SECTION 12.0
DISTRIBUTION LIST

This section of the Environmental Impact Report (EIR) contains a list of those entities to which a copy of the Notice of Availability (NOA) of this EIR or a copy of the NOA and a copy of the EIR have been distributed. Organizations or individuals listed below with a superscript$^{(EIR+CD)}$ received a copy of the NOA and Volume I of the EIR in hard copy format and Volume II (Technical Appendix) of the EIR in electronic format on a compact disc (CD). Those with the superscript$^{(CD)}$ received a copy of the NOA and Volumes I and II (Technical Appendix) of the EIR in electronic format on a CD. Organizations or individuals listed below with a superscript$^{(NOA)}$ received a copy of the NOA that directed them to the location of the EIR document.

Copies of the EIR are available during the 45-day public review period, beginning on Tuesday August 31, 2010, and ending on Friday October 15, 2010, at the following library:

Willowbrook Library
Ms. Alice Tang
Community Library Manager
11838 South Wilmington Avenue
Los Angeles, California 90059
Telephone number: (323) 564-5698
Hours of operation: Monday – 10:00 a.m. to 6:00 p.m.
Tuesday – 12:00 p.m. to 8:00 p.m.
Wednesday – 10:00 a.m. to 6:00 p.m.
Thursday – 10:00 a.m. to 6:00 p.m.
Friday – 11:00 a.m. to 5:00 p.m.
Saturday – 11:00 a.m. to 5:00 p.m.
Sunday – Closed

In addition, copies of the EIR are available during the 45-day public review period at the following location:

Martin Luther King, Jr. Multi-Service Ambulatory Care Center[1]

Administration Office
Cynthia Moore-Oliver or Elaine Saafir
12021 South Wilmington Avenue
Los Angeles, California 90059
Telephone number: (310) 668-5201
Hours of operation: Monday – Friday 8:00 a.m. to 4:30 p.m.

---

[1] Responsible agencies for the proposed project are indicated by an asterisk.

Copies of Volumes I and II of the EIR will be available for purchase, at reproduction cost, from the following location:

Sapphos Environmental, Inc.
430 North Halstead Street
Pasadena, California 91107
Telephone number: (626) 683-3547
Hours of operation: Monday – Friday 8:00 a.m. to 5:00 p.m.

An electronic copy of the EIR is also available online at:

http://ridley-thomas.lacounty.gov/Pages/Issues/mlk_hospital.htm

12.1 PUBLIC AGENCIES

12.1.1 Federal

SECTION 1.0
PROJECT DESCRIPTION

1.1 PROJECT TITLE

Martin Luther King, Jr. Medical Center Campus Redevelopment Project

1.2 LEAD AGENCY

County of Los Angeles

1.3 PRIMARY CONTACT PERSON

Ms. Sabra White
County of Los Angeles
Chief Executive Office
Kenneth Hahn Hall of Administration
500 West Temple Street, Room 754
Los Angeles, California 90012
Telephone: (213) 974-2620

1.4 PROJECT LOCATION

The proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) site is located on the existing 38-acre Martin Luther King, Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles (County), California (Figure 1.4-1, *Project Location Map*).

The proposed project site is located approximately 3 miles north of State Route 91 (SR-91; Artesia Freeway), approximately 3 miles northeast of Interstate 710 (I-710; Long Beach Freeway), approximately 2 miles east of I-110 (Harbor Freeway), less than 1 mile south of SR-90 (East Imperial Highway), and less than 1 mile south of I-105 (Glen Anderson Freeway) (Figure 1.4-2, *Regional Vicinity Map*). The proposed project site can be accessed from East 120th Street or from Wilmington Avenue.

The proposed project site is bounded on the north by East 120th Street, on the east by Wilmington Avenue, on the south by a narrow alley which separates the proposed project site from the residential neighborhood which is largely located north of East 122nd Street, and on the west by Compton Avenue of Los Angeles (Figure 1.4-1). The proposed project site is less than 1 mile north of the City of Compton and less than 1 mile west of the City of Lynwood (Figure 1.4-3, *Local Vicinity Map*). The proposed project site is also less than 1 mile south of the City of Los Angeles.

The proposed project site appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle (Figure 1.4-4, *Topographic Map*).[1] Elevations at the proposed project site range from 86 feet above mean sea level (MSL) to 88 feet above MSL. The topography of the site can be generally characterized as flat.

1.5 PROJECT SPONSORS

Martin Luther King, Jr. Medical Center
12021 Wilmington Avenue
Los Angeles, California 90059
Telephone: (310) 668-4254

County of Los Angeles
Chief Executive Office
Kenneth Hahn Hall of Administration
500 West Temple Street, Room 754
Los Angeles, California 90012

1.6 GENERAL PLAN LAND USE DESIGNATION

The proposed project site consists of County Office of the Assessor parcel numbers (APNs) 6140-028-902, 6140-028-900, 6140-028-907, and 6140-028-903. The County General Plan land use designation for these APNs is Public and Semipublic Facilities (P). According to the County General Plan, the Public and Semipublic land use designation provides for activities by public and quasipublic entities and allows for the establishment of facilities, infrastructure, and their related operations in these areas that are public or semipublic in nature, including hospitals (Figure 1.6-1, *General Plan Land Use*).[2] The current use of the proposed project site as a medical facility is in conformance with this land use designation.

The land use designations surrounding the proposed project site include the Public and Semipublic Facilities and Major Commercial (C) to the north, Medium-density Residential [12 to 22 dwelling units (du)/acre] to the east, Low-density Residential (1 to 6 du/acre) to the south, and Low-density Residential (1 to 6 du/acre) and Low/Medium-density Residential to the west. Other land uses within the vicinity of the proposed project site include High-density Residential, Major Commercial, Major Industrial, Open Space, and Transportation Corridor (Figure 1.6-1).

1.7 ZONING

The County zoning designation for all project parcels (APNs 6140-028-902, 6140-028-900, 6140-028-907, and 6140-028-903) is Neighborhood Commercial (C-2; Neighborhood Business Zone) (Figure 1.7-1, *Zoning Designations*). This zoning designation is established to identify community-related commercial uses and permits the following uses: drugstores, medical clinics (including laboratories), professional or business office space, parking lots and buildings, and hospital equipment and supply rentals.[3]

The County has established development standards for the Neighborhood Business Zone:

> No more than 90 percent of the net area be occupied by buildings, with a minimum of 10 percent of the net area landscaped with a lawn, shrubbery, flowers

FIGURE 1.7-1

Zoning Designations

> and/or trees, which shall be continuously maintained in good condition. Incidental walkways, if needed, may be developed in the landscaped area; that there be parking facilities as required by Part 11 of Chapter 22.52; and that a building or structure shall not exceed a height of 35 feet above grade, excluding signs which are permitted by Part 10 of Chapter 22.52 (such as chimneys, and rooftop antennas).[4]

Zoning designations surrounding the proposed project site include Single-family Residential (R-1) to the south and west, Limited Multiple Residences (R-3) to the east, and Two-family Residence (R-2) and Commercial (C-2; specifically, Neighborhood Commercial) to the north. Other zoning designations within the vicinity of the proposed project site include Commercial Planned Development, Unlimited Commercial, Light Manufacturing, Restricted Business, and Restricted Parking (Figure 1.7-1). The proposed project's hospital-related uses would be consistent with the permitted uses of this zoning designation, and no General Plan amendment or zone change would be required. However, uses related to residential development would be subject to a conditional use permit and would be required to meet the conditions of the permit.[5] It is anticipated that the County would obtain a conditional use permit during the planning phase of the proposed project and would be required to meet the specified conditions.

1.8 BACKGROUND AND EXISTING CONDITIONS

1.8.1 Background

The Martin Luther King, Jr. Medical Center Campus began operations in 1972. The Martin Luther King, Jr. Medical Center Campus was developed to address a need for local community services in south Los Angeles. Following the 1965 Watts Civil Unrest/Riots, a commission appointed by the Governor reported a lack of healthcare access as one of the contributing factors to the unrest.[6]

The hospital was operational from 1972 to August 2007, when the license was suspended for the provision of inpatient services at the Martin Luther King, Jr. Medical Center Campus due to concerns over levels of service. Currently, the existing Martin Luther King, Jr. Medical Center Campus (existing campus) is not fully operational; however, the proposed project site provides various outpatient and administrative support services. In 2009, the County initiated improvements to the existing campus to provide community-based inpatient hospital functions and support spaces that would be seismically compliant beyond 2030 seismic standards established by the Office of Statewide Health and Planning Development (OSHPD). These improvements to the existing campus would be an adjacent and ongoing project.

In 2009, a Categorical Exemption was approved by the County Board of Supervisors for minor renovations and improvements to the existing campus. This process allowed the minor renovations and improvements to the campus to be exempt from the State California Environmental Quality Act (CEQA) process under Class 1, "Existing Facilities"; Class 2, "Replacement or reconstruction of existing schools and hospitals to provide earthquake resistant structures which do not increase

capacity more than 50 percent"; and Class 3, "New Construction or Conversion of Small Facilities;"[7] Categorical Exemption [Sections 15301, 15302, and 15303 of the Guidelines], pursuant to the requirements specified in Section 15300.2 of the State CEQA Guidelines.

The upgrades that will be completed as part of the ongoing CEQA-exempt project on the campus include renovation and improvements of up to 172,591 square feet within the Inpatient Tower to include hospital beds and other hospital functions, including the placement of the Emergency Department (ED) on the first floor of the Inpatient Tower, renovation to the basement and second floor, and build-out of three unused upper floors to accommodate the hospital functions use. In addition, the improvements include necessary renovations within other buildings on the existing campus to accommodate various hospital support functions, hospital administration support, and other outpatient services. Renovations to house the hospital support functions and hospital administration support will be placed in the Pediatric Acute Care, Medical Records and Laundry, North Support, South Support, Central Plant, and Plant Management buildings. Renovations to house the outpatient services will be placed in the existing Multiservice Ambulatory Care Center (MACC; formerly known as the Main Hospital Building). The Pediatric Acute Care building will be renovated to serve as the hospital entry and lobby area. Finally, a Pneumatic Tube System (PTS) will be installed in the penthouse to the roof of the Medical Records building. The PTS will serve the Inpatient Tower and Augustus F. Hawkins Comprehensive Mental Health Center buildings. The work described above will operate with the capacity of up to 120 licensed beds; the 120 beds will be located on the first through fifth floors of the Inpatient Tower. These adjacent and ongoing CEQA-exempt improvements to the campus serve as a related project for the proposed project.

The renovations and improvements to the campus as described above will allow the County to regain the hospital license and quickly and cost-effectively meet the unmet inpatient needs for the community, while also allowing the County to reopen a fully functional medical campus that more accurately reflects community needs.

The existing structures within the proposed project site are described in the following section. The existing campus information described in this section are based on information provided by the County Chief Executive Office and County Department of Public Works, as well as from information described in a Martin Luther King, Jr. Medical Center Campus Planning Programming Report that was prepared by HMC Architects.[8]

1.8.2 Existing Structures

The proposed project site consists of 15 buildings: Geneses Clinic, Oasis Clinic (old), Oasis Clinic (new), Registration Building, Augustus F. Hawkins Comprehensive Mental Health Center, Inpatient Tower, MACC, Pediatric Acute Care Building, Medical Records and Laundry Building, Central Plant, Plant Management Building, North Support Building, South Support Building, Interns and Physicians Building, and Hub Clinic. There is also a multilevel parking structure available for parking and several support and ancillary buildings and facilities including: an Emergency Room, Magnetic Resonance Imaging (MRI) Building, Claude Hudson Auditorium, Cooling Towers, and Storage Building on the proposed project site (Figure 1.8.2-1, *MLK Existing Campus Plan*, and Table 1.8.2-1, *Existing Buildings*). Below are structural descriptions and status of the existing buildings and other structural components. The developed floor area (not including the parking

NOTE:
a. These structures would likely be demolished following the reuse or replacement of the existing MACC building.
b. This building is in the footprint of the Central Plant expansion, but may just be incorporated during design and remain.

1.8.2.1 Geneses Clinic

The Geneses Clinic is a 2,100-square-foot outpatient clinic located on the north-eastern portion of the proposed project site. The Geneses Clinic is attached by a walkway to the Oasis Clinic. This clinic is currently not operational.

1.8.2.2 Oasis Clinic (Old)

The Oasis Clinic is a 2,580-square-foot HIV/AIDS clinic that provided comprehensive HIV/AIDS medical care to patients, while it was operational. The services of this clinic included nutritional counseling; treatment education; women's services; mental health; on-site case management; Aids Drug Assistance Program enrollment, orientation, and education for patients diagnosed with HIV; hormone therapy; and adolescent services. This clinic is currently not operational.

1.8.2.3 Oasis Clinic (New)

The Oasis Clinic is a 1,850-square-foot HIV/AIDS clinic that provides comprehensive HIV/AIDS medical care to patients. The services of this clinic include nutritional counseling; treatment education; women's services; mental health; on-site case management; Aids Drug Assistance Program enrollment, orientation, and education for patients diagnosed with HIV; hormone therapy; and adolescent services.

1.8.2.4 Registration Building

The 10,950-square-foot Registration Building is a two-story building, which provides office space in support of the campus. The registration building is located off the existing main entrance of the proposed project site, off Wilmington Avenue.

1.8.2.5 Augustus F. Hawkins Comprehensive Mental Health Center

The existing 226,818-square-foot Augustus F. Hawkins Comprehensive Mental Health Center is a three-story building with a partial one-level basement and was constructed in 1979. The building provides inpatient and outpatient mental healthcare. This building is composed of reinforced-concrete construction. The lateral-force-resisting system is composed of reinforced-concrete shear walls. The foundation system is composed of reinforced-concrete piles. The building is categorized by the OSHPD as Structural Performance Category–4 (SPC-4), which means that the building can remain functional to beyond the year 2030.

1.8.2.6 Inpatient Tower

The 187,676-square-foot Inpatient Tower was constructed in 1993. This building consists of a five-floor facility with a one-level basement that provides outpatient services. The roof of the Inpatient Tower contains a helipad. The building is base isolated, utilizing rubber bearing isolators and sliders to reduce the seismic forces or accelerations experienced by the building in a seismic event. The building superstructure is composed of structural steel construction. The gravity system utilizes a concrete-filled metal deck supported by structural steel beams, girders, and columns. Special concentric-braced frames are used for the building's lateral-force-resisting system. The foundation system is composed of cast-in-place concrete-drilled piles. The SPC of the building is categorized by California OSHPD as SPC-5, which is the highest SPC rating and permits the building to be used for hospital functions beyond the year 2030.

1.8.2.7 Multiservice Ambulatory Care Center Building

The existing 495,335-square-foot MACC was constructed in the late 1960s. This building is a six-story building with a penthouse constructed in the late 1960s. The building consists of three structurally independent buildings: Central Tower, North Tower, and South Tower. This building was formerly used as a 437-bed inpatient, outpatient, and emergency facility. All components of the MACC building are composed of reinforced concrete construction. The gravity system utilizes two-way reinforced concrete slabs supported by reinforced concrete beams and columns. The lateral-force-resisting system is composed of reinforced concrete shear walls. The foundation system is composed of cast-in-place concrete drilled piles. The SPC of the building is categorized by OSHPD as SPC-1.

1.8.2.8 Pediatric Acute Care Building

The existing 7,878-square-foot Pediatric Acute Care Building is a one-story building with a mezzanine level and was constructed in 1992. The building is composed of structural steel construction. The gravity system utilizes a concrete-filled metal deck supported by structural steel beams, girders, and columns. Special concentric braced frames are used for the building's lateral-force-resisting system. The foundation system is composed of cast-in-place concrete drilled piles. The building is categorized by OSHPD as SPC-3, which permits the building to remain functional to the year 2030 and beyond. The existing Nonstructural Performance Category (NPC) of the building is NPC-3. Under the CEQA-exempt ongoing project, the building will be upgraded to continue to be used for hospital functions.

1.8.2.9 Medical Records and Laundry Building

The existing 26,355-square-foot Medical Records Building is a one-story building constructed in 1972. The building is composed of reinforced-concrete construction. The gravity system utilizes two-way reinforced-concrete slabs supported by reinforced-concrete beams and columns. The lateral-force-resisting system is composed of reinforced-concrete shear walls. The foundation system is composed of cast-in-place concrete drilled piles. The building is categorized by the OSHPD as SPC-2, which means that the building can remain functional until only the year 2030, unless it is brought into compliance with the OSHPD structural provisions. Under the CEQA-exempt ongoing project, the building will be upgraded seismically to bring it up to OSHPD SPC-4 or SPC-5, thus allowing the building to be used for inpatient functions until the year 2030 and beyond. The seismic retrofit work would include the addition of new reinforced-concrete shear walls, mitigation of existing discontinuous shear wall conditions, and possible localized strengthening of existing foundations. The building is also expected to be completely gutted, and all new nonstructural and information technology work would comply with the current code.

The CEQA-exempt, ongoing project includes installation of a pneumatic tube blower room on the roof of the existing building. This would probably require strengthening of the building as well as localized strengthening of the framing to support the added weight.

1.8.2.10 Central Plant

The 24,103-square-foot Central Plant was constructed in two phases. The Phase I component is a single-story building, with partial mezzanine floor, built in the 1960s. Roof structure consists of reinforced concrete one-way slab supported by tapered steel girder. Concrete shear walls form the perimeter of the building and provide the seismic bracing for the building. Foundation system of the building consists of cast-in-place concrete piles. However, the mechanical, electrical, and plumbing equipment upgrade within it and some structural work (voluntary) were performed in 1993 under OSHPD permit number HS912289. OSHPD records show the building rated as SPC-1. Under the CEQA-exempt ongoing project, the building will be upgraded seismically to bring it up to OSHPD SPC-4 or SPC-5, thus allowing the building to be used for hospital function until the year 2030 and beyond.

The Central Plant Phase II building, located to the south of the Phase I building, was constructed in 1975. The building structure currently has an SPC-4 rating; therefore, no seismic retrofit upgrade of the building is required. The construction of the Phase II building is similar to the Phase I building. There is an underground water storage tank, measuring 47 feet by 47 feet by 22.5 feet deep and occupying the southern half of the building. Construction of water storage tank consists of cast-in-place concrete slabs and walls. Under the CEQA-exempt ongoing project, new plant equipment will be placed on the floor slab above the tank, which may require strengthening.

The CEQA-exempt ongoing project, a 6,000-square-foot expansion to the Central Plant will include installation of chiller equipment on the roof.

1.8.2.11 Plant Management Building

The 15,648-square-foot Plant Management Building supports campus functions at the proposed project site. This building is architecturally comparable to the other structures on the proposed project site in that it has concrete walls. Under the CEQA-exempt ongoing project, renovations and improvements to the interior of the building may be required.

1.8.2.12 North Support Building

The existing 52,276-square-foot North Support Building is a two-story building, constructed in two phases. The original building, which consisted of the lower full level and a partial second level, was built as a concrete structure in 1973. The second floor and roof consist of two-way waffle slab supported on concrete columns. Perimeter concrete walls provide lateral bracing to the structure. Foundation system consists of cast-in-place drilled pile. The second phase consisted of capturing the setback area over the second floor at the east side to provide additional space in the late 1980s. The addition was constructed of steel framing with concrete fill roof deck. The two phases appear to be connected so that the buildings function structurally as one. Under the CEQA-exempt ongoing project, interior renovations to the first and second floors will be included.

1.8.2.13 South Support Building

The 34,762-square-foot South Support building is a single-story concrete building with partial mezzanine floor, built in the early 1970s. Construction is similar to the North Support building. The gravity system of the building consists of concrete waffle slab supported on concrete columns. The lateral-force-resisting system is composed of reinforced concrete shear walls. Under the CEQA-exempt ongoing project, interior renovations will be included.

1.8.2.14 Interns and Physicians Building

The 124,391-square-foot Interns and Physicians Building is a six-story building also built in the 1970s. This building is currently not fully operational. This building housed mainly the interns and physicians involved in the Physician Assistant Program of the Charles R. Drew Postgraduate Medical School. This building is architecturally comparable to the other structures on the proposed project site in that it has concrete walls.

1.8.2.15 Emergency Room

The 3,300-square-foot Emergency Room is connected to the northwestern portion of the existing MACC Building. This one-story structure served as a waiting room for the emergency room. This structure would be demolished following the reuse or replacement of the existing MACC building.

1.8.2.16 Storage Building

The 1,060-square-foot, one-story Storage Building is currently used for campus storage. This building is located south of the existing MACC building and would be demolished following the reuse or replacement of the existing MACC building.

1.8.2.17 Magnetic Resonance Imaging Building

The 1,100-square-foot MRI Building houses the MRI systems. This one-story structure is located north of the existing MACC building and may be relocated in Tier I of the proposed project.

1.8.2.18 Claude Hudson Auditorium

The 3,922-square-foot Claude Hudson Auditorium is a one-story structure that is attached by a walkway to the existing MACC building. This building would remain following the reuse or replacement of the existing MACC building.

1.8.2.19 Cooling Towers

The 6,790-square-foot Cooling Towers are one-story structures that serve the heat removal and heating, ventilating, air conditioning functions of the existing MACC. These structures would likely be demolished following the reuse or replacement of the existing MACC building in Tier II of the proposed project.

1.8.2.20 Hub Clinic

The 12,265-square-foot Hub Clinic is situated north of the Hawkins Building off East 120th Street. This is a one-story building. The Hub Clinic services the needs of children and families in the foster care system.

1.8.2.21 Storage Building

The 2,533-square-foot, one-story Storage Building is currently used for storage. This building is located south of the Central Plant and Medical Records and Laundry Buildings.

1.8.2.22 Additional Support Structures

1.8.2.22.1 Existing Tunnel

The existing underground utility tunnel was constructed in two phases. The Phase I tunnel extends north from the north side of Central Plant Phase I and connects to the east-west segment serving the existing MACC building to the east and Interns and Physicians Building to the west. Phase I tunnel was constructed in the early 1970s. Under the CEQA-exempt ongoing project, the existing Phase I tunnel will be seismically retrofitted to obtain an SPC-5 rating.

The Phase II tunnel consists of north-south segment extending north from the Phase I tunnel to serve the Hawkins Building and Inpatient Tower. The Phase II tunnel was built in late 1970s.

1.8.2.22.2 Existing Retaining Wall between Hawkins Building and Inpatient Tower

The existing concrete retaining wall is about 500 feet long spanning in the east-west direction, between the Hawkins Building to the north and the service road to the south. The retaining wall was built in the late 1970s. The existing retaining wall and footings appear to be structurally adequate under the current lateral soil loadings. Strengthening of the retaining wall is not anticipated.

1.8.3 Existing Operational Conditions

The existing campus currently provides urgent care services and outpatient clinic services. The Urgent Care Center consists of 27 treatment spaces and operates out of the space that was previously occupied by the Emergency Department.[9,10] There are currently 70 specialty Outpatient Clinics operating at the existing hospital.[11]

The Outpatient Clinics and Departments available at MLK include but are not limited to:[12]

- Ancillary Services
  - Echocardiogram
  - Electroencephalogram
  - Occupational Therapy
  - Physical Therapy
- Community Health Plan
  - Adult
  - Pediatric
- Internal Medicine
  - Cardiology
  - Chemotherapy
  - Chest
  - Dermatology
  - Diabetic
  - Dietary
  - Endocrinology
  - Gastroenterology
  - General medicine
  - Geriatrics
  - Hematology-Oncology
  - Hypertension

    - General surgery
    - Prostate
    - Urology

Although the proposed project site is not currently operating at full capacity, the past operational use of the existing campus will provide a reference for the capacity of the proposed project site to operate at full capacity and will also be utilized to further establish baseline conditions for this analysis.

1.8.3.1 Patient Volume

The existing patient volume on the campus is largely determined by the MACC patient volume and services. The patient volume for the MACC, based on the 2008–2009 workload, is as follows: 160,000 annual outpatient services visits (including 11,000 walk-in clinic visits); 10,000 inpatient visits; 30,000 annual emergency services visits; 2,700 inpatient surgery procedures; and 3,500 outpatient surgery procedures.

1.8.3.2 Accessibility

The existing campus is accessible via both pedestrian and vehicular traffic. Public access is available off 120th Street and Wilmington Avenue. There is a service entry to the loading docks and buildings located off Compton Avenue, and there is one ambulance ED entry to the existing campus located off 120th Street.

1.8.3.3 Parking

There are 1,925 parking spaces on the existing campus.[13] Although 2,994 parking spaces would be required by County Code, a parking forecast prepared for the existing campus determined that approximately 1,915 parking spaces were required on the existing campus due to the proximity of public transportation.[14]

1.8.3.4 Public Transportation

The existing campus is currently accessible by public transportation. There are two bus stations located on the existing campus boundary: one bus station is located on the northern boundary on 120th Street, and one bus station is located on the eastern boundary on Wilmington Avenue. In addition, a blue line and green line metro stations are located approximately 0.5 mile northeast of the existing campus; the blue line and green line metro stations have a shuttle bus that transports individuals between the existing campus and blue line and green line metro stations. It is anticipated that these public transportation services would continue to operate following completion of the proposed project.

The County Board of Supervisors currently funds the *Hahn's Trolley and Shuttle Service*, which provides shuttle services to the community surrounding the existing campus. *Hahn's Trolley and Shuttle Service* operates three interconnecting routes. The County also funds a van service, *L.A. County Dial-A-Ride,* in the community surrounding the campus that provides transportation service for senior citizens and people with disabilities who reside within the unincorporated areas of Willowbrook, Walnut Park, Florence/Graham, Athens, Rosewood, and Rancho Dominguez.

[14] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus—Campus Planning and Programming Report*. Los Angeles, CA.

1.8.3.5 Utilities

The existing campus is connected to the public utilities, water, gas, and sewer through a system of underground piping, valves, and access points to all the buildings. This complex piping system is used to maintain the connectivity from the buildings to the utilities in the streets.[15]

Existing utilities for the campus are provided through the following equipment and structures: underground utility tunnel, cooling towers, electrical equipment, bulk oxygen (O_2) storage, gas cylinders, generator fuel storage, central plant, underground fuel tanks, and emergency generators.

1.8.3.5.1 Electrical Infrastructure

The existing campus is served by the Southern California Edison Company. The existing campus has the capacity to supply approximately 10 megawatts of power to the campus. A review of the existing electrical infrastructure has determined the following: (1) portions of the existing campus electric system equipment and cable, which receive power at 4160 V, have not been upgraded since the hospital was constructed in the 1970s; these systems would be replaced as part of the ongoing campus improvements; (2) many building power systems on the existing campus would need to meet the requirements of the California Electric Code and National Fire Protection Association 99, Standard for Health Care facilities. Furthermore, building power diesel generators do not meet the existing Air Quality Management District emissions requirements, and the electrical systems require modifications that will be addressed under the CEQA-exempt ongoing project.

1.8.3.6 Water Use

Water use at the existing campus has varied over time. The average water use on the campus between the years 2002 and 2006 was more than 80 million gallons (or 107,793 hundred cubic foot (HCF) unit) of water per year.[16] The maximum amount of water consumption at the campus was roughly 88 million gallons. It is anticipated that the maximum water consumption amounts for the campus following development would not be significantly greater than the maximum operational usage amount of approximately 88 million gallons.

1.8.4 Existing Campus Surroundings

The areas surrounding the existing Martin Luther King, Jr. Medical Center Campus include various commercial, retail, transit, and institutional land uses. Among these uses are the Charles Drew University of Medicine and Science (CDU), the Rosa Parks Transit Station, the Kenneth Hahn Plaza and Village, and various residential neighborhoods, commercial businesses, public and semipublic, industrial, open space, and transportation corridor uses (Figure 1.6-1).

1.8.4.1 Charles Drew University of Medicine and Science

The CDU is located between 118th Street to the north and 120th Street to the south. Historically, the existing campus and CDU have maintained a complimentary relationship; the existing campus has been used by CDU as a teaching hospital. In 2008, CDU opened a health clinic to provide

---

[15] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus—Campus Planning and Programming Report*. Los Angeles, CA.

[16] One (1) HCF equals 748 gallons of water.

service to some patients that have been impacted by the suspension of the license for the provision of inpatient services at the Martin Luther King, Jr. Medical Center Campus.[17] Just north of the existing campus, CDU is joined by other institutional uses, including the King Drew Magnet High School of Medicine and Science, and Lincoln Drew Elementary School.

1.8.4.2 Rosa Parks Transit Station

The Rosa Parks Transit Station is located northeast of the existing campus. This station houses the blue line and green line metro stations described in Section 1.8.3.4, *Public Transportation,* of this project description. As previously noted, the blue line and green line metro stations have a shuttle bus that transports individuals between the existing campus and blue line and green line metro stations.

1.8.4.3 Other Surrounding Uses

The Kenneth Hahn Plaza and Village at Willowbrook shopping center are located northeast and east of the existing campus. These areas house commercial, retail, and other uses including a public library.

These properties are not currently included in the Martin Luther King, Jr. Redevelopment efforts, as they are owned and operated by various private and public entities. However, in response to the community's interest in the inclusion of the development of these properties along with the existing campus (which is owned by the County), the County is currently reviewing alternatives and opportunities to include these properties in a master plan that encompasses the surrounding community.

1.9 PROJECT DESCRIPTION

The proposed project entails two tiers. Tier I involves project-level development of the new MACC and the Ancillary Building, tenant improvements in existing buildings, site improvements, and the potential relocation of the MRI Building. The existing buildings that would be part of Tier I of the proposed project include the North Support Building, South Support Building, Interns and Physicians Building, and the Plant Management Building.

Development of the new MACC and the Ancillary Building are currently registered with the U.S. Green Building Council under Leadership in Energy and Environmental Design for New Construction (LEED-NC).[18] The County will seek LEED Silver certification for the MACC and the Ancillary buildings.[19] The LEED program recognizes and promotes a project's success in five areas: (1) sustainable sites, (2) water efficiency, (3) energy and atmosphere efficiencies, (4) materials and resources, and (5) indoor environmental quality. In addition, the federal government has a program titled "Green Guide for Healthcare Construction" (GGHC), which is designed to help hospitals navigate through the LEED program. The proposed project would incorporate energy efficient and sustainable strategies throughout the construction, development, and operation of the proposed project.

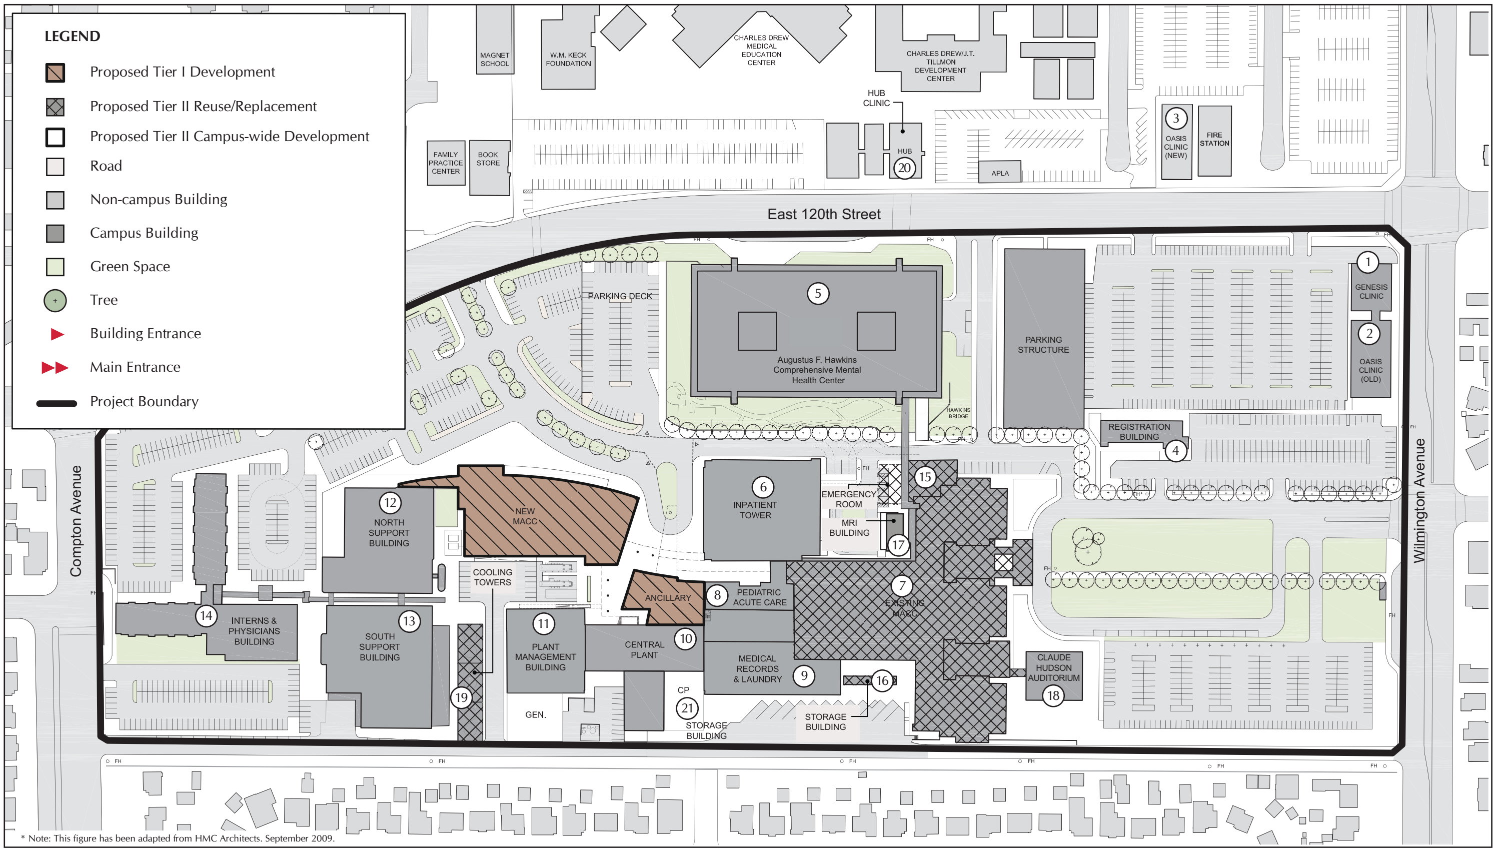
[17] Charles Drew University of Medicine and Science. Accessed 26, January 2010. Available at: http://www.cdrewu.edu/news/2008/urgent-care-clinic

[18] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus - Campus Planning and Programming Report*. Los Angeles, CA.

[19] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus - Campus Planning and Programming Report*. Los Angeles, CA.

Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building, Emergency Room Expansion, Storage Building, and Cooling Towers, and master-planned, mixed-use development, which may include the potential for medical office, commercial, retail, residential, recreational, office space, and other development that is appurtenant to and compatible with the primary land use, in support of the campus.

To establish a proposed programmed development level for the mixed-use portion of Tier II, the currently undeveloped areas of the campus (undeveloped in this case includes parking lots and structures but not buildings) were calculated and adjustments were made for buildings to be demolished and developed, to obtain a surface area from which to calculate allowable build-out. A maximum build-out of this remaining area was calculated using maximum build-out criteria from the Los Angeles County Zoning Code restrictions applicable to the site. Initially, this maximum build-out number was in excess of 2 million square feet and included zoning code allowances of a maximum of three stories in building height and 10 percent open space (i.e., areas without structures). To determine a more accurate level of development for Tier II, the following assumptions were added: (1) open space sitewide would remain 10 percent in order to maintain some of the current character of the site as an open and landscaped campus; (2) the site area to be set aside for the potential development of an up to 100-unit residential component, parking structures or parking lots, and walkways would be 40 percent of the entire site; and (3) although a maximum of three stories would be allowed for new buildings, an average height of 2.5 stories was assumed. With these assumptions added in, the maximum programmed development for Tier II could consist of up to 1,814,696 square feet (Figure 1.9-1, *MLK Proposed Campus Plan*, and Table 1.9-1, *Proposed Campus Development Matrix*).



* Note: This figure has been adapted from HMC Architects. September 2009.

FIGURE 1.9-1
MLK Proposed Campus Plan

TABLE 1.9-1
PROPOSED CAMPUS DEVELOPMENT MATRIX

	Building Name	Current Total Floor Area (sq ft)	To Remain	Floors	Proposed Total Floor Area of Campus Buildings (sq ft)	Proposed Footprint of Campus Buildings (sq ft)
1	Geneses Clinic	2,100	Y	1	2,100	2,100
2	Oasis Clinic (old)	2,580	Y	1	2,580	2,580
3	Oasis Clinic (new)	1,850	Y	1	1,850	1,850
4	Registration Building	10,950	Y	2	10,950	5,475
5	Augustus F. Hawkins Comprehensive Mental Health Center	226,818	Y	3[a]	226,818	75,606
6	Inpatient Tower	187,676	Y	5[a]	187,676	37,535.2
7	Existing MACC[b]	495,335	N	5[a]	0	0
8	Pediatric Acute Care	7,878	Y	1	7,878	7,878
9	Medical Records and Laundry	26,355	Y	1	26,355	26,355
10	Central Plant	24,103	Y	1	24,103	24,103
11	Plant Management	15,648	Y	1	15,648	15,648
12	North Support Building	52,276	Y	2	52,276	26,138
13	South Support Building	34,762	Y	2	34,762	17,381
14	Interns and Physicians Building	124,391	Y	6	124,391	20,731.83
15	Emergency Room	3,300	N	1	0	0
16	Storage Building	1,060	N	1	0	0
17	MRI Building	1,100	Y	1	1,100	1,100
18	Claude Hudson Auditorium	3,922	Y	1	3,922	3,922
19	Cooling Towers[c]	6,790	N	1	0	0
20	Hub Clinic	12,265	Y	1	12,265	12,265
21	Storage Building[d]	2,533	Y	1	2533	2,533
	TIER I DEVELOPMENT					
	New MACC			4	130,000	32,500
	Ancillary Building			2	22,000	11,000
	Total Campus Area (38.36 acres)					**1,670,920**
	TIER II DEVELOPMENT					
	Total Campus Area (less the buildings retained)					1,344,219
	Total Campus Area (less 10% open space)					1,209,797
	Total Campus Area (less 40% potential residential area and parking)					725,878
	Total Campus Area (multiplied by average building stories 2.5)					1,814,696
	Total Campus Potential Build-out					**1,814,696**

NOTES:

- "Less" as used in this table means that the value is subtracted from the specified value.
- The calculations assume that the campus would retain 10-percent open space through use of landscape for the purpose of aesthetic designs / beautification, noise barriers, stormwater runoff reduction, air quality, and overall health and sustainability. The County Zoning Code specifications require a minimum of 10 percent open space).
- The calculations assume that a maximum of 40 percent of the campus would be reserved for the potential residential component and parking structures or parking lots.
- The calculations include a 2.5-story-average building-height limit, based on the existing structures. The County Zoning Code specifications require a 35' (3-story) height limit.
- There is no required setback for the development.

a. These buildings also have basements.

b. This scenario takes into account the replacement of the MACC Building. Should this structure be reused, 130,000 square feet for the MACC Building should be accounted for in both the proposed total floor area and proposed footprint of the campus buildings.

c. These structures would likely be demolished following the reuse or replacement of the existing MACC building.

d. This building is in the footprint of the Central Plant expansion but may just be incorporated during design and remain.

1.9.1 Tier I: Project Development

Tier I of the proposed project would entail the development of two new buildings: the new MACC and the Ancillary Building, tenant improvements in existing buildings, site improvements, and potential relocation of the MRI Building. Project-level environmental impact report (EIR) analysis will be provided for Tier I.

1.9.1.1 Multiservice Ambulatory Care Center Building

The proposed MACC Building would be a four-story building consisting of approximately 130,000 square feet of floor area. This building would house the walk-in clinic, outpatient imaging, outpatient surgery, and various other outpatient clinics that are currently operating in the existing MACC. The proposed building would most likely be of structural steel construction. The gravity system of the building would consist of lightweight fill over metal decking supported by steel beams and columns. Similar to the proposed Ancillary Building, the lateral-force-resisting system of the MACC building can be any one of the following: moment frames, braced frames, or a combination of the two. The lateral-force-resisting system, whether moment frames or braced frames, would be located along the perimeter of the building, which would accommodate maximum flexibility for planning and space layout. The foundation for the new building would likely be a cast-in-place drilled pile foundation system.

1.9.1.2 Ancillary Building

The proposed Ancillary Building would be a two-story structure consisting of approximately 22,000 square feet of floor area. This building would house the campus kitchen and cafeteria, and administrative offices. The building would be constructed to the east of the new MACC. A new pedestrian foot bridge would be provided at the east end of the building for connection to the existing Inpatient Tower for the transportation of materials and supplies. The bridge would most likely be constructed of steel with a seismic joint at the Inpatient Tower.

The new building would most likely be structural steel construction. The gravity system of the building would consist of lightweight fill over metal decking supported by steel beams and columns. The lateral-force-resisting system for the building can be any one of the following: moment frames, braced frames, or a combination of the two. It is anticipated that the lateral-force-resisting system, whether moment frames or braced frames, would be located along the perimeter of the building, which would accommodate maximum flexibility for planning and space layout. The foundation for the new building would likely be a cast-in-place drilled pile foundation system.

1.9.1.3 Tenant Improvements

The tenant improvements would be performed in the North Support Building to provide space for the MACC administrative departments. The South Support Building would be reorganized to serve as the main warehouse for the MACC. The South Support Building may also serve as a central distribution center for other Los Angles County healthcare facilities in the area. Other tenant improvements would be performed in the Interns and Physicians and Plant Management Buildings for support functions to the MACC.

1.9.1.4 Site Improvements

The site work would consist of a new parking terrace, new parking lots, re-striping of existing lots, and new landscaping at the entry of the new MACC and its surrounding area. A service yard with technical (tech) dock positions that connect mobile radiology equipment would also be provided.

1.9.2 Tier II: Master Plan Development

Tier II of the proposed project would entail the development of a campuswide master plan. It is anticipated that the development described in the Master Plan would seek to prepare the proposed project site for future mixed-use campus support development that would provide the health services necessary to respond to and address the needs of the community. Tier II would have the potential to build out approximately 1,814,696 square feet of development on the proposed project site with mixed uses including medical office, commercial, retail, office space, recreation, and other development in support of the campus. In addition, up to 100 residential units, to be developed at a multifamily density consistent with surrounding residential area multifamily development densities, are proposed in Tier II. The Tier II components would also entail the reuse or replacement of the existing MACC building. The Tier II components are conceptual at this time, and will therefore only be discussed in a programmatic level in the EIR, as permitted under CEQA. Once the detailed future development plans for Tier II components are prepared, consistent with the guidelines for programmatic EIRs under CEQA, the projects will be examined in light of the program EIR analysis, to determine whether an additional environmental document must be prepared.

1.10 STATEMENT OF OBJECTIVES

1.10.1 Goal

The goal of the proposed project is to provide new campus improvements and to reopen a fully functional medical campus that meets the community needs for quality health care.

The County seeks to establish the Martin Luther King, Jr. Medical Center Campus as a center of excellence for health care delivery, urban health promotion and prevention, health workforce development, academic research and teaching, and economic development. The campus provides an opportunity to develop up to 1,814,696 square feet for a mix of uses, including space for medical offices, commercial, retail, residential, recreation, and general offices, in addition to any other development that will improve the community-based health program facility.

1.10.1.1 Tier I: Project Development Objectives

The County identified and prioritized the basic objectives that are important in achieving the proposed project goals for Tier I:

- Revitalize the Martin Luther King, Jr. Medical Center Campus through the provision of comprehensive medical care.
- Demonstrate leadership in sustainable planning and design.
- Create a campus environment that encourages pedestrian movement and optimizes connectivity, staff interaction, and links to the community.

- Develop a campus that is contextually integrated with the County of Los Angeles and respects the surrounding communities.
- Improve the efficiency and quality of staff and tenant services.
- Maintain the 2,100-square-foot Genesis Clinic; 2,580-square-foot Oasis Clinic (old); 1,850-square-foot Oasis Clinic (new); 10,950-square-foot Registration Building; 226,818-square-foot Augustus F. Hawkins Comprehensive Mental Health Center; 187,676-square-foot Inpatient Tower; 7,878-square-foot Pediatric Acute Care; 26,355-square-foot Medical Records and Laundry; 24,103-square-foot Central Plant; 15,648-square-foot Plant Management; 52,276-square-foot North Support Building; 34,762-square-foot South Support Building; 124,391-square-foot Interns and Physicians Buildings; 3,922-square-foot Claude Hudson Auditorium; 1,100-square-foot MRI Building; and 12,265-square-foot Hub Clinic Building.
- Provide a 22,000-building-gross-square-footage (BGSF) space to accommodate the Ancillary Building to house the cafeteria, administrative functions, and support services for the MACC and the Inpatient Tower.
- Provide a 130,000-BGSF space to accommodate the MACC program.
- Provide 30,000 square feet of tenant improvements to accommodate support functions in the North Support, South Support, Interns and Physicians, and Plant Management Buildings.
- Connect to an upgraded central plant to service the MACC, North Support Building, South Support Building, and Interns and Physicians Building.
- Provide a parking terrace to allow sufficient parking for patients, client, visitors, employees, medical staff; site work; and landscaping.
- Provide for a possible relocation of the MRI Building.

1.10.1.2 Tier II: Master Plan Development Objectives

The County identified and prioritized the basic objectives that are important in achieving the proposed project goals for Tier II:

- Provide opportunities for development of up to 1,814,696 square feet of mixed use, including medical office, commercial, retail, residential, recreational, office space, and other development in support of the campus that are appurtenant to and compatible with the primary land use of a community-based health program facility.
- Provide sufficient parking for mixed-use development.

1.11 CONSTRUCTION SCENARIO

1.11.1 Tier I Construction Scenario

Tier I of the proposed project—which consists of the construction of the new MACC and the Ancillary Building tenant improvements, site improvements, and potential relocation of the MRI Building—would require approximately 37 months to complete (November 2010 to December 2013). Construction at the proposed project site is anticipated to be in accordance with all federal, state, regional, and County regulations, including the National Pollution Discharge Elimination System[20] and the County General Plan.[21]

It is anticipated that construction related to Tier I for the proposed project may require the type of equipment listed below in Table 1.11.1-1, *Anticipated Construction Equipment*. The information contained in Table 1.11.1-1 will be used in the assessment of potential construction impacts to air quality, ambient noise levels, and traffic and circulation for Tier I of the proposed project.

TABLE 1.11.1-1
ANTICIPATED CONSTRUCTION EQUIPMENT

Approximate Quantity	Type of Equipment or Vehicle	Approximate Duration of On-site Construction Activity (in months)
2	Man lift	3
4	Pickup truck	8
2	Hand compactor	5
2	Crane	3
1	Concrete mixer	4
1	Backhoe	3
40–60	Crew members	8
50	Crew vehicles (maximum)	8
1	Pile Driver	6
1	Large Bulldozer	3
2	Dozer	3
1	Front-end loader	1
1	Water truck	2
1	Grader	1
5	Dump truck	6
16	Concrete mix truck	9
1	Roller	1
3	Fork lift / grade all	3

Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes. Daily construction activities would be subject to County noise regulations. All construction-related activities would be scheduled in compliance with the County Noise Ordinance, which prohibits construction activities and operation of construction equipment between the hours of 8:00 p.m. and 7:00 a.m., Monday through Friday, or at any time on Sunday or holidays. Work conducted on Saturdays would commence at 7:00 a.m. and cease no later than 5:00 p.m. Noise levels exceeding 65 dBA (decibels, A-weighted sound levels) for single-family residences and 70 dBA for multifamily residences during construction hours are prohibited.

The construction contractor would ensure that source-reduction techniques and the development of recycling programs during construction and operation of the proposed project are considered

[21] County of Los Angeles Department of Regional Planning. 2007. *Los Angeles County Draft Preliminary General Plan*. Available at: http://planning.co.la.ca.us/doc/gp/gp_draft.pdf

and implemented whenever possible.[22] In addition, employee vehicles, construction equipment and vehicles, and storage and materials used throughout the proposed project site would be located in a designated staging area in an effort to minimize impacts to the site, pedestrians, and medical center employee or visitor traffic.

It is anticipated that there would be grading activities associated with the development of Tier I of the proposed project. It is anticipated that excavation may exceed 20 feet but would not be expected to be greater than 60 feet deep. It is anticipated that a geotechnical engineer would be available for observation and testing of the earthwork-related tasks to ensure proper subgrade preparation, selection of satisfactory materials, and placement and compaction of structural fills. Any unanticipated adverse conditions encountered would be evaluated by the proposed project engineering geologist and the soil engineer.[23]

The construction contractor would be required to incorporate best management practices (BMPs) consistent with the guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[24] Should the construction period continue into the rainy season, supplemental erosion measures would need to be implemented, including, but not limited to, the following:

- Mulching
- Geotextiles and mats
- Earth dikes
- Temporary drains and gullies
- Silt fence
- Straw-bale barriers
- Sandbag barrier
- Brush or rock filter
- Sediment trap

The anticipated construction period would begin in November 2010 and conclude in December 2013. BMPs to control surface runoff and soil erosion would be required for construction taking place during rainy periods.

Construction equipment would be turned off when not in use. The construction contractor would ensure that all construction and grading equipment is properly maintained. All vehicles and compressors would utilize exhaust mufflers and engine enclosure covers (as designed by the manufacturer) at all times. It is currently anticipated that up to 90 construction workers would be on site at any given time during the construction of the proposed project.

Construction-related ingress and egress to the proposed project site would occur primarily off East 120th Street to the north or Wilmington Avenue to the east.

1.11.2 Tier II Construction Scenario

The Tier II of the proposed project consists of a campus-wide master plan and up to 1,814,696 square feet of development on the proposed project site. The potential construction scenario for Tier II may be envisioned as a multiphase process to be completed concurrently with Tier I. The longest scenario is to develop Tier II within a 10-year timeframe, between 2010 and 2020. This analysis approach of the construction scenario has been developed based on an aggressive scenario (which allows the proposed project site to be developed to the maximum extent possible) to allow the consideration of a reasonable worst-case scenario in the even that the County chooses to complete up to 1,814,696 square feet of development.

The type and quantity of equipment that would potentially be used in construction of Tier II would vary for each component. However, for the purposes of this analysis, it is anticipated that development of Tier II would require up to eight phases that would utilize equipment that is comparable to the equipment described in Table 1.11.1-1 for each phase.

Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes.

As with Tier I of the proposed project, the construction contractor would ensure that source-reduction techniques and the development of recycling programs during construction and operation of the proposed project are considered and implemented whenever possible.[25] The construction contractor would be required to incorporate BMPs consistent with the guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[26]

BMPs to control surface runoff and soil erosion would be required for construction taking place during rainy periods.

Any construction equipment used during the potential development of Tier II would be turned off when not in use. The construction contractor would ensure that all construction and grading equipment is properly maintained. All vehicles and compressors would utilize exhaust mufflers and engine enclosure covers (as designed by the manufacturer) at all times. It is currently anticipated that up to 150 construction workers would be on-site at any given time during the construction of the proposed project.

Construction-related ingress and egress to the proposed project site would occur primarily off East 120th Street to the north or Wilmington Avenue to the east.

1.12 RELATED PROJECTS

Related projects are projects that are within the area surrounding the proposed project site that are currently in progress or proposed for the future that, when considered with the proposed project, could potentially result in cumulative environmental impacts.

---

[25] *Los Angeles County Code*. Title 12, "Environmental Protection," Chapter 20.87.08.060, "Approval of Recycling and Reuse Plan." Available at: http://ordlink.com/codes/lacounty/index.htm

[26] California Stormwater Quality Association. 2003. *California Stormwater Best Management Practice Handbooks: Construction*. Menlo Park, CA. Available at: http://www.cabmphandbooks.com/Documents/Construction/Section_3.pdf

There are nine related projects that are anticipated within the next year and that lie within an approximate 1-mile radius of the proposed project site. These are shown in Table 1.12-1, *List of Related Projects*.

TABLE 1.12-1
LIST OF RELATED PROJECTS[a]

Cumulative Project	Location	Description
County of Los Angeles		
MLK Campus Improvements	12021 South Wilmington Avenue	Hospital[27]
South Public Health Clinic[b]	11815 Bandera Street	Health Clinic
Charter High School[b]	12628 Avalon Boulevard	High School

1.13 REQUIRED APPROVALS

The anticipated approvals that would be required for the proposed project includes but are not limited to those listed in Table 1.13-1, *Required Approvals*. Table 1.13-1 describes the anticipated permits, approvals, and licenses that would be required for development of the proposed project and specifies the agency(ies) and programs responsible for issuing each approval.

---

[27] This includes the improvements and minor renovation as described in Section 1.8.1, Background, of the project description.

TABLE 1.13-1
REQUIRED APPROVALS

Permit / Approval / License Title	Agency/Program
Clinic License	• County of Los Angeles Department of Health Services, Health Facilities Inspection Division • State of California Department of Health Services, Licensing, and Certification Division • California Department of Public Health Licensing and Certification Program
Asbestos and Lead-Based Paint Abatement	• U.S. Environmental Protection Agency
Asbestos Abatement Notification / Asbestos Worker Notification	• California EPA, Department of Toxic Substances Control • California Division of Occupational Safety and Health • South Coast Air Quality Management District
Building, Grading, Excavation, Encroachment Permit	• County of Los Angeles Department of Regional Planning • County of Los Angeles Department of Public Works
Construction Permit	• County of Los Angeles Department of Regional Planning • County of Los Angeles Department of Public Works • County of Los Angeles Fire Department • Office of Statewide Health Planning and Development
Conditional Use Permit	• County of Los Angeles Department of Regional Planning • County of Los Angeles Department of Public Works • Office of Statewide Health Planning and Development
Demolition Permit	• County of Los Angeles Department of Public Works • California Division of Occupational Safety and Health • Office of Statewide Health Planning and Development
Abatement, Notification, Grading, and Operating Permit	• South Coast Air Quality Management District
NPDES Permit / SUSMP / SWPPP	• County of Los Angeles Department of Public Works
Notification (Cultural Resources)	• Advisory Council on Historic Preservation
Transportation permits - encroachment permit, parking, transportation permit for the use of oversized vehicles, and traffic modifications on state highways	• State of California Department of Transportation • Metropolitan Transportation Authority (MTA) • County of Los Angeles Department of Regional Planning
Campus Plan Approval	• Office of Statewide Health Planning and Development • County of Los Angeles Department of Public Works • County of Los Angeles, Board of Supervisors

SECTION 2.0
ENVIRONMENTAL CHECKLIST

This section contains a copy of the Environmental Checklist prepared for the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment (proposed project). The checklist used is consistent with Appendix G to the State CEQA Guidelines. A summary of the substantial evidence that was used to support the responses in the Environmental Checklist is contained in Section 3. The answers contained in this Environmental Checklist are based on literature review of published and unpublished documents (see Section 4.0, References), for a list of reference materials consulted, and site reconnaissance of the proposed project site (conducted on October 20, 2009).

DETERMINATION

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

X I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.1. AESTHETICS—Would the proposed project:				
a) Have a substantial adverse effect on a scenic vista?				X
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?				X
c) Substantially degrade the existing visual character or quality of the site and its surroundings?		X		
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?		X		
2.2. AGRICULTURE AND FOREST RESOURCES—In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land—including the Forest and Range Assessment Project and the Forest Legacy Assessment project—and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the proposed project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on				X

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?				
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?				X
c) Conflict with existing zoning for, or cause rezoning of, forest land [as defined in Public Resources Code section 12220(g)], timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production [as defined by Government Code section 51104(g)]?				X
d) Result in the loss of forest land or conversion of forest land to non-forest use?				X
e) Involve other changes in the existing environment, which due to their location or nature could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?				X
2.3. AIR QUALITY—Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the proposed project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?		X		
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	X			

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the proposed project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	X			
d) Expose sensitive receptors to substantial pollutant concentrations?	X			
e) Create objectionable odors affecting a substantial number of people?		X		
2.4. BIOLOGICAL RESOURCES—Would the proposed project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?				X
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?				X
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				X

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?				X
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?				X
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				X
2.5. CULTURAL RESOURCES—Would the proposed project:				
a) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?		X		
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?		X		
c) Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?	X			
d) Disturb any human remains, including those interred outside of formal cemeteries?				X
2.6. GEOLOGY AND SOILS—Would the proposed project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the			X	

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.				
ii) Strong seismic ground shaking?			X	
iii) Seismic-related ground failure, including liquefaction?			X	
iv) Landslides?				X
b) Result in substantial soil erosion or the loss of topsoil?		X		
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?		X		
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?		X		
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?				X
2.7. GREENHOUSE GAS EMISSIONS—Would the proposed project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?		X		
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?		X		

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.8. HAZARDS AND HAZARDOUS MATERIALS—Would the proposed project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?		X		
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?		X		
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?		X		
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?		X		
e) For a proposed project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the proposed project area?				X
f) For a proposed project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the proposed project area?				X
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?				X

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				X
2.9. HYDROLOGY AND WATER QUALITY—Would the proposed project:				
a) Violate any water quality standards or waste discharge requirements?			X	
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?				X
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?				X
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?				X
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?		X		
f) Otherwise substantially degrade water quality?				X

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?				X
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?				X
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?				X
j) Inundation by seiche, tsunami, or mudflow?				X
2.10. LAND USE AND PLANNING—Would the proposed project:				
a) Physically divide an established community?				X
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?			X	
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?				X
2.11. MINERAL RESOURCES—Would the proposed project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?				X
2.12. NOISE—Would the proposed project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?		X		
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?		X		
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?		X		
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?		X		
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the proposed project expose people residing or working in the proposed project area to excessive noise levels?				X
f) For a project within the vicinity of a private airstrip, would the proposed project expose people residing or working in the proposed project area to excessive noise levels?				X

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.13. POPULATION AND HOUSING— Would the proposed project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	_____	X	_____	_____
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	_____	_____	_____	X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	_____	_____	_____	X
2.14. PUBLIC SERVICES				
a) Would the proposed project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
Fire protection?	_____	X	_____	_____
Police protection?	_____	X	_____	_____
Schools?	_____	_____	X	_____
Parks?	_____	X	_____	_____
Other public facilities?	_____	X	_____	_____

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.15. RECREATION				
a) Would the proposed project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?		X		
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?		X		
2.16. TRANSPORTATION AND TRAFFIC—Would the proposed project:				
a) Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation, including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?		X		
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?		X		
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?				X
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			X	

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
e) Result in inadequate emergency access?			X	
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?				X

2.17. UTILITIES AND SERVICE SYSTEMS—Would the proposed project:

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?			X	
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?				X
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?		X		
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?		X		
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?		X		
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?			X	
g) Comply with federal, state, and local statutes and regulations related to solid waste?			X	

	Potentially Significant Impact	Potentially Significant Unless Mitigation Incorporated	Less Than Significant Impact	No Impact
2.18. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	X			
b) Does the project have impacts that are individually limited, but cumulatively considerable? (Cumulatively considerable means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?		X		
c) Does the proposed project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	X			

SECTION 3.0
ENVIRONMENTAL ANALYSIS

The environmental analysis provided in this section describes the information that was considered in evaluating the questions in Section 2.0, Environmental Checklist. The information used in this evaluation is based on a review of relevant literature and technical reports (see Section 4.0, References, for a list of reference material consulted).

3.1 AESTHETICS

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to aesthetics that would require the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Aesthetics at the proposed project site were evaluated with regard to the County of Los Angeles General Plan;[2] California Department of Transportation (Caltrans) Scenic Highway Program designations; previously published information regarding the visual character of the proposed project site, including light and glare, site reconnaissance, and conceptual elevations; and existing and proposed site plans of the Martin Luther King, Jr. Medical Center Campus.[3]

The State CEQA Guidelines recommend the consideration of four questions when addressing the potential for significant impacts to aesthetics.

Would the proposed project have any of the following effects:

a) Have a substantial adverse effect on a scenic vista?

The proposed project would not be expected to result in impacts to aesthetics in relation to scenic vistas. Based on the review of the County of Los Angeles General Plan Recreation element and studies of regional maps, the proposed project site is not within a scenic vista, and there are no scenic vistas identified within the vicinity of the proposed project site.[4] Existing development at the proposed project site consists of the Martin Luther King, Jr. Medical Center Campus, which provides medical services to the South Los Angeles community. The proposed project would modify the existing medical services facilities, including development of a new Multiservice Ambulatory Care Center (MACC) and Ancillary Buildings, reuse or replacement of the existing MACC Building, and renovations and other improvements to other existing buildings. Additional Master Plan development would allow for up to 1,814,696 square feet of development on the proposed project site, along with up to 100 units of residential development. Public facilities, commercial development, and residential development—all of which are typical of an urban setting—comprise the land uses surrounding the proposed project site. Therefore, there would be no expected impacts to aesthetics related to scenic vistas. No further analysis is warranted.

b) Substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?

The proposed project would not be expected to result in impacts to aesthetics in relation to substantial damage to scenic resources within a state scenic highway. According to the California Scenic Highway Program, the nearest eligible or officially designated scenic highway or historic parkway is California

---

State Route 110 (SR 110), located approximately 2 miles to the west of the proposed project site.[5] The proposed project site cannot be viewed from SR 110 due to distance. Moreover, the elevation of the proposed project site ranges from 86 feet above mean sea level (MSL) at the southwest corner to 90 feet above MSL at the northeast corner. As such, the topography of the proposed project site can be characterized as flat. The distance from the scenic route, the site's flat topography, and the fact that none of the proposed project structures are anticipated to exceed the height of existing structures, all serve to curtail any potential structural obstruction of available public access views. Therefore, there would be no expected impacts to aesthetics related to substantial damage to scenic resources within a state scenic highway. No further analysis is warranted.

c) Substantially degrade the existing visual character or quality of the site and its surroundings?

The proposed project would be expected to result in potentially significant impacts to aesthetics in relation to the degradation of the existing visual character of the proposed project site and its surroundings. Incorporation of mitigation measures would be required to reduce the proposed project's impacts to below the level of significance. The existing Martin Luther King, Jr. Medical Center Campus is composed of a six-story main hospital tower located on the south-facing portion of the campus, as well as an adjacent five-story building, and various other structures and support buildings that surround these structures. The support buildings include a two-story medical records building, the one-story Pediatric Acute Care Building, and the three-story Hawkins Building, as well as other support buildings that range in height from one to six stories. The area surrounding the proposed project site is characterized by common urban development, where land uses include public facilities, commercial development, and residential development. The proposed project includes the construction of a new MACC and Ancillary Building, as well as the reuse or replacement of the existing MACC Building and program-level development of a campuswide Master Plan. The proposed project area can currently be seen from adjacent homes located across from the existing MACC, and as such, future planned development may create a major visual impact by obstructing current views or by having inconsistent visual character with the existing neighborhood as viewed from these residential areas due to potential placement of the proposed structures. This potential impact would result from a building design that, due to differences in scale, design, and character, would be inconsistent with the existing visual character of the surrounding area. In this way, neighborhood visual quality may be affected. Therefore, there would be potentially significant impacts to aesthetics related to degradation of the existing visual character of the proposed project site and its surroundings, which would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Impacts to aesthetics related to the creation of a new source of substantial light or glare that would adversely affect daytime or nighttime views in the proposed project area would be expected to be less than significant with the incorporation of mitigation measures. It is anticipated that construction of the proposed project would utilize existing light sources and would create additional safety lighting around the proposed project site and in the parking structures. However, the development of the campus-wide Master Plan may potentially lead to the construction of structures containing reflective surfaces that could create additional glare because of the windows and lighting structures that would be viewed from surrounding areas, including residential uses. In addition, the activation of interior

---

[5] California Department of Transportation. 2 October 2009. *The California Scenic Highway System: A List of Eligible (E) and Officially Designated (OD) Routes (by Route)*. Available at: http://www.dot.ca.gov/hq/LandArch/scenic/schwy1.html

lighting within the proposed facilities during nondaytime hours would be expected to create additional effects from bright lighting. As previously noted, the area surrounding the proposed project site can be characterized as a typical urban setting. As such, there exist tree lights and other sources of light and glare from the existing structures at the proposed project site and in the surrounding community. The proposed project area can be seen from adjacent homes located across from the existing MACC, and as such, future planned development may create a major visual impact with respect to significantly increasing the intensity of nighttime lighting effects and glare. Street lights, neon store signage, and the absence of treescape and other landscaping coverage could potentially contribute to the increase in these lighting and glare effects, thus potentially adversely affecting daytime or nighttime views. Although the existing medical center has a setback from residences facing its buildings that would reduce the impact of glare and nighttime lighting effects, further review of the Master Plan development and of the proposed development would be required to ensure that the proposed project would not create new source of substantial light or glare. Therefore, impacts to aesthetics related to the creation of a new source of substantial light or glare that would adversely affect daytime or nighttime views in the proposed project area would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

3.2 AGRICULTURE AND FOREST RESOURCES

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to agricultural resources, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Agricultural resources at the proposed project site were evaluated with regard to the California Department of Conservation (CDC) Farmland Mapping and Monitoring Program (FMMP)[2] and the County of Los Angeles General Plan (County General Plan).[3]

State CEQA Statutes {[§21060.1(a)] Public Resources Code 21000-21177} define agricultural land to mean "prime farmland, farmland of statewide importance, or unique farmland, as defined by the United States Department of Agriculture (USDA) land inventory and monitoring criteria, as modified for California" and is herein collectively referred to as "Farmland." Public Resources Code section 12220(g), defines forest land as " land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits."

State CEQA Guidelines recommend the consideration of five questions when addressing the potential for significant impacts to agriculture and forest resources.

Would the proposed project:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

The proposed project would not be expected to result in impacts to agricultural resources in relation to the conversion of Farmland. The County of Los Angeles General Plan land use designation for the proposed project is Public and Semipublic Facilities (P). According to the County of Los Angeles General Plan Land Use element, areas designated P are intended for major existing and proposed public and semipublic uses, including airports and other major transportation facilities, solid and liquid waste disposal sites, utilities, public buildings, public and private educational institutions, religious institutions, hospitals, detention facilities, and fairgrounds.[4]

The proposed project site is located in the unincorporated area of Willowbrook, County of Los Angeles (County), California. The existing zoning for the proposed project site is Neighborhood Commercial (C-2; Neighborhood Business Zone). This zoning designation is established to identify

community-related commercial uses and allows the following uses: drugstores, medical clinics (including laboratories), professional or business office space, parking lots and buildings, and hospital equipment and supply rentals.[5] The proposed project does not include the development of agricultural land and is located within an urban area in the unincorporated area of Willowbrook. The most recent mapping of the County of Los Angeles for Farmland undertaken by the CDC FMMP was reviewed for the proposed project site.[6] Based on the review of the land use designations and applicable Important Farmland map for the proposed project site,[7] there are no Farmlands located within or immediately adjacent to the proposed project site. Therefore, there would be no expected impacts to agricultural resources related to the conversion of Farmland. No further analysis is warranted.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

The proposed project would not be expected to result in impacts to agricultural resources in relation to a conflict with existing zoning for agricultural use or a Williamson Act contract. Based on an analysis of zoning within the County of Los Angeles, the proposed project site is not zoned for agricultural use.[8] In addition, no parcels within or adjacent to the proposed project site are subject to Williamson Act Contracts, as the County of Los Angeles does not offer Williamson Act contracts.[9] Based on the review of the County's zoning and the status of Williamson Act contracts, there would be no expected impacts to agricultural resources related to a conflict with existing zoning for agricultural use or a Williamson Act contract. No further analysis is warranted.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

The proposed project would not be expected to result in impacts to forest resources, in relation to the potential to conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by the Government Code section 51104(g)). As noted above, the Public Resources Code section 12220(g), defines forest land as " land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits." Public Resources Code section 4526 states that "Timberland" means land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species

[8] County of Los Angeles Department of Regional Planning. *GIS-NET*. Accessed 1 October 2009. Available at: http://planning.lacounty.gov/gisnet

[9] California Department of Conservation, Division of Land Resource Protection. Accessed 1 October 2009. *Williamson Act Program—Basic Contract Revisions*. Available at: http://www.consrv.ca.gov/dlrp/lca/basic_contract_provisions/Pages/index.aspx#does my county participate

used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined by the board on a district basis after consultation with the district committees and others.[10] Government Code section 51104 (g) states, "'Timberland production zone' or 'TPZ' means an area which has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, as defined in subdivision (h). With respect to the general plans of cities and counties, 'timberland preserve zone' means 'timberland production zone."[11] Sections 51112 and 51113 relate to timberland production within timberland production zones.[12] Finally, subdivision (h) states, a "'compatible use' is any use which does not significantly detract from the use of the property for, or inhibit, growing and harvesting timber" and provides six specific instances where such uses would be 'contrary' or inconsistent with the land being considered a 'compatible use.'[13]

According to the Department of Forestry and Fire Protection, the state of California consists of approximately 5,418,979 acres of land that has been classified as TPZ.[14] TPZ is designated in 32 counties within the state. The County of Los Angeles does not contain land that is designated as a timberland production zone.[15,16] The proposed project site is a hospital campus and is not zoned for forest land, timberland, or timberland production, nor is it adjacent to land zoned as such.[17] Based on the review of the County's zoning and the forest land, timberland, and Timberland Production codes, there would be no expected impacts to agricultural and forest resources in relation to a conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)). No further analysis is warranted.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

The proposed project would not be expected to result in impacts to agricultural and forest resources in relation to the loss of forest land or conversion of forest land to non-forest use. The proposed project site is located in the unincorporated community of Willowbrook which is an urban area. As such, the proposed project would not result in the loss of forest land or conversion of forest land to non-forest use because there is no forest land on or immediately adjacent to the proposed project site.[18] Therefore, the proposed project would not be expected to result in impacts to agricultural and forest resources in relation to the loss of forest land or conversion of forest land to non-forest use.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

The proposed project would not be expected to result in impacts to agricultural resources in relation to changes in the existing environment that, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forest land to non-forest use. Based on the review of the most recent mapping of the County for Farmland undertaken by the CDC FMMP, there is no Farmland on or immediately adjacent to the proposed project site.[19] The proposed project would not enhance the suitability of any designated farmland for development because there are no designated farmlands within the proposed project area. Forest land is not located on or immediately adjacent to the proposed project site. The proposed project would not cause the conversion of forest land to non-forest use because no forest land is located in the unincorporated area of Willowbrook. Therefore, there would be no expected impacts to agricultural resources related to changes in the existing environment that, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forest land to non-forest use. No further analysis is warranted.

---

[19] California Department of Conservation, Division of Land Resource Protection, Farmland Mapping and Monitoring Program. 2006. *Los Angeles Important Farmland, 2006*. Sacramento, CA.

3.3 AIR QUALITY

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to air quality, thus requiring the consideration of mitigation measures or alternatives in accordance with Section 15063 of the California Environmental Quality Act (CEQA) Guidelines.[1] Air quality at the proposed project site was evaluated with regard to the County of Los Angeles (County) General Plan,[2] the National Ambient Air Quality Standards (NAAQS),[3] the California Ambient Air Quality Standards,[4] and the Clean Air Act (CAA).[5]

Data on existing air quality in the South Coast Air Basin (SCAB), where the proposed project site is located, is monitored by a network of air monitoring stations operated by the California Environmental Protection Agency, the California Air Resources Board (CARB), and the South Coast Air Quality Management District (SCAQMD). The assessment of construction impacts was based on a construction scenario for a building of comparable size to the proposed project and a construction schedule of comparable duration. The conclusions reflect guidelines established by the SCAQMD *CEQA Air Quality Handbook*.[6]

The proposed project is located in the SCAQMD South Central Los Angeles County Air Monitoring Subregion No. 12, which is served by the Lynwood Monitoring Station, approximately 1.7 miles east-northeast of the proposed project site at 11220 Long Beach Boulevard, Lynwood, California. This monitoring station measures particulate matter ($PM_{2.5}$ and PM_{10}), CO, O_3, and NO_2.

The potential for the project to result in new or substantially more adverse significant impacts to air quality was evaluated in relation to five questions recommended for consideration by the State CEQA Guidelines.[7]

Would the proposed project:

a) Conflict with or obstruct implementation of the applicable air quality plan?

Impacts to air quality related to whether the proposed project conflicts with or obstructs implementation of the applicable air quality plan would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. The proposed project area is located in the unincorporated area of Willowbrook, which is located within the SCAQMD portion of the SCAB. Ozone (O_3) is the pollutant of greatest concern throughout the SCAB. No single source is responsible for most of the emissions of O_3 precursors, nitrogen oxides (NO_x) and volatile organic compounds; many sources are spread throughout the basin. The SCAB is designated as a

[6] South Coast Air Quality Management District. 1993. *CEQA Air Quality Handbook*. Diamond Bar, CA.

[7] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Sections 15000–15387, Appendix G.

federal-level nonattainment area for the O_3 and particulate matter with a diameter of 2.5 microns or less ($PM_{2.5}$) air quality standards, but the basin has recently improved from nonattainment to attainment with the NAAQS for both nitrogen dioxide (NO_2) and carbon monoxide (CO).[8] The SCAB is a state-level nonattainment area for the O_3 and $PM_{2.5}$ air quality standards, and the County is a state-level nonattainment area for the O_3, PM_{10}, and $PM_{2.5}$, based on the California Ambient Air Quality Standards.[9]

The most recent update to the SCAQMD Air Quality Management Plan (AQMP) was prepared for air quality improvements to meet both state and federal CAA planning requirements for all areas under AQMP jurisdiction. This update was adopted by CARB for inclusion in the State Implementation Plan on September 27, 2007. The AQMP sets forth strategies for attaining the federal PM_{10} and $PM_{2.5}$ air quality standards and the federal 8-hour O_3 air quality standard, as well as meeting state standards at the earliest practicable date. With the incorporation of new scientific data, emission inventories, ambient measurements, control strategies, and air quality modeling, this 2007 AQMP focuses on O_3 and $PM_{2.5}$ attainments.

Existing air quality within the proposed project vicinity is characterized by a mix of local emission sources that include stationary activities, such as space and water heating, landscape maintenance, and consumer products; and mobile sources, such as primarily automobile and truck traffic. Motor vehicles are the primary source of pollutants within the proposed project vicinity because they have the potential to generate elevated localized concentrations of CO, termed CO *hotspots*. Section 9.4 of the SCAQMD *CEQA Air Quality Handbook* identifies CO as a localized problem requiring additional analysis when a proposed project is likely to expose sensitive receptors to CO hotspots.[10]

The SCAQMD evaluates the project in terms of air pollution thresholds.[11] The proposed project would be considered significant if implementation of the proposed project would result in daily operation, daily construction, or operation-related emissions that cause or exceed the SCAQMD thresholds of significance. As described in Section 1.0, *Project Description*, of this Initial Study, the proposed project would require construction and use of new facilities covering an area of up to approximately 38 acres. In addition, construction of the proposed project, as currently conceived, would occur daily for a period of 37 months for the Tier I portion of the proposed project (and on a multiphased schedule for approximately 120 months [10 years] for the Tier II portion of the proposed project). Therefore, the proposed project would be expected to result in significant impacts in relation to its consistency with the applicable air quality plan.

Implementation of the proposed project would be expected to be consistent with the County General Plan land use designations for the area.[12] The proposed project, as currently conceived, entails development of new buildings and renovations to existing buildings, as well as development of the campuswide Master Plan, which would include up to 1,814,696 square feet of mixed-use development and up to 100 units of residential development. Implementation of the proposed project would be expected to create new activity that would contribute to air quality

---

[12] County of Los Angeles Department of Regional Planning. January 1993. *County of Los Angeles Streamlined General Plan*. Los Angeles, CA.

impacts in the surrounding area. In addition, during operation of the proposed project, emissions generated daily from space and water heating and vehicle trips generated by new employees and visitors traveling to and from the proposed project area would be expected to have the potential to result in operational air quality impacts beyond the SCAQMD thresholds of significance.

Impacts to air quality associated with the proposed project in relation to its consistency with the applicable air quality plan would have the potential to be significant and require the incorporation of mitigation measures specified by SCAQMD to mitigate these impacts to below the level of significance. Further analysis is warranted.

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Implementation of the proposed project would be expected to result in significant impacts to air quality related to a violation of any air quality standard or a substantial contribution to an existing or projected air quality violation. Construction-related air quality impacts may result from combustion emissions from on-site construction and mobile equipment and from fugitive dust emissions from demolition, grading, and site preparation activities. The proposed project would be expected to entail several construction components, such as demolition, mass site grading, fine site grading, trenching, paving, facility construction, and architectural coating. The total area that would be under construction is approximately 38 acres. Construction of the proposed project would be expected to last 37 months for the Tier I portion of the proposed project and up to 120 months (10 years) for the Tier II portion of the proposed project and to potentially contribute to an exceedance of air quality standards, especially if all construction work occurred in one phase.

Operational phase impacts may occur from increased equipment emissions as a result of maintenance for new buildings and landscape, from increased emissions from new building support systems as a result of space and water heating, and from increased vehicle emissions generated from trips to and from the proposed project site. Once constructed, the proposed project is likely to result in an increase in employees and visitors to the proposed project site, resulting in the production of a significant number of daily vehicular trips. Although the operational function of the proposed project as a hospital and mixed-use facility would not be expected to cause a new air quality violation, the size, the number, and the capacity of the proposed new buildings suggest that the proposed project has the potential to cause a measurable increase in existing violations.

Emissions of criteria pollutants associated with the proposed project would have the potential for cumulative and significant impacts due to the relatively large area that would be scheduled for construction activities and the 37-month construction duration of Tier I of the proposed project (as well as the anticipated 10-year multiphase Tier II portion of the proposed project. In addition, maintenance of the new building and additional daily commute trips by new employees and visitors to and from the proposed project site would increase criteria pollutant emissions associated with the operational phase of the proposed project. Therefore, the proposed project has the potential to result in impacts to air quality in relation to violating applicable air quality standards or contributing to an existing or projected air violation. These impacts may not be able to be reduced to below the level of significance through the incorporation of mitigation measures specified by SCAQMD.[13] Therefore, the consideration of alternatives to the proposed project may be required. Further analysis is warranted.

[13] South Coast Air Quality Management District. 1993. *CEQA Air Quality Handbook*. Diamond Bar, CA.

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Implementation of the proposed project would be expected to result in significant impacts to air quality related to a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard. The proposed project site is located within the SCAB, which is designated as a nonattainment area according to the state and federal O_3 and $PM_{2.5}$ air quality standards. During the construction phase, primary emissions would include ozone precursor emissions and particulate matter. Ozone precursor emissions from vehicles coming to and from the proposed project site would be the primary source of impact to air quality associated with operation of the proposed project. Due to the relatively large size of the proposed project, the proposed project would be expected to result in a cumulatively considerable net increase of one or more criteria pollutant for which the project region is in nonattainment status under the applicable federal or state ambient air quality standards. These impacts may not be able to be reduced to below the level of significance through the incorporation of mitigation measures. Therefore, the consideration of alternatives to the proposed project may be required. Further analysis is warranted.

d) Expose sensitive receptors to substantial pollutant concentrations?

Implementation of the proposed project would be expected to result in significant impacts to air quality related to the exposure of sensitive receptors to substantial pollutant concentrations. Construction of the proposed project would occur within an area of up to approximately 38 acres, bounded by East 120th Street to the north, Wilmington Avenue to the east, East 122nd Street to the south, and Compton Avenue to the west. Area sensitive receptors that may be affected by project-related pollutant concentrations include the following: King Drew Magnet High School located adjacent to the MLK campus on East 120th Street, Lincoln Drew Elementary School located 0.10 mile to the north, Harriet Tubman High School located 0.25 mile south, Cesar Chavez Alternative School located 0.25 mile south, Compton Community Day Middle School located 0.25 mile south and Carver Elementary located 0.21 mile to the west; all are located within 0.25 miles of the site. Sensitive receptors may be exposed to construction emissions such as fugitive dust, combustion emissions, and diesel particulate matter. Operation of the proposed project may also expose sensitive receptors in the vicinity of the proposed project site to equipment and building emissions as a result of building operational activities, maintenance activities, and space and water heating and to automotive combustion emissions as a result of the generation of increased vehicle trips. With two elementary schools identified within 0.25 miles of the proposed project site, consideration of the SCAQMD standard list of mitigation measures would be required to reduce significant impacts. Therefore, the proposed project has the potential to result in impacts to air quality in relation to the exposure of sensitive receptors to substantial pollutant concentrations. These impacts may not be able to be reduced to below the level of significance through the incorporation of mitigation measures. Therefore, the consideration of alternatives to the proposed project may be required. Further analysis is warranted.

e) Create objectionable odors affecting a substantial number of people?

Impacts to air quality related to whether the proposed project would create objectionable odors affecting a substantial number of people would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. Construction of the proposed project would require the use of diesel-powered equipment. Odors associated with emissions from diesel equipment may be considered unpleasant by some people. Because a relatively large square footage of buildings would be under construction and the use of diesel-powered equipment would be anticipated to occur daily during its construction phase, construction of the proposed project would be expected to result in impacts in relation to creating objectionable odors. However, these construction-related air quality impacts would be expected to be below the level of significance because the use of diesel-powered equipment would occur only in the short-term during the construction period. In addition, the proposed project would implement best management practices (BMPs) during construction (such as reducing queuing and idling time) that would further reduce this potential impact. Therefore, with a potential to create objectionable odors during its construction, the proposed project would be expected to result in impacts that would be below the level of significance.

The proposed project would operate as a medical and mixed-use facility, and as such, the operational function of the proposed project would not be likely to result in the creation of objectionable odors. However, given the size and numerous components involved in the proposed project, operation of the proposed project would have the potential to result in significant impacts to air quality related to creating objectionable odors affecting a substantial number of people, thus requiring the consideration of mitigation measures to reduce these impacts to below the level of significance. Further analysis is warranted.

3.4 BIOLOGICAL RESOURCES

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact on biological resources, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Biological resources at the proposed project site were evaluated with regard to (1) the County of Los Angeles (County) General Plan;[2] (2) a query of the California Natural Diversity Database (CNDDB)[3] for the U.S. Geological Survey (USGS) 7.5-minute South Gate series topographic quadrangle[4] where the proposed project is located and all surrounding USGS 7.5-minute series topographic quadrangles, including Inglewood,[5] Long Beach,[6] Whittier,[7] Torrance,[8] Los Alamitos,[9] El Monte,[10] Hollywood,[11] and Los Angeles;[12] (3) and a review of published and unpublished literature germane to the proposed project.

State CEQA Guidelines recommend the consideration of six questions when addressing the potential for significant impacts to biological resources:

Would the proposed project have any of the following effects:

a) Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or the U.S. Fish and Wildlife Service?

3.4.1 Listed Species

The proposed project would not be expected to result in impacts to biological resources in relation to species listed as rare, threatened, or endangered pursuant to the federal and state Endangered Species Acts (ESAs). This analysis is based on the habitat requirements and historical occurrences of the listed species with the potential to occur in the proposed project area. The proposed project site is within an urbanized area of the County of Los Angeles, with developed areas surrounding the proposed project site, and consists of streets, parking lots, existing buildings, and landscaping with nonnative plant species that are open to the public. The subject property is a hospital facility, characterized by hospital and medical functions. The proposed project site is a completely developed property. A query of the CNDDB identified 18 listed species that are known from the region, including 8 plant species and 10 wildlife species. Of the 18 species listed as rare, threatened, or endangered pursuant to the federal and state ESAs that were identified as having the potential to occur in the region of southwestern County of Los Angeles (Table 3.4.1-1, *Listed Plant and Wildlife Species with the Potential to Occur in the Region of the Proposed Project Site*), none were determined to have the potential to occur within the proposed project area due to lack of suitable habitat. Therefore, there would be no expected impacts to biological resources related to species listed as rare, threatened, or endangered pursuant to the federal and state Endangered Species Acts. No further analysis is warranted.

TABLE 3.4.1-1
LISTED PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE

Species	Status	Habitat Requirements	Habitat Assessment
Plant			
Lyon's pentachaeta (*Pentachaeta lyonii*)	FE, SE, CNPS 1B.1	Chaparral, coastal scrub, and valley and foothill grassland; occurs between 90 and 1,980 feet (30 and 630 meters) above mean sea level (MSL); annual herb in the *Asteraceae* family that blooms from March to August.	No suitable habitat occurs within the proposed project site.
Gambel's water cress (*Nasturtium gambelii*)	FE, ST, CNPS 1B.1	Marshes and swamps, brackist marshes at the margins of lakes or streams; occurs between 15 and 990 feet (5 and 330 meters) above MSL; annual herb in the *Brassicaceae* family that blooms from April to October.	No suitable habitat occurs within the proposed project site.
Marsh sandwort (*Arenaria paludicola*)	FE, SE, CNPS 1B.1	Marshes and swamps, dense mats of typha, juncus, and scirpus in freshwater marshes; occurs between 30 and 510 feet (10 and 170 meters) above MSL; stoloniferous herb in the family *Caryophyllaceae* that blooms from May to August.	No suitable habitat occurs within the proposed project site.
Braunton's milk-vetch (*Astragalus brauntonii*)	FE, CNPS 1B.1	Chaparral, coastal scrub, and valley and foothill grassland; occurs between 12 and 1,860 feet (4 and 620 meters) above MSL; perennial herb in the *Fabaceae* family that blooms from January to August.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.1-1
LISTED PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat Requirements	Habitat Assessment
Coastal dunes milk-vetch (*Astragalus tener* var. *titi*)	FE, SE, CNPS 1B.1	Coastal bluff scrub, coastal dunes, and coastal prairie; occurs between 3 and 150 feet (1 and 50 meters) above MSL; perennial herb in the *Fabaceae* family that blooms from March to May.	No suitable habitat occurs within the proposed project site.
Moran's navarretia (*Navarretia fossalis*)	FT, CNPS 1B.1	Chenopod scrub, marshes and swamps, playas, and vernal pools; occurs between 90 and 3,900 feet (30 and 1,300 meters) above MSL; annual herb in the *Polemoniaceae* family that blooms from April to July.	No suitable habitat occurs within the proposed project site.
Salt marsh bird's-beak (*Cordylanthus maritimus* ssp. *maritimus*)	FE, SE, CNPS 1B.2	Coastal dunes, marshes, and swamps; occurs between 0 and 90 feet (0 and 30 meters) above MSL; annual herb in the *Scrophulariaceae* family that blooms from May to October.	No suitable habitat occurs within the proposed project site.
California Orcutt grass (*Orcuttia californica*)	FE, SE, CNPS 1B.1	Vernal pools; occurs between 45 and 1,980 feet (15 and 660 meters) above MSL; annual herb in the *Poaceae* family that blooms from April to August.	No suitable habitat occurs within the proposed project site.
Wildlife			
Palos Verde blue butterfly (*Glaucopsyche lygdamus palosverdesensis*)	FE	Occurs in coastal sage scrub on the Palos Verdes Peninsula and requires either deerweed or locoweed as a host plant.	No suitable habitat occurs within the proposed project site.
Mohave tui chub (*Gila bicolor mohavensis*)	FE, SE	Found in deep pools and slough-like areas of the Mojave River but now only occurs in highly modified refuge sites in San Bernardino County.	No suitable habitat occurs within the proposed project site.
California brown pelican (*Pelecanus occidentalis californicus*)	FE, SE	Nest on islands in the Gulf of California and along the coast to West Anacapa and Santa Barbara Islands; they rarely occur inland.	No suitable habitat occurs within the proposed project site.
California least tern (*Sternula antillarum browni*)	FE, SE	Nest in colonies on bare or sparsely vegetated flat substrates near the coast.	No suitable habitat occurs within the proposed project site.
Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)	SE	Found in association with riparian forest, along lower flood bottom of larger river systems.	No suitable habitat occurs within the proposed project site.
Southwestern willow flycatcher (*Empidonax traillii extimus*)	FE, SE	Found in association with riparian habitat where willow, cottonwoods, and stinging nettles are dense.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.1-1
LISTED PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat Requirements	Habitat Assessment
Coastal California gnatcatcher (*Polioptila californica californica*)	FT, CSC	Occurs in or near sage scrub habitat, which includes the following plant communities: Venturan coastal sage scrub, Diegan coastal sage scrub, maritime succulent scrub, Riversidean sage scrub, Riversidean alluvial fan scrub, southern coastal bluff scrub, and coastal sage-chaparral scrub.	No suitable habitat occurs within the proposed project site.
Belding's savannah sparrow (*Passerculus sandwichensis beldingi*)	SE	Resides year-round in coastal salt marshes from Goleta Slough in Santa Barbara County to northern Baja California; nests primarily in pickleweed habitat.	No suitable habitat occurs within the proposed project site.
Least Bell's vireo *(Vireo bellii pusillus)*	FE, SE	Summer resident in low riparian habitat in vicinity of water or in dry river bottoms below 2,000 feet; nests along margins of bushes or on twigs projecting into pathways, usually willow, baccharis, mesquite.	No suitable habitat occurs within the proposed project site.
Pacific pocket mouse (*Perognathus longimembris pacificus*)	FE, CSC	Found on soils of fine, alluvial sands near the ocean; open spaces in otherwise dense, weedy areas.	No suitable habitat occurs within the proposed project site.

KEY:
Rare = Listed as rare by the State of California
CNPS 1B = Listed as rare, threatened, or endangered in California and elsewhere by the California Native Plant Society
CSC = California Department of Fish and Game species of special concern
FC= Federal candidate species
FE = Listed as endangered under the federal Endangered Species Act
FT = Listed as threatened under the federal Endangered Species Act
SE = Listed as endangered by the State of California
ST = Listed as threatened by the State of California

The eight plant species include the following: Lyon's pentachaeta (*Pentachaeta lyonii*), Gambel's water cress (*Nasturtium gambelii*), marsh sandwort (*Arenaria paludicola*), Braunton's milk-vetch (*Astragalus brauntonii*), coastal dunes milk-vetch (*Astragalus tener* var. *titi*), Moran's navarretia (*Navarretia fossalis*), salt marsh bird's-beak (*Cordylanthus maritimus* ssp. *maritimus*), and California Orcutt grass (*Orcuttia californica*). The subject plant species require natural habitats with specific aquatic, lowland and upland characteristics that were determined to be absent from the proposed project site. Due to the lack of habitats suitable to support the subject species, they have been determined absent from the proposed project site.

The 10 wildlife species include the following: Palos Verde blue butterfly (*Glaucopsyche lygdamus palosverdesensis*), Mohave tui chub (*Gila bicolor mohavensis*), California brown pelican (*Pelecanus occidentalis californicus*), California least tern (*Sternula antillarum browni*), western yellow-billed cuckoo (*Coccyzus americanus occidentalis*), southwestern willow flycatcher (*Empidonax traillii extimus*), coastal California gnatcatcher (*Polioptila californica californica*), Belding's savannah sparrow (*Passerculus sandwichensis beldingi*), least Bell's vireo (*Vireo bellii pusillus*), and Pacific pocket mouse (*Perognathus longimembris pacificus*). The subject wildlife species require natural habitats with specific aquatic, lowland and upland characteristics that were determined to be absent from the proposed project site. Due to the lack of habitats suitable to support the subject species, they have been determined absent from the proposed project site.

3.4.2 Sensitive Species

The proposed project would not be expected to result in impacts to biological resources in relation to sensitive species recognized by the U.S. Fish and Wildlife Service (USFWS) as federal species of concern or by the California Department of Fish and Game (CDFG) as California special concern species. Sensitive wildlife species are those not listed pursuant to the state and federal ESAs but listed as federal species of concern, proposed for listing, or identified by the CDFG as California species of special concern. This analysis is based on the habitat requirements and historical occurrences of the sensitive species with the potential to occur in the area. The proposed project site is within an urbanized area of the County of Los Angeles, with developed areas surrounding the site, and consists of streets, parking lots, existing buildings, and landscaping with nonnative plant species that are open to the public. The proposed project site is a hospital facility, characterized by hospital and medical functions. A query of the CNDDB identified no plant species and 15 sensitive wildlife species that are known from the region. Of the 15 sensitive species that were identified as having the potential to occur in the region of southwestern County of Los Angeles (Table 3.4.2-1, *Sensitive Plant and Wildlife Species with the Potential to Occur in the Region of the Proposed Project Site*), none were determined to have the potential to occur within the proposed project area due to lack of suitable habitat: western spadefoot (*Spea hammondii*), southwestern pond turtle (*Clemmys marmorata pallida*), coast (San Diego) horned lizard (*Phrynosoma coronatum blainvillii*), Coastal California gnatcatcher (*Polioptila californica californica*), burrowing owl (*Athene cunicularia*), tricolored blackbird (*Agelaius tricolor*), Southern California saltmarsh shrew (*Sorex ornatus salicornicus*), Pacific pocket mouse (*Perognathus longimembris pacificus*), greater western mastiff bat (*Eumops perotis californicus*), western yellow bat (*Lasiurus xanthinus*), pocketed free-tailed bat (*Nyctinomops femorosaccus*), big free-tailed bat (*Nyctinomops macrotis*), pallid bat (*Antrozous pallidus*), American badger (*Taxidea taxus*), and south coast marsh vole (*Microtus californicus stephensi*). The subject sensitive wildlife species require natural habitats with specific aquatic, lowland and upland characteristics that were determined to be absent from the proposed project site. Due to the lack of habitats suitable to support the subject species, they have been determined absent from the proposed project site. Therefore, there would be no expected impacts to biological resources related to sensitive species recognized by the USFWS as federal species of concern or by the CDFG as California special concern species. No further analysis is warranted.

TABLE 3.4.2-1
SENSITIVE PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE

Species	Status	Habitat	On-site Potential
Amphibians			
Western spadefoot (*Spea hammondii*)	CSC	Require temporary rain pools, with water temperatures between 9 and 30 degrees Celsius for reproducing; soil characteristics of burrow refuge sites have not been studied; occurs between near sea level and 1,363 meters above MSL.	No suitable habitat occurs within the proposed project site.
Reptiles			
Southwestern pond turtle (*Actinemys marmorata pallida*)	CSC, BLM	Require some slack- or slow-water aquatic habitat; reach higher densities where many aerial and aquatic basking sites are available; nests are located on unshaded slopes usually within 200 meters of the aquatic site.	No suitable habitat occurs within the proposed project site.
Coast (San Diego) horned lizard (*Phrynosoma coronatum blainvillii*)	CSC	Coastal sage, annual grassland, chaparral, oak woodland, riparian woodland, and coniferous forest.	No suitable habitat occurs within the proposed project site.
Birds			
Coastal California gnatcatcher (*Polioptila californica californica*)	CSC	Obligate, permanent resident of coastal sage scrub below 2,500 feet in southern California; low, coastal sage scrub in arid washes, on mesas and slopes.	No suitable habitat occurs within the proposed project site.
Burrowing owl (*Athene cunicularia*)	CSC	Found in open grasslands, agricultural and range lands, and desert habitats and are often associated with burrowing animals, specifically the California ground squirrel; they can also inhabit grass, forbs, and shrub stages of pinyon and ponderosa pine habitats.	No suitable habitat occurs within the proposed project site.
Tricolored blackbird (*Agelaius tricolor*)	CSC	Freshwater marshes and croplands.	No suitable habitat occurs within the proposed project site.
Mammals			
Southern California saltmarsh shrew (*Sorex ornatus salicornicus*)	CSC	No information other than coastal marshes; likely requires dense ground cover and nesting sites above mean high tide and free from inundation.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.2-1
SENSITIVE PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat	On-site Potential
Pacific pocket mouse (*Perognathus longimembris pacificus*)	CSC	Inhabits the narrow coastal plains from the Mexican border north to El Segundo; prefers soils of fine alluvial sands near the ocean.	No suitable habitat occurs within the proposed project site.
Western mastiff bat (*Eumops perotis californicus*)	CSC	Occurs in many open, semiarid to arid habitats, including conifer and deciduous woodlands, coastal scrub, annual and perennial grasslands, palm oases, chaparral, and desert scrub; also occurs in urban habitats.	No suitable habitat occurs within the proposed project site.
Western yellow bat (*Lasiurus xanthinus*)	CSC	Valley foothill riparian, desert riparian, desert wash, and palm oasis; roosts in trees, particularly palms; forages over water and among trees.	No suitable habitat occurs within the proposed project site.
Pocketed free-tailed bat (*Nyctinomops femorosaccus*)	CSC	Associated with rocky, desert areas with relatively high cliffs.	No suitable habitat occurs within the proposed project site.
Big free-tailed bat (*Nyctinomops macrotis*)	CSC	Rocky areas in the arid southwest, roosting primarily in crevices in cliffs.	No suitable habitat occurs within the proposed project site.
Pallid bat (*Antrozous pallidus)*	CSC	Deserts, grasslands, shrublands, woodlands, and forests; most common in open, dry habitats with rocky areas for roosting.	No suitable habitat occurs within the proposed project site.
American badger (*Taxidea taxus*)	CSC	Found in arid, open habitats, particularly grasslands, savannahs, mountain meadows, and desert scrub openings; needs friable soils for digging and open, uncultivated ground; occurs at low to moderate slopes; has been associated with Joshua tree woodland and pinyon-juniper habitats.	No suitable habitat occurs within the proposed project site.
South coast marsh vole (*Microtus californicus stephensi*)	CSC	Marshland habitat (generally restricted to this habitat type).	No suitable habitat occurs within the proposed project site.

