This section includes the traffic impact analysis for the study intersection in the County of Los Angeles determined using the specified significant impact criteria included in County's traffic study guidelines. The traffic impact analysis compares the volume to capacity (V/C) ratios at each study location under the future base and future plus project conditions to determine the incremental difference in V/C ratios caused by the Proposed Tier II Project. An additional analysis compares the future base and future plus project with related projects to determine the cumulative impacts. This provides the information needed to assess the potential Tier II Project impacts (and cumulative impacts) using significance criteria established by the County of Los Angeles.

Significant Traffic Impact Criteria. The County of Los Angeles Department of Public Works has established threshold criteria that determine if a project has a significant traffic impact at a specific intersection. According to the criteria provided by the County of Los Angeles, a project impact is considered significant if the following conditions are met:

Pre-Project Conditions		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
C	0.71 – 0.80	equal to or greater than 0.040
D	0.81 – 0.90	equal to or greater than 0.020
E, F	> 0.91	equal to or greater than 0.010

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS D after the addition of project traffic and the incremental change in the V/C ratio is less than 0.020. However, if the intersection is operating at a LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.010 or greater, the project would be considered to have a significant impact.

Tier II Project Impacts. Using the specified significant impact criteria, the traffic impacts at the 27 analysis locations in the County of Los Angeles were determined for Existing Baseline with Ambient Growth (2020) plus Tier I and II Project conditions. Table 21 summarizes the V/C ratio and corresponding level of service and identifies the individual impacts during both A.M. and P.M. peak hours at each of the analysis locations. It can be observed that 7 of the 27 analyzed intersections (7 in the AM peak hour and 5 in the PM peak hour) would be significantly impacted by the Proposed Tier II Project and includes the following intersections:

- Compton Avenue/Imperial Highway – AM Peak Hour
- I-105 Westbound Ramps/Imperial Highway – AM Peak Hour
- Wilmington Avenue/118th Street – AM and PM Peak Hours
- Wilmington Avenue/120th Street-119th Street – AM and PM Peak Hours
- Wilmington Avenue/I-105 Eastbound Ramps – AM and PM Peak Hours
- Wilmington Avenue/MLK Jr. Hospital Driveway-120th Street – AM and PM Peak Hours
- Wilmington Avenue/El Segundo Boulevard – AM and PM Peak Hours

Therefore, mitigation measures would be required for the Proposed Tier II Project.

Cumulative Projects Impacts. Using the specified significant impact criteria, the traffic impacts at the 27 analysis locations in the County of Los Angeles were determined for cumulative conditions. Table 22 summarizes the V/C ratio and corresponding level of service and identifies the individual impacts during both A.M. and P.M. peak hours at each of the analysis locations. It can be observed that 13 of the 27 analyzed intersections (10 in the AM peak hour and 12 in the PM peak hour) would be significantly impacted by the cumulative effects of Proposed Tier II Project and related projects and includes the following intersections:

- Alameda Street/103rd Street – AM and PM Peak Hours
- Alameda Street/El Segundo Boulevard – PM Peak Hour
- Alameda Street/Imperial Highway – AM and PM Peak Hours
- Avalon Boulevard/El Segundo Boulevard – PM Peak Hour
- Central Avenue/El Segundo Boulevard – AM and PM Peak Hours
- Central Avenue/Rosecrans Avenue – PM Peak Hour
- Compton Avenue/Imperial Highway – AM Peak Hour
- I-105 Westbound Ramps/Imperial Highway – AM and PM Peak Hours

* Los Angeles County Congestion Management Program (CMP) monitoring location

** City of Los Angeles ATSAC/ATCS location. V/C ratio includes ATSAC/ATCS reduction of 0.10

[1] Shares jurisdiction with City of Lynwood

[2] Shares jurisdiction with City of Compton.

[3] Shares jurisdiction with City of Los Angeles

[4] Shares jurisdiction with Caltrans.

[5] Per County of Los Angeles *Traffic Impact Analysis Report Guidelines, January 1997*, the project-related increase in V/C ratio is determined from the pre-project V/C ratio value of 0.71 (LOS C) to compare with the significance thresholds to identify significant impacts.

- Wilmington Avenue/118th Street – AM and PM Peak Hours
- Wilmington Avenue/120th Street-119th Street – AM and PM Peak Hours
- Wilmington Avenue/I-105 Eastbound Ramps – AM and PM Peak Hours
- Wilmington Avenue/MLK Jr. Hospital Driveway-120th Street – AM and PM Peak Hours
- Wilmington Avenue/El Segundo Boulevard – AM and PM Peak Hours

Therefore, mitigation measures would be required under cumulative (2020) conditions.

Other Jurisdictions Traffic Impact Analysis

This section includes the traffic impact analysis for the study intersections in the Cities of Compton and Lynwood determined by using the specified significant impact criteria included in the Los Angeles County Congestion Management Program (CMP) traffic study guidelines. Also included in this section is the traffic impact analysis for study intersections within the City of Los Angeles. City of Los Angeles significant impact criteria were utilized to assess significant impacts for these City of Los Angeles locations.

The traffic impact analysis compares the volume to capacity (V/C) ratios at each study location under the future base and future plus project conditions to determine the incremental difference in V/C ratios caused by the Proposed Tier II Project. This provides the information needed to assess the potential Tier II Project impacts at various locations in each of these jurisdictions using significance criteria acceptable in these jurisdictions.

City of Los Angeles Significant Traffic Impact Criteria. The City of Los Angeles Department of Transportation (LADOT) has established threshold criteria that determine if a project has a significant traffic impact at a specific intersection. According to the criteria provided by the City of Los Angeles, a project impact is considered significant if the following conditions are met:

Intersection Condition With Project Traffic		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
C	0.701 – 0.800	equal to or greater than 0.040
D	0.801 – 0.900	equal to or greater than 0.020
E, F	> 0.901	equal to or greater than 0.010

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the V/C ratio is less than 0.040. However, if the intersection is operating at a LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.010 or greater, the project would be considered to have a significant impact.

Los Angeles County Congestion Management Program Significant Traffic Impact Criteria. The Cities of Compton and Lynwood locations have been evaluated based on the criteria from the Los Angeles County Congestion Management Program (CMP) to determine if a project has a significant traffic impact at a specific intersection. A project impact is considered significant if the following conditions are met:

Intersection Condition With Project Traffic		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
F	> 1.000	equal to or greater than 0.020

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the V/C ratio is less than 0.040. However, if the intersection is operating at a LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.020 or greater, the project would be considered to have a significant impact.

Tier II Project Impacts. Using the specified significant impact criteria, the traffic impacts at the 37 analysis locations in the Cities of Los Angeles, Compton and Lynwood were determined for Cumulative (2020) plus Tier I and II Project conditions. Table 23 summarizes the V/C ratio and corresponding level of service and identifies the individual impacts during both A.M. and P.M. peak hours at each of the analysis locations. It can be observed that 1 of the 37 analyzed intersections, the intersection of Central Avenue/120th Street, would be significantly impacted by the Proposed Tier II Project in the AM and PM peak hours. Therefore, mitigation measures would be required for the Proposed Tier II Project. It is worth noting that several impacted intersections have joint jurisdictions with the County of Los Angeles. The impacts at these joint jurisdiction locations are discussed under County of Los Angeles Tier II Project and cumulative impacts section.

* Los Angeles County Congestion Management Program (CMP) monitoring location
** City of Los Angeles ATSAC/ATCS location. V/C ratio includes ATSAC/ATCS reduction of 0.10
[1] Determination of significant impacts based on Los Angeles County Congestion Management Program (CMP) significant impact criteria.
[2] Shares jurisdiction with Caltrans.
[3] Determination of significant impacts based on City of Los Angeles significant impact criteria.

SPECIFIC ROADWAY INTERSECTION IMPROVEMENTS

The various intersection improvements proposed to alleviate the significant impacts of the Proposed Tier II Project as well as the cumulative projects impacts are described in this section. The improvements have been organized in the following section by project-level intersection mitigation measures and cumulative projects intersection mitigation measures. The conceptual schematic drawings for these intersection improvements are included in Appendix Q.

Project-Level Intersection Mitigation Measures

In order to address the Tier II Project's impacts, the following mitigation measures described in the section below are recommended for implementation by the Tier II Project:

- Compton Avenue/Imperial Highway – County of Los Angeles/City of Los Angeles: Restripe westbound approach to provide a separate right-turn lane.

- I-105 Westbound Ramps-Croesus Avenue/Imperial Highway – County of Los Angeles/City of Los Angeles/Caltrans: Provide a third northbound left-turn lane by widening off-ramp by 10' for approximately 150' to 200'.

- Wilmington Avenue/El Segundo Boulevard – County of Los Angeles/Compton: Restripe eastbound and westbound approaches to have separate right-turn lanes. Allow buses to go through the intersection from the right-turn lanes.

- Central Avenue/120th Street – City of Los Angeles: Restripe northbound approach to provide a separate right-turn lane. Also, widen the east leg by 3' on each curbside (i.e. reduce sidewalk along 120th street east of Central Avenue by 3' for approximately 120' and restripe westbound 120th Street approach to provide a left-turn, two through lanes and a separate right turn lane.

- Wilmington Avenue Corridor Improvements: Provide an additional southbound travel lane by widening 2' on either side of Wilmington Avenue (reducing the sidewalk to 8' from 10') and restriping the travel lanes between 120th Street-119th Street and the I-105 Eastbound Off-Ramp and by just restriping the lanes (after reducing the central median) between MLK Jr. Hospital Driveway-120th Street and 120th Street-119th Street. The following intersection improvements would also be implemented as part of this corridor improvement:

- Wilmington Avenue/I-105 Eastbound Ramps – County of Los Angeles/Caltrans: Provide an additional eastbound lane by widening (reducing the raised median on the ramp) the off-ramp. The eastbound approach would have a left-turn lane, shared left-right turn lane and a separate right-turn lane. The sidewalks on either side of Wilmington Avenue (as noted above) would be reduced by 2’ and the Wilmington Avenue roadway would be widened by 2’ on either side (a total of 4’) from the south leg of this intersection.

