff. The effect of burning the watershed can increase the design runoff rate from 10 percent to 20 percent.

The final factor in adjusting the Capital Flood design flow rate is referred to as a bulking factor. In the area where a watershed is burned, the runoff would carry with it a large layer of eroded topsoil. This sediment, along with the associated burned trees and brush, is referred to as debris. In order to account for these quantities of debris, the design flow rate is artificially increased using a prescribed bulking factor, which is a function of not only soil type, but also the steepness of the terrain and the size of the drainage basin. The bulking factors for larger drainage basins range from about 1.20 to 1.50, or from 20 percent to 50 percent over and above the burned flow rate.

In summary, the County's Qcap is based on a theoretical four-day storm event occurring right after the watershed has been burned with the resulting flow rate being increased again by a bulking factor, thereby yielding a peak flow rate that is 32 to 80 percent higher than a 50-year storm over an unburned-unbulked drainage basin. The probability of all of the theoretical assumptions identified in the County's Capital Flood happening at the same time is extremely small, and yields greater design flows than the Federal Insurance Administration's methodology for calculating the 100-year and 500-year floods. As a result, the County's methodology is more conservative than that of the Federal Emergency Management Agency. The City has adopted the County's Qcap requirements for projects within its jurisdiction.

2.1.3 Method of Drainage Analysis

The engineering term for the methods used to properly size pipes and channels is "hydraulic analysis." To determine the proper sizes of pipes and channels, assumptions must be made regarding the amount of rainfall to design for and the amount and type of development that would take place in a drainage basin. An estimate must also be made as to how often that amount of rainfall could occur. This is referred to as the storm recurrence interval, or its reciprocal value – storm frequency. For example, a storm that has a 10 percent recurrence interval is a storm that has a 10 percent chance of occurring in any given year. The reciprocal of this number (1/10) is also known as a 10-year frequency. The most important concept to keep in mind is that a pipe or channel is "designed" for a rate of flow (measured in cubic feet per second), not a volume of flow (measured in cubic feet or acre-feet). A dam or a lake is designed for storing or containing a fixed volume of water. A pipe of a fixed size, on the other hand, can carry different flow rates, depending on the pressure placed on the water.

In designing a storm drain system, the size of a pipe that would safely carry a predicted rate of flow (expressed in cubic feet per second - cfs) must be calculated. A 1-foot square box which is 1-foot deep (a cubic-foot) can hold 7.5 gallons of water. From this fact, the amount of storm water passing through a pipe or channel in one second can, very simply put, be calculated by multiplying the cross sectional area of the flow in the pipe (in square feet) by the rate of storm flows through the pipe in feet per second. This three-dimensional rate of flow is referred to as "cubic feet per second."

With the above concepts in mind, the effects of development on natural ground can be considered. Buildings, driveways, patios, sidewalks, and roads all create new impervious covers to the natural ground, and prevent water from being absorbed into the ground. The water that would normally infiltrate into the ground, therefore, runs off at higher than normal flow rates, referred to as "Q." Therefore, the flow rates from developed areas are greater than from undeveloped areas.

2.1.4 Explanation of Design Hydrology

The following provides a more discussion of the effects of soil type, imperviousness, and burning and bulking on storm runoff quantities.

(a) Effects of Soil Type and Amount of Imperviousness on Runoff Rates

The rate of runoff in undeveloped areas is directly related to the type of soil. Certain soil types accept water faster (are more pervious) than other soils. Therefore, the types of soils present on a site are used in the calculations of runoff. Different soil types have very different water infiltration (or absorption) rates. If a sandy soil (highly pervious) is paved over, the coefficient of runoff (C) would greatly increase, whereas if a clay soil (not highly pervious) is paved over, runoff values would go up, but not as high as in the case of sandy soil because the sandy soil absorbs water faster. In small storms, some soils can absorb 100 percent of the rainfall. For example, soil type 015, Tujunga Fine Sandy Loam, can completely absorb a 0.5-inch per hour (in/hr) storm and almost completely absorb a 1.0 in/hr storm, thereby yielding extremely low runoff rates. For a 200-acre parcel with soil types 015 (Tujunga Fine Sandy Loam) and 012 (Ramona Clay Loam), radically different runoff quantities for the same rainfall events occur. For an intense storm, I = 1.0 inch per hour, and the very pervious soil type 015 (Tujunga Fine Sandy Loam), the runoff rate would be 20 cfs. For the same size parcel on a very impervious soil, such as soil type 012 (Ramona Clay Loam), the runoff rate would be 168 cfs.

(b) Effects of Burning and Bulking

In an undeveloped watershed, Capital Flood flow rates assume a burned condition, which causes the coefficient of runoff to increase. Further, after increasing the coefficient of runoff for burning, the flow rate is then multiplied by a bulking factor, which is used to account for the amount of mud, and debris that would be contained within the flow from the burned watershed. In the case of the project, the increase in runoff, or flow rates, due to an increase in the coefficient of runoff (C) to account for burning is from 10 to 20 percent. Application of the

bulking factor to account for debris production would increase runoff quantities by 20 to 50 percent over and above the burned flow rate.

(c) Effects of Development

As previously mentioned, development places impervious materials over soils that had previously absorbed storm water. Once the impervious materials are placed over the soil, no direct percolation occurs and runoff takes place. Because development does not typically completely over cover the ground surface, portions of each developed parcel (e.g., front, side, and rear yards, landscaping, open space, etc.) remain pervious to infiltration by storm water. Percent imperviousness for each land use existing on or proposed for the site is presented in **Table 1, Percent Imperviousness for Selected Land Uses.**

Table 1

2.2 SANTA CLARA RIVER HYDRAULICS

The floodplain conditions of the Santa Clara River were modeled using River Analysis System (RAS) software developed by the United States Army Corps of Engineers (U.S. ACOE) Hydrologic Engineering Center (HEC). Inputs to the HEC-RAS model include channel geometry, boundary conditions, hydraulic roughness, and hydrology. HEC-GeoRAS is a HEC-developed pre-/post-processor to the hydraulic model HEC-RAS and was used to compile and store a three dimensional representation of the land surface for defining channel and floodplain geometry. A Triangular Irregular Network (TIN) was created from surveyed 2-foot topographic data using the ArcInfo program Topogrid. The TIN was used to extract geometric data for hydraulic analysis. The geometric data were then imported to the hydraulic model HEC-RAS. The modeling prepared for the Riverpark project is consistent with that prepared for the NRMP.

The project and cumulative condition models for the river were created by modifying existing cross section geometrics of the river to simulate the hydraulic effects of the proposed project bank stabilization, erosion protection and Newhall Ranch Road, including the Newhall Ranch Road/Golden Valley Road bridge (project scenario) and Santa Clarita Parkway Bridges (cumulative scenario) on the river. The encroachment due to the bank stabilization was conservatively approximated with levees in the hydraulic model (model levees set at equivalent elevation on slope of channel invert). The proposed Newhall Ranch Road/Golden Valley Road Bridge is modeled on the conservative assumption that the bridge span, bank stabilization and

abutment locations are consistent with the Vesting Tentative Tract Map and the pier spacing is conservatively modeled from the City of Santa Clarita Project Study Report Equivalent Cross Valley Connector Between Soledad Canyon Road and Bouquet Canyon Road configuration that would have the greatest impact on river hydraulics.

Existing Santa Clara River discharge rates for the 2-, 5-, 10-, 20-, 50-, and 100-year storm events were obtained from a 1994 U.S. ACOE study entitled, Santa Clara River Adopted Discharge Frequency Values. This study is based upon a frequency analysis of stream flow data along the Santa Clara River and, therefore, approximates river flows from observed data.

Using the Los Angeles County Flood Control District formula provided below the increase in flow resulting from development was estimated for each storm frequency in the proposed scenario.

$$Q_y = \left(\frac{y}{x}\right)^{0.223} \cdot Q_x \text{ where,}$$

Qy = target flow

Qx = known flow

y = target storm event frequency

x = known storm event frequency

These calculated increases in flow were then added to the Santa Clara River existing discharge rates in order to approximate the proposed discharge rates. Because the calculations for the proposed clear flows do not account for proposed debris collection facilities, these increases in flows represent a conservative upper limit used for impact analysis.

Six of the seven recurrence intervals included in the analysis were obtained from this Los Angeles County study; the seventh, the Los Angeles County Capital flood, is referenced from the NRMP. Because the NRMP flow represents the full-buildout of the drainage area (i.e. cumulative development), this flow represents a upper limit and therefore is conservative when used for the existing and proposed scenarios.

The following parameters apply to all three model settings: Existing, Proposed, and Cumulative.

- Bank stations
- Hydraulic roughness
- Boundary conditions

The bank station locations are approximated as the water surface elevation level of the runoff from an existing scenario 2-year storm event. The 2-year return interval approximates typical bankfull conditions.

Hydraulic roughness is estimated by coefficients in the Manning's equation (metric units) below:

$$Q = \frac{1}{n} \bullet A \bullet R^{\frac{2}{3}} \bullet S^{\frac{1}{2}}, where$$

n is the Manning's Roughness Coefficient
A is the cross-sectional area
R is the ration of A divided by the wetted perimeter and,
S is the energy slope

For this report, the Manning's roughness coefficients were estimated from local condition observations of in-stream and floodplain vegetation, mapped by field biologists (Impact Sciences, 2002). The following **Table 2, Hydraulic Roughness Coefficients** shows the variation of Manning's roughness coefficients based on vegetation and how those compare to published values.

Table 2.
Hydraulic Roughness Coefficients

Vegetation/Land Use	Manning's Roughness Coefficient [used in this study]	Reference Manning's Coefficient (Chow 1959)
Sand with no vegetation	0.025	0.025-0.033
Sand with Sporadic Growth/Grass Pasture	0.035	0.03-0.05
Scattered Brush/Heavy Weeds/Light Brush and Trees	0.050	0.035-0.07

Boundary conditions represent the flow conditions at the limits of the hydraulic analysis. Model reach limits were established such that the boundary conditions do not affect model results. In this study, boundary conditions reflect normal depth and an approximate channel slope of 1 percent at the upstream boundary and critical depth at the downstream boundary. The input hydrology is the flow rate data for the seven return periods as documented in **Table 3, Existing Drainages and Runoff Quantities.**

The proposed project and cumulative condition models were created by modifying existing condition cross section geometries to simulate the proposed project bank stabilization and bridges. The encroachment due to the bank stabilization was approximated with levees in the hydraulic model (model levees set at equivalent elevation on slope of channel invert). The Newhall Ranch Road Bridge is modeled on the conservative assumption that the bridge span is consistent with the Vesting Tentative Tract Map and the pier spacing is modeled from the Project Study Report Equivalent Cross Valley Connector between Soledad Canyon Road and Bouquet Canyon Road (PSRE) configuration that results in the most severe impacts to flood waters.

3 EXISTING CONDITIONS

3.1 DRAINAGE AREAS AND WATERCOURSES

The Santa Clara River traverses the southern portion of the site, which is located within an unnamed approximately 834-acre tributary watershed of the 1,634 square mile Santa Clara River

basin. The area of this tributary watershed represents 0.08 percent of the Santa Clara River basin and consists primarily of open space and vacant land. Annual rainfall in the tributary area is typically low (an annual average of 17 inches) and generally occurs in the winter months. Runoff flows to and through eight drainage areas on the site via sheet flows and natural concentrated flows.

3.1.1 Santa Clara River

The reach of the Santa Clara River at the Project site has intermittent low surface flows created by larger storm events. Downstream of the project site, flows are created by tertiary treated effluent discharges from two downstream water reclamation plants operated by the County Sanitation Districts of Los Angeles County and storm water runoff. Completely natural flows in the river only occur in the winter due to storm runoff. The flows vary significantly from year-to-year. In addition, there are short-term releases from Castaic Lake during summer months that reach the river via Castaic Creek, which joins the river several miles downstream of the Project site.

The reach of the river within and adjacent to the site has multiple channels (braided). This kind of system is characterized by high sediment loads, high bank erodibility, and intense and intermittent runoff conditions. Combined with the relatively flat gradient of the river at this point (less than one percent), it has a high potential to aggrade (deposit sediment) at low flow velocities.

Flows eventually discharge from the project to the Santa Clara River from the eight areas. The acreage for each of the drainage areas is provided in **Table 3, Existing Drainages and Runoff Quantities.** There are currently no existing drainage or erosion/sedimentation control improvements located within the site.

Capital Flood runoff quantities for each of the eight drainage areas and are provided in **Table 3, Existing Drainages and Runoff Quantities.** Under existing conditions, combined clear flows total 1,396 cubic feet per second (cfs), while burned and bulked flows total 2,225 cfs. The calculated total debris volume is 31,770 cubic yards (cy).

Table 3
Existing Drainages and Runoff Quantities

Drainage Area	Acreage	Q50c[1] (cfs)	Q50bb[2] (cfs)	Debris Volume (cy)
100 series[3]	49.2	103	163	1,270

[1] *Q50c - 50-year rainfall intensity clear flow.*
[2] Q50bb - 50-year rainfall intensity burned and bulked flow.
[3] *"Series" is intended to represent that there is more than one number in succession. For example in the 100 series there is 100, 101, 102, etc that as a whole make up the 100 series drainage area. Instead of listing each individual number of the subarea only the series is listed. It should be noted that series designations for existing and proposed conditions do not represent identical drainage conditions*

Existing flow rates from observed data for the Santa Clara River during 2-, 5-, 10-, 20-, 50-, and 100-year storm events are compiled in **Table 4, Existing River Flows upstream of confluence at Bouquet Canyon.**

Table 4
Existing River Flows upstream of confluence at Bouquet Canyon.

Recurrence Interval	Flow (Discharge) Rate (cfs)
2-Year[1]	1,300
5-Year[1]	4,100
10-Year[1]	7,400
20-Year[1]	12,100
50-Year[1]	21,400
100-Year[1]	31,300
Capital Flood[2]	52,100

Applicant, Valencia Company. August 1998.*

3.1.2 On-Site Drainages

The total tributary area that drains through the project site and to the river at the project boundaries is approximately 834 acres. This runoff flows to and through the site via sheet flows and natural concentrated flows. When compared with the Capital Flood on the Santa Clara River, the project peak (burned and bulked) flow rate represents approximately 5 percent of the Santa Clara River peak discharge rate.

There are a total of seven jurisdictional drainages located on-site, excluding the Santa Clara River.

3.2 FLOOD HAZARDS

A portion of the site lies within the 100-year floodplain of the Santa Clara River and within the Federal Emergency Management Administration (FEMA) 100-year floodplain. Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) number 060729 0345C dated September 9, 1989 for the Unincorporated Areas of Los Angeles County, California. The map is included in the Appendix. The 100-year floodplain boundaries are based

on historical runoff records as actually measured with stream gauges. Mapping the 100-year floodplain is important because FEMA and the Federal Insurance Administration (FIA) uses it to establish standards for flood insurance coverage. Under FIA criteria, the 100-year flood elevation is the "base flood" and any land that is outside of this 100-year, or base flood, elevation would be considered reasonably safe and free from flood hazard.

Table 5, Existing Floodplain/Stream Area Within the Project Tributary Watershed, shows the areas of each existing floodplain and stream for seven storm events. The existing floodplains for the seven storm events are shown in **Figures 3** through **9**.

Table 5
Existing Floodplain/Stream Area
Within the Project Tributary Watershed

4 PROJECT CONDITIONS

The impacts of project implementation are discussed below. In summary, the project includes the construction of approximately 9,000 linear feet of bank stabilization which is necessary to protect Newhall Ranch Road and the residential and commercial development. In addition, approximately, 1,500 linear feet of toe or erosion protection would be installed adjacent to the project's Area B. The impacts of installing bank protection, bridge piers and abutments (Newhall Ranch Road/Golden Valley Road Bridge) and erosion protection on the Santa Clara River are analyzed in this section This project condition analysis focuses only on the potential hydrologic and hydraulic impacts of the project.

4.1 ALTERATION OF EXISTING DRAINAGE PATTERNS

4.1.1 Santa Clara River

The Santa Clara River will be altered with the placement of the bank stabilization, erosion protection, bridge abutments and piers, storm drain outlets and energy dissipators as proposed by the project.

Impacts associated with erosion and sediment deposition and therefore streambed modification within the river are evaluated as a function of in-stream velocities, which are indicators for potential riverbed scouring. While this is discussed in Section 4.5, in summary, there would be no increases in velocity during the 5- and 10-year storm events, and decreases in river velocity for the 20- to 100-year storm events. **Table 11, Pre- and Post-Development River Velocities**, indicates that increases in areas of the floodplain that would be subject to velocities over 4 feet/second during a 2-year storm event would be minimal, localized, and would be caused only by the smallest event scenario.

Additionally, **Table 6, Summary of Water Surface Elevations** shows that there are no significant increases in water surface elevation due to project improvements.

Table 6.

4.1.2 On-site drainage

Implementation of the project (with the associated storm drain system) would affect the natural tributary drainage channels described previously. While existing discharges from the project site are not concentrated into centralized outlet structures (as proposed by the project), surface water flows will naturally form paths of least resistance and will either concentrate at existing topographic depressions or cut channels that serve as concentrated discharge locations. Therefore, while the project includes development of the storm drain system and will have pre-defined outlets, this will not significantly alter drainage patterns. Further, the project includes

the use of energy dissipators at the storm drain outlets to the Santa Clara River. The installation of these improvements will dissipate the energy that could cause erosion at the project outlet.

4.2 WHETHER RUNOFF VOLUMES WOULD EXCEED EXISTING OR PLANNED SYSTEMS

The Riverpark project would increase the amount of runoff from those areas of the site that would be covered by roads, buildings, paved parking areas, and other relatively impermeable or impervious features (see **Table 1, Percent Imperviousness for Selected Land Uses**, for the assumed percent imperviousness for each land use proposed for the site). Specifically, impervious surfaces on the site would increase the amount of clear flow runoff from the site. Burned and bulked runoff and debris volumes, however, would be reduced because the developed portions of the site would be covered with impervious surfaces and non-erodable vegetation, and because debris basins that would reduce the amount of debris and sediment in the runoff are proposed at upstream locations.

The post-development runoff quantities provided in **Table 7, Post-Development Runoff Quantities**, would total 1,687 cfs for the tributary area during a 50-year storm. A comparison of this table with **Table 3, Existing Drainages and Runoff Quantities**, demonstrates that clear flows would increase over existing conditions. Burned and bulked flows being discharged from the site would total 2,112 cfs, which is a 5.0 percent reduction in Capital Flood flows, from the site [(2,225 – 2,112)/2,225 = 0.05], when compared to pre-development conditions. This reduction in burned and bulked flows is largely due to project debris basins that would capture upstream bulk flows and allow debris to settle out from the runoff before it enters the storm system through the developed portion of the site.

The County and City-defined criteria for design of flood control systems establish the more severe hydrologic conditions (i.e., burned and bulked)as the basis of impact evaluation (see Sections 2.1.1 and 2.1.2 of this report). Therefore, because the 50-year Capital Flood burned and bulked runoff from the project would decrease, the project would not result in downstream flooding.

Table 7
Post-Development Runoff Quantities

Drainage Area[4]	Acreage	Q50c[2] (cfs)	Q50bb[3] (cfs)	Debris Volume (cy)
100 series	34.8	108	111	363
200 series	79.6	180	187	902
300 series	201	440	510	2668
400 series	17.2	34	34	0
500 series	116.5	281	295	1424
600 series	356.5	538	854	9982
700 series	2.1	7	11	116
800 series	4.0	14	25	103
900 series	22.2	85	85	0
Totals[1]	**833.9**	**1,687**	**2,112**	**15,558**

[1] *Slight reduction (about 2 acres) in total area from existing conditions is due to on-site grading and rounding of numbers.*
[2] *Q50c - 50-year rainfall intensity clear flow.*
[3] *Q50bb - 50-year Capital Flood burned and bulked flow.*
[4] *When compared to the pre-development conditions, typically more drainage areas are called out because the proposed project provides detail on how the hydrologic would be addressed*
[5] *When compared to pre-development conditions the acreage of the drainage area actually changes due to several factors: rounding of numbers and by altering some of the slopes on the site, some of drainage areas causing them to drain away from the river instead of toward the river.*
Note.Drainage conditions for specific areas should not be compared with existing-condition series, but should be reviewed as a whole. Changes to series-specific flows are largely a function of modifications to drainage subareas.

4.3 HOUSING OR STRUCTURES WITHIN A 100-YEAR FLOOD HAZARD AREA

The project encroaches upon the existing FEMA flood hazard area, and residential lots 338 through 352 along the southern site boundary would be located within the 100-year flood hazard area. As previously indicated, the project proposes buried bank stabilization which would protect the affected residential units from flood waters.

The bank stabilization improvements and the proposed Newhall Ranch Road/Golden Valley Road Bridge would be placed within the 100-year flood hazard area of the Santa Clara River. The Santa Clara River will be slightly altered by the placement of the bank stabilization, erosion protection and the Newhall Ranch/Golden Valley Road Bridge. The bank stabilization and erosion protection would provide adequate protection to the developed areas from flood danger; therefore, a modification to the FEMA flood hazard boundary will be necessary and appropriate to correspond to the location of the bank stabilization improvements. As shown above, their locations and dimensions are such that neither the bank stabilization, erosion protection nor the bridge would impede or redirect flood flows within the river. .

4.4 EXPOSURE TO SIGNIFICANT RISK OF LOSS, INJURY, OR DEATH

The project site is located inland from the Pacific Ocean and not in proximity to any large, continuously-filled bodies of surface water; therefore, it is not subject to seiche or tsunamis. There are no dams upstream of the Riverpark site. There is no indication that the proposed project, or other existing or planned projects in the project area, would be at risk due to a failure of a dam. Furthermore, although the site is subject to some debris and mud flows, adequate

building setbacks from natural slopes and debris control facilities proposed in upstream areas of the site would protect the project development from debris and mudflow hazards. Therefore, the following impact analysis focuses on potential impacts associated with flooding within the river.

As designed, the proposed bank stabilization will protect the development areas on the site from the 100-year and 50-year Capital Flood events in the Santa Clara River and would only slightly increase the water surface elevation of the river on-site (by less than a foot).

Under both existing and developed conditions, floodplain areas would be inundated during extreme events (i.e., the 50-Year, 100-Year and Capital floods). **Table 8, Pre- and Post-Development Floodplain/Stream Area,** compares the pre- and post-development acreages of the floodplain for the seven storm events. The floodplain of the river in this analysis begins at the Bouquet Canyon Road Bridge and ends 3,040 feet upstream of the California Aqueduct pipeline crossing, or directly north of the Newhall Ranch Road/Golden Valley Road Bridge. As shown, the acreage within the river study area that would be subject to flooding would decrease with project development by as much as 42.3 acres. As indicated the project includes bank stabilization and erosion protection, which would protect the development areas from flood waters.

Table 8
Pre- and Post-Development Floodplain/Stream Area

Storm Event	Existing Conditions Acreage	Post Development Acreage	Difference
2-Year	109.4	105.0	-4.4
5-Year	187.6	179.3	-8.3
10-Year	266.0	250.8	-15.2
20-Year	300.5	278.7	-21.8
50-Year	325.0	295.2	-29.8
100-Year	337.4	303.7	-33.7
Capital Flood	355.5	313.2	-42.3

Figures 10 through 16 graphically illustrate the effects of the installation of the proposed bank stabilization, erosion protection and the Newhall Ranch Road/Golden Valley Road Bridge. Water surface elevations on-site would increase slightly with construction of the proposed bank stabilization, but would dissipate. These increases are not considered significant as they are less than one foot and would not expose people or structures to a significant risk of loss, injury or death involving flooding.

4.5 WHETHER SUBSTANTIAL ALTERATION OF AN EXISTING DRAINAGE PATTERN WOULD RESULT IN SUBSTANTIAL EROSION OR SILTATION AND HARMFUL INCREASES IN EROSION

4.5.1 Santa Clara River

Erosion is not anticipated to be a concern on developed portions on the site. Potential for erosion within the river can be evaluated by reviewing changes to hydraulic shear stress or flow velocities, in conjunction with potentially erodible materials. In Los Angeles County, velocities are the preferred indicator for potential streambed erosion. Because the Santa Clara Riverbed is composed of alluvial materials such as alluvial silts, sands, and gravels, the nonerodible velocities (velocities below which no erosion would occur) range from 2.5 feet per second (fine gravels under clear flow conditions) to 5.0 feet per second (alluvial silts transporting colloidal materials) (Chow, 1959). Therefore, a representative velocity of 4.0 feet per second was determined to be the appropriate indicator for potential erosion.

If a significant amount of floodplain area were in the 0-4-foot/second range, but as a result of the project (including the Newhall Ranch Road/Golden Valley Road Bridge), would be subjected to velocities greater than 4 feet/second, it would be considered potentially significant. However, **Table 9, Pre- and Post-Development River Velocities**, indicates that increases in areas of the river that would be subject to velocities over 4 feet/second during a 2-year storm event would be minimal (increase of two acres), localized (in the immediate vicinity of the abutments and piers), and would be caused only by the smallest event scenario. There would be no net increases in areas affected by velocity during the 5- and 10-year storm events, and, decreases in river velocity for the 20- to 100-year storm events.

Table 9
Pre- and Post-Development River Velocities

	Area (acres) with Velocities Greater than 4 ft/sec		Impacts
Storm Event	Existing Scenario	Post-Development	(Percent Increase from Existing)
2-Year	32	34	6%
5-Year	86	86	0%
10-Year	137	137	0%
20-Year	174	168	-3%
50-Year	228	223	-2%
100-Year	276	264	-4%

4.5.2 Siltation

A comparison between **Table 3, Existing Drainages and Runoff Quantities**, and **Table 7, Post-Development Runoff Quantities**, demonstrates that total debris volume from the approximately 835-acre tributary watershed would decrease from 31,770 cy to 15,688 cy, which is approximately a 50 percent decrease . This reduction in sedimentation and debris production is a result of reduced erosion of the site due to coverage of much of the development area with pavement, roofs, vegetation, and other non-erosive surfaces. It is also a result of the proposed debris basins that would capture sediment and debris from project runoff.

With these improvements in place, the project would reduce post-construction impacts on on- and off-site erosion, downstream sedimentation, and debris production and transport.

4.5.3 On-Site Drainage Discharge Points

The Los Angeles MS4 Permit notes that increased volume, velocity, and discharge duration of storm water runoff from developed areas could potentially accelerate downstream erosion and impair stream habitat. As a result, the Permit stipulates that "Permittees shall control post-peak storm water runoff in Natural Drainage Systems to prevent accelerated stream erosion and protect stream habitat." The following discussion supports the conclusion that there are no significant downstream impacts potentially accelerating erosion and stream habitat:

- In smaller natural riverine systems, frequent discharges (on the order of the average annual and 2-year flows) dictate stream geomorphology. Extended and frequent discharges at these critical flow rates would potentially impact stream health. The project proposes water quality basins, which will capture small, frequent storms and release flows at non-erosive rates.
- To reduce storm flow velocities during smaller, more frequent flows (i.e., 2-year storm events) and to prevent erosion at stormwater discharge points into the river, the project has incorporated energy dissipaters consisting of either rip-rap or larger standard impact type energy dissipaters would be constructed at affected storm system outlets in the River.. These energy dissipaters would slow the rate of flow of runoff into the river in order to prevent erosion of the stream channel.

5 CUMULATIVE ANALYSIS

It has been estimated that approximately 4 percent of that portion of the Santa Clara River watershed found in Los Angeles County would be developed and approximately 2.5 percent of the portion of the watershed found in Ventura County would be developed.[3] Each development project in the Santa Clara River watershed (1,634 sq. miles) will be of varying character and size, will have its own unique topographic and geologic characteristics, will have flood impacts that will be unique to the geologic/soil conditions of the site and the tributary watershed in which it is located, and will be subject to the development criteria of the jurisdiction in which it is located.

All development within the portion of the watershed of the Santa Clara River located in Los Angeles County, including that within the City of Santa Clarita, is required to comply with the LACFWD Qcap requirements to ensure that upstream or downstream flooding does not occur. Compliance with these requirements ensures consistency with the County's Qcap model. Pursuant to LACDPW requirements, all drainage systems in developments that carry runoff from developed areas must be designed for the 25-year Urban Design storm, while storm drains under major and secondary highways, open channels (main channels), debris carrying systems, and sumps must be designed for the 50-year Capital Flood storm. LACDPW also prohibits significant increases in off-site post-development storm flows and significant increases in storm

[3] Alex Sheydayi, Deputy Director, Ventura County Public Works Agency, Flood Control Department, statement made at the Santa Clara River Enhancement and Management Plan Steering Committee Meeting, May 30, 1995.

flow velocities. Development in the Los Angeles County portion of the watershed must also comply with LACDPW design criteria. As a result of compliance, overall storm runoff discharge quantities from the watershed under post-development runoff conditions would be less than or equal to existing conditions largely because the runoff would be free of the debris that is typical of undeveloped watersheds and flow velocities would not increase significantly. Because on-site facilities would already have been built for burned and bulked flows from undeveloped areas, they would have more than adequate capacity to accommodate off-site flows as the off-site portions of the drainage areas develop.

As the analysis of project development demonstrates, development in minor drainage courses within the portions of the watershed located in Los Angeles County in compliance with these requirements would experience a decrease in burned and bulked runoff as the hillsides of the watershed develop.[4] Discharge quantities into the Santa Clara River from these minor drainages under post-development conditions would be less than under existing conditions because the runoff would be free of the debris that is typical of undeveloped watersheds. As a policy, both the City of Santa Clarita and the LACDPW prohibit significant increases in flow velocity from a project site; therefore, adherence to this policy would result in no significant cumulative increases in velocity or erosion/sedimentation impacts along that portion of the Santa Clara River which drains to this watershed.

Other projects within the City of Santa Clarita and Los Angeles County would be subject not only to the same general requirements as the proposed Riverpark project, but also to such other requirements as the City of Santa Clarita (as applicable) and LACDPW would specifically identify for them based on their unique topographic and geologic characteristics.

The analysis of project conditions, above, demonstrates that project development, which must comply with all of these City and County requirements, would not create any significant impacts. Compliance with the applicable regulations results in the less discharge from the project post-development as compared to pre-development levels, and thus runoff from the project causes no incremental increase in the cumulative impact of watershed-wide development.

The City of Santa Clarita General Plan provides for additional development within this tributary watershed. However, the only probable future development within the approximate 835-acre tributary drainage in which the project is located is the Santa Clarita Parkway Bridge. As shown by the analysis below, the addition of that Bridge to the tributary drainage also would not cause any significant impacts. Therefore, cumulative development within this tributary drainage would not cause any cumulative impacts.

Because the cumulative project drainage improvements in the City of Santa Clarita and Los Angeles County would be required to conform to the requirements of the City of Santa Clarita Department of Engineering Services and the LACDPW in order to handle the Capital Flood from the affected watershed, no potentially significant cumulative project flooding impacts are expected to occur from the incremental impacts of the project. The development criteria of each jurisdiction will ensure that no potentially significant cumulative impacts will occur.

[4] **See sections 2.1.1 amd 2.1.2 for reference discussion.**

5.1 LACDPW DESIGN CRITERIA

Because on-site drainage facilities would have adequate capacity to capture and convey off-site flows from developed upstream areas and because the storm drainage improvements in the remainder of the watershed would be required to comply with LACDPW design criteria, no significant increases in velocity and related scouring, and no potentially significant cumulative project flooding impacts are expected to occur downstream of the site as the watershed builds out.

5.2 FLOODPLAIN

Table 10, Pre-, Post-Development, and Cumulative Floodplain/Stream Area, compares the pre- and post-development acreages of the floodplain for seven storm events. As shown, the acreage subject to flooding under would decrease with cumulative project development for all storm events except the 2-year. In the cumulative scenario, the already constructed bank stabilization associated with Tract 20838 would protect Soledad Canyon Road from flooding in all storm events.

Table 10
Pre-, Post-Development, and Cumulative Floodplain/Stream Area

Storm Event	Pre-Development (acres)	Post-Development (acres)	Cumulative (including Santa Clarita Parkway Bridge) (acres)
2-Year	109.4	105	106.2
5-Year	187.6	179.3	178.4
10-Year	266.0	250.8	250.7
20-Year	300.5	278.7	278.3
50-Year	325	295.2	295.1
100-Year	337.4	303.7	302.9
Capital Flood	355.5	313.2	310.7

As shown in **Table 11,** there would be no significant increases in water surface elevation in the Santa Clara River under the cumulative impacts scenario, which assumes full buildout upstream from the project site. No potentially significant floodplain impacts are anticipated as a result of cumulative buildout.

5.3 STREAM EROSION AND DEBRIS DEPOSITION

Using the benchmark of increases in areas with velocities of 4 feet/second, **Table 12, Cumulative Impacts on Erosion**, demonstrates no appreciable increases in potentially eroded areas due to buildout of the study area during the 2- and 5-year storm events, and a decrease in area during the 10-year and greater storm events. Any increase is for relatively small storm events and local mitigation measures would be required in specific locations. Unlike larger storm events, which would transport sediment downstream, for smaller storms it is probable that many of these localized conditions will equilibrate. Therefore no potentially significant stream erosion and debris deposition impacts are anticipated due to the project, subject to mitigation.

Table 12
Cumulative Impacts on Erosion

Storm Event	Area (acres) with Velocities Greater than 4 ft/sec		Difference in Acreage
	Existing Conditions	Cumulative Conditions (including Santa Clarita Parkway Bridge)	
2-Year	31	35	+4
5-Year	85	86	+1
10-Year	136	133	-3
20-Year	176	172	-4
50-Year	229	223	-6
100-Year	286	267	-19

Because the cumulative project drainage improvements in the City of Santa Clarita and Los Angeles County would be required to conform to the requirements of the City of Santa Clarita Department of Engineering Services and the LACDPW in order to handle the Capital Flood from the affected watershed, no potentially significant cumulative project flooding impacts are expected to occur when the watershed reaches buildout. Erosion and sedimentation, when controlled as required by the City and County, would also not result in potentially significant cumulative impacts.

5.4 CONCLUSION

Other projects within Santa Clarita and Los Angeles County would not only be subject to the same general requirements as the proposed Riverpark project, but to other requirements that the City of Santa Clarita (as applicable) and LACDPW would specifically identify for them. All development within the watershed of the Santa Clara River within the City of Santa Clarita is already required to comply with the City of Santa Clarita Department of Engineering Services' requirements and locations within the unincorporated Los Angeles County would comply with the Los Angeles County. Department of Public Works Flood Control Division requirements have been established specifically to ensure that upstream or downstream flooding does not occur.. Erosion and sedimentation, when controlled as required by the City and County, would also not result in potentially significant cumulative impacts.
Therefore no unavoidable potential significant cumulative flooding, erosion and sedimentation impacts would be created. Compliance with these requirements ensures consistency with the County's Qcap model.

1.0 INTRODUCTION

This report presents the results of a traffic study carried out to evaluate the Riverpark project (VTTM 53425) and associated entitlements located in the City of Santa Clarita. It provides the traffic and circulation material for the Environmental Impact Report (EIR) prepared for this project.

1.1 PROJECT DESCRIPTION

A detailed description of this project and the resulting California Environmental Quality Act (CEQA) requirements addressed here can be found in the Notice of Preparation and in the EIR itself. The proposed project is located on an approximately 695 acre site and consists of 1,183 residential dwelling units, a maximum of 40,000 square feet of retail commercial uses and a neighborhood park. The site is generally bounded by Bouquet Canyon Road to the west and the Santa Clara River to the south. Newhall Ranch Road will bisect the site and will provide the primary means of access. Figure 1-1 illustrates the location of the site in relation to the surrounding roadway system.

1.2 STUDY AREA

The study area includes the roadways and intersections near to the project site and those locations where project generated traffic could cause a significant impact. Figure 1-2 illustrates the intersections selected for study through consultations with City Transportation and Engineering Services staff.

1.3 METHODOLOGY

The traffic analysis evaluates the proposed project for both interim year and long-range timeframes using the Santa Clarita Valley Consolidated Traffic Model (SCVCTM). The SCVCTM was developed jointly by the City of Santa Clarita and the County of Los Angeles and is the primary tool used for forecasting traffic volumes for the Santa Clarita Valley.

Figure 1-2

INTERSECTION STUDY LOCATIONS

The SCVCTM has the ability to provide traffic volume forecasts for two future scenarios; Interim Year which generally corresponds to a horizon of ten years in the future and Long-Range Cumulative which represents buildout conditions. As part of the development of this traffic impact analysis, an update to the traffic model was prepared which involved a review of current related project information from both the City and County. The SCVCTM land use database was then updated where necessary in order to include the most current information (see Section 2.2 for related project information).

The development of the full project (i.e., 1,183 residential dwelling units, a maximum of 40,000 square feet of retail commercial uses and a neighborhood park) includes the planned extension of Newhall Ranch Road over the Santa Clara River to connect with the planned and substantially funded extension of Golden Valley Road (referred to collectively as segments of the Cross-Valley Connector). Planned for completion in 2006/2007, the Cross-Valley Connector will provide a continuous route from the State Route 14 (SR-14) freeway at Golden Valley Road to Interstate 5 (I-5) at the SR-126 interchange. Since this major infrastructure improvement will result in significant and complex changes to existing travel patterns, an analysis scenario in which project traffic is added to existing conditions would not adequately analyze reasonably foreseeable future conditions and potential impacts. Therefore, this analysis adds project traffic to background conditions that include the future traffic patterns that will occur as a result of this new roadway.

An analysis of a partial occupancy of the project (occupancy of a maximum of 500 residential units) is also provided for a scenario with assumptions that do not include the completion of the Cross-Valley Connector.

The impact analysis is based on specific performance criteria which are outlined in the following section. Where appropriate, mitigation measures are identified for those scenarios in which one or more locations do not meet the performance criteria.

1.4 PERFORMANCE CRITERIA

For CEQA purposes, defined performance criteria are utilized to determine if a proposed project causes a significant impact. In most traffic studies, performance criteria are based on two primary measures. The first is "capacity" which establishes the vehicle carrying ability of a roadway and the second is "volume." The volume measure is either a traffic count (in the case of existing volumes) or a forecast for a future point in time. The ratio between the volume and the capacity gives a

volume/capacity (V/C) ratio and based on that V/C ratio, a corresponding level of service (LOS) is defined. The end of this chapter contains level of service descriptions for arterial roadways and freeways as contained in the 2000 Highway Capacity Manual (see Reference 1 at the end of this chapter and referred to as "HCM 2000" in this report).

Table 1-1 summarizes the V/C ranges that correspond to LOS "A" through "F" for arterial roads and freeway segments. The V/C ranges listed for arterial roads within the study area are designated in the General Plan for the City of Santa Clarita (see Reference 10 at the end of this chapter). The V/C ranges listed for freeway segments are based on the V/C and LOS relationships specified in the HCM 2000 for basic freeway sections.

Both the V/C ratio and the LOS are used in determining impact significance. Certain LOS values are deemed unacceptable by the City and increases in the V/C ratio which cause or contribute to the LOS being unacceptable are defined as a significant impact.

In establishing V/C based performance criteria, there are certain items that need to be addressed to obtain suitable V/C estimates and relate them to LOS. For instance, while average daily traffic (ADT) is a useful measure to show general levels of traffic on a facility and to provide data for other related aspects such as noise and air quality, highway congestion is largely a peak hour or peak period occurrence and ADT does not reflect peak period conditions very effectively. Because of this, ADT is not used here as the basis for capacity evaluation but instead this evaluation focuses on those parts of the day when such congestion can occur, specifically the AM and PM peak hours.

The performance criteria are based on defined criteria for three fundamental components of the circulation system; freeway mainline segments, arterial roads (including intersections), and freeway ramps. Peak hour data (AM and PM) is used in each case to establish V/C and LOS measures and to define what constitutes a significant impact. The following section outlines the impact criteria for the facilities within the project study area.

1.4.1 Freeways

The impact analysis for freeway mainline segments uses peak hour volumes by direction as the basis for the analysis. Capacities for calculating peak hour V/C ratios for freeway mainline segments are based on information contained in the July 1995 Caltrans Highway Design Manual (see Reference 3 in

Table 1-1

VOLUME/CAPACITY RATIO LEVEL OF SERVICE RANGES

VOLUME/CAPACITY (V/C) RATIO RANGE	LEVEL OF SERVICE (LOS)
ARTERIAL ROADS	
0.00 – 0.60	A
0.61 – 0.70	B
0.71 – 0.80	C
0.81 – 0.90	D
0.91 – 1.00	E
Above 1.00	F
FREEWAY SEGMENTS	
0.00 – 0.30	A
0.31 – 0.50	B
0.51 – 0.71	C
0.72 – 0.89	D
0.90 – 1.00	E
Above 1.00	F

Section 1.7) and have been verified through discussions with Caltrans staff (see Appendix F). A capacity of 2,000 vehicles per hour per lane (vphpl) is used for mixed-flow (general purpose) mainline freeway lanes, a capacity that corresponds to LOS E conditions. HOV capacities used for this analysis are lower than the capacity for a mixed-flow freeway lane and reflect the objective for HOV facilities to operate better than LOS E. Consistent with this objective, a desirable operating capacity of 1,600 vphpl is applied for a one-lane "buffer-separated" HOV facility.

For this analysis, any additional mainline capacity that may be realized due to the existence of an auxiliary lane (the portion of the roadway for weaving, truck climbing, speed change, or for other purposes supplementary to through traffic movement) was not included in order to provide a conservative estimate of overall capacity. The capacity of a freeway auxiliary lane is difficult to define since auxiliary lanes are typically implemented to preserve standard freeway capacities at locations where the geometric design is below standard (for example, between interchanges that are spaced less than one mile apart or where heavy on/off ramp volumes occur between interchanges). While an auxiliary lane can increase the overall capacity of a mainline freeway segment, the practical increase depends on such key factors as the length of the auxiliary lane and the on/off ramp volumes at the beginning and end of the auxiliary lane.

The capacity assumptions for freeway mixed-flow and HOV lanes are summarized in Table 1-2 together with the overall impact criteria for analyzing freeway mainline segments within the traffic analysis study area. The LOS E performance standard listed here had been established by Caltrans (see Appendix F) as the operating standard for freeway mainline segments and is also consistent with Los Angeles County Congestion Management Program (CMP) requirements (see Reference 9 in Section 1.7).

1.4.2 Arterial Roads

For the arterial system, the peak hour is the accepted time period used for impact evaluation and a number of techniques are available to establish suitable V/C ratios and define the corresponding LOS. These definitions and procedures are established by individual local jurisdictions and by regional programs such as the CMP.

The analysis of the arterial road system is based on intersection capacity since this is the defining capacity limitation on an arterial highway system. Levels of service for arterial roadway intersections are determined based on operating conditions during the AM and PM peak hours. The intersection capacity

Table 1-2

FREEWAY MAINLINE PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on peak hour volume/capacity (V/C) ratios calculated using the following capacities:

2,000 vehicles per hour per lane (vphpl) for mixed-flow (general purpose) lanes under stable flow conditions.

1,600 vphpl for a one-lane high occupancy vehicle (HOV) facility under stable flow conditions.

Performance Standard

Level of Service E (peak hour V/C less than or equal to 1.00).

Threshold of Significance

If based on a comparison with existing conditions, a project related V/C increase is greater than or equal to .02 (the impact threshold specified in the CMP) for a freeway mainline segment that is forecast to operate worse than the performance standard, then the impact of that project scenario or alternative is considered significant.

Abbreviations: CMP – Los Angeles County Congestion Management Program

utilization (ICU) methodology is applied using peak hour volumes and the geometric configuration of the intersection. This methodology sums the V/C ratios for the critical movements of an intersection and is the preferred procedure for intersection analysis by the City of Santa Clarita (see Reference 5 in Section 1.7). The ICU methodology is comparable to the intersection capacity analysis methodology outlined in the HCM 2000.

The ICU calculation methodology and associated impact criteria proposed for the study area arterial system are summarized in Table 1-3. The City utilizes LOS D (ICU not to exceed 0.90) as the accepted standard and target level of service for future intersections. The City's *General Plan Circulation Element*, updated in December 1997 (see Reference 10 in Section 1.7), establishes the basis for the thresholds of significance for traffic impacts used in this analysis. These thresholds supercede the thresholds specified in the 1990 *Preliminary Traffic Impact Report Guidelines* (see Reference 5 in Section 1.7). Discussions with City staff in the Transportation and Engineering Services Department provided the detailed impact thresholds listed in the previously referenced Table 1-3.

1.4.3 Freeway Ramps

Similar to the arterial system evaluation, the peak hour is also the accepted time period used for impact evaluation of freeway interchange ramps. For this study, levels of service for freeway ramps within the traffic analysis study area are based on AM and PM peak hour V/C ratios. Capacities for the various ramp configurations that either exist or are anticipated on the freeway system within the traffic analysis study area are based on information contained in the July 1995 *Caltrans Highway Design Manual* and the January 2000 *Caltrans Ramp Meter Design Manual* (see References 3 and 4, respectively, in Section 1.7) and have been verified through discussions with Caltrans staff (see Appendix F).

The capacities for calculating ramp V/C ratios are summarized in Table 1-4 together with the overall impact criteria for freeway ramps within the study area. The LOS E performance standard listed in the table has been established by Caltrans as the operating standard for freeway ramps.

1.5 LEVEL OF SERVICE DESCRIPTIONS

Tables 1-5, 1-6, and 1-7 summarize the level of service descriptions for arterial highways, intersections and freeways, respectively. These descriptions are taken from material contained in HCM 2000.

1.6 DEFINITIONS

Certain terms used throughout this report are defined below to clarify their intended meaning:

ADT — Average Daily Traffic. Generally used to measure the total two-directional traffic volumes passing a given point on a roadway.

CMP — Congestion Management Program. A state mandated program administered by the Los Angeles County Metropolitan Transportation Authority (MTA) that provides a mechanism for coordinating land use and development decisions.

ICU — Intersection Capacity Utilization. A measure of the volume to capacity ratio for an intersection. Typically used to determine the peak hour level of service for a given set of intersection volumes.

LOS — Level of Service. A scale used to evaluate circulation system performance based on intersection ICU values or volume/capacity ratios of arterial segments.

Peak Hour — This refers to the hour during the AM peak period (typically 7 AM - 9 AM) or the PM peak period (typically 3 PM - 6 PM) in which the greatest number of vehicle trips are generated by a given land use or are traveling on a given roadway.

Tripend — A trip generation measure which represents the total trips entering and leaving a location.

V/C — Volume to Capacity Ratio. This is typically used to describe the percentage of capacity utilized by existing or projected traffic on a segment of an arterial or intersection.

Table 1-3

ARTERIAL INTERSECTION PERFORMANCE CRITERIA

ICU Calculation Methodology

Level of service to be based on peak hour ICU values calculated using the following assumptions:

Saturation Flow Rate: 1,750 vehicles/hour/lane
Clearance Interval: .10
RTOR Allowed: Yes*
RTOR Saturation Factor: .75
No minimum volume/capacity assumed

Performance Standard

LOS D

Thresholds of Significance

A significant impact occurs when any of the following conditions are met:

With-Project ICU	Project Increment
.81-.90 (LOS D)	greater than or equal to .02
.91 or more (LOS E or F)	greater than or equal to .01

Mitigation must be identified that results in an ICU less than or equal to pre-project conditions.

Sources: City of Santa Clarita Traffic Impact Report Guidelines and December 1997 City of Santa Clarita General Plan Circulation Element (See Reference 5 & 10, respectively, in Section 1.7), and the City Transportation and Engineering Services Department.

* "De facto" right-turn lane is used in the ICU calculation if 19 feet from edge of pavement to inside of through-lane exists and parking is prohibited during peak hours.

Abbreviations: ICU – Intersection Capacity Utilization
RTOR – Right-turn On Red
LOS – Level of Service

Table 1-4

FREEWAY RAMP PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on peak hour volume/capacity (V/C) ratios calculated using the following ramp capacities:

Freeway to Arterial Road Interchanges

Metered On-Ramps

A maximum capacity of 900 vehicles per hour (vph) for a one-lane metered on-ramp with only one mixed-flow lane at the meter.

A maximum capacity of 1,080 (20 percent greater than 900) vph for a one-lane metered on-ramp with one mixed-flow lane at the meter plus one HOV preferential lane at the meter.

A maximum capacity of 1,500 vph for a one-lane metered on-ramp with two mixed-flow lanes at the meter.

A maximum capacity of 1,800 vph for a two-lane metered on-ramp with two mixed-flow lanes at the meter.

Non-Metered On-Ramps and Off-Ramps

A maximum capacity of 1,500 vph for a one-lane ramp.

A maximum capacity of 2,250 (50 percent greater than 1,500) vph for a two-lane on-ramp that tapers to one merge lane at or beyond the freeway mainline gore point and for a two-lane off-ramp with only one auxiliary lane.

A maximum capacity of 3,000 vph for a two-lane on-ramp that does not taper to one merge lane and for a two-lane off-ramp with two auxiliary lanes.

Performance Standard

Level of Service E (peak hour V/C less than or equal to 1.00).

Thresholds of Significance

If based on a comparison with existing conditions, a project related V/C increase is greater than or equal to .02 (the impact threshold specified in the CMP) for a freeway ramp that is forecast to operate worse than the performance standard, then the impact of that project scenario or alternative is considered significant.

Abbreviations: V/C – Volume to Capacity Ratio
VPH – Vehicles per Hour

Table 1-5

LEVEL OF SERVICE DESCRIPTIONS – URBAN STREETS

The average travel speed along an urban street is the determinant of the operating level of service (LOS). The travel speed along a segment, section, or entire length of an urban street is dependent on the running speed between signalized intersections and the amount of control delay incurred at signalized intersections. The following general statements characterize LOS along urban streets and show the relationship to free flow speeds (FFS)

LOS	DESCRIPTION	PERCENT OF FFS
A	LOS A describes primarily free-flow operations at average travel speeds, usually about 90 percent of the FFS for the given street class. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is normal.	90
B	LOS B describes reasonably unimpeded operations at average travel speeds, usually about 70 percent of the FFS for the street class. Vehicles are completely unimpeded in their ability to maneuver with the traffic stream. Control delay at signalized intersections is minimal.	70
C	LOS C describes stable operations; however, ability to maneuver and change lanes in midblock locations may be more restricted that at LOS B, and longer queues, adverse signal coordination, or both may contribute to lower average travel speeds of about 50 percent of the FFS for the street class.	50
D	LOS D borders on a range in which small increases in flow may cause substantial increases in delay and decreases in travel speed. LOS D may be due to adverse signal progression, inappropriate signal timing, high volumes, or a combination of these factors. Average travel speeds are about 40 percent of FFS	40
E	LOS E is characterized by significant delays and average travel speeds of 33 percent or less of the FFS. Such operations are caused by a combination of adverse progression, high signal density, high volumes, extensive delays at critical intersections, and inappropriate signal timing.	33
F	LOS F is characterized by urban street flow at extremely low speeds, typically one-third to one-fourth of the FFS. Intersection congestion is likely at critical signalized locations, with high delays, high volumes, and extensive queuing.	25

Source: Highway Capacity Manual 2000, Transportation Research Board, National Research Council

Table 1-6

LEVEL OF SERVICE DESCRIPTIONS – SIGNALIZED INTERSECTIONS

Levels of service (LOS) for signalized intersections are defined in terms of control delay as follows:

LOS	DESCRIPTION	DELAY PER VEHICLE (sec)	ICU RANGE
A	LOS A describes operations with low control delay, up to 10 seconds per vehicle. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.	< 10	.00-.60
B	LOS B describes operations with control delay greater than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than the LOS A, causing higher levels of delay.	10 – 20	.61-.70
C	LOS C describes operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from only fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.	20 – 35	.71-.80
D	LOS D describes operations with control delay greater than 35 and up to 55 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high V/C ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	35 – 55	.81-.90
E	LOS E describes operations with control delay greater than 55 and up to 80 seconds per vehicle. These high delay values generally indicate poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent.	55 – 80	.91-1.00
F	LOS F describes operations with control delay in excess of 80 seconds per vehicle. This level, considered unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high V/C ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.	> 80	>1.00

Source: Highway Capacity Manual 2000, Transportation Research Board, National Research Council

Table 1-7

LEVEL OF SERVICE DESCRIPTIONS – FREEWAYS

LOS	DESCRIPTION
A	LOS A describes free-flow operations. Free-flow speeds (FFS) prevail. Vehicles are almost completely unimpeded in their ability to maneuver with the traffic stream. The effects of incidents or point breakdowns are easily absorbed at this level.
B	LOS B represents reasonably free-flow, and FFS are maintained. The ability to maneuver with the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. The effects of minor incidents and point breakdowns are still easily absorbed.
C	LOS C provides for flow with speeds at or near the FFS of the freeway. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver. Minor incidents may still be absorbed, but the local deterioration in service will be substantial. Queues may be expected to form behind any significant blockage.
D	LOS D is the level at which speeds begin to decline slightly with increasing flows and density begins to increase somewhat more quickly. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels. Even minor incidents can be expected to create queuing, because the traffic stream has little space to absorb disruptions.
E	At its highest density value, LOS E describes operation at capacity. Operations at this level are volatile, because there are virtually no usable gaps in the traffic stream. Vehicles are closely spaces, leaving little room to maneuver with the traffic stream at speeds that still exceed 49 miles per hour. Any disruption of the traffic stream, such as vehicles entering from a ramp or a vehicle changing lanes, can establish a disruption wave that propagates throughout the upstream traffic flow. At capacity, the traffic stream has no ability to dissipate even the most minor disruption, and any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability with the traffic stream is extremely limited, and the level of physical and psychological comfort afforded the driver is poor.
F	LOS F describes breakdowns in vehicular flow. Such conditions generally exist within queues forming behind breakdown points, and are the result of a bottleneck downstream point. LOS F is also used to describe conditions at the point of the breakdown or bottleneck and the queue discharge flow that occurs at speeds lower than the lowest speed for LOS E, as well as the operations within the queue that forms upstream. Whenever LOS F conditions exist, they have the potential to extend upstream for significant distances.