KEY:
CSC = California Department of Fish and Game Species of Special Concern
BLM = Sensitive species under Bureau of Land Management

3.4.3 Locally Important Species

The proposed project would not be expected to result in impacts to biological resources in relation to locally important species afforded protection by the California Native Plant Society (CNPS). Locally important plant species are those not listed pursuant to the state or federal ESA but identified by CNPS as sensitive species that should be considered in assessing the potential effects of proposed projects. A query of the CNDDB identified 24 locally important plant species that are known from the region. Of the 24 locally important species that were identified as having the potential to occur in the region of southwestern County of Los Angeles (Table 3.4.3-1, *Locally Important Plant and Wildlife Species with the Potential to Occur in the Region of the Proposed Project Site*), none were determined to have the potential to occur within the proposed project area due to lack of suitable habitat: southern tarplant (*Centromadia parryi* ssp. *australis*), Los Angeles sunflower (*Helianthus nuttallii* ssp. *parishii*), Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*), white rabbit-tobacco (*Pseudognaphalium leucocephalum*), San Bernardino aster (*Symphyotrichum defoliatum*), Greata's aster (*Symphyotrichum greatae*), Coulter's saltbush (*Atriplex coulteri*), south coast saltscale (*Atriplex pacifica*), Parish's brittlescale (*Atriplex parishii*), Davidson's saltscale (*Atriplex serenana* var. *davidsonii*), estuary seablite (*Suaeda esteroa*), Santa Barbara morning-glory (*Calystegia sepium* ssp. *bingamiae*), many-stemmed dudleya *(Dudleya multicaulis)*, round-leaved filaree (*California macrophylla*), Parish's gooseberry (*Ribes divaricatum* var. *parishii*), mud nama (*Nama stenocarpum*), Brand's star phacelia (*Phacelia stellaris*), southern mountains skullcap (*Scutellaria bolanderi* ssp. *austromontana*), Salt Spring checkerbloom (*Sidalcea neomexicana*), Orcutt's linanthus (*Linanthus orcuttii*), prostrate vernal pool navarretia (*Navarretia prostrate*), coast woolly-heads (*Nemacaulis denudata* var. *denudate*), mesa horkelia (*Horkelia cuneata* ssp. *puberula*), and Plummer's mariposa-lily (*Calochortus plummerae*). The subject plant species require natural habitats with specific aquatic, lowland and upland characteristics that were determined to be absent from the proposed project site. Due to the lack of habitats suitable to support the subject species, they have been determined absent from the proposed project site. Therefore, there would be no expected impacts to biological resources related to locally important species afforded protection by CNPS. No further analysis is warranted.

TABLE 3.4.3-1
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE

Species	Status	Habitat	On-site Potential
Plants			
Southern tarplant (*Centromadia parryi* ssp. *Australis*)	CNPS 1B.1	Marshes and swamps, valley and foothill grassland, and vernal pools; occurs between 9 and 1,275 feet (0 and 425 meters) above MSL; annual herb in the *Asteraceae* family that blooms from May to November.	No suitable habitat occurs within the proposed project site.
Los Angeles sunflower (*Helianthus nuttallii* ssp. *parishii*)	CNPS 1A	Coastal salt and freshwater marshes and swamps; occurs between 15 and 5,025 feet (5 and 1,675 meters) above MSL; rhizomatous herb in the *Asteraceae* family that blooms from August to October.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.3-1
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat	On-site Potential
Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*)	CNPS 1B.1	Coastal salt marshes and swamps, playas, and vernal pools; occurs between 3 and 3,660 feet (1 and 1,220 meters) above MSL; annual herb in the *Asteraceae* family that blooms from February to June.	No suitable habitat occurs within the proposed project site.
White rabbit-tobacco (*Pseudognaphalium leucocephalum*)	CNPS 2.2	Riparian woodland, cismontane woodland, coastal scrub, chaparral; occurs between 0 and 6,300 feet (0 and 2,100 meters) above MSL; perennial herb in the *Asteraceae* family that blooms from August to November.	No suitable habitat occurs within the proposed project site.
San Bernardino aster (*Symphyotrichum defoliatum*)	CNPS 1B.2	Cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and valley and foothill grassland; occurs between 6 and 6,120 feet (2 and 2,040 meters) above MSL; rhizomatous herb in the *Asteraceae* family that blooms from July to November.	No suitable habitat occurs within the proposed project site.
Greata's aster (*Symphyotrichum greatae*)	CNPA 1B.3	Chaparral, cismontane woodland, mesic canyons; occurs between 2,400 and 4,500 feet (800 and 1500 meters) above MSL; rhizomatous herb in the *Asteraceae* family that blooms from June to October.	No suitable habitat occurs within the proposed project site.
Coulter's saltbush (*Atriplex coulteri*)	CNPS 1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, valley and foothill grassland; occurs between 15 and 1,380 feet (3 and 460 meters) above MSL; annual herb in the *Chenopodiacea* family that blooms from March to October.	No suitable habitat occurs within the proposed project site.
South coast saltscale (*Atriplex pacifica*)	CNPS 1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, and playas; occurs between 1 and 420 feet (0 and 140 meters) above MSL; annual herb in the *Chenopodiaceae* family that blooms from March to October.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.3-1
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat	On-site Potential
Parish's brittlescale (*Atriplex parishii*)	CNPS 1B.1	Chenopod scrub, playas, and vernal pools; occurs between 75 and 5,700 feet (25 and 1,900 meters) above MSL; annual herb in the *Chenopodiaceae* family that blooms from June to October.	No suitable habitat occurs within the proposed project site.
Davidson's saltscale (*Atriplex serenana* var. *davidsonii*)	CNPS 1B.2	Coastal bluff scrub and coastal scrub; occurs between 30 and 600 feet (10 and 200 meters) above MSL; annual herb in the *Chenopodiaceae* family that blooms from April to October.	No suitable habitat occurs within the proposed project site.
Estuary seablite (*Suaeda esteroa*)	CNPS 1B.2	Marshes and swamps; occurs between 0 and 15 feet (0 and 5 meters) above MSL; perennial herb in the *Chenopodiaceae* family that blooms from May to October.	No suitable habitat occurs within the proposed project site.
Santa Barbara morning-glory (*Calystegia sepium* ssp. *bingamiae*)	CNPS 1A	Coastal marches; occurs between 0 and 60 feet (0 and 20 meters) above MSL; rhizomatous herb in the *Convolvulaceae* family that blooms from April to May.	No suitable habitat occurs within the proposed project site.
Many-stemmed dudleya (*Dudleya multicaulis*)	CNPS 1B.2	Chaparral, coastal scrub, valley and foothill grassland; occurs in heavy, often clayey soils or grassy slopes between 0 and 2,370 feet (0 and 790 meters) above MSL; perennial herb in the *Crassulaceae* family that blooms from April to June.	No suitable habitat occurs within the proposed project site.
Round-leaved filaree (*Erodium macrophylla*)	CNPS 1B.1	Cismontane woodland, valley and foothill grassland; occurs in clay soils between 75 and 3,600 feet (15 and 1,200 meters) above MSL; annual herb in the *Geraniaceae* family that blooms from March to May.	No suitable habitat occurs within the proposed project site.
Parish's gooseberry (*Ribes divaricatum* var. *parishii*)	CNPS 1A	Riparian woodland, salix swales; occurs between 195 and 300 feet (65 and 100 meters) above MSL; deciduous shrub in the *Grossulariaceae* family that blooms from February to April.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.3-1
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat	On-site Potential
Mud nama (*Nama stenocarpum*)	CNPS 2.2	Marshes and swamps; occurs between 15 and 1,500 feet (5 and 500 meters) above MSL; annual/perennial herb in the *Hydrophyllaceae* family that blooms from January to July.	No suitable habitat occurs within the proposed project site.
Brand's star phacelia (*Phacelia stellaris*)	CNPS 1B.1	Coastal dunes and coastal scrub; occurs between 3 and 1,200 feet (1 and 400 meters) above MSL; annual herb in the *Hydrophyllaceae* family that blooms from March to June.	No suitable habitat occurs within the proposed project site.
Southern mountains skullcap (*Scutellaria bolanderi* ssp. *austromontana*)	CNPA 1B.2	Chaparral, cismontane woodland, lower montane coniferous forests, gravely soils on streambanks or in mesic sites in oak or pine woodland; occurs between 1,275 and 6,000 feet (425 and 2,000 meters) above MSL; rhizomatous herb in the *Lamiaceae* family that blooms from June to July.	No suitable habitat occurs within the proposed project site.
Plummer's mariposa-lily (*Calochortus plummerae*)	CNPS 1B.2	Coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest; occurs on rocky and sandy sites between 270 and 4,830 feet (90 and 1610 meters) above MSL; bulbiferous herb in the *Liliaceae* family that blooms from June to August.	No suitable habitat occurs within the proposed project site.
Salt Spring checkerbloom (*Sidalcea neomexicana*)	CNPS 2.2	Chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, and playas; occurs between 75 and 4,590 feet (15 and 1,530 meters) above MSL; perennial herb in the *Malvaceae* family that blooms from March to June.	No suitable habitat occurs within the proposed project site.
Orcutt's linanthus (*Linanthus orcuttii*)	CNPS 1B.3	Chaparral, lower montane coniferous forest; occurs between 3,180 and 6,000 feet (1,060 to 2,000 meters) above MSL; annual herb in the *Polemoniaceae* family that blooms from May to June.	No suitable habitat occurs within the proposed project site.

TABLE 3.4.3-1
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, Continued

Species	Status	Habitat	On-site Potential
Prostrate vernal pool navarretia (*Navarretia prostrata*)	CNPS 1B.1	Coastal scrub, meadows and seeps, valley and foothill grassland, and vernal pools; occurs between 75 and 2,100 feet (15 and 700 meters) above MSL; annual herb in the *Polemoniaceae* family that blooms from April to July.	No suitable habitat occurs within the proposed project site.
Coast woolly-heads (*Nemacaulis denudata* var. *denudate*)	CNPS 1B.2	Coastal dunes; occurs between 0 and 300 feet (0 and 100 meters) above MSL; annual herb in the *Polygonaceae* family that blooms from April to September.	No suitable habitat occurs within the proposed project site.
Mesa horkelia (*Horkelia cuneata* ssp. *puberula*)	CNPS 1B.1	Chaparral, cismontane woodland, coastal scrub; occurs between 210 and 2,430 feet (70 and 810 meters) above MSL in sandy or gravelly sites; perennial herb in the *Rosaceae* family that blooms from February to July.	No suitable habitat occurs within the proposed project site.

KEY:

CNPS = California Native Plant Society (as List 1, List 2, List 3, or List 4 species). Listed as rare, threatened, or endangered in California and elsewhere by the California Native Plant Society

CNPS2 = CNPS listings from its January 2000 edition of *Inventory of Rare and Endangered Vascular Plants of California*. List 2 (CNPS2) indicates that plants are rare, threatened, or endangered in California but are common elsewhere (Skinner and Pavlik, 1994).

CNPS 3 = Plants about which we need more information

CNPS1A = Plant presumed extinct in California by the CNPS

CNPS1B = Plants considered rare, threatened, or endangered in California and elsewhere by the CNPS
Threat ranks:
0.1: Seriously threatened in California.
0.2: Fairly threatened in California.
0.3: Not very threatened in California.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or the U. S. Fish and Wildlife Service?

The proposed project would not be expected to result in impacts to biological resources in relation to riparian habitat or other sensitive natural communities. Based on the results of the review of the USGS 7.5-minute series South Gate topographic quadrangle[13] and the National Wetlands Inventory map,[14] no natural communities exist within the proposed project area. The proposed project site is an urbanized area with no riparian areas or sensitive natural communities and consists of existing buildings, as well as paved and landscaped areas. No natural plant communities or habitats exist within the proposed project site. Therefore, there would be no expected impacts to biological

---

[14] U.S. Fish and Wildlife Service. June 1976. *National Wetland Inventory, Pasadena, California*. Washington, DC.

resources related to riparian habitat or other sensitive natural communities. No further analysis is warranted.

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) Through direct removal, filling, hydrological interruption, or other means?

The proposed project would not be expected to result in impacts to biological resources in relation to federally protected wetlands as defined by Section 404 of the Clean Water Act through direct removal, filling, hydrological interruption, or other means. Based on the results of the review of the USGS 7.5-minute series South Gate topographic quadrangle[15] and the National Wetlands Inventory map,[16] wetlands or waters under the jurisdiction of the U.S. Army Corps of Engineers pursuant to the Section 404 of the Clean Water Act do not exist at the proposed project site. The proposed project site has been previously developed and includes multiple buildings, paved areas, and landscaped gardens. Therefore, there would be no expected impacts to biological resources related to federally protected wetlands as defined by Section 404 of the Clean Water Act. No further analysis is warranted.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

The proposed project would not be expected to result in impacts to biological resources in relation to movement of any migratory fish or wildlife species or with an established wildlife corridor. The entire proposed project area is set within an urbanized section of Los Angeles County with developed areas surrounding each of its borders. Due to the absence of native plant communities or natural aquatic resources, there are no established wildlife corridors within the proposed project site.[17] No suitable habitat exists to encourage wildlife movement.[18] Therefore, there would be no expected impacts to biological resources related to movement of any migratory fish or wildlife species or with an established wildlife corridor. No further analysis is warranted.

The proposed project would not be expected to result in impacts to biological resources in relation to impeding the use of native wildlife nursery sites. The entire proposed project area is set within an urbanized section of Los Angeles County with development surrounding all sides of the proposed project site. The proposed project site has some landscaping and large trees that may be suitable for nesting birds that surround the proposed project site. However, the scope of the proposed project only includes minor construction activities, which would not be expected to have an effect on nesting birds in the area. Therefore, there would be no expected impacts to biological resources related to impeding the use of native wildlife nursery sites. No further analysis is warranted.

[18] U.S. Fish and Wildlife Service. June 1976. *National Wetland Inventory, Pasadena, California*. Washington, DC.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The proposed project would not be expected to result in impacts to biological resources in relation to conflicts with any local policies or ordinances protecting biological resources. The proposed project does not include activities that would interfere with or impact the biological resources at the proposed project site. Therefore, there would be no expected impacts to biological resources related to conflicts with any local policies or ordinances protecting biological resources. No further analysis is warranted.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The proposed project would not be expected to result in impacts to biological resources in relation to conflicts with the provisions of any adopted Habitat Conservation Plan (HCP) or Natural Community Conservation Plan (NCCP). Based on review of all currently proposed and adopted HCP, NCCP, and other approved local, regional, and state HCPs, it was determined that the proposed project area was not subject to the jurisdiction of a proposed or adopted HCP.[19,20] Further review of local, regional, and state HCPs not presently listed as an HCP or NCCP determined no proposed or adopted plans with jurisdictional boundaries containing the proposed project site. Therefore, there would be no expected impacts to biological resources related to conflicts with the provisions of any adopted HCP or NCCP. No further analysis is warranted.

3.5 CULTURAL RESOURCES

This analysis is undertaken to determine if the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to cultural resources, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines. Cultural resources at the proposed project site were evaluated with regard to existing information regarding the proposed project site.

State CEQA Guidelines recommend the consideration of four questions when addressing the potential for significant impacts to cultural resources:

Would the proposed project have any of the following effects:

a) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

The proposed project may result in impacts to cultural resources related directly or indirectly to the destruction of a unique paleontological resource or unique geologic feature; these impacts are expected to be reduced to below the level of significance with the incorporation of mitigation measures. While the proposed project site has been substantially disturbed, it is anticipated that excavation at the proposed project site has the potential to exceed 20 feet in depth, and in such event, the excavation activities would impact native soils and underlying rock units. A paleontological records search[1] revealed no known vertebrate fossil localities recorded within the proposed project site. The geology of the proposed project site is composed of surficial deposits of younger Quaternary Alluvium (Holocene) as a result of deposition from the Los Angeles River, which currently flows through a concrete channel just east of the proposed project site and Compton Creek nearby to the west. These younger deposits are underlain by older Quaternary Alluvium. The younger Quaternary deposits do not usually contain significant fossil vertebrates; however, the older Quaternary deposits have the potential to contain significant fossil vertebrates. The closest known fossil localities—identified as LACM 1295, 1344, 3266, and 4206—were recovered from these older Quaternary deposits. They are situated west of the proposed project site in the Athens vicinity around the Harbor Freeway (I-110), from north of Imperial Highway to near El Segundo Boulevard. These localities produced Late Pleistocene fossil specimens of pond turtle (*Clemmys*), puffin (*Mancalla*), turkey (*Parapova*), ground sloth (*Paramylodon*), mammoth (*Mammuthus*), dire wolf (*Canis dirus*), rabbit (*Sylvilagus*), squirrel (*Sciuridae*), deer mouse (*Microtus*), pocket gopher (*Thomomys*), horse (*Equus*), deer (*Cervus*), pronghorn antelope (*Capromeryx*), and bison (*Bison*) at depths as shallow as 15 feet below the surface. Therefore, the areas underlain by older Quaternary Alluvium deposits have a high level of sensitivity to produce unique paleontological resources. Due to level of sensitivity and the anticipated depths of excavation, excavations in older Quaternary alluvium should be monitored closely to quickly and efficiently recover any fossil remains without unduly delaying project development. Mitigation of paleontological resource impacts, where and if paleontological resources are found, would be expected to reduce impacts to below the level of significance through the requirement to fully recover paleontological resources from the area of potential effect in accordance with standards for such recovery established by the Society of Vertebrate Paleontology. Therefore, impacts to cultural resources directly or indirectly related to the destruction of a unique paleontological resource or

---

[1] McLeod, Samuel A. 21 November 2009. "Vertebrate Paleontology Section, Natural History Museum of Los Angeles County, Los Angeles, California." Letter response to Chris Purtell, Sapphos Environmental, Inc., Pasadena, CA.

unique geologic feature would be reduced to below the level of significance by the incorporation of the specified mitigation measures.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

The proposed project may result in substantial adverse changes to cultural resources related to causing a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5; these changes are expected to be mitigated to below the level of significance by the incorporation of mitigation measures. While the proposed project site has been substantially disturbed, it is anticipated that excavation at the proposed project site has the potential to exceed 20 feet in depth, and in such event, the excavation activities would impact native soils. Further study and consultation are required to determine if the proposed project site is likely to contain previously unknown archaeological resources. Mitigation of impacts to previously unknown archaeological resources would be expected to be reduced to below the level of significance through implementation of mitigation measures specified in §21083.2 of CEQA. Therefore, impacts to cultural resources related to a substantial adverse change in the significance of an archeological resource would be reduced to below the level of significance by the incorporation of the specified mitigation measures.

c) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

The proposed project may result in substantial adverse change in the significance of a historical resource pursuant to §15064.5; these changes are expected to be reduced to a level of less than significant through the incorporation of mitigation measures. Substantial adverse change in the significance of a historical resource that may not be able to be reduced to below the level of significance through the incorporation of mitigation measures would require the consideration of project alternatives. A review of the National Register of Historic Places, California Register of Historical Resources, and the State of California Historical Resources Inventory database revealed that the Martin Luther King, Jr. Medical Center Campus has not been previously evaluated and that no historical resources on the campus have been recorded.[2] Historical research indicates the Martin Luther King, Jr. Medical Center Campus was initially constructed between 1968 and 1972 and was designed by three local architecture firms: Adrian Wilson Associates; Nielsen, Moffatt, and Wolverton; and Carey K. Jenkins. The hospital was built by contractor Robert E. McKee. The earliest improvements to the Martin Luther King, Jr. Medical Center Campus include (but are not limited to) the three wings of the Main Hospital (now known as the Multiservice Ambulatory Care Center; MACC) and the Medical Records and Laundry Building, which opened in 1972. Additional buildings were constructed in subsequent decades. The individual buildings and the Martin Luther King, Jr. Medical Center Campus as a whole have been continuously modified to meet the needs of the hospital and hospital building safety codes; between 1973 and 2008, nearly 140 construction projects were completed, with costs in excess of $143 million, including a structural and seismic upgrade valued at $28 million undertaken in 2003.[3] The hospital was constructed as a direct response by the Los Angeles County Board of Supervisors to recommendations made by the McCone Commission, convened to study the causes and effects of the civil disturbances in the

---

[2] Based on assessments completed by Sapphos Environmental, Inc. cultural resources specialists in January 2009.

Watts area of Los Angeles during the summer of 1965. As such, the campus requires further study to evaluate if it meets the significance criteria and integrity requirements for identification as a historical resource as defined by CEQA Guidelines and, if so, to examine the feasibility of rehabilitation and adaptive reuse. Further analysis is warranted.

d) Disturb any human remains, including those interred outside of formal cemeteries?

The proposed project would not be expected to disturb any human remains, including those interred outside of formal cemeteries. There are no formal cemeteries on the property, and the ground has been substantially disturbed for the construction of the Martin Luther King, Jr. Medical Center Campus. A record search with the Native American Heritage Commission failed to indicate the known presence of Native American sacred sites, including burial sites, on or within a ½-mile radius of the proposed project site. Therefore, the proposed project would not be expected to disturb any human remains, including those interred outside of formal cemeteries. No further analysis is warranted.

3.6 GEOLOGY AND SOILS

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to geology and soils that would require the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Geology and soils at the proposed project site were evaluated with regard to the U.S. Geological Survey (USGS) 7.5-minute series, South Gate, California, topographic quadrangle,[2] California Geological Survey Special Publication 42, and the most recent Alquist-Priolo Earthquake Fault Zoning (APEFZ) maps.[3]

State CEQA Guidelines recommend the consideration of seven questions when addressing the potential for significant impacts to geology and soils.

Would the proposed project:

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

   i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

The proposed project would be expected to result in less than significant impacts related to exposing people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. There are no known surface faults within the proposed project site, and the proposed project location does not lie within an APEFZ.[4] However, the proposed project site is located approximately 1.8 miles northeast of the Newport-Inglewood Alquist-Priolo Fault Zone.[5] The proposed project site is roughly 42 miles south of the active San Andreas Fault.[6] Conformance of the proposed project to applicable requirements under the California Building Code (CBC) and Uniform Building Code (UBC) would reduce impacts related to the rupture of a surface fault to the maximum extent possible under current engineering practices. Therefore, the proposed project would be expected to result in less than significant impacts from exposing people or structures to potentially substantial adverse effects involving rupture of a known earthquake fault. No further analysis is warranted.

   ii) Strong seismic ground shaking?

The proposed project would be expected to result in less than significant impacts from exposing people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. As previously mentioned, the proposed project site

---

[5] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

[6] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

is located approximately 1.8 miles to the northeast of the Newport-Inglewood Fault Zone and is situated within a seismically active region that could potentially result in impacts from seismic shaking. However, conforming to applicable requirements under the CBC and UBC would reduce impacts from strong seismic ground shaking to the maximum extent possible under currently accepted engineering practices. Therefore, the proposed project would be expected to result in less than significant impacts related to exposing people or structures to strong seismic ground shaking. No further analysis is warranted.

iii) Seismic-related ground failure, including liquefaction?

The proposed project would be expected to result in less than significant impacts from exposing people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. According to the California Geological Survey,[7] the proposed project site is located within a Seismic Hazard Zone for liquefaction, which indicates a potential for permanent ground displacements such that mitigation, as defined in Public Resources Code Section 2693(c), would be required.[8] However, the proposed project's compliance with Office of Statewide Planning and Development (OSHPD) standards would only further reduce any potential for impacts resulting from liquefaction. Therefore, the proposed project would be expected to result in less than significant impacts from exposing people or structures to potential substantial adverse effects involving seismic-related ground failure, including liquefaction. No further analysis is required.

iv) Landslides?

The proposed project would not be expected to result in impacts related to exposing people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. The topography of the proposed project site and surrounding area can be characterized as flat, and therefore would pose no potential risk for landslides to occur. Moreover, no areas susceptible to seismic-induced landslides are shown in the proposed project vicinity on the USGS 7.5-minute series South Gate topographic quadrangle. Therefore, due to the absence of steep slopes, there would be no expected impacts from exposing people or structures to potentially substantial adverse effects involving landslides. No further analysis is warranted.

b) Result in substantial soil erosion or the loss of topsoil?

The proposed project would be expected to result in potentially significant impacts related to substantial soil erosion and loss of topsoil that would be reduced to below the level of significance with the incorporation of mitigation measures. It is anticipated that there would be grading associated with the reuse or replacement of the existing Multiservice Ambulatory Care Center (MACC) and construction of the new MACC, Ancillary Building, support buildings, and other development related to the campuswide Master Plan. It is anticipated that the construction contractor would incorporate best management practices (BMPs) consistent with the guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[9] As discussed in the Geotechnical Investigation that was prepared for the proposed project site,

---

[7] California Geological Survey. Revised February 2009. Seismic Hazards Zonation Program, Seismic Hazard Zone Map, South Gate. Available at: http://gmw.consrv.ca.gov/shmp/download/pdf/ozn_sgate.pdf

[8] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

[9] California Stormwater Quality Association. 2003. *California Stormwater Best Management Practice Handbooks: Construction*. Menlo Park, CA. Available at: http://www.cabmphandbooks.com/Documents/Construction/Section_3.pdf

earthwork at the proposed project site should be performed in conformance with the Los Angeles, County Building Code, and under the observation and testing of a geotechnical engineer, in order to ensure proper subgrade preparation, selection of satisfactory materials, and placement and compaction of structural fills.[10] However, mitigation would be required to ensure that these, and other measures are implemented during construction of the proposed project would be required. Therefore, impacts related to substantial soil erosion or the loss of topsoil would be reduced to below the level of significance by the incorporation of the specified mitigation measures. Further analysis is warranted.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

The proposed project would be expected to result in potentially significant impacts related to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse, that would be reduced to below the level of significance with the incorporation of mitigation measures. According to the California Geological Survey,[11] the proposed project site is located within a Seismic Hazard Zone for liquefaction,[12] which indicates a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required. It is anticipated that due to seismic compliance standards established by the OSHPD, the proposed project would incorporate project design elements consistent with OSHPD standards, and thus further reduce any potential for impacts resulting from unstable geologic units and soils. However, the County's conformance with measures described in the geotechnical study would need to be verified to ensured throughout the construction and development of the proposed project. Therefore, impacts related to being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

The proposed project would be expected to result in potentially significant impacts related to being located on expansive soil, creating substantial risks to life or property, that would be reduced to below the level of significance with the incorporation of mitigation measures. It is anticipated that there would be grading and earthwork performed under construction, improvements, and renovations to the proposed project. However, in the event that any grading-related work is required, a geotechnical engineer should be available for observation of these tasks to ensure proper subgrade preparation, selection of satisfactory materials, and placement and compaction of structural fills. Any unanticipated adverse conditions encountered would be evaluated by the proposed project engineering geologist and the soil engineer. Mitigation would be required to ensure that these, and other measures are implemented during construction of the proposed project would be required. Therefore, impacts related to being located on expansive soil and thereby

---

[11] California Geological Survey. Revised February 2009. Seismic Hazards Zonation Program, Seismic Hazard Zone Map, South Gate. Available at: http://gmw.consrv.ca.gov/shmp/download/pdf/ozn_sgate.pdf

[12] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

creating substantial risks to life or property would be reduced to below the level of significance by the incorporation of the specified mitigation measures. Further analysis is warranted.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The proposed project would not be expected to result in impacts to geology and soils in relation to being located on soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. The proposed project would not require the use of septic tanks or alternative wastewater disposal systems. Sewers are available for wastewater disposal at the proposed project site. Furthermore, wastewater generated at the proposed project would be treated at the Hyperion Treatment Plant.[13] The Hyperion Treatment Plant currently supports wastewater leaving the proposed project site and would continue to do so following the development of the proposed project. The Hyperion Treatment Plant is the largest wastewater treatment plants in the City of Los Angeles and is anticipated to have the capacity to support the proposed project. Therefore, the proposed project would not be expected to result in impacts to geology and soils related to the adequate use of septic tanks or alternative wastewater disposal systems. No further analysis would be required.

3.7 GREENHOUSE GAS EMISSIONS

This analysis is undertaken to determine if the proposed project may have significant environmental impacts due to greenhouse gas (GHG) emissions that would require the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] GHG emissions generated by the proposed project were evaluated based on guidance provided by regulatory publications from the California Air Pollution Control Officers Association;[2] the State Office of the Attorney General;[3] CARB;[4] and OPR.[5] According to the California Global Warming Solutions Act of 2006 (Assembly Bill 32), GHG emissions are defined as emissions of the following gases: carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. The U.S. Environmental Protection Agency (EPA) has reported that the majority of GHG emissions in the United States can be attributed to the energy sector, which accounted for 86.3 percent of total U.S. GHG emissions in 2007 due to stationary and mobile fuel combustion.[6] The industrial sector accounted for 4.9 percent of U.S. GHG emissions in 2007.[7]

The State CEQA Guidelines recommend the consideration of two questions when addressing the potential for significant impacts to GHG emissions.

Would the proposed project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Impacts to greenhouse gas emissions related to whether the proposed project generates greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment would be expected to be reduced to below the level of significance with the incorporation of mitigation measures.

The primary contributors of GHG emissions for the proposed project would include the use of construction equipment and automobiles for the construction workers' daily commute trips and daily vehicle trips generated by people working at and visiting the proposed project site during its operation. Given the relatively large area that would be scheduled for construction activities and the 37-month construction duration of Tier I of the proposed project (in addition to the anticipated

---

[7] U.S. Environmental Protection Agency. April 2009. *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2007.* Washington, DC.

10-year multiphase Tier II portion of the proposed project), emissions of GHGs associated with construction of the proposed project would have the potential for cumulative and significant impacts. During the operational phase of the proposed project, the potential electricity consumption by the new buildings and additional daily commute trips by new employees and visitors to and from the proposed project site would increase the GHG emissions associated with the proposed project. Although it is anticipated that a portion of this consumption may be offset by the Leadership in Energy and Environmental Design (LEED) elements of the proposed project, additional analysis is required to determine the potential impacts to the anticipated GHG emissions from these elements. Therefore, the proposed project has the potential to generate greenhouse gas emissions that may have significant impacts on the environment and would require the consideration of mitigation measures in order to reduce these impacts to below the level of significance. Further analysis is warranted.

b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impacts to greenhouse gas emissions related to whether the proposed project would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases would be expected to be reduced to below the level of significance with the incorporation of mitigation measures.

Assembly Bill 32 established the goal of reducing GHG emissions in California to the year 1990 levels by 2020. The proposed project's incremental impact on GHG emissions would be considered to conflict with the goals of AB 32 if the size, nature, or duration of the construction phase would generate a substantial amount of GHG emissions. It is anticipated that the Tier I portion of the proposed project would take approximately 37 months to complete; Tier II of the proposed project would take approximately 120 months (or up to 10 years of multiphased construction) to occur and would cover an area of up to approximately 38 acres in size. During construction, heavy-duty construction equipment would be operated. The construction duration, the relatively large area under construction, and the nature of the construction activities would be expected to generate greenhouse gas emissions, but these emissions would be temporary and would not be considered to be significant on a regional scale. However, the construction impacts of the proposed project would be expected to be cumulatively considerable when taken into account with related past, present, or reasonably foreseeable, probable future projects. The construction impacts of the proposed project with relation to creating conflicts with the guidelines established by AB 32 would be expected to be reduced to below the level of significance with the incorporation of mitigation measures.

During the operational phase of the proposed project, emissions of GHG would occur from daily operation and maintenance and from vehicular trips traveling to and from the proposed project site. Daily operational emissions would be caused by electricity use for space and water heating, lighting, and electrical appliances. Although the proposed project's application as a medical and mixed-use facility would cause far less GHG emissions than a larger industrial building such as a power plant or factory, the proposed project has the potential to result in impacts to greenhouse gas emissions with respect to the issue of potential conflict with the State's goal of reducing GHG emissions in California to 1990 levels by 2020. As previously noted, these impacts may be reduced by the LEED elements that would be incorporated into the proposed project; however, these impacts would require the consideration of mitigation measures to be reduced to below the level of significance. Further analysis is warranted.

3.8 HAZARDS AND HAZARDOUS MATERIALS

This analysis is undertaken to determine if the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact related to hazards and hazardous materials, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1]

Hazardous wastes are by-products of society that can pose a substantial or potential hazard to human health or the environment when improperly managed. Hazardous wastes possesses at least one of four characteristics (ignitability, corrosivity, reactivity, or toxicity), or appears on special Environmental Protection Agency (EPA) lists.[2]

Hazards and hazardous materials at the proposed project site were evaluated based on expert opinion supported by facts, review of an environmental database,[3] and the County of Los Angeles (County) General Plan.[4]

State CEQA Guidelines include a list of classes of projects that have been determined not to have a significant effect on the environment and which shall, therefore, be exempt from the provisions of CEQA.[5] Projects that have a reasonable possibility of resulting in a significant effect on the environment due to unusual circumstances do not qualify for a categorical exemption.

State CEQA Guidelines recommend the consideration of eight questions when addressing the potential for significant impacts to Hazards and Hazardous Materials.

Would the proposed project have any of the following effects:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

The proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials with respect to creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The proposed project would involve the use of minimal hazardous materials during the construction phase, which may include standard cleaning materials, lubricants, and oils. In addition, the proposed project site is a hospital registered as a small- and large-quantity generator of hazardous materials such as waste oil and mixed oil; oxygenated solvents including acetone, butanol, and ethyl acetate; spent halogenated solvents; and other hazardous materials including batteries, lamps, pesticides, thermostats, mercury, and silver. The hospital may also deal with biomedical and radiological wastes. However, there are specific government regulations restricting the transport, use, and disposal of these hazardous materials, and the proposed project would not entail use of such materials beyond regulated parameters.

---

[1] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Sections 15000–15387, Appendix G.

[2] *Code of Federal Regulations*. Title 40, Chapter 1, Part 261.

[3] Environmental Data Resources. 2008. *The EDR Radius Map™ Report with GeoCheck®*. Inquiry Number: 2388899.2s, 23 December 2008. Milford, CT.

[4] County of Los Angeles Department of Regional Planning. 2007. *Los Angeles County Draft Preliminary General Plan, Safety Element*. Available at: http://planning.co.la.ca.us/doc/gp/gp_draft.pdf

[5] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Section 15300.

Therefore, the proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials related to creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Further analysis is warranted.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous material?

The proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials in relation to the creation of a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous material. The proposed project site is the location of documented past releases of gasoline and oil from leaking underground storage tanks (LUSTs), which occurred prior to existing underground storage tank (UST) regulations. Cleanup of the site has been completed for the release of oil and gasoline, and no further action is warranted.[6] Because the proposed project site is both a small- and a large-quantity generator of hazardous materials, the potential exists for a hazardous materials release to occur. As discussed in the project description, the proposed project would directly address seismic safety compliance with upgrades of all the existing buildings. While the proposed project elements do not directly address hospital operations that require the use or transport of hazardous materials, such use is controlled by existing government regulations, the proposed project would not entail use of such materials beyond regulated parameters. However, as part of the proposed project, it is anticipated that some emergency generators and USTs may have to be relocated. To prevent impacts, tank relocation would be conducted according to the following applicable federal and state regulations related to tank management: Code of Federal Regulations (CFR) 40, Part 112; 40 CFR, Part 280; CFR 281; 40 CFR, Part 282; and the California Code of Regulations (CCR) Title 22 and Title 23 Regulations. It is unlikely that the proposed project would result in accidental leaks and spills that would affect the public or the environment. Therefore, the proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials related to the creation of a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous material. Further analysis is warranted.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

The proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials with respect to the emission of hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school. The nearest schools to the proposed project site are Lincoln Drew Elementary School located 0.10 mile to the north, Carver Elementary located 0.21 mile to the west, Harriet Tubman High School located 0.25 mile south, Cesar Chavez Alternative School located 0.25 mile south, Compton Community Day Middle School located 0.25 mile south, and King Drew Magnet High School located adjacent to the proposed project campus on East 120th Street.

---

[6] Environmental Data Resources. 2008. *The EDR Radius Map™ Report with GeoCheck®*. Inquiry Number: 2388899.2s, 23 December 2008. Milford, CT.

Although the proposed project site is the current location of a hospital and some hazardous materials are handled and transported for disposal, and the proposed project would likely increase the volume of hazardous materials on site, such use is controlled by existing government regulations, and the proposed project would not entail use of such materials beyond regulated parameters. Therefore, the proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials with respect to the emission of hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school. Further analysis is warranted.

d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to the Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

The proposed project would be expected to result in less than significant impacts with the incorporation of mitigation measures from hazards and hazardous materials in relation to the proposed project being located on a site included on a list of hazardous materials sites. Project features may also be required to assure that hazards and hazardous materials sites do not adversely affect the residential component of the proposed project.

Due to the nature of the site use as a hospital, the proposed project site is included on multiple environmental regulatory databases for permitted USTs and LUSTs. The LUST at the proposed project site was initially identified at the site in 1998. This LUST involved an unauthorized release of gasoline, which affected soil. Cleanup of the LUST was completed and the case was closed by the Regional Water Quality Control Board in 1996. Therefore, this LUST would not result in impacts to people or the environment.

An additional release of 14,000 gallons of oily water occurred at the site in 2006 due to a ruptured pipe coming from the on-site power plant. The substance was pumped into tanker trucks and cleanup is near completion. No significant impact to people or the environment occurred as a result of this release. This release was reported through the California Hazardous Material Incident Reporting System (CHMIRS) database.[7]

The proposed project site is included on a list of Resource Conservation and Recovery Act (RCRA) small quantity generators (SQGs), but no violations have been reported. The proposed project site is also listed under the Hazardous Waste Information System (HAZNET) because it disposes waste oil and mixed oil, paint sludge, inorganic solid waste, oxygenated solvents, polychlorinated biphenyls (PCBs), mercury waste, and asbestos-containing waste. In addition, the proposed project site is considered an RCRA large-quantity generator (LQG) of waste products such as batteries, lamps, pesticides, thermostats, mercury, silver, halogenated solvents, as well as other ignitable and corrosive hazardous materials. However, no violations were identified.[8]

Three LUST sites are located within 0.5 mile upgradient of the proposed project site. All three of these LUST sites are undergoing remediation and are not expected to impact the proposed project site. The nearest is the Hooper Texaco Service located at 11913 Compton Avenue, 0.04 mile from

---

[7] Environmental Data Resources. 2008. *The EDR Radius Map™ Report with GeoCheck®.* Inquiry Number: 2388899.2s, 23 December 2008. Milford, CT.

[8] Environmental Data Resources. 2008. *The EDR Radius Map™ Report with GeoCheck®.* Inquiry Number: 2388899.2s, 23 December 2008. Milford, CT.

the site. In addition, a One-Hour Photo and High Sky Cleaners are located 0.2 mile north of the proposed project site, but no violations have been reported for either of these SQGs.[9]

Although the proposed project would not be expected to result in significant impacts from hazards and hazardous materials related to location on a hazardous waste site, mitigation measures may be required in order to ensure that no hazardous waste related event would occur in the future. Further analysis is warranted.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

The proposed project would not be expected to result in impacts from hazards and hazardous materials in relation to proximity to an airport and the creation of safety hazards for people residing or working in the proposed project area. The nearest airports are the Compton Airport, located at 901 West Alondra Boulevard in the City of Compton, approximately 2.1 miles south; the Saint Francis Medical Center Helistop in the City of Lynwood, approximately 2.7 miles east; the Gardena Valley Airport in the City of Gardena, approximately 4 miles southeast; and the Hawthorne Municipal Airport in the City of Hawthorne, approximately 4.6 miles west of the proposed project site. The proposed project site is located at an existing hospital campus. Therefore, the proposed project would not be expected to result in significant impacts from hazards and hazardous materials in relation to proximity to an airport and the creation of safety hazards for people residing or working in the proposed project area. No further analysis is warranted.

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

The proposed project would not be expected to result in impacts from hazards and hazardous materials due to the proposed project being located in the vicinity of a private airstrip and the potential for safety hazards for people residing or working in the proposed project area. The nearest private airstrip is located in Playa Vista at 5510 Lincoln Boulevard, approximately 11.5 miles northwest of the proposed project site.[10] However, a heliport is located on site at the proposed project site. Because the proposed project would only improve the safety of the facilities, impacts involving this heliport would not be expected to result from the proposed project. Therefore, the proposed project would not be expected to result in significant impacts from hazards and hazardous materials due to the proposed project being located in the vicinity of a private airstrip and the potential for safety hazards for people residing or working in the project area. No further analysis is warranted.

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

The proposed project would not be expected to result in impacts from hazards and hazardous materials related to impairing the implementation of or physically interfering with an adopted emergency response plan or emergency evacuation plan. Consistent with the Safety element of the

---

[9] Environmental Data Resources. 2008. *The EDR Radius Map™ Report with GeoCheck®*. Inquiry Number: 2388899.2s, 23 December 2008. Milford, CT.

[10] Airport IQ Data Center. Accessed on 10 April 2008. Web site. Available at: http://www.gcr1.com/5010web/

County of Los Angeles General Plan,[11] the purpose of the proposed project is to improve conditions related to healthcare services. No part of the proposed project is anticipated to interfere with an emergency response plan or evacuation plan. Therefore, the proposed project would not be expected to result in significant impacts from hazards and hazardous materials related to impairing the implementation of or physically interfering with an adopted emergency response plan or emergency evacuation plan. No further analysis is warranted.

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

The proposed project would not be expected to result in impacts from hazards and hazardous materials related to exposure of people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. The proposed project site is located in an urban environment without adjacent or nearby wildlands. In addition, the proposed project location is not considered to be in a fire hazard severity zone.[12] Therefore, the proposed project would not be expected to result in significant impacts from hazards and hazardous materials related to exposure of people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. No further analysis is warranted.

---

[11] County of Los Angeles Department of Regional Planning. 2007. *Los Angeles County Draft Preliminary General Plan, Safety Element*. Available at: http://planning.co.la.ca.us/doc/gp/gp_draft.pdf

[12] California Department of Forestry and Fire Protection, 1997. Los Angeles Fire Hazard Severity Zoning (FHSZ) Map. Sacramento, CA. Available at: http://www.fire.ca.gov/fire_prevention/fhsz_maps/fhsz_maps_losangeles.php

3.9 HYDROLOGY AND WATER QUALITY

This analysis is undertaken to determine if the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to hydrology and water quality, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Hydrology and water quality at the proposed project site were evaluated with regard to the Los Angeles County (County) Department of Public Works Hydrology Manual,[2] the National Pollution Discharge Elimination System (NPDES),[3] the County General Plan,[4] the Los Angeles Regional Water Quality Control Board (LA-RWQCB),[5] National Flood Insurance Program Flood Insurance Rate Maps for the County,[6] the California Storm Water Best Management Practice Handbook,[7] and the U.S. Geological Survey (USGS) 7.5-minute series, South Gate, California, topographic quadrangle.[8]

State CEQA Guidelines recommend the consideration of 10 questions when addressing the potential for significant impacts to hydrology and water quality.

Would the proposed project have any of the following effects:

a) Violate any water quality standards or waste discharge requirements?

The proposed project would be expected to result in less than significant impacts to hydrology and water quality in relation to violating any water quality standards or waste discharge requirements. The proposed project would entail both construction and operational elements in Tier I, as well as demolition, construction, and operational elements in Tier II, which would be expected to involve ground-disturbing activities. The construction of the proposed project may contribute to erosion, sediment-laden runoff, discharge of non-storm water runoff from the proposed project site, or other water quality–related events that would violate water quality standards or waste discharge requirements. In addition, both Tier I and Tier II of the proposed project would include construction-related activities and operational activities that would be expected to result in shifts from current hydrology-related activities at the proposed project site.

The proposed project would implement best management practices (BMPs) to reduce or eliminate non-storm discharges to the storm water system. These requirements meet the water quality standards set forth by the responsible agencies, and address storm runoff quantity and flow rate, suspended solids (primarily from erosion), and contaminants such as phosphorus and

---

[6] Federal Emergency Management Agency. *Flood Maps*. Available at: http://www.fema.gov/hazard/map/index.shtm

[7] California Stormwater Quality Association. 1993. *California Stormwater Best Management Practice Handbook*. Available at: http://www.cabmphandbooks.com

[8] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

hydrocarbons. BMPs would be incorporated in accordance with the NPDES permit issued to the County by the LA-RWQCB, the County Storm Water Management, and the County General Plan. Therefore, the proposed project would be expected to result in less than significant impacts to hydrology and water quality in relation to violating any water quality standards or waste discharge requirements. No further analysis is warranted.

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)?

The proposed project would not be expected to result in impacts to hydrology and water quality in relation to groundwater supplies or groundwater recharge. The proposed project site is located within the Central Basin Municipal Water District.[9] Although groundwater has been encountered at the site at approximately 38 to 52 feet below ground surface, the proposed project site and its existing uses do not influence the local groundwater basin; and the site does not serve as a groundwater recharge site.[10] Further, neither Tier I nor Tier II of the proposed project would use groundwater supplies or interfere with groundwater recharge into this basin. There is no potential for the proposed project to contribute to the depletion of groundwater supplies or to create substantial interference with groundwater recharge for the area. Therefore, the proposed project would not be expected to result in impacts to hydrology and water quality in relation to groundwater supplies or groundwater recharge. No further analysis is warranted.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?

The proposed project would not be expected to result in impacts to hydrology and water quality in relation to alteration of existing drainage patterns in a manner that would result in substantial erosion or siltation on or off site. The proposed project would not substantially alter the existing drainage pattern of the proposed project site or area, or alter the course of any existing streams or rivers in the proposed project area.

Review of the proposed project site on the USGS 7.5-minute series South Gate topographic quadrangle,[11] indicates that there is no potential for impacts to hydrology and water quality in relation to alteration of existing drainage patterns in a manner that would result in substantial erosion or siltation on or off site. There are no existing drainage patterns on or within the vicinity that would be impacted by the proposed project. The proposed project entails the redevelopment of a previously disturbed site. Furthermore, as previously mentioned, the proposed project would be required to incorporate BMPs during construction and operation of both Tiers. BMPs are consistent with guidelines provided in the *California Storm Water Best Management Practices Handbook for Construction Activities* and in the Los Angeles County Storm Water Management Program for substantiated erosion or siltation.

---

[9] Central Basin Municipal Water District. Accessed 2 October 2009. "Water Demand." Available at: http://www.centralbasin.org/chartWaterDemand.html

[10] URS Corporation. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

[11] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

As such, the proposed project would not be expected to result in impacts to hydrology and water quality in relation to alteration of existing drainage patterns in a manner that would result in substantial erosion or siltation on or off site. No further analysis is warranted.

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site?

The proposed project would not be expected to result in impacts to hydrology and water quality in relation to alteration of existing drainage patterns in a manner that would result in flooding on site or off site. As previously mentioned, the proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site. The USGS 7.5-minute series South Gate topographic quadrangle was reviewed, and there is no potential for impacts to hydrology and water quality in relation to the alteration of existing drainage patterns in a manner that would result in flooding on site or off site.[12] Therefore, there would be no expected impacts to hydrology and water quality related to alteration of existing drainage patterns in a manner that would result in flooding on site or off site. No further analysis is warranted.

e) Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff?

The impacts to hydrology and water quality related to exceeding the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff from the proposed project would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. While the proposed project site is part of the Los Angeles storm drain system and the County of Los Angeles Department of Public Works has implemented measures to initiate storm water pollution reduction programs throughout the County;[13] the proposed project would entail construction and operational activities that may impact the existing the capacity of the existing or planned storm water drainage systems. The existing campus is not currently operating at full capacity. It is anticipated that Tier I of the proposed project, development of Leadership in Energy and Environmental Design (LEED) efficient Multiservice Ambulatory Care Center (MACC) and Ancillary Buildings would require the campus to function at levels that could be absorbed with the current capacity. Further, the addition of the two buildings would not be expected to contribute to runoff as the buildings would be developed on existing impervious surface lots.

However, it is anticipated that elements of Tier II of the proposed project, specifically the reuse or replacement of the existing MACC may require alterations to the existing stormwater drainage systems. As noted, the proposed project would implement BMPs and would be required to comply with County, state, and federal guidelines (including the NPDES), which would reduce the potential impacts related to some demolition, construction, and operation activities at the site. However, the demolition-related activities as described in Tier II of the proposed project may entail activities (such as site preparation or grading) that have the potential to result in impacts related to

---

[12] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

[13] County of Los Angeles Department of Public Works. Accessed 2 October 2009. "Stormwater Pollution Prevention Home." Available at: http://ladpw.org/PRG/StormWater/Page_03.cfm

runoff water. In addition, the construction of additional structures on pervious areas of the campus, has the potential to reduce the amount of pervious areas at the site and create or contribute to runoff at the site. Further analysis and the implementation of mitigation measures may be required to ensure that the demolition and construction activities of the proposed project (specifically as they relate to the activities as described in Tier II), do not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.

Therefore, impacts to hydrology and water quality in relation to exceeding the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff would be reduced to below the level of significance with the incorporation of specified mitigation measures. Further analysis is warranted.

f) Otherwise substantially degrade water quality?

The proposed project would not be expected to result in impacts to hydrology and water quality in relation to substantial degradation of water quality. The proposed project would be required to comply with the NPDES requirements and the County of Los Angeles General Plan, and as such there is no potential for impacts to hydrology and water quality in relation to substantial degradation of water quality for the proposed project.[14,15] As previously stated, construction and operation of the proposed project would incorporate BMPs that would further reduce the potential for the proposed project degrade water quality. Therefore, there would be no expected impacts to hydrology and water quality in relation to substantial degradation of water quality. No further analysis is warranted.

g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

The proposed project would not be expected to result in impacts to hydrology and water quality in relation to placement of housing within a 100-year flood hazard area. The proposed project does not entail housing components nor does it include the development of housing. Further, the proposed project site is not located within a 100-year or 500-year flood zone.[16] Therefore, there would be no expected impacts to hydrology and water quality related to placement of housing within a 100-year flood hazard area. No further analysis is warranted.

h) Place within a 100-year flood hazard area structures that would impede or redirect flood flows?

The proposed project would not be expected to result in significant impacts to hydrology and water quality in relation to placement of structures (other than housing) within a 100-year flood hazard area. The proposed project site is not located within a 100-year or 500-year flood zone. The proposed project consists of the development and redevelopment of the existing campus. The proposed project site would not involve the development of structures within a 100-year flood hazard area. Therefore, there would be no expected impacts to hydrology and water quality related

---

[14] County of Los Angeles Department of Public Works. *2006 Hydrology Manual*. Available at: http://ladpw.org/wrd/publications.

[15] County of Los Angeles Department of Regional Planning. November 1980.*County of Los Angeles General Plan*. Available at: http://planning.co.la.ca.us/doc/gp/gp_draft.pdf

[16] Federal Emergency Management Agency. *Flood Maps*. Available at: http://www.fema.gov/hazard/map/index.shtm

to placement of structures (other than housing) within a 100-year flood hazard area. No further analysis is warranted.

i) Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?

The proposed project would not be expected to result in impacts to hydrology and water quality in relation to the failure of a levee or dam. The County of Los Angeles maintains over 15 major dams and a host of other flood control facilities such as spreading grounds within the County.[17] The flood control facilities within the proposed project vicinity are maintained by the County Flood Control District and are in compliance with local, state, and federal regulations.[18] It is anticipated that the proposed project would have no impacts on the operation of the existing levees or dams. Therefore, there would be no expected impacts to hydrology and water quality related to the failure of a levee or dam. No further analysis is warranted.

j) Inundation by seiche, tsunami, or mudflow?

The proposed project introduces no potential threat of seiches, tsunamis, or mudflow. Seiches are large waves generated in enclosed bodies of water in response to ground shaking. Tsunamis are tidal waves generated in large bodies of water in response to ground shaking. The proposed project would not be expected to result in impacts to hydrology and water quality in relation to the inundation by seiche, tsunami, or mudflow. The elevation of the project site ranges from approximately as low as 85 feet above mean sea level (MSL) to as high as 105 feet above MSL. The proposed project site is roughly 10 miles east of the Pacific Ocean. Due to the elevation of the proposed project area and its distance from the ocean and other bodies of water, there would be no direct or indirect impacts related to seiches or tsunamis.

A mudflow is a large flow of mud resulting from soil saturation on steep slopes. The proposed project site is not located in a section of the County that is susceptible to mudslides and there are no steep slopes with soils or vegetation on or immediately adjacent to the proposed project area. Therefore, there would be no potential for impacts related to mudflows. The proposed project would not be expected to result in impacts to hydrology and water quality in relation to the inundation by seiche, tsunami, or mudflow. No further analysis is warranted.

---

3.10 LAND USE AND PLANNING

This analysis is undertaken to determine if the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to land use, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Land use and planning at the proposed project site was evaluated with regard to the County of Los Angeles (County) General Plan,[2] adopted published maps and other adopted plans, and in coordination with the U.S. Fish and Wildlife and the California Department of Fish and Game.

State CEQA Guidelines recommend the consideration of three questions when addressing the potential for significant impacts to land use and planning.

Would the proposed project:

a) Physically divide an established community?

The proposed project would not be expected to result in impacts to land use and planning through the physical division of an established community. The Land Use element of the County General Plan[3] (including General Plan Land Use and Zoning maps) and the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle[4] were reviewed to determine the relationship of the proposed project to the surrounding communities. The proposed project would entail two tiers of development. Tier I would consist of the construction of a new Multiservice Ambulatory Care Center (MACC) and Ancillary Building. Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building, Emergency Room Expansion, MRI Modular Building, and Cooling Towers, and master planned mixed-use development, which may include the potential for: (1) up to 1,814,696 square feet of medical office, commercial, recreational, retail, office space, and other development in support of the campus, which are appurtenant to and compatible with the primary land use, a community-based health program facility, and (2) up to 100 units of multifamily residential development. Both tiers of the proposed project would occur on the same parcels as the existing Martin Luther King, Jr. Medical Center Campus and would not encroach on the surrounding community. A review of site plan maps in conjunction with site reconnaissance reveal that the existing Martin Luther King, Jr. Medical Center Campus is set back from the residential development immediately surrounding the proposed project site, as it is bordered by East 120th Street to the north, South Wilmington Avenue to the east, East 122nd Street to the south, and Compton Avenue to the west. The proposed project would not extend development beyond the existing medical facility site and, therefore, would not cause a physical division within the established community. There would be no expected impacts to land use and planning resulting in a physical division to the established community. No further analysis is warranted.

---

[3] County of Los Angeles Department of Regional Planning. November 1980. *County of Los Angeles General Plan*. Los Angeles, CA. Available at: http://ceres.ca.gov/docs/data/0700/791/HYPEROCR/hyperocr.html

[4] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

The proposed project would be expected to result in less than significant impacts to land use and planning in relation to a conflict with adopted or proposed land use plans, policies, or regulations. The General Plan Land Use element and Zoning Ordinance were reviewed to determine the compatibility of the proposed project with adopted land use plans, policies, and regulations.[5,6] According to the General Plan, the proposed project site is designated for Public and Semipublic land use (P), which provides for activities by public and quasipublic entities and allows for the establishment of facilities, infrastructure, and their related operations in these areas that are public or semipublic in nature, including hospitals.[7] As such, the intended use of the proposed project site as a medical facility is in conformance with this land use designation. Furthermore, the proposed project site is zoned as Neighborhood Commercial (C-2; Neighborhood Business Zone), which includes community-related commercial uses and permits the following uses: drugstores, medical clinics (including laboratories), professional or business office space, parking lots and buildings, and hospital equipment and supply rentals.[8] The proposed project's hospital-related uses would be consistent with the permitted uses of this zoning designation, and no General Plan amendment or zone change would be required. However, the uses related to the development of the residential units would be subject to a conditional use permit (CUP) and would be required to meet the conditions of the permit.[9] It is anticipated that the County would obtain a CUP during the planning phase of the proposed project and would be required to meet the specified conditions. The potential residential component, along with all Tier II components, are conceptual at this time, and will therefore only be discussed in a programmatic level in the Environmental Impact Report (EIR), as permitted under CEQA. Once the detailed future development plans for Tier II components are prepared, consistent with the guidelines for programmatic EIRs under CEQA, the projects will be examined in light of the program EIR analysis, to determine whether an additional environmental document must be prepared. Therefore, impacts to land use and planning related to a conflict with adopted or proposed land use plans, policies, or regulations would be less than significant. No further analysis is warranted.

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

The proposed project would not be expected to result in impacts to land use and planning in relation to conflicting with any applicable habitat conservation plan or natural community conservation plan. The proposed project area would not be located in an area proposed or adopted as part of a habitat conservation plan or natural community conservation plan.[10,11] Therefore, there

would be no expected impacts to existing land use and planning related to a conflict with any adopted habitat conservation plan or natural community conservation plan. No further analysis is warranted.

---

[11] County of Los Angeles Department of Regional Planning. November 1980. *County of Los Angeles General Plan*. Los Angeles, CA. Available at: http://ceres.ca.gov/docs/data/0700/791/HYPEROCR/hyperocr.html

3.11 MINERAL RESOURCES

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to mineral resources, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Mineral resources at the proposed project site were evaluated with regard to California Geological Survey publications[2,3] and the County of Los Angeles (County) General Plan.[4]

State CEQA Guidelines recommend the consideration of two questions when addressing the potential for significant impact to mineral resources:

Would the proposed project have either of the following effects:

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

The proposed project would not be expected to result in impacts to mineral resources in relation to the loss of availability of a known mineral resource. Based on a review of the California Geological Survey report,[5] there are no known mineral resources of statewide or regional importance produced within the proposed project site. According to the *Mines and Minerals Producers Active in California (1977–1998)*,[6] the County of Los Angeles contains 25 active mines. However, there are no mining districts located in or around the vicinity of the proposed project site. Therefore, there would be no expected impacts to mineral resources related to the loss of availability of a known mineral resource. No further analysis is warranted.

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

The proposed project would not be expected to result in impacts to mineral resources in relation to the loss of availability of a known mineral resource recovery site. Based on a review of the Conservation element of the County General Plan,[7] mineral resources are not specifically addressed in this document. Furthermore, this site has not been delineated in any known local plans as a site of local importance,[8] and thus, no significant impacts would be expected. Therefore,

there would be no expected impacts to mineral resources related to the loss of availability of a known locally important mineral resource recovery site. No further analysis is warranted.

3.12 NOISE

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to noise, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Noise at the proposed project site was evaluated with regard to the County of Los Angeles (County) General Plan[2] and the County Noise Ordinance.[3]

State CEQA Guidelines recommend the consideration of six questions when addressing the potential for significant impact to noise:

Would the proposed project result in:

a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

The proposed project would be expected to result in potentially significant impacts to noise in relation to exposure or generation of noise levels in excess of established standards that would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. In addition, the proposed project's residential component could be affected by the noise levels in the vicinity, to an extent that requires project features or mitigation.

The County General Plan and the County Noise Ordinance have established standards governing noise within the County. The Noise element of the County General Plan outlines the County's approach to controlling noise, including a definition of the nature of sound, a description of existing noise levels in the County, and a proposed safe noise environment for the County.[4] If noise disturbance crosses a residential or commercial property line, the County Noise Control Ordinance prohibits any tools or equipment used in construction, drilling, repair, alteration, or demolition work between weekday hours of 7:00 p.m. and 7:00 a.m. or at any time on Sundays or holidays.[5]

Sensitive receptors in the vicinity of the proposed project that may be affected by noise levels in excess of established standards range from schools to child care centers. Sensitive receptors located within a 0.25-mile radius of the proposed project site include: Lincoln Drew Elementary School located 0.10 mile to the north; Carver Elementary located 0.21 mile to the west; Harriet Tubman High School located 0.25 mile to the south; Cesar Chavez Alternative School located 0.25 mile to the south; Compton Community Day Middle School located 0.25 mile south; and King Drew Magnet High School located adjacent to the Martin Luther King, Jr. Medical Center Campus on East 120th Street. Sensitive receptors located within a 0.5-mile radius include: New Designs Charter

---

[3] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ordinance 11778, Section 2 (Article 1, Section 101); Ordinance 11773, Section 2 (Article 1, Section 101). Chapter 12.08. Available at: http://ordlink.com/codes/lacounty/index.htm

[4] *Los Angeles County Code*. Title 12, "Environmental Protection," Chapter 12.08.08.90, "Exterior Noise Standards." Available at: http://ordlink.com/codes/lacounty/index.htm.

[5] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ordinance 11778, Section 2 (Article 1, Section 101); Ordinance 11773, Section 2 (Article 1, Section 101). Chapter 12.08. Available at: http://ordlink.com/codes/lacounty/index.htm.

School located 0.28 mile to the northwest; Los Angeles Computer Science Academy located 0.36 mile to the northeast; Ronald E. McNair Elementary located 0.41 mile to the south; Martin Luther King, Jr. Elementary located 0.43 mile to the east; and Willowbrook Middle School located 0.47 mile to the south.

The proposed project, as currently conceived, would involve reuse or replacement of obsolete buildings and structures, retrofitting of existing buildings and structures, and construction of new facilities. With a large square footage currently scheduled for construction activities, construction of the proposed project would be expected to use heavy equipment over a long construction period. Therefore, construction of the proposed project would be expected to result in significant impacts resulting from exposure of sensitive receptors near the proposed project site to construction-related noise levels exceeding the adopted standards of the County Noise element and Noise Ordinance, thus requiring the consideration of mitigation measures.

As discussed in Section 3.15, *Transportation and Traffic*, of this Initial Study, operation of the proposed project would be expected to generate additional vehicle trips in the proposed project area. With increased traffic anticipated from the proposed project, operation of the proposed project would result in potential significant impacts resulting from exposure of sensitive receptors near the proposed project site to operation-related noise levels exceeding the adopted standards of the County Noise element and Noise Ordinance.

As the proposed project Tier II development includes a residential component, an analysis of noise levels appropriate for residential development, based on the County Noise element and Noise Ordinance, would be required. Project features or mitigation measures may be required.

Implementation of the proposed project would result in potentially significant impacts to noise levels, related to exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, that would be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Implementation of the proposed project would be expected to generate excessive groundborne vibration or groundborne noise levels, resulting in potentially significant impacts, thus requiring the consideration of mitigation measures. Groundborne vibration or groundborne noise levels associated with the proposed project would originate from earth movement and the use of heavy equipment during the construction phase. Such noise levels would be expected to be reduced to below the level of significance with the incorporation of mitigation measures.

As shown in Table 3.12-1, *Vibration Velocities for Construction Equipment*, use of heavy equipment (e.g., a large bulldozer) generates vibration levels of 0.089 inch per second peak particle velocity (PPV) at a distance of 25 feet. The proposed project may require pile driving. Impact pile driving would generate a vibration level of up to 0.644 inch per second at a distance of 25 feet. It is anticipated that any heavy equipment used for impact pile driving would be located at a distance away from sensitive receptors so that vibration impacts would be minimized. Therefore, vibration levels at nearby sensitive receptors, such as King-Drew Magnet High School, would be perceptible but would not exceed the potential building damage threshold of 0.3 inch per second PPV.

TABLE 3.12-1
VIBRATION VELOCITIES FOR CONSTRUCTION EQUIPMENT

Equipment	PPV at 25 Feet (Inches/Second)[a]
Pile Driving (Impact)	0.644
Pile Driving (Sonic)	0.170
Caisson Drilling	0.089
Large Bulldozer	0.089
Loaded Trucks	0.076

[a] Typical concrete and steel buildings can be exposed to groundborne vibration levels of 0.3 inch per second PPV without experiencing structural damage.

SOURCE: Federal Transit Authority. May 2006. Transit Noise and Vibration Impact Assessment.

Operation of the proposed project would not require continued use of heavy equipment or earth-moving activities, and, therefore, would not be expected to generate impacts related to ground-borne vibration or ground-borne noise levels. Impacts to noise in relation to generation of excessive ground-borne vibration or ground-borne noise would be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Implementation of the proposed project would have the potential to permanently increase the ambient noise levels in the proposed project's vicinity, exceeding the existing baseline conditions established in the County General Plan Noise element and Noise Ordinance, thus requiring the incorporation of mitigation measures. The proposed project would result in increased traffic levels due to the construction-related activities, the ongoing operation and maintenance of the proposed project, and increased vehicle trips to and from the proposed project site. The increase in ambient noise levels has the potential to result in significant impacts unless mitigation measures are incorporated. Therefore, impacts to noise in relation to permanent increases in ambient noise levels in the vicinity of the proposed project would be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity about levels existing without the project?

Implementation of the proposed project would be expected to generate high noise levels during construction, which would increase ambient noise levels in the proposed project's vicinity, exceeding the existing baseline conditions. The County Noise Control Ordinance prohibits any tools or equipment used in construction, drilling, repair, alteration, or demolition work between weekday hours of 7:00 p.m. and 7:00 a.m. or at any time on Sundays or holidays.[6] Valid permits shall be obtained from the County for construction, and in accordance with the noise ordinance no construction, repair, or remodeling noise impacts shall exceed 85 decibels A-weighted [db(A)] across any property boundary at any time during the course of a day. Demolition and construction activities associated with the proposed project would be expected to generate high noise levels during the anticipated 37-month Tier I construction phase. In addition, construction of the proposed project would require heavy construction equipment to be utilized over an extended

---

[6] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ordinance 11778, Section 2 (Article 1, Section 101); Ordinance 11773, Section 2 (Article 1, Section 101). Chapter 12.08. Available at: http://ordlink.com/codes/lacounty/index.htm.

construction period during both the Tier I and Tier II construction phase (anticipated at approximately 120 months), and the use of heavy construction equipment would periodically increase ambient noise levels above significance thresholds. Noise impacts in relation to a periodic increase in ambient nose levels, as a result of the proposed project, would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The proposed project would not be expected to result in impacts to noise in relation to public airports. The nearest airports are the Compton Airport, located at 901 West Alondra Boulevard in the City of Compton, approximately 2.1 miles south; the Saint Francis Medical Center Helistop in the City of Lynwood, approximately 2.7 miles east; the Gardena Valley Airport in the City of Gardena, approximately 4 miles southeast; and the Hawthorne Municipal Airport in the City of Hawthorne, approximately 4.6 miles west of the proposed project site. The proposed project would not be located within 2 miles of a public airport, and thus the proposed project would not result in significant impacts from the exposure of people residing or working in the project area to excessive noise levels caused by a public airport. Therefore, there would be no expected impacts to noise related to public airport. No further analysis is warranted.

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

The proposed project would not be expected to result in impacts to noise in relation to private airstrips. The nearest private airstrip is located in Playa Vista at 5510 Lincoln Boulevard, approximately 11.5 miles northwest of the proposed project site.[7] In addition, a heliport is located at the proposed project site for hospital-specific use. Use of the heliport would not be expected to increase substantially with the proposed project; therefore, impacts to people residing or working in project area would not be expected to increase as a result of the proposed project. Therefore, there would be no expected impacts to noise related to private airstrips. No further analysis is warranted.

---

3.13 POPULATION AND HOUSING

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project) may have a significant impact to population and housing that would require the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Population and housing at the proposed project site were evaluated with regard to County of Los Angeles (County) General Plan;[2] state, regional, and local data and forecasts for population and housing; and the proximity of the proposed project to existing and planned utility infrastructure.

The State CEQA Guidelines recommend the consideration of three questions when addressing the potential for significant impacts to population and housing:

Would the proposed project have any of the following effects:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The proposed project would be expected to result in potentially significant impacts to population and housing in relation to inducing substantial direct or indirect population growth that may require the incorporation of mitigation measures. Implementation of the proposed project would take place in two Tiers. Tier I of the proposed project would incorporate the construction of a new Multiservice Ambulatory Care Center (MACC) and Ancillary Buildings, as well as seismic improvements and renovations to support buildings already existing at the project site. Tier II would entail the reuse or replacement of the existing MACC Building and development of the campuswide Master Plan that would result in the potential construction of up to 1,814,696 square feet of mixed uses, including medical office space and other uses that are appurtenant to and compatible with the primary land use, namely, a community-based health program facility. The mixed-use component of Tier II of the proposed project may also entail the development of residential units. Development of up to 100 multifamily residential units on the proposed project site would be expected to induce population growth at the proposed project site and within the area. The proposed project development, including up to 1,814,696 square feet of new mixed uses in Tier II, would provide employment opportunities. These jobs would be expected to be filled with the workforce in the surrounding communities and possibly in other areas within a commuting distance of the project site; therefore, no indirect population growth would be anticipated. No growth-inducing extensions of infrastructure, including roadways, are proposed as a part of the project. Considering the size of the no-residential portions of the proposed project and the available workforce in the immediate and surrounding area, it is anticipated that the growth in population within the area would not exceed Section 15064.7 of the State CEQA Guidelines' thresholds of significance for housing and population growth.

However, the proposed project would propose new homes. Tier II has the potential for development of up to 100 units of multifamily housing. Therefore, the Tier II portion of the proposed project may result in potentially significant impacts to population and housing in relation

---

[1] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Sections 15000–15387, Appendix G.

[2] County of Los Angeles Department of Regional Planning. November 1980. *County of Los Angeles General Plan*. Los Angeles, CA. Available at: http://ceres.ca.gov/docs/data/0700/791/HYPEROCR/hyperocr.html

to inducing substantial direct or indirect population growth, unless mitigation measures are incorporated. Further analysis is warranted.

b) Displace substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere?

The proposed project would be expected to result in no impacts to population and housing in relation to the displacement of substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere. There are currently no housing units on the proposed project; therefore, none would be removed. Therefore, no displacement of housing necessitating the construction of replacement housing would occur. No further analysis is warranted.

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

The proposed project would be expected to result in no impacts to population and housing related to the displacement of substantial numbers of people, necessitating the construction of replacement housing elsewhere. Implementation of the proposed project includes the construction of a new MACC and Ancillary Buildings, reuse or replacement of the existing MACC Building, and development of the campuswide Master Plan that would result in the potential construction of mixed-use development. No residential buildings would be demolished as part of the proposed project. As such, there would be no displacement of a substantial number of people. Therefore, there would be no impacts to population and housing in relation to the displacement of substantial numbers of people, necessitating the construction of replacement housing elsewhere. No further analysis is warranted.

3.14 PUBLIC SERVICES

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project) may have a significant impact to public services that would require the consideration of mitigation measures or alternatives in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Public services at the proposed project site were evaluated based on review of the County of Los Angeles (County) General Plan,[2] the City of Los Angeles Web site,[3] the County of Los Angeles Fire Department Web site,[4] and the County of Los Angeles Sheriff's Department Web site.[5]

State CEQA Guidelines recommend the consideration of the following five-part question when addressing the potential for significant impact to public services:

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following five public services:

    i) Fire protection

The proposed project could potentially result in significant impacts to public services in relation to fire protection that would require mitigation measures. The proposed two-tier project development, including the campuswide Master Plan, would result in additional buildings, residents, and additional employees and visitors on the site requiring fire protection. The Los Angeles County Fire Department provides fire services to the unincorporated County of Los Angeles, including the proposed project site.[6] The first responding fire station is Los Angeles County Fire Department Station Number 41, located less than 0.1 north of the proposed project. Station Number 147 also provides as-needed fire-protection support to the proposed project site and is located approximately 1.5 miles northeast of the proposed project. Additional information will be obtained from the Fire Department to determine that adequate services (such as service ratios, response times, adequate design features, or other performance objectives) can be provided. Potentially significant impacts to public services related to fire protection could occur that warrant further analysis in the Environmental Impact Report (EIR). Significant impacts, if found, would require the consideration of mitigation measures. Further analysis is warranted (Table 3.14-1, *Fire Stations in the Proposed Project Vicinity*).

---

SOURCE: Los Angeles County Fire Department. 2009. Web site. Available at: http://www.fire.lacounty.gov/HometownFireStations/HometownFireStations.asp

ii) Police protection

The proposed project could potentially result in significant impacts to public services in relation to police protection that would require mitigation measures. The proposed two-tier project development, including the campuswide Master Plan, would result in additional buildings, residents, and additional employees and visitors on the site requiring police protection. Police protection services in the proposed project area are provided by the Los Angeles County Sheriff's Department's Century Station, located approximately 0.8 mile northeast of the proposed project site, at 11703 Alameda Street, Lynwood, California 90262. The Century Station is responsible for providing law enforcement services to more than 200,000 individuals residing within 13 square miles of southern Los Angles County, including the Willowbrook area where the proposed project is located.[7] Additional information will be obtained from the Sheriff's Department to determine that adequate services (such as service ratios, response times, adequate design features, or other performance objectives) can be provided. Potentially significant impacts to public services related to police protection could occur that warrant further analysis in the EIR. Significant impacts, if found, would require the consideration of mitigation measures. Further analysis is warranted.

iii) Schools

The proposed project would be expected to result in less than significant impacts to public services in relation to schools. School-age children residing within the Willowbrook Community attend schools in the Los Angeles Unified School District and in the Compton Unified School District.[8,9] There are 11 schools and education facilities located within a 0.5-mile radius of the proposed project site: King Drew Magnet High School located adjacent to the MLK campus on East 120th Street, Lincoln Drew Elementary School located 0.10 mile to the north, Los Angeles Computer Science Academy located 0.36 mile northeast, Martin Luther King Elementary located 0.43 mile east, Harriet Tubman High School located 0.25 mile south, Cesar Chavez Alternative School located 0.25 mile south, Compton Community Day Middle School located 0.25 mile south, Ronald E. McNair Elementary located 0.41 mile south, Willowbrook Middle School located 0.47 mile south, Carver Elementary located 0.21 mile to the west, and New Designs Charter School located 0.28 mile northwest. Although implementation of the campuswide Master Plan could induce a growth in population due to the potential creation of new employment opportunities, it is anticipated that existing schools would support the needs of the proposed project. The Los Angeles Unified School District is expected to complete a multiphase program that would provide

classroom seats to address the current need for classroom seats within its service area (which included the proposed project site).[10] Furthermore, as determined by the State of California, mandated payment of school fees for new development in compliance with Senate Bill (SB) 50, is considered full mitigation under CEQA. School fees are collected prior to project development.[11] Therefore, impacts related to public services related to schools would be expected to be less than significant. No further analysis is warranted (Table 3.14-2, *Schools in the Proposed Project Vicinity*).

TABLE 3.14-2
SCHOOLS IN THE PROPOSED PROJECT VICINITY

School Name	Location	Distance from Site
King Drew Magnet High School	1601 East 120th Street, Los Angeles 90059	Adjacent to the northwest boundary
Lincoln Drew Elementary	1667 East 118th Street, Los Angeles 90059	0.10 mile north
Carver Elementary	1425 East 120th Street, Los Angeles 90059	0.21 mile west
Harriet Tubman High School	12501 South Wilmington Avenue, Compton 90222	0.25 mile south
Cesar Chavez Alternative School	12051 South Wilmington Avenue, Compton 90222	0.25 mile south
Compton Community Day Middle School	12501 South Wilmington Avenue, Compton 90222	0.25 mile south
New Designs Charter School	1339 East 120th Street, Los Angeles 90059	0.28 mile northwest
Los Angeles Computer Science Academy	2209 East 118th Street, Los Angeles 90059	0.36 mile northeast
Ronald E. Mc Nair Elementary	1450 West El Segundo Boulevard, Compton, 90222	0.41 mile south
Martin Luther King Elementary	2270 East 122nd Street, Compton 90222	0.43 mile east
Willowbrook Middle School	2601 North Wilmington Avenue, Compton 90222	0.47 mile south

iv) Parks

The proposed project would be expected to result in potentially significant impacts to public services in relation to parks that would require mitigation measures. There are currently six area parks within a 1-mile radius of the proposed project site: 109th Street Recreational Center Park (0.83 miles north of the proposed project), Sibrie Park (0.42 miles south of the proposed project), Enterprise Park (0.77 miles southwest of the proposed project), Mona Park (0.51 miles west of the proposed project), Earvin Magic Johnson Park (0.59 miles west of the proposed project), and George W. Carver Park (0.25 miles northwest of the proposed project). As the proposed project would be expected to induce some population growth, as described in Section 3.12, Population

---

[10] Los Angeles Unified School District. January 2009. *Strategic Execution Plan*. Available at: http://www.laschools.org/sepdocs/sep/pdf/sep-2009-web.pdf

[11] California Department of Education. Accessed on November 12, 2009. *Chaptered Senate Bills*. Available at: http://www.cde.ca.gov/re/lr/ga/chapsen07.asp

and Housing, it would be anticipated that the capacity of the existing park facilities in the neighboring areas during operation would need to be evaluated to ensure that they are able to support the demand for recreational facilities generated by the proposed project. Significant impacts, if found, would require the consideration of mitigation measures. Further analysis is warranted.

v) Other public facilities

The proposed project would be expected to result in potentially significant impacts to public services in relation to other public facilities that would require mitigation measures. Implementation of the two-tiered project, including the campuswide Master Plan, is anticipated to include up to 1,814,696 square feet of mixed use development, including development of up to 100 multifamily dwelling units and medical office buildings that are appurtenant to and compatible with the primary land use of a community-based health program facility. Furthermore, the proposed project would induce some population growth, as described in Section 3.12, and therefore would necessitate substantial additional public facilities needs. Existing public facilities include the Willowbrook Library at 11838 South Wilmington Avenue, located less than 0.1 mile north of the proposed project site,[12] and a U.S. Post Office at 2241 East El Segundo Boulevard, located approximately 0.6 mile southeast of the proposed project site.[13] Significant impacts, if found, would require the consideration of mitigation measures. Further analysis is warranted.

3.15 RECREATION

This analysis is undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) may have a significant impact to recreation, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality (CEQA) Guidelines.[1] Recreation at the proposed project site was evaluated with regard to the County of Los Angeles (County) General Plan,[2] expert opinion, previously published information, and the consideration of the potential for growth-inducing impacts evaluated in Section 3.12, Population and Housing.

State CEQA Guidelines recommend the consideration of two questions when addressing the potential for significant impact to recreation.

Would the proposed project have any of the following effects:

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The proposed project would be expected to result in potentially adverse impacts to recreation in relation to increased use of existing neighborhood and regional parks or other recreational facilities that would contribute to their physical deterioration that could be reduced to below the level of significance with the incorporation of mitigation measures. A review of recreation maps shows that there are currently five County parks within a 1-mile radius of the proposed project site: 109th Street Recreational Center Park (0.83 mile north of the proposed project), Sibrie Park (0.42 mile south of the proposed project), Enterprise Park (0.77 mile southwest of the proposed project), Mona Park (0.51 mile west of the proposed project), Earvin Magic Johnson Park (0.59 mile west of the proposed project), and George W. Carver Park (0.25 mile northwest of the proposed project). These parks and facilities serve the existing recreational needs of the surrounding community. However, the proposed project is intended to provide health services to the residents and visitors of the Willowbrook area and, in accordance with proposed project components. The proposed project's Tier II development includes a potential residential component of up to 100 multifamily residential units, development of which may induce population growth in the surrounding area, as discussed in Section 3.12. Therefore, the existing neighborhood, park, or recreation facilities may be expected to experience increased usage and potentially a physical deterioration as a result of an increase in the number of people (proposed project residents) visiting existing park facilities. Although it is anticipated that the proposed project would have a residential component, the proposed project would be expected to result in potentially adverse impacts to recreation in relation to increased use of existing neighborhood and regional parks or other recreational facilities that would contribute to their physical deterioration that could be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

---

[1] *California Code of Regulations.* Title 14, Division 6, Chapter 3, Sections 15000-15387, Appendix G.

[2] County of Los Angeles Department of Regional Planning. November 1980. *County of Los Angeles General Plan*. Los Angeles, CA. Available at: http://ceres.ca.gov/docs/data/0700/791/HYPEROCR/hyperocr.html

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

The proposed project would be expected to result in potentially significant impacts related to adverse physical effects on the environment as a result of proposed construction or expansion of recreational facilities that could be reduced to below the level of significance with the incorporation of mitigation measures. Implementation of the proposed project would entail development of a new Multiservice Ambulatory Care Center and Ancillary Buildings at the existing project site, renovations and improvements to the existing Inpatient Tower, and development of a hospital-related mixed-use component consistent with the campus-wide Master Plan. It is anticipated that development of the mixed-use component of the proposed project would entail the development of residential units, which may be slightly offset by the development of recreational space in the proposed project; however, construction would not include expanded recreational facilities in the surrounding area. The proposed project would require further analysis to determine whether it would be expected to result in new population growth that would increase the usage of recreational facilities and may increase the need for the expansion of existing recreation facilities or the construction of new recreational facilities beyond those anticipated in the proposed project. Therefore, there would be potentially significant impacts related to adverse physical effects on the environment as a result of existing recreational facilities or proposed construction or expansion of recreational facilities that could be reduced to below the level of significance with the incorporation of mitigation measures. Further analysis is warranted.

3.16 TRANSPORTATION AND TRAFFIC

This analysis is undertaken to determine if the proposed Martin Luther King, Jr. Medical Center Campus (proposed project) may have a significant impact to transportation and traffic, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Transportation and traffic at the proposed project site was evaluated with regard to the Circulation element of the County of Los Angeles (County) General Plan,[2] the County Congestion Management Program (CMP),[3] and California Department of Transportation (Caltrans) Traffic Guidelines.[4]

State CEQA Guidelines recommend the consideration of six questions when addressing the potential for significant impacts to transportation and traffic:

Would the proposed project have any of the following effects:

a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Implementation of the proposed project would be expected to result in significant impacts to transportation and traffic by creating a substantial increase in traffic within the circulation system that would be expected to conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, unless mitigation measures are incorporated. The proposed project entails, as currently conceived in Tier I, construction of two new facilities. Tier II of the proposed project would entail the reuse or replacement of the existing MACC building, Emergency Room Expansion, MRI Modular Building, and Cooling Towers, and the construction of new master planned mixed-use development, which may include the potential development of up to 1,814,696 square feet for (1) medical office, commercial, retail, office space, and other development in support of the campus, which are appurtenant to and compatible with the primary land use, a community-based health program facility, and (2) up to 100 units of multifamily residential development.

With a large square footage currently scheduled for construction activities, construction of the proposed project would be expected to require a large number of construction workers and a large number of hauling and delivery trucks to travel to and from the proposed project site over a long construction period. Therefore, construction of the proposed project would be expected to generate a large number of additional vehicle trips to and from the proposed project site and would be expected to result in impacts to transportation and traffic on the existing traffic load and capacity of the street system established by the County CMP[5] for designated roads or highways from the

[5] County of Los Angeles, Metropolitan Transit Authority. 1998. *Congestion Management Program*. Los Angeles, CA.

proposed project. Incorporation of mitigation measures would be required to reduce these construction-related impacts to transportation and traffic to below the level of significance.

Operation of the proposed project would also be expected to result in significant impacts to transportation and traffic by creating a substantial increase in traffic within the circulation system, and it would therefore conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system. The proposed project would be operated as a site to provide critical healthcare services and would have future mixed-use development that would provide the health services necessary to respond to and address the needs of the community. Based on such operational functions of the proposed project, the proposed project, as currently conceived, would provide facilities for critical healthcare services, and in Tier II, additional development of approximately 1,814,696 square feet of nonresidential uses and 100 units of multifamily housing. Vehicle trips as a result of the increased population would be expected to increase during the operational phase of the proposed project. Therefore, operation of the proposed project would be expected to result in impacts to transportation and traffic in regards to a conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system established by the County of Los Angeles CMP for designated roads or highways from the proposed project. Mitigation measures are required to be incorporated in order to reduce these operation-related transportation and traffic impacts to below the level of significance. Further analysis is warranted.

b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

The proposed project would be expected to result in impacts to transportation and traffic in relation to conflicting with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways and would require the incorporation of mitigation measures to reduce these impacts to below the level of significance. The County's CMP standard is Level-of-Service (LOS) D or better for roads and highways in the vicinity of the proposed project site. LOS is a measure of traffic operation condition whereby a letter grade, A through F, corresponding to progressively worsening operation conditions, is assigned to an intersection or roadway segment. The significance criteria of the County of Los Angeles are based on the projected increase in intersection volume-to-capacity (V/C) ratios due to the proposed project and the future intersection LOS, which includes traffic due to the proposed project, as well as other related development projects.

The proposed project would be expected to exceed the LOS beyond the level of significance because the operational purpose of the proposed project to provide future mixed-use development and provide the health services necessary to respond to and address the needs of the community would expand the existing uses at the proposed project site, and it would therefore conflict with the County's applicable congestion management program regarding LOS. Implementation of the proposed project would be anticipated to generate a significant number of additional vehicle trips. Therefore, the proposed project would be expected to result in significant impacts on the LOS of surrounding roads and be required to incorporate mitigation measures to reduce these impacts to below the level of significance. Further analysis is warranted.

c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

The proposed project would not be expected to result in impacts to transportation and traffic in relation to a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks. The nearest airport to the proposed project site is the Compton Airport located approximately 2.1 miles south of the proposed project in the City of Compton. There would be no change in relation to existing air traffic patterns as a result of the proposed project. Therefore, there would be no expected impacts to transportation and traffic related to a change in air traffic patterns that would result in substantial safety risks. No further analysis is warranted.

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Implementation of the proposed project would be expected to result in less than significant impacts from hazards due to a design feature. The proposed project would be expected to involve a physical change in the environment. However, any construction-induced traffic would not be expected to result in increased hazards related to traffic engineering design features or incompatible uses. The proposed project site is connected by a network of well-defined and pre-existing paved roads including 120th Street to the north and Wilmington Avenue to the east. The site would continue to be accessed by these roads following construction of the proposed project. There would be no expected significant impacts from an increase in hazards due to a design feature. No further analysis is warranted.

e) Result in inadequate emergency access?

The proposed project would be expected to result in less than significant impacts with regard to inadequate emergency access. Implementation of the proposed project would not be expected to alter any existing emergency access routes nor change existing patterns of emergency access. Two fire stations are located within 2 miles from the proposed project site. Police protection services in the proposed project area are provided by the Los Angeles County Sheriff's Department's Century Station, located approximately 0.8 mile northeast from the proposed project site.

Although there would be additional traffic generated by implementation of the proposed project, and there may be an expected change of the LOS levels near points of public ingress or egress, it is not anticipated that the proposed project would result in traffic levels that significantly surpass the amount of traffic entitled in such a manner that it would result in inadequate emergency access to the proposed project site. Existing roadways were planned and designed to support the anticipated needs of the facility and it is anticipated that these roadways would be able to provide adequate emergency access to the proposed project site, and no additional access roads would need to be constructed to assist in the provision of adequate emergency access. As a medical center campus, the proposed project would be required to ensure that the project is properly designed for emergency vehicle access (e.g., driveway widths and turning radius allowances). Therefore, the proposed project would be expected to result in less than significant impacts with regard to inadequate emergency access. No further analysis is warranted.

f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

The proposed project would not be expected to result in impacts to transportation and traffic in relation to conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. Based on analysis of the County General Plan Circulation element, implementation of the proposed project would not conflict with adopted policies or plans determined by the County. Relevant policies include the following:[6]

- **Policy 31.** Support the development of a mass transportation system that will provide a viable alternative to the automobile.
- **Policy 33.** Support a public transit system that provides accessible service, particularly to the transit dependent.
- **Policy 17.** Encourage provision of transit service at a reasonable cost to the users and the community.
- **Policy 24.** Encourage the efficient use and conservation of energy used in transportation.
- **Policy 15.** Provide opportunity for timely citizen input and guidance in the transportation decision-making process.

The proposed project would not involve construction- or operation-related traffic activities that would be expected to interfere with regular operation of the established plans or policies. Moreover, the proposed project site is connected by a network of well-defined, pre-existing, and traffic-controlled paved roads. These roads include 120th Street to the north and Wilmington Avenue to the east, traversing through and around the proposed project site area. These paved roads incorporate ample design and planning to allow for alternative transportation methods such as bicycles and buses to share access to the existing site with automobile vehicles. The existing Martin Luther King, Jr. Medical Center is accessible by public transportation services with nine bus lines currently serving the proposed project area. These bus lines are operated by Los Angeles County Metropolitan Transit Authority (LACMTA), Hahn Trolley and Shuttle Service (HTSS), and the Los Angeles Department of Transportation (LADOT). The proposed project would be consistent with the County's goals and policies to improve the efficiency of the transportation system, and to reduce transportation energy consumption and transportation-related degradation of the environment. Therefore, there would be no expected impacts to transportation and traffic related to conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. No further analysis is warranted.

---

3.17 UTILITIES AND SERVICE SYSTEMS

This analysis is undertaken to determine if the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project) may have a significant impact to utilities and service systems, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15063 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Utilities and service systems at the proposed project site were evaluated with regard to the County of Los Angeles (County) General Plan Safety element,[2] Central Basin Municipal Water District,[3] the Los Angeles Regional Water Quality Control Board (LA-RWQCB),[4] and State of California RWQCB Basin Plan for Los Angeles.[5] The scope of the utilities and service systems investigations included the natural gas, telephone, electric, sewer, storm drain, and water utilities.

State CEQA Guidelines recommend the consideration of seven questions when addressing the potential for significant impact to utilities and service systems:

Would the proposed project have any of the following effects:

a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

The proposed project would be expected to result in less than significant impacts to utilities and service systems in relation to exceeding wastewater treatment requirements of the LA-RWQCB. It is anticipated that the proposed project would contribute to additional amounts of wastewater going through the wastewater treatment system than what currently leaves the proposed project site. However, wastewater treatment requirements due to construction and development related to Tier I and Tier II of the proposed project would not be expected to exceed the wastewater treatment requirements or standards of the RWQCB. Wastewater generated at the proposed project would be treated at the Hyperion Treatment Plant.[6] The Hyperion Treatment Plant currently supports wastewater leaving the proposed project site and would continue to do so following the development of the proposed project. The Hyperion Treatment Plant is the largest wastewater treatment plants in the City of Los Angeles. The facility provides both primary and secondary treatment for approximately 340 million gallons of wastewater per day (MGD).[7] The Hyperion Treatment Plant has an average flow capacity of 450 MGD (during wet conditions, i.e., the rainy season, the facility has a capacity of 850 MGD).[8] The Hyperion Treatment Plant currently operates

in conformance with the applicable standards of the LA-RWQCB. The plant serves a population of approximately 4 million people throughout the County of Los Angeles.[9] Although the proposed project would be expected to generate additional wastewater that would flow into the existing system, the proposed project would not be anticipated to add additional water quality concerns beyond those already enforced and being met by the Hyperion Treatment Plant. Further, the proposed project would connect to the existing wastewater system and would not include the development of major new sewer lines. Therefore, the proposed project would be expected to result in less than significant impacts to utilities and service systems in relation to exceeding wastewater treatment requirements of the RWQCB. No further analysis is required.

b) Require or result in the construction of new water or wastewater treatment facilities, the construction of which could cause significant environmental effects?

The proposed project would not be expected to result in impacts to utilities and service systems in relation to the requiring or resulting in the construction of substantial new water supply or wastewater treatment facilities. The proposed project is located in the Central Basin Municipal Water District service area. Annually, the Central Basin Municipal Water District provides approximately 60,000 acre-feet of imported water to a 227 square mile service area, which includes 24 cities and the unincorporated parts of the County.[10] It is anticipated that the proposed project would result in an increase in water supply and wastewater treatment demands for the proposed project site, the increases require further analysis for potentially significant impacts (see questions "d" and "e", below). While the increases in water usage and sewage generation are potentially significant on the proposed project level, it is not anticipated that the project alone would result in the need for substantial new water supply or wastewater treatment facilities. The general project area is well-served by major pipeline infrastructure for water supply and wastewater collection, though some new project connections on on-site infrastructure may be needed. The County Building and Safety's site plan review will assure that appropriate localized connections to water and wastewater systems are provided and adequately designed to approved standards. Therefore, the proposed project would not be expected to result in impacts to utilities and service systems related to requiring or producing the construction of new water or wastewater treatment facilities. No further analysis is required.

c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental impacts?

The proposed project could result in potentially significant impacts to utilities and service systems in relation to the construction of new storm water drainage facilities or the expansion of existing facilities, which could cause significant environmental impacts that may require the incorporation of mitigation measures. The proposed project site is served by stormwater drains that convey stormwater away from the site. Implementation of the proposed project would increase the impervious surface area on the project site, with the largest change to occur in Tier II with the Master Plan mixed-use development. Currently, impervious surfaces on the proposed project site consist of buildings and paved areas, including parking lots, which cover the soil and do not allow for stormwater to percolate into the soil. Stormwater, which drains off the impervious surface areas of the site, is conveyed by gutters and catch basins into the system of stormdrains surrounding the

---

[9] City of Los Angeles Hyperion Sewage. Accessed 19 October 2009. Web site. *City of Los Angeles Hyperion Sewage*. Available at: http://www.lastormwater.org/siteorg/general/hypern1.htm

[10] Central Basin Municipal Water District. Accessed 7 October 2009. Web site. *Central Basin Municipal Water District*. Available at: http://www.centralbasin.org/

project site. With the proposed project, undeveloped portions of the site would be covered with buildings and potentially parking areas, thus increasing the amount of stormwater draining from the site. Thus, evaluation of the stormdrain needs and the capacity of the local stormdrain system is warranted, and mitigation measures and/or the analysis of alternatives may be required.

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Further analysis is warranted to determine if the proposed project may result in significant impacts to utilities and service systems in relation to having sufficient water supplies available to serve the proposed project from existing entitlements and resources. Further analysis is required in order to determine whether the proposed water requirements for the proposed project would surpass the existing water use entitlements for the proposed project site.

The proposed project site is located within an unincorporated area of the County of Los Angeles, which receives its potable (drinking) water supply from two sources. Ownership of water rights allows approximately half of the water supply needs to be produced from groundwater wells located within the City of Los Angeles. The other portion of the City's potable (drinking) water supply is treated surface water purchased from the Central Basin Municipal Water District.[11] The Central Basin Municipal Water District now serves more than 2 million people (including the unincorporated parts of the County) and would potentially supply water to the proposed project area. Several factors would drive future water demands, including population growth, housing density, employment, and household income. The population of the Central Basin Municipal Water District's service area is expected to increase approximately 16 percent from 1,614,400 in 2005 to approximately 1,872,500 by 2030.[12] The proposed project could be expected to increase the water use demands at the proposed project site.

As mentioned above, given the size of the proposed project, including the Tier II master plan–related development, which would add up to 1,814,696 square feet of new development, including up to 100 units of multifamily residential, potentially significant project impacts to water supply could occur, and possibly could necessitate the need for a Waster Supply Assessment under Senate Bill (SB) 610. Recent water usage at the proposed project site must be examined and compared to proposed water demand in order to make this determination.

Water use at the existing campus while it was fully operational, has varied over time. The average water use on the campus between the years 2002 to 2006 was more than 80 million gallons (or 107 thousand hundred cubic foot (HCF) unit) of water per year.[13] Water consumption at the existing campus during these years are described below in Table 3.17-1, *Operational Water Use at the Proposed Project Site, 2002–2006*, below for each of these four operational years.

---

OPERATIONAL WATER USE AT THE PROPOSED PROJECT SITE
2002–2006

Fiscal Year	HCF (hundred cubic foot) Units	Gallons	Acre-Feet
2002-2003	104,572	78,219,856	240
2003-2004	118,426	88,582,648	271
2004-2005	104,494	78,161,512	239
2005-2006	103,681	77,553,388	238
4-year Average	**107,793**	**80,629,351**	**247**

According to the Central Basin Municipal Water District, in the year 2005, the water demand in the district was 330,557 acre-feet and the projected demand in 2010 and 2015 would be 351,591 acre-feet and 358,441 acre-feet, respectively.[14] A project is subject to SB 610 and requires the preparation of a Waster Supply Assessment if it meets one of several criteria including:

1) The project demands water use that is comparable to a 500 unit residential development (guidelines for other land uses include: a shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor area; a commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor area; a hotel or motel with more than 500 rooms; an industrial facility employing more than 1,000 persons or having more than 250,000 square feet of floor area; or a mixed use facility that combined meets these guidelines);[15] or

2) The project would increase the number of the public water system's existing service connections by 10%.[16]

The U.S. Department of Agriculture, Forest Service estimates that an average California household uses between one half acre-foot and one acre-foot of water each year.[17] This usage rate would indicate that an average 500-unit residential development would be expected to consume between 250 to 500 acre-feet per year, or an average of 375 acre-feet per year. During the most recent past four years when the hospital was fully operational, the existing campus utilized an average 247 acre-feet of water per year; however, the maximum water use at the existing campus during the four-year period observed was 271 acre-feet. It is anticipated that the maximum water consumption amounts for the campus following development would not be significantly greater than the maximum operational usage amount of 271 acre-feet (88,582,648 gallons) cited above; which represents approximately .08 percent of the 2005 water demand rates for the County and .07 percent of the 2010 and 2015 rates. A Waster Supply Assessment should be prepared if the proposed project would provide additional development requiring an increase of water use of 375

[16] California Status Department of Water Resources. Accessed on 2 November 2009. "SB 610 / SB 221 Guidebook FAQs." Available at: http://www.water.ca.gov/urbanwatermanagement/SB610_SB221/

[17] U.S. Department of Agriculture, Forest Service. Accessed on 3 November 2009. "Water Use Facts." Sacramento, CA. Available at: http://www.fs.fed.us/r5/publications/water_resources/html/water_use_facts.html

acre-feet per year (i.e., the amount of water required by 500 homes) beyond the recent maximum existing use demand of 271 acre-feet.

However, additional study is warranted to confirm that the proposed project falls below SB 610 thresholds, and to assure that the proposed project can be adequately served by the water supplier. Further analysis is warranted, and mitigation measures and/or the analysis of alternatives may be required.

e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing conditions?