Provide an additional northbound left-turn lane by widening (reducing the medians). The northbound approach would have dual left-turn lanes and three through lanes.

- Wilmington Avenue/118th Street – County of Los Angeles: Widen Wilmington Avenue roadway by 2’ on either side and restripe to provide two through lanes, a shared through-right turn lane and dual left-turn lanes along the southbound approach. Restripe the westbound approach to provide a separate right-turn land and a share left-through lane. Northbound approach would have the same lane geometry as existing conditions. Under cumulative conditions, widen 118th Street roadway by 4’ and restripe to provide a separate right-turn lane and shared left-through lane along the eastbound approach.

- Wilmington Avenue/120th Street-119th Street – County of Los Angeles: Widen Wilmington Avenue roadway by 2’ on either side and restripe the southbound approach to provide a separate right-turn lane, three through lanes and a left-turn lane.

  Restripe northbound approach to provide a shared through-right turn lane, two through lanes and a left-turn lane. Remove median adjacent to northbound approach to facilitate three southbound receiving lanes. Restrict parking along Wilmington Avenue roadway during AM and PM peak periods along the eastside of Wilmington between 120th Street & MLK Jr. Hospital Driveway Entrance.

  Widen 120th Street west of Wilmington Avenue for 250’, on the south side by 2’ and restripe the eastbound approach to provide a separate right-turn lane, dual left-turn lanes, and a through lane. The westbound approach of 119th Street would have the same lane geometry as existing conditions.

- Wilmington Avenue/MLK Jr. Hospital Entrance-120th Street – County of Los Angeles: Restripe southbound approach to provide a separate right-turn lane, two through lanes and a left turn lane. Provide three northbound receiving lanes and restrict on-street curb parking along the eastside of Wilmington Avenue between MLK Jr. Hospital Driveway-120th Street and 120th Street-119th Street during morning and evening peak hours.

  Remove median within the hospital entrance and restripe the driveway to provide dual left turn lanes, a through lane and a separate right-turn lane along the eastbound approach. Restripe to provide one receiving lane. The east-west signal phasing would operate as a split phase due to the lane configurations.

Effectiveness of Mitigation Measures. The results of the implementation of the recommended project-level improvements are summarized in Table 21 for County of Los Angeles analyzed locations and in Table 23 for the other jurisdictions. As indicated in the tables, the recommended improvements would fully mitigate the Tier II Project-related impacts at the 8 impacted intersections.

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2020) plus Tier I and II Project with Mitigation conditions are attached in Appendix O and Cumulative (2020) plus Tier I and II Project conditions are attached in Appendix P of the report.

Cumulative Projects-Level Intersection Mitigation Measures

In order to address the cumulative projects impacts determine using County of Los Angeles traffic study guidelines, the following mitigation measures described in the section below are recommended for implementation to alleviate the cumulative significant impacts. These improvements are needed in addition to the improvements identified above for the project-level mitigation measures.

- Avalon Boulevard/El Segundo Boulevard – County of Los Angeles: Widen NB approach by 2 feet and restripe the approach to provide a left turn lane, two through lanes and a separate right turn lane (10’, 10’, 10’, 12’). The approach could be widened by narrowing the 5’ median to a 3’ median, or by reducing the 12’ sidewalk to a 10’ sidewalk. This widening would need to occur all the way to an alley located approximately 100’ south of the intersection. The bus stop at this approach would continue to be located at the same location; however, buses would be allowed to go straight through the intersection.

- Alameda Street/El Segundo Boulevard – County of Los Angeles/Compton: Restripe northbound/southbound approaches and provide a SBR turn lane. The lanes along the north leg would be restriped to provide 13’ and 11’ receiving lanes; 10’, 11’, 10’, 12’ approach lanes for SBL, SBT, SBT, and SBR lanes, respectively. The lanes along the south leg would have 13’ shared thru-right, 11’ thru lane, 10’ left turn lane, 12’ receiving lane and a 20’ receiving lane. Remove 2 on-street parking spaces along SB approach during peak hours.

- Alameda Street/103rd Street – County of Los Angeles/Lynwood: Restripe eastbound approach to provide a 10’ left turn lane and a 12’ left-right shared lane. The receiving lane would be restriped for 18.5’.

- Central Avenue/Rosecrans Avenue – County of Los Angeles/Compton: Restripe westbound approach to provide a separate right-turn lane. Allow buses to go through the intersection from the right-turn lane.

- Central Avenue/El Segundo Boulevard – County of Los Angeles/Compton: Restripe SB approach to provide a separate right-turn lane. Widen NB approach by reducing median by 1’ to 2’. Provide restriping to show a separate NB right-turn lane. Allow buses to go through the intersection from the right-turn lane.

- Alameda Street/Imperial Highway – County of Los Angeles/City of Lynwood: Restripe southbound approach to provide the following roadway geometry: dual left-turn lanes, a through lane, a shared through-right turn lane, and a separate right turn lane.

Effectiveness of Mitigation Measures. The results of the implementation of the recommended project-level improvements are summarized in Table 22 for County of Los Angeles analyzed locations. As indicated in the tables, the recommended improvements would fully mitigate the cumulative projects-related impacts at the 13 impacted intersections. Many of these intersections lie partly or fully within non-county jurisdictions. Any improvements at these locations would need to be coordinated with and approved by these jurisdictions. If for any reason, these improvements are not approved by these non-county jurisdictions, then significant impacts will remain at these locations.

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects with Mitigation conditions are attached in Appendix P of the report.

V. REGIONAL CONGESTION MANAGEMENT PROGRAM (CMP) ANALYSIS

This section presents the Congestion Management Program (CMP) transportation impact analysis. This analysis was conducted in accordance with the procedures outlined in the *Congestion Management Program for Los Angeles County* (Los Angeles County Metropolitan Transportation Authority, July 2004). The CMP requires that when a traffic impact report is prepared for a project, traffic impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use these facilities.

The CMP guidelines for determining the study area of the analysis for CMP arterial monitoring intersections and for freeway monitoring locations are as follows:

- All CMP arterial monitoring intersections where the Proposed Project will add 50 or more trips during either the AM or PM weekday peak hours of adjacent street traffic.
- All CMP mainline freeway monitoring locations where the Proposed Project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.

Evaluation of the freeway operations and ramp intersections using Caltrans' guidelines has also been performed at Caltrans' request for informational and long-range planning purposes and is included in Appendix R.

CMP ARTERIAL MONITORING LOCATIONS ANALYSIS

The following two intersections within the Martin Luther King Jr. Medical Center Campus Project study area are classified as arterial monitoring stations.

- Alameda Street at Imperial Highway
- Alameda Street at Compton Boulevard

As indicated in the analyses in Chapters III and IV, one of the CMP arterial monitoring locations, Alameda Street/Imperial Highway, would be significantly impacted under Existing (Baseline) with Ambient Growth (2020) plus Tier I and II Project and Related Project conditions. The recommended improvement identified in Chapter IV at this location would fully mitigate the cumulative projects-related impact.

CMP FREEWAY MONITORING STATIONS ANALYSIS

Operating conditions on the freeways are also classified by Level of Service. Level of Service for freeways is based on the measured flow past a point compared to the estimated capacity of that section of roadway. Capacity is calculated by multiplying the lane capacity, 2,000 vehicles per hour (1,000 vehicles per hour for high occupancy vehicle (HOV) lanes), by the number of lanes in each segment. The level of service definitions for freeway segments are contained in Table 24.

The freeway operating conditions within the study area was analyzed as per the CMP guidelines. This assessment includes the Harbor Freeway (I-110), Century Freeway (I-105), Artesia Freeway (SR-91), and Long Beach Freeway (I-710). The freeway analysis locations include the following:

- I-110 Freeway at Manchester Boulevard (CMP monitoring location)
- I-110 Freeway north of Rosecrans Avenue
- I-105 Freeway east of Crenshaw Boulevard (CMP monitoring location)
- I-105 Freeway west of Central Avenue
- I-105 Freeway west of Wilmington Avenue
- I-105 Freeway west of Long Beach Boulevard
- I-105 Freeway west of I-710 Freeway, east of Harris Avenue (CMP monitoring location)
- I-105 Freeway east of Bellflower Boulevard (CMP monitoring location)
- I-710 Freeway north of Firestone Boulevard (CMP monitoring location)
- I-710 Freeway north SR-91 Freeway
- SR-91 Freeway west of Wilmington Avenue
- SR-91 Freeway east of Alameda Street (CMP monitoring location)

Existing Conditions

Traffic volumes for the freeway facilities were obtained from 2008 Caltrans Traffic Volumes (ADT and peak hour volume data). These traffic volumes were adjusted using a growth rate of 0.72% per year to reflect Year 2010 conditions. This growth rate was obtained from the 2004 Congestion Management Program (CMP) for Los Angeles County. The resulting traffic volumes are illustrated in Table 25.

Demand/Capacity (D/C) ratios were calculated for each freeway segment identified above, using a capacity value of 2,000 vehicles per hour per freeway mainline lane (in accordance with CMP guidelines). A capacity value of 1,000 vehicles per hour is applied to high occupancy vehicle (HOV) and auxiliary lanes. Table 25 also summarizes the existing demand-to-capacity (D/C) ratios and Levels of Service during the peak hours at the analyzed locations.

TABLE 24
FREEWAY SEGMENT LEVEL OF SERVICE DEFINITIONS

Level of Service	Demand/Capacity Ratio	Flow Conditions
A	0.00 - 0.35	Highest quality of service. Free traffic flow, low volumes and densities. Little or no restriction on maneuverability or speed.
B	0.36 - 0.54	Stable traffic flow, speed becoming slightly restricted. Low restriction on maneuverability.
C	0.55 - 0.77	Stable traffic flow, but less freedom to select speed, change lanes, or pass. Density increasing.
D	0.78 - 0.93	Approaching unstable flow. Speeds tolerable but subject to sudden and considerable variation. Less maneuverability and driver comfort.
E	0.94 - 1.00	Unstable traffic flow with rapidly fluctuating speeds and flow rates. Short headways, low maneuverability and low driver comfort.
F(0)	1.01 - 1.25	Forced traffic flow. Speed and flow may be greatly reduced with high densities.
F(1)	1.26 - 1.35	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
F(2)	1.36 - 1.45	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
F(3)	>1.45	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.