Source: Highway Capacity Manual 2000, Transportation Research Board, National Research Council

VPH Vehicles Per Hour. Used for roadway volumes (counts or forecasts) and trip generation estimates. Measures the number of vehicles in a one hour period, typically the AM or PM peak hour.

VPHPL Vehicles Per Hour Per Lane. Similar to VPH but with the roadway volume averaged to the total number of roadway lanes.

2.0 TRANSPORTATION SETTING

This chapter describes the transportation setting for the traffic analysis. Existing conditions are first discussed, followed by a description of the future circulation system as outlined in the City's Circulation Element.

2.1 EXISTING CONDITIONS

The following section describes existing traffic conditions in the study area. It includes a description of the study area roadway system, existing traffic volumes and corresponding levels of service as defined by the performance criteria outlined in the previous chapter.

2.1.1 Existing Roadway System

The existing roadway network in the study area is illustrated in Figure 2-1 in the form of mid-block lanes and intersection lane configurations for the intersections being studied. Major arterial streets near to the project site consist of Bouquet Canyon Road, Newhall Ranch Road, Soledad Canyon Road, Valencia Parkway and Golden Valley Road.

The SR-14 Freeway provides regional access for residents of the site and is located approximately 3.5 miles south of the project site. The I-5 Freeway is located approximately 3.5 miles west of the project site.

2.1.2 Existing Traffic Volumes and Levels of Service

The existing average daily traffic (ADT) volumes on the study area roadway system are illustrated in Figure 2-2. Illustrations of peak hour turning movement volumes for each study area intersection can be found in Figures 2-3 and 2-4 for the AM and PM peak hours, respectively. The peak hour counts were collected at various times during the past year and a half and in most cases during the second half of 2002 (see Table 2-1 for dates).

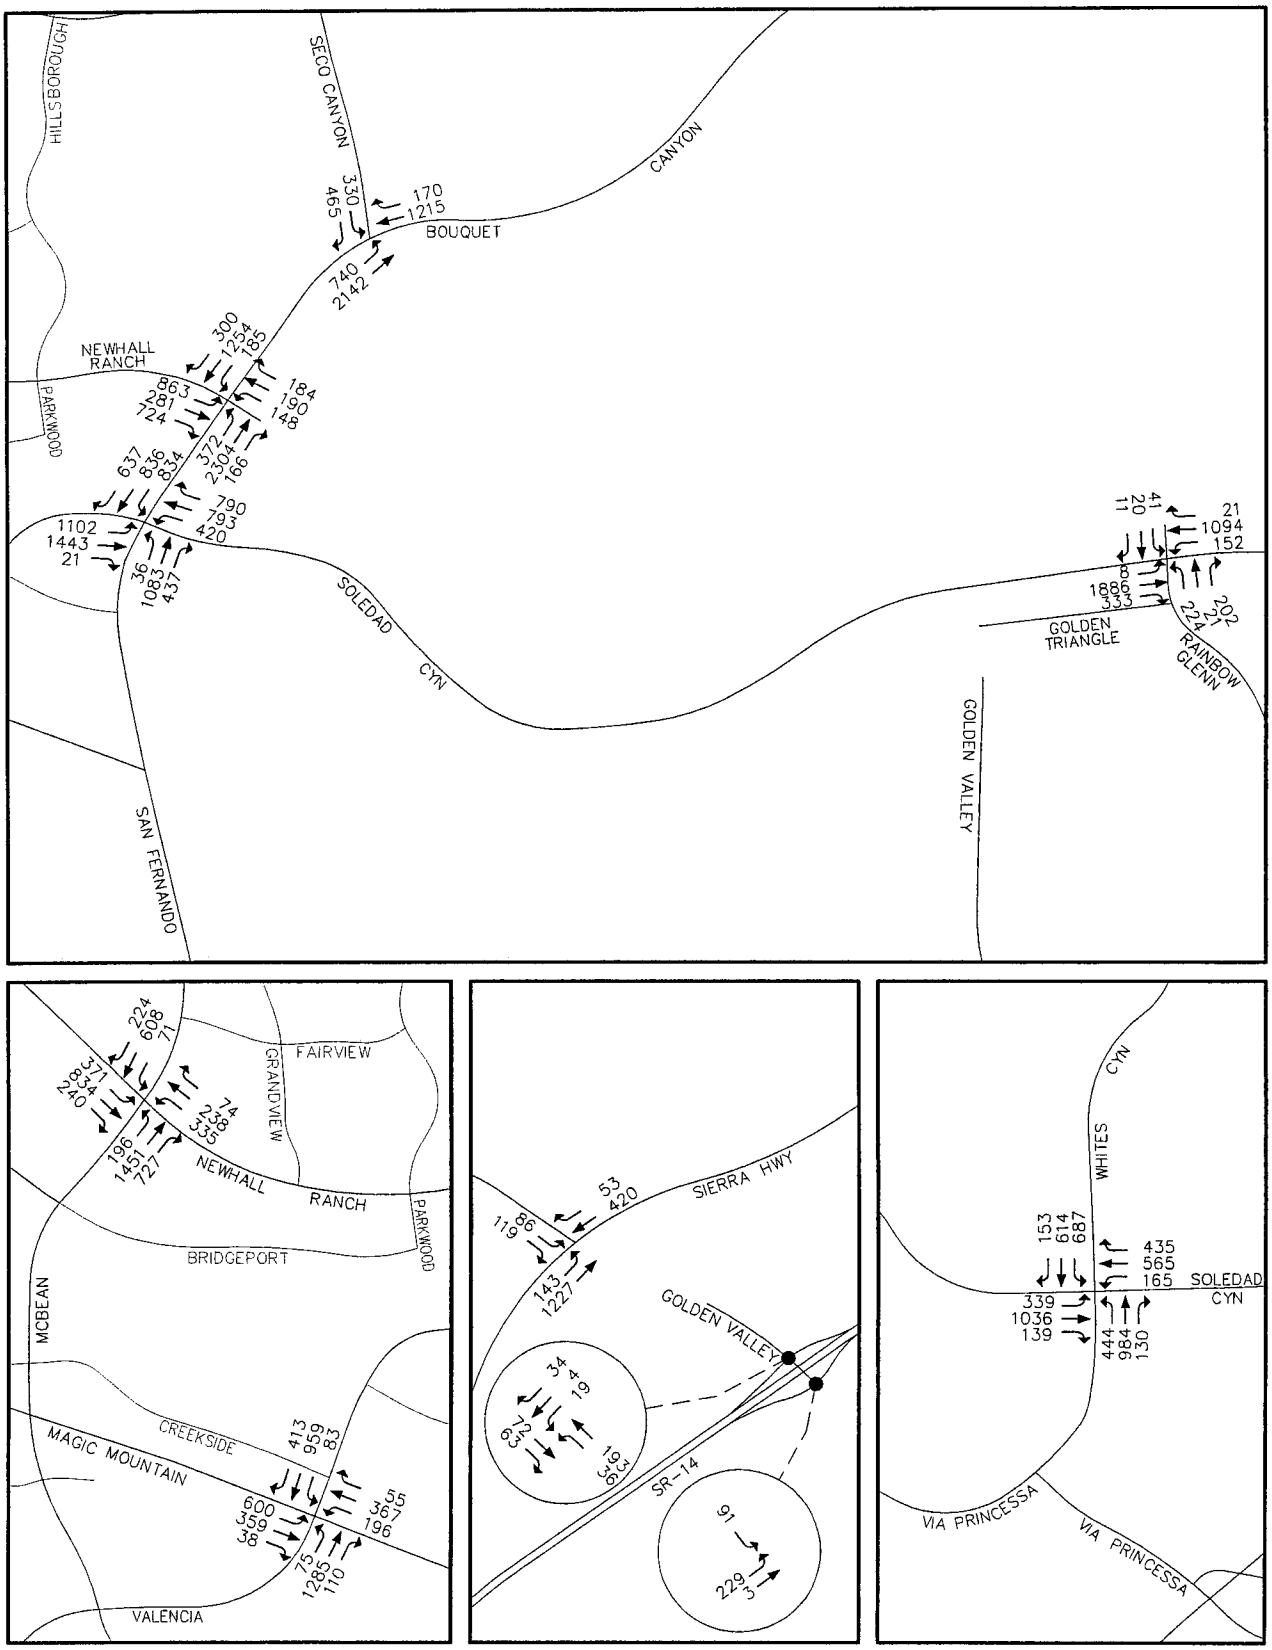

Figure 2-4

PM PEAK HOUR TURNING MOVEMENT VOLUMES
- EXISTING CONDITIONS

As discussed in the section on performance criteria in Chapter 1.0, level of service (LOS) is a concept developed to quantify the degree of comfort afforded to drivers as they travel on a given roadway. The degree of comfort includes such elements as travel time, number of stops, total amount of stopped delay, etc. As defined in the HCM 2000, six grades are used to denote the various LOS. The six are denoted A through F and a discussion on these was also given in Chapter 1.0.

The results of the ICU LOS analyses for project area intersections are shown in Table 2-1 (ICU worksheets are provided in Appendix A). The table shows how the following intersections on Soledad Canyon Road do not currently meet the City's performance standard:

- Bouquet Canyon Road & Soledad Canyon Road (LOS F in PM Peak Hour)
- Whites Canyon Road & Soledad Canyon Road (LOS E in AM Peak Hour)

2.1.3 Public Transportation

Santa Clarita Transit currently operates six fixed-route transit lines (Routes 3, 4, 502, 503, 504 and 507) which provide service near to the project site. Each route passes the project site via the intersection of Bouquet Canyon Road and Newhall Ranch Road.

In addition to the bus routes, there is a Metrolink rail station just south of the project site on Soledad Canyon Road which provides regional transit access to the site.

2.2 INTERIM YEAR TRANSPORTATION SYSTEM

The Interim Year transportation system consists of roadway improvements and future infrastructure consistent with the related projects included within the horizon year. Generally, this horizon year corresponds to a level of development approximately 10 years in the future. While this horizon does not coincide specifically with the buildout of the project site (estimated to occur by 2008), it represents the best timeframe for planning purposes since it includes a comprehensive set of cumulative development projects that have been incorporated into the SCVCTM. With this, a conservative scenario is established for analyzing the impacts of the proposed project combined with projected and approved growth on a reasonably expanded circulation system. This approach is supported by the City Transportation and Engineering Services staff and was established through consultation with Ian Pari of the Transportation and Engineering Services Department.

Future roadways that affect the study area include the extension of Newhall Ranch Road west to I-5 (estimated completion in 2006), the extension of Newhall Ranch Road east to Golden Valley Road/Soledad Canyon Road (est. 2006), the connection of Via Princessa between its current western terminus (near San Fernando Road) and its current eastern terminus (near Rainbow Glenn Drive) (est. post-2010), and the extension of Magic Mountain Parkway to Via Princessa (est. post-2010). Figure 2-5 illustrates the general location of these future arterial roadways.

At the direction of the City, an alternative Interim Year scenario is also analyzed that includes the construction and operation of Santa Clarita Parkway between Bouquet Canyon Road and Placerita Canyon Road. While Santa Clarita Parkway is not usually included within the Interim Year horizon, the City Planning and Transportation and Engineering Services staff requested this special analysis as a portion of the roadway passes through the project site.

Interim Year land use is based on data provided by the City and County. For this analysis, the Interim Year land use database was updated to include the most recent data from the City and County regarding approved, pending and planned projects. See Appendix C for the list of Related Projects in the vicinity of the proposed project and Appendix H for the complete Interim Year land use database.

2.3 LONG-RANGE TRANSPORTATION SYSTEM

The City's Circulation Element includes significant future roadway projects near the project site in addition to those included in the Interim Year scenario. Specifically, Santa Clarita Parkway which will bisect the project site in a north/south alignment and is planned to connect Bouquet Canyon Road with SR-14 at Placerita Canyon Road. Also shown in the Circulation Element is a northerly extension of Golden Valley Road that intersects with Newhall Ranch Road within the project site, just north of the Santa Clara River, and extends to Plum Canyon Road.

The previously referenced Figure 2-5 illustrates the general location of these future facilities.

3.0 PROJECT DESCRIPTION

This chapter describes the project in terms of its transportation characteristics. Trip generation is summarized and the distribution of project trips on the study area roadway network is presented.

3.1 PROJECT OVERVIEW

The site plan for the proposed Riverpark project can be seen in Figure 3-1. The project site is located entirely within in the City of Santa Clarita, just north of Soledad Canyon Road and just east of Bouquet Canyon Road.

Riverpark is currently being planned as a development consisting of 1,183 dwelling units and a maximum of 40,000 square feet of retail commercial uses. A total of 439 dwelling units are single-family detached units with the remaining 744 dwelling units consisting of apartments. The project applicant estimates that first occupancies will occur in 2006 with the project building out over a period of two to three years.

There are four potential points of access to the site, two of which will be available prior to buildout of the project. One is the existing intersection of Bouquet Canyon Road and Newhall Ranch Road. Newhall Ranch Road currently terminates just east of Bouquet Canyon Road but will be extended into the site. This segment of Newhall Ranch Road (a portion of the Cross Valley Connector) is shown on the City's Circulation Element as a major highway and ultimately extends via a bridge, across the Santa Clara River, further to the east to connect with the planned extension of Golden Valley Road in the vicinity of Soledad Canyon Road. This access from Golden Valley Road and Soledad Canyon Road is the second point of access into the site.

Two additional potential access points result from the future extensions of Santa Clarita Parkway. This future roadway is shown on the City's Circulation Element as a major highway that would provide a north/south connection between Bouquet Canyon Road and Sierra Highway. The alignment of Santa Clarita Parkway bisects the Riverpark site and will ultimately provide southerly access to the site from

Soledad Canyon Road and northerly access from Bouquet Canyon Road. The project includes the construction of a portion of Santa Clarita Parkway (from Newhall Ranch Road south approximately 1,500 feet). The timeframe for the construction of these future segments of Santa Clarita Parkway has not been established by the City at this time.

The proposed commercial uses are located near the southeast corner of the Bouquet Canyon Road/Newhall Ranch Road intersection. Detailed development plans for these commercial uses are not being proposed at this time, therefore exact driveway locations are unknown. For this analysis, it is assumed that the center will have a full access driveway on Newhall Ranch road (approximately 500 feet east of Bouquet Canyon Road) as well as a right-turn-in/right-turn-out driveway on Bouquet Canyon Road (approximately 250 feet south of Newhall Ranch Road).

3.2 PROJECT TRIP GENERATION

Trip generation estimates for the proposed project are shown in Table 3-1. The trip generation for the non-commercial uses is calculated using trip rates from the SCVCTM which are based on published data from the Institute of Transportation Engineers (ITE) Sixth Edition Trip Generation Manual (see Reference 2 in Section 1.7). The commercial center trip generation is calculated using the ITE equation based shopping center trip rate.

The proposed project is estimated to generate approximately 13,300 total average daily trips with approximately 800 occurring in the AM peak hour (600 outbound) and approximately 1,250 occurring in the PM peak hour (760 inbound).

3.3 PROJECT TRIP DISTRIBUTION

The geographic distribution of project generated trips was determined using the SCVCTM to prepare a project only select zone run. The Interim Year version of the SCVCTM provided the background conditions for this select zone run. The model takes into account the specific type of land use proposed for the site and how that land use would interact with the other land uses in the City.

Table 3-1

TRIP GENERATION AND TRIP RATE SUMMARY

LAND USE	UNITS	AM PEAK HOUR IN	AM PEAK HOUR OUT	AM PEAK HOUR TOTAL	PM PEAK HOUR IN	PM PEAK HOUR OUT	PM PEAK HOUR TOTAL	ADT

DU = Dwelling Unit
AC = ACRE
TSF = Thousand Square Feet

Figure 3-2 illustrates the project only average daily trips (ADT) and distribution percentages for the residential portion of the site. Figures 3-3 and 3-4 illustrate the residential generated trips for the AM and PM peak hours, respectively. Approximately two thirds of the project's residential traffic accesses the site via the Newhall Ranch Road/Bouquet Canyon Road intersection and approximately 30 percent access the site via the Newhall Ranch Road/Golden Valley Road intersection at Soledad Canyon Road. Approximately five percent of the residential trips are local interaction with the project's commercial center and with the existing commercial center located on the northeast corner of the Bouquet Canyon Road/Newhall Ranch Road intersection.

At the regional level, over 90 percent of the project's residential generated traffic stays within the Santa Clarita Valley. This is due in part to the substantial employment base that has developed within the area as well as to the majority of residential daily trip generation being non-work based (i.e. work trips typically account for only two to four of the average ten trips generated each day by a single family residence). The remaining traffic is oriented outside the Valley with approximately five percent south on SR-14/I-5, approximately one percent east on SR-14, approximately one percent north on I-5 and less than one percent west on SR-126.

Figure 3-5 illustrates the ADT and distribution percentages for the commercial center. Figures 3-6 and 3-7 illustrate the retail commercial generated trips for the AM and PM peak hours, respectively. The distribution of traffic generated by the retail commercial center will be more localized than the project's residential component, as is depicted in the distribution illustration.

4.0 IMPACT ANALYSIS

This chapter addresses the traffic impacts of the proposed project. As discussed in Section 1.3, an interim year and long-range horizon are the time frames used for this analysis. Traffic conditions with and without the proposed project are described in the following sections. Project impacts are identified using the criteria outlined in Chapter 1.0.

4.1 INTERIM YEAR ANALYSIS

The Interim Year traffic conditions are based on the Interim Year setting described in Section 2.2. This setting forms the basis for identifying the potential Interim Year traffic impacts of the proposed project. The following sections discuss Interim Year no-project and with-project conditions.

4.1.1 Interim Year No-Project Traffic Conditions

Interim Year no-project ADT volumes within the study area are shown in Figure 4-1. The Interim Year no-project peak hour turning movement volumes for the intersections in the study area are illustrated in Figures 4-2 and 4-3 for the AM and PM peak hours, respectively.

Table 4-1 provides the corresponding ICU values and also listed for comparison purposes are the ICUs for existing conditions. The ICU tabulations indicate that deficiencies at three additional intersections (McBean Parkway/Newhall Ranch Road, Valencia Boulevard/Magic Mountain Parkway, and Seco Canyon Road/Bouquet Canyon Road) are forecast to occur by the Interim Year when compared to existing conditions. The Bouquet Canyon Road/Soledad Canyon Road intersection and the Whites Canyon Road/Soledad Canyon Road intersection, which have been shown to be deficient for existing conditions, are forecast to remain deficient for Interim Year conditions without the proposed project. While remaining deficient, conditions improve from LOS F to LOS E at the Bouquet Canyon Road/Soledad Canyon Road intersection due to the planned improvement project at this location. Specifically, the planned improvements consist of adding a third left-turn lane in the eastbound direction.

4.1.2 Interim Year With Project Traffic Conditions

As discussed in Chapter 3.0, the proposed project would generate approximately 13,300 vehicle trips per day, with approximately 800 trips in the AM peak hour and approximately 1,250 trips in the PM peak hour.

Interim Year volumes that include project generated traffic are provided in Figure 4-4 for the ADT volumes and in Figures 4-5 and 4-6 for the AM and PM peak hours, respectively. Peak hour ICU values can be found in Table 4-2 which provides a comparison between Interim Year no-project and Interim Year with-project conditions. The table shows that six intersections experience a significant impact due to the project generated traffic (see Table 1-3 for significant impact criteria) with four of those intersections forecast to exceed LOS "D". The following intersections are those significantly impacted:

Intersections with Significant Project Impact at LOS "E" or LOS "F":

- McBean Parkway and Newhall Ranch Road (both a.m. and p.m. peak)
- Valencia Boulevard and Magic Mountain Parkway (both a.m. and p.m. peak)
- Bouquet Canyon Road and Soledad Canyon Road (p.m. peak)
- Seco Canyon Road and Bouquet Canyon Road (both a.m. and p.m. peak)

Intersections with Significant Project Impact at LOS "D":

- Bouquet Canyon Road and Newhall Ranch Road (both a.m. and p.m. peak)
- Whites Canyon Road and Soledad Canyon Road (p.m. peak)

4.1.3 Interim Year With Mitigation

The previous section identified the six intersections that are significantly impacted by the proposed project under Interim Year conditions. Four result in conditions of LOS "E" or worse and two result in LOS "D". Mitigation measures that address these impacts are as follows:

Mitigation not requiring acquisition of right-of-way:

48. McBean & Newhall Ranch	Add 4th Eastbound Through Lane, and Add 4th Westbound Through Lane
66. Bouquet & Newhall Ranch	Add 4th Eastbound Through Lane, and Add 4th Westbound Through Lane
67. Seco & Bouquet	Convert 1st Southbound Right-Turn Lane to a shared Left-Turn/Right-Turn Lane (for 1 Left-Turn Lane, 1 shared Left-Turn/Right-Turn Lane, 1 Right-Turn Lane)

(mitigation continued on Page 4-11)

.71 - .80	C
.81 - .90	D
.91 – 1.00	E
Above 1.00	F

(mitigation continued from Page 4-6)

Mitigation requiring acquisition of right-of-way:

57. Valencia & Magic Mountain	Add 3rd Eastbound Through Lane
65. Bouquet & Soledad	Add 4th Northbound Through Lane
67. Seco & Bouquet	Add 1st Westbound Right-Turn Lane
172. Whites Canyon & Soledad	Add 2nd dedicated Northbound Left-Turn Lane & convert shared Northbound Left-Turn/Through Lane to 3rd dedicated Through Lane, Or, Add 1st Eastbound Right-Turn Lane

Table 4-3 summarizes the resulting ICUs and LOS with this mitigation. As shown above, most of these improvements require the acquisition of right-of-way which is out of the applicant's control.

The project's percentage impact (as shown by the ICU) on the affected intersections, based on mitigation only where right-of-way is not required, is as follows:

o McBean & Newhall Ranch (mitigated)	AM: -.04	PM: -.05
o Bouquet & Newhall Ranch (mitigated)	AM: -.03	PM: -.01
o Seco & Bouquet (partially mitigated)	AM: .01	PM: -.10
o Valencia & Magic Mountain (unmitigated)	AM: .01	PM: .02
o Bouquet & Soledad (unmitigated)	AM: .02	PM: .05
o Whites Canyon & Soledad (unmitigated)	AM: .00	PM: .02

The Riverpark project is located within the Bouquet Canyon Bridge and Thoroughfare District (Bouquet B & T District). This district is considered a full-mitigation district, that is, traffic improvements identified in the district mitigate traffic impacts created by planned growth within the district. In summary, the District has been designed to accommodate the needs of future development anticipated by the City and County General Plans.

Future identified improvements within the Bouquet Bridge and Thoroughfare District may result in improved operation at the impacted intersections. Various factors, including but not limited to, dedication of additional right-of-way at these affected intersections due to use alteration, expansion, or change, acquisition of the affected right-of-way by the City via funds from a Bridge and Thoroughfare

Table 4-3

District, continued expansion of the Valley's circulation system (i.e. construction of regional roadway improvements), and increased public transit use may improve the operation of each of the affected intersections.

Without mitigation, the Valencia Boulevard/Magic Mountain Parkway intersection is forecast as LOS F (same as the no-project conditions), the Bouquet Canyon Road/Soledad Canyon Road intersection is forecast as LOS E (same as the no-project conditions), the Seco Canyon Road/Bouquet Canyon Road intersection is forecast as LOS E (same as the no-project conditions), and the Whites Canyon Road/Soledad Canyon Road intersection is forecast as LOS D (same as the no-project and the with project/with mitigation conditions). The remaining significantly impacted intersections will be fully mitigated with the proposed improvements and are forecast as LOS D.

4.1.4 Alternative Interim Year No-Project Traffic Conditions

An alternative Interim Year setting has been analyzed with and without the proposed project. This setting differs from the Interim Year setting analyzed in the previous section due to the inclusion of the entire length of the future Santa Clarita Parkway (for both the with- and without-project scenarios). No-project ADT volumes for this scenario are shown in Figure 4-7. The no-project peak hour turning movement volumes for the intersections in the study area are illustrated in Figures 4-8 and 4-9 for the AM and PM peak hours, respectively. Table 4-4 provides the corresponding ICU values and also listed for comparison purposes are the ICUs for existing conditions.

Under this alternative, the ICU tabulations indicate that deficiencies occur at two additional intersections (Valencia Boulevard/Magic Mountain Parkway, and Seco Canyon Road/Bouquet Canyon Road) when compared to existing conditions. The Bouquet Canyon Road/Soledad Canyon Road intersection and the Whites Canyon Road/Soledad Canyon Road intersection, which have been shown to be deficient for existing conditions, are forecast to remain deficient for the alternative Interim Year conditions without the proposed project. While remaining deficient, conditions improve from LOS F to LOS E at the Bouquet Canyon Road/Soledad Canyon Road intersection due to the planned improvement project at this location. Specifically, the planned improvements consist of adding a third left-turn lane in the eastbound direction.

4.1.5 Alternative Interim Year With Project Traffic Conditions

Alternative Interim Year volumes that include project generated traffic are provided in Figure 4-10 for the ADT volumes and in Figures 4-11 and 4-12 for the AM and PM peak hours, respectively. Peak hour ICU values can be found in Table 4-5 which provides a comparison between Interim Year no-project and Interim Year with-project conditions. The table shows that five intersections experience a significant impact due to the project generated traffic (see Table 1-3 for significant impact criteria) with four of those intersections forecast to exceed LOS "D". The following intersections are those significantly impacted:

Intersections with Significant Project Impact at LOS "E" or LOS "F":

- McBean Parkway and Newhall Ranch Road (both AM and PM peak)
- Valencia Boulevard and Magic Mountain Parkway (both AM and PM peak)
- Bouquet Canyon Road and Soledad Canyon Road (PM peak)
- Seco Canyon Road and Bouquet Canyon Road (PM peak)

Intersections with Significant Project Impact at LOS "D":

- Bouquet Canyon Road and Newhall Ranch Road (both AM and PM peak)

4.1.6 Alternative Interim Year With Mitigation

The previous section identified five intersections that are significantly impacted by the proposed project under the Alternative Interim Year conditions. Four result in conditions of LOS "E" or worse and one results in LOS "D". Mitigation measures that address these impacts are as follows:

Mitigation not requiring acquisition of right-of-way:

48. McBean & Newhall Ranch	Add 4th Eastbound Through Lane, and Add 4th Westbound Through Lane
66. Bouquet & Newhall Ranch	Add 4th Eastbound Through Lane, and Add 4th Westbound Through Lane
67. Seco & Bouquet	Convert 1st Southbound Right-Turn Lane to a shared Left-Turn/Right-Turn Lane (for 1 Left-Turn Lane, 1 shared Left-Turn/Right-Turn Lane, 1 Right-Turn Lane)

Mitigation requiring acquisition of right-of-way:

57. Valencia & Magic Mountain	Add 3rd Eastbound Through Lane
65. Bouquet & Soledad	Add 4th Northbound Through Lane

Above 1.00 F

Table 4-6 summarizes the resulting ICUs and LOS with this mitigation. As shown above, some of these improvements require the acquisition of right-of-way, which is out of the applicants control.

The project's percentage impact (as shown by the ICU) on the affected intersections, based on mitigation only where right-of-way is not required, is as follows:

o	McBean & Newhall Ranch (mitigated)	AM: -.01	PM: -.04
o	Bouquet & Newhall Ranch (mitigated)	AM: -.02	PM: -.02
o	Seco & Bouquet (mitigated)	AM: .01	PM: -.13
o	Valencia & Magic Mountain (unmitigated)	AM: .02	PM: .01
o	Bouquet & Soledad (unmitigated)	AM: .02	PM: .02

The Riverpark project is located within the Bouquet Canyon Bridge and Thoroughfare District (Bouquet B & T District). This district is considered a full-mitigation district, that is, traffic improvements identified in the district mitigate traffic impacts created by planned growth within the district. In summary, the District has been designed to accommodate the needs of future development anticipated by the City and County General Plans.

Future identified improvements within the Bouquet Bridge and Thoroughfare District may result in improved operation at the impacted intersections. Various factors, including but not limited to, dedication of additional right-of-way at these affected intersections due to use alteration, expansion, or change, acquisition of the affected right-of-way by the City via funds from a Bridge and Thoroughfare District, continued expansion of the Valley's circulation system (i.e. construction of regional roadway improvements), and increased public transit use may improve the operation of each of the affected intersections.

Without mitigation, the Valencia Boulevard/Magic Mountain Parkway intersection is forecast as LOS F (same as the no-project and the with project/with mitigation conditions) and the Bouquet Canyon Road/Soledad Canyon Road intersection is forecast as LOS E (same as the no-project conditions). The remaining significantly impacted intersections will be fully mitigated with the proposed improvements and are forecast as LOS D or better.

4.2 LONG-RANGE ANALYSIS

Since the proposed project involves a General Plan amendment, an evaluation of long-range conditions is provided. The long-range conditions are obtained from the SCVCTM and are based on long-range cumulative (buildout) land use projections for the Santa Clarita Valley and a roadway network that is consistent with the City's General Plan Circulation Element. The purpose of this analysis is to determine if the proposed project results in significant changes in roadway volumes when compared to the forecasts used to develop the City's General Plan Circulation Element. This forms the basis for identifying the potential long-range traffic impacts of the proposed project.

The following sections discuss conditions with and without the project for this scenario as well as an alternative long-range scenario which does not include the future Santa Clarita Parkway and a scenario for a four lane Santa Clarita Parkway between Bouquet Canyon Road and Soledad Canyon Road. Consistent with the City's previous General Plan studies which only address ADT volumes, ADT volumes are forecast for Long Range Cumulative conditions in the following analyses. Peak hour intersection turning movement volumes are used to compare the four lane and deletion scenarios to the current Circulation Element.

4.2.1 Long-Range Cumulative Traffic Conditions

Long-range Cumulative ADT volumes within the study area are shown in Figure 4-13. These forecasts are based on the project site being developed with the land use that has historically been used by the City and the County for long-range planning (see following section for details). Figure 4-14 illustrates the Long Range Cumulative ADT volumes without Santa Clarita Parkway.

4.2.2 Long-Range Cumulative With Project Traffic Conditions

The proposed project represents a net reduction in traffic generation when compared to the land uses allowed by the current General Plan. Table 4-7 compares the proposed project to the General Plan land use and shows that the proposed project generates approximately 68,000 ADT less than what was planned for the property under the City's General Plan. Likewise, when compared to the land use that has historically been used by the City and the County for long-range planning in the SCVCTM, the proposed project generates approximately 14,000 ADT less, as shown in Table 4-8.

TOTAL			27,064		13,274		-13,790

Notes:
DU = Dwelling Unit
TSF = Thousand Square Feet
AC = Acres

Figure 4-15 illustrates Long-range Cumulative conditions based on development of the site with the proposed project. Figure 4-16 illustrates the proposed project with the removal of Santa Clarita Parkway. When compared to the figures presented in the previous section, these figures illustrate how the net reduction in trip generation for the project site results in lower traffic volumes than would be realized if the site were to be developed as previously anticipated by the City in the SCVCTM. In the vicinity of the project site, volumes along Bouquet Canyon Road would reduce by 2 percent, Newhall Ranch Road volumes would reduce by 1 percent, volumes on Valencia Boulevard would reduce by 4 percent and on Santa Clarita Parkway, volumes would reduce by 12 percent.

However, the magnitude of difference between the land uses, as shown on the roadway network, isn't as evident as it is in the trip generation tables. Since each scenario is modeled independent of the other, two distinct volume assignments result. Each assignment is unique and optimizes the available roadway capacity in order to minimize total travel times. Therefore, high demand roadways such as Bouquet Canyon Road and Soledad Canyon Road will be utilized nearly the same given either land use scenario. Nonetheless, the proposed plan results in a significant reduction of traffic volume on the City's roadways as compared to the City's General Plan designations for the site and the long-range uses identified in the SCVCTM.

4.2.3 Long-Range Cumulative With Project and Santa Clarita Parkway Alternatives

The previous sections presented Long-range Cumulative ADT volumes consistent with the City's Circulation Element, which includes Santa Clarita Parkway as a six lane major highway from Bouquet Canyon Road to SR-14. This section evaluates two alternative configurations for the segment of Santa Clarita Parkway between Bouquet Canyon Road and Soledad Canyon Road. The first alternative changes this segment to a four lane secondary highway and the second alternative removes this segment altogether. Since each of these alternatives would represent a permanent change to the City's Circulation Element, they are evaluated in the context of long-range (buildout) conditions.

To determine the impacts of each of these scenarios, peak hour turning movement volumes at affected intersections were derived. Table 4-9 summarizes the ICU values and LOS for intersections in the vicinity of this section of Santa Clarita Parkway that are affected by implementation of one of the

Santa Clarita Parkway alternatives. ADT volumes for each scenario with a comparison to the six lane baseline scenario are provided in Figures 4-17 and 4-18 for the four lane and deletion scenarios, respectively.

The peak hour analysis indicates that the downgrade to a four lane roadway, or secondary highway, between Bouquet Canyon Road and Soledad Canyon Road, yields results very similar to the baseline six lane scenario. This is to be expected since the forecasts that are based on a six lane roadway indicate a demand for Santa Clarita Parkway that can be accommodated by just a four lane roadway. Some shifting of traffic patterns does occur during the peak hours due to the downgrade and this is indicated by intersection ICU values that increase in some instances and decrease in others. Overall, no deficiencies occur and the LOS either remains the same or changes slightly. For example, the Santa Clarita Parkway intersections at Soledad Canyon Road and at Newhall Ranch Road each increase from LOS C to LOS D during one peak hour and remain the same in the other peak hour. Conversely, the intersections of Santa Clarita Parkway/Bouquet Canyon Road and Valley Center/Soledad Canyon Road each experience an improvement in LOS during the AM peak hour with a change from LOS C to LOS B. All intersections remain at LOS D or better and ADT volumes for the surrounding roadways are relatively unaffected by the change to the roadway. No significant impacts would occur with implementation of this alternative.

Deleting the segment altogether has a much greater effect on the surrounding roadway system. With the deletion, the following three intersections are forecast to have a deficient LOS (E or worse):

- Bouquet Canyon Road and Soledad Canyon Road
- Bouquet Canyon Road and Newhall Ranch Road
- Seco Canyon Road and Bouquet Canyon Road

Likewise, ADT volumes with the deletion scenario have a much greater effect on the surrounding roadways. Bouquet Canyon Road north of Newhall Ranch Road increases by 20,000 ADT (from 58,000 ADT to 78,000 ADT) when compared to the six lane baseline scenario. The segment of Bouquet Canyon Road between Newhall Ranch Road and Soledad Canyon Road increases by 11,000 ADT (from 81,000 ADT to 92,000 ADT). The deletion also effects a larger geographical area with notable increases to ADT volumes on McBean Parkway (4,000 ADT), Whites Canyon Road (2,000 ADT) and San Fernando Road (3,000 ADT).

Figure 4-18

AVERAGE DAILY TRAFFIC VOLUMES
- LONG-RANGE WITH PROJECT ON SITE AND
DELETED SEGMENT OF SANTA CLARITA PKWY

The long-range forecasts presented above indicate that there would be no detrimental effects to the roadway system if the segment of Santa Clarita Parkway between Bouquet Canyon Road and Soledad Canyon Road were to be downgraded from a six lane roadway to a four lane roadway, or from a major highway to secondary highway. All intersections affected by the change are forecast to operate at an acceptable LOS.

In contrast to the four lane scenario, the deletion scenario has a significant negative effect on the roadway system. Three intersections along Bouquet Canyon Road become deficient and ADT volumes along Bouquet Canyon Road increase by as much as 20,000 ADT. The deletion scenario affects a wider area with notable ADT increases from McBean Parkway to Whites Canyon Road. For the LOS calculations, the three intersections shown as deficient in the deletion scenario have been assumed to be constructed to their maximum (buildout) configuration. For example, the intersection of Newhall Ranch Road and Bouquet Canyon Road, which is forecast as LOS E, consists of four through lanes in each direction. Mitigation that would result in LOS D for any of the deficient intersections would require significant measures such as two additional lanes through the intersection.

4.3 SPECIAL ISSUES

4.3.1 Freeway Analysis

Freeway mainline segments and ramps have been analyzed using the criteria outlined in Sections 1.4.1 and 1.4.3, respectively. Table 4-10 summarizes the comparison of future conditions with and without the proposed project for Interim Year conditions. The Alternative Interim Year conditions are summarized in Table 4-11. Detailed V/C calculations, including a summary of existing conditions, are located in Appendix C.

The southbound SR-14 freeway experiences significant congestion in the southbound direction during the AM peak hour and in the northbound direction during the PM peak hour. This is quantified in the above referenced tables which indicate LOS "F" for those time periods. Peak hour volumes on the freeway on and off ramps are forecast as LOS "C" or better.

[1] SB On-ramp from Sierra Highway
[2] SB On-ramp from Placerita Canyon Road

The amount of project traffic forecast for the SR-14 freeway segments is generally less than 50 vehicles per hour. For those segments forecast as LOS "F", the project's component of the future V/C is .007 or less which is under the threshold of significance (.020) established by the County CMP (see Table 1-2). Likewise, the project does not cause a significant impact on the freeway on and off ramps since those locations remain at an acceptable LOS with the project traffic.

4.3.2 CMP Analysis

The Los Angeles County Congestion Management Program (CMP) (see Reference 9 in Section 1.7) requires that a proposed development address two major subject areas with respect to traffic impacts. These are the project's impacts on the CMP highway system and on the local and regional transit systems. Also included is a debit/credit analysis that uses the CMP's New Development Activity Debits and the CMP's Countywide Deficiency Plan Credits to assess the project's impacts and benefits.

According to the CMP guidelines, the geographical area examined in a CMP traffic impact analysis (TIA) consists of the CMP monitoring locations that meet the following criteria:

1. CMP intersections where the proposed project will add 50 or more trips during the AM or PM weekday peak hours (of adjacent street traffic).
2. Mainline freeway locations where the project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.

Two CMP intersections and no mainline freeway locations meet the above criteria. The following list indicates the two CMP intersections:

- Valencia Boulevard & Magic Mountain Parkway
- Sierra Highway and Placerita Canyon Road

Table 4-12 summarizes the intersection ICUs and LOS for the two intersections based on the CMP ICU calculation methodology. The CMP ICU methodology differs from the City methodology used elsewhere in this report in regards to the per lane capacity used in the calculations (2,880 vphpl for dual left-turn lanes and 1,600 vphpl for all other lane configurations). Included in the table are the relevant ICUs and LOS after taking into account the project mitigation identified in previous sections.

Table 4-12

ICU AND LOS SUMMARY – CMP MONITORING INTERSECTIONS

INTERSECTION	WITHOUT PROJECT AM		WITHOUT PROJECT PM		WITH PROJECT AM		WITH PROJECT PM		INCREASE AM	INCREASE PM
INTERIM YEAR										
57. Valencia & Magic Mountain	1.17	F	1.19	F	1.18 (1.10)	F (F)	1.20 (1.20)	F (F)	.01 (-.07)	.01 (.01)
145. Sierra Hwy & Placerita Canyon	.92	E	1.10	F	.93	E	1.11	F	.01	.01
ALTERNATIVE INTERIM YEAR										
57. Valencia & Magic Mountain	1.14	F	1.26	F	1.16 (1.09)	F (F)	1.28 (1.20)	F (F)	.02* (-.05)	.02* (-.06)
145. Sierra Hwy & Placerita Canyon	1.13	F	1.27	F	1.13	F	1.28	F	.00	.01

* Significant Project Impact – CMP Criteria (V/C increase ≥ .02 causing or worsening LOS "F")

Note: Values in parenthesis indicate ICU and LOS with the project mitigation identified in previous sections. ICUs calculated using Los Angeles County CMP methodology (see Section 4.3.2 for description).

Level of service ranges:	
.00 - .60	A
.61 - .70	B
.71 - .80	C
.81 - .90	D
.91 – 1.00	E
Above 1.00	F

CMP methodology states that a significant project impact occurs when the proposed project increases traffic demand at a CMP monitoring location by two percent of capacity (V/C ≥ .02), causing or worsening LOS "F". Without mitigation, the project causes a significant impact at the intersection of Valencia Boulevard & Magic Mountain Parkway for the Alternative Interim Year scenario since it worsens LOS "F" conditions. With the mitigation previously identified in section 4.1.6, the project has no significant impacts since the project results in an improvement over no-project conditions.

Another component of the CMP transportation impact analysis is a review of transit impacts. This review includes evidence that transit operators received the Notice of Preparation (included in the project EIR), identification of existing transit services near the project (see Section 2.1.3), estimation of the number of project trips assigned to transit, information on facilities and/or programs that will encourage public transit use, and an analysis of project impacts on transit service.

The proposed project is forecast to generate 13,274 ADT. The conversion to person trips is accomplished by using the CMP guidelines (multiplying the ADT by an occupancy factor of 1.4) which results in a total of 18,584 average daily person trips. Applying the CMP's factor for converting total person trips to transit trips (.035) results in approximately 650 total daily transit trips and approximately 65 peak hour transit trips (based on the peak hour representing ten percent of the total daily trips).

The City of Santa Clarita does not have level of service standards for transit service that are applicable to future development such as the proposed project. Transit service is evaluated and funded on an as-needed basis. If additional fixed route service will be needed near the project site in the future, the project should coordinate with the transit provider to identify appropriate bus stop/turnout locations.

One purpose of the CMP is to track new development activity. This is accomplished by using established impact values (debits) for each type of land use developed. Conversely, credits are applied for transportation improvement strategies that have been identified as beneficial to the transportation system. Table 4-13 summarizes the CMP debits and credits associated with the proposed project and its mitigation. The table shows that the proposed project results in a net credit surplus of 95,430 points. These surplus credit points can be transferred to other jurisdictions or can be pooled through sub-regional forums to offset impacts at other locations as determined by the County in cooperation with other local jurisdictions.

Table 4-13

CMP DEBIT AND CREDIT SUMMARY

CATEGORY	UNITS	DEBIT VALUE	SUBTOTAL
Single-Family Residential	1,183 DU	6.80	8,044
Commercial 0-299 TSF	40.00 TSF	22.23	889

TOTAL DEFICIENCY PLAN IMPROVEMENTS (CREDIT POINTS)			104,363
SURPLUS CREDIT POINTS			**95,430**

4.3.3 Pre-Interim Year Analysis

This section evaluates an occupancy of up to 500 units of the project without the Newhall Ranch Road extension to Golden Valley Road, including the Newhall Ranch Road/Golden Valley Road bridge across the Santa Clara River. This scenario differs from the interim year analyses of previous sections by not including any future development in the Whitaker-Bermite area and only including development of the Valencia Commerce Center (an approved industrial park development located east of I-5 and north of SR-126 that will ultimately consist of approximately 13,500,000 square feet of development) up through the currently approved "Phase 3" (approximately 9,400,000 total square feet of development). Roadway infrastructure also does not include the future extensions of Via Princessa and Magic Mountain Parkway through the Whitaker-Bermite site since these improvements are not anticipated to occur before the development of the Whitaker-Bermite property.

Included in this analysis is the development of project's first 500 dwelling units. Table 4-14 summarizes the land use and trip generation characteristics for the 500 units. The table shows that the first 500 units will generate 4,260 total average daily trips with 319 occurring in the AM peak hour (250 outbound) and 415 occurring in the PM peak hour (270 inbound). The distribution of these trips is illustrated in Figures 4-19 and 4-20 which show the project-only traffic turning movement volumes for the AM and PM peak hours, respectively.

Pre-Interim Year volumes without the proposed project are illustrated in Figures 4-21 and 4-22 for the AM and PM peak hours, respectively. Corresponding volumes for "with project" conditions are shown in Figures 4-23 and 4-24.

Table 4-14

TRIP GENERATION SUMMARY FOR 500 DWELLING UNITS

			------ AM PEAK HOUR ------			------ PM PEAK HOUR ------

PM PEAK HOUR TURNING MOVEMENT VOLUMES
- PRE-INTERIM YEAR WITH PROJECT

Table 4-15 summarizes the ICUs and LOS for the study area intersections for the Pre-Interim Year scenario. The table shows that four intersections experience a significant impact due to the project generated traffic (see Table 1-3 for significant impact criteria) with three of those intersections forecast to exceed LOS "D". The following intersections are those significantly impacted:

Intersections with Significant Project Impact at LOS "E" or LOS "F":

- Valencia Boulevard and Magic Mountain Parkway
- Bouquet Canyon Road and Soledad Canyon Road
- Seco Canyon Road and Bouquet Canyon Road

Intersections with Significant Project Impact at LOS "D":

- Bouquet Canyon Road and Newhall Ranch Road

Mitigation that addresses the above impacts is summarized as follows:

Mitigation not requiring acquisition of right-of-way:

65. Bouquet & Soledad	Temporary configuration to consist of 3 Southbound Left-Turn Lanes and 2 Southbound Through Lanes. Will revert to 2 Southbound Left-Turn Lanes and 3 Southbound Through Lanes (existing configuration) when Cross-Valley Connector is completed.
66. Bouquet & Newhall Ranch	Add 2nd Southbound Left-Turn Lane Temporary configuration to consist of 3 Northbound Left-Turn Lanes, 3 Northbound Through Lanes and 2 Westbound Right-Turn Lanes. Will revert to 2 Northbound Left-Turn Lanes, 4 Northbound Through Lanes, and 1 Westbound Right-Turn Lane (existing configuration) when Cross-Valley Connector is completed.
67. Seco & Bouquet	Convert 1st Southbound Right-Turn Lane to a shared Left-Turn/Right-Turn Lane (for 1 Left-Turn Lane, 1 shared Left-Turn/Right-Turn Lane, 1 Right-Turn Lane)

Mitigation requiring acquisition of right-of-way:

57. Valencia & Magic Mountain	Add 3rd Eastbound Through Lane

Table 4-16 summarizes the resulting ICUs and LOS with this mitigation. As shown above, some of these improvements require the acquisition of right-of-way which is out of the applicant's control.

The improvements at the Bouquet Canyon Road/Soledad Canyon Road intersection consist of reconfiguring the southbound approach to include three left-turn lanes and two through lanes. Similarly, the improvements at the Bouquet Canyon Road/Newhall Ranch Road intersection consist of

reconfiguring the northbound approach to include three left-turn lanes and three through lanes. This configuration is necessary only until the segment of Newhall Ranch Road from Bouquet to Golden Valley Road, including the construction of the Newhall Ranch Road/Golden Valley Road Bridge, across the Santa Clara River is constructed. The construction of this bridge results in a connection between Soledad Canyon Road and Newhall Ranch Road that reduces the volume of traffic through these left-turn movements. With the reduction in traffic, the northbound and southbound triple left-turn lanes are not required and these approaches should be reconfigured back to their planned ultimate configuration which consists of two left-turn lanes, three through lanes and two right-turn lanes at Bouquet Canyon Road/Soledad Canyon Road and two left-turn lanes, four through lanes and one right-turn lane at Bouquet Canyon Road/Newhall Ranch Road.

The project's percentage impact (as shown by the ICU) on the affected intersections, based on mitigation only where right-of-way is not required, is as follows:

- Bouquet & Soledad (mitigated) AM: .03 PM: -.09
- Bouquet & Newhall Ranch (mitigated) AM: .00 PM: .01
- Seco & Bouquet (mitigated) AM: .00 PM: -.12
- Valencia & Magic Mountain (unmitigated) AM: .01 PM: .01

The Riverpark project is located within the Bouquet Canyon Bridge and Thoroughfare District (Bouquet B & T District). This district is considered a full-mitigation district, that is, traffic improvements identified in the district mitigate traffic impacts created by planned growth within the district. In summary, the District has been designed to accommodate the needs of future development anticipated by the City and County General Plans.

Future identified improvements within the Bouquet Bridge and Thoroughfare District may result in improved operation at the impacted intersections. Various factors, including but not limited to, dedication of additional right-of-way at these affected intersections due to use alteration, expansion, or change, acquisition of the affected right-of-way by the City via funds from a Bridge and Thoroughfare District, continued expansion of the Valley's circulation system (i.e. construction of regional roadway improvements), and increased public transit use may improve the operation of each of the affected intersections.

4.4 MITIGATION

4.4.1 On-site Mitigation

The project is responsible for providing vehicular access onto and within the site that is compliant with City codes and regulations. Appropriate traffic control devices will be employed at each location where a project driveway intersects a public roadway.

Two future major arterial roadways pass through the project site (Newhall Ranch Road and Santa Clarita Parkway). The project will construct the portion of these arterials that are located within the site boundary to the arterial standards established by the City. Since the funding of these arterials is included in the Bridge and Thoroughfare (B&T) District improvement program (see Section 4.4.3), the project's B&T payments will be credited with the cost of the construction of these arterials.

4.4.2 Off-site Mitigation

The preceding sections show how a significant impact occurs at the following intersections for the indicated scenarios:

Intersection	Interim Year	Alternative Interim Year	Pre-Interim Year
McBean Parkway and Newhall Ranch Road	X	X	
Valencia Boulevard and Magic Mountain Parkway	X	X	X
Bouquet Canyon Road and Soledad Canyon Road	X	X	X
Bouquet Canyon Road and Newhall Ranch Road	X	X	X
Seco Canyon Road and Bouquet Canyon Road	X	X	X
Whites Canyon Road and Soledad Canyon Road	X		

Each of the off-site impacts occurs in one or more of the Interim Year analysis scenarios. There are no significant impacts due to the project for the Long-Range scenario.

Intersection improvements that fully mitigate the impacts of the proposed project were identified in the applicable section and are summarized in Table 4-17. Locations are noted where mitigation measures will require the acquisition of right-of-way that is not under the control of the project applicant. Therefore, the implementation of these mitigation measures may require the condemnation of property by the City in order to acquire the necessary right-of-way.

Table 4-17

MITIGATION SUMMARY

LOCATION	SCENARIO	MITIGATION
48. McBean & Newhall Ranch	IY, AIY	Add 4th Eastbound Through Lane Add 4th Westbound Through Lane
57. Valencia & Magic Mountain	IY, AIY, PIY	Add 3rd Eastbound Through Lane (requires right-of-way on south side of Valencia Boulevard)
65. Bouquet & Soledad	IY, AIY	Add 4th Northbound Through Lane (requires right-of-way on southeast corner of intersection along Bouquet Canyon Road)
	PIY	Temporary configuration to consist of 3 Southbound Left-Turn Lanes and 2 Southbound Through Lanes. Would revert to 2 Southbound Left-Turn Lanes and 3 Southbound Through Lanes (existing configuration) when Cross-Valley Connector is completed.
66. Bouquet & Newhall Ranch	IY, AIY	Add 4th Eastbound Through Lane Add 4th Westbound Through Lane
	PIY	Add 2nd Southbound Left-Turn Lane Temporary configuration to consist of 3 Northbound Left-Turn Lanes, 3 Northbound Through Lanes and 2 Westbound Right-Turn Lanes. Would revert to 2 Northbound Left-Turn Lanes, 4 Northbound Through Lanes, and 1 Westbound Right-Turn Lane (existing configuration) when Cross-Valley Connector is completed.
67. Seco & Bouquet	IY, AIY, PIY	Convert 1st Southbound Right-Turn Lane to a shared Left-Turn/Right-Turn Lane (for 1 Left-Turn Lane, 1 shared Left-Turn/Right-Turn Lane, 1 Right-Turn Lane)
	IY	Add 1st Westbound Right-Turn Lane (requires right-of-way on northeast corner of intersection along Bouquet Canyon Road)
172. Whites Canyon & Soledad	IY	Add 2nd dedicated Northbound Left-Turn Lane & convert shared Northbound Left-Turn/Through Lane to 3rd dedicated Northbound Through Lane (requires right-of-way on southeast side of intersection along Whites Canyon Road) Or Add 1st Eastbound Right-Turn Lane (requires right-of-way on southwest corner of intersection along Soledad Canyon Road)

IY = Interim Year Scenario
AIY = Alternative Interim Year Scenario
PIY = Pre-Interim Year Scenario

See Appendix G for drawings of each intersection improvement.