Further analysis is warranted to determine if the proposed project would be expected to result in significant impacts to utilities and service systems, based on a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments. The community of Willowbrook sanitary sewer system carries wastewater from the proposed project site into the sanitary sewer system where it is conveyed to the Hyperion Treatment Plant.[18] As previously discussed, the Hyperion Treatment Plant provides primary, secondary, and tertiary treatment for approximately 340 million gallons of wastewater per day.[19] The Hyperion Treatment Plant has the capacity to absorb projects that are consistent with regional growth projections established by the Southern California Association of Governments (SCAG). Although the proposed project would not be expected to increase population, the proposed project would be expected to substantially increase generation of wastewater at the proposed project site. Further analysis of the proposed project's impact on the capacity at Hyperion Treatment Plant is warranted. Therefore, impacts to utilities and service systems in relation to resulting in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments would be potentially significant. Further analysis is warranted, and mitigation measures and/or the evaluation of alternatives may be necessary.

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

The proposed project would be expected to result in less than significant impacts to utilities and service systems in relation to being served by a landfill with sufficient permitted capacity to accommodate the proposed project's solid waste disposal needs. The solid waste facilities within the central Los Angeles area are listed in Table 3.16-2, *Solid Waste Facilities in the Los Angeles Area*.[20]

[21] County of Los Angeles Public Works. Accessed 7 October 2009. Web site. "Solid Waste Facilities in Los Angeles County." Available at: http://dpw.lacounty.gov/swims/general/facilities/nearestfacilitylist.asp

[22] County of Los Angeles Department of Public Works. 10 May 2007. Sanitation Districts of Los Angeles County. Accessed 7 October 2009. "Solid Waste Management In Los Angeles County - Disposal System Overview." Available at: http://ladpw.org/swims/Upload/SWM%20in%20LA%20County_7250.pdf

The proposed project would require an increase in waste disposal during the constructional and operational phases of the proposed project. Refuse collected in the community of Willowbrook, California, which includes collection at the proposed project site, may be taken to three facilities operated by the Sanitation Districts of Los Angeles County: the Downey Area Recycling & Transfer facility, Puente Hills Materials Recovery facility, or the South Gate Transfer Station facility. The Downey Area Recycling & Transfer facility is located at 9770 Washburn Road, Downey, California, roughly 7 miles east of the proposed project site. This facility has a daily maximum permitted capacity of 5,000 tons per day.[23] The Puente Hills Materials Recovery facility is located at 13130 Crossroads Parkway South, City of Industry, California, roughly 18 miles northeast of the proposed project site. This facility has a daily a maximum permitted capacity of 13,200 tons of waste per day and is scheduled to close in November 2013.[24] The South Gate Transfer Station is located at 530 South Garfield Avenue, South Gate, California, roughly 4 miles northeast of the proposed project site. The South Gate Transfer Station has a daily maximum permitted capacity of 1,000 tons of waste per day.[25] It is anticipated that waste collected at the proposed project site would be taken to one of the three stations listed above. Each station has the capacity to service the proposed project site. Therefore, the proposed project would not be expected to result in significant impacts to utilities and service systems in relation to being served by a landfill with sufficient permitted capacity to accommodate the proposed project's solid waste disposal needs. No further analysis is warranted.

g) Comply with Federal, State, and Local statutes and regulations related to solid waste?

The proposed project would be expected to result in less than significant impacts to utilities and service systems related to compliance with federal, state, and local statutes and regulations related to solid waste. The California Integrated Waste Management Act of 1989 [which consists of Assembly Bill (AB) 939 and SB 1322] requires the County of Los Angeles to attain specific waste diversion goals.[26] In addition, the California Solid Waste Reuse and Recycling Access Act of 1991, as amended, requires expanded or new development projects to incorporate adequate areas for the storage and collection of recyclables into the existing design.[27] The proposed project would be subject to the policies discussed above. It is anticipated that the incorporation of the waste management requirements described above would ensure that the proposed project is in compliance with federal, state, and local statues and regulations to reduce the amount of solid waste. The County would be required to ensure that the proposed project implements the requirements and shall ensure that the best method of solids disposal and reduction of the solid waste stream is implemented throughout the development and operation of the proposed project. As a County hospital, the proposed project would be required to demonstrate that all solid waste would be disposed of properly at the permitted facilities for solid waste (including medical hazardous waste). Therefore, the proposed project would be expected to result in less than significant impacts to utilities and service systems in relation to compliance with federal, state, and local statutes and regulations related to solid waste. No further analysis is warranted.

3.18 MANDATORY FINDINGS OF SIGNIFICANCE

This analysis was undertaken to determine if the Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) would be expected to have a significant impact to Mandatory Findings of Significance, thus requiring the consideration of mitigation measures or alternatives, in accordance with Section 15065 of the State California Environmental Quality Act (CEQA) Guidelines.[1] Mandatory Findings of Significance for the proposed project were evaluated with regard to the information contained in this Environmental Analysis gathered during literature reviews (see Section 4.0, References, for a list of reference materials consulted).

State CEQA Guidelines recommend the consideration of three questions when addressing the potential for significant impacts to Mandatory Findings of Significance.

Would the proposed project:

a) Does the proposed project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

The proposed project would be expected to result in potentially significant impacts to Mandatory Findings of Significance in relation to the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory that may not be able to be reduced to below the level of significance through the incorporation of mitigation measures, therefore requiring the consideration of alternatives. The proposed projects intends to provide inpatient hospital functions and support spaces in conjunction with a community-based healthcare program that would be seismically compliant beyond 2030 seismic standards established by Office of Statewide Planning and Development (OSHPD). Tier II of the proposed project would entail the reuse or replacement of existing structures on the Martin Luther King, Jr. Medical Center Campus. The Martin Luther King, Jr. Medical Center Campus was developed to address the community needs for healthcare facilities following the civil disturbances in the Watts area of Los Angeles during the summer of 1965. As discussed in Section 3.5, Cultural Resources, of this Initial Study, the campus requires further study to determine if it meets the significance criteria and integrity requirements for identification as an historical resource as defined by the State CEQA Guidelines. Implementation of the proposed project has the potential to result in significant impacts to Mandatory Findings of Significance in relation to the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory, which may require the consideration of alternatives. Further analysis is warranted.

---

[1] *California Code of Regulations*, Title 14, Division 6, Chapter 3, Sections 15000–15387, Appendix G.

b) Does the proposed project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

The impact to Mandatory Findings of Significance related to Mandatory Findings of Significance in relation to impacts that are individually limited but cumulatively considerable from the proposed project would be expected to be reduced to below the level of significance with the incorporation of mitigation measures. The proposed project may be expected to contribute to the incremental environmental impacts when viewed in connection with the effects of past, current, or reasonably foreseeable projects. The proposed project would entail development that would be expected to result in impacts to air quality, cultural resource, greenhouse gases, hydrology and water quality, noise, public services, recreation, traffic and transportation, and utilities and service systems. Although these impacts would be largely temporary and localized, they may have the potential to result in incremental effects that when considered in connection to other projects, could result in potentially significant impacts. The County of Los Angeles (County) has proposed efforts to minimize these impacts through the use of best management practices (BMPs) and sustainable practices for the development and operation of the proposed project. However, further review of these impacts in relation to the effects of past projects, the effects of other current projects, and the effects of probable future projects, is required in order to determine whether the proposed project would contribute to this adverse impact. Therefore, the expected impacts to Mandatory Findings of Significance related to impacts that are individually limited but cumulatively considerable would be expected to be reduced to below the level of significance by the incorporation of mitigation measures. Further analysis is warranted.

c) Does the proposed project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

The proposed project would be expected to result in significant impacts to Mandatory Findings of Significance in relation to having environmental effects that would cause substantial adverse effects on human beings, either directly or indirectly that may not be able to be reduced to below the level of significance through the incorporation of mitigation measures, therefore requiring the consideration of alternatives. While the adverse impacts related to the construction of the proposed project would be temporary, the implementation of BMPs would significantly reduce these impacts. In addition, it is anticipated that the proposed project would result in less than significant operational impacts due to the fact that the proposed project is designed to create more efficient structures on the proposed project site, and would entail the implementation of sustainable elements into the developmental and operational phases of the proposed project. The proposed project could be expected to result in impacts to air quality, cultural resources, greenhouse gases, hydrology and water quality, noise, public services, recreation, traffic and transportation, and utilities and service system. These impacts would not be considered substantial to human beings as they would be limited and would be significantly reduced by the County's efforts to provide inpatient hospital functions and support spaces in conjunction with a community-based health care program that would be seismically compliant beyond 2030 seismic standards established by OSHPD. The beneficial environmental impacts discussed throughout this Initial Study (i.e., seismic upgrades for compliance to 2030 and beyond) would be expected to have positive impacts on human beings and their environment although the potentially adverse impacts, as discussed in the response to question (a) above (i.e., replacement of an historical resource) would require further analysis in order to determine whether these impacts would constitute a substantially adverse indirect impact on human beings.

Therefore, implementation of the proposed project has the potential to result in significant impacts to Mandatory Findings of Significance in relation to environmental effects that would cause substantial adverse effects on human beings, either directly or indirectly and may require the consideration of alternatives. Further analysis is warranted.

SECTION ES
EXECUTIVE SUMMARY

This Aesthetics Technical Analysis in support of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project) resulted in the conclusion that a less than significant impacts to aesthetic and visual resources would occur after mitigation was incorporated. This technical report addresses the 38-acre proposed project site located in the unincorporated area of the Willowbrook community within the County of Los Angeles, California.

This Aesthetics Technical Analysis was prepared to address the aesthetic issues identified in the Initial Study (IS) requiring further analysis to identify the significance levels of the proposed project pursuant to the California Environmental Quality Act (CEQA). The goal of the proposed project is to provide new campus improvements proposed to reopen a fully functional medical campus that meets community needs for quality health care. Construction of the proposed project would entail a Tier I and a Tier II development program. Tier I involves project-level development of the new Multi-service Ambulatory Care Center (MACC) and the Ancillary Building, tenant improvements in existing buildings, site improvements, and the potential relocation of the MRI Building. Tier II of the proposed project would entail the development of a campus-wide master plan. Tier II would have the potential to build out approximately 1,814,696 square feet (sf) of development on the proposed project site with mixed uses including medical office, general offices, commercial, retail, recreation, and other development in support of the campus. In addition, up to 100 residential units would be developed at a density consistent with surrounding residential area development densities.

A summary of the main conclusion of this Aesthetics Technical Analysis are as follows:

- As proposed, the project would not obstruct any prominent scenic vista or views open to the public; or result in the creation of an aesthetically offensive site from a designated scenic public view.
- There are no designated scenic vistas within the vicinity for the proposed project property; therefore, the proposed project would not result in a significant impact on a scenic vista.
- No designated scenic highways are present in the immediate project vicinity; therefore, no significant impact would occur with implementation of the proposed project.
- Both Tier I and Tier II are compatible with the existing land uses at the proposed project site and in the adjacent area, would be compatible with the visual appearance of the surrounding area after mitigation. Therefore, the proposed project would not degrade the existing visual character of quality of the site or the surrounding area.
- If the proposed Tier II buildings were placed along the edge of the western and/or eastern campus property line, a six-story building would have the potential to shadow various adjacent residences. However, the proposed project would result in less than significant impacts with mitigation incorporated.
- Implementation of mitigation measure Aesthetics-1 is recommended to ensure that the development proposed under Tier I and Tier II utilizes and incorporate materials to ensure campus is visual consistency and continuity. The proposed project must adhere to the design goals presented in the HCP report.

- Implementation of mitigation measure Aesthetics-2 is recommended to ensure that shade and shadow impacts are maintained at below the level of significance.
- The construction of the proposed project would involve the presence of additional interior lighting within the proposed facilities and their activation during non-daytime hours would create additional effects of increased lighting but remain less than significant.
- Implementation of mitigation measure Aesthetics-3 would ensure that all exterior lighting proposed by Tier I and Tier II be shielded and directed downwards to minimize the impacts on the surrounding land uses. In addition, no large expanses of reflective or otherwise glare-producing surfaces would be included within the building components or materials of Tier I and Tier II.
- Implementation of mitigation measure Aesthetics-4 is recommended to reduce potential vehicle and headlight intrusion impacts below the level of significance.

In summary, with the incorporation of the above referenced mitigation measures, the proposed project would be expected to result in less than significant impacts to aesthetic resources during construction and operation.

SECTION 1.0
INTRODUCTION

1.1 PURPOSE AND SCOPE

This Aesthetics Technical Analysis was undertaken by Sapphos Environmental, Inc. in support of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project). The Aesthetics Technical Analysis was prepared to characterize the visual resources that could be affected by construction and operation of the proposed project with respect to potential impacts related to aesthetics, including scenic vistas and resources, scenic highways, visual quality, shade and shadow and light and glare. This analysis was undertaken to determine if the proposed project may have a significant impact to aesthetics that would require the consideration of mitigation measures or alternatives in accordance with Section 15063 of the California Environmental Quality Act Guidelines (State CEQA Guidelines).[1]

The proposed project would be subject to discretionary approvals by the County of Los Angeles (County) acting in its capacity as lead agency under CEQA. The County would need to determine the potential for the proposed project to result in significant impacts, consider mitigation measures and alternatives capable of avoiding significant impacts, and take the environmental impacts of the proposed action into consideration as part of their decision-making process. This Aesthetics Technical Analysis provides substantial evidence upon which the required evaluation of feasibility, environmental analysis, and findings of facts in relation to visual resources can be made. This study identifies and evaluates key visual resources in the project area and determines the degree of visual impacts that could occur from the proposed project on the existing landscape and built environment. The study evaluates potential aesthetics impacts associated with the proposed project on key viewpoints based upon a photographic representation, proposes mitigation measures for significant impacts to visual resources, and documents the findings of the levels of significance after implementation of mitigation measures, as applicable.

1.2 PROJECT LOCATION

The proposed project site consists of the existing 38-acre Martin Luther King, Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles (County), California (Figure 1.2-1, *Regional Vicinity Map*). The project site is located approximately three miles north of State Route 91 (SR-91; Artesia Freeway), approximately three miles northeast of Interstate 710 (I-710; Long Beach Freeway), approximately two miles east of I-110 (Harbor Freeway), less than one mile south of East Imperial Highway, and less than one mile south of I-105 (Glen Anderson Freeway). The proposed project can be accessed from East 120th Street or from Wilmington Avenue (Figure 1.2-2, *Project Location Map*).

The proposed project site appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle (Figure 1.2-3, *Topographic Map*).[2] Elevations at the proposed project site range from 86 feet above mean sea level (MSL) to 88 feet above MSL. The topography of the site can be generally characterized as flat.

1.3 PROJECT DESCRIPTION

The proposed project entails two tiers: Tier I involves project-level development of the new Multi-service Ambulatory Care Center (MACC) and the Ancillary Building, tenant improvements in existing buildings, site improvements, and the potential relocation of the MRI Building. Tier II of the proposed project would entail the development of a campus-wide master plan. Tier II would have the potential to build out approximately 1,814,696 square feet (sf) of new development on the proposed project site with mixed uses including medical office, general offices, commercial, retail, recreation, and other development in support of the campus. In addition, up to 100 residential units would be developed at a density consistent with surrounding residential area development densities. Tier II components would also entail the reuse or replacement of the existing 495,335 square foot MACC building.[3]

The proposed project would require land modifications to accommodate construction, operation, and maintenance of up to 100 residential units, new commercial and retail space, and additional campus supporting buildings and facilities. The proposed facility is intended to serve the Martin Luther King, Jr. Medical Center Campus, the Willowbrook community and the County of Los Angeles (County). The proposed project would provide medical, commercial, retail, office space, and other facilities in support of the campus.

1.4 GENERAL PROJECT GOALS

The goal of the proposed project is to provide new campus improvements proposed to reopen a fully functional medical campus that meets community needs for quality health care. The County seeks to establish the Martin Luther King, Jr. Medical Center Campus as a center of excellence for health care delivery, urban health promotion and prevention, health workforce development, academic research and teaching, and economic development. The campus provides an opportunity to develop up to 1,814,696 square feet for a mix of uses, including space for medical offices, commercial, retail, residential, recreation, and general offices, in addition to any other development that will improve the community-based health program facility. Pursuant to this goal, the proposed project would be designed and constructed in accordance with all federal, state, regional, and Los Angeles County regulations, including building codes, the National Pollution Discharge Elimination System,[4] and the County General Plan.[5] Consistent with the standards provided, the proposed project would also implement sustainable elements throughout its design, operation, and maintenance: development of the new MACC and the Ancillary Building are currently registered with the U.S. Green Building Council under Leadership in Energy and Environmental Design for New Construction (LEED-NC).[6] The County will seek LEED Silver certification for the MACC and the Ancillary buildings,[7] and implement the "Green Guide for Healthcare Construction" (GGHC), a program developed by the federal government designed to

---

[3] The Tier II components are conceptual at this time and therefore will be discussed only in a general level examining the potential development envelope proposed.

help hospitals navigate through the LEED program. Moreover, the proposed project would use best management practices (BMPs) and technologies aimed to limit the use of natural resources as well as the operating cost over the life of the building, such as those guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[8]

1.5 AUDIENCE AND USE

This analysis is intended to provide the County with a comprehensive study of the potential impacts to aesthetics that could be created by project implementation. Other target audience groups of the Aesthetics Technical Analysis include various regulatory trustees, i.e., the City of Los Angeles, the Department of Public Works, as well as the general public. This technical analysis is incorporated into the proposed project Environmental Impact Report (EIR). The purpose of the EIR is to disclose potential environmental impacts of the proposed project to allow for informed public participation and informed decision-making in the project approval process.

1.6 SCOPE

The Aesthetics Technical Analysis provides a description of the regulatory framework used to guide the analysis, existing conditions of the proposed project site, and the visual impact analysis. A detailed narrative of the existing conditions at the proposed project site in relation to scenic vistas, nearby scenic highways, visual quality of the site, light and glare, and shade and shadow in support of the Aesthetics Section of the EIR. As such, this study is a quantitative and qualitative investigation of the potential impacts based on existing conditions and the design of the project's buildings' scale, general shade and shadow, light and glare, and landscaping on sensitive receptors present in the vicinity of the project site. Impacts are determined as significantly adverse based upon thresholds of significance defined in conjunction with Section 15063 of the State CEQA Guidelines.[9]

SECTION 2.0
REGULATORY FRAMEWORK

This regulatory framework identifies the federal, state, and local statutes, ordinances, and or policies that govern light, glare, viewsheds, and the scenic character that will be considered by the County of Los Angeles (County) during the decision-making process for projects that have the potential to have impacts related to aesthetic resources, including scenic vistas and resources, scenic highways, visual quality, shade and shadow, and light and glare.

2.1 FEDERAL

2.1.1 Section 4(f) of the U.S. Department of Transportation Act of 1966

The U.S. Department of Transportation Act of 1966, Section 4(f), "Protection of Publicly Owned Park, Recreation Area, Wildlife or Waterfowl Refuge, or Land from Historic Sites," was established to provide certain protections to publicly owned parks, recreation areas, wildlife and waterfowl refuges, and land from historic sites of national, state, or local significance. Section 4(f) requires that the federal agency must show that there are no feasible or prudent alternatives to the use of these areas.[10]

The Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) would not result in the conversion of existing publicly owned park areas. The County zoning designation for all project parcels (APNs 6140-028-902, 6140-028-900, 6140-028-907, and 6140-028-903) is Neighborhood Commercial (C-2; Neighborhood Business Zone). This zoning designation is established to identify community-related commercial uses and permits the following uses: drugstores, medical clinics (including laboratories), professional or business office space, parking lots and buildings, and hospital equipment and supply rentals.[11] The Martin Luther King, Jr. Medical Center Campus began operations in 1972 following the 1965 Watts Civil Unrest/Riots as a response to the community health care needs.[12] The proposed project would meet the community needs for quality health care and is not intended to alter the public use or historic relevance of the site. Therefore, no further analysis regarding project compliance with the U.S. Department of Transportation Act would be required.

2.1.2 National Trails System Act

The National Trails System Act seeks to preserve scenic and natural qualities along trails, and recognizes the rights of private landowners and provides that "full consideration shall be given to minimizing the adverse effects upon the adjacent landowner or user and his operation" in the development and use of a trail.[13] The National Trails System Act assigns management responsibility

for trails to various federal resource agencies, depending on which agency holds jurisdiction over the land on which the trail is located in a given area.

The Juan Bautista de Anza National Historic Trail was created under the 1968 National Trails System Act to provide for outdoor recreation opportunities and the conservation of significant scenic, historic, natural, or cultural qualities. At its closest point, the Juan Bautista de Anza National Historic Trail is located approximately 9.2 miles to the north of the property.

2.2 STATE

2.2.1 California Scenic Highway Program

California's Scenic Highway Program preserves and protects scenic highway corridors from changes that would diminish their aesthetic value. The California Department of Transportation (Caltrans) designates scenic highway corridors and establishes those highways that are eligible for the program. The program was created in 1963 with the enactment of the State Scenic Highways Law.[14] The street and highway code includes a list of those highways that are either eligible for designation or are designated. There are no officially designated State scenic highways or eligible State scenic highways within the vicinity of the proposed project site.

The nearest recognized highway to the proposed project California State Route 110 (SR 110), which is located west of the proposed project site boundary. The Caltrans Scenic Highway System has identified a portion of SR 110 as a "Historic Parkway" (sometime referred to as a Scenic Byway), which is distinct from an official scenic designation.[15] Assembly Bill (AB 27) designated the SR 110 as a California Historic Parkway, a new category of road within the Scenic Highway system. This stimulated efforts to pursue preservation and rehabilitation of the historic roadway.[16] A Historic Parkway designation was given to a portion of SR 110; this designation marked an important transitional moment in the history of American freeway engineering and transportation. SR 110 is the first freeway—a grade-separated, limited-access, high-speed divided road—in the western United States. SR 110 is identified as a Historic Parkway between milepost 25.7 and milepost 31.9 in Los Angeles.[17] The scenic designation begins near Glenarm Street in the Pasadena area, to US 101 in Los Angeles.[18] The designated portion of SR 110 route passes through Chinatown and Elysian Park, and the Cypress Park neighborhood in Downtown Los Angeles, which is located approximately 14-mile proximity away from the proposed project site.

2.3 REGIONAL

2.3.1 Los Angeles County General Plan

The County General Plan (General Plan) provides a framework for coordinating short- and medium-range actions designed to meet public needs, address critical public issues and guide development and growth within the County. It sets forth guidelines for how the County should allocate its resources related to overall land use direction and development in the County. Moreover, the County General Plan serves as a document that provides decision-makers with a policy framework to guide specific, incremental decisions in support of achieving the Plan's stated goals and objectives, and to ensure the effective use of public resources.

The County General Plan land use designation for the proposed project is Public and Semipublic Facilities (P). As described in the County General Plan, the Public and Semipublic land use designation provides for activities by public and quasipublic entities and allows for the establishment of facilities, infrastructure, and their related operations in these areas that are public or semipublic in nature, including hospitals.

Two specific elements, the Conservation and Open Space element and the Scenic Highway element, provide policies related to scenic views and vistas, and were therefore considered for this analysis.

2.3.1.1 Conservation and Open Space Element

The Conservation and Open Space element sets forth the goals, policies, and directions the County will take in guiding the long-range conservation of natural resources, management of open space, and natural and energy-related resources. Open space refers to both public and private lands and waters that are preserved for long-term open dedication and recreational uses. Existing open spaces in the County include national forests, state, county, city parks and nature preserves. Open space can also include recreational uses such as golf courses, beaches, and other private open space lands. Compliance with the Conservation and Open Space element goal and policies contributes towards avoiding atheistic impacts and or reducing visual impacts. The following goal and policy from the Conservation and Open Space element are relevant to the proposed project.

> **Goal.** To preserve and protect sites of historical, archeological, scenic, and scientific value.
>
> **Policy 16.** Protect the visual quality of scenic areas including ridgelines and scenic view from public roads, trails, and key vantage points.

2.3.1.2 County General Plan Scenic Highway Element

The Scenic Highway element provides goals, policies, and action items related to the establishment and protection of scenic highways in the County by identifying and evaluating a system of existing roads that traverse areas of scenic beauty and interest. The element's policies support the County General Plan policy of protection of environmental, social, and economic values associated with aesthetic scenic corridor resources and expansion of the opportunity for the enjoyment of these resources. Actions affecting the quality of roadside scenic resources should be based on the intent of the Scenic Highway Element's goals.[19] As the proposed project site is not within a scenic corridor, the intent of the goals and policies is relevant only to the extent that it provides guidance in avoiding and reducing aesthetic impacts.

2.3.2 Los Angeles County Zoning Ordinance[20]

The Zoning Ordinance (Title 22 of the Municipal Code), in conformance with the General Plan, regulates land use development within the County. The Ordinance also indicates Zoning Districts for parcels of land within the County. Within each Zoning District, the Zoning Ordinance specifies the permitted and prohibited uses, as well as the development standards including setbacks, height, parking, and design standards, among others.

As previously noted, the County zoning designation for all parcels within the proposed project (APNs 6140-028-902, 6140-028-900, 6140-028-907, and 6140-028-903) is Neighborhood Commercial (C-2; Neighborhood Business Zone) (Figure 2.3.2-1, *Zoning Designations*). This zoning designation is established to identify community-related commercial uses and permits the following uses: drugstores, medical clinics (including laboratories), professional or business office space, parking lots and buildings, and hospital equipment and supply rentals.[21]

The County has established development standards for the Neighborhood Business Zone:

> No more than 90 percent of the net area can be occupied by buildings, with a minimum of 10 percent of the net area landscaped with a lawn, shrubbery, flowers, and/or trees, which shall be continuously maintained in good condition. Incidental walkways, if needed, may be developed in the landscaped area; that there be parking facilities as required by Part 11 of Chapter 22.52; and that a building or structure shall not exceed a height of 35 feet above grade, excluding signs which are permitted by Part 10 of Chapter 22.52 (such as chimneys, and rooftop antennas).[22]

The zoning classification for C-2 does not have a set-back requirement.[23] Tier I is a replacement development with ancillary uses. Tier II is an expansion of the medical campus facilities. The County would seek to ensure compatibility of the proposed project with the existing campus and its surroundings but reserves the right to exempt elements of the proposed project from the zoning designation. Therefore, the proposed development would not conflict with the permitted uses of this zoning designation, and no General Plan amendment or zone change would be required. However, specific project elements such as the residential development may be subject to additional approvals, which include but are not limited to approvals such as a conditional use

SECTION 3.0
IMPACT ANALYSIS

This section of the Aesthetics Technical Analysis provides information regarding the existing visual characteristics of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) site and surrounding area. Relevant regulatory framework is used to determine the consistency of the proposed project with any federal, state, regional, and local laws governing the regulations of aesthetic resources, including scenic vistas and resources, scenic highways, visual quality, shade and shadow and light and glare. This report is intended to address the level of significance of the proposed project impacts to aesthetics. Recommended mitigation measures have been provided for any aesthetics impacts identified to be potentially significant.

3.1 IMPACT SETTING

3.1.1 Scenic Vistas and Resources

The County of Los Angeles General Plan, the Conservation and Open Space Element and the Recreation Element were evaluated with regard to scenic resources and the components proposed by the project.[25,26] Typically, a scenic vista is defined as a view of an area that is visually or aesthetically pleasing. Aesthetic components of a scenic vista include (1) scenic quality, (2) sensitivity level, and (3) view access. One example of a scenic vista would be the area encompassing a lake or a park-land water amenity, and the view-shed extending from the lake to the highest visible point surrounding the lake. An urban setting can offer scenic vistas as well, due to the value provided by architectural style, landscaping, and or the historical significance of a development. The skyline of downtown Los Angeles is an example of an urban setting that offers a vivid landscape in contrast with the surrounding areas. However, because the downtown Los Angeles skyline is located approximately 9 miles from the proposed project site, the skyline is not considered readily visible from the proposed project site or surrounding area under existing conditions, and the proposed project site is therefore not considered to have a high level of sensitivity for scenic vista impacts.

The Juan Bautista de Anza National Trail, a historic route that stretches 1,210 miles from Nogales, Arizona to San Francisco, California is located to the north of the project area. The distance between the Juan Bautista de Anza National Historic Trail and the proposed project is approximately 9.2 miles. The project site represents only a minimal and distant portion of the potential viewshed from the trail. Therefore, the proposed project site is not considered to have a high level of sensitivity with regard to scenic vistas from the trail. There are no other scenic resources, including but not limited to significant trees or unique rock outcrops located within the project vicinity.

---

3.1.2 Scenic Highways

The proposed project site is located approximately 2 miles east of State Route 110 (SR-110). The California Department of Transportation (Caltrans) Scenic Highway System has identified segments of the SR-110 as a "Historic Parkway," which is distinct from an official scenic designation.[27] A Historic Parkway designation was given to a portion of SR 110 given the highway's unique and historic engineering. SR 110 was the first freeway—a grade-separated, limited-access, high-speed divided road—in the western United States. SR 110 is identified as a Historic Parkway between milepost 25.7 and milepost 31.9 in Los Angeles.[28] The designation begins near Glenarm Street in the Pasadena area, to US 101 in Downtown Los Angeles for approximately 8.2 miles.[29] The designated portion of SR 110 route passes through Chinatown and Elysian Park, and the Cypress Park neighborhood in Downtown Los Angels, approximately 14 miles away from the proposed project site, it is not likely that the project site would be discernable. The proposed project would add additional buildings to the existing urban development is prevalent in the region between SR 110 and the edge of the proposed project site, which includes residential, commercial, public facilities, and some industrial buildings (as determined by site assessments and regional maps).

3.1.3 Visual Quality

The proposed site for the Martin Luther King, Jr. Medical Center Campus Redevelopment Project is located on the existing 38-acre Martin Luther King, Jr. Medical Center Campus, and therefore is developed with medical and medical support structures including: outpatient and administrative support buildings, ancillary structures, and parking structures. Landscaping within the proposed project boundary consists of trees, shrubs, and general nonnative vegetation for landscaping line areas surrounding the buildings. Lawn and other open space areas are also located throughout the property.

Visual sensitivity can be described as viewer awareness of visual changes in the environment and is based on viewers' activities from public areas near a particular site. To define the visual quality of the proposed project site, important views that include the proposed project site have been identified as key viewpoints (KVP).[30] To portray the aesthetic character of the proposed project site, photographs were taken from several KVPs. These KVPs are typically public viewing areas and include a variety of locations at the medical campus and in the vicinity of the proposed project campus. The KVPs include foreground views (0 to 500 meters), middle-ground views (500 to 2,000 meters), and background views (greater than 2,000 meters) from several locations. Figure 3.1.3-1, *Photograph Location Map: Key Viewpoints*, is a location map showing the location

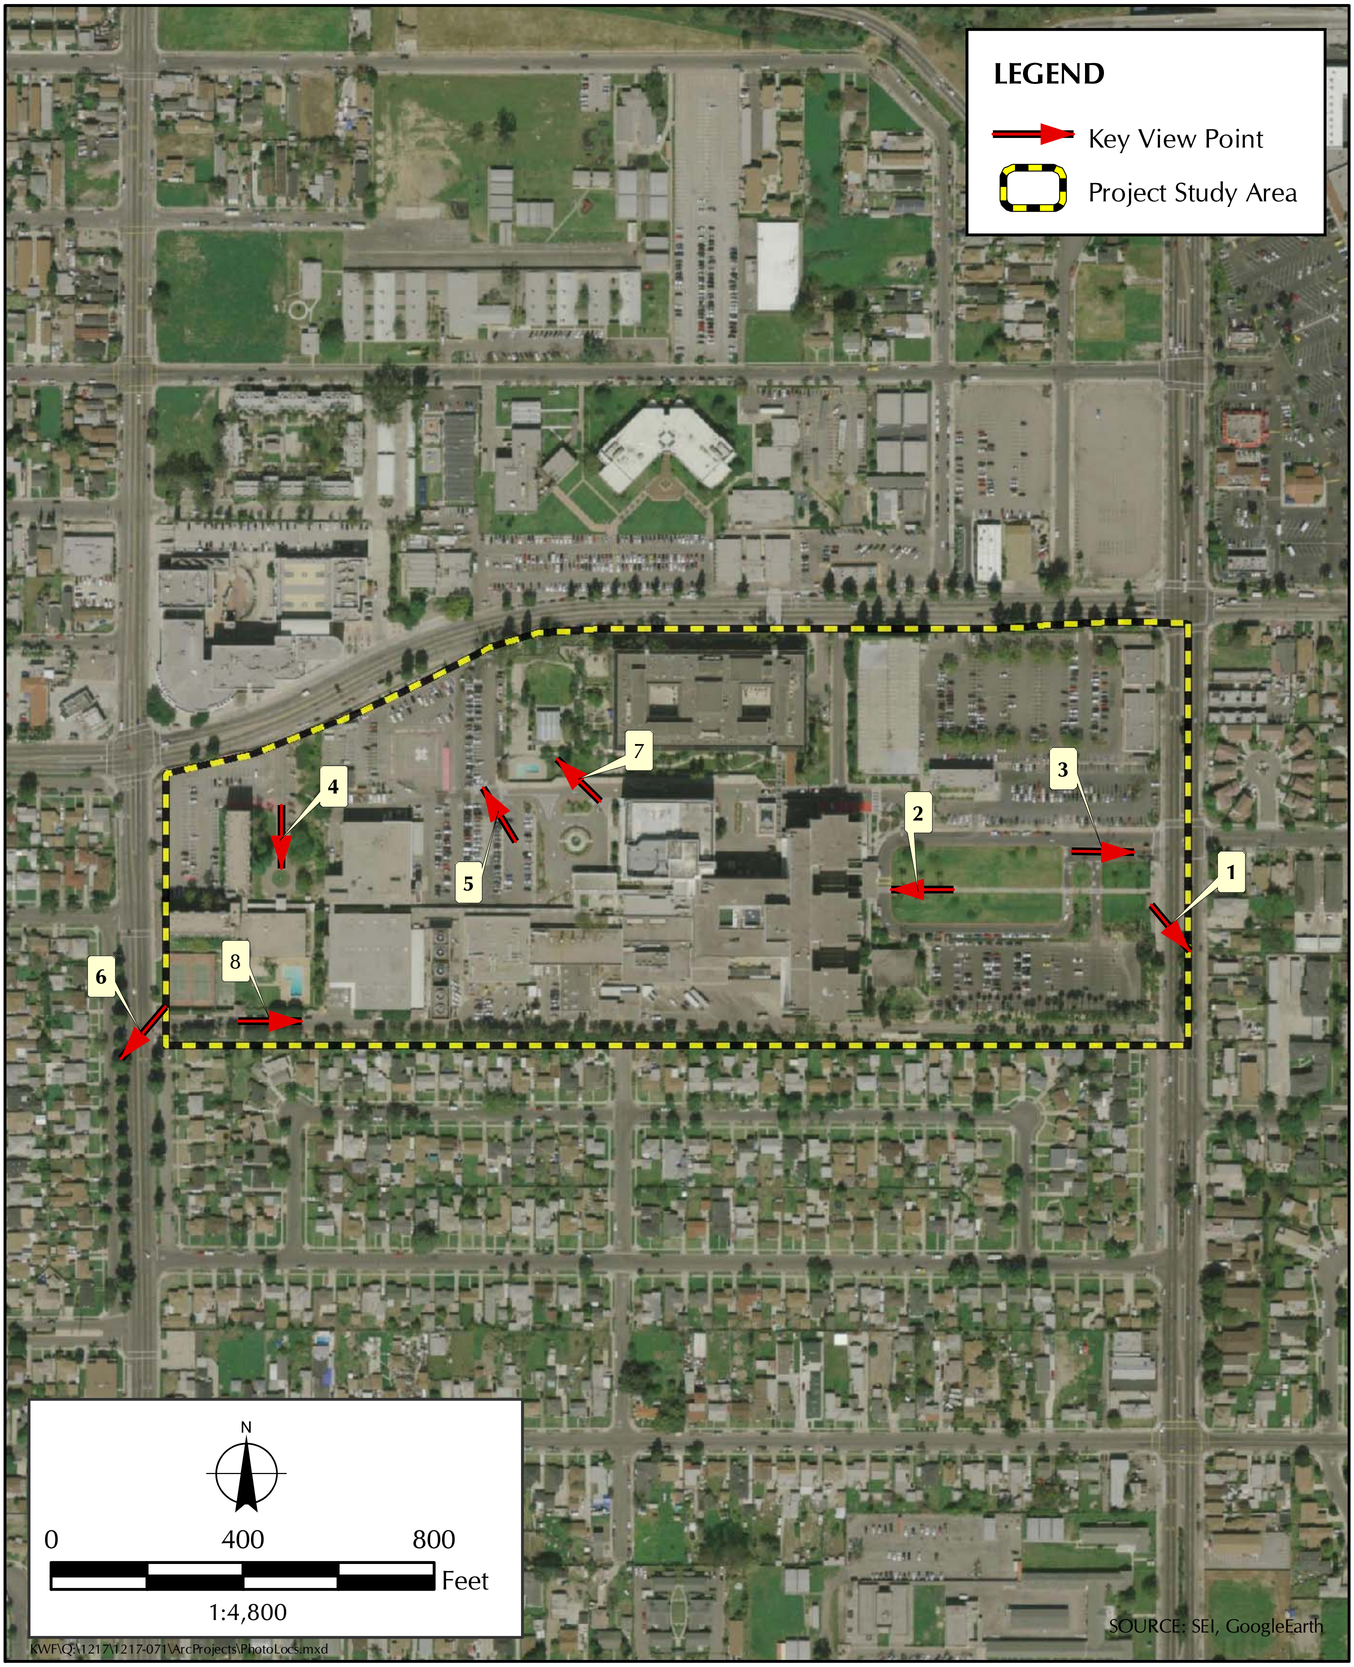
[27] California Department of Transportation. 1 May 2006. The California Scenic Highway System: A List of Eligible (E) and Officially Designated (OD) Routes (by Route). Available at: http://www.dot.ca.gov/hq/LandArch/scenic/schwy1.html

[28] California Department of Transportation. California Scenic Highway Mapping System: Route 110 Photo Album.

[29] California Department of Transportation. Byway –State Route 110. Accessed 21 May 2010. Available at: http://www.dot.ca.gov/dist07/sync/cpimages/file/updated%20fact%20sheet.pdf

[30] Distance Zones: When discussing the view of a landscape from a specific point, this report divides the landscape into key viewpoints (KVP). KVPs provide an overview of the visual resources of the project site from the various existing vantage points located throughout the campus. Accordingly, distances from a KVP are divided into three distance zones:

- Foreground: 0–500 meters from the viewer.
- Middle ground: 500–2,000 meters from the viewer; at this distance, large landscape features—such as individual large trees, boulders, and small rock outcrops—are visible.
- Background: greater than 2,000 meters from the viewer; at this distance, patterns and colors within the landscape are visible.



SOURCE: SEI, GoogleEarth

FIGURE 3.1.3-1

Photograph Location Map: Key View Points (KVP) of the KVPs. Each KVP is discussed below with a narrative description of the view. Figure 3.1.3-2, *KVP 1 through KVP 8*, illustrates the views from the KVPs.

- **KVP 1** View of the main entrance of the existing Multi-service Ambulatory Care Center (MACC), a five-story building. View from the east looking west at existing structure (Figure 3.1.3-2A).

- **KVP 2** View from the eastern side of the medical campus looking southeast towards Wilmington Avenue (Figure 3.1.3-2A). Views in the foreground include the sidewalk within the project site along with a grassy lawn area. The middle-ground displays cars parked along Wilmington Avenue and the background illustrates a few residential units and palm trees.

- **KVP 3** View from eastern side of the medical campus looking east at the existing residential development across Wilmington Avenue (Figure 3.1.3-2B). The foreground displays a portion of the campus' open space lawn area and pathways. The residential structures located on Wilmington Avenue block the views from buildings in the background. The residential structures are approximately two stories in height.

- **KVP 4** View from the northern area of the medical campus looking south toward the existing Interns and Physicians Building (Figure 3.1.3-2B).

- **KVP 5** View from the northwest looking southeast towards the Pediatric Acute Care building (Figure 3.1.3-2C). The foreground includes landscaping, a fence, and ancillary building; the middle-ground area provides a view of the parking lot and the background of the photo displays the Interns and Physicians building.

- **KVP 6** View from the southwest edge of the medical campus looking west at the residential development along Compton Avenue (Figure 3.1.3-2C). This photo displays Compton Avenue and the roadway medium in the foreground, with single-family residences lining the roadway in the middle ground. Views of the background are obstructed by the homes.

- **KVP 7** View looking northwest at the Inpatient Tower on the medical campus (Figure 3.1.3-2D).

- **KVP 8** View from the alleyway at the southern boundary of the campus. View from the southwest looking southeast (Figure 3.1.3-2D). This photo displays the adjacent alley and the residential fences of homes adjacent to the alleyway.

3.1.4 Shade and Shadow

New development can create new shadows that shade private and public outdoor space. Shadow-sensitive receptors would be considered residences (particularly yards), solar collectors, recreational facilities and parks, schools and or outdoor restaurants. Shadow is dependent on the height, size and shape (or massing) of the building from which shadow is cast and the angle of the sun. The angle of the sun varies with respect to the rotation of the earth and the earth's elliptical orbit. The longest shadows are cast during winter months and the shortest shadows are cast during

KVP 7 and KVP 8

the summer months. The shortest day of the year (i.e., the shortest day of the year and the longest night) is the winter solstice, which occurs in late December.

3.1.5 Sources of Light and Glare

Perceived glare is the unwanted and potentially objectionable sensation as observed by a person as they look directly into the light source (e.g., the sun, its reflection, automobile headlights, or other light fixtures). Reflective surfaces on existing buildings, car windshields, etc. can expose people and property to varying levels of glare. A significant light impact would typically occur if a proposed project would cause a substantial increase in ambient illumination levels beyond the property line, visible glare from either fixtures or illuminated surfaces, or if it were to cause new lighting to spill-over onto light-sensitive land uses such as residences, schools, parks, or public open space. The primary sources of light on the proposed project site include light emanating from building interiors that passes through windows and light from exterior sources (i.e., street lighting, building illumination, security lighting, automobile headlights, and landscape lighting). This technical analysis addressed only project-related lighting. Street lighting, required for safety, would not be affected by the proposed project.

3.2 SIGNIFICANCE THRESHOLDS

The potential for the proposed project to result in impacts related to aesthetics was analyzed in relation to the questions contained in Appendix G of the State CEQA Guidelines. The proposed project would be considered to have a significant impact to aesthetics when there is the potential for any of the following four thresholds to occur:

- Results in a substantial adverse effect on a scenic vista
- Substantially damages scenic resources, including but not limited to, trees, rock outcrops, and historic buildings within a state scenic highway
- Substantially degrades the existing visual character or quality of the site and its surroundings
- Creates a new source of light or glare that would adversely affect daytime or nighttime views in the area

3.3 ANALYSIS AND RESULTS

3.3.1 Scenic Vistas

An aesthetic resource consists of the landforms, vegetation, water features, and cultural modifications that impart an overall visual impression of an area's landscape. Scenic areas typically include open space, landscaped corridors, and viewsheds.[31] The property is located approximately 9.2 miles south of Juan Bautista de Anza National Historic Trail. The distance between the Juan Bautista de Anza National Historic Trail and the proposed project is large enough that the proposed project site is not visible from this Historic Trail. Moreover, urban development—including residential, commercial, and industrial buildings—is widespread within the 9.2 miles between the proposed project's northern boundary and where the Juan Bautista de Anza National

---

[31] A view corridor is typically defined as the line of sight of an observer from a public viewpoint, looking toward an object of significance to the community (e.g., ridgeline, river, historic building) or as the route that directs the viewers attention. A viewshed is typically defined as the area within view from a defined observation point.

Historic Trail commences. Therefore, the proposed project would have no adverse impact to a designated scenic trail; substantially degrade the visual character of the area, or negatively impact views from the designated trial.

Under CEQA, an impact on views is considered significant if a view of a public scenic vista, scenic resource, or public object of aesthetic significance, is substantially impeded or obstructed from a public vantage point. Typically, views enjoyed from a particular private vantage point are not protected. The Court of Appeal held in *Topanga Beach Renters Assn. v. Department of General Services* (1976) 58 Cal.App.3d 188, 195, "[t]he issue is not whether [the Project] will adversely affect particular persons, but whether [the Project] will adversely affect the environment of persons in general." Views would remain along the perimeter of the project site, as well as between buildings, on sidewalks and adjacent roadways.

The area surrounding the project site is an urbanized mix of existing development, including commercial, office spaces, public facilities, and residential land use. Residential development provides low to moderate density housing opportunities, including single-family homes along the west, south, and east sides of the medical campus boundary. Multifamily residential developments are also located along the eastern boundary of the project site, located on the opposite side of Wilmington Avenue. Zoning designations surrounding the proposed project site include Single-family Residential (R-1) to the south and west, Limited Multiple Residences (R-3) to the east, and Two-family Residence (R-2), Commercial (C-2; specifically, Neighborhood Commercial) to the north. Other zoning designations within the vicinity of the proposed project site include Commercial Planned Development, Unlimited Commercial, Light Manufacturing, Restricted Business, and Restricted Parking.

The County zoning designation for the project site is C-2, which identifies community-related commercial uses including drugstores, medical clinics (including laboratories), and parking lots and buildings.[32] Typically, buildings within this zoning are limited to 35 feet in height; however, although the County would seek to ensure compatibility of the proposed project with the existing campus and its surroundings it reserves the right to exempt elements of the proposed project from the zoning designation. Building heights at the existing project site range between 13 feet to 78 feet tall. Despite the scale of several buildings on the existing project site, the distance between the proposed project site and the skyline is large enough for the public to access views both within and outside the proposed project boundary. The areas where the public would be able to view the proposed project includes nearby residences, sidewalks and adjacent roadways. As previously noted, the visual character of the area consists of various urban developments. Properties in the surrounding area have varying fence styles, and other appurtenances, such as mail boxes, building trim, and hardscaping (e.g., driveways).

3.3.1.1 Tier I

The proposed project would result in an addition to the urbanization in the surrounding area than currently exists, such as the construction of more medical buildings, commercial, office, and

---

[32] County of Los Angeles Department of Regional Planning. 1980. *County of Los Angeles General Plan*. Available at: http://ceres.ca.gov/docs/data/0700/791/HYPEROCR/hyperocr.html and County of Los Angeles Department of Regional Planning. 2007. *Los Angeles County Draft Preliminary General Plan*. Available at: http://planning.co.la.ca.us/doc/gp/gp_draft.pdf

residential uses than those that are present at the proposed project site. Once constructed,[33] the proposed project would add to the diverse urban style of the area, and would maintain the character of the area with regard to open space, vegetation and landscaping. Tier I would incorporate new buildings and landscaping at the existing campus, such as landscaping at the entry of the new MACC and its surrounding area. A service yard with technical (tech) dock positions that connect mobile radiology equipment would also be provided. There are no designated scenic vistas within the vicinity for the proposed project property; therefore, Tier I of the proposed project would result in less than significant impacts.

3.3.1.2 Tier II

The proposed development within the Tier II component would seek to maintain the 10 percent of open space sitewide (i.e., areas without structures) as required by County zoning, in order to maintain some of the current character of the site as an open and landscaped campus.

Visual quality describes the intrinsic aesthetic appeal of a landscape or scene due to a combination of physical characteristics (such as a landform, body of water and vegetation) and cultural modifications (physical change to a landscape caused by human activity). Visual character is influenced by many different landscape attributes including color contrasts, landform prominence, repetition of geometric forms, and uniqueness of textures among other characteristics. The proposed project site is presently developed as a medical campus with existing supporting uses. The proposed project site does not contain any scenic resources such as trees, rock outcroppings, and unique or landmark features. As proposed, the project would not obstruct any prominent scenic vista or views open to the public; or result in the creation of an aesthetically offensive site from a designated scenic public view.

The proposed project site and the surrounding area, as observed by its existing conditions, do not meet the criteria of scenic vista characterization as described above. The proposed project site is located in an area developed with public facilities, commercial uses, and residential structures. There are no designated scenic vistas within the vicinity for the proposed project property; therefore, Tier II of the proposed project would not result in a significant impact on a scenic vista.

3.3.2 Scenic Highways

As indicated above, the proposed project site is located approximately 2 miles east of the I-110 freeway. Urban development is prevalent in the region between I-110 and the edge of the proposed project site, which includes residential, commercial, public facilities, and some industrial buildings as determined by site assessments and regional maps. The density of the existing development as well as the distance of the I-110 from the proposed project site, is large enough to obstruct the viewshed from I-110 in viewing the project site. Additionally, the proposed project is not located on or within the viewshed of the scenic segment of the I-110, or any other scenic highway corridor, nor is the project located at an elevation that would significantly degrade the view of the surrounding area. No designated scenic highways are present in the immediate project vicinity and no scenic highway viewsheds would be affected by the proposed project.

---

[33] Tier II project components are in the preliminary stages and may require additional environmental analysis on a project-by-project basis, pending their final engineering and design.

3.3.2.1 Tier I

For the reasons noted above, Tier I of the proposed project would not be expected to result in significant impacts to visual resources related to damaging a scenic resource within a state scenic highway.

3.3.2.2 Tier II

For the reasons noted above, Tier II of the proposed project would not be expected to result in significant impacts to visual resources related to damaging a scenic resource within a state scenic highway.

3.3.3 Visual Quality

This Aesthetics Technical Analysis is designed to evaluate the visual impacts of the proposed project on potential viewers of the proposed project from public viewpoints. As illustrated in Figure 3.1.3-2, the proposed project area is primarily visible from existing sidewalk, adjacent streets, and from the residential and commercial land uses located in the immediate area. The assessment of visual quality for a development project is an assessment of the aesthetics in relation to its surroundings. Determinants of visual quality include land uses, density or intensity of land use, extent of open space and landscaping, building height and mass, architecture, and pedestrian usage or "walkability" of a neighborhood, among others.

Land uses surrounding the proposed project area include Public and Semipublic Facilities and Major Commercial (C) to the north, Medium-density Residential [12 to 22 dwelling units (du)/acre] to the east, Low-density Residential (1 to 6 du/acre) to the south, and Low-density Residential (1 to 6 du/acre) and Low/Medium-density Residential to the west. Other land uses within the vicinity of the project site include High-density Residential, Major Commercial, Major Industrial, Open Space, and Transportation Corridor. The Public and Semipublic Facilities as well as Major Commercial land uses include office and commercial structures with observed height of up to three-stories tall. Residential land uses are located to the east, south, and west of the proposed project site and include homes with an observed height of up to three-stories tall. There are single-family residences to the west, south and east, and multifamily structures located to the east of the project site. In addition, there are homes located to the south of the project site adjacent to the alleyway. These residences are separated by a brick retaining wall and tress that line the south side of the alleyway. The visual characterization of the surrounding area is typical of a residential development. many of the residential structures has have stucco finish in natural hues such as beige, brown and or grey. Surrounding streets have sidewalks, and development in the area incorporates building setbacks and landscaping. Commercial areas have large surface-level parking areas.

The proposed project site is characterized by large medical buildings, surrounding by multiple areas of open space, which have been developed with grass lawns and paved parking lots. The medical campus is designed with large landscaped areas, which include the substantial sized lawn to the east of the MACC, gardens, courtyards, and circulation routes for pedestrians and vehicles. Several pedestrian walkways enable medical personnel and students to travel expeditiously around the campus. The MACC, for example, is connected to the Claude Hudson Auditorium via a low covered walkway that extends from the MACC's east facade, which provides a physical link between the medical (MACC) and assembly (Auditorium) uses. Existing gardens and courtyards, particularly those associated with the Augusts F. Hawkins Comprehensive Mental Health Center and the Interns and Physicians Building, provided recreational facilities for medical students. There are 21 buildings at the project site. The design and use of materials for construction of these existing structures along with the landscaped areas of the campus dominate the overall urban visual image of the project's immediate surrounding area.

3.3.3.1 Tier I

As described in Section 1.3 Project Description of this technical analysis, the proposed project entails two tiers. Tier I involves project-level development of the new MACC and other site improvements. Development of the new MACC and the Ancillary Building are currently registered with the U.S. Green Building Council under Leadership in Energy and Environmental Design for New Construction (LEED-NC).[34] The County will seek LEED Silver certification for the MACC and the Ancillary buildings.[35] The site work would also consist of a new parking terrace, new parking lots, re-striping of existing lots, site improvements, and new landscaping at the entry of the new (or refurbished and reused) MACC and its surrounding area. Tier I is consistent with the existing land uses at the site and in the adjacent area, and would be compatible with the visual appearance of the surrounding area.

3.3.3.2 Tier II

Tier II of the proposed project would include the Emergency Room Expansion, Storage Building, and Cooling Towers, and the mixed-use development among other project components. The development envelope of Tier II allows for additional medical office space, general offices, commercial and retail space, residential units and other facility improvements. The proposed project will be generally compatible with the visual appearance of the existing community although the campus will maintain a different style given the facilities past and continued medical uses. It is anticipated that the design of the proposed project will incorporate a complimentary style for all proposed structures. Architectural continuity within the campus will be achieved through consistency in the quality of design, workmanship, and materials utilized. The building orientation and envelope system are planned to maximize daylight into the interior space, optimize exterior envelope energy performance and maximize view to the natural elements of the outdoors.[36] However, as many of the Tier II project elements and design features are unknown, this impact is considered potentially significant.

Tier II of the proposed project would allow for a development envelope that would provide the health services necessary to respond to and address the needs of the community. All campus development would be subject to the design goals and guidelines of a Master Plan for the campus, which will ensure the development on the campus is consistent and compatible with the of the proposed project with the existing campus and its surroundings; in addition, the proposed development would be subject to general design criteria, specified in the proposed project's mitigation measures. Tier II of the proposed project is not anticipated to "degrade the existing visual character of quality of the site and its surroundings," as stated in the CEQA criterion,

[34] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus—Campus Planning and Programming Report*. Los Angeles, CA.

[35] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus—Campus Planning and Programming Report*. Los Angeles, CA.

[36] Martin Luther King, Jr. Medical Campus Center. 18 September 2009. Campus Planning and Programming Report, Executive Summary.

however, the impact is considered potentially significant given many of the unknown design elements and mitigation measures have been provided to ensure that impacts are reduced to less than significant.

3.3.4 Shade and Shadow

The analysis examined shade-sensitive uses including residential uses, schools, parks, open space, and public outdoor facilities. Existing shadow was not considered significant given that the existing buildings are located in the central and southern portions of the medical campus and do not generate adverse shadow impacts. Commercial and retail uses are not considered shade-sensitive. Shadow representations (see Figure 3.3.4-1, *Potential Shade and Shadow Impacts: Worst-Case Scenario*; and Figure 3.3.4-2, *Possible Placement of Buildings Causing No Shade Shadow Impacts*) were generated through the use of shadow calculation software for the proposed project.[37]

3.3.4.1 Tier I

Tier I of the proposed project, which consist of the development of a four-story 132,000-square-foot building and a 24,700–square-foot two-story building would have no adverse impacts related to shade and shadow. Impacts would be less than significant.

3.3.4.2 Tier II

Tier II was examined on a programmatic level and the analysis was based upon the height of tallest existing building (which is a six-story building) on the proposed site. This height was then used as the height of a building that could to placed continuously along the west and east perimeter of the campus property.

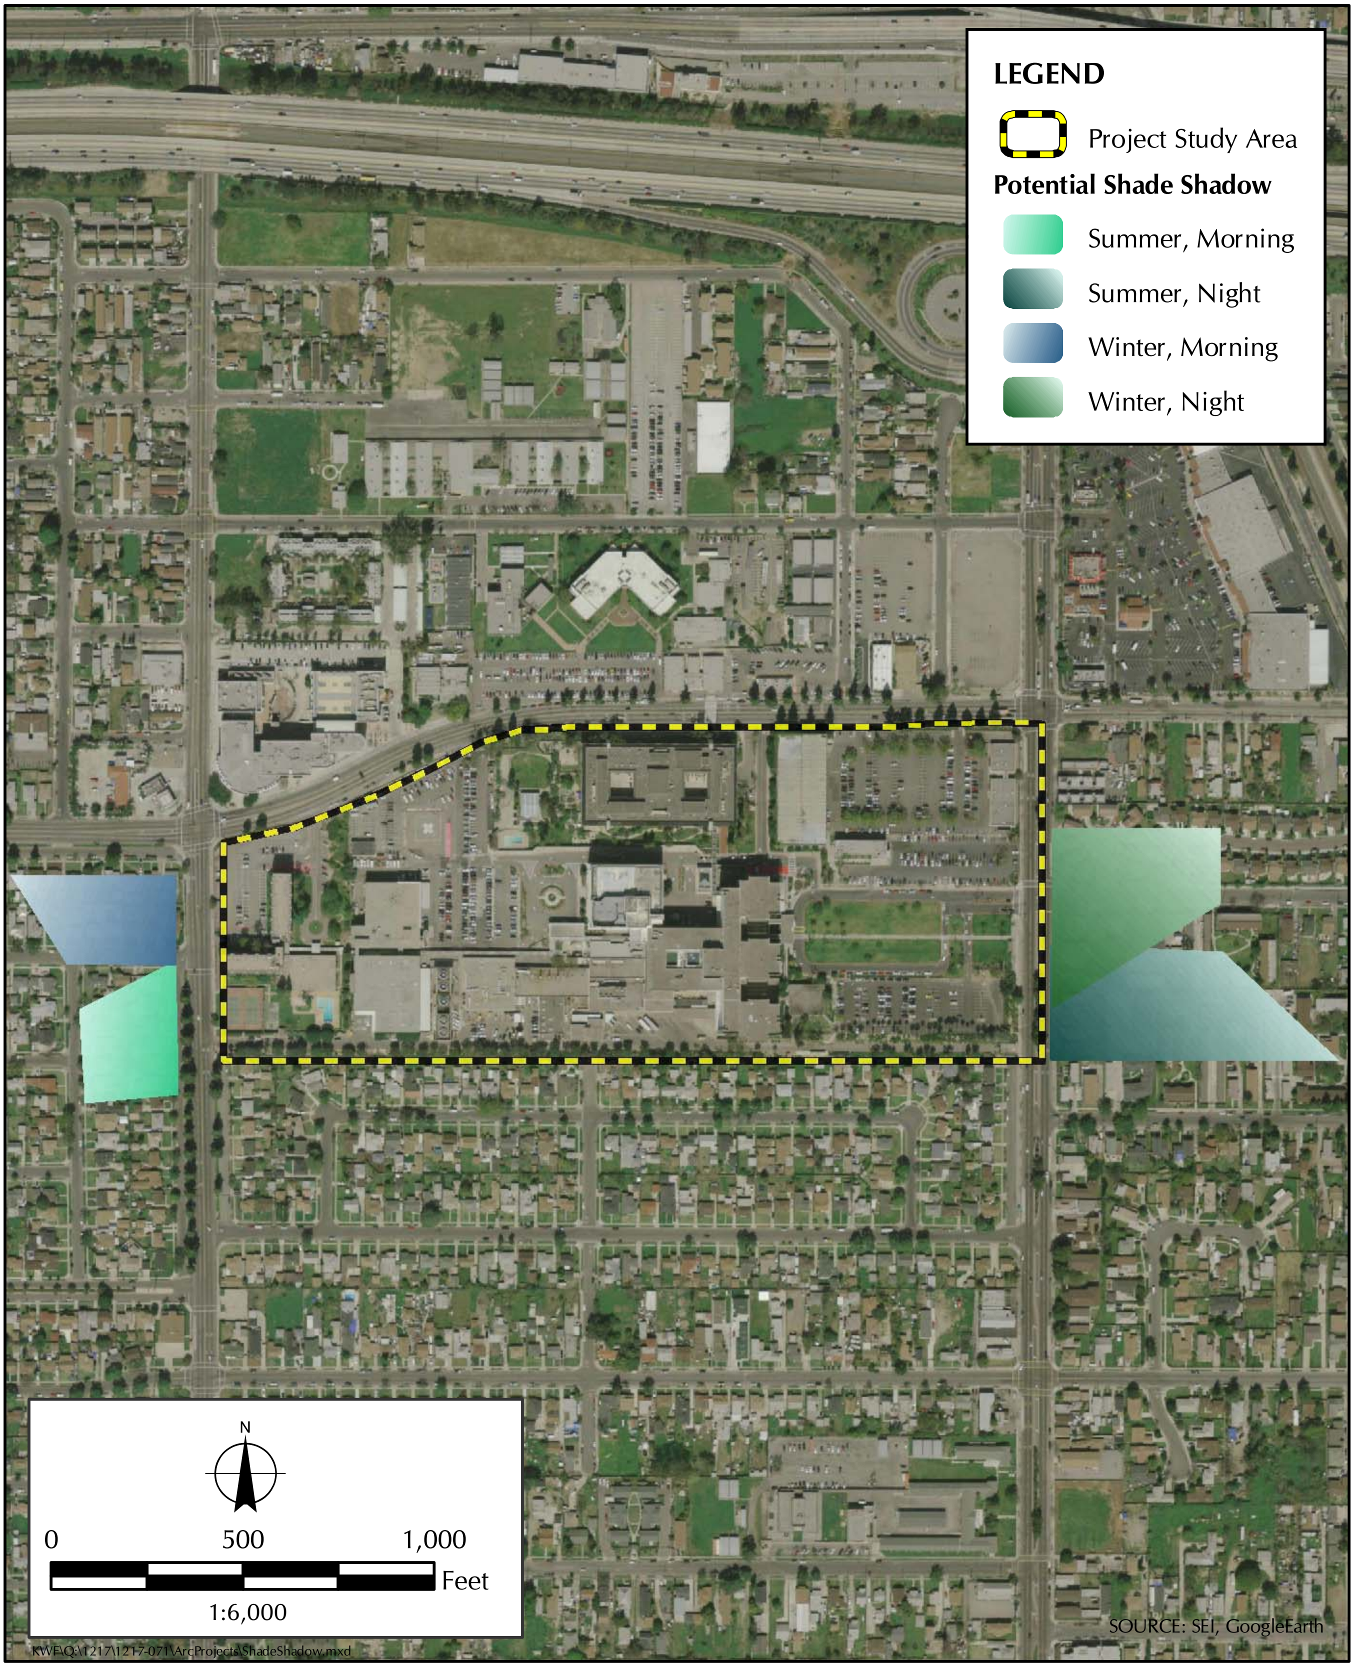
Figure 3.3.4-1 illustrates the worst-case shade and shadow scenario for Tier II: development of a six-story building placed continuously along the edge of the existing campus property boundary. Figure 3.3.4-1 presents a maximum building height of six-stories[38] (or 78 feet tall) and also assumes that there would not be any setbacks from the property boundary and roadways. At a minimum the development components in Tier II would have an approximately 14′ setback from the property boundary, which is consistent with the set backs for the existing buildings on the property.[39] As depicted in the figures, the areas that have the potential to be shaded by the worst-case shade and shadow scenario include residences to the west and to the east of the proposed project site. No shadow impacts would occur along the southern boundary of the property given the placement of the proposed project site relative to the sun's rising and setting patterns.

---

[37] Google's Sketch-Up 7.1 was utilized for preparation of the analysis diagrams. The hypothetical buildings were placed imported into Google Earth using the sunrise/sunset light module in Google Earth.

[38] This analysis used the height of the tallest existing building on the medical campus as a basis for the shadow estimate. Tier II is in the preliminary stages of design; however, the average anticipated building height is not expected to exceed three stories.

[39] The existing set backs include the pediatric modular building/ oasis clinic located approximately 14.8 feet from the property line along Wilmington Avenue, Interns & Physician's Building at approximately 20.0 feet from property line along Compton Avenue, the Hawkin's Building located at approximately 30.7 feet from property line along 120th Street, the Cooling Tower located at 44.8 feet from property line along south property line.



SOURCE: SEI, GoogleEarth

FIGURE 3.3.4-1

Potential Shade Shadow Impact Areas: Worse Case Scenario

SOURCE: SEI, GlobeXplorer

FIGURE 3.3.4-2

Possible Placement of Building Causing No Shade Shadow Impact

For the western campus property line, given the project site's longitude and latitude, the time frame with the longest shadows would occur in the winter from 6:23 a.m. to 7:18 a.m. and in the summer from approximately 5:42 a.m. to 6:29 a.m. If the above-described 6 story (worst-case height) Tier II building were placed along the edge of the western campus property line, it would have the potential to shadow approximately 17 homes along Compton Avenue during the winter morning hours and approximately 12 homes during the summer morning period. Shade impacts on these adjacent land uses would increase and or decrease progressively as the earth rotates; however, the duration of the shadow could last up to a maximum of one and a half (1.5) hours for the homes closest to the proposed project site.

For the eastern campus property line, given the project site's longitude and latitude, the time frame with the longest shadows would occur in the winter from 3:53 p.m. to 4:48 p.m. and in the summer from approximately 6:48 p.m. to 8:08 p.m. If the above-described 6 story (worst-case height) Tier II building were placed along the edge of the eastern proposed project boundary, it would have the potential to shade approximately 20 single-family residential homes along Wilmington Avenue during the winter night period and approximately 20 single-family residential homes and approximately five multifamily buildings during the summer night period. The duration of the shadow could last up to one and a half (1.5) hours for the homes closest to the proposed project site. Continuous and prolonged shade and shadow on adjacent residents could represent a potentially significant impact. However, the shading of adjacent properties by the proposed buildings would only occur for a short duration during the day/night and only for a small portion of the year, the impact to the adjacent residents is anticipated to be less than significant. However, mitigation measures have been provided to ensure that impacts remain less than significant.

As illustrated Figure 3.3.4-2, reasonable building setbacks have been incorporated into the shade and shadow projections at the project site. As displayed in Figure 3.3.4-2, with implementation of building setbacks, potential shadows would fall within the project site avoiding impacts on adjacent residences, roads and other land uses. These setbacks significant reduce shade impacts to these adjacent uses. The likelihood of shadow spillover is low given the medical facilities existing building layout (buildings that would remain on site), access to proposed buildings (allowed under Tier II), emergency medical access and general transportation and facility parking needs. With incorporation of mitigation measures, Tier II impacts would be less than significant.

3.3.5 Light and Glare

As stated above, there are three primary sources of light on the proposed project site: light emanating from building interiors that passes through windows; light from the headlights of parked and or traveling vehicles and light from exterior sources. The construction of the proposed project would involve the presence of additional interior lighting within the proposed facilities and their activation during non-daytime hours would create additional effects of increased lighting. The residential component of the project would create a minor source of light due to the residents' interior lights; however, the residential lighting proposed would be similar to the amount of light generated by the single-family and multifamily residences located adjacent to the project site, along the west, south and east side. No adverse impacts are anticipated from interior light sources.

There are currently no significant sources of glare at the project site (e.g., mirrored buildings, building materials, etc.). As proposed, the project would not contain large expanses of reflective or mirrored building surfaces or glare producing light fixtures; however, mitigation measures have been provided to ensure that impacts remain less than significant. .As stated in the Martin Luther

King Jr. Medical Campus Center, Campus Planning and Programming Report,[40] the architecture of the proposed building would be designed "to be sustainable, soothing, and uplifting. It should capture the spirit of the contemporary architecture at the site. The building orientation and envelope system are planned to maximize daylight into the interior space, optimize exterior envelope energy performance and maximize view to the natural elements of the outdoors."

3.3.5.1 Tier I

Tier I involves project-level development of the new MACC and other site improvements. Pedestrian scale street lamps, which will be coordinated with the landscape elements, would be located adjacent to the buildings and near the parking areas to provide safety and allow for appropriate nighttime visibility. Tier I of the proposed project would incorporate low level downward facing lights that would be used to illuminate the entrance of buildings, stairs and where pathways occur between buildings, and adjacent to designated parking areas. Lighting placement and selection will be carefully considered to reduce the chance of glare and light spillover to adjacent land uses. The proposed project's landscape lighting is intended to provide a softened nighttime appearance for the medical campus site. These lights would be expected to contribute to minimal increases and alterations in the location of light and glare at the campus during operation of the Tier I proposed project. Tier I impacts would be less than significant with mitigation incorporated. Therefore, the light and glare effects of the proposed project's construction and operation is not anticipated to result in a significant impact to the surrounding developments; however, mitigation measures have been provided to ensure that impacts related to Tier I of the proposed project remain less than significant. Therefore, the light and glare effects of the proposed project's construction and operation would not be anticipated to result in a significant impact to the surrounding developments; however, mitigation measures have been provided to ensure that impacts related to Tier I of the proposed project remain less than significant.

3.3.5.2 Tier II

The components of the Tier II development would involve pedestrian, security and parking lighting within and around the perimeter of project site. These lights are intended to enhance the visual character of the buildings and provide necessary pedestrian safety lighting for patients, workers and visitors using the sidewalks throughout the project site. These lights would be expected to contribute to increases in light and glare at the campus during operation of the Tier II proposed project.

Tier II of the proposed project would incorporate low level downward facing lights that would be used to illuminate the entrance of buildings, stairs and where pathways occur between buildings, and adjacent to designated parking areas. Lighting placement and selection will be carefully considered to reduce the chance of glare and light spillover to adjacent land uses. The proposed project's landscape lighting is intended to provide a softened nighttime appearance for the medical campus site. Therefore, the light and glare effects of the proposed project's construction and operation is not anticipated to result in a significant impact to the surrounding developments; however, mitigation measures have been provided to ensure that impacts related to Tier II of the proposed project remain less than significant.

---

[40] Martin Luther King, Jr. Medical Campus Center. 18 September 2009. Campus Planning and Programming Report, Executive Summary.

SECTION 4.0
RECOMMENDATIONS AND MITIGATION MEASURES

4.1 VISUAL QUALITY

4.1.1 Tier II

4.1.1.1 Measure Aesthetics-2

The County of Los Angeles shall review all plans for the Tier II development. Contractors shall conform with all design features described in the Campus Planning and Programming Report, which is intended to serve as a guide for development at the project site to ensure visual consistency and continuity at the project site and within the surrounding area.

4.1.1.2 Level of Significance after Mitigation

Implementation of mitigation measure Aesthetics-2 would be expected to ensure consistency within the medical campus and with the surrounding area. As supported by project design guidelines listed in mitigation measure Aesthetics-1, the materials used to construct Tier II of proposed project would be consistent with existing visual quality conditions at the proposed project site and within the surrounding area, and would reduce potential impacts to visual character to below the level of significance.

4.2 SHADE AND SHADOW

4.2.1 Tier II

4.2.1.1 Mitigation Measure Aesthetics-3

All development shall be limited to three stories in height if the proposed structure is located along the western or eastern edge of the property. The existing setback includes the pediatric modular building/ oasis clinic located approximately 14 feet from the property line along the eastern boundary at Wilmington Avenue, the Interns & Physician's Building at approximately 20 feet from the property line along the western boundary at Compton Avenue, the Hawkin's Building located at approximately 30 feet from the property line along the northern boundary at 120th Street, the Cooling Tower located at 44 feet from the property line along the south. Alternatively, if a structure exceeds three stories in height along the perimeter of the property (western or eastern perimeter only), at a minimum, the building shall be required to stay within the approximately 20-foot and for 14-foot existing campus respective western and eastern boundary setbacks to reduce shade and shadow impacts to adjacent land uses along Compton Avenue and Wilmington Avenue.

4.2.1.2 Level of Significance after Mitigation

Implementation of mitigation measure Aesthetics-3 would be expected to prevent vehicle highlights from causing significant levels of light intrusion. Therefore, implementation of mitigation measure Aesthetics-2 would be expected to reduce impacts related to a new source of light and glare to below the level of significance.

4.3 LIGHT AND GLARE

4.3.1 Tier I

4.3.1.1 Mitigation Measure Aesthetics-1

All exterior lighting proposed for building and on-site security lighting shall be shielded and directed downward to minimize the impacts on the surrounding land uses. No large expanses of reflective or otherwise glare-producing surfaces (such as windows or walls) would be included within the building components or materials.

4.3.1.2 Level of Significance after Mitigation

The recommended mitigation measure Aesthetics-1 would be able to reduce project-specific impacts related to light and glare to below the level of significance.

4.3.2 Tier II

4.3.2.1 Mitigation Measure Aesthetics-1

All exterior lighting proposed for building and on-site security lighting shall be shielded and directed downward to minimize the impacts on the surrounding land uses. No large expanses of reflective or otherwise glare-producing surfaces (such as windows or walls) would be included within the building components or materials.

4.3.2.2 Mitigation Measure Aesthetics-4

Where parking lots or structures are adjacent to residential areas or near other sensitive light receptors along the southern portion of the campus, Compton Avenue, and Wilmington Avenue, retaining walls and or landscaping of sufficient height shall be incorporated into the design of the proposed project to shield vehicle headlights (which typically sit at a minimum of 3 feet in height above ground). These project features shall be included in the landscape plans and final project design plans (to avoid and reduce potential light and glare obstructions that could impact residential areas).

4.3.3 Level of Significance after Mitigation

Implementation of mitigation measures Aesthetics-1 would be expected to prevent security lighting and building lighting from causing significant levels of light spillover or light trespass. Implementation of mitigation measures Aesthetics-4 would be expected to prevent vehicle highlights from causing significant levels of light intrusion. Therefore, implementation of mitigation measures Aesthetics-4 would be expected to reduce impacts related to a new source of light and glare to below the level of significance.

SECTION ES
EXECUTIVE SUMMARY

This Air Quality Technical Impact Report in support of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) resulted in the conclusion that potentially significant impacts to air quality would occur as a result of construction and operation of the proposed project. This technical report addresses a 38-acre study area bound on the north by East 120th Street, on the east by Wilmington Avenue, on the south by a narrow alley which separates the proposed project site from the residential neighborhood which is largely located north of East 122nd Street, and on the west by Compton Avenue of Los Angeles, in the unincorporated community of Willowbrook, in the County of Los Angeles (County), California. The proposed project site appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle.[1] The proposed project area is located within the South Coast Air Quality Management District (SCAQMD) portion of the South Coast Air Basin.

This report was prepared to address air quality issues identified in the initial study as requiring further analysis to define significance levels of air quality impacts pursuant to CEQA. The proposed project entails two tiers. Tier I would involve development of a new Multi-Service Ambulatory Care Center (MACC) and the Ancillary Building. Tier I would also include tenant improvements to the following existing buildings: North Support Building, South Support Building, Interns and Physicians Building, and the Plant Management Building; site improvements; and potential relocation of the MRI building. Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building (which will be vacant following construction of the new MACC Building in Tier I) and demolition of the following: Emergency Room; Storage Building; and Cooling Towers. Tier II construction would entail additional master-planned mixed-use development, which may include the potential for medical offices, general offices, commercial and retail space, residential units, recreational areas, and other development that is appurtenant to and compatible with the primary land use, in support of the campus. Construction of Tier I is anticipated to start in 2011 and finish in 2014. Construction of Tier II is anticipated to start in 2010 and finish by 2020.

The main conclusions of this report include the following:

ES.1 TIER I

- Project construction would generate short-term emissions of criteria pollutants. Particulates would be generated from demolition and site grading, volatile organic compounds (VOCs) would be generated from paving and coating activities, and exhaust emissions would be generated from construction equipment and vehicular trips to and from the proposed project site. The daily emissions of all criteria pollutants associated with the project's construction activities for Tier I are anticipated to be below the SCAQMD daily construction emission thresholds of significance and, as such, would be expected to result in a less than significant impact to air quality during construction.

  Operation of the proposed project would result in emissions of criteria pollutants due to electricity use and vehicular trips to and from the proposed project site. The daily

---

[1] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

emissions of all criteria pollutants associated with the project's operational activities for Tier I are anticipated to be less than existing conditions; and therefore would not be expected to result in a significant impact to air quality during operation.

- Carbon monoxide (CO) concentrations generated by vehicle trips from construction workers and vehicle trips during operation of Tier I of the proposed project at sensitive receptors in the vicinity of the proposed project area would be expected to be below the level of significance.

- Tier I construction-related emissions of CO, PM_{10}, and $PM_{2.5}$ would be below the level of significance at nearest sensitive receptors, but emissions of NO_x would have the potential to be above the level of significance at nearest sensitive receptors.

- Toxic air contaminant (TAC) emissions associated with the proposed project's construction and operation of Tier I at sensitive receptors would be expected to be below the level of significance.

- Odor impacts associated with Tier I of the proposed project would be expected to be below the level of significance.

- Tier I of the proposed project would be consistent with SCAQMD's 2007 Air Quality Management Plan.

- Tier I of the proposed project's construction phase would be expected to result in substantial increases in greenhouse gas (GHG) emissions if a quantitative threshold of 900 metric tons of CO_{2e} is used to determine significance. Tier I of the proposed project's operational phase would be expected to result in a decrease in greenhouse gas (GHG) emissions compared to existing conditions, and Tier I's cumulative impact on global climate change would be expected to be below the level of significance.

- Implementation of air quality mitigation measures Air-1 through Air-8 would reduce fugitive dust emissions associated with Tier I construction activities, which would cause daily PM2.5 and PM_{10} emissions to remain at below the SCAQMD thresholds of significance.

- Implementation of mitigation measure Air-9 would ensure that criteria pollutant emissions associated with the use of construction equipment would be reduced to the maximum extent feasible. Therefore, criteria pollutant emissions during construction of Tier I would remain at below the level of significance.

- Mitigation measures Air-1 through Air-9 would also ensure that cumulative air quality impacts during construction would remain at below the level of significance and that construction-related impacts to sensitive receptors would be reduced to below the level of significance.

- Mitigation measure GHG-1 would ensure GHG emissions associated with operation of the proposed project are reduced to the maximum extent feasible and would remain at below the level of significance.

In conclusion, with the incorporation of mitigation measures, Tier I the proposed project would not be expected to produce significant impacts with respect to construction or operational emissions. Tier I may be expected to contribute significantly to GHG emissions during construction, if a quantitative threshold of 900 metric tons of CO_{2e} is used to determine significance.

ES.2 TIER II

- Project construction would generate short-term emissions of criteria pollutants. Particulates would be generated from demolition and site grading, volatile organic compounds (VOCs) would be generated from paving and coating activities, and exhaust emissions would be generated from construction equipment and vehicular trips to and from the proposed project site. The daily emissions of NO_x and VOCs associated with the project's construction activities for Tier II are anticipated to be above the SCAQMD daily construction emission thresholds of significance, and, as such, would be expected to result in a significant impact to air quality during construction.

- Operation of the proposed project would result in emissions of criteria pollutants due to electricity use and vehicular trips to and from the proposed project site. The daily emissions of CO, VOCs, NO_X, and PM_{10} associated with the project's operational activities for Tier II are anticipated to be above the SCAQMD daily operational emission thresholds of significance, and, as such, would be expected to result in a significant impact to air quality during operation.

- Carbon monoxide (CO) concentrations generated by vehicle trips from construction workers and vehicle trips during operation of Tier II of the proposed project at sensitive receptors in the vicinity of the proposed project area would be expected to be below the level of significance.

- Tier II construction-related emissions of NO_x, $PM_{2.5}$, and PM_{10} at nearest sensitive receptors would be expected to be above the level of significance.

- Toxic air contaminant (TAC) emissions associated with the proposed project's construction and operation of Tier II at sensitive receptors would be expected to be below the level of significance.

- Odor impacts associated with Tier II of the proposed project would be expected to be below the level of significance.

- Tier II of the proposed project would be consistent with SCAQMD's 2007 Air Quality Management Plan.

- Tier II of the proposed project's construction and operational phases may be expected to result in substantial increases in greenhouse gas (GHG) emissions, and Tier II's cumulative impact on global climate change may be expected to be above the level of significance.

- Implementation of air quality mitigation measures Air-1 through Air-8 would reduce fugitive dust emissions associated with Tier II construction activities, which would cause daily PM2.5 and PM_{10} emissions to remain at below the SCAQMD thresholds of significance.

- Implementation of mitigation measure Air-9 would ensure that criteria pollutant emissions associated with the use of construction equipment would be reduced to the maximum extent feasible. However, VOCs and NO_x emissions during construction of Tier II would still result in temporary significant and unavoidable impacts.

- Mitigation measures Air-1 through Air-9 would also ensure that air quality impacts upon sensitive receptors during construction would be reduced to the maximum extent feasible. However, implementation of Tier II of the proposed project would still have the potential to result in significant impacts to sensitive receptors related to emissions of NO_x, $PM_{2.5}$, and $PM_{10.}$

- Mitigation measures Air-1 through Air-9 would also ensure that cumulative air quality impacts during construction would be reduced to the maximum extent feasible. However, implementation of Tier II of the proposed project would still be expected to result in cumulative construction-related impacts when considered with construction and operation of the related past, present, or reasonably foreseeable, probable future projects.

In conclusion, with the incorporation of mitigation measures, Tier II of the proposed project would be expected to produce significant impacts with respect to construction emissions of NO_x, VOCs, and GHGs; operational emissions of NO_x, VOCs, CO, PM_{10}, and GHGs; and emissions of NO_x, $PM_{2.5}$, and PM_{10} at sensitive receptors. Tier II of the proposed project may also be expected to contribute significantly to cumulative global GHG emission impacts.

SECTION 1.0
INTRODUCTION

1.1 PURPOSE AND SCOPE

The Air Quality Technical Impact Report was undertaken by Sapphos Environmental, Inc. for the County of Los Angeles in support of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project). The aims of this study are: to evaluate potential air quality and greenhouse gas emission impacts associated with the proposed project; to propose mitigation measures for any significant air quality and/or greenhouse gas emission impacts caused by implementation of the proposed project; and to document the findings of significance and non-significance. The Air Quality Technical Impact Report focuses on all phases (i.e., construction, operation, and maintenance) of the proposed project as well as the proposed project's potential cumulative impacts and impacts on global climate change.

1.2 PROJECT LOCATION

The proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) site is located on the existing 38-acre Martin Luther King, Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles (County), California. The proposed project site is located approximately 3 miles north of State Route 91 (SR-91; Artesia Freeway), approximately 3 miles northeast of Interstate 710 (I-710; Long Beach Freeway), approximately 2 miles east of I-110 (Harbor Freeway), less than 1 mile south of East Imperial Highway, and less than 1 mile south of I-105 (Glen Anderson Freeway). The proposed project site can be accessed from East 120th Street or from Wilmington Avenue. The proposed project site is bounded on the north by East 120th Street, on the east by Wilmington Avenue, on the south by a narrow alley which separates the proposed project site from the residential neighborhood which is largely located north of East 122nd Street, and on the west by Compton Avenue of Los Angeles. The proposed project site is less than 1 mile north of the City of Compton and less than 1 mile west of the City of Lynwood. The proposed project site is also less than 1 mile south of the City of Los Angeles.

The proposed project site appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle.[2] Elevations at the proposed project site range from 86 feet above mean sea level (MSL) to 88 feet above MSL. The topography of the site can be generally characterized as flat.

1.3 PROJECT DESCRIPTION

The proposed project entails two tiers. Tier I would involve development of a new Multi-Service Ambulatory Care Center (MACC) and the Ancillary Building. Tier I would also include tenant improvements to the following existing buildings: North Support Building, South Support Building, and the Plant Management Building; site improvements; and potential relocation of the MRI building.

Development of the new MACC and the Ancillary Building are currently registered with the U.S. Green Building Council under Leadership in Energy and Environmental Design for New Construction (LEED-NC).[3] The County will seek LEED Silver certification for the MACC and the Ancillary buildings.[4]

---

[2] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

[3] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus - Campus Planning and Programming Report*. Los Angeles, CA.

The LEED program recognizes and promotes a project's success in five areas: (1) sustainable sites, (2) water efficiency, (3) energy and atmosphere efficiencies, (4) materials and resources, and (5) indoor environmental quality. In addition, the federal government has a program titled "Green Guide for Healthcare Construction" (GGHC), which is designed to help hospitals navigate through the LEED program. The proposed project would incorporate energy efficient and sustainable strategies throughout the construction, development, and operation of the proposed project.

Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building (which will be vacant following construction of the new MACC Building in Tier I) and reuse or replacement of the following: Emergency Room; Storage Building; and Cooling Towers. Tier II construction would entail additional master-planned mixed-use development, which may include the potential for medical offices, general offices, commercial and retail space, residential units, recreational areas, and other development that is appurtenant to and compatible with the primary land use, in support of the campus.

To establish a proposed program of development level for the mixed-use portion of Tier II, the currently undeveloped areas of the campus (undeveloped in this case includes parking lots and structures but not buildings) were calculated and adjustments were made for buildings to be reused/replaced and developed, to obtain a surface area from which to calculate allowable build-out. A maximum build-out of this remaining area was calculated using maximum build-out criteria from the Los Angeles County Zoning Code restrictions applicable to the site. Initially, this maximum build-out number was in excess of 2 million square feet and included zoning code allowances of a maximum of three stories in building height and 10 percent open space (i.e., areas without structures). To determine a more accurate level of development for Tier II, the following assumptions were added: (1) open space sitewide would remain 10 percent to maintain some of the current character of the site as an open and landscaped campus; (2) the site area to be set aside for the potential development of an up to 100-unit residential component, parking structures or parking lots, and walkways would be 40 percent of the entire site; and (3) although a maximum of three stories would be allowed for new buildings, an average height of 2.5 stories was assumed. Tier I of the proposed project will result in a decrease of the existing square feet, as the functions of several existing buildings would be removed. With these assumptions added in, the maximum programmed development for Tier II could consist of up to 1,814,696 square feet. Given the net reduction in building floor area in Tier I, the net new development after completion of Tier I plus Tier II is 1,476,010 square feet of floor area.

1.4 CONSTRUCTION SCENARIO

1.4.1 Tier I Construction Scenario

Tier I of the proposed project—which consists of the construction of the new MACC and the Ancillary Building tenant improvements, site improvements, and potential relocation of the MRI Building—would require approximately 37 months to complete (March 2011 to April 2014). Construction at the proposed project site is anticipated to be in accordance with all federal, state, regional, and County regulations, including the National Pollution Discharge Elimination System[5] and the County General Plan.[6]

---

[4] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus - Campus Planning and Programming Report*. Los Angeles, CA.

[6] County of Los Angeles Department of Regional Planning. 2007. *Los Angeles County Draft Preliminary General Plan*.

It is anticipated that construction related to Tier I for the proposed project may require the type of equipment listed below in Table 1.4.1-1, *Anticipated Construction Equipment*. The information contained in Table 1.4.1-1 will be used in the assessment of potential construction impacts to air quality and greenhouse gas emissions for Tier I of the proposed project.

TABLE 1.4.1-1
ANTICIPATED CONSTRUCTION EQUIPMENT

Approximate Quantity	Type of Equipment or Vehicle	Approximate Duration of On-site Construction Activity (in months)
2	Man lift	3
4	Pickup truck	8
2	Hand compactor	5
2	Crane	3
1	Concrete mixer	4
1	Backhoe	3
40–60	Crew members	8
50	Crew vehicles (maximum)	8
1	Pile Driver	6
1	Large Bulldozer	3
2	Dozer	3
1	Front-end loader	1
1	Water truck	2
1	Grader	1
5	Dump truck	6
16	Concrete mix truck	9
1	Roller	1
3	Fork lift / grade all	3

Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes. Daily construction activities would be subject to County noise regulations. All construction-related activities would be scheduled in compliance with the County Noise Ordinance, which prohibits construction activities and operation of construction equipment between the hours of 8:00 p.m. and 7:00 a.m., Monday through Friday, or at any time on Sunday or holidays. Work conducted on Saturdays would commence at 7:00 a.m. and cease no later than 5:00 p.m. Noise levels exceeding 65 dBA (decibels, A-weighted sound levels) for single-family residences and 70 dBA for multifamily residences during construction hours are prohibited.

The construction contractor would ensure that source-reduction techniques and the development of recycling programs during construction and operation of the proposed project are considered and implemented whenever possible.[7] In addition, employee vehicles, construction equipment and vehicles, and storage and materials used throughout the proposed project site would be located in a designated staging area in an effort to minimize impacts to the site, pedestrians, and medical center employee or visitor traffic.

Available at: http://planning.co.la.ca.us/doc/gp/gp_draft.pdf

[7] Los Angeles County Code. Title 12, "Environmental Protection," Chapter 20.87.08.060, "Approval of Recycling and Reuse Plan." Available at: http://ordlink.com/codes/lacounty/index.htm

It is anticipated that there would be grading activities associated with the development of Tier I of the proposed project. It is anticipated that the approximately 30,000 cubic yards of material will be exported from the site during construction of the proposed project. It is further anticipated that excavation may exceed 20 feet but would not be expected to be greater than 60 feet deep. It is anticipated that a geotechnical engineer would be available for observation and testing of the earthwork-related tasks to ensure proper subgrade preparation, selection of satisfactory materials, and placement and compaction of structural fills. Any unanticipated adverse conditions encountered would be evaluated by the proposed project engineering geologist and the soil engineer.[8] The existing access roads to and the streets surrounding the proposed project site will be used to transport import, export, and other construction related materials to and from the proposed project site.

The construction contractor would be required to incorporate best management practices (BMPs) consistent with the guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[9] Should the construction period continue into the rainy season, supplemental erosion measures would need to be implemented, including, but not limited to, the following:

- Mulching
- Geotextiles and mats
- Earth dikes
- Temporary drains and gullies
- Silt fence
- Straw-bale barriers
- Sandbag barrier
- Brush or rock filter
- Sediment trap

The anticipated construction period would begin in March 2011 and conclude in April 2014. BMPs to control surface runoff and soil erosion would be required for construction taking place during rainy periods.

Construction equipment would be turned off when not in use. The construction contractor would ensure that all construction and grading equipment is properly maintained. All vehicles and compressors would utilize exhaust mufflers and engine enclosure covers (as designed by the manufacturer) at all times. It is currently anticipated that up to 150 construction workers would be on site at any given time during the construction of the proposed project.

Construction-related ingress and egress to the proposed project site would occur primarily off East 120th Street to the north or Wilmington Avenue to the east.

1.4.2 Tier II Construction Scenario

The Tier II of the proposed project consists of a campus-wide master plan and up to 1,814,696 square feet of development on the proposed project site. The potential construction scenario for Tier II may be envisioned as a multiphase process to be completed concurrently with Tier I. The longest scenario

---

[8] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

[9] California Stormwater Quality Association. 2003. *California Stormwater Best Management Practice Handbooks: Construction*. Menlo Park, CA. Available at: http://www.cabmphandbooks.com/Documents/Construction/Section_3.pdf

is to develop Tier II within a 10-year timeframe, between 2010 and 2020. This analysis approach of the construction scenario has been developed based on an aggressive scenario (which allows the proposed project site to be developed to the maximum extent possible) to allow the consideration of a reasonable worst-case scenario in the even that the County chooses to complete up to 1,814,696 square feet of development.

The type and quantity of equipment that would potentially be used in construction of Tier II would vary for each component. However, for the purposes of this analysis, it is anticipated that development of Tier II would require up to eight phases that would utilize equipment that is comparable to the equipment described in Table 1.4.1-1 for each phase.

Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes.

As with Tier I of the proposed project, the construction contractor would ensure that source-reduction techniques and the development of recycling programs during construction and operation of the proposed project are considered and implemented whenever possible.[10] The construction contractor would be required to incorporate BMPs consistent with the guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[11]

BMPs to control surface runoff and soil erosion would be required for construction taking place during rainy periods.

Any construction equipment used during the potential development of Tier II would be turned off when not in use. The construction contractor would ensure that all construction and grading equipment is properly maintained. All vehicles and compressors would utilize exhaust mufflers and engine enclosure covers (as designed by the manufacturer) at all times. It is currently anticipated that up to 150 construction workers would be on-site at any given time during the construction of the proposed project.

Construction-related ingress and egress to the proposed project site would occur primarily off East 120th Street to the north or Wilmington Avenue to the east.

SECTION 2.0
AIR QUALITY AND GREENHOUSE GAS EMISSIONS ANALYSIS

The air quality analysis provided in this section evaluates the air quality impact level of significance associated with the construction, operation, and maintenance activities of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project). The analysis contained herein focuses on criteria pollutants designated by the Federal Clean Air Act as well as greenhouse gas emissions. Relevant regulatory framework is used to determine the consistency of the proposed project with federal and state laws governing the regulations of air quality and the level of significance of the proposed project impacts to air quality. Mitigation measures are subsequently provided for any impacts identified to be potentially significant. The information used in this analysis is based on a review of relevant literature and technical reports (see Section 3.0, *References*, for a list of reference materials consulted). The conclusion reached in this analysis is supported by relevant air quality data and modeling results.

2.1 POLLUTANTS AND EFFECTS

Criteria air pollutants are defined as pollutants that are hazardous for human health and are regulated by federal and state ambient air quality standards or criteria for outdoor concentrations. The federal and state standards have been set at levels above which concentrations would be harmful to human health. These standards are designed to protect the most sensitive persons from illness or discomfort. Criteria pollutants of concern include carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM_{10} and $PM_{2.5}$), and lead (Pb). A detailed description of the characteristics and effects of criteria pollutants and GHGs are provided in the following sections.

2.1.1 Air Pollutants and Effects

Carbon Monoxide (CO)

CO is a colorless and odorless gas formed by the incomplete combustion of fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircrafts, and trains. In urban areas, automobile exhaust accounts for the majority of CO emissions. CO is a nonreactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions, including wind speed, topography, and atmospheric stability. CO produced by motor vehicle exhaust can be locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, such as situations at dusk in urban areas between November and February.[12] The highest levels of CO typically occur during the colder months of the year when inversion conditions are more frequent. CO has a higher binding affinity to hemoglobin than oxygen (O_2), so it can replace O_2 in the blood and cause a reduction in the ability of blood to transport O_2 to vital organs. Low CO concentrations can cause fatigue in healthy people and chest pain in people with heart disease. At moderate concentrations, angina, impaired vision, and reduced brain function may result. At high concentrations, CO can cause impaired vision and coordination, headaches, dizziness, confusion, and nausea. At very high concentrations, CO exposure can be fatal.

---

[12] Inversion is an atmospheric condition in which a layer of warm air traps cooler air near the surface of the earth, preventing the normal rising of surface air.

Ozone (O_3)

O_3 is a colorless gas that is formed in the atmosphere when reactive organic gases (ROGs), which include volatile organic compounds (VOCs) and nitrogen oxides (NO_x), react in the atmosphere in the presence of ultraviolet sunlight. The primary sources of VOCs and NO_x are automobile exhaust emissions and industrial emissions. Ideal conditions for O_3 formation occur during summer and early fall on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 is one of the main components of photochemical smog in urban areas. Health effects associated with exposure to O_3 include increased respiratory and cardiovascular disease; increased symptoms of respiratory illness such as cough, phlegm, and wheeze; decreased lung function; increase in bronchodilator usage; and increased daily mortalities.

Nitrogen Dioxide (NO_2)

NO_2 is a brownish-red, highly reactive gas that plays a major role in the formation of ground-level O_3 and acid rain. NO_2 is produced in the atmosphere from the reaction of atmospheric oxygen (O_2) with nitric oxide (NO). NO_x collectively refers to both NO and NO_2. The main sources of NO_2 include fuel combustion in industry and motor vehicles. High concentrations of NO_2 can cause breathing difficulties and can result in a brownish-red cast to the atmosphere with reduced visibility. NO_2 is toxic to various animals as well as to humans, because it has the ability to react with water to form nitric acid in the eye, lung, mucus membranes, and skin. Epidemiological studies have shown associations between NO_2 concentrations and chronic pulmonary fibrosis and daily mortalities from respiratory and cardiovascular causes. Some increase in bronchitis in children (two and three years old) has also been observed at concentrations below 0.3 parts per million (ppm).

Sulfur Dioxide (SO_2)

SO_2 is a colorless and pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. Generally, the highest levels of SO_2 are found near large industrial complexes where coal and oil are used in power plants and industries. In recent years, SO_2 concentrations have been reduced due to the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels. SO_2 causes its irritant effects by stimulating nerves in the lining of the nose and throat and the lung's airways. This causes a reflex cough, irritation, and a feeling of chest tightness, which may lead to narrowing of the airways. Acute respiratory symptoms and diminished ventilator function in children can be caused by SO_2 emissions, which can also damage plants and erode metals.

Particulate Matter (PM)

Particulate matter consists of very small liquid and solid particles suspended in air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can be formed when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. Fine particulate matter, or $PM_{2.5}$, refers to particles that are 2.5 microns or less in diameter, roughly 1/28th the diameter of a human hair. PM_{10} refers to particles that are 10 microns or less in diameter, about 1/7th the thickness of a human hair. Sources of primary $PM_{2.5}$ emissions include from fuel combustion from motor vehicles, power generation, industrial facilities, residential fireplaces, and wood stoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as SO_2, NO_x, and VOCs. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning activities; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-sized particles. When inhaled, small particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. A strong link between elevated particulate levels and premature deaths, hospital admissions, emergency room visits, and asthma attacks has been demonstrated;[13] particulate matter inhalations could also significantly reduce lung function growth in children.[14] Components of particulate matter can include substances such as lead, sulfates, and nitrates, which can cause lung damage directly. These substances can be absorbed into the blood stream and cause damage elsewhere in the body. Moreover, these substances can transport absorbed gases such as chlorides or ammonium into the lungs and cause injury. PM_{10} tends to collect in the upper portion of the respiratory system; whereas, $PM_{2.5}$ can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle and produce haze in the atmosphere that reduces regional visibility.