		EB	9,000	6,076	0.68	C	6,310	0.70	C
SR-91	w/o Wilmington Avenue	WB	9,000	11,236	1.25	F(0)	6,421	0.71	C
		EB	9,000	6,293	0.70	C	15,198	1.69	F(3)
SR-91	e/o Alameda Street [4]	WB	9,000	12,002	1.33	F(1)	6,819	0.76	C
		EB	11,000	6,715	0.61	C	16,161	1.47	F(3)

[1] Traffic volumes obtained from 2008 Caltrans Traffic Volumes and were adjusted using growth rate factors from the 2004 Congestion Management Program (CMP) for Los Angeles County to obtain "existing" conditions.

[2] Demand-to-Capacity ratio (D/C) calculated based on a capacity of 2,000 vehicles per lane per hour applied to through lanes. A capacity of 1,000 vehicles per lane per hour in each direction is added for high-occupancy vehicles (HOV) and auxiliary lanes.

[3] Freeway mainline Levels of Service is based on the following D/C scale:

D/C Ratio	LOS
> 0.00 - 0.35	A
> 0.35 - 0.54	B
> 0.54 - 0.77	C
> 0.77 - 0.93	D
> 0.93 - 1.00	E
> 1.00 - 1.25	F(0)
> 1.25 - 1.35	F(1)
> 1.35 - 1.45	F(2)
> 1.45	F(3)

It can be seen from Table 25 that many segments of the I-110, I-105, I-710 and SR-91 are currently operating at or near capacity (LOS E or LOS F) during the AM and PM peak hours. As indicated in the table, approximately 42% of the analyzed freeway segments located within the study area would operate at acceptable levels of service (LOS D or better) during the AM peak hour. Approximately 17% and 42% would operate at LOS E and LOS F, respectively. During the PM peak hour, approximately 50% of the analyzed freeway segments within the study area would operate at LOS D or better and 21% and 29% would operate at LOS E and LOS F, respectively.

Future 2014 without Project Conditions

As with the intersection operations, traffic volumes on freeways would increase as a result of regional growth anticipated by the year 2014 and growth due to related projects within and in the vicinity of the Project study area. It was estimated that the growth in traffic on the freeways in the study area amounted to an increase of approximately 0.72% per year in the AM and PM peak hours, respectively.

Table 26 summarizes the overall freeway system performance within the Martin Luther King Jr. Medical Center Campus Project study area during the AM and PM peak hours. Under the Cumulative (2014) Base (without Project) conditions, as shown in Table 27, approximately 38% of the analyzed freeway segments located within the study area would operate at acceptable levels of service (LOS D or better) during the AM peak hour. Approximately 13% and 50% would operate at LOS E and LOS F, respectively. During the PM peak hour, approximately 42% of the analyzed freeway segments within the study area would operate at LOS D or better and 21% and 38% would operate at LOS E and LOS F, respectively.

It can be seen that the regional growth would bring certain segments of the I-105, I-70 and I-605 to LOS E or LOS F conditions during the AM and PM peak hours. It would also add to the congestion along some of the freeway segments that are currently operating at LOS E and LOS F during the peak hours.

[3] CMP monitoring location.

Future 2014 with Project Conditions

The Cumulative (2014) plus Tier I Project freeway operating conditions for the AM and PM peak hours are shown in Table 26. It can be seen that the Tier I Project traffic would improve operating conditions along the segments of the I-105, I-710 and I-110. However, some of these freeway segments continue to operate at LOS E and LOS F during the peak hours.

Table 26 indicates, under the Cumulative (2014) plus Tier I Project conditions, approximately 38% of the analyzed freeway segments located within the study area would operate at LOS D or better during the AM peak hour. Approximately 13% and 50% would operate at LOS E and LOS F, respectively. During the PM peak hour, approximately 42% of the analyzed freeway segment within the study area would operate at LOS D or better and 21% and 38% would operate at LOS E and LOS F, respectively.

Tier I Project Freeway Impacts. According to the 2004 CMP impact criteria, a project impact is considered to be significant if the Proposed Project increases traffic demand on a CMP facility by 2% of capacity (V/C >= 0.02), causing or worsening LOS F (V/C > 1.00). Under this criterion, a project would not be considered to have a significant impact if the analyzed facility is operating at LOS E or better after the addition of project traffic. However, if the facility is operating at LOS F with project traffic and the incremental change in the V/C ratio caused by the project is 0.02 or greater, the project would be considered to have a significant impact.

Table 26 summarizes the incremental increase in the D/C ratio which can be attributed to the Proposed Tier I Project during the AM and PM peak hours. Using the CMP significant impact criteria, the Proposed Tier I Project will not have any significant impacts during the AM and PM peak hours.

Future 2020 without Project Conditions

As with the intersection operations, traffic volumes on freeways would increase as a result of regional growth anticipated by the year 2020 and growth due to related projects within and in the vicinity of the Project study area. It was estimated that the growth in traffic on the freeways in the study area amounted to an increase of approximately 0.72% per year in the AM and PM peak hours, respectively.

Table 27 summarizes the overall freeway system performance within the Martin Luther King Jr. Medical Center Campus Project study area during the AM and PM peak hours. Under Cumulative (2020) Base conditions, as shown in Table 27, approximately 21% of the analyzed freeway segments located within the study area would operate at acceptable levels of service (LOS D or better) during the AM peak hour. Approximately 21% and 58% would operate at LOS E and LOS F, respectively. During the PM peak hour, approximately 33% of the analyzed freeway segments within the study area would operate at LOS D or better and 13% and 54% would operate at LOS E and LOS F, respectively.

It can be seen that the regional growth would bring certain segments of the I-105, I-70 and I-605 to LOS E or LOS F conditions during the AM and PM peak hours. It would also add to the congestion along some of the freeway segments that are currently operating at LOS E and LOS F during the peak hours.

Future 2020 with Project Conditions

The Cumulative (2020) plus Tier I and II Project freeway operating conditions for the AM and PM peak hours are shown in Table 27. It can be seen that the Tier I and II Project traffic would bring certain segments of the I-105, I-710 and I-110 to LOS E or LOS F conditions during the AM and PM peak hours. However, some of these freeway segments are currently operating at LOS E and LOS F during the peak hours.

Table 27 indicates, under the Cumulative (2020) plus Tier I and II Project conditions, approximately 21% of the analyzed freeway segments located within the study area would operate at LOS D or better during the AM peak hour. Approximately 21% and 58% would operate at LOS E and LOS F, respectively. During the PM peak hour, approximately 29% of the analyzed freeway segment within the study area would operate at LOS D or better and 13% and 58% would operate at LOS E and LOS F, respectively.

Tier II Project Freeway Impacts. Table 27 summarizes the incremental increase in the D/C ratio which can be attributed to the Proposed Tier II Project during the AM and PM peak hours. Using the CMP significant impact criteria, the Proposed Tier II Project will have significant impacts at two of the analyzed freeway segments during the AM and/or PM peak hours.

[3] CMP monitoring location.

The impacted freeway segments include the following:

- I-105 Freeway west of Long Beach Boulevard – westbound direction (AM Peak Hour)
- I-105 Freeway west of Long Beach Boulevard – eastbound direction (PM Peak Hour)
- I-105 Freeway west of I-710 Freeway – eastbound direction (PM Peak Hour)

Per Caltrans traffic study guidelines, the Project's proportional share at these locations has been determined and is included in Appendix R.

CMP TRANSIT ANALYSIS

This subsection provides a description of the transit analysis performed in accordance with the Los Angeles County Congestion Management Program guidelines. The following components are involved in the CMP transit analysis:

- Evidence that affected transit operations received the Notice of Preparation (NOP);
- Summary of existing transit service in the study area;
- Project trip generation estimates;
- Project transit trip estimates;
- Project components including facilities and programs to encourage public transit use;
- Analysis of transit impacts and mitigations, if any.

Evidence that affected transit operators received the NOP

The NOP was sent out to Metro and as well as the several other transit operators serving the study area. The list of recipients of the NOP is included in the DEIR.

Summary of Existing Transit Services in the Project Area

It is required that all local fixed route services within a ¼ mile radius of the project, express bus routes within a 2 miles radius of the project, and rail service within a 2 mile radius of the project be included as part of this CMP transit analysis. Chapter 2, Existing Transit Conditions section includes a description of all key transit routes within the Project Area as defined above. Figure 5 in Chapter 2 includes all transit lines within the study area.

Table 28 includes all transit lines serving the vicinity of the Project site. Information on the service provider line number, service area, service type, hours of operations and AM, Mid-day, and PM frequencies have been compiled in Table 28. Within the vicinity of the Project site, it can be observed that 33 buses per direction and 20 trains per direction serve the vicinity of the Project site in the morning peak hour while 41 buses per direction and 20 trains per direction serve the community in the evening peak hour.

Project Trip Generation Estimates

Table 18 in Chapter 4 summarizes the Tier I and II Project Trip Generation Estimates. It can be observed from Table 18 that the Proposed Tier I Project generates a net total reduction of approximately -5,771 daily trips of which -391 trip ends occur during the morning peak hour and -398 trip ends occur during the evening peak hour, prior to any transit and internal trip adjustments. The Proposed Tier I and II Project (combined) generates a net total of approximately 32,527 daily trips of which 2,044 trip ends occur during the morning peak hour and 2,834 trip ends occur during the evening peak hour, prior to any reductions due to transit and internal trips.

Project Transit Trip Estimates

The transit trips expected to be generated by the Project was estimated based on the number of vehicle trips, per the guidelines outlines in the CMP document, Section B.8.4. The transit trip estimates are summarized in Table 29. These estimates assume an Average Vehicle Occupancy (AVO) of 1.40 and a maximum of 15% reduction in auto trips resulting in 15% of the total person trips using transit. This analysis assumes a conservative worst-case usage of 15% transit. From Table 29, it can be observed that the Proposed Tier 1 Project would generate a net total reduction of approximately -1,212 daily person transit trips including -82 morning peak hour transit trips and -84 evening peak hour transit trips. Under Tier I and II Project conditions, the Project would generate approximately 6,831 daily person transit trips including 429 morning peak hour transit trips and 595 evening peak hour transit trips.