At the intersections of Valencia Boulevard/Magic Mountain Parkway, Bouquet Canyon Road/Soledad Canyon Road, Seco Canyon Road/Bouquet Canyon Road, and Whites Canyon Road/Soledad Canyon Road, the City has determined that improvements to reduce the project's impact to a level less than significant require additional right-of-way. These intersections are currently built to their ultimate size. Since the project and these intersections are in a full improvement Bridge and Thoroughfare (B&T) district, the project will pay B&T fees that can be used by the district to acquire additional right-of-way at these intersections. For Interim Year conditions, without mitigation, the Valencia Boulevard/Magic Mountain Parkway intersection is forecast as LOS F (same as the no-project conditions), the Bouquet Canyon Road/Soledad Canyon Road intersection is forecast as LOS E (same as the no-project conditions), the Seco Canyon Road/Bouquet Canyon Road intersection is forecast as LOS E (same as the no-project conditions), and the Whites Canyon Road/Soledad Canyon Road intersection is forecast as LOS D (same as the no-project and the with project with mitigation conditions). The remaining significantly impacted intersections will be fully mitigated with the proposed improvements and are forecast as LOS D or better. The project's share of the future traffic for each location requiring mitigation is provided in Table 4-18.

The first 500 units of the project can be occupied with the Newhall Ranch Road extension from Bouquet Canyon Road as the point of access and does not require the construction of the Newhall Ranch Road/Golden Valley Road bridge across the Santa Clara River. The full buildout of the project necessitates the construction of the Newhall Ranch Road extension to Golden Valley Road, including the Newhall Ranch Road/Golden Valley Road bridge across the Santa Clara River. While a two lane road and bridge would accommodate the project generated traffic alone (approximately 3,000 ADT at the bridge), four to six lanes are required to accommodate the additional non-project traffic that will use the road and bridge (an additional 29,000 ADT).

Table 4-18

PROJECT SHARE AT SIGNIFICANTLY IMPACTED LOCATIONS

INTERSECTION	INTERIM YEAR	ALTERNATIVE INTERIM YEAR
48. McBean & Newhall Ranch	8%	8%
57. Valencia & Magic Mountain	5%	5%
65. Bouquet & Soledad	4%	4%
66. Bouquet & Newhall Ranch	22%	26%
67. Seco & Bouquet	13%	2%
172. Whites Canyon & Soledad	4%	N/A

See Appendix E for share calculations

4.4.3 Bridge and Thoroughfare District Fee

Within the Santa Clarita Valley, the County and the City have established Bridge and Thoroughfare (B&T) Districts to manage the many significant infrastructure improvements planned to occur within the valley. The project site is located within the Bouquet Canyon District and the B&T fee for the Bouquet Canyon District is $14,200 per factored dwelling unit.

The Bouquet Canyon B&T District has recently been updated and is considered a full improvement district. The implication of this is that the B&T fees collected within the district have been calculated to cover all the anticipated improvements necessary to build out the arterial roadway network as outlined in the City's General Plan Circulation Element. Since most of the mitigation identified for the project is included in the B&T program, B&T improvements constructed directly by the project should be credited against the project's total B&T fee.

APPENDIX A
INTERSECTION CAPACITY UTILIZATION WORKSHEETS

Peak hour intersection volume/capacity ratios are calculated by means of intersection capacity utilization (ICU) values. ICU calculations were performed for the intersections shown in Figure A-1.

The procedure is based on the critical movement methodology, and shows the amount of capacity utilized by each critical move. A "de-facto" right-turn lane is used in the ICU calculation for cases where a curb lane is wide enough to separately serve both through and right-turn traffic (typically with a width of 19 feet from curb to outside of through-lane with parking prohibited during peak periods). Such lanes are treated the same as striped right-turn lanes during the ICU calculations, but they are denoted on the ICU calculation worksheets using the letter "d" in place of a numerical entry for right-turn lanes.

The methodology also incorporates a check for right-turn capacity utilization. Both right-turn-on-green (RTOG) and right-turn-on-red (RTOR) capacity availability are calculated and checked against the total right-turn capacity need. If insufficient capacity is available, then an adjustment is made to the total capacity utilization value. The following example shows how this adjustment is made.

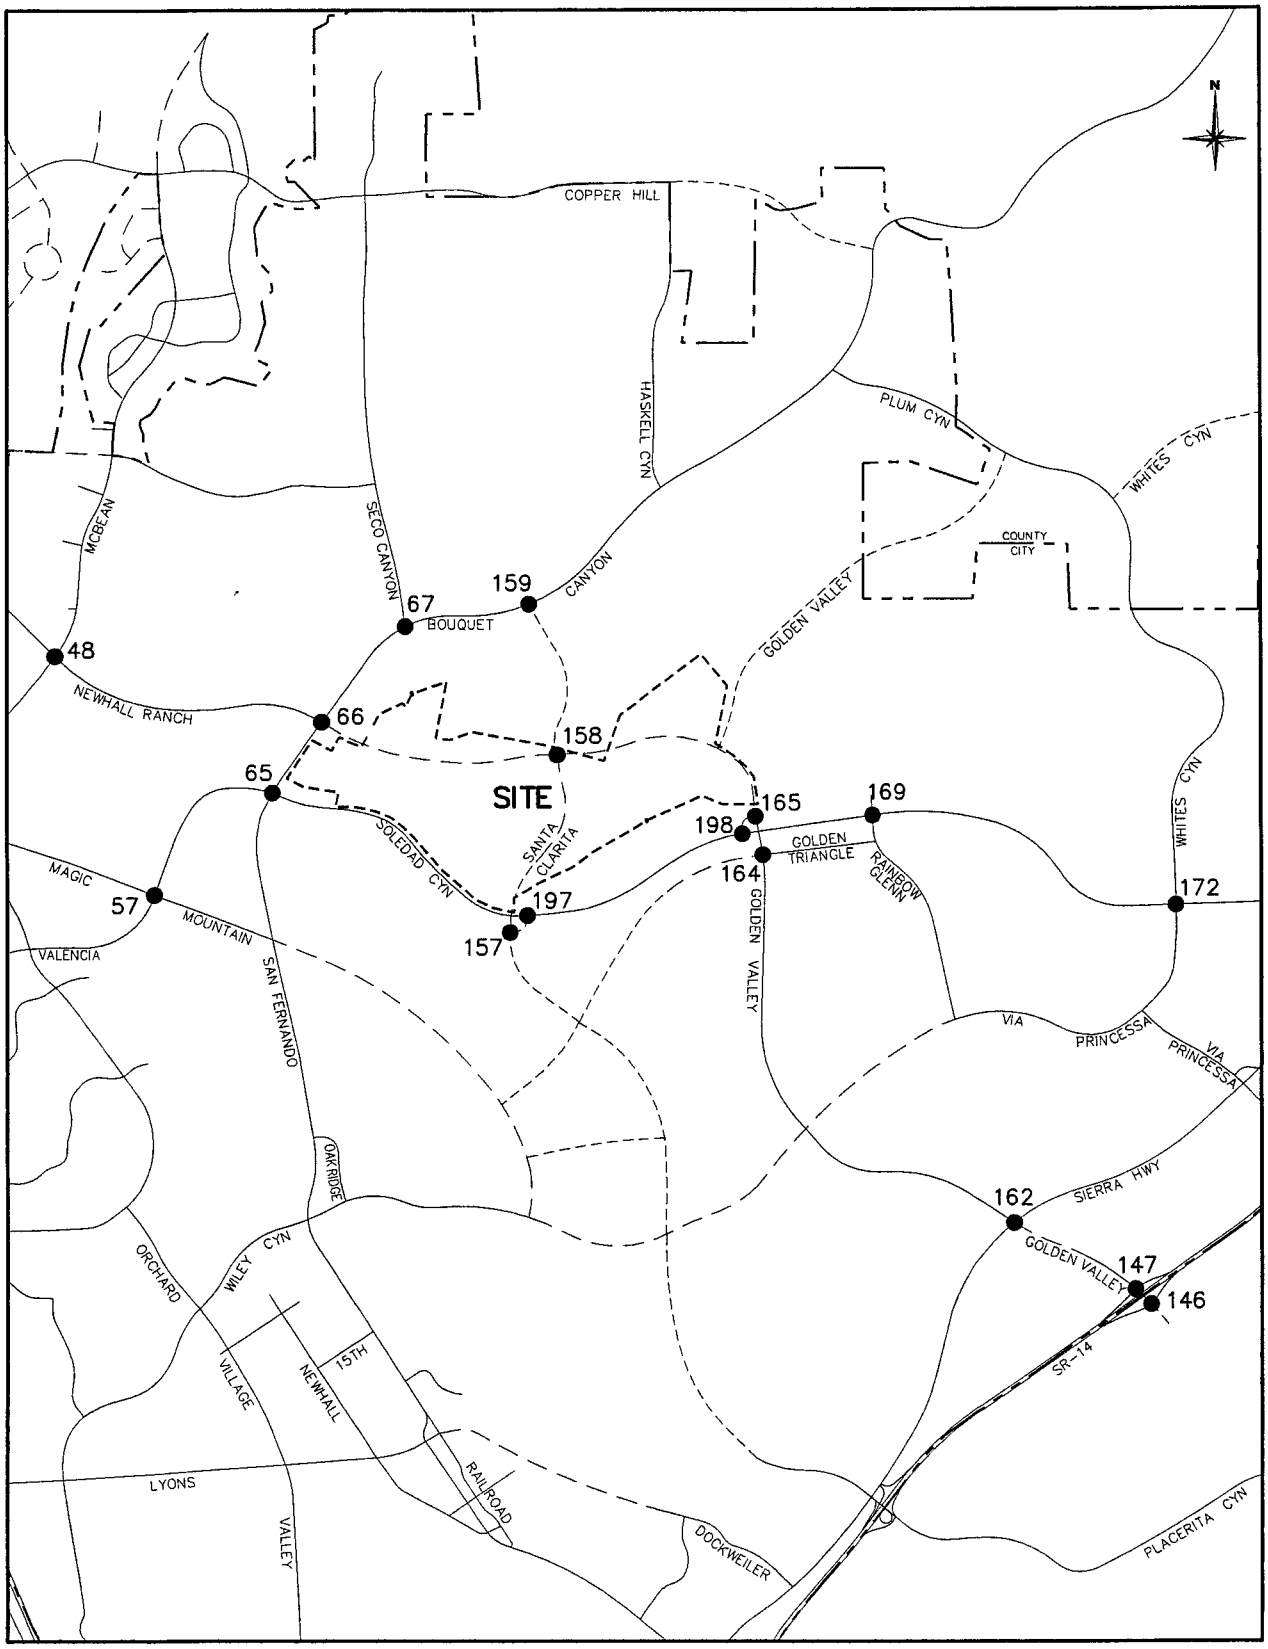
Example of Right-turn Capacity Utilization For Northbound Right

1. Right-Turn-On-Green (RTOG)

If NBT is critical move, then:
RTOG = V/C (NBT)
Otherwise,
RTOG = V/C (NBL) + V/C (SBT) - V/C (SBL)

2. Right-Turn-On-Red (RTOR)

If WBL is critical move, then:
RTOR = V/C (WBL)
Otherwise,
RTOR = V/C (EBL) + V/C (WBT) - V/C (EBT)



Legend

- Study Location
- Site Boundary
- Existing Roadway
- Interim Year Roadway
- Long-Range Roadway
- City Boundary

Figure A-1

INTERSECTION STUDY LOCATIONS

3. Right-Turn Overlap Adjustment

If the northbound right is assumed to overlap with the adjacent westbound left, adjustments to the RTOG and RTOR values are made as follows:

RTOG = RTOG + V/C (WBL)
RTOR = RTOR - V/C (WBL)

4. Total Right-Turn Capacity (RTC) Availability For NBR

RTC = RTOG + factor x RTOR
Where factor = RTOR saturation flow factor (typically 75%)

5. Right-turn Adjustment for ICU Calculation

Right-turn adjustment is then as follows: Additional ICU = V/C (NBR) - RTC

A zero or negative value indicates that adequate capacity is available and no adjustment is necessary. A positive value indicates that the available RTOR and RTOG capacity does not adequately accommodate the right-turn V/C, therefore the right-turn is essentially considered to be a critical movement. In such cases, the right-turn adjustment is noted on the ICU worksheet and it is included in the total capacity utilization value. When it is determined that a right-turn adjustment is required for more than one right-turn movement, the word "multi" is printed on the worksheet instead of an actual right-turn movement reference, and the right-turn adjustments are cumulatively added to the total capacity utilization value. In such cases, further operational evaluation is typically carried out to determine if under actual operational conditions, the critical right-turns would operate simultaneously, and therefore a right-turn adjustment credit should be applied.

Shared Lane V/C Methodology

For intersection approaches where shared usage of a lane is permitted by more than one turn movement (e.g., left/through, through/right, left/through/right), the individual turn volumes are evaluated to determine whether dedication of the shared lane is warranted to any one given turn movement. The following example demonstrates how this evaluation is carried out:

Example of Shared Lane Utilization for Shared Left/Through Lane

1. Average Lane Volume (ALV)

$$ALV = \frac{\text{Left-Turn Volume + Through Volume}}{\text{Total Left + Through Approach Lanes (including shared lane)}}.$$

2. ALV for Each Approach

$$ALV\ (Left) = \frac{\text{Left-Turn Volume}}{\text{Left Approach Lanes (including shared lane)}}.$$

$$ALV\ (Through) = \frac{\text{Through Volume}}{\text{Through Approach Lanes (including shared lane)}}.$$

3. Lane Dedication is Warranted

If ALV (Left) is greater than ALV then full dedication of the shared lane to the left-turn approach is warranted. Left-turn and through V/C ratios for this case are calculated as follows:

$$V/C\ (Left) = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (including shared lane)}}.$$

$$V/C\ (Through) = \frac{\text{Through Volume}}{\text{Through Approach Capacity (excluding shared lane)}}.$$

Similarly, if ALV (Through) is greater than ALV then full dedication to the through approach is warranted, and left-turn and through V/C ratios are calculated as follows:

$$V/C\ (Left) = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (excluding shared lane)}}.$$

$$V/C\ (Through) = \frac{\text{Through Volume}}{\text{Through Approach Capacity (including shared lane)}}.$$

4. Lane Dedication is not Warranted

If ALV (Left) and ALV (Through) are both less than ALV, the left/through lane is assumed to be truly shared and each left, left/through or through approach lane carries an evenly distributed volume of traffic equal to ALV. A combined left/through V/C ratio is calculated as follows:

$$\text{V/C (Left/Through)} = \frac{\text{Left-Turn Volume + Through Volume}}{\text{Total Left + Through Approach Capacity (including shared lane)}}.$$

This V/C (Left/Through) ratio is assigned as the V/C (Through) ratio for the critical movement analysis and ICU summary listing.

If split phasing has not been designated for this approach, the relative proportion of V/C (Through) that is attributed to the left-turn volume is estimated as follows:

If approach has more than one left-turn (including shared lane), then:

$$\text{V/C (Left)} = \text{V/C (Through)}$$

If approach has only one left-turn lane (shared lane), then:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Single Approach Lane Capacity}}.$$

If this left-turn movement is determined to be a critical movement, the V/C (Left) value is posted in brackets on the ICU summary printout.

These same steps are carried out for shared through/right lanes. If full dedication of a shared through/right lane to the right-turn movement is warranted, the right-turn V/C value calculated in step three is checked against the RTOR and RTOG capacity availability if the option to include right-turns in the V/C ratio calculations is selected. If the V/C value that is determined using the shared lane methodology described here is reduced due to RTOR and RTOG capacity availability, the V/C value for the through/right lanes is posted in brackets.

When an approach contains more than one shared lane (e.g., left/through and through/right), steps one and two listed above are carried out for the three turn movements combined. Step four is carried out if dedication is not warranted for either of the shared lanes. If dedication of one of the shared lanes is warranted to one movement or another, step three is carried out for the two movements involved, and then steps one through four are repeated for the two movements involved in the other shared lane.

APPENDIX C
RELATED PROJECTS

Gate King Industrial Park - Subdivide 584 acres into 88 industrial lots for 4.4 million square feet of industrial building square footage. The project would also dedicate 239 acres of open space to the City- South of San Fernando Road between Pine Street and Sierra Highway - Master Case 99-264

Western Pacific Housing (Lyons Ranch) - subdivide 384 acres into 3 commercial lots, 831 residential units, a 6 acre park site, and dedicate 211 acres of open space to the City of Santa Clarita. - West of Interstate 5 at Calgrove and The Old Road. Master Case 02-349

Rice Development - development for a 84,000 square foot self storage facility- southwest corner of Bouquet Canyon Road and Newhall Ranch Road – Master Case 02-231

Carl's Jr. - development for a new 3000 square foot drive through restaurant
Northwest corner of Via Princessa and Sierra Highway - Master Case 02-309

Aspen Investment Company - development for eight new industrial buildings totaling 109,000 square feet - north corner of Soledad Canyon Road and Valley Center Drive - Master Case 02-273

Rodgers Development - development for a new 34,000 square foot commercial shopping center - northeast corner of Bouquet Canyon Road and Plum Canyon Road- Master Case 02-232

Motezuma Land Development - subdivision of 90 acres for 174 single family homes, a park site, and four open space lots - southeast corner of Golden Valley Road and Sierra Highway - Master Case 02-063

HH Seco II LLC - development for a new 40,000 square foot commercial shopping center - southwest corner of Seco Canyon Road and Copper Hill - Master Case 01-317

California Canyons Annexation - located in the northeast corner of City. Total area 43.10 acres. 68 existing single family homes. Master Case 96-206

North Valencia No. 2: 1,900 dwelling units (1,400 sfd and 500 multifamily), 210,000 commercial square feet, 15.9 acre community park and 4.1 acres private recreation areas.

West Creek: 2,545 dwelling units (1806 sfd and 739 multi-family), 180,000 commercial retail, 10 acre elementary school, 6.4 acres of recreational facilities.

Lost Canyon Road Annexation - located west of the Sand Canyon area, south of 14 Freeway. 38.8 acres of vacant Business park zoning. Master Case 02-235

Northpark Annexation - north park of the City (north and south portions of Decoro Drive. 1351 existing residential units on 457 acres. Master Case 98-183

Stonecrest Annexation - west of Pinetree area, north of 14 Freeway. 425 existing residential units on 215.9 acres. Master Case 01-068

Whitney Canyon Annexation - located east of 14 Freeway extending east at the terminus of San Fernando Road and into a portion of the Angeles National Forest. 481.75 acres of open space. Master Case 02-345

Golden Valley Ranch – located southeast of the City, east of SR-14 and north of Placerita Canyon Road. 1311 acres of planned community (488 sfr, 2 commercial lots, 1 school lot, 1 fire station site). Master Case 97-212

Towsley Canyon Annexation - located southwest of the City, west of Interstate 5. 60 acres of open space. Master Case 89-016

Porta Bella or Whitaker-Bermite(partial) – located south of Soledad Canyon Road, east of Circle J Ranch area. Approximately 50% of the project land use is included in the Interim Year database. 100% of the project land use is included in the long-range database. 2,911 dwelling units and 92 acres of commercial development on 996 total acres.

Tesoro del Valle – located north of Copper Hill Drive, west of McBean Parkway. 1,791 dwelling units, 10 acre commercial center and elementary school.

Synergy Ermine Street – 116.71 acres site located just west of existing Ermine Street, east of Riverpark site and north of the Santa Clara River. Residential site zoned RVL, ½ to 1 unit/acre.

Valencia Town Center – located east of McBean Parkway, north of Valencia Boulevard, south of Magic Mountain Parkway and west of Citrus Street. Expansion of the existing shopping mall to consist of a 250,000 square foot Department Store.

TPM 20838 – Located north of Bouquet Canyon Road and south of the Santa Clara River. 168 apartment units.

APPENDIX D
NEWHALL RANCH ROAD INTERIM DESIGN

Newhall Ranch Road will be constructed as a six lane roadway between Bouquet Canyon Road and the Santa Clara River Bridge and the bridge will initially be constructed to accommodate four lanes. The following exhibit illustrates this interim configuration. Ultimately, the bridge will be improved to six lanes as envisioned by the City Circulation Element.

Traffic volume forecasts presented in the previous sections of this report indicate that the interim 6 lane/4 lane configuration results in acceptable levels of service as shown in the following intersection capacity utilization worksheets.

Average share is calculated by dividing the volume of project traffic in the AM and PM peak hours by the total increase in traffic (future conditions minus existing conditions) forecast to occur during the AM and PM peak hours. For intersections not existing today, or for intersections in which future parallel facilities will effect a net reduction in traffic volumes when compared to existing conditions, average share is calculated by dividing the volume of project traffic by the total volume of future traffic.

APPENDIX F
CALTRANS CAPACITY – MEETING NOTES

Meeting Notes – August 10, 2000 Meeting to Discuss Caltrans' Comment Letter on Draft EIR No. 573

Meeting Attendees:	Terry Austin, Austin-Foust Associates, Inc. Joe El Harake, Caltrans Kendall Elmer, Austin-Foust Associates, Inc. Everett Evans, Caltrans Michael Haberkorn, County of Orange Firooz Hamedani, Caltrans Bob Joseph, Caltrans Aileen Kennedy, Caltrans Bryan Speegle, County of Orange
Meeting Location:	Caltrans District 12 Headquarters, Irvine

The primary topic of discussion during the meeting pertained to methodologies for performing level of service analysis on the freeway system within the EIR No. 573 traffic analysis study area. The primary objective of the discussion was to develop a general consensus on a set of freeway facility capacities, level of service standards, and project impact thresholds for the County to apply in order to address freeway impact comments contained in Caltrans' February 22, 2000 DEIR comment letter as well as DEIR comment letters received from others. Two basic components of the freeway system were discussed in-depth during the meeting: 1) the freeway mainline, and 2) freeway ramps. By the end of the meeting a general consensus had been reached as to the assumptions and standards to apply in an updated impact analysis of these two basic freeway components. These assumptions and standards are summarized below.

Freeway Mainline

A maximum capacity of 2,000 vehicles per hour per lane (vphpl) is to be assumed for mixed-flow mainline freeway lanes, a capacity that is cited in the Caltrans Highway Design Manual. A maximum capacity of 1,600 vphpl is to be assumed for high occupancy vehicle (HOV) freeway lanes, a capacity that Caltrans has applied in the past when performing freeway capacity analyses. It should be assumed that no additional mainline capacity is provided by auxiliary lanes that are located between the on-ramp and off-ramp of two adjacent interchanges (i.e., auxiliary lanes that do not extend beyond two adjacent interchanges).

These capacities, which correspond to level of service (LOS) "E" conditions, are to be applied to calculate existing volume-to-capacity (V/C) ratios and future demand-to-capacity (D/C) ratios. LOS "E" (V/C or D/C less than or equal to 1.00) is the performance standard that is to be applied to the freeway mainline (i.e., a freeway mainline segment is considered deficient (LOS "F") when the V/C or D/C ratio is greater than 1.00). Project mitigation is required for freeway mainline segments that are forecast to operate at LOS "F" if the project contribution to the V/C or D/C ratio is greater than 0.03 (the impact threshold specified in the Orange County Congestion Management Program).

For existing traffic conditions which are reported based on observed traffic volumes, existing levels of service based on V/C ratios will be validated against Caltrans' 1998 Freeway Traffic Conditions publication in order to ensure that the V/C methodology accurately depicts existing levels of service, particularly for freeway segments which are currently deficient according to the Caltrans publication. Modeled future traffic forecasts that are applied in the DEIR No. 573 traffic analysis represent the future volume demand on the freeway system. The corresponding future D/C ratios can therefore be directly utilized to accurately portray future levels of service on the freeway mainline.

Freeway Ramps

Carrying capacities for ramps of various configurations were developed based on information contained in the Caltrans Highway Design Manual and the Caltrans Ramp Meter Design Manual. The various ramp configurations and their associated capacities are summarized below.

Metered On-Ramps

A maximum capacity of 900 vehicles per hour (vph) is to be assumed for a one-lane metered on-ramp with only one mixed-flow lane at the meter.

A maximum capacity of 1,080 (20 percent greater than 900) vph is to be assumed for a one-lane metered on-ramp with one mixed-flow lane at the meter plus one HOV preferential lane at the meter.

A maximum capacity of 1,500 vph is to be assumed for a one-lane metered on-ramp with two mixed-flow lanes at the meter.

A maximum capacity of 1,800 vph is to be assumed for a two-lane metered on-ramp with two mixed-flow lanes at the meter.

A maximum capacity of 2,250 (50 percent greater than 1,500) vph is to be assumed for a two-lane metered on-ramp with three mixed-flow lanes at the meter.

Toll Ramps

A maximum capacity of 1,500 vph is to be assumed for a one-lane toll ramp with one cash (stopped) lane and one FasTrak (unstopped) lane.

Non-Metered and Non-Tolled On-Ramps and Off-Ramps

A maximum capacity of 1,500 vph is to be assumed for a one-lane ramp.

A maximum capacity of 2,250 (50 percent greater than 1,500) vph is to be assumed for a two-lane on-ramp that tapers to one merge lane at or beyond the freeway mainline gore point and for a two-lane off-ramp with only one auxiliary lane.

A maximum capacity of 3,000 vph is to be assumed for a two-lane on-ramp that does not taper to one merge lane and for a two-lane off-ramp with two auxiliary lanes.

These capacities, which correspond to level of service (LOS) "E" conditions, are to be applied to calculate ramp V/C ratios. LOS "E" (V/C less than or equal to 1.00) is the performance standard that is to be applied to freeway/tollway ramps (i.e., a ramp is considered deficient (LOS "F") when the V/C ratio is greater than 1.00). Project mitigation is required for ramps that are forecast to operate at LOS "F" if the project contribution to the V/C ratio is greater than 0.03 for ramps at CMP intersections and 0.01 or greater for ramps at non-CMP intersections.

GENERAL NOTES

1. UTILITIES SHOWN ON THESE PLANS ARE CORRECT AND ACCURATE TO THE EXTENT OF AVAILABLE RECORDS AND KNOWLEDGE. THE CONTRACTOR IS REQUIRED TO TAKE STEPS TO ASCERTAIN THE EXACT LOCATION OF THE UNDERGROUND FACILITIES PRIOR TO DOING THE WORK THAT MAY DAMAGE SUCH FACILITIES OR INTERFERE WITH THEIR SERVICE.
2. ALL MATERIAL AND EQUIPMENT SHALL BE FURNISHED AND INSTALLED BY THE CONTRACTOR.
3. ALL WIRING SHALL BE MARKED (TAGGED) WITHIN THE CONTROLLER CABINET FOR PHASE IDENTIFICATION.
4. ALL SIGNAL EQUIPMENT SHALL BE WIRED IN ACCORDANCE WITH THE SIGNAL PHASE DIAGRAM.
5. EACH LOOP ASSEMBLY SHALL HAVE A SEPARATE LEAD-IN CABLE TO THE CONTROLLER.
6. LOOPS SHALL BE TYPE E AND CENTERED IN LANES UNLESS OTHERWISE SPECIFIED.
7. PEDESTRIAN HEADS SHALL BE MODULAR TYPE III WITH INTERNATIONAL SYMBOLS.
8. CONDUIT SHALL BE 2" UNLESS OTHERWISE SPECIFIED.
9. PULL BOXES SHALL BE SIZE No. 5 UNLESS OTHERWISE SPECIFIED.
10. ALL WORK IS TO BE DONE IN ACCORDANCE WITH CALTRANS STANDARD PLANS AND SPECIFICATIONS, LATEST EDITION.
11. POLE LOCATIONS SHOWN HEREON ARE APPROXIMATE. PRECISE LOCATIONS SHALL BE ESTABLISHED IN THE FIELD AND VERIFIED BY THE PROJECT ENGINEER.

TITLE: STRIPING PLAN

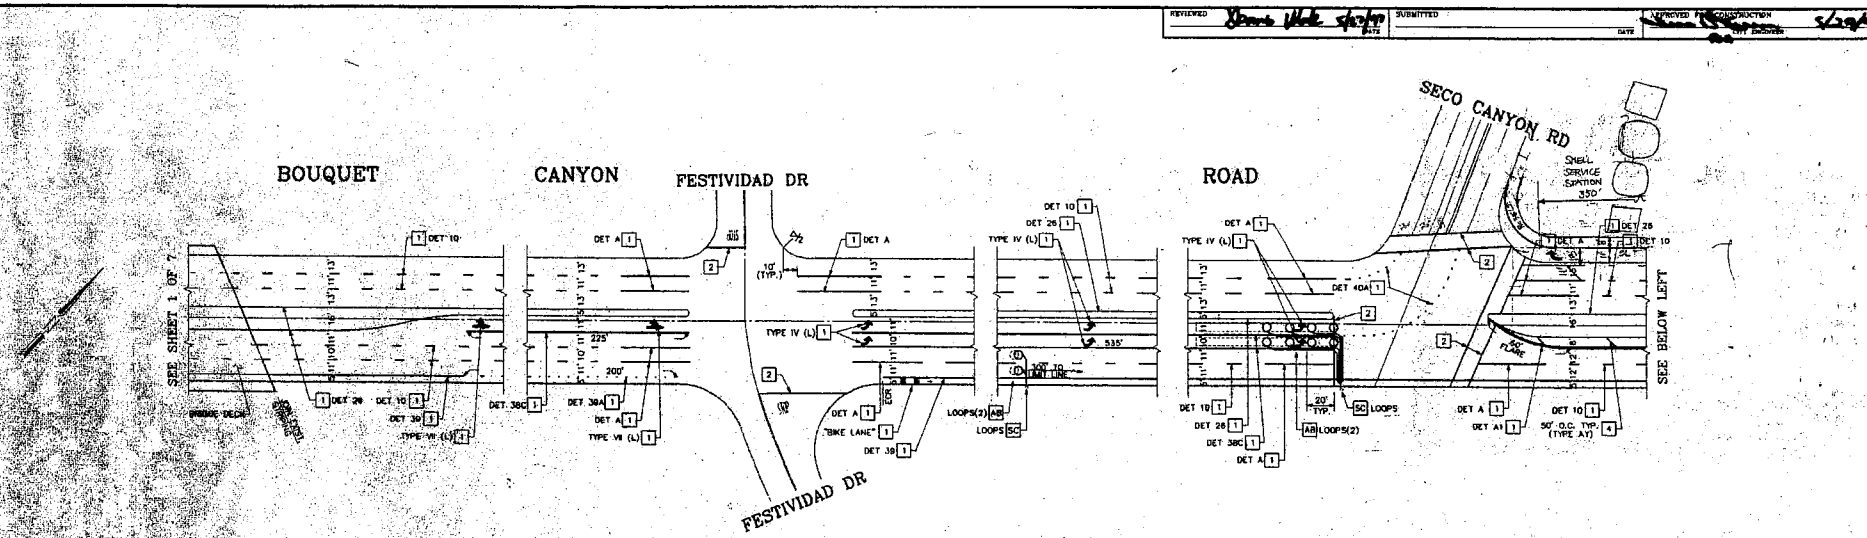
DESCRIPTION: SOLEDAD CANYON ROAD
FROM 800' W/O CAMP PLENTY RD TO 500' E/O HIDAWAY AVE

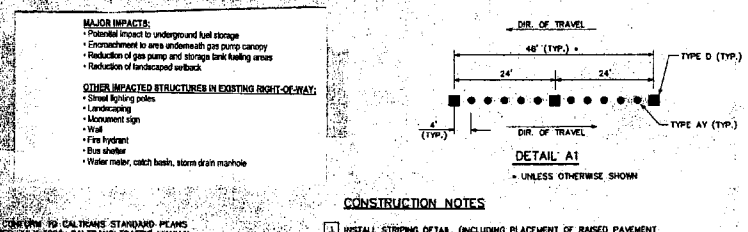
205B

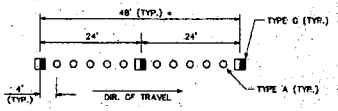
PROJECT: 95-906

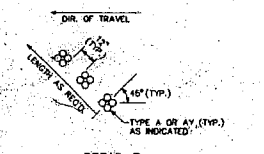
SHT. 3 of SHTS. 4

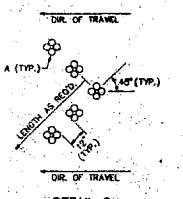
WHITE CANYON & SOLEDAD 1Y











MAJOR IMPACTS:
- Potential impact to underground fuel storage
- Encroachment to area underneath gas pump canopy
- Reduction of gas pump and storage tank fueling areas
- Reduction of landscaped setback

OTHER IMPACTED STRUCTURES IN EXISTING RIGHT-OF-WAY:
- Street lighting poles
- Landscaping
- Monument sign
- Wall
- Fire hydrant
- Bus shelter
- Water meter, catch basin, storm drain manhole

GENERAL NOTES

1. TRAFFIC STRIPING SHALL CONFORM TO CALTRANS STANDARD PLANS AND SPECIFICATIONS, DATED JULY 1992, CALTRANS TRAFFIC MANUAL, LATEST EDITION, THIS PLAN, AND THE SPECIAL PROVISIONS.
2. INDUCTIVE LOOP DETECTORS, SHALL BE 6' DIAMETER; PLACE LIMIT LINE OR CROSSWALK LOOPS 2' BEYOND LIMIT LINE OR CROSSWALK. NEW STRIPING SHALL BE LOCATED, AND APPROVED BY THE ENGINEER IN THE FIELD PRIOR TO POSITIONING LOOPS.
3. INSTALL TWO-WAY BLUE REFLECTIVE MARKER AT EVERY FIRE HYDRANT.
4. ALL ARROW, LEGEND, CROSSWALK, LIMIT LINE, AND STOP BAR PAVEMENT MARKINGS SHALL BE THERMOPLASTIC. ALL BIKE LANE LINES AND BIKE PAVEMENT MARKINGS SHALL BE PAINT.
5. BIKE LANE PAVEMENT MARKINGS SHALL BE INSTALLED AT EVERY INTERSECTION, AS INDICATED ON PLANS, AND AS INSTRUCTED BY THE ENGINEER IN THE FIELD.
6. LIMIT LINES & ARROW LEGENDS SHALL BE INSTALLED AFTER LOOP INSTALLATIONS ARE COMPLETED.

CONSTRUCTION NOTES

1. INSTALL STRIPING DETAIL (INCLUDING PLACEMENT OF RAISED PAVEMENT MARKERS), ARROW, OR PAVEMENT LEGEND AS SHOWN.
2. INSTALL 12" WHITE LINE AS SHOWN.
3. INSTALL 12" YELLOW LINE AS SHOWN.
4. INSTALL DETAIL B, SPACED AS INDICATED.
5. INSTALL DETAIL C, SPACED AS INDICATED.
6. INSTALL TYPE K-4 OBJECT MARKERS SPACED 10' O.C.

R-61 INSTALL SIGN PER DESIGNATION. SEE STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION, (CALTRANS) "UNIFORM SIGN CHART."

GENERAL NOTES

1. ALL STRIPING AND PAVEMENT MARKINGS TO BE PAINTED (2 COATS) PER STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD PLANS AND SPECIFICATIONS. (Current Edition)
2. ALL CONFLICTING STRIPING SHALL BE REMOVED BY SANDBLASTING.
3. ALL SIGNS AND SIGN POSTS SHALL MEET SPECIFICATION ON FILE WITH OPERATIONAL SERVICES DIVISION, D.P.W. AT (818) 458-3708.
4. ALL ARROWS SHALL BE TYPE IV (L OR R) UNLESS OTHERWISE SPECIFIED.
5. ALL LANE STRIPING AT INTERSECTION APPROACHES WITHOUT CROSSWALK (X) LIMIT LINES SHALL END 18' FROM THE EXTENSION OF THE INTERSECTION CURB LINE.
6. ALL STRIPING, PAVEMENT MARKINGS AND SIGNS SHALL BE INSTALLED BY THE COUNTY.

MAJOR IMPACTS:
- Loss of required parking spaces from McDonald's and Kmart sites along Soledad Canyon

OTHER IMPACTED STRUCTURES IN EXISTING RIGHT-OF-WAY:
- Street lighting poles
- Landscaped setbacks
- Signs
- Low wall
- Manhole
- Fire hydrant
- Bus shelter

MAJOR IMPACTS:
- Potential impact to underground fuel storage
- Encroachment to area underneath gas pump canopy
- Reduction of gas pump and storage tank fueling areas
- Loss of parking spaces
- Potential elimination of building/landscaped setback
- Elimination of Del Taco Drive-Thru

OTHER IMPACTED STRUCTURES IN EXISTING RIGHT-OF-WAY:
- Street lighting poles
- Landscaping
- Billboard sign
- Catch basin, storm drain manhole
- Wall
- Commercial signs

MAJOR IMPACTS:
- Potential impact to underground fuel storage
- Encroachment to area underneath gas pump canopy
- Reduction of gas pump and storage tank fueling areas
- Need to relocate paved trail

OTHER IMPACTED STRUCTURES IN EXISTING RIGHT-OF-WAY:
- Street lighting poles
- Landscaping
- Monument sign
- Fence, wall
- Utility vault
- Water meter

MAJOR IMPACTS:
- Potential impact to underground fuel storage
- Encroachment to area underneath gas pump canopy
- Reduction of gas pump and storage tank fueling areas
- Encroachment onto parking areas
- Potential elimination of building/landscaped setbacks
- Required acquisition and demolition of two commercial buildings

OTHER IMPACTED STRUCTURES IN EXISTING RIGHT-OF-WAY
- Street lighting poles
- Landscaping
- Monument sign and other commercial signs
- Water meter
- Water valve

Does not include correction for passby trips.
Does not include double counting adjustment for internal trips.

OPERATIONAL (Vehicle) EMISSION ESTIMATES

Analysis Year: 2004 Temperature (F): 90 Season: Summer

EMFAC Version: EMFAC2002 (9/2002)

Summary of Land Uses:

Unit Type	Trip Rate	Size	Total Trips
Single family housing	9.90 trips / dwelling units	459.00	4,544.10
Apartments low rise	6.90 trips / dwelling units	744.00	5,133.60
City park	2.60 trips / acres	4.50	11.70
Strip mall	40.00 trips / 1000 sq. ft.	40.00	1,600.00

Vehicle Assumptions:

Fleet Mix:

Vehicle Type	Percent Type	Non-Catalyst	Catalyst	Diesel
Light Auto	93.00	2.70	96.80	0.50
Light Truck < 3,750 lbs	0.00	4.60	92.70	2.70
Light Truck 3,751- 5,750	0.00	2.60	96.20	1.20
Med Truck 5,751- 8,500	2.00	2.90	94.20	2.90
Lite-Heavy 8,501-10,000	0.00	0.00	80.00	20.00
Lite-Heavy 10,001-14,000	0.00	0.00	66.70	33.30
Med-Heavy 14,001-33,000	0.00	10.00	20.00	70.00
Heavy-Heavy 33,001-60,000	2.00	0.00	12.50	87.50
Line Haul > 60,000 lbs	0.00	0.00	0.00	100.00
Urban Bus	0.10	0.00	0.00	100.00
Motorcycle	1.60	87.50	12.50	0.00
School Bus	0.00	0.00	0.00	100.00
Motor Home	1.30	15.40	76.90	7.70

Travel Conditions

	Residential			Commercial		
	Home-Work	Home-Shop	Home-Other	Commute	Non-Work	Customer
Urban Trip Length (miles)	11.5	4.9	6.0	10.3	5.5	5.5
Rural Trip Length (miles)	11.5	4.9	6.0	10.3	5.5	5.5
Trip Speeds (mph)	35.0	40.0	40.0	40.0	40.0	40.0
% of Trips - Residential	20.0	37.0	43.0			
% of Trips - Commercial (by land use)						
City park				5.0	2.5	92.5
Strip mall				2.0	1.0	97.0

Changes made to the default values for Land Use Trip Percentages

Changes made to the default values for Area

The natural gas residential percentage changed from 60 to 100.
The consumer product persons per residential unit changed from 2.861 to 3.056.

Changes made to the default values for Operations

The light auto percentage changed from 56.1 to 93.
The light truck < 3750 lbs percentage changed from 15.1 to 0.
The light truck 3751-5750 percentage changed from 15.6 to 0.
The med truck 5751-8500 percentage changed from 6.9 to 2.
The lite-heavy truck 8501-10000 percentage changed from 1.0 to 0.
The lite-heavy truck 10001-14000 percentage changed from 0.3 to 0.
The med-heavy truck 14001-33000 percentage changed from 1.0 to 0.
The heavy-heavy truck 33001-60000 percentage changed from 0.8 to 2.
The school bus percentage changed from 0.2 to 0.
The double counting internal work trip limit changed from to 32.585.
The double counting shopping trip limit changed from to 16.2925.
The double counting other trip limit changed from to 1562.8225.

Commercial Uses											
	X	Preferential parking spaces for carpools and vanpools	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Retail commercial is not suited for carpools and vanpools.
	X	Implement on-site circulation plan in parking lots	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Provide separate windows for fast-food restaurants	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Provide video-conference facilities	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	No office requiring video conferencing is proposed on the site.
	X	Set up resident worker training programs to improve job/housing balance	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Implement home dispatching system for employees	0.1%	0.0%	0.1%	0.1%	0.0	0.0	0.0	0.0	This measure is not suitable for retail uses.
	X	Minimize use of fleet vehicles during smog alerts	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Retail use does not employ fleet vehicles.
	X	Use low emission fleet vehicles	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Retail use does not employ fleet vehicles.
	X	Reduce employee parking spaces for those business not under Rule 2202	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Staggered retail employee hours not suited for carpooling or vanpooling
	X	Lunch shuttle service from a worksite to food establishments	0.5%	0.4%	0.5%	0.5%	0.0	0.0	0.0	0.0	Adequate restaurant uses exist in project area within walking distance.
	X	Implement compressed work-week schedules	1.0%	0.8%	1.0%	1.0%	0.0	0.0	0.0	0.0	Compressed work weeks not suitable for retail uses.
	X	Trip reduction plan to achieve 1.5 AVR for businesses	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Staggered retail employee hours not suited for carpooling or vanpooling
	X	Utilize satellite offices rather than regular worksite to reduce VMT	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Office uses not proposed on the commercial site.
	X	Establish a home-based telecommuting program	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Telecommuting not suitable for retail uses.
	X	Provide or contribute to child care and after school facilities	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	There is no clear connection between providing this service and reducing air emissions.
	X	Offer travel incentives such as discounts on purchases for transit riders	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Provide on-site employee services such as cafeteria, banks, etc.	0.3%	0.2%	0.3%	0.3%	0.0	0.0	0.0	0.0	Food establishments and services already exist in the project area.
	X	Shuttle service from residential core area to the worksite	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	There is no residential core that would generate all or most of the employees for this project.
X		Construct bus passenger benches and shelters	0.1%	0.1%	0.1%	0.1%	0.2	0.0	0.0	0.0	
	X	Pricing structure for single-occupancy employee parking	2.0%	1.5%	2.0%	2.0%	0.0	0.0	0.0	0.0	Employee scheduling of retail uses do not facilitate carpooling, so single occupancy vehicles are the norm.
	X	Residential units within or adjacent to commercial developments	4.0%	3.1%	4.0%	4.0%	0.0	0.0	0.0	0.0	Measure already incorporated into project
	X	Utilize excess parking as park-n-ride or contribute to park-n-ride	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	No excess parking is proposed at the project.
	X	Construct bicycle facility improvements	0.3%	0.2%	0.3%	0.3%	0.0	0.0	0.0	0.0	Measure already incorporated into project
	X	Construct pedestrian facility improvements	0.2%	0.2%	0.2%	0.2%	0.0	0.0	0.0	0.0	Measure already incorporated into project
	X	Shuttles to major rail transit centers or multi-modal stations	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Bus service already serves the area.
X		Contribute to regional transit systems	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Charge visitors to park	2.0%	1.5%	2.0%	2.0%	0.0	0.0	0.0	0.0	Retail uses do not typically charge patrons to park.
X		Synchronize traffic lights on streets impacted by development	4.0%	4.0%	4.0%	4.0%	7.0	0.5	0.7	0.5	
	X	Reschedule truck deliveries and pickups for off-peak hours	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Paid parking at walkup kiosks	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Retail uses do not typically charge patrons to park.
	X	On-site truck loading zones	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Implement or contribute to public outreach programs	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
X		Provide commuter information areas	0.1%	0.1%	0.1%	0.1%	0.2	0.0	0.0	0.0

Mobile Sources											
Residential Uses											
	X	Allow satellite telecommunications centers in residential subdivisions	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Satellite telecommunications centers are superseded by other technology.
	X	Shuttle service from res. subdivisions to commercial core areas	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Bus transit and Metrolink already serve the area.
X		Construct bus passenger benches and shelters	0.2%	0.2%	0.2%	0.2%	2.4	0.2	0.3	0.2	
	X	Construct pedestrian facility improvements	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	This measure is already incorporated into the project.
	X	Retail services within or adjacent to residential subdivisions	1.3%	1.0%	1.3%	1.3%	0.0	0.0	0.0	0.0	This measure is already incorporated into the project.
	X	Shuttles to major rail transit centers or multi-modal stations	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Bus transit and Metrolink already serve the area.
X		Contribute to regional transit systems	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
X		Synchronize traffic lights on streets impacted by development	4.0%	4.0%	4.0%	4.0%	49.0	4.2	6.7	3.9	
	X	Construct bicycle trails	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	This measure is already incorporated into the project.
Commercial Uses											
	X	Preferential parking spaces for carpools and vanpools	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Retail commercial is not suited for carpools and vanpools.
	X	Implement on-site circulation plan in parking lots	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Provide separate windows for fast-food restaurants	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Provide video-conference facilities	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	No office requiring video conferencing is proposed on the site.
	X	Set up resident worker training programs to improve job/housing balance	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Implement home dispatching system for employees	0.1%	0.0%	0.1%	0.1%	0.0	0.0	0.0	0.0	This measure is not suitable for retail uses.
	X	Minimize use of fleet vehicles during smog alerts	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Retail use does not employ fleet vehicles.
	X	Use low emission fleet vehicles	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Retail use does not employ fleet vehicles.
	X	Reduce employee parking spaces for those business not under Rule 2202	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Staggered retail employee hours not suited for carpooling or vanpooling.
	X	Lunch shuttle service from a worksite to food establishments	0.5%	0.4%	0.5%	0.5%	0.0	0.0	0.0	0.0	Adequate restaurant uses exist in project area within walking distance.
	X	Implement compressed work-week schedules	1.0%	0.8%	1.0%	1.0%	0.0	0.0	0.0	0.0	Compressed work weeks not suitable for retail uses.
	X	Trip reduction plan to achieve 1.5 AVR for businesses	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Staggered retail employee hours not suited for carpooling or vanpooling.
	X	Utilize satellite offices rather than regular worksite to reduce VMT	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Office uses not proposed on the commercial site.
	X	Establish a home-based telecommuting program	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Telecommuting not suitable for retail uses.
	X	Provide or contribute to child care and after school facilities	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	There is no clear connection between providing this service and reducing air emissions.
	X	Offer travel incentives such as discounts on purchases for transit riders	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Provide on-site employee services such as cafeteria, banks, etc.	0.3%	0.2%	0.3%	0.3%	0.0	0.0	0.0	0.0	Food establishments and services already exist in the project area.
	X	Shuttle service from residential core area to the worksite	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	There is no residential core that would generate all or most of the employees for this project.
X		Construct bus passenger benches and shelters	0.1%	0.1%	0.1%	0.1%	0.2	0.0	0.0	0.0	
	X	Pricing structure for single-occupancy employee parking	2.0%	1.5%	2.0%	2.0%	0.0	0.0	0.0	0.0	Employee scheduling of retail uses do not facilitate carpooling, so single occupancy vehicles are the norm.
	X	Residential units within or adjacent to commercial developments	4.0%	3.1%	4.0%	4.0%	0.0	0.0	0.0	0.0	Measure already incorporated into project
	X	Utilize excess parking as park-n-ride or contribute to park-n-ride	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	No excess parking is proposed at the project.
	X	Construct bicycle facility improvements	0.3%	0.2%	0.3%	0.3%	0.0	0.0	0.0	0.0	Measure already incorporated into project
	X	Construct pedestrian facility improvements	0.2%	0.2%	0.2%	0.2%	0.0	0.0	0.0	0.0	Measure already incorporated into project
	X	Shuttles to major rail transit centers or multi-modal stations	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	Bus service already serves the area.
X		Contribute to regional transit systems	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Charge visitors to park	2.0%	1.5%	2.0%	2.0%	0.0	0.0	0.0	0.0	Retail uses do not typically charge patrons to park.
X		Synchronize traffic lights on streets impacted by development	4.0%	4.0%	4.0%	4.0%	6.7	0.6	0.9	0.5	
	X	Reschedule truck deliveries and pickups for off-peak hours	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Paid parking at walkup kiosks	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Retail uses do not typically charge patrons to park.
	X	On-site truck loading zones	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
	X	Implement or contribute to public outreach programs	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	Measure does not reduce emissions.
X		Provide commuter information areas	0.1%	0.1%	0.1%	0.1%	0.2	0.0	0.0	0.0	

ESTIMATED EMISSIONS REDUCTIONS EFFICIENCIES
River Park Recommended Mitigation - Wintertime Emissions Without Wood Burning Stoves or Fire Places

Recommended Measures already incorporated into Project are marked "No."			Emission Reduction Efficiency				Reduced Emissions in Pounds per Day				
Yes	No	MEASURES, EFFICIENCIES, AND REDUCTIONS	CO	VOC	NO_x	PM_{10}	CO	VOC	NO_x	PM_{10}	REASONS FOR REJECTING MITIGATION MEASURES
Industrial Uses											
	X	Preferential parking spaces for carpools and vanpools	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	No industrial uses are proposed within the project.
	X	Implement on-site circulation plan in parking lots	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Set up resident worker training programs to improve job/housing balance	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Implement home dispatching system for employees	0.1%	0.0%	0.1%	0.1%	0.0	0.0	0.0	0.0	
	X	Minimize use of fleet vehicles during smog alerts	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Use low emission fleet vehicles	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Provide commuter information areas	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Reduce employee parking spaces for those business not under Rule 2202	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	
	X	Implement compressed work-week schedules	1.0%	0.8%	1.0%	1.0%	0.0	0.0	0.0	0.0	
	X	Offer loans or other incentives to employees who move locally	0.0%	0.0%	0.0%	0.0%	0.0	0.0	0.0	0.0	
	X	Trip reduction plan to achieve 1.5 AVR for businesses	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	
	X	Provide or contribute to child care and after school facilities	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0	
	X	Provide on-site employee services such as cafeteria, banks, etc.	0.3%	0.2%	0.3%	0.3%	0.0	0.0	0.0	0.0	
	X	Shuttle service from residential core area to the worksite	0.1%	0.1%	0.1%	0.1%	0.0	0.0	0.0	0.0

RE: **Oak Tree Report ADDENDUM #1 – River Park Project** - Tract No. 53425

This addendum letter will address changes to the existing OTR (dated 5-22-03). One oak (#9L) will be taken from the removal list and added to the impacted list, one oak (#73H) will be removed from the relocation list and one oak (#74) will be removed from the impacted list. I have reviewed the plan changes and concur with these adjustments

1. Santa Clarita Parkway, which is proposed to pass through the center of the Riverpark Project has been shortened by approximately 700'. This change will result in the preservation of Heritage Oak #73. This tree will not be impacted or encroached upon. It will require protective fencing prior to construction activities. The Parkway will end approximately 190' north of its northern PZ. This tree is now removed from the list of proposed relocations.