Lead (Pb)

Pb in the atmosphere occurs as particulate matter. Main sources of Pb emissions include leaded gasoline, battery manufacture, paint, ink, ceramics, ammunition, and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. After the phase-out of leaded gasoline between 1978 and 1987, secondary lead smelters, battery recycling, and manufacturing facilities became lead-emission sources of greater concern. Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with lead exposure include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Infants and young children are particularly sensitive to even very low levels of Pb, and such exposure could result in decrements in neurobehavioral performance including intelligent quotient performance, psychomotor performance, reaction time, and growth.

2.1.2 Greenhouse Gases and Effects

On April 2, 2007, the Supreme Court in *Massachusetts, et al. v. Environmental Protection Agency, et al.* (549 U.S. 1438; 127 S. Ct. 1438) ruled that the Clean Air Act gives the U.S. Environmental Protection Agency (USEPA) the authority to regulate emissions of GHGs, thereby legitimizing GHGs as air pollutants under the Clean Air Act.

The six GHGs regulated by the Kyoto Protocol and AB 32 include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_20), sulphur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs). These gases trap the energy from the sun and help maintain the temperature of the Earth's surface, creating a process known as the greenhouse effect. The sun emits solar radiation and provides energy to the Earth. Six percent of the solar radiation emitted by the sun is reflected back by the atmosphere surrounding the Earth, 20 percent of the solar radiation is scattered and reflected by clouds, 19 percent of the solar radiation is absorbed by the atmosphere and clouds, 4 percent of the solar radiation is reflected back to the atmosphere by the Earth's surface, and 51 percent of the solar energy is absorbed by the Earth. GHGs such as CO_2 and CH_4 are naturally present in the atmosphere. The presence of these gases prevents outgoing infrared radiation from escaping the Earth's surface and lower atmosphere, allowing incoming solar radiation to be absorbed by living organisms on Earth. Without these GHGs, the earth would be too cold to be habitable; however, an excess of GHGs in the atmosphere can raise

[13] California Air Resources Board. November 2007. *Recent Research Findings: Health Effects of Particulate Matter and Ozone Air Pollution, November 2007*. Available at: http://www.arb.ca.gov/research/health/fs/pm_ozone-fs.pdf

[14] California Air Resources Board. November 2007. *Recent Research Findings: Health Effects of Particulate Matter and Ozone Air Pollution, November 2007*. Available at: http://www.arb.ca.gov/research/health/fs/pm_ozone-fs.pdf

the Earth's temperature and cause global climate change, resulting in environmental consequences related to snowpack losses, flood hazards, sea-level rises, and fire hazards.

Global climate change results from a combination of three factors: 1) natural factors such as changes in the sun's intensity or slow changes in the Earth's orbit around the sun; 2) natural processes within the Earth's climate system, such as changes in ocean circulation; and 3) anthropogenic activities, such as fossil fuel combustion, deforestation, reforestation, urbanization, and desertification, that change the composition of atmospheric gases. In its 2007 climate change synthesis report to policymakers, the Intergovernmental Panel on Climate Change (IPCC) concluded that "global GHG emissions due to human activities have grown since pre-industrial times, with an increase of 70 percent between 1970 and 2004."[15] Therefore, significant attention is being given to the anthropogenic causes of the increased GHG emissions level. In the review of regulatory publications from CAPCOA,[16] CARB,[17] the California Attorney General,[18] and OPR,[19] there is a consensus on the closely associated relationship between fossil fuel combustion, in conjunction with other human activities, and GHG emissions. In California, GHG emissions are largely contributed by the transportation sector, which was responsible for 35 percent and 38 percent of statewide 1990 and 2004 GHG emissions, respectively; followed by the electricity generation sector, which was responsible for 25 percent of statewide emissions in both 1990 and 2004; the industrial sector, which was responsible for 24 percent and 20 percent of statewide 1990 and 2004 GHG emissions; and the commercial sector, which was responsible for 3 percent of statewide emissions in both 1990 and 2004 (Figure 2.1.2-1, *California 1990 GHG Emissions*; and Figure 2.1.2-2, *California 2004 GHG Emissions*).[20]

The characteristics and effects of three GHGs and a group of fluorinated GHGs, including SF_6, HFCs, and PFCs, are described to set the context for the analysis.

Carbon Dioxide (CO_2)

CO_2 is a colorless, odorless, and nonflammable gas that is the most abundant GHG in the Earth's atmosphere after water vapor. CO_2 enters the atmosphere through natural process such as respiration and forest fires, and through human activities such as the burning of fossil fuels (oils, natural gas, and coal) and solid waste, deforestation, and industrial processes. CO_2 absorbs terrestrial infrared radiation that would otherwise escape to space, and therefore plays an important role in warming the atmosphere. CO_2 has a long atmospheric lifetime of up to 200 years, and is therefore a more important GHG than water vapor, which has a residence time in the atmosphere of only a few days. CO_2 provides the reference point for the global warming potential (GWP) of other gases; thus, the GWP of CO_2 is equal to 1.

FIGURE 2.1.2-2
California 2004 GHG Emissions

Methane (CH_4)

CH_4 is a principal component of natural gas and consists of a single carbon atom bonded to four hydrogen atoms. It is formed and released to the atmosphere by biological processes from livestock and other agricultural practices and by the decay of organic waste in anaerobic environments such as municipal solid waste landfills. CH_4 is also emitted during the production and transport of coal, natural gas, and oil. CH_4 is about 21 times more powerful at warming the atmosphere than CO_2 (a GWP of 21). Its chemical lifetime in the atmosphere is approximately 12 years. The relatively short atmospheric lifetime of CH_4, coupled with its potency as a GHG, makes it a candidate for mitigating global warming over the near-term. CH_4 can be removed from the atmosphere by a variety of processes such as the oxidation reaction with hydroxyl radicals (OH), microbial uptake in soils, and reaction with chlorine (Cl) atoms in the marine boundary layer.

Nitrous Oxide (N_2O)

N_2O is a clear and colorless gas with a slightly sweet odor. N_2O has a long atmospheric lifetime (approximately 120 years) and heat trapping effects about 310 times more powerful than carbon dioxide on a per molecule basis (a GWP of 310). N_2O is produced by both natural and human-related sources. The primary anthropogenic sources of N_2O are agricultural soil management such as soil cultivation practices, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuels, and production of adipic and nitric acids. The natural process of producing N_2O ranges from a wide variety of biological sources in soil and water, particularly microbial action in wet tropical forests.

Fluorinated Gases

HFCs, PFCs, and SF_6 are synthetic, powerful GHGs that are emitted from a variety of industrial processes, including aluminum production, semiconductor manufacturing, electric power transmission, magnesium production and processing, and the production of HCFC-22. Fluorinated gases are being used as substitutes for ozone-depleting chlorofluorocarbons (CFCs). Fluorinated gases are typically emitted in small quantities; however, they have high global warming potentials of between 140 and 23,900.[21]

2.2 REGULATORY FRAMEWORK

This regulatory framework identifies the federal, state, regional, and local laws that govern the regulation of air quality and must be considered by the County regarding decisions on projects that involve construction, operation, or maintenance activities that would result in air pollutant or GHG emissions.

Responsibility for attaining and maintaining ambient air quality standards in California is divided between CARB and regional air pollution control or air quality management districts. Areas of control for the regional districts are set by CARB, which divides the state into air basins. These air basins are based largely on topography that limits air flow access, or by county boundaries. The proposed project area is located in the unincorporated area of Willowbrook, California, within the SCAQMD portion of the South Coast Air Basin.

---

[21] California Climate Action Registry. January 2009. *California Climate Action Registry General Reporting Protocol, Version 3.1.* Los Angeles, CA.

While the regulatory framework is discussed in detail below, it is important to note that the OPR has been tasked with developing CEQA guidelines with regard to GHG emissions. OPR has indicated that many significant questions must be answered before a consistent, effective, and workable process for completing climate change analyses can be created for use in CEQA documents. No federal or State agency (e.g. USEPA, CARB, or SCAQMD) responsible for managing air quality emissions has promulgated a global warming significance threshold that may be used in reviewing newly proposed projects. On a local level, the County has not adopted a climate change significance threshold. Neither the CEQA Statutes nor the CEQA Guidelines establish thresholds of significance or particular methodologies for performing an impact analysis. The determination of significance is left to the judgment and discretion of the lead agency.

2.2.1 Federal

Federal Clean Air Act

The Federal Clean Air Act (Federal CAA) requires that federally supported activities must conform to the State Implementation Plan (SIP), whose purpose is that of attaining and maintaining the National Ambient Air Quality Standards (NAAQS). Section 176 (c) of the Clean Air Act as amended in 1990, established the criteria and procedures by which the Federal Highway Administration (FHWA) (Title 23 USC), the Federal Transit Administrations (FTA),[22] and metropolitan planning organizations (MPOs) determine the conformity of federally funded or approved highway and transit plans, programs, and projects to SIPs. The provisions of 40 CFR Parts 51 and 93[23] apply in all non-attainment and maintenance areas for transportation-related criteria pollutants for which the area is designated non-attainment or has a maintenance plan.

The U.S. EPA sets NAAQS. Existing national standards are shown in Table 2.2.1-1, *Ambient Air Quality Standards,* together with state standards. Primary standards are designed to protect public health, including sensitive individuals such as the children and the elderly, whereas secondary standards are designed to protect public welfare, such as visibility and crop or material damage. The Clean Air Act requires the EPA to routinely review and update the NAAQS in accordance with the latest available scientific evidence. For example, the EPA revoked the annual PM_{10} standard in 2006 due to a lack of evidence linking health problems to long-term exposure to PM_{10} emissions. The 1-hour standard for O_3 was revoked in 2005 in favor of a new 8-hour standard that is intended to be more protective of public health.

TABLE 2.2.1-1
AMBIENT AIR QUALITY STANDARDS

Air Pollutant	National		State Standard
	Primary	**Secondary**	
Ozone (O_3)[1]	0.08 ppm, 8-hr avg. (1997) 0.075 ppm, 8-hr avg. (2008)	0.08 ppm, 8-hr avg. (1997) 0.075 ppm, 8-hr avg. (2008)	0.09 ppm, 1-hr avg. 0.07 ppm, 8-hr avg.
Carbon Monoxide (CO)	9 ppm, 8-hr avg. 35 ppm, 1-hr avg.	None	9 ppm, 8-hr avg. 20 ppm, 1-hr avg.
Nitrogen Dioxide (NO_2)	0.053 ppm, annual avg.	0.053 ppm, annual avg.	0.03 ppm, annual avg. 0.18 ppm, 1-hr avg.
Sulfur Dioxide (SO_2)	0.03 ppm, annual avg. 0.14 ppm, 24-hr avg.	0.5 ppm, 3-hr avg.	0.25 ppm, 1-hr 0.04 ppm, 24-hr avg.
Suspended Particulate Matter (PM_{10})	150 $\mu g/m^3$, 24-hr avg.	150 $\mu g/m^3$, 24-hr avg.	50 $\mu g/m^3$, 24-hr avg. 20 $\mu g/m^3$, annual avg.
Fine Particulate Matter ($PM_{2.5}$)	35 $\mu g/m^3$, 24-hr avg. 15 $\mu g/m^3$, annual avg.	35 $\mu g/m^3$, 24-hr avg. 15 $\mu g/m^3$, annual avg.	12 $\mu g/m^3$, annual avg.
Sulfates (SO_4)	—	—	25 $\mu g/m^3$, 24-hr avg.
Lead (Pb)	1.5 $\mu g/m^3$, calendar quarter 0.15 $\mu g/m^3$, rolling 3-month avg.	1.5 $\mu g/m^3$, calendar quarter 0.15 $\mu g/m^3$, rolling 3-month avg.	1.5 $\mu g/m^3$, 30-day avg.
Hydrogen Sulfide (H_2S)	—	—	0.03 ppm, 1-hr avg.
Vinyl Chloride	—	—	0.01 ppm, 24-hr avg.
Visibility-Reducing Particles	—	—	Extinction coefficient of 0.23 per kilometer — visibility of 10 miles or more (0.07–30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. (8-hr avg.)

SOURCES:

1. U.S. Environmental Protection Agency. Updated 14 July 2009. *National Ambient Air Quality Standards (NAAQS).* Available at: http://www.epa.gov/air/criteria.html
2. California Air Resources Board. Reviewed 24 November 2009. *California Ambient Air Quality Standards (CAAQS).* Available at: http://www.arb.ca.gov/research/aaqs/caaqs/caaqs.htm

NOTES:

1. The 1997 standard of 0.08 ppm will remain in place for implementation purposes as EPA undertakes rulemaking to address the transition to the 2008 ozone standard of 0.075 ppm.
2. ppm = parts per million by volume
3. avg. = average
4. μg/m3 = micrograms per cubic meter

The 1990 Amendments to the CAA divide the nation into five categories of planning regions, depending on the severity of their pollution and set new timetables for attaining the NAAQS. The categories range from "marginal" to "extreme." Attainment deadlines are from 3 to 20 years, depending on the category. The Basin as a whole is an extreme non-attainment area for ozone. The County is currently designated as a Severe-17 non-attainment area for O_3, a non-attainment area for

$PM_{2.5}$, and a Serious non-attainment area for PM_{10},[24] but the Basin has achieved the federal 1-hour and 8-hour carbon monoxide (CO) air quality standards since 1990 and 2002, respectively, and the County has met the federal air quality standards for nitrogen dioxide (NO_2) since 1992.[25] Although the Basin as a whole is designated as a non-attainment area for PM_{10}, federal PM_{10} standards in the County are currently being met at all monitoring stations.[26]

Areas designated as Severe-17 for non-attainment of the federal 8-hour O_3 standard, such as the County, are required to reach attainment levels within 17 years after designation. Areas designated as "serious" for non-attainment of the federal PM_{10} air quality standard have a maximum of 10 years to reduce PM_{10} emissions to attainment levels. All non-attainment areas for $PM_{2.5}$ have 3 years after designation to meet the $PM_{2.5}$ standards. The Basin has until 2021 to achieve the 8-hour O_3 standards and 2010 to achieve the $PM_{2.5}$ air quality standards.[27] Section 182(e)(5) of the Federal CAA allows the EPA administrator to approve provisions of an attainment strategy in an "extreme" area that anticipates development of new control techniques or improvement of existing control technologies if the state has submitted enforceable commitments to develop and adopt contingency measures to be implemented if the anticipated technologies do not achieve planned reductions.

Non-attainment areas that are classified as "serious" or "worse" are required to revise their air quality management plans to include specific emission reduction strategies to meet interim milestones in implementing emission controls and improving air quality. The EPA can withhold certain transportation funds from states that fail to comply with the planning requirements of the CAA. If a state fails to correct these planning deficiencies within two years of federal notification, the EPA is required to develop a federal implementation plan (FIP) for the identified non-attainment area or areas.

2.2.2 State

California Clean Air Act

The California CAA of 1988 requires all air-pollution control districts in the state to work to achieve and maintain state ambient air quality standards for O_3, CO, and NO_2 by the earliest practicable date and to develop plans and regulations specifying how they will meet this goal. There are no planning requirements for the state PM_{10} standard. The CARB, which became part of the Cal/EPA in 1991, is responsible for meeting state requirements of the Federal CAA, administrating the California CAA, and establishing the CAAQS. The California CAA, amended in 1992, requires all air districts in the state to endeavor to achieve and maintain the CAAQS. The CAAQS are generally stricter than national standards for the same pollutants, but there is no penalty for non-attainment. California has also established state standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles, for which there are no national standards (Table 2.2.1-1).

On April 2, 2007, the Supreme Court ruled in *Massachusetts, et al. v. Environmental Protection Agency, et al.* (549 U.S. 1438; 127 S. Ct. 1438) that the CAA gives the USEPA the authority to regulate

emissions of GHGs, including CO_2, CH_4, N_2O, and fluorinated gases, such as HFCs, PFCs, and SF_6,[28] thereby legitimizing GHGs as air pollutants under the CAA.

Off-Road Emission Standards

Off-road diesel vehicles in California, including construction equipment, are regulated by CARB under increasingly stringent sets of standards called Tiers. Tier 1 standards began in 1996, and Tiers 2 and 3 were adopted in 2000. Tier 2 and 3 standards were fully phased in by 2006 and 2008 respectively. In 2004, CARB adopted the Tier 4 emission standards designed to decrease PM and NO_x emissions from newly manufactured vehicle engines.

CARB also approved a regulation in 2007 to control emissions from existing vehicles that are currently in use. This regulation became effective on June 15, 2008, and includes an anti-idling limit of five minutes for all off-road vehicles with a horsepower of 25 or greater. In addition, this regulation establishes emission rate targets that decline over time to accelerate a conversion to newer cleaner engines and require exhaust retrofits to meet these targets.

Executive Order S-3-05

On June 1, 2005, Governor Arnold Schwarzenegger signed Executive Order S-3-05. Recognizing that California is particularly vulnerable to the impacts of climate change, Executive Order S-3-05 establishes statewide climate change emission reduction targets to reduce $CO_{2equivalent}$ (CO_{2e}) to the 2000 level (473 million metric tons) by 2010, to the 1990 level (427 million metric tons of CO_{2e}) by 2020, and to 80 percent below the 1990 level (85 million metric tons of CO_{2e}) by 2050 (Table 2.2.2-1, *California Business-as-Usual Greenhouse Gas Emissions and Targets*).[29,30] The executive order directs the Cal/EPA secretary to coordinate and oversee efforts from multiple agencies (i.e., secretary of the Business, Transportation and Housing Agency; secretary of the Department of Food and Agriculture; Secretary of the Resources Agency; chairperson of the Air Resources Board; chairperson of the Energy Commission; and president of the Public Utilities Commission) to reduce GHG emissions to achieve the target levels. In addition, the Cal/EPA secretary is responsible for submitting biannual reports to the governor and state legislature that outline 1) progress made toward reaching the emission targets, 2) impacts of global warming on California's resources, and 3) measures and adaptation plans to mitigate these impacts. To further ensure the accomplishment of the targets, the Secretary of Cal/EPA created a Climate Action Team made up of representatives from the agencies listed above to implement global warming emission reduction programs and report on the progress made toward meeting the statewide GHG targets established in this executive order. In 2006, the first report was released and identified that "the climate change emission reduction targets [could] be met without adversely affecting the California economy," and "when all [the] strategies are implemented, those underway and those needed to meet the Governor's targets, the economy will benefit."[31]

TABLE 2.2.2-1
CALIFORNIA BUSINESS-AS-USUAL GREENHOUSE GAS EMISSIONS AND TARGETS

California Business-as-Usual Greenhouse Gas Emissions and Targets (Million Metric Tons of $CO_{2Equivalent}$)					
Year	**1990**	**2000**	**2010**	**2020**	**2050**
Business-as-usual emissions	427	473	532	596	762[1]
Target emissions	—	—	473	427	85

NOTE:

1. The CARB has not yet projected 2050 emissions under a business-as-usual scenario; therefore, 2050 business-as-usual emissions were calculated assuming a linear increase of emissions from 1990 to 2050.

Assembly Bill 32: Global Warming Solutions Act of 2006

In September 2006, Governor Arnold Schwarzenegger signed into law the Global Warming Solutions Act, or AB 32, which requires a statewide commitment and effort to reduce GHG emissions to 1990 levels by 2020 (25 percent below business-as-usual).[32] This intended reduction in GHG emissions will be accomplished with an enforceable statewide cap on GHG emissions, which will be phased in 2012. To effectively implement the cap, AB 32 requires CARB to develop appropriate regulations and establish a mandatory reporting system to track and monitor global warming emissions levels from stationary sources.

This bill is the first statewide policy in the United States to mitigate GHG emissions and to include penalties for non-compliance. Consistent with goals and targets set by other actions taking place at the regional and international levels, AB 32 sets precedence in inventorying and reducing GHG emissions.

In passing AB 32, the State legislature acknowledged that global warming and related effects of climate change are a significant environmental issue, particularly the anthropogenic causes that are believed to be largely attributable to increased concentration of GHGs in the atmosphere. The proposed ordinances would primarily impact the commercial sector, as it intends to ban retail establishments from distributing plastic carryout bags. Any potential decrease or increase in GHG emissions that could be attributed to the proposed ordinances would have the potential to impact statewide GHG emissions; therefore, potential incremental contributions to GHG emissions are analyzed in this EIR.

Executive Order S-20-06

On October 17, 2006, Governor Arnold Schwarzenegger signed Executive Order S-20-06, which calls for continued efforts and coordination among state agencies on the implementation of GHG emission reduction policies, AB 32, and Health and Safety Code (Division 25.5) through the design and development of a market-based compliance program.[33] In addition, Executive Order S-20-06 requires the development of GHG reporting and reduction protocols and a multi-state registry through joint efforts among CARB, Cal/EPA, and the California Climate Action Registry (CCAR). Executive Order S-20-06 directs the Secretary for Environmental Protection to coordinate with the Climate Action Team to develop a plan to create incentives for market-based mechanisms that have the potential of reducing GHG emissions.[34]

[34] California Governor. 2006. Executive Order S-20-06. Sacramento, CA.

California Senate Bill 97

Approved by Governor Arnold Schwarzenegger on August 24, 2007, Senate Bill (SB) 97 is designed to work in conjunction with the State CEQA Guidelines and AB 32. Pursuant to the State CEQA Guidelines, the OPR is required to prepare for and develop proposed guidelines for implementation of CEQA by public agencies. Pursuant to AB 32, the CARB is required to monitor and regulate emission sources of GHGs that cause global warming to reduce GHG emissions. SB 97 states, "SB 97 requires OPR, by July 1, 2009, to prepare, develop, and transmit to the [CARB] guidelines for the feasible mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions, as required by CEQA, including, but not limited to, effects associated with transportation or energy consumption."[35] As directed by SB 97, the Natural Resources Agency adopted amendments to the CEQA Guidelines for GHG emissions on December 30, 2009. On February 16, 2010, the Office of Administrative Law approved the amendments, and filed them with the Secretary of State for inclusion in the California Code of Regulations. The amendments became effective on March 18, 2010.

In addition, OPR and CARB are required to periodically update the guidelines to incorporate new information or criteria established by CARB pursuant to AB 32. SB 97 applies to any environmental documents, including an EIR, a Negative Declaration, a Mitigated Negative Declaration, or other documents required by CEQA that have not been certified or adopted by the CEQA lead agency by the date of the adoption of the regulations.

State of California Office of the Attorney General Guidance Letter on California Environmental Quality Act, Addressing Global Warming Impacts at the Local Agency Level

On May 21, 2008, the California Office of the Attorney General provided guidance to public agencies on how to address global warming impacts in CEQA documents. In the publication entitled *The California Environmental Quality Act Addressing Global Warming Impacts at the Local Agency Level*, the Office of Attorney General directs public agencies to take a leadership role in integrating sustainability into public projects by providing 52 project-level mitigation measures for consideration in the development of projects.[36] In addition, the Office of Attorney General has negotiated four settlement agreements under CEQA, all of which require the project proponents to consider sustainable design for projects and feasible mitigation measures and alternatives to substantially lessen global warming related effects.

State of California Office of Planning and Research Technical Advisory

On June 19, 2008, OPR provided guidance on how to address climate change in CEQA documents. In the technical advisory, *CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review*, OPR issues technical guidance on how to perform GHG analyses in the interim before further state guidelines become available.[37]

California Climate Action Registry

Established in 2001, the CCAR is a private non-profit organization originally formed by the State of California. The CCAR serves as a voluntary GHG registry and has taken a leadership role on climate change by developing credible, accurate, and consistent GHG reporting standards and tools for businesses, government agencies, and non-profit organizations to measure, monitor, and reduce GHG emissions. For instance, the CCAR General Reporting Protocol, version 3.1, dated January 2009, provides the principles, approach, methodology, and procedures required for voluntary GHG emissions reporting by businesses, government agencies, and non-profit organizations. In 2007, the County became a member of the CCAR and has committed its efforts to monitor, report, and reduce GHG emissions pursuant to its participation in the CCAR.

2.2.3 Regional

South Coast Air Quality Management District

The South Coast Air Quality Management District (SCAQMD), which monitors air quality within the proposed project area, has jurisdiction over an area of approximately 10,743 square miles and a population of over 16 million. The 1977 Lewis Air Quality Management Act created SCAQMD to coordinate air quality planning efforts throughout Southern California. This Act merged four (4) county air pollution agencies into one regional district to improve air quality in Southern California. SCAQMD is responsible for monitoring air quality as well as planning, implementing, and enforcing programs designed to attain and maintain Federal and State Ambient Air Quality Standards in the district. In addition, SCAQMD is responsible for establishing stationary source permitting requirements and for ensuring that new, modified, or related stationary sources do not create net emission increases.

SCAQMD Rule 402, Nuisance, states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. The provisions of Rule 402 do not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.

It is mandatory for all construction projects in the South Coast Air Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Amended on June 3, 2005, the Fugitive Dust Rule 403 requires actions to prevent, reduce, or mitigate fugitive dust emissions of particulate matter in the ambient air as a result of any anthropogenic activities that are capable of generating fugitive dusts.

On a regional level, SCAQMD and the Southern California Association of Governments (SCAG) have responsibility under state law to prepare the Air Quality Management Plan (AQMP), which contains measures to meet state and federal requirements. When approved by CARB and the U.S. EPA, the AQMP becomes part of the SIP.

The most recent update to the SCAQMD Air Quality Management Plan (AQMP) was prepared for air quality improvements to meet both state and federal CAA planning requirements for all areas under AQMP jurisdiction. This update was adopted by CARB for inclusion in the SIP on September 27, 2007. The AQMP sets forth strategies for attaining the federal PM_{10} and $PM_{2.5}$ air quality standards and the federal 8-hour O_3 air quality standard, as well as meeting state standards at the earliest practicable date. With the incorporation of new scientific data, emission inventories, ambient measurements, control strategies, and air quality modeling, the 2007 AQMP focuses on O_3 and $PM_{2.5}$ attainments.

On September 5, 2008, the SCAQMD Governing Board approved the SCAQMD Climate Change Policy, which directs SCAQMD to assist the state, cities, local governments, businesses, and residents in areas related to reducing emissions that contribute to global warming.[38]

Pursuant to the policy, the SCAQMD will achieve the following:

a. Establish climate change programs
b. Implement SCAQMD command-and-control and market-based rules
c. Review and comment on future legislation related to climate change and GHGs
d. Prioritize projects that reduce both criteria and toxic pollutants and GHG emissions
e. Provide guidance on analyzing GHG emissions and identify mitigation measures to CEQA projects
f. Provide revisions to *SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*[39] consistent with the state guidance to include information on GHG strategies as a resource for local governments
g. Update the SCAQMD's GHG inventory in conjunction with each AQMP and assist local governments in developing GHG inventories
h. Reduce SCAQMD climate change impacts
i. Inform the public on various aspects of climate change, including understanding impacts, technology advancement, public education, and other emerging aspects of climate change science

Therefore, SCAQMD Climate Change Policy aims to decrease SCAQMD's carbon footprint, assist businesses and local governments with implementation of climate change measures, and provide information regarding climate change to the public.

2.2.4 Local

County of Los Angeles General Plan

The proposed project site is located within and owned by the County; therefore, development in the area is governed by the policies, procedures, and standards set forth in the County General Plan. The proposed project is considered as a capital facility for the County; therefore, pursuant to the OPR's guidelines for a general plan related to capital facilities, the proposed project must be consistent with the County General Plan.[40] In addition, the County is required to review the capital improvement programs to ensure their consistency with the General Plan.[41] The proposed project would be expected to be consistent with the County General Plan governing air quality and would not be expected to result in a change to the population growth assumption used by the SCAG for attainment

planning. The County General Plan has developed goals and policies for improving air quality in the County. Many policies are transportation-based because of the direct link between air quality and the circulation element. The objectives and policies relevant to the proposed project and capable of contributing toward avoiding and reducing the generation of air pollutants include the following:[42]

- **Objective:** To support local efforts to improve air quality.
- **Policy:** Actively support strict air quality regulations for mobile and stationary sources, and continued research to improve air quality. Promote vanpooling, carpooling, and improved public transportation.

- **Objective:** To conserve energy resources and develop alternative energy sources.
- **Policy:** Support the conservation of energy and encourage the development and utilization of new energy sources including geothermal, thermal waste, solar, wind, and ocean-related sources.

County of Los Angeles Energy and Environmental Policy

The County Board of Supervisors adopted a Countywide energy and environmental policy (Policy No. 3.045), which became effective on December 19, 2006.[43] The goal of this policy is to provide guidelines for development, implementation, and enhancement of energy conservation and environmental programs within the County. The policy established an Energy and Environmental Team to coordinate the efforts of various County departments, established a program to integrate sustainable technologies into its Capital Project Program, established an energy consumption reduction goal of 20 percent by the year 2015 in County facilities, and became a member of the CCAR to assist the County in establishing goals for reducing GHG emissions. In addition, the policy included four program areas to promote green design and operation of County facilities and reduce the County's environmental footprint. Goals and initiatives for each program area are included as follows:

Energy and Water Efficiency

- Implementing and monitoring energy and water conservation practices
- Implementing energy and water efficiency projects
- Enhancing employee energy and water conservation awareness through education and promotions

Environmental Stewardship

- Investigating requirements and preferences for environmentally friendly packaging, greater emphasis on recycled products, and minimum energy efficiency standards for appliances
- Placing an emphasis on recycling and landfill volume reduction within County buildings
- Investigating the use of environmentally friendly products
- Supporting environmental initiatives through the investigation of existing resource utilization

[43] County of Los Angeles Board of Supervisors Policy Manual. 19 December 2006. *Policy No. 3.045, Energy and Environmental Policy*. Available at: http://countypolicy.co.la.ca.us/

Public Outreach and Education

- Implementing a program that provides County residents with energy-related information, including energy and water conservation practices, utility rates and rate changes, rotating power outage information, emergency power outage information, and energy efficiency incentives
- Seeking collaboration with local governments, public agencies, and County affiliates to strengthen regional, centralized energy and environmental management resources and identify and develop opportunities for information and cost sharing in energy management and environmental activities

Sustainable Design

- Enhancing building sustainability through the integration of green, sustainable principles into the planning, design, and construction of County capital projects, which complement the functional objectives of the project, extend the life cycle / useful life of buildings and sites, optimize energy and water use efficiency, improve indoor environmental quality and provide healthy work environments, reduce ongoing building maintenance requirements, and encourage use and reuse of environmentally friendly materials and resources
- Establishing a management approach that instills and reinforces the integration of sustainable design principles into the core competency skill set of the County's planner, architects, engineers, and project managers
- Establishing practical performance measures to determine the level of sustainability achieved relative to the objectives targeted for the individual project and overall capital program

2.3 EXISTING CONDITIONS

2.3.1 South Coast Air Basin

The proposed project area is located in the South Coast Air Basin, which is composed of a 6,745-square-mile area encompassing all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The analysis of existing conditions related to air quality includes a summary of pollutant levels prior to implementation of each component of the proposed project. All of the proposed project components are located within the Basin; therefore, all air quality data and analysis are presented as an aggregate of the entire proposed project area.

The Basin is the subregion of SCAQMD and is in an area of high air pollution potentials due to its climate and topography. The climate of the proposed project area (i.e., the Basin) is characterized by warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This mild climatological pattern is interrupted infrequently by extremely hot summers, winter storms, or Santa Ana winds. The Basin is a coastal plain bounded by the Pacific Ocean to the west; the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east; and the San Diego County line to the south. During the dry season, the Eastern Pacific High-Pressure Area (a semi-permanent feature of the general hemispheric circulation pattern) dominates the weather over much of Southern California, resulting in a mild climate tempered by cool sea breezes with light average wind speed. High mountains surround the rest of the Basin's perimeter, contributing to the variation of rainfall, temperature, and winds in the Basin.

2.3.2 Temperature Inversions

The Basin frequently experiences temperature inversions, a condition characterized by an increase in temperature with an increase in altitude. In a normal atmosphere, temperature decreases with altitude. In a temperature inversion condition, as the pollution rises, it reaches an area where the ambient temperature exceeds the temperature of the pollution, thereby limiting vertical dispersion of air pollutants and causing the pollution to sink back to the surface, trapping it close to the ground. During the summer, the interaction between the ocean surface and the low layer of the atmosphere creates a marine layer. With an upper layer of warm air mass over the cool marine layer, air pollutants are prevented from dispersing upward. Additional air quality problems in the Basin can be attributed to the bright sunshine, which causes a reaction between hydrocarbons and oxides of nitrogen to form ozone. Peak ozone concentrations in the Basin over the past two decades have occurred at the base of the mountains around Azusa and Glendora in the County and at the crestline in the mountain area above the City of San Bernardino. Both the peak ozone concentrations and the number of days the standards were exceeded decreased everywhere in the Basin throughout the 1990s. During the fall and winter, the greatest pollution problems are CO and NO_x emissions, which are trapped and concentrated by the inversion layer. CO concentrations are generally worse in the morning and late evening (around 10:00 p.m.). In the morning, CO levels are relatively high due to cold temperatures and the large number of cars traveling. High CO levels during the late evenings are a result of stagnant atmospheric conditions trapping CO in the area. Since CO is produced almost entirely from automobiles, the highest CO concentrations in the Basin are associated with heavy traffic. However, CO concentrations have also dropped significantly throughout the Basin as a result of strict new emission controls and reformulated gasoline sold in winter months. NO_2 levels are also generally higher during fall and winter days.

2.3.3 Climatic Conditions

The annual average temperature, as recorded at the Los Angeles Civic Center (8.6 miles north of the proposed project site at 34° 03′ N, 118° 14′ W), is 65 degrees Fahrenheit (°F) with an average winter (December, January, and February) temperature of approximately 58°F and an average summer (June, July, and August) temperature of approximately 72°F (Appendix A, *Wind and Climate Data*). The average maximum recorded temperatures are 81°F during the summer and 67°F during the winter (Appendix A).[44] The annual average of total precipitation in the proposed project area is approximately 15 inches, which occurs mostly during the winter and relatively infrequently during the summer. Precipitation averages approximately 9.0 inches during the winter, approximately 3.7 inches during the spring (March, April, and May), approximately 2.0 inch during the fall (September, October, and November), and approximately 0.1 inch during the summer (Appendix A).[45] The average wind speed within the proposed project area and its vicinity, as recorded in 1981 at the Lynwood Wind Monitoring Station (1.7 miles east northeast of the proposed project site at 11220 Long Beach Boulevard in the City of Lynwood), is approximately 4.1 miles per hour (MPH), which blows predominantly from the southwest direction (Appendix A).[46] Calm winds occur approximately 17 percent of the time (Appendix A).[47] Winds in the Basin are generally light, tempered by afternoon

sea breezes. Severe weather is uncommon in the Basin, but strong easterly winds known as the Santa Ana winds can reach 25 to 35 MPH below the passes and canyons. During the spring and summer months, air pollution is carried out of the region through mountain passes in wind currents or is lifted by the warm vertical currents produced by the heating of the mountain slopes. From the late summer through the winter months, because of the average lower wind speeds and temperatures in the proposed project area and its vicinity, air contaminants do not readily disburse, thus trapping air pollution in the area.

2.3.4 Emission Sources

The approximately 38-acre proposed project area currently contains buildings, structures, and other built features. Air and greenhouse gas emissions are generated daily from the hospital facilities by landscape maintenance equipment, campus operations including but not limited to space and water heating, and vehicle trips to and from the proposed project site. The average daily emissions generated by the existing uses at the proposed project sight were estimated using URBEMIS 2007 (Table 2.3.4-1, *Estimated Existing Daily Operational Emissions*; and Appendix B, *URBEMIS Output for the Proposed Project*), assuming that there is currently 1.2 million square feet of operational hospital space at the proposed project site. The current operational emissions of criteria pollutants at the proposed project site do exceed the SCAQMD operational thresholds of significance for VOCs, NO$_x$, CO, and PM$_{10}$ due to the large number of vehicle trips (17,443 in total) generated by the hospital campus.[48] These emission estimates are an overestimate due to the fact that the current campus is not fully utilized. For example, the MACC and the Interns and Physicians Building are not fully operational. However, the calculated emissions provide an estimate of the worst-case scenario, should the current buildings become fully operational prior to completion of the proposed project.

TABLE 2.3.4-1
ESTIMATED EXISTING DAILY OPERATIONAL EMISSIONS

Emission Sources	**Air Pollutants (Pounds/Day)**						
	VOCs	**NO$_x$**	**CO**	**SO$_x$**	**PM$_{2.5}$**	**PM$_{10}$**	**CO$_2$**
Mobile Sources	127	164	1,472	2	47	240	143,940
Area Sources	8	8	9	0	<1	<1	9,949
Total Emissions	**135**	**172**	**1,480**	**1**	**47**	**240**	**153,892**
SCAQMD Threshold	**55**	**55**	**550**	**150**	**55**	**150**	**N/A**
Exceedance of Significance?	**Yes**	**Yes**	**Yes**	**No**	**No**	**Yes**	**N/A**

2.3.5 Existing Air Quality

Existing air quality within the unincorporated area of Willowbrook and its vicinity is characterized by a mix of local emission sources that include stationary activities, such as space and water heating, landscape maintenance, consumer products, and mobile sources, which includes primarily automobile and truck traffic. Motor vehicles are the primary source of pollutants within the proposed project vicinity, because they have the potential to generate localized levels of CO, termed as CO "hotspots." Section 9.4 of SCAQMD's *CEQA Air Quality Handbook* identifies CO as a localized problem requiring additional analysis when a proposed project is likely to expose sensitive receptors to CO hotspots.[49]

2.3.6 Source Receptor Area

The SCAQMD has divided the Basin into source receptor areas (SRAs), based on similar meteorological and topographical features. The proposed project site is located in SCAQMD's Southeast Los Angeles County SRA 12, which is served by the Lynwood Monitoring Station, which is located 1.7 miles east northeast of the proposed project site at 11220 Long Beach Boulevard in the City of Lynwood. Criteria pollutants monitored at the Lynwood Monitoring Station include O3, CO, PM2.5, and NO2. This station does not monitor PM10 or SO2. The nearest, most representative monitoring station that gathers PM10 and SO2 data is located approximately 9.6 miles north of the proposed project site in the Central Los Angeles County Subregion (No. 1) at 1630 North Main Street, Los Angeles. The ambient air quality data in the proposed project vicinity as recorded at the Lynwood and Los Angeles-North Main Street Monitoring Stations from 2006 to 2008 and the applicable state standards are shown in Table 2.3.6-1, *Summary of 2006–2008 Ambient Air Quality Data in the Project Vicinity*. Background CO concentration in the proposed project area is established because CO concentrations are typically used as an indicator of the conformity with CAAQS, and estimated changes in CO concentrations generally reflect operational air quality impacts associated with the project. The highest reading of the CO concentrations over the past three years is defined by SCAQMD as the background level. A review of data from the Lynwood Monitoring Station from the 2006 to 2008 period indicates that the maximum 1- and 8-hour background concentrations are approximately 8 and 6.4 parts per million (ppm), respectively. The existing 1- and 8-hour background concentrations do not exceed the State CO standards of 20 ppm and 9.0 ppm, respectively.

TABLE 2.3.6-1
SUMMARY OF 2006–2008 AMBIENT AIR QUALITY DATA IN THE PROJECT VICINITY

Pollutants	Pollutant Concentration & Standards	Number of Days above State Standard		
		2006	2007	2008
Ozone	Maximum 1-hr Concentration (ppm)	0.09	0.10	0.08
	Days > 0.09 ppm (State 1-hr standard)	0	1	0
	Maximum 8-hr Concentration (ppm)	0.07	0.08	0.06
	Days > 0.07 ppm (State 8-hr standard)	0	2	0
Carbon Monoxide	Maximum 1-hr Concentration (ppm)	8	8	6
	Days > 20 ppm (State 1-hour standard)	0	0	0
	Maximum 8-hr Concentration (ppm)	6.4	5.1	4.3
	Days > 9.0 ppm (State 8-hr standard)	0	0	0
Nitrogen Dioxide	Maximum 1-hr Concentration (ppm)	0.14	0.10	0.12
	Days > 0.18 ppm (State 1-hr standard_	0	0	0
PM$_{10}$	Maximum 24-hr Concentration (μg/m^3)	59	78	66
	Days > 50 μg/m^3 (State 24-hr standard)	3	5	2
PM$_{2.5}$	Maximum 24-hr Concentration (μg/m^3)	55.0	49.0	44.2
	Exceed State Standard (12 μg/m^3 Annual Arithmetic Mean)?	Yes	Yes	Yes
Sulfur Dioxide	Maximum 24-hr Concentration (ppm)	0.006	0.003	0.002
	Days > 0.25 ppm (State 24-hr standard)	0	0	0

2.3.7 Greenhouse Gas Emissions

To establish a reference point for future GHG emissions, CO_{2e} emissions are projected based on an unregulated business-as-usual GHG emissions scenario that does not take into account the reductions in GHG emissions required by Executive Order S-3-05 or AB 32. CARB has stated that California contributed 427 million metric tons of GHG emissions in CO_{2e} in 1990, and under a business-as-usual development scenario, would contribute approximately 596 million metric tons of CO_{2e} emissions in 2020, presenting a linear upward trend in California's total GHG emissions levels (Figure 2.3.7-1, *California Business-as-Usual Emissions and Targets*).

To characterize the GHG emissions business-as-usual conditions for the County, information on County population was collected from SCAG. It has been projected that the County would increase its population from approximately 10.6 million in 2010 to approximately 12.0 million in 2030.[50] Using the current CO_{2e} emissions factor of 14 metric tons per capita,[51] the County would be expected to be responsible for approximately 149 million metric tons of CO_{2e} emissions in 2010 under a business-as-usual emissions scenario, and each year, more GHGs would be expected to be emitted by the County than the previous year due to the increase in population (Table 2.3.7-1, *Characterization of Business-as-Usual and Target GHG Emissions for the County*). Using the target emissions necessary for compliance with AB 32 reduction goals,[52] the County would be responsible for approximately 141 million metric tons of CO_{2e} emissions in 2010 and 70 million metric tons of CO_{2e} emissions in 2030 (Table 2.3-3). The 2014 and 2020 data presented in Table 2.3-3 was used for the GHG analysis for the proposed project, because construction of Tier I is anticipated to be completed by 2014 and construction of Tier II is anticipated to be completed by 2020.

2.3.8 Sensitive Receptors

Some people, such as individuals with respiratory illnesses or impaired lung function because of other illnesses, the elderly over 65 years of age, and children under 14, are particularly sensitive to certain pollutants. Facilities and structures where these sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses identified to be sensitive receptors by SCAQMD in the CEQA Handbook include residences, schools, playgrounds, child care centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Sensitive receptors may be at risk of being affected by air emissions released from the construction and operation of the proposed project. The greatest potential for exposure of sensitive receptors to air contaminants would occur during the temporary construction phase, when potentially contaminated soil would be uncovered and equipment would be used for site grading, materials delivery, and building construction.

The proposed project would be located in the unincorporated area of Willowbrook, near existing residences and commercial facilities. Exposure to potential emissions would vary substantially from day to day, depending on the amount of work being conducted, the weather conditions, the location of receptors, and the length of time that receptors would be exposed to air emissions. The construction phase emissions estimated in this analysis are based on conservative estimates and worst-case conditions, with maximum levels of construction activity occurring simultaneously within a short period of time. The nearest sensitive receptors, school land uses, with the highest potential to be impacted by the proposed project are listed below in Table 2.3.8-1, *Sensitive Receptor Locations* (Figure 2.3.8-1, *Air Quality Sensitive Receptor Locations*).

FIGURE 2.3.8-1

Air Quality Sensitive Receptor Locations

TABLE 2.3.8-1
SENSITIVE RECEPTOR LOCATIONS

	Receptor Name	Location	Distance from Site
1	King Drew Magnet High School	1601 East 120th Street, Los Angeles 90059	Adjacent to the northwest boundary
2	Head Start/Lincoln Drew Elementary	1667 East 118th Street, Los Angeles 90059	0.10 mile north
3	Carver Elementary	1425 East 120th Street, Los Angeles 90059	0.21 mile west
4	Harriet Tubman High School	12501 South Wilmington Avenue, Compton 90222	0.25 mile south
5	Cesar Chavez Alternative School and Compton Community Day Middle School	12051 South Wilmington Avenue, Compton 90222	0.25 mile south
6	New Designs Charter School	1339 East 120th Street, Los Angeles 90059	0.28 mile northwest
7	Los Angeles Computer Science Academy	2209 East 118th Street, Los Angeles 90059	0.36 mile northeast
8	Ronald E. Mc Nair Elementary	1450 West El Segundo Boulevard, Compton, 90222	0.41 mile south
9	Martin Luther King Elementary	2270 East 122nd Street, Compton 90222	0.43 mile east
10	Willowbrook Middle School	2601 North Wilmington Avenue, Compton 90222	0.47 mile south

Additional single-family and multiple-family residences are located in the surrounding community, within 0.25 mile (1,320 feet) of the proposed project site and visitors, staff, and certain other individuals on the campus that would potentially be exposed to emissions would also be considered sensitive receptors.

2.4 SIGNIFICANCE THRESHOLDS

The proposed project's air quality and greenhouse gas emission impacts can be separated into short-term impacts due to construction and long-term or permanent impacts from project operation. Both types of impacts may occur on a local or regional scale. The potential for the proposed project to result in impacts related to air quality and greenhouse gas emissions was analyzed in relation to the questions contained in Appendix G of the State CEQA Guidelines. Would the proposed project:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including release in emissions which exceed quantitative thresholds for ozone precursor);

- Expose sensitive receptors to substantial pollutant concentrations;
- Create objectionable odors affecting a substantial number of people;
- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The County relies on significance thresholds recommended by the SCAQMD in its *CEQA Air Quality Handbook*, as revised in November 1993 and approved by the SCAQMD's Board of Directors to determine whether projects will have significant impacts to air quality.[53] The SCAQMD's emission thresholds apply to all federally regulated air pollutants except lead, which is not exceeded in the Basin.

The SCAQMD is currently in the process of preparing a new air quality handbook, *AQMD Air Quality Analysis Guidance Handbook*. Supplemental details related to air quality analysis are available online at SCAQMD's Web site.[54] Proposed chapters will be posted there as they become available. The revisions completed to date make no change in significance thresholds or analysis methodology.

There are currently no established thresholds of significance for evaluating GHG emissions under CEQA. As previously mentioned, no federal or State agency (e.g. USEPA, CARB, or SCAQMD) responsible for managing air quality emissions in the County has adopted a GHG emission significance threshold that may be used in reviewing newly proposed projects.

CAPCOA has provided several approaches to consider potential cumulative significance of projects with respect to GHGs.[55] A zero threshold approach can be considered based on the concept that climate change is a global phenomenon and all GHG emissions generated throughout the earth contribute to climate change. However, the California Environmental Quality Act (CEQA) Guidelines also recognizes that there may be a point where a project's contribution, although above zero, would not be a considerable contribution to the cumulative impact (CEQA Guidelines, Section 15130 (a)). Therefore, a threshold of greater than zero is considered more appropriate for the analysis of GHG emissions under CEQA. CAPCOA's summary of suggested thresholds for GHG emissions includes efficiency-based thresholds, quantitative emission limits, and limits on the size of projects (Table 2.4-1, *CAPCOA-Suggested Thresholds for Greenhouse Gases*).

2.4.1 Construction Phase Significance Criteria

The significance criteria for the construction phase of the proposed project include the following:

- SCAQMD regional construction emission thresholds for CO, volatile organic compounds (VOCs), NO_x, SO_x, $PM_{2.5}$, and PM_{10} as presented in Table 2.4.1-1, *SCAQMD Daily Construction Emission Thresholds of Significance*
- Localized emissions of 10.4 micrograms per cubic meter averaged over a 24 hour period of PM_{10} or $PM_{2.5}$ at a sensitive receptor
- Emissions of Toxic Air Contaminants (TACs) including carcinogens and non-carcinogens - Maximum Incremental Cancer Risk ≥ 10 in 1 million; Hazard Index ≥1.0 (project increment)
- Odor nuisance pursuant to SCAQMD's Rule 402
- Inconsistency with the goal to reduce GHG emissions to 1990 levels (approximately 427 million metric tons or 10 metric tons of CO_{2e} per capita) by 2020 as required by AB 32

TABLE 2.4.1-1
SCAQMD DAILY CONSTRUCTION EMISSION THRESHOLDS OF SIGNIFICANCE

Criteria Air Pollutant	**Project Construction (lbs/day)**
Carbon monoxide (CO)	550
Volatile organic compounds (VOCs)	75
Nitrogen oxides (NO_x)	100
Sulfur oxides (SO_x)	150
Fine particulates ($PM_{2.5}$)	55
Particulates (PM_{10})	150

SOURCE: South Coast Air Quality Management District. 1993; accessed 6 July 2010. Air Quality Analysis Guidance Handbook. Web site. Available at: http://www.aqmd.gov/ceqa/hdbk.html

2.4.2 Operational Phase Significance Criteria

The significance criteria for the operational phase of the proposed project include the following:

- Daily SCAQMD operational emissions thresholds for CO, VOCs, NO_x, SO_x, $PM_{2.5}$, and PM_{10} as presented in Table 2.4.2-1, *SCAQMD Daily Operational Emission Thresholds of Significance*

- The CAAQS for the 1- and 8-hour periods of CO concentrations of 20 ppm and 9.0 ppm, respectively. If CO concentrations currently exceed the CAAQS, then an incremental increase of 1.0 ppm over "no project" conditions for the 1-hour period would be considered a significant impact. An incremental increase of 0.45 ppm over the "no project" conditions for the 8-hour period would be considered significant

- Emissions of TACs

- Odor nuisance pursuant to SCAQMD's Rule 402

- Inconsistency with the goal to reduce GHG emissions to 1990 levels (approximately 427 million metric tons or 10 metric tons of CO_{2e} per capita) by 2020 as required by AB 32

TABLE 2.4.2-1
SCAQMD DAILY OPERATIONAL EMISSION THRESHOLDS OF SIGNIFICANCE

Criteria Air Pollutant	Project Operation (lbs/day)
Carbon monoxide (CO)	550
Volatile organic compounds (VOCs)	55
Nitrogen oxides (NO_x)	55
Sulfur oxides (SO_x)	150
Fine particulates ($PM_{2.5}$)	55
Particulates (PM_{10})	150

SOURCE: South Coast Air Quality Management District. 1993; accessed 6 July 2010. Air Quality Analysis Guidance Handbook. Web site. Available at: http://www.aqmd.gov/ceqa/hdbk.html

2.5 IMPACT ANALYSIS

This section analyzes the potential for significant impacts to air quality that would occur from implementation of the proposed project. Air quality impacts of a project generally fall into four major categories:

1. *Construction Impacts*: temporary impacts, including airborne dust from grading, demolition, and dirt hauling and gaseous emissions from heavy equipment, delivery and dirt hauling trucks, employee vehicles, and paints and coatings.

   Construction emissions vary substantially from day to day, depending on the level of construction phase and weather conditions.

2. *Operational Regional Impacts*: primarily gaseous emissions from natural gas and electricity usage and vehicles traveling to and from a project site.

3. *Operational Local Impacts*: increases in pollutant concentrations, primarily carbon monoxide, resulting from traffic increases in the immediate vicinity of a project, as well as any toxic and odor emissions generated on site.

4. *Cumulative Impacts*: air quality changes resulting from the incremental impact of the project when added to other projects in the vicinity as well as cumulative global climate change impacts

2.5.1 Assessment Methods and Models

Among the modeling tools recommended by SCAQMD, four (4) tools, CALINE4, URBEMIS, EMFAC, and AERMOD, were used to quantitatively evaluate the proposed project's potential impacts to criteria pollutant emission levels.

Methodology to assess the proposed project's impacts on global climate change has not been developed by SCAQMD, state, or federal agencies. No significance thresholds have been established to determine the project's construction and operational impacts on global climate change. Given the absence of methodology and thresholds to evaluate global climate change impacts of the proposed project and the challenges associated with determining criteria for the proposed project-specific significance in regards to GHG emissions, the proposed project's global climate change impacts were analyzed qualitatively according to its operational scenario, size, and location. To quantify the amount of GHG emissions contributed by construction and operation of the proposed project, the URBEMIS 2007 emissions model, the EMFAC 2007 model, and the CCAR General Reporting Protocol were used. Typically, the more energy used during operation of the proposed project, the more GHG emissions will be contributed by the proposed project. Therefore, the quantitative analysis on the proposed project's potential impacts to global climate change also includes the analysis on energy consumption that will be required during its operational phase. Due to the absence of adopted significance criteria and thresholds for GHG emissions, the level of significance of the proposed project's potential impacts to global climate change will be determined by comparing the GHG emissions per capita to the GHG emissions per capita required to reduce California's GHG emissions to 1990 levels (10 metric tons per capita) by 2020 as required by AB 32, as well as the suggested thresholds by CAPCOA.[56]

CALINE4

The SCAQMD recommends that a CO hotspots analysis with CALINE4 be performed if a project results in increasing congestion whereby the LOS of an intersection is changed from C to D or if there is a two percent increase in the volume to capacity ratio of any intersection rated D or worse. As it is anticipated that the proposed project would result in an increase in congestion that would result in a LOS of D or worse at several of the analyzed intersections prior to implementation of traffic mitigation measures, CO hotspots analysis was performed based on a simplified CALINE4 screening procedure developed by the Bay Area Air Quality Management District and accepted by the SCAQMD. This simplified procedure is intended as a screening method that identifies potential CO hotspots. The CALINE4 screening method was used for the six intersections that would experience the greatest increases in traffic volumes as a result of the proposed project. In order to obtain the most conservative results, it was assumed that sensitive receptors were located at the edge of each roadway.

---

[56] California Air Pollution Control Office Association. January 2008. *CEQA and Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act.* Sacramento, CA.

For each intersection analyzed, roadway-specific CO emissions calculated from peak-hour traffic volumes were added to the background CO concentrations. The emission factors used in the CALINE4 calculations were from the EMFAC 2007 model.

URBEMIS Model

The methodology used to analyze construction and operational air quality impacts is consistent with the methods described in the 1993 *CEQA Air Quality Handbook.*[57] The CARB URBEMIS 2007, version 9.2.4, was used to estimate construction emissions from the demolition of up to four buildings (the existing Multi-service Ambulatory Care Center (MACC) Building, Emergency Room, Storage Building, and Cooling Towers) and the construction of approximately 156,700 square feet of new buildings during Tier I and up to approximately 1,814,696 square feet of new buildings during Tier II, although it is understood that the net new development proposed on the campus is less than the approximately 1.8 million square feet. URBEMIS is a computer program that can be used to estimate emissions associated with land development projects in California such as residential neighborhoods, shopping centers, and office buildings; area sources such as gas appliances, wood stoves, fireplaces, and landscape maintenance equipment; and construction projects. The URBEMIS 2007 model directly calculates VOCs, NO_x, CO, SO_2, PM_{10}, $PM_{2.5}$, and CO_2 emissions. SCAQMD regional significance thresholds were used to compare the project's regional construction emission impacts to determine project significance. URBEMIS 2007, version 9.2.4, was also used to analyze the proposed project's operational emissions, which would likely result from the vehicle trips to and from the proposed project site, and area source emissions, which would likely result from natural gas combustion and landscaping activities within the vicinity of the proposed project site. Because the proposed project site does not contain an industrial component that is considered a lead emission source, the concentrations and emissions of lead were not analyzed for the proposed project. The URBEMIS 2007 model was used for analysis of construction impacts to air quality and CO_2 emissions based on the construction scenario described as an element of Section 1.0, *Introduction*.

Assumptions listed in the following were made to perform the air quality technical analysis using the URBEMIS 2007, version 9.2.4 emission model:

1. The proposed project was assumed to consist of a 38-acre development.

2. Tier 1 project construction was assumed to take 37 months in maximum from March 2011 to April 2014.
3. Six construction phases were assumed for Tier I. The activities undertaken within each phase would be as follows:

03/16/2011–04/14/2011:	Demolition
04/15/2011–05/17/2011:	Mass site grading
05/18/2011–08/15/2011:	Trenching
08/16/2011–12/15/2013:	Building construction
12/16/2013–02/12/2014:	Paving
02/13/2014–04/15/2014:	Architectural coating

4. The construction of Tier II was set to cover a ten year period from 2010 to 2020 with eight overlapping phases, each containing the same construction equipment and construction phases as assumed for Tier I:

---

[57] South Coast Air Quality Management District. 1993. *CEQA Air Quality Handbook*. Diamond Bar, CA.

Phase 1 of Tier II: 11/01/2010–11/30/2013
Phase 2 of Tier II: 11/01/2011–11/30/2014
Phase 3 of Tier II: 11/01/2012–11/30/2015
Phase 4 of Tier II: 11/01/2013–11/30/2016
Phase 5 of Tier II: 11/01/2014–11/30/2017
Phase 6 of Tier II: 11/01/2015–11/30/2018
Phase 7 of Tier II: 11/01/2016–11/30/2019
Phase 8 of Tier II: 11/01/2017–11/30/2020

5. It was assumed that a maximum of 1.25 acres would be disturbed daily during grading.

6. It was assumed that 40,000 cubic yards of soil would be exported during mass site grading.

7. The build-out year for Tier I was set to 2014 and the build-out year from Tier II was set to 2020.

8. The winter temperature was set to 60 degrees Fahrenheit and the summer temperature was set to 80 degrees Fahrenheit.

9. Tier I was assumed to require a maximum of 150 construction workers on a daily basis.

10. Tier II was assumed to require a maximum of 150 construction workers on a daily basis.

11. Consistent with the traffic study prepared for the proposed project, it was assumed that the proposed project would generate 19,677 additional daily vehicle trips upon build out of both Tier I and Tier II.

12. Default parameters, such as the horsepower and the operational duration, were used for all construction equipment anticipated to be used for the proposed project.

EMFAC 2007 Model

The CARB Emissions Factors (EMFAC) 2007 model, version 2.3, was used to evaluate the proposed project's air pollutant emissions contributed by mobile sources, such passenger cars, based on the expected vehicle fleet mix, vehicle speeds, commute distances, and temperature conditions for the estimated completion dates of Tier I and Tier II of the proposed project. The EMFAC 2007, version 2.3, which is embedded within the URBEMIS 2007 model, includes emission factors for criteria pollutants. In this analysis, fleet mix, vehicle speeds, commute distances, and temperature conditions were based on the default values in the URBEMIS 2007 and EMFAC 2007 models.

AERMOD

According to SCAQMD's localized significance threshold (LST) methodology, projects greater than 5 acres in size require air quality dispersion modeling to determine whether construction activities would cause or contribute to adverse localized air quality impacts. The criteria pollutants that are required to be analyzed are NO_x, CO, and PM. The two principal components of NO_x are NO_2 and NO, with the vast majority of NO_x emissions existing as NO. However, due to the adverse health effects that are associated with NO_2, the analysis of air quality impacts assumes all NO_X emissions are NO_2 for the purpose of modeling a worst-case scenario.

AMS/EPA Regulatory Model Improvement Committee, AERMIC Model (AERMOD) atmospheric dispersion model can be used for modeling the potential impacts of point, area, or volume sources in simple (i.e., flat) and complex (i.e., hilly) terrain. This program uses Gaussian dispersion to determine concentration of pollutants from sources based on available meteorological data. It is an accepted mathematical estimate of pollutant levels based on distance from a point source and physical conditions of equipment, site, and weather conditions. The model is limited to approximately a 50 kilometer radius, and the units of output are micrograms per cubic meter. This model was used to analyze the proposed project's short-term construction emission impacts on sensitive receptors.

Development of Tier II of the proposed project would occur over the course of 10 years. Construction activities would either occur within localized areas or concurrently at more than one development area within the 38-acre site. For the purposes of conducting conservative air quality dispersion modeling, it was assumed that the proposed project site would consist of 8 separate, approximately 5-acre development areas for Tier II, as well as the specific, known area for Tier I development (Figure 2.5.1-1, *Development Areas Used for Dispersion Modeling*), within the proposed project site. Each development area was modeled based on the worst-case daily emission scenario for each pollutant.

In accordance with SCAQMD's LST methodology, volume sources were set up to model the combustion emissions from construction equipment and area sources were set up to model the fugitive dust emissions from grading activities. Meteorological data provided by SCAQMD for the Lynwood monitoring station was used to run the dispersion model for the proposed project.

Estimated peak concentrations of NO_2 and CO generated by construction activities were added to the respective ambient concentrations to determine significance. The current peak background concentrations for NO_2, 1-hour CO, and 8-hour CO are 0.12, 6, and 4.3, respectively. Consistent with SCAQMD LST methodology, due to the fact that the Basin is currently in non-attainment for $PM_{2.5}$ and PM_{10}, the peak concentrations of $PM_{2.5}$ and PM_{10} generated by AERMOD were not added to the existing background concentrations but instead were compared directly to the SCAQMD thresholds of significance.

Dispersion modeling was not required for the operational phase of the proposed project as the main source of criteria pollutants during operation is expected to be mobile source emissions, which would not be considered to be localized impacts as they would be spread out along roadways throughout the area. SCAQMD recommends applying the LST methodology to the operational phase of a project, only if a project includes mobile sources that would spend long periods of time idling at the site, such as warehouse/transfer facilities, or stationary sources, such as boilers or combustion units.[58]

Although the campus currently contains an existing Central Plant, the proposed project would not increase the capacity of the Central Plant and would not add additional components or equipment. The proposed project does include improvements to the Central Plant, including replacing certain components with more efficient equipment that would be expect to reduce water and salt use. The existing Central Plant currently uses and will continue to use Refrigerant-134, but there will be no anticipated increases in emissions as a result of the proposed project. Due to the fact that the emissions of the Central Plant are an existing condition, no dispersion modeling is required for the proposed project.

FIGURE 2.5.1-1
Development Areas Used for Dispersion Modeling

CCAR General Reporting Protocol

Another method used to estimate the GHG emissions of the proposed project was CCAR's General Reporting Protocol, Version 3.1. The CCAR General Reporting Protocol outlines the GHG emissions reporting rules, emission calculation methodologies, and standardized recommended reporting mechanism. The CCAR General Reporting Protocol provides information on emission factors for CO_2, CH_4, N_2O, and CFCs and methodologies on how to calculate GHG emissions from annual electricity and natural gas consumption.

The methodology to quantify electricity consumption at the proposed project using the CCAR General Reporting Protocol consists of quantification of the annual electricity use required by the proposed project facilities.

2.5.2 Construction Impacts

During construction of the proposed project, there is a potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the proposed project site. The proposed project is anticipated to be developed as described in Section 1.0, *Introduction*. The timeline for construction of the different buildings at the proposed project site would result in the likelihood of overlapping construction activities. Potential emission estimates from construction activities are based on emission factors and construction scenario information for development at the proposed project site. The total amount of construction, including duration and level of construction activity occurring at the proposed project site, would influence the estimated construction emissions and resulting potential impacts. The emission forecasts are therefore based on conservative assumptions about the construction scenario, with a large amount of construction activity occurring in a relatively short time frame. In addition, worker commute trips would vary throughout the construction period. Estimates included in this analysis include the highest potential worker commute trips. Due to the conservative nature of these assumptions, actual emissions from the individual construction projects would most likely be less than the estimates forecasted.

Construction emissions are expected to result from the following activities:

- Demolition of existing structures
- Site grading
- Soil removal
- Delivery and hauling of construction materials and equipment
- Fuel combustion by on-site construction equipment
- Construction worker commute trips
- Application of architectural coatings
- Asphalt operations

The proposed project would include the demolition of up to four buildings. The primary air pollutants emitted during demolition of existing structures and site preparation (i.e., site excavation, grading, and soil removal) activities would be fugitive dust emissions. The delivery and hauling of construction materials and equipment, the use of heavy-duty construction equipment, and the construction workers' commute trips from and to the proposed project site would primarily result in NO_x emissions. During the application of architectural coating and asphalt paving operations, VOCs would likely be released. The construction air impacts assessment considers each of these potential emission sources; however, the level of activity, the specific type of operation, and, for dust, the prevailing weather conditions can contribute to substantial variations in daily construction emissions.

The demolition of the structures shall be preceded by asbestos abatement, as necessary. The contractor shall comply with requirements of SCAQMD Rule 1403 regarding asbestos control during demolition. This rule ensures that if there is any asbestos present in the buildings scheduled for demolition, it is removed and encapsulated prior to demolition so that no asbestos fibers are released. The SCAQMD *CEQA Air Quality Handbook* (1993 edition) states that asbestos emissions from a project are fully mitigated and do not present a significant impact when the project is in compliance with Rule 1403. In addition, should any contamination be found to be present in the soils in the area exposed after demolition, construction shall stop and appropriate health and safety procedures and agency coordination shall be undertaken prior to continuing work on site.

Qualitative GHG Emission Impacts

Tier I

Tier I project construction is anticipated to take up to 37 months with build-out anticipated in 2014. During construction, standard heavy-duty construction equipment would be operated. The relatively small size of the area under construction (approximately 5 acres) and the relatively short duration of construction activities (up to 37 months) would not be expected to result in substantial emissions of GHGs. In addition, it is anticipated that mitigation measures recommended in the Air Quality Subsection 3.2.5, Mitigation Measures, of this EIR for reducing PM_{10} emissions and NO_x emissions and compliance with Leadership in Energy and Environmental Design (LEED) criteria would reduce the proposed project's GHG emission impacts during construction. Therefore, GHG emission impacts due to Tier I of the proposed project's construction phase would be expected to be below the level of significance.

Tier II

Tier II in anticipated to be completed within a ten year period from 2010 to 2020. The construction phase of Tier II of the proposed project would cover an area of approximately 38 acres in size. During construction, standard heavy-duty construction equipment would be operated. The relatively large area under construction and long duration of construction activities would be expected to result in substantial GHG emissions. Therefore, GHG emissions due to Tier II of the proposed project's construction phase may be expected to be above the level of significance.

Quantitative GHG Emission Impacts

GHG emissions during the construction phase can be attributed to emissions from demolition, excavation and construction equipment and mobile emissions from worker and vendor trips.

Tier I

Based on the methods and modeling tools previously described, Tier I construction activities would result in up to a maximum of 12,740 pounds per day of CO_2 emissions, or approximately 3,840 metric tons for the total 37-month duration of the Tier I construction phase, which is equivalent to approximately 0.0004 metric tons per capita (Table 2.5.2-1, *Tier I: Unmitigated Estimated Daily Regional Construction Emissions;* and Appendix B). The annual emissions due to construction of Tier I of the proposed project would be expected to be below the level of significance when compared to

California's GHG emissions target for 2020, 427 million metric tons per year, and the County's GHG emissions target for 2020, 108 million metric tons per year (approximately 9.6 metric tons per capita). In addition, when compared with the suggested thresholds for GHG emissions provided by CAPCOA (Table 3.5.4-1), construction of Tier I of the proposed project would not exceed the suggested cap and trade threshold of 10,000 tons CO_{2e} per year. However, construction of the proposed project may be expected to be above the level of significance if CAPCOA's suggested quantitative threshold of 900 tons of CO_{2e} per year is used. On this basis, and specific to this proposed project only, and because the County is attempting to evaluate the impacts of the proposed project from a conservative worst-case scenario, it can be conservatively determined that the GHG emission impacts due to construction of Tier I of the proposed project may be above the level of significance. (Table 2.5.2-2, *Tier I: Unmitigated Estimated Daily Regional Construction Emissions;* and Appendix B).

TABLE 2.5.2-1
TIER I: UNMITIGATED ESTIMATED DAILY REGIONAL CONSTRUCTION EMISSIONS

Construction Phase	CO_2 Emissions (Pounds/ Day)	Duration of Construction Phase (days)	CO_2 Emissions (Metric tons)	CO_2 Emissions (Metric tons per capita)
Demolition	1,915	22	19	0.0000
Mass Site Grading	9,743	23	102	0.0000
Trenching	3,150	64	91	0.0000
Building Construction[1]	11,890	609	3,284	0.0003
Paving	1,565	43	31	0.0000
Architectural Coating	107	44	2	0.0000
90 worker trips	850	805	310	0.0000
Maximum Total	**12,740**	**805**	**3,840**	**0.0004**

NOTE: Metric tons per capita were calculated using the 2014 population projection for the County.

Tier II

Tier II construction activities would result in up to a maximum of 37,088 pounds per day of CO_2 emissions, or approximately 37,804 metric tons for the total 10-year duration of the Tier II construction phase, which is equivalent to approximately 0.0033 metric tons per capita (Table 2.5.2-2, *Tier II: Unmitigated Estimated Daily Regional Construction Emissions*). The annual emissions during construction of Tier II would be a maximum of 4,206 metric tons per year, or 0.0004 metric tons per capita per year. The annual emissions due to construction of Tier II of the proposed project would be expected to be below the level of significance when compared to California's GHG emissions target for 2020, 427 million metric tons per year, and the County's GHG emissions target for 2020, 108 million metric tons per year (approximately 9.6 metric tons per capita). In addition, when compared with the suggested thresholds for GHG emissions provided by CAPCOA (Table 2.4-1), construction of Tier II of the proposed project would not exceed the suggested cap and trade threshold of 10,000 tons CO_{2e} per year. However, construction of the proposed project may be expected to be above the level of significance if CAPCOA's suggested quantitative threshold of 900 tons of CO_{2e} per year is used. On this basis, and specific to this proposed project only, and because the County is attempting to evaluate the impacts of the proposed project from a conservative worst-case scenario, it can be conservatively determined that the GHG emission impacts due to construction of Tier II of the proposed project may be above the level of significance.

TABLE 2.5.2-2
TIER II: UNMITIGATED ESTIMATED DAILY REGIONAL CONSTRUCTION EMISSIONS

Year	CO_2 Emissions (Pounds/Day)	Duration of Construction Phase (days)	CO_2 Emissions (Metric tons)	CO_2 Emissions (Metric tons per capita)
2010	9,743	45	199	0.0000
2011	21,968	260	2,591	0.0002
2012	33,857	260	3,993	0.0004
2013	35,668	260	4,206	0.0004
2014	35,668	260	4,206	0.0004
2015	35,668	260	4,206	0.0004
2016	35,667	260	4,206	0.0004
2017	35,667	260	4,206	0.0004
2018	35,667	260	4,206	0.0004
2019	23,778	260	2,804	0.0002
2020	11,889	239	1,289	0.0001
150 worker trips	1,420	2,624	1,690	0.0001
Maximum Total	**37,088**	**2,624**	**37,804**	**0.0033**

NOTE: Metric tons per capita were calculated using the 2020 population projection for the County.

Criteria Pollutant Impacts

Tier I

Daily regional construction emissions were estimated by using the URBEMIS 2007 emissions model for the construction scenario for Tier I (Table 2.5.2-3, *Tier I: Unmitigated Estimated Daily Regional Construction Emissions,* and Appendix B*)*. The daily regional construction emissions associated with the proposed project's construction activities for Tier I would not be expected to exceed the SCAQMD regional significance thresholds. Construction of Tier I is currently projected to take approximately 37 months in total. Therefore, regional construction impacts related to the emission of criteria pollutants would be expected to be below the level of significance.

TABLE 2.5.2-3
TIER I: UNMITIGATED ESTIMATED DAILY REGIONAL CONSTRUCTION EMISSIONS

Construction Phase	Construction Emissions (Pounds/Day)					
	VOCs	**NO_x**	**CO**	**SO_x**	**$PM_{2.5}$**	**PM_{10}**
Demolition	3	21	13	0	1	1
Mass Site Grading	7	79	33	<1	9	29
Trenching	4	31	20	0	2	2
Building Construction[1]	10	81	42	<1	3	3
Paving	2	14	11	0	1	1
Architectural Coating	74	<1	0	0	<1	0
90 worker trips	<1	1	6	<1	<1	1
Maximum Regional Total	**74**	**82**	**48**	<1	**9**	**30**
SCAQMD Daily Significance Threshold (Pounds/Day)	**75**	**100**	**550**	**150**	**55**	**150**
Significant?	**No**	**No**	**No**	**No**	**No**	**No**

It is mandatory for all construction projects in the South Coast Air Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Amended on June 3, 2005, the Fugitive Dust Rule 403 requires actions to prevent, reduce, or mitigate fugitive dust emissions of particulate matter in the ambient air as a result of any anthropogenic activities that are capable of generating fugitive dusts. Compliance with Rule 403 would reduce regional PM_{10} emissions associated with grading activities by at least 60 percent.

Tier II

Daily regional construction emissions were estimated by using the URBEMIS 2007 emissions model for the construction scenario for Tier II (Table 2.5.2-4, *Tier II: Unmitigated Estimated Daily Regional Construction Emissions)*. The daily regional construction emissions associated with the proposed project's construction activities for Tier II would be expected to exceed the SCAQMD regional significance thresholds for VOCs and NO_x due to the potential for overlap of the construction phases. Therefore, regional construction impacts related to the emission of criteria pollutants would be expected to be above the level of significance.

TABLE 2.5.2-4
TIER II: UNMITIGATED ESTIMATED DAILY REGIONAL CONSTRUCTION EMISSIONS

	Maximum Construction Emissions (Pounds/Day)					
Year	**VOCs**	**NO_x**	**CO**	**SO_x**	**$PM_{2.5}$**	**PM_{10}**
2010	7	79	34	<1	9	29
2011	16	156	75	<1	11	32
2012	25	217	111	<1	14	34
2013	94	207	116	<1	13	34
2014	94	185	112	<1	12	33
2015	93	166	108	<1	11	32
2016	90	148	105	<1	10	31
2017	88	131	102	<1	10	31
2018	85	118	99	<1	4	5
2019	80	70	65	<1	3	3
2020	76	31	32	<1	1	1
150 worker trips	1	1	7	<1	<1	2
Maximum Regional Total	95	218	123	<1	14	36
SCAQMD Daily Significance Threshold (Pounds/Day)	**75**	**100**	**550**	**150**	**55**	**150**
Significant?	**Yes**	**Yes**	**No**	**No**	**No**	**No**

It is mandatory for all construction projects in the South Coast Air Basin to comply with SCAQMD Rule 403 for Fugitive Dust. Amended on June 3, 2005, the Fugitive Dust Rule 403 requires actions to prevent, reduce, or mitigate fugitive dust emissions of particulate matter in the ambient air as a result of any anthropogenic activities that are capable of generating fugitive dusts. Compliance with Rule 403 would reduce regional PM_{10} emissions associated with grading activities by at least 60 percent.[59]

Toxic Air Contaminants

Tier I

Toxic air contaminant (TAC) impacts at the proposed project site would primarily result from diesel particulate emissions associated with heavy-duty equipment operations and have been analyzed by using the standard health risks assessment methodology to determine "Individual Cancer Risk" of a person continuously exposed to TACs over a 70-year lifetime. Due to the relatively short-term construction schedule of approximately 37 months, construction-related TAC emissions due to construction of Tier I of the proposed project would be expected to be below the level of significance.

Tier II

Toxic air contaminant (TAC) impacts at the proposed project site would primarily result from diesel particulate emissions associated with heavy-duty equipment operations and have been analyzed by using the standard health risks assessment methodology to determine "Individual Cancer Risk" of a person continuously exposed to TACs over a 70-year lifetime. Construction of the proposed project

---

[59] Sapphos Environmental, Inc. July 2010. *Martin Luther King, Jr. Medical Center Campus Redevelopment Project Air Quality and Greenhouse Gas Emissions Technical Impact Report*. Pasadena, CA.

is anticipated to occur within a 10-year time period. Despite the relatively long time frame currently set for construction activities for Tier II, construction equipment would not be anticipated to operate every day throughout the 10 year timeframe. It is anticipated that construction would occur in distinct phases, between which would be periods of inactivity. In addition, the USEPA adopted low sulfur diesel fuel standards in 2006, which reduce the TAC emissions from diesel engines. Therefore, construction-related TAC emissions of the proposed project would be expected to be below the level of significance.

Odor Impacts

Tier I

Odor impacts at the proposed project site would primarily result from equipment exhaust, application of architectural coatings, and asphalt operation. However, since odors are normally localized and would be confined to the proposed project site, an odor nuisance is not likely to happen. The construction of the proposed project would use typical construction equipment, and odors at the proposed project site would be typical for most construction sites. In addition, construction of the proposed project is required to comply with SCAQMD Rule 402; therefore, odor impacts resulting from construction activities for Tier I of the proposed project would be expected to be below the level of significance.

Tier II

Odor impacts at the proposed project site would primarily result from equipment exhaust, application of architectural coatings, and asphalt operation. However, since odors are normally localized and would be confined to the proposed project site, an odor nuisance is not likely to happen. The construction of the proposed project would use typical construction equipment, and odors at the proposed project site would be typical for most construction sites. In addition, construction of the proposed project is required to comply with SCAQMD Rule 402; therefore, odor impacts resulting from construction activities of the proposed project would be expected to be below the level of significance.

Sensitive Receptors

Due to the large amount of construction activities required for complete build-out of the proposed project, sensitive receptors would have the potential be expected to be significantly affected by emissions of criteria pollutants. SCAQMD Sample LST Spreadsheets were used for the daily maximum emissions generated by a construction worst-case scenario for each phase of construction that were inputted into AEMOD for dispersion modeling (Table 2.5.2-5, *Peak SCAQMD Emissions from Sample LST Spreadsheets*; and Appendix C, *SCAQMD Sample LST Spreadsheets*).

TABLE 2.5.2-5
PEAK SCAQMD EMISSIONS FROM SAMPLE LST SPREADSHEETS

Construction Phase	Construction Emissions (Pounds/Day)			
	NO_x	CO	$PM_{2.5}$	PM_{10}
Demolition	29.6	16.7	1.9	3.8
Grading and Trenching	29.4	16.0	2.0	4.8
Building	84.7	36.6	2.9	3.3
Architectural Coating and Paving	22.3	14.1	1.4	1.5

Dispersion modeling using AERMOD was performed for the closest sensitive receptor (Table 2.3.8.1) as well as single-family residences located adjacent to the southern boundary of the proposed project site. Estimated peak concentrations of NO_2 and CO generated by construction activities were added to the respective ambient concentrations to determine significance. The current peak background concentrations for NO_2, 1-hour CO, and 8-hour CO are 0.12, 6, and 4.3, respectively (Table 2.3.6-1).

Tier I

The 1-hour and 8-hour CO emissions at the nearest sensitive receptors during construction of Tier I would not exceed the CAAQS or NAAQS, when added to the peak background concentrations (Table 2.5.2-6, *Tier I Peak Emissions at Nearest Sensitive Receptors;* and Appendix D, *AERMOD Output for the Proposed Project*). Based on the dispersion modeling results, the maximum one-hour NO_2 concentration generated by construction of the proposed project would exceed the 0.18 ppm threshold at the identified off-site receptors (Table 2.5.2-6 and Appendix D). Thus, the localized air quality impacts associated with NO_2 concentrations at sensitive receptors would have the potential to be significant. Due to the fact that the Basin is currently in non-attainment for $PM_{2.5}$ and PM_{10}, the peak concentrations of $PM_{2.5}$ and PM_{10} generated by AERMOD were not added to the existing background concentrations but instead were compared directly to the SCAQMD thresholds of significance. Based on the dispersion modeling results, PM_{10} emissions at all sensitive receptors would be below the level of significance (Table 2.5.2-6 and Appendix D).

TABLE 2.5.2-6
TIER I PEAK EMISSIONS AT NEAREST SENSITIVE RECEPTORS

Receptor Name	1-hour NO_2 (ppm)	1-hour CO (ppm)	8-hour CO (ppm)	24-hourP $M_{2.5}$ ($\mu g/m^3$)	24-hour PM_{10} ($\mu g/m^3$)

SCAQMD				**10.4**	**10.4**

Tier II

The 1-hour and 8-hour CO emissions at the nearest sensitive receptors during construction of Tier II would not exceed the CAAQS or NAAQS, when added to the peak background concentrations (Table 2.5.2-7, *Tier II Peak Emissions at Nearest Sensitive Receptors;* and Appendix D, *AERMOD Output for the Proposed Project*). Based on the dispersion modeling results, the maximum one-hour NO_2 concentration generated by construction of the proposed project would exceed the 0.18 ppm threshold at the identified off-site receptors (Table 2.5.2-7 and Appendix D). Thus, the localized air quality impacts associated with NO_2 concentrations at sensitive receptors would have the potential to be significant. Due to the fact that the Basin is currently in non-attainment for $PM_{2.5}$ and PM_{10}, the peak concentrations of $PM_{2.5}$ and PM_{10} generated by AERMOD were not added to the existing background concentrations but instead were compared directly to the SCAQMD thresholds of significance. Based on the dispersion modeling results, $PM_{2.5}$ and PM_{10} emissions at both of the nearest sensitive receptors would be above the level of significance prior to implementation of mitigation measures (Table 2.5.2-7 and Appendix D).

2.5.3 Operational Impacts

Qualitative GHG Emission Impacts

Tier I

Tier I of the proposed project's operational phase would not be expected to result in substantial increases in GHG emissions. Due to the fact that Tier I would result in a decrease in square footage compared to existing conditions, the electricity consumption and mobile source emissions during operation of Tier I would be expected to be less than the existing conditions. In addition, operation of Tier I would be expected to emit less than significant levels of GHGs since it would incorporate green building design principles. Energy efficiency, reduction in materials and resources, and attainment of the indoor environmental quality would be integrated into the design features of Tier I to reduce or prevent GHG emissions associated with the proposed project's operation. Attainment of LEED credits and the utilization of energy-efficient equipment would be expected to be consistent with the County Energy and Environmental Policy, particularly with the Energy and Water Efficiency Program, the Environmental Stewardship Program, and the Sustainable Design Program set forth in the policy. Therefore, there would be no anticipated significant GHG emission impacts due to operation of Tier I of the proposed project.

Tier II

Incorporation of green building design principles, attainment of LEED credits and the utilization of energy-efficient equipment would be expected to reduce the operational GHG impacts of Tier II to the maximum extent feasible. However, due to the large extent of the Tier II development of the proposed project, and the large number of daily vehicle trips (19,549) expected to occur during operation of the proposed project upon full build-out, the proposed project's operational phase would be expected to result in significant and unavoidable impacts related to GHG emissions.

Quantitative GHG Emission Impacts

Over 50 percent of the electricity generated in California is derived from fossil fuels, such as natural gas and coal.[60] The combustion of fossil fuels for electricity production results in emissions of GHGs.

---

[60] U.S. Environmental Protection Agency. Accessed 21 May 2009. "How Clean Is the Electricity I Use—Power Profiler." Available at: http://www.epa.gov/cleanenergy/energy-and-you/how-clean.html

Therefore, an analysis of projected electricity consumption of the proposed project is required to quantify the potential amount of GHGs emitted by the proposed project.

Two GHG emissions estimation tools, the URBEMIS 2007 model and the CCAR General Reporting Protocol, were used in evaluating the proposed project's potential GHG emission levels due to operation and maintenance. The URBEMIS 2007 model was used to estimate CO_2 emissions from on-road vehicle trips, and the CCAR General Reporting Protocol was used to estimate the CO_{2e} emissions from electricity use. (Table 2.5.3-1, *Estimated Daily Increase in Operational Emissions Due to the Proposed Project;* and Appendix E, *Operational GHG Emissions).*

TABLE 2.5.3-1
ESTIMATED DAILY INCREASE IN OPERATIONAL EMISSIONS DUE TO THE PROPOSED PROJECT

Emission Sources	CO_2 Emissions		
	Pounds/Day	**Metric Tons/Year**	**Metric Tons/Per Capita/Per Year**
Tier I Mobile Source Emissions	-40,594	-6,721	-0.0006
Tier II Mobile Source Emissions	204,009	33,776	0.0030
Net Mobile Source Emissions	**163,415**	**27,055**	**0.0024**
Tier I Electricity Consumption	-8,739	-1,447	-0.0001
Tier II Electricity Consumption	46,825	7,752	0.0007
Net Electricity Consumption	**38,085**	**6,305**	**0.0006**
Total Area Sources	**11,811**	**1,955**	**0.0002**
TOTAL EMISSIONS	**213,311**	**35,315**	**0.0032**

NOTE:

1. Metric tons per capita for Tier I and Tier II were calculated using the 2014 and 2020 population projections for the County, respectively.
2. Negative numbers indicate a decrease in emissions in comparison with existing conditions.

Tier I

Due to the fact that Tier I would reduce the existing square footage of available building space on site, Tier I would result in a decrease in emissions due to electricity consumption and mobile sources compared to existing conditions (Table 2.5.3-1). Based on a build-out year of 2014, results from the URBEMIS 2007 model suggest that CO_2 emissions associated with on-road vehicle use would be reduced by a maximum of approximately 40,560 pounds per day or 6,715 metric tons per year in comparison with existing conditions (Table 2.5.3-1). Results from the CCAR General Reporting Protocol calculations suggest that CO_{2e} emissions associated with electricity consumption would be reduced by a maximum of approximately 8,739 pounds per day or 1,447 metric tons per year in comparison with existing conditions (Table 2.5.3-1). Therefore, there would be no expected GHG emission impacts associated with operation of Tier I.

Tier II

Based on a build-out year of 2020, results from the URBEMIS 2007 model suggest that CO_2 emissions associated with on-road vehicle use would be a maximum of approximately 204,009 pounds per day or 33,776 metric tons per year upon completion of Tier II (Table 2.5.3-1). Tier II would also result in approximately 46,825 pounds per day or 7,752 metric tons of CO_{2e} emissions per year as a result of electricity consumption (Table 2.5.3-1). Using the projected 2020 population for the County, Tier II of the proposed project would be expected to contribute up to 0.004 metric tons of CO_2 per capita per year (Table 2.5.3-1).

The calculations presented do not account for the energy efficiency measures that will be incorporated into the proposed project design. For example, development of the new MACC and the Ancillary Building are currently registered with the U.S. Green Building Council under Leadership in Energy and Environmental Design for New Construction (LEED-NC).[61] The County will seek LEED Silver certification for the MACC and the Ancillary buildings.[62] The LEED program recognizes and promotes a project's success in five areas: (1) sustainable sites, (2) water efficiency, (3) energy and atmosphere efficiencies, (4) materials and resources, and (5) indoor environmental quality. In addition, the federal government has a program titled "Green Guide for Healthcare Construction" (GGHC), which is designed to help hospitals navigate through the LEED program. The proposed project would incorporate energy efficient and sustainable strategies throughout the construction, development, and operation of the proposed project. LEED requires that new construction or renovation projects achieve at least two Optimize Energy Performance points. The projects can achieve two points in this credit either by following a prescriptive compliance path or by demonstrating a percentage improvement in the proposed building performance rating compared to the baseline building performance rating of 14 percent or higher for new buildings or 7 percent or higher for existing building renovations;[63] therefore, the actual CO_{2e} emissions due to electricity consumption will be at least 14 percent less than that predicted for any buildings designed and constructed by the County.

When the worst-case scenario analysis of Tier II is compared with the suggested thresholds for GHG emissions provided by CAPCOA, operation of Tier II of the proposed project would exceed the suggested cap and trade threshold of 10,000 tons CO_{2e} per year as well as the suggested unit-based threshold of 50,000 square feet of commercial building space. On this basis, and specific to this proposed project only, and because the County is attempting to evaluate the impacts of the proposed project from a conservative worst-case scenario, it can be conservatively determined that the GHG emission impacts due to operation of the proposed project may be above the level of significance.

Criteria Pollutant Regional Impacts

The proposed project would not be anticipated to have significant impacts to air quality during operation. Long-term operational air emissions at the proposed project site are likely to result from both stationary sources (i.e., area sources from natural gas combustion and landscape maintenance equipment) and mobile sources. The URBEMIS 2007 model was used to calculate emissions from mobile and area sources (Appendix B). Mobile source emissions in the URBEMIS 2007 emissions model are based on the EMFAC 2007, version 2.3, emission inventory model, which projects emission estimates based upon the expected vehicle fleet mix for the estimated start date of the project, the vehicle speed and distance assumptions, and temperature conditions.

[63] U.S. Green Building Council, Leadership in Energy and Environmental Design Green Building Rating System. October 2007. *New Construction and Major Renovations*. Washington, DC.

Tier I

Tier I of the proposed project would not be anticipated to have significant impacts to air quality during operation. Completion of Tier I of the proposed project would result in a decrease in square footage of facilities on the campus compared to existing conditions and a corresponding reduction in vehicle trips to and from the site. Therefore, Tier I of the proposed project would be responsible for a reduction in emissions related to mobile source emissions (Table 2.5.3-2, *Estimated Daily Operational Emissions* and Appendix B). Therefore, there would be no expected significant regional impacts due to operation of Tier I of the proposed project.

TABLE 2.5.3-2
ESTIMATED DAILY OPERATIONAL EMISSIONS

	Air Pollutants (Pounds/Day)					
Emission Sources	**VOCs**	**NO_x**	**CO**	**SO_x**	**$PM_{2.5}$**	**PM_{10}**

Tier II Mobile Sources	93	105	1,020	2	66	339
Total Mobile Sources	**66**	**71**	**712**	**2**	**53**	**271**
Area Sources	9	10	10	0	<1	<1
Total Emissions	**75**	**81**	**722**	**2**	**53**	**271**
SCAQMD Threshold	**55**	**55**	**550**	**150**	**55**	**150**
Exceedance of Significance?	**Yes**	**Yes**	**Yes**	**No**	**No**	**Yes**

Tier II

Tier II of the proposed project would be anticipated to have significant impacts to air quality during operation. Long-term operational air emissions at the proposed project site are likely to result from both stationary sources (i.e., area sources from natural gas combustion, central plant, and landscape maintenance equipment) and mobile sources. It is anticipated that Tier II of the proposed project would generate approximately 24,582 net daily vehicle trips.[64]

Daily operational emissions of SO_x and $PM_{2.5}$ would not exceed SCAQMD thresholds; however, daily operational emissions of CO, VOCs, NO_X, and PM_{10} would exceed SCAQMD thresholds (Table 2.5.3-2). Thus, the operational impacts of Tier II of the proposed project would be expected to be above the level of significance for these four criteria pollutants.

Criteria Pollutant Local Impacts

Tier I

As noted previously, completion of Tier I of the proposed project would result in a decrease in square footage of facilities on the campus compared to existing conditions and a corresponding reduction in vehicle trips to and from the site. Therefore, localized daily operational emissions would be expected to be below the level of significance.

---

[64] Raju Associates, Inc. July 2010. *Traffic Study for Martin Luther King, Jr. Medical Center Campus Redevelopment Project*. Pasadena, CA.

Tier II

Carbon monoxide is considered a localized problem under Section 9.4 of SCAQMD's *CEQA Air Quality Handbook*; thus, additional analysis when a proposed project is likely to expose sensitive receptors to CO hotspots is required. Localized levels of CO concentrations from vehicles termed as CO hotspots were analyzed for Tier II of the proposed project as additional number of peak hour vehicle trips that would be added to the intersections under the existing congested condition without the proposed project. Results of the CALINE4 screening method indicated that impacts of localized concentrations of CO at sensitive receptors would be below the CAAQS and NAAQS for 1-hour and 8-hour CO concentrations (Appendix F, *CALINE4 Output for the Proposed Project)*. The CALINE4 calculations do not indicate the potential for CO hotspots. Therefore, local impacts of CO as a result of Tier II of the proposed project would be expected to be below the level of significance.

Toxic Air Contaminants

Tier I

As noted previously, completion of Tier I of the proposed project would result in a decrease in square footage of facilities on the campus compared to existing conditions and a corresponding reduction in vehicle trips to and from the site. Therefore, TAC levels would be expected to be below the level of significance.

Tier II

Toxic air contaminants impacts at the proposed project site would primarily result from diesel particulate emissions associated with heavy-duty equipment operations. The operation of Tier II of the proposed project would not generate a substantial number of heavy-duty equipment operations or daily truck trips. Delivery truck trips, during project operation, would be the only primary source contributing to the TAC level at the proposed project site. However, the number of heavy-duty delivery trucks accessing the proposed project site on a daily basis would be minimal due to the application of the proposed project as a medical and mixed use facility. In addition, other sources including manufacturing industries and automobile repair facilities are typical sources of acute and chronically hazardous TACs. Because the proposed project site does not contain manufacturing industries or automobile repair facilities, additional amounts of TACs would be less likely to be contributed to the proposed project site. Therefore, operation-related TAC emissions due to Tier II of the proposed project would be below the level of significance, and, consequently, would have a less than significant impact on human health.

Odor Impacts

Tier I

According to SCAQMD's *CEQA Air Quality Handbook*,[65] odor nuisance is associated with land uses and industrial operations including agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. Since the proposed project development does not include any land uses or industrial operations that are typically associated with odor nuisance, Tier I of the proposed project would cause less than significant odor impacts. Furthermore, although on-site trash receptacles have the potential to create

---

[65] South Coast Air Quality Management District. 1993. *CEQA Air Quality Handbook*. Diamond Bar, CA.

odors, they would be maintained and controlled in a manner that controls adverse odors and complies with SCAQMD Rule 402. Therefore, operational odor impacts due to Tier I of the proposed project would be below the level of significance.

Tier II

According to SCAQMD's *CEQA Air Quality Handbook*,[66] odor nuisance is associated with land uses and industrial operations including agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. Since the proposed project development does not include any land uses or industrial operations that are typically associated with odor nuisance, Tier II of the proposed project would cause less than significant odor impacts. Furthermore, although on-site trash receptacles have the potential to create odors, they would be maintained and controlled in a manner that controls adverse odors and complies with SCAQMD Rule 402. Therefore, operational odor impacts due to Tier II of the proposed project would be below the level of significance.

Sensitive Receptors

Tier I

Localized daily operational emissions, TAC levels, and odor impacts would be expected to be below the level of significance. In addition, implementation of mitigation measures, such as carpooling and the use of public transportation, would reduce NO_x emissions from mobile sources, as well as the overall NO_x emission levels, from the proposed project. Therefore, although there may be short-term related impacts, the long-term exposure of sensitive receptors to the proposed project's operational NO_x emissions would be expected to be below the level of significance.

Tier II

Localized daily operational emissions, TAC levels, and odor impacts would be expected to be below the level of significance. In addition, implementation of mitigation measures, such as carpooling and the use of public transportation, would reduce NO_x emissions from mobile sources, as well as the overall NO_x emission levels, from the proposed project. Therefore, although there may be short-term related impacts, the long-term exposure of sensitive receptors to the proposed project's operational NO_x emissions would be expected to be below the level of significance.

2.6 CUMULATIVE IMPACTS

SCAQMD's methodological framework was used to assess the proposed project's cumulative impacts. To assess cumulative impacts based on the AQMP's forecasts of attainment of ambient air quality standards set forth in the Federal and State Clean Air Acts, this methodological framework takes into account forecasted regional growth projections from SCAG. Cumulative development can affect implementation of the AQMP. The 2007 AQMP was prepared to accommodate growth, to reduce pollutants within the SCAQMD portion of the SCAB, and to minimize the impact on the economy. Growth considered to be consistent with the 2007 AQMP would not interfere with attainment because this growth is included in the projections utilized in the formulation of the AQMP. Consequently, as long as growth in the SCAB is within the projections for growth identified by SCAG,

---

[66] South Coast Air Quality Management District. 1993. *CEQA Air Quality Handbook*. Diamond Bar, CA.

implementation of the 2007 AQMP will not be obstructed by such growth and cumulative impacts would be less than significant.

Tier I

Since the proposed project would not induce substantial population growth and would be consistent with the growth projections anticipated by SCAG (as further discussed in Section 3.9, *Population and Housing,* of this EIR), Tier I of the proposed project would be expected to cause a less than significant cumulative air quality impact in relation to consistency with the AQMP.

However, it was determined that there are at least forty (40) projects (excluding the MLK campus improvements) that could affect the cumulative impact analysis of the proposed project that are anticipated to be implemented within the next year occurring within an approximate 1to 2.25 mile radius of the proposed project site (Section 2.0, *Project Description,* Table 2.6-1). According to the SCAQMD, individual construction projects that exceed the SCAQMD recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the basin is a non-attainment area. As discussed previously, construction and operational air quality emissions from Tier I of the proposed project as analyzed in this EIR would not have the potential to be above the level of significance. Therefore, implementation of Tier I of the proposed project would not be expected to result in cumulative impacts when considered with construction and operation of the related past, present, or reasonably foreseeable, probable future projects.

Tier II

Since the proposed project would not induce substantial population growth and would be consistent with the growth projections anticipated by SCAG (as further discussed in Section 3.9, *Population and Housing,* of this EIR), Tier II of the proposed project would be expected to cause a less than significant cumulative air quality impact in relation to consistency with the AQMP.

However, it was determined that there are at least forty (40) projects (excluding the MLK campus improvements) that could affect the cumulative impact analysis of the proposed project that are anticipated to be implemented within the next year occurring within an approximate 1to 2.25 mile radius of the proposed project site (Section 2.0, *Project Description,* Table 2.6-1). According to the SCAQMD, individual construction projects that exceed the SCAQMD recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the basin is a non-attainment area. As discussed previously, construction and operational air quality emissions from Tier II of the proposed project as analyzed in this EIR may have the potential to be above the level of significance. Therefore, implementation of Tier II of the proposed project would be expected to result in cumulative impacts when considered with construction and operation of the related past, present, or reasonably foreseeable, probable future projects.

2.7 MITIGATION MEASURES

Air quality mitigation measures are provided to reduce criteria pollutant emissions to the maximum extent feasible and to ensure compliance with SCAQMD Rule 403 Fugitive Dust to reduce, prevent, or mitigate PM_{10} emissions from the proposed project's construction phase. These mitigation measures shall be implemented for all areas of construction activities related to the proposed project (referred to as the *project* in the mitigation measures below), both on and off site.