Transit Impact Analysis and Mitigations

Transit impact analysis was performed based on the methodology laid out in the Los Angeles County CMP document. The number of project-generated transit trips is estimated and the existing and proposed transit capacity serving the study area is determined.

TABLE 28
EXISTING TRANSIT ROUTES SERVING THE PROJECT SITE

PROVIDER	LINE NUMBER / COLOR	SERVICE AREA	SERVICE TYPE	HOURS OF OPERATIONS	FREQUENCY (AM/MID-DAY/PM)	BUS LINE TRAVEL CORRIDOR

Legend:
MTA - Metropolitan Transportation Authority is operated by the Los Angeles County Metropolitan Transportation Authority
DASH - Downtown Area Short Hop is operated by the City of Los Angeles, Department of Transportation
CRT - Compton Renaissance Transit System is operated by the City of Compton
GMB - Gardena Municipal Bus Line (GMB) is operated by the City of Gardena
HTS - Hahn Trolley and Shuttle Service is operated by the Watts Labor Community Action Committee

TABLE 29
CONGESTION MANAGEMENT PROGRAM TRANSIT TRIP ESTIMATES

	Daily	AM Peak Hour	PM Peak Hour
TIER I PROJECT TRIPS OVERALL			
# of Trips	(5,771)	(391)	(398)
AVO factor	1.4	1.4	1.4
# of people trips	(8,079)	(547)	(557)
% Transit factor	15%	15%	15%
transit trips	(1,212)	(82)	(84)
Total (Person) Transit Trips	(1,212)	(82)	(84)
TIER I AND II PROJECT TRIPS OVERALL			
# of Trips	32,527	2,044	2,834
AVO factor	1.4	1.4	1.4
# of people trips	45,538	2,862	3,968
% Transit factor	15%	15%	15%
transit trips	6,831	429	595
Total (Person) Transit Trips	6,831	429	595

Table 30 summarizes the transit demands and impact analysis. As indicated in Table 30, there are a total of approximately 66 to 82 buses during the peak hours that serve the study area, as well as 40 trains (Metro Green Line and Blue Line) that operate during the peak hours. There would be residual capacity available on a daily basis, both on the existing bus and train lines, serving the study area. Further, the existing residual transit system supply would accommodate the Proposed Project's anticipated transit demands.

TABLE 30
CONGESTION MANAGEMENT PROGRAM TRANSIT IMPACT ANALYSIS

	AM Peak Hour	PM Peak Hour

VI. ALTERNATIVES ANALYSIS

This chapter presents a summary of the project alternatives for the Martin Luther King Jr. Medical Center Campus Redevelopment Project. Alternatives analyses are required per CEQA as part of the Environmental Impact Report (EIR) being prepared for the Project. The trip generation estimates of the alternatives, as well as their potential traffic impacts in relation to those of the Proposed Project are discussed in this chapter.

A total of six alternatives have been analyzed in this study. They include the following:

- No Project Alternative
- Alternative 1 – Reduced Project Size Alternative (900,000 square feet in Tier II)
- Alternative 2 – Re-opening of Existing MACC Alternative (250 Beds)
- Alternative 3 – Public Transportation Focused Alternative
- Alternative 4 – 500 Beds Alternative (in Tier I)
- Alternative 5 – No Tier II Alternative

A description of the above alternatives including their proposed land uses and their corresponding trip generation estimates and comparison to the Proposed Project's trip generation is provided in the following sections. The same trip generation rates and assumptions as those used for the Proposed Project have been utilized for the analysis and evaluation of these alternatives.

Table 31 summarizes the net trip generation estimates of all project alternatives as well as a comparison of those estimates to that of the Proposed Project. The differences in trip generation estimates of the various alternatives in relation to those of the Proposed Project expressed in net AM, PM and daily total trip ends as well as percentages are all shown in Table 31 as well. As indicated in the table, all of the proposed alternatives would generate less trips than those generated by the Proposed Project.

TABLE 31
ALTERNATIVES ANALYSIS - SUMMARY AND COMPARISON OF NET TRIP GENERATION ESTIMATES

Scenario	DAILY TOTAL	AM PEAK HOUR IN	AM PEAK HOUR OUT	AM PEAK HOUR TOTAL	PM PEAK HOUR IN	PM PEAK HOUR OUT	PM PEAK HOUR TOTAL
Proposed Project							
Total Net Trip Generation - Tier I + II	19,677	921	319	1,240	568	1,185	1,753
No Project Alternative	0	0	0	0	0	0	0

Alternative 5 - No Tier II Alternative *	(4,905)	(196)	(136)	(332)	(142)	(196)	(338)
Difference from Proposed Project	(24,582)	(1,117)	(455)	(1,572)	(710)	(1,381)	(2,091)
% Difference	*>-100%*	*>-100%*	*>-100%*	*>-100%*	*>-100%*	*>-100%*	*>-100%*

Note: * In this 'No Tier II Alternative', existing buildings with entitlements will be reduced in entitlements by relinquishing those uses from the buildings.

NO PROJECT ALTERNATIVE

The No Project Alternative, which is required for all EIRs, assumes there would be no change to the existing conditions and use of the project site. The existing structures would remain as they currently are and the limited operations at the hospital would continue. Construction of the Tier I and II portions of the Project would not be completed under the No Project Alternative. Therefore, no further analysis is needed for this Alternative. This Alternative will result in no significant traffic impacts and implementation of any mitigation measures would not be required.

ALTERNATIVE 1 – REDUCED PROJECT SIZE ALTERNATIVE

Alternative 1, the Reduced Project Size Alternative, would include the same elements that are described in Tier I of the Proposed Project but have reduced Tier II uses. This Alternative would consist of the same project-level development and improvements described in Tier I of the Proposed Project including the construction of 156,700 square feet, consisting of a new 132,000 square feet MACC and 24,700 square feet ancillary building, tenant improvements in existing buildings, and site improvements. The tenant improvements would be performed in the North and South Support buildings, Interns and Physicians building and Plant Management building to provide support to the new MACC building. Additionally, Tier I would include site improvement consisting of a new parking terrace, new parking lots, and re-striping of existing lots.

Alternative 1 would vary from the Proposed Project in its development of Tier II. Under this Alternative, Tier II of the Proposed Project would still entail the development of a Campus-wide Master Plan and their respective improvements. The buildings that have been identified as being replaced, demolished, or reused for the Proposed Project would be replaced, demolished or reused for this Alternative. However, the potential buildout of Tier II of this Alternative would be less than half of the development that would be included for Tier II of the Proposed Project. Alternative I Tier II would consist of a maximum potential buildout of 900,000 square feet and include 562,753 square feet of hospital use, 39,676 square feet of retail use, 148,785 square feet of medical office use, 74,393 square feet of general office use, and 50 single family residential dwelling units (in approximately 74,393 square feet).

Table 32 presents details of Alternative 1 Project's trip generation including type of use, size, applicable rate and trip generation estimates. Other calculations within the tables also provide for trip generation reductions from transit, internal capture, and pass-by trips.

Alternative 1 Tier I trip generation would be the same as that of Tier I of the Proposed Project. As indicated in Table 32, Tier I would result in 2,586 daily trips of which 176 trips would occur in the morning peak hour and 179 trips would occur in the evening peak hour. Since Tier I also involves removal of existing uses, a net reduction in trips of approximately 4,905 daily trips, 332 A.M. trips and 338 P.M. trips would occur.

Alternative I Tier II component trip generation would result in a net total of approximately 11,909 daily trips of which 745 trips would occur during the morning peak hour and 1,048 trips during the evening peak hour.

Alternative 1 Tiers I and II combined would have a total net trip generation of 7,004 daily trips of which 413 trips would occur during the morning peak hour and 710 trips during the evening peak hour. As indicated in Table 31, this represents 64% less daily trips than the Proposed Project and 67% and 59% less trips during the morning and evening peak hours, respectively.

Similar to the Proposed Project, the Reduced Project Size Alternative would have the potential to result in significant traffic impacts. However, this Alternative would adversely impact traffic to a lesser degree, based on the 67% less trip generation than the Proposed Project. No significant differences in travel patterns outside the project area would be expected between this Alternative and that of the Proposed Project.

ALTERNATIVE 2 – RE-OPENING OF THE EXISTING MACC ALTERNATIVE

Alternative 2, the Re-Opening of the Existing MACC Alternative, would contain no new development. This Alternative would restore the former outpatient and inpatient functions of the MACC building into the existing MACC building located on the existing campus. The existing MACC would be re-opened and would provide up to 250 beds, along with the inpatient services that were previously provided at the hospital. The new MACC and Ancillary buildings would not be constructed and the related tenant and site improvements would not be completed. The focus of this Alternative would be to obtain the licensing, funding, and adequate operational requirements

TABLE 32
ESTIMATED TRIP GENERATION - ALTERNATIVE 1

			AM Peak Hour			PM Peak Hour		
	Size	Daily	IN	OUT	TOTAL	IN	OUT	TOTAL
Proposed Tier I								
Hospital - Removal of Use [1]	(506,485) s.f.	(8,357)	(335)	(232)	(567)	(242)	(335)	(577)
Hospital - Addition	156,700 s.f.	2,586	104	72	176	75	104	179
Tier I Net Trip Generation Total		(5,771)	(231)	(160)	(391)	(167)	(231)	(398)
Tier I Net Trip Generation Less Transit Reduction (15%)		**(4,905)**	**(196)**	**(136)**	**(332)**	**(142)**	**(196)**	**(338)**
Proposed Tier II								
Hospital (Additional Campus Support)	562,753 s.f.	9,285	372	258	630	270	372	642

Single Family Residential	50 d.u.	550	11	34	45	35	21	56
Medical Office	148,785 s.f.	5,376	270	72	342	139	376	515
General Office	74,393 s.f.	1,062	130	18	148	28	134	162
Tier II Trip Generation Total		19,997	837	417	1,254	640	1,077	1,717
Tier II Trip Generation Total Less Transit Reduction (15%)		16,997	711	354	1,065	544	915	1,459
*Internal Capture Trip Credit (15% - Existing + Tier I + II)		(4,431)	(144)	(144)	(288)	(175)	(174)	(349)
**Pass-By Trip Credit [2]		(657)	(24)	(8)	(32)	(22)	(40)	(62)
Tier II Net Trip Generation Total		**11,909**	**543**	**202**	**745**	**347**	**701**	**1,048**
Alternative 1 - Tier I + Tier II Net Trip Generation Total		**7,004**	**347**	**66**	**413**	**205**	**505**	**710**

* Internal capture credit taken after reduction of transit trips.
** Pass-by trip reduction taken after transit trip and internal capture credits.
[1] Demolition of this facility would occur in Tier II.
[2] Includes 10% pass-by credit for medical office use and retail use.