2. In addition to this tree preservation, Oak #74 will not be encroached upon. The construction of the Parkway was going to noticeably impact this tree by encroachment well within its dripline. Santa Clarita Parkway will end approximately 600' north of this tree. This tree will be fenced prior to construction.

3. Oak #9 was listed as a removal. It will now be preserved and encroached upon at its eastern quadrant. The grading of the existing nearby slope will occur 5' within the PZ on the uphill side 17' from the trunk (see attached Section View). In my opinion, this impact will be minor and the tree should be affected short-term or long-term by this activity. The grading and slope work within the PZ will be monitored.

RE: **Oak Tree Report – River Park Project - Tract No. 53425**

THE REPORT

This Oak Tree Report includes:

1. **Tree Location Maps (200 scale area map, 40 scale detail sheets and cross-sections for encroachment trees)** showing the location of existing trees (incl. exact driplines of on-site oaks) and a number assigned to each tree

2. **Background Information**

3. **Summary of Field Inspection** (Oak Trees) with information regarding:
   A. Form - Tree number corresponding to the number on the Tree Location Map (TLM), species of oak, and size
   B. Physical condition
   C. Recommended treatment
   D. Rating: Oak tree vigor is rated alphabetically (Example: a. Excellent, b. Good, c. Fair, d. Poor, e. Nearly Dead, . f. Dead
4. **Summary of Data** (Refer to Table 1)
5. **Schedule of Proposed Removals or Relocations** (Refer to Table 2)
6. **Discussion of oak tree preservation** (general information) and **Mitigation Measures**
7. **Oak Transplantation**
8. **Tree Value Appraisal**
9. **Canopy Forms**
10. **Photographs**
11. **Arborist's Resume**
12. **Appendix** (Glossary of Terms)

LEGEND

H = Heritage oak (ex. HV = Heritage Valley oak)

V = Valley oak

L = California Live oak

S = Scrub oak

SUMMARY OF DATA

TOTAL NUMBER OF OAKS (2" or larger at 4.5' per City ord.) LISTED ON MAP ---------- 87
(25- Q. agrifolia, 15-Q. lobata, 46-Q. dumosa, 1-Q.douglasii)

TOTAL NUMBER OF DEAD OAKS AT SITE ---------- 2
(#3HL & 81HV)

TOTAL NUMBER OF OAKS TO BE REMOVED (Not incl. dead oaks) --- 4
(#9L,10S,11S,12S)

OAK TREES TO BE RELOCATED ---------- 13
(#68HV,69V,70V,71V,72V,73V,75HV,82L,83V,84V,85V,86HV,87V)

TOTAL NUMBER OF OAKS TO BE IMPACTED BY CONSTRUCTION (Encroachment into the Prot. Zone) -------- 3
(#6HL,13L,74HV)

TOTAL NUMBER OF OAKS NOT DEAD, NOT TO BE REMOVED AND NOT TO BE IMPACTED ---------- 65

TOTAL NUMBER OF HERITAGE OAKS ---------- 10
(#3L,5L,6L,67L,68V,74V,75V,80L,81V,86V)

BLUE OAKS - 1 (#76)

REMOVALS OR RELOCATIONS BY SPECIES (not incl. dead oaks) :

VALLEY OAKS - 12 (#68H,69,70,71,72,73,75H,83,84,85,86H,87)

LIVE OAKS - 2 - #9 & 82)

SCRUB OAKS - 3 (#10,11,12)

Robert W. Wallace
Registered Consulting Arborist

LOCATION

This site is located in the City of Santa Clarita north of Soledad Canyon Road and east and east of Bouquet Canyon Road.

BACKGROUND INFORMATION

At the request of Mr. Glenn Adamick (Newhall Land), this report has been prepared to meet the City of Santa Clarita requirements for Oak Tree Reports in accordance with the City's Oak Tree Preservation and Protection Guidelines. While gathering background information for this report, data was collected on 87 oak trees. The majority (67) of the trees were found near the center of this site in a canyon proposed for preservation in conjunction with the project. This canyon is occupied by a construction company contained within several small temporary buildings. The remaining oaks are scattered widely throughout the site.

- Ten Heritage oaks are also present on-site (#3L[dead],5L,6L,67L,68V,74V,75V,80L,81V[dead],86V). These are oaks with a DBH (diameter at breast height) of 34" or larger and oaks with two trunks at 23" diameter or larger.

- In this report each Heritage Oak will be indicated by a capital "H" after its identification number, i.e., 75H. The species of each oak will be indicated by a "V" (Valley oak), "L" (Live oak) or an "S" (Scrub oak) following its number and/or Heritage tree designation, i.e., 75HV.

- Of the 87 oaks found, 25 are California Live oaks (*Quercus agrifolia*), 15 are Valley oaks (*Q. lobata*), 1 is a Blue oak (*Q. douglasii*) and the remainder (46) are Scrub oaks (*Q. berberidifolia*).

- The proposed development will require the removal and/or relocation of 17 living oaks; twelve are Quercus lobata (#68HV,69V,70V,71V,72V,73V,75V, 83V,84V,85V,86V,87V), three are Q. berberidifolia (#10S,11S,12S) and two (#9L & 82L) are Q. agrifolia. Thirteen of the seventeen will be relocated on the project site (68HV,69V,70V,71V,72V,73V,75HV,82L,83V,84V,85V, 86HV,87V). Four will be removed for construction purposes (#9L,10S,11S,12S).

- Three oaks (#6HL, 13L, & 74HV) will be impacted by construction within the protective zone. The work near these oaks will be closely monitored by the project arborist.

- There are 65 oaks that will not be impacted by this project. Most of these will be "fenced" during construction to ensure their protection from possible equipment damage (refer to the Tree Location Map for fencing locations).

OAK TREE PRESERVATION - MITIGATION - APPRAISAL
(Notes on Oak #3)

OAK TREE PRESERVATION

The City of Santa Clarita Protects oak trees that are at least 2" in diameter as measured at 4 1/2' above natural grade. The City's Oak Tree Ordinance seeks to curb the destruction of its native oaks, preserve the natural environment, and protect its plant life heritage.

The following are some helpful recommendations and comments to help preserve and protect the oaks in this report:

A. Control of Diseases and Pests

The oaks referred to in this report generally have an acceptable level of indigenous insect pests. During my visual, above ground inspection I found no sign of Oak Root Fungus (Armillaria mellea) or Bleeding Canker Disease (Erwinnia nimpressuralis/Phytophthora cactorum) on any of the living oaks.

B. Protective Fencing

Equipment damage to the limbs, trunks and roots must be avoided. Even slight trunk injuries can result in long-term, life threatening pathogenic maladies. No storage of equipment or debris within the Protective Zone (dripline plus 5') will be allowed. No dumping of construction waste water i.e., paint, stucco, concrete, clean-up, etc. within Protective Zones. Generally, fencing shall be placed at the Protective Zone of any oak or groups of oaks within 50' of proposed construction activity. Protective Fencing must remain in place during construction projects and shall not be moved or removed without prior written approval from the Department of Community Development under the direct supervision of the Project Consulting Arborist.

Protective Fencing shall be at least 4' in height with a visible sign attached at 50' intervals which reads: [WARNING - THIS FENCE IS FOR THE PROTECTION OF THIS TREE AND SHALL NOT BE REMOVED OR RELOCATED WITHOUT WRITTEN AUTHORIZATION FROM THE CITY OF SANTA CLARITA COMMUNITY DEVELOPMENT DEPARTMENT]

C. Pruning Recommendations

These oaks have never been pruned and many are in an over-weighted condition making them susceptible to main crotch failures or limb failures. Healthy oaks, if not maintained, will eventually grow beyond their ability to support themselves and fail at a weak point. This is commonly at a branch union or the main crotch. Weight reduction pruning and/or cabling is vitally important in an oak tree preservation program. Refer to the Summary of Field Inspection worksheets for specific tree pruning recommendations.

If possible, complete pruning of the larger California Live or Valley oaks, is recommended for health and weight reduction (inspect for occupied woodpecker nests prior to removal of larger dead snags). Any cuts over 2" diameter would require a "Pruning Permit" from the City. After pruning, the installation of support cables to prevent future main crotch failures is recommended (refer to the Summary of Field Inspection for specific tree and cable numbers). All cables should be a minimum of 5/16" diameter EHS (Extra High Strength) and attached with 5/8" diameter, galvanized thru-bolts. Heavy-duty 3/8" thimbles are to be utilized at each attachment point. These recommendations are presented for consideration by the City, current and/or future property owners.

Generally, mature oaks in a residential setting should be pruned every four to six years or at the recommendation of a Certified Arborist. It is advised that mature oaks in park or public space be inspected on an annual basis for tree health and safety (structural integrity).

D. Frequency of Watering

Care should be taken to avoid placing any sprinklers within watering distance to the trunk of an oak tree. Generally, sprinklers should not reach within 15' of a mature oak trunk. Grass or ground covers must never be planted next to the trunks. Too much moisture near the base of an oak is generally believed to be their leading cause of death in residential settings. Oak Root Fungus is the result of over-watering. Oak trees survive and thrive on annual rainfall alone and generally do not need supplemental irrigation except during periods of drought. Watering should take place at or near the dripline. Landscape plans should leave the area within the dripline of an oak tree in a native or natural setting.

E. Grading Restrictions Near Protective Zones

Care must be taken to limit grade changes near the trunk areas. The grade should not be lowered or raised around the trunks of trees. This can lead to plant stress from oxygen deprivation or Oak Root Fungus at the root collar. The grades near the trunks will not be raised on the trees listed in this report.

While speaking at a recent seminar, Dr. Tom Smiley of Bartlett Research Laboratory, told of two recent studies which concluded that moderate "fills" over the outer rootzone of oaks proved to be a minor impact. The studies also concluded that roots tended to grow upward and into these fill areas with no deleterious effect to the tree. This has been my experience in the field as well. Note: "fill" over a root buttress or root collar of an oak can be deadly.

F. Mitigation Measures and Comments

1. The general purpose and intent of the City's Oak Tree Preservation Ordinance is to preserve oak trees, yet allow for their removal in certain circumstances where it is necessary to enable reasonable use of the subject property which would otherwise be prevented by the presence of the trees and no reasonable alternative can be accommodated due to the unique physical development constraints on the property. The approval of the request will not be contrary to or in conflict with the general purpose and intent of the Oak Tree Preservation Ordinance.

   Mitigation for the 17 tree removals/relocations includes the dedication of a 24-acre property with oak tree habitat. This property is directly adjacent to the 4.25 acre active neighborhood park and contains a majority of the oak trees on the project site. The proposed mitigation (dedication of 24 acres of oak habitat open space and the transplanting of 13 oak trees on-site including the costs associated with the corresponding five-year maintenance plan of said trees) for oak tree impacts is consistent with the provisions of the City's Oak Tree Preservation Ordinance.

   It is necessary to relocate three Heritage oak trees (#68HV, 75HV & 86HV) to enable reasonable use of the subject property which is otherwise prevented by the presence of the trees and no reasonable alternative can be accommodated due to the unique physical development constraints of the property. The relocation of these Heritage oak trees is a costly but reasonable alternative to removal. With proper aftercare and monitoring these majestic trees can continue to be a valuable asset to the community and the surrounding area.

   Oak #68HV – This oak exhibits signs of stress and there is deadwood throughout the canopy. During my initial site inventory, I rated this tree "D" (Poor) and advised NHL&F that it was not a candidate for relocation. A year later and after above normal rainfall this past winter, the tree is responding with new growth scattered throughout it's canopy.

F. Mitigation Measures and Comments (Cont'd)

This tree has now been upgraded to a "C" rating (Fair). After consulting with the City's Tree Specialist during an on-site inspection (5-13-03) a determination was made to relocate this tree and attempt to preserve it. The deadwood will be pruned and the tree will be fertilized at least three months prior to side-boxing.

Oak #75HV – This tree has also been upgraded to a "C" rating due to its response to seasonal rains. The trunk is significantly decayed and the tree is leaning but I believe that it has a reasonable chance of surviving relocation efforts. I am recommending weight reduction pruning at the south quadrant of the upper canopy to help stabilize and balance the tree. This pruning should be performed next October or November and prior to boxing.

As mentioned under Background Information, 17 oak trees are proposed for removal, 13 of which are being relocated on-site due to unavoidable grading requirements. Refer to the TreeCalc Appraisal Worksheets for the pecuniary value of these trees, i.e., "Oak Removals" ($18,085.33 and "Oaks to be Relocated On-site" ($368,489.68). The sum total of all on-site oak tree values ($1,158,020.37) are also listed in the attached TreeCalc Worksheets.

The 13 transplanted oak trees shall be carefully maintained and monitored for a five year period. A watering system must be installed and the trees will be monitored at quarterly intervals for the first two years and biannually for the next three years. A Letter of Compliance will be submitted at the end of that time period. As the applicant is proposing to dedicate property to mitigate oak tree impacts, the applicant shall only be responsible for monitoring and maintaining the transplant trees for a five year period. The proposed landscape plan must specify that these transplant oaks are properly installed, staked/guyed and watered to ensure their survival. An irrigation system designed for "dryscape" planting is mandatory for successful oak establishment. Drip-system irrigation is ideal for managing water distribution near oaks. If a transplant tree dies during the monitoring period, the applicant shall replace the tree with two (minimum 24" box size) oak trees. These replacement trees and planting locations shall be approved in advance by the City's Tree Specialist and their survival guaranteed for a five year period.

F. Mitigation Measures and Comments (Cont'd)

2. The following three oaks (#6HL,13L & 74HV) will be encroached upon and impacted by the proposed construction activities:

   6HL - An encroachment 5' within the dripline (to a point 28' from the trunk) at the south canopy quadrant will occur for slope preparation. This oak is located downhill from the grading activity (see cross-section on TLM). In my opinion, it is unlikely that roots will be encountered during the excavation and the impact will be insignificant.

   13L - Slope preparation may encroach up to 2' within the south quadrant of the PZ on Oak #13. This impact will be minor and should not affect the health of this tree. This work must be monitored by the project arborist.

   74HV - The buried bank stabilization in the area of Tree #74 has been carefully designed to avoid this heritage tree. Grading operations for the buried bank stabilization shall remain approximately 12' outside this tree's eastern dripline (well outside the PZ). At the tree's northwestern dripline quadrant, the temporary backcut for alluvium removals, related to the grading at the terminus of Santa Clarita Parkway, will encroach up to the tree's dripline (30' from the trunk). The consulting soils engineer has recommended between 5 and 14 feet of removals in this area. To be conservative, we have assumed that 14 feet of removals will be required. If the maximum 14' removal is necessary (with a 1:1 back-cut extending toward the tree) this excavation would extend 8' within the dripline at that point and 22' from the trunk. To determine the potential for negatively impacting the rootzone, it is recommended that a 14' deep exploratory trench be excavated across this quadrant at a distance of 22' from the trunk. This trench should be hand-excavated (shoring may be required for safety purposes during excavation) and any roots over 1.5" diameter carefully preserved and protected by wrapping with burlap after tunneling around each root to be saved. The project arborist will monitor this excavation and supply an impact determination with recommendations in regard to minimizing root impacts to this tree.

   It is my opinion that due to the porous soil profile (sandy-loam) it is not likely that a significant number of larger roots will be encountered this distance from the trunk. I believe that the majority of the root system will be deeply oriented and will not be impacted. If several larger roots are exposed during the hand trenching, the excavation plan will be modified to correspond to recommendations of the project's arborist and the City. This work shall be monitored by the project arborist and approved by the City Tree Specialist.

F. Mitigation Measures and Comments (Cont'd)

In order to avoid the removal of Tree #74 in the event that Santa Clarita Parkway be extended to Soledad Canyon Road, several atypical construction techniques would be required to be employed. Without such techniques the impact of remedial grading operations, due to the placement of the embankment, would result in the tree being removed. To preserve this tree, it is proposed that an 8-foot parkway and 19-foot, right-of-way (adjacent landscaped lot), be eliminated. Additionally, to reduce the amount of necessary remedial grading, it is recommended that a geogrid-supported crib wall, or equivalent, be used adjacent to the sidewalk along a portion of the easterly right-of-way. Future utilities in Santa Clarita Parkway should be located in the western side of the right-of –way in order to avoid the proposed geogrid and tree roots.

Should Santa Clarita Parkway be extended, it is likely that some degree of clearance pruning may be required to accommodate construction and provide vehicle clearances. This pruning must be monitored by the project arborist. The degree of pruning and the style of cuts must be determined and performed in accordance with International Society of Arboriculture, Pruning Standards and ANSI A-300 Pruning Guidelines.

3. Protective fencing shall be installed around all oaks not listed for removal. Place protective fencing at the PZ as shown on the TLM. The fencing can be re-positioned as needed to allow for grading near the oaks listed as "impacted". The project arborist must be present during the fence placement. Final fencing locations shall be inspected by the City prior to the commencement of development activities. Regular inspections of this fencing shall occur during site development (refer to "B" Protective Fencing).

4. An Oak Tree Information Packet including the City of Santa Clarita Oak Tree Protection and Preservation Guidelines must be available on-site during construction. The property owner and contractor should be familiar with the contents of these documents.

5. Vehicle travel along dirt roadways to and from the site may create a heavy coating of dust on the foliage of nearby oaks. These oaks should be hosed off periodically during construction activities.

6. All work performed within the Protective Zone (dripline plus 5') of any oak shall be accomplished by utilizing hand tools only and must be "monitored" by the project's Oak Tree Consultant.

7. All roots over 1.5" diameter will be clean cut at a 45 degree angle and treated by the Consulting Arborist.

8. No oaks outside the property line are to be impacted by this construction project.

F. Mitigation Measures and Comments (Cont'd)

9. The leaf-litter build-up under the canopies of the oaks on this site is ideal for healthy tree growth and root development. Do not alter or remove if possible. A three inch layer of mulch may be advisable in settings where leaf-litter has been lost.

10. Do not remove the aluminum tags numbering each oak on this site

11. No construction materials are to be stored or discarded within the PZ of any oak. Rinse water, concrete residue, liquid contaminates (paint, thinners, gasoline, oils, etc.) of any type shall not be deposited in any form at the base of an oak.

12. No vehicles shall be parked within the PZ of an oak. No construction vehicles are to be parked under the shade (within the PZ) of an oak.

OAK TRANSPLANTATION

The thirteen oaks listed for transplanting shall be professionally "boxed" and relocated on-site to the designated "storage area" (see TLM). A qualified transplant company shall perform the relocations (it is anticipated that Valley Crest Tree Company will be performing the relocations). To enhance the success of each tree for long-term survival the relocations will be monitored by the Project Arborist. The size of box for each tree will be determined by the Arborist and Valley Crest representative (see chart below). Consideration will be given to the buttress spread, as well as the trunk diameter. Generally, the larger the box the greater the probability of success. In every case where a decision is to be made between a smaller size box and a larger box, i.e., 180" or 192" box, the box of choice will be the 192" box.

PROPOSED TREE RELOCATION (RECOMMENDED BOX SIZE)

Tree #	Size Dec-02	Size May-03	Description
68	288" - 24'	336" – 28'	Quercus lobata
69	204" - 17'	216" – 18'	Quercus agrifolia
70	216" - 18'	240" – 20'	Quercus agrifolia
71	168" – 14'	192" – 16'	Quercus lobata
72	216" – 18'	228" – 19'	Quercus lobata
73	264" – 22'	288" – 24'	Quercus lobata
75	---------	264" – 22'	Quercus lobata
82	180" – 15'	216" – 18'	Quercus agrifolia
83	156" – 13'	168" – 14'	Quercus lobata
84	180" – 15'	180" – 15'	Quercus lobata
85	144" – 12'	168" – 14'	Quercus lobata
86	240" – 20'	264" – 22'	Quercus lobata
87	48"	48"	Quercus lobata

The above described trees were initially inspected on December 9, 2002. During this inspection each tree was sized for transplant as indicated. On May 12, 2003, a secondary inspection was performed and box sizes have been modified as agreed between the City of Santa Clarita (Mr. Robert Sartain, Tree Life Concern (Mr. Bob Wallace) and Valley Crest Tree Company (Mr. Brett Richardson)

OAK TRANSPLANTATION (Cont'd)

1. Under the direction of the Project Arborist, side-boxing/root-pruning operations shall take place during the months of November through January. These trees will then be maintained in situ for a 90-day period prior to bottom-board installation and relocation to the "storage site".

2. A "storage site" has been designated (see TLM) with a permanent water supply, which will be accessible to each boxed tree.

3. The Project Arborist (in conjunction with the relocation company) will determine if and when fungicides, fertilizer or soil amendments are needed. Each tree will be monitored for any condition that may require a specific treatment to enhance survivability before, during and after relocation.

4. Prior to side-boxing and root pruning the soil moisture content must be sufficient to maintain the rootball intact during this process.

5. Each oak should be lightly pruned at this point to remove deadwood, stubs, broken limbs, crossing limbs or for clearance purposes. The pruning will be monitored.

6. The excavation process will first begin with a back-hoe. As roots are encountered the back-hoe will be removed and roots 2" or larger will be hand excavated and clean-cut with a handsaw. The exposed cuts will treated with a bordeaux/linseed oil solution to help prevent desication. All roots shall be clean cut with pruning shears or by handsaw. Root balls that are exposed to full sun will be tarped until the side-box wall is installed.

7. After side-boxing/root-pruning operations the trees will remain in place for approximately 90 days before the bottom boards are installed.

8. The boxed trees will be hoisted by the box itself (not by the trunk) and carried to the storage area.

9. The orientation of each oak (north, south, east, west) will be carefully maintained during the storage process. The project arborist will mark each box for proper direction while in storage. This is important to prevent damage from sunburn.

10. Valley Crest shall guy-wire each tree as needed into the box and/or into the ground as needed. The storage area is notoriously windy and extra attention will be paid to securing the trees until planting. The guy-wires will be placed through hose-sections where they are in contact with the tree.

OAK TRANSPLANTATION (Cont'd)

11. When planting the oaks, the planter-hole (pit) location will be partially filled with loosened native soil. The size of the hole will be 2' larger than the box size. If drainage is determined to be a concern, PVC drain tubes will be installed in a rectangular fashion with breather ports attached at four locations. The bottom of the pit will be filled with 8" of gravel and a layer of permeable soil-cloth will be placed over the gravel.

An 8" layer of native soil will then be placed over the cloth and the tree installed/backfilled. This will allow for monitoring any possible water pooling at the base of each tree. Un-amended native soil will be utilized for the backfill unless a soil analysis indicates that amendments will be required.

A soil analysis will be performed at the planting site 30 days prior to relocation. The backfill soil will be compacted to normal (native-soil compaction).

The height of the root ball is critically important in the long-term survival of a transplanted oak. Each rootball will be placed at least 6" above existing grade. This will allow for settling and ensure that water does pool at the root collar.

12. Soil watering-basins will be constructed to properly irrigate the entire rootball of each tree. The trees will be monitored by relocation company and the Project Arborist on a weekly basis to determine current condition and maintenance requirements.

APPRAISAL

The appraised value of the oaks to be removed from this site was determined by utilizing the International Society of Arboriculture publication, "Guide for Plant Appraisal", Ninth Edition 2000, (refer to Chapter 5, Page 70, "Trunk Formula Method" and Page 60, "Replacement Cost Method".

Quercus agrifolia were given a Species Rating of 95% due to their commonality in the region. Q. lobata were rated at 98% and Q. douglasii at 100% based on their reduced numbers and regeneration statistics.

The Location Rating was given at 85%. This was the average of three factors: Site (85%), Contribution (85%), and Placement (85%).

Three nurseries were contacted to determine retail replacement tree and shrub values, (Sperling's in Calabasas, Treeland in Woodland Hills and Valley Crest Tree Co. in Arleta).

Note: Refer to the attached TreeCalc Appraisal Worksheets for specific tree appraisal procedures and values.

APPRAISAL (Cont'd)

Total Appraised Value of the 4 oaks to be Removed = **$18,100.00 (r.o.)**

Total Appraised Value of the Oaks to be Relocated = **$368,500.00 (r.o.)**

Total Appraised Value of the 87 Oaks on this site = **$1,158,000.00 (r.o.)**

OAK #3

My initial field inspection of the trees on this site took place in December 2001, for the purpose of gathering background information for this oak Tree Report. At that time, Oak #3 was rated "excellent" in health and vigor. It was noted that there was a soil build up at the base of the tree. This was obviously the result of natural erosion and sand build-up in the vicinity of this oak over a period of many years. This tree was growing in the lower end of a canyon and was exposed to run-off and erosion which apparently buried the root collar with sandy soil to a point approximately 2'above the root collar. It is not uncommon to find an oak growing in a dry streambed setting but oaks in this situation are in jeopardy of drowning during periods of high rainfall or from root disease caused by lack of oxygen and excess moisture in the rootzone. Unfortunately, this is what occurred to Oak #3. In January of this year, during an inspection of the site, I noticed that this oak had suddenly turned brown and was certainly dead (I had seen the oak in December 2002 and it appeared healthy). I excavated around the base of the tree to inspect tissue at the root collar region. The inner bark and recent sapwood rings were discolored and had been invaded by a white mycelium (fungus) that I could not identify. It did not appear to be Oak Root Fungus (*Armillaria mellea*) which is the most common killer of oaks in our region. I notified Mr. Glen Adamick and suggested that tissue samples be taken and submitted to a plant laboratory for analysis. I sent the tissue to Soil and Plant Laboratory, Inc., in Orange, CA. I described the setting to the pathologist and told him that the tree was "buried" and that the grade had been raised significantly by natural erosion. The reference in the lab analysis correspondence that "a grade change has predisposed the tree to infection" is accurate and it is this fact has undoubtedly led to the death of Oak #3. The fungus that was found is currently under study in several plant labs in California and we are still waiting for identification.

During a follow-up site inspection on 5-13-03, Mr. Bob Sartain requested that the root collar be fully exposed and additional tissue samples analyzed for pathogens. He would like to see a scientific determination on the causal factors relating to the death of this tree. The second excavation and tissue sampling will occur during the week of May 26th and the findings will be supplied to City Tree Specialist.

LAB RESULTS (OAK #3) AND ARTICLES ON CARE OF OAKS

SOIL AND PLANT LABORATORY, INC.

Orange Office
Path No. 246
Lab No. 46211
April 15, 2003

Tree Life Concern, Inc.
Attn: Bob Wallace
8458 Eton Avenue
Canoga Park, CA 91304

PATHOLOGY RESULTS: QUERCUS AGRIFOLIA **(OAK #3)**

Examination and culturing of the plant specimen(s) delivered to our laboratory on 3/31/03 found the following microorganisms.

Tissues examined and cultured: portion of punky bark/wood with white mycelium present

Pathogens (disease causing organisms) isolated: an unknown Basidiomycete fungus was recovered from the bark/wood sample. Armillaria was not isolated from the samples.

Due to the fact that it is very difficult to get Basidiomycete fungi to produce spores/fruiting bodies in artificial culture, we were unable to determine the identity of this fungus. Visual characters noted in the samples and photographs provided, as well as the description of the problem in the field, lead me to suspect this might be the same fungus noted by Bob Hansen. In both cases it appears that a grade change has predisposed the trees to infection, which culminates in the eventual decline of the oak. If anything, this clearly demonstrates the severe deleterious effects of grade changes on oaks.

Please call if you have any questions.

Paul F. Santos, M.S.
Plant Pathologist

The handsome *coast live oak is an asset to your property, worthy of a little extra care*

SOUTHERN CALIFORNIA PROBLEM . . .

How to keep a live oak alive

Although it has proved to be one of our most picturesque garden trees, the coast live oak poses some tricky problems of garden care. Now that Southern California is going into the tenth year of a long-term drought, the decline and loss of these oaks in gardens calls for some review of the rules for their care.

Watch for oak root fungus

Inspect your oak tree for oak root fungus each year. It prevails in many areas. It's an easy disease to identify and, if you do find it on your tree, there are ways to stop it. If it hasn't gone too far, you can take steps to prevent further damage.

If clusters of mushrooms appear at the base of the tree in late fall and winter, these usually indicate an advanced stage of the disease. Cleavage lines in the bark at the base of the trunk are a strong indication of severe damage. You can also identify this disease by the wide, cream colored, fan-shaped fungus layer that grows between the bark and wood.

To determine which are the damaged areas, you have to cut the bark in small test areas around the root crown and pull it away from the trunk and roots. In active stages of development, the fresh, watery, soft tissues of the fungus invade the wood and bark and give off a sharp, mushroom odor.

Controlling this oak root fungus disease is difficult, but if you can check the early stages of infection, the life of the tree can be prolonged.

Carefully remove the diseased roots and tissue. Then disinfect the cuts, and feed the tree. The photographs on pages 158 and 159 show how you can check the growth of this fungus by digging away the soil from the trunks and root crowns. The exposure to air and the drying will aid considerably in arresting the advance of the fungus.

Live oaks prefer winter watering

You help prevent or arrest oak root fungus growth when you try to water your oak trees in a manner to which they were accustomed before you took over their maintenance. Under their natural

How to recognize oak root fungus

WILLIAM APLIN

2. *This cream colored, fan-shaped growth under tree bark and on exposed roots shows oak root fungus active*

WILLIAM APLIN

Surgical control *of oak root fungus means cutting away all infected bark or wood, disinfecting and keeping the areas exposed*

Galvanized metal *is used to hold soil back in this tree well. Very economical and easy to install. Will last for many years*

growing conditions, they usually receive the majority of their moisture during the winter months. They are not as happy when they receive a lot of water during the dry summer months.

In years of normal rainfall, the soil usually takes in sufficient moisture during the winter months to carry these trees over the balance of the year. But during the last 10 years, lack of rainfall has practically eliminated any water table that might help even these deep-rooted trees.

In gardens, the walks, structures of all kinds, and lack of natural mulches also cut off much natural absorption. This lack has brought on a progressive deterioration of the roots as well as the tops.

In a weakened condition, the oaks are much more susceptible to some diseases and insects. The best possible remedy seems to be deep winter irrigation to provide the trees with a more normal water supply.

For deep irrigations from December to April, you might use a soil soaker or a sprinkler, or run water in a deep trench just inside the drip line for a period of 10 to 12 hours each winter month as long as drought conditions exist. Another possibility is to use sub-irrigating attachments that can be pushed into the soil around the trees and allowed to run for at least 6 or 8 hours in four or five positions at the drip line of the tree.

Should you plant around the base?

Common sense seems to indicate that trees without underplanting can lead a more normal life; they don't have to put up with shallow waterings that tend to keep the root areas moist at all times. These waterings create out-of-season moisture problems and are an invitation to oak root fungus troubles.

If you must plant around the base of oaks, use plant material that goes dormant during the summer months—shade loving natives such as evergreen currant *(Ribes viburnifolium)*, fuchsia flowered gooseberry *(Ribes speciosum)*, island alum root *(Heuchera maxima)*, and wild strawberry *(Fragaria chiloensis)*. Even these should be planted at least 6 feet from the tree trunk.

Moisture loving plants, such as tuberous begonias, camellias, rhododendrons, and ferns should never be planted near oaks—constant moisture at the base of the trunk makes the tree vulnerable to crown rot and oak root fungus, and rots primary as well as feeder roots.

You will hear pros and cons on the matter of growing a lawn under oaks. In deep, sandy, well drained soil, you probably will not run into trouble if: (1) you provide a natural grade away from the tree; and (2) you divert water from sprinklers away from the trunk.

Heavy adobe or clay soils present additional problems. A dense turf or compacted soil can greatly reduce aeration in the soil. Reduced aeration, plus excessive water, favors development of harmful soil organisms such as oak root fungus, which may be present in an inactive state until stimulated by favorable growing conditions or even mechanical root injury.

Heavy pruning can be hard on oaks

Don't prune your trees just to make them look more attractive. Pruning excessively or thinning limbs to expose the stem pattern may kill the tree. Prune only to remove dead wood or dangerous branches.

Experience has shown that any pruning of coast live oaks should be done only during July and August. A relatively low amount of new growth takes place at this time, compared to the heavy flush in the spring months. Also, there is least likelihood of mildew, which usually has a decided weakening effect on oaks during the spring months.

Heavy pruning and mildew attacks have often been mentioned as principal reasons for oak trees' decline in vigor. The excessive pruning often begins a vicious cycle of forced new growth, which becomes subject to attack by diseases—primarily a powdery mildew which occurs on the new shoots and leaves. This is called tip mildew. The surface of these new shoots and leaves becomes covered with a powdery, white growth.

These diseased shoots develop as a cluster of shortened, fleshy, main stem and lateral branches bearing tiny stunted leaves. They later turn brown and dry, and shrivel up.

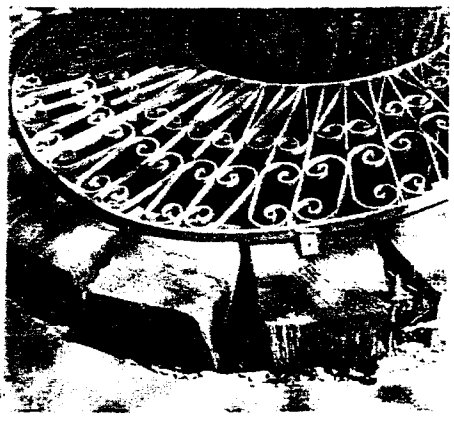
Control the destructive insects

Three oak insects seem to cause the greatest amount of trouble: the larvae of the leaf eating California oak moth, the twig killing larvae of the oak twig girdler, and the common nuisance, the crown whitefly.

Oak moth. This is the most common and the most serious insect contributing to the decline of oak trees. It can consume the full leaf or portions of it, leaving only a network of veins. With serious infestations the entire tree, or a portion of it, may be defoliated.

The larvae that do the chewing are about an inch long and olive green with a prominent black and yellow stripe on the side

Exposed roots *at the base of oak trees will help prevent fungus attacks on healthy trees and further spread on diseased ones*



Tree well *of 6-inch redwood posts and ornamental grating protect base of oak in a patio 6 feet above the natural soil level*

and back. Two broods usually develop—in spring and summer. The adult moths appear and lay their eggs in October and November. The eggs hatch during the later winter and spring months. Then the spring-hatched larvae become mature moths and lay another crop of eggs, which in turn hatch and become leaf-eating larvae for the second time during the year.

To get effective control of both the adults and larvae on large trees, it is necessary to spray thoroughly with a power sprayer. Most spray companies use 50 per cent wettable DDT powder at the rate of 2 pounds per 100 gallons of water.

Others use malathion or chlordane alone or as additives. The spray should be applied when leaf damage is noted, from the middle of March through April or May, and then possibly again when the moths are flying in June, July, or August. In gardens where fish pools are located under oak trees, use cryolite (it doesn't kill fish), or cover the pool with a sheet of polyethylene film during the spraying.

Oak twig girdler. This is the next most damaging insect. In the photograph shown below, the injury is indicated by patches of dead leaves on various parts of the tree. On a severely infested tree, all the leaves may be dead. The leaves die because their source of water and nutrients has been cut off by this insect's twig girdling. Usually, the damaged twigs will be less than half an inch in diameter.

WILLIAM APLIN

Patches of dead *leaves throughout tree are indication of oak twig girdler. Sprays to control are only effective in May and June*

You can find the twig girdler's burrow by peeling the bark from a dead twig. Since the mature larva works inside the twig, the only way to control its activity is to destroy it when it emerges in May and June. Since the life cycle occupies two years, there is only about 1 month in 24 in which the insect is outside the twig and can be contacted with a spray.

Presently, DDT in the same formula used on oak moth is used as a control spray. Cryolite is not effective. Best control is obtained when you continue this program over a period of at least 3 to 4 years. Where there is heavy infestation, 2 yearly sprayings are recommended. The first of these should be applied during the latter part of May or the first part of June, and the second during the latter half of June and the first half of July.

Crown whitefly. Swarms of this tiny, white, gnat-like insect appear mostly during the spring months and suck sap from the leaves. When they take over a healthy tree, little harm is done. But when they attack sickly or damaged trees, they add their bit to the decline of the tree. In most cases the damage is slight, and specific control measures are rarely necessary. Spraying these insects in early spring has often been found more harmful than beneficial to tender foliage.

Spraying a large 50 to 75-foot oak tree is no job for the home sprayer. Only power sprayers have the capacity to reach into these large trees and apply the spray where it's needed. Commercial spray companies have become well acquainted with the oak tree insects and understand their type of damage and the best timing of controls.

Your money will be well spent if you hire a commercial spray operator to spray at the proper times. He can usually work out your oak tree spraying program on a yearly basis, watching your trees and coming in whenever spraying is necessary. Your trees will be sprayed even while you're on a trip or vacation. Some spray companies include free consultation with their contract.

1958 - 1968	Groundman - Family Tree Business, Canoga Park, CA

GLOSSARY

APPENDIX

GLOSSARY OF TERMS

Terminolgy utilized in Summary of Field Inspection worksheets

Form

1. Tree Number – The number on the TLM coincides with the tag number attached to each tree in the study area.

Size

2. Trunk Diameter - Most of the oaks were measured at 4 ½ feet above grade or diameter at breast height (DBH). Those trees where measurement at 4 ½ feet would not produce an accurate width due to a tree crotch or anomaly at that height, were then measured below the main crotch (BMC). This will usually result in a more accurate picture of the actual size of a tree. All oak trees where the main stem equaled 2" diameter or more were included in the study as required by the Oak Tree Ordinance.

3. Height & Canopy Spread – Tree height was calculated using a clinometer. In areas of rough terrain or where canopies were crowded, heights were estimated. The canopy spreads were measured by rangefinder or measuring tape. In areas of difficult terrain or where tree canopies were naturally pleached, the spreads were estimated.

Physical Condition

4. Tree Declining – The health and condition of the tree is declining. This could be the result of many influences such as: end of life span, disease, drought, insect attack, nutrient deficiency, cultural impacts (over-watering, etc.). An X in this column is usually referring to an irreversible condition.

5. Mainstem Dieback – An area of deadwood at the upper or outer edge of the canopy. This is usually a symptom of tree decline. In many cases the tree may recover on its own or with the help of remedial measures.

6. Soil Buildup at Base – Soil has been raised naturally (as on a slope) or unnaturally by construction or landscaping activities. Oak trees are very sensitive to grade changes, particularly near the root collar. Many oaks die from slight grade changes that obscure the root collar by even a few inches.

Rating

10. Health – This is an assessment of each tree's overall condition and vigor based on a visual, above-ground inspection (A.Excellent, B. Good, C. Fair, D. Poor, E. Nearly Dead, F. Dead)

11. Aethetics and Conformity – An appraisal of the tree's form and its association with adjacent trees or objects (wall, homes, etc.). Example: an oak may be poorly balanced and deformed due to growing in close proximity (or under) a larger oak. This tree would receive a "D" (Poor) rating in this column.

12. Balance – This rating is based on the archetypical form (stout, straight trunk) for the species being appraised. Oaks with an unnatural lean of 20 degrees or greater would receive a "C" or "D" rating.

Protective Zone (PZ) = The zone of protection around an oak tree where all proposed construction activities are to be documented, authorized and monitored. The City of Santa Clarita Oak Tree Ordinance describes this zone as that point 5 feet outside the dripline (outer edge of canopy) peripherally or 15 feet from the trunk, whichever is farther. Any construction activity that enters into this zone is considered encroachment and does require a Permit and/or Oak Tree Report.

RE: **Oak Tree Report ADDENDUM #1 – River Park Project** - Tract No. 53425

This addendum letter will address changes to the existing OTR (dated 5-22-03). One oak (#9L) will be taken from the removal list and added to the impacted list, one oak (#73H) will be removed from the relocation list and one oak (#74) will be removed from the impacted list. I have reviewed the plan changes and concur with these adjustments

1. Santa Clarita Parkway, which is proposed to pass through the center of the Riverpark Project has been shortened by approximately 700'. This change will result in the preservation of Heritage Oak #73. This tree will not be impacted or encroached upon. It will require protective fencing prior to construction activities. The Parkway will end approximately 190' north of its northern PZ. This tree is now removed from the list of proposed relocations.

2. In addition to this tree preservation, Oak #74 will not be encroached upon. The construction of the Parkway was going to noticeably impact this tree by encroachment well within its dripline. Santa Clarita Parkway will end approximately 600' north of this tree. This tree will be fenced prior to construction.

3. Oak #9 was listed as a removal. It will now be preserved and encroached upon at its eastern quadrant. The grading of the existing nearby slope will occur 5' within the PZ on the uphill side 17' from the trunk (see attached Section View). In my opinion, this impact will be minor and the tree should be affected short-term or long-term by this activity. The grading and slope work within the PZ will be monitored.

June 2003

1. INTRODUCTION

The River Park site in the Newhall Ranch/Valencia Company project area, Los Angeles County, California, was surveyed for rare plant species and vegetation types in Spring 2003. The site is located about 2.5 miles east of the junction of Interstate 5 and Magic Mountain Parkway. It is bounded on the south by Soledad Canyon Road and on the west by Bouquet Canyon Road. Commercial and residential development occurs in most of the area surrounding the site. The project area contains a mixture of previously disturbed and undisturbed areas. The Santa Clara River runs through the southern part of the site in an east-west direction.

A team of two consultants from FL*x* (Dr. Anuja Parikh and Dr. Nathan Gale) conducted the vegetation and rare plant surveys from April 9 through April 19, 2003. Surveys also were conducted for later-flowering species on May 23 and June 16. Vegetation types and plant species associations were mapped for the site during previous surveys conducted by FL*x* in April 2002. As part of the 2003 surveys, the vegetation map was confirmed and a new list of plant species, including rare and commonly occurring plants observed at the site, was compiled (see Appendix A). Plant community descriptions in this report follow Holland (1986) where applicable; species nomenclature follows Hickman (1993).

2. VEGETATION TYPES AND PLANT SPECIES ASSOCIATIONS

The River Park project area is composed of variable terrain, ranging from relatively flat riverwash, secondary washes, and terrace areas, to previously disturbed flat areas or fields above the banks of the Santa Clara River, to hillslopes in the northern part of the site.

Disked Fields. Many areas of the project site comprise fields that have been disturbed previously by disking. These fields now have grass cover and ruderal vegetation with native and non-native species. Species observed included bromegrasses (*Bromus diandrus*, *B. madritensis* ssp. *rubens*), hare barley (*Hordeum murinum*), shortpod mustard (*Hirschfeldia incana*), red-stemmed filaree (*Erodium cicutarium*), goosefoot (*Chenopodium album*, *C. californicum*), rancher's fireweed (*Amsinckia menziesii*), poverty weed (*Iva axillaris* ssp. *robustior*), and Jimson weed (*Datura wrightii*).

Non-Native Grassland. This community occurs on relatively flat terrain and sometimes on gentle hillslopes throughout the River Park site. Annual introduced grasses up to about 0.5 m tall are dominant in non-native grasslands; annual herb species also are found. Flowering occurs in spring, and the plants mostly are dead in summer and fall. Non-native grasslands occur on fine-textured, usually clay soils, that are moist to wet in the winter but dry in the summer and fall (Holland, 1986). Grass species found at the site include mainly bromegrasses (*Bromus diandrus*, *B. madritensis* ssp. *rubens*, *B. hordeaceus*) and wild oats (*Avena barbata*, *A. fatua*). Introduced herbaceous ruderal species also are found, and commonly include red-stemmed filaree (*Erodium cicutarium*), small-seed sandmat (*Chamaesyce polycarpa*), and shortpod mustard (*Hirschfeldia incana*). Scattered native plants found in this community include wishbone bush (*Mirabilis californica*), California fuschia (*Epilobium canum*), tansy phacelia (*Phacelia tanacetifolia*), and California thistle (*Cirsium occidentale* var. *californicum*).

Non-Native Grassland with Scattered Shrubs. In a few areas covered with non-native grasses, also on relatively flat terrain and on gentle slopes, shrubs are sparsely distributed in the grassland. These native

shrubs include California buckwheat (*Eriogonum fasciculatum*), goldenbush (*Ericameria palmeri* var. *pachylepis*), skunkbrush (*Rhus trilobata*), and California sagebrush (*Artemisia californica*).

Planted Scrub. In the northwestern part of the River Park project area, several slopes have been cut or graded for the installation of water lines and concrete-lined drainage channels. These relatively steep slopes have been restored by planting native shrubs, primarily California buckwheat (*Eriogonum fasciculatum*); some California sagebrush (*Artemisia californica*) also occurs.

Riversidian Sage Scrub. This community is the most xeric type of coastal sage scrub south of Point Conception in California (Holland, 1986), and is found along the coastal side of the Transverse and Peninsular Ranges. It contains low, soft-woody shrubs up to 1 m tall. Plant growth occurs in late winter and spring after the rains, with most species flowering in spring and summer. Typical stands are relatively open and dominated by California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), and annual grasses such as foxtail chess (*Bromus madritensis* ssp. *rubens*), each attaining 20 percent or greater cover. Riversidian sage scrub is found on xeric sites such as steep slopes, severely drained soils, or relatively clayey soils that are slow to release moisture. It intergrades with several southern California chaparrals. On the River Park site, this community is found on sloping terrain throughout the site; the dominant species is California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*). Other less dominant plants include thickleaf yerba santa (*Eriodictyon crassifolium* var. *nigrescens*), California sagebrush (*Artemisia californica*), sages (*Salvia mellifera, S. apiana, S. leucophylla*), goldenbush (*Ericameria palmeri* var. *pachylepis*), encelias (*Encelia actoni, E. californica*), chaparral mallow (*Malacothamnus fasciculatus*), Our Lord's candle (*Yucca whipplei*), linear-leaved stillingia (*Stillingia linearifolia*), California-aster (*Lessingia filaginifolia* var. *filaginifolia*), California broom (*Lotus scoparius*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), giant wild-rye (*Leymus condensatus*), and cotton-thorn (*Tetradymia comosa*). Introduced annual grasses prevalent in the understory are dominated by foxtail chess (*Bromus madritensis* ssp. *rubens*) and slender wild oat (*Avena barbata*). Native needlegrasses (*Nassella cernua, N. lepida*) also are scattered in the understory. Among herbaceous species found in this community, the non-native shortpod mustard (*Hirschfeldia incana*), red-stemmed filaree (*Erodium cicutarium*), and tocalote (*Centaurea melitensis*) is present, as well as the native wishbone bush (*Mirabilis californica*), fascicled tarweed (*Hemizonia fasciculata*), woolly-fruited lomatium (*Lomatium dasycarpum* ssp. *dasycarpum*), malacothrix (*Malacothrix saxatilis* var. *tenuifolia*), and chia (*Salvia columbariae*). With respect to sensitivity status, Riversidian sage scrub has been state-ranked as S3.1 (10,000 to 50,000 acres, very threatened) by the CNDDB.

Chamise Chaparral. This type of chaparral is found in small scattered patches on flat to sloping terrain, mostly in the northeastern part of the River Park site. Chamise chaparral is the most common type of chaparral in southern California, and is dominated by chamise (*Adenostoma fasciculatum*) shrubs 1 to 3 m tall. It is often dense and impenetrable and has a sparse understory (Holland, 1986). It is adapted to repeated fires, and is found on shallow, dry soils on xeric slopes and ridges. Growth is highest in the spring and reduced in the summer; flowering occurs from late winter to early summer. Typically, several other native shrubs also occur in this chaparral, but at the River Park site, the small patches of this community are made up almost exclusively of chamise (*Adenostoma fasciculatum*). With respect to sensitivity status, chamise chaparral has been state-ranked as S4 (apparently secure) by the CNDDB.

Coastal Sage - Chaparral Scrub. In some areas of the site, on mostly west-facing slopes, a mix of Riversidian sage scrub and chamise chaparral species occurs. The overstory is relatively open, and the understory in these areas often has annual grasses and herbaceous species. Common species include chamise (*Adenostoma fasciculatum*), California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*), California sagebrush (*Artemisia californica*), chaparral mallow (*Malacothamnus fasciculatus*) and black sage (*Salvia mellifera*).

Holly-Leaf Cherry Scrub. In the northeastern corner of the site on relatively flat terrain, a unique stand of holly-leaf cherry scrub is found. It occurs on the low terraces of a secondary wash that leads to the Santa Clara River. The stand is dominated by relatively large, mature shrubs of holly-leaf cherry (*Prunus ilicifolia* ssp. *ilicifolia*), 3 to 5 m in height; other shrub associates are skunkbrush (*Rhus trilobata*) and spiny redberry (*Rhamnus crocea*). Other native species found in the understory of these shrubs include woolly star (*Eriastrum densifolium* ssp. *elongatum*), scarlet bugler (*Penstemon centranthifolius*), and linear-leaved stillingia (*Stillingia linearifolia*). Also found in this community are the species red-stemmed filaree (*Erodium cicutarium*), lastarriaea (*Lastarriaea coriacea*), valley lessingia (*Lessingia glandulifera* var. *glandulifera*), Mediterranean schismus (*Schismus barbatus*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), and primroses (*Camissonia micrantha, C. californica*). With respect to sensitivity status, mainland cherry forest has been state-ranked as S1.1 (<2,000 acres, very threatened) by the CNDDB. The canopy cover of the holly-leaf cherry shrubs at this site did not amount to a forest canopy. Holly-leaf cherry scrub, as identified in this survey, is not defined in Holland (1986), and therefore, it has no assigned ranking. However, it should be recognized as a unique and sensitive community at the site.

Mule Fat Scrub. Several very small patches of this community occur mostly in the western part of the River Park site, adjacent to the river floodplain. Mule fat scrub typically is a tall, semi-woody and herbaceous riparian scrub, and is relatively species-poor. An early seral community, it often grades to riparian woodland or forest (Holland, 1986). The dominant species found in this community is the native species mule fat (*Baccharis salicifolia*). The understory includes mostly introduced species such as bromegrasses (*Bromus* spp.) and shortpod mustard (*Hirschfeldia incana*). With respect to sensitivity status, mule fat scrub has been state-ranked as S4 (apparently secure) by the CNDDB.

Southern Willow Scrub. Several small patches of this community occur in tributary drainages of the River Park site. Willow scrub is a broadleaved, winter-deciduous riparian community, typically too dense to allow understory development. It is a relatively early seral community, succeeding to cottonwood-sycamore forests (Holland, 1996). In the project area, this community includes willows (*Salix lasiolepis, S. exigua*), Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), Mexican elderberry (*Sambucus mexicana*), tree tobacco (*Nicotiana glauca*), mule fat (*Baccharis salicifolia*), and western poison oak (*Toxicodendron diversilobum*). The understory is sparse or absent, but sometimes includes species such as Mexican rush (*Juncus mexicanus*), western ragweed (*Ambrosia psilostachya*), and giant wild-rye (*Leymus condensatus*). With respect to sensitivity status, southern willow scrub has been state-ranked as S2.1 (2,000 to 10,000 acres, very threatened) by the CNDDB.

Southern Riparian Scrub. This community is found on the Santa Clara River floodplain, on relatively flat terraces immediately adjacent to the riverbed; some branched channels of the river cross this community. A combination of mule fat scrub and southern willow scrub species is found on the terraces, including mule fat (*Baccharis salicifolia*), willows (*Salix exigua, S. lasiolepis, S. laevigata*), Fremont cottonwood (*Populus*

fremontii ssp. *fremontii*), tamarisk (*Tamarix* sp.), scale-broom (*Lepidospartum squamatum*), and arundo (*Arundo donax*). In addition, other native species include Great Basin sagebrush (*Artemisia tridentata*), shadscale (*Atriplex canescens* ssp. *linearis*), Mexican elderberry (*Sambucus mexicana*), thickleaf yerba santa (*Eriodictyon crassifolium* var. *nigrescens*), cholla (*Opuntia prolifera*), and mugwort (*Artemisia douglasiana*). With respect to sensitivity status, southern riparian scrub has been state-ranked as S3.2 (10,000 to 50,000 acres, threatened) by the CNDDB.

Riverwash. The main channel of the Santa Clara River is sparsely vegetated and is subject to scouring. Soils are sandy riverwash and gravel, and in places form sand bars and low terraces within the channel. No well-defined plant community is found here, although scattered elements of southern riparian scrub were observed. Shrub species found in the dry riverbed are mule fat (*Baccharis salicifolia*), tamarisk (*Tamarix* sp.), scale-broom (*Lepidospartum squamatum*), arundo (*Arundo donax*), California broom (*Lotus scoparius*), woolly star (*Eriastrum densifolium* ssp. *elongatum*), and California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*). Smaller plants growing in the riverbed include buckwheat (*Eriogonum baileyi*), Mediterranean schismus (*Schismus barbatus*), cryptantha (*Cryptantha micrantha*), hairy goldenaster (*Heterotheca sessiliflora* ssp. *fastigiata*), tumble mustard (*Sisymbrium altissimum*), foxtail chess (*Bromus madritensis* ssp. *rubens*), slender pectocarya (*Pectocarya linearis* ssp. *ferocula*), and annual bur-sage (*Ambrosia acanthicarpa*). Fremont cottonwoods (*Populus fremontii* ssp. *fremontii*) and willows (*Salix* spp.) are found scattered individually or in small clumps in the channel; no riparian forest is found.