The incorporation of GHG emission mitigation measure GHG-1 would ensure a full implementation of sustainable building design for the proposed project to assist the County in attaining the goal of reducing GHG emissions to 1990 levels by the year 2020 as required by AB 32.

The California Office of Attorney General's guidance to local agencies for addressing GHG emission impacts is recommended for consideration by the County to increase sustainability and reduce GHG emission impacts associated with operation of the proposed project.[67] Among the 52 general applicable project-level measures that can be applied to a diverse range of projects, seven (7) measures have been incorporated into the design of the proposed project.

The CARB's guidance on 44 early action measures to reduce GHG emissions has been considered by the County to reduce GHG emission impacts associated with implementation of the proposed project. In developing mitigation measures for the proposed project, only the feasible GHG emission reduction early action measures provided by the CARB that are also applicable to the proposed project have been recommended for incorporation.

2.7.1 Measure Air-1

Water or a stabilizing agent shall be applied to exposed surfaces in sufficient quantity to prevent generation of dust plumes. Soil moistening shall be required to treat exposed soil during construction of each element of the project to avoid fugitive dust emissions, ensure compliance with current air quality standards, and avoid contributions to cumulative increases in criteria pollutants. Prior to advertising for construction bids for each element of the project, the plans and specifications shall be reviewed by the lead agency to ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to ensure that soil shall be moistened not more than 15 minutes prior to the daily commencement of soil-moving activities and three times a day, or four times a day under windy conditions, to maintain a soil moisture content of 12 percent. The construction contractor shall demonstrate compliance with this measure through the submission of weekly monitoring reports to the lead agency. At a minimum, active operations shall utilize one or more of the applicable best available control measures to minimize fugitive dust emissions from each fugitive dust source type that is part of the active operation.

2.7.2 Measure Air-2

Moistening or covering of excavated soil piles shall be required to treat grading areas during construction of each element of the project to avoid fugitive dust emissions, ensure compliance with current air quality standards, and avoid contributions to cumulative increases in critical pollutants. Prior to advertising for construction bids for the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to ensure that excavated soil piles are watered hourly for the duration of construction or covered with temporary coverings.

2.7.3 Measure Air-3

Discontinuing construction activities that occur on unpaved surfaces during windy conditions shall be required to avoid fugitive dust emissions, ensure compliance with current air quality standards, and avoid contributions to cumulative increases in critical pollutants. Prior to advertising for

---

[67] California Department of Justice Office of the Attorney General. Updated 9 December 2008. *The California Environmental Quality Act Addressing Global Warming Impacts at the Local Agency Level*. Sacramento, CA.

construction bids for each element of the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to cease construction activities that occur on unpaved surfaces during periods when winds exceed 25 miles per hour.

2.7.4 Measure Air-4

Track-out shall not extend 25 feet or more from an active operation, and track-out shall be removed at the conclusion of each workday. Prior to advertising for construction bids for each element of the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to ensure that the track-out shall not extend 25 feet or more from an active operation and that it would be removed at the conclusion of each workday.

2.7.5 Measure Air-5

A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the project site. Washing of wheels leaving the construction site during construction of each element of the project shall be required to avoid fugitive dust emissions, ensure compliance with current air quality standards, and avoid contributions to cumulative increases in criteria pollutants. The lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to clean adjacent streets of tracked dirt at the end of each workday or install on-site wheel-washing facilities.

2.7.6 Measure Air-6

All haul trucks hauling soil, sand, and other loose materials shall be covered (e.g., with tarps or other enclosures that would reduce fugitive dust emissions). All transport of soils to and from the project site for each element of the project shall be conducted in a manner that avoids fugitive dust emissions, ensures compliance with current air quality standards, and avoids contributions to cumulative increases in criteria pollutants. Prior to advertising for construction bids for each element of the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to cover all loads of dirt leaving the site or to leave sufficient freeboard capacity in the truck to prevent fugitive dust emissions en route to the disposal site.

2.7.7 Measure Air-7

Traffic speeds on unpaved roads shall be limited to 15 miles per hour. Prior to advertising for construction bids for each element of the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to ensure a traffic speed limited to 15 miles per hour.

2.7.8 Measure Air-8

Heavy-equipment operations shall be suspended during first- and second-stage smog alerts. Prior to advertising for construction bids for each element of the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to ensure heavy-equipment operations be suspended during first- and second-stage smog alerts.

2.7.9 Measure Air-9

All diesel engines used for construction activities for the project that are not registered under California Air Resources Board's Statewide Portable Equipment Registration Program and have a rating of 50 horsepower (hp) or more, shall meet, at a minimum, the Tier 2 California Emission Standards for Off-road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, section 2423(b)(1) unless that such engine is not available for a particular item of equipment. In the event a Tier 2 engine is not available for any diesel engine larger than 50 hp, that engine shall be equipped with retrofit controls that would provide nitrogen oxide and particulate matter emissions that are equivalent to a Tier 2 engine. All equipment shall be turned off when not in use. Engine idling of all equipment used during both construction and operation/maintenance shall be minimized. All equipment engines shall be maintained in good operating condition and in proposed tune per manufacturers' specification. Prior to advertising for construction bids for each element of the project, the lead agency shall ensure that the plans and specifications for each element of the project include the requirement for the construction contractor to ensure the construction equipment meet the aforementioned criteria.

2.7.10 Measure GHG-1

Prior to construction of the project, the final design plan and schemes shall be reviewed to ensure that the County of Los Angeles conforms to their commitments pursuant to the California Climate Action Registry and the GHG emissions reduction targets established in Assembly Bill 32 are dependent on the incorporation of this mitigation measure, which is based on seven (7) of the sustainable design strategies or comparable measures recommended by the California Office of Attorney General to reduce carbon dioxide (CO_2) emissions per capita:

- Design buildings to be energy efficient. Site buildings to take advantage of shade, prevailing winds, landscaping and sun screens to reduce energy use;

- Install efficient lighting and lighting control systems. Use daylight as an integral part of lighting systems in buildings;

- Create water-efficient landscapes;

- Implement low-impact development practices that maintain the existing hydrologic character of the site to manage storm water and protect the environment. (Retaining storm water runoff on site can drastically reduce the need for energy-intensive imported water at the site.);

- Include mixed-use, infill, and higher density in development projects to support the reduction of vehicle trips, promote alternatives to individual vehicle travel, and promote efficient delivery of services and goods;

- Incorporate provisions for future public transit into project design; and

- Preserve and create open space and parks. Preserve existing trees, and plant replacement trees at a set ratio.

The review will further ensure that all applicable sustainable design measures or comparable measures have been incorporated in to the final project design.

2.8 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Tier I

Implementation of air quality mitigation measures Air-1 through Air-8 would reduce fugitive dust emissions associated with construction activities, which would cause daily PM2.5 and PM_{10} emissions to remain at below the SCAQMD thresholds of significance (Table 2.8-1, *Tier I: Mitigated Estimated Daily Regional Construction Emissions*, and Appendix B).

TABLE 2.8-1
TIER I: MITIGATED ESTIMATED DAILY REGIONAL CONSTRUCTION EMISSIONS

Construction Phase	**Construction Emissions (Pounds/Day)**					
	VOCs	**NO_x**	**CO**	**SO_x**	**$PM_{2.5}$**	**PM_{10}**
Demolition	3	21	13	0	1	1
Mass Site Grading	7	79	34	<1	5	10
Trenching	4	31	20	0	2	2
Building Construction[1]	10	81	42	<1	3	3
Paving	2	14	11	0	1	1
Architectural Coating	74	<1	0	0	<1	0
90 worker trips	<1	1	6	<1	<1	1
Maximum Regional Total	**74**	**82**	**48**	<1	**5**	**11**
SCAQMD Daily Significance Threshold (Pounds/Day)	**75**	**100**	**550**	**150**	**55**	**150**
Significant?	**No**	**No**	**No**	**No**	**No**	**No**

Implementation of mitigation measure Air-9 would ensure that criteria pollutant emissions associated with the use of construction equipment would be reduced to the maximum extent feasible. Therefore, criteria pollutant emissions during construction would remain at below the level of significance.

Mitigation measures Air-1 through Air-9 would also ensure that cumulative air quality impacts during construction would remain at below the level of significance and that construction-related impacts to sensitive receptors would be reduced to below the level of significance.

Mitigation measure GHG-1 would reduce CO_2 emissions contributed by operation of Tier I of the proposed project, thereby assisting compliance with the goals of AB 32 to reduce CO_{2e} emissions to 1990 levels by the year 2020. Mitigation measure GHG-1 would ensure that indirect and cumulative GHG emission impacts would be reduced to the maximum extent feasible. After implementation of mitigation measure GHG-1, potential GHG emission impacts associated with operation of Tier I would remain at below the level of significance. However, cconstruction of Tier I of the proposed project may be expected to remain above the level of significance if CAPCOA's suggested quantitative threshold of 900 tons of CO_{2e} per year is used.

Tier II

Implementation of air quality mitigation measures Air-1 through Air-8 would reduce fugitive dust emissions associated with construction activities, which would cause daily $PM_{2.5}$ and PM_{10} emissions to remain at below the SCAQMD thresholds of significance (Table 2.8-2, *Tier II: Mitigated Estimated Daily Regional Construction Emissions*, and Appendix B).

TABLE 2.8-2
TIER II: MITIGATED ESTIMATED DAILY REGIONAL CONSTRUCTION EMISSIONS

	Maximum Construction Emissions (Pounds/Day)					
Year	**VOCs**	**NO_x**	**CO**	**SO_x**	**$PM_{2.5}$**	**PM_{10}**
2010	7	79	34	<1	5	10
2011	16	156	75	<1	8	13
2012	25	217	111	<1	10	16
2013	94	207	116	<1	9	15
2014	94	185	112	<1	8	14
2015	93	166	108	<1	7	13
2016	90	148	105	<1	7	13
2017	88	131	102	<1	6	12
2018	85	118	99	<1	4	5
2019	80	70	65	<1	3	3
2020	76	31	32	<1	1	1
150 worker trips	1	1	7	<1	<1	2
Maximum Regional Total	95	218	123	<1	10	18
SCAQMD Daily Significance Threshold (Pounds/Day)	**75**	**100**	**550**	**150**	**55**	**150**
Significant?	**Yes**	**Yes**	**No**	**No**	**No**	**No**

Implementation of mitigation measure Air-9 would ensure that criteria pollutants emissions associated with the use of construction equipment would be reduced to the maximum extent feasible. However, VOCs and NO_x emissions during construction would still result in temporary significant and unavoidable impacts.

Mitigation measures Air-1 through Air-9 would also ensure that air quality impacts upon sensitive receptors during construction would be reduced to the maximum extent feasible. However, implementation of Tier II of the proposed project would still have the potential to result in significant impacts to sensitive receptors related to emissions of NO_x, $PM_{2.5}$, and PM_{10}.

Mitigation measures Air-1 through Air-9 would also ensure that cumulative air quality impacts during construction would be reduced to the maximum extent feasible. However, implementation of Tier II of the proposed project would still be expected to result in cumulative construction-related impacts when considered with construction and operation of the related past, present, or reasonably foreseeable, probable future projects.

As there are no feasible mitigation measures for operation of Tier II; therefore, criteria pollutant emissions from mobile sources during operation of Tier II would remain at above the level of significance.

Mitigation measure GHG-1 would reduce CO_2 emissions contributed by operation of Tier II of the proposed project, thereby assisting compliance with the goals of AB 32 to reduce CO_{2e} emissions to 1990 levels by the year 2020. Mitigation measure GHG-1 would ensure that indirect and cumulative GHG emission impacts would be reduced to the maximum extent feasible. However, potential GHG emission impacts associated with construction and operation of Tier II would remain as significant and unavoidable.

Phase Assumptions

Phase: Demolition 3/16/2011 - 4/14/2011 - Default Mass Site Grading/Excavation Description

Building Volume Total (cubic feet): 0

Building Volume Daily (cubic feet): 0

On Road Truck Travel (VMT): 0

Off-Road Equipment:

1 Concrete/Industrial Saws (10 hp) operating at a 0.73 load factor for 8 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day

2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

Phase: Mass Grading 4/15/2011 - 5/17/2011 - Default Fine Site Grading/Excavation Description

Total Acres Disturbed: 5

Maximum Daily Acreage Disturbed: 1.25

Fugitive Dust Level of Detail: Default

20 lbs per acre-day

On Road Truck Travel (VMT): 1739.13

Off-Road Equipment:

1 Graders (174 hp) operating at a 0.61 load factor for 6 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

1 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Trenching 5/18/2011 - 8/15/2011 - Default Trenching Description
Off-Road Equipment:
2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Paving 12/16/2013 - 2/12/2014 - Default Paving Description
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Building Construction 8/16/2011 - 12/15/2013 - Default Building Construction Description
Off-Road Equipment:
2 Aerial Lifts (60 hp) operating at a 0.46 load factor for 8 hours per day
1 Bore/Drill Rigs (291 hp) operating at a 0.75 load factor for 8 hours per day
16 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 8 hours per day
2 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day
3 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day
4 Off Highway Trucks (479 hp) operating at a 0.57 load factor for 8 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Architectural Coating 2/13/2014 - 4/15/2014 - Default Architectural Coating Description
Rule: Residential Interior Coatings begins 1/1/2005 ends 6/30/2008 specifies a VOC of 100
Rule: Residential Interior Coatings begins 7/1/2008 ends 12/31/2040 specifies a VOC of 50
Rule: Residential Exterior Coatings begins 1/1/2005 ends 6/30/2008 specifies a VOC of 250
Rule: Residential Exterior Coatings begins 7/1/2008 ends 12/31/2040 specifies a VOC of 100
Rule: Nonresidential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250
Rule: Nonresidential Exterior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

Operational Changes to Defaults

Urbemis 2007 Version 9.2.4

Detail Report for Summer Construction Unmitigated Emissions (Pounds/Day)

File Name: X:\1217\1217-071\Data\Air Quality\Tier II.urb924

Project Name: MLK Tier II

Project Location: South Coast AQMD

On-Road Vehicle Emissions Based on: Version : Emfac2007 V2.3 Nov 1 2006

Off-Road Vehicle Emissions Based on: OFFROAD2007

CONSTRUCTION EMISSION ESTIMATES (Summer Pounds Per Day, Unmitigated)

	ROG	NOx	CO	SO2	PM10 Dust	PM10 Exhaust	PM10 Total	PM2.5 Dust	PM2.5 Exhaust	PM2.5 Total	CO2

2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Paving 8/1/2013 - 9/30/2013 - Default Paving Description
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2014 - 9/30/2014 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2015 - 9/30/2015 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2016 - 9/30/2016 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2017 - 9/30/2017 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2018 - 9/30/2018 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2019 - 9/30/2019 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Paving 8/1/2020 - 9/30/2020 - Type Your Description Here
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day

1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Building Construction 4/1/2011 - 7/31/2013 - Default Building Construction Description
Off-Road Equipment:
2 Aerial Lifts (60 hp) operating at a 0.46 load factor for 8 hours per day
1 Bore/Drill Rigs (291 hp) operating at a 0.75 load factor for 8 hours per day
16 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 8 hours per day
2 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day
3 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day
4 Off Highway Trucks (479 hp) operating at a 0.57 load factor for 8 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Building Construction 4/1/2012 - 7/31/2014 - Type Your Description Here
Off-Road Equipment:
2 Aerial Lifts (60 hp) operating at a 0.46 load factor for 8 hours per day
1 Bore/Drill Rigs (291 hp) operating at a 0.75 load factor for 8 hours per day
16 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 8 hours per day
2 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day
3 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day
4 Off Highway Trucks (479 hp) operating at a 0.57 load factor for 8 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Building Construction 4/1/2013 - 7/31/2015 - Type Your Description Here
Off-Road Equipment:
2 Aerial Lifts (60 hp) operating at a 0.46 load factor for 8 hours per day

Construction Related Mitigation Measures

The following mitigation measures apply to Phase: Mass Grading 4/15/2011 - 5/17/2011 - Default Fine Site Grading/Excavation Description

For Soil Stablizing Measures, the Apply soil stabilizers to inactive areas mitigation reduces emissions by:

PM10: 84% PM25: 84%

For Soil Stablizing Measures, the Water exposed surfaces 3x daily watering mitigation reduces emissions by:

PM10: 61% PM25: 61%

The following mitigation measures apply to Phase: Architectural Coating 2/13/2014 - 4/15/2014 - Default Architectural Coating Description

For Nonresidential Architectural Coating Measures, the Nonresidential Exterior: Use Low VOC Coatings mitigation reduces emissions by:

ROG: 10%

For Nonresidential Architectural Coating Measures, the Nonresidential Interior: Use Low VOC Coatings mitigation reduces emissions by:

ROG: 10%

Phase Assumptions

Phase: Demolition 3/16/2011 - 4/14/2011 - Default Mass Site Grading/Excavation Description

Building Volume Total (cubic feet): 0

Building Volume Daily (cubic feet): 0

On Road Truck Travel (VMT): 0

Off-Road Equipment:

1 Concrete/Industrial Saws (10 hp) operating at a 0.73 load factor for 8 hours per day

1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 6 hours per day

Phase: Mass Grading 4/15/2011 - 5/17/2011 - Default Fine Site Grading/Excavation Description
Total Acres Disturbed: 5
Maximum Daily Acreage Disturbed: 1.25
Fugitive Dust Level of Detail: Default
20 lbs per acre-day
On Road Truck Travel (VMT): 1739.13
Off-Road Equipment:
1 Graders (174 hp) operating at a 0.61 load factor for 6 hours per day
1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 6 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day
1 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Trenching 5/18/2011 - 8/15/2011 - Default Trenching Description
Off-Road Equipment:
2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
1 Rubber Tired Dozers (357 hp) operating at a 0.59 load factor for 8 hours per day
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Paving 12/16/2013 - 2/12/2014 - Default Paving Description
Acres to be Paved: 1.25
Off-Road Equipment:
4 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 6 hours per day
1 Pavers (100 hp) operating at a 0.62 load factor for 7 hours per day
1 Paving Equipment (104 hp) operating at a 0.53 load factor for 8 hours per day
1 Rollers (95 hp) operating at a 0.56 load factor for 7 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 7 hours per day

Phase: Building Construction 8/16/2011 - 12/15/2013 - Default Building Construction Description
Off-Road Equipment:
2 Aerial Lifts (60 hp) operating at a 0.46 load factor for 8 hours per day
1 Bore/Drill Rigs (291 hp) operating at a 0.75 load factor for 8 hours per day
16 Cement and Mortar Mixers (10 hp) operating at a 0.56 load factor for 8 hours per day

2 Cranes (399 hp) operating at a 0.43 load factor for 6 hours per day
3 Forklifts (145 hp) operating at a 0.3 load factor for 6 hours per day
4 Off Highway Trucks (479 hp) operating at a 0.57 load factor for 8 hours per day
1 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Architectural Coating 2/13/2014 - 4/15/2014 - Default Architectural Coating Description
Rule: Residential Interior Coatings begins 1/1/2005 ends 6/30/2008 specifies a VOC of 100
Rule: Residential Interior Coatings begins 7/1/2008 ends 12/31/2040 specifies a VOC of 50
Rule: Residential Exterior Coatings begins 1/1/2005 ends 6/30/2008 specifies a VOC of 250
Rule: Residential Exterior Coatings begins 7/1/2008 ends 12/31/2040 specifies a VOC of 100
Rule: Nonresidential Interior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250
Rule: Nonresidential Exterior Coatings begins 1/1/2005 ends 12/31/2040 specifies a VOC of 250

APPENDIX C

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses User-Specified Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
```

```
         3. Plume Volume Molar Ratio Method (PVMRM) Used for NO2 Conversion
            with an Equilibrium NO2/NOx Ratio of  0.900
            and with a Default In-stack Ratio of  0.100

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  NO2

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                               ;
Emission Rate Unit Factor =    521.95
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
```

```
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses User-Specified Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Plume Volume Molar Ratio Method (PVMRM) Used for NO2 Conversion
           with an Equilibrium NO2/NOx Ratio of  0.900
           and with a Default In-stack Ratio of  0.100

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  NO2

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                               ;
Emission Rate Unit Factor =    521.95
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses User-Specified Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Plume Volume Molar Ratio Method (PVMRM) Used for NO2 Conversion
           with an Equilibrium NO2/NOx Ratio of  0.900
           and with a Default In-stack Ratio of  0.100

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  NO2

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =    521.95
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses User-Specified Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Plume Volume Molar Ratio Method (PVMRM) Used for NO2 Conversion
           with an Equilibrium NO2/NOx Ratio of  0.900
           and with a Default In-stack Ratio of  0.100

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  NO2

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                               ;

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  CO

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                               ;
Emission Rate Unit Factor =    857.28
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  CO

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =    857.28
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  CO

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
```

```
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                     ;
Emission Rate Unit Factor =    857.28
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  CO
```

```
**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;
Emission Rate Unit Factor =    857.28
                 Output Units   = PPM

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - -

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM25

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                  ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM25

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                    ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM25

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                               ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM25

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                  ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and       4
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM10

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO GAS DRY DEPOSITION Data Provided.

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   9862049.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
           1. Stack-tip Downwash.
           2. Model Accounts for ELEVated Terrain Effects.
           3. Use Calms Processing Routine.
           4. Use Missing Data Processing Routine.
           5. No Exponential Decay for URBAN/Non-SO2

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     8 Source(s);      1 Source Group(s); and       7
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM10

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and
Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    87.00 ;  Decay Coef.
=    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                     ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

APPENDIX F
CALINE4 CALCULATIONS

Background one hour CO concentration is 8.0 ppm.
Background eight hour CO concentration is 6.4 ppm.
Receptor points were assumed to be located at edge of roadway.

Tier I Calculations: Analysis year = 2014
Using EMFAC2007, a 2014 vehicle fleet would emit 3.6 grams CO per mile
Therefore, the Tier I emission factor used was 3.6 g/mi

Tier II Calculations: Analysis year = 2020
Using EMFAC2007, a 2020 vehicle fleet would emit 2.4 grams CO per mile
Therefore, the Tier II emission factor used was 2.4 g/mi

Intersection 25: Compton Avenue/Imperial Highway

Intersection of 4-lane road and a 2-lane road at grade level.

Existing (Baseline) with Ambient Growth (2014) Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,385	1,202
Equation:	$\frac{(11.9)(2,385)(3.6)}{100,000}$	$\frac{(3.7)(1,202)(3.6)}{100,000}$

1-Hr Local Concentration: 1.0 + 0.2 = 1.2 ppm

1-Hr Total Concentration: 1.2 (intersection) + 8.0 (1-hr background) = 9.2 ppm

8-Hr Local Concentration: (1.2) x (.7) = 0.8 ppm

8-Hr Total Concentration: 0.8 (intersection) + 6.4 (8-hr background) = 7.2 ppm

Existing (Baseline) with Ambient Growth (2014) Plus Tier I Project Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,378	1,187
Equation:	$\frac{(11.9)(2,378)(3.6)}{100,000}$	$\frac{(3.7)(1,187)(3.6)}{100,000}$

1-Hr Local Concentration: 1.0 + 0.2 = 1.2 ppm

1-Hr Total Concentration: 1.2 (intersection) + 8.0 (1-hr background) = 9.2 ppm

8-Hr Local Concentration: (1.2) x (.7) = 0.8 ppm

8-Hr Total Concentration: 0.8 (intersection) + 6.4 (8-hr background) = 7.2 ppm

Existing (Baseline) with Ambient Growth (2014) Plus Tier I Project and Related Project/Cumulative Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,445	1,220
Equation:	$\frac{(11.9)(2{,}445)(3.6)}{100{,}000}$	$\frac{(3.7)(1{,}220)(3.6)}{100{,}000}$

1-Hr Local Concentration: 1.0 + 0.2 = 1.2 ppm

1-Hr Total Concentration: 1.2 (intersection) + 8.0 (1-hr background) = 9.2 ppm

8-Hr Local Concentration: (1.2) x (.7) = 0.8 ppm

8-Hr Total Concentration: 0.8 (intersection) + 6.4 (8-hr background) = 7.2 ppm

Existing (Baseline) with Ambient Growth (2020) Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,484	1,255
Equation:	$\frac{(11.9)(2{,}484)(2.4)}{100{,}000}$	$\frac{(3.7)(1{,}255)(2.4)}{100{,}000}$

1-Hr Local Concentration: 0.7 + 0.1 = 0.8 ppm

1-Hr Total Concentration: 0.8 (intersection) + 8.0 (1-hr background) = 8.8 ppm

8-Hr Local Concentration: (0.8) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Existing (Baseline) with Ambient Growth (2020) Plus Tier I and Tier II Project Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,512	1,306
Equation:	$\frac{(11.9)(2{,}512)(2.4)}{100{,}000}$	$\frac{(3.7)(1{,}306)(2.4)}{100{,}000}$

1-Hr Local Concentration: 0.7 + 0.1 = 0.8 ppm

1-Hr Total Concentration: 0.8 (intersection) + 8.0 (1-hr background) = 8.8 ppm

8-Hr Local Concentration: (0.8) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Existing (Baseline) with Ambient Growth (2020) Plus Tier I and Tier II and Related Project/Cumulative Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,596	1,339
Equation:	$\frac{(11.9)(2{,}512)(2.4)}{100{,}000}$	$\frac{(3.7)(1{,}306)(2.4)}{100{,}000}$

1-Hr Local Concentration: 0.7 + 0.1 = 0.8 ppm

1-Hr Total Concentration: 0.8 (intersection) + 8.0 (1-hr background) = 8.8 ppm

8-Hr Local Concentration: (0.8) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Intersection 34: Wilmington Avenue/I-105 Eastbound Ramps

Intersection of 5-lane highway and 2-lane eastbound ramps at grade level.

Existing (Baseline) with Ambient Growth (2014) Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,616	1,045
Equation:	$\frac{(9)(2{,}616)(3.6)}{100{,}000}$	$\frac{(3.7)(1{,}045)(3.6)}{100{,}000}$

1-Hr Local Concentration: 0.8 + 0.1 = 0.9 ppm

1-Hr Total Concentration: 0.9 (intersection) + 8.0 (1-hr background) = 8.9 ppm

8-Hr Local Concentration: (0.9) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Existing (Baseline) with Ambient Growth (2014) Plus Tier I Project Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,505	613
Equation:	$\frac{(9)(2{,}505)(3.6)}{100{,}000}$	$\frac{(3.7)(613)(3.6)}{100{,}000}$

1-Hr Local Concentration: 0.8 + 0.1 = 0.9 ppm

1-Hr Total Concentration: 0.9 (intersection) + 8.0 (1-hr background) = 8.9 ppm

8-Hr Local Concentration: (0.9) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Existing (Baseline) with Ambient Growth (2014) Plus Tier I Project and Related Project/Cumulative Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,639	637
Equation:	$\frac{(9)(2,639)(3.6)}{100,000}$	$\frac{(3.7)(637)(3.6)}{100,000}$

1-Hr Local Concentration: 0.9 + 0.1 = 1.0 ppm

1-Hr Total Concentration: 1.0 (intersection) + 8.0 (1-hr background) = 9.0 ppm

8-Hr Local Concentration: (1.0) x (.7) = 0.7 ppm

8-Hr Total Concentration: 0.7 (intersection) + 6.4 (8-hr background) = 7.1 ppm

Existing (Baseline) with Ambient Growth (2020) Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,378	1,088
Equation:	$\frac{(9)(2,378)(2.4)}{100,000}$	$\frac{(3.7)(1,088)(2.4)}{100,000}$

1-Hr Local Concentration: 0.5 + 0.1 = 0.6 ppm

1-Hr Total Concentration: 0.6 (intersection) + 8.0 (1-hr background) = 8.6 ppm

8-Hr Local Concentration: (0.6) x (.7) = 0.4 ppm

8-Hr Total Concentration: 0.4 (intersection) + 6.4 (8-hr background) = 6.8 ppm

Existing (Baseline) with Ambient Growth (2020) Plus Tier I and Tier II Project Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	3,295	701
Equation:	$\underline{(9)(3,295)(2.4)}$	$\underline{(3.7)(701)(2.4)}$

100,000 100,000

1-Hr Local Concentration: 0.7 + 0.1 = 0.8 ppm

1-Hr Total Concentration: 0.8 (intersection) + 8.0 (1-hr background) = 8.8 ppm

8-Hr Local Concentration: (0.8) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Existing (Baseline) with Ambient Growth (2020) Plus Tier I and Tier II and Related Project/Cumulative Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	3,489	773
Equation:	$\frac{(9)(3,489)(2.4)}{100,000}$	$\frac{(3.7)(773)(2.4)}{100,000}$

1-Hr Local Concentration: 0.8 + 0.1 = 0.9 ppm

1-Hr Total Concentration: 0.9 (intersection) + 8.0 (1-hr background) = 8.9 ppm

8-Hr Local Concentration: (0.9) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Intersection 35: Wilmington Avenue/118th Street

Intersection of 5-lane road and a 2-lane road at grade level.

Existing (Baseline) with Ambient Growth (2014) Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,495	371
Equation:	$\frac{(9)(2,495)(3.6)}{100,000}$	$\frac{(3.7)(371)(3.6)}{100,000}$

1-Hr Local Concentration: 0.8+ 0.0 = 0.8 ppm

1-Hr Total Concentration: 0.8 (intersection) + 8.0 (1-hr background) = 8.8 ppm

8-Hr Local Concentration: (0.8) x (.7) = 0.6 ppm

8-Hr Total Concentration: 0.6 (intersection) + 6.4 (8-hr background) = 7.0 ppm

Existing (Baseline) with Ambient Growth (2014) Plus Tier I Project Conditions

	Primary Road	Secondary Road
Peak-hour Traffic Volume:	2,375	371
Equation:	$\frac{(9)(2,375)(3.6)}{100,000}$	$\frac{(3.7)(371)(3.6)}{100,000}$

SECTION ES
EXECUTIVE SUMMARY

This Biological Resources Technical Report documents information regarding the biological resources for the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project). An evaluation of the biotic resources was conducted at the proposed project location. The site assessment entailed a thorough investigation of the biotic populations and community of the proposed project location with consideration of adjacent areas. As a result of the site assessment, Sapphos Environmental, Inc. has determined that no Significant Ecological Areas (SEA),[1] federally state-listed species by the California Department of fish and Game or by the United States Fish and Wildlife Services, or any state or local species of concern are present on the project location or in any adjacent areas.

---

SECTION 1
INTRODUCTION

Sapphos Environmental, Inc. conducted a literature review and database query for biological resources to assist the County of Los Angeles in identifying the scope and magnitude of potential environmental constraints associated with the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project). The information provided in this report is based on field efforts and a review of readily available databases, public records, maps, web sites, and in-house records covering the California Environmental Quality Act (CEQA) biological resources environmental issue areas. The site assessment and analysis is undertaken to determine if the proposed project may have a significant impact to any sensitive populations or communities in accordance with, but not limited to, federal, state, and local laws, regulations, and ordinances. Biological resources at the proposed project site were evaluated with regard to the County of Los Angeles General Plan;[2] a query of the California Natural Diversity Database (CNDDB)[3] for the U.S. Geological Survey (USGS) 7.5-minute series, South Gate, California, topographic quadrangle,[4] where the proposed project is located; a query of all surrounding USGS 7.5-minute series topographic quadrangles, including Inglewood,[5] Long Beach,[6] Whittier,[7] Torrance,[8] Los Alamitos,[9] El Monte,[10] Hollywood,[11] and Los Angeles;[12] and a review of published and unpublished literature. A site visit was conducted on October 27, 2009, to evaluate the potential presence of significant biological resources at the proposed project site. As a result of the above, with an adherence to the State CEQA Guidelines, there would be no impacts of biotic significance with regard to any federal, state, and local statutes, ordinances, or policies that govern the conservation and protection of biological resources at the proposed project or adjacent areas due to the proposed project.

SECTION 2
PROJECT DESCRIPTION

The proposed project site is situated within the existing 38-acre Martin Luther King, Jr. Medical Center Campus, located at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, in Los Angeles County, California (Figure 2-1, *Project Location Map*). The proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project) site is located within a highly urbanized area, with developed areas surrounding the site. The proposed project site is a hospital facility, characterized by roughly 38 acres of hospital and medical functions. The proposed project is intended to revitalize the campus, enhance patient and staff safety, and improve efficiency and quality of services. The revitalized campus would be designed to improve medical service for the County of Los Angeles and to allow for new, mixed-use development at the proposed project campus. The proposed project would include environmentally sustainable design features to be efficient in the use of energy, water, and other resources.

The proposed project would be implemented in two phases, or tiers. Tier I would involve development of a new Multi-service Ambulatory Care Center (MACC) and the Ancillary Building. Tier I would also include tenant improvements to the North Support Building, South Support Building, and the Plant Management Building; site improvements; and the potential relocation of the MRI Building.

Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building (which will be vacant following construction of the new MACC Building in Tier I) and subsequent demolition of the Emergency Room, MRI Modular Building, and Cooling Towers. Tier II construction would entail additional master-planned mixed-use development, which may include the potential for medical offices, general offices, commercial and retail space, residential units, recreational areas, and other development in support of the campus. The maximum programmed development for Tier II is currently estimated at approximately 1.8 million (1,814,696) square feet.

Project Location Map

SECTION 3
REGULATORY FRAMEWORK

This regulatory framework identifies the federal, state, and local statutes, ordinances, or policies that govern the conservation and protection of biological resources that must be considered by the County of Los Angeles during the decision-making process for projects that have the potential to impact biological resources.

3.1 FEDERAL

3.1.1 Federal Endangered Species Act

The purposes of the federal Endangered Species Act (ESA) are to provide a means to conserve the ecosystems that endangered and threatened species depend on and to provide a program for conservation and recovery of these species. The federal ESA designates species as "endangered" or "threatened" and provides regulatory protection for any species thus designated. Section 9 of the federal ESA prohibits the take of species listed by the U.S. Fish and Wildlife Service (USFWS) as threatened or endangered. As defined in the federal ESA, *take* means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in such conduct." In recognition that take cannot always be avoided, Section 10(a) of the federal ESA includes provisions for take that is incidental to, but not the purpose of, otherwise lawful activities. Section 10(a)(1)(B) permits (incidental take permits) may be issued if taking is incidental and does not jeopardize the survival and recovery of the species in the wild. This regulation was considered applicable to the proposed project site due to the potential presence of two avian and two plant species listed as endangered under the federal ESA.

Section 7(a)(2) of the federal ESA requires all federal agencies, including the USFWS, to evaluate the proposed project with respect to any species proposed for listing or already listed as endangered or threatened and their critical habitat, if any is proposed or designated. Federal agencies must undertake programs for the conservation of endangered and threatened species and are prohibited from authorizing, funding, or carrying out any action that will jeopardize a listed species or destroy or modify its "critical habitat."

As defined in the federal ESA, "Individuals, organizations, states, local governments, and other non-Federal entities are affected by the designation of critical habitat only if their actions occur on Federal lands, require a Federal permit, license, or other authorization, or involve Federal funding."

Listed species are those species provided special legal protection under the federal ESA. A federally or state-listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A federally threatened species is one that is likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal government for listing as endangered or threatened.

Sensitive species are those not listed by the federal government as endangered, threatened, or candidate species but categorized by the federal government as a federal species of concern. *Federal species of concern* is a term-of-art that describes a taxon whose conservation status may be of concern to the USFWS but does not have official status. In addition, the sensitive species include those designated as such by the Bureau of Land Management and the U.S. Forest Service.

3.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) makes it unlawful to pursue, capture, kill, or possess or attempt to do the same to any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union. As with the federal ESA, the MBTA authorizes the Secretary of the Interior to issue permits for incidental take. Nesting birds and the contents of the nest within the construction area of the proposed project are protected pursuant to the MBTA.

3.2 STATE

3.2.1 California Endangered Species Act

The California ESA prohibits the taking of listed species except as otherwise provided in state law. Unlike the federal ESA, the California ESA applies the take prohibitions to species petitioned for listing (state candidates). State lead agencies are required to consult with the California Department of Fish and Game (CDFG) to ensure that any actions undertaken by that lead agency are not likely to jeopardize the continued existence of any state-listed species or result in destruction or degradation of required habitat. CDFG is authorized to enter into memoranda of understanding with individuals, public agencies, universities, zoological gardens, and scientific or educational institutions to import, export, take, or possess listed species for scientific, educational, or management purposes. The California ESA was considered due to the potential for state-listed rare, threatened, or endangered species to be present. This regulation was considered applicable to the proposed project site due to the potential presence of two avian and one plant species listed as endangered under the California ESA.

3.2.2 Native Plant Protection Act

The Native Plant Protection Act includes measures to preserve, protect, and enhance rare and endangered native plants. The definitions of "rare and endangered" differ from those contained in the California ESA. However, the list of native plants afforded protection pursuant to this Act includes those listed as rare and endangered under the California ESA. The Native Plant Protection Act provides limitations on take as follows: "No person will import into this State, or take, possess, or sell within this State" any rare or endangered native plant, except in compliance with provisions of the Act. Individual landowners are required to notify CDFG at least 10 days in advance of changing land uses to allow the CDFG to salvage any rare or endangered native plant material. The Native Plant Protection Act was considered due to the potential for state-listed rare, threatened, or endangered plant species to be present.

Species that are not monitored by the resource agencies but are monitored by private organizations or local municipal governments are considered to be locally important species. For the purposes of this report, locally important species include plants recognized by the California Native Plant Society, a private organization dedicated to the conservation of native plants.

3.3 COUNTY

3.3.1 County of Los Angeles Oak Tree Ordinance

The County Oak Tree Ordinance (Sections 22.56.2020 and 22.56.2070 of the Los Angeles County Zoning Ordinance) stipulates the protection of all oak trees (genus *Quercus*) with an 8-inch diameter at breast height (DBH), or a 12-inch combined DBH for multiple trunks, within the County of Los Angeles. All areas of the County of Los Angeles that are defined as unincorporated or county-owned are subject to the County Oak Tree Ordinance. This regulation was considered applicable to the proposed project site due to the potential presence of native tree species, specifically oak trees.

3.3.2 County of Los Angeles Significant Ecological Areas

The design of the proposed project and the proposed improvements will not cause environmental damage or substantial and avoidable injury to fish or wildlife or their habitat, since the project is not located in a significant ecological area and the initial study for the project shows that the proposed development will not have a significant effect on the environment.[13]

SECTION 4
METHODS

This section of the Biological Resources Technical Report employed in the characterization and evaluation of the proposed project site's potential to have any biologically significant resources of concern by federal, state, and local statutes, ordinances, or policies for the conservation and protection of these resources at the proposed project or adjacent areas.

4.1 LITERATURE REVIEW

A query of the California Natural Diversity Database (CNDDB) identified 18 listed species that are known from the region, including 8 plant species and 10 wildlife species. Of the 18 species listed as rare, threatened, or endangered pursuant to the federal and State ESAs that were identified as having the potential to occur in the region of southwestern county of Los Angeles, none were determined to have the potential to occur within the proposed project area due to lack of suitable habitat. Therefore, there would be no expected impacts to biological resources related to species listed as rare, threatened, or endangered pursuant to the federal and state Endangered Species Acts. The City of Los Angeles Native Tree Ordinance (2006) protects all native Oak tree species (*Quercus* sp.), California Sycamore (*Platanus racemosa*), California Bay (*Umbellularia californica*), and California Black Walnut (*Juglans californica*) trees 4" or greater in diameter at 4.5' above ground and trees on any lot size are protected. Protected tree removal requires a removal permit by the Board of Public Works. Any act that may cause the failure or death of a protected tree requires inspection by the Urban Forestry Division. Therefore, no further analysis is warranted.

4.2 SITE VISIT

A site visit was conducted on October 27, 2009, to evaluate the potential presence of significant biological resources at the proposed project site with respect to the CNDDB. The 38-acre site was walked, and all populations and communities were noted (Appendix A, Avifaunal *Compendium*; Appendix B, *Botanical Compendium*). Included during the site assessment were 56 pictures taken throughout the site, documenting the lack of significant communities or populations (Appendix C, *Site Photographs*).

This section of the Biological Resources Technical Report presents the results of the investigations of biological resources. The scope of the analysis includes the six potential biological effects that could impact biological resources as specified in Appendix G of the California Environmental Quality Act (CEQA) Guidelines.

Habitat Modification or Any Species Identified as a Candidate, Sensitive, or Special Status Species in Local or Regional Plans, Policies, or Regulations, or by the California Department of Fish and Game or the U.S. Fish and Wildlife Service

Listed species

As a result of database searches, literature reviews, contact with California Department of Fish and Game (CDFG), and a site assessment conducted by Sapphos Environmental, Inc. on October 27, 2009, no listed species or designated habitats occur on the proposed project site. A query of the California Natural Diversity Database (CNDDB) identified 17 listed species that are known from the region, including 7 plant species and 10 wildlife species. Of the 17 species listed as rare, threatened, or endangered pursuant to the federal and state Endangered Species Acts (ESAs) that were identified as having the potential to occur in the region of southwestern County of Los Angeles (Table 5-1, *Listed Plant and Wildlife Species with the Potential to Occur in the Region of the Proposed Project Site*), none of the species were determined to have the potential to occur within the proposed project area due to lack of suitable habitat; the site assessment supported these findings.

TABLE 5-1
LISTED PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE

Species	Status	Habitat Requirements	Habitat Assessment
Plants			
Lyon's pentachaeta (*Pentachaeta lyonii*)	FE, SE, CNPS 1B.1	Chaparral, coastal scrub, and valley and foothill grassland. Occurs between 30 and 630 meters above mean sea level (MSL). Blooms from March to August.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
marsh sandwort (*Arenaria paludicola*)	FE, SE, CNPS 1B.1	Marshes and swamps, dense mats of typha, juncus, scirpus in freshwater marshes. Occurs between 10 and 170 meters above MSL.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Braunton'smilk-vetch (*Astragalus brauntonii*)	FE, SE, CNPS 1B.1	Closed-cone coniferous forest, chaparral, coastal scrub, valley and foothill grassland. Occurs in distressed or recently burned areas between 4 and 620 meters above MSL.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
coastal dunes milk-vetch (*Astragalus tener* var. *titi*)	FE, SE, CNPS 1B.1	Coastal bluff scrub, coastal dunes, and coastal prairie. Occurs between 1 and 50 meters above MSL. Blooms from March to May.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.

TABLE 5-1
LISTED PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, *Continued*

Species	Status	Habitat Requirements	Habitat Assessment
Moran's spreading navarretia (*Navarretia fossalis*)	FT, SE, CNPS 1B.1	Chenopod scrub, marshes and swamps, playas, and vernal pools. Occurs between 30 and 1,300 meters above MSL. Blooms from April to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
salt marsh bird's-beak (*Cordylanthus maritimus* ssp. *maritimus*)	FE, SE, CNPS 1B.2	Coastal dunes, marshes, and swamps. Occurs between 0 and 30 meters above MSL. Blooms from May to October.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
California Orcutt grass (*Orcuttia californica*)	FE, SE, CNPS 1B.1	Vernal pools. Occurs between 15 and 660 meters above MSL. Blooms from April to August.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Wildlife			
Palos Verde blue butterfly (*Glaucopsyche lygdamus palosverdesensis*)	FE	Occurs in coastal sage scrub on the Palos Verdes Peninsula and requires either deerweed or locoweed as a host plant.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Mohave tui chub (*Gila bicolor mohavensis*)	FE, SE	Found in deep pools and slough-like areas of the Mojave River, but now only occurs in highly modified refuge sites in San Bernardino County.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
California brown pelican (*Pelecanus occidentalis californicus*)	FE, SE	Nest on islands in the Gulf of California and along the coast to West Anacapa and Santa Barbara Islands. They rarely occur inland.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
California least tern (*Sternula antillarum browni*)	FE, SE	Nest in colonies on bare or sparsely vegetated flat substrates near the coast.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)	SE	Found in association with riparian forest, along lower flood-bottom of larger river systems.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
southwestern willow flycatcher (*Empidonax traillii extimus*)	FE, SE	Found in association with riparian habitat where willow, cottonwoods, and stinging nettles are dense.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Coastal California gnatcatcher (*Polioptila californica californica*)	FT, CSC	Occurs in or near sage scrub habitat, which includes the following plant communities: Venturan coastal sage scrub, Diegan coastal sage scrub, maritime succulent scrub, Riversidean sage scrub, Riversidean alluvial fan scrub, southern coastal bluff scrub, and coastal sage-chaparral scrub.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.

TABLE 5-1
LISTED PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, *Continued*

Species	Status	Habitat Requirements	Habitat Assessment
Belding's savannah sparrow (*Passerculus sandwichensis beldingi*)	SE	Resides year-round in coastal salt marshes from Goleta Slough in Santa Barbara County to northern Baja California. Primarily nests in pickleweed habitat.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
least Bell's vireo *(Vireo bellii pusillus)*	FE, SE	Summer resident in low riparian habitat in vicinity of water or in dry river bottoms below 2,000 feet. Nests along margins of bushes or on twigs projecting into pathways, usually willow, baccharis, mesquite.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Pacific pocket mouse (*Perognathus longimembris pacificus*)	FE, CSC	Found on soils of fine, alluvial sands near the ocean. Open spaces in otherwise dense, weedy areas.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.

KEY:
CSC = California Department of Fish and Game species of special concern
CNPS 1B = Listed as rare, threatened, or endangered in California and elsewhere by the California Native Plant Society
FE = Listed as endangered under the federal Endangered Species Act
FT = Listed as threatened under the federal Endangered Species Act
FC= Federal candidate species
SE = Listed as endangered by the State of California
ST = Listed as threatened by the State of California
Rare = Listed as rare by the State of California

Sensitive species

The proposed project would not be expected to result in impacts to biological resources in relation to sensitive species recognized by USFWS as federal species of concern or by the CDFG as California species of special concern. Sensitive wildlife species are those not listed pursuant to the state and federal ESAs, but listed as federal species of concern, proposed for listing, or identified by the CDFG as California species of special concern. This analysis is based on the habitat requirements and historical occurrences of the sensitive species with the potential to occur in the area. A query of the CNDDB identified no plant species and 14 sensitive wildlife species that are known from the region. Of the 14 sensitive species that were identified as having the potential to occur in the region of southwestern County of Los Angeles (Table 5-2, *Sensitive Plant and Wildlife Species with the Potential to Occur in the Region of the Proposed Project Site*), none of the species was determined to have the potential to occur within the proposed project area due to lack of suitable habitat.

TABLE 5-2
SENSITIVE PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE

Species	Status	Habitat	On-site Potential
Amphibians			
western spadefoot (*Spea hammondii*)	CSC	Require temporary rain pools, with water temperatures between 9 and 30 degrees Celsius for reproducing. Soil characteristics of burrow refuge sites have not been studied. Occurs between near sea level and 1,363 meters above MSL.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Reptiles			
southwestern pond turtle (*Actinemys marmorata pallida*)	CSC, BLM	Require some slack- or slow-water aquatic habitat. Reach higher densities where many aerial and aquatic basking sites are available. Nests are located on unshaded slopes usually within 200 meters of the aquatic site.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
coast (San Diego) horned lizard (*Phrynosoma coronatum blainvillii*)	CSC	Coastal sage, annual grassland, chaparral, oak woodland, riparian woodland, and coniferous forest.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Birds			
Coastal California gnatcatcher (*Polioptila californica californica*)	CSC	Obligate, permanent resident of coastal sage scrub below 2,500 feet in southern California. Low, coastal sage scrub in arid washes, on mesas and slopes.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
burrowing owl (*Athene cunicularia*)	CSC	Found in open grasslands, agricultural and range lands, and desert habitats and are often associated with burrowing animals, specifically the California ground squirrel. They can also inhabit grass, forbs, and shrub stages of pinyon and ponderosa pine habitats.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
tricolored blackbird (*Agelaius tricolor*)	CSC	Freshwater marshes and croplands.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Mammals			
Southern California saltmarsh shrew (*Sorex ornatus salicornicus*)	CSC	No information other than coastal marshes. Likely requires dense ground cover and nesting sites above mean high tide and free from inundation.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.

TABLE 5-2
SENSITIVE PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, *Continued*

Species	Status	Habitat	On-site Potential
Pacific pocket mouse (*Perognathus longimembris pacificus*)	CSC	Inhabits the narrow coastal plains from the Mexican border north to El Segundo. Prefers soils of fine alluvial sands near the ocean.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
greater western mastiff bat (*Eumops perotis californicus*)	CSC, BLM	Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, annual and perennial grasslands, palm oases, chaparral, and desert scrub. Also occurs in urban habitats.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
pocketed free-tailed bat (*Nyctinomops femorosaccus*)	CSC	Associated with rocky, desert areas with relatively high cliffs.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
big free-tailed bat (*Nyctinomops macrotis*)	CSC	Rocky areas in the arid southwest, roosting primarily in crevices in cliffs.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
pallid bat (*Antrozous pallidus)*	CSC	Deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky areas for roosting.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
American badger (*Taxidea taxus*)	CSC	Found in arid, open habitats, particularly grasslands, savannahs, mountain meadows, and desert scrub openings. Needs friable soils for digging and open, uncultivated ground. Occurs at low to moderate slopes. Has been associated with Joshua tree woodland and pinyon-juniper habitats.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
south coast marsh vole (*Microtus californicus stephensi*)	CSC	Marshland habitat (generally restricted to this habitat type)	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.

KEY:
CSC = California Department of Fish and Game Species of Special Concern
BLM = Sensitive species under Bureau of Land Management

As a result of a site reconnaissance to evaluate environmental issue areas conducted by Sapphos Environmental, Inc. on October 27, 2009, a review of an aerial photograph for the proposed project property and surrounding areas, and a review of the habitat requirements of the 14 sensitive species, it was determined that none of the species have the potential to occur on the proposed project site. The proposed project is located in an urban setting lacking the native plant communities needed to support the subject species. Therefore, there would be no expected impacts to biological resources related to sensitive species recognized by USFWS as federal species of concern or by CDFG as California special concern species.

Locally Important Species

The proposed project would not be expected to result in impacts to biological resources that are considered locally important species afforded protection by the CNPS. Locally important plant species are those not listed pursuant to the State or federal ESA, but identified by CNPS as sensitive species that should be considered in assessing the potential effects of proposed projects. A query of the CNDDB identified 23 locally important plant species that are known from the region. Of the 23 locally important species that were identified as having the potential to occur in the region of southwestern County of Los Angeles (Table 5-3, *Locally Important Plant and Wildlife Species with the Potential to Occur in the Region of the Proposed Project Site*), none of the species were determined to have the potential to occur within the proposed project area due to lack of suitable habitat.

TABLE 5-3
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE

Species	Status	Habitat	On-site Potential
Plants			
Southern tarplant (*Centromadia parryi* ssp. *Australis*)	CNPS 1B.1	Marshes and swamps, valley and foothill grassland, and vernal pools. Occurs between 0 and 425 meters above MSL. Blooms from May to November.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Los Angeles sunflower (*Helianthus nuttallii* ssp. *parishii*)	CNPS 1A	Coastal salt and freshwater marshes and swamps. Occurs between 5 and 1675 meters above MSL. Blooms from April to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*)	CNPS 1B.1	Marshes and swamps, playas, and vernal pools. Occurs between 1 and 1,220 meters above MSL. Blooms from February to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
white rabbit-tobacco (*Pseudognaphalium leucocephalum*)	CNPS 2.2	Riparian woodland, cismontane woodland, coastal scrub, chaparral. Occurs between 0 and 2100 meters above MSL. Blooms from July to December.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
San Bernardino aster (*Symphyotrichum defoliatum*)	CNPS 1B.2	Cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and valley and foothill grassland. Occurs between 2 and 2,040 meters above MSL. Blooms from July to November.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site

TABLE 5-3
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, *Continued*

Species	Status	Habitat	On-site Potential
Greata's aster (*Symphyotrichum greatae*)	CNPA 1B.3	Chaparral, cismontane woodland, mesic canyons. Occurs between 800 and 1500 meters above MSL. Blooms from June to October.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
south coast saltscale (*Atriplex pacifica*)	CNPS 1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, and playas. Occurs between 0 and 140 meters above MSL. Blooms from March to October.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Parish's brittlescale (*Atriplex parishii*)	CNPS 1B.1	Chenopod scrub, playas, and vernal pools. Occurs between 25 and 1,900 meters above MSL. Blooms from June to October.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Davidson's saltscale (*Atriplex serenana* var. *davidsonii*)	CNPS 1B.2	Coastal bluff scrub and coastal scrub. Occurs between 10 and 200 meters above MSL. Blooms from April to October.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
estuary seablite (*Suaeda esteroa*)	CNPS 1B.2	Marshes and swamps. Occurs between 0 and 5 meters above MSL. Blooms from May to October.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Santa Barbara morning-glory (*Calystegia sepium* ssp. *bingamiae*)	CNPS 1A	Marshes and swamps. Occurs between 0 and 20 meters above MSL. Blooms from April to May.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
many-stemmed dudleya (*Dudleya multicaulis*)	CNPS 1B.2	Chaparral, coastal scrub, valley and foothill grassland. Occurs in heavy, often clayey soils or grassy slopes between 0 and 790 meters above MSL. Blooms from April to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
round-leaved filaree (*California macrophylla*)	CNPS 1B.1	Cismontane woodland, valley and foothill grassland. Occurs in clay soils between 15 and 1200 meters above MSL. Blooms from March to May.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Parish's gooseberry (*Ribes divaricatum* var. *parishii*)	CNPS 1A	Riparian woodland, salix swales. Occurs between 65 and 100 meters above MSL. Blooms from February to April.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
mud nama (*Nama stenocarpum*)	CNPS 2.2	Marshes and swamps. Occurs between 5 and 500 meters above MSL. Blooms from January to July.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Brand's star phacelia (*Phacelia stellaris*)	CNPS 1B.1	Coastal dunes and coastal scrub. Occurs between 1 and 400 meters above MSL. Blooms from March to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
southern mountains skullcap (*Scutellaria bolanderi* ssp.	CNPA 1B.2	Chaparral, cismontane woodland, lower montane coniferous forests,	Not observed on the proposed project study area. No suitable

TABLE 5-3
LOCALLY IMPORTANT PLANT AND WILDLIFE SPECIES WITH THE POTENTIAL TO OCCUR IN THE REGION OF THE PROPOSED PROJECT SITE, *Continued*

Species	Status	Habitat	On-site Potential
austromontana)		gravely soils on streambanks or in mesic sites in oak or pine woodland. Occurs between 425 and 2000 meters above MSL. Blooms from June to July.	habitat occurs within the proposed project site.
Salt Spring checkerbloom (*Sidalcea neomexicana*)	CNPS 2.2	Chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, and playas. Occurs between 15 and 1,530 meters above MSL. Blooms from March to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Orcutt's linanthus (*Linanthus orcuttii*)	CNPS 1B.3	Chaparral, lower montane coniferous forest. Occurs between 1060 to 2000 meters above MSL. Blooms from May to June.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
prostrate vernal pool navarretia (*Navarretia prostrate*)	CNPS 1B.1	Coastal scrub, meadows and seeps, valley and foothill grassland, and vernal pools. Occurs between 15 and 700 meters above MSL. Blooms from April to July.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
coast woolly-heads (*Nemacaulis denudata* var. *denudate*)	CNPS 1B.2	Coastal dunes. Occurs between 0 and 100 meters above MSL. Blooms from April to September.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
mesa horkelia (*Horkelia cuneata* ssp. *puberula*)	CNPS 1B.1	Chaparral, cismontane woodland, coastal scrub. Occurs between 70 and 810 meters above MSL in sandy or gravelly sites. Blooms from February to July.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.
Plummer's mariposa-lily (*Calochortus plummerae*)	CNPS 1B.2	Coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest. Occurs on rocky and sandy sites between 90 and 1610 meters above MSL. Blooms from June to August.	Not observed on the proposed project study area. No suitable habitat occurs within the proposed project site.

KEY:

CNPS = California Native Plant Society (as List 1, List 2, List 3, or List 4 species). Listed as rare, threatened, or endangered in California and elsewhere by the California Native Plant Society

CNPS2 = CNPS listings from its January 2000 edition of *Inventory of Rare and Endangered Vascular Plants of California*. List 2 (CNPS2) indicates that plants are rare, threatened, or endangered in California, but are common elsewhere (Skinner and Pavlik, 1994).

CNPS 3 = Plants about which we need more information.

CNPS1A = Plant presumed extinct in California by the CNPS

CNPS1B = Plants considered rare, threatened, or endangered in California and elsewhere by the CNPS

Threat ranks:
0.1: Seriously threatened in California.
0.2: Fairly threatened in California.
0.3: Not very threatened in California.

As a result of a site assessment to evaluate environmental issue areas conducted by Sapphos Environmental, Inc. on October 27, 2009, a review of an aerial photograph for the proposed project property and surrounding areas, and a review of the habitat requirements for the subject species, it was determined that the proposed project lacked suitable habitat to support the 23 locally important species with the potential to be present in the region of the proposed project. As described above, the proposed project is in an urban setting lacking the native plant communities needed to support the subject species. Therefore, there would be no expected impacts to biological resources related to species listed as rare, threatened, or endangered pursuant to the federal and State ESAs.

Riparian Habitat or Other Sensitive Natural Community Identified in Local or Regional Plans, Policies, or Regulations, or by the CDFG or USFWS

Sensitive Natural Communities

The proposed project would not be expected to result in impacts to riparian habitat or other sensitive natural communities. Based on the results of the review of the USGS 7.5-minute series South Gate topographic quadrangle[14] and the National Wetlands Inventory map,[15] no natural communities exist within the proposed project area. The proposed project site is an urbanized area with no riparian areas or sensitive natural communities, and consists of existing buildings, paved and landscaped areas. No natural plant communities or habitats exist within the proposed project site. Therefore, there would be no expected impacts to biological resources related to riparian habitat or other sensitive natural communities.

Federally Protected Wetlands as Defined by Section 404 of the Clean Water Act

The proposed project would not be expected to result in impacts to federally protected wetlands as defined by Section 404 of the Clean Water Act through direct removal, filling, hydrological interruption, or other means. Based on the results of the review of the USGS 7.5-minute series South Gate topographic quadrangle[16] and the National Wetlands Inventory map,[17] wetlands or waters under the jurisdiction of the U.S. Army Corps of Engineers pursuant to the Section 404 of the Clean Water Act do not exist at the proposed project site. The proposed project site has been previously developed and includes multiple buildings, paved areas, and landscaped gardens. Therefore, there would be no expected impacts to biological resources related to federally protected wetlands as defined by Section 404 of the Clean Water Act.

Native Resident or Migratory Fish or Wildlife Species or with Established Native Resident, Migratory Wildlife Corridors, or Native Wildlife Nursery Sites

Wildlife Movement/Corridors

The proposed project would not be expected to result in impacts to, or impede the movement of, any migratory fish or wildlife species or with an established wildlife corridor. The entire proposed

[15] U.S. Fish and Wildlife Service. June 1976. *National Wetland Inventory, Pasadena, California*. Washington, DC.

[16] U.S. Geological Survey. [1965] Photo revised 1981. 7.5-Minute Series, South Gate, California, Topographic Quadrangle. Reston, VA.

[17] U.S. Fish and Wildlife Service. June 1976. *National Wetland Inventory, Pasadena, California*. Washington, DC.

project area is set within an urbanized section of Los Angeles County with developed areas surrounding each of its borders.[18] No suitable habitat exists to encourage wildlife movement.[19] Therefore, there would be no expected impacts to biological resources related to movement of any migratory fish or wildlife species or with an established wildlife corridor.

Nursery Site

The proposed project would not be expected to result in impacts to biological resources in relation to impeding the use of native wildlife nursery sites. Based on site visits, the entire proposed project area is set within an urbanized section of Los Angeles County with development surrounding all sides of the proposed project site. The proposed project site has some landscaping and large trees that may be suitable for nesting birds, such as American crow, rock pigeon, and house finch, that surround the proposed project site; however, even with these common species the project site appears to be a sink for their populations, and would not be expected to have an effect on nesting birds in the area. Therefore, there would be no expected impacts to biological resources related to impeding the use of native wildlife nursery sites.

Local Policies or Ordinances Protecting Biological Resources, such as a Tree Preservation Policy or Ordinance

Local Ordinances

The proposed project would not be expected to result in impacts to biological resources in relation to conflicts with any local policies or ordinances, such as Los Angeles County's Oak Tree Ordinance,[20] as no Oaks (*Quercus* sp.) are present on the site. Therefore, there would be no expected impacts to biological resources related to conflicts with any local policies or ordinances protecting biological resources.

Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or Other Approved Local, Regional, or State Habitat Conservation Plan

Based on review of all currently proposed and adopted HCPs, NCCPs, and other approved local, regional, and State conservation plans, it was determined that the proposed project area was not subject to the jurisdiction of a proposed or adopted conservation plan.[21,22] Thus the proposed project would not result in significant impacts to biological resources including, but not limited to, any adopted HCP or NCCP. Further review of local, regional, and state habitat conservation plans not presently listed as an HCP or NCCP determined no proposed or adopted plans with jurisdictional boundaries containing the proposed project site.

AVIAN SPECIES OBSERVED IN THE PROPOSED PROJECT AREA

Family	Species	Year-round Resident	Over-wintering Species	Migrant
Accipitridae: hawks	Cooper's hawk (*Accipiter cooperii*)		+	
	Red-tailed hawk (*Buteo jamaicensis)*		+	
Laridae: gulls	Western gull (*Larus occidentalis*)		+	
	California gull (*larus californicus*)		+	
Columbidae: Pigeons, doves	Rock pigeon (*Columba livia*)	+		
	Eurasian collared-dove (*Streptopelia decaocto*)	+		
	Mourning dove *(Zenaida macroura)*	+		
Trochilidae: hummingbirds	*Selasphorus* spp. hummingbird	+		
Tyrannidae: tyrant flycatchers	black phoebe (*Sayornis nigricans)*	+		
Corvidae: jays, crows	Common raven (*Corvus corax)*	+		
Aegithalidae bushtits	bushtit (*Psaltriparus minimus*)	+		
Mimidae: thrashers	Northern mockingbird *(Mimus polyglottos)*	+		
Sturnidae: starlings	European starling (*Sturnus vulgaris)*	+		
Parulidae: warblers	Orange-crowned warbler (*Vermivora celata*)		+	
	Yellow-rumped warbler (*Dendroica coronata*)		+	
Emberizidae: buntings, sparrows	White-crowned sparrow (*Zonotrichia leucophrys*)		+	
	Dark-eyed junco (*Junco hyemalis*)		+	
Icteridae: blackbirds	Brewer's blackbird (*Euphagus cyanocephalus)*	+		
Fringillidae: finches	House finch *(Carpodacus mexicanus)*	+		
Passeridae	house sparrow (*Passer domesticus*)	+		

APPENDIX B
BOTANICAL COMPENDIUM

APPENDIX B
BOTANICAL COMPENDIUM

TABLE B-1
BOTANICAL COMPENDIUM OBSERVED IN THE PROPOSED PROJECT AREA

Family	Species	Nonnative	Native
Polypodiaceae: Ferns	tree fern (*Dicksonia antarctica*)	+	
Pinaceae: Pines	columnar pines, (*Araucaria columnaris*)	+	
Cupressaceae: Cypresses	Coast Redwood (*Sequoia sempervirens)*	+	
Arecaceae: Palms	Queen Palm (*Syagrus romanzoffiana*)	+	
	California fan palm (*Washingtonia filifera*)	+	
	Mexican fan palm (*Washingtonia robusta*)	+	
	Canary Island date palm (*Phoenix Canariensis*)	+	
Myrtaceae: Eucalyptus	Bottlebrush Sp (*Callistemon* sp.*)*	+	
	Blue Gum, *(Eucalyptus globulus)*	+	
Bombacaceae: Bombax	Silk Floss Tree (*Chorisia speciosa)*	+	
Moraceae: Drumstick trees	Creeping Ficus (*Ficus pumila)*	+	
	Laural fig (*Ficus elastica*)	+	
Sapindaceae: Soapberry	Carrotwood (*Cupaniopsis anacardioides*)	+	
Bignoniaceae: Catalpa	Blue jacaranda (jacaranda *mimosifolia)*	+	
Platanaceae: Sycamore	American sycamore (*Platanus occidentalis)*	+	
Fabaceae: Bean, pea	Flowering Redbud Tree (Cercis Canadensis)	+	
	Coral tree *(Erythrina* sp.)	+	
Oleaceae: Olive	Ash sp *(Fraxinus* sp.*)*	+	
Altingiaceae: Witch hazel	Liquidambar (*Liquidambar styraciflua*)	+	
Ulmaceae: Elm	Chinese Elm (*Ulmus parvifolia)*	+	
Rosaceae: Rose	Bradford Pear (*Pyrus calleryana)*	+	
	Indian Hawthorn (*Rhaphiolepis indica*)	+	
Agapanthaceae: Lily	Afican lily (Agapanthus africanus)	+	
Iridaceae: Iris	Iris sp	+	
Pittosporaceae: Araliales	mock orange (*Pittosporum tobira)*	+	
Araliaceae: Ginseng	English ivy (*Hedera helix*)	+

CULTURAL RESOURCES TECHNICAL REPORT

MARTIN LUTHER KING, JR. MEDICAL CENTER CAMPUS REDEVELOPMENT

CULTURAL RESOURCES TECHNICAL REPORT

The location data for the archaeological resources will not be circulated for public review. To protect the sites from unauthorized excavation, looting, and/or vandalism, the County of Los Angeles has been notified of the need to keep confidential the location of known archaeological resources beyond what is necessary. Records in the information centers are exempt from the California Public Records Act (Government Code Section 6250 et seq.). Government Code Section 6254.19 states, "Nothing in this chapter requires disclosure of records that relate to archaeological sites information maintained by the Department of Parks and Recreation, the State Historical Resources Commission, or the State Lands Commission." Government Code Section 6254 explicitly authorizes public agencies to withhold information from the public relating to "Native American graves, cemeteries, and sacred places maintained by the Native American Heritage Commission." Due to the sensitive nature of cultural resources described herein, this report is confidential and meant for the exclusive use of the County of Los Angeles and other trustee and responsible agencies related to planning, construction, operation, maintenance, and management of the Martin Luther King, Jr. Medical Center Campus Redevelopment Project.

SECTION ES
EXECUTIVE SUMMARY

Sapphos Environmental, Inc. was contracted by the County of Los Angeles Chief Executive Office, (County) to prepare a Cultural Resources Technical Report, in compliance with the California Environmental Quality Act (CEQA), in support of the proposed Martin Luther King, Jr. (MLK) Medical Center Campus Redevelopment project (proposed project) located in the community of Willowbrook, in the unincorporated territory of the County of Los Angeles, California. The proposed project site encompasses the existing 38-acre Martin Luther King, Jr. Medical Center Campus, which is occupied by 15 buildings and several ancillary buildings and facilities that were constructed from 1968 to the early 1990s. The proposed project consists of potential demolition, new construction, potential relocation of a building, tenant improvements in existing buildings, and site improvements. The objective of the cultural resources analysis was to identify any significant cultural resources that may be affected by the implementation of the proposed project, to propose mitigation for any adverse impacts, and to document the findings of significance and nonsignificance. Categories of cultural resources are specified in Appendix G of the California Environmental Quality Act (CEQA) Guidelines as paleontological resources, archaeological resources, historical resources, and human remains.

This technical report presents the results of the investigation. Mitigation measures are recommended to address paleontological resources, historical resources, and human remains. Due to the level of disturbance that has occurred within the proposed project area in conjunction with construction of the Martin Luther King, Jr. Medical Center in 1972, extant archaeological resources would not be likely to be present and no mitigation for archaeological resources is recommended.

ES.1 PALEONTOLOGICAL RESOURCES

Regarding paleontological resources, the proposed project site is underlain by older Quaternary Alluvium, which has the potential to contain significant fossil vertebrates.[1] The proposed project therefore has the potential to result in significant impacts to cultural resources related directly or indirectly to the destruction of a unique paleontological resource. The following paleontological mitigation measure is recommended:

ES.1.1 Mitigation Measure Cultural-1

The impacts to cultural resources related directly or indirectly to the destruction of a unique paleontological resource from the proposed project shall be reduced to below the level of significance through the salvage and disposition of paleontological resources that result from ground-disturbing activities in areas located 20 feet below the ground surface that would have the potential to contact extant older Quaternary Alluvium. Ground-disturbing activities include, but are not limited to, drilling, excavation, trenching, and grading. If paleontological resources are encountered during ground-disturbing activities, the County of Los Angeles shall require and be responsible for salvage and recovery of those resources consistent with standards for such recovery established by the Society of Vertebrate Paleontology:

---

[1] McLeod, Samuel A. 21 November 2009. "Vertebrate Paleontology Section, Natural History Museum of Los Angeles County, Los Angeles, California." Letter response to Chris Purtell, Sapphos Environmental, Inc., Pasadena, CA.

- Paleontological Resources Sensitivity Training is required for all project personnel prior to the start of ground-disturbing activities. This brief (approximately 15 minute) field training reviews what fossils are, what fossils might potentially be found, and the appropriate procedures to follow if fossils are found.

- Prior to any ground-disturbing activities, the County of Los Angeles shall be responsible for creating a site plan that indicates all locations of ground-disturbing activities that affect previously undisturbed native soils in areas located 15 feet below the ground surface or further and have the potential to contact older Quaternary Alluvium.

- A qualified paleontologist shall be retained to implement a monitoring and recovery program in any area identified as having the potential to contain unique paleontological resources.

- Construction monitoring by a qualified paleontological monitor shall be implemented during all ground-disturbing activities that affect areas located 15 feet below the ground surface or further and have the potential to contact older Quaternary Alluvium. Should a potentially unique paleontological resource be encountered, ground-disturbing activities within 100 feet shall cease until a qualified paleontologist assesses the find.

- If fossil localities are discovered, the paleontologist shall assess the find and proceed accordingly. This includes the controlled collection of fossil and geologic samples for processing.

- Daily logs shall be kept by the qualified paleontological monitor during all monitoring activities. The daily monitoring log shall be keyed to a location map to indicate the area monitored, the date, and assigned personnel. In addition, this log shall include information of the type of rock encountered, fossil specimens recovered, and associated specimen data.

- All significant specimens collected shall be appropriately prepared, identified, and catalogued prior to their placement in a permanent accredited repository. The qualified paleontologist shall be required to secure a written agreement with a recognized repository, regarding the final disposition, permanent storage, and maintenance of any significant fossil remains and associated specimen data and corresponding geologic and geographic site data that might be recovered as a result of the specified monitoring program. The written agreement shall specify the level of treatment (i.e., preparation, identification, curation, cataloguing, etc.) required before the fossil collection would be accepted for storage. In addition, a technical report shall be completed.

- Within 90 days of the completion of any salvage operation or monitoring activities, a mitigation report shall be submitted to the County of Los Angeles with an appended, itemized inventory of the specimens. The report and inventory, when submitted to the County of Los Angeles, signify the completion of the program to mitigate impacts to paleontological resources.

ES.2 HISTORICAL RESOURCES

Sapphos Environmental, Inc. identified five historical resources that would be impacted by the proposed project: the Martin Luther King, Jr. Medical Center Campus Historic District and the four contributing buildings that comprise the district: Multi-Service Ambulatory Care Center (MACC; formerly known as the Main Hospital Building); Augustus F. Hawkins Comprehensive Mental Health Center; Interns and Physicians Building; and Dr. H. Claude Hudson Auditorium. The historic district was evaluated as eligible under NRHP and CRHR Criteria A/1 for its exceptional importance in relation to the history and development of the Willowbrook area and direct linkage with the McCone Commission's recommendation for a new hospital in South Los Angeles in the wake of the 1965 civil unrest centered in the Watts community. The historic district and the four NRHP/CRHR-eligible buildings were recorded on California Historic Resources Inventory forms.

The proposed project may result in demolition of the MACC building. Demolition of an historic resource would result in a significant adverse change in the significance of the historic resource, therefore requiring the consideration of mitigation measures. Two mitigation measures are recommended for historical resources:

ES.2.1 Mitigation Measure Cultural-2

Tier II impacts to four significant historical resources (Multi-Service Ambulatory Care Center [MACC], Augustus F. Hawkins Comprehensive Medical Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium) and the integrity of the Martin Luther King, Jr. Medical Center Campus Historic District shall be reduced to below the level of significance through utilization of the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines of Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings* for any proposed alterations, including all site work, structural upgrades, architectural, and mechanical systems improvements and repairs. The work shall conform to the standards and guidelines for "rehabilitation." Conformance with the Secretary of the Interior's Standards shall be monitored by an architectural historian or historic architect who meets the Secretary of the Interior's Professional Qualification Standards. Completion of this mitigation measure shall be monitored and enforced by the County of Los Angeles.

ES.2.2 Mitigation Measure Cultural-3

Tier II impacts resulting from demolition or substantial alteration of significant historical resources not in conformance with the Secretary of the Interior's Standards shall be reduced to the maximum extent feasible through archival documentation of as-found condition. Prior to the initiation of construction activities, the County of Los Angeles shall ensure that documentation of the Martin Luther King, Jr. Medical Center Campus Historic District, Multi-Service Ambulatory Care Center (MACC), Augustus F. Hawkins Comprehensive Medical Health Center, Interns and Physicians Building, and/or Dr. H. Claude Hudson Auditorium is completed in accordance with Historic American Buildings Survey (HABS) requirements for donated material. The documentation shall be in the form of a Historic American Building Survey and shall comply with the *Secretary of the Interior's Standards for Architectural and Engineering Documentation*. The documentation shall include large-format photographic recordation, detailed historic narrative report, measured architectural drawings, and compilation of historic research. The documentation shall be completed by a qualified architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards for History and/or Architectural History. The original archival-quality documentation shall be offered as donated material to Historic American Building

Survey for inclusion in the Library of Congress. Archival copies of the documentation also would be available at the Martin Luther King, Jr. Medical Center campus and maintained by the County of Los Angeles.

ES.2.3 Mitigation Measure Cultural-4

Impacts resulting from the loss of integrity of the Martin Luther King, Jr. Medical Center Campus Historic District such that its significance is materially impaired will be reduced to the maximum extent feasible through the development of a retrospective exhibit detailing the history of the Martin Luther King, Jr. Medical Center Campus Historic District, its significance, and its important details and features. The retrospective exhibit shall be in the form of a physical exhibit installed on the Martin Luther King, Jr. Medical Center Campus, which is located either within a building or on a freestanding kiosk or comparable structure or installation on the property. The exhibit should commemorate the historic appearance of the district and provide the public with sufficient information to understand its historic significance.

The exhibit shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards for History and/or Architectural History. The exhibit should be completed within a period of no more than two years from the date of completion of Tier II of the proposed project.

ES.3 HUMAN REMAINS

ES.3.1 Mitigation Measure Cultural-5

Although the discovery of human remains is not anticipated during ground-disturbing activities for the proposed project, a process has been delineated for addressing the unanticipated discovery of human remains:

- Unanticipated Discovery of Human Remains (Public Resources Code 5097). The Los Angeles County Coroner shall be notified within 24 hours of the discovery of human remains. Upon discovery of human remains, there shall be no further excavation or disturbance of the site or any of that area reasonably suspected to overlie adjacent human remains until the following conditions are met:

- The Los Angeles County Coroner has determined that no investigation of the cause of death is required, and

- Whenever the Native American Heritage Commission receives notification of a discovery of Native American human remains from the Los Angeles County Coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code, it shall immediately notify those persons it believes to be most likely descended from the deceased Native American. If the remains are of Native American origin, the descendants from the deceased Native Americans shall complete their inspection and make recommendations or preferences to the landowner or the person responsible for the excavation work, for treatment or disposition of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98.

ES.3.2 Level of Significance after Mitigation

Implementation of mitigation measure Cultural-1 would reduce any potential significant impacts to cultural resources related to an adverse change in the significance of a unique paleontological resource discovered under Tier I and Tier II to below the level of significance.

Implementation of mitigation measure Cultural-2 would reduce Tier II impacts to the Martin Luther King, Jr. Medical Center Campus Historic District, Multi-Service Ambulatory Care Center (MACC), Augustus F. Hawkins Comprehensive Mental Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium as a result of Tier II of the proposed project to below the level of significance.

Implementation of mitigation measures Cultural-3 and Cultural-4 would reduce Tier II impacts to the Martin Luther King, Jr. Medical Center Campus Historic District, Multi-Service Ambulatory Care Center (MACC), Augustus F. Hawkins Comprehensive Mental Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium as a result of Tier II of the proposed project to the maximum extent feasible. However, the demolition of a historical resource still would remain a significant adverse impact.

Implementation of mitigation measure Cultural-5 would reduce any potential significant impacts to human remains discovered under Tier I or Tier II to below the level of significance.

SECTION 1
INTRODUCTION

1.1 STATEMENT OF PROBLEM

This Cultural Resources Technical Report was prepared to assess the potential effects of construction, operation, and maintenance of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment (proposed project) on cultural resources and the ability to avoid or resolve adverse effects of the proposed project. The objectives of the cultural resources analysis were to identify any significant historic resources that may be affected by the implementation of the proposed project, to propose mitigation for any adverse impacts, and to document the findings of significance and non-significance. The project is located within the community of Willowbrook, an unincorporated area of the County of Los Angeles (County), California. Land use decisions required to accommodate the proposed project would be subject to discretionary approvals by the County Board of Supervisors. Acting in their capacity as lead agency under the California Environmental Quality Act (CEQA), the County would need to determine the potential for the proposed project to result in significant impacts, consider mitigation measures and alternatives capable of avoiding significant impacts, and take the environmental effects of the proposed action into consideration as part of their decision-making process.

1.2 PURPOSE

This Cultural Resources Technical Report provides the substantial evidence on which the required evaluation of feasibility, environmental analysis, and findings of fact in relation to cultural resources can be made. The Cultural Resources Technical Report documents the presence or absence of cultural resources that are afforded protection pursuant to CEQA and other relevant federal, state, and local statues and regulations. This Cultural Resources Technical Report was prepared as an aid to support project-planning efforts to minimize impacts to cultural resources and to provide the County Board of Supervisors with data regarding the potential effects of the proposed project on cultural resources, as well as feasible avoidance and minimization measures to reduce impacts to the maximum extent practicable.

1.3 INTENDED AUDIENCE

This Cultural Resources Technical Report presents the results of the cultural resources assessment for consideration by the Los Angeles County Board of Supervisors, as the lead agency, in their decision-making process related to the proposed project. In addition, the Cultural Resources Technical Report serves as a disclosing document for other trustee and responsible agencies, including the State Historic Preservation Officer and the Native American Heritage Commission. The information contained in this report will be summarized in the enclosed environmental impact report for consideration by the public. However, specific locations of significant archaeological sites will be on file at the County and the South Central Coastal Information Center) located at California State University, Fullerton for review on an "as need to know" basis only, to protect Native American artifacts from vandalism.

1.4 SCOPE OF THE INVESTIGATION

The analysis of cultural resources consists of a summary of the regulatory framework that guides the decision-making process to be undertaken by the County Board of Supervisors, a description of the methods employed to support the characterization and evaluation of cultural resources within the proposed project site, the analysis of baseline conditions for cultural resources, the potential for the proposed project to affect cultural resources, and opportunities to avoid, minimize, or mitigate the potential effects of the proposed project. The report addresses each of the environmental issues considered in Appendix G of the State CEQA Guidelines for cultural resources:[2]

- Unique paleontological resources or sites or unique geologic features
- Archaeological resources
- Historical resources
- Human remains

1.5 SOURCES OF RELEVANT INFORMATION

Information used in the preparation of this Cultural Resources Technical Report was derived from extensive research and literature review, including published and gray literature, consultation with experts knowledgeable of the cultural resources identified as having the potential to occur within the proposed project study area, and field investigation. Sources of relevant information are cited in footnotes and compiled in the References section of this document.

1.6 WORKING DEFINITIONS

There are a number of technical terms that are used in the characterization of baseline conditions and assessment of the potential for the proposed project to result in effects to cultural resources. A glossary of terms used in this report is provided as Appendix A, *Glossary of Terms*.

---

[2] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Section 15000-15387, Appendix G.

SECTION 2
PROJECT DESCRIPTION

2.1 PROJECT LOCATION

The proposed Martin Luther King, Jr. Medical Center Campus Redevelopment Project (proposed project) site is located on the existing 38-acre Martin Luther King, Jr. Medical Center Campus, at 12021 Wilmington Avenue in the community of Willowbrook, in the unincorporated territory of the County of Los Angeles (County), California (Figure 2.1-1, *Regional Vicinity Map*; and Figure 2.1-2, *Local Vicinity Map*).

The proposed project site is located approximately 3 miles north of State Route 91 (SR-91; Artesia Freeway), approximately 3 miles northeast of Interstate 710 (I-710; Long Beach Freeway), approximately 2 miles east of I-110 (Harbor Freeway), less than 1 mile south of SR-90 (East Imperial Highway), and less than 1 mile south of I-105 (Glen Anderson Freeway). The proposed project site can be accessed from East 120th Street or from Wilmington Avenue.

The proposed project site is bounded on the north by East 120th Street, on the east by Wilmington Avenue, on the south by a narrow alley which separates the proposed project site from the residential neighborhood which is largely located north of East 122nd Street, and on the west by Compton Avenue of Los Angeles (Figure 2.1-3, *Project Location Map*). The proposed project site is less than 1 mile north of the City of Compton and less than 1 mile west of the City of Lynwood. The proposed project site is also less than 1 mile south of the City of Los Angeles.

The proposed project site appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle (Figure 2.1-4, *Topographic Map*).[3] Elevations at the proposed project site range from 86 feet above mean sea level (MSL) to 88 feet above MSL. The topography of the site can be generally characterized as flat.

2.2 BACKGROUND AND EXISTING CONDITIONS

2.2.1 Background

The Martin Luther King, Jr. Medical Center Campus began operations in 1972. The Martin Luther King, Jr. Medical Center Campus was developed to address a need for local community services in south Los Angeles. Following the 1965 Watts Civil Unrest/Riots, a commission appointed by the Governor reported a lack of healthcare access as one of the contributing factors to the unrest.[4]

The hospital was operational from 1972 to August 2007, when the license was suspended for the provision of inpatient services at the Martin Luther King, Jr. Medical Center Campus due to concerns over levels of service. Currently, the existing Martin Luther King, Jr. Medical Center Campus (existing campus) is not fully operational; however, the proposed project site provides various outpatient and administrative support services. In 2009, the County initiated improvements to the existing campus to provide community-based inpatient hospital functions and support spaces

Proposed Project Boundary

FIGURE 2.1-4

Topographic Map

that would be seismically compliant beyond 2030 seismic standards established by the Office of Statewide Health and Planning Development (OSHPD). These improvements to the existing campus would be an adjacent and ongoing project.

In 2009, a Categorical Exemption was approved by the County Board of Supervisors for minor renovations and improvements to the existing campus. This process allowed the minor renovations and improvements to the campus to be exempt from the State California Environmental Quality Act (CEQA) process under Class 1, "Existing Facilities"; Class 2, "Replacement or reconstruction of existing schools and hospitals to provide earthquake resistant structures which do not increase capacity more than 50 percent"; and Class 3, "New Construction or Conversion of Small Facilities;"[5] Categorical Exemption [Sections 15301, 15302, and 15303 of the Guidelines], pursuant to the requirements specified in Section 15300.2 of the State CEQA Guidelines.

The upgrades that will be completed as part of project approved in 2009 on the campus include renovation and improvements of up to 172,591 square feet within the Inpatient Tower to include hospital beds and other hospital functions, including the placement of the Emergency Department (ED) on the first floor of the Inpatient Tower, renovation to the basement and second floor, and build-out of three unused upper floors to accommodate the hospital functions use. In addition, the improvements include necessary renovations within other buildings on the existing campus to accommodate various hospital support functions, hospital administration support, and other outpatient services. Renovations to house the hospital support functions and hospital administration support will be placed in the Pediatric Acute Care, Medical Records and Laundry, North Support, South Support, Central Plant, and Plant Management buildings. Renovations to house the outpatient services will be placed in the existing MACC building. The Pediatric Acute Care building will be renovated to serve as the hospital entry and lobby area. Finally, a Pneumatic Tube System (PTS) will be installed in the penthouse to the roof of the Medical Records building. The PTS will serve the Inpatient Tower and Augustus F. Hawkins Comprehensive Mental Health Center buildings. The work described above will operate with the capacity of up to 120 licensed beds; the 120 beds will be located on the first through fifth floors of the Inpatient Tower. These adjacent and ongoing CEQA-exempt improvements to the campus serve as a related project for the proposed project.

The renovations and improvements to the campus as described above will allow the County to regain the hospital license and quickly and cost-effectively meet the unmet inpatient needs for the community, while also allowing the County to reopen a fully functional medical campus that more accurately reflects community needs.

2.2.2 Existing Structures

The existing buildings, structures, and features within the proposed project site are described in this section. These descriptions are based on information provided by the County Chief Executive Office and County Department of Public Works, as well as from information described in a Martin Luther King, Jr. Medical Center Campus Planning Programming Report that was prepared by HMC Architects.[6]

---

[5] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Sections 15301–3.

[6] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus—Campus Planning and Programming Report*. Los Angeles, CA.

The proposed project site consists of 15 buildings: Genesis Clinic, Oasis Clinic (old), Oasis Clinic (new), Registration Building, Augustus F. Hawkins Comprehensive Mental Health Center, Inpatient Tower, MACC building, Pediatric Acute Care Building, Medical Records and Laundry Building, Central Plant, Plant Management Building, North Support Building, South Support Building, Interns and Physicians Building, and Hub Clinic. There is also a multilevel parking structure available for parking and several support and ancillary buildings and facilities including: an Emergency Room, Magnetic Resonance Imaging (MRI) Building, Claude Hudson Auditorium, Cooling Towers, and Storage Building on the proposed project site (Table 2.2.2-1, *Existing Buildings and Structures*; and Figure 2.2.2-1, *MLK Existing Campus Plan*). Below are structural descriptions and status of the existing buildings and other structural components. The developed floor area (not including the parking structure) is approximately 1.2 million square feet. The existing conditions on the campus are described based on the conditions as they occurred on the day that the Notice of Preparation for the EIR was published on March 8, 2010.

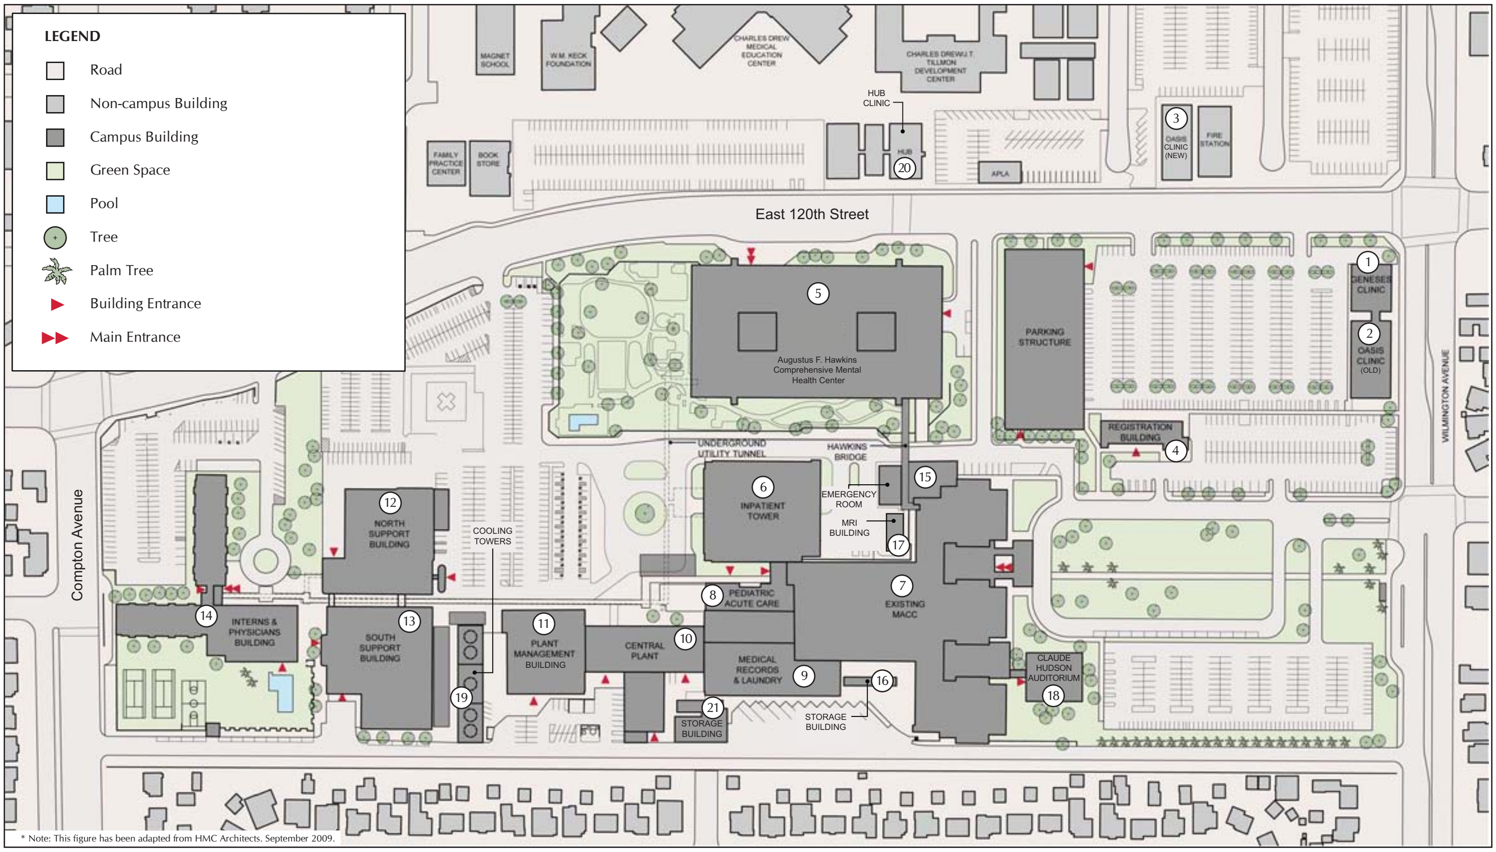
TABLE 2.2.2-1
EXISTING BUILDINGS AND STRUCTURES

	Building/Structure Name	Floor Area (square feet)	Would Buildings/ Structures Remain Following the Development of the Proposed Project? (Y/N)	Floors	Currently Operational	Footprint of Campus Buildings / Structures (square feet)
1	Genesis Clinic	2,100	Y	1	N	2,100
2	Oasis Clinic (old)	2,580	Y	1	N	2,580
3	Oasis Clinic (new)	1,850	Y	1	Y	1,850
4	Registration Building	10,950	Y	2	Y	5,475
5	Augustus F. Hawkins Comprehensive Mental Health Center	226,818	Y	3 (and a basement)	Y	75,606
6	Inpatient Tower	187,676	Y	5 (and a basement)	Y	37,535
7	Multi-Service Ambulatory Care Center (MACC)	495,335	N	5 (and a basement)	Y (not fully operational)	99,067
8	Pediatric Acute Care	7,878	Y	1	Y	7,878
9	Medical Records and Laundry	26,355	Y	1	Y	26,355
10	Central Plant (I and II)	24,103	Y	1	Y	24,103
11	Plant Management Building	15,648	Y	1	Y	15,648
12	North Support Building	52,276	Y	2	Y	26,138
13	South Support Building	34,762	Y	2	Y	17,381
14	Interns and Physicians Building	124,391	Y	6	Y (not fully operational)	20,731
15	Emergency Room	3,300	N	1	Y	3,300
16	Storage Building	1,060	N	1	Y	1,060
17	MRI Building	1,100	Y	1	Y	1,100
18	Claude Hudson Auditorium	3,922	Y	1	Y	3,922
19	Cooling Towers[a]	6,790	N	1	Y	6,790
20	Hub Clinic	12,265	Y	1	Y	12,265
21	Storage Building[b]	2,533	Y	1	Y	2,533
	EXISTING CAMPUS TOTAL	**1,243,692**				**393,417**

NOTES:

a. These structures would likely be reused or replaced following the reuse or replacement of the existing MACC building.

b. This building is in the footprint of the Central Plant expansion, but may just be incorporated during design and remain.



* Note: This figure has been adapted from HMC Architects. September 2009.

FIGURE 2.2.2-1
MLK Existing Campus Plan

2.2.2.1 Genesis Clinic

The Genesis Clinic is a 2,100-square-foot outpatient clinic located on the north-eastern portion of the proposed project site. The Geneses Clinic is attached by a walkway to the Oasis Clinic. This clinic is currently not operational.

2.2.2.2 Oasis Clinic (Old)

The Oasis Clinic is a 2,580-square-foot HIV/AIDS clinic that provided comprehensive HIV/AIDS medical care to patients, while it was operational. The services of this clinic included nutritional counseling; treatment education; women's services; mental health; on-site case management; Aids Drug Assistance Program enrollment, orientation, and education for patients diagnosed with HIV; hormone therapy; and adolescent services. This clinic is currently not operational.

2.2.2.3 Oasis Clinic (New)

The Oasis Clinic, located to the north of East 120th Street, is a 1,850-square-foot HIV/AIDS clinic that provides comprehensive HIV/AIDS medical care to patients. The services of this clinic include nutritional counseling; treatment education; women's services; mental health; on-site case management; Aids Drug Assistance Program enrollment, orientation, and education for patients diagnosed with HIV; hormone therapy; and adolescent services.

2.2.2.4 Registration Building

The 10,950-square-foot Registration Building is a two-story building, which provides office space in support of the campus. The registration building is located off the existing main entrance of the proposed project site, off Wilmington Avenue.

2.2.2.5 Augustus F. Hawkins Comprehensive Mental Health Center

The existing 226,818-square-foot Augustus F. Hawkins Comprehensive Mental Health Center is a three-story building with a partial one-level basement and was constructed in 1979. The building provides inpatient and outpatient mental healthcare. This building is composed of reinforced-concrete construction. The lateral-force-resisting system is composed of reinforced-concrete shear walls. The foundation system is composed of reinforced-concrete piles. The building is categorized by the OSHPD as Structural Performance Category–4 (SPC-4), which means that the building can remain functional to beyond the year 2030.

2.2.2.6 Inpatient Tower

The 187,676-square-foot Inpatient Tower was constructed in 1993. This building consists of a five-floor facility with a one-level basement that provides outpatient services. The roof of the Inpatient Tower contains a helipad that is used for hospital specific emergency use. The building is base isolated, utilizing rubber-bearing isolators and sliders to reduce the seismic forces or accelerations experienced by the building in a seismic event. The building superstructure is composed of structural steel construction. The gravity system utilizes a concrete-filled metal deck supported by structural steel beams, girders, and columns. Special concentric-braced frames are used for the building's lateral-force-resisting system. The foundation system is composed of cast-in-place concrete-drilled piles. The SPC of the building is categorized by California OSHPD as SPC-5, which is the highest SPC rating and permits the building to be used for hospital functions beyond the year 2030.

The CEQA-exempt, ongoing project includes installation of a pneumatic tube blower room on the roof of the existing building. This would probably require strengthening of the building as well as localized strengthening of the framing to support the added weight.

2.2.2.7 Multi-Service Ambulatory Care Center (MACC)

The existing 495,335-square-foot MACC was constructed in the late 1960s. This building is a six-story building with a penthouse constructed in the late 1960s. The building consists of three structurally independent buildings: Central Tower, North Tower, and South Tower. This building was formerly used as a 437-bed inpatient, outpatient, and emergency facility. All components of the MACC building are composed of reinforced concrete construction. The gravity system utilizes two-way reinforced concrete slabs supported by reinforced concrete beams and columns. The lateral-force-resisting system is composed of reinforced concrete shear walls. The foundation system is composed of cast-in-place concrete drilled piles. The SPC of the building is categorized by OSHPD as SPC-1.

2.2.2.8 Pediatric Acute Care Building

The existing 7,878-square-foot Pediatric Acute Care Building is a one-story building with a mezzanine level and was constructed in 1992. The building is composed of structural steel construction. The gravity system utilizes a concrete-filled metal deck supported by structural steel beams, girders, and columns. Special concentric braced frames are used for the building's lateral-force-resisting system. The foundation system is composed of cast-in-place concrete drilled piles. The building is categorized by OSHPD as SPC-3, which permits the building to remain functional to the year 2030 and beyond. The existing Nonstructural Performance Category (NPC) of the building is NPC-3. Under the CEQA-exempt ongoing project, the building will be upgraded to continue to be used for hospital functions.

2.2.2.9 Medical Records and Laundry Building

The existing 26,355-square-foot Medical Records Building is a one-story building constructed in 1972. The building is composed of reinforced-concrete construction. The gravity system utilizes two-way reinforced-concrete slabs supported by reinforced-concrete beams and columns. The lateral-force-resisting system is composed of reinforced-concrete shear walls. The foundation system is composed of cast-in-place concrete drilled piles. The building is categorized by the OSHPD as SPC-2, which means that the building can remain functional until only the year 2030, unless it is brought into compliance with the OSHPD structural provisions. Under the CEQA-exempt ongoing project, the building will be upgraded seismically to bring it up to OSHPD SPC-4 or SPC-5, thus allowing the building to be used for inpatient functions until the year 2030 and beyond. The seismic retrofit work would include the addition of new reinforced-concrete shear walls, mitigation of existing discontinuous shear wall conditions, and possible localized strengthening of existing foundations. The building is also expected to be completely gutted, and all new nonstructural and information technology work would comply with the current code.