(including but not limited to staff, supplies, etc.) to re-open the existing MACC. Only the existing MACC would be reused. No other buildings would be replaced, demolished or reused.

Under this Alternative, it is anticipated that no community-based, comprehensive, or mixed use development as described in Tier II, Master Plan Development of the Proposed Project would occur. There would be no new development.

Alternative 2 would contain no new development and therefore would not generate any new trips. This Alternative would generate trips less than the existing baseline. The existing baseline trip generation includes both operational and non-operational existing uses which includes the existing MACC Building. The Re-opening of the Existing MACC Alternative would result in no significant traffic impacts and implementation of any mitigation measures would not be required.

ALTERNATIVE 3 – PUBLIC TRANSPORTATION FOCUSED ALTERNATIVE

Alternative 3, the Public Transportation Focused Alternative, would consist of both Tier I and Tier II development elements of the Proposed Project. Buildings would be reused, replaced, or removed and Tier II elements of the Proposed Project would be developed. Additionally, there would be a greater focus on enhancing the current public transportation services at the existing campus and the surrounding area. The intent of this Alternative is to reduce the anticipated vehicle trips to the campus by approximately 10% more than that of the Proposed Project by implementing a series of transit improvement measures.

The transit improvement measures provided in this Alternative could potentially include a combination of one or more of the following - increase of frequency of service, improvement of connectivity in the system, coordination of transfers and other incentives for increased transit usage. The potential frequency improvement measures could be achieved by increasing the frequency of the Metro Green and Blue lines and by adding more connections between campus and the metro stations. Additional bus routes including extension of Metro Rapid Service with close coordination with the Metropolitan Transportation Authority (MTA) would also be explored with this Alternative. Improvement of frequency, connectivity and coordination of transfers between various transit lines operated by MTA, Los Angeles Department of Transportation Downtown Area Short Hop (DASH), Renaissance Transit System, Gardena Municipal Bus Line, Rosewood Smart Shuttle, Lynwood Trolley, Torrance Transit System, Carson Circuit System, Long Beach Transit, and the Hahn Trolley Shuttle Service would also be explored in this Alternative. The county would also investigate the potential to increase subsidies for visitors using public transportation as well as provision of universal transit passes to employees at subsidized fares. Finally, the County would seek to utilize / purchase an off-site parking lot for patients / visitors to use instead of parking on campus and to use and then be transferred (via shuttle) to/from the campus.

Table 33 presents details of Alternative 3 trip generation including type of use, size, applicable rate and trip generation estimates. Other calculations within the tables also provide for trip generation reductions from transit, internal capture, and pass-by trips. As indicated in Table 33, Alternative 3 Tiers I and II combined would have a total net trip generation of 17,709 daily trips of which 1,116 trips would occur during the morning peak hour and 1,578 trips during the evening peak hour. As indicated in Table 31, this represents 10% less daily, morning and evening peak hour trips than the Proposed Project.

Similar to the Proposed Project, Alternative 3 would have the potential to result in significant traffic impacts. However, this Alternative would adversely impact traffic to a lesser degree, given up to 10% less in trip generation, than the Proposed Project. No significant differences in travel patterns outside the project area would be expected between this Alternative and the Proposed Project.

ALTERNATIVE 4 – 500 BEDS (IN TIER I) ALTERNATIVE

Alternative 4, 500 Beds (in Tier I) Alternative, wound contain no new development. This Alternative would consist of the development and operation of a 500-bed hospital located on the existing campus. The focus of this Alternative would be ensuring that there is a 500 bed facility of the campus. Tier I would consist of the development of a 500 bed hospital that would occupy the existing MACC. The existing MACC would provide up to 500 inpatient beds along with the inpatient services that were previously provided at the hospital.

Similar to Alternative 2, Re-Opening the Existing MACC Alternative, this Alternative would place a limited amount of the former outpatient and inpatient (i.e. the trauma center, emergency services, and up to 500 beds) functions of the MACC building into the existing MACC building.

TABLE 33
ESTIMATED TRIP GENERATION - ALTERNATIVE 3

			AM Peak Hour			PM Peak Hour

* Internal capture credit taken after reduction of transit trips.
** Pass-by trip reduction taken after transit trip and internal capture credits.
[1] Demolition of this facility would occur in Tier II.
[2] Includes 10% pass-by credit for medical office use and retail use.

The new MACC and Ancillary buildings would not be constructed and the related tenant and site improvements would not be completed. The focus of this Alternative would be to obtain the licensing, funding, and adequate operational requirements (including but not limited to staff, supplies, etc.) to re-open the existing MACC.

Under this Alternative, it is anticipated that no community-based, comprehensive, or mixed use development as described in Tier II, Master Plan Development of the Proposed Project would occur. There would be no new development.

Alternative 4 would contain no new development and therefore would not generate any net new trips. This Alternative would generate trips equal to or less than the existing baseline. The existing baseline trip generation includes both operational and non-operational existing uses which includes the existing MACC Building. Alternative 4 would result in no significant traffic impacts and implementation of any mitigation measures would not be required.

ALTERNATIVE 5 – NO TIER II ALTERNATIVE

Alternative 5, No Tier II Alternative, would entail the development of Tier I of the Proposed Project. This Alternative would focus on the development of two new buildings (the new 132,000 square feet MACC and 24,700 square feet Ancillary Building) tenant improvements in existing buildings, site improvements, and potential relocation of the MRI Building.

This Alternative would not entail the Campus-wide Master Plan development described in Tier II of the Proposed Project. The existing MACC building, Emergency Room, Storage Building, and Cooling Towers would be vacated but would not reused, replaced, or removed as part of this Alternative. Under this Alternative, it is anticipated that no community-based mixed-use development as described in Tier II Master Plan development of the Proposed Project would occur. There would be no Tier II development.

Alternative 5 Tier I trip generation would be the same as that of the Tier I of the Proposed Project. As indicated in Table 34, Tier I would result in 2,586 daily trips of which 176 trips would occur in the morning peak hour and 179 trips would occur in the evening peak hour. Since Tier I also involves removal of existing uses, a net reduction in trips of approximately 4,905 daily trips, 332 A.M. trips and 338 P.M. trips would occur.

TABLE 34
ESTIMATED TRIP GENERATION - ALTERNATIVE 5

			AM Peak Hour			PM Peak Hour		
	Size	**Daily**	**IN**	**OUT**	**TOTAL**	**IN**	**OUT**	**TOTAL**
Proposed Tier I								
Hospital - Removal of Use	(506,485) s.f.	(8,357)	(335)	(232)	(567)	(242)	(335)	(577)
Hospital - Addition	156,700 s.f.	2,586	104	72	176	75	104	179
Tier I Net Trip Generation Total		(5,771)	(231)	(160)	(391)	(167)	(231)	(398)
Tier I Net Trip Generation Less Transit Reduction (15%)		**(4,905)**	**(196)**	**(136)**	**(332)**	**(142)**	**(196)**	**(338)**

Since Alternative 5 does not contain Tier II development but involves vacation of existing entitlement, this Alternative would result in less trips that that projected for the Proposed Project.

Alternative 5 would result in the net reduction of trips on the street system since it would not generate any net new trips. This Alternative would result in no significant traffic impacts and implementation of any mitigation measures would not be required.

VII. SUMMARY OF CONCLUSIONS

This study was undertaken to assess existing traffic conditions, estimate future conditions with and without the proposed project, analyze potential traffic impacts of the Proposed Project, assess required improvements and identify/recommend project mitigation to alleviate the significant traffic impacts on the transportation system. Raju Associates, Inc. performed this detailed study and the following summarizes the results of the analysis:

- The Project study area encompasses a geographic area bounded by the Century Boulevard to the north, the I-110 Freeway to the west, the SR-91 Freeway to the south and Long Beach Boulevard to the east. The study area was established working closely with the County of Los Angeles by reviewing the travel patterns of the Proposed Project to ensure that all potential traffic impacts of the Martin Luther King Jr. Medical Center Campus Project would be addressed. Within the study area, 64 intersections have been selected for detailed study. These study intersections are located in the County of Los Angeles and Cities of Compton, Los Angeles, and Lynwood jurisdictions.

- Key elements of the traffic study include assessment of existing conditions, evaluation of future horizon year (2014) conditions without and with the Tier I Project, evaluation of future horizon year (2020) conditions without and with the Tier I and II Project, determination of the Proposed Project's trip generation, distribution and assignment on the roadway network, analysis of future conditions with the Proposed Project prior to mitigation, identification of significant impacts, testing of mitigation measures and documentation of significant impacts, if any.

- A detailed inventory of the existing roadway and transit systems was assembled to define the existing transportation supply-side parameters. Detailed field surveys were conducted to compile the specific parameters.

- Detailed morning and evening peak period traffic counts on a commuter weekday were conducted and the peak hour traffic demands on the roadway system were identified.

- Currently, 63 of the 64 analyzed intersection locations are operating at acceptable levels of service (LOS D or better) both during the morning and evening peak hours.