Oak Woodland. Small patches of oak woodland occur in the central part of the River Park site, mostly on or at the base of north-facing and west-facing slopes. Typically, oak woodlands have a single dominant species, but at the River Park site, three species are found intermixed in the oak woodland areas: the evergreen coast live oak (*Quercus agrifolia* var. *agrifolia*) and Tucker's oak (*Quercus john-tuckeri*), and the winter-deciduous valley oak (*Quercus lobata*). Coast live oaks (*Quercus agrifolia* var. *agrifolia*) can reach 10 to 25 m in height, and occur away from the direct influence of the ocean in shaded canyons and on north-facing slopes (Holland, 1986). Tucker's oak (*Quercus john-tuckeri*) is a shrubby oak that grows 2 to 5 m tall, and is relatively uncommon and restricted in range to interior southern California locations. Valley oaks (*Quercus lobata*) are California's largest broad-leaved tree, reaching 15 to 35 m in height, and occur on alluvial soils in valleys, and also on slopes in the South Coast Ranges. At the River Park site, some large mature individuals of valley oak (*Quercus lobata*) also are scattered in disked fields. The shrub layer in oak woodlands generally is poorly developed, and the herb layer often has annual grasses, which have replaced the native perennial grasses once commonly associated with this community.

Developed Area with Mixed Trees. In the central part of the River Park site, there is an area that apparently was used as a camp in the past. Currently, it is occupied by a construction company, with buildings, trailers, and equipment storage areas. Many large and mature native and non-native trees occur in this area, some of which may be plantings, and some natural. Species observed include western sycamore (*Platanus racemosa*), Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), Mexican elderberry (*Sambucus mexicana*), eucalyptus (*Eucalyptus* spp.), Peruvian pepper tree (*Schinus molle*), and various conifers.

3. RARE PLANT SPECIES

The rare plant surveys were carried out from April to June to accommodate the blooming periods of various species found in the region, or previously reported by the CNDDB. A list of target species potentially

occurring at the site is presented in Table 1; these species were searched for during the focused rare plant surveys.

TABLE 1: SENSITIVE PLANT SPECIES POTENTIALLY OCCURRING ON THE RIVER PARK SITE

Scientific Name	Common Name	Family	Status* Federal/State/CNPS
Astragalus brauntonii	Braunton's milk-vetch	Fabaceae	FE/-/1B
Berberis nevinii	Nevin's barberry	Berberidaceae	FE/SE/1B
Calochortus clavatus var. *gracilis*	Slender mariposa lily	Liliaceae	-/-/1B
Calochortus plummerae	Plummer's mariposa lily	Liliaceae	-/-/1B
Calochortus weedii var. *vestus*	Late-flowered mariposa lily	Liliaceae	-/-/1B
Calystegia peirsonii	Peirson's morning-glory	Convolvulaceae	-/-/4
Centromadia parryi ssp. *australis*	Southern tarplant	Asteraceae	-/-/1B
Chorizanthe parryi var. *fernandina*	San Fernando Valley spineflower	Polygonaceae	FC/SE/1B
Deinandra minthornii	Santa Susana tarplant	Asteraceae	-/SR/1B
Delphinium parryi ssp. *blochmaniae*	Dune larkspur	Ranunculaceae	FSC/-/1B
Dodecahema leptoceras	Slender-horned spineflower	Polygonaceae	FE/SE/1B
Dudleya blochmaniae ssp. *blochmaniae*	Blochman's dudleya	Crassulaceae	-/-/1B
Dudleya multicaulis	Many-stemmed dudleya	Crassulaceae	-/-/1B
Dudleya parva	Conejo dudleya	Crassulaceae	FT/-/1B
Erodium macrophyllum	Round-leaved filaree	Geraniaceae	-/-/2
Harpagonella palmeri	Palmer's grappling hook	Boraginaceae	-/-/4
Helianthus nuttallii ssp. *parishii*	Los Angeles sunflower	Asteraceae	-/-/1A
Juglans californica	Southern California black walnut	Juglandaceae	-/-/4
Juncus acutus ssp. *leopoldii*	Southwestern spiny rush	Juncaceae	-/-/4
Malacothamnus davidsonii	Davidson's bush mallow	Malvaceae	FSC/-/1B
Navarretia fossalis	Spreading navarretia	Polemoniaceae	FT/-/1B
Nolina cismontana	Chaparral nolina	Liliaceae	-/-/1B
Opuntia basilaris var. *brachyclada*	Short-joint beavertail	Cactaceae	-/-/1B
Orcuttia californica	California Orcutt grass	Poaceae	FE/SE/1B
Pentachaeta lyonii	Lyon's pentachaeta	Asteraceae	FE/SE/1B
Perideridia pringlei	Pringle's yampah	Apiaceae	-/-/4
Senecio aphanactis	Rayless ragwort	Asteraceae	-/-/2

* - = No listing
FE = Federal endangered
FT = Federal threatened
FC = Federal candidate
FSC = Federal species of concern
SE = State/California endangered
SR = State/California rare
1A = CNPS List 1A, plants presumed extinct in California
1B = CNPS List 1B, plants rare, threatened, or endangered in California and elsewhere
2 = CNPS List 2, plants rare, threatened, or endangered in California, but more common elsewhere
4 = CNPS List 4, plants of limited distribution, a watch list

Five sensitive species were found in the project area during the current surveys: slender mariposa lily (*Calochortus clavatus* var. *gracilis*), Plummer's mariposa lily (*Calochortus plummerae*), Peirson's morning-glory (*Calystegia peirsonii*), Palmer's grappling hook (*Harpagonella palmeri*), and southern California black walnut (*Juglans californica*). Slender mariposa lily (*Calochortus clavatus* var. *gracilis*) and Plummer's mariposa lily (*Calochortus plummerae*) are CNPS List 1B species, the other three are CNPS List 4 species; none is a state- or federally-listed species. In addition, a sixth species that may be sensitive was found at the site. This plant is a larkspur with some characteristics of the common species Parry's larkspur (*Delphinium parryi* ssp. *parryi*), as well as characteristics of the CNPS List 1B species dune larkspur (*Delphinium parryi* ssp. *blochmaniae*). Specimens of the plant have been sent to a species expert to confirm its identification.

Locations of sensitive species observed in 2002 were checked and their numbers verified or updated. This information, along with a summary of all new populations of sensitive species located at the site, is included in the following sections. The population locations, as numbered below, have been marked on the accompanying map.

Slender mariposa lily (*Calochortus clavatus* var. *gracilis*) was found in 12 locations in relatively small numbers, mostly on north-facing slopes and ridges. The plants most often were found in openings within coastal sage scrub, on sandy clay soils. Elevations ranged from 1235 feet to 1350 feet. Most plants were flowering.

1. 1 plant, with *Eriogonum fasciculatum*.
2. 1 plant, with *Bromus madritensis* ssp. *rubens* and *Eriogonum fasciculatum*.
3. 5 plants, with *Salvia leucophylla*, *Eriogonum fasciculatum*, *Artemisia californica*, and *Malacothamnus fasciculatus*.
4. 1 plant, with *Eriogonum fasciculatum* and *Artemisia californica*.
5. 1 plant, with *Eriogonum fasciculatum*, *Artemisia californica* and *Bromus madritensis* ssp. *rubens*.
6. 3 plants, with *Eriogonum fasciculatum*, *Artemisia californica* and *Bromus diandrus*.
7. ~50 plants, with *Eriogonum fasciculatum*, *Artemisia californica* and *Bromus madritensis* ssp. *rubens*.
8. 3 plants, with *Artemisia californica*, *Bromus diandrus*, and *Yucca whipplei*.
9. 1 plant, with *Bromus madritensis* ssp. *rubens*, and *Eriogonum fasciculatum*.
10. 10 plants, with *Eriogonum fasciculatum*, *Artemisia californica*, *Melica imperfecta*, and *Bromus madritensis* ssp. *rubens*.
11. 3 plants, with *Avena barbata* and *Eriogonum fasciculatum*.
12. 1 plant, with *Avena barbata* and *Eriogonum fasciculatum*.

Plummer's mariposa lily (*Calochortus plummerae*) was found in three locations in small numbers, mostly on south-facing slopes and ridges. The plants were found in coastal sage scrub, on sandy clay soils with gravel and stones. Elevations ranged from 1225 feet to 1335 feet. All plants were flowering, and some were fruiting.

1. 3 plants, with *Salvia mellifera* and *Artemisia californica*.
2. 1 plant, with *Eriogonum fasciculatum*, *Erodium cicutarium*, and *Bromus madritensis* ssp. *rubens*.
3. 3 plants, with *Eriogonum fasciculatum*, *Hemizonia fasciculata*, *Hirschfeldia incana*, *Erodium cicutarium*, and *Bromus madritensis* ssp. *rubens*.

Peirson's morning-glory (*Calystegia peirsonii*) populations were found in 29 locations on relatively gentle slopes (generally south-facing) or in flat areas. The plants are associated with various grassland and coastal sage scrub species. Elevations range from 1250 feet to 1450 feet, and the soils are sandy to gravelly/stony in texture. Most plants were in vegetative form; some were flowering.

1. ~50 plants, with *Bromus madritensis* ssp. *rubens*, *Bromus hordeaceus*, *Hirschfeldia incana*, near *Eriogonum fasciculatum*.
2. ~300 plants, with *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, near *Salvia mellifera*.
3. ~100 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, *Hirschfeldia incana*, near *Eriogonum fasciculatum*.
4. ~300 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, *Lotus scoparius*, near *Artemisia californica* and *Malacothamnus fasciculatus*.
5. ~100 plants, with *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, near *Sambucus mexicana*.
6. ~50 plants, with *Bromus diandrus*, *Hirschfeldia incana*, and *Ericameria palmeri* var. *pachylepis*.
7. ~20 plants, with *Bromus diandrus* and *Hirschfeldia incana*.
8. ~700 plants, with *Bromus madritensis* ssp. *rubens*, near *Eriogonum fasciculatum* and *Salvia leucophylla*.
9. ~250 plants, with *Bromus madritensis* ssp. *rubens*, near *Salvia leucophylla* and *Yucca whipplei*.
10. ~250 plants, with *Bromus madritensis* ssp. *rubens*, *Salvia mellifera*, and *Eriogonum fasciculatum*.
11. ~100 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, and *Eriogonum fasciculatum*.
12. ~100 plants, with *Bromus madritensis* ssp. *rubens*, near *Malacothamnus fasciculatus*.
13. ~100 plants, with *Bromus madritensis* ssp. *rubens*, *Eriogonum fasciculatum*, and *Encelia californica*.
14. ~200 plants, with *Nassella lepida*, *Bromus madritensis* ssp. *rubens*, *Bromus diandrus*, and *Hirschfeldia incana*.
15. ~100 plants, with *Bromus diandrus*, *Hirschfeldia incana*, near *Sambucus mexicana*.
16. ~200 plants, with *Melica imperfecta*, *Avena barbata*, *Bromus madritensis* ssp. *rubens*, near *Malacothamnus fasciculatus* and *Salvia apiana*.
17. ~100 plants, with *Yucca whipplei*, *Bromus madritensis* ssp. *rubens*, *Hirschfeldia incana*, near *Eriogonum fasciculatum* and *Lotus scoparius*.
18. ~50 plants, in disturbed bare ground near *Eriogonum fasciculatum*.
19. ~800 plants, with *Bromus diandrus*, *Avena barbata*, *Bromus madritensis* ssp. *rubens*, near *Salvia* spp., *Artemisia tridentata*, and *Eriodictyon crassifolium*.
20. ~350 plants, with *Bromus hordeaceus*, *Bromus madritensis* ssp. *rubens*, *Avena barbata*, near *Yucca whipplei* and *Artemisia californica*.

21. ~100 plants, with *Bromus diandrus*, *Avena barbata*, *Eriogonum fasciculatum*, *Artemisia californica*, near *Eriodictyon crassifolium*.
22. ~150 plants, with *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, and *Lotus scoparius*.
23. ~250 plants, with *Bromus diandrus*, *Eriogonum fasciculatum*, near *Acourtia microcephala* and *Lotus scoparius*.
24. ~250 plants, with *Hirschfeldia incana*, *Bromus madritensis* ssp. *rubens*, near *Encelia actoni* and *Artemisia californica*.
25. ~800 plants, with *Erodium cicutarium*, *Chamaesyce polycarpa*, *Mirabilis californica*, and *Bromus madritensis* ssp. *rubens*.
26. ~100 plants, with *Salvia mellifera*, *Artemisia californica*, and *Eriogonum fasciculatum*.
27. ~50 plants, with *Salvia mellifera* and *Eriogonum fasciculatum*.
28. ~500 plants, with *Salvia leucophylla*, *Yucca whipplei*, *Eriogonum fasciculatum*, and *Bromus madritensis* ssp. *rubens*.
29. ~500 plants, with *Bromus diandrus* and *Adenostoma fasciculatum*.

Palmer's grappling hook (*Harpagonella palmeri*) populations were found in 11 locations on south-facing slopes and ridges. The plants were found in relatively sparsely vegetated and exposed areas within coastal sage scrub on sandy clay soils with gravel, stones, and rocks. Elevations ranged from 1320 feet to 1430 feet. Most plants had flowers and fruit.

1. ~250 plants, with *Hemizonia fasciculata*, *Plantago erecta*, *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, and *Hirschfeldia incana*.
2. 5 plants, with *Artemisia californica*, *Hemizonia fasciculata*, *Erodium cicutarium*, and *Plantago erecta*.
3. ~100 plants, with *Hemizonia fasciculata*, *Eriogonum fasciculatum*, *Pectocarya linearis* ssp. *ferocula*, and *Lasthenia californica*.
4. ~500 plants, with *Salvia mellifera*, *Artemisia californica*, *Yucca whipplei*, *Hirschfeldia incana*, *Hemizonia fasciculata*, and *Eriogonum fasciculatum*.
5. ~500 plants, with *Hemizonia fasciculata*, *Eriogonum fasciculatum*, *Yucca whipplei*, *Lotus strigosus*, *Salvia columbariae*, and *Chorizanthe staticoides*.
6. 10 plants, with *Hirschfeldia incana*, *Bromus madritensis* ssp. *rubens*, *Hemizonia fasciculata*, *Yucca whipplei*, and *Salvia columbariae*.
7. ~100 plants, with *Pectocarya linearis* ssp. *ferocula*, *Pectocarya setosa*, *Eriogonum fasciculatum*, *Opuntia basilaris*, *Bromus madritensis* ssp. *rubens*, and *Chorizanthe staticoides*.
8. ~50 plants, with *Hemizonia fasciculata*, *Plantago erecta*, *Pectocarya linearis* ssp. *ferocula*, and *Bromus madritensis* ssp. *rubens*.
9. ~25 plants, with *Eriogonum fasciculatum*, *Hemizonia fasciculata*, *Bromus madritensis* ssp. *rubens*, and *Filago californica*.
10. ~1000 plants, with *Eriogonum fasciculatum*, *Salvia leucophylla*, *Artemisia californica*, and *Hemizonia fasciculata*.
11. ~100 plants, with *Hemizonia fasciculata*, *Plantago erecta*, and *Eriogonum fasciculatum*.

Southern California black walnut (*Juglans californica*) trees occur in three small populations in the developed area of the River Park site used previously as a camp. The area occurs in a valley in the central part of the site, where several other tree species also are found. The walnut trees occur on relatively flat terrain at an elevation of about 1200 feet. Some trees may have been planted; others appear to have grown naturally. The three populations have 5, 4, and 12 trees, respectively. A solitary black walnut tree occurs at the edge of the north bank of the river, among cottonwood trees.

Larkspur (*Delphinium parryi*) was found in 8 locations on north-facing slopes. The plants were observed in openings within coastal sage scrub. Elevations ranged from 1250 feet to 1320 feet. Most plants were flowering.

1. ~20 plants, with *Eriogonum fasciculatum*, *Salvia leucophylla*, and *Artemisia californica*.
2. ~100 plants, with *Salvia leucophylla*, *Eriogonum fasciculatum*, *Artemisia californica*, and *Malacothamnus fasciculatus*.
3. ~50 plants, with *Salvia leucophylla*, *Eriogonum fasciculatum*, *Artemisia californica*, and *Cercocarpus betuloides*.
4. ~100 plants, with *Eriogonum fasciculatum* and *Artemisia californica*.
5. ~25 plants, with *Bromus diandrus* and *Artemisia californica*.
6. ~100 plants, with *Eriogonum fasciculatum*, *Artemisia californica*, and *Melica imperfecta*.
7. ~25 plants, with *Artemisia californica*, *Cercocarpus betuloides*, and *Bromus diandrus*.
8. ~25 plants, with *Eriogonum fasciculatum*, *Artemisia californica*, and *Bromus madritensis* ssp. *rubens*.

The holly-leaf cherry scrub community found in the northeastern corner of the site on relatively flat wash terraces has several understory species that are associates of the sensitive **slender-horned spineflower (*Dodecahema leptoceras*)**, as observed previously from a known population in the region. These species include lastarriaea (*Lastarriaea coriacea*), valley lessingia (*Lessingia glandulifera* var. *glandulifera*), red-stemmed filaree (*Erodium cicutarium*), Mediterranean schismus (*Schismus barbatus*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), and primroses (*Camissonia micrantha*, *C. californica*). At this specific location in the River Park site, the soils are medium to coarse terrace/riverwash sands, also similar to areas where slender-horned spineflower (*Dodecahema leptoceras*) is found. A known location (not on Newhall property) of this sensitive species was checked in April 2003 as a reference; the species had germinated and some plants were flowering. If slender-horned spineflower (*Dodecahema leptoceras*) exists at the River Park site, it should have been observable in 2003, but it was not found.

A known population of the sensitive **San Fernando Valley spineflower (*Chorizanthe parryi* var. *fernandina*)** also was field-checked as a reference in April 2003. This species had germinated and was observed flowering. Although potential habitat exists for this plant at the River Park site, the species was not found.

APPENDIX A

PLANT SPECIES LIST,
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

PLANT SPECIES LIST
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

SCIENTIFIC NAME	COMMON NAME	GROWTH FORM
FERNS AND FERN-ALLIES		
Pteridaceae	**Brake Family**	
Pellaea andromedifolia	Coffee fern	PH
Pentagramma triangularis ssp. *triangularis*	Goldenback fern	PH
Selaginellaceae	**Spike-Moss Family**	
Selaginella bigelovii	Bigelow's spike-moss	PH
ANGIOSPERMS - MONOCOTS		
Cyperaceae	**Sedge Family**	
*Cyperus involucratus**	Umbrella plant	PH
Juncaceae	**Rush Family**	
Juncus macrophyllus	Long-leaved rush	PH
Juncus mexicanus	Mexican rush	PH
Liliaceae	**Lily Family**	
Allium haematochiton	Red-skinned onion	PH
Bloomeria crocea	Common goldenstar	PH
Calochortus clavatus var. *gracilis* ■	Slender mariposa lily	PH
Calochortus plummerae ■	Plummer's mariposa lily	PH
Calochortus splendens	Splendid mariposa lily	PH
Chlorogalum pomeridianum var. *pomeridianum*	Wavy-leaved soap plant	PH
Dichelostemma capitatum	Blue dicks	PH
Yucca whipplei	Our Lord's candle	Ss
Poaceae	**Grass Family**	
Achnatherum speciosum	Desert needlegrass	PG
*Arundo donax**	Giant reed	PG
*Avena barbata**	Slender wild oat	AG
*Avena fatua**	Wild oat	AG
*Avena sativa**	Cultivated oat	AG
*Bromus diandrus**	Ripgut grass	AG
*Bromus hordeaceus**	Soft chess	AG
Bromus madritensis ssp. *rubens**	Foxtail chess	AG
*Bromus tectorum**	Cheat grass, Downy brome	AG
*Cynodon dactylon**	Bermuda grass	PG
Distichlis spicata	Saltgrass	PG
Hordeum murinum ssp. *leporinum**	Hare barley	AG
Leymus condensatus	Giant wild-rye	PG
Leymus triticoides	Beardless wild-rye	PG
*Lolium multiflorum**	Italian ryegrass	AG, BG
Melica imperfecta	Coast range melic	PG
Muhlenbergia rigens	Deergrass	PG
Nassella cernua	Nodding needlegrass	PG
Nassella lepida	Foothill needlegrass	PG
Nassella pulchra	Purple needlegrass	PG

PLANT SPECIES LIST
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

SCIENTIFIC NAME	COMMON NAME	GROWTH FORM
*Piptatherum miliaceum**	Smilo grass	PG
Poa secunda ssp. *secunda*	One-sided bluegrass	PG
*Polypogon monspeliensis**	Annual beard grass	AG
*Schismus barbatus**	Mediterranean schismus	AG
*Triticum aestivum**	Wheat	AG
Vulpia microstachys var. *pauciflora*	Nuttall's fescue	AG
Vulpia myuros var. *hirsuta**	Rat-tail fescue	AG
Vulpia octoflora var. *octoflora*	Tufted fescue	AG
ANGIOSPERMS - DICOTS		
Anacardiaceae	**Sumac or Cashew Family**	
Rhus trilobata	Skunkbrush	S
*Schinus molle**	Peruvian pepper tree	T
Toxicodendron diversilobum	Western poison oak	S
Apiaceae	**Carrot Family**	
Apiastrum angustifolium	Wild-celery	AH
*Conium maculatum**	Poison hemlock	BH
Daucus pusillus	Rattlesnake weed	AH
Lomatium dasycarpum ssp. *dasycarpum*	Woolly-fruited lomatium	PH
Lomatium mohavense	Desert parsley	PH
Asclepiadaceae	**Milkweed Family**	
Asclepias fascicularis	Narrow-leaf milkweed	PH
Asteraceae	**Sunflower Family**	
Acourtia microcephala	Perezia	PH
Ambrosia acanthicarpa	Annual bur-sage	AH
Ambrosia psilostachya	Western ragweed	AH
Ancistrocarphus filagineus	Woolly fishhooks	AH
Artemisia californica	California sagebrush	S
Artemisia douglasiana	Mugwort	PH
Artemisia dracunculus	Tarragon	PH
Artemisia tridentata ssp. *tridentata*	Big sagebrush	S
Baccharis emoryi	Emory's baccharis	S
Baccharis pilularis	Coyote brush, Chaparral broom	S
Baccharis salicifolia	Mule fat, Seep-willow, Water-wally	S
*Carduus pycnocephalus**	Italian thistle	AH, BH
*Centaurea melitensis**	Tocalote	AH
*Centaurea solstitialis**	Yellow star-thistle	AH
Chaenactis glabriuscula var. *glabriuscula*	Yellow pincushion	AH
*Chamomilla suaveolens**	Pineapple weed, Rayless chamomile	AH
Chrysothamnus nauseosus ssp. *hololeucus*	Rubber rabbitbrush	S
Cirsium occidentale var. *californicum*	California thistle	BH
Cirsium occidentale var. *occidentale*	Cobwebby thistle	BH
*Cirsium vulgare**	Bull thistle	BH

PLANT SPECIES LIST
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

SCIENTIFIC NAME	COMMON NAME	GROWTH FORM
*Cnicus benedictus**	Blessed thistle	AH
Conyza canadensis	Horseweed	AH
*Cotula australis**	Australian brass-buttons	AH
Encelia actoni	Acton's encelia	S
Encelia californica	California encelia	S
Ericameria palmeri var. *pachylepis*	Palmer's goldenbush	S
Erigeron foliosus var. *foliosus*	Fleabane aster	Ss
Eriophyllum confertiflorum var. *confertiflorum*	Golden-yarrow	Ss, S
Filago californica	California filago	AH
*Filago gallica**	Narrow-leaved filago	AH
Gnaphalium californicum	California everlasting	AH, BH
Gnaphalium canescens ssp. *microccephalum*	Felty everlasting	BH, PH
Gutierrezia californica	California matchweed	Ss
Hazardia squarrosa var. *grindelioides*	Saw-toothed goldenbush	S
Helianthus annuus	Common sunflower	AH
Helianthus gracilentus	Slender sunflower	PH
Hemizonia fasciculata	Fascicled tarweed	AH
Heterotheca grandiflora	Telegraph weed	AH, PH
Heterotheca sessiliflora ssp. *fastigiata*	Hairy goldenaster	PH
*Hypochaeris glabra**	Smooth cat's-ear	AH
*Lactuca serriola**	Prickly lettuce	AH
Lasthenia californica	Coastal goldfields	AH
Layia glandulosa	White layia	AH
Lepidospartum squamatum	Scale-broom	S
Lessingia filaginifolia var. *filaginifolia*	California-aster	PH, Ss
Lessingia glandulifera var. *glandulifera*	Valley lessingia	AH
Malacothrix saxatilis var. *tenuifolia*	Cliff malacothrix	PH
Psilocarphus tenellus var. *tenellus*	Slender woolly-heads	AH
Rafinesquia californica	California chicory	AH
Senecio flaccidus var. *douglasii*	Bush senecio	Ss
*Senecio vulgaris**	Common groundsel	AH
*Silybum marianum**	Milk thistle	AH, BH
Sonchus asper ssp. *asper**	Prickly sow thistle	AH
*Sonchus oleraceus**	Common sow thistle	AH
Stephanomeria virgata	Wand chicory	AH
Stylocline gnaphaloides	Everlasting nest straw	AH
Tetradymia comosa	Cotton-thorn	S
Uropappus lindleyi	Silver puffs	AH
Xanthium strumarium	Cocklebur	AH
Boraginaceae	**Borage Family**	
Amsinckia menziesii var. *intermedia*	Rancher's fireweed	AH
Amsinckia menziesii var. *menziesii*	Rancher's fireweed	AH

PLANT SPECIES LIST
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

SCIENTIFIC NAME	COMMON NAME	GROWTH FORM
Cryptantha intermedia	Large-flowered popcorn flower	AH
Cryptantha micrantha	Hairy purpleroot cryptantha	AH
Cryptantha microstachys	Tejon cryptantha	AH
Cryptantha muricata	Prickly popcorn flower	AH
Cryptantha nevadensis	Nevada cryptantha	AH
Harpagonella palmeri ■	Palmer's grappling hook	AH
Heliotropium curassavicum	Salt heliotrope	PH
Pectocarya linearis ssp. *ferocula*	Slender pectocarya	AH
Pectocarya penicillata	Winged pectocarya	AH
Pectocarya recurvata	Recurved pectocarya	AH
Pectocarya setosa	Bristly pectocarya	AH
Plagiobothrys arizonicus	Popcornflower	AH
Plagiobothrys canescens	Rusty popcornflower	AH
Plagiobothrys nothofulvus	Popcornflower	AH
Brassicaceae	**Mustard Family**	
*Brassica nigra**	Black mustard	AH
Descurainia pinnata ssp. *halictorum*	Western tansy mustard	AH
*Hirschfeldia incana**	Shortpod mustard	BH, PH
Lepidium densiflorum var. *elongatum*	Peppergrass	BH
*Sisymbrium altissimum**	Tumble or Jim Hill mustard	AH
*Sisymbrium irio**	London rocket	AH
Cactaceae	**Cactus Family**	
Opuntia basilaris var. *basilaris*	Beavertail	S
Opuntia littoralis	Coast prickly-pear	S
Opuntia prolifera	Cholla	S
Capparaceae	**Caper Family**	
Isomeris arborea	Bladderpod	S
Caprifoliaceae	**Honeysuckle Family**	
Sambucus mexicana	Blue elderberry	S
Caryophyllaceae	**Pink Family**	
Herniaria hirsuta ssp. *cinerea**	Gray herniaria	AH
Loeflingia squarrosa var. *squarrosa*	California loeflingia	AH
*Spergularia bocconii**	Boccone's sand-spurrey	AH
Chenopodiaceae	**Goosefoot Family**	
Atriplex canescens ssp. *canescens*	Fourwing saltbush, Shad-scale	S
*Atriplex semibaccata**	Australian saltbush	PH, S
*Chenopodium album**	Lamb's quarters, Pigweed	AH
Chenopodium berlandieri	Pitseed goosefoot	AH
Chenopodium californicum	California goosefoot	PH
*Chenopodium murale**	Nettle-leaved goosefoot	AH
*Salsola tragus**	Russian thistle, Tumbleweed	AH

PLANT SPECIES LIST
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

SCIENTIFIC NAME	COMMON NAME	GROWTH FORM
Convolvulaceae	**Morning-Glory Family**	
Calystegia peirsonii■	Peirson's morning-glory	PH
Crassulaceae	**Stonecrop Family**	
Crassula connata	Pygmy-weed	AH
Dudleya lanceolata	Lance-leaf live-forever	PH
Cucurbitaceae	**Gourd Family**	
Marah macrocarpus var. *macrocarpus*	Wild cucumber	PH
Cuscutaceae	**Dodder Family**	
Cuscuta californica var. *californica*	California dodder	AV
Euphorbiaceae	**Spurge Family**	
Chamaesyce albomarginata	Rattlesnake weed	PH
Chamaesyce polycarpa	Small-seed sandmat	PH
Eremocarpus setigerus	Dove weed, Turkey mullein	AH
*Ricinus communis**	Castor bean	S
Stillingia linearifolia	Linear-leaved stillingia	PH
Fabaceae	**Legume Family**	
Astragalus didymocarpus var. *didymocarpus*	Two-seeded milkvetch	AH
Astragalus didymocarpus var. *obispoensis*	Two-seeded milkvetch	AH
Astragalus gambelianus	Gambell's locoweed	AH
Astragalus trichopodus var. *phoxus*	Santa Barbara locoweed	PH
Lotus hamatus	San Diego lotus	AH
Lotus salsuginosus var. *salsuginosus*	Coastal lotus	AH
Lotus scoparius var. *scoparius*	California broom	PH, S
Lotus strigosus	Strigose lotus	AH
Lotus wrangelianus	Chilean lotus	AH
Lupinus bicolor	Miniature lupine	AH
Lupinus concinnus	Bajada lupine	AH
Lupinus excubitus var. *excubitus*	Grape soda lupine	S
Lupinus hirsutissimus	Stinging lupine	AH
Lupinus microcarpus var. *densiflorus*	Chick lupine	AH
Lupinus microcarpus var. *microcarpus*	Chick lupine	AH
Lupinus sparsiflorus	Coulter's lupine	AH
Lupinus succulentus	Arroyo lupine	AH
Lupinus truncatus	Collar lupine	AH
*Medicago polymorpha**	California burclover	AH
*Melilotus albus**	White sweetclover	AH, BH
*Melilotus indicus**	Sourclover	AH
*Parkinsonia aculeata**	Mexican palo verde	T
Trifolium albopurpureum var. *albopurpureum*	Rancheria clover	AH
Trifolium gracilentum var. *gracilentum*	Pinpoint clover	AH
*Trifolium hirtum**	Rose clover	AH
Vicia villosa ssp. *varia**	Hairy or winter vetch	AH

PLANT SPECIES LIST
RIVER PARK SITE, LOS ANGELES COUNTY, CALIFORNIA

SCIENTIFIC NAME	COMMON NAME	GROWTH FORM
Fagaceae	**Oak Family**	
Quercus agrifolia var. *agrifolia*	Coast live oak	T
Quercus john-tuckeri	Tucker's oak	S, T
Quercus lobata	Valley oak, Roble	T
Geraniaceae	**Geranium Family**	
*Erodium botrys**	Long-beaked filaree	AH
*Erodium cicutarium**	Red-stemmed filaree	AH
Grossulariaceae	**Gooseberry Family**	
Ribes aureum var. *gracillimum*	Golden currant	S
Hydrophyllaceae	**Waterleaf Family**	
Emmenanthe penduliflora	Whispering bells	AH
Eriodictyon crassifolium var. *nigrescens*	Thickleaf yerba santa	S
Eucrypta chrysanthemifolia	Common eucrypta	AH
Phacelia cicutaria var. *hispida*	Caterpillar phacelia	AH
Phacelia distans	Fern-leaf phacelia	AH
Phacelia minor	Wild canterbury-bell	AH
Phacelia ramosissima	Branching phacelia	PH

NOTES:

1. Species observed during field surveys conducted by FL*x*, April 9 through April 19, May 23, and June 16, 2003.

2. Scientific and common names are from Hickman (1993), Smith (1998), and Skinner and Pavlik (1994). Additional common plant names are taken from Abrams (1923, 1944), Abrams and Ferris (1951, 1960), Beauchamp (1986), McAuley (1996), Munz (1974), Raven (1986), Roberts (1989), and Sawyer and Keeler-Wolf (1995).

3. Growth Form indicates species growth habit:
AG = Annual Grass; AH = Annual Herb; AV = Annual Vine; BG = Biennial Grass; BH = Biennial Herb; PG = Perennial Grass; PH = Perennial Herb; PV = Perennial Vine; Ss = Subshrub; S = Shrub; T = Tree.

* Non-native plant species
▪ Sensitive plant species

May 2002

1. INTRODUCTION

The River Park site in the Newhall Ranch/Valencia Company project area, Los Angeles County, California, was surveyed for rare plant species and vegetation types from April 24 through April 27, 2002. The site is located about 2.5 miles east of the junction of Interstate 5 and Magic Mountain Parkway. It is bounded on the south by Soledad Canyon Road and on the west by Bouquet Canyon Road. Commercial and residential development occurs in most of the area surrounding the site. The project area contains a mixture of previously disturbed and undisturbed areas. The Santa Clara River runs through the southern part of the site in an east-west direction.

A team of two consultants from FL*x* (Dr. Anuja Parikh and Dr. Nathan Gale) conducted the vegetation and rare plant surveys. Vegetation types and plant species associations were mapped for the site during the walk-over surveys, and additionally by viewing the area from vantage points on ridges or hilltops. A list of plant species including rare and commonly occurring plants observed at the site was compiled. Plant community descriptions in this report follow Holland (1986) where applicable; species nomenclature follows Hickman (1993).

2. VEGETATION TYPES AND PLANT SPECIES ASSOCIATIONS

The River Park project area is composed of variable terrain, ranging from relatively flat riverwash, secondary washes, and terrace areas, to previously disturbed flat areas or fields above the banks of the Santa Clara River, to hillslopes in the northern part of the site.

Disked Fields. Many areas of the project site comprise fields that have been disturbed previously by disking. These fields now have grass cover and ruderal vegetation with native and non-native species. Species observed included bromegrasses (*Bromus diandrus*, *B. madritensis* ssp. *rubens*), hare barley (*Hordeum murinum*), shortpod mustard (*Hirschfeldia incana*), red-stemmed filaree (*Erodium cicutarium*), goosefoot (*Chenopodium album*, *C. californicum*), rancher's fireweed (*Amsinckia menziesii*), poverty weed (*Iva axillaris* ssp. *robustior*), and Jimson weed (*Datura wrightii*).

Non-Native Grassland. This community occurs on relatively flat terrain and sometimes on gentle hillslopes throughout the River Park site. Annual introduced grasses up to about 0.5 m tall are dominant in non-native grasslands; annual herb species also are found. Flowering occurs in spring, and the plants mostly are dead in summer and fall. Non-native grasslands occur on fine-textured, usually clay soils, that are moist to wet in the winter but dry in the summer and fall (Holland, 1986). Grass species found at the site include mainly bromegrasses (*Bromus diandrus*, *B. madritensis* ssp. *rubens*, *B. hordeaceus*) and wild oats (*Avena barbata*, *A. fatua*). Introduced herbaceous ruderal species also are found, and commonly include red-stemmed filaree (*Erodium cicutarium*), small-seed sandmat (*Chamaesyce polycarpa*), and shortpod mustard (*Hirschfeldia incana*). Scattered native plants found in this community include wishbone bush (*Mirabilis californica*), California fuschia (*Epilobium canum*), tansy phacelia (*Phacelia tanacetifolia*), and California thistle (*Cirsium occidentale* var. *californicum*).

Non-Native Grassland with Scattered Shrubs. In a few areas covered with non-native grasses, also on relatively flat terrain and on gentle slopes, shrubs are sparsely distributed in the grassland. These native shrubs include California buckwheat (*Eriogonum fasciculatum*), goldenbush (*Ericameria palmeri* var. *pachylepis*), skunkbrush (*Rhus trilobata*), and California sagebrush (*Artemisia californica*).

Planted Scrub. In the northwestern part of the River Park project area, several slopes have been cut or graded for the installation of water lines and concrete-lined drainage channels. These relatively steep slopes have been restored by planting native shrubs, primarily California buckwheat (*Eriogonum fasciculatum*); some California sagebrush (*Artemisia californica*) also occurs.

Riversidian Sage Scrub. This community is the most xeric type of coastal sage scrub south of Point Conception in California (Holland, 1986), and is found along the coastal side of the Transverse and Peninsular Ranges. It contains low, soft-woody shrubs up to 1 m tall. Plant growth occurs in late winter and spring after the rains, with most species flowering in spring and summer. Typical stands are relatively open and dominated by California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), and annual grasses such as foxtail chess (*Bromus madritensis* ssp. *rubens*), each attaining 20 percent or greater cover. Riversidian sage scrub is found on xeric sites such as steep slopes, severely drained soils, or relatively clayey soils that are slow to release moisture. It intergrades with several southern California chaparrals. On the River Park site, this community is found on sloping terrain throughout the site; the dominant species is California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*). Other less dominant plants include thickleaf yerba santa (*Eriodictyon crassifolium* var. *nigrescens*), California sagebrush (*Artemisia californica*), sages (*Salvia mellifera*, *S. apiana S. leucophylla*), goldenbush (*Ericameria palmeri* var. *pachylepis*), encelias (*Encelia actoni*, *E. californica*), chaparral mallow (*Malacothamnus fasciculatus*), Our Lord's candle (*Yucca whipplei*), linear-leaved stillingia (*Stillingia linearifolia*), California-aster (*Lessingia filaginifolia* var. *filaginifolia*), California broom (*Lotus scoparius*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), giant wild-rye (*Leymus condensatus*), and cotton-thorn (*Tetradymia comosa*). Introduced annual grasses prevalent in the understory are dominated by foxtail chess (*Bromus madritensis* ssp. *rubens*) and slender wild oat (*Avena barbata*). Native needlegrasses (*Nassella cernua*, *N. lepida*) also are scattered in the understory. Among herbaceous species found in this community, the non-native shortpod mustard (*Hirschfeldia incana*), red-stemmed filaree (*Erodium cicutarium*), and tocalote (*Centaurea melitensis*) is present, as well as the native wishbone bush (*Mirabilis californica*), fascicled tarweed (*Hemizonia fasciculata*), woolly-fruited lomatium (*Lomatium dasycarpum* ssp. *dasycarpum*), malacothrix (*Malacothrix saxatilis* var. *tenuifolia*), and chia (*Salvia columbariae*). With respect to sensitivity status, Riversidian sage scrub has been state-ranked as S3.1 (10,000 to 50,000 acres, very threatened) by the CNDDB.

Chamise Chaparral. This type of chaparral is found in small scattered patches on flat to sloping terrain, mostly in the northeastern part of the River Park site. Chamise chaparral is the most common type of chaparral in southern California, and is dominated by chamise (*Adenostoma fasciculatum*) shrubs 1 to 3 m tall. It is often dense and impenetrable and has a sparse understory (Holland, 1986). It is adapted to repeated fires, and is found on shallow, dry soils on xeric slopes and ridges. Growth is highest in the spring and reduced in the summer; flowering occurs from late winter to early summer. Typically, several other native shrubs also occur in this chaparral, but at the River Park site, the small patches of this community are made up almost exclusively of chamise (*Adenostoma fasciculatum*). With respect to sensitivity status, chamise chaparral has been state-ranked as S4 (apparently secure) by the CNDDB.

Coastal Sage - Chaparral Scrub. In some areas of the site, on mostly west-facing slopes, a mix of Riversidian sage scrub and chamise chaparral species occurs. The overstory is relatively open, and the understory in these areas often has annual grasses and herbaceous species. Common species include chamise (*Adenostoma fasciculatum*), California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*), California sagebrush (*Artemisia californica*), chaparral mallow (*Malacothamnus fasciculatus*) and black

sage (*Salvia mellifera*).

Holly-Leaf Cherry Scrub. In the northeastern corner of the site on relatively flat terrain, a unique stand of holly-leaf cherry scrub is found. It occurs on the low terraces of a secondary wash that leads to the Santa Clara River. The stand is dominated by relatively large, mature shrubs of holly-leaf cherry (*Prunus ilicifolia* ssp. *ilicifolia*), 3 to 5 m in height; other shrub associates are skunkbrush (*Rhus trilobata*) and spiny redberry (*Rhamnus crocea*). Other native species found in the understory of these shrubs include woolly star (*Eriastrum densifolium* ssp. *elongatum*), scarlet bugler (*Penstemon centranthifolius*), and linear-leaved stillingia (*Stillingia linearifolia*). Also found in this community are the species red-stemmed filaree (*Erodium cicutarium*), lastarriaea (*Lastarriaea coriacea*), valley lessingia (*Lessingia glandulifera* var. *glandulifera*), Mediterranean schismus (*Schismus barbatus*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), and primroses (*Camissonia micrantha, C. californica*). With respect to sensitivity status, mainland cherry forest has been state-ranked as S1.1 (<2,000 acres, very threatened) by the CNDDB. The canopy cover of the holly-leaf cherry shrubs at this site did not amount to a forest canopy. Holly-leaf cherry scrub, as identified in this survey, is not defined in Holland (1986), and therefore, it has no assigned ranking. However, it should be recognized as a unique and sensitive community at the site.

Mule Fat Scrub. Several very small patches of this community occur mostly in the western part of the River Park site, adjacent to the river floodplain. Mule fat scrub typically is a tall, semi-woody and herbaceous riparian scrub, and is relatively species-poor. An early seral community, it often grades to riparian woodland or forest (Holland, 1986). The dominant species found in this community is the native species mule fat (*Baccharis salicifolia*). The understory includes mostly introduced species such as bromegrasses (*Bromus* spp.) and shortpod mustard (*Hirschfeldia incana*). With respect to sensitivity status, mule fat scrub has been state-ranked as S4 (apparently secure) by the CNDDB.

Southern Willow Scrub. Several small patches of this community occur in tributary drainages of the River Park site. Willow scrub is a broadleaved, winter-deciduous riparian community, typically too dense to allow understory development. It is a relatively early seral community, succeeding to cottonwood-sycamore forests (Holland, 1996). In the project area, this community includes willows (*Salix lasiolepis, S. exigua*), Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), Mexican elderberry (*Sambucus mexicana*), tree tobacco (*Nicotiana glauca*), mule fat (*Baccharis salicifolia*), and western poison oak (*Toxicodendron diversilobum*). The understory is sparse or absent, but sometimes includes species such as Mexican rush (*Juncus mexicanus*), western ragweed (*Ambrosia psilostachya*), and giant wild-rye (*Leymus condensatus*). With respect to sensitivity status, southern willow scrub has been state-ranked as S2.1 (2,000 to 10,000 acres, very threatened) by the CNDDB.

Southern Riparian Scrub. This community is found on the Santa Clara River floodplain, on relatively flat terraces immediately adjacent to the riverbed; some branched channels of the river cross this community. A combination of mule fat scrub and southern willow scrub species is found on the terraces, including mule fat (*Baccharis salicifolia*), willows (*Salix exigua, S. lasiolepis, S. laevigata*), Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), tamarisk (*Tamarix* sp.), scale-broom (*Lepidospartum squamatum*), and arundo (*Arundo donax*). In addition, other native species include Great Basin sagebrush (*Artemisia tridentata*), shad-scale (*Atriplex canescens* ssp. *linearis*), Mexican elderberry (*Sambucus mexicana*), thickleaf yerba santa (*Eriodictyon crassifolium* var. *nigrescens*), cholla (*Opuntia prolifera*), and mugwort (*Artemisia douglasiana*). With respect to sensitivity status, southern

riparian scrub has been state-ranked as S3.2 (10,000 to 50,000 acres, threatened) by the CNDDB.

Riverwash. The main channel of the Santa Clara River is sparsely vegetated and is subject to scouring by the river. Soils are sandy riverwash and gravel, and in places form sand bars and low terraces within the channel. No well-defined plant community is found here, although scattered elements of southern riparian scrub were observed. Shrub species found in the dry riverbed are mule fat (*Baccharis salicifolia*), tamarisk (*Tamarix* sp.), scale-broom (*Lepidospartum squamatum*), arundo (*Arundo donax*), California broom (*Lotus scoparius*), woolly star (*Eriastrum densifolium* ssp. *elongatum*), and California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*). Smaller plants growing in the riverbed include buckwheat (*Eriogonum baileyi*), Mediterranean schismus (*Schismus barbatus*), cryptantha (*Cryptantha micrantha*), hairy goldenaster (*Heterotheca sessiliflora* ssp. *fastigiata*), tumble mustard (*Sisymbrium altissimum*), foxtail chess (*Bromus madritensis* ssp. *rubens*), slender pectocarya (*Pectocarya linearis* ssp. *ferocula*), and annual bur-sage (*Ambrosia acanthicarpa*). Fremont cottonwoods (*Populus fremontii* ssp. *fremontii*) and willows (*Salix* spp.) are found scattered individually or in small clumps in the channel; no riparian forest is found.

Oak Woodland. Small patches of oak woodland occur in the central part of the River Park site, mostly on or at the base of north-facing and west-facing slopes. Typically, oak woodlands have a single dominant species, but at the River Park site, three species are found intermixed in the oak woodland areas: the evergreen coast live oak (*Quercus agrifolia* var. *agrifolia*) and Tucker's oak (*Quercus john-tuckeri*), and the winter-deciduous valley oak (*Quercus lobata*). Coast live oaks (*Quercus agrifolia* var. *agrifolia*) can reach 10 to 25 m in height, and occur away from the direct influence of the ocean in shaded canyons and on north-facing slopes (Holland, 1986). Tucker's oak (*Quercus john-tuckeri*) is a shrubby oak that grows 2 to 5 m tall, and is relatively uncommon and restricted in range to interior southern California locations. Valley oaks (*Quercus lobata*) are California's largest broad-leaved tree, reaching 15 to 35 m in height, and occur on alluvial soils in valleys, and also on slopes in the South Coast Ranges. At the River Park site, some large mature individuals of valley oak (*Quercus lobata*) also are scattered in disked fields. The shrub layer in oak woodlands generally is poorly developed, and the herb layer often has annual grasses, which have replaced the native perennial grasses once commonly associated with this community.

Developed Area with Mixed Trees. In the central part of the River Park site, there is an area that apparently was used as a camp in the past. Currently, it is occupied by a construction company, with buildings, trailers, and equipment storage areas. Many large and mature native and non-native trees occur in this developed area, some of which may be plantings, and some natural. Species observed include western sycamore (*Platanus racemosa*), Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), Mexican elderberry (*Sambucus mexicana*), eucalyptus (*Eucalyptus* spp.), Peruvian pepper tree (*Schinus molle*), and various conifers.

3. RARE PLANT SPECIES

The rare plant surveys were carried out in late April to accommodate the blooming periods of various species potentially occurring in the region, or previously reported by the CNDDB. Surveys were conducted earlier than typically would be the case (May through July), due to a very low rainfall year in southern California that has resulted in annual plants having a particularly short-lived season. A list of target species potentially occurring at the site is presented in Table 1; these species were searched for

during the focused rare plant surveys.

TABLE 1: SENSITIVE PLANT SPECIES POTENTIALLY OCCURRING ON THE NEWHALL RANCH/VALENCIA COMPANY PROPERTY SITES

Scientific Name	Common Name	Family	Status* Federal/State/CNPS
Astragalus brauntonii	Braunton's milk-vetch	Fabaceae	FE/-/1B
Berberis nevinii	Nevin's barberry	Berberidaceae	FE/SE/1B

* FE = Federal endangered
FC = Federal candidate
FSC = Federal species of concern
SE = State/California endangered
SR = State/California rare
1B = CNPS List 1B, rare or endangered in California and elsewhere
2 = CNPS List 2, rare or endangered in California, more common elsewhere
4 = CNPS List 4, plants of limited distribution

Two sensitive species were found in the project area during the current surveys: Peirson's morning-glory (*Calystegia peirsonii*) and southern California black walnut (*Juglans californica* var. *californica*), both CNPS List 4 species. A summary of the populations of these species located at the site is provided below. These population locations, as numbered below, have been marked on the accompanying topographical map.

Peirson's morning-glory (*Calystegia peirsonii*) populations were found in 24 locations on relatively gentle slopes (generally south-facing) or in flat areas. The plants are associated with various grassland and coastal sage scrub species. Elevations range from 1250 feet to 1450 feet, and the soils are sandy to gravelly/stony in texture. Most plants were in vegetative form; some were flowering.

1. 5 plants, with *Bromus madritensis* ssp. *rubens*, *Bromus hordeaceus*, *Hirschfeldia incana*, near *Eriogonum fasciculatum*.
2. ~300 plants, with *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, near *Salvia*

mellifera.

3. ~100 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, *Hirschfeldia incana*, near *Eriogonum fasciculatum.*
4. ~300 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, *Lotus scoparius*, near *Artemisia californica* and *Malacothamnus fasciculatus.*
5. ~100 plants, with *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, near *Sambucus mexicana.*
6. ~50 plants, with *Bromus diandrus*, *Hirschfeldia incana*, and *Ericameria palmeri* var. *pachylepis.*
7. ~20 plants, with *Bromus diandrus* and *Hirschfeldia incana.*
8. ~700 plants, with *Bromus madritensis* ssp. *rubens*, near *Eriogonum fasciculatum* and *Salvia leucophylla.*
9. ~100 plants, with *Bromus madritensis* ssp. *rubens*, near *Salvia leucophylla* and *Yucca whipplei.*
10. ~40 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, and *Eriogonum fasciculatum.*
11. ~100 plants, with *Bromus madritensis* ssp. *rubens*, *Avena barbata*, *Eriogonum fasciculatum*, near *Sambucus mexicana.*
12. ~40 plants, with *Bromus madritensis* ssp. *rubens*, near *Malacothamnus fasciculatus.*
13. ~100 plants, with *Bromus madritensis* ssp. *rubens*, *Eriogonum fasciculatum*, and *Encelia californica.*
14. ~100 plants, with *Nassella lepida*, *Bromus madritensis* ssp. *rubens*, *Bromus diandrus*, and *Hirschfeldia incana.*
15. ~100 plants, with *Bromus diandrus*, *Hirschfeldia incana*, near *Sambucus mexicana.*
16. ~200 plants, with *Melica imperfecta*, *Avena barbata*, *Bromus madritensis* ssp. *rubens*, near *Malacothamnus fasciculatus* and *Salvia apiana.*
17. ~100 plants, with *Yucca whipplei*, *Bromus madritensis* ssp. *rubens*, *Hirschfeldia incana*, near *Eriogonum fasciculatum* and *Lotus scoparius.*
18. ~40 plants, in disturbed bare ground near *Eriogonum fasciculatum.*
19. ~800 plants, with *Bromus diandrus*, *Avena barbata*, *Bromus madritensis* ssp. *rubens*, near *Salvia* spp., *Artemisia tridentata*, and *Eriodictyon crassifolium.*
20. ~350 plants, with *Bromus hordeaceus*, *Bromus madritensis* ssp. *rubens*, *Avena barbata*, near *Yucca whipplei* and *Artemisia californica.*
21. ~100 plants, with *Bromus diandrus*, *Avena barbata*, *Eriogonum fasciculatum*, *Artemisia californica*, near *Eriodictyon crassifolium.*
22. ~150 plants, with *Eriogonum fasciculatum*, *Bromus madritensis* ssp. *rubens*, and *Lotus scoparius.*
23. ~250 plants, with *Bromus diandrus*, *Eriogonum fasciculatum*, near *Acourtia microcephala* and *Lotus scoparius.*
24. ~250 plants, with *Hirschfeldia incana*, *Bromus madritensis* ssp. *rubens*, near *Encelia actoni* and *Artemisia californica.*

Southern California black walnut (*Juglans californica* var. *californica*) trees occur in three small populations in the developed area of the River Park site used previously as a camp. The area occurs in a valley in the central part of the site, where several other tree species also are found. The walnut trees occur on relatively flat terrain at an elevation of about 1200 feet. Some trees may have been planted; others appear to have grown naturally. The three populations have 5, 4, and 12 trees, respectively.