The CEQA-exempt, ongoing project includes installation of a pneumatic tube blower room on the roof of the existing building. This would probably require strengthening of the building as well as localized strengthening of the framing to support the added weight.

2.2.2.10 Central Plant

The 24,103-square-foot Central Plant was constructed in two phases. The Phase I component is a single-story building, with partial mezzanine floor, built in the 1960s. Roof structure consists of reinforced concrete one-way slab supported by tapered steel girder. Concrete shear walls form the perimeter of the building and provide the seismic bracing for the building. Foundation system of the building consists of cast-in-place concrete piles. However, the mechanical, electrical, and plumbing equipment upgrade within it and some structural work (voluntary) were performed in 1993 under OSHPD permit number HS912289. OSHPD records show the building rated as SPC-1. Under the CEQA-exempt ongoing project, the building will be upgraded seismically to bring it up to OSHPD SPC-4 or SPC-5, thus allowing the building to be used for hospital function until the year 2030 and beyond.

The Central Plant Phase II building, located to the south of the Phase I building, was constructed in 1975. The building structure currently has an SPC-4 rating; therefore, no seismic retrofit upgrade of the building is required. The construction of the Phase II building is similar to the Phase I building. There is an underground water storage tank, measuring 47 feet by 47 feet by 22.5 feet deep and occupying the southern half of the building. Construction of water storage tank consists of cast-in-place concrete slabs and walls. Under the CEQA-exempt ongoing project, new plant equipment will be placed on the floor slab above the tank, which may require strengthening.

The CEQA-exempt ongoing project, a 6,000-square-foot expansion to the Central Plant will include installation of chiller equipment on the roof.

2.2.2.11 Plant Management Building

The 15,648-square-foot Plant Management Building supports campus functions at the proposed project site. This building is architecturally comparable to the other structures on the proposed project site in that it has concrete walls. Under the CEQA-exempt ongoing project, renovations and improvements to the interior of the building may be required.

2.2.2.12 North Support Building

The existing 52,276-square-foot North Support Building is a two-story building, constructed in two phases. The original building, which consisted of the lower full level and a partial second level, was built as a concrete structure in 1973. The second floor and roof consist of two-way waffle slab supported on concrete columns. Perimeter concrete walls provide lateral bracing to the structure. Foundation system consists of cast-in-place drilled pile. The second phase consisted of capturing the setback area over the second floor at the east side to provide additional space in the late 1980s. The addition was constructed of steel framing with concrete fill roof deck. The two phases appear to be connected so that the buildings function structurally as one. Under the CEQA-exempt ongoing project, interior renovations to the first and second floors will be included.

2.2.2.13 South Support Building

The 34,762-square-foot South Support building is a single-story concrete building with partial mezzanine floor, built in the early 1970s. Construction is similar to the North Support building. The gravity system of the building consists of concrete waffle slab supported on concrete columns. The lateral-force-resisting system is composed of reinforced concrete shear walls. Under the CEQA-exempt ongoing project, interior renovations will be included.

2.2.2.14 Interns and Physicians Building

The 124,391-square-foot Interns and Physicians Building is a six-story building also built in the 1970s. This building is currently not fully operational. This building housed mainly the interns and physicians involved in the Physician Assistant Program of the Charles R. Drew Postgraduate Medical School. This building is architecturally comparable to the other structures on the proposed project site in that it has concrete walls.

The 1,100-square-foot MRI Building houses the MRI systems. This one-story structure is located north of the existing MACC building and may be relocated in Tier I of the proposed project.

2.2.2.15 Claude Hudson Auditorium

The 3,922-square-foot Claude Hudson Auditorium is a one-story structure that is attached by a walkway to the existing MACC building. This building may remain following the reuse or replacement of the existing MACC building.

2.2.2.16 Cooling Towers

The 6,790-square-foot Cooling Towers are one-story structures that serve the heat removal and heating, ventilating, air conditioning functions of the existing MACC. These structures may be reused or replaced following the reuse or replacement of the existing MACC building in Tier II of the proposed project.

2.2.2.17 Hub Clinic

The 12,265-square-foot Hub Clinic is situated north of the Hawkins Building off East 120th Street. This is a one-story building. The Hub Clinic services the needs of children and families in the foster care system.

2.2.2.18 Storage Building

The 2,533-square-foot, one-story Storage Building is currently used for storage. This building is located south of the Central Plant and Medical Records and Laundry Buildings. This building will be removed under the CEQA-exempt ongoing project.

2.2.2.19 Additional Support Structures

Existing Tunnel

The existing underground utility tunnel was constructed in two phases. The Phase I tunnel extends north from the north side of Central Plant Phase I and connects to the east-west segment serving the existing MACC building to the east and Interns and Physicians Building to the west. Phase I tunnel was constructed in the early 1970s as part of the CEQA exempt and ongoing project approved in 2009. The existing Phase I tunnel will be seismically retrofitted to obtain an SPC-5 rating.

The Phase II tunnel consists of north-south segment extending north from the Phase I tunnel to serve the Hawkins Building and Inpatient Tower. The Phase II tunnel was built in late 1970s.

Existing Retaining Wall between Hawkins Building and Inpatient Tower

The existing concrete retaining wall is about 500 feet long spanning in the east-west direction, between the Hawkins Building to the north and the service road to the south. The retaining wall was built in the late 1970s. The existing retaining wall and footings appear to be structurally adequate under the current lateral soil loadings. Strengthening of the retaining wall is not anticipated.

2.3 PROJECT DESCRIPTION

The proposed project entails two tiers. Tier I involves project-level development of the new MACC and the Ancillary Building, tenant improvements in existing buildings, site improvements, and the potential relocation of the MRI Building. The existing buildings that would be part of Tier I of the proposed project include the North Support Building, South Support Building, Interns and Physicians Building, and the Plant Management Building.

Development of the new MACC and the Ancillary Building are currently registered with the U.S. Green Building Council under Leadership in Energy and Environmental Design for New Construction (LEED-NC).[7] The County will seek LEED Silver certification for the MACC and the Ancillary buildings.[8] The LEED program recognizes and promotes a project's success in five areas: (1) sustainable sites, (2) water efficiency, (3) energy and atmosphere efficiencies, (4) materials and resources, and (5) indoor environmental quality. In addition, the federal government has a program titled "Green Guide for Healthcare Construction" (GGHC), which is designed to help hospitals navigate through the LEED program. The proposed project would incorporate energy efficient and sustainable strategies throughout the construction, development, and operation of the proposed project.

Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building, Emergency Room Expansion, Storage Building, and Cooling Towers, and master-planned, mixed-use development, which may include the potential for medical office, commercial, retail, residential, recreational, office space, and other development that is appurtenant to and compatible with the primary land use, in support of the campus.

To establish a proposed programmed development level for the mixed-use portion of Tier II, the currently undeveloped areas of the campus (undeveloped in this case includes parking lots and structures but not buildings) were calculated and adjustments were made for buildings to be demolished and developed, to obtain a surface area from which to calculate allowable build-out. A maximum build-out of this remaining area was calculated using maximum build-out criteria from the Los Angeles County Zoning Code restrictions applicable to the site. Initially, this maximum build-out number was in excess of 2 million square feet and included zoning code allowances of a maximum of three stories in building height and 10 percent open space (i.e., areas without structures). To determine a more accurate level of development for Tier II, the following assumptions were added: (1) open space sitewide would remain 10 percent in order to maintain some of the current character of the site as an open and landscaped campus; (2) the site area to be set aside for the potential development of an up to 100-unit residential component, parking structures or parking lots, and walkways would be 40 percent of the entire site; and (3) although a

[8] HMC Architects. 18 September 2009. *Martin Luther King, Jr. Medical Center Campus—Campus Planning and Programming Report*. Los Angeles, CA.

maximum of three stories would be allowed for new buildings, an average height of 2.5 stories was assumed. With these assumptions added in, the maximum programmed development for Tier II could consist of up to 1,814,696 square feet (Table 2.3-1, *Proposed Campus Development Matrix*, and Figure 2.3-1, *MLK Proposed Campus Plan*).

TABLE 2.3-1
PROPOSED CAMPUS DEVELOPMENT MATRIX

	Building Name	Current Total Floor Area (square feet)	Proposed Total Floor Area of Existing Campus to Remain Buildings (square feet)	Floor Area to Be Reused or Replaced (Vacated or Demolished[a] square feet)	Net New Total Floor Area of Campus Buildings (square feet)	Floors
1	Genesis Clinic	2,100	2,100	N/A	N/A	1
2	Oasis Clinic (old)	2,580	2,580	N/A	N/A	1
3	Oasis Clinic (new)	1,850	1,850	N/A	N/A	1
4	Registration Building	10,950	10,950	N/A	N/A	2
5	Augustus F. Hawkins Comprehensive Mental Health Center	226,818	226,818	N/A	N/A	3[a]

18	Claude Hudson Auditorium	3,922	3,922	N/A	N/A	1
19	Cooling Towers[c]	6,790	0	(6,790)	N/A	1
20	Hub Clinic	12,265	12,265	N/A	N/A	1
21	Storage Building[d]	2,533	0	(2,533)	N/A	1
A	New MACC	0		N/A	132,000	4
A	Ancillary Building	0		N/A	24,700	2
A	Emergency Generator	0		N/A	4,223	1
A	Central Plant III	0		N/A	9,409	1
	TOTAL	**1,243,692**	**737,207**	**509,018**	**170,332**	**N/A**

NOTES: It is understood that the emergency room, storage buildings, cooling towers, and existing MACC will be vacated as in Tier I and reused or replaced as part of Tier II of the proposed project These buildings may be either (1) removed during Tier II or (2) reused or replaced in Tier II. In either case, the building space would not be operational as part of Tier I. Should these buildings be reused or replaced in Tier II, the floor area of the space would be included within the total Tier II potential development of 1,814,696 square feet. Thus, the total of all net new development floor area at build-out of the campus would not exceed 1,476,010 square feet (not including the 100 residential units). The new MACC, Ancillary Building, emergency generator space, and new central plant III are labeled "A" in Table 2.4-1, are proposed buildings.

a. These buildings also have basements.
b. This scenario takes into account the replacement of the MACC Building. Should this structure be reused, 132,000 square feet for the MACC Building should be accounted for in both the proposed total floor area and proposed footprint of the campus buildings.
c. These structures would likely be demolished following the reuse or replacement of the existing MACC building.
d. This building is in the footprint of the Central Plant (Phase III) expansion but may just be incorporated during design and remain.

* Note: This figure has been adapted from HMC Architects. July 2010.

FIGURE 2.3-1
MLK Proposed Campus Plan

2.3.1 Tier I: Project Development

Tier I of the proposed project would entail the development of two new buildings: the new MACC and the Ancillary Building, tenant improvements in existing buildings, site improvements, and potential relocation of the MRI Building. Project-level environmental impact report (EIR) analysis will be provided for Tier I.

2.3.1.1 Multi-Service Ambulatory Care Center (MACC)

The proposed MACC building would be a four-story building consisting of approximately 132,000 square feet of floor area. This building would house the walk-in clinic, outpatient imaging, outpatient surgery, and various other outpatient clinics that are currently operating in the existing MACC. The proposed building would most likely be of structural steel construction. The gravity system of the building would consist of lightweight fill over metal decking supported by steel beams and columns. Similar to the proposed Ancillary Building, the lateral-force-resisting system of the MACC building can be any one of the following: moment frames, braced frames, or a combination of the two. The lateral-force-resisting system, whether moment frames or braced frames, would be located along the perimeter of the building, which would accommodate maximum flexibility for planning and space layout. The foundation for the new building would likely be a cast-in-place drilled pile foundation system.

2.3.1.2 Ancillary Building

The proposed Ancillary Building would be a two-story structure consisting of approximately 24,700 square feet of floor area. This building would house the campus kitchen and cafeteria, and administrative offices. The building would be constructed to the east of the new MACC. A new pedestrian foot bridge would be provided at the east end of the building for connection to the existing Inpatient Tower for the transportation of materials and supplies. The bridge would most likely be constructed of steel with a seismic joint at the Inpatient Tower.

The new building would most likely be structural steel construction. The gravity system of the building would consist of lightweight fill over metal decking supported by steel beams and columns. The lateral-force-resisting system for the building can be any one of the following: moment frames, braced frames, or a combination of the two. It is anticipated that the lateral-force-resisting system, whether moment frames or braced frames, would be located along the perimeter of the building, which would accommodate maximum flexibility for planning and space layout. The foundation for the new building would likely be a cast-in-place drilled pile foundation system.

2.3.1.3 Tenant Improvements

The tenant improvements would be performed in the North Support Building to provide space for the MACC administrative departments. The South Support Building would be reorganized to serve as the main warehouse for the MACC. The South Support Building may also serve as a central distribution center for other Los Angles County healthcare facilities in the area. Other tenant improvements would be performed in the Interns and Physicians and Plant Management Buildings for support functions to the MACC.

2.3.1.4 Site Improvements

The site work would consist of a new parking terrace, relocated entrance to the facility, new parking lots, re-striping of existing lots, and new landscaping at the entry of the new MACC and its surrounding area. A space for an emergency generator and a service yard with technical (tech) dock positions that connect mobile radiology equipment would also be provided.

2.3.2 Tier II: Master Plan Development

Tier II of the proposed project would entail the development of a campuswide master plan. It is anticipated that the development described in the Master Plan would seek to prepare the proposed project site for future mixed-use campus support development that would provide the health services necessary to respond to and address the needs of the community. Tier II would have the potential to build out approximately 1,814,696 square feet of development on the proposed project site with mixed uses including medical office, commercial, retail, office space, recreation, and other development in support of the campus. In addition, up to 100 residential units, to be developed at a multifamily density consistent with surrounding residential area multifamily development densities, are proposed in Tier II. Although the these buildings would be vacated as a component of Tier I, the Tier II components would entail the reuse or replacement of the existing MACC building, Emergency Room, Storage Building, and Cooling Towers. The Tier II components are conceptual at this time, and will therefore only be discussed in a programmatic level in the EIR, as permitted under CEQA. Once the detailed future development plans for Tier II components are prepared, consistent with the guidelines for programmatic EIRs under CEQA, the projects will be examined in light of the program EIR analysis, to determine whether an additional environmental document must be prepared.

2.4 CONSTRUCTION SCENARIO

2.4.1 Tier I Construction Scenario

Tier I of the proposed project—which consists of the construction of the new MACC, the Ancillary Building, tenant improvements, site improvements, and potential relocation of the MRI Building—would require approximately 37 months to complete (November 2010 to December 2013). Construction at the proposed project site is anticipated to be in accordance with all federal, state, regional, and County regulations, including the National Pollution Discharge Elimination System[9] and the County General Plan.[10]

It is anticipated that construction related to Tier I for the proposed project may require the type of equipment listed below in Table 2.4.1-1, *Tier I Anticipated Construction Equipment*.

---

[9] U.S. Environmental Protection Agency. 2009. *National Pollution Discharge Elimination System*. Available at: http://cfpub.epa.gov/npdes/

[10] County of Los Angeles Department of Regional Planning. 1980. *County of Los Angeles General Plan*. Available at: http://planning.lacounty.gov/generalplan#gp-existing

TABLE 2.4.1-1
TIER I ANTICIPATED CONSTRUCTION EQUIPMENT

Approximate Quantity	Type of Equipment or Vehicle	Approximate Duration of On-site Construction Activity (in months)
2	Man lift	3
4	Pickup truck	8
2	Hand compactor	5
2	Crane	3
1	Concrete mixer	4
1	Backhoe	3
40–60	Crew members	8
50	Crew vehicles (maximum)	8
1	Pile Driver	6
1	Large Bulldozer	3
2	Dozer	3
1	Front-end loader	1
1	Water truck	2
1	Grader	1
5	Dump truck	6
16	Concrete mix truck	9
1	Roller	1
3	Fork lift / grade all	3

It is anticipated that there would be grading activities associated with the development of Tier I of the proposed project. It is anticipated that the approximately 40,000 cubic yards of material will be exported from the site during construction of the proposed project. It is further anticipated that excavation may exceed 20 feet but would not be expected to be greater than 45 feet deep. It is anticipated that a geotechnical engineer would be available for observation and testing of the earthwork-related tasks to ensure proper subgrade preparation, selection of satisfactory materials, and placement and compaction of structural fills. Any unanticipated adverse conditions encountered would be evaluated by the proposed project engineering geologist and the soil engineer.[11] The existing access roads to and the streets surrounding the proposed project site will be used to transport import, export, and other construction related materials to and from the proposed project site.

2.4.2 Tier II Construction Scenario

The Tier II of the proposed project consists of a campus-wide master plan and up to 1,814,696 square feet of development on the proposed project site. The potential construction scenario for Tier II may be envisioned as a multiphase process to be completed concurrently with Tier I. The longest scenario is to develop Tier II within a 10-year timeframe, between 2010 and 2020. This analysis approach of the construction scenario has been developed based on an aggressive scenario (which allows the proposed project site to be developed to the maximum extent possible) to allow the consideration of a reasonable worst-case scenario in the even that the County chooses to complete up to 1,814,696 square feet of development.

---

[11] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

The type and quantity of equipment that would potentially be used in construction of Tier II would vary for each component. However, for the purposes of this analysis, it is anticipated that development of Tier II would require up to eight phases that would utilize equipment that is comparable to the equipment described for each phase.

Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes.

SECTION 3
REGULATORY FRAMEWORK

This regulatory framework identifies the federal, state, and local statutes, regulations, and guidelines that govern the identification and treatment of cultural resources and analysis of potential impacts to cultural resources. The lead agency must consider this regulatory framework when rendering decisions on projects that have the potential to affect cultural resources.

3.1 FEDERAL

3.1.1 National Historic Preservation Act of 1966[12]

Enacted in 1966, the National Historic Preservation Act (NHPA) declared a national policy of historic preservation and instituted a multifaceted program, administered by the Secretary of the Interior, to encourage the achievement of preservation goals at the federal, state, and local levels. The NHPA authorized the expansion and maintenance of the National Register of Historic Places (NRHP), established the position of State Historic Preservation Officer (SHPO) and provided for the designation of State Review Boards, set up a mechanism to certify local governments to carry out the purposes of the NHRA, assisted Native American tribes to preserve their cultural heritage, and created the Advisory Council on Historic Preservation (ACHP).

3.1.1.1 Section 106

Section 106 of the NHPA states that federal agencies with direct or indirect jurisdiction over federally funded, assisted, or licensed undertakings must take into account the effect of the undertaking on any historic property that is included in or eligible for inclusion in the NRHP and that the ACHP must be afforded an opportunity to comment—through a process outlined in the ACHP regulations, in Title 36 of the Code of Federal Regulations (CFR) Part 800—on such undertakings. The Section 106 process involves identification of significant historic resources within an "area of potential effect," determination if the undertaking will cause an adverse effect on historic resources, and resolution of those adverse effects through execution of a Memorandum of Agreement. In addition to the ACHP, interested members of the public, including individuals, organizations, and agencies (such as the California Office of Historic Preservation), are provided with opportunities to participate in the process.

The proposed project is financed in part by federally funded Build America Bonds issued under the American Reinvestment and Recovery Act of 2009. The issuance of these federal bonds has been determined by the ACHP to constitute a ministerial action on the part of the US Treasury or Internal Revenue Service.[13] Ministerial acts are not subject to Section 106 review. The County of Los Angeles General Counsel concurs with this interpretation of Build America Bonds as a ministerial action.[14] The project does not meet the definition of a federal undertaking; therefore, Section 106 of the NHPA is not applicable.

---

[12] *United States Code*. Title 16, Section 470.

[13] Advisory Council on Historic Preservation. 9 October 2009. "Build America Bonds and Section 106." Available at: http://www.achp.gov/news091009.html

[14] Hawkins, Delafield, and Wood (Mr. Arto C. Becker and Mr. Russell Miller). 7 April 2010. Memorandum: Various Questions Regarding the American Recovery and Reinvestment Act of 2009. Submitted to the County of Los Angeles (Mr. Glenn Byers, Mr. Douglas Baron, Ms. Cammy DuPont).

3.1.1.2 National Register of Historic Places

The NRHP was established by the NHPA of 1966 as "an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[15] The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American or regional/local history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance also must possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it is significant under one or more of the four established criteria:[16]

Criterion A: It is associated with events that have made a significant contribution to the broad patterns of our history;

Criterion B: It is associated with the lives of persons who are significant in our past;

Criterion C: It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or

Criterion D: It has yielded, or may be likely to yield, information important in prehistory or history.

Ordinarily cemeteries, birthplaces, or graves of historic figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature are not considered eligible for the NRHP, unless they satisfy certain conditions. In general, a resource must be 50 years old to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

No properties within the proposed project site are listed in or have been formally determined eligible for listing in the NRHP.

3.1.2 Secretary of the Interior's Standards for the Treatment of Historic Properties

Evolving from the *Secretary of the Interior's Standards for Historic Preservation Projects with Guidelines for Applying the Standards* that were developed in 1976, the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings* was published in 1995 and codified as 36 CFR 67. Neither technical nor prescriptive, these standards are "intended to promote responsible preservation practices that help protect our Nation's irreplaceable cultural resources."[17] *Preservation* acknowledges a resource as a document of its history over time and emphasizes

---

[15] *Code of Federal Regulations*. Title 36, Section 60.2.

[16] *Code of Federal Regulations*. Title 36, Section 60.4.

[17] Weeks, Kay D., and Anne E. Grimmer. 1995. *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstruction Historic Buildings*. Washington, DC: U.S. Department of the Interior, National Park Service.

stabilization, maintenance, and repair of existing historic fabric. *Rehabilitation* not only incorporates the retention of features that convey historic character but also accommodates alterations and additions to facilitate continuing or new uses. *Restoration* involves the retention and replacement of features from a specific period of significance. *Reconstruction*, the least used treatment, provides a basis for recreating a missing resource. These standards have been adopted, or are used informally, by many agencies at all levels of government to review projects that affect historic resources.

3.1.3 Native American Graves Protection and Repatriation Act of 1990

The Native American Graves Protection and Repatriation Act (NAGPRA) of 1990 sets provisions for the intentional removal and inadvertent discovery of human remains and other cultural items from federal and tribal lands. It clarifies the ownership of human remains and sets forth a process for repatriation of human remains and associated funerary objects and sacred religious objects to the Native American groups claiming to be lineal descendants or culturally affiliated with the remains or objects. It requires any federally funded institution housing Native American remains or artifacts to compile an inventory of all cultural items within the museum or with its agency and to provide a summary to any Native American tribe claiming affiliation.

3.2 STATE OF CALIFORNIA

3.2.1 California Environmental Quality Act[18]

Pursuant to the California Environmental Quality Act (CEQA), an historical resource is a resource listed in, or eligible for listing in, the California Register of Historical Resources (CRHR). In addition, resources included in a local register of historical resources or identified as significant in a local survey conducted in accordance with state guidelines also are considered historical resources under CEQA, unless a preponderance of evidence demonstrates otherwise. According to CEQA, the fact that a resource is not listed in or determined eligible for listing in the CRHR or is not included in a local register or survey shall not preclude a Lead Agency, as defined by CEQA, from determining that the resource may be an historical resource as defined in California Public Resources Code (PRC) Section 5024.1.[19] Pursuant to CEQA, a project with an effect that may cause a substantial adverse change in the significance of an historical resource may have a significant effect on the environment.[20]

CEQA also applies to effects on archaeological sites. Archaeological sites may be eligible for the CRHR and thus would qualify as historical resources under CEQA. If an archaeological site does not satisfy the criteria as an historical resource but does meet the definition of a "unique archaeological resource," it is also subject to CEQA. A unique archaeological resource is defined as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:[21]

---

[18] *California Public Resources Code*. Division Thirteen, Statutes 21083.2, 21084.1.

[19] *California Code of Regulations*. Title 14, Chapter 3. CEQA Guidelines, Section 15064.5(a).

[20] *California Code of Regulations*. Title 14, Chapter 3. CEQA Guidelines, Section 15064.5(b).

[21] *California Public Resources Code*. Section 21083.2(g).

(1) It contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information

(2) It has a special and particular quality such as being the oldest of its type or the best available example of its type

(3) It is directly associated with a scientifically recognized important prehistoric or historic event or person

3.2.2 California Register of Historical Resources

Created in 1992 and implemented in 1998, CRHR is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change."[22] Certain properties, including those listed in or formally determined eligible for listing in the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historical resources surveys or designated by local landmarks programs, may be nominated for inclusion in the CRHR. A resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:[23]

Criterion 1: It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Criterion 2: It is associated with the lives of persons important in our past.

Criterion 3: It embodies the distinctive characteristics of a type, period, region, or method of construction; represents the work of an important creative individual; or possesses high artistic values.

Criterion 4: It has yielded, or may be likely yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance.[24] It is possible that a resource whose integrity does not satisfy NRHP criteria still may be eligible for listing in the CRHR. Similarly, resources that have achieved significance within the past 50 years may be eligible for inclusion in the CRHR if enough time has lapsed to obtain a scholarly perspective on the events or individuals associated with the resource.[25]

---

[22] *California Public Resources Code*. Section 5024.1(a).

[23] *California Public Resources Code*. Section 5024.1(c).

[24] Office of Historic Preservation. n.d. "Technical Assistance Bulletin 6: California Register and National Register, A Comparison (for purposes of determining eligibility for the California Register)." Available at: http://www.ohp.parks.ca.gov

[25] Office of Historic Preservation. n.d. "Technical Assistance Bulletin 6: California Register and National Register, A Comparison (for purposes of determining eligibility for the California Register)." Available at: http://www.ohp.parks.ca.gov

No properties within the proposed project site are listed in or have been formally determined eligible for listing in the CRHR.

3.2.3 California Historical Landmarks[26]

California Historical Landmarks are buildings, structures, sites, or places that have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value and that have been determined to have statewide historical significance by meeting at least one of the criteria listed below. The resource also must be approved for designation by the County Board of Supervisors or be recommended by the State Historical Resources Commission, and be officially designated by the Director of California State Parks. The specific standards now in use first were applied in the designation of CHL 770. CHLs 770 and above are automatically listed in the CRHR.

To be eligible for designation as a *landmark*, a resource must meet at least one of the following criteria:

- Be the first, last, only, or most significant of its type in the state or within a large geographic region (Northern, Central, or Southern California)
- Be associated with an individual or group having a profound influence on the history of California
- Be a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or be one of the more notable works or the best surviving work in a region of a pioneer architect, designer, or master builder

The proposed project site does not include any California Historical Landmarks.

3.2.4 California Points of Historical Interest[27]

California Points of Historical Interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. Points of Historical Interest designated after December 1997 and recommended by the State Historical Resources Commission also are listed in the CRHR. No historical resource may be designated as both a landmark and a *point*. If a point is subsequently granted status as a landmark, the point designation will be retired.

To be eligible for designation as a Point of Historical Interest, a resource must meet at least one of the following criteria:

- Be the first, last, only, or most significant of its type within the local geographic region (city or county)

---

[26] Office of Historic Preservation. Accessed 17 July 2006. "California Historical Landmarks Registration Program." Available at: http://ohp.parks.ca.gov

[27] Office of Historic Preservation. Accessed 17 July 2006. "California Points of Historical Interest, Registrations Programs." Available at: http://ohp.parks.ca.gov

- Be associated with an individual or group having a profound influence on the history of the local area
- Be a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or be one of the more notable works or the best surviving work in the local region of a pioneer architect, designer, or master builder

The proposed project site does not include any California Points of Historical Interest.

3.2.5 State Historical Building Code[28]

Created in 1975, the State Historical Building Code (SHBC) provides regulations and standards for the preservation, restoration, rehabilitation, or relocation of historic buildings, structures, and properties that have been determined by an appropriate local or state governmental jurisdiction to be significant in the history, architecture, or culture of an area. Rather than being prescriptive, the SHBC constitutes a set of performance criteria. The SHBC is designed to help facilitate restoration or change of occupancy in such a way as to preserve original or restored elements and features of a resource; to encourage energy conservation and a cost-effective approach to preservation; and to provide for reasonable safety from earthquake, fire, or other hazards for occupants and users of such buildings, structures, and properties." The SHBC also serves as a guide for providing reasonable availability, access, and usability by the physically disabled.

3.2.6 Native American Heritage Commission

Section 5097.91 of the Public Resources Code established the Native American Heritage Commission (NAHC), whose duties include the inventory of places of religious or social significance to Native Americans and the identification of known graves and cemeteries of Native Americans on private lands. Section 5097.98 of the Public Resources Code specifies a protocol to be followed when the NAHC receives notification of a discovery of Native American human remains from a county coroner.

There are no listed Native American Sacred Sites within the proposed project site.

3.2.7 Government Code, Sections 6254(r) and 6254.10

These sections of the California Public Records Act were enacted to protect archaeological sites from unauthorized excavation, looting, or vandalism. Section 6254(r) explicitly authorizes public agencies to withhold information from the public relating to "Native American graves, cemeteries, and sacred places maintained by the NAHC." Section 6254.10 specifically exempts from disclosure requests for "records that relate to archaeological site information and reports, maintained by, or in the possession of the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the NAHC, another state agency, or a local agency, including the records that the agency obtains through a consultation process between a Native American tribe and a state or local agency."

---

[28] California State Historical Building Safety Board, Division of the State Architect. 2 June 2006. "California's State Historical Building Code and State Historical Building Safety Board." Sacramento, CA. Available at: http://www.dsa.dgs.ca.gov/StateHistoricalBuildingSafetyBoard/default.htm

3.2.8 Health and Safety Code, Sections 7050 and 7052

Health and Safety Code, Section 7050.5 declares that, in the event of the discovery of human remains outside of a dedicated cemetery, all ground-disturbing activities must cease and the county coroner must be notified. Section 7052 establishes a felony penalty for mutilating, disinterring, or otherwise disturbing human remains, except by relatives.

3.2.9 Penal Code, Section 622.5

Penal Code, Section 622.5 provides misdemeanor penalties for injuring or destroying objects of historic or archaeological interest located on public or private lands, but specifically excludes the landowner.

3.2.10 Public Resources Code, Section 5097.5

Public Resources Code, Section 5097.5 defines as a misdemeanor the unauthorized disturbance or removal of archaeological, historic, or paleontological resources located on public lands.

3.3 LOCAL

3.3.1 Southern California Association of Governments

The Southern California Association of Governments (SCAG) Growth Management Chapter (GMC) has instituted policies regarding the protection of cultural resources. SCAG GMC Policy No. 3.21 "encourages the implementation of measures aimed at the preservation and protection of recorded and unrecorded cultural resources and archaeological sites."[29]

3.3.2 County of Los Angeles General Plan

The Conservation, Open Space, and Recreation element of the General Plan[30] establishes goals and policies for conservation of cultural resources in the unincorporated territory of County of Los Angeles. The General Plan recognizes that the County has numerous archaeological and historical sites from the Native American, Hispanic, and American periods of California's history, as well as paleontological sites and important geological formations that predate man's occupation and that such cultural resources are nonrenewable and irreplaceable. Policy 20 states the County's intention to "protect cultural heritage resources, including historical, archaeological, paleontological, and geological sites, and significant architectural structures."[31]

3.3.3 Los Angeles County Historical Landmarks and Records Commission

The Los Angeles County Historical Landmarks and Records Commission (Commission) considers and recommends to the Board of Supervisors local historical landmarks defined to be worthy of registration by the State of California, either as California Historical Landmarks or as Points of

SECTION 4
STUDY METHODS

This section of the Cultural Resources Technical Report describes the methods employed in the characterization and evaluation of cultural resources at the Martin Luther King, Jr. Medical Center Campus (proposed project) site. The study methods were designed to provide the substantial evidence required to address the scope of analysis recommended in Appendix G of the State of California Environmental Quality Act (CEQA) Guidelines[33] and policies related to cultural resources, paleontological resources, prehistoric resources, historical resources, Native American sacred sites, and human remains.

4.1 PALEONTOLOGICAL RESOURCES

The potential to yield paleontological resources within the approximately 38-acre proposed project site was assessed in relation to a three-tier probability analysis:

- **High:** Sedimentary geologic units and other geologic units that have yielded unique paleontological resources
- **Moderate:** Older alluvium geologic units
- **Low to none:** Younger alluvium and metamorphic and igneous geologic units

The potential presence of paleontological resources within the proposed project site and vicinity was determined through a records search at the Natural History Museum of Los Angeles County (NHMLAC). The records search consisted of review of the paleontological locality and specimen data collection for the proposed project area from the NHMLAC.[34]

4.2 ARCHAEOLOGICAL AND HISTORICAL RESOURCES

The methodology undertaken to identify and evaluate archaeological and historical resources was designed to accomplish three goals:

- Identification of previously known, recorded, and/or designated resources
- Identification of potentially significant resources
- Evaluation of the significance of properties using established criteria within the framework of a historic context, in accordance with the Secretary of the Interior's Standards for Evaluation

4.2.1 Record Search and Literature Review

Preparation of this report included the use of information housed at the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton, one of the 12 independent centers operated under contract to the State Office of Historic Preservation (OHP) for the purposes of maintaining the federally and state-mandated California Historic Resources Inventory (HRI).

---

[33] *California Code of Regulations*. Title 14, Division 6, Chapter 3, Section 15000–15387, Appendix G.

[34] McLeod, Samuel A. 21 November 2009. "Vertebrate Paleontology Section, Natural History Museum of Los Angeles County, Los Angeles, California." Letter response to Chris Purtell, Sapphos Environmental, Inc., Pasadena, CA.

A literature review was undertaken to determine if the proposed project would have the potential to adversely affect known archaeological and historical resources. Published and unpublished literature was reviewed. An archaeological and historic resources records search for the proposed project site and surrounding 1.0-mile radius was conducted in October 2009 by a Sapphos Environmental, Inc. staff historian at the SCCIC. This search included a review of all known relevant cultural resource surveys and excavation reports, and an examination of the 2009 editions of the California HRI,[35] the National Register of Historic Places (NRHP),[36] the listing of California Historic Landmarks (CHL),[37] and the California Points of Historical Interest (CPHI).[38]

Additional research was conducted in public records and a number of repositories, including building permits as available, the California History Index of the Los Angeles Public Library, the Avery Index of Architectural Periodicals, aerial photographs, parcel and zoning maps, Sanborn fire insurance maps, general histories, historic images, historic newspapers and periodicals indexed by the ProQuest Newspaper Database, ephemera, historical resources survey reports, relevant ordinances, technical materials relating to federal, state, and local historic preservation, and other materials, as available or appropriate. The information collected was used to assist in the evaluation of the property for historical significance, to develop an architectural description, determine periods of significance, and identify character-defining features.

4.2.2 Historic Resource Evaluation

An intensive-level survey of the proposed project site was conducted on October 27, 2010 in order to identify any buildings, structures, objects, or districts that meet the CEQA definition of a historical resource. The survey was conducted in accordance with the *Instructions for Recording Historical Resources*[39] and National Register Bulletin 24, *Guidelines for Local Surveys*.[40] The buildings and their settings were inspected and photographed. Character-defining features were assessed in accordance with *Preservation Brief No. 17: Architectural Character: Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving Their Character*[41] and *Preservation Brief No. 18: Rehabilitating Interiors in Historic Buildings: Identifying and Preserving Character-Defining Elements*.[42] This information was recorded on updated State of California Department of Parks and Recreation Historic Resources Inventory forms (DPR 523 series) (Appendix B, *California*

Historic Resources Inventory DPR 523 Forms), which were prepared for NRHP/CRHR–eligible properties (Appendix A). The results of the survey are presented in Section 5, *Results*, of this report. A historic context was developed to provide a framework for evaluation. Resources were evaluated using the criteria of significance for listing in the NRHP and CRHR.

4.3 HUMAN REMAINS

The potential presence of human remains, including those interred outside of formal cemeteries, was assessed through the inquiry to the Native American Heritage Commission (NAHC) and examination of historic topographic maps[43,44] for the presence of cemetery icons. In addition, the history of the property was reviewed to determine if any burials were recorded on the site.

4.4 PERSONNEL

Sapphos Environmental, Inc. cultural resources manager, Ms. Leslie Heumann, supervised the work effort. Ms. Marie Campbell reviewed the technical and procedural adequacy of the report under CEQA and NEPA. Ms. Marlise Fratinardo prepared the architectural history and historical resources sections of this report. Ms. Laura Carias assisted with research and written documentation, including the records search conducted at the SCCIC. Mr. Chris Purtell, Ms. Roberta Thomas, and Mr. Karl Huebchen prepared the archaeological and paleontological sections of this report. Ms. Heumann, Ms. Fratinardo, and Ms. Carias meet the Secretary of the Interior's Professional Qualifications Standards for Architectural History. Mr. Huebchen and Mr. Purtell meet the Secretary of the Interior's Professional Qualification Standards for Archaeology (Appendix C, *Résumés of Key Personnel*).

[44] U.S. Geological Survey. 1964. *7.5-Minute Series South Gate, California, Topographic Quadrangle*. Reston, VA.

This section of the Cultural Resources Technical Report presents the results of the investigations of cultural resources. The scope of the analysis includes the categories of resources specified in Appendix G of the California Environmental Quality Act (CEQA) Guidelines: paleontological resources, archaeological resources, historical resources, and human remains. The discussion of each resource category consists of a context that provides background information and a framework for evaluation, a resource characterization that describes previously identified cultural resources and existing cultural resources, an impact analysis that includes significance thresholds and an itemization of potential impacts, and recommended mitigation measures that would avoid or reduce potential project impacts.

5.1 PALEONTOLOGICAL RESOURCES

5.1.1 Paleontological Context

The geology of the proposed project site is composed of surficial deposits of younger Quaternary Alluvium (Holocene) as a result of deposition from the Los Angeles River to the east and Compton Creek nearby to the west.[45] These younger deposits are underlain by older Quaternary Alluvium, which has the potential to contain significant fossil vertebrates.[46] By 1954, the depositional process was halted when the Los Angeles River and portions of Compton Creek were channelized and the banks paved with cement to provide 100-year levels of flood protection. The flood control system was further enhanced in the 1990s.[47] Excavation depths of the existing Martin Luther King, Jr. Medical Center Campus are assumed to have exceeded 15 feet below the natural ground surface; therefore, there would be no expected paleontological resources within 15 feet of the ground surface at the locations where these excavations occurred.

5.1.2 Paleontological Resource Characterization

The results of the record search indicate that there are no known vertebrate fossil localities recorded within the proposed project site. The proposed project site is located within an area with a moderate level of sensitivity to contain unique paleontological resources and is not in the vicinity of recognized unique geologic features. The geology of the proposed project site is composed of surficial deposits of younger Quaternary Alluvium (Holocene) as a result of deposition from the Los Angeles River, which currently flows through a concrete channel just east of the proposed project site, and Compton Creek nearby to the west. These younger deposits are underlain by older Quaternary Alluvium. The younger Quaternary deposits do not usually contain significant fossil vertebrates; however, the older Quaternary deposits have the potential to contain significant fossil vertebrates. The closest known fossil localities, identified as LACM 1295, 1344, 3266, and 4206, were recovered from these older Quaternary deposits. They are situated west of the proposed project site in the Athens vicinity around the Harbor Freeway (I-110), from south of Imperial

[45] Saucedo, G.J., H.G. Greene, M.P. Kennedy, and S.P. Bezore. 2003. Geologic Map of the Long Beach 30′ x 60′ Quadrangle, California, Version 1.0. California Department of Conservation, California Geological Survey.

[46] McLeod, Samuel A. 21 November 2009. "Vertebrate Paleontology Section, Natural History Museum of Los Angeles County, Los Angeles, California." Letter response to Chris Purtell, Sapphos Environmental, Inc., Pasadena, CA.

[47] Los Angeles and San Gabriel Rivers Watershed Council, EIP Associates, and Heal the Bay. June 2005. Compton Creek Watershed Management Plan.

Highway to near El Segundo Boulevard. These localities produced specimens of fossil pond turtle (*Clemmys*), puffin (*Mancalla*), turkey (*Parapova*), ground sloth (*Paramylodon*), mammoth (*Mammuthus*), dire wolf (*Canis dirus*), rabbit (*Sylvilagus),* squirrel (*Sciuridae*), deer mouse (*Microtus*), pocket gopher (*Thomomys*), horse (*Equus*), deer (*Cervus*), pronghorn antelope (*Capromeryx*), and bison (*Bison*), at depths as shallow as 15 feet below the surface. Therefore, extant, undisturbed deposits of older Quaternary Alluvium have a moderate level of sensitivity to produce unique paleontological resources. While the proposed project site has been substantially disturbed, it is anticipated that excavation at the proposed project site has the potential to exceed 15 feet in depth, and based on previous findings, the excavation activities would have the potential to impact native soils, underlying extant rock units, and potentially the older Quaternary deposits that have a higher likelihood of containing vertebrate fossil localities.

5.1.3 Paleontological Impacts Analysis

5.1.3.1 Significance Thresholds

With respect to paleontological resources, CEQA does not specifically establish thresholds for significant impacts; however, Appendix G of the CEQA Guidelines indicates that a project may have a significant effect on the environment if it would directly or indirectly destroy a unique paleontological resource or a unique geologic feature. For the purposes of the analysis, excavation of rock with a moderate to high potential to yield paleontological resources is considered to be significant and would warrant the consideration of mitigation measures.

5.1.3.2 Impacts

Tier I and Tier II of the proposed project has the potential to result in significant impacts to cultural resources related directly or indirectly to the destruction of a unique paleontological resource. The geology of the proposed project site is composed of surficial deposits of younger Quaternary Alluvium underlain by older Quaternary Alluvium. The older Quaternary Alluvium deposits have moderate sensitivity for paleontological resources and, therefore, have the potential to reveal important vertebrate fossils that can contribute to the life history of the area. Excavations are expected to exceed 15 feet and may impact previously undisturbed native soils and thus would have the potential to encounter paleontological resources in these older deposits. As a result, the proposed project has the potential to result in significant impacts to cultural resources related directly or indirectly to the destruction of a unique paleontological resource, therefore requiring the consideration of mitigation measures to reduce impacts to below the level of significance.

There are no unique geological features currently identified within the proposed project boundary; therefore, there would be no expected impacts to cultural resources related to the destruction of a unique geologic feature.

5.1.4 Paleontological Mitigation Measures

5.1.4.1 Mitigation Measure Cultural-1

The impacts to cultural resources related directly or indirectly to the destruction of a unique paleontological resource from the proposed project shall be reduced to below the level of significance by monitoring, salvage, and curation of unanticipated paleontological resources discovered during ground-disturbing activities in previously undisturbed native soils located 15 or more feet below the ground surface that would have the potential to contact extant older

Quaternary Alluvium. Ground-disturbing activities include, but are not limited to, drilling, excavation, trenching, and grading. If paleontological resources are encountered during ground-disturbing activities, the County of Los Angeles shall require and be responsible for salvage and recovery of those resources consistent with standards for such recovery established by the Society of Vertebrate Paleontology:

- Paleontological Resources Sensitivity Training is required for all project personnel prior to the start of ground-disturbing activities. This brief (approximately 15 minute) field training reviews what fossils are, what fossils might potentially be found, and the appropriate procedures to follow if fossils are found.

- Prior to any ground-disturbing activities, the County shall be responsible for creating a site plan that indicates all locations of ground-disturbing activities that affect previously undisturbed native soils in areas located 15 feet below the ground surface or further and have the potential to contact older Quaternary Alluvium.

- A qualified paleontologist shall be retained to implement a monitoring and recovery program in any area identified as having the potential to contain unique paleontological resources.

- Construction monitoring by a qualified paleontological monitor shall be implemented during all ground-disturbing activities that affect previously undisturbed native soils in areas located 15 feet below the ground surface or further and have the potential to contact older Quaternary Alluvium. Should a potentially unique paleontological resource be encountered, ground-disturbing activities within 100 feet shall cease until a qualified paleontologist assesses the find.

- If fossil localities are discovered, the paleontologist shall assess the find and proceed accordingly. This includes the controlled collection of fossil and geologic samples for processing.

- Daily logs shall be kept by the qualified paleontological monitor during all monitoring activities. The daily monitoring log shall be keyed to a location map to indicate the area monitored, the date, and assigned personnel. In addition, this log shall include information of the type of rock encountered, fossil specimens recovered, and associated specimen data.

- All significant specimens collected shall be appropriately prepared, identified, and catalogued prior to their placement in a permanent accredited repository. The qualified paleontologist shall be required to secure a written agreement with a recognized repository, regarding the final disposition, permanent storage, and maintenance of any significant fossil remains and associated specimen data and corresponding geologic and geographic site data that might be recovered as a result of the specified monitoring program. The written agreement shall specify the level of treatment (i.e., preparation, identification, curation, cataloguing, etc.) required before the fossil collection would be accepted for storage. In addition, a technical report shall be completed.

- Within 90 days of the completion of any salvage operation or monitoring activities, a mitigation report shall be submitted to the County of Los Angeles with an appended, itemized inventory of the specimens. The report and inventory, when submitted to the County of Los Angeles, signify the completion of the program to mitigate impacts to paleontological resources.

5.2 ARCHAEOLOGICAL RESOURCES

5.2.1 Archaeological Context

5.2.1.1 Ethnographic Context

At the time of contact, the Native Americans subsequently known as the Gabrielino Indians occupied nearly the entire basin comprising the Counties of Los Angeles and Orange. They belonged to the Takic family of the Uto-Aztecan linguistic stock. Named after the Mission San Gabriel, the Gabrielino are considered to have been one of the two wealthiest and largest ethnic groups in aboriginal Southern California,[48] the other being the Chumash. This was largely due to the many natural resources within the land base they controlled, primarily the rich coastal section from Topanga Canyon to Aliso Creek and the offshore islands of San Clemente, San Nicholas, and Santa Catalina.

The Gabrielino arrived in the Los Angeles basin around 500 BC and began to spread throughout the area, displacing a preexisting Hokan-speaking population. The expansion of this Uto-Aztecan-speaking population toward the coast separated the Yuman and Chumashan blocks of the Hokan linguistic stock.[49] The Chumash occupy the region to the north of the Gabrielino, as well as the islands off the coast, and share many attributes, beliefs, and religious practices. Commonly, it is stated that the Chumash occupied areas as far south as what is now Ventura County, with a few sites found within the boundaries of Los Angeles County.[50] There has been evidence of Chumash further south and intermixed with Gabrielino populations.

The first Spanish contact with the Chumash and Gabrielino took place in 1542, when Juan Rodriguez Cabrillo arrived in Santa Catalina Island. According to Kroeber,[51] the Chumash were the first Native American group to encounter Europeans while Cabrillo was sailing among the islands. In 1602, the Spanish returned to Santa Catalina under Sebastián Vizcaíno, and in 1769, Gaspar de Portolá made the first attempt to colonize Gabrielino territory. By 1771, the Spanish had built four missions, and the decimation of the Chumash and Gabrielino had already begun.[52] European diseases and conflicts among the native populations, as well as conversion to Christianity, carried a toll in their numbers, traditions, and beliefs.

Although determining an accurate account of the population numbers is difficult, Bean and Smithstate that by AD 500, the Gabrielino established permanent settlements and their population continued to grow.[53] Early Spanish accounts indicate that the Gabrielino lived in permanent

villages with a population ranging from 50 to 200 individuals. The Gabrielino population surpassed 5,000 people by around 1770.

5.2.1.2 Gabrielino Ways of Life and Customs

Several types of structures characterized the Gabrielino villages. They lived in domed circular structures covered with tule, ferm, or carrizo. Communal structures measured over 60 feet in diameter and could house three or four families. Sweathouses, menstrual huts, and a ceremonial enclosure were also part of the village arrangements.[54]

The Gabrielino practiced different subsistence strategies that included hunting, fishing, and gathering. Hunting activities inland were carried out with the use of bow and arrow, deadfalls, snares, and traps. Smoke and throwing clubs also were used to assist with the hunt of burrowing animals. Aquatic animals were hunted with harpoons, spear-throwers, and clubs. Although most fishing activities took place along rivers and from the shore, open-water fishing trips between mainland and the islands also took place using boats made from wood planks and asphalt. The Gabrielino fishing equipment included fishhooks made of shells, nets, basketry traps, and poison substances obtained from plants.[55]

The Gabrielino diet included a large number of animals, such as deer, rabbit, squirrel, snake, and rats, as well as a wide variety of insects. However, some meat taboos also existed. The meat of bears, rattlesnakes, stingrays, and ravens were not consumed; these animals were believed to be messengers of the god Chengiichngech. Aquatic animals such as fish, whales, seals, sea otters, and shellfish were also an important part of the diet, mainly among the coastal population.[56]

A variety of plant foods were consumed by the Gabrielino, the main one being acorns. These nuts are rich in nutrients and have a high content of fiber and fat. Other plants used for consumption by the Gabrielino include the seeds of the Islay (*Prunus ilicifolia*), which were ground into a meal, and the seeds and shoots of the Chía (*Salvia columbariae*), which were eaten raw, made into loaves, or mixed with water to make a beverage. Roots and bulbs were also part of the diet among the mainland and island groups, as well as clover, wild sunflower seeds, and cholla seeds. Wild tobacco was used with medicinal purposes and as a sedative and narcotic.[57]

The Gabrielinos were involved in trade among themselves and with other groups. Archaeological evidence suggests that Shoshonean-speaking groups such as the Gabrielino inhabited San Nicolas Island by 8,500 years ago; by 5,000 years ago, the inhabitants of the island were involved in an exchange network of symbolic items and raw materials.[58] On Santa Catalina Island, a steatite (soapstone) "industry" was developed and the material was obtained by the groups living on the

mainland from the inhabitants of Santa Catalina. This rock is abundant on the island and was widely used among the Gabrielino to make arrow straighteners and artistic or ritualistic objects. In addition, this rock was used in the making of functional objects for food preparation such as bowls, mortars, pestles, and comals.[59] The island inhabitants also obtained other items such as acorns, different types of seeds, obsidian, and deerskin from the Serranos, who lived on the mainland. Coastal people exchanged shell and shell beads, dried fish, sea otter pelts and salt.

5.2.1.3 Chumash Ways of Life and Customs

Regardless of the arbitrary boundary line drawn between the Gabrielino and the Chumash, the two groups exhibit enough parallels and crossover evidence that it is necessary to consider that Chumash ways of life and customs may be found in areas that extend into Los Angeles and Orange Counties and vice versa.

According to Kroeber,[60] the Chumash had only a couple of structures that characterized their villages or settlements. Like the Gabrielino, they lived in domed circular structures covered with tule, ferm, or carrizo. These were also communal structures spanning 50 feet or more in diameter that could house three to four families or up to 50 individuals.[61] The Chumash were also one of the few groups that put to use a true bed, meaning a raised platform, and separated rooms inside their homes.[62] Sweathouses were another common structure found in Chumash villages and settlements but there is not much known about the common sweathouse.

Despite the use of the word "pots" in the ethnographic record, the Chumash did not make use of pottery. They did not manufacture it or acquire it by use of trade networks. Any references to "pots" were groundstone vessels usually made from steatite.[63] The Chumash utilized steatite to manufacture other groundstone implements such as milling stones and mortars. They also made use of other materials in the area such as sandstone.

One groundstone implement shaped like a plummet, commonly referred to as a charm stone, is believed to be a religious or ceremonial object despite the fact that little is known about their religious practices.[64] Charm stones have been found within what is considered Gabrielino territory even though there is no ethnographic connection between the Gabrielino and these objects. Kroeber[65] suggests that because what is known of the Chumash religious practices is similar if not the same as certain aspects of the Gabrielino religion that these two groups mutually developed a religion based on toloache.

5.2.1.4 Regional and Local Chronology

The chronology used here is Arnold's[66] modification of King's[67] chronology for coastal areas of California (Table 5.2.1.4-1, *Coastal Regional Chronology*). Although King's chronology has been widely used, it has been criticized because the time frames reflect changes in artifact styles but do not necessarily reflect social and behavioral changes.

TABLE 5.2.1.4-1
COASTAL REGIONAL CHRONOLOGY

Epoch	Coastal Region	Dates
Middle to Late Holocene	Early Period	Circa 5500 to 600 BC
Late Holocene	Middle Period	Circa 600 BC to AD 1150
Late Holocene	Transitional Period	AD 1150 to 1300
Late Holocene	Late Period	AD 1300 to Historic Period (post–1769)

Early Period (5500–600 BC)

The latter part of the Early Period is characterized by high numbers of ground stone implements, such as manos (handstones) and metates (milling slabs). These artifacts suggest that plant foods, and particularly hard seeds, increasingly became dietary staples during this period.[68] Grave goods from areas throughout California suggest that relatively egalitarian social systems prevailed during the Early Period.

Middle Period (600 BC–AD 1150)

During the Middle Period, changes occurred in the types of plant foods exploited and in the technologies used to process them. Yucca buds and acorns were processed through roasting or leaching techniques, allowing the consumption of these otherwise inedible plants. The introduction of these fleshy foods to the diet is signaled by technological changes; the use of portable milling equipment (manos and metates) used in the processing of hard seeds apparently declined, while permanent milling features such as bedrock mortars and pestles increased in frequency. As population densities and sedentism increased, food storage became an increasingly common practice. King et al. interpret differing quantities and qualities of grave goods among burials in several Southern California sites as evidence that social differentiation may have increased during the Middle Period and then declined during the subsequent Transitional and Late Periods.[69] The Middle Period also apparently brought a shift in the production of shell beads, with *Haliotis* and *Olivella* beads changing from rectangular to circular varieties. Overall, there was an

increase in the variety of ornaments present in Southern California sites at this time,[70] although bead production did not become a form of craft specialization per se until later periods.[71]

Transitional Period (AD 1150–1300)

The end of the Middle Period and the beginning of the Transitional Period are characterized by the nucleation of previously independent villages. This time also marks the appearance of simple chiefdoms in Chumash territory, characterized by complex socioeconomic relationships, hereditary inequality, and defined leadership. This higher complexity is evidenced in the archaeological record by the presence of craft specialization, advanced boating technology, extensive exchange networks, and subsistence patterns. Craft specialization is represented in microblade production and in increased manufacturing of shell beads from the thickest part (the callus) of the *Olivella* shells. Toward the end of the Transitional Period and beginning of the Late Period, *Olivella* callus beads began to be used as currency in the exchange system. Although beads were produced in coastal areas, changes in bead production also were reflected inland because of trading systems.[72] The development of a sophisticated water craft, the plank canoe or *tomol*, intensified existing trade networks among the islands and mainland, thus affecting exchange throughout inland California.

Late Period (AD 1300–1769) and Historic Period (Post–1769)

During the Late Period, the trade networks continued to expand among islanders and between coastal and inland populations. In coastal areas, production of beads and microliths increased, while standardization of manufactured items became more common. Similar intensification of bead and microlith production is not as well known inland; ethnographic evidence suggests that the collection of foods (such as acorn, seeds, and bulbs) and the manufacturing of other items (such as baskets and bowls) intensified, thus providing inland groups with currency that could be traded for needed coastal products.[73]

5.2.2 Archaeological Resource Characterization

5.2.2.1 Previous Research Conducted in the Area

On October 20, 2009, a records search was conducted at the South Central Coastal Information Center (SCCIC), located at California State University, Fullerton. The U.S. Geological Survey (USGS) 7.5-minute series South Gate and Inglewood, California, topographic quadrangles were reviewed for previously recorded archaeological resources within the proposed project area and within a 1.0-mile radius of the Martin Luther King, Jr. Medical Center Campus.[74] The results of the

Coordination also was undertaken with the Native American Heritage Commission (NAHC) to ascertain the presence of known Native American sacred sites. According to NAHC,[75] no Native American cultural resources have been recorded in the Sacred Lands File on or within one mile of the proposed project site.

LA 00078. In 1975, the Institute of Archaeology, Archaeological Survey, University of California, Los Angeles, conducted field reconnaissance, in the form of pedestrian survey, of the proposed project area for construction of Route 105 Freeway from El Segundo to Norwalk. No historic or prehistoric archaeological resources were observed during the survey.

LA 01111. In 1977, the Institute of Archaeology, Archaeological Survey, University of California, Los Angeles, conducted field reconnaissance, in the form of pedestrian survey, of the proposed project area for the Willowbrook Park for the Los Angeles County Department of Parks and Recreation. The proposed project area encompassed approximately 80 acres. No historic or prehistoric archaeological resources were observed during the survey.

LA 02644. In 1992, a crew of five archaeologists from H.E.A.R.T. surveyed the proposed project area for the proposed Alameda Transportation Corridor. No historic or prehistoric archaeological resources were observed during the survey.

LA 02877. In 1993, a Fugro-McClelland archaeologist conducted an archaeological survey of the project site located at 1711 East 126th Street, Willowbrook District, Los Angeles County for

---

[75] Singleton, Dave, Native American Heritage Commission, Sacramento, California. 2 November 2009. Letter to Chris Purtell, Sapphos Environmental, Inc., Pasadena, CA.

proposed housing development. No significant historic or prehistoric archaeological resources were observed during the survey.

LA 02950. In 1992, Peak & Associates, Inc. conducted an archaeological survey of the proposed 171.1-mile crude oil pipeline between Gaviota in Santa Barbara and refineries in El Segundo and Long Beach, Los Angeles County. The survey found 19 sites along the proposed route and 2 along the Southern Alternative; none of these sites are located on or within 1 mile of the Martin Luther King, Jr. Medical Center Campus.

LA 03202. In 1995, a Fugro archaeologist conducted an archaeological survey of the undeveloped portions of the project area for the proposed construction of a commercial business strip at 11742–58 Bandera Avenue, 11758 Wilmington Avenue and 1865 East 118th Street, in Willowbrook, Los Angeles County, California. No historic or prehistoric archaeological resources were observed during the survey.

LA 03514. In 1995, Petra Resources, Inc. provided an archaeological assessment, which included a field survey, for the property located at 1941–1947 East 113th Street, in the Watts area of Los Angeles at the request of the Historic Resources Group for a proposed housing project. No prehistoric archaeological resources were observed during the survey.

LA 03573. In 1997, Compass Rose Archaeological Consultants conducted an archaeological survey at 2053 Santa Ana Boulevard, Los Angeles, California at the request of the Historic Resources Group for a proposed housing project. No historic or prehistoric archaeological resources were observed during the survey.

LA 03738. In 1997, ENSR conducted an archaeological survey at 1601–1625 117th Street and 11668 Compton Boulevard in Willowbrook, Los Angeles County at the request of the Los Angeles County Community Development Commission (CDC) for planned housing developments and street improvements. The project area consisted of about 1.25 acres. No historic or prehistoric archaeological resources were observed during the survey.

LA 04009. In 1998, Compass Rose Archaeological Consultants completed an archaeological survey at 11516 Willowbrook Avenue, Watts, Los Angeles, California at the request of the Historic Resources Group for a proposed housing project. No historic or prehistoric archaeological resources were observed during the survey.

LA 04144. In 1998, Conejo Archaeological Consultants conducted an archaeological investigation, including a reconnaissance survey, for the proposed CDC 12710 Wilmington Avenue project located in unincorporated Los Angeles County. The CDC plans to acquire two vacant parcels for the development of 20 housing units. No historic or prehistoric archaeological resources were observed during the survey.

LA 04543. In 1999, Conejo Archaeological Consultants conducted an archaeological investigation, including a field survey, for the proposed acquisition and development of a 0.42 acre vacant lot located at 2010 El Segundo Boulevard, Willowbrook, Los Angeles County. No historic or prehistoric archaeological resources were observed during the survey.

LA 04625. In 1994, Myra L. Frank & Associates conducted archival and field investigations to determine if cultural resources were present in the Area of Potential Effect (APE) for the proposed Alameda Corridor Improvements Project extending north from the ports of Los Angeles and Long

Beach to downtown Los Angeles in southern Los Angeles County. No prehistoric or historic archaeological resources within the APE appeared to qualify for the NRHP. As a result of a historic architectural survey, five properties were identified as listed in or eligible for listing in the NRHP, including one located approximately 1 mile from the Martin Luther King, Jr. Medical Center Campus (Ritter Elementary School, 11108 Watts Avenue, Los Angeles).

LA 04836. In 2000, a Phase I archaeological survey of the onshore portions of the proposed Global West Fiber Optic Cable project was conducted by Science Applications International Corporation. No historic or prehistoric archaeological resources were observed during the survey.

LA 04980. In 2000, Conejo Archaeological Consultants conducted an archaeological investigation, including a field survey, for the 11651 Antwerp Avenue Project, which involved the proposed construction of two single-family residences and associated utilities on the vacant project site. No historic or prehistoric archaeological resources were observed during the survey.

LA 05569. In 2000, Compass Rose Archaeological Consultants completed an archaeological survey at 2250 East 111th Street, Los Angeles at the request of the Historic Resources Group, for the Los Angeles Housing Department, in preparation for the construction of 78 apartment units. No historic or prehistoric archaeological resources were observed during the survey.

LA 05570. In 2000, Compass Rose Archaeological Consultants completed an archaeological survey at 2115 East Imperial Highway, Los Angeles for the proposed undertaking by the Housing Authority of the City of Los Angeles, consisting of the development of the Imperial Courts Child Care Facility. No historic or prehistoric archaeological resources were observed during the survey.

LA 05571. In 2000, Conejo Archaeological Consultants conducted an archaeological investigation, including a field survey, for the Willow Apartments/ Project No. G89203 at the request of the Los Angeles County Community Development Commission (CDC). No historic or prehistoric archaeological resources were observed during the survey.

LA 05573. In 2000, Conejo Archaeological Consultants conducted an archaeological investigation, including a field survey, for the Willowbrook Community Redevelopment Project No. BB2200-99, which involved the acquisition of four properties located at 1631, 1635, 1641 and 1651 East 117th Street. No historic or prehistoric archaeological resources were observed during the survey.

LA 05944. In 2002, Conejo Archaeological Consultants completed an archaeological survey in the form of a site visit for the Los Angeles Eye Institute, CDC Project No. 62BE17C-01, located at 11801–11839 Wilmington Avenue, 1854 East 118th Street, 11805, 11823, 11826, 11830, and 11836 Bandera Avenue, and 11800–11832 South Holmes Avenue, Willowbrook, Los Angeles County California. No historic or prehistoric archaeological resources were observed during the survey.

LA 06226. In 2002, Conejo Archaeological Consultants conducted an archaeological investigation, including a field survey, for the CDC-Oasis Eye Clinic, the Los Angeles Eye Institute Project, located at 11830 and 11832 South Holmes Avenue in Willowbrook, Los Angeles County, California. No historic or prehistoric archaeological resources were observed during the survey.

LA 06877. In 2003, Conejo Archaeological Consultants conducted an archaeological investigation, including a field survey, for the Salinas Avenue Housing Project in preparation for the acquisition of APN 6134-033-900 for the construction of 115 single-family homes in the unincorporated

Compton area of Los Angeles County. No historic or prehistoric archaeological resources were observed during the survey.

LA 07641. In 2004, Michael Brandman Associates conducted a partial survey in the form of a site visit at the request of Sprint for the Sprint telecommunications facility candidate LA60XC327A (Trinity Chapel), located at 2813 North Wilmington Avenue, Compton, CA 90222. No prehistoric archaeological resources were observed within the direct APE or the indirect APE. No historic archaeological resources were observed within the direct APE. There were four properties located within the indirect APE that were over 45 years of age that were recommended for evaluation of significance following Section 106 of the NHPA.

LA 07648. In 2004, Galvin and Associates conducted a site visit and historic architectural assessment for the Nextel telecommunications facility located on a monopine at 2237 East El Segundo Boulevard in the community of Willowbrook (Los Angeles County), California. Two buildings were evaluated and determined not to be historical resources. No prehistoric archaeological resources were observed during the site visit.

LA 07693. In 2004, Michael Brandman Associates conducted an indirect APE historic architectural assessment, which included a partial survey in the form of a site visit, for Sprint telecommunications facility candidate LA60XC354A located at 11860 Avalon Boulevard, Los Angeles, CA 90061. There were three properties that were 45 years of age or older (610–612 East 118th Place, 613 East 119th Street and 616–618 East 118th Place) were recommended not eligible for the NRHP. No prehistoric archaeological resources were observed during the site visit in either the direct APE or indirect APE.

LA 08237. In 2007, McKenna et al. completed cultural resource investigations, including field studies, for the proposed Park Water Company Well Site No. 19C for the existing facility located at 1743 East 118th Street, Compton, Los Angeles County, California. No historic or prehistoric archaeological resources were observed during the field studies within the project area.

LA 08255. In 2004, SWCA conducted a cultural resources investigation, including pedestrian surveys and cultural monitoring, for the maintenance (replacement and repair) of fiber optic cable within the Qwest network backbone throughout the state of California, known as the Qwest Network Construction Project. No previously unknown historic or prehistoric archaeological resources were observed during the survey or the cultural monitoring.

LA 08959. In 2007, Jones & Stokes conducted an archaeological survey for the City of Los Angeles Department of Recreation and Parks 109th Street Pool and Bathhouse Replacement Project, located approximately 1.0 mile northwest of Martin Luther King, Jr. Medical Center. The 109th Street Pool and Bathhouse has been identified as eligible for listing in the CRHR. No other historic or prehistoric archaeological resources were observed during the survey.

LA 09188. In 2007, Michael Brandman Associates conducted a cultural resources investigation, including a partial survey in the form of a site visit, at the request of Environmental Assessment Specialists, Inc. (EAS) for T-Mobile candidate LA13086B (Fierro Building), located at 2714 South Compton Avenue, Compton, CA 90222. No historic or prehistoric archaeological resources were observed during the site visit.

LA 10029. In 2005, Applied EarthWorks, Inc. encountered two sets of human remains during construction monitoring associated with the Alameda Corridor Project. The Alameda Corridor

Project was launched to improve motor vehicle and railroad traffic along the Alameda Corridor, which is a consolidated railroad link that runs between the ports of Los Angeles and Long Beach and the regional and national rail systems. One set of human remains was a cemetery site containing the remains of 12 individuals that dates between A.D. 990–1250 and the second was an isolated burial that dates from A.D. 1310–1440. The majority of the burials are female, with the exception of one possible adolescent male. DNA analyses revealed that one individual was probably of Chumash descent despite the fact that the cemetery is within what is known as Gabrielino territory, while at least two other individuals support an Uto-Aztecan origin. The burials are located approximately 0.85 miles east of the proposed project site.

LA 10045. In 2004, Conejo Archaeological Consultants conducted archaeological investigations, including a partial survey in the form of a site visit, for the CDC-Mason Court Construction Project. The proposed project consists of demolition of an apartment building located at 2129 East El Segundo Boulevard in the unincorporated Willowbrook area of Los Angeles County to construct a new, larger apartment building. No historic or prehistoric archaeological resources were observed during the site visit.

5.2.2.2 Previously Recorded Prehistoric and Historic Archaeological Resources

Two prehistoric burials and two historic archaeological sites have been recorded within one mile of the proposed project site (Figure 5.2.2.2-1, *Previously Recorded Prehistoric and Historic Archaeological Resources*; Table 5.2.2.2-1, *Previously Recorded Prehistoric and Historic Archaeological Resources Located within 1 Mile of Martin Luther King, Jr. Medical Center Campus*).

TABLE 5.2.2.2-1

5.2.3 Archaeological Impact Analysis

5.2.3.1 Significance Thresholds

Archaeological resources under CEQA may meet the definition of a either a historical resource or unique archaeological resource. A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment. Substantial adverse change in the significance of a historical resource is defined as physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired. The significance of a historical resource would be significantly impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the

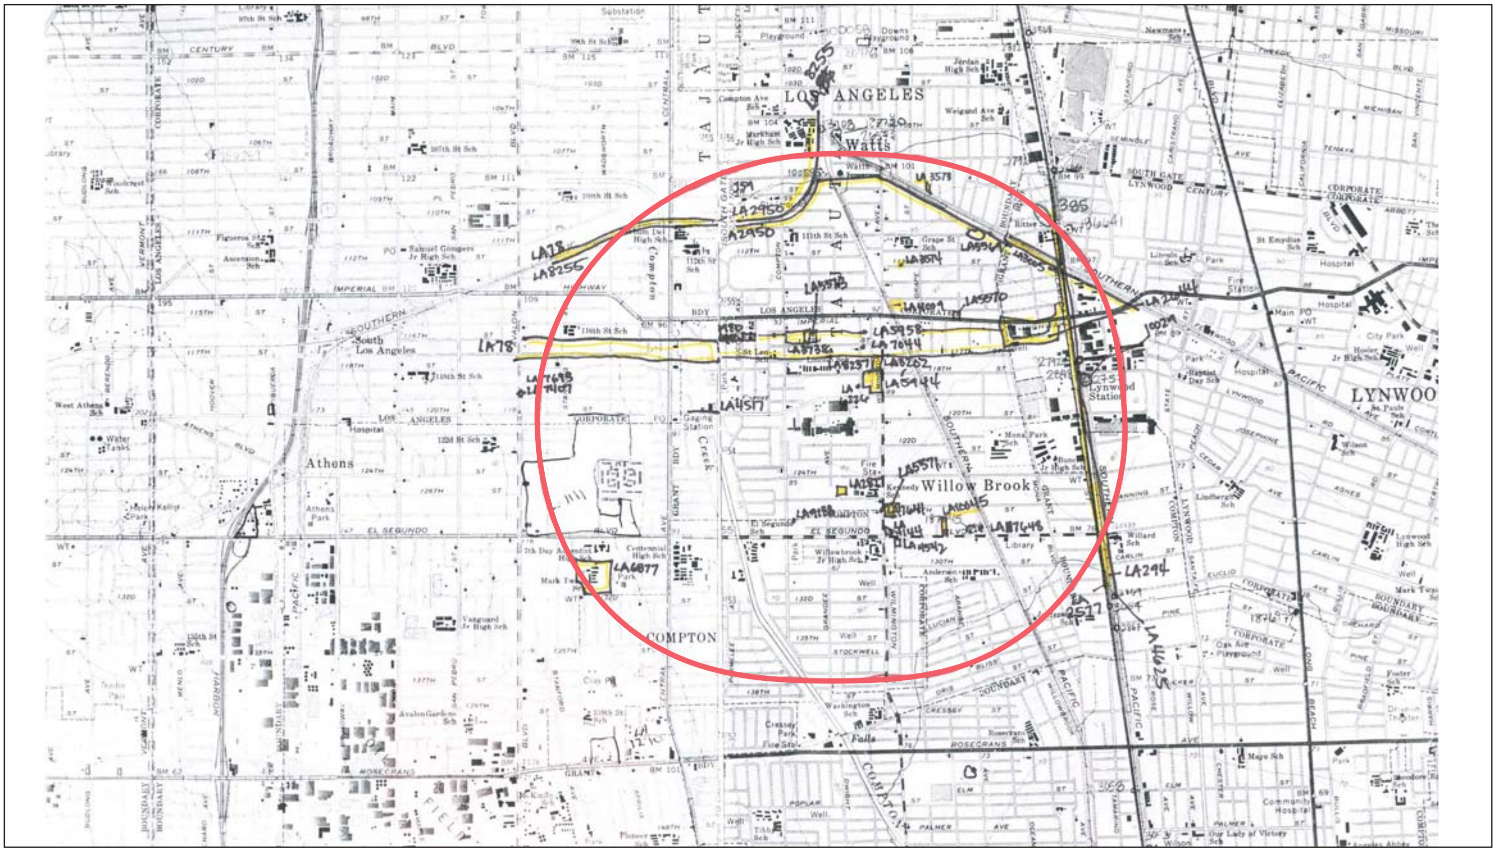

FIGURE 5.2.2.2-1
Previously Recorded Prehistoric and Historic Archaeological Resources

CRHR, a local register of historic resources pursuant to Section 5020.1(k) of the Public Resources Code, or historic resources survey meeting the requirements of Section 5024.1(g) of the Public Resources Code. With regard to unique archaeological resources, CEQA states that when a project will cause damage to a unique archaeological resource, reasonable efforts must be made to preserve the resource in place or left in an undisturbed state. Mitigation measures and alternatives are required to be considered when a historical resource or unique archaeological resource would potentially be damaged or destroyed by a project.

5.2.3.2 Impacts

Tier I and Tier II of the proposed project would not result in significant impacts to cultural resources related to a substantial adverse change in the significance of prehistoric or historic archaeological resources. There are no known prehistoric or historic archaeological resources within the proposed project area. Although it is not certain whether the proposed project site has the potential to yield archaeological resources, it is unlikely due to the historical development of the area. The ground surface has been highly disturbed since its early agricultural use and the subsequent construction and landscaping of the existing buildings within the proposed project property (see Figure 5.2.3.2-1, *1893 Topographic Map*; Figure 5.2.3.2-2, *1923 Topographic Map*; and Figure 5.2.3.2-3, *2000 Topographic Map*, to compare the development of the project site preconstruction and postconstruction of Martin Luther King, Jr. Medical Center). Construction of the Martin Luther King, Jr. Medical Center Campus involved excavation of native soils and the underlying geologic units to an estimated depth that exceeded 15 feet below the ground surface. Due to the level of disturbance that has occurred within the proposed project area in conjunction with construction of the Martin Luther King, Jr. Medical Center in 1972 and subsequent years, extant archaeological resources would likely not be present.

5.3 HISTORICAL RESOURCES

5.3.1 Historic Context

The history and development of the Martin Luther King, Jr. Medical Center Campus may be understood within the contexts of its association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for a new hospital in South Los Angeles in the wake of the 1965 civil unrest. The Martin Luther King, Jr. Medical Center Campus, the Willowbrook area's largest construction project in the years following the 1965 civil unrest, was constructed on the recommendation of the McCone Commission, which identified the lack of access to health care as one of the contributing factors that culminated in the civil unrest.

5.3.1.1 Development of the Willowbrook Area (1893–1980)

The unincorporated area of Los Angeles County known today as Willowbrook originated as one of several early settlements located to the southeast of the Pueblo de Los Angeles. On September 4, 1781, Governor Felipe de Neve granted the region's first settlement, Nuestra Senora La Reina de Los Angeles, or the Pueblo de Los Angeles, with a vast territory covering approximately 28 square miles.[76] In the 1820s, an early settler, Anastacio Abila, utilized the larger Willowbrook area for grazing his herds of cattle. In 1843, Abila was granted approximately 4,500 acres of land, named

FIGURE 5.2.3.2-3
2000 Topographic Map

Rancho Tajauta. Rancho Tajauta occupied an area that can be roughly defined today as south of Firestone Boulevard and north of Rosecrans Avenue, from Alameda Street on the east to the Harbor Freeway on the west. The present-day community of Willowbrook is located entirely within the original boundaries of Rancho Tajauta (Figure 5.3.1.1-1, *Approximate Location of Rancho Tajauta*).[77,78]

Rancho Tajauta's boundaries were surveyed and slightly altered after the admission of California to the Union in 1850. During this period, the southern boundary of the incorporated City of Los Angeles was established in the vicinity of the present-day Exposition Boulevard. Despite the introduction of residential development in Willowbrook, the area continued to be used primarily for grazing. A map of Rancho Tajauta, circa 1854, depicted the area as open land crossed by springs with a dwelling and a corral.[79,80]

The construction of railroad lines in the 1870s increased Los Angeles' connectivity with the rest of the nation. During this period, the rangeland uses that had previously typified Rancho Tajauta gave way to a new era of farming, as roads were surveyed and new farmhouses began to dot the landscape.[81]

In ensuing decades, new arrivals flooded Los Angeles, dramatically increasing the city's population and creating unprecedented demands for housing. Land speculators targeted the southern portion of the growing metropolitan area for new housing developments, which were often strategically concentrated along railroad lines. According to historical topographic maps, in 1893, the area where Willowbrook would be located in ensuing years was located adjacent to the San Pedro branch of the Southern Pacific railroad line and consisted of undeveloped land, dotted by occasional dwellings and crossed by a small network of roads.[82] The settlement in this era was concentrated to the south of the project site in Compton and, to the east, in Downey.[83] In 1903, the Willowbrook Tract was recorded along the newly constructed Pacific Electric railway line to Long Beach. By 1904, much of the formerly open land located to the east of the project site was platted with unusually deep 300-foot lots to accommodate agricultural and residential uses.[84] A 1904 *Los Angeles Times* advertisement for the Willowbrook subdivision described the benefits of the tract's distinctive appeal as an agricultural community,

> Willowbrook faces the Long Beach Electric Line. Only 17 minutes ride from Los Angeles. With the rapid service of the Long Beach system it can be easily reached. The soil is rich, loamy and fertile. It is right in the heart of one of the finest berry, fruit, and vegetable regions of California. For a small dairy, a chicken ranch, etc. it is unexceled [*sic*]. . . . Willowbrook is regularly laid out with wide streets, graded

Approximate Location of Rancho Tajauta

> and oiled according to city specifications. 4 and 6 water mains are laid to every lot, making it a good proposition for an ideal country home.[85]

Willowbrook's proximity to rail lines provided the area's working-class residents with ready access to downtown Los Angeles, located to the northeast, and, to the south, the City of Long Beach. The wider area also became known as Willowbrook due to a Pacific Electric Railroad Company stop that was located near the Willowbrook subdivision along 126th Street. In 1915, an eight-room school was constructed in Willowbrook.[86] A 1923 map of the Willowbrook area depicts several widely spaced and unconnected streets, suggesting the presence of undeveloped land or land occupied by agricultural uses during this period.[87] No historic Sanborn maps were located for the project site for this period, suggesting that buildings were so limited and widely spaced as not to warrant mapping for fire insurance purposes. Willowbrook retained its low-density mix of residential and agricultural uses into the 1940s. In 1945, the Palm Lane Housing Project, consisting of 300 units located in 75 buildings, was constructed on the project site to provide temporary housing for returning World War II veterans. In 1966, the Palm Lane Housing Project was purchased by the County of Los Angeles and demolished shortly thereafter for the construction of the Martin Luther King, Jr. Medical Center.

By the late 1970s, Willowbrook was a metropolitan area anachronism, "Deep in the blighted slums of South Central Los Angeles, there are horses grazing, roosters crowing and corn growing. . . . Homeowners in Willowbrook, right next to Martin Luther King, Jr. County Hospital have turned their 300-foot-deep lots into agricultural havens to supplement poverty-level incomes."[88] In 1979, the Los Angeles County Board of Supervisors approved a plan, conceived by the Watts Labor Community Action Committee, to redevelop 365 acres in Willowbrook. During the 1980s, 56 new homes, the $23 million Kenneth Hahn Shopping Plaza, and a new water system were built in Willowbrook.[89,90] In 1984, the first permanent building on the campus of Charles Drew University immediately to the north of the medical center, the W. Montague Cobb Medical Education Building, was dedicated. Campus construction would continue at Charles Drew University throughout the 1980s.

The south area of Los Angeles, including the Willowbrook area, has a historic identity with African-American settlement, dating back to the late 1910s when migrating African Americans began settling in Watts, a rural working-class community then located just outside the boundaries of the City of Los Angeles. As opportunities to live in the City of Los Angeles were often unavailable to African Americans due in part to restrictive residential covenants, locations just outside the city boundaries provided opportunities for African Americans to establish communities. Only with the easing of discriminatory practices after World War II did African Americans begin to move to other parts of the Los Angeles metropolitan area. The historically African American areas of south Los Angeles experienced a demographic shift between 1970 and 1990. The 1970 Census reported that the residential composition of south Los Angeles was predominantly African American at 86.2

percent. By 1990, the African American population of South Los Angeles decreased, with African Americans comprising only 39.6 percent of residents, while the Latino population rose to 58 percent. Today, south Los Angeles comprises a mix of African Americans, Latinos, and other ethnicities.[91,92,93,94]

5.3.1.2 Development of the Martin Luther King, Jr. Medical Campus (1965–1971)

The development of the Martin Luther King, Jr. Medical Center Campus between 1966 and 1971 was a direct result of the County of Los Angeles Board of Supervisor's approval of recommendations of the McCone Commission to respond to the civil unrest that had occurred in the Watts-Willowbrook area in 1965. On August 11, 1965, California Highway Patrol officers arrested a man named Marquette Frye for suspected drunken driving in the Watts neighborhood in South Los Angeles. A subsequent confrontation erupted in civil unrest. Over the following six days, violence left 34 persons dead, over 1,000 persons injured, damaged over 600 buildings, and burned business districts. The National Guard was called to intervene and would place a cordon around a vast region of South Los Angeles. The affected area ranged as far east as Alameda Street, as far west as Crenshaw Boulevard, and extended south of the Santa Monica Freeway to Rosecrans Avenue (Figure 5.3.1.2-1, *Approximate Area of National Guard Cordon, 1965*).[95,96]

In December 1965, California Governor Pat Brown appointed John McCone, former director of the Central Intelligence Agency, to investigate the causes of the unrest. The resulting Governor's Commission on the Los Angeles Riots, known as the McCone Commission, produced a report, *Violence in the City: an End or a Beginning?*, which cited poverty and racial discrimination as the unrest's major contributing causes. The McCone Commission report acknowledged the commitment required by all citizens to address the severity of the issue,

> The avenue of violence and lawlessness leads to a dead end. To travel the long and difficult road will require courageous leadership and determined participation by all parts of our community, but no task in our times is more important. Of what shall it avail our nation if we can place a man on the moon but cannot cure the sickness in our cities?[97]

In comparison to the rest of the metropolitan area, the McCone Commission found that south Los Angeles had a greater incidence of disease, fewer medical facilities, inadequate private hospitals, and a lack of medical professionals. The McCone Commission recommended the construction of a hospital, stating that "Immediate and favorable consideration should be given to a new, comprehensively-equipped hospital in this area" and called for the establishment of a local

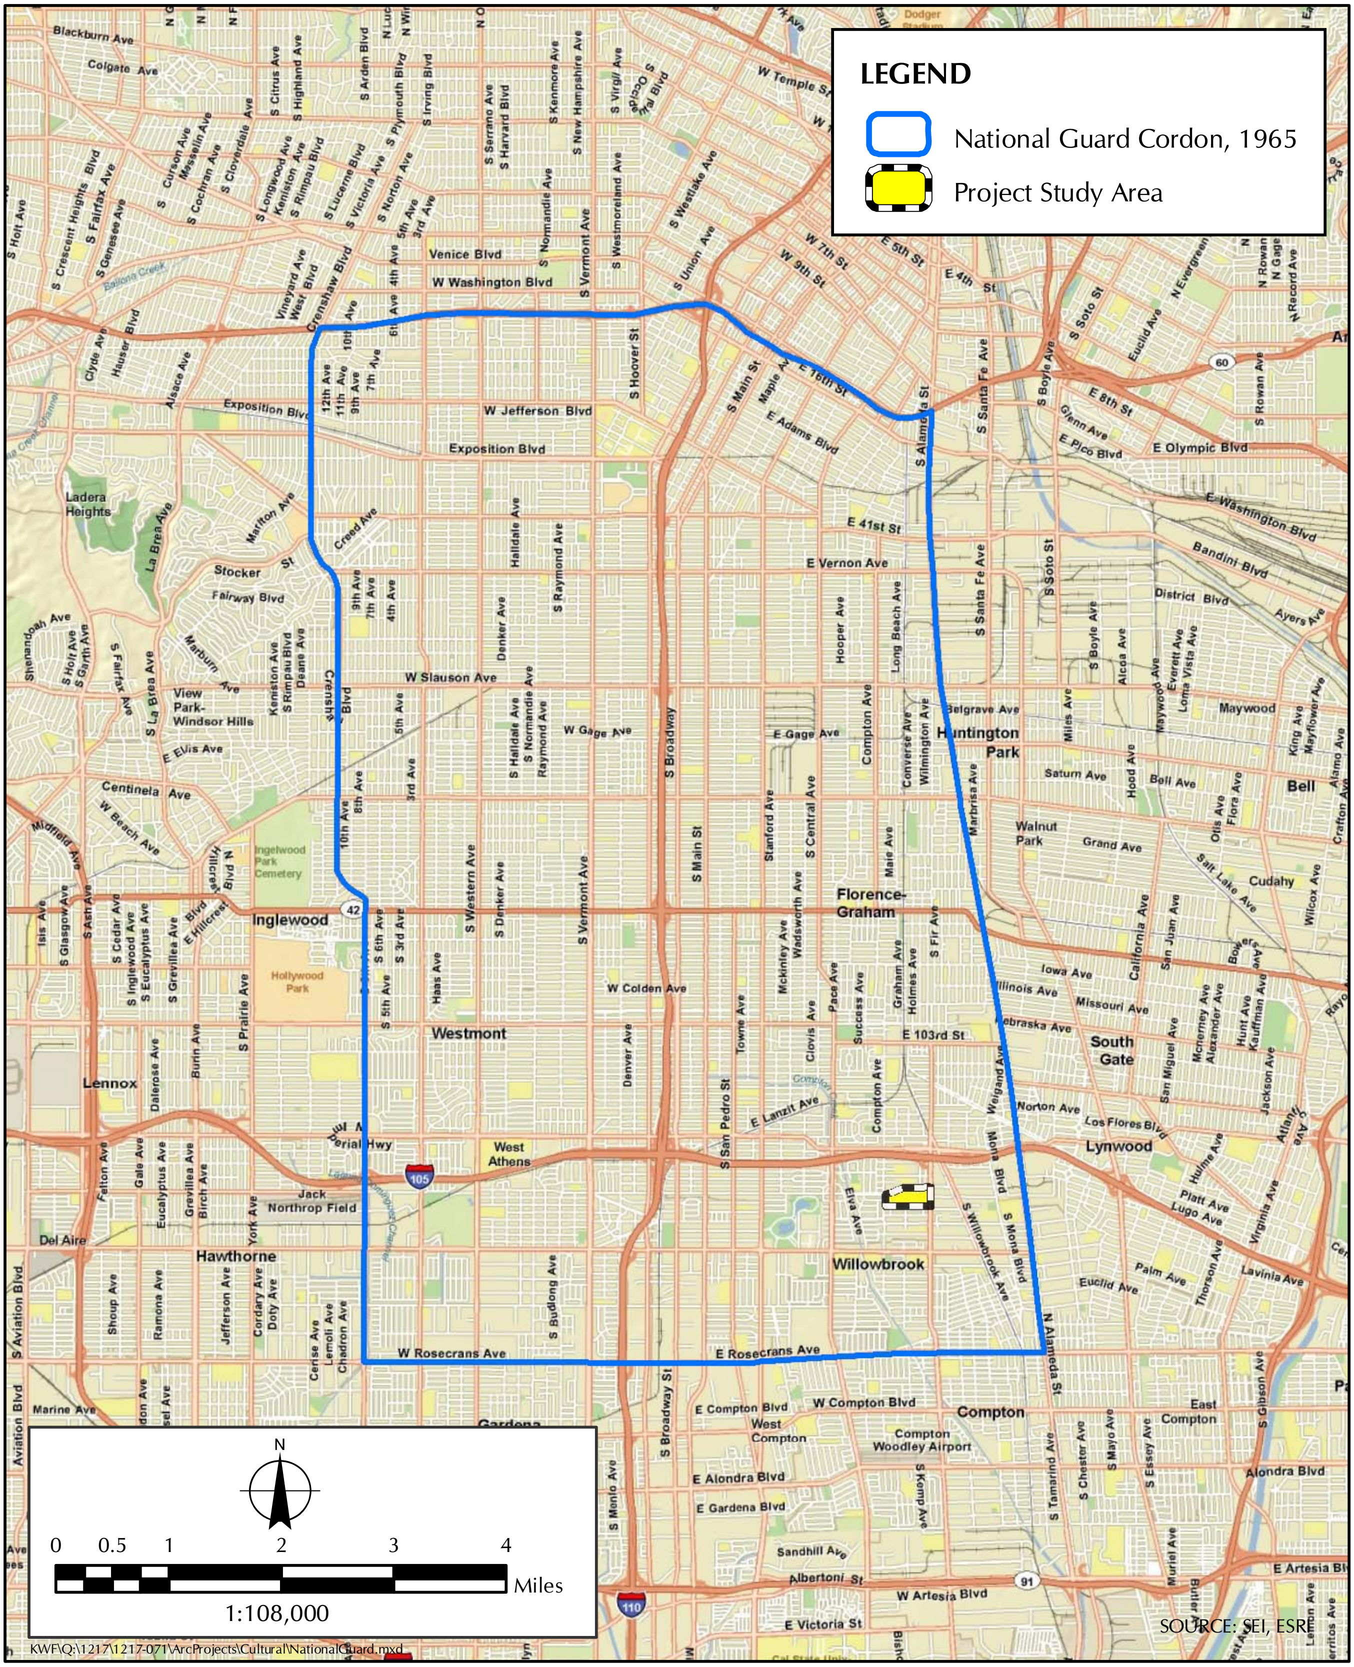

FIGURE 5.3.1.2-1

Approximate Area of National Guard Cordon, 1965 committee comprised of "citizens of the area and representatives of the Los Angeles County Department of Charities, Los Angeles County Medical Association, the California Medical Association, the State Department of Health, and medical and public health schools"[98] In addition to the recommendation for a new hospital, the McCone Commission recommended that the facility should specialize in postgraduate education of physicians and medical assistants through an affiliation with one or more medical schools.

The McCone Commission's recommendation for a hospital reiterated a need that was already an identified local concern in the years leading to the 1965 unrest. The Charles Drew Medical Society, an association of African American medical professionals named in honor of pioneering African American physician and plasma specialist Charles R. Drew, had advocated for the construction of a medical school and hospital in the Willowbrook area since the 1950s.[99] Lack of a local hospital required Willowbrook area residents seeking medical care to travel over 15 miles to County facilities located near downtown Los Angeles for emergency or outpatient services.[100,101]

In February 1966, the Los Angeles County Board of Supervisors unanimously approved the construction of a new teaching hospital in the Watts-Willowbrook area in a direct response to the findings of the McCone Commission.[102] A task force was organized to develop an architectural program for the new hospital.[103] In March 1966, an architectural team for the "Los Angeles County Southeast General Hospital" was selected. The team was composed of three firms: Adrian Wilson and Associates; Nielsen, Moffatt, and Wolverton; and Carey K. Jenkins and Associates, Inc.[104] The Los Angeles County Board of Supervisors appointed Carey K. Jenkins and Associates, Inc. to develop a multi-phased master plan of projected facilities.[105]

County Supervisor Kenneth Hahn spearheaded the drive to construct the new hospital facility, navigating considerable political and funding obstacles, including a general obligation bond proposition that fell just short of the required percentage for successful passage. A Southeast General Hospital Joint Authority Commission was subsequently established to fund and complete the project, which would be leased back to the County at an annual rate.[106] In August 1966, seeking a location for the new facility, the County Board of Supervisors purchased the 30-acre Palm Lane Housing Project from the County Housing Authority for $100,000.[107,108] In April1968, Los Angeles County Supervisors accepted contractor Robert E. McKee's $24.5 million bid to construct the facility. Local efforts—including the Watts Health Foundation and the King-Drew

Auxilliary, led by community activists such as Mary Henry, Caffie Green, Johnnie Tillman, Nona Carter, and Lillian Harkless Mobley—were instrumental in securing community support for the project.[109,110] Following the assassination of Dr. Martin Luther King, Jr. on April 4, 1968, the County Board of Supervisors unanimously adopted Supervisor Hahn's resolution to rename the Southeast General Hospital in honor of Dr. King. A groundbreaking ceremony for Martin Luther King Jr. General Hospital was held on May 4, 1968.[111,112,113]

Planning efforts for the hospital represented the area's largest construction project since the 1965 civil unrest. The project's primary building, known today as the MACC, estimated at $23.5 million, was promoted not only as an opportunity to increase the availability of medical care in South Los Angeles but as an important new source of local employment. Supervisor Hahn personally monitored the ethnic and racial composition of the project's construction workers to ensure that employment reflected the predominantly African American demographic of the area. Priority was also given to African Americans for hospital staff positions.[114,115]

5.3.1.3 Operation of the Martin Luther King, Jr. Medical Campus (1972–2010)

In July 1971, Martin Luther King Jr. General Hospital and Charles R. Drew Postgraduate Medical School entered into a contract to provide health care and education services. In addition to the promise of increased employment and educational opportunities, it was hoped that the project would positively impact the wider community and generate local investment. In 1972, hospital administrator Charles E. Windsor stated that,

> Like the rock thrown in the pond, this Area Health-Education Center will set in motion ripples of productive activity throughout the community. For where there are hospitals there will be uniform shops and shoe shops, recreational facilities, restaurants, lodging places, rest homes, convalescent homes, medical offices and all of the other things that will create the kind of economic base that is required to support a healthy community.[116]

Approximately one year later, on March 27, 1972, the new hospital accepted its first patient. Over the next five months, the hospital treated 42,618 outpatients, prompting County Supervisor Kenneth Hahn to note, "Building the hospital fulfilled the No. 1 health recommendation of the McCone Commission which investigated the Watts riot of 1965." During 1973, the facility cared for approximately 9,000 inpatients, 40,000 emergency room visitors, and 160,000 outpatients, and delivered 1,832 babies. In December 1977, Drew Medical School established an undergraduate medical program in conjunction with the University of California, Los Angeles. In 1982, the Martin

Luther King Jr. General Hospital and Drew Medical School became known as the Martin Luther King, Jr./Drew Medical Center.[117,118,119,120,121]

During the 1980s and 1990s, the facility provided medical services to some of Los Angeles County's neediest citizens. As the only public hospital in South Los Angeles, the facility persevered through numerous challenges, including meeting the intense need for medical care of the poor and uninsured, funding cuts, treating victims of violence, and addressing new health crises such as HIV/AIDS. By the late 1990s, the Martin Luther King, Jr. Medical Center Campus was the only Level 1 trauma center in the region and charged with handling the most difficult medical emergencies over a 94 square mile area of Watts, Compton, Willowbrook and South Los Angeles inhabited by 1.5 million residents. The facility employed 3,000 people and provided postgraduate training for 300 resident physicians.[122]

Founded with high aspirations after the Watts civil disturbance, Martin Luther King Jr. Medical Center Campus was troubled by repeated incidents of purported mismanagement. In 2004, the *Los Angeles Times* published the results of an in-depth investigation by a team of reporters documenting managerial issues and neglect at the facility that were believed to have contributed to harm to some patients and even the loss of life. In 2005, the hospital's Level 1 trauma center was closed with other hospital facilities and departments following suit. Since 2007, the hospital has functioned as a Multi-Service Ambulatory Care Center with clinics for urgent care and outpatient visits. In 2009, the County of Los Angeles Board of Supervisors approved the rehabilitation of the Inpatient Tower (constructed in 1993) to house a 120-bed inpatient facility, and state and county officials announced a new agreement that would reopen the hospital in 2012.[123,124,125,126]

5.3.1.4 Architectural Design and Construction

Historical research indicates the Martin Luther King Jr. Medical Center Campus was planned and constructed between 1968 and 1972.[127,128,129,130] Three Los Angeles firms were selected to collaboratively design the new facility: Adrian Wilson and Associates; Carey K. Jenkins; and

Nielsen, Moffatt, and Wolverton. Two of these firms, Adrian Wilson and Associates and Nielsen, Moffatt, and Wolverton already had considerable experience in the planning and design of hospitals and medical facilities.[131,132,133,134,135,136,137]

The initial buildings, including the MACC, of the Martin Luther King Jr. Medical Center Campus were built by contractor Robert E. McKee, Inc. As the hospital's primary patient care facility, the MACC, exhibits elements of the Brutalism style, which was a popular choice for public and institutional buildings constructed during the 1960s and 1970s. In the ensuing years, subsequently constructed buildings and structures located on the project site refer broadly to the Brutalism design precedent embodied in the MACC.

The main buildings of the Martin Luther King, Jr. Medical Center Campus were constructed in phases during the late 1960s and 1970s. The earliest improvements included the three wings of the MACC, the Central Plant, and the Medical Records and Laundry Building, which were all operational by 1972. In 1973, the North and South Support buildings and the Dr. H. Claude Hudson Auditorium were built. The Interns and Physicians Building was constructed circa 1974. A second phase of the Central Plant building was completed in 1975, followed by the Augustus F. Hawkins Comprehensive Mental Health Center in 1979. No building permits were located that provided specific dates of subsequent buildings; however, several support buildings, such as the Cooling Towers, Oasis Clinic, Storage Buildings, and the Hub Clinic were built during the 1970s and 1980s. The early 1990s brought several new buildings to the Medical Center: the Registration Building, Inpatient Tower, Pediatric Acute Care, Emergency Room, and the MRI Building.[138]

The individual buildings and the Martin Luther King Jr. Medical Center Campus as a whole have been continuously modified to meet the needs of the hospital and hospital building safety codes; between 1973 and 2008, nearly 140 construction projects were completed, with costs in excess of $143 million.