Future Year 2014 – Tier I Analysis

- At the 27 intersections located in the County of Los Angeles, in the Existing (Baseline) with Ambient Growth (2014) conditions, i.e., future conditions without the implementation of the proposed project, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

- At the study intersections located in the other jurisdictions, in the Cumulative (2014) Base conditions, i.e., future conditions without the implementation of the proposed project, 36 of the 37 analyzed intersections in both the morning and evening peak hours are projected to operate at LOS D or better.

- The Proposed Tier I Project involves construction of 156,700 square feet including a new MACC and ancillary buildings, tenant improvements in existing buildings, and site improvements. The construction of Tier I would also include the removal of four structures containing approximately 506,485 square feet. The Tier I Project is estimated to generate a net total of -332 trips during the morning peak hour and -338 trips during the evening peak hour.

- At the County of Los Angeles locations, under the Existing (Baseline) with Ambient Growth (2014) plus Project conditions, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better. The Existing (Baseline) with Ambient Growth (2014) plus Project conditions indicate that the Proposed Tier I Project would not cause a significant traffic impact at any of the analyzed intersections.

- Under the cumulative (2014) with Tier I Project conditions, 63 of the 64 analyzed intersections in the morning peak hour are projected to operate at LOS D or better. During the evening peak hour, 62 of the 64 analyzed intersections are projected to operate at LOS D or better. At the 27 County of Los Angeles locations, 27 intersections during the morning peak hour and 26 intersections during the evening peak hour are projected to operate at LOS D or better. At the 37 locations in other jurisdictions, 36 intersections during both the morning and evening peak hours are projected to operate at LOS D or better.

- At the County of Los Angeles locations, the Existing (Baseline) with Ambient Growth (2014) plus Tier I Project and Related Projects traffic conditions indicate that the cumulative projects (including the Proposed Tier I Project) would not cause a significant traffic impact at any of the analyzed intersections.

- At the study intersections located in other jurisdictions, the Cumulative (2014) plus Tier I Project conditions indicate that the Proposed Tier I Project would not cause a significant traffic impact at any of the 37 analyzed intersections.

Future Year 2020 – Tier II Analysis

- At the County of Los Angeles locations, in the Existing (Baseline) with Ambient Growth (2020) conditions, i.e., future conditions without the implementation of the proposed project, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

- At the study intersections located in the other jurisdictions, in the Cumulative (2020) Base conditions, i.e., future conditions without the implementation of the proposed project, 36 of the 37 analyzed intersections during the morning peak hour are projected to operate at

LOS D or better. During the evening peak hour, 34 of the 37 analyzed intersections during the morning peak hour are projected to operate at LOS D or better.

- The Proposed Tier II Project consists of 1,134,695 square feet of hospital use, 80,000 square feet of retail use, 300,000 square feet of medical office use, 150,000 square feet of general office use, and 100 single-family residential dwelling units. The Tier II Project is estimated to generate a net total of 1,572 trips during the morning peak hour and 2,091 trips during the evening peak hour.

- The overall Proposed Project (Tier I combined with Tier II) would have a total net trip generation of 1,240 trips (918 inbound, 322 outbound) during the morning peak hour and 1,753 trips (571 inbound, 1,182 outbound) during the evening peak hour.

- At the County of Los Angeles locations, under the Existing (Baseline) with Ambient Growth (2020) plus Tier I and II Project conditions, 25 of the 27 analyzed intersections in the morning peak hour and 22 of the 27 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

- The Proposed Tier II Project would cause a significant traffic impact at 7 of the 27 analyzed County of Los Angeles intersections (7 in the AM peak hour and 5 in the PM peak hour) and includes the following intersections:

    - Compton Avenue/Imperial Highway – AM Peak Hour
    - I-105 Westbound Ramps/Imperial Highway – AM Peak Hour
    - Wilmington Avenue/118th Street – AM and PM Peak Hours
    - Wilmington Avenue/120th Street-119th Street – AM and PM Peak Hours
    - Wilmington Avenue/I-105 Eastbound Ramps – AM and PM Peak Hours
    - Wilmington Avenue/MLK Jr. Hospital Dwy-120th Street – AM and PM Peak Hours
    - Wilmington Avenue/El Segundo Boulevard – AM and PM Peak Hours

- Under the cumulative (2020) with Tier II Project conditions, 59 of the 64 analyzed intersections during the morning peak hour and 53 of the 64 analyzed intersections during the PM peak hour are projected to operate at LOS D or better. At the 27 County of Los Angeles locations, 24 intersections during the morning peak hour and 19 intersections during the evening peak hour are projected to operate at LOS D or better. At the 37 locations in other jurisdictions, 35 and 34 intersections are projected to operate at LOS D or better during the morning and evening peak hours, respectively.

- At the County of Los Angeles locations, the Existing (Baseline) with Ambient Growth (2020) plus Tier I and II Project and Related Projects traffic conditions indicate that the cumulative projects (including the Proposed Tier II Project) would cause a significant traffic impact at 13 of the 27 analyzed intersections (10 in the AM peak hour and 12 in the PM peak hour) and includes the following intersections:

    - Alameda Street/103rd Street – AM and PM Peak Hours
    - Alameda Street/El Segundo Boulevard – PM Peak Hour
    - Alameda Street/Imperial Highway – AM and PM Peak Hours

- Avalon Boulevard/El Segundo Boulevard – PM Peak Hour
- Central Avenue/El Segundo Boulevard – AM and PM Peak Hours
- Central Avenue/Rosecrans Avenue – PM Peak Hour
- Compton Avenue/Imperial Highway – AM Peak Hour
- I-105 Westbound Ramps/Imperial Highway – AM and PM Peak Hours.
- Wilmington Avenue/118th Street – AM and PM Peak Hours
- Wilmington Avenue/120th Street-119th Street – AM and PM Peak Hours
- Wilmington Avenue/I-105 Eastbound Ramps – AM and PM Peak Hours
- Wilmington Avenue/MLK Jr. Hospital Dwy-120th Street – AM and PM Peak Hours
- Wilmington Avenue/El Segundo Boulevard – AM and PM Peak Hours

- At the study intersections located in the other jurisdictions, the Cumulative (2020) plus Tier I and II Project conditions indicate that the Proposed Tier II Project would cause a significant traffic impact at one of the 37 analyzed intersections. The intersection of Central Avenue/120th Street would be significantly impacted in both the morning and evening peak hours.

In order to address the Tier II Project's impacts, the following mitigation measures described in the section below are recommended for implementation by the Tier II Project:

- Compton Avenue/Imperial Highway – County of Los Angeles/City of Los Angeles: Restripe westbound approach to provide a separate right-turn lane.

- I-105 Westbound Ramps-Croesus Avenue/Imperial Highway – County of Los Angeles/City of Los Angeles/Caltrans: Provide a third northbound left-turn lane by widening off-ramp by 10' for approximately 150' to 200'.

- Wilmington Avenue/El Segundo Boulevard – County of Los Angeles/Compton: Restripe eastbound and westbound approaches to have separate right-turn lanes. Allow buses to go through the intersection from the right-turn lanes.

- Central Avenue/120th Street – City of Los Angeles: Restripe northbound approach to provide a separate right-turn lane. Also, widen the east leg by 3' on each curbside (i.e. reduce sidewalk along 120th street east of Central Avenue by 3' for approximately 120' and restripe westbound 120th Street approach to provide a left-turn, two through lanes and a separate right turn lane.

- Wilmington Avenue Corridor Improvements: Provide an additional southbound travel lane by widening 2' on either side of Wilmington Avenue (reducing the sidewalk to 8' from 10') and restriping the travel lanes between 120th Street-119th Street and the I-105 Eastbound Off-Ramp and by just restriping the lanes (after reducing the central median) between MLK Jr. Hospital Driveway-120th Street and 120th Street-119th Street. The following intersection improvements would also be implemented as part of this corridor improvement:

- Wilmington Avenue/I-105 Eastbound Ramps – County of Los Angeles/Caltrans: Provide an additional eastbound lane by widening (reducing the raised median on the ramp) the off-ramp. The eastbound approach would have a left-turn lane, shared left-right turn lane and a separate right-turn lane. The sidewalks on either side of Wilmington Avenue (as noted above) would be reduced by 2' and the Wilmington Avenue roadway would be widened by 2' on either side (a total of 4') from the south leg of this intersection.

  Provide an additional northbound left-turn lane by widening (reducing the medians). The northbound approach would have dual left-turn lanes and three through lanes.

- Wilmington Avenue/118th Street – County of Los Angeles: Widen Wilmington Avenue roadway by 2' on either side and restripe to provide two through lanes, a shared through-right turn lane and dual left-turn lanes along the southbound approach. Restripe the westbound approach to provide a separate right-turn land and a share left-through lane. Northbound approach would have the same lane geometry as existing conditions. Under cumulative conditions, widen 118th Street roadway by 4' and restripe to provide a separate right-turn lane and shared left-through lane along the eastbound approach.

- Wilmington Avenue/120th Street-119th Street – County of Los Angeles: Widen Wilmington Avenue roadway by 2' on either side and restripe the southbound approach to provide a separate right-turn lane, three through lanes and a left-turn lane.

  Restripe northbound approach to provide a shared through-right turn lane, two through lanes and a left-turn lane. Remove median adjacent to northbound approach to facilitate three southbound receiving lanes. Restrict parking along Wilmington Avenue roadway during AM and PM peak periods along the eastside of Wilmington between 120th Street & MLK Jr. Hospital Driveway Entrance.

  Widen 120th Street west of Wilmington Avenue for 250', on the south side by 2' and restripe the eastbound approach to provide a separate right-turn lane, dual left-turn lanes, and a through lane. The westbound approach of 119th Street would have the same lane geometry as existing conditions.

- Wilmington Avenue/MLK Jr. Hospital Entrance-120th Street – County of Los Angeles: Restripe southbound approach to provide a separate right-turn lane, two through lanes and a left turn lane. Provide three northbound receiving lanes and restrict on-street curb parking along the eastside of Wilmington Avenue between MLK Jr. Hospital Driveway-120th Street and 120th Street-119th Street during morning and evening peak hours.