The holly-leaf cherry scrub community found in the northeastern corner of the site on relatively flat

wash terraces has several understory species that are associates of the sensitive **slender-horned spineflower (*Dodecahema leptoceras*)**, as observed previously from a known population in the region. These species include lastarriaea (*Lastarriaea coriacea*), valley lessingia (*Lessingia glandulifera* var. *glandulifera*), red-stemmed filaree (*Erodium cicutarium*), Mediterranean schismus (*Schismus barbatus*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), and primroses (*Camissonia micrantha*, *C. californica*). At this specific location in the River Park site, the soils are medium to coarse terrace/riverwash sands, also similar to areas where slender-horned spineflower (*Dodecahema leptoceras*) is found. A known location of this sensitive species was checked in late April 2002 as a reference, but no plants were seen, possibly because it did not germinate due to low rainfall this winter season. Therefore, if slender-horned spineflower (*Dodecahema leptoceras*) exists at the River Park site, it may not be observable in 2002. We recommend that the holly-leaf cherry scrub area be surveyed again for this species after a better rainfall season.

A known population of the sensitive **San Fernando Valley spineflower (*Chorizanthe parryi* var. *fernandina*)** also was field-checked as a reference in late April 2002. Despite the low rainfall, this species had germinated and was observed flowering. Although potential habitat exists for this plant at the River Park site, the species was not found.

4. PLANT SPECIES LIST

Plant species observed in the River Park project site are listed below.

ANGIOSPERMS
DICOTYLEDONS
Anacardiaceae
Rhus trilobata
*Schinus molle**
Toxicodendron diversilobum
Apiaceae
+Lomatium dasycarpum ssp. *dasycarpum*
Asclepiadaceae
Asclepias fascicularis
Asteraceae
Acourtia microcephala
Ambrosia acanthicarpa
Ambrosia psilostachya
Artemisia californica
Artemisia douglasiana
Artemisia dracunculus
+Artemisia tridentata
Baccharis pilularis
Baccharis salicifolia
*Centaurea melitensis**
*Centaurea solstitialis**
+Chaenactis glabriuscula var. *glabriuscula*
+Cirsium occidentale var. *californicum*
+Encelia actoni

Encelia californica
+Ericameria palmeri var. *pachylepis*
Eriophyllum confertiflorum
Gnaphalium californicum
Grindelia ?camporum
Hemizonia fasciculata
Heterotheca grandiflora
+Heterotheca sessiliflora ssp. *fastigiata*
*Hypochaeris glabra**
+Iva axillaris ssp. *robustior*
Lepidospartum squamatum
Lessingia filaginifolia
+Lessingia glandulifera var. *glandulifera*
+Malacothrix saxatilis var. *tenuifolia*
*Sisymbrium altissimum**
Sonchus asper ssp. *asper**
*Sonchus oleraceus**
Tetradymia comosa

Boraginaceae
Amsinckia menziesii
Cryptantha intermedia
Cryptantha micrantha
Heliotropium curassavicum
Pectocarya linearis ssp. *ferocula*

Brassicaceae
*Brassica nigra**
*Hirschfeldia incana**

Cactaceae
+Opuntia basilaris var. *basilaris*
Opuntia littoralis
Opuntia prolifera

Caprifoliaceae
Sambucus mexicana

Chenopodiaceae
+Atriplex canescens ssp. *linearis*
*Atriplex semibaccata**
*Chenopodium album**
Chenopodium californicum
*Salsola tragus**

Convolvulaceae
+Calystegia peirsonii[†]

Cucurbitaceae
+Marah macrocarpus var. *macrocarpus*

Euphorbiaceae
Chamaesyce polycarpa
Eremocarpus setigerus

Stillingia linearifolia
Fabaceae
Lotus scoparius
Lupinus hirsutissimus
*Medicago polymorpha**
*Melilotus albus**
*Melilotus indicus**

Fagaceae
Quercus agrifolia var. *agrifolia*
+Quercus john-tuckeri
Quercus lobata
Geraniaceae
*Erodium botrys**
*Erodium cicutarium**
Grossulariaceae
+Ribes aureum var. *gracillimum*
Hydrophyllaceae
Emmenanthe penduliflora
+Eriodictyon crassifolium var. *nigrescens*
Phacelia tanacetifolia
Juglandaceae
Juglans californica var. *californica*[†]
Lamiaceae
*Marrubium vulgare**
Salvia apiana
Salvia columbariae
Salvia leucophylla
Salvia mellifera
Trichostema lanatum
Malvaceae
Malacothamnus fasciculatus
*Malva parviflora**
Myrtaceae
Eucalyptus spp.*
*Eucalyptus globulus**
Nyctaginaceae
Mirabilis californica
Onagraceae
Camissonia californica
Camissonia micrantha
Epilobium canum
+Oenothera californica ssp. *californica*
Platanaceae
Platanus racemosa
Polemoniaceae

+*Eriastrum densifolium* ssp. *elongatum*
+*Eriastrum densifolium* ssp. *mohavense*
Eriastrum sapphirinum
Polygonaceae
+*Eriogonum baileyi*
+*Eriogonum fasciculatum* var. *foliolosum*
+*Eriogonum fasciculatum* var. *polifolium*
Lastarriaea coriacea
Rhamnaceae
Rhamnus crocea
Rosaceae
Adenostoma fasciculatum
Cercocarpus betuloides var. *betuloides*
Heteromeles arbutifolia
Prunus ilicifolia ssp. *ilicifolia*
Salicaceae
Populus fremontii ssp. *fremontii*
Salix exigua
Salix laevigata
Salix lasiolepis
Scrophulariaceae
Penstemon centranthifolius
Solanaceae
Datura wrightii
*Nicotiana glauca**
Solanum douglasii
Solanum xanti
Tamaricaceae
Tamarix species*

ANGIOSPERMS
MONOCOTYLEDONS
Juncaceae
Juncus mexicanus
Liliaceae
+*Chlorogalum pomeridianum* var. *pomeridianum*
Yucca whipplei
Poaceae
*Arundo donax**
*Avena barbata**
*Avena fatua**
*Bromus diandrus**
*Bromus hordeaceus**
+*Bromus madritensis* ssp. *rubens**
*Bromus tectorum**
Distichlis spicata

*Hordeum murinum**
Leymus condensatus
*Lolium multiflorum**
Melica imperfecta
Muhlenbergia rigens
Nassella cernua
Nassella lepida
*Polypogon monspeliensis**
*Schismus barbatus**

NOTE:
* Non-native plant species
\+ Species not listed on the ISI Floral Compendium
† Sensitive species

Subject: Results of Butterfly Survey for River Park SEATAC Biota Project.

Dear Mr. Johnson:

Introduction

At the request of Impact Sciences, Inc. (ISI), Guy P. Bruyea (GPB) conducted a field survey of the above-referenced site in the Santa Clarita area near the intersection of Bouquet Canyon Road and Soledad Canyon Road in northwestern Los Angeles County, California. The specific goal of this survey is to assess potential suitability of the River Park site as habitat to support the San Emigdio blue butterfly (*Plebulina emigdionis*, herein referred to as SEB), a federal species of concern. Additional searches were conducted for habitat that may support the federally endangered Quino checkerspot butterfly (*Euphydryas editha quino*, herein QCB), historically known from other areas of Los Angeles County south of the project site. In addition to surveys for habitat that may support the aforementioned butterfly taxa, a general butterfly inventory was performed during a three-day survey in May 2003. This report briefly describes the relevant vegetation, topography, and present land use throughout the River Park site in an effort to assess the overall quality of the habitat as it pertains to the SEB, QCB and potential butterfly diversity on the site.

Sensitive Butterfly Species Background Information

Many butterflies are becoming increasingly scarce in southern California, especially in coastal and valley areas were natural habitats have been converted for human uses or have been adversely impacted by various anthropogenic disturbances. Additionally, in the relatively less disturbed foothill and mountain areas the spread of invasive non-native weedy vegetation, grazing, fire suppression, and off-road vehicle activity is threatening many native plants, including butterfly host plants.

There are approximately 135 recorded butterfly species from Los Angeles County, of which approximately 120 are considered resident. Some species have adapted well to ornamental landscapes, but many formerly common species have now become increasingly rare over the past few decades due to urban expansion and other factors. Several butterflies presently (and/or historically) found in Los Angeles County are now protected or are considered species of special concern (Table 1). At least three butterflies that once occurred in Los Angeles County are now presumably extinct. These include, 1) the unsilvered fritillary (*Speyeria adiaste atossa*), which was last observed near Mt. Pinos in 1959, 2) a very localized race of the Sonoran blue (*Philotes sonorensis*) that once occurred in the upper San Gabriel wash above Azusa (to 1968), and 3) the Palos Verdes blue (*Glaucopsyche lygdamus palosverdesensis*, herein referred to as PVB), which was last observed on the Palos Verdes peninsula in 1983.

Three butterflies known from Los Angeles County are now on the federal list of endangered wildlife. These include the El Segundo blue (*Euphilotes battoides allyni*, herein referred to as ESB[1]), the QCB, and the PVB.

[1] Some researchers consider the ESB to be a subspecies of *Euphilotes bernardino*, not *E. battoides*. The ESB is listed as endangered by the U.S. Fish & Wildlife Service as *E. **battoides** allyni*.

No relatively recent records for QCB exist from Los Angeles County. Populations of QCB are historically known from two locations in the Santa Monica Mountains, 1) Tapia Camp (1947), and 2) Point Dume (1954). Both of these colonies appear to have been extirpated, as adults have not been observed at or in the vicinity of either location in approximately 35 years. Most extant populations of QCB are known from southwestern Riverside County in the vicinity of Temecula and Murrieta, and southern San Diego County in the vicinity of Otay Mountain.

Table 1.
Los Angeles County Sensitive Butterflies

Common Name	Scientific Name	Status	Range*
Quino Checkerspot	*Euphydryas editha quino*	FE	N
El Segundo Blue	*Euphilotes battoides allyni*	FE	N
Palos Verdes Blue	*Glaucopsyche lygdamus palosverdesensis*	FE	N
San Emigdio Blue	*Plebulina emigdionis*	C	Y
Bright Blue Copper	*Lycaena heteronea clara*	R	N
San Gabriel Mountain Sonoran Blue	*Philotes sonorensis* form	X	N
Veined Blue	*Icaricia neurona*	R	N
Green (=Skinner's) Blue	*Icaricia lupini chlorina*	R	N
Santa Monica Mountains Hairstreak	*Satyrium auretorum fumosum*	C	N
Emmel's Elfin	*Callophrys mossii* (new subspecies?)	R	N
Wandering Skipper	*Panoquina errans*	C	N
Alkali Skipper	*Pseudocopaeodes eunus*	C	N
Tehachapi Mountains Silverspot	*Speyeria egleis tehachapina*	C	N
Unsilvered Fritillary	*Speyeria adiaste atossa*	X	N
Monarch Butterfly	*Danaus plexippus*	[1]	Y

*Indicates whether survey area is within known range of indicated taxon (Y=yes, N=no)
FE=Federally endangered, C=Concern, X=Presumed extinct (no status), R=Highly restricted range
[1] Overwintering (or nesting) sites should be protected, butterfly probably not at risk currently

The ESB is restricted to the coastal dune systems in southwestern Los Angeles County. The ESB is presently known from only three locations: 1) the dunes west of the Los Angeles International Airport (LAX); 2) the dunes west of the Chevron Oil refinery; and, 3) Malaga Cove north of the Palos Verdes peninsula. This butterfly is strongly associated with the flower heads of its host plant, coastal or dune buckwheat (*Eriogonum parviflorum*). Adults are active in a single brood from mid-July to early September.

The PVB was restricted to the Palos Verdes peninsula where it flew in a single generation during February and March. This butterfly was strongly associated with its principal host plant, milkvetch (*Astragalus trichopodus* var. *lonchus*). The closest relative of the PVB is the southern blue (*Glaucopsyche lygdamus australis*), which occurs throughout most of the remainder of southern California. The southern blue is known to feed in the larval stage primarily on deerweed (*Lotus scoparius*), although larvae occasionally have been found on milkvetch.

The PVB was believed to have become extinct in 1983 when the last known large stand (approximately 120 plants) of milkvetch was eliminated by construction of a baseball field at Hesse Park on the peninsula. In the spring of 1994, a colony of what is considered by some researchers to be the PVB was discovered at a slightly more inland locality on Navy property in San Pedro. At this locality the butterflies are associated with both milkvetch and deerweed. Some researchers maintain that it is possible that genetic differences exist between seaward-facing peninsular populations (PVB) and the extant Navy colony.

Several other butterflies are considered uncommon in Los Angeles County, some having federal or state status (i.e., species of special concern), and others that warrant careful monitoring due to declining populations or extremely limited ranges within Los Angeles County. These include the San Emigdio blue (*Plebulina emigdionis*), the Santa Monica Mountains hairstreak *(Satyrium auretorum fumosum*), the wandering skipper (*Panoquina errans*), and the Tehachapi Mountain silverspot (*Speyeria egleis tehachapina*).

Several other butterfly species that appear to be declining (or may be extirpated) in Los Angeles County, but remain common in other areas of their respective ranges include the purplish copper (*Lycaena helloides*), giant copper (*Lycaena xanthoides*), Columella hairstreak (*Strymon columella istapa*), southern sylvan hairstreak (*Satyrium sylvinum sylvinum*), western tailed blue (*Everes amyntula*), coastal arrowhead blue (*Glaucopsyche piasus sagittigera*), California ringlet (*Ceonympha tullia californica*), and sylvan satyr (*Cercyonis sthenele sylvestris*).

Sensitive butterflies considered to have potential for occurrence on the subject property, based on known ranges, the presence of associated vegetation communities, elevations on site, host plant availability within the general vicinity, and other requirements, are discussed in more detail below.

Sensitive Butterfly Species Background Information
San Emigdio Blue Butterfly (*Plebulina emigdionis*)
The SEB is restricted to southern California in lower Sonoran and riparian habitats from the Owens Valley south to the Mojave River and west to northern Ventura and Los Angeles Counties. This butterfly can be locally abundant in association with its primary host plant, four-wing saltbush (*Atriplex canescens*). The limited distribution of SEB was perplexing to early researchers based on the abundance and widespread distribution of its host plant, which occurs throughout the western United States. SEB larvae have formed a symbiotic relationship with at least one ant species, *Formica pilicornis* (Ballmer *et al*, 1991). This may account for, at least in part, SEB's limited range. These ants presumably extract droplets from SEB larvae and the ants offer the larvae protection from predators. This relationship is actually quite common among other members of the butterfly family Lycaendidae, to which the SEB belongs. The male butterfly is small (approximately 20-25 millimeters in wingspan) and is blue with a wide brown border on the dorsal wing surface. The slightly larger female is primarily brown with blue at the wing bases and orange bands on the edges of the dorsal wing surface. The ventral wing surface of both sexes is primarily white with small black dots, with smaller blue dots along the hind wing edges.

SEB adults are active from late April to early September. The SEB can have up to three broods per year with the first brood in late April to May, the second brood from late June to early July, and the third brood in August to early September (Emmel & Emmel, 1973). Adults are generally observed perching on their host plant or on other plants in the immediate vicinity, and have also been observed nectaring on nearby flowers. The females deposit single echinoid eggs on the leaves of the host plant after mating. These eggs hatch in about eight to ten days and the larvae begin feeding on the leaves immediately. Diapause normally occurs in the late or last instar of larval development, presumably in the second and/or third broods depending on climatic conditions. The mature larva is variable in color from blue, green, brown, and combinations thereof, and is densely covered with fine white hairs. Retractile glands located on the eleventh larval segment can be protruded when stimulated. Researchers believe these organs are attractive to ants (Emmel & Emmel, 1973).

There are several other Lycaenid butterflies classified as 'blues' (subfamily Polyommatinae) that occur with the SEB in portions of its range. Some of these species are similarly sized and contain markings that can be easily confused with SEB. Commonly observed sympatric butterfly species include the blue copper (*Lycaena heteronea*), southern blue (*Glaucopsyche lygdamus australis*), Boisduval's blue (*Icaricia icaroides*), acmon blue (*Icaricia acmon*), western tailed-blue (*Everes amyntula*), marine blue (*Leptotes marina*), pigmy blue (*Brephidium exilis*), Bernardino blue (*Euphilotes bernardino*), and

square-spotted blue (*Euphilotes battoides*). SEB can be initially distinguished from many of these species by its relatively large size and its strong association with four-wing saltbush.

Due to its extremely limited distribution in southern California and its propensity for isolated small colonies, the SEB can be easily impacted by anthropogenic disturbances. Many colonies in the Mojave Desert and Owens Valley are isolated and are probably not under any immediate threat, but other colonies found closer to growing desert communities and suburban Los Angeles cities are situated near major roads, railroad tracks and other developments. Some of these populations have already been extirpated; others are threatened by various developments.

Some of the known localities for this species include the Lower Haiwee Reservoir in Inyo County, Mojave River area near Victorville, and Bouquet and Mint Canyons in Los Angeles County. Although populations in the Mint Canyon area near Santa Clarita were extirpated by housing developments in the late 1980's and early 1990's, GPB did observe one extant SEB population in nearby Soledad Canyon as recently as August 1999.

Quino Checkerspot Butterfly (*Euphydryas editha quino*)

The United States Fish and Wildlife Service (Service) added this rare butterfly to the federal list of endangered wildlife in early 1997. The Quino Checkerspot Butterfly (QCB) is a geographic race (subspecies) of *Euphydryas editha*, whose combined ranges extend from northern Baja California to Canada along the Pacific coast, and east to Colorado (Bauer, 1975). The QCB is presently known to exist only as several, probably isolated, colonies in southwestern Riverside County, southern San Diego County and northern Baja California, Mexico.

This butterfly is associated with sparsely vegetated or bare areas usually characterized by clay or cryptobiotic soil deposits that develop a hard crust within southern California sage scrub vegetation communities. Low-growing herbaceous annuals including the QCB's primary larval host plant, dot-seed plantain, *Plantago erecta* (Plantaginaceae), typically inhabit these areas. Other potential QCB host plants (considered secondary) may occupy these areas and include owl's clover (*Castilleja exserta*) and white snapdragon (*Antirrhinum coulterianum*), both in the plant family Schrophulariaceae.

GPB did not conduct a focused survey for the QCB during the present survey. GPB currently holds a valid section 10(a)(1)(A) QCB recovery permit for QCB issued under the Endangered Species Act of 1973, as amended (Permit Number TE-837439-4).

Methods

The River Park property was visited by GPB on May 14, 26 and 27, 2003. Detailed survey times are presented in Table 2.

Table 2.
River Park SEATAC Butterfly Survey Information
May 2003

Date	Time PST	Weather	Wind	Biologist	Results
5/14/03	0900-1500	Partly Cloudy, 71-92 °F	0-1 F	GB	No SEB or QCB
5/26/03	0900-1500	Sunny, 81-104 °F	0-1 F	GB	No SEB or QCB
5/27/03	0700-1400	Sunny, 68-102 °F	0-2 F	GB	No SEB or QCB

This survey primarily consisted of determining the presence or absence of SEB, QCB and their associated host plants. Special consideration was given to areas containing native vegetation that may support specific larval host plant habitat requirements for any of the aforementioned sensitive species.

The presence or absence of invasive, non-native plant species was noted in an effort to assess the level of previous anthropogenic disturbance in a given area. Other habitat requirements including the presence of potential nectar resources and the overall quality of the site as it pertains to potential QCB topographical resources (i.e., hilltops) were assessed.

This field survey was conducted during daylight hours from 0700 to 1500 Pacific Daylight (Savings) Time (PDT). Temperatures recorded during the survey ranged from 68 to 104 °F (degrees Fahrenheit) and conditions ranged from partly cloudy to sunny with little or light winds (at or less than 2 Beaufort scale). Digital photographs were taken to record the condition of the site during the present survey and are available on request. Plant and animal (including some invertebrate and all butterfly) species were identified in the field by GPB or later identified using various texts. In addition, all observed plant and animal species and any additional biological information relevant to this study were recorded on field forms.

Daily weather data were noted on field forms and/or a digital audio recorder roughly once per hour during survey visits. Weather data were recorded using a digital anemometer (Beaufort scale of wind speed measurement), thermometer, and by visual observation and estimation of cloud cover and other pertinent daily weather characteristics (rain, drizzle, marine layer, etc.). Digital recordings were later transcribed to field forms.

Not all plants and/or associated butterfly species that may have been present on site were necessarily observable (or identified) during this survey. For an exhaustive assessment of the butterfly fauna of a given area, surveys are best performed throughout the year to achieve a complete inventory. GPB's general knowledge of the butterfly diversity for this area was utilized in an effort to locate specific habitats for some butterfly species. A California Natural Diversity Database (CNDDB) records search was conducted by ISI prior to the start of this survey to determine the probability that sensitive butterfly species may be present on the site.

Nomenclature primarily used in this report comes from Hickman (1993) for plants; Emmel et al. (1973) and Howe (1975) for butterflies; and Arnett (2000) for other insects. Additional resources may be found at the end of this report.

Site Description

The River Park site and survey area is generally located along the Santa Clara River north of Soledad Canyon Road and east of Bouquet Canyon Road. The River Park property contains ± 692 acres and primarily consists of alluvial fan sage scrub vegetation associated with the Santa Clara River basin, portions of which remain naturally unconfined. During the present survey, a persistent water flow was not observed within most of the Santa Clara River bottom except in one small area at the southeastern portion of the site. Surface flow in this area was limited to approximately 10 to 20 meters and was less than 2 meters wide.

Topographically, much of the site is primarily flat in association with the Santa Clara River basin. Gently to steeply sloping hills and ridgelines are present along the northern portions of the site. The River Park site contains a combined maximum vertical relief of roughly 295 feet between its highest and lowest on-site elevation points, with a reduction in elevation throughout the site from north to south. Elevations on the site range from approximately 1165 to 1460 feet above mean sea level (AMSL).

Adjacent land use varies considerably within and adjacent to the survey area, including anthropogenic disturbances such as actively cultivated in-use agricultural fields, fallow fields, industrial and commercial areas, paved and unimproved roads, pipelines, and other developments. Other disturbances associated with off-road vehicle (ORV) use, illegal dumping, and target shooting were observed.

Vegetation Characteristics
Areas of relatively undisturbed coastal sage chaparral scrub, alluvial fan sage scrub, and riparian vegetation communities inhabit the subject site. Much of the site is inhabited by open, relatively sparsely vegetated alluvial fan sage scrub. Riparian vegetation is present along the Santa Clara River at the southern portion of the site. Non-native grasses and other weedy annuals have invaded many open (some previously disturbed) areas of the site, and have also invaded sage scrub portions along the northern portion of the site, possibly choking out many native low-growing forbs. Valley oak (*Quercus lobata*) was observed on the eastern portion of the subject property.

Alluvial Fan Sage Scrub (Holland Element Code 32720)
Alluvial fan sage scrub (AFSS) contains mostly drought-deciduous shrubs with soft leaves, and occurs in association with washes and gently sloping alluvial fans. Areas containing AFSS are usually subject to periodic flooding, and mature phases of this vegetation community can contain significant cover of larger perennials. Scalebroom (*Lepidospartum squamatum*) is typically an indicator plant species of this vegetation community. This vegetation community was present in association with the Santa Clara River basin on the subject property, and was the most predominant vegetation community on the site. Other larger perennial plants observed within AFSS on the subject property include thick-leaved yerba santa (*Eriodictyon crassifolium*) and great basin sage (*Artemisia tridentata*).

Smaller shrubs such as flat top buckwheat, tarragon (*Artemesia dracunculus*), jimsonweed (*Datura wrightii*), telegraph weed (*Heterotheca grandiflora*), cholla (*Opuntia* sp.), tree tobacco (*Nicotiana glauca*), and blue elderberry (*Sambucus mexicana*) were present. Mustard evening primrose (*Camisonia californica*) was found abundantly throughout most AFSS areas of the site.

Several plants typically associated with alkali playa were observed scattered throughout the subject property, including four-wing saltbush, wild heliotrope (*Heliotropium curassavicum*), saltgrass (*Distichlis spictata*), and alkali weed (*Cressa truxillensis*).

Coastal Sage-Chaparral Scrub (Holland Element Code 37G00)
Coastal sage chaparral scrub (CSCS) contains a mixture of sclerophyllous low chaparral shrubs and drought-deciduous sage scrub species, and is regarded as an ecotone between the two communities. This area contains floristic elements of both coastal sage scrub and lower chaparral, including shrubs such as chamise (*Adenostoma fasciculatum*), flat top buckwheat (*Eriogonum fasciculatum*), California sagebrush (*Artemisia californica*), purple sage (*Salvia leucophylla*), black sage (*Salvia mellifera*), white sage (*Salvia apiana*), and chaparral yucca (*Yucca whipplei*).

Scattered throughout this vegetation community, less dense (and open) areas are present that contain native species such as blue dicks (*Dichelostemma capitatum*), forget-me-not (*Cryptantha* sp.), tarplant (*Hemizonia* sp.), Turkish rugging (*Chorizanthe staticoides*), chia (*Salvia columbariae*), deerweed (*Lotus scoparius*), bush mallow (*Malacothamnus fasciculatus*), wild cucumber (*Marah macrocarpus*), wooly aster (*Lessingia filaginifolia*), wishbone bush (*Mirabilis californica*), and other herbaceous annuals. Non-native grasses found abundantly in CSCS areas included slender wild oats (*Avena barbata*), foxtail chess (*Bromus madritensis* ssp. *rubens*), Mediterranean grass (*Schismus barbatus*).

Southern Arroyo Willow Riparian (Holland Element Code 61320)
Mulefat Scrub (Holland Element Code 63310)
Some riparian communities observed within portions of the Santa Clara River are characterized by various willow (*Salix* species), Fremont's cottonwood (*Populus fremontii*) and western sycamore (*Platanus racemosa*). On the River Park project site, sandbar willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*), and Fremont's cottonwood were observed. Other plants observed on the subject

property in association with wet areas include basketbush *(Rhus trilobata)*, stinging nettle (*Urtica dioica*), giant reed (*Arundo donax*), and cattail (*Typha* sp.).

Mulefat scrub is dependent on periodic flooding and is characterized by the presence of mulefat (*Baccharis salicifolia*), which was observed commonly on the River Park site. Stands of this series mix with other wetland communities inhabited by larger trees along the Santa Clara River, and mix with smaller shrubs inhabiting CSCS slope areas on the site.

Disturbed / Ruderal Habitat (Holland Element Code 11300)
Disturbed habitat includes areas that contain mostly non-native plant species including ornamentals and ruderal exotics. Mostly non-native, weedy species have invaded portions of the site adjacent to paved and unimproved roads, commercial developments, and other site disturbances. The most common invasive plants observed included short-pod mustard (*Hirschfeldia incana*), horehound (*Marrubium vulgare*), tocalote (*Centaurea melitensis*), cheeseweed (*Malva parviflora*), sourclover (*Melilotus indica*), knotweed (*Polygonum aviculare*), sow thistle (*Sonchus oleraceus*), and various filaree species (*Erodium*). Other plants including Russian thistle (*Salsola tragus*), milk thistle (*Silybum marianum*), annual sunflower (*Helianthus annuus*), doveweed (*Eremocarpus setigerus*), tamarisk (*Tamarix* sp.), and various non-native grasses including foxtail chess, slender wild oat, and Mediterranean grass are present throughout these disturbed areas. A few native species that are tolerant of disturbance such as fiddleneck (*Amsinckia menziesii*) and dove lupine (*Lupinus bicolor*) were locally abundant along road and fence margins, and in other open areas of the site.

Results
SEB was not observed during the present study but its larval host plant (*Atriplex canescens*) is present within alluvial fan sage scrub areas of the site along the Santa Clara River. Based on the presence of other sympatric and synchronous butterfly species observed during the present study, conditions appeared to be conducive to SEB seasonal flight activity. Although SEB can appear as early as late April in any given year, relatively cool conditions throughout April and into early May likely delayed its flight season to about mid or late May in 2003. This species is strongly associated with its larval host plant where it occurs, and all *Atriplex* on the subject property were carefully surveyed by GPB visually and/or by tapping on *Atriplex* plants to stir up potentially resting butterflies.

Although historic records exist for areas north of the site in Bouquet Canyon and east of the site in Soledad and Mint Canyons, this species is presumed extirpated in the region due to increased human-related activities including commercial and residential developments, agricultural operations, ORV use, and other disturbances. It is GPB's understanding that no SEB have been observed in the Santa Clarita area in recent years.

The present study indicates that the property does not currently contain high quality potential habitat for QCB. This is primarily based on the lack of historical QCB data from this region of Los Angeles County, and the apparent absence of its primary host plant, dot-seed plantain, which was not detected during the present study. Additionally, QCB was historically known from two locations in the Santa Monica Mountains approximately 25 to 30 miles south and southwest of the subject property, but has not been observed in those areas since 1954. Extant QCB populations are found much further south and southeast in Riverside and San Diego Counties. It is highly unlikely that QCB once occupied the Santa Clarita area due to a lack of records indicating its presence in the northern portion of Los Angeles County.

To GPB's knowledge no recent data indicates that occupied habitat exists on any portion of the River Park property for the sensitive butterfly species discussed in this report.

Other Lepidoptera Observations

A total of seventeen (17) relatively common butterfly species were observed on the property during the present survey (Table 3). In general the River Park property appears to represent a relatively average site for diversity of butterfly fauna in the area. However, this may be due in part to atypically cool conditions throughout the spring months and just before the start of the present survey, and/or the limits of the present study. Only one common hilltopping species (*Pontia protodice*) was observed during the present study in association with a low elevation hilltop area at the north-central portion of the site. GPB believes that this topographic feature of the River Park site and adjacent areas is a resource for hilltopping butterfly species in the area. Other hilltops and ridgelines are present near this hilltop on and adjacent to the subject property, and are probably equally utilized as hilltopping resources for butterfly species in the general vicinity.

Table 3.
River Park SEATAC Lepidoptera Observations
March – May 2003

Common Name / Scientific Name		**May**		
		14	26	27

Bernardino Blue (*Euphilotes bernardino*)			x	x
Common Hairstreak (*Strymon melinus*)		x		
17 Species Total	Total Observed/Day	9	10	11

Interestingly, the great copper (*Lycaena xanthoides*) was abundant on the subject property. Due to urban expansion and confinement of natural creek flow patterns throughout Los Angeles County, this butterfly has become increasingly uncommon in this region of southern California. The flight season of this single-brooded butterfly is typically in April and May, and into June and July at upper elevations. The larval host plant is various *Rumex* species, which were observed commonly on the subject property. This species is now mostly confined to the mountain foothills of the Santa Ana Mountains in Los Angeles County (Mattoni, 1998).

A list of butterfly species that could potentially occur on the project site (based on known historical and current ranges) is provided as part of this report (Appendix A).

Other Sensitive Resources

One special status wildlife species observed while conducting butterfly surveys at the River Park project site is the black-tailed jackrabbit (*Lepus californicus*, herein referred to as BTJ). The California Department of Fish and Game considers the BTJ a special species of concern to California.

Sensitive species observations by GPB occurred incidentally while conducting butterfly surveys at the River Park site. Focused surveys were not conducted for the above-referenced sensitive resource during the present survey.

Conclusion

During the three-day survey period, the entire River Park property was specifically surveyed for the sensitive butterfly species named above. Additionally, a general butterfly inventory (both observed and expected to occur) was performed.

Although conditions during the present field season were conducive to SEB seasonal flight activity, SEB population densities may be relatively low throughout its range in 2003 due to previous 2000-2002 drought conditions. As such, population density and/or the relative frequency of potentially dispersing SEB adults in the area may not have been adequately assessed during the present 2003 flight season. However, the absence of SEB adult observations during the present survey indicates that the River Park property does not appear to be currently occupied by SEB. Although the site supports sufficient larval host plant resources for the biological development of SEB, no adults, larvae, or pupae were detected during the present study and none are expected to occur based on the lack of SEB records from the Santa Clarita area since the extirpation of known colonies.

Based on the lack of recent QCB observations for Los Angeles County, the apparent absence of primary larval host plants (i.e. *P. erecta*) and lack of suitable high quality habitat, and the site location (not known to be within the historical range of QCB), it is highly unlikely that a QCB breeding population or the occasional dispersing individual QCB would utilize the subject property.

If I can be of any further assistance regarding this project and report, please do not hesitate to contact me.

Sincerely,
Bruyea Biological Consulting

Butterfly Species with potential for occurrence on the **River Park SEATAC** Project Site **(N=62*)**
Los Angeles County, California
May 2003

Family / Scientific Name	Common Name
Order Lepidoptera	Butterflies and Moths
Papilionidae	**Swallowtails**
Papilio rutulus	Western Tiger Swallowtail **
Papilio eurymedon	Pale Swallowtail
Papilio multicaudatus	Two-tailed Swallowtail
Papilio zelicaon	Anise Swallowtail **
Nymphalidae	**Brush-footed Butterflies**
Danaus gilippus	Striated Queen **
Danaus plexippus	Monarch **
Ceonympha tullia californica	California Ringlet
Agraulis vanillae incarnata	Gulf Fritillary
Basilarchia lorquini	Lorquin's Admiral **
Adelphia bredowii californica	California Sister
Euphydryas chalcedona	Chalcedon Checkerspot
Euphydryas editha quino	Quino Checkerspot
Junonia coenia	Buckeye **
Charidryas gabbii	Gabb's Checkerspot
Phyciodes mylitta	Mylitta Crescent
Polygonia satyrus	Satyr Anglewing **
Nymphalis californica	California Tortoise-shell
Nymphalis milberti	Milbert's Tortoise-shell
Nymphalis antiopa	Mourning Cloak **
Vanessa virginiensis	Virginia Lady **
Vanessa atalanta	Red Admiral **
Vanessa cardui	Painted Lady **
Vanessa annabella	West Coast Lady **
Ceonympha tullia californica	California Ringlet
Cercyonis sthenele silvestris	California Wood Nymph
Pieridae	**Whites and Sulfurs**
Colias eurydice	California Dogface
Colias alexandra harfordii	Harford's Sulfur
Colias eurytheme	Alfalfa Sulfur **
Nathalis iole	Dwarf Yellow
Anthocharis cethura	Felder's Orange-tip
Anthocharis sara sara	Sara Orange-tip **
Eurema nicippe	Nicippe Yellow
Phoebis sennae	Cloudless Sulfur
Pontia protodice	Checkered White **
Pieris rapae	Cabbage White **

Appendix A (Continued)

Family / Scientific Name	Common Name
Order Lepidoptera	Butterflies and Moths
Lycaenidae	**Blue, Hairstreaks, Coppers**
Atlides halesus	Great Purple Hairstreak **
Callophrys perplexa	Bramble Hairstreak **
Euphilotes bernardino	Bernardino Blue **
Incisalia augustinus iroides	Western Elfin
Icaricia acmon	Acmon Blue **
Everes amyntula	Western Tailed-blue
Glaucopsyche lygdamus australis	Southern Blue**
Hemiargus ceraunus gyas	Edward's Blue
Hemiargus isola alce	Mexican Blue
Leptotes marina	Marine Blue **
Brephidium exilis	Pygmy Blue **
Lycaena helloides	Purplish Copper
Lycaena xanthoides	Great Copper **
Plebulina emigdionis	San Emigdio Blue
Satyrium californica	California Hairstreak
Satyrium sylvinus sylvinus (or *sylvinus dryope*)	Sylvan Hairstreak
Strymon melinus	Common Hairstreak **
Riodinidae	**Metalmarks**
Apodemia mormo virgulti	Behr's Metalmark**
Hesperiidae	**Skippers**
Lerodea eufala	Eufala Skipper **
Paratrytone melane	Umber Skipper **
Hylephila phyleus	Fiery Skipper **
Atalopedes campestris	Field Skipper **
Polites sabuleti	Sandhill Skipper
Erynnis funeralis	Funereal Duskywing **
Erynnis tristes	Mournful Duskywing
Heliopetes ericetorum	Large White Skipper **
Pyrgus communis albescens	Western Checkered Skipper **

Note:
* Butterfly species included on this list have varying degrees of potential for occurrence on the subject property. ** Indicates a high potential for occurrence (doesn't indicate residence) based on a combination of known ranges (historical and present), host plant presence/absence, and other factors. This list does not include rare stray species (i.e. from Mexico or out of State) that occasionally show up in the region.

Compliance Biology. Letter summarizing the results of Focused Surveys for the Unarmored Threespine Stickleback. May 2003b.

compliance·biology

May 30, 2003

Mr. Jeff Johnson
Impact Sciences, Inc.
30343 Canwood Street
Suite 210
Agoura Hills, California 91301

Dear Mr. Johnson,

The purpose of this letter is to provide you with results of focused surveys conducted for the federally-listed endangered unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*) (UTS) in a portion of the Santa Clara River on project site located in Los Angeles County, California. Specifically, the survey area is known as the River Park project, located east of Bouquet Canyon.

The focused survey was conducted on May 28, 2003. The portion of the Santa Clara River occurring within the River Park project site is ephemeral to seasonal in nature; typically supporting surface flows only for a short time following storm events. However, even during dry periods, this stream course does have a potential to support small pools for extended periods of time.

At the time of the surveys, there were no surface flows within the drainage. However, the entire length of the river, between its outer banks, were all walked in search of any remnant surface pools that could potentially support fish. The only standing water detected on the entire site was a small persistent pool resulting from off-site runoff that results from adjacent development. This small pool occurs immediately adjacent to and east of the Los Angeles aqueduct crossing on the south side of the project. The entire surface area of the standing water was approximately 20 feet in length, a maximum of five feet wide, and a maximum of 4 inches deep. The pool occurred in the path of a dirt access road that appeared to support relatively regular vehicular traffic. There was no evidence of any fish or other aquatic fauna with the exception of a few insect larvae within the pool. As such, it is concluded that there are currently no UTS within the River Park project boundaries.

During storm events, when surface flows occur through the project site, it is expected that some UTS occurring upstream of the project site, would occur within the project boundaries. As such, it is recommended that any project construction in or adjacent to the river channel occur during dry periods. If this can be accomplished, it is expected that there would be no adverse impacts to UTS. Further, in order to minimize potential impacts to seasonally occurring UTS, it is recommended that project related drainage designs meet all state water quality standards for discharge into sensitive habitat areas.

Please feel free to contact me if you have any questions regarding this information.

Sincerely,

Dave Crawford
Principal Biologist

Agoura Hills, California 91301

Subject: **Results of Focused Surveys for Coastal California Gnatcatcher Surveys; River Park Project. Santa Clarita, Los Angeles County, California.**

Dear Ms. Tebo,

This letter report summarizes the methodology and findings of surveys for the federally-listed threatened coastal California gnatcatcher (*Polioptila californica californica*) conducted in Los Angeles County, California by Compliance Biology for Impact Sciences, Inc. The surveys were conducted to determine the presence and distribution (if present) of the species within the River Park study area. A USGS-based survey area location map (**Figure 1**) is included to provide the U.S. Fish and Wildlife Service (Service) with specific survey locality information.

SURVEY LOCATION

Compliance Biology was retained to conduct California gnatcatcher surveys on an approximately 664 acre project site that supports approximately 80 acres of suitable to marginally suitable coastal sage scrub habitat located in Los Angeles County, California. The project site located on the Newhall, California U.S.G.S. 7.5-minute quadrangle map at T4N, R16W, situated west of Sections 18 and 19 (Figure 1). The survey area is located on the north side of Soledad Canyon Road, east of Bouquet Canyon Road. Most of the project site includes a portion of the Santa Clara River and the Los Angeles Aqueduct crosses the river in the eastern portion of the site. The survey area is comprised of variable terrain, ranging from relatively flat riverwash, secondary washes and terrace areas, to previously disturbed flat areas or fields above the banks of the Santa Clara River, to hillslopes in the northern portion of the site. Elevation in the survey area ranges from approximately 1200 feet in the river bed to 1580 feet above mean sea level (MSL) in the northeastern portion of the site.

PLANT COMMUNITIES

The following provides a summary of some of the plant communities present on the site. Other plant assemblages occur, including cottonwood woodland, willow riparian and riparian scrub. However, these habitats were separated from any suitable gnatcatcher habitats on site and were not included in the gnatcatcher survey area. These riparian areas, associated with the Santa Clara River, have been surveyed separately for special-status riparian bird species by another permitted biologist. The following summaries are taken from the Rare Plant Surveys report prepared by Drs. Anuja Parikh and Nathan Gale that discusses results of surveys conducted on the River Park project site in May 2002.

Riversidian Sage Scrub

This community is the most xeric type of coastal sage scrub south of Point Conception in California (Holland, 1986), and is found along the coastal side of the Transverse and Peninsular Ranges. It supports low, soft-woody shrubs up to 1 m tall. Typical stands are relatively open and dominated by California sagebrush (*Artimisa californica*), California buckwheat (*Eriogonum fasciculatum*), and annual grasses such as foxtail chess (*Bromus madritensis*), each attaining 20 percent or greater cover. On the River Park site, this community occurs on gradual to steeply sloping terrain. The dominant species present is California buckwheat (*E. f.* var. *foliolosum*). Other commonly occurring native species include thickleaf yerba sanda (*Eriodictyon crassifolium* var. *nigrescens*), California sagebrush, sages (*Salvia mellifera, S. apiana,* and *S. leucophylla*), goldenbush (*Ericameria palmeri* var. *pachylepis*), encelias (*Encelia actoni, E. californica*), chaparral mallow (*Malacothamnus fasciculatus*), Our Lord's candle (*Yucca whipplei*), linear-leaved stillingia (*Stillingia linearifolia*), California-aster (*Lessingia filaginifolia* var. *filaginifolia*), California broom (*Lotus scoparius*), beavertail cactus (*Opuntia basilaris* var. *basilaris*), giant wild-rye (*Leymus condensatus*), and cotton-thorn (*Tetradymia comosa*). Introduced annual grasses prevalent in the understory are dominated by foxtail chess, and slender wild oat (*Avena barbata*). Native needlegrasses (*Nassella cernua, N. lepida*) are also scattered in the understory. Non-native herbaceous species found in this community include shortpod mustard (*Hirschfeldia incana*), red-stemmed filaree (*Erodium cicutarium*), and tocalote (*Centaurea melitensis*). Native herbaceous species include wishbone bush (*Mirabilis californica*), fascicled tarweed (*Hemizonia fasciculate*), woolly-fruited lomatium (*Lomatium dasycarpum* ssp. *dasycarpum*), malacothrix (*Malacothrix saxitilis* var. *tenuifolia*), and chia (*Salvia columbariae*).

Chamise Chaparral

This type of chaparral is found in small scattered patches on flat to sloping terrain, mostly in the northeastern part of the River Park site. Chamise chaparral is the most common type of chaparral in southern California, and is dominated by chamise (*Adenostoma fasciculatum*) shrubs from 1 to 3 m tall. It is typically dense and impenetrable and has a sparse understory (Holland, 1986). It is adapted to repeated fires, and is found on shallow, dry soils on xeric slopes and ridges. Typically, seveal other native shrub species also occur in this assemblage. However, at the River Park site, the small patches of this community are made up almost exclusively of chamise.

Coastal Sage – Chaparral Scrub

In some areas of the site, on mostly west-facing slopes, a mix of Riversidian sage scrub and chamise chaparral species occur. The overstory is relatively open, and the understory in these areas often includes annual grasses and herbaceous species. Common species in this community include chamise, California buckwheat, California sagebrush, chaparral mallow, and black sage (*S. mellifera*).

Planted Scrub

In the northwestern part of the River Park site, several slopes have been cut or graded for the installation of water lines and concrete-lined drainage channels. These relatively steep slopes have been re-vegetated with native shrubs, primarily California buckwheat. Some California sagebrush also occurs.

Holly-Leaf Cherry Scrub

In the northeastern corner of the site, on relatively flat terrain, a unique stand of holly-leaf cherry scrub occurs. It is situated on the low terraces of a secondary wash that drains to the Santa Clara River. The stand is dominated by relatively large, mature shrubs of holly-leaf cherry (*Prunus ilicifolia* ssp. *ilicifolia*), 3 to 5 m in height. Other shrub associates in this community include skunkbrush (*Rhus trilobata*) and spiny redberry (*Rhamnus crocea*). Other native species found in the understory include woolly star (*Eriastrum densifolium* ssp. *elongatum*), scarlet bugler (*Penstemon centranthifolius*), and linear-leaved stillingia. Also present in this community are lastarriaea (*Lastarriaea coriacea*), valley lessingia (*L. glandulifera* var. *glandulifera*), Mediterranean schismus (*Schismus barbatus*), beavertail cactus, primroses (*Camissonia micrantha, C. californica*), and red-stemmed filaree.

METHODOLOGY

Service recommended survey guidelines stipulate a minimum of six surveys shall be conducted at least one week apart between March 15 through June 30, and from July 1 through March 14, a minimum of nine surveys shall be conducted at least two weeks apart. Further stipulations include that surveys should be completed between 6:00 a.m. and 12 p.m.; surveys shall avoid periods of inclement weather or excessive heat, rain, wind, and fog; and the rate of coverage should be no more than 80 acres per day per permitted biologist.

Based on the aforementioned guidelines, nine protocol gnatcatcher surveys were conducted within potentially suitable on-site coastal sage scrub, and adjacent scrub habitats, with at least a 14-day interval between site visits. All of the field surveys were performed by David Crawford under the authority of individual federal permit number TE-821229-3.

Surveys were conducted on October 4 and 18, November 1, 15, and 29, December 13 and 27, and January 10 and 24. Each survey covered areas supporting coastal sage scrub communities considered potentially suitable for gnatcatcher habitation. Approximately 80 acres of scrub habitat and immediately adjacent habitats were surveyed each day. All potential habitat areas were systematically surveyed on foot by walking slowly and methodically along varyied transect routes. The location of transects and survey points along each transect were based on the vegetation and topographic conditions (size, location, and shape of habitat) of the area to be surveyed to ensure complete sage scrub coverage. Calling points were separated by approximately 200-feet intervals, or as needed, depending upon the vegetation and topography in each area. A combination of taped vocalizations (played at 30-60 second increments) and "pishing" sounds were used at each calling point.

Weather conditions during the surveys varied from cool to very warm and were generally conducive to a high level of bird activity. Because of the temperatures on some of the survey dates were relatively low early morning, surveys on those days were conducted between the hours of about 7:00 to 7:30 and approximately 1:00 p.m. On warmer days, surveys were conducted between the hours of about 6:30 a.m. to 12:30 pm. Temperatures varied from approximately 52 degrees Fahrenheit (F) to a maximum of about 80 degrees F.

Wind speed ranged from 0 to 15 M.P.H. during the surveys, averaging between 0 to 5 M.P.H. over the survey period. Cloud cover varied from completely overcast to sunny. On most days cloud cover typically "burned-off" by mid-morning.

RESULTS

A total of 46 different bird species were identified on the River Park site during the protocol survey effort. No coastal California gnatcatchers or any other federal or state-listed endangered, threatened, or candidate species were recorded on the project site during the focused protocol surveys conducted by Compliance Biology. However, three avian species considered to be state Species of Special Concern and/or federal Species of Concern were observed or detected. A complete list of all vertebrate species observed during the survey efforts is included as **Attachment A.**

A northern harrier (*Circus cyaneus*) was observed on a single occasion foraging over scrub and riverwash habitats. The hawk was observed soaring over the site for approximately 15 minutes, but did not land. At least two individual Bell's sage sparrow (*Amphispiza belli belli*) were observed in the northeastern portion of the site on two occasions and loggerhead shrike (*Lanius ludovicianus*) was observed perching and foraging on six of the nine survey dates. Additionally, though not observed during this survey effort, southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), has been detected in scrub habitat on site during previous biological evaluations.

Additional observations included at least two individual blue-gray gnatcatchers (*Polioptila caerulea*) observed on three occasions. Twice, these birds were observed in the re-vegetated scrub. Also, at least two male brown-headed cowbirds were observed on two occasions. No females were detected.

Please feel free to contact me at the letterhead address/phone if you have any questions regarding the contents of this report.

Sincerely,

Dave Crawford

Subject: **Results of Focused Coastal California Gnatcatcher Surveys; Prospective Water Tank Locations, River Park Project, Los Angeles County, California**

Dear Ms. Tebo,

This letter report summarizes the methodology and findings of surveys for the federally-listed Threatened California gnatcatcher (*Polioptila californica*) (herein CAGN) conducted by Compliance Biology associated with the River Park project, Santa Clarita, Los Angeles County, California. The surveys were conducted to determine the presence or absence of CAGN within the study area.

SURVEY LOCATION

Compliance Biology was retained to conduct CAGN surveys on a project site totaling approximately two (2) acres. The site consists of two prospective sites for the installation of water storage tanks. The site is located immediately west of Section 13 on the Newhall, California U.S.G.S. 7.5-minute quadrangle maps at T4N, R16W (**Exhibit 1**). The survey site is located to the immediate east of the Castaic Lake water treatment facility (previously the Bouquet Canyon Boys Camp), south of Bouquet Canyon Road and north of the Santa Clara River. The site is situated near the northeast corner of the proposed River Park project..

With the exception of the water treatment facility to the west, the only other surrounding development is an existing water tank and accessory structures to the north that are associated the treatment plant. Topography of the site includes a hilltop that slopes dramatically downward in all directions. Elevation on the survey site ranges from approximately 1475 feet to 1600 feet above mean sea level (MSL).

VEGETATION

The survey site supports two relatively distinct habitat types that coincide with the two proposed water tank locations. The northern half of the site is predominantly a southwest-facing slope that supports non-native grassland with pine trees along the top of the slope and remnant sage scrub along the bottom. Dominant plant species include wild oats (Avena sp.), ripgut brome (*Bromus rigidus*), shortpod mustard (*Hirschfeldia incana*), pine trees (*Pinus* sp.), and California sagebrush (*Artemesia californica*).

The southern portion of the site is most accurately described as a hilltop and supports species consistent with a Riversidian sage scrub community. Dominant plant species include California buckwheat (*Eriogonum fasciculatum*), thick-leaf yerba santa (*Eriodictyon crassifolium*), purple sage (*Salvia leucophylla*), California sagebrush, and chamise (*Adenostoma fasciculatum*). Less dominant species present also include native blue dicks (*Dichelostemma capitatum*), popcorn flower (*Plagiobothrys* sp.), and Our Lord's candle (*Yucca whipplei*). Non-native filaree (*Erodium* sp.) and brome grasses (*Bromus* spp.) were also common as ground cover between shrubs.

There is very little suitable CAGN habitat within the project boundaries as the vegetation has been disturbed, the site is situated on a hilltop that is frequently exposed to winds, and because of noise and human activity associated with the adjacent water treatment facility. However, if was determined that surveys should still be conducted as CAGN have been identified in the Santa Clarita area and because the site is situated in the vicinity of relatively high quality sage scrub habitat.

METHODOLOGY

Service recommended survey guidelines stipulate a minimum of six surveys shall be conducted at least one week apart between March 15 through June 30, and from July 1 through March 14, a minimum of nine surveys shall be conducted at least two weeks apart. Guidelines also recommend that surveys be completed between 6:00 a.m. and 12 p.m.; that they shall avoid periods of inclement weather or excessive heat, rain, wind, and fog; and the rate of coverage should be no more than 80 acres per day per permitted biologist.

Based on the aforementioned guidelines, six focused surveys were conducted within potentially suitable on-site coastal sage scrub habitats with at least a seven-day interval between site visits. All field surveys were performed by David Crawford under the authority of his individual Endangered Species Recovery Permit (# TE-821229-3).

Surveys were conducted on March 14 (authorization was obtained from FWS to begin surveys a day early), 21, and 28 and April 4, 11, and 18, 2003. The entire two-acre site and a surrounding buffer zone were surveyed each day. All potential habitat areas were systematically surveyed on foot by walking slowly and methodically along random transect routes. The location of transects and survey points along each transect were based on the vegetation and topographic conditions (size, location, and shape of habitat) of the area to be surveyed to ensure complete coverage. A combination of taped vocalizations (played at 30-60 second increments) and "pishing" sounds were used at each calling point.

Weather conditions during the surveys were generally conducive to a high level of bird activity. Surveys were typically conducted between the hours of about 7:00 a.m. and approximately 11:00 a.m. Temperatures varied from approximately 55 degrees Fahrenheit (F) to a maximum of about 77 degrees F. Wind speed ranged from 0 to 15 M.P.H. during the surveys. Cloud cover varied from clear to overcast.