Brutalism Style

Brutalism, pioneered by the architect Le Corbusier, developed in part as a return to the functionalist principles defined by early modernist architects. Brutalism prioritized simplicity and function in form and materials. Brutalist buildings are typically constructed of rough unfinished concrete, or *breton brut*, and utilized prefabricated construction techniques. Structural elements, such as steel beams, are often left exposed. Forms are often monolithic and monumental. Windows may be small and/or nonfunctional. Many Brutalist buildings convey a sense of stark austerity. In contrast to the transparency and refinement conveyed by the use of glass and steel in International style buildings, Brutalist buildings, constructed primarily of concrete, often appear solid, raw and

unfinished. Considered easy to construct and maintain, the Brutalist style was widely popular for government, civic, and institutional buildings during the 1960s and 1970s.[139,140] Examples of Brutalist buildings include Le Corbusier's Unité d'Habitation (1952) in Marseille, France and Secretariat Building (1953) in Chandigarh, India, the Architecture Building at Yale University (Paul Rudolph, 1958), and the Jack Langson Library, UC Irvine (William Pereira, 1965).[141]

The MACC building, constructed in the early 1970s, incorporates elements of the Brutalism style. Like many Brutalist buildings, it is characterized by use of concrete, horizontality, monolithic massing, geometric repetition, and exposed structural elements. In contrast to the International Style's enthusiasm for transparency via glass curtain walls, its windows are de-emphasized and the contrast between the heavy solidity of the concrete structure and the voids of the horizontal bands of windows are played up instead. In keeping the Brutalism aesthetic, ornamentation is minimal, with an overall appearance of simplicity in form and an implied visual strength. Similarly, the Interns and Physicians Building (circa 1975) and Augustus F. Hawkins Comprehensive Mental Health Center (1979) also exhibit the hallmarks of Brutalist architecture.

Adrian Wilson and Associates

Adrian Jennings Wilson (1898–1988) studied architecture, structural engineering, and mechanical engineering at Washington University in St. Louis, Missouri, where he graduated in 1919. In 1920, he began his career as a draftsman for the Los Angeles firm of Dodd and Richards. While at Dodd and Richards, Mr. Wilson participated in the design of several notable buildings in downtown Los Angeles, including the Pacific Mutual Building at Sixth and Olive Streets (1922). In 1930, Mr. Wilson began a partnership with Erle Farrington Webster to create the architectural firm of Webster and Wilson, Architects. In 1936, the firm was renamed Adrian Wilson Associates.[142]

Adrian Wilson Associates specialized in the design of numerous institutional, civic, defense, and commercial projects in the United States and abroad. Early projects of note in the Los Angeles area include Pueblo Del Rio (circa 1942), Victory Park Housing Project in Compton (circa 1945), and Pacific Palisades High School (circa 1961). The firm was one of several architects involved with the Kenneth Hahn Hall of Administration (1960) and the Los Angeles County Courthouse (1958) in downtown Los Angeles. The firm obtained numerous commissions in Asia, and Mr. Wilson established a network of offices in Japan, Vietnam, Korea, the Philippines, Turkey and Thailand.[143,144,145,146,147,148,149]

[149] *Los Angeles Times*. 6 February 1988. "Adrian Wilson; Architect for L.A. Buildings," p. 30.

By the late 1960s, Adrian Wilson Associates were recognized in the field of hospital design and planning. The firm designed several medical facilities, including the Mira Loma Hospital (1961) and the Harbor General Hospital in Torrance (1963). In Los Angeles, Mr. Wilson collaborated with architect Paul R. Williams in the design of the Psychopathic Unit (circa 1951), Communicable Diseases building (1955), and Osteopathic Hospital (1958) of Los Angeles County General Hospital. Adrian Wilson and Paul R. Williams collaborated again in the design of the Post-Acute Polio Hospital at Rancho Los Amigos in Downey (1955). In addition, the firm obtained commissions for many large hospital projects in Asia, such as the V. Luna General Hospital in Quezon City, Philippines. In 1967, the firm was awarded a contract to design three hospital units in Vietnam. The Department of the Army contracted with Adrian Wilson Associates to design the 121st Evacuation Hospital in Seoul, Korea and the firm also worked on alterations to the Seoul Military Hospital.[150,151,152,153,154,155,156]

Mr. Wilson served as president of the Southern California chapter of the American Institute of Architects (AIA) and was chosen as a Fellow of the AIA. Adrian Wilson Associates was sold to Howard Needles Tammen and Bergendoof, an architecture firm based in Kansas City, in 1976.[157,158] Adrian Wilson International Associates, Inc. (AWIA) continues to operate today as an independent, multi-disciplinary engineering consulting firm. AWIA began in 1956 as the Philippines Office of the Los Angeles-based Adrian Wilson Associates.[159]

Carey K. Jenkins

Carey K. Jenkins (1919–1987) was one of the first African-American graduates in architecture at University of Southern California.[160] During the 1970s, Mr. Jenkins was involved in Watts Industrial Park, a federally funded 53–acre economic revitalization project. Mr. Jenkins designed the project's 22,000 sq. ft. Community Service Center. Other projects included the Mary McLeod Bethune Middle School in Los Angeles. In addition to his participation in the development of the Martin Luther King, Jr. Medical Campus, Mr. Jenkins designed the Southeast Comprehensive Health Center (Hubert H. Humphrey Comprehensive Health Center), a satellite facility to the Medical Center Campus, located at 5850 South Main Street in Los Angeles. This building was recognized as the first public comprehensive health center in the nation.[161,162,163] The firm Mr.

Jenkins founded in 1981 continues to operate in Los Angeles as Jenkins, Gales & Martinez, Inc. The USC School of Architecture maintains the Carey K. Jenkins Memorial Scholarship, which is designated for a minority student in memory of Mr. Jenkins.[164,165]

Reiner C. Nielsen, Gene E. Moffatt

During the 1950s, Reiner C. Nielsen and Gene E. Moffatt collaborated on the design of several hospital projects in Southern California. In 1951, Reiner C. Nielsen designed the Metropolitan Hospital at 2001 South Hoover Street in Los Angeles.[166] Mr. Nielsen and Gene E. Moffatt were awarded the contract to design Victory General Hospital in Northridge in 1952.[167] Neilsen and Moffatt also designed the San Vicente Hospital at 6000 San Vicente Boulevard in Los Angeles (1954).[168] Other hospital commissions included the Lark Allen General Hospital in West Covina (1955) and the Southwest Foundation Hospital at La Brea Boulevard and Coliseum Street in Los Angeles (1958). A third designer, identified as "Wolverton," is listed as on a program for the 1968 groundbreaking celebration for Martin Luther King, Jr. Medical Center; however, no additional information was located regarding this individual.[169,170]

Robert McKee, Inc.

Robert Eugene McKee (1889–1965) began his career as a draftsman in El Paso, Texas for the City engineering department. After moonlighting as a surveyor, Mr. McKee established his own business as an independent contractor. In ensuing decades, the company would grow into one of the world's largest private construction firms. Robert McKee, Inc. built more than 3,000 projects in 35 states and abroad during the 1930s through the 1960s. Headquartered in El Paso, the firm maintained branch offices in Dallas, Santa Fe, Los Angeles, Honolulu, and the Panama Canal Zone.[171,172,173] Firm projects include the United States Air Force Academy Cadet Chapel in Colorado Springs, Colorado (Skidmore Owings Merrill, 1963) and military installations in the Panama Canal Zone. During World War II, the firm was selected to build the Los Alamos Atomic Energy Project in New Mexico.[174]

Robert E. McKee, Inc. constructed many high profile projects in Los Angeles: Union Station Terminal (1938); Hotel Statler (Statler Hilton) (1952); and Wilshire Federal Building (1969). The firm was the primary contractor for the Los Angeles International Airport (1959).[175,176]

5.3.2 Resource Characterization

5.3.2.1 Previously Surveyed Areas and Recorded Historical Resources

The historical resources investigations included archival records searches and literature reviews to determine: (i) if known historical resources sites have previously been recorded on, or within a 1-mile radius of, the project site; (ii) if the project site has been systematically surveyed by historians prior to the initiation of the study; and/or (iii) whether there is other information that would indicate whether or not the area of the project site is historically sensitive or may pose indirect impacts to adjacent historic resources. Sapphos Environmental, Inc. conducted a records search at SCCIC. The record search indicated that four of the cultural resources surveys described in Section 5.2.2.1, *Previous Research Conducted in the Area*, documented historic architectural surveys. As a result of the records search, it was determined that there is one property within a 1 mile radius of the proposed project site that has been formally determined to be a historical resource as defined by CEQA: Watts Towers (1761–1765 East 107th Street) is listed in the NRHP and the CRHR. It is has also been designated a National Historic Landmark, California Historical Landmark, and City of Los Angeles Historic-Cultural Monument (LAHCM No. 15). Located approximately 1 mile north of the Martin Luther King, Jr. Medical Center campus, Watts Towers are a California State Historic Park. Watts Towers are not visible from the proposed project site, nor can the proposed project site be seen from the area immediately surrounding Watts Towers. Two additional properties, the 109th Street Pool and Bathhouse (1464 East 109th Street) and Ritter Elementary School (11108 Watts Avenue) were recommended eligible for listing in the NRHP and CRHR.[177,178] Both properties are located approximately 1 mile from the project site, out of visible range. No other properties documented within the study area, either through performance of the cultural resources surveys itemized above or through listing in the California HRI, meet the definition of a historical resource pursuant to CEQA.

5.3.2.2 Existing Conditions

Summary of Historical Resources Evaluation

An intensive level historic resources survey of the Martin Luther King, Jr. Medical Center Campus was completed in support of the proposed project. A total of 21 buildings that occupy the proposed project site were evaluated as potential historical resources as defined by CEQA (Table 5.3.2.2-1, *Historic Resources Survey Results*; and Figure 5.3.2.2-1, *Martin Luther King, Jr. Medical Center Campus Historic District*). Four buildings, of the total of 21 buildings, appear to meet the criteria for listing in the NRHP and CRHR as contributors to a potential Martin Luther King, Jr. Medical Center Campus Historic District (California Historical Resources Code [CHR] 3D): (Building 5) Augustus F. Hawkins Comprehensive Medical Health Center; (Building 7) Multi-Service Ambulatory Care Center (MACC); (Building 14) Interns and Physicians Building; and (Building 18) Dr. H. Claude Hudson Auditorium. Contributing features to the potential historic district would also include seven appurtenant elements (discussed below in Section *5.3.2.2.2, Martin Luther King, Jr. Medical Center Campus Historic District*). The remaining 17 buildings and structures do not contribute to the historic district and are not considered to be historical resources.

Martin Luther King, Jr. Medical Center Campus Historic District

TABLE 5.3.2.2-1
HISTORIC RESOURCES SURVEY RESULTS

	Name[a]	Date of Construction[b]	General Description	Treatment Under Project	Recommended CHR Status Code
1	Genesis Clinic	ca. 1979	One story	Tiers 1&2: To remain	6Z
2	Oasis Clinic (old)	ca. 1979	One story	Tiers 1&2: To remain	6Z
3	Oasis Clinic (new)	ca. 1995	One story	Tiers 1&2: To remain	6Z
4	Registration Building	ca. 1990	Two stories	Tiers 1&2: To remain	6Z (1)
5	Augustus F. Hawkins Comprehensive Mental Health Center	1979	Three stories plus a basement	Tiers 1&2: To remain	3D
6	Inpatient Tower	1993	Five stories plus basement	Tiers 1&2: To remain	6Z (1)
7	Multi-Service Ambulatory Care Center (MACC) (aka, King/Drew Hospital)	1968–1972	Five stories plus a basement and penthouse	Tier I: to remain; Tier II: Reuse, Replace, or Remove	3D
8	Pediatric Acute Care	1992	One story	Tiers 1&2: To remain	6Z (1)
9	Medical Records and Laundry	1972	One story plus basement	Tiers 1&2: To remain	6Z
10	Central Plant	Phase I: late1960s; Phase II: 1975	Phase I: one story with partial mezzanine floor Phase II: one story	Tiers 1&2: To remain	6Z
11	Plant Management Building	1979	One story	Tier I: to remain, with tenant improvements	6Z
12	North Support Building	1973	Two stories	Tier I: to remain, with tenant improvements	6Z
13	South Support Building	ca. 1973	One story	Tier I: to remain, with tenant improvements	6Z
14	Interns and Physicians Building	ca. 1974	Six stories	Tier I: to remain, with tenant improvements	3D
15	Emergency Room	ca. 1985	One story	Tier I: to remain; Tier II: Reuse, Replace, or Remove	6Z
16	Storage Building (1,060 sq. ft)	ca. 1980	One story	Tier I: to remain; Tier II: Reuse, Replace, or Remove	6Z (1)
17	MRI Building	ca. 1980	One story	Tier I: potentially moved	6Z (1)
18	Dr. H. Claude Hudson Auditorium	ca. 1973	One story	Tiers 1&2: To remain	3D
19	Cooling Towers	ca. 1979	One story	Tier I: to remain; Tier II: Reuse, Replace, or Remove	6Z (1)
20	Hub Clinic	ca. 1980	One story	Tiers 1&2: To remain	6Z
21	Storage Building (2,533 sq. ft.)	ca. 1980	One story	Tiers 1&2: To remain	6Z

NOTES:

a. Names used in this report to identify contributing resources are based on the results of the current survey and correlate with the buildings' historic use and name and may contradict previously used resource names.

b. Construction dates used in this report to calculate the age of contributing resources are based on the results of the current survey and were calculated using building materials and historical newspaper records. The date of construction may contradict previously estimated construction years.

KEY:

CHR Status Code:	California Historical Resources Status Code, adopted by the Office of Historic Preservation in August 2003
3D:	Appears eligible for NR as a contributor to a NR eligible district through survey evaluation.
6Z:	Found ineligible for NRHP, CRHR, or local designation through survey evaluation
6Z (1)	Less than 50 years old and not of exceptional significance
Ca.	Circa

5.3.2.2.2 Martin Luther King, Jr. Medical Center Campus Historic District

The intensive level survey of the Martin Luther King, Jr. Medical Center Campus indicated that there are a total of five historical resources present, the Martin Luther King, Jr. Medical Center Campus Historic District and four contributing buildings with seven appurtenant elements that comprise the historic district:

- MACC building
- Augustus F. Hawkins Comprehensive Mental Health Center
- Interns and Physicians Building
- Dr. H. Claude Hudson Auditorium

The five recommended-eligible historical resources were recorded on California Historic Resources Inventory forms (Appendix A).

Martin Luther King, Jr. Medical Center Campus Historic District. The historic district appears eligible under NRHP and CRHR Criteria A/1 for its exceptional importance in relation to the Civil Rights movement in Los Angeles, as epitomized by the 1965 civic unrest in the Watts area and resultant McCone Commission's recommendations. The McCone Commission identified the lack of access to health care in the historically underserved area of South Central Los Angeles as one of the primary contributing factors to the civil disturbances, along with high unemployment and limited educational opportunities. The historic district is also significant as a major milestone in the history and development of the Willowbrook area.

Originating during a turbulent era in the history of Los Angeles County and the nation, the Martin Luther King, Jr. Medical Center Campus represented the hopes and aspirations of South Central Los Angeles residents and Los Angeles County officials. The new campus was intended to serve multiple roles as a medical facility and economic engine, rectifying past inequalities regarding medical services, employment, and educational facilities in South Central Los Angeles. The Martin Luther King, Jr. Medical Center Campus Historic District demonstrates exceptional importance as a rare, surviving community development project that was built to respond to the 1965 civil unrest.

As part of the national civil rights movement that culminated in the 1960s, the civil disturbances in and around Watts in 1965 were a pivotal moment in the history of Los Angeles County. The McCone Commission and its recommendations represented a turning point in local governance, when the County made a concerted effort to redress the inequalities that the McCone Commission identified as some of the underlying causes of the upheaval. The Martin Luther King, Jr. Medical Center was a centerpiece of the County's response and as such has exceptional importance as a physical manifestation of significant historical events of the 1960s in Los Angeles. Furthermore, the name it bears represents one of the most visible local efforts to commemorate a prophet of the national civil rights movement, Dr. Martin Luther King, Jr.

In fulfilling the mandate of the McCone Commission, the Martin Luther King, Jr. Medical Center Campus project incorporated an active program of community involvement efforts. Hospital staff regularly attended various local community meetings and the community participated in the plans for the development and operation of the hospital. As a result of community outreach efforts, medical service needs that expanded beyond the facility's initial vision were identified and led to the acquisition by the County of Los Angeles of an additional 16 acres north of 120th Street to create a comprehensive "Area Health Education Center." Demonstrating the project's responsiveness to the provision of local community services, the MACC incorporated spaces for educational and assembly uses, including 50,000 square feet for classrooms and conference rooms. This space was intended for use in providing employment training for local residents and continuing education classes for health professionals at the facility.

The development of the Martin Luther King, Jr. Medical Center represented a major shift in the history and development of the Willowbrook area, which, prior to the project, was a relatively undistinguished community that still retained substantial vestiges of its original rural uses. The new hospital inspired high hopes as an economic generator and top-notch medical facility that would provide abundant opportunities in an area of considerable need, or, as stated by Martin Luther King, Jr. Medical Center Administrator Charles E. Windsor in 1972,

> This multimillion dollar project is being set in the middle of desert of deprivation offering hope and light where there has been none, offering opportunities in fields heretofore unknown to the residents in this area, and offering medical services of a quality which would be desirable even in the most prosperous of communities.[179]

In ensuing years, the presence of a Los Angeles County hospital employed approximately 3,000 workers, provided opportunities for medical professional training and development, and spurred numerous additional development projects in Willowbrook, which included a large scale redevelopment plan, dozens of new homes, the Kenneth Hahn Shopping Plaza and a new water system.

Related by function, period of significance (1968–1979), physical placement, and complementary architectural styles, the four buildings (Augustus F. Hawkins Comprehensive Mental Health Center, Multi-Service Ambulatory Care Center (MACC), Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium) that comprise the historic district convey intentionality as the key buildings of the Martin Luther King, Jr. Medical Center Campus. The campus function of the property is most evident in the design of its landscaped areas, which include the large lawn to the east of the MACC, gardens, courtyards, and circulation routes for pedestrians and vehicles. There are several pedestrian walkways that connect the four historic district contributors. The walkways enabled medical personnel and students to travel expeditiously around the campus. The MACC, for example, is connected to the Dr. H. Claude Hudson Auditorium via a low covered walkway that extends from the MACC's east façade, which provides a physical link between the medical (MACC) and assembly (Auditorium) uses. Existing gardens and courtyards, particularly those associated with the Augusts F. Hawkins Comprehensive Mental Health Center and the Interns and Physicians Building, provided recreational facilities for medical students and expressed the property's historic function as a medical center campus.

Character-defining features of the Martin Luther King, Jr. Medical Center Campus Historic District convey its historical function as a medical center campus. The character-defining features include four buildings and seven appurtenant elements:

Buildings

- MACC building
- Augustus F. Hawkins Comprehensive Mental Health Center
- Interns and Physicians Building
- Dr. H. Claude Hudson Auditorium

---

[179] Windsor, Charles E. November 1972. "A Summary of the History and Plan for Development of the Los Angeles County Martin Luther King, Jr. General Hospital." *Journal of the National Medical Association*, *64* (6): pp. 544–547.

Appurtenant Elements

- Elongated lawn located east of the MACC, which is bounded by a primary entrance road
- Sunken garden and walled courtyard located south and west of the Augustus F. Hawkins Comprehensive Mental Health Center
- Walled courtyard and recreation area located south of the Interns and Physicians Building
- Drop-off area located north of the Interns and Physicians Building and west of the North Support Building
- Pedestrian walkway extending from the MACC's east facade to the Dr. H. Claude Hudson Auditorium
- Pedestrian walkway extending from the north elevation of the MACC to the Augustus F. Hawkins Comprehensive Mental Health Center
- Pedestrian walkway extending from the east facade of the Interns and Physicians Building to the MACC

Multi-Service Ambulatory Care Center (MACC). Planning for a new hospital in South Los Angeles began in 1966, after the Los Angeles County Board of Supervisors unanimously approved the project. Construction of the 5-story (plus basement and penthouse) MACC began in 1968. The facility accepted its first patient in 1972 (Figure 5.3.2.2.2-1, *Multi-Service Ambulatory Care Center, Facade, View West*). Character-defining features of the MACC are consistent with the Brutalism style:

- Ample use of concrete (e.g., vertically striated concrete supports and exterior framing) (Figure 5.3.2.2.2-2, *Multi-Service Ambulatory Care Center, Corner Detail, View Northwest*)
- Monolithic massing
- Geometric repetition (e.g., the plan configuration consisting of three identical towers, repetitive bands of windows, and a series of balconies located on the building's facade)
- Recessed primary entrance with deeply cantilevered canopy
- Minimal ornamentation
- Overall simplicity of form
- Original landscaping (elongated central lawn crossed by a single path)

The MACC is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The MACC was constructed as the primary component of the Martin Luther King, Jr. Medical Center Campus, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles (Figure 5.3.2.2.2-3, *Multi-Service Ambulatory Care Center, circa 1975*). Located at the far west end of a large grassy lawn, the MACC occupies a commanding location within the site, conveying the prominence of its hospital function to visitors entering the facility from the property's main entrance at Wilmington Avenue. The building is a highly characteristic example of the Brutalism style. The Brutalism style, considered easy to construct and maintain, was a popular choice for government, civic and institutional buildings during the 1960s and 1970s and thus use of Brutalist architecture reflects the building's public

FIGURE 5.3.2.2.2-1
Multi-service Ambulatory Care Center, Facade, View West

FIGURE 5.3.2.2.2-2
Multi-service Ambulatory Care Center, Corner Detail, View Northwest

SOURCE: Los Angeles Public Library

FIGURE 5.3.2.2.2-3
Multi-service Ambulatory Care Center, circa 1975

function and era of construction. Landscape elements—including the central lawn crossed by a single paved sidewalk, an allée of tall palms to the south of the property, and ornamental trees and shrubs located along the building's primary façade—serve to further emphasize the building's role as the primary care facility of the Martin Luther King, Jr. Medical Center Campus. The three pedestrian walkways associated with the MACC (consisting of a low covered walkway extending from the MACC's east facade to the Dr. H. Claude Hudson Auditorium, an elevated walkway constructed of reinforced concrete, providing pedestrian access from the MACC to the Augustus F. Hawkins Comprehensive Mental Health Center, and a walkway extending from the west elevation of the MACC, constructed of reinforced concrete columns, and traversing past several medical campus buildings before terminating at the Dr. Julius W. Hill Interns and Physicians Building) (Figure 5.3.2.2.2-4, *Concrete Colonnade, View East*), contribute to the property's architectural and functional character. The MACC exhibits few exterior alterations since its construction; its character-defining features are intact; and it retains integrity in its location, design, setting, materials, workmanship, feeling and association. As a hospital, the MACC is a key property type associated with the property's overall function as a medical care facility and postgraduate medical teaching facility.

The MACC satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the MACC meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional importance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest.

Augustus F. Hawkins Comprehensive Mental Health Center. The 3-story Augustus F. Hawkins Comprehensive Mental Health Center was built in 1979 (Figure 5.3.2.2.2-5, *Augustus F. Hawkins Comprehensive Mental Health Center, East Elevation, View Southwest*). Character-defining features of the Mental Health Center are consistent with the Brutalism style:

- Ample use of concrete with vertically striated, unfinished detailing
- Monumental horizontal massing with overhanging upper floor
- Small, recessed, fixed, tinted windows
- Recessed primary entrance
- Elevated pedestrian walkway extending from south elevation to the MACC
- Original landscaping (walled courtyard with pathways, sunken garden along south elevation, low planter wall along north facade)

The Mental Health Center is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The Mental Health Center was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles. Located south of 120th Street, the Mental Health Center's monolithic north facade is a prominent feature of the medical center campus. The building is a highly characteristic example of the Brutalism style. Brutalism style buildings, considered easy to construct and maintain, were widely popular for government, civic and institutional buildings built during the 1960s and 1970s and thus use of Brutalist architecture reflects the building's public function. The building's unusual massing, weighted upwards,

FIGURE 5.3.2.2.2-4
Concrete Colonnade, View East

FIGURE 5.3.2.2.2-5
Augustus F. Hawkins Comprehensive Mental Health Center, East Elevation, View Southwest

incorporates elements of the Brutalism style in its ample use of reinforced concrete with striated unfinished detailing, small recessed fixed tinted windows, general appearance of solidity, and lack of ornamentation. Landscape elements include a low planter wall that extends along the building's north facade and continues beyond the building to the west, consisting of a thickly planted assortment of compact trees, ornamental shrubs, and landscape plantings, which contribute to the architectural and functional character of the property. An entrance located on the building's south elevation is accessed via a pedestrian bridge that passes over a sunken garden containing numerous examples of evergreens and ornamental vegetation (Figure 5.3.2.2.2-6, *Augustus F. Hawkins Comprehensive Mental Health Center, North Facade, View South*). To the west, the sunken garden transitions into a landscaped recreational area with a swimming pool, handball courts, and a small playground. The Mental Health Center exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association. The Mental Health Center is associated with the function of the Martin Luther King, Jr. Medical Center Campus as a medical care and postgraduate medical teaching facility.

The Augustus F. Hawkins Comprehensive Mental Health Center satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the Mental Health Center meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest. In addition, the Mental Health Center may become eligible for listing in the NHRP/CRHR under Criterion C/3 when it reaches 50 years of age as a good example of a Brutalism style building.

Interns and Physicians Building. The 6-story Interns and Physicians Building was constructed circa 1975 (Figure 5.3.2.2.2-7, *Interns and Physicians Building, Facade, View Southwest*; and Figure 5.3.2.2.2-8, *Interns and Physicians Building, North and West Elevations, View Southeast*). Character-defining features of the Interns and Physicians Building are consistent with the Brutalism style:

- Ample use of concrete with vertically striated, unfinished detailing
- Small, recessed, fixed, tinted windows
- Flat roof
- Geometric repetition in fenestration
- Monumental window above primary entrance
- Concrete colonnade extending from east facade
- Original landscaping (walled courtyard and drop-off area)

The Interns and Physicians Building is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The Interns and Physicians Building was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles. Dedicated in 1974, the building was named for Dr. Julius Wanser Hill, the first African-American physician to

FIGURE 5.3.2.2.2-6
Augustus F. Hawkins Comprehensive Mental Health Center, North Façade, View South

FIGURE 5.3.2.2.2-8
Interns and Physicians Building, North and West Elevations, View Southeast

complete his internship and residency at the Los Angeles County/University of Southern California Medical Center, Los Angeles. In 1961, Dr. Hill was appointed to the Los Angeles County Health Commission, where he served until his death in 1983.[180] Located at the southwest portion of the medical center campus near the intersection of 120th Street and Compton Avenue, the Physicians Building consists of two towers, perpendicular in plan, which point to the north and west. Constructed to house the interns and physicians involved with the Physician Assistant Program of the Charles R. Drew Postgraduate Medical School, the building incorporates elements of the Brutalism style in its ample use of reinforced concrete with striated unfinished detailing, small recessed fixed tinted windows, the geometric repetition in its fenestration, and square monumental window located above the building's primary entrance. Landscape elements include a concrete block retaining wall that bounds a courtyard, which contains a swimming pool, game courts for tennis and basketball, and a grass lawn. A long concrete colonnade extends from the building's east facade, traverses numerous buildings, and terminates at the MACC. The Interns and Physicians Building exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association. The Interns and Physicians Building is a key property type associated with the function of the Martin Luther King, Jr. Medical Center Campus as a medical care and postgraduate medical teaching facility.

The Interns and Physicians Building satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the Interns and Physicians Building meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest.

Dr. H. Claude Hudson Auditorium. The single-story, Dr. H. Claude Hudson Auditorium, circa 1973, is located directly along the east facade of the MACC building (Figure 5.3.2.2.2-9, *Dr. H. Claude Hudson Auditorium, North Elevation, View South*). It departed somewhat from the emphatically Brutalist architecture of the other three district contributors by merging the Brutalism inspired use of concrete and solid, enclosed volumes with elements associated with the "New Formalism" style of the 1960s and 1970s. Character-defining features of the Auditorium representative of New Formalism include:

- Single, freestanding block with square plan and low massing
- Heavy, flat overhanging roof, with cantilevered eaves, extended beams, and coffer-like treatment of soffits
- Raised piers suggestive of columns
- Symmetrical facade
- Smooth concrete walls and brick panel detailing

The Auditorium is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The Auditorium was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los

FIGURE 5.3.2.2.2-9
Dr. H. Claude Hudson Auditorium, North Elevation, View South

Angeles and the rest of the City of Los Angeles. Located directly adjacent to a secondary entrance on the MACC's east facade, the Auditorium's west-facing entrance is oriented towards the MACC and connected to the MACC by a covered walkway, which reinforces the spatial relationship between the Auditorium and the MACC. The east end of the building is located on the edge of a small hill, where an angular concrete stairway with a metal railing descends into a parking lot located at the foot of the hill. The Auditorium's New Formalism style elements (square plan, low massing, brick panel detailing, flat roof with cantilevered eaves, oversized beams and soffit detailing) complement the Brutalism-inspired design of the MACC. Landscape elements associated with the Auditorium include the covered walkway, landscape plantings, original outdoor lighting, and concrete stairway at the east end of the building. The Auditorium exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association. The Auditorium is a key property type associated with the postgraduate medical teaching function of the Martin Luther King, Jr. Medical Center Campus.

The Dr. H. Claude Hudson Auditorium satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the Auditorium meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest.

Ineligible Martin Luther King, Jr. Medical Center Campus Buildings and Structures

The 17 remaining buildings and structures were determined ineligible as historical resources because they are less than 50 years old, do not exhibit exceptional importance related to the recommendation of the McCone Commission, reflect ancillary functions of the medical center campus, or lack aspects of integrity due to alterations.

Genesis Clinic. This one-story building, circa 1979, is located in the northeast corner of the Martin Luther King, Jr. Medical Center Campus. The west-facing building is rectangular in plan and is constructed of reinforced concrete. The building sits upon a concrete foundation. Concrete walls support the building's flat metal roof, which has a large, hipped parapet with overhanging eaves. The building is attached to the adjacent Oasis Clinic by a hyphen. A solid metal door on the hyphen functions as the primary entrance to the Genesis Clinic and Oasis Clinic. Regularly spaced, fixed metal windows, with protruding metal lintels, are located on the building's west-facing facade. A concrete walkway with a metal rail is located along the building's west facade. A parking lot at the corner of Washington Avenue and 120th Street provides the setting for the Genesis Clinic. Landscape plantings consisting of flowering shrubs are located along the building's west facade. No building permits were located. The building's condition is poor and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Oasis Clinic (old). This one-story building, circa 1979, is located in the northeast corner of the Martin Luther King, Jr. Medical Center Campus. The west-facing building is rectangular in plan and is constructed of reinforced concrete. The building sits upon a concrete foundation. Concrete walls support the building's flat metal roof, which has a large, hipped parapet with overhanging eaves. The building is attached to the adjacent Genesis Clinic by a hyphen. A solid metal door on the hyphen functions as the primary entrance to the Genesis Clinic and Oasis Clinic. Regularly spaced, fixed metal windows, with protruding metal lintels, are located on the building's west facade. A parking lot at the corner of Washington Avenue and 120th Street provides the setting for the Pediatric Acute Care building. A children's playground enclosed by a tall metal fence is located to the north of the Oasis Clinic. Landscape plantings consisting of flowering shrubs are located along the building's west facade. No building permits were located. The building's condition is poor and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Oasis Clinic (new). This one-story building, circa 1995, is located north of East 120th Street in an area that is primarily occupied by the Charles Drew University of Medicine and Science. The west-facing building is rectangular in plan and is constructed of reinforced concrete. The building sits upon a concrete foundation. Concrete walls support the building's flat roof. Minimally ornamented, the building's west facade has a concrete walkway, a metal door, and fixed metal windows. The (south) street-facing elevation has no windows and a single solid metal door. Landscape plantings, consisting of street trees and shrubs along 120th Street, provide the setting for the Oasis Clinic. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation; it is not exceptional and it was not constructed during the period of significance associated with the historic district. The building's construction is unrelated to the historic development of the Charles Drew University campus, which was not evaluated as part of the scope of this report. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Registration Building. This two-story modern office building, circa 1990, is located in the eastern portion of the Martin Luther King, Jr. Medical Center Campus along the primary road leading to the MACC. The south-facing building is rectangular in plan and constructed of reinforced concrete, with concrete walls supporting a flat roof. Two large concrete pilasters with a vertically striated pattern project from the building's facade, one at the southwest corner and another directly west of the building's primary entrance. A continuous panel of fixed, mirrored windows is located on the second floor of the building's facade. Visitor parking, landscape plantings, and the grassy lawn located to the east of the MACC provide the setting for the Registration Building. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation; it is not exceptional and it was not constructed during the period of significance associated with the historic district. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical support office building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Inpatient Tower. This five-story building, circa 1993, is located to the northwest of the MACC in the central portion of the Martin Luther King, Jr. Medical Center Campus. The west-facing building has a square plan and is constructed with a superstructure of structural steel and reinforced concrete. The building's foundation is composed of cast-in-place concrete-drilled piles. Concrete walls support the building's flat roof, which supports a helipad. Bands of fixed, tinted windows with alternating bands of concrete are located on all elevations of the building. A vehicular drop-off structure extends from the building's west facade, which consists of a massive concrete colonnade with a flat roof that is supported by thick columns. Local access roads located along the building's north elevation and west facade provide the setting for the Inpatient Tower. Landscape plantings consisting of small ornamental shrubs and flowering plants are located at the building's west facade. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation; it is not exceptional and it was not constructed during the period of significance associated with the historic district. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Pediatric Acute Care. This one-story building, circa 1992, is located in a small opening between the Central Plant and Laundry Building to the south and the Inpatient Tower to the north. The MACC is adjacent to the building's east elevation. The north-facing building is rectangular in plan and is constructed of structural steel and reinforced concrete. The building's foundation is composed of cast-in-place concrete-drilled piles. Concrete walls support the building's flat roof. Fixed metal windows are located on the building's north-facing facade. The building is sheltered by a large pavilion with a flat roof known as the Denzel Washington Pediatric Pavilion. The MACC and Inpatient Tower and Pediatric Pavilion provide the setting for the Pediatric Acute Care building. Landscape plantings consisting of flowering plants are located along the building's north-facing facade. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation; it is not exceptional and it was not constructed during the period of significance associated with the historic district. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Medical Records and Laundry. The Medical Records and Laundry building, constructed in 1972, is one of a series of south-facing ancillary buildings oriented along the service road that defines the southern border of the Martin Luther King, Jr. Medical Center Campus where service uses are concentrated. Constructed of reinforced concrete, the one-story building has an L-shaped plan with a flat roof. The building's foundation system is composed of cast-in-place concrete drilled piles. An example of functional, utilitarian architecture, the building has few windows and minimal detailing, with the exception of concrete walls that are scored in a rectangular pattern. Paved areas for loading and the landscaped service road along the south border of the property provide the setting for the Medical Records and Laundry building. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Central Plant. The Central Plant building is one of a series of south-facing ancillary buildings oriented along the service road that defines the southern border of the Martin Luther King, Jr. Medical Center Campus where service uses are concentrated. The one-story building has a T-shaped plan with a flat roof. The building's foundation system is composed of cast-in-place concrete drilled piles. Reinforced concrete walls support a reinforced concrete slab roof supported by a steel girder. Constructed in two phases, the Phase I portion has a partial mezzanine floor that was built in the late 1960s. Extending in a perpendicular direction to the south of the Phase I portion, the Phase II portion was built in 1975. An example of functional, utilitarian architecture, the building has few windows and minimal detailing, with the exception of concrete walls scored with a rectangular pattern. Paved areas for loading and the landscaped service road provide the setting for the Central Plant building. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Plant Management Building. The Plant Management Building, circa 1979, is one of a series of south-facing ancillary buildings oriented along the service road that defines the southern border of the Martin Luther King, Jr. Medical Center Campus where service uses are concentrated. The one-story building has a square plan with a flat roof. The building's foundation system is composed of cast-in-place concrete drilled piles. Reinforced concrete walls support a reinforced concrete overhanging slab roof. An example of functional, utilitarian architecture, the building has few windows and minimal detailing, with the exception of concrete walls scored with a rectangular pattern. The building's south-facing facade has a series of double metal doors that provide access to various maintenance shop uses. A loading dock extends the length of the facade. Paved areas for loading and the landscaped service road provide the setting for the Central Plant building. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

North Support Building. The North Support Building is located in the western portion of the Martin Luther King, Jr. Medical Center Campus. The building's east-facing facade is oriented toward large parking lots that are located to the north and east of the building. The two-story building is square in plan with a flat roof. The foundation system is composed of cast-in-place concrete drilled piles. Reinforced concrete walls support a reinforced concrete slab roof. Constructed in two phases, the original building (1975) consisted of a lower full level and a partial second floor. In the late 1980s, the second floor was expanded to cover the entire first floor. An example of functional, utilitarian architecture, the building has ribbon windows on the second floor, and a recessed entrance covered by concrete column. Detailing is otherwise minimal. Paved parking areas provide the setting for the Central Plant building. No building permits were located. The building's condition is good. The building's second floor addition in the 1980s compromised the original design and massing of the building and is a significant alteration. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

South Support Building. The South Support Building, circa 1973, is one of a series of south-facing ancillary buildings oriented along the service road that defines the southern border of the Martin Luther King, Jr. Medical Center Campus where service uses are concentrated. The one-story building has an L-shaped plan with a flat roof. The building's foundation system is composed of cast-in-place concrete drilled piles. Reinforced concrete walls support a reinforced concrete slab roof. An example of functional, utilitarian architecture, the building has a band of ribbon windows on the second floor of the south facade overlooking a loading dock that is located in the southwest portion of the building. The building has minimal detailing, with the exception of concrete walls scored with a rectangular pattern. Paved areas for loading and the landscaped service road provide the setting for the South Support Building. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Emergency Room. The one-story building, circa 1985, is connected to the north portion of the MACC building and extends to the north. The building is rectangular in plan and is constructed of concrete. The building sits upon a concrete foundation. The immediate setting of the building consists of the MACC and a one-way service road traveling from the facade (east) of the MACC building to the Emergency Room. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. It was not constructed during the period of significance associated with the historic district. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and its materials and construction are typical of its era. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Storage Building. The 1,060 square-foot one-story building, circa 1980, is located south of the MACC building along the service road that defines the property's southern border where service uses are concentrated. The building is rectangular in plan, with low massing, metal doors, and is constructed of concrete with a flat roof. The building sits upon a concrete foundation. The immediate setting of the building consists of the MACC and loading docks associated with the Medical Records and Laundry Building. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. It was not constructed during the period of significance associated with the historic district. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

MRI Building. The one-story building, circa 1980, is located directly north of the MACC building. The west-facing building is rectangular in plan, with low massing, metal doors, and is constructed of concrete with a flat roof. The building sits upon a concrete foundation. The immediate setting of the building consists of the MACC. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. It was not constructed during the period of significance associated with the historic district. The building has a contemporary design and is a typical example of a medical support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Cooling Towers. The one-story Cooling Towers building houses the cooling towers that function to remove excess heat and provide heat, ventilation, and air conditioning to the MACC. Built circa 1979, the Cooling Towers are located in the south portion of the Martin Luther King, Jr. Medical Center Campus along the service road that defines the property's southern border. The windowless building is rectangular in plan constructed of concrete and sits upon a concrete foundation. The building's east and west concrete exterior walls are scored in a vertically striated pattern. No landscape elements are associated with the Cooling Towers. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Hub Clinic. This one-story building, circa 1980, is located north of East 120th Street in an area that is primarily occupied by the Charles Drew University of Medicine and Science. The south-facing building is rectangular in plan and is constructed of wood. The building sits upon a concrete foundation. Wood walls support the building's flat roof. An elevated concrete pad enclosed by a metal rail, with a short stairway and a ramp, provides access to the building's primary entrance. Minimally ornamented, the building's facade has a solid metal door and metal sliding windows. A metal door is located on the north elevation. Landscape plantings consisting of street trees and shrubs along 120th Street provide the setting for the Hub Clinic. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. It was not constructed during the period of significance associated with the historic district. The building's construction is unrelated to the historic development of the Charles Drew University campus, which was not evaluated as part of the scope of this report. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a medical support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

Storage Building. This 2,533 square-foot one-story building, circa 1980, is located south of the Central Plant and Medical Records and Laundry Building, along the service road that defines the property's southern border where service uses are concentrated. The building is rectangular in plan and is constructed of concrete with a flat slab concrete roof with overhanging eaves. The building sits upon a concrete foundation. Minimally ornamented, a wide band of rusticated concrete detailing, intended to resemble stone, wraps the building. A rolling metal garage door and a metal sliding window are located on the building's east elevation. Surrounded by concrete paving and parking areas, landscape elements consist of shrubs that have been planted along the south and east elevations. No building permits were located. The building's condition is good and it does not appear to have been altered since its construction. The property does not meet the criteria for listing in the NRHP, CRHR, or for local designation. It was not constructed during the period of significance associated with the historic district. The building has a contemporary design that is not representative of the Brutalism or New Formalism style exhibited by the historic district contributors and is a typical example of a maintenance support building. Research failed to identify any evidence to suggest that the property has achieved exceptional importance since its construction. Therefore, the property does not qualify as a historical resource as defined by CEQA.

5.3.3 Impact Analysis

5.3.3.1 Significance Thresholds

Under CEQA, a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. Substantial adverse change in the significance of a historical resource is defined as physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired. The significance of an historical resource would be significantly impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR, a local register of historic resources pursuant to Section 5020.1(k) of the Public Resources Code, or historic resources survey meeting the requirements of Section 5024.1(g) of the Public Resources Code. In general, a project that follows the *Secretary of the Interior's Standards for the Treatment of Historic Properties* and associated guidelines shall be considered as mitigated to below the level of significance.[181]

5.3.3.2 Impacts to Martin Luther King, Jr. Medical Center Campus Historic District Contributors

Summary of Impacts to Historical Resources

The proposed project entails two tiers: Tier I and Tier II. Both tiers involve modifications that will impact character-defining features of the Martin Luther King, Jr. Medical Center Campus Historic District and its four contributing buildings (Table 5.3.3.2-1, *Project Impacts to Historical*

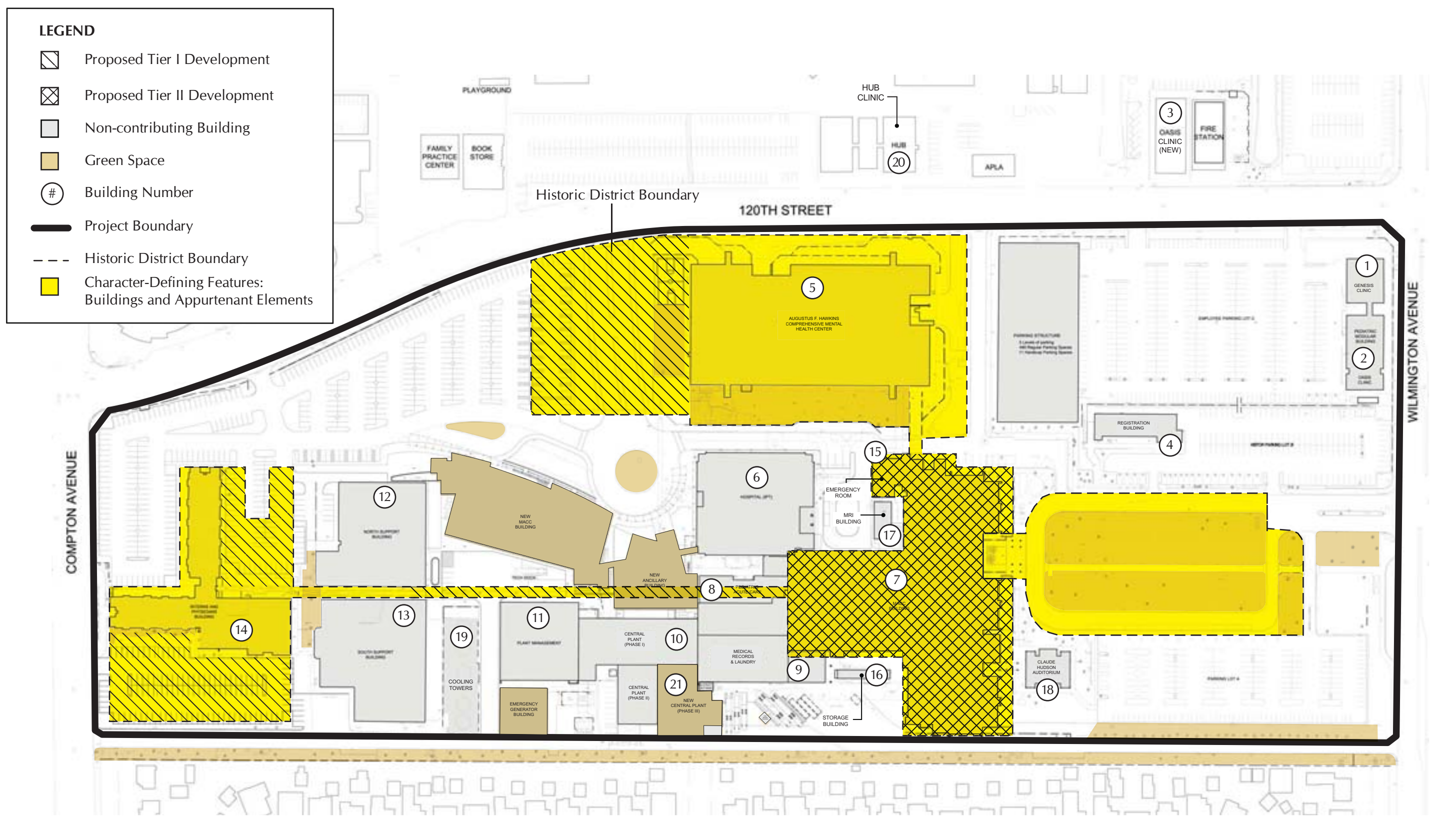
---

[181] Weeks, Kay D., and Anne E. Grimmer. 1995. *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstruction Historic Buildings*. Washington, DC: U.S. Department of the Interior, National Park Service.

Resources; and Figure 5.3.3.2-1, *Project Impacts to the Martin Luther King, Jr. Medical Center Campus Historic District*). Construction of the Tier I improvements would affect character-defining features of three historical resources: appurtenant elements of the Martin Luther King, Jr. Medical Center Campus Historic District, specifically those associated with the Augustus F. Hawkins Comprehensive Mental Health Center and the Interns and Physicians Building. However, the Tier I project would not result in substantial adverse changes in the significance of the historical resources such that the historic district or its contributors would no longer be eligible for inclusion in the CRHR. Construction of the Tier II improvements would be expected to affect two historical resources, appurtenant elements of the Martin Luther King, Jr. Medical Center Campus Historic District and the MACC building. If Tier II improvements include the demolition and replacement of the MACC, a significant adverse change in the significance of the Martin Luther King, Jr. Medical Center Campus Historic District and the MACC would occur and neither resource would continue to be eligible for inclusion in the CRHR. If Tier II improvements include rehabilitation and reuse of the MACC, impacts to cultural resources would be reduced to below the level of significance with the implementation of mitigation measures.

TABLE 5.3.3.2-1
PROJECT IMPACTS TO HISTORICAL RESOURCES

Historical Resource	Impacted by Tier I	Impacted by Tier II
Martin Luther King, Jr. Medical Center Campus Historic District	• Removal of portion of covered corridor/colonnade extending from the east facade of the Interns and Physicians Building to the MACC • Removal of landscaped open spaces, pedestrian walkways, walled courtyards	• Reuse/redevelopment of MACC • Mixed use site development
MACC building	• N/A	• Reuse/redevelopment of MACC • Removal of pedestrian walkway extending from the north elevation of the MACC to the Augustus F. Hawkins Comprehensive Mental Health Center • Removal of pedestrian walkway extending from the MACC's east facade to the Dr. H. Claude Hudson Auditorium
Augustus F. Hawkins Comprehensive Mental Health Center	• Reduction of courtyard size and partial replacement of walled courtyard, located south and west of the Augustus F. Hawkins Comprehensive Mental Health Center, with entry drive and parking	• Removal of pedestrian walkway extending from the north elevation of the MACC to the Augustus F. Hawkins Comprehensive Mental Health Center • Master Plan may result in unknown modifications
Interns and Physicians Building	• Replacement of landscaped drop-off area, located north of the Interns and Physicians Building and west of the North Support Building, with parking • Replacement of walled courtyard, located south of the building, with parking	• Master Plan may result in unknown modifications
Dr. H. Claude Hudson Auditorium	• N/A	• Removal of pedestrian walkway extending from the MACC's east facade to the Dr. H. Claude Hudson Auditorium • Master Plan may result in unknown modifications



* Note: This figure has been adapted from HMC Architects. July 2010.

FIGURE 5.3.3.2-1
Project Impacts to Martin Luther King, Jr. Medical Center Campus Historic District

Tier I Impacts to Historical Resources

Tier I involves construction of two new buildings, the new MACC and the Ancillary Building, vacation of the existing MACC building, tenant improvements in existing buildings, and site improvements. These modifications will affect the historic district and its contributors but will leave the majority of the character-defining features intact:

- **Martin Luther King, Jr. Medical Center Campus Historic District**. The historic district will be affected by the demolition of a portion of the covered walkway that extends west from the MACC, replacement of walled courtyards and gardens at the Augustus F. Hawkins Comprehensive Mental Health Center and the Interns and Physicians Building, construction of two new buildings, and vacation of the MACC. However, the character-defining features of the four contributing buildings will be left intact, and the majority of the covered walkways would remain in situ. Original landscaping will be retained at the historic campus entrance east of the MACC along Willowbrook Avenue and south of the Augustus F. Hawkins Comprehensive Mental Health Center. The new construction will occur in the interior of the campus, which already hosts several non-contributing buildings and structures. Although these changes are not negligible, they do not compromise the physical features of the historic district to the extent that the district would lose its eligibility for inclusion in the CRHR.

- **Multi-Service Ambulatory Care Center (MACC).** The MACC will remain in situ but will be vacated. No changes to the exterior of this building are proposed; therefore, other than the colonnaded walkway extending west from the building, the character-defining features itemized in Section 5.3.2.2.2, *Martin Luther King, Jr. Medical Center Campus Historic District*, will remain intact. The building will retain sufficient integrity to convey its significance as a contributor the historic district.

- **Augustus F. Hawkins Comprehensive Mental Health Center.** No changes to the exterior of this building are proposed; therefore, the majority of the character-defining features itemized in Section 5.3.2.2.2, *Martin Luther King, Jr. Medical Center Campus Historic District*, will remain intact. Replacement of the adjacent walled courtyard will negatively affect the integrity of the setting of the building. However, the building will retain sufficient integrity to convey its significance as a contributor the historic district.

- **Interns and Physicians Building.** Tenant improvements would be performed in the Interns and Physicians Building. No changes to the exterior of this building are proposed; therefore, the majority of the character-defining features itemized in Section 5.3.2.2.2, *Martin Luther King, Jr. Medical Center Campus Historic District*, will remain intact. Replacement of the adjacent walled courtyard will negatively affect the integrity of the setting of the building. However, the building will retain sufficient integrity to convey its significance as a contributor the historic district.

- **Dr. H. Claude Hudson Auditorium**. No changes to the exterior of this building are proposed; therefore, the character-defining features itemized in Section 5.3.2.2.2, *Martin Luther King, Jr. Medical Center Campus Historic District*, will remain intact. The building will retain its integrity and will continue to convey its significance as a contributor the historic district.

Tier II Impacts to Historical Resources

Tier II entails the development of a campuswide master plan, the components of which are conceptual at this time. Tier II would have the potential to build out approximately 1,814,696 square feet of development on the proposed project site with mixed uses including medical office, commercial, retail, office space, recreation, and other development in support of the medical center. In addition, up to 100 residential units, to be developed at a multifamily density consistent with surrounding residential area multifamily development densities, are proposed in Tier II. Tier II components would also entail the reuse or replacement of the existing MACC building. Tier II may result in substantial adverse impacts to at least two historical resources, the Martin Luther King, Jr. Medical Center Campus Historic District and the Multi-Service Ambulatory Care Center (MACC):

- **Martin Luther King, Jr. Medical Center Campus Historic District**. Redevelopment of the Martin Luther King, Jr. Medical Center Campus has the potential to result in demolition or alteration of the four contributing buildings and the remaining appurtenant features that contribute to the historic district to the extent that the significance of the district would be materially impaired. No plans for the Augustus F. Hawkins Comprehensive Mental Health Center, Interns and Physicians Building, or Dr. Claude H. Hudson Auditorium are known at this time. The MACC may be reused or demolished and replaced with other development. In association with the demolition of the MACC, the covered walkways connecting it to the Augustus F. Hawkins Comprehensive Mental Health Center and the Dr. H. Claude Hudson Auditorium would also be demolished. The MACC is the focal point of the historic district. It is the largest building on the campus and the one most closely associated with the historic function of the campus. Demolition of the MACC would result in a loss of integrity of the historic district and it would no longer be eligible for inclusion in the CRHR.

- **Multi-Service Ambulatory Care Center (MACC).** The MACC may be reused or replaced (demolished) as a result of Tier II. If the MACC is retained and reused, impacts to this historical resource would be less than significant if any modifications to character-defining features conformed to the *Secretary of the Interior's Standards for the Treatment of Historic Properties* and associated guidelines. Demolition or alterations not in conformance with the Standards would result in substantial adverse impacts to this historical resource. If the MACC building is not removed, this impact would be anticipated to be less than significant with respect to this building.

- **Augustus F. Hawkins Comprehensive Mental Health Center.** No plans for this historical resource have been formulated under Tier II; however, the master plan and comprehensive redevelopment of the campus have the potential to result in alterations to the existing building. In addition, if the MACC is demolished, the covered walkway that links it to this building would also be demolished. Impacts to this historical resource would be less than significant if any modifications to character-defining features conformed to the *Secretary of the Interior's Standards for the Treatment of Historic Properties* and associated guidelines. Alterations not in conformance with the Standards would result in substantial adverse impacts to this historical resource.

- **Interns and Physicians Building.** No plans for this historical resource have been formulated under Tier II; however, the master plan and comprehensive redevelopment of the campus have the potential to result in alterations to the existing building. Impacts to this historical resource would be less than significant if any modifications to character-defining features conformed to the *Secretary of the Interior's Standards for the Treatment of Historic Properties* and associated guidelines. Alterations not in conformance with the Standards would result in substantial adverse impacts to this historical resource.

- **Dr. H. Claude Hudson Auditorium**. No plans for this historical resource have been formulated under Tier II; however, the master plan and comprehensive redevelopment of the campus have the potential to result in alterations to the existing building. In addition, if the MACC is demolished, the covered walkway that links it to this building would also be demolished. Impacts to this historical resource would be less than significant if any modifications to character-defining features conformed to the *Secretary of the Interior's Standards for the Treatment of Historic Properties* and associated guidelines. Alterations not in conformance with the Standards would result in substantial adverse impacts to this historical resource.

Cumulative Impacts to Historical Resources

The incremental impact of the proposed project when evaluated in relation to the closely related past, present, or reasonably foreseeable probable future projects would be expected to contribute to cumulative impacts to cultural resources related to the loss of historic resources. The proposed project would result in the loss of limited resources with similar historic contexts regarding the history of Willowbrook and the direct linkage with the McCone Commission's recommendation for a new hospital in south Los Angeles in the wake of the 1965 civil unrest.

5.3.4 Mitigation Measures

No significant adverse impacts to historical resources have been identified as a result implementation of the Tier I project. Potentially significant adverse impacts to historical resources have been identified in relation to five historical resources as a result of implementation of the Tier II project:, the Martin Luther King, Jr. Medical Center Campus Historic District, MACC building, Augustus F. Hawkins Comprehensive Medical Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium. Three mitigation measures have been identified in association with Tier II to reduce impacts to the maximum extent practicable.

5.3.4.1 Mitigation Measure Cultural-2

Tier II impacts to four significant historical resources (MACC building, Augustus F. Hawkins Comprehensive Medical Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium) and the integrity of the Martin Luther King, Jr. Medical Center Campus Historic District shall be reduced to below the level of significance through utilization of the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines of Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings* for any proposed alterations, including all site work, structural upgrades, architectural, and mechanical systems improvements and repairs. The work shall conform to the standards and guidelines for "rehabilitation." Conformance with the Secretary of the Interior's Standards shall be monitored by an architectural historian or historic architect who meets the Secretary of the Interior's Professional

Qualification Standards. Completion of this mitigation measure shall be monitored and enforced by the County of Los Angeles.

5.3.4.2 Mitigation Measure Cultural-3

Tier II impacts resulting from demolition or substantial alteration of significant historical resources not in conformance with the Secretary of the Interior's Standards shall be reduced to the maximum extent feasible through archival documentation of as-found condition. Prior to the initiation of construction activities, the County of Los Angeles shall ensure that documentation of the Martin Luther King, Jr. Medical Center Campus Historic District, MACC building, Augustus F. Hawkins Comprehensive Medical Health Center, Interns and Physicians Building, and/or Dr. H. Claude Hudson Auditorium is completed in accordance with Historic American Buildings Survey (HABS) requirements for donated material. The documentation shall be in the form of a Historic American Building Survey and shall comply with the *Secretary of the Interior's Standards for Architectural and Engineering Documentation*. The documentation shall include large-format photographic recordation, detailed historic narrative report, measured architectural drawings, and compilation of historic research. The documentation shall be completed by a qualified architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards for History and/or Architectural History. The original archival-quality documentation shall be offered as donated material to Historic American Building Survey for inclusion in the Library of Congress. Archival copies of the documentation also would be available at the Martin Luther King, Jr. Medical Center campus and maintained by the County of Los Angeles.

5.3.4.3 Mitigation Measure Cultural-4

Impacts resulting from the loss of integrity of the Martin Luther King, Jr. Medical Center Campus Historic District such that its significance is materially impaired will be reduced to the maximum extent feasible through the development of a retrospective exhibit detailing the history of the Martin Luther King, Jr. Medical Center Campus Historic District, its significance, and its important details and features. The retrospective exhibit shall be in the form of a physical exhibit installed on the Martin Luther King, Jr. Medical Center Campus, which is located either within a building or on a freestanding kiosk or comparable structure or installation on the property. The exhibit should commemorate the historic appearance of the district and provide the public with sufficient information to understand its historic significance.

The exhibit shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards for History and/or Architectural History. The exhibit should be completed within a period of no more than two years from the date of completion of Tier II of the proposed project.

5.4 HUMAN REMAINS

5.4.1 Human Remains Context

The interment of human remains among California Native Americans can be classified into three methods: inhumation (burial), cremation, and a combination of both inhumation and cremation. The preferred method varied depending on the region and cultural group, and some groups practiced both methods simultaneously depending of the situation in which the individual died. With interment came the practice of grave goods, a practice favored by most of the tribes in

California. Grave goods usually consisted of beads of various materials, knifes, projectile points, and exotic trade items among other objects.

Interment of human remains among pioneers and homesteaders also varied between inhumation and cremation. The internment method chosen was a result of the circumstances and location at the time of death, as well as the religion or cultural beliefs. In the late-nineteenth and early twentieth centuries, cemeteries were few and often located at some distance. Burial on the homestead grounds was often a preferred alternative.

5.4.2 Human Remains Resource Characterization

Reviews of historic maps,[182,183] along with the results of the records search with the NAHC,[184] indicate that there are no known Native American or historic period cemeteries, nor known informal Native American burials, within the proposed project site. Monitoring for the construction of the Alameda Corridor Project within the cultural resources study area did result in the discovery of two human burial sites located approximately 0.85 miles east of the proposed project site.

5.4.3 Human Remains Impacts Analysis

5.4.3.1 Significance Thresholds

While a significance threshold for impacts to human remains is not explicitly stated in CEQA, Appendix G of the CEQA Guidelines indicates that any disturbance of human remains could potentially be considered an impact to cultural resources, particularly with respect to Native American graves and burials.

5.4.3.2 Impacts

The proposed project would not be expected to directly or indirectly disturb human remains, including those interred outside of formal cemeteries. The results of the archaeological record search, review of historic maps,[185,186] and the NAHC Sacred Lands File search,[187] indicate that no historic period or Native American burial grounds are located within the proposed project site. However, two sites of human burials were discovered in the vicinity. It is anticipated that ground-disturbing activities, which would include, but are not limited to, drilling, excavation, trenching, and grading, for the proposed project may exceed 20 feet. Although there are no known burial sites within the proposed project site, the potential disruption of human remains from of an unanticipated discovery during ground-disturbing activities constitutes a significant impact requiring the consideration of mitigation measures.

5.4.4 Human Remains Mitigation Measure

5.4.4.1 Mitigation Measure Cultural-5

Although the discovery of human remains is not anticipated during ground-disturbing activities for the proposed project, a process has been delineated for addressing the unanticipated discovery of human remains:

- Unanticipated Discovery of Human Remains (Public Resources Code 5097). The Los Angeles County Coroner shall be notified within 24 hours of the discovery of human remains. Upon discovery of human remains, there shall be no further excavation or disturbance of the site or any of that area reasonably suspected to overlie adjacent human remains until the following conditions are met:
    - The Los Angeles County Coroner has determined that no investigation of the cause of death is required, and
- Whenever the Native American Heritage Commission receives notification of a discovery of Native American human remains from the Los Angeles County Coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code, it shall immediately notify those persons it believes to be most likely descended from the deceased Native American. If the remains are of Native American origin, the descendants from the deceased Native Americans shall complete their inspection and make recommendations or preferences to the landowner or the person responsible for the excavation work, for treatment or disposition of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98.

5.5 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Implementation of mitigation measure Cultural-1 would reduce any potential significant impacts to cultural resources related to an adverse change in the significance of a unique paleontological resource discovered under Tier I or Tier II to below the level of significance.

Implementation of mitigation measure Cultural-2 would reduce Tier II impacts to the Martin Luther King, Jr. Medical Center Campus Historic District, MACC building, Augustus F. Hawkins Comprehensive Mental Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium as a result of Tier II of the proposed project to below the level of significance.

Implementation of mitigation measures Cultural-3 and Cultural-4 would reduce Tier II impacts to the Martin Luther King, Jr. Medical Center Campus Historic District, MACC building, Augustus F. Hawkins Comprehensive Mental Health Center, Interns and Physicians Building, and Dr. H. Claude Hudson Auditorium as a result of Tier II of the proposed project to the maximum extent feasible. However, the demolition of a historical resource still would remain a significant adverse impact.

Implementation of mitigation measure Cultural-5 would reduce any potential significant impacts to human remains discovered under Tier I or Tier II to below the level of significance.

APPENDIX A
GLOSSARY OF TERMS

APPENDIX A
GLOSSARY OF TERMS

This glossary provides definitions of architectural terms used in various environmental documentation produced in support of the Martin Luther King, Jr. Medical Center Campus. These definitions were obtained from recognized literature in the field of historic resources. A list of reviewed literature is provided in the References section below.

Bay: Within a structure, a regularly repeated spatial element defined by beams or ribs and their supports.

Béton brut: Refers to concrete left in its natural state after its formwork has been removed. Literally translated from the French as "raw concrete."

Bracket: Any overhanging member projecting from a wall or other body to support a weight, such as a cornice, acting outside the wall.

Brutalist: A style of architecture that prioritized simplicity and function in form and materials. Often constructed of rough unfinished concrete, Brutalist buildings typically utilized prefabricated construction techniques and exposed structural elements, such as steel beams. Forms are monolithic and monumental. Windows may be small and/or nonfunctional. Many Brutalist buildings convey a sense of stark austerity and appear solid, raw, and unfinished. Considered easy to construct and maintain, the Brutalist style was widely popular for government, civic, and institutional buildings during the 1960s and 1970s.

Brick Vernacular: A vernacular building using brick as its structural system.

Building code: Law setting forth minimum standards for the construction and use of buildings to protect the public health and safety.

California Register of Historical Resources: The California Register of Historical Resources is the State of California's official list of cultural resources worthy of preservation. The California Register program encourages public recognition and protection of resources of architectural, historical, archeological, and cultural significance; identifies historical resources for state and local planning purposes; determines eligibility for state historic preservation grant funding; and affords certain protections under the California Environmental Quality Act. Properties listed in the California Register include districts, sites, buildings, structures, and objects that are significant in California history, architecture, archaeology, engineering, and culture. The California Register is administered by the California Department of Parks and Recreation.

Casement window: A window sash that swings open along its entire length, usually on hinges fixed to the sides of the opening into which it is fitted.

Character-defining feature: *Character* refers to all those visual aspects and physical features that make up the appearance of every historic building. Character-defining elements include the overall shape of the building, its materials, craftsmanship, decorative details, interior spaces, and features, and the various aspects of its site and environment.

Colonnade: A row of columns, typically carrying an entablature.

Contributor: A site, building, or structure in a historic district that generally has historic, architectural, cultural, or archaeological significance.

Coping: A protective cap, top, or cover of wall, parapet, pilaster, or chimney; often of stone, terracotta, concrete, metal, or wood. May be flat but commonly sloping, double-beveled, or curved to shed water so as to protect masonry below from penetration of water from above. Most effective if extended beyond wall face and cut with a drip.

Corbel: In masonry, a projection or one of a series of projections, each stepped progressively farther forward with height; anchored in a wall, story, column, or chimney; used to support an overhanging member above or, if continuous, to support overhanging courses; may support an ornament of similar appearance.

Corbel brick course: A masonry course acting as a corbel, or an ornament of similar appearance.

Cornice: Any molded horizontal projection that crowns or finishes the top of a wall where it meets the edge of the roof; sometimes ornamented. The exterior trim of a structure where the wall and roof meet. The third or uppermost division of an entablature, resting on the frieze. An ornamental molding that forms the top member of a door or window frame, usually of wood or plaster. An ornamental molding that usually extends around the walls of a room just below the ceiling.

Elevation: A drawing showing the vertical elements of a building, either exterior or interior, as a direct projection onto a vertical plane. The vertical distance above or below some established reference level.

Eligible property: Property that meets the criteria for inclusion in the National Register of Historic Places but is not formally listed.

Facade: The exterior face of a building that is considered to be the architectural front, sometimes distinguished from the other faces by more elaborate architectural and/or ornamental details.

Fenestration: The design and arrangement of windows in a building.

Freestanding: A term descriptive of a structural element that is fixed at its lower end but not constrained throughout its vertical height.

Guidelines: A reference to *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring & Reconstructing Historic Buildings* (Guidelines). The Guidelines have been prepared to assist in applying the Secretary of the Interior's Standards to all project work; consequently, they are not meant to give case-specific advice or address exceptions or rare instances. Therefore, it is recommended that the advice of qualified historic preservation professionals be obtained early in the planning stage of the project. Such professionals may include architects, architectural historians, historians, historical engineers, archaeologists, and others who have experience in working with historic buildings. The Guidelines pertain to both exterior and interior work on historic buildings of all sizes, materials, and types.

Historic district: An area that generally includes within its boundaries a significant concentration of properties linked by architectural style, historical development, or a past event.

Hyphen: A connection between two buildings.

Integrity: The authenticity of physical characteristics from which properties obtain their significance.

Le Corbusier: Pseudonym of the profoundly influential Swiss architect, urban theorist, and painter (1887–1966), born Charles-Édouard Jeanneret at La-Chaux-de-Fonds in French Switzerland. One of the most recognized architects of the 20th century, Le Corbusier is renowned for his architectural projects and theoretical works. He is closely associated with the pioneering forms of his iconic residences, notably Villa Savoye (1931), which were typically cubist in proportion, white, and supported wholly or partially on cylindrical concrete stilts or pillars, known as pilotis. As a theorist, Le Corbusier published and promoted numerous urban plans, notably Ville Contemporaine (1922), Plan Voisin (1925), and Ville Radieuse (1935). He was a charter member of CIAM (Congres Intemationaux d'Architecture Modeme), whose principal area of concern was architecture's relation to economic and political spheres. Le Corbusier developed his own system of architectural proportion, which became an integral part of his practice after World War II. A prolific author, Le Corbusier's books include *Towards a New Architecture* (1923), *The City of Tomorrow* (1925), and *When the Cathedrals Were White* (1937).

Lintel: A horizontal structural member that spans the top of an opening such as a window; supports the weight of the wall directly above it.

Massing: The overall bulk, size, physical volume, or magnitude of a structure.

Monitor: A superstructure that straddles the ridge of a roof or that crowns a roof or dome; may be glazed to provide light below or may be louvered to provide ventilation below.

National Register of Historic Places: The National Register of Historic Places is the nation's official list of cultural resources worthy of preservation. Authorized under the National Historic Preservation Act of 1966, the National Register is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect the nation's historic and archaeological resources. Properties listed in the National Register include districts, sites, buildings, structures, and objects that are significant in American history, architecture, archaeology, engineering, and culture. The National Register is administered by the National Park Service, which is part of the U.S. Department of the Interior.

Noncontributor: A feature consisting of a site, building, or structure located within a historic district that is not recognized as contributing to the historic, architectural, cultural, or archaeological significance of the district.

Ornament: In architecture, a detail of shape, texture, and/or color—such as an embellishment or decoration—that is deliberately exploited to attract the attention of an observer.

Panel: A flat, usually rectangular, section of a surface that is either sunk or raised within a margin or framework.

Parapet: A low-guarding wall at any point of sudden drip, as at the edge of a terrance, roof, battlement, balcony, and so on. In an exterior wall, fire wall, or party wall, the part entirely above the roof.

Pent roof: A roof formed like an inclined plane, the slope being all on one side.

Period of significance: The span of time during which significant events and activities occurred. Events and associations with historic properties are finite; most properties have a clearly definable period of significance.

Pier: A column designed to support concentrated load. Also known as a member, usually in the form of a thickened section, which forms an integral part of a wall; usually placed at intervals along the wall to provide lateral support or to take concentrated vertical loads.

Pile: A shaft driven into the ground, typically a heavy timber, metal, or concrete that functions to transfer building loads and provide support structural support for foundations.

Preservation: The act or process of applying measures necessary to sustain the existing form, integrity, and materials of a historic property. Work, including preliminary measures to protect and stabilize the property, generally focuses on the ongoing maintenance and repair of historic materials and features rather than on extensive replacement and new construction. New exterior additions are not within the scope of this treatment; however, the limited and sensitive upgrading of mechanical, electrical, and plumbing systems and other code-required work to make properties functional is appropriate within a preservation project.

Reconstruction: The act or process of depicting, by means of new construction, the form, features, and detailing of a nonsurviving site, landscape, building, structure, or object for the purpose of replicating its appearance at a specific period of time and in its historic location.

Rehabilitation: The act or process of making possible a compatible use for a property through repair, alterations, and additions while preserving those portions or features that convey its historical, cultural, or architectural values.

Restoration: The act or process of accurately depicting the form, features, and character of a property as it appeared at a particular period of time by means of the removal of features from other periods in its history and reconstruction of missing features from the restoration period. The limited and sensitive upgrading of mechanical, electrical, and plumbing systems and other code-required work to make properties functional is appropriate within a restoration project.

Ribbon Window: A horizontal band of windows separated only by mullions.

Standards: Refers to *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, & Reconstructing Historic Buildings* (Standards). The Standards makes recommendations for maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations; as such, the Standards cannot, in and of itself, be used to make essential decisions about which features of a historic property should be saved and which might be changed. But once an appropriate treatment is selected, the Standards provides philosophical consistency to the work. There are Standards for four distinct, but interrelated, approaches to the treatment of historic properties: preservation, rehabilitation, restoration, and reconstruction.

Steel-frame construction: Construction in which the structural supporting elements consist of some combination of steel beams, steel girders, and/or steel columns that are rigidly joined at their intersections.

Striated: Marked with stripes, grooves, or ridges. From the Latin, *striatus*, meaning furrowed.

Truss: A combination of structural members, usually in some form of triangular arrangement that provides a rigid framework for supporting roofs, floors, and the like.

Utilitarian: An approach to construction predicated on function rather than appearance and, as such, cannot not be described in terms of a standard set of character-defining features. Utilitarian buildings and structures utilize materials and structure appropriate to the intended use. Although often undistinguished and unremarkable, at its best, the utilitarian building or structure may be an honest and even an elegant expression of function and engineering.

Vernacular architecture: Architecture that makes use of common regional forms and materials at a particular place and time; sometimes includes strong ethnic influences of an immigrant population. Usually modest, unassuming, and unpretentious, and often a mixture of traditional and more modern styles or a hybrid of several styles. Houses were often owner-built by people familiar with local materials, regional climatic conditions, and local building customs and techniques, as described under folk literature. In contrast, industrial vernacular architecture has been the work of architects as well as by owner-builders; their designs often have been based on examples from pattern books, using readily available manufactured components described in catalogs.

***D6. Significance (continued from page 1):**
The Augustus F. Hawkins Comprehensive Mental Health Center is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The building was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, a medical care and postgraduate medical teaching facility, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles. As an inpatient and outpatient mental healthcare facility, the building provides medical services.

Historical research indicates the Martin Luther King Jr. Medical Center Campus was planned and constructed between 1968 and 1972. The main buildings of the Martin Luther King, Jr. Medical Center Campus were constructed in phases during the late 1960s and 1970s. The earliest improvements included the three wings of the MACC, the Central Plant, and the Medical Records and Laundry Building, which were all operational by 1972. In 1973, the North and South Support buildings and the Dr. H. Claude Hudson Auditorium were built. The Interns and Physicians Building was constructed circa 1974. A second phase of the Central Plant building was completed in 1975, followed by the Augustus F. Hawkins Comprehensive Mental Health Center in 1979.

The building is a highly characteristic example of the Brutalism style. Brutalism style buildings, considered easy to construct and maintain, were widely popular for government, civic and institutional buildings built during the 1960s and 1970s and thus use of Brutalist architecture reflects the building's public function. The main buildings of the medical center campus, including the Augustus F. Hawkins Comprehensive Mental Health Center, exhibit Brutalist elements. In the ensuing years, subsequently constructed buildings and structures located on the project site refer broadly to the Brutalism design precedent. The building exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association.

The Augustus F. Hawkins Comprehensive Mental Health Center satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the building meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest. In addition, the Augustus F. Hawkins Comprehensive Mental Health Center may become eligible for listing in the NHRP/CRHR under Criterion C/3 when it reaches 50 years of age as a good example of a Brutalism style building.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The Augustus F. Hawkins Comprehensive Mental Health Center is located along the north streetscape at the center of the block bounded by 120th Street to the north, Wilmington Avenue to the east, Compton Avenue to the west, and the southern boundary of the Martin Luther King, Jr. Medical Center Campus to the south. The three-story building has a partial basement level and a rectangular plan. The building sits on a foundation of reinforced concrete piles that support reinforced-concrete shear walls. The building is distinguished by its large size and monolithic north façade along 120th Street. A highly characteristic example of the Brutalism style, the building's unusual massing, weighted upwards, incorporates Brutalist elements in its ample use of reinforced concrete with striated unfinished detailing, small deeply recessed recessed fixed tinted windows, general appearance of solidity, and lack of ornamentation. (See Continuation Sheet 2 of 2)

***P3a. Description: (continued from page 1):**

Landscape elements include a low planter wall that extends along the building's north facade and continues beyond the building to the west, which consists of a thickly planted assortment of compact trees, ornamental shrubs, and landscape plantings that contribute to the building's architectural and functional character. A secondary entrance located on the building's south elevation is accessed via a pedestrian bridge that passes over a sunken garden containing numerous examples of evergreens and ornamental vegetation. To the west, the sunken garden transitions into a landscaped recreational area with a swimming pool, handball courts, and a small playground. The surrounding setting of the Martin Luther King, Jr. Medical Center Campus is extant.

No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction and its character-defining features are intact. The building's exterior appearance continues to convey its original design and reflects its period of construction. The property is in good condition.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The Dr. H. Claude Hudson Auditorium is located near the southern boundary of the Martin Luther King, Jr. Medical Center Campus, bounded by 120th Street to the north, Wilmington Avenue to the east, Compton Avenue to the west, and the southern boundary of the Martin Luther King, Jr. Medical Center Campus to the south. Sited directly adjacent to a secondary entrance on the east façade of the Multi-service Ambulatory Care Center building (MACC), the Auditorium's west-facing façade is oriented towards the MACC and is connected to the MACC by a covered walkway, which establishes the spatial relationship between the Auditorium and the MACC. The one-story building has a square plan. The building sits on a concrete foundation that supports concrete walls. As an example of a New Formatlism style building, the Auditorium's square plan, low massing, brick panel detailing, flat roof with cantilevered eaves, oversized beams and soffit detailing complement the Brutalism-inspired design of the MACC. The east elevation of the Auditorium is located on the edge of a small hill, where an angular concrete stairway with a metal railing descends into a parking lot located at the foot of the hill. Landscape elements associated with the Auditorium include the covered walkway, landscape plantings, original outdoor lighting, and the east stairway. (See Continuation Sheet 2 of 2)

***D6. Significance (continued from page 1):**
The Dr. H. Claude Hudson Auditorium is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The building was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, a medical care and postgraduate medical teaching facility, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles. As an auditorium, the building reflects the property's educational function.

Historical research indicates the Martin Luther King Jr. Medical Center Campus was planned and constructed between 1968 and 1972. The main buildings of the Martin Luther King, Jr. Medical Center Campus were constructed in phases during the late 1960s and 1970s. The earliest improvements included the three wings of the MACC, the Central Plant, and the Medical Records and Laundry Building, which were all operational by 1972. In 1973, the North and South Support buildings and the Dr. H. Claude Hudson Auditorium were built. The Interns and Physicians Building was constructed circa 1974. A second phase of the Central Plant building was completed in 1975, followed by the Augustus F. Hawkins Comprehensive Mental Health Center in 1979.

The main buildings of the medical center campus exhibit Brutalist elements. The design of the Dr. H. Claude Hudson Auditorium departs somewhat from the emphatically Brutalist architecture of the other three district contributors by merging the Brutalism inspired use of concrete and solid, enclosed volumes with elements associated with the "New Formalism" style of the 1960s and 1970s. The building exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association.

The Dr. H. Claude Hudson Auditorium satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the building meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest.

***D6. Significance (continued from page 1):**

The Interns and Physicians Building is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The building was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, a medical care and postgraduate medical teaching facility, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles. As an dormitory for medical students, the building reflects the property's educational function.

Historical research indicates the Martin Luther King Jr. Medical Center Campus was planned and constructed between 1968 and 1972. The main buildings of the Martin Luther King, Jr. Medical Center Campus were constructed in phases during the late 1960s and 1970s. The earliest improvements included the three wings of the MACC, the Central Plant, and the Medical Records and Laundry Building, which were all operational by 1972. In 1973, the North and South Support buildings and the Dr. H. Claude Hudson Auditorium were built. The Interns and Physicians Building was constructed circa 1974. A second phase of the Central Plant building was completed in 1975, followed by the Augustus F. Hawkins Comprehensive Mental Health Center in 1979. Dedicated in 1974, the Interns and Physicians Building was named for Dr. Julius Wanser Hill, the first African-American physician to complete his internship and residency at the Los Angeles County/University of Southern California Medical Center, Los Angeles. In 1961, Dr. Hill was appointed to the Los Angeles County Health Commission, where he served until his death in 1983.

The building is a characteristic example of the Brutalism style. Brutalism style buildings, considered easy to construct and maintain, were widely popular for government, civic and institutional buildings built during the 1960s and 1970s and thus use of Brutalist architecture reflects the building's public function. The main buildings of the medical center campus, including the Interns and Physicians Building, exhibit Brutalist elements. In the ensuing years, subsequently constructed buildings and structures located on the project site refer broadly to the Brutalism design precedent. The building exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association.

The Interns and Physicians Building satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the building meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest.

***P3a. Description: (continued from page 1):**

Distinguished by its large size and monolithic east façade, the six-story building with a penthouse is comprised of three structurally independent buildings: Central Tower, North Tower, and South Tower that protrude from the east facade. A characteristic example of the Brutalism style, the building's design utilizes geometric repetition. Vertically striated concrete exterior framing, a series of balconies, the three independent towers, and repetititve bands of windows are located on the building's east façade and south elevation, providing a sense of solidity and weighted volumes that are associated with Brutalist style architecture.

The building's primary entrance is recessed with a deeply cantilevered canopy. Landscape elements—including the central lawn crossed by a single paved sidewalk, an allée of tall palms to the south of the property, and ornamental trees and shrubs located along the building's primary façade—serve to further emphasize the building's role as the primary care facility of the Martin Luther King, Jr. Medical Center Campus. The three pedestrian walkways associated with the MACC (consisting of a low covered walkway extending from the MACC's east facade to the Dr. H. Claude Hudson Auditorium, an elevated walkway constructed of reinforced concrete, providing pedestrian access from the MACC to the Augustus F. Hawkins Comprehensive Mental Health Center, and a walkway extending from the west elevation of the MACC, constructed of reinforced concrete columns, and traversing past several medical campus buildings before terminating at the Dr. Julius W. Hill Interns and Physicians Building) contribute to the property's architectural and functional character. The surrounding setting of the Martin Luther King, Jr. Medical Center Campus is extant.

No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction and its character-defining features are intact. The building's exterior appearance continues to convey its original design and reflects its period of construction. As a hospital, the MACC is a key property type associated with the property's overall function as a medical care facility and postgraduate medical teaching facility. The property is in good condition.

BUILDING, STRUCTURE, AND OBJECT RECORD

Page 1 **of** 2 ***NRHP Status Code:** 3D

***Resource Name or #** (Assigned by recorder) *Multi-service Ambulatory Care Center (MACC)*

B1. Historic Name: *Multi-service Ambulatory Care Center (MACC)*
B2. Common Name: *MACC*
B3. Original Use: *Medical Building* **B4. Present Use:** *Medical Building*
***B5. Architectural Style:** *Brutalism*
***B6. Construction History**: (Construction date, alterations, and date of alterations) *Constructed from 1968 to 1972*

***B7. Moved?** ☒**No** ☐**Yes** ☐**Unknown** **Date: Original Location:** *N/A*
***B8. Related Features:**

Character-defining features of the Multi-service Ambulatory Care Center (MACC) are consistent with the Brutalism style: ample use of concrete (e.g., vertically striated concrete supports and exterior framing); monolithic massing; geometric repetition (e.g., the plan configuration consisting of three identical towers, repetitive bands of windows, and a series of balconies located on the building's facade); recessed primary entrance with deeply cantilevered canopy; minimal ornamentation; overall simplicity of form; original landscaping (elongated central lawn crossed by a single path).

B9a. Architect: *Adrian Wilson and Associates; Carey K. Jenkins; Nielsen, Moffatt, and Wolverton* **b. Builder:** *Robert McKee, Inc.*
***B10. Significance: Theme:** *Development of the Willowbrook Area (1893-1980); Development of the Martin Luther King, Jr. Medical Center Campus (1965–1971); Operation of the Martin Luther King, Jr. Medical Campus (1972–2010)*
Area: *Willowbrook, County of Los Angeles* **Period of Significance:** *1968-1979* **Property Type:** *Building*

Applicable Criteria: *A/1* (Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

(See Continuation Sheet 2 of 2)

***D6. Significance (continued from page 1):**

The Multi-service Ambulatory Care Center (MACC) is a significant contributing building of the Martin Luther King, Jr. Medical Campus Historic District. The building was constructed as a component of the Martin Luther King, Jr. Medical Center Campus, a medical care and postgraduate medical teaching facility, which was built as a direct response to the findings of the McCone Commission that was organized to examine the causes of the 1965 civil unrest that began in nearby Watts. The McCone Commission found that South Los Angeles was severely lacking in access to medical services and recommended the immediate construction of a comprehensive hospital to remedy the stark disparities in the availability of health care services between South Los Angeles and the rest of the City of Los Angeles. As an inpatient and outpatient healthcare facility, the building provides medical services.

Historical research indicates the Martin Luther King Jr. Medical Center Campus was planned and constructed between 1968 and 1972. The main buildings of the Martin Luther King, Jr. Medical Center Campus were constructed in phases during the late 1960s and 1970s. The earliest improvements included the three wings of the MACC, the Central Plant, and the Medical Records and Laundry Building, which were all operational by 1972. In 1973, the North and South Support buildings and the Dr. H. Claude Hudson Auditorium were built. The Interns and Physicians Building was constructed circa 1974. A second phase of the Central Plant building was completed in 1975, followed by the Augustus F. Hawkins Comprehensive Mental Health Center in 1979.

The building is a characteristic example of the Brutalism style. Brutalism style buildings, considered easy to construct and maintain, were widely popular for government, civic and institutional buildings built during the 1960s and 1970s and thus use of Brutalist architecture reflects the building's public function. The main buildings of the medical center campus, including the Augustus F. Hawkins Comprehensive Mental Health Center, exhibit Brutalist elements. In the ensuing years, subsequently constructed buildings and structures located on the project site refer broadly to the Brutalism design precedent. The building exhibits few exterior and interior alterations since its construction and retains integrity in its location, design, setting, materials, workmanship, feeling and association.

The Multi-service Ambulatory Care Center (MACC) satisfies the definition of a historical resource pursuant to CEQA [State CEQA Guidelines Section 15064.5(3)]. As a contributing building to the Martin Luther King, Jr. Medical Center Historic District, the building meets Criterion A/1 for listing in the NRHP/CRHR for its exceptional significance in association with the history and development of the Willowbrook area and its direct linkage with the McCone Commission's recommendation for the construction of a new hospital facility in South Los Angeles in the wake of the 1965 civil unrest.

DISTRICT RECORD

Trinomial

Page *1* **of** *5* ***NRHP Status Code:** *3S*

***Resource Name or #** (Assigned by recorder)**:** *Martin Luther King, Jr. Medical Center Campus Historic District*

D1. Historic Name: *Martin Luther King, Jr. General Hospital* **D2. Common Name:** *Martin Luther King, Jr. Hospital, King-Drew Medical Center*

***D3. Detailed Description** (Discuss overall coherence of the district, its setting, visual characteristics, and minor features. List all elements of district.): *The Martin Luther King, Jr. Medical Center Campus Historic District is comprised of four buildings and seven appurtenant elements located on the existing 38-acre Martin Luther King, Jr. Medical Center Campus, at 12021 Wilmington Avenue in the community of Willowbrook, in the unincorporated territory of the County of Los Angeles, California. Related by function, period of significance (1968–1979), physical placement, and complementary architectural styles, the district contributors convey intentionality as the key spaces of the Martin Luther King, Jr. Medical Center Campus. The historic district's four buildings are representative of the property's historical function as a medical center and campus and include inpatient, outpatient, and emergency facilities, a dormitory for medical students, and an auditorium. The historic district's seven appurtenant elements consist of site plan and landscaping that contribute to the property's feel and character as a medical center campus. The appurtenant elements include: a distinctive elongated entrance lawn and roadway; a sunken garden; walled courtyards; a recreation area; and circulation routes for pedestrians and vehicles. (See Continuation Sheet 2 of 5)*

***D4. Boundary Description** (Describe limits of district and attach map showing boundary and district elements.): *The district boundaries were established by outlining the four buildings and seven appurtenant elements that comprise the primary spaces of the Martin Luther King, Jr. Medical Center Campus. The period of significance begins with the groundbreaking of the Martin Luther King Jr. General Hospital in 1968 and ends with the 1979 completion of the Augustus F. Hawkins Comprehensive Mental Health Center.*

***D5. Boundary Justification:** *The district boundaries contain a group of buildings and appurtenant elements that were constructed between 1968-1979 and retain a sense of time and place associated with the development of the Martin Luther King, Jr. Medical Center.*

***D6. Significance: Theme:** *Development of the Martin Luther King, Jr. Medical Campus (1965–1971); Operation of the Martin Luther King, Jr. Medical Campus (1972–2010)* **Area:** *Los Angeles County*
Period of Significance: *1968-1979* **Applicable Criteria:** *A/1* (Discuss district's importance in terms of its historical context as defined by theme, period of significance, and geographic scope. Also address the integrity of the district as a whole.)
The current evaluation found that the Martin Luther King, Jr. Medical Center Campus Historic District is significant under Criterion A of the National Register of Historic Places (NRHP), and Criterion 1 of the California Register of Historical Resources (CRHR) for its association with development of the Martin Luther King, Jr. Medical Center Campus. The Martin Luther King, Jr. Medical Center Campus is significant for its exceptional importance in relation to the Civil Rights movement in Los Angeles, as epitomized by the 1965 civic unrest in the Watts area and resultant McCone Commission's recommendations. The Martin Luther King, Jr. Medical Center Campus demonstrates exceptional importance as a rare, surviving community development project with a direct historical linkage to the 1965 civil unrest and is also significant as a major milestone in the history and development of the Willowbrook area.

The development of the Martin Luther King, Jr. Medical Center Campus was a direct result of the County of Los Angeles Board of Supervisor's approval of recommendations of the McCone Commission to respond to the civil unrest that had occurred in the Watts-Willowbrook area in 1965. On August 11, 1965, California Highway Patrol officers arrested a man named Marquette Frye for suspected drunken driving in the Watts neighborhood in South Los Angeles. A subsequent confrontation erupted in civil unrest. Over the following six days, violence left 34 persons dead, over 1,000 persons injured, damaged over 600 buildings, and burned business districts. The McCone Commission, established in the wake of the civil disturbance to investigate its causes, identified the lack of access to health care in the historically underserved area of South Central Los Angeles as one of the primary contributing factors to the civil disturbance, along with high unemployment and limited educational opportunities. (See Continuation Sheet 3 of 5)

Page *2* **of** *5* ***Resource Name or #** (Assigned by recorder) *Martin Luther King, Jr. Medical Center Campus Historic District*

Recorded by: *Leslie J. Heumann and Marlise Fratinardo* ***Date:** *July 14, 2010* ☒ Continuation ☐ Update

***D3. Detailed Description (continued from page 1):**

The appurtenant elements either physically connect individual buildings, expand building functions into the surrounding landscape, or express the property's function as a medical center campus. There are three pedestrian walkways that connect the four historic district contributors. The walkways enabled medical personnel and students to travel expeditiously around the campus. The MACC, for example, is connected to the Dr. H. Claude Hudson Auditorium via a low covered walkway that extends from the MACC's east façade, which provides a physical link between the medical (MACC) and assembly (Auditorium) uses. Existing gardens and courtyards are closely associated with building functions. For example, the Interns and Physicians Building, a medical student dormitory, includes a walled courtyard and recreation area for medical students.

The character-defining features of the Martin Luther King, Jr. Medical Center Campus Historic District are listed below. All building names are listed in chronological order by construction date. Additional information on the buildings is provided in the attached DPR 523A forms. The corresponding map gives the exact location of the buildings within the district boundaries.

Contributing Buildings	***Date Constructed***
Multi-service Ambulatory Care Center (MACC)	1968
Dr. H. Claude Hudson Auditorium	1973
Interns and Physicians Building	1975
Augustus F. Hawkins Comprehensive Mental Health Center	1979

Appurtenant Elements

- Elongated lawn located east of the MACC, which is bounded by a primary entrance road
- Sunken garden and walled courtyard located south and west of the Augustus F. Hawkins Comprehensive Mental Health Center
- Walled courtyard and recreation area located south of the Interns and Physicians Building
- Drop-off area located north of the Interns and Physicians Building and west of the North Support Building
- Pedestrian walkway extending from the MACC's east facade to the Dr. H. Claude Hudson Auditorium
- Pedestrian walkway extending from the north elevation of the MACC to the Augustus F. Hawkins Comprehensive Mental Health Center
- Pedestrian walkway extending from the east facade of the Interns and Physicians Building to the MACC

The remaining extant 17 buildings located on the Martin Luther King, Jr. Medical Center Campus were identified as noncontributors to the Historic District because they are less than 50 years old, were constructed outside the 1968-1979 period of significance, do not exhibit exceptional importance related to the recommendation of the McCone Commission, reflect ancillary functions of the medical center campus, or lack aspects of integrity due to alterations.

Non-Contributing Buildings	***Date Constructed***
Central Plant	Phase I: late1960s; Phase II: 1975
Medical Records and Laundry	1972
North Support Building	1973
South Support Building	ca. 1973
Plant Management Building	1979
Cooling Towers	ca. 1979
Genesis Clinic	ca. 1979
Oasis Clinic (old)	ca. 1979
Hub Clinic	ca. 1980
MRI Building	ca. 1980
Storage Building (1,060 sq. ft)	ca. 1980
Storage Building (2,533 sq. ft.)	ca. 1980
Emergency Room	ca. 1985
Oasis Clinic (new)	ca. 1995
Registration Building	ca. 1990
Pediatric Acute Care	1992
Inpatient Tower	1993

***D6. Significance (continued from page 1):**

As part of the national civil rights movement that culminated in the 1960s, the civil disturbances in and around Watts in 1965 were a pivotal moment in the history of Los Angeles County. The McCone Commission and its recommendations represented a turning point in local governance, when the County made a concerted effort to redress the inequalities that the McCone Commission identified as some of the underlying causes of the upheaval. The Martin Luther King, Jr. Medical Center was a centerpiece of the County's response and as such has exceptional importance as a physical manifestation of significant historical events of the 1960s in Los Angeles. Furthermore, the name it bears represents one of the most visible local efforts to commemorate a prophet of the national civil rights movement, Dr. Martin Luther King, Jr. The new campus, the largest development project in the area since the 1965 civil disturbance, was intended to serve multiple roles as a medical facility and economic engine, rectifying past inequalities regarding medical services, employment, and educational facilities in South Central Los Angeles.

Originating during a turbulent era in the history of Los Angeles County and the nation, the construction of the Martin Luther King, Jr. Medical Center Campus represented the hopes and aspirations of South Central Los Angeles residents and Los Angeles County officials. In fulfilling the mandate of the McCone Commission, the Martin Luther King, Jr. Medical Center Campus project incorporated an active program of community involvement efforts. Hospital staff regularly attended various local community meetings and the community participated in the plans for the development and operation of the hospital. As a result of community outreach efforts, medical service needs that expanded beyond the facility's initial vision were identified and led to the acquisition by the County of Los Angeles of an additional 16 acres north of 120th Street to create a comprehensive "Area Health Education Center." Demonstrating the project's responsiveness to the provision of local community services, the MACC incorporated spaces for educational and assembly uses, including 50,000 square feet for classrooms and conference rooms. This space was intended for use in providing employment training for local residents and continuing education classes for health professionals at the facility.

The development of the Martin Luther King, Jr. Medical Center Campus represented a major shift in the history and development of the Willowbrook area, which, prior to the project, was a relatively undistinguished community that still retained substantial vestiges of its original rural uses. The new hospital inspired high hopes as an economic generator and top-notch medical facility that would provide abundant opportunities in an area of considerable need, or, as stated by Martin Luther King, Jr. Medical Center Administrator Charles E. Windsor in 1972,

> *This multimillion dollar project is being set in the middle of desert of deprivation offering hope and light where there has been none, offering opportunities in fields heretofore unknown to the residents in this area, and offering medical services of a quality which would be desirable even in the most prosperous of communities.*[1]

Planning efforts for the hospital represented the area's largest construction project since the 1965 civil unrest. The project's primary building, known today as the MACC, estimated at $23.5 million, was promoted not only as an opportunity to increase the availability of medical care in South Los Angeles but as an important new source of local employment. Supervisor Hahn personally monitored the ethnic and racial composition of the project's construction workers to ensure that employment reflected the predominantly African American demographic of the area. Priority was also given to African Americans for hospital staff positions.

In ensuing years, the presence of a Los Angeles County hospital employed approximately 3,000 workers, provided opportunities for medical professional training and development, and spurred numerous additional development projects in Willowbrook, which included a large scale redevelopment plan, dozens of new homes, the Kenneth Hahn Shopping Plaza and a new water system.

Historical research indicates the Martin Luther King Jr. Medical Center Campus was planned and constructed between 1968 and 1972. Three Los Angeles firms were selected to collaboratively design the new facility: Adrian Wilson and Associates; Carey K. Jenkins; and Nielsen, Moffatt, and Wolverton. The initial buildings, including the MACC, of the Martin Luther King Jr. Medical Center Campus were built by contractor Robert E. McKee, Inc. As the hospital's primary patient care facility, the MACC, exhibits elements of the Brutalism style, which was a popular choice for public and institutional buildings constructed during the 1960s and 1970s. In the ensuing years, subsequently constructed buildings and structures located on the project site refer broadly to the Brutalism design precedent embodied in the MACC. (See Continuation Sheet 4 of 5)

***D6. Significance (continued from page 3):**

The main buildings of the Martin Luther King, Jr. Medical Center Campus were constructed in phases during the late 1960s and 1970s. The earliest improvements included the three wings of the MACC, the Central Plant, and the Medical Records and Laundry Building, which were all operational by 1972. In 1973, the North and South Support buildings and the Dr. H. Claude Hudson Auditorium were built. The Interns and Physicians Building was constructed circa 1974. A second phase of the Central Plant building was completed in 1975, followed by the Augustus F. Hawkins Comprehensive Mental Health Center in 1979. No building permits were located that provided specific dates of subsequent buildings; however, several support buildings, such as the Cooling Towers, Oasis Clinic, Storage Buildings, and the Hub Clinic were built during the 1970s and 1980s. The early 1990s brought several new buildings to the Medical Center: the Registration Building, Inpatient Tower, Pediatric Acute Care, Emergency Room, and the MRI Building.