  Remove median within the hospital entrance and restripe the driveway to provide dual left turn lanes, a through lane and a separate right-turn lane along the eastbound approach. Restripe to provide one receiving lane. The east-west signal phasing would operate as a split phase due to the lane configurations.

- The recommended improvements would fully mitigate the project-related impacts at the 8 impacted intersections.

In order to address the cumulative projects impacts determine using County of Los Angeles traffic study guidelines, the following mitigation measures described in the section below are recommended for implementation to alleviate the cumulative significant impacts. These improvements are needed in addition to the improvements identified above for the project-level mitigation measures.

- Avalon Boulevard/El Segundo Boulevard – County of Los Angeles: Widen NB approach by 2 feet and restripe the approach to provide a left turn lane, two through lanes and a separate right turn lane (10’, 10’, 10’, 12’). The approach could be widened by narrowing the 5’ median to a 3’ median, or by reducing the 12’ sidewalk to a 10’ sidewalk. This widening would need to occur all the way to an alley located approximately 100’ south of the intersection. The bus stop at this approach would continue to be located at the same location; however, buses would be allowed to go straight through the intersection.

- Alameda Street/El Segundo Boulevard – County of Los Angeles/Compton: Restripe northbound/southbound approaches and provide a SBR turn lane. The lanes along the north leg would be restriped to provide 13’ and 11’ receiving lanes; 10’, 11’, 10’, 12’ approach lanes for SBL, SBT, SBT, and SBR lanes, respectively. The lanes along the south leg would have 13’ shared thru-right, 11’ thru lane, 10’ left turn lane, 12’ receiving lane and a 20’ receiving lane. Remove 2 on-street parking spaces along SB approach during peak hours.

- Alameda Street/103rd Street – County of Los Angeles/Lynwood: Restripe eastbound approach to provide a 10’ left turn lane and a 12’ left-right shared lane. The receiving lane would be restriped for 18.5’.

- Central Avenue/Rosecrans Avenue – County of Los Angeles/Compton: Restripe westbound approach to provide a separate right-turn lane. Allow buses to go through the intersection from the right-turn lane.

- Central Avenue/El Segundo Boulevard – County of Los Angeles/Compton: Restripe SB approach to provide a separate right-turn lane. Widen NB approach by reducing median by 1’ to 2’. Provide restriping to show a separate NB right-turn lane. Allow buses to go through the intersection from the right-turn lane.

- Alameda Street/Imperial Highway – County of Los Angeles/City of Lynwood: Restripe southbound approach to provide the following roadway geometry: dual left-turn lanes, a through lane, a shared through-right turn lane, and a separate right turn lane.

- The recommended improvements would fully mitigate the cumulative projects-related impacts at the 13 impacted intersections.

SCOPING FOR TRAFFIC STUDY

Project Name:	Martin Luther King Jr. Medical Center Campus Redevelopment Project

3. Study Intersections: At minimum, the study shall include the following intersections. The list is subject to change after related projects, trip generation and distribution are determined. Consultant should check with adjoining Cities regarding their requirements in addition to the following County/City intersections. Documentation of the consultation from these agencies shall be included in the traffic study.

Xtn #	% County	Thomas Guide Page+Grid	N S/E W Street Name	City	Signalized	CMP
			See Attachment B.			

Cities to be consulted: Los Angeles, Compton, County of Los Angeles Regional Planning

4. Related Projects: Consultant should check with Los Angeles County Department of Regional Planning and planning departments of adjoining Cities. Documentation of the consultation from these agencies shall be included in the traffic study. Related projects list shall be submitted to TLD for our review and approval before being incorporated in the study.

5. Congested Management Program (CMP): A CMP TIA is required for all projects required to prepare an environmental assessment based on local determination or projects requiring a traffic study. Where the project meets the criteria established in the Transportation Impact Analysis (TIA section of the County of Los Angeles' CMP TIA Land Use Analysis Guidelines, a CMP analysis must be prepared. At a minimum, the geographic area examined in the TIA must include the following:

- All CMP arterial monitoring intersections (see Appendix A, exhibit A-2, page A-15 of the 2002 Guidelines), including freeway on- or off-ramp intersections, where the proposed project will add 50 or more trips during either the a.m. or p.m. peak hours.

- Main line freeway monitoring locations (see Chapter 2, exhibit 2-4, page 16 of the 2002 Guidelines) where the project will add 150 or more trips, in either direction, during the a.m. or p.m. weekday peak hours.

A copy of the 2002 CMP Land Use Analysis Guidelines can be obtained by calling the CMP Hotline at (213) 922-2830.

6. Freeway Analysis: The potential traffic impact on the following Freeway(s) must be considered.

- Century (I-105) Freeway, Long Beach (I-710) Freeway, Gardena (SR-91) Freeway, and Harbor (I-110) Freeway

The applicant shall consult with the State of California Department of Transportation (Caltrans) to determine the California Environmental Quality Act levels of significance with regard to traffic impacts on Caltrans' freeway facilities. This consultation shall also include a determination of Caltrans requirements for the study of traffic impacts to its facilities and the mitigation of any such impacts. This analysis must follow the most current Caltrans' Guide for the Preparation of Traffic Impact Studies (December 2002) and can be obtained from http://www.dot.ca.gov/hq/traffops/developserv/operationalsystems/reports/tiguide.pdf. If Caltrans finds that the project has a significant impact on the freeway, Caltrans shall be requested to include the basis for this finding in their response. If fees are proposed to mitigate the freeway impact, Caltrans shall be requested to identify the specific project to which the fees will apply. These written comments from Caltrans shall be included with the traffic study and submitted to Public Works for review and approval. If a documented good faith effort is made to consult with Caltrans and written comments cannot be obtained from within a reasonable amount of time, an analysis of the freeway impact shall be made using the County of Los Angeles' CMP Land Use Analysis Guidelines.

7. Other:

-For the proposed project and/or cumulative mitigation measures, a feasibility study, cost estimate, and conceptual plan (including signing and striping plans, signal plans, etc.) for the improvements shall be included in the study for review and approval.
A 40 foot scale site plan indicating all adjacent driveways, adjacent intersections, and opposite driveways along the project frontage shall be prepared and submitted to our Land Development Review Section of Traffic and Lighting Division.
Additional intersections may be added if required upon the review of the study.
Traffic Counts:
• Must be taken on Tuesdays, Wednesdays or Thursdays.
• Must exclude holidays, and the first weekdays before and after the holiday.
• Must be taken on days when local schools or colleges are in session.
• Must be taken on days of good weather, and avoid atypical conditions (e.g., road construction, detours, or major traffic incidents).
• Traffic counts used for other traffic studies in the area shall **NOT** be reused again, unless 25% of the counts conducted for that particular traffic study are validated with new counts. The difference in volumes between the old and new counts at each corresponding movement should not be more than 10%.
• New traffic counts shall be checked to ensure the difference in volumes at corresponding approaches, if applicable, between two adjacent intersections is no more than 10% unless the difference can be justified.
• The County's methodology shall be used when evaluating the County and/or County/City intersections. The applicant must confer with Caltrans and City of Los Angeles in order to select the methodology to use when determining the impact to the freeways and the transportation circulation system within their respective jurisdictions.

This analysis must follow the most current Traffic Impact Analysis Report Guidelines.

Address:	500 West Temple Street, Room 754		
City:	Los Angeles	**Zip:**	90012

The traffic study (TS, required as part of the environmental review process, has been received. **Before a traffic study review can begin, the indicated fee must be paid to this Department.** The fee may be paid in person or mailed to:

In Person	By Mail
Cashier, Mezzanine (626) 458-6399 **Los Angeles County Department of Public Works** **900 South Fremont Avenue** **Alhambra, CA 91803-1331**	**Cashier, Mezzanine** **Los Angeles County Department of Public Works** **P.O. Box 1460** **Alhambra, CA 91802-1460**

Please **return this form** along with your payment to insure proper credit to your account. Make check payable to the **Los Angeles County Department of Public Works.**

TS review fees are based on the number of Average Daily Trips (ADT's) generated by the project (before any trip reductions or credits) and for six traffic conditions as indicated on page 5 of our 1997 guidelines, as follows:

ADT's		**FEE (Effective September 22, 2008)*	Conditions/phases/alternatives
1 - 1,000		$1,574	
1,001 - 5,000		$3,147	
5,001 - 10,000		$3,935	
10,001 and over		$4,722	
ADT For This Project:	32,449	Fee:	$4,722

* For additional information, http://planning.lacounty.gov/fees ** Additional fee is required for additional traffic conditions/phases/alternatives, and for 3rd & alternating subsequent reviews of the study for the same project.

Processing Engineer		Section	Telephone No.	Fax No.	E-Mail Address
	Jeff Pletyak, P.E.	Traffic Studies	(626) 300-4721	(626) 300-4736	JPletyak@ladpw.org

EXHIBIT B-5

GENERAL PROCEDURE FOR CALCULATING TRIP DISTRIBUTION

1. Using Exhibit B-2 as guidance, determine the proportion of project trip generation which is work versus non-work. Assumptions and sources for land uses not listed in Exhibit B-2 must be documented.

2. Using Exhibit B-4, determine the RSA in which the project is located (the "project RSA").

3. Using Exhibit B-3, determine the RSA-level work and non-work trip distributions for the project. Any basis for variation from these travel patterns must be documented.

4. While specific characteristics of the project and study area must be considered, traffic assignment should be conducted according to the following guidelines:

    a. Trips internal to the project RSA may be primarily assigned to non-CMP routes;

    b. Trips from the project RSA to adjacent RSAs should be primarily assigned to CMP arterials or freeways, if present; and

    c. Trips from the project RSA to RSAs not adjacent to the project RSA should be primarily assigned to freeways, if present.

Caltrans Analysis

APPENDIX R. CALTRANS ANALYSIS

This appendix section includes an evaluation of the freeway operations and ramp intersections using Caltrans' guidelines and has also been performed at Caltrans' request for informational and long-range planning purposes.

ANALYSIS SCENARIOS

The analysis presented in this section was conducted for the following scenarios:

- Existing (2010) Conditions - The analysis of existing traffic conditions is intended to provide a basis for the remainder of the study.