RESULTS

A total of 19 avian species was observed or detected on the subject property. No California gnatcatchers or any other federal or state-listed endangered, threatened, or candidate species were recorded on the project site during the focused protocol surveys. A complete list of all vertebrate species observed or detected during the survey efforts is included as **Attachment A.**

Although none of the individual birds observed are afforded protection under the state or federal endangered species acts, several of the species observed are protected under the federal Migratory Bird Species Treaty Act while actively nesting. As such, grading and/or any other activity resulting in

the removal of vegetation should be conducted outside the typical nesting season (March 1 through July 30). Should such activities be required during this period of time, it is recommended that nesting bird surveys be conducted no greater than 10 days prior to vegetation removal to ensure compliance with federal laws protecting nesting birds.

Further, based on the existing conditions of the two prospective sites, with respect to biological considerations only, the northern site would result in fewer impacts as very little sage scrub habitat would be disturbed.

Thank you for the opportunity to provide Impact Sciences with biological services. Please feel free to contact me if you have any questions regarding the contents of this report.

Sincerely,

Dave Crawford
Principal Biologist

Nature and Scope of Surveys

The survey area consisted of the channel of the Santa Clara River upstream from Bouquet Canyon Rd crossing to the water pipeline crossing the river, a distance of approximately 2 miles. The upland portion of the survey covered the slopes on the north side of the river along this section, extending from one quarter to one half mile north of the river channel. Three surveys were conducted. The survey on May 19th included only the river channel and the survey on May 30th covered only the upland portion of the study site. The June 4th survey covered both areas.

Each survey was conducted on foot by observers well acquainted with visual, auditory and behavioral characteristics of southern California birds. Survey routes were designed to cover all areas of the project. All surveys occurred between 6:00 and 10:00 a.m. Personnel for the surveys were Daniel A. Guthrie (May 30, June 4) and Judith A. Sugden May 19, June 4), both working under Federal Fish and Wildlife Service Permit number TE810394-1, issued under section 10(a)(1)(A) of the Endangered Species Act.

Habitat Condition and Bird Observations.

Because of the timing of surveys, nearly all birds observed were either resident or summering species. A complete list of species sighted is presented in Table 1. The river channel in this section consists of a broad, flat, dry wash with narrow margins of dry riparian woodland. Within the channel are areas of coastal sage scrub habitat. This section of the Santa Clara River in past years has been wet only briefly during spring rains and due to water release from pumps one mile upstream from Bouquet Canyon Road. This section was completely dry during all surveys this year. This resulted in the almost complete absence of riparian species such as song sparrow and yellowthroat. Aside from migrants, most of the other birds observed in this section are characteristic of coastal sage and dry riparian woodlands

The upland portion of this survey consists of coastal sage scrub and planted grass fields. Except for a yellowthroat and red-winged blackbirds visiting the area from reservoirs just north of the site, all birds observed here were characteristic of coastal sage.

The Southern California rufous-crowned sparrow, considered a California Special Concern species by the Department of Fish and Game and also a Federal Special Concern species was fairly common. Other species of concern that might be looked for include Bell's sage sparrow, horned lark, Lawrence's goldfinch and California gnatcatcher. Despite careful searches in appropriate habitat, none of these species were found. A single observation of summer tanager in trees along the north side of the river channel on May 19th is believed to have been of a migrant as the bird could not be found on subsequent visits to the area.

Nature and Scope of Surveys

During the spring and early summer of 2002 surveys were conducted along a section of the Santa Clara River and its tributaries near Valencia, California (Figure 1). Surveys were focused on determining presence or absence of yellow-billed cuckoo, least Bell's vireo and southwestern willow flycatcher, and followed U.S. Fish and Wildlife Service Guidelines for the latter two species. Numbers of all species observed were noted, and, in addition to the three species noted above, special attention was placed on locating species considered rare and endangered or of Special Concern, and on determining numbers of brown-headed cowbirds.

Each survey was conducted on foot by observers well acquainted with visual, auditory and behavioral characteristics of southern California birds. Survey routes were designed to cover all areas of each section of the river, with emphasis placed on wetter habitats where least Bell's vireos and other sensitive riparian species are most likely to occur. All surveys occurred between 6:00 and 10:00 a.m. If focus species (yellow-billed cuckoo, least Bell's vireo, and southwestern willow flycatcher), were not visually observed, tapes of their calls were played in an attempt to elicit a response. Personnel for all surveys were Daniel A. Guthrie and Judith A. Sugden, both working under Federal Fish and Wildlife Service Permit number TE810394-1, issued under section 10(a)(1)(A) of the Endangered Species Act.

To facilitate surveys and observe the coverage guidelines for focus species, the area was divided into eight sections (Figure 1). Delineation of the eight areas and comments on each follow. Surveys of all sections of the river system were conducted five times during the nesting season and followed the Revised Protocol (Fish And Wildlife Service, July 2000) for southwestern willow flycatcher. Several sections of the river (Areas 4, 6-8) had no running water or wet riparian vegetation and were not considered suitable habitat for least Bell's vireo. However, areas 1-3,5 had flowing water and wet riparian vegetation. These sections were surveyed according to the protocol for least Bell's vireo as outlined by the Fish and Wildlife Service. This latter protocol requires 8 surveys between April 10 and July 31st, at least 10 days apart.

Habitat Condition and Bird Observations.

The riparian zone of the Santa Clara River, as described here, consists of two major habitat types, a wet riparian zone and a dry riparian woodland. The wet riparian zone consists of obligatory wet plants such as cattail and watercress found in continually moist soils along the active river channel and some willow, tamarisk and *Baccharis* shrubs also found in this zone. This zone is usually flooded during winter rains with the removal of much of the annual vegetation. Although this results in bare areas in April and early May, by June and July, most of this wet riparian vegetation has been reestablished. The dry riparian woodland consists of larger willow and cottonwood forests along the margins of the wet riparian zone and occurring on soils above the flood plain that are normally not damaged in winter floods. The 2001-2002 winter and spring seasons were the driest on record in southern California. As a result, there was no flooding. All annual vegetation away from the permanently flowing sections of the river failed to show any development, except near runoff drains from nearby suburban areas. Many perennial plants showed the effects of drought. Some smaller perennials died while older trees dropped branches.

Observations of all birds are shown in Tables 1-8. The numbers shown are of birds seen and heard, with heard individuals forming the majority of the observations. Numbers vary between censuses. Bird activity varies with season. Different species breed at different times of the year. In general, species are most easily observed when they are actively defending territories by song during the establishment of breeding pairs. Once pairs are established and nesting begins song often decreases and the numbers of birds observed, therefore, also decreases. After young leave the nest, numbers observed may increase. Thus, for most resident species, numbers of adult birds are most accurately censused in April and May, when territorial activity is at a maximum. A few species such as Anna's hummingbird that nest early in the season may be underestimated. Numbers of some nesting species, such as yellow warbler may be higher than normal in May due to migratory birds passing through the area. Numbers may also increase in late June and July when young birds leave the nest.

Due to drought conditions, more migratory birds than usual were observed in wet areas along the river. However, in dry sections not only were migrants absent but many resident species, especially insect feeders were less numerous than usual. The following sections contain specific comments on the habitat and bird observations in each area.

Area 1 (Table 1). Santa Clara River; The Old Road Bridge to the mouth of Castaic Creek.

Length of section, 3.5 miles. The Santa Clara River flows continuously in this section and is augmented by the Valencia waste water outfall near the upstream end of this section and by some irrigation runoff from Magic Mountain and agricultural fields along the north side.

Along most of this section, wet riparian vegetation forms a narrow strip along the main channel of the Santa Clara River. There was no scouring of this vegetation during the winter, and

wet riparian vegetation was very well developed. A section of dense willows along The Old Road, protected from spring flooding by a dike and irrigated by runoff from agricultural fields was the site of nesting by two pairs of least Bell's vireos (Figure 3).

Construction at the Valencia Waste water outfall throughout the survey period, plus the drought conditions, limited observations of species normally found in dry riparian forests. A cowbird trap was in operation just north of the Valencia Waste water outfall during the latter half of the study period.

Area 2 (Table 2). Santa Clara River; McBean Parkway downstream to The Old Road.

Length of section, 1.4 miles. The Santa Clara River flows continuously in this section and additional water is provided by irrigation runoff from industrial parks along the north side. There was no scouring of the channel be winter flooding, but dry conditions limited vegetation to a narrow band along the flowing stream. The wet willow forest near the mouth of San Francisquito Creek was carefully surveyed for focus species as migrating willow flycatcher have been seen here in previous years. None were found this year.

Area 3 (Table 3). Santa Clara River; Bouquet Canyon Road downstream to McBean Parkway

Length of section, 1.2 miles. Water, supplied by the Saugus wastewater outfall at the Bouquet Canyon Bridge, is continuous in this section of the Santa Clara River. A small amount of additional water is provided from irrigation runoff coming from Bouquet Canyon and suburban development along the north side of the Santa Clara River. Drought conditions resulted in green vegetation being restricted to a narrow band along the flowing river. Cottonwood plantings along both sides of the river showed signs of drought with many smaller trees dying. A single willow flycatcher was observed along this section of the river on May 18th (Figure 2) but could not be found on subsequent visits. This sighting is thought to be of an individual migrating through the area rather than of a breeding individual.

Area 4 (Table 4). Santa Clara River; Bouquet Canyon Road upstream to DWP transmission lines.

Length of section, 2.3 miles. The river channel in this section consists of a broad, flat, dry wash with narrow margins of dry riparian woodland. Within the channel are areas of coastal sage scrub habitat. This section of the Santa Clara River in past years has been wet only briefly during spring rains and due to water release from pumps one mile upstream from Bouquet Canyon Road. This section was completely dry during all surveys this year. This resulted in the almost complete absence of riparian species such as song sparrow and yellowthroat. A single yellow warbler was observed during migration and two rufous-crowned sparrows, resident on hillsides along the river, were observed once in the stream channel. Aside from migrants, most

of the other birds observed in this section are characteristic of coastal sage and dry riparian woodlands.

Area 5 (Table 5). Castaic Creek; Route 126 to Interstate 5.

Length of section, 1.8 miles. Except for pockets of wet vegetation formed near irrigation runoff channels, and remnant puddles near the middle of this section, the creek was dry much of this spring. Despite this lack of permanent water flow, many wet riparian species (song sparrow, yellowthroat, nested successfully. Swallows nested under the three bridges that cross this section of the river. The extensive willow forest on this section where least Bell's vireo once nested has matured and was dry much of this year. No vireos have been seen here the last four years and the area no longer seems suitable habitat due to its age and lack of permanent water. A single willow flycatchers was observed in this section on May 19th. As this bird was not singing and could not be relocated on subsequent visits, it is considered to be a migrant passing through the area.

Area 6 (Table 6). San Francisquito Creek; Santa Clara River upstream to Copper Hill Drive Crossing.

Length of section, 2.5 miles. Along most of this section the riparian zone consists of a broad sandy channel. In the upper part of this section the creek is bordered by land undergoing development. Coastal sage scrub plants occur within the channel as do sections of dry riparian woodland consisting mostly of cottonwoods. *Arundo* and tamarisk are common along this section as well. The lower ½ mile of San Francisquito Creek is wet due to runoff from adjacent development and is the only portion of this section where species preferring wet riparian habitat were observed. Although some water releases from upstream dams occurred during the winter months, no water was present during the survey period. Bridge construction across San Francisquito Creek affected one narrow section of the survey area and pumping in this area created limited water flow in about a 1/4 mile stretch of the stream.

Area 7 (Table 7). South Fork of the Santa Clara River; McBean Parkway to Magic Mountain Parkway (Route 126).

Length of section, 1.0 miles. The channel along this section of the South Fork is narrow and very sandy. Along most of this section vegetation is restricted to a narrow band of dry woodland and at each side of the channel and a few pockets of wet vegetation supported by runoff from adjacent development. Near the confluence with the main channel of the Santa Clara River a more extensive area of woodland exists on the north side of this section and a small cattail marsh is present.

Area 8 (Table 8). South Fork of the Santa Clara River, Route 126 upstream to Newhall Creek.

Length of section, 1.4 miles. This section of the river consists of a wide sandy channel intersected by several concrete sills designed to restrict sand movement and flood damage. The river is entirely bordered by developed areas but contains small islands of dry riparian vegetation

and some wet riparian areas formed by runoff from culverts along the sides of the creek. No flooding has occurred on this section of the river in recent years and riparian vegetation around these culverts continues to develop into areas of cottonwood and willow woodland, resulting in the continued increase in riparian species along this section of the river.

Comments on Threatened and Endangered Species

Yellow-billed Cuckoo

The Yellow-billed Cuckoo is listed as a State Endangered Species. Despite playing taped calls of this species during June and July surveys, no individuals of this species were observed in 2002.

Southwestern Willow Flycatcher

This subspecies is listed under the Federal Endangered Species Act. Willow Flycatchers were once widespread in wet riparian woodland in southern California but now only a few individuals exist. Following the Revised Protocol (Fish And Wildlife Service, July 2000) five surveys were conducted specifically for Southwestern willow flycatcher. All surveys occurred between 6:00 and 10:00 am. and used taped calls to elicit a response if flycatchers were not first observed.

Five willow flycatchers were observed at locations shown on Figure 2. None of these birds were calling, but did respond to tapes. Despite attempts on subsequent visits to elicit responses none of these birds could be relocated. Based on lack of singing and subsequent observations, these sightings are considered to be of migrants passing through the area. The report forms required for this species have been forwarded to the Ventura Office of the U.S. Fish and Wildlife Service.

Least Bell's Vireo

Surveys of the wet riparian areas (Areas 1-3,5) followed U.S. Fish and Wildlife Service Guidelines for least Bell's vireo. Eight surveys were conducted between April 10 and July 31 (see Tables 1-3,5 for dates). All surveys occurred between 6:00 and 10:00 am. and taped vireo calls were played if no vireos were heard or seen. The only vireos observed were on the Santa Clara River at Castaic Junction in an extensive stand of willows. Vireos were heard in at least 5 locations (Figure 3) but sere present at only two of the locations throughout the study period. Single observations at other sights on May 18th were at the height of migration and may have been of birds passing through the area.

Comments on Sensitive Species

Great Blue Heron

Great blue herons are listed on the California Natural Diversity Data Base as a species that warrants monitoring. Individuals of this species were observed sparingly along the river after the breeding season. No nesting was observed and herons were absent during the nesting season.

Great Egret

The great egret is listed on the California Natural Diversity Data Base as a species that warrants monitoring. A few individuals were observed along the river during migration and after the breeding season.

White-tailed Kite

This species, formerly the black-shouldered kite, is considered a Species of Special Concern by the State of California. Kites were infrequently observed along the river and there was no evidence of nesting this year.

Sharp-shinned Hawk

This species is considered a Species of Special Concern by the State of California. Sharp-shinned hawks regularly winter in southern California and the bird observed on May 7th is thought to be a late migrant through the area.

Cooper's Hawk

Cooper's hawk is considered a Species of Special Concern by the State of California. Cooper's hawks were observed rarely along the main river in 2002 and may have nested near Castaic Junction.

California Horned Lark

This is a California Special Concern species. Although none were observed nesting on the study site, horned larks are ground nesters that prefer bare hillsides and abandoned fields. A few were observed feeding on bare fields and construction areas along Castaic Creek

Yellow Warbler

The yellow warbler is considered a Species of Special Concern by the State of California. Yellow warblers prefer wet riparian habitat but are also found in large cottonwoods in drier riparian areas. Singing yellow warblers were observed along the continuously wet sections of the survey area during nesting season, but were observed in other dry sections of the river only during migration.

Yellow-breasted Chat

The yellow-breasted chat is considered a Species of Special Concern by the State of California. A few chats nested along the wet sections of the Santa Clara River.

Southern California Rufous-crowned Sparrow

This species is considered a California Special Concern species by the Department of Fish and Game and is also a Federal Special Concern species. Because of drought conditions a few rufous-crowned sparrows were visitors to the riparian zone from the surrounding coastal sage habitat where this species is a breeding resident.

Lawrence's Goldfinch

This species is a highest priority species on the Audubon Birds to Watch list for 1996 and is a Bird of Management Concern for the Fish and Wildlife Service. Although a species of the coastal sage, small flocks of this species visited the riparian zone of the Santa Clara River during early spring and summer.

Comments of Brown-headed Cowbirds

Although not a Species of Concern, comments about this species are warranted due to its influence on several endangered species. Cowbirds were regularly observed along all sections of the Santa Clara River, usually flying along the riparian corridor searching for either mates or potential nests to parasitize. Cowbird females often responded to taped calls of least Bell's Vireo. Cowbird traps were operated throughout the study period just north of the Valencia Wastewater outfall (section 1).

Summary

No yellow-billed cuckoos were observed in 2002. Five southwestern willow flycatchers were observed but could not be relocated on subsequent surveys. This failure, and their behavior suggests that these were migrant birds passing through the area. Two pairs of Least Bell's vireos were regularly observed and probably nested at Castaic Junction. Additional individuals of this species observed only on May 18th were probably migrants.

Three riparian Species of Concern, Cooper's hawk, yellow warbler and yellow-breasted chat nested in small numbers along wet sections of the river. Other Species of Concern include three migrant or wintering species; great blue heron, great egret and sharp-shinned hawk, and three visitors from nearly coastal sage scrub habitat; horned lark, rufous-crowned sparrow, and Lawrence's goldfinch. Cowbirds were numerous along the river and probably contributed to the small numbers of yellow warblers and least Bell's vireos observed.

Nature and Scope of Surveys

During the spring and early summer of 2001 surveys were conducted along a section of the Santa Clara River and its tributaries near Valencia, California (Figure 1). Surveys were focused on determining presence or absence of yellow-billed cuckoo, least Bell's vireo and southwestern willow flycatcher, and followed U.S. Fish and Wildlife Service Guidelines for the latter two species. Numbers of all species observed were noted, and, in addition to the three species noted above, special attention was placed on locating species considered rare and endangered or of Special Concern, and on determining numbers of brown-headed cowbirds.

Each survey was conducted on foot by observers well acquainted with visual, auditory and behavioral characteristics of southern California birds. Survey routes were designed to cover all areas of each section of the river, with emphasis placed on wetter habitats where least Bell's vireos and other sensitive riparian species are most likely to occur. All surveys occurred between 6:00 and 10:00 a.m. If focus species (yellow-billed cuckoo, least Bell's vireo, and southwestern willow flycatcher), were not visually observed, tapes of their calls were played in an attempt to elicit a response. Personnel for all surveys were Daniel A. Guthrie and Judith A. Sugden, both working under Federal Fish and Wildlife Service Permit number TE810394-1, issued under section 10(a)(1)(A) of the Endangered Species Act.

To facilitate surveys and observe the coverage guidelines for focus species, the area was divided into eight sections (Figure 1). Delineation of the eight areas and comments on each follow. Surveys of all sections of the river system were conducted five times during the nesting season and followed the Revised Protocol (Fish And Wildlife Service, July 2000) for southwestern willow flycatcher. Several sections of the river (Areas 4, 6-8) had no running water or wet riparian vegetation and were not considered suitable habitat for least Bell's vireo. However, areas 1-3,5 had flowing water and wet riparian vegetation. These sections were surveyed according to the protocol for least Bell's vireo as outlined by the Fish and Wildlife Service. This latter protocol requires 8 surveys between April 10 and July 31st, approximately 2 weeks apart, except when interrupted by periods of poor weather.

Habitat Condition and Bird Observations.

The riparian zone of the Santa Clara River, as described here, consists of two major habitat types, a wet riparian zone and a dry riparian woodland. The wet riparian zone consists of obligatory wet plants such as cattail and watercress found in continually moist soils along the active river channel and some willow, tamarisk and *Baccharis* shrubs also found in this zone. This zone is usually flooded during winter rains with the removal of much of the annual vegetation. Although this results in bare areas in April and early May, by June and July, most of this wet riparian vegetation has been reestablished. The dry riparian woodland consists of larger willow and cottonwood forests along the margins of the wet riparian zone and occurring on soils above the flood plain that are normally not damaged in winter floods. During the spring of 2001 much of the wet riparian vegetation was scoured from the river channel by floods. The result was poor development of streamside wet riparian vegetation during April and May. Except for one cold spell in April, there was little spring rain, with the result that in the dry riparian woodlands smaller trees died and there was little development of annual plants.

Observations of all birds are shown in Tables 1-8. The numbers shown are of birds seen and heard, with heard individuals forming the majority of the observations. Numbers vary between censuses. Bird activity varies with season. Different species breed at different times of the year. In general, species are most easily observed when they are actively defending territories by song during the establishment of breeding pairs. Once pairs are established and nesting begins song often decreases and the numbers of birds observed, therefore, also decreases. After young leave the nest, numbers observed may increase. Thus, for most resident species, numbers of adult birds are most accurately censused in April and May, when territorial activity is at a maximum. A few species such as Anna's hummingbird that nest early in the season may be underestimated. Numbers of some nesting species, such as yellow warbler may be higher than normal in May due to migratory birds passing through the area. Numbers may also increase in late June and July when young birds leave the nest.

The following sections contain specific comments on the habitat and bird observations in each area.

Area 1 (Table 1). Santa Clara River; The Old Road Bridge to the mouth of Castaic Creek.

Length of section, 3.5 miles. The Santa Clara River flows continuously in this section and is augmented by the Valencia waste water outfall near the upstream end of this section and by some irrigation runoff from Magic Mountain and agricultural fields along the north side.

Along most of this section, wet riparian vegetation forms a narrow strip along the main channel of the Santa Clara River. Although this vegetation was scoured by spring flooding, leaving extensive sand flats, numbers of wet riparian species were similar to those found in previous years. A section of dense willows along The Old Road, protected from spring flooding by a dike and irrigated by runoff from agricultural fields was the site of nesting by two pairs of least Bell's vireos (Figure 3).

Extensive dry riparian forests occur near the Valencia Waste water outfall, near Magic mountain, and near the Valencia Travel Village. Cooper's Hawk and white-tailed kite were rarely seen in these areas.

Species such as rufous-crowned sparrow and Lawrence's goldfinch visit this section of the Santa Clara River during late summer from the coastal sage scrub community on the south side of the river. A red-tailed hawk, ravens, and cliff swallows nested on cliffs along the south side of the river near the mouth of Castaic Creek.

Area 2 (Table 2). Santa Clara River; McBean Parkway downstream to The Old Road.

Length of section, 1.4 miles. The Santa Clara River flows continuously in this section and additional water is provided by irrigation runoff from industrial parks along the north side. The channel was scoured by spring flooding resulting in removal of most wet riparian vegetation. A small area of coastal sage scrub borders the river just east of Interstate 5, but along the rest of this section the river is now bordered by commercial development.

The wet willow forest near the mouth of San Francisquito Creek was carefully surveyed for focus species as migrating willow flycatcher have been seen here in previous years. None were found this year. Cowbird traps were operated along this section of the river throughout the study period.

Area 3 (Table 3). Santa Clara River; Bouquet Canyon Road downstream to McBean Parkway

Length of section, 1.2 miles. Water, supplied by the Saugus wastewater outfall at the Bouquet Canyon Bridge, is continuous in this section of the Santa Clara River. A small amount of additional water is provided from irrigation runoff coming from Bouquet Canyon. Flooding during the spring removed all wet riparian vegetation from this section of the river. Today dry riparian vegetation is restricted to a narrow zone on the north side of the river near McBean Parkway, to some islands of vegetation within the river channel, and a more extensive forest near the athletic park on the south side. Wet riparian vegetation consists of a narrow zone along the outflow from the Saugus outfall. An extensive willow forest in the flood control channel at the mouth of Bouquet Canyon Creek was removed during the winter to facilitate water movement. Cowbird traps were operated in the section just above the McBean Bridge throughout the census period.

A single willow flycatcher was observed along this section of the river on June 12,th (Figure 2) but could not be found on subsequent visits. This sighting is thought to be of an individual migrating through the area rather than of a breeding individual.

Area 4 (Table 4). Santa Clara River; Bouquet Canyon Road upstream to DWP transmission lines.

Length of section, 2.3 miles. The river channel in this section consists of a broad, flat, dry wash with narrow margins of dry riparian woodland. Within the channel are areas of coastal sage scrub habitat. This section of the Santa Clara River in past years has been wet only briefly during spring rains and due to water release from pumps one mile upstream from Bouquet Canyon Road. This section was completely dry during all surveys this year. This resulted in the almost complete absence of riparian species such as song sparrow and yellowthroat. Most birds observed in this section are characteristic of coastal sage and dry riparian woodlands.

Area 5 (Table 5). Castaic Creek; Route 126 to Interstate 5.

Length of section, 1.8 miles. Water was released from upstream dams during April through June but not continuously. Except for pockets of wet vegetation formed near irrigation runoff channels, and remnant puddles near the middle of this section, the creek was dry much of this spring. Despite this lack of permanent water flow, many wet riparian species (song sparrow, yellowthroat, nested successfully. Swallows nested under the three bridges that cross this section of the river. The extensive willow forest on this section where least Bell's vireo once nested has matured and was dry much of this year. No vireos have been seen here the last four years and the area no longer seems suitable habitat due to its age and lack of permanent water. Two willow flycatchers were observed in this section, one on June 7 and another on June 17. As they were in different places, not singing, and could not be relocated on subsequent visits, these individuals are considered migrant birds passing through the area.

Area 6 (Table 6). San Francisquito Creek; Santa Clara River upstream 2.5 miles.

Length of section, 2.5 miles. Along most of this section the riparian zone consists of a broad sandy channel. Once bordered by coastal sage scrub habitat, the channel is now bordered by developed areas. In the upper part of this section, however, coastal sage scrub plants still occur within the channel as do sections of dry riparian woodland consisting mostly of cottonwoods. *Arundo* and tamarisk are common along this section along the stream channel. The lower ½ mile of San Francisquito Creek is wet due to runoff from adjacent development and is the only portion of this section where species preferring wet riparian habitat were observed.

Area 7 (Table 7). South Fork of the Santa Clara River; McBean Parkway to Magic Mountain Parkway (Route 126).

Length of section, 1.0 miles. The channel along this section of the South Fork is narrow and very sandy. Along most of this section vegetation is restricted to a narrow band of dry woodland and at each side of the channel and a few pockets of wet vegetation supported by runoff from adjacent development. Near the confluence with the main channel of the Santa Clara River a more extensive area of woodland exists on the north side of this section and a small cattail marsh is present.

Area 8 (Table 8). South Fork of the Santa Clara River, Route 126 upstream to Newhall Creek.

Length of section, 1.4 miles. This section of the river consists of a wide sandy channel intersected by several concrete sills designed to restrict sand movement and flood damage. The river is entirely bordered by developed areas but contains small islands of dry riparian vegetation and some wet riparian areas formed by runoff from culverts along the sides of the creek. No flooding has occurred on this section of the river in recent years and riparian vegetation around these culverts continues to develop into areas of cottonwood and willow woodland, resulting in the continued increase in riparian species along this section of the river.

Comments on Threatened and Endangered Species

Yellow-billed Cuckoo

The Yellow-billed Cuckoo is listed as a State Endangered Species. Despite playing taped calls of this species during June and July surveys, no individuals of this species were observed in 2001.

Southwestern Willow Flycatcher

This subspecies is listed under the Federal Endangered Species Act. Willow Flycatchers were once widespread in wet riparian woodland in southern California but now only a few individuals exist. Following the Revised Protocol (Fish And Wildlife Service, July 2000) five surveys were conducted specifically for Southwestern willow flycatcher. All surveys occurred between 6:00 and 10:00 am. and used taped calls to elicit a response if flycatchers were not first observed.

Two willow flycatchers were observed at locations shown on Figure 2. One was observed along Castaic Creek on June 7th and one was observed along the Santa Clara River between Bouquet Bridge and McBean Parkway on June 12th. Neither bird was singing or responded to tapes. Although these birds were in potential nesting habitat for this species, neither could be relocated on subsequent visits. Based on lack of singing and territorial defense, both observations are considered migrants passing through the area. The report forms required by the U.S. Fish and Wildlife Service Protocol for this species are attached to this report.

Least Bell's Vireo

Surveys of the wet riparian areas (Areas 1-3,5) followed U.S. Fish and Wildlife Service Guidelines for least Bell's vireo. Eight surveys were conducted between April 10 and July 31

(see Tables 1-3,5 for dates). All surveys occurred between 6:00 and 10:00 am. and taped vireo calls were played if no vireos were heard or seen. The only vireos observed were on the Santa Clara River at Castaic Junction in an extensive stand of willows. Vireos were heard in two locations (Figure 3, loc. 1,2) and were present throughout most of the study period.

The willow forest in which vireo sightings occurred is along the north side of the Santa Clara River in an area cut off from the main channel of the river by a dike created during the spring of 1998. The dike was designed to redirect the river away from the Old Road along the northeastern edge of the river channel, thus protecting it from further erosion. The willows that have developed in this section are now three years old and form an ideal habitat for least Bell's vireo. However, the dike that protects this area from flooding is slowly being destroyed by spring river floods.

Comments on Sensitive Species

Great Blue Heron

Great Blue Herons are listed on the California Natural Diversity Data Base as a species that warrants monitoring. Individuals of this species were observed sparingly along the river after the breeding season. No nesting was observed and herons were absent during the nesting season.

Great Egret

The Great egret is listed on the California Natural Diversity Data Base as a species that warrants monitoring. A few individuals were observed along the river during migration and after the breeding season.

White-tailed Kite

This species, formerly the Black-shouldered Kite, is considered a Species of Special Concern by the State of California. Kites were infrequently observed along the river and there was no evidence of nesting this year.

Cooper's Hawk

Cooper's Hawk is considered a Species of Special Concern by the State of California. Cooper's Hawks were observed rarely along the main river in 2000 and there was no evidence of successful nesting.

Prairie Falcon

The prairie falcon is considered a Species of Special Concern by the State of California. A single prairie falcon was observed along Castaic Creek on July 2nd and is considered a migrant passing through the area.

California Horned Lark

This is a California Special Concern species. Although none were observed nesting on the study site, horned larks are ground nesters that prefer bare hillsides and abandoned fields. A few were observed feeding on bare fields and construction areas along Castaic Creek

Yellow Warbler

The Yellow Warbler is considered a Species of Special Concern by the State of California. Yellow Warblers prefer wet riparian habitat but are also found in large cottonwoods in drier riparian areas. Singing yellow warblers were observed along the continuously wet sections of the survey area during nesting season, but were observed in other dry sections of the river only during migration.

Yellow-breasted Chat

The Yellow-breasted Chat is considered a Species of Special Concern by the State of California. A few chats nested along the wet sections of the Santa Clara River.

Tricolored Blackbird

The Tricolored Blackbird is a California Special Concern species and a Bird of Management Concern for the U.S. Fish and Wildlife Service. A few individuals, probably wintering birds, were observed in early April and a single individual, probably a returning migrant, was observed in July.

Southern California Rufous-crowned Sparrow

This species is considered a California Special Concern species by the Department of Fish and Game and is also a Federal Special Concern species. In late summer rufous-crowned sparrows were an uncommon visitor to the riparian zone from the surrounding coastal sage habitat where this species is a breeding resident.

Lawrence's Goldfinch

This species is a highest priority species on the Audubon Birds to Watch list for 1996 and is a Bird of Management Concern for the Fish and Wildlife Service. Although a species of the coastal sage, small flocks of this species visited the riparian zone of the Santa Clara River during early spring and summer.

Comments of Brown-headed Cowbirds

Although not a Species of Concern, comments about this species are warranted due to its influence on several endangered species. Cowbirds were regularly observed along all sections of the Santa Clara River, usually flying along the riparian corridor searching for either mates or potential nests to parasitize. Cowbird females often responded to taped calls of Least Bell's Vireo. Cowbird traps were operated throughout the study period between Bouquet Canyon Bridge and Interstate 5 (Sections 2 and 3). Numbers of cowbirds observed along these sections were normal in April but greatly diminished after late May. Numbers did not show much change along other sections were trapping did not occur.

Summary

No yellow-billed cuckoos were observed in 2001. Two individual southwestern willow flycatchers were observed but could not be relocated on subsequent surveys. This failure, and their behavior suggests that these were migrant birds passing through the area. Least Bell's vireos nested at Castaic Junction. This area was the site of nesting also in 2000.

Two riparian Species of Concern, yellow warbler and yellow-breasted chat nested in small numbers along wet sections of the river. Other Species of Concern great blue heron, Cooper's Hawk, white-tailed kite, prairie falcon, horned lark, rufous-crowned sparrow, tricolored redwing and Lawrence's goldfinch visited the river sporadically but there was no evidence of nesting for any of these species. Cowbirds were numerous along the river and probably contributed to the small numbers of yellow warblers and least Bell's vireos observed.

Fill in the following information completely. Submit original form. Retain copy for your records.

Name of Reporting Individual DANIEL GUINRIE Phone # 909 607 2836

Affiliation CLAREMONT COLLEGES Email DGUINRIE@CMC.CLAREMONT.EDU

Site Name SANTA CLARA R ABOVE CASTAIC Creek. VALENCIA CORPORATION

Did you verify that this site name is consistent with that used in previous years? (Yes) No ? (circle one)

Management Authority for Survey Area (circle one): Federal Municipal/County State Tribal (Private)

Name of Management Entity or Owner (e.g., Tonto National Forest) VALENCIA CORPORATION

Length of area surveyed: 15.1 mi (specify units, e.g., miles = mi, kilometers = km, meters = m)

Did you survey the same general area during each visit to this site this year? (Yes) No If no, summarize in comments below.

If site was surveyed last year, did you survey the same general area this year? (Yes) No If no, summarize in comments below.

Vegetation Characteristics: Overall, are the species in tree/shrub layer at this site comprised predominantly of (check one):

- ☐ Native broadleaf plants (entirely or almost entirely, includes high-elevation willow)
- ☒ Mixed native and exotic plants (mostly native)
- ☐ Mixed native and exotic plants (mostly exotic)
- ☐ Exotic/introduced plants (entirely or almost entirely)

Identify the 2-3 predominant tree/shrub species: WILLOW, COTTONWOOD / TAMARISK

Average height of canopy: 40 FT (specify units)

Was surface water or saturated soil present at or adjacent to site? Yes No (circle one) see MAP WATER IN AREAS 1-3,5
Distance from the site to surface water or saturated soil: _____ (specify units) NO WATER IN 4, 6-8

Did hydrological conditions change significantly among visits (did the site flood or dry out)? Yes (No) (circle one)
If yes, describe in comments section below.

Remember to attach a xerox copy of a USGS quad/topographical map (REQUIRED) of the survey area, noting the survey site and location of WIFL detections. You may also include a sketch or aerial photograph showing details of site location, patch shape, survey route in relation to patch, and location of any willow flycatchers or willow flycatcher nests detected. Such sketches or photographs are welcomed, but DO NOT substitute for the required USGS quad map.

Comments (attach additional sheets if necessary):

Willow Flycatcher Survey and Detection Form (rev. 4/98)

Site Name SANTA CLARA R. + TRIB. ABOVE CASTAIC CR. Total Site No _____

Was site surveyed in previous year? (Yes) No Drainage SANTA CLARA R.

If yes, what site name was used? _____

County LOS ANGELES State CA USGS Quad Name NEWHALL, CA

Is copy of USGS map marked with survey area and WIFL sightings attached (as required)? ☐ *Yes* ☐ *No*

Site Coordinates: Start: N _____ E _____ UTM

Stop: N _____ E _____ UTM Zone _____

Elevation 1000 – 1300 FT (feet) / meters (circle one)

Bird Surveys along a Portion of the Santa Clara River Upstream from the Castaic Creek Confluence, near Valencia, California, 2000

Prepared by: Daniel A. Guthrie
W.M. Keck Science Center
925 N. Mills Ave
Claremont Ca. 91711
(909) 607-2836

Nature and Scope of Surveys

During the spring and early summer of 2000 surveys were conducted along a section of the Santa Clara River and its tributaries near Valencia, California (Figure 1). Surveys were focused on determining presence or absence of , yellow-billed cuckoo, least Bell's vireo and southwestern willow flycatcher, and followed U.S. Fish and Wildlife Service Guidelines for the latter two species. Numbers of all species observed were noted, and, in addition to the three species noted above, special attention was placed on locating species considered rare and endangered or of Special Concern, and on determining numbers of brown-headed cowbirds.

Each survey was conducted on foot by observers well acquainted with visual, auditory and behavioral characteristics of southern California birds. Survey routes were designed to cover all areas of each section of the river, with emphasis placed on wetter habitats where least Bell's vireos and other sensitive riparian species are most likely to occur. All surveys occurred between 5:30 and 10:00 a.m. If focus species (yellow-billed cuckoo, least Bell's vireo, and southwestern willow flycatcher), were not visually observed, tapes of their calls were played in an attempt to elicit a response. Personnel for all surveys were Daniel A. Guthrie and Judith A. Sugden, both working under Federal Fish and Wildlife Service Permit number TE810394-1, issued under section 10(a)(1)(A) of the Endangered Species Act.

To facilitate surveys and observe the coverage guidelines for focus species , the area was divided into eight sections (Figure 1). Delineation of the eight areas and comments on each follow. Surveys of the normally dry sections of the river system (Areas 4,6-8) were conducted twice during the nesting season. Although the habitat in these sections, due to dryness, was not considered suitable for focus species, the two surveys were conducted in June to insure that late arriving species such as yellow-billed cuckoo and willow flycatcher, if present, would not be missed. Surveys of the remaining sections of the Santa Clara River (Areas 1-3,5) were conducted according to the least Bell's vireo protocol outlined by the Fish and Wildlife Service, and consisted of 8 surveys between April 10 and July 31st, approximately 2 weeks apart, except when interrupted by periods of poor weather. Surveys in late May and during June also followed Fish and Wildlife Service protocol for southwestern willow flycatcher.

Habitat Condition and Bird Observations.

The riparian zone of the Santa Clara River, as described here, consists of two major habitat types, a wet riparian zone and a dry riparian woodland. The wet riparian zone consists of obligatory wet plants such as cattail and watercress found in continually moist soils along the active river channel and some willow, tamarisk and Baccharis shrubs also found in this zone. This zone is usually flooded during winter rains with the removal of much of the annual vegetation. Although this results in bare areas in April and early May, by June and July, most of this wet riparian vegetation has been reestablished. The dry riparian woodland consists of larger willow and cottonwood forests along the margins of the wet riparian zone and occurring on soils above the flood plain that are normally not damaged in winter floods. The winter of 1999-2000 was fairly mild, with the result that there was little scouring of the river channel and little removal of vegetation. The result was continued development of streamside wet riparian vegetation that was also not damaged during the mild winter of 1998-1999. Except for one cold spell in April, there was little spring rain, with the result that in the dry riparian woodlands smaller trees died and there was little development of annual plants.

Observations of all birds are shown in Tables 1-8. The numbers shown are of birds seen and heard, with heard individuals forming the majority of the observations. Numbers vary between censuses for several reasons. First, there was fog on some censuses which decreased bird activity. Secondly, some censuses were not complete but, rather, were focused on particular places or areas. Thirdly, bird activity varies with season. Different species breed at different times of the year. In general, species are most easily observed when they are actively defending territories by song during the establishment of breeding pairs. Once pairs are established and nesting begins song often decreases and the numbers of birds observed, therefore, also decreases. After young leave the nest, numbers observed may increase. Thus, for most resident species, numbers of adult birds are most accurately censused in April and May, when territorial activity is at a maximum. A few species such as Anna's hummingbird that nest early in the season may be underestimated. Numbers of some nesting species, such as yellow warbler may be higher than normal in May due to migratory birds passing through the area. Numbers may also increase in late June and July when young birds leave the nest.

The following sections contain specific comments on the habitat and bird observations in each area.

Area 1 (Table 1). Santa Clara River; Old Highway to the mouth of Castaic Creek and Castaic Creek from this confluence upstream to State Route 126.

Length of section, 3.5 miles. The Santa Clara River flows continuously in this section and is augmented by the Valencia waste water outfall near the upstream end of this section and by some irrigation runoff from Magic Mountain and agricultural fields along the north side. Extensive dry

riparian forests occur near the Valencia Waste water outfall, near Magic mountain, and near the

Valencia Travel Village. Cooper's hawk and white-tailed kite nested in these areas as did many wrens and towhees.

Along most of this section, wet riparian vegetation forms a narrow strip along the main channel of the Santa Clara River. This vegetation was unaffected by flooding this year. In order to prevent damage to the Old road, the main channel of the river was moved south at Castaic Junction during the spring of 1998 by the creation of a new channel by bulldozer. This new channel has moved the active river channel away from the road edge and has created a zone of low lying land along the north side of the riparian zone at Castaic Junction that is protected from erosion and scouring by spring floods. This protected section is wet from seepage from the main channel and from agricultural and urban runoff, with the result that a dense stand of willows has developed along the north edge of the riparian zone. These willows are now three years old and are prime habitat for both willow flycatchers and least Bell's vireo. Willow flycatchers were observed in migration (Figure 2) and at least two pair of least Bell's vireo nested (Figure 3).

The section of Castaic Creek between the Santa Clara River and Route 126, which is included in this section consists of a wide dry wash. This section was dry throughout the survey period and contains almost exclusively dry riparian vegetation plus some remnants of coastal sage scrub habitat.

The river between the Old Road and Castaic Creek is bounded on the nouth side by agricultural fields and developed land. On the north side, the river is bounded by coastal sage, which contributes such species as wrentit and Lawrence's goldfinch to the avifauna. A red-tailed hawk, ravens, and cliff swallows nested on cliffs along the south side of the river near the mouth of Castaic Creek.

The surveys on this section of the river includes the proposed river crossing area formed by the extension of Commerce Center Drive. This area was carefully searched for focus species and other species of concern. None of the focus species were found in this section. Yellow-breasted chat and yellow warbler, two species of concern, were heard in this section.

Area 2 (Table 2). Santa Clara River; McBean Parkway downstream to the Old Road.

Length of section, 1.4 miles. The Santa Clara River flows continuously in this section and additional water is provided by irrigation runoff from industrial parks along the north side. The channel was received little scouring during the winter of 1999-2000 with the result that wet riparian vegetation was well developed. Noisemakers along the both sides of the river just west of McBean were active during April and May censuses. A small area of coastal sage scrub borders the river just east of Interstate 5, but along the rest of this section the river is now bordered by commercial development.

The wet willow forest near the mouth of San Francisquito Creek was carefully surveyed for focus species as migrating willow flycatcher have been seen here in previous years. None were

found this year. White-tailed kite, Cooper's hawk and many woodpeckers nested in dry riparian woodlands along this section of the river while other species of concern, yellow warbler, yellow-breasted chat, were rarely encountered. Horned larks were observed in dirt fields along the sides of the river.

Area 3 (Table 3). Santa Clara River; Bouquet Canyon Road downstream to McBean Parkway

Length of section, 1.2 miles. Water, supplied by the Saugus wastewater outfall at the Bouquet Canyon Bridge, is continuous in this section of the Santa Clara River. A small amount of additional water is provided from irrigation runoff coming from Bouquet Canyon. Flooding in 1997-98 removed all wet riparian vegetation from this section of the river. Today dry riparian vegetation is restricted to a narrow zone on the north side of the river near McBean Parkway, to some islands of vegetation within the river channel, and a more extensive forest near the athletic park on the south side. Wet riparian vegetation consists of a narrow zone along the outflow from the Saugus outfall, a willow forest in the mouth of Bouquet Canyon Creek, and an extensive flat of cattail, baccharis and willow just upstream from the McBean Bridge.

Cowbird traps were operated in the section just above the McBean Bridge throughout the census period, The cattail flat just east of the McBean Bridge attracted a colony of red-winged blackbirds and other wet riparian species. Tricolored redwing, a California Species of Concern, has nested in this area in previous years but was only observed during migration this year. Barn owls, cliff swallows and a black phoebe nested under the McBean Bridge.

Area 4 (Table 4). Santa Clara River; Bouquet Canyon Road upstream to DWP transmission lines.

Length of section, 2.3 miles. The river channel in this section consists of a broad, flat, dry wash with narrow margins of dry riparian woodland. Within the channel are areas of coastal sage scrub habitat. This section of the Santa Clara River in past years has been wet only briefly during spring rains and due to water release from pumps one mile upstream from Bouquet Canyon Road. This year water flowed only in early April. By the time of the two census dates, water was completely absent. This resulted in very small numbers of riparian species such as song sparrow and yellowthroat. Most birds observed in this section are characteristic of coastal sage and dry riparian woodlands.

Area 5 (Table 5). Castaic Creek; Route 126 to Old Road next to Interstate 5.

Length of section, 1.8 miles. Water was released from upstream dams during April through June but not continuously. Except for pockets of wet vegetation formed near irrigation runoff channels, and remnant puddles near the middle of this section, the creek was dry much of this

spring. Despite this lack of permanent water flow, many wet riparian species (song sparrow, yellowthroat, nested successfully. Construction along both sides of the upper portion of this section has removed most of the coastal sage and ruderal vegetation that once bordered both sides of the riparian zone, eliminating some coastal sage species that visited this area in earlier years. Swallows nested again under the bridge across Route 126 and began nesting under the new bridge during July. The extensive willow forest on this section where least Bell's vireo once nested has matured and was dry much of this year. No vireos have been seen here the last four years and the area no longer seems suitable habitat due to its age and lack of permanent water. Two willow flycatchers were observed in this section on May 24th (Figure 2) but could not be relocated on subsequent visits and are, therefore, considered migrant birds passing through the area.

Area 6 (Table 6). San Francisquito Creek; Santa Clara River upstream 2.5 miles.

Length of section, 2.5 miles. Along most of this section the riparian zone consists of a broad sandy channel. Once bordered by coastal sage scrub habitat, the channel is now bordered by developed areas. In the upper part of this section, however, coastal sage scrub plants still occur within the channel as do sections of dry riparian woodland consisting mostly of cottonwoods. *Arundo* and tamarisk are common along this section along the stream channel. A single wet area exists near power transmission lines in the upper section of this stream, which was dry during surveys, but showed some effects of flow earlier in the spring. The lower ½ mile of San Francisquito Creek is wet due to runoff from adjacent development. Construction activity and noisemakers were present along the lower section downstream from Newhall Ranch Road during April and May.

Area 7 (Table 7). South Fork of the Santa Clara River; McBean Parkway to Magic Mountain Parkway (Route 126).

Length of section, 1.0 miles. The channel along this section of the South Fork is narrow and very sandy. Along most of this section vegetation is restricted to a narrow band of dry woodland and at each side of the channel and a few pockets of wet vegetation supported by runoff from adjacent development. Near the confluence with the main channel of the Santa Clara River a more extensive area of woodland exists on the north side of this section.

Area 8 (Table 8). South Fork of the Santa Clara River, Route 126 upstream to Newhall Creek.

Length of section, 1.4 miles. This section of the river consists of a wide sandy channel intersected by several concrete sills designed to restrict sand movement and flood damage. The river is entirely bordered by developed areas but contains small islands of dry riparian vegetation and some wet riparian areas formed by runoff from culverts along the sides of the creek. No flooding has occurred on this section of the river in recent years and riparian vegetation around these culverts continues to develop the well develop into areas of cottonwood and willow

woodland, resulting in the continued increase in riparian species along this section of the river.

Comments on Threatened and Endangered Species

Yellow-billed Cuckoo

The Yellow-billed Cuckoo is listed as a State Endangered Species. Despite playing taped calls of this species during June and July surveys, no individuals of this species were observed in 2000.

Southwestern Willow Flycatcher

This subspecies is listed under the Federal Endangered Species Act. Willow Flycatchers were once widespread in wet riparian woodland in southern California but now only a few individuals exist. The main California breeding populations of this species are along the Kern River and north of Santa Barbara.

Following the Protocol outlined by Sogge (Technical Report NPS/NAUCPRS/NRTR-97/12) four surveys were conducted specifically for Southwestern Willow Flycatcher in Areas 1-3 and 5 (see dates on tables 1-3, 5). All surveys occurred between 5:30 and 10:00 am. and used taped calls to elicit a response if flycatchers were not first observed. Other sections of the river (Areas 4 and 6-8)were dry during the nesting season for this species, and, therefore, were not considered suitable habitat. However, the two surveys that were conducted of these areas were timed so as to be within the time frame recommended for Southwestern Willow Flycatcher.

Four willow flycatchers were observed at locations shown on Figure 2. Two were observed along Castaic Creek on May 24th, and two others were observed along the Santa Clara River at Castaic Junction, one on May 18th and one on June 6th. Although these birds were in suitable nesting habitat for this species, none could be relocated on subsequent visits. Also, all observations were of single birds that call sporadically, not actively as is expected of territorial birds. For these reasons all four observed birds are considered migrants passing through the area. The report forms required by the U.S. Fish and Wildlife Service Protocol for this species are attached to this report.

Least Bell's Vireo

Surveys of the wet riparian areas (Areas 1-3,5) followed U.S. Fish and Wildlife Service Guidelines for least Bell's vireo. Eight surveys were conducted between April 10 and July 31 (see Tables 1-3,5 for dates). All surveys occurred between 5:30 and 10:00 am. and taped vireo calls were played if no vireos were heard or seen. The only vireos observed were on the Santa Clara River at Castaic Junction in an extensive stand of willows. Vireos were heard in four

places, but at two locations were present for only a limited time period (Figure 3, loc 1,3). These two observations were probably of unpaired birds. At two other locations (Figure 3, loc. 2,4), birds were present throughout most of the study period and nested.

The willow forest in which all four vireo sightings occurred is along the north side of the Santa Clara River in an area cut off from the main channel of the river by a dike created during the spring of 1998. The dike was designed to redirect the river away from the Old Road along the northeastern edge of the river channel, thus protecting it from further erosion. The willows that have developed in this section are now three years old and form an ideal habitat for least Bell's vireo. However, the dike protects this area from flooding and the result is that these willows will continue to mature, eventually forming a forest of older age than preferred by vireos.

Comments on Sensitive Species

Great Blue Heron

Great Blue Herons are listed on the California Natural Diversity Data Base as a species that warrants monitoring. Individuals of this species was observed sparingly along the river after the breeding season and along other sections of the river during migration. No nesting was observed and herons were absent during the nesting season.

Great Egret

The Great egret is listed on the California Natural Diversity Data Base as a species that warrents monitoring. A few individuals were observed along the river during migration and after the breeding season.

White-tailed Kite

This species, formerly the Black-shouldered Kite, is considered a Species of Special Concern by the State of California. A pair of kites nested successfully at Castaic Junction. A second attempted nesting in the area apparently failed due to harassment by the large number of ravens.

Cooper's Hawk

Cooper's Hawk is considered a Species of Special Concern by the State of California. Cooper's Hawks were observed rarely along the main river in 2000, with several observations just east of Interstate 5.

California Horned Lark

This is a California Special Concern species. Although none were observed nesting on the study site, horned larks are ground nesters that prefer bare hillsides and abandoned fields. A few were observed in late summer feeding on bare fields and construction areas along Castaic Creek, along the north side of the Santa Clara River both between Boquet Canyon crossing and McBean Parkway and at Castaic Junction.

Yellow Warbler

The Yellow Warbler is considered a Species of Special Concern by the State of California. Yellow Warblers prefer wet riparian habitat but are also found in large cottonwoods in drier riparian areas. Singing yellow warblers were observed along the continuously wet sections of the survey area during nesting season, but were observed in other dry sections of the river only during migration.

Yellow-breasted Chat

The Yellow-breasted Chat is considered a Species of Special Concern by the State of California. A few chats nested along the wet sections of the Santa Clara River.

Tricolored Blackbird

The Tricolored Blackbird is a California Special Concern species and a Bird of Management Concern for the U.S. Fish and Wildlife Service. A few individuals, probably wintering birds, were observed in early April.

Lawrence's Goldfinch

This species is a highest priority species on the Audubon Birds to Watch list for 1996 and is a Bird of Management Concern for the U.S. Fish and Wildlife Service. This species nests in chaparral vegetation and small flocks of this species were observed drinking along the Santa Clara River and its tributaries both before and after the breeding season.

Comments of Brown-headed Cowbirds

Although not a Species of Concern, comments about this species are warranted due to its influence on several endangered species. Cowbirds were regularly observed along all sections of the Santa Clara River, usually flying along the riparian corridor searching for either mates or potential nests to parasitize. Cowbird females often responded to taped calls of Least Bell's Vireo. Cowbird numbers showed a marked decrease after mid July between Bouquet Canyon and McBean Bridges, probably due to the operation of cowbird traps just upstream from the McBean Bridge during late May and June. These traps also caught large numbers of red-winged

blackbirds, which may have affected the breeding of this species.

Summary

No yellow-billed cuckoos were observed in 2000. Four individuals of Southwestern willow flycatcher were observed but could not be relocated on subsequent surveys. This failure, and their behavior suggests that these were migrant birds passing through the area. Least Bell's vireos nested at Castaic Junction. Although this nesting occurred in a newly created habitat, this general area has been the site of nesting by small numbers of this species in previous years. Other riparian species, including yellow warbler, yellow-breasted chat and white-tailed kite nested in small numbers along wet sections of the river while coastal sage species, namely Lawrence's goldfinch and grassland species, namely horned lark, visited the river sporadically from nearby areas of habitat suitable for these species. Cowbirds were numerous along the river and probably contributed to the small numbers of yellow warblers and least Bell's vireos observed.

Nature and Scope of Surveys

During the spring and early summer of 1999 surveys were conducted along a section of the Santa Clara River and its tributaries near Valencia, California (Figure 1). Surveys were focused on determining presence or absence of ,Yellow-billed Cuckoo, Least Bell's Vireo and Southwestern Willow Flycatcher, and followed U.S. Fish and Wildlife Service Guidelines for the latter two species. Numbers of all species observed were noted, and, in addition to the three species noted above, special attention was placed on locating species considered rare and endangered or of Special Concern, and on determining numbers of Brown-headed Cowbirds.

Each survey was conducted on foot by observers well acquainted with visual, auditory and behavioral characteristics of southern California birds. Survey routes were designed to cover all areas of each section of the river, with emphasis placed on wetter habitats where Least Bell's Vireos and other sensitive riparian species are most likely to occur. All surveys occurred between 5:30 and 10:00 a.m. If focus species (Yellow-billed Cuckoo, Least Bell's Vireo, and Southwestern Willow Flycatcher), were not visually observed, tapes of their calls were played in an attempt to elicit a response. Personnel for all surveys were Daniel A. Guthrie and Judith A. Sugden, both working under Federal Fish and Wildlife Service Permit number TE810394-1, issued under section 10(a)(1)(A) of the Endangered Species Act.

To facilitate surveys and observe the coverage guidelines for focus species , the area was divided into eight sections (Figure 1). Delineation of the eight areas and comments on each follow. Surveys of the normally dry sections of the river system (Areas 4,6-8) were conducted twice during the nesting season. Both surveys was conducted in June to insure that late arriving species such as Yellow-billed Cuckoo and Willow Flycatcher would not be missed. Surveys of the remaining sections of the Santa Clara River (Areas 1-3,5) were conducted according to the Least Bell's Vireo protocol outlined by the Fish and Wildlife Service (Appendix 1), and consisted of 8 surveys, two each in April, May, June and July. Surveys in late May and during June also followed Fish and Wildlife Service protocol for Southwestern Willow Flycatcher.

Habitat Condition and Bird Observations.

The riparian zone of the Santa Clara River, as described here, consists of two major habitat types, a wet riparian zone and a dry riparian woodland. The wet riparian zone consists of obligatory wet plants such as cattail and watercress found in continually moist soils along the active river channel and some willow, tamarisk and baccharis shrubs also found in this zone. This zone is usually flooded during winter rains with the removal of much of the annual vegetation. The dry riparian woodland consists of larger willow and cottonwood forests along the margins of the wet riparian zone and occurring on soils above the flood plain that are normally not damaged in winter floods. Due to El Nino, the winter of 1997-98 was very wet, with several heavy rains causing severe flooding along most sections of the river. Except for Castaic Creek, where flooding was controlled by upstream dams, flooding removed all wet riparian vegetation along the river as well as many areas of dry riparian woodland. During 1999 there was less rain than usual with the result that wet riparian vegetation that began to grow in 1998 continued development, gaining in density and height. However, in many areas the river channel was cut into old flood deposits, leaving areas of bare sand and dead and dying vegetation along many areas of the river.

Different species breed at different times of the year. In general, species are most easily observed when they are actively defending territories by song during the establishment of breeding pairs. Once pairs are established and nesting begins song often decreases and the numbers of birds observed, therefore, also decreases. After young leave the nest, numbers observed increase. Thus, for most resident species, numbers of adult birds are most accurately censused in April and May, when territorial activity is at a maximum. A few species such as Anna's Hummingbird that nest early in the season may be underestimated. Numbers observed may decrease slightly in June and early July when birds are less active during nesting, and increase in late June and July when young birds leave the nest.

Several species that are not considered riparian species but are common in adjacent coastal sage and chaparral habitats come into the riparian zone in late summer when other vegetational areas are dry. The increase in numbers of House Finch, and Mourning Dove in late July follow this trend.

The lack of flooding in 1999 and the continued growth of wet riparian vegetation caused an increase in number of many wet riparian species. However, construction activities along several sections of the river and associated noisemakers caused a noticeable reduction in numbers of riparian species and reduced numbers of coastal sage species visiting the riparian zone from neighboring habitats. Following are specific comments on the habitat and bird observations in each area.

Area 1. Santa Clara River; Old Highway to the mouth of Castaic Creek and Castaic Creek from this confluence upstream to State Route 126.

Length of section, 3.5 miles. The Santa Clara River flows continuously in this section and is augmented by the Valencia waste water outfall near the upstream end of this section and by some

irrigation runoff from Magic Mountain and agricultural fields along the north side. Extensive dry riparian forests occur near the Valencia Waste water outfall, near Magic mountain, and near the Valencia Travel Village. Cooper's Hawk and White-tailed Kite nested in these areas as did many wrens and towhees. Wet riparian vegetation in this section forms a narrow strip near the Old Road but widens out further downstream. This wet vegetation was unaffected by spring floods. However, some areas that were wet before the floods of 1997-98 were dry due to channel deepening and vegetation in these areas was dying. A wet riparian area along the south side near Magic Mountain where Least Bell's Vireos have nested in past years was becoming more mature and drier. Perhaps due to these habitat changes, no vireos were found here this year. A section of the river bypassed by a channel cut to prevent flood damage to the Old Road in 1997-98 showed continued development of wet riparian vegetation, including a willow thicket and cattail marsh. This section was attractive to many Red-winged Blackbirds and other wet riparian species and should be suitable habitat for vireos in another year.

The section of Castaic Creek between the Santa Clara River and Route 126, which is included in this section consists of a wide dry wash. This section was dry throughout the survey period and contains almost exclusively dry riparian vegetation plus some remnants of coastal sage scrub habitat.

The river along this section is bordered by agricultural fields, Magic Mountain development but on the south side in the lower section is still bordered by extensive coastal sage scrub habitat. This accounts for the many observations of wrentit and other species from this habitat.

Area 2. Santa Clara River; Old Highway to McBean Parkway.

Length of section, 1.4 miles. The Santa Clara River flows continuously in this section and additional water is provided by irrigation runoff from industrial parks along the north side. The channel was heavily scoured by spring flooding in 1997-98 which eliminated all wet riparian vegetation along the main channel of the river and destroyed a large area of dry riparian forest along the south side. However, a large stand of dry riparian forest and some wet riparian areas along the north side near the mouth of San Francisquito creek were unaffected. As in previous years, this section of the river was impacted by off road vehicles during the study period. Noisemakers along the both sides of the river just west of McBean were active during most censuses to scare birds away from construction sites along the sides of the river and caused a reduction in sightings of many dry riparian species. A small area of coastal sage scrub borders the river just east of Interstate 5, but along the rest of this section the river is now bordered by commercial development.

The wet willow forest near the mouth of San Francisquito Creek attracted a migrating Willow Flycatcher and seems suitable for Least Bell's Vireo, although none were seen here. White-tailed Kite, Cooper's Hawk and many woodpeckers nested in dry riparian woodlands along this section of the river.

Area 3. Santa Clara River; McBean Parkway to Bouquet Canyon Road.

Length of section, 1.2 miles. Water, supplied by the Saugus wastewater outfall at the Bouquet Canyon Bridge, is continuous in this section of the Santa Clara River. A small amount of additional water is provided from irrigation runoff coming from Bouquet Canyon Flooding in 1997-98 removed all wet riparian vegetation from this section of the river and also removed large sections of cottonwoods planted as mitigation for development. Today dry riparian vegetation is restricted to a narrow zone on the north side of the river near McBean Parkway, to some islands of vegetation within the river channel, and a more extensive forest near the athletic park on the south side. Wet riparian vegetation consists of a narrow zone along the outflow from the Saugus outfall, a willow forest in the mouth of Bouquet Canyon Creek, and an extensive flat of cattail, baccharis and willow just upstream from the McBean Bridge.

Noisemakers along the north side of the entire length of this section were active during most censuses to scare birds away from construction sites. This resulted in a reduction in the number of birds seen and heard. Cowbird traps were operated in the section just above the McBean Bridge during May and June. The cattail flat just east of the McBean Bridge attracted a colony of Red-winged Blackbirds and other wet riparian species. Barn Owls, Cliff Swallows and a Black Phoebe nested under the McBean Bridge.

Area 4. Santa Clara River; Bouquet Canyon Road upstream to DWP transmission lines.

Length of section, 2.3 miles. The river channel in this section consists of a broad, flat, dry wash with narrow margins of dry riparian woodland. Within the channel are areas of coastal sage scrub habitat. This section of the Santa Clara River in past years has been wet only briefly during spring rains and due to water release from pumps one mile upstream from Bouquet Canyon Road. This year there was water flowing continuously in this section of the river only during the early Spring. By the time of this census, water was present only in the small section of continuous flow about 1 mile upstream from the Bouquet Canyon Bridge. However, remnant cattails from earlier spring flow provided habitat for some wet riparian species such as Red-winged Blackbirds and Song Sparrows. A White-tailed Kite nested in the large cottonwoods on the north side of the river just upstream from Bouquet Canyon Bridge.

Area 5. Castaic Creek; Route 126 to Old Road next to Interstate 5.

Length of section, 1.8 miles. Water was released from upstream dams during most of the study period but not continuously. Except for pockets of wet vegetation formed near irrigation runoff channels, and a section of continuous flow near the middle of this section, the creek was dry much of this spring. Construction occurred on a new road crossing and bridge on this section of Castaic Creek and development during 1998 removed most of the coastal sage and ruderal vegetation that once bordered both sides of the riparian zone, eliminating some coastal sage species that visited this area in earlier years. Swallows nested again under the bridge across Route 126 and began nesting under the new bridge during July. The extensive willow forest on

this section where Least Bell's Vireo once nested has matured and was dry much of this year. No vireos have been seen here the last three years and the area no longer seems suitable habitat due to its age and lack of permanent water.

Area 6. San Francisquito Creek; Santa Clara River upstream 2.5 miles.

Length of section, 2.5 miles. Along most of this section the riparian zone consists of a broad sandy channel. Once bordered by coastal sage scrub habitat, the channel is now bordered by developed areas. In the upper part of this section, however, coastal sage scrub plants still occur within the channel as do sections of dry riparian woodland consisting mostly of cottonwoods. Arundo and tamarisk are common along this section along the stream channel. A single wet area exists near power transmission lines in the upper section of this stream, which was dry during surveys, but showed some effects of flow earlier in the spring. The lower ½ mile of San Francisquito Creek is wet due to runoff from adjacent development. Construction activity and noisemakers to scare away birds were present along this section throughout the survey period and resulted in lower observations of wet riparian species..

Area 7. South Fork of the Santa Clara River; McBean Parkway to Magic Mountain Parkway (Route 126).

Length of section, 1.0 miles. The channel along this section of the South Fork is narrow and very sandy. Along most of this section vegetation is restricted to a narrow band of dry woodland and at each side of the channel and a few pockets of wet vegetation supported by runoff from adjacent development. Near the confluence with the main channel of the Santa Clara River a more extensive area of woodland exists on the north side of this section.

Area 8. South Fork of the Santa Clara River, Route 126 upstream to Newhall Creek.

Length of section, 1.4 miles. This section of the river consists of a wide sandy channel intersected by several concrete sills designed to restrict sand movement and flood damage. The river is entirely bordered by developed areas but contains small islands of dry riparian vegetation and some wet riparian areas formed by runoff from culverts along the sides of the creek. No flooding has occurred on this section of the river in recent years and riparian vegetation around this culverts continues to develop the well develop into areas of cottonwood and willow woodland. The result was the continued increase in riparian species along this section of the river.

Comments on Threatened and Endangered Species

Yellow-billed Cuckoo

The Yellow-billed Cuckoo is listed as a State Endangered Species. Despite playing taped calls

of this species during June and July surveys, no individuals of this species were observed in 1999. Two migrating cuckoos were observed about ½ mile above McBean Bridge in 1998.

Southwestern Willow Flycatcher

This subspecies is listed under the Federal Endangered Species Act. Willow Flycatchers were once widespread in wet riparian woodland in southern California but now only a few individuals exist. The main California breeding populations of this species are along the Kern River and north of Santa Barbara.

Following the Protocol outlined by Sogge (Technical Report NPS/NAUCPRS/NRTR-97/12) four surveys were conducted specifically for Southwestern Willow Flycatcher in Areas 1-3 and 5 (see dates on tables 1-3, 5). All surveys occurred between 5:30 and 10:00 am. and used taped calls to elicit a response if flycatchers were not first observed. Other sections of the river (Areas 4 and 6-8)were dry during the nesting season for this species, and, therefore, were not considered suitable habitat. However, the two surveys that were conducted of these areas were timed so as to be within the time frame recommended for Southwestern Willow Flycatcher.

Three Willow Flycatchers were observed at locations shown on Figure 2. All three observations were of single birds that did not call except in response to a tape. The two sightings on June 9th could not be refound on subsequent surveys on June 22 and July 6th. Both these birds were in suitable nesting habitat for this species. The bird found on June 17 was not refound on a visit to the site on June 22 and was found in an area of riparian habitat probably not suitable for nesting due to its small extent and isolation from other suitable habitat. All three birds are considered migrants passing through the area..

Least Bell's Vireo

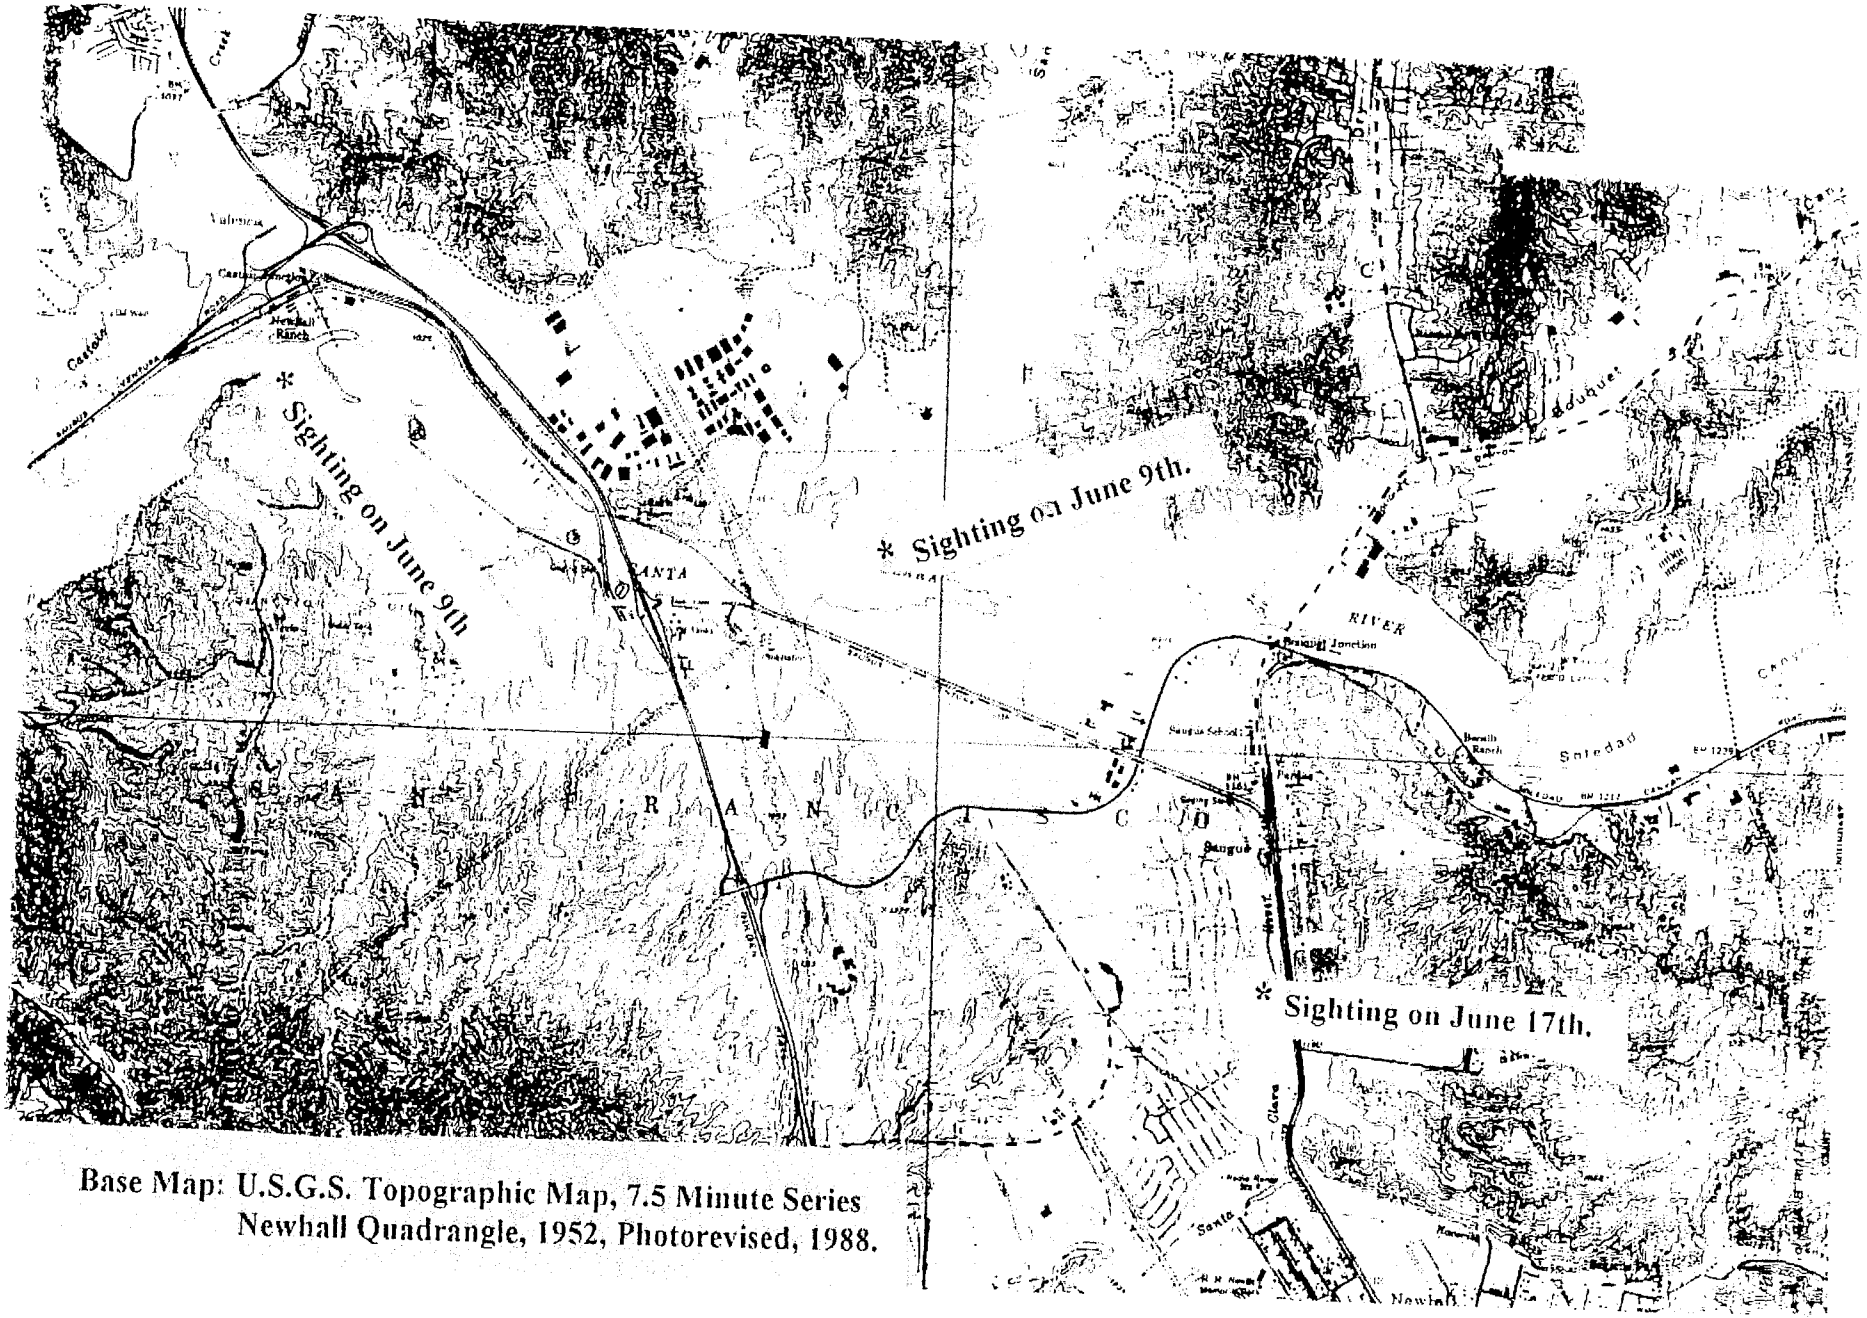
Surveys of the wet riparian areas (Areas 1-3,5) followed U.S. Fish and Wildlife Service Guidelines for Least Bell's Vireo. Eight surveys were conducted between April 10 and July 31 (see Tables 1-3,5 for dates). All surveys occurred between 5:30 and 10:00 am. and taped vireo calls were played if no vireos were heard or seen. No vireos were observed during 1999 surveys. In past years vireos have been present along Castaic Creek and along the Santa Clara River near Magic Mountain. In both areas vegetation has become perhaps too mature to be prime habitat for this species. However, at Magic Mountain new habitat is developing nearby and may be suitable for vireos in another year.

Comments on Sensitive Species

Great Blue Heron

Great Blue Herons are listed on the California Natural Diversity Data Base as a species that

Figure 2. Southwestern Willow Flycatcher Sightings during 1999.



Base Map: U.S.G.S. Topographic Map, 7.5 Minute Series
Newhall Quadrangle, 1952, Photorevised, 1988.

warrants monitoring. Individuals of this species was observed sparingly along the river after the breeding season and along other sections of the river during migration. No nesting was observed and herons were absent during the nesting season.

Great Egret

The Great egret is listed on the California Natural Diversity Data Base as a species that warrents monitoring. A few individuals were observed along the river during migration and after the breeding season.

White-tailed Kite

This species, formerly the Black-shouldered Kite, is considered a Species of Special Concern by the State of California. Three pair of kites nested successfully in the survey area. One pair of kites nested in the dry riparian woodland near Castaic Junction. A second pair nested near the mouth of San Francisquito Creek and a third pair nested approximately 1/4th mile east of the Bouquet Canyon Bridge.

Cooper's Hawk

Cooper's Hawk is considered a Species of Special Concern by the State of California. Cooper's Hawks were observed rarely along the main river in 1999 and may have nested just east of Interstate 5.

California Horned Lark

This species is a candidate for listing under the Federal Endangered Species Act. Although none were observed nesting on the study site, Horned Larks do nest on dry hillsides and agricultural areas in adjacent areas and were observed in late summer feeding on a bare construction area north of the Santa Clara River just west of the Bouquet Canyon Bridge.

Yellow Warbler

The Yellow Warbler is considered a Species of Special Concern by the State of California. Yellow Warblers prefer wet riparian habitat but are also found in large cottonwoods in drier riparian areas. Singing yellow warblers were observed along the continuously wet sections of the survey area during nesting season, but were observed in other dry sections of the river only during migration.

Yellow-breasted Chat

The Yellow-breasted Chat is considered a Species of Special Concern by the State of California. A few chats nested along the wet sections of the Santa Clara River.

Tricolored Blackbird

The Tricolored Blackbird is a Candidate for listing under the Federal Endangered Species Act. A small group of male Blackbirds were present throughout the survey period in irrigated areas of the baseball park on the south side of the Santa Clara River between McBean Bridge and Bouquet Canyon crossing. No evidence of nesting was observed.

Lawrence's Goldfinch

This species is a highest priority species on the Audubon Birds to Watch list for 1996. This species nests in chaparral vegetation and small flocks of this species were observed drinking along the Santa Clara River and its tributaries where native vegetation is still present next to the river.

Comments of Brown-headed Cowbirds

Although not a Species of Concern, comments about this species are warranted due to its influence on several endangered species. Cowbirds were regularly observed along all sections of the Santa Clara River, usually flying along the riparian corridor searching for either mates or potential nests to parasitize. Cowbird females often responded to taped calls of Least Bell's Vireo. Cowbird numbers showed a marked decrease after mid July between Bouquet Canyon and McBean Bridges, probably due to the operation of cowbird traps just upstream from the McBean Bridge during late May and June. These traps also caught large numbers of red-winged blackbirds. Although released each day, this trapping may have affected the breeding of this species.

Table 1. Bird Observations along the Santa Clara River System, 1999; Santa Clara River from Old Highway along I-5 to the mouth of Castaic Creek and Castaic Creek from this confluence to State Route 126.

Bird Surveys along the Santa Clara River and its Tributaries near Valencia, California, 1998

Prepared by: Daniel A. Guthrie
W.M. Keck Science Center
925 N. Mills Ave
Claremont Ca. 91711
(909) 607-2836

Nature and Scope of Surveys

During the spring and early summer of 1998 surveys were conducted along a section of the Santa Clara River and its tributaries in the vicinity of Valencia, California to determine presence or absence of Least Bell's Vireo and other Species of Concern. Numbers of all species observed were noted, and special attention was placed on locating species considered rare and endangered.

Each survey was conducted on foot by observers well acquainted with both visual and auditory patterns of southern California birds. All surveys occurred between 6 and 10 a.m. If no vireos were found during the first two surveys, calls of Least Bell's Vireo were played during subsequent censuses to elicit response from territorial males. Survey routes were designed to cover all areas of each section of the river, with emphasis placed on wetter habitats where Least Bell's Vireos and other sensitive riparian species are most likely to occur. Personnel for all surveys were Daniel A. Guthrie, Richard F. Clements, and Judith A. Sugden.

To facilitate surveys, the area was divided into eight sections (Figure 1). Delineation of the eight areas and comments on each follow. Surveys of the normally dry sections of the river system (Areas 4,6-8) and sections where Least Bell's Vireos have not been observed in the past (Area 3) were conducted twice during the nesting season. The second survey was delayed until June to insure that late arriving species such as Yellow-billed Cuckoo and Willow Flycatcher would not be missed. Surveys of the remaining sections of the Santa Clara River (Areas 1-3,5) were conducted according to the protocol outlined by the Fish and Wildlife Service (Appendix 1), and consisted of 8 surveys, two each in April, May, June and July. The first survey in July was restricted to areas where vireos had been seen in the past. Thus, while the species seen were noted, numbers of individuals were not recorded.

Habitat Condition and Bird Observations.

Due to El Nino, the winter of 1998 was very wet, with several heavy rains which caused severe flooding along most sections of the river. Except for Castaic Creek, where flooding was controlled by upstread dams, flooding removed all wet riparian vegetation along the river as well as many sections of large trees. Wet riparian vegetation was only beginning to appear during the July censuses.

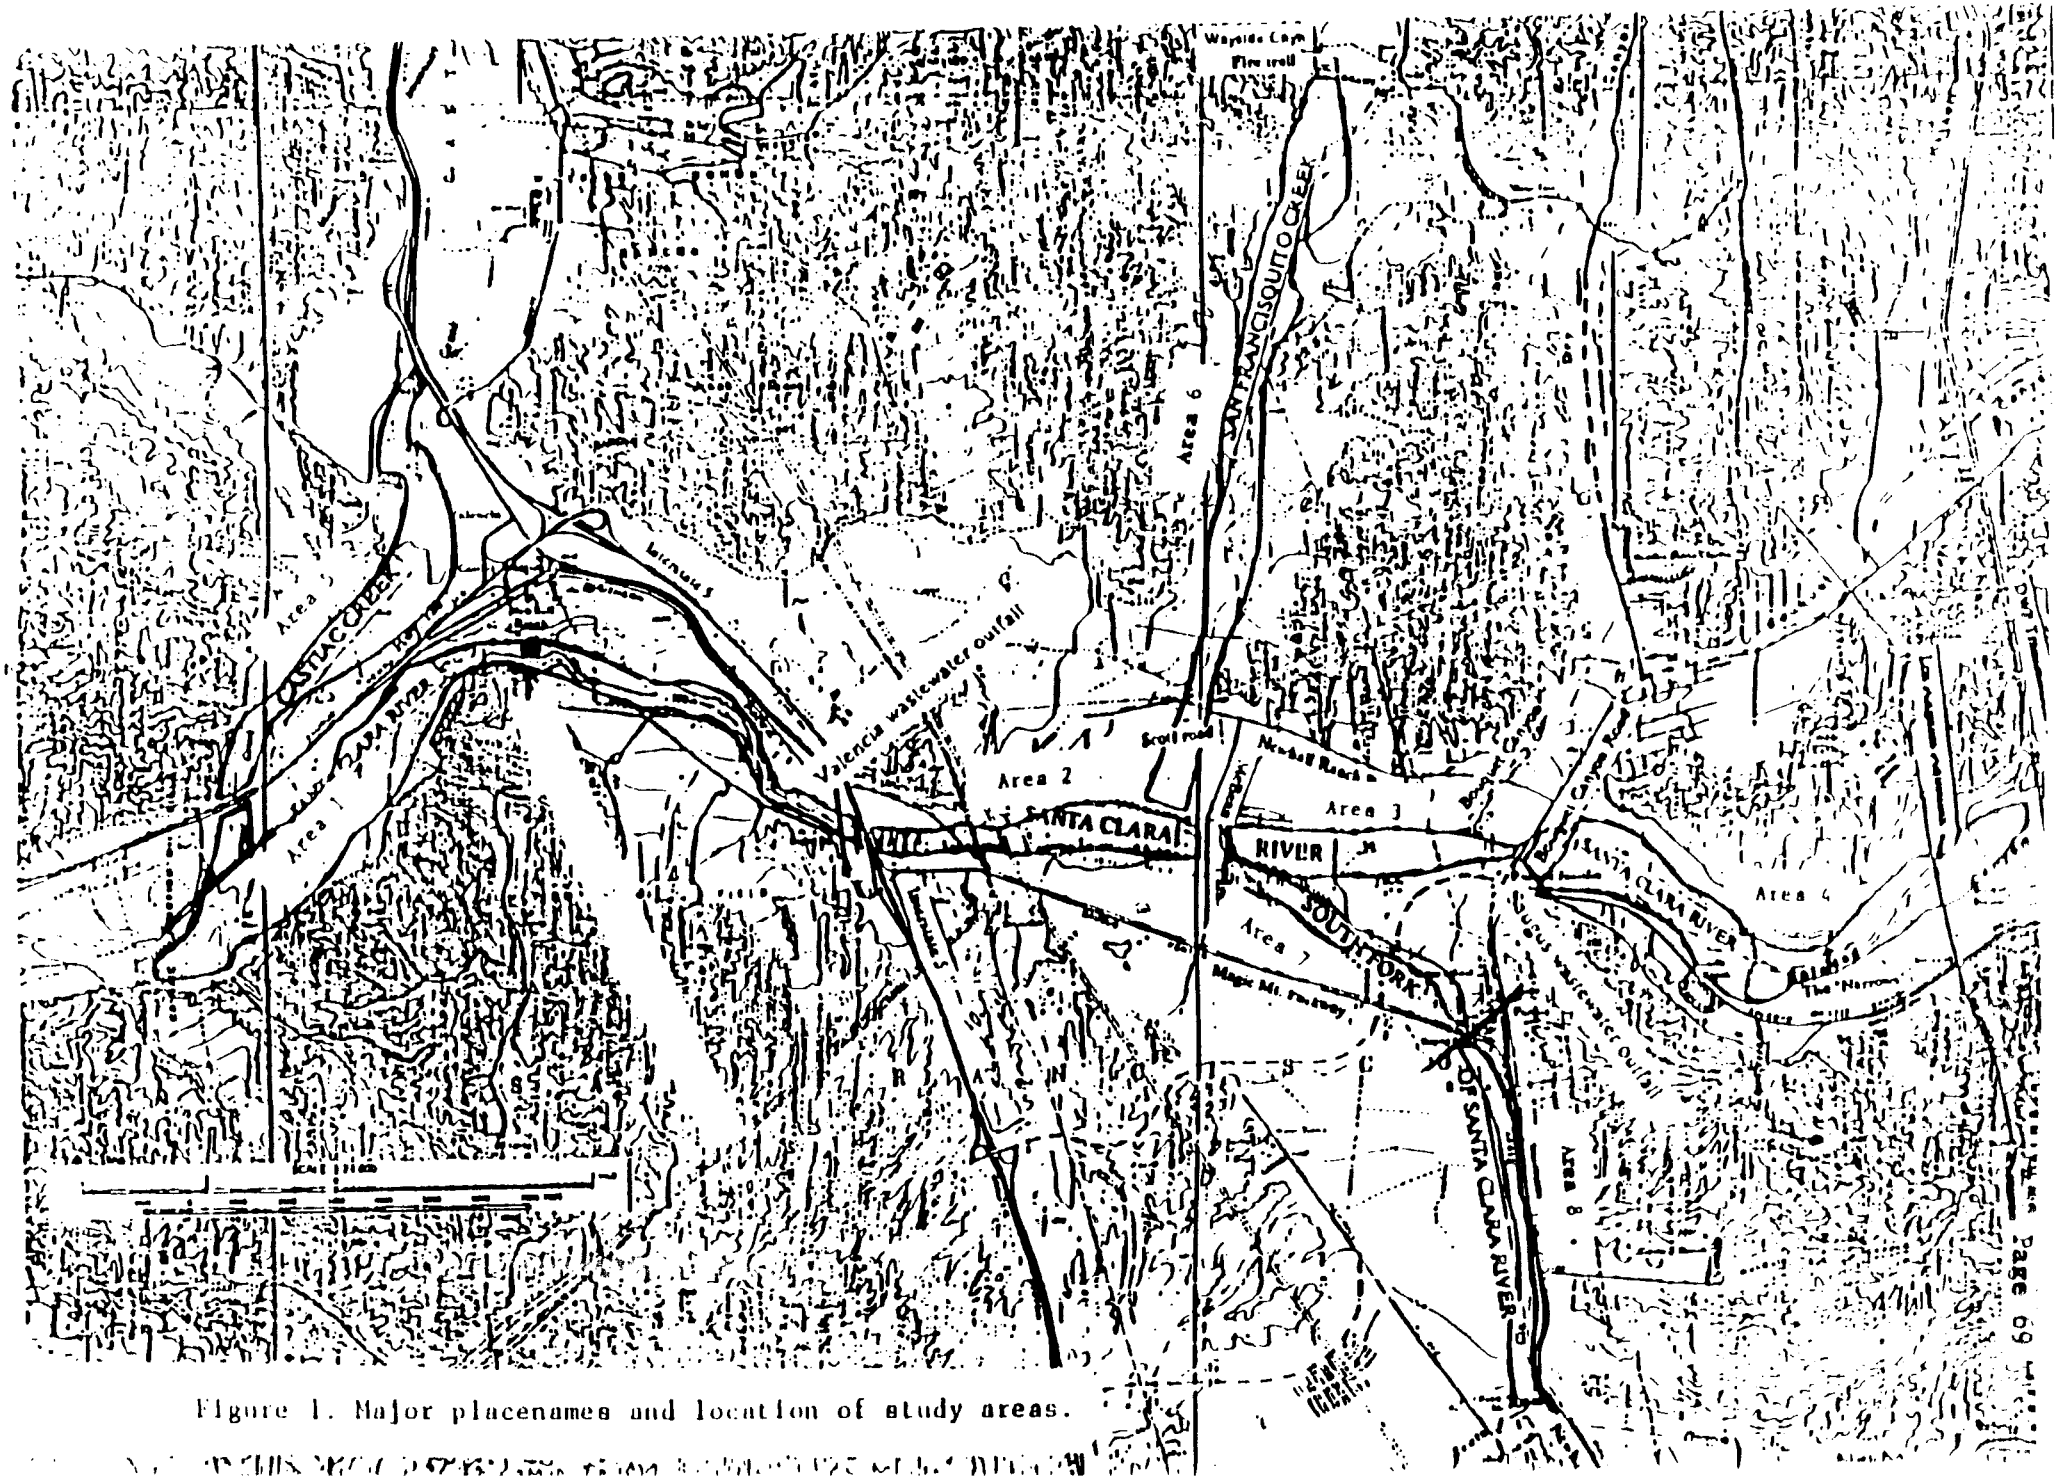

Figure 1. Major placenames and location of study areas.

Water continued to flow in all sections of the river throughout the census period.

Tables 1 through 8 present bird observations in each of the specific study areas for 1998. Different species breed at different times of the year. In general, species are most easily observed when they are actively defending territories by song during the establishment of breeding pairs. Once pairs are established and nesting begins song often decreases and the numbers of birds observed, therefore, also decreases. After young leave the nest, numbers observed increase. Thus, for most resident species, numbers of adult birds are most accurately censused in April and May, when territorial activity is at a maximum. A few species such as Anna's Hummingbird that nest early in the season may be underestimated. Numbers observed may decrease slightly in June and early July when birds are less active during nesting, and increase in late June and July when young birds leave the nest.

Several species that are not considered riparian species but are common in adjacent coastal sage and chaparral habitats come into the riparian zone in late summer when other vegetational areas are dry. The increase in numbers of Lazuli Bunting, Lark Sparrow, House Finch, Phainopepla and Mourning Dove in late July follow this trend.

The general effect of flooding in 1998 was to reduce the numbers of obligate wet riparian species. Thus red-winged blackbirds, which are usually found in cattail marshes, were fewer in number. Some species that nest on gravel bars, such as killdeer and spotted sandpiper were also reduced in numbers as their habitat was flooded in April and May during the nesting season. The lack of change in numbers of most other species between 1997 and 1998 indicates that they accomodated to flooding. For instance, song sparrows, usually common along the wet riparian vegetation, moved into weedy fields and wooded habitat at the sides of the river as did some red-winged blackbirds and blue grosbeaks.

Following are specific comments on the habitat and bird observations in each area.

Area 1. Santa Clara River; Old Highway to the mouth of Castaic Creek and Castaic Creek from this confluence to State Route 126.

Length of section, 3.5 miles. The Santa Clara River flows continuously in this section and is augmented by the Valencia waste water outfall near the upstream end of this section. Severe flooding and the threat of bank erosion led to the construction of a new river channel to divert water away from the Old Highway (fig. 2). Although this new channel bisected an area where Least Bell's Vireos were found in 1997, it apparently did not affect the vireos as they were regularly observed along the sides of this channel during 1998 (see additional comments in section on Least

Bell's Vireo). The section of river channel bypassed by this diversion was one of the few remaining wet riparian areas along the river and provided nest sites for Spotted Sandpiper and killdeer.

Area 2. Santa Clara River; Old Highway to McBean Parkway.

Length of section, 1.4 miles. The Santa Clara River flows continuously in this section. The channel was heavily scoured by spring flooding which eliminated all wet riparian vegetation along the main channel of the river. A small area of wet riparian vegetation remained at the mouth of San Francisquito Creek. As in previous years, this area was impacted by off road vehicles during the study period. However, vehicles remained for the most part in the main channel of the river.

Area 3. Santa Clara River; McBean Parkway to Boquet Canyon Road.

Length of section, 1.2 miles. Water, supplied by the Saugus wastewater outfall at the Boquet Canyon Bridge, is continuous in this section of the Santa Clara River. This area was almost completely scoured by spring flooding, leaving only a narrow strip of vegetation along the sides of the river. Species number and the number of individuals seen in this area were reduced from previous years.

Area 4. Santa Clara River; Boquet Canyon Road upstream to DWP transmission lines.

Length of section, 2.3 miles. This section of the Santa Clara River in past years has been wet only briefly during spring rains. and due to water release from the DWP aqueduct 2.0 miles upstream from Boquet Canyon Road. This year there was water flowing continuously in this section of the river. However, flood scouring reduced the overall amount of vegetation and deepened the river channel, leaving much vegetation along the sides of the wide channel out of contact with ground water with the result that much of last years new vegetation was dead and wet riparian species were very reduced.

Area 5. Castaic Creek; Route 125 to Old Road next to Interstate 5.

Length of section, 1.8 miles. Water was released from upstream dams during most of the study period but not continuously so that at times the river was dry. Noise makers and scarecrows were placed along the upper portion of this section to scare birds away from the vicinity of construction to the east. The result was that nesting by red-winged blackbirds and other wet riparian species near the wet pond in this area was greatly reduced as were the overall numbers of individuals and species.

Area 6. San Francisquito Creek; Santa Clara River upstream 2.5 miles.

Length of section, 2.5 miles. This section was wet throughout the study period and showed some effects of flooding, especially in the lower portion where a heavy mud deposit covered most wet riparian vegetation.

Area 7. South Fork of the Santa Clara River; McBean Parkway to Magic Mountain Parkway (Route 126).

Length of section, 1.0 miles. The channel along this section of the South Fork is narrow and very sandy. Flooding removed all vegetation except for a narrow band at each side of the channel.

Area 8. South Fork of the Santa Clara River, Route 126 upstream to Newhall Creek.

Length of section, 1.4 miles. This section of the river was dry except for damp areas formed by runoff from culverts along the west side of the creek. Flooding was restricted to the central channel of the river and did not affect the well developed cattail and willow areas near these culverts. The result was the continued increase in riparian species along this section of the river.

Comments on Sensitive Species

Cooper's Hawk

Cooper's Hawk is considered a Species of Special Concern by the State of California. Coopers hawks were observed rarely on most sections of the main river in 1998 and also along San Francisquito and Castaic Creek. This species is a resident that nests and hunts in riparian woodland habitat.

White-tailed Kite

This species, formerly the Black-shouldered Kite, is considered "Special" by the State of California. Two pair of kites nested along the river in 1998, both in areas where the have been noted in previous years. One pair of kites nested in the dry woodland on the north side of the Santa Clara River near the confluence with Castaic Creek and a second pair of kites nested on the south side of the Santa Clara River about 1/2 mile west of the McBean Bridge.

Yellow-billed Cuckoo

The Yellow-billed Cuckoo is listed as a State Endangered Species. Although no individuals of this species were observed by us in 1998, there was a report of an observation along the Santa Clara River above the McBean crossing in July. As these birds could not be found subsequently and as the referred food of this species

(tent caterpillers and tree frogs) is lacking in this area, this sighting was probably of post-breeding birds on their way south during migration. In the past, cuckoos have been rarely observed as migrants passing through the area in June.

Willow Flycatcher

This species is listed as an Endangered Species under the Federal Endangered Species Act. Willow Flycatchers were once widespread in wet riparian woodland in southern California but now only a few individuals exist. The main California breeding populations of this species are along the Kern River and in northern California. Although migrating individuals of this species have been observed in the past in early June, none were observed this year.

California Horned Lark

This species is a candidate for listing under the Federal Endangered Species Act. Horned Larks nest on dry hillsides and agricultural areas and were observed in late summer on plowed fields adjacent to the Castaic Creek and near the main river at Castaic Junction.

Loggerhead Shrike

This is a California Species of Special Concern. Shrikes are resident in the coastal sage scrub areas adjacent to the Santa Clara River System. This habitat has been nearly completely eliminated along the sides of the upper river. Although shrikes have been observed in the past to enter the riparian area in late summer seeking water, none were observed this year.

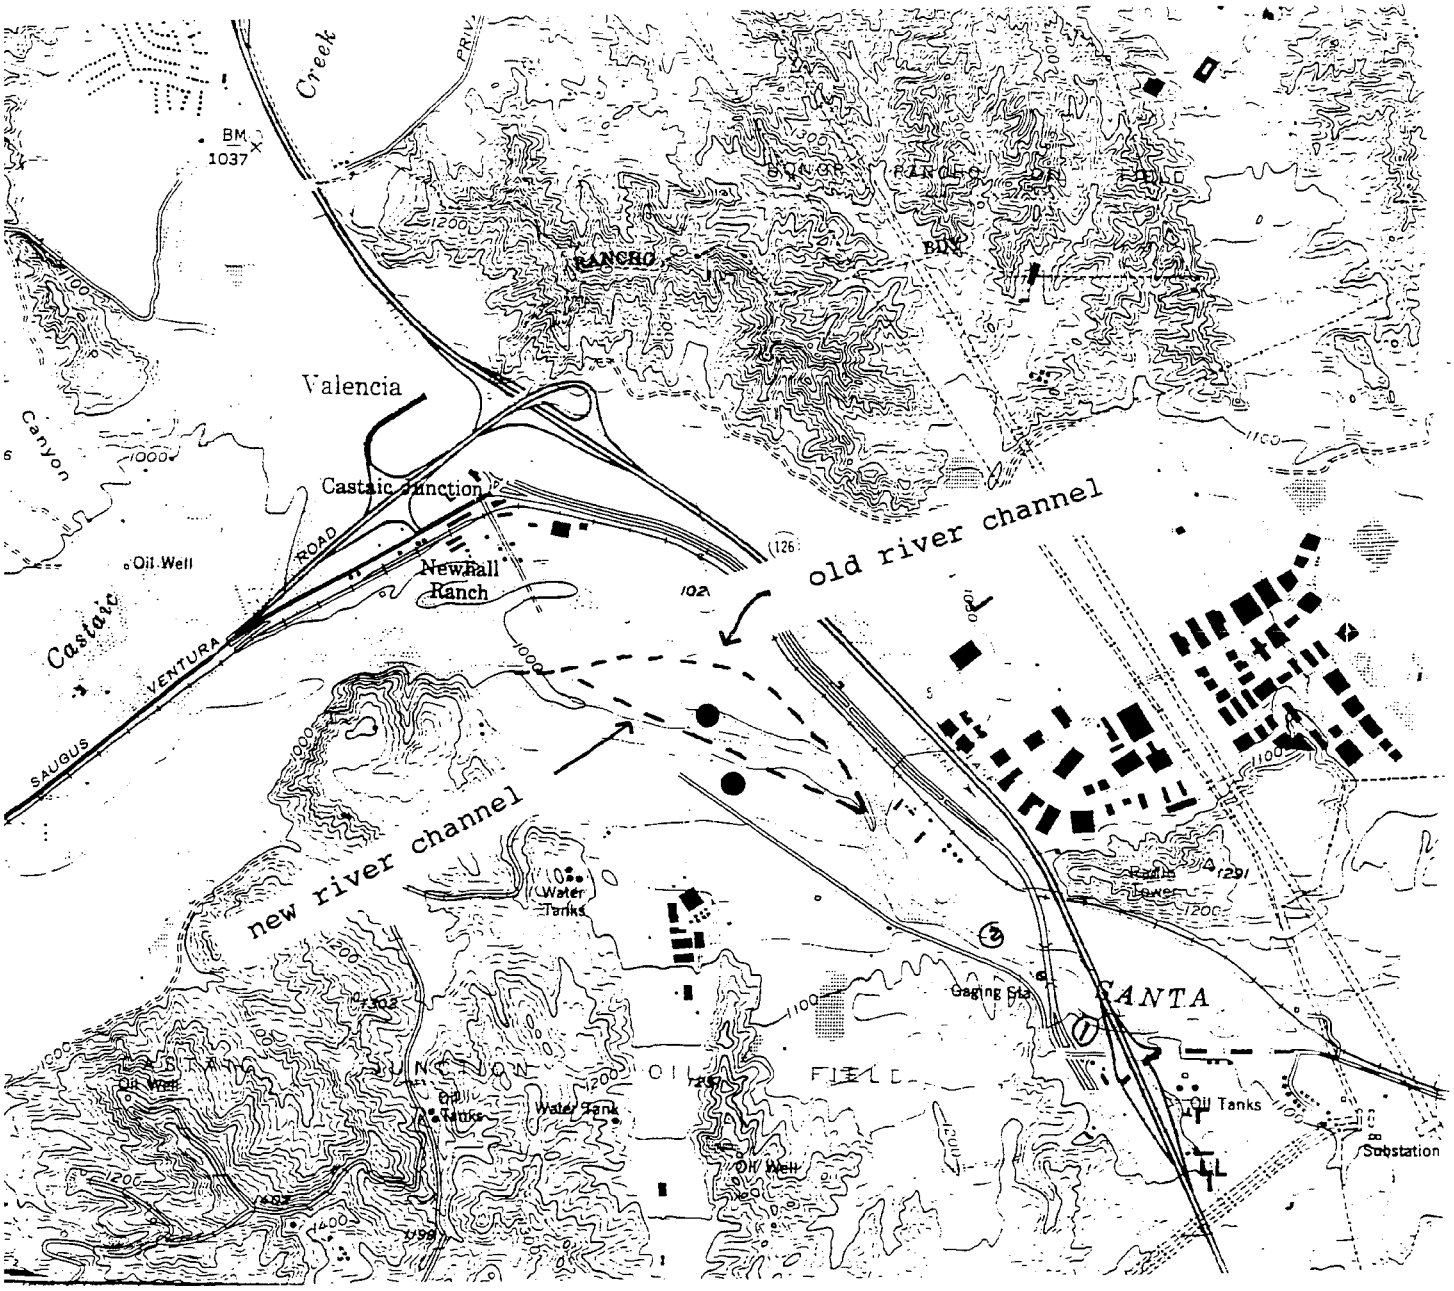
Least Bell's Vireo

Two singing Least Bell's Vireos were observed near Castaic Junction, one on each side of the newly created channel (Figure 2) and both appeared paired and nesting. Although these birds were in dense willow, the berms along the new channel prevented water from reaching this vegetation and much of it was dying by July. Also, the creation of the new channel created edges through the vireo habitat, thus openning the area to increased cowbird predation. There were two cowbird traps in this area in 1997 but no cowbird traps this year and the number of cowbirds observed was higher than in 1997, when two birds were also observed in this area.

Yellow Warbler

The Yellow Warbler is considered a Species of Special Concern by the State of California. Yellow Warblers prefer wet riparian habitat but are also found in large cottonwoods in drier riparian areas. Singing yellow warblers were observed along nearly every section of the Santa Clara River and Castaic Creek. The drop in

Figure 2. Location of Least Bell's Vireo sightings in 1998



● - Singing Least Bell's Vireo

numbers observed between May and June indicate that most of the earlier birds observed were migrants passing through the area. The Yellow Warblers that remained in June along wet sections of the Santa Clara river presumably were breeding birds.

Yellow-breasted Chat

The yellow-breasted chat is considered a Species of Special Concern by the State of California. Chats were observed sparingly along the wet sections of the Santa Clara River.

Lawrence's Goldfinch

This species is a highest priority species on the Audubon Birds to Watch list for 1996. A few birds were observed drinking along The Santa Clara River. This species nests in coastal sage and chaparral habitat and visits the river during the dry late summer.

SANTA CLARA RIVER – LEAST BELL'S VIREO SURVEY

6 July 1998 Lower Santa Clara River, Ventura County

Marcy and I walked the river between the Los Brisos Bridge and slightly beyond the the bend opposite the canyon that comes in from the north. We found four singing birds along the south side of the river as shown on the attached map. Two of these were paired so there was a total of six vireos. The vireo near the bridge (aka the "ranch house vireo") was not in evidence.

We did not keep track of birds but did make note of the following:

1. One white-tailed kite.
2. Three to four common ground-doves slightly downstream from the vireos.
3. One ring-necked pheasant in the same area as the ground-doves.

I ure 1. Location of Least Bell's Vireos a Yellow-billed Cuckoo
sightings in 1997

SANTA CLARA RIVER – LEAST BELL'S VIREO SURVEY

2 July 1998 Blue Moon Saloon vicinity
Marcy and I walked the main channel, the new berm and the old channel. Three vireos were found as shown on the attached map. The single vireo was heard singing twice. The pair were actively feeding in the willows; the male singing.

We did not keep track of birds but did make note of the following:
1. Juvenile white-tailed kite
2. A few Lazuli buntings feeding in the water cress and clover along the old channel
3. MOST IMPORTANT: Spotted sandpiper adult calling repeatedly and a downy chick trying to hide in the weeds along the old channel. First definite evidence of breeding.

2 July 1998 County Line vicinity
Marcy and I searched diligently for an hour in the area at the county line where vireos have occurred in past years and were seen on early 1998 surveys. We found no evidence of vireos.