Future Year 2014 Conditions – Tier I Analysis

- Cumulative (2014) Base Conditions - Future traffic conditions without the proposed project has been developed for the year 2014. The objective of this analysis is to project future traffic growth and operating conditions, which could be expected to result from regional growth and related projects in the vicinity of the study area by the year 2014.
- Cumulative (2014) plus Tier I Project Conditions – The net traffic expected to be generated by the Proposed Tier I Project is estimated and added to the Cumulative (2014) Base traffic forecasts.

Future Year 2020 Conditions – Tier II Analysis

- Cumulative (2020) Base Conditions - Future traffic conditions without the proposed project has been developed for the year 2020. The objective of this analysis is to project future traffic growth and operating conditions, which could be expected to result from regional growth and related projects in the vicinity of the study area by the year 2020.
- Cumulative (2020) plus Tier I and II Project Conditions – The net traffic expected to be generated by the Proposed Tier I and II Project is estimated and added to the Cumulative (2020) Base traffic forecasts.

As part of the Congestion Management Program and Caltrans analysis, 12 freeway segments are analyzed and 10 intersection ramp locations. These locations include segments of the Century (I-105) Freeway, Harbor (I-110) Freeway, Long Beach (I-710) Freeway and Artesia (SR-91) Freeway.

TRAFFIC VOLUMES

Existing traffic volumes for the freeway segments were obtained from 2008 Caltrans Traffic Volumes (ADT and peak hour volume data). These traffic volumes were adjusted using a growth rate of 0.72% per year to reflect Year 2010 conditions. This growth rate was obtained from the 2004 Congestion Management Program (CMP) for Los Angeles County. Intersection ramp locations existing traffic counts were collected in January and April 2010.

Future 2014 and 2020 traffic volumes were developed using the same methodology described in both Chapters 3 and 4 in the traffic study report.

FREEWAY MAINLINE SEGMENTS

Freeway mainline segments were analyzed for operating conditions and significant impacts in accordance with the Los Angeles County Congestion Management Program (CMP) guidelines identified in Chapter 5. Operating conditions on freeways were classified by LOS based on the measured flow past a point on a “screenline” compared to the estimated capacity of that section of the freeway. Capacity is calculated by multiplying the lane capacity by the number of lanes in each segment. In accordance with CMP guidelines, the lane capacities are assumed to be 2,000 vehicles per hour (vph) and 1,000 vph per high-occupancy vehicle (HOV) and auxiliary lanes. The LOS definitions for freeway segments are presented in Table R1.

Tables R2 and R3 summarize the freeway segments volumes, demand-to-capacity (D/C) ratios and Levels of Service during the peak hours at the analyzed locations for both existing and future conditions using the above described methodology. In addition to these analyses, operating conditions were determined using Highway Capacity Methodology (HCM) for the freeway mainline segments. The results of this analysis are included in Tables R4 through R6.

Significant Impact Criteria

According to the 2004 CMP impact criteria, a project impact is considered to be significant if the Proposed Project increases traffic demand on a CMP facility by 2% of capacity ($V/C >= 0.02$), causing or worsening LOS F ($V/C > 1.00$). Under this criterion, a project would not be considered to have a significant impact if the analyzed facility is operating at LOS E or better after the addition of project traffic. However, if the facility is operating at LOS F with project traffic and the incremental change in the V/C ratio caused by the project is 0.02 or greater, the project would be considered to have a significant impact.

There are no feasible mitigation measures that a single project can be expected to implement that would directly reduce freeway mainline impacts to less than significant. Caltrans requires that a applicant pay its fair-share of any feasible improvements that may be implemented at the significantly impacted segments. Caltrans has adopted a mathematical formula to calculate a project's fair-share of an overall improvement cost to the significantly impacted segments. The fair-share calculation assigns costs to a project in proportion to the project's share of the traffic growth between existing conditions and the long-range planning horizon year 2020. The payment of the fair-share amount is then deemed to be mitigation of the project impacts.

Tier I Freeway Impacts

Table R2 summarizes the incremental increase in the D/C ratio which can be attributed to the Proposed Tier I Project during the AM and PM peak hours. Using the CMP significant impact criteria, the Proposed Tier I Project will not have any significant impacts during the AM and PM peak hours.

Tier II Project Freeway Impacts

Table R3 summarizes the incremental increase in the D/C ratio which can be attributed to the Proposed Tier II Project during the AM and PM peak hours. Using the CMP significant impact criteria, the Proposed Tier II Project will have a significant impact at two of the analyzed freeway segments during either the AM and/or PM peak hours.

The impacted freeway segments include the following:

- I-105 Freeway west of Long Beach Boulevard – eastbound direction (PM Peak Hour) and westbound direction (AM Peak Hour)
- I-105 Freeway west of I-710 Freeway – eastbound direction (PM Peak Hour)

Potential mitigation measures for the impacted segments may include widening of the freeway mainline to provide for additional travel lanes. As mentioned above, the Project's fair-share participation in the mitigation measures was calculated by comparing the Project's traffic using the mainline segment to the total growth in the mainline segment traffic between today's levels and future 2020 levels. This calculation is consistent with the requirements of the Caltrans' Guidelines for Traffic Impact Studies. This fair-share calculation indicates that the Project would be responsible for between 16.28% and 22.64% of the cost of improvements along the I-105 Freeway mainline segments.

FREEWAY RAMPS

As indicated above, 10 of the study intersections are also freeway ramp locations and fall under Caltrans jurisdiction. Analyses were conducted for on-ramp and off-ramp evaluations.

On-Ramps

Based on on-ramp metering, Caltrans has established a maximum capacity of 900 vehicles per hour per lane (vphpl) for on-ramps. An on-ramp is considered to be 'over-saturated' or failing if the existing or future peak hour traffic on the ramp exceeds 900 vphpl. Analysis of the on-ramps was conducted for existing, future (2014) with and without the Tier I Project conditions, and future (2020) with and without Tier II Project conditions. The results of this analysis are provided in Tables R7 and R8. As shown in the tables, none of the ramps are exceeding the Caltrans standard under existing, future (2014) with and without the Tier I Project conditions, and future (2020) with and without Tier II Project conditions.

Off-Ramps

For off-ramps, Caltrans defines a significant impact if the peak hour traffic queue length (85th percentile as determined by 2000 HCM Operations Methodology) on the ramp exceeds the storage length and results in queues backing into the freeway mainline. Analysis of the off-ramps was conducted for existing, future (2014) without and with the Tier I Project conditions, and future (2020) without and with Tier II Project conditions. The results of this analysis are provided in Tables R9 and R10. Failing ramps conditions were determined for two levels: (1). If the queue exceeded the storage length of any individual approach lane (e.g. left-turn lane on the ramp) at the junction of the ramp with the surface street intersection (identified as 'LANE' in the tables), and/or (2). If the queue was large enough to result in backing up into the freeway mainline (identified as 'YES' in the tables). Mitigation measures would need to be provided for impact criteria (2).

Based on the impact criteria (2), none of the ramps are exceeding the Caltrans standard under existing, future (2014) without and with the Tier I Project conditions, and future (2020) without and with Tier II Project conditions.

Intersection Analysis

Caltrans requires that all intersections of ramps be analyzed with the 2000 HCM Operations Methodology. Each intersection of a ramp with a city street (10 study intersections in total) was evaluated using the HCM methodology and the worksheets for each of these analyses are included at the end of this appendix.

The HCM methodology was also used to determine the queue lengths on the off-ramps as described above and to evaluate the overall performance of the ramp intersections. Tables R11 and R12 summarize the delay and corresponding LOS at each of the study ramp intersections for existing, future (2014) without and with the Tier I Project conditions, and future (2020) without and with Tier II Project conditions.

Tier II Project Ramps Improvements

As indicated in the traffic study report, two of the analyzed freeway ramp intersections were significantly impacted under Tier II conditions. The Proposed Tier II Project would provide intersection improvements at these two ramps locations. This includes the following improvements:

- I-105 Westbound Ramps-Croesus Avenue/Imperial Highway: Provide a third northbound left-turn lane by widening off-ramp by 10' for approximately 150' to 200'. The northbound approach would provide dual left-turn lanes, a shared though-left turn lane, and a separate right-turn lane
- Wilmington Avenue/I-105 Eastbound Ramps: Provide an additional eastbound lane by widening (reducing the raised median on the ramp) the off-ramp. The eastbound approach would have a left-turn lane, shared left-right turn lane and a separate right-turn lane. The sidewalks on either side of Wilmington Avenue (as noted above) would be

reduced by 2’ and the Wilmington Avenue roadway would be widened by 2’ on either side (a total of 4’) from the south leg of this intersection.

Provide an additional northbound left-turn lane by widening (reducing the medians). The northbound approach would have dual left-turn lanes and three through lanes.

The recommended improvements would fully mitigate the Tier II Project-related impacts at the two impacted ramp intersections.

TABLE R1
FREEWAY SEGMENT LEVEL OF SERVICE DEFINITIONS

Level of Service	Demand/Capacity Ratio	Flow Conditions
A	0.00 - 0.35	Highest quality of service. Free traffic flow, low volumes and densities. Little or no restriction on maneuverability or speed.
B	0.36 - 0.54	Stable traffic flow, speed becoming slightly restricted. Low restriction on maneuverability.
C	0.55 - 0.77	Stable traffic flow, but less freedom to select speed, change lanes, or pass. Density increasing.
D	0.78 - 0.93	Approaching unstable flow. Speeds tolerable but subject to sudden and considerable variation. Less maneuverability and driver comfort.
E	0.94 - 1.00	Unstable traffic flow with rapidly fluctuating speeds and flow rates. Short headways, low maneuverability and low driver comfort.
F(0)	1.01 - 1.25	Forced traffic flow. Speed and flow may be greatly reduced with high densities.
F(1)	1.26 - 1.35	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
F(2)	1.36 - 1.45	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
F(3)	>1.45	Forced traffic flow. Severe congested conditions prevail for more than one hour. Speed and flow may drop to zero with high densities.