The Genesis Clinic, circa 1979, is located in the eastern portion of the Martin Luther King, Jr. Medical Center Campus, bounded by 120th Street to the north, Wilmington Avenue to the east, Compton Avenue to the west, and the southern boundary of the Martin Luther King, Jr. Medical Center Campus to the south. Constructed of reinforced concrete, the one-story building is rectangular in plan with a flat roof that is shielded from view by a large overhanging metal parapet. The primary entrance on the west façade is accessed by a concrete stepped stoop with a ramp and metal handrail. The immediate setting of the building consists of a parking lot and small playground. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries) *The Oasis Clinic, circa 1995, is located north of East 120th Street in an area that is primarily occupied by the Charles Drew University of Medicine and Science. The west-facing building is rectangular in plan and is constructed of reinforced concrete. The building sits upon a concrete foundation. Concrete walls support the building's flat roof. Minimally ornamented, the building's west facade has a concrete walkway, a metal door, and fixed metal windows. The (south) street-facing elevation has no windows and a single solid metal door. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.*

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The Registration Building, circa 1990, is located in the eastern portion of the Martin Luther King, Jr. Medical Center Campus along the primary road leading to the MACC. The south-facing building is rectangular in plan and constructed of reinforced concrete, with concrete walls supporting a flat roof. Two large concrete pilasters with a vertically striated pattern project from the building's facade, one at the southwest corner and another directly west of the building's primary entrance. A continuous panel of fixed, mirrored windows is located on the second floor of the building's facade. Visitor parking, landscape plantings, and the grassy lawn located to the east of the MACC provide the setting for the Registration Building. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The Inpatient Tower, circa 1993, is located to the northwest of the MACC in the central portion of the Martin Luther King, Jr. Medical Center Campus. The west-facing building has a square plan and is constructed with a superstructure of structural steel and reinforced concrete. The building's foundation is composed of cast-in-place concrete-drilled piles. Concrete walls support the building's flat roof, which supports a helipad. Bands of fixed, tinted windows with alternating bands of concrete are located on all elevations of the building. A vehicular drop-off structure extends from the building's west facade, which consists of a massive concrete colonnade with a flat roof that is supported by thick columns. No building permits, original plans, or construction drawings were found for this building. The building exhibits no exterior alterations since its construction.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The Pediatric Acute Care, circa 1992, is located in a small opening between the Central Plant and Laundry Building to the south and the Inpatient Tower to the north. The MACC is adjacent to the building's east elevation. The north-facing building is rectangular in plan and is constructed of structural steel and reinforced concrete. The building's foundation is composed of cast-in-place concrete-drilled piles. Concrete walls support the building's flat roof. Fixed metal windows are located on the building's north-facing facade. The building is sheltered by a large pavilion with a flat roof known as the Denzel Washington Pediatric Pavilion. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries) *The North Support Building is located in the western portion of the Martin Luther King, Jr. Medical Center Campus. The building's east-facing facade is oriented toward large parking lots that are located to the north and east of the building. The two-story building is square in plan with a flat roof. The foundation system is composed of cast-in-place concrete drilled piles. Reinforced concrete walls support a reinforced concrete slab roof. Constructed in two phases, the original building (1975) consisted of a lower full level and a partial second floor. In the late 1980s, the second floor was expanded to cover the entire first floor. An example of functional, utilitarian architecture, the building has ribbon windows on the second floor, and a recessed entrance covered by a concrete column. Detailing is otherwise minimal. Paved parking areas provide the setting for the Central Plant building. No building permits were located. The building's condition is good. The building's second floor addition in the 1980s compromised the original design and massing of the building and is a significant alteration. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.*

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The one-story Cooling Towers building houses the cooling towers that function to remove excess heat and provide heat, ventilation, and air conditioning to the MACC. The Cooling Towers are located in the south portion of the Martin Luther King, Jr. Medical Center Campus along the service road that defines the property's southern border. The windowless building is rectangular in plan constructed of concrete and sits upon a concrete foundation. The building's east and west concrete exterior walls are scored in a vertically striated pattern. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
This one-story Hub Cilnic, circa 1980, is located north of East 120th Street in an area that is primarily occupied by the Charles Drew University of Medicine and Science. The south-facing building is rectangular in plan and is constructed of wood. The building sits upon a concrete foundation. Wood walls support the building's flat roof. An elevated concrete pad enclosed by a metal rail, with a short stairway and a ramp, provides access to the building's primary entrance. Minimally ornamented, the building's facade has a solid metal door and metal sliding windows. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The 2,533 square-foot one-story Storage Building, circa 1980, is located south of the Central Plant and Medical Records and Laundry Building, along the service road that defines the property's southern border where service uses are concentrated. The building is rectangular in plan and is constructed of concrete with a flat slab concrete roof with overhanging eaves. The building sits upon a concrete foundation. Minimally ornamented, a wide band of rusticated concrete detailing, intended to resemble stone, wraps the building. A rolling metal garage door and a metal sliding window are located on the building's east elevation. No building permits, original plans, or construction drawings were found for this building. The building exhibits few exterior alterations since its construction.

APPENDIX C
RÉSUMÉS OF KEY PERSONNEL

Marie C. Campbell, MA

Master of Arts, Geography, Geomorphology/Biogeography, University of California, Los Angeles, 1988

Principal/President

- *Ensure technical and procedural adequacy pursuant to NEPA, CEQA, and other federal, state, and local statutes and regulations*
- *Provide strategy for regulatory permit compliance*
- *Agency coordination*
- *Coordination with special interests*
- *Identify opportunities for issue resolution*
- *Public outreach*
- *Quality assurance / quality control*
- *Milestone compliance*

Years of Experience: 25+

Relevant Experience/
Speaking Engagements:

- *Board Member, California Wind Energy Association*
- *Past Chapter Director, Los Angeles Association of Environmental Professionals*
- *Lecturer on the California Environmental Quality Act (CEQA) before the Association of Environmental Professionals and the Los Angeles County Chief Executive Office Staff*
- *Lecturer at Cal Poly Pomona*
- *Quality assurance manager for Long Beach Memorial Medical Center*
- *Project manager for Los Angeles Grand Avenue and Environs EIR*
- *Technical expert to successfully support clients in 12 CEQA lawsuits*

Ms. Marie Campbell, principal of Sapphos Environmental, Inc., is an environmental compliance specialist with more than 25 years of experience in managing public- and private-sector projects requiring strategic planning, environmental compliance documentation, and resource management planning. In particular, Ms. Campbell has extensive experience with complex and controversial alternative energy projects, including the 300-megawatt PdV Wind Energy Project, which was unanimously approved by the Kern County Board of Supervisors in July 2008, and the Lompoc Wind Energy Project, which was unanimously approved by the Santa Barbara County Board of Supervisors in May of 2009. Success of these projects was reinforced by the strong working relationships Ms. Campbell built between the many diverse parties who had an interest in the projects. Ms. Campbell managed the coordination between agencies, special interests, and the public to resolve issues and meet project goals and milestones.

Ms. Campbell has served as project manager or senior technical advisor for numerous challenging and high-profile projects, including the Hollywood Bowl Shell Rehabilitation and Acoustical Improvements EIR, Addendum No. 2 to the First Street Properties (Walt Disney Concert Hall) EIR, the Los Angeles Plaza de Cultura y Arte EIR, Grand Avenue and Environs EIR, Bonelli Regional County Park Master Plan EIR, and Deane Dana Friendship Community Regional County Park EIR. Many of these projects involved the preparation of joint environmental documents with multiple agencies. Ms. Campbell has developed strong working relationships with numerous regulatory oversight agencies, including the South Coast Air Quality Management District, Regional Water Quality Control Board, Department of Toxic Substances Control, U.S. Fish and Wildlife Service, and California Department of Fish and Game.

Although the majority of projects for which environmental compliance documents have been prepared have not involved litigation, the strategic planning and compliance advice provided by Ms. Campbell have been critical to the success of Sapphos Environmental, Inc.'s clients in each of the 13 cases (on 11 projects) that were subject to litigation. In each case, Sapphos Environmental, Inc.'s client prevailed, and the project was able to proceed as analyzed.

Throughout her career, Ms. Campbell has been actively engaged in community service. Ms. Campbell established the Sapphos Foundation, through the California Community Foundation, as a means of supporting community service efforts that are meaningful to her clients, employees, and family. She serves on the board of the Pasadena Mothers' Club Family Learning Center and is honored to be the recipient of their 2009 Corporate Responsibility Award.

Leslie Heumann

Master of Arts, Architecture, University of California, Los Angeles (1976–1978; incomplete)

Bachelor of Arts, History, University of California, Los Angeles, 1975

Section 106 Essentials, Advistory Council on Historic Preservation, 2009

Cultural Resources Manager; Architectural Historian

- *Historic resources surveys*
- *NRHP nominations*
- *Historic resources impact analyses in support of NEPA and CEQA, and Section 106 of the NHPA*
- *Historic American Buildings Survey documentation*
- *Secretary of the Interior's Standards for the Treatment of Historic Properties*
- *Historic schools modernization issues*

Years of Experience: 33

Relevant Experience:

- *Cultural Resources Technical Report, PdV Wind Energy Project (Sapphos Environmental, Inc., August 11, 2006)*
- *Fatal Flaw Analysis for a wind energy project in the Southern Sierras, Kern County (Sapphos Environmental, Inc., May 24, 2006)*
- *Cultural Resources Technical Report, for a wind energy project in the Southern Sierras, Kern County (Sapphos Environmental, Inc., 2009)*
- *Historic Resources Technical Reports (Multiple projects: Shoreline Gateway, Long Beach, 2006; Main Street Redevelopment Corridor, Alhambra, 2006; South Pasadena Downtown Revitalization, 2007)*

Ms. Leslie Heumann manages the multidisciplinary cultural resources group at Sapphos Environmental, Inc. An architectural historian with more than 33 years of experience covering all aspects of historic architectural evaluation, documentation, and preservation, she specializes in coordination of historic resources surveys, assessment of historic significance, and preparation of documentation pursuant to the California Environmental Quality Act (CEQA), National Historic Preservation Act (NHPA), and National Environmental Policy Act (NEPA). She satisfies the Secretary of the Interior's professional qualification standards as an architectural historian.

As cultural resources manager, Ms. Heumann has overseen the analysis of cultural resources with respect to paleontological, archaeological, and historical resources, Native American Sacred Sites, and human remains. Recent projects have entailed the characterization of baseline conditions, determination of project impacts, and recommendation of mitigation and avoidance measures in support of 6,440-acre and 15,182-acre wind energy projects in Kern County, California, and a 9,664-acre dust mitigation project in Owens Valley, California. These efforts have encompassed comprehensive records searches, Phase I archaeological surveys, and preparation of cultural resources technical reports and have enabled clients to achieve project objectives while avoiding and/or minimizing potential project impacts on cultural resources. Ms. Heumann has coordinated with a variety of entities, including the Bureau of Land Management, the California State Lands Commission, the Office of Historic Preservation, and the Native American Heritage Commission in connection with these studies.

In her capacity as an architectural historian, Ms. Heumann has undertaken the identification, evaluation, and documentation of historic resources for an extensive body of properties in the Southwest, including California, Texas, Arizona, Nevada, and Hawaii. She has directed intensive- and reconnaissance-level historic resources surveys for the Cities of Beverly Hills, Los Angeles, Santa Monica, Glendale, Pasadena, Long Beach, Rancho Mirage, Santa Ana, and Upland, among others. She is an expert in Section 106 of the NHPA and has prepared historic property surveys, findings of effects, and Memoranda of Agreement for California Department of Transportation projects in Upland and Alhambra, a Vandenberg Air Force Base facility, and a historic ranch complex on the site of a proposed housing development in the Santa Clarita Valley.

Additional areas of expertise include Historic American Buildings Survey documentation, application of the Secretary of the Interior's Standards for the Treatment of Historic Properties, and historic schools modernization issues. Ms. Heumann is currently overseeing a multimillion-dollar effort to assess the feasibility for reuse of 73 buildings and structures comprising a former poor farm that has been formally determined eligible for inclusion in the National Register of Historic Places (NRHP). She has authored several nominations to the NRHP, most recently for the Bungalow Heaven district of Pasadena. At present, she is part of an elite team of specialists that is developing a Historic Context Statement for the City of Los Angeles.

Ms. Heumann often provides expert testimony to local planning and cultural resources commissions and city councils and has had the opportunity to share her knowledge through speaking at numerous conferences and gatherings, most recently at the 2008 national conference of the Association of Environmental Professionals.

Marlise Fratinardo, MLA

Master of Landscape Architecture (Historic Preservation Certificate), University of Colorado, Denver, 2006

Graduate Study, Landscape Architecture and Urbanism, Delft University of Technology, The Netherlands, 2005

Bachelor of Arts, Anthropology
Bryn Mawr College,
Bryn Mawr, PA, 1993

Senior Cultural Resources Coordinator

- *CEQA/NEPA documentation*
- *National Register of Historic Places Nominations*
- *Preparation of historic resources surveys*
- *Secretary of the Interior's Standards for the Treatment of Historic Properties documentation*
- *Preservation economics*
- *Cultural landscapes*

Years of Experience: 8

Relevant Experience:

- *Martin Luther King, Jr. Hospital Cultural Resources Technical Report (in progress)*
- *Rancho Los Amigos National Rehabilitation Center Cultural Resources Technical Report (in progress)*
- *LA Plaza de Cultura y Artes Section 106 Compliance Report (in progress)*

Marlise Fratinardo, senior cultural resources coordinator for Sapphos Environmental, Inc., has more than eight years of professional and academic experience in the practice of historic preservation, urban planning, and applied architectural history in the United States and abroad. Ms. Fratinardo's qualifications meet and exceed the Secretary of the Interior's Professional Qualification Standards in Architectural History, History, and Historic Preservation Planning.

As an architectural historian, Ms. Fratinardo has extensive experience in evaluating the significance of a diverse range of building types and landscapes. In addition to preparing assessments for projects in Los Angeles, Santa Monica, Laguna Beach, West Hollywood, Santa Clarita, and Pasadena, she participated in a comprehensive survey and cultural resources analysis of the RMS Queen Mary in Long Beach, California. Ms. Fratinardo contributed to the Wilshire Center/Koreatown Redevelopment Area Historic Resources Survey for the City of Los Angeles, in which she utilized tablet PCs to collect survey data, established eligibility requirements, developed the survey's historic overview, and conducted significance evaluations for surveyed properties. She has demonstrated experience in CEQA/NEPA documentation, particularly in developing historical resources sections, technical reports, and mitigation recommendations to reduce impacts to historical resources.

In her capacity as an urban planner, Ms. Fratinardo has advised local governments and community groups on the process of integrating historic preservation goals into local planning efforts by participating in the development of historic preservation ordinances, design standards, unified development codes and growth management plans that addressed community character, aesthetics, and local identity for municipalities throughout the United States. A specialist in preservation economics, she prepared two comprehensive statewide studies on the economic benefits of historic preservation on behalf of the Colorado Historical Society and the Michigan Historic Preservation Network.

Her professional background includes numerous projects aimed at the protection and revitalization of historic areas. She has demonstrated experience in preparing National Register of Historic Places nominations and rehabilitation grant applications, including a successful grant application ($200,000) for a historic rehabilitation project in Rio Blanco County, Colorado. As a participant in the US/ICOMOS International Exchange Program, she worked in partnership with TURATH Heritage Management Consultants and community members to develop a historic preservation plan for a rehabilitation project in Al-Houson, Jordan.

Ms. Fratinardo's areas of interest include cultural landscapes, preservation economics, urban infill development, parks, streetscapes, and infrastructure. She is a member of the U.S. National Committee of the International Council on Monuments and Sites (US/ICOMOS), Historic Gardens and Cultural Landscapes Committee, and the Los Angeles Conservancy.

Laura G. Carías, MA

Master of Arts, Public History, California State University, Sacramento, 2006

Cultural Resources Coordinator

- *Historic resources surveys and assessments*
- *Secretary of the Interior's Standards for the Treatment of Historic Properties*
- *Conduct and implement cultural resources mitigation, including HABS documentation*
- *Developing Historic Contexts*

Years of Experience: 4

Relevant Experience:

- *Rancho Los Amigos Historic District*
- *American Beet Sugar Factory Historic Structures Report*
- *Santa Paula Train Depot and Mill Rehabilitation and Restoration*
- *Long Beach Press Telegram Mitigation*
- *Countywide Historic Inventory Survey for the County of Sutter*
- *Packing historical inventory for Patriotic Hall, Los Angeles*

Ms. Laura G. Carías, cultural resources coordinator for Sapphos Environmental, Inc., has four years of experience in the field of historic cultural resources evaluation and identification, documentation, and preservation. She specializes in coordination of historic resources surveys, Historic American Buildings Survey (HABS) documentation, assessment of historic significance, and preparation of documentation to support the California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), and National Historic Preservation Act (NHPA). Ms. Carias satisfies the Secretary of the Interior's professional standards as an architectural historian.

Ms. Carías has assisted in the preliminary assessment of various types of historic resources. Ms. Carias has performed, or contributed to intensive and reconnaissance level historic resources surveys for the Cities of Pomona, Glendale, Huntington Park, and San Juan Bautista as well as Sutter County. Ms. Carías has conducted extensive archival research throughout Los Angeles, Riverside, San Bernardino, San Diego, Sacramento, and Solano Counties. Ms. Carias has also assisted in authoring historic structures report for the Santa Paula Depot in Santa Paula, Ventura County, and the American Sugar Beet Factory in Chino, San Bernardino County.

Ms. Carías's experience encompasses historical resources projects throughout Southern California. She has researched and analyzed contexts for a wide variety of property types. For City of Ontario in County of San Bernardino, she conducted the research for the historic context for the City's historic citrus industry. Ms. Carias also has assisted with Historic Structures Report for the American Beet Sugar Factory in Chino both with the written report and the fieldwork.

Since working at Sapphos Environmental, Inc, Ms. Carías has assisted with writing sections of the report and the Historic Context for the Rancho Los Amigos Historic District report as well as the research and report writing for a variety of projects, including the proposed Long Beach Kroc Community Center and the proposed Los Angeles Unified School District expansion for the Bellingham Elementary School. Currently, she is managing the mitigation efforts for Rancho Los Amigos Data Center project which include HABS documentation, oral history interviews and commemorative exhibit and kiosk designs.

Ms. Carías's educational background includes public history, architectural history, Oral History methods, and archival management. She is a member of the Los Angeles Conservancy, California Council for the Promotion of History and the California Preservation Foundation.

Christopher W. Purtell

Master of Arts, Archaeology Science, California State University, Fullerton (in progress; degree expected in 2011)

Bachelor of Arts, Anthropology/Archaeology, California State University, Dominguez Hills, 1992

Senior Cultural Resources Coordinator / Archaeologist

- *Environmental analysis in support of CEQA, NEPA, and NHPA*
- *Archaeological principal investigator*
- *Project management of archaeological studies*
- *Phase I ,II, and III archaeological investigations*
- *Prehistoric and historic laboratory analysis*
- *Coordination with Native American Heritage Commission*
- *Archaeological construction monitoring*
- *Archaeological record search*
- *Rock art analysis*
- *Ethnographic research*

Years of Experience: 5

Relevant Experience:

- *Phase I surveys, Avalon I Alternative Energy Project, Manzana Wind Energy Project, Hoffman Summit Wind Energy Project, and PdV Wind Energy Project*
- *Phase I survey for 2008 Owens Valley PM$_{10}$ Planning Area Demonstration Attainment State Implementation Plan Subsequent Environmental Impact Report*
- *Phase I survey of 932 acres of the Vasquez Rocks Natural Area Park*

Mr. Christopher Purtell is a senior cultural resources coordinator / archaeologist for Sapphos Environmental, Inc. Mr. Purtell has five years of experience in project management, environmental compliance, archaeological survey, excavation, monitoring, laboratory analysis, and documentation. His qualifications meet the Secretary of the Interior's Professional Qualifications Standards in Archaeology.

As a senior cultural resources coordinator, Mr. Purtell has undertaken and contributed to work efforts for prehistoric and historic archaeology in the Great Basin and Mojave Desert pursuant to the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). As a field director, Mr. Purtell has managed field crews in intensive pedestrian surveys, excavations, and laboratory analyses. He has co-authored cultural analyses for Fatal Flaw studies; environmental compliance documents, such as Initial Studies, Environmental Impact Reports, and Cultural Resources Technical Reports; and has compiled California Department of Parks and Recreation (DPR) site records. He has successfully coordinated with a variety of lead and regulatory agencies, including the Bureau of Land Management (BLM) among others.

Mr. Purtell has conducted archaeological research in California, Western Mexico, Baja California, and the North Coast of Peru. He specializes in lithic trajectories and technologies, and received the 2007–2008 Professional Distinction Award for Field and Laboratory Analysis from the California State University, Fullerton, Graduate School of Anthropology. Additional research interests include geographic information system (GIS) studies on prehistoric migration patterns, the archaeology of San Nicolas Island and Baja California, and California rock art. Mr. Purtell's recent work assignments have included cultural resources monitoring at the 9,212-acre site of the 2008 Owens Valley PM$_{10}$ Planning Area Demonstration of Attainment State Implementation Plan in Inyo County, California, for the Great Basin Unified Air Pollution Control District; cultural resources task manager for the 8,300-acre Avalon I Alternative Energy Project; and project manager for cultural resources monitoring at LA Plaza de Cultura y Artes in El Pueblo de Los Angeles Historic District in downtown Los Angeles.

Mr. Purtell's professional experience includes over 20 years as a business director and program manager in the manufacturing of aerospace airframe components prior to his cultural resources management work. Mr. Purtell has extensive working knowledge in program management practices, quality management principles, and International Organization for Standardization 9002 quality procedures and applications, which are international in scope, and which have given him the necessary knowledge and expertise to manage complex cultural resources projects.

Roberta L. Thomas, MA

Master of Arts, Archaeology Science, California State University, Long Beach, 2009

Bachelor of Arts, Anthropology/Archaeology, University of Oklahoma, Norman, Oklahoma, 2005

Cultural Resource Analyst

- *Phase I archaeological surveys*
- *Implementation of study design consistent with project objectives*
- *Research design*
- *Excavation*
- *Data recording and interpretation*
- *Native American coordination*
- *NAGPRA compliance*
- *Geophysical surveys with GPR and conductivity*

Years of Experience: 2

Relevant Experience:

- *Playa Vista Development, Los Angeles County, California Phase I survey, laboratory analysis, Native American coordination, and repatriation of Native American remains*
- *Bolsa Bay Archaeological Project, Huntington Beach, California Osteology lab supervisor: repatriation preparation and special studies analysis*
- *Kern County Wind Development Projects, California Phase I survey and recordation of sites and isolates*

Ms. Roberta Thomas, resource analyst at Sapphos Environmental, Inc., has more than two years of experience in the field of archaeology, including Native American coordination, pedestrian surveys, artifact analysis, and laboratory analysis. Ms. Thomas has worked closely with Native American monitors to perform quality assurance checks, as well as prepare human remains for repatriation.

Ms. Thomas has participated in many projects, including Phase I archaeological survey of Rapa Nui (Easter Island), data documentation, quality assurance checks, curation, repatriation of Native American remains, and artifact photography of the Playa Vista site, Los Angeles, and repatriation preparation, quality assurance checks, and special studies research and preparation of the Bolsa Bay site, Huntington Beach, California. Currently, Ms. Thomas is preparing site documentation and participating in a Phase I survey for two wind energy projects being developed in Kern County.

As a graduate student, Ms. Thomas spent three field seasons (five to six weeks each) working on Rapa Nui (Easter Island) to help teach the Rapa Nui Archaeological Field School. Her duties included, but were not limited to, project planning and coordination, and instruction on pedestrian survey, mapping, artifact/feature documentation, and small-scale excavation. During the second field season, Ms. Thomas began research and collection of materials necessary to complete her Master's thesis. For this project, Ms. Thomas used time of flight- laser ablation-inductively coupled-plasma mass spectrometry to elementally source obsidian artifacts to their origins on the island.

Ms. Thomas's professional experience includes a working knowledge of Native American Graves Protection and Repatriation Act (NAGPRA) procedures, applications, and compliance. She is also familiar with remote-sensing techniques and instrumentation, such as ground-penetrating radar, magnetometry, resistivity, and conductivity. Most recently, she was in charge of planning and tracking all the special studies analyses: obsidian sourcing, C14 dating, pollen and protein residue analysis, and so on.

Karl R. Huebchen, MA

Master of Arts, Anthropology, University of Cincinnati, Ohio

Bachelor of Arts, Anthropology University of Cincinnati, Ohio

Senior Cultural Resources Coordinator

- *Phase I, II, and III archaeological field projects*
- *Archaeological monitoring and compliance*
- *Implementation of study design consistent with project objectives*
- *Research design*
- *Excavation*
- *Data recording and interpretation*
- *Ethnographic research*
- *Preparation of CEQA/NEPA documents*
- *Native American and agency coordination*

Years of Experience: 19

Relevant California Experience:

- *Avalon I Wind Energy Project, Phase I Archaeological Survey, Kern County, California (in progress)*
- *Pacific Wind Energy Project, Technical Report*
- *Phase II and Phase III Archaeological Investigations in Support of the Vasquez Rocks Natural Area Park Interpretive Center, County of Los Angeles, California (in progress)*

Mr. Karl Huebchen, senior cultural resources coordinator for Sapphos Environmental, Inc., has more than 19 years of professional experience as an archaeologist. He is a Registered Professional Archaeologist (RPA). His qualifications meet and exceed the Secretary of the Interior's Professional Qualification Standards in Archaeology.

Mr. Huebchen has worked in more than 20 states on a variety of archaeological survey, testing, and data recovery projects. With a broad knowledge of prehistoric material culture, he has authored or coauthored numerous cultural resources management reports for compliance with both state and federal historic preservation laws. He has demonstrated experience in environmental documentation, particularly in developing archaeological resources sections for NEPA documents, technical reports, and mitigation recommendations to reduce impacts to archaeological resources.

As a project manager, Mr. Huebchen has conducted background research, led field investigations, mobilized field crews, coordinated with subcontractors and agencies, and drafted consultation letters. He has led numerous archaeological field crews and has been responsible for shovel test and test unit excavation/documentation, site location, mapping, and photography. He has contributed to archaeological investigations located along U.S. 93, Mohave County, Arizona, to examine the information potential associated with the Historic State Highway System, as well as the McCarthy Road Maintenance Project in Alaska; the Upper Basin Archaeological Research Project (UBARP); Kaibab National Forest, Arizona; and the Fort Ancient State Memorial in Warren County, Ohio.

A specialist in prehistoric ceramics, Mr. Huebchen has prepared a variety of cultural materials and documentation for curation, including ceramics, lithics, bone, and historic artifacts. His interests include dynamics and systematics related to the late prehistoric cultures of the Midwest and the contact period between Native Americans and early Spanish explorers in the Southeast. He has extensive experience in archival research, geographic information system applications, artifact analysis, and statistical analysis.

Mr. Huebchen is a member of the Society for Historic Archaeology, the Society for American Archaeology, the Southeastern Archaeological Conference, the National Trust for Historic Preservation, and the Midwest Archaeological Conference.

SECTION ES
EXECUTIVE SUMMARY

This Noise Impact Technical Report has been prepared in support of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project). This technical report addresses the potential for the proposed project to result in noise-related impacts on the 38-acre proposed project site located in the unincorporated area of the Willowbrook community within the County of Los Angeles, California, as well as sensitive receptors located in the surrounding area.

This report was prepared to address the noise issues identified in the Initial Study (IS) that require further analysis to identify the significance levels of potential impacts from the proposed project pursuant to the California Environmental Quality Act (CEQA). The goal of the proposed project is to implement new campus improvements to reopen a fully functional medical campus that meets community needs for quality health care. Construction of the proposed project would entail a Tier I and Tier II development program. Tier I involves project-level development of the new Multi-Service Ambulatory Care Center (MACC) and the Ancillary Building, tenant improvements in existing buildings, site improvements, and the potential relocation of the Magnetic Resonance Imaging (MRI) Building. Tier II of the proposed project would entail the development of a campus-wide Master Plan. Tier II would have the potential to build out approximately 1,814,696 square feet of development on the proposed project site with mixed uses including medical office, general offices, commercial, retail, recreation, and other development in support of the campus. In addition, up to 100 residential units would be developed at a density consistent with surrounding residential area development densities.

The key findings of this Noise Impact Technical Report are as follows:

- Construction activities related to the proposed project have the potential to result in significant impacts related to noise and vibration.
- Operational activities related to the proposed project have the potential to result in significant impacts related to noise.
- Four mitigation measures are recommended to reduce the anticipated noise impacts associated with the proposed project:
    - Implementation of mitigation measures Noise-1 and Noise-2 would reduce construction noise at residential properties; however, noise impacts from construction, while temporary, would remain significant and unavoidable at residences to the south of the proposed project boundary.
    - Implementation of mitigation measure Noise-3 would reduce significant impacts related to vibration during construction to below the level of significance.
    - Implementation of mitigation measure Noise-4 would reduce significant impacts related to mechanical noise to below the level of significance.
- Noise generated by construction of the proposed project, while temporary, would remain significant and unavoidable.

1.1 PURPOSE AND SCOPE

The Noise Technical Impact Report was undertaken by Sapphos Environmental, Inc. for the County of Los Angeles (County) in support of the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (proposed project). The purpose of this study is to evaluate potential noise impacts associated with the proposed project, to propose mitigation measures for any significant noise impacts caused by implementation of the proposed project, and to document the findings of significance and non-significance of potential impacts. The Noise Technical Impact Report focuses on all phases (i.e., construction, operation, and maintenance) of the proposed project, as well as on the potential cumulative impacts of the proposed project.

1.2 PROPOSED PROJECT LOCATION

The proposed project site is located on the existing 38-acre Martin Luther King, Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles, California (Figure 1.2-1, *Project Location Map*).

The proposed project site is located approximately 3 miles north of State Route 91 (SR-91; Artesia Freeway), approximately 3 miles northeast of Interstate 710 (I-710; Long Beach Freeway), approximately 2 miles east of Interstate 110 (I-110; Harbor Freeway), less than 1 mile south of East Imperial Highway, and less than 1 mile south of Interstate 105 (I-105; Glen Anderson Freeway) (Figure 1.2-2, *Regional Vicinity Map*). The proposed project site can be accessed from East 120th Street or from Wilmington Avenue.

The proposed project site is bounded on the north by East 120th Street, on the east by Wilmington Avenue, on the south by East 122nd Street, and on the west by Compton Avenue of Los Angeles (Figure 1.2-1). The proposed project site is less than 1 mile north of the City of Compton and less than 1 mile west of the City of Lynwood (Figure 1.2-3, *Local Vicinity Map*). The proposed project site is also less than 1 mile south of the City of Los Angeles.

The proposed project site appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate topographic quadrangle (Figure 1.2-4, *Topographic Map with USGS 7.5-Minute Quadrangle Index*).[1] Elevations at the proposed project site range from 86 feet above mean sea level (MSL) to 88 feet above MSL. The topography of the site can be generally characterized as flat.

1.3 PROPOSED PROJECT COMPONENTS

The proposed project entails two tiers. Tier I would involve development of a new Multi-Service Ambulatory Care Center (MACC) and the Ancillary Building. Tier I would also include tenant improvements to the following existing buildings: North Support Building, South Support Building, and the Plant Management Building; site improvements; and potential relocation of the Magnetic Resonance Imaging (MRI) Building.

Tier II of the proposed project would entail the reuse or replacement of the existing MACC Building (which will be vacant following construction of the new MACC Building in Tier I) and reuse or replacement of the Emergency Room, Storage Building, and Cooling Towers.[2] Tier II construction would entail additional master-planned mixed-use development, which might potentially include medical offices, general offices, commercial and retail space, residential units, recreational areas, and other development that is appurtenant to and compatible with the primary land use in support of the campus.

1.3.1 Tier I: Project Development

Tier I of the proposed project would entail the development of two new buildings: the new MACC and the Ancillary Building, as well as tenant improvements in existing buildings, site improvements, and potential relocation of the MRI Building. A project-level Environmental Impact Report (EIR) analysis will be provided for Tier I.

Multi-Service Ambulatory Care Center Building

The proposed MACC Building would be a four-story building consisting of approximately 132,000 square feet of floor area. This building would house the walk-in clinic, outpatient imaging, outpatient surgery, and various other outpatient clinics currently operating in the existing MACC. The proposed building would most likely be of structural steel construction. The gravity system of the building would consist of lightweight fill over metal decking supported by steel beams and columns. Similar to the proposed Ancillary Building, the lateral-force–resisting system of the MACC Building can be any one of the following: moment frames, braced frames, or a combination of the two. The lateral-force–resisting system, whether moment frames or braced frames, would be located along the perimeter of the building, which would accommodate maximum flexibility for planning and space layout. The foundation for the new building would likely be a cast-in-place drilled pile foundation system.

Ancillary Building

The proposed Ancillary Building would be a two-story structure consisting of approximately 24,700 square feet of floor area. This building would house the campus kitchen and cafeteria and administrative offices. The building would be constructed to the east of the new MACC. A new pedestrian foot bridge would be provided at the east end of the building for connection to the existing Inpatient Tower for the transportation of materials and supplies. The bridge would most likely be constructed of steel with a seismic joint at the Inpatient Tower.

The new building would most likely be structural steel construction. The gravity system of the building would consist of lightweight fill over metal decking supported by steel beams and columns. The lateral-force–resisting system for the building can be any one of the following: moment frames, braced frames, or a combination of the two. It is anticipated that the lateral-force–resisting system, whether moment frames or braced frames, would be located along the perimeter of the building, which would accommodate maximum flexibility for planning and space layout. The foundation for the new building would likely be a cast-in-place drilled pile foundation system.

---

[2] Although the functions of these buildings would be substituted.

Tenant Improvements

The tenant improvements would be performed in the North Support Building to provide space for the MACC administrative departments. The South Support Building would be reorganized to serve as the main warehouse for the MACC. The South Support Building may also serve as a central distribution center for other Los Angeles County health-care facilities in the area. Other tenant improvements would be performed in the Interns and Physicians and Plant Management Buildings for support functions to the MACC.

Site Improvements

The site work would consist of a new parking terrace, relocated entrance to the facility, new parking lots, re-striping of existing lots, and new landscaping at the entry of the new MACC and its surrounding area. A space for an emergency generator and a service yard with technical dock positions that connect mobile radiology equipment would also be provided.

1.3.2 Tier II: Master Plan Development

Tier II of the proposed project would entail the development of a campus-wide master plan. It is anticipated that the development described in the master plan would prepare the proposed project site for future mixed-use campus support development that would provide the health services necessary to respond to and address the needs of the community. Tier II would potentially build out approximately 1,814,696 square feet of development on the proposed project site with mixed uses including medical office, commercial, retail, office space, recreation, and other development in support of the campus. In addition, up to 100 residential units, to be developed at a multi-family density consistent with surrounding residential area multi-family development densities, are proposed in Tier II. Although the buildings would be vacated as part of Tier I, Tier II would entail the reuse or replacement of the existing MACC building, Emergency Room, Storage Building, and Cooling Towers. The Tier II components are conceptual at this time, and will therefore only be discussed on a programmatic level in the EIR, as permitted under CEQA. Once the detailed future development plans for Tier II components are prepared, consistent with the guidelines for programmatic EIRs under CEQA, the projects will be examined in light of the programmatic EIR analysis to determine whether an additional environmental document must be prepared.

1.4 CONSTRUCTION SCENARIO

1.4.1 Tier I Construction Scenario

Tier I of the proposed project would require approximately 37 months to complete, including the construction of the new MACC and Ancillary Buildings, tenant improvements, site improvements, and potential relocation of the MRI Building (November 2010 to December 2013). Construction at the proposed project site is anticipated to be in accordance with all federal, state, regional, and County regulations, including the National Pollution Discharge Elimination System[3] and the County General Plan.[4]

---

[3] U.S. Environmental Protection Agency. 2009. *National Pollution Discharge Elimination System*. Available at: http://cfpub.epa.gov/npdes/

[4] County of Los Angeles Department of Regional Planning. 1980. *County of Los Angeles General Plan*. Available at: http://planning.lacounty.gov/generalplan#gp-existing

It is anticipated that Tier I construction for the proposed project may require the type of equipment listed below (Table 1.4.1-1, *Anticipated Construction Equipment*).

TABLE 1.4.1-1
ANTICIPATED CONSTRUCTION EQUIPMENT

Approximate Quantity	Type of Equipment or Vehicle	Approximate Duration of On-site Construction Activity (in months)
2	Man lift	3
4	Pickup truck	8
2	Hand compactor	5
2	Crane	3
1	Concrete mixer	4
1	Backhoe	3
40–60	Crew members	8
50	Crew vehicles (maximum)	8
1	Pile Driver	6
1	Large Bulldozer	3
2	Dozer	3
1	Front-end loader	1
1	Water truck	2
1	Grader	1
5	Dump truck	6
16	Concrete mix truck	9
1	Roller	1
3	Fork lift / grade all	3

Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes. Daily construction activities would be subject to County noise regulations. All construction-related activities would be scheduled in compliance with the County Noise Ordinance, which prohibits construction activities and operation of construction equipment between the hours of 8:00 p.m. and 7:00 a.m., Monday through Friday, or at any time on Sunday or holidays. Work conducted on Saturdays would commence at 7:00 a.m. and cease no later than 5:00 p.m. Noise levels exceeding 65 dBA (decibels, A-weighted sound levels) for single-family residences and 70 dBA for multi-family residences during construction hours are prohibited.

The construction contractor would ensure that source-reduction techniques and development of recycling programs for construction and operation of the proposed project are considered and implemented whenever possible.[5] In addition, employee vehicles, construction equipment and vehicles, and storage and materials used at the proposed project site would be located in a designated staging area to minimize impacts to the site, pedestrians, and medical center employee or visitor traffic.

It is anticipated that there would be grading activities associated with the development of Tier I of the proposed project. It is anticipated that the export/import of material and deep-soil excavation would be undertaken during construction of the proposed project. It is further anticipated that excavation may exceed 20 feet, but would not be expected to be greater than 60 feet deep. It is

---

[5] *Los Angeles County Code*, Title 12, "Environmental Protection," Chapter 20.87.08.060, "Approval of Recycling and Reuse Plan." Available at: http://ordlink.com/codes/lacounty/index.htm

anticipated that a geotechnical engineer would be available for observation and testing of the earthwork-related tasks to ensure proper subgrade preparation, selection of satisfactory materials, and placement and compaction of structural fills. Any unanticipated adverse conditions encountered would be evaluated by the proposed project engineering geologist and the soil engineer.[6] The existing access roads to the proposed project site and the streets surrounding the proposed project site will be used to transport import/export and other construction-related materials to and from the proposed project site.

The construction contractor would be required to incorporate best management practices (BMPs) consistent with the guidelines provided in the *California Storm Water Best Management Practice Handbooks: Construction*.[7] Should the construction period continue into the rainy season, supplemental erosion measures would need to be implemented, including, but not limited to, the following:

- Mulching
- Geotextiles and mats
- Earth dikes
- Temporary drains and gullies
- Silt fence
- Straw-bale barriers
- Sandbag barrier
- Brush or rock filter
- Sediment trap

The anticipated construction period would begin in November 2010 and conclude in December 2013. BMPs to control surface runoff and soil erosion would be required for construction occurring during rainy periods.

Construction equipment would be turned off when not in use. The construction contractor would ensure that all construction and grading equipment is properly maintained. All vehicles and compressors would use exhaust mufflers and engine enclosure covers (as designed by the manufacturer) at all times. It is currently anticipated that an average of 150 construction workers would be on site at any given time during the construction of the proposed project.

Construction-related ingress and egress to the proposed project site would occur primarily off East 120th Street to the north or Wilmington Avenue to the east.

1.4.2 Tier II Construction Scenario

Tier II of the proposed project consists of a campus-wide Master Plan and up to 1,814,696 square feet of development on the proposed project site. The potential construction scenario for Tier II may be a multi-phase process to be completed concurrently with construction of Tier I. The longest scenario is to develop Tier II within a 10-year timeframe, between 2010 and 2020. This analysis approach of the construction scenario has been developed based on an aggressive scenario (which allows the proposed project site to be developed to the maximum extent possible) to allow the

---

[6] URS. 14 May 2009. *Geotechnical Investigation*. Los Angeles, CA.

[7] California Stormwater Quality Association. 2003. *California Stormwater Best Management Practice Handbooks: Construction*. Menlo Park, CA. Available at: http://www.cabmphandbooks.com/Documents/Construction/Section_3.pdf

consideration of a reasonable worst-case scenario if the County chooses to develop up to 1,814,696 square feet.

The type and quantity of equipment that would potentially be used in construction of Tier II would vary for each component of the tier. However, for the purposes of this analysis, it is anticipated that development of Tier II would require up to eight phases using equipment comparable to the equipment described in Table 1.4.1-1 for each phase. Site preparation and construction of the proposed project would be in accordance with all federal, state, and County building codes.

Any construction equipment used during the development of Tier II would be turned off when not in use. The construction contractor would ensure that all construction and grading equipment is properly maintained. All vehicles and compressors would use exhaust mufflers and engine enclosure covers (as designed by the manufacturer) at all times. It is currently anticipated that up to 150 construction workers would be on site at any given time during the construction of the proposed project.

Construction-related ingress and egress to the proposed project site would occur primarily off East 120th Street to the north or Wilmington Avenue to the east.

SECTION 2.0
NOISE ANALYSIS

The noise analysis in this section evaluates the potential noise impacts associated with the construction, operation, and maintenance activities of the proposed project. A relevant regulatory framework is used to determine the consistency of the proposed project with state and local laws governing the regulations of noise and the level of significance of noise impacts of the proposed project. Mitigation measures are subsequently provided for noise impacts identified to be potentially significant. The information used in this analysis is based on a review of relevant literature and technical reports (see Section 4.0, References, for a list of reference materials consulted).

2.1 NOISE TERMINOLOGY

The following is a brief discussion of noise terminology used in this assessment.

- *Sound:* A vibratory disturbance created by a vibrating objects, which, when transmitted by pressure waves through a medium such as air, is capable of being detected by a receiving mechanism, such as the human ear or a microphone.

- *Noise:* Sound that is loud, unpleasant, unexpected, or otherwise undesirable.

- *Decibel (dB):* A unit-less measure of sound on a logarithmic scale, which indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micropascals.

- *A-weighted Decibel (dBA)*: Overall frequency-weighted sound level in decibels that approximates the frequency response of the human ear.

- *Equivalent Sound Level (L_{eq})*: The equivalent steady-state sound or vibration level, which in a stated period of time would contain the same acoustical or vibration energy.

- *Ambient:* The total of all noise in the environment other than the noise from the source of interest. This term is used interchangeably with *background noise*.

- *Frequency:* The number of times per second that the sine wave of sound repeats itself, or that the sine wave of a vibrating object repeats itself. Expressed in hertz (Hz).

- *Vibration*: Vibration is the mechanical motion of earth or ground, building, or other type of structure, induced by the operation of any mechanical device or equipment located upon or affixed thereto. For purposes of this report, the calculated magnitude of vibration is expressed in terms of the peak particle velocity (PPV) in the unit of inches per second. PPV is the maximum velocity experienced during a vibration event.

2.2 NOISE AND VIBRATION CHARACTERISTICS AND METHODS OF MEASUREMENT

2.2.1 Noise

Noise is defined as unwanted sound. The human response to environmental noise is subjective and varies considerably from individual to individual. Sensitive receptors, such as residential areas, convalescent homes, schools, auditoriums, and other similar land uses, may be affected to a greater degree by increased noise levels than industrial, manufacturing, or commercial facilities are affected. The effects of noise can range from interference with sleep, concentration, and communication, to the causation of physiological and psychological stress, and at the highest intensity levels, hearing loss.[8]

The method commonly used to quantify environmental noise involves evaluation of all frequencies of sound, adjusted to reflect the constraints of human hearing. Since the human ear is less sensitive to low and high frequencies than to midrange frequencies, noise measurements are weighted more heavily within those frequencies of maximum human sensitivity in a process called "A-weighting." A measured noise level is called the A-weighted sound level measured in A-weighted decibels, written as dBA. In practice, environmental noise is measured using a sound-level meter that includes an electronic filter corresponding to the A-weighted frequency spectrum (Table 2.2.1-1, *Common Noise Levels and Loudness*).

---

TABLE 2.2.1-1
COMMON NOISE LEVELS AND LOUDNESS

Noise Source	A-weighted Sound Level (dBA)	Subjective Loudness
Near jet engine	130	Threshold of pain
	120	
Rock-n-roll band	110	Deafening
Jet flyover at 1,000 feet	100	
Loud auto horn at 10 feet Power mower	90	
Motorcycle at 25 feet Food blender	80	Very loud
Garbage disposal	70	
Living room music Human voice at 3 feet	60	Loud
	50	
Residential air conditioner at 50 feet	40	Moderate
Bird calls	30	
Quiet living room	20	
Average whisper	10	Faint
Rustling leaves	0	Very faint Threshold of human audibility

SOURCE: Cowan, James P. 1993. *Handbook of Environmental Acoustics*. Hoboken, NJ: John Wiley and Sons.

There are several statistical tools used to evaluate and compare noise level measurements. To account for the fluctuation in noise levels over time, noise impacts are commonly evaluated using time-averaged noise levels. L_{eq} are used to represent the noise level experienced over a stated period of time averaged as a single noise level. Because community receptors are more sensitive to unwanted noise intrusion during the evening and at night, an artificial decibel increment is added to quiet-time noise levels to create a 24-hour noise descriptor, or a 24-hour L_{eq}, which is the community noise equivalent level (CNEL).[9] The day-night level (L_{dn}) standard also adds an artificial decibel increment to the sound level during nighttime hours, but does not adjust the sound level during evening hours.

Another measure used to characterize noise exposure is the variation in sound levels over time, measured by percentage exceedance level. L10 is the A-weighted sound level that is exceeded 10 percent of the measurement period, and L90 is the level exceeded 90 percent of the measurement period. L50 is the median sound level. Additional statistical measures include L_{min} and L_{max}, the minimum and maximum sound levels, respectively, measured during a stated measurement period.

These descriptions of noise are based on the sound level at the point of measurement. When determining potential impacts to the environment, the noise level at the receptor is considered. Noise is attenuated as it propagates from the source to the receptor. Attenuation is the reduction in the level of sound resulting from the absorption by the topography of an area (i.e., paved or vegetated surface), atmosphere, distance, barriers, and other factors. Attenuation is also logarithmic rather than linear, so that for stationary sources like the proposed project, noise levels decrease approximately 6 dBA for every doubling of distance. For linear sources, such as streets, noise levels decrease by between 3 and 5 dBA for every doubling of distance.

To estimate a receptor's subjective reaction to a new noise is to compare the new noise with the existing noise environment, the "ambient" noise level, to which the receptor has become adapted. An increase of 1 dBA over the ambient noise level cannot be perceived unless it occurs in carefully controlled laboratory experiments; a 3-dBA increase is considered as a just-perceivable difference; an increase of at least 5 dBA is a noticeable change, thereby causing community response and often being considered a significant impact; and a 10-dBA increase is subjectively heard as approximately a doubling in loudness, thereby almost always causing an adverse community response.

The assessment of the noise impact depends on the environment, the nature and level of noise-generating activities, the pathway through which the noise travels, the sensitivity of the receptor, the period of exposure, and the exceedance of the noise level over the ambient level.

2.2.2 Vibration

Vibration is an oscillatory motion in terms of displacement, velocity, or acceleration. It refers to the minimum ground- or structure-borne motion that causes a normal person to be aware of the vibration by means such as, but not limited to, sensation by touch or visual observation of moving objects. The effects of groundborne vibration include fellable movements of building floors, rattling of windows, and shaking of items on shelves or hangings on the walls. In extreme cases, vibration can cause damage to buildings. The noise radiated from the motion of room surfaces is called groundborne noise (Table 2.2.2-1, *Typical Levels of Groundborne Vibration*). The vibration motion

---

[9] City of Los Angeles. 2006 *L.A. CEQA Thresholds Guide*. "I. Noise." Available at: http://www.lacity.org/ead/eadweb-aqd/Thresholds/I-Noise.pdf

normally does not provoke the same adverse human reactions as noise unless there is an effect associated with the shaking of a building. In addition, vibration noise can only occur inside buildings. Similar to the propagation of noise, vibration propagated from the source to the receptor depends on the receiving building (i.e., the weight of the building), soil conditions, layering of the soils, the depth of groundwater table, and so on.

TABLE 2.2.2-1
TYPICAL LEVELS OF GROUNDBORNE VIBRATION

Response	Velocity Level [a]	Typical Sources (at 50 feet)
Minor cosmetic damage of fragile buildings	100	Blasting from construction projects
Difficulty with tasks such as reading a video display terminal (VDT) screen	90	Bulldozers and other heavy tracked construction equipment
Residential annoyance, infrequent events	80	Rapid transit, upper range
Residential annoyance, frequent events	70	High speed rail, typical
Approximate threshold for human perception	60	Bus or truck, typical
	50	Typical background vibration

NOTE:
a. Root mean square (RMS) vibration velocity level in VdB relative to 10^{-6} inches/second

2.3 REGULATORY FRAMEWORK

2.3.1 State

In the State of California, Senate Bill 860 (the Noise Element Guidelines), which became effective January 1, 1976, directed the California Office of Noise Control within the State Department of Health Services to prepare Guidelines for the Preparation and Content of Noise Elements of the General Plan.[10] These guidelines provide information concerning the noise environment in the community that should be considered in the land use planning process. As part of this publication, Land Use Compatibility Standards were developed in four categories: Normally Acceptable, Conditionally Acceptable, Normally Unacceptable, and Clearly Unacceptable. These categories were based on earlier work completed by the Department of Housing and Urban Development. The interpretation of the four categories is as follows:

---

[10] California Department of Health Services, Office of Noise Control. February 1976. *Guidelines for the Preparation and Content of Noise Elements of the General Plan*. Sacramento, CA.

Normally Acceptable: Specified land use is satisfactory without special insulation.

Conditionally Acceptable: New development requires detailed analysis of noise insulation requirements.

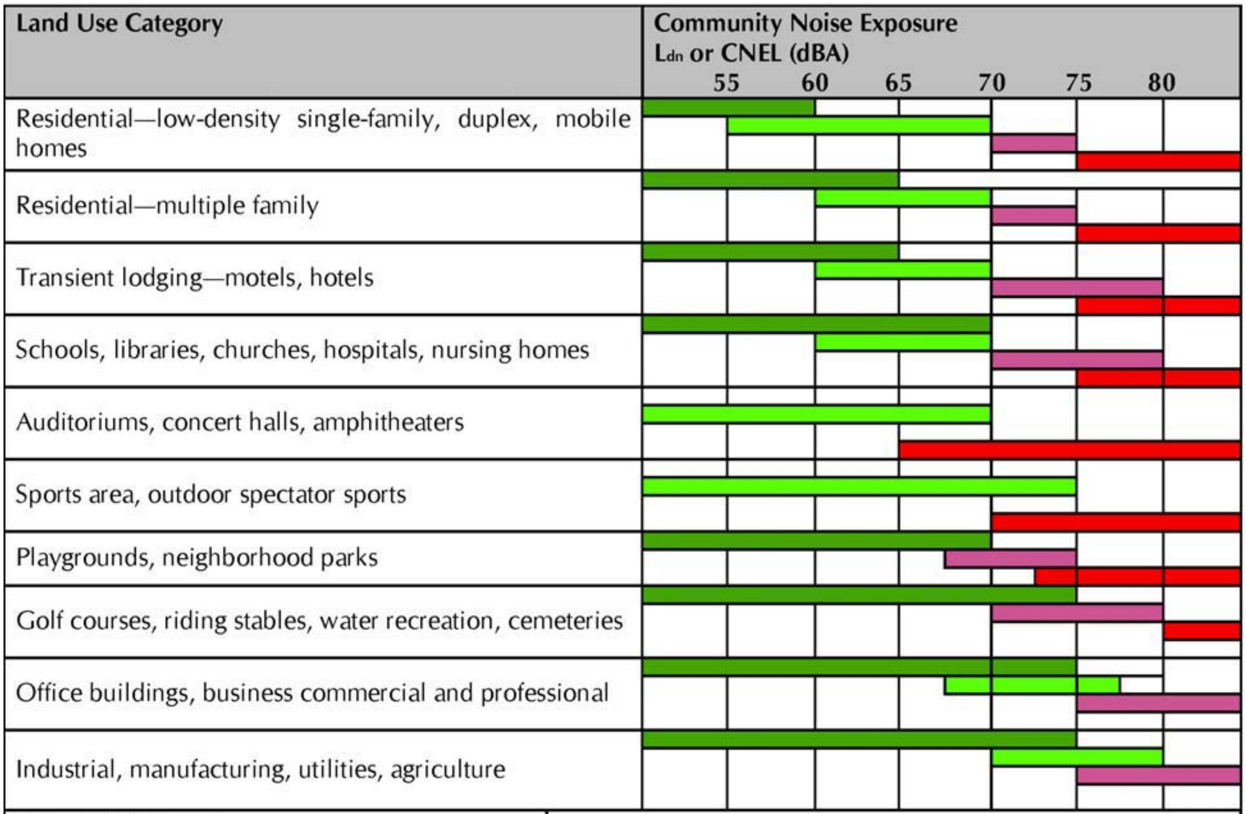
Normally Unacceptable: New development is discouraged and requires a detailed analysis of insulation features.

Clearly Unacceptable: New development should not be undertaken.

The Land Use Compatibility Matrix for Community Noise Environments, as established by the State of California, defines and assigns CNEL values to four categories of acceptance.

The State Uniform Building Code (Title 24, Part 2, California Code of Regulations) establishes uniform minimum noise insulation performance standards to protect persons within new hotels, motels, dormitories, long-term care facilities, apartment houses, and residential units other than detached single-family residences, from the effects of excessive noise, including, but not limited to, hearing loss or impairment and interference with verbal communication and sleep. Residential structures to be located where the CNEL or L_{dn} is 60 dBA or greater are required to provide sound insulation to limit the interior CNEL to a maximum of 45 dBA. An acoustical analysis report, prepared by a person experienced in the field of acoustical engineering, is required for the issuance of a building permit for these structures. Conversely, land use changes that result in increased noise levels of 60 dBA or greater at residences must be considered in the evaluation of impacts on ambient noise levels. Table 2.3.1-1, *Land Use Compatibility for Community Noise Environments*, depicts noise levels for a variety of uses.

TABLE 2.3.1-1
LAND USE COMPATIBILITY FOR COMMUNITY NOISE ENVIRONMENTS



INTERPRETATION:

🟩 **Normally acceptable** Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.	🟪 **Normally unacceptable** New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
🟩 **Conditionally acceptable** New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design. Conventional construction with closed windows and fresh air supply systems or air conditioning will normally suffice.	🟥 **Clearly unacceptable** New construction of development should not be undertaken.

NOTES:

L_{dn} = Day-Night Level

CNEL = Community Noise Equivalent Level

dBA = decibels in A-weighted sound levels

California Department of Health Services, Office of Noise Control. February 1976. *Guidelines for the Preparation and Content of Noise Elements of the General Plan*. Sacramento, CA.

2.3.2 Regional

County of Los Angeles

The County Noise Control Ordinance provides for designation of noise-sensitive zones but does not define specific land uses for these zones.[11] Instead, Section 12.08.260 of the ordinance defines a "noise-sensitive zone" as any area designated, pursuant to Part 4 of the chapter, for the purpose of ensuring a state of exceptional quiet. Section 12.08.470 of the ordinance refers to the use of these zones at individual institutions or facilities that have been designated by the local health officer. These zones must be indicated by the display of conspicuous signs in at least three separate locations within 164 meters (0.1 mile) of the institution or facility.

Operational Noise

The County does not set land use standards for noise in the Noise element of the General Plan. However, the County has adopted the Noise Control Ordinance, which specifies exterior noise standards (Table 2.3.2-1, *County of Los Angeles Exterior Noise Standards*).[12] The exterior noise levels presented in the final column of Table 2.3.2-1 indicate the average hourly dBA to be maintained for each designated noise zone land use.

TABLE 2.3.2-1
COUNTY OF LOS ANGELES EXTERIOR NOISE STANDARDS

Noise Zone	Designated Noise Zone Land Use (Receptor Property)	Time Interval	Exterior Noise Level[1]
I	Noise-sensitive Area[2]	Anytime	45 dBA
II	Residential Area	10:00 p.m. – 7:00 a.m. (Nighttime)	45 dBA
		7:00 a.m. – 10:00 p.m. (Daytime)	50 dBA
III	Commercial Area	10:00 p.m. – 7:00 a.m. (Nighttime)	55 dBA
		7:00 a.m. – 10:00 p.m. (Daytime)	60 dBA
IV	Industrial Area	Anytime	70 dBA

NOTES:
1. Required average hourly noise standard.
2. Noise-sensitive area is designated to ensure exceptional quiet.

SOURCE: County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101). Available at: http://ordlink.com/codes/lacounty/index.htm

---

[11] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101). Available at: http://ordlink.com/codes/lacounty/index.htm

[12] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101). Available at: http://ordlink.com/codes/lacounty/index.htm

The County Noise Control Ordinance includes five standards for governing exterior noise levels:

> **Standard No. 1** shall be the exterior noise level that may not be exceeded for a cumulative period of more than 30 minutes in any hour. Standard No. 1 shall be the applicable noise level stated above, or if the ambient L_{50} exceeds the foregoing level, then the ambient L_{50} becomes the exterior noise level for Standard No. 1.
>
> **Standard No. 2** shall be the exterior noise level that may not be exceeded for a cumulative period of more than 15 minutes in any hour. Standard No. 2 shall be the applicable noise level stated above, plus 5 dB, or if the ambient L_{25} exceeds the foregoing level, then the ambient L_{25} becomes the exterior noise level for Standard No. 2.
>
> **Standard No. 3** shall be the exterior noise level that may not be exceeded for a cumulative period of more than 5 minutes in any hour. Standard No. 3 shall be the applicable noise level stated above, plus 20 dB, or if the ambient $L_{8.3}$ exceeds the foregoing level, then the ambient $L_{8.3}$ becomes the exterior noise level for Standard No. 3.
>
> **Standard No. 4** shall be the exterior noise level that may not be exceeded for a cumulative period of more than 1 minute in any hour. Standard No. 4 shall be the applicable noise level stated above, plus 15 dB, or if the ambient $L_{1.7}$ exceeds the foregoing level, then the ambient $L_{1.7}$ becomes the exterior noise level for Standard No. 4.
>
> **Standard No. 5** shall be the exterior noise level that may not be exceeded for any period of time. Standard No. 5 shall be the applicable noise level stated above, plus 20 dB, or if the ambient L_0 exceeds the foregoing level, then the ambient L_0 becomes the exterior noise level for Standard No. 5.

Construction Noise

The County Noise Control Ordinance also includes the following construction noise restrictions:

- Operating or causing the operation of any tools or equipment used in construction, drilling, repair, alteration, or demolition work is prohibited between the weekday hours of 7:00 p.m. and 7:00 a.m., or at any time on Sundays or holidays, such that the sound creates a noise disturbance across a residential or commercial property line, except for emergency work of public service utilities or by a variance issued by the health officer.[13]

- The contractor shall conduct construction activities in such a manner that the maximum noise levels for non-scheduled, intermittent, short-term operation of mobile equipment and that for repetitively scheduled and relatively long-term operation of stationary equipment at affected structures will not exceed those listed in Table 2.3.2-2, *Maximum Construction Noise Levels*, at any time.

---

[13] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101). Available at: http://ordlink.com/codes/lacounty/index.htm

- All mobile or stationary equipment or machinery powered by internal combustion engines will be equipped with suitable exhaust and air-intake silencers in proper working order.

- In case of a conflict between this noise ordinance and any other ordinance regulating construction activities, provisions of any specific ordinance regulating construction activities will take precedence.

TABLE 2.3.2-2
MAXIMUM CONSTRUCTION NOISE LEVELS

Noise Source / Time Frame	**Residential Structures**		
	Single-family Residential	**Multi-family Residential**	**Semi-residential / Commercial**
Mobile Equipment: Maximum noise levels for nonscheduled, intermittent, short-term operation (less than 10 days) of mobile equipment			
Daily – 7:00 a.m. to 8:00 p.m. (except Sundays and legal holidays)	75 dBA	80 dBA	85 dBA
Daily – 8:00 p.m. to 7:00 a.m., Sundays and legal holidays	60 dBA	64 dBA	70 dBA
Stationary Equipment: Maximum noise level for repetitively scheduled and relatively long-term operation (more than 10 days) of stationary equipment			
Daily – 7:00 a.m. to 8:00 p.m. (except Sundays and legal holidays)	60 dBA	65 dBA	70 dBA
Daily – 8:00 p.m. to 7:00 a.m., Sundays and legal holidays	50 dBA	55 dBA	60 dBA
Noise Source / Time Frame	**Business Structures**		
Mobile Equipment: Maximum noise levels for nonscheduled, intermittent, short-term operation (less than 10 days) of mobile equipment			
Daily – all hours (including Sundays and legal holidays)	85 dBA		

SOURCE: County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101).

However, the County Noise Control Ordinance includes a list of activities that are exempt, including the following:

- The emission of sound for the purpose of alerting persons to the existence of an emergency, or the emission of sound in the performance of emergency work.

- The use of warning devices necessary for the protection of public safety, such as police, fire, and ambulance sirens, and train horns.[14]

---

[14] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101). Available at: http://ordlink.com/codes/lacounty/index.htm

Vibration

The threshold of vibration set forth by the County is presumed to be a motion velocity of 0.01 inches per second over the range of 1 to 100 Hertz.[15]

2.3.3 Summary of Project Noise Requirements

Based on the existing regulatory framework at both the County and City levels, the proposed project is required to comply with permitted noise level limits (Table 2.3.4-1, *Summary of Noise Requirements for the Proposed Project*).

TABLE 2.3.3-1
SUMMARY OF NOISE REQUIREMENTS FOR THE PROPOSED PROJECT

Activity	Maximum Permitted Noise Level
Construction[1]	County requirements • Single-family residential area: 75 dBA • Multi-family residential area: 80 dBA • Commercial area: 85 dBA
Operation[2]	Daytime (7:00 a.m. to 10:00 p.m.) County requirements • Residential area: 50 dBA • Commercial area: 60 dBA Nighttime (10:00 p.m. to 7:00 a.m.) County requirements • Residential area: 45 dBA • Commercial area: 55 dBA
Vibration	County requirements • 0.01 inch per second over the range of 1 to 100 Hertz

NOTES:
1. Construction is assumed to occur between the hours of 7:00 a.m. and 7:00 p.m. from Monday through Saturday.
2. The proposed project is assumed to be in operation 24 hours a day.

2.4 EXISTING CONDITIONS

2.4.1 Noise

The existing noise environment in the vicinity of the proposed project site is typical of urban areas and is characterized by noise levels generated by vehicular traffic on nearby streets and highways, occasional aircraft flyway, dogs barking, and lawn mowers.

To analyze the significance of noise and vibration levels associated with the proposed project's construction and operation, the existing noise levels (the ambient noise level at the proposed project site) were measured. Ambient noise levels were measured on April 6, 2010, during a typical weekday at sensitive receptors to the north, east, south, and west of the proposed project

---

[15] County of Los Angeles. 1978. *Noise Control Ordinance of the County of Los Angeles*. Ord. 11778, Section 2 (Art.1, Section 101), and Ord.11773, Section 2 (Art. 1, Section 101). Available at: http://ordlink.com/codes/lacounty/index.htm

site (Figure 2.4.1-1, *Measured Ambient Noise Levels in the Vicinity of the Proposed Project*). The measured ambient noise levels ranged from 55.2 dBA to 70.2 dBA (Table 2.4.1-1, *Measured Ambient Noise Levels in the Proposed Project Vicinity)*. The measurements are 20-minute L_{eq} noise levels.

TABLE 2.4.1-1
MEASURED AMBIENT NOISE LEVELS IN THE PROPOSED PROJECT VICINITY

Location	Ambient Noise Level
North (119th Street)	66.2 dBA
East (Wilmington Avenue)	69.7 dBA
South (122nd Street)	55.2 dBA
West (Compton Avenue)	70.2 dBA

2.5 IMPACT ANALYSIS

2.5.1 Introduction

Noise sources and noise levels associated with the construction and operation of the proposed project include:

- **Demolition/Construction Noise Levels:** In general, construction activities would be carried out in phases during the two tiers of the proposed project and each phase has its own noise characteristics based on the mix of construction equipment in use. Construction would commence at 7:00 a.m. and cease no later than 7:00 p.m. on weekdays and Saturdays. Construction work would not be conducted outside of these hours or on Sundays and federal holidays.

- **Operation Noise Levels:** The proposed project's operational noise levels fall into three categories:

    - **Building operations:** Noise generated by building operations typically includes noise from mechanical and electrical systems associated with the proposed project.

    - **Hospital activities:** Noise generated by hospital activities would be expected to be consistent with current levels and would typically be minimal beyond the boundaries of the buildings, as most activities will be inside the hospital buildings. Therefore, there would be no impact.

    - **Increased traffic:** Noise generated by increased traffic volume resulting from expansion of the hospital capacity would result in an increase in ambient noise levels at nearby roadways.

2.5.2 Noise Receptors

The noise levels of the proposed project were evaluated at noise receptors in the vicinity of the proposed project site (Figure 2.5.2-1, *Noise Receptors*, and Table 2.5.2-1, *Noise-sensitive Receptor Points in the Vicinity of the Proposed Project*).

SOURCE: SEI, GlobeXplorer

Noise Receptors

- School (Figure 2.5.2-1, Receptor 1): The King/Drew Magnet High School of Medicine and Science (King Drew High School) is located north of the proposed project site, across 119th Street.

- Residential Land Uses (Figure 2.5.2-1, Receptors 2A, 2B, and 2C): Residential areas are located to the east, south, and west of the proposed project site.

TABLE 2.5.2-1
NOISE-SENSITIVE RECEPTOR POINTS IN THE VICINITY OF THE PROPOSED PROJECT

Type of Receptor	Label in Figure 2.5.2-1	Direction	Shortest Distance to the Proposed Project Site
School	1	North (Across 119th Street)	95 feet
Residential	2A	East (across Wilmington Avenue)	100 feet
	2B	South (across 122nd Street)	50 feet
	2C	West (across Compton Avenue)	90 feet

2.5.3 Generation of Noise Levels in Excess of Standards

The impact to noise related to exposure or generation of noise levels in excess of established standards from the proposed project would be expected to remain significant and unavoidable with the incorporation of mitigation measures.

Noise from Construction and Demolition

The proposed project entails two phases, Tier I and Tier II. Tier I would entail construction of two new buildings and site and tenant improvements (site improvements would entail the removal of pavement). Tier II would entail the reuse or replacement of various campus buildings and structures (replacement may include demolition), along with potential new development of a total floor area of up to 1,814,696 square feet (a footprint of up to approximately 725,878 square feet). The proposed project would result in a net reduction in building floor area in Tier I, and a total net new development of approximately 1,462,211 square feet of floor area after completion of Tier I plus Tier II.

Construction noise for the proposed project would occur in discreet phases. Table 2.5.3-1, *Construction Activity Noise Levels at 50 Feet*, presents average noise levels associated with various construction phases where all pertinent equipment is present and operating at a reference distance of 50 feet.

TABLE 2.5.3-1
CONSTRUCTION ACTIVITY NOISE LEVELS AT 50 FEET

Activity	Noise Level at 50 feet (dBA)
Ground clearing	84 ± 6 dBA
Excavations	89 ± 6 dBA
Foundations	78 ± 3 dBA
Erection of structures	85 ± 5 dBA
Finishing (i.e., paving)	89 ± 6 dBA

SOURCE: Bolt, Beranek, and Newman. December 1971. *Noise from Construction Equipment and Operations, Building Equipment, and Home Appliances*. Washington, DC.

The distance at which impacts would be below the level of significance is predicted based on the construction activity noise levels presented in Table 2.5.3-1. Noise attenuates at a rate of approximately 6 dB per doubling of distance from a point source. The noise calculations are based on a formula that considers the ambient noise level and distance to the noise source:

$$L2 = L1 - 20\log(d2/d1)$$

where:

L1 = known sound level at d1
L2 = desired sound level at d2
d1 = distance of known sound level from the noise source
d2 = distance of the sensitive receptor from the noise source

This distance is then compared to the nearest noise receptor distance. This approach is used rather than predicting the noise levels at the nearest receptor because noise sources are not stationary. If the distance to the nearest noise receptor were greater than the distance at which impact would occur, there would be no negative impact (Table 2.5.3-2, *Predicted Distance at Which Construction Noise Impacts Would Be Below the Level of Significance*).

TABLE 2.5.3-2
PREDICTED DISTANCE AT WHICH CONSTRUCTION NOISE IMPACTS WOULD BE BELOW THE LEVEL OF SIGNIFICANCE

Construction Phase	**Distance at Which Impact Would Be Below the Level of Significance at Respective Land Uses***	
	Residential (75 dBA)	**Commercial (85 dBA)**
Ground clearing	160 feet	50 feet
Excavations	280 feet	90 feet
Foundations	80 feet	25 feet
Erection of structures	180 feet	50 feet
Finishing (i.e., paving)	280 feet	90 feet
Actual distance to nearest noise receptor	East (across Wilmington Avenue) 100 ft South (across 122nd Street) 50 ft West (across Compton Avenue) 90 ft	North (across 119th Street): 95 ft

NOTE:
* Noise levels will vary depending on the location of the construction activities on site.

The distance at which construction noise impacts would be below the level of significance for a commercial property for the different construction phases ranges from 25 to 90 feet (Table 2.5.3-2). Therefore, construction noise levels would not be expected to exceed 85 dBA at King Drew High School. Implementation of mitigation measures for construction noise would be expected to further reduce noise levels at King Drew High School.

As shown in Table 2.5.3-2, impacts to affected residential structures would be below the level of significance at a distance of 280 feet from the proposed project site. The nearest residential land use is approximately 50 feet south of the proposed project. In addition, visitors, staff, and other individuals at the hospital campus would be exposed to construction-related noise. Since residential structures are located to the east, south, and west within 280 feet of the proposed project site, and individuals at the proposed project site would be exposed to noise during construction related activities, consideration of mitigation measures would be required.

The proposed project would result in significant impacts from exposure of persons to, or generation of, noise during construction of the proposed project. The noise generated by the proposed project would potentially exceed County construction noise limits at sensitive receptors. Therefore, implementation of the proposed project would result in significant impacts from exposure of persons to, or generation of, noise, thus requiring the consideration of mitigation measures.

Operational Noise

Building Operation

Operation of the mechanical systems of the proposed project would generate noise. Potential building operation noise was calculated using typical heating, ventilation, and air conditioning (HVAC) equipment systems. Typical HVAC equipment noise levels are 55 dBA at 50 feet from the rooftop source without shielding.[16] Standard design features including shielding would reduce noise emissions to below the 55-dBA level. The nearest sensitive receptors to potential locations of HVAC equipment are residences located to the south of the proposed project site, at which the measured ambient noise level is 55.2 dBA. If HVAC equipment were located 50 feet from the residences to the south of the proposed project site, noise generated by the HVAC equipment would potentially exceed the 50-dBA daytime noise level limit and the 45-dBA nighttime noise level limit. However, it would not exceed the measured ambient noise level of 55.2 dBA. During nighttime hours, when noise from traffic is less than during daytime hours, noise from HVAC equipment at 50 feet from residences would be expected to have a less-than-significant impact. However, new buildings on the campus would be anticipated to be consistent with the existing campus layout and building setbacks. As a result, any anticipated increases in noise levels would be reduced. In addition, mitigation measures would be incorporated to ensure that noise levels from building operation are below the level of significance.

Traffic

The traffic study prepared for the proposed project was reviewed to determine off-site noise impacts from changes in traffic volumes along adjacent roadways resulting from implementation of the proposed project. With respect to roadway noise impacts from vehicles traveling to and from the proposed project site, the greatest project-related traffic would be generated during peak a.m. and p.m. hours.

Tier I of the proposed project would be expected to result in a net decrease in trips to the Martin Luther King, Jr. Medical Center Campus, as the tier would remove functions, programs, and operations of various campus buildings and structures. Therefore, Tier I of the proposed project would not result in an increase in noise levels from project-related traffic.

Tier II of the proposed project would be expected to result in an increase in traffic volumes at intersections in the vicinity of the proposed project site due to the new development and extended phased construction period. The two intersections that are located on the borders of the proposed

---

[16] The anticipated location/positioning of the system represents a worst-case scenario, as the plans for the campus buildings were not available at the time that this report was completed.

project that would be anticipated to have traffic volume increases during the a.m. and p.m. peak hours are Compton Avenue at 118th Street and the intersection of Wilmington Avenue and 120th Street. Increased traffic could cause a perceptible change in noise levels if it were to result in an increase in ambient noise levels of greater than 3-dBA L_{dn}. Since traffic volumes would need to double to increase noise levels by more than 3 dBA in areas that already experience excessive noise from heavy traffic, the increases in traffic volumes associated with completion of Tier II of the proposed project would not be expected to result in significant impacts. Furthermore, mitigation measures for Tier II of the proposed project would mitigate significant traffic-related impacts to ensure the continued flow of traffic and to ensure that the implementation of the proposed project does not double the existing volume of traffic at these or other intersections within the proposed project vicinity. Implementation of the proposed project would result in less than a 3-dBA noise level increase, and as such, the traffic-related noise increases would not be expected to be perceptible. Therefore, increased noise levels generated by the anticipated increase in traffic levels from implementation of the proposed project would result in a less-than-significant impact.

2.5.4 Generation of Excessive Groundborne Vibration/Noise Levels

The proposed project would potentially result in significant impacts from groundborne vibration and groundborne vibration noise levels, which would be generated during construction activities. Operation of the proposed project would not generate substantial levels of vibration and therefore is not analyzed below. Construction activities can generate varying degrees of ground vibration, depending on the construction procedures, construction equipment used, and proximity to vibration-sensitive uses. Operation of construction equipment generates vibrations that spread through the ground and diminish in amplitude with distance from the source. Vibration is typically noticed nearby when objects in a building generate noise from rattling windows or picture frames. It is typically not perceptible outdoors and therefore impacts are based on the distance to the nearest building. The effect on buildings near a construction site varies depending on soil type, ground strata, and receptor building construction. The generation of vibration can range from no perceptible effects at the lowest vibration levels, to low rumbling sounds and perceptible vibrations at moderate levels, to slight damage at the highest levels. Ground vibrations from construction activities rarely reach levels that can damage structures, but can achieve the audible and perceptible ranges in buildings close to a construction site. PPV is defined as the maximum instantaneous peak of the vibration signal. PPV is an appropriate measure for evaluating potential building damage during construction. Construction vibration impacts are assessed in terms of PPV.

The nearest sensitive land uses from the existing campus are the residences located approximately 50 feet south of the proposed project site. Vibration would primarily occur during the grading and foundation phases of construction (Table 2.5.4-1, *Vibration Velocities for Construction Equipment*).

TABLE 2.5.4-1
VIBRATION VELOCITIES FOR CONSTRUCTION EQUIPMENT

Equipment	PPV at 25 feet (inches/second)*
Pile driving (impact)	0.644
Pile driving (sonic)	0.170
Caisson drilling	0.089
Large bulldozer	0.089
Loaded trucks	0.076

Anticipated vibration levels at the sensitive receptors were calculated using the following formula, which assumes that the source of vibration is a point source under normal propagation conditions:[17]

$$PPVequip = PPVref \times (25/D)^{1.5}$$

where:

PPV (equip) = peak particle velocity in inches per second of the equipment adjusted for distance
PPV (ref) = the reference vibration level in inches per second at 25 feet
D = the distance from the equipment to the receiver

To evaluate human annoyance from daytime construction activities, the potential construction equipment and the potential maximum PPV of each source were reviewed. Five common sources of PPV vibration that are typically used during construction-related activities were assessed: pile driving (impact), pile driving (sonic), caisson drilling, large bulldozer, and loaded trucks. Table 2.5.4-2, *Construction-related Vibration Levels at the Nearest Sensitive Receptor, Structural Damage*, lists the maximum vibration levels resulting from heavy construction equipment that have the potential to be experienced during construction related activities at the nearest sensitive receptor.

TABLE 2.5.4-2
CONSTRUCTION-RELATED VIBRATION LEVELS AT THE NEAREST SENSITIVE RECEPTOR, STRUCTURAL DAMAGE

Equipment	Maximum PPV in Inches/Second at Residences (50 feet from vibration source)	Significance Threshold (PPV in Inches/Second)	Exceeds Significance Threshold
Pile driving (impact)	0.2277	0.2	Yes
Pile driving (sonic)	0.0601	0.2	No
Caisson drilling	0.0315	0.2	No
Large bulldozer	0.0315	0.2	No
Loaded trucks	0.0269	0.2	No

The Federal Transit Administration has found that structural damage is possible when the PPV exceeds 0.2 inch per second. This criterion is the threshold at which there is a risk of damage to residential buildings. As shown in Table 2.5.4-2, proposed project construction activities would potentially result in PPV levels that exceed the Federal Transit Administration's criteria for vibration-induced structural damage at residences 50 feet away from the proposed project site if impact pile driving was used. Of the five sources of PPV reviewed for the analysis, only pile driving-related activities would exceed the significance threshold for PPV levels. Therefore, implementation of the proposed project would potentially result in significant impacts from generation of groundborne vibration (specifically, resulting from construction-related activities that require pile driving), thus requiring the consideration of mitigation measures.

---

[17] Federal Transit Administration. May 2006. *Transit Noise and Vibration Impact Assessment*. Washington DC.

2.5.5 Substantial Permanent Increase in Ambient Noise Levels

The proposed project would be expected to result in less-than-significant impacts to noise in relation to permanent increases in ambient noise levels.

The County Noise Control Ordinance does not define "substantial." In general, one way to estimate a person's subjective reaction to a new noise is to compare the new noise with the existing noise environment to which the person has become adapted; for example, the increase over the "ambient" noise level. As stated earlier, a 5-dBA increase is often considered a significant increase and thus a significant impact. Therefore, an increase in noise levels of 5 dBA would be considered substantial.

Noise levels in the vicinity of the proposed project on a typical day range from 55.2 dBA to 70.2 dBA; therefore, significant impacts would occur when noise levels exceed 60.2 dBA. Increases in ambient noise levels would occur from building operations and increased traffic. Traffic noise, as discussed in Section 2.5.3, would not be expected to increase ambient noise levels by more than 3 dBA. As discussed in Section 2.5.3, building operation would potentially increase ambient noise levels at residences located south of the proposed project area; however, mitigation measures would be incorporated to ensure that noise levels from building operation are reduced to below the level of significance.

2.5.6 Substantial Temporary Increase in Ambient Noise Levels

The proposed project would be expected to result in temporary significant impacts to noise in relation to temporary or periodic increases in ambient noise levels during the construction of the proposed project. Construction of the proposed project would be expected result in temporary noise increases at nearby residences that exceed County thresholds for construction noise. Therefore, construction of the proposed project would temporarily result in significant impacts from increases in ambient noise levels, thus requiring the consideration of mitigation measures.

2.5.7 Project Located within an Airport Land Use Plan

The proposed project would not be expected to result in impacts to noise in relation to public airports. The proposed project site is located neither within 2 miles of a public or private airstrip nor within an airport land use plan. The nearest airport, the Compton/Woodley Airport, is located approximately 2.1 miles south of the proposed project site. The proposed project is relatively removed for the airport activities and would not be expected to result in significant impacts by exposing people residing or working in the proposed project area to excessive noise levels caused by airports or by the implementation of airport land use plans.

2.5.8 Project Located within Vicinity of Private Airstrip

The proposed project would not be expected to result in impacts to noise in relation to private airstrips. The proposed project would not be located near a private airstrip. The closest private airstrip is located more than 11 miles from the proposed project site. Therefore, the proposed project would not result in significant impacts from exposure of people residing or working in the project area to excessive noise levels caused by private airstrips.

2.5.9 Cumulative Impacts

The incremental impact of the proposed project, when added to the related past, present, or reasonably foreseeable, probable future projects listed in Section 2, Project Description, would not be expected to result in cumulative impacts from noise. If construction of the proposed project were to coincide with construction of nearby related projects, it would potentially result in noise level increases at nearby sensitive receptors beyond the proposed project that are considered isolated. As construction of the proposed project would be expected to result in significant noise impacts requiring the consideration of mitigation measures, cumulative increases in noise levels from construction of the proposed project when considered with related projects would not be an additional noise impact. However, the mitigation measures considered to reduce the construction noise levels would also reduce the contribution of the proposed project to potential cumulative construction noise impacts.

When determining the significance of noise levels from increased traffic, the anticipated traffic volumes at intersections in the vicinity of the proposed project for the year 2020 were based on projected future volumes of traffic from ambient growth. Therefore, determination of significance levels of traffic-related noise impacts considered the cumulative increase in future traffic noise levels at build out of the proposed project along with future ambient growth relative to the existing baseline, and were determined to be below the level of significance. The mechanical systems of the proposed project would not be expected to be audible to the north, east, and west of the proposed project site because ambient noise levels, primarily due to automobile traffic, would be sufficiently high that mechanical noise would not be perceptible.

SECTION 3.0
MITIGATION MEASURES

3.1 MITIGATION MEASURES

The mitigation measures outlined below shall be implemented for the construction and operation activities related to the proposed Martin Luther King, Jr. Medical Center Campus Redevelopment project (referred to as the *project* in the mitigation measures below).

3.1.1 Construction

Measure Noise-1

The County of Los Angeles shall require that the plans and specifications require that construction equipment shall be equipped with state-of-the-art noise-muffling devices. Barriers or curtains shall be required to be installed close to equipment to shield the equipment from the noise receptor. Barriers or curtains utilized at the project site shall be required to reduce A-weighted construction noise levels at nearby sensitive receptors by a minimum of 10 dB. The height and length of the barriers or curtains shall be determined based on location of construction activity and receptor.

Due to the proximity of the source and receptors, the noise impact would depend on the location of the noise sources. Prior to the start of demolition and construction, the contractor shall develop a noise control plan based on the actual equipment that will be used during demolition and construction and the location of various demolition and construction activities. If the actual equipment noise levels are not available, equipment noise shall be measured in the field. The noise control plan shall predict the noise levels with actual equipment and with barriers or curtains in place. In addition, the plan shall consider the demolition and equipment mix that would be operated at the same time. Equipment mix and/or the number of equipment operating shall be considered in reducing the noise levels.

Measure Noise-2

Prior to the completion of final plans and specifications, the County of Los Angeles shall ensure that the plans and specifications include a requirement that all demolition and construction equipment be properly maintained. All vehicles and compressors shall utilize exhaust mufflers. Engine enclosure covers as designed by the manufacturer shall be in place at all times. The County of Los Angeles shall monitor the use of heavy equipment during all demolition and construction activities to ensure conformance with the requirements of properly maintained heavy equipment.

Measure Noise-3

The distance at which impact pile driving would not exceed a peak particle velocity of 0.2 inch per second at a residence would be 55 feet. Therefore, the County of Los Angeles shall require that impact pile driving will not be utilized within 55 feet of a residential structure. Should pile driving be necessary within 55 feet of a residence, sonic pile driving shall be used.

3.1.2 Operation

Measure Noise-4

The County of Los Angeles shall ensure that mechanical noise generated by the project is less than 45 dBA at residences located immediately south of the project. This shall be achieved by implementing one, or a combination of more than one, of the following strategies: utilizing quiet mechanical systems; placing mechanical systems away from residences (mechanical systems that produce a noise level of 55 dBA at 50 feet would need to be located a minimum of 160 feet from residences to bring mechanical noise levels below 45 dBA at residences); or utilizing insulating screens to break the line-of-sight between the mechanical systems and nearby residences.

3.1.3 Level of Significance after Mitigation

Implementation of mitigation measures Noise-1 and Noise-2 would reduce construction-related noise levels by a minimum of 10 dB. Based on the mitigated construction noise levels, the distance at which impacts would be below the level of significance is predicted. This distance is then compared to the distance of the nearest noise receptor. Since noise sources are not stationary, this approach is used rather than predicting the noise levels at the nearest receptor. If the distance to the nearest noise receptor is more than the "distance at which impact will occur," then there would be no negative impact (Table 3.1.3-1, *Predicted Distance at Which Mitigated Construction Noise Impacts Would Be Below the Level of Significance*).

TABLE 3.1.3-1
PREDICTED DISTANCE AT WHICH MITIGATED CONSTRUCTION NOISE IMPACTS WOULD BE BELOW THE LEVEL OF SIGNIFICANCE

	Distance at Which Impact Would Be Below the Level of Significance at Respective Land Uses*
Construction Phase	**Residential (75 dBA)**
Ground clearing	45 feet
Excavations	80 feet
Foundations	23 feet
Erection of structures	50 feet
Finishing (i.e., paving)	80 feet
Actual distance to nearest noise receptor	East (across Wilmington Avenue: 100 ft South (across 122nd Street): 50 ft West (across Compton Avenue): 90 ft

NOTE:
* Noise levels will vary depending on the location of the construction activities on the site.

As shown in Table 3.1.3-1, impacts to affected residential structures would be below the level of significance at a distance of 80 feet from the proposed project site. The nearest residential land use is approximately 50 feet south of the proposed project site. Implementation of mitigation measures Noise-1 and Noise-2 would reduce construction noise at residential properties to the east and west of the proposed project site to below the level of significance; however, construction noise levels would exceed the permissible 75-dBA level at residences south of the proposed project site that are within 80 feet of the proposed project site. Therefore, noise impacts from construction, while temporary, would remain significant and unavoidable.

Implementation of mitigation measure Noise-3 would reduce significant impacts related to vibration during construction to below the level of significance.

Implementation of mitigation measure Noise-4 would reduce significant impacts related to mechanical noise to below the level of significance.

- LEED STORMWATER DESIGN REQUIREMENTS

MARTIN LUTHER KING JR.
MEDICAL CARE CAMPUS REDEVELOPMENT PROJECT
STORMWATER ANALYSIS FOR TIER I DEVELOPMENT

Purpose

The County of Los Angeles is seeking Leadership in Energy and Environmental Design (LEED) certification on a proposed 132,000 square foot hospital structure and a 24,700 square foot ancillary structure that will be constructed on the Martin Luther King Jr. Medical Center Campus. This Stormwater Analysis is intended to satisfy the LEED – Sustainable Sites (SS) Credit 6.1 Stormwater Design -Quantity Control and Sustainable Sites Credit 6.2 Stormwater Design - Quality Control. Copies of SS-6.1 and SS-6.2 requirements are included in Appendix A, *LEED Stormwater Design Reqirements*.

Project Description

The proposed Martin Luther King Jr. Medical Center Campus Redevelopment project consists of two tiers. This Stormwater Analysis Report involves only the Tier I phase. The Tier I Pre and Post Project site for development are depicted in Figure 1. The Tier I phase of the proposed project development includes the design and construction of the new 132,000 square foot Multi-service Ambulatory Care Center (MACC) building, a 24,700 square foot Ancillary Building and adjacent parking lots and site improvements.

Sustainable Sites Credit 6.1

The SS Credit 6.1 Stormwater Design - Quantity Control requirement is intended to limit disruption of natural hydrology by reducing impervious cover, increasing on-site infiltration, reducing or eliminating pollution from stormwater runoff and eliminating contaminants.

Analysis

The Tier I Phase of the proposed project site surface area falls into the SS Credit 6.1 Case 2 Classification with existing imperviousness of greater than 50%. The existing buildings and existing paved parking lots cover the greater part of the Tier I Phase proposed project area. The requirement for Case 2 projects is to implement a stormwater management plan that results in a 25% decrease in the volume of stormwater runoff leaving the site from the 2-year 24 hour design storm. On this site it will not be possible to reduce impervious cover, however, it is possible to reduce pollution from on-site stormwater runoff, eliminate contaminants, provide stormwater storage and increase on-site infiltration.

The drainage on the existing Tier I Project site is served by existing storm drains with grating catch basins located in the parking lots with storm drain pipes that connect to existing County storm drains in 120th Street on the north, Compton Avenue on the west and the alley on the south.

Recommendations

The stormwater management plan shall incorporate a subsurface stormwater collection chamber that will store 25% of the volume of the on-site stormwater runoff from the 2 year 24-hour design storm under the post construction condition. This type of chamber may also be used as a stormwater infiltration structure placed under the parking lot between the new building and 120th Street. The stormwater storage/infiltration structure shall have an overflow outlet pipe to connect to the County storm drain in the adjacent street. All storm water directed to the stormwater collection chamber shall be treated first in the bio-filtration catch basins and bio-filtration planters.

The existing storm drain system shall be redesigned to fit the new parking lot configuration and design. All catch basins shall have trash removal devices installed. The onsite storm drain system shall be designed for the pre-treatment of dry weather nuisance flows and the first flush rainfall incorporating a bio-filtration method of treatment.

The same bio-filtration method shall be used for the stormwater drainage from the buildings roofs using a raised planter bed bio-filtration structure that can be placed above ground next to the buildings that contains an engineered filter material and can be piped under a sidewalk or landscaped planter through a curb outlet to an onsite storm drain.

Sustainable Sites Credit 6.2

The SS Credit 6.2 Stormwater Design - Quality Control requirement is intended to limit disruption and pollution of natural water flows by managing stormwater runoff.

Analysis

The requirement for SS Credit 6.2 is to implement a stormwater management plan that reduces impervious cover, promotes infiltration and captures and treats the stormwater runoff from 90% of the average annual rainfall using acceptable best management practices (BMPs). BMPs used to treat runoff must be capable of removing 80% of the average annual post development total suspended solids (TSS) load based on existing monitoring reports. BMPs are considered to meet these criteria if they are designed in accordance with standards and specifications from a state or local program that has adopted these performance standards.

The bio-filtration technology is an innovative and unique stormwater best management practice (BMP) and is approved by the Los Angeles County Department of Public Works (LACDPW). The bio-filtration treatment system generally consists of a patented engineered soil filter media placed in a concrete container planted with selected trees and/or bushes. A mulch layer is placed on the filter media, and infiltrated water is removed via an under-drain system connected to a stormwater detention structure or storm drain outlet. The bio-filtration treatment system is well suited for the urban environment with high removal efficiencies for pollutants such as petroleum, heavy metals, phosphorus, nitrogen, total suspended solids, and bacteria. These pollutants are collected in the mulch and soil media and adsorbed through the roots into the planted trees and/or bushes. The bio-filtration units shall have a demonstrated TSS removal rate of 80% for typical urban runoff sediments.

Recommendations

All stormwater runoff from the site shall be pre-treated by a bio-filtration method before being discharged to the storage/infiltration chamber and the storm drains in the adjacent streets. The method for calculating the quantity of stormwater runoff to be treated shall be in accordance with LACDPW standards and specifications.

The stormwater management plan shall incorporate a subsurface stormwater collection chamber that will store 25% of the volume of the on-site stormwater runoff from the 2 year 24-hour design storm as noted under SS Credit 6.1 above

Pre and Post Construction Stormwater Discharge Analysis

A hydrology study of the Tier I Project site was prepared for the existing site condition and the proposed site development condition based on the architect's conceptual site drawings of pre and post construction. The hydrology study used a 2 year 24 hour design storm. The purpose of this study is to compare the difference in stormwater runoff quantity due to the changes in pervious and impervious areas that affect the amount of surface runoff.

Recommendations

The proposed development changes and additions to the site results in increasing the amount of impervious surface area by approximately 14% which increases the on-site stormwater runoff in the Tier I Project post construction site by a volume of approximately 15,800 cubic feet. This increase in stormwater runoff shall be mitigated on this site by a combination of onsite storage detention and infiltration by constructing subsurface stormwater collection chambers under the parking lots in the areas designated in a soil infiltration report as the best infiltration locations. The volume of increased runoff shall be compared with the volume of the 25 % decrease required as described under Sustainable Sites Credit 6.1 above, and the larger of the two volumes shall be used for design of the stormwater collection chambers. Under the post construction condition the 25% volume will be approximately 24,500 cubic feet which is the larger of the two volumes and should be used as the design volume. (Note: Numbers and calculation results presented in this study were made from conceptual level drawings and data.)

Pre Project Drainage Map

The Pre Project Drainage Map encompasses the Tier 1 Project area and for purposes of computing drainage areas is divided into 4 areas. The pre project drainage map is depicted in Figure 2. The computed areas are used in the hydrology calculations to determine the volume of stormwater runoff to the off-site storm drain system.

Pre Project Peak Stormwater Runoff Discharge Rate

The hydraulic analysis for stormwater runoff is calculated using the Los Angeles County Department of Public Works approved methods. For this report the 2 year frequency of occurrence for rainfall in a 24 hour period was used. The amount of stormwater runoff in this case will vary depending on the difference of the percent of surface imperviousness versus perviousness between pre construction and post construction. This table and the calculations establish the volume of on-site stormwater runoff in a 24 hour period for the pre construction condition. Table I entitled "Martin Luther King Jr. Medical Care Campus Redevelopment Project Pre Project Peak Stormwater Runoff Discharge Rate" summarizes the project's pre project on-site runoff for the four sub areas.

Post Project Drainage Map

The Post Project Drainage Map encompasses the same Tier 1 Project area and for purposes of computing drainage areas for this report is divided into the same 4 areas as the Pre Project Drainage Map. The Post Project drainage map is depicted in Figure 3. The proposed drainage design may change the on-site shape of the individual drainage areas but the total site area will not change. The computed areas are used in the hydrology calculations to determine the volume of stormwater runoff to the off-site storm drain system. In the post construction condition the addition of the two buildings and the increased area of parking lot increases the imperviousness of the surface and increases the on-site stormwater runoff.

Post Project Stormwater Runoff Discharge Rate

The hydraulic analysis for stormwater runoff is calculated using the Los Angeles County Department of Public Works approved methods. For this report the 2 year frequency of occurrence for rainfall in a 24 hour period was used. The amount of stormwater runoff in this case will vary depending on the difference of the percent of impervious versus pervious surface areas between pre construction and post construction. This table and the calculations establish the volume of stormwater runoff in a 24 hour period for the post construction condition. Table II entitled "Martin Luther King Jr. Medical Care Campus Redevelopment Project Post Project Peak Stormwater Runoff Discharge Rate" summarizes the project's post project on-site runoff for the four sub areas.

50 Year Frequency 24 Hour Isohyet Map

The Isohyet Map uses a USGS contour map to superimpose contours of the depth in inches of stormwater that falls in a 24 hour period from a 50 year frequency storm based on LACDPW rainfall records. For this project a 2 year reduction factor is applied to the 50 year frequency Isohyet to obtain the calculated volume for a 2 year frequency 24 hour storm in order to calculate the mitigation and treatment stormwater volumes required for the LEED Sustainable Sites Credits. The 50 year frequency 24 hour Isohyet Map is depicted in Figure 4.

Runoff Coefficient Curve

The Isohyet Map also has soil classification numbers that designate the type of soil in the area of the Project which is used to select a Rainfall Intensity (Inches per Hour) graphic curve that provides a factor in computing the stormwater runoff from unpaved pervious soil areas. The runoff coefficient curve is depicted in Figure 5.

Storm Frequency Multiplication Factor

The storm frequency reduction factor is obtained from the LACDPW Hydrology Design Manual, Chapter 5- Rainfall and Design Storm Characteristics, Rainfall Frequency Multiplication Factors, Table 5.3.1 which provides the 2 year frequency reduction factor for use in this project's calculations. Table III entitled "Storm Frequency Multiplication Factor" depicts the storm frequency reduction Factor.

HYDROLOGY ANALYSIS

1) This analysis conforms to Los Angeles County Department of Public Works hydrology calculation methods.
The design is for a 2 year 24 hour storm,
The Soil type is 003
The 50-year 24-hour Isohyet is 5.9 in. => 2-year 24" Isohyet = 0.387x5.9=2.28 in

2) Subarea A, B, & C collected by on-site catch basins and drains to existing storm drain system in 120th Street and Compton Avenue.
Q_A+ QB + QC = 1.91+3.05+1.81 = 6.77 cfs

3) Subarea D collected by catch basin and drains to storm drain system in the Alley and Compton Avenue
Q_D = 1.19 cfs

4) Subarea A, B & C Peak Runoff Volume, V_p = (43560)(2.28/12)(%imp)(Area)
V_A+ V_B + V_C = 20889+31806+18249 =70944 cu. ft
=>25% Vp = (0.25)70944)=17736 cu. ft

5) Subarea D Peak Runoff Volume, V_D = 11235cu. ft
=>25% Vp = (0.25)(11235)=2809 cu. ft

TABLE II MARTIN LUTHER KING JR.
MEDICAL CARE CAMPUS REDEVELOPMENT PROJECT
POST PROJECT PEAK STORMWATER RUNOFF DISCHARGE RATE

Project	Subarea	Area (acres)	%imp	Frequency	Soil Type	Length (ft)	Slope (ft/ft)	Isohyet (in.)	Tc-calculated (min.)	Intensity (in./hr)	Cu	Cd	Flowrate (cfs)	Volume (cu. Ft)	Tc Equation
MLK	A	4.31	0.82	2	3	400	0.01	2.28	13	0.87	0.1	0.76	2.85	29250	Tc=(10)^-0.507*(Cd*I)^-0.519*(L)^0.483*(S)^-0.135
MLK	B	4.27	0.9	2	3	450	0.01	2.28	13	0.87	0.1	0.82	3.05	31806	Tc=(10)^-0.507*(Cd*I)^-0.519*(L)^0.483*(S)^-0.135
MLK	C	3.15	0.9	2	3	400	0.01	2.28	12	0.9	0.11	0.82	2.32	23464	Tc=(10)^-0.507*(Cd*I)^-0.519*(L)^0.483*(S)^-0.135
MLK	D	1.81	0.9	2	3	400	0.01	2.28	12	0.9	0.11	0.82	1.34	13482	Tc=(10)^-0.507*(Cd*I)^-0.519*(L)^0.483*(S)^-0.135

HYDROLOGY ANALYSIS

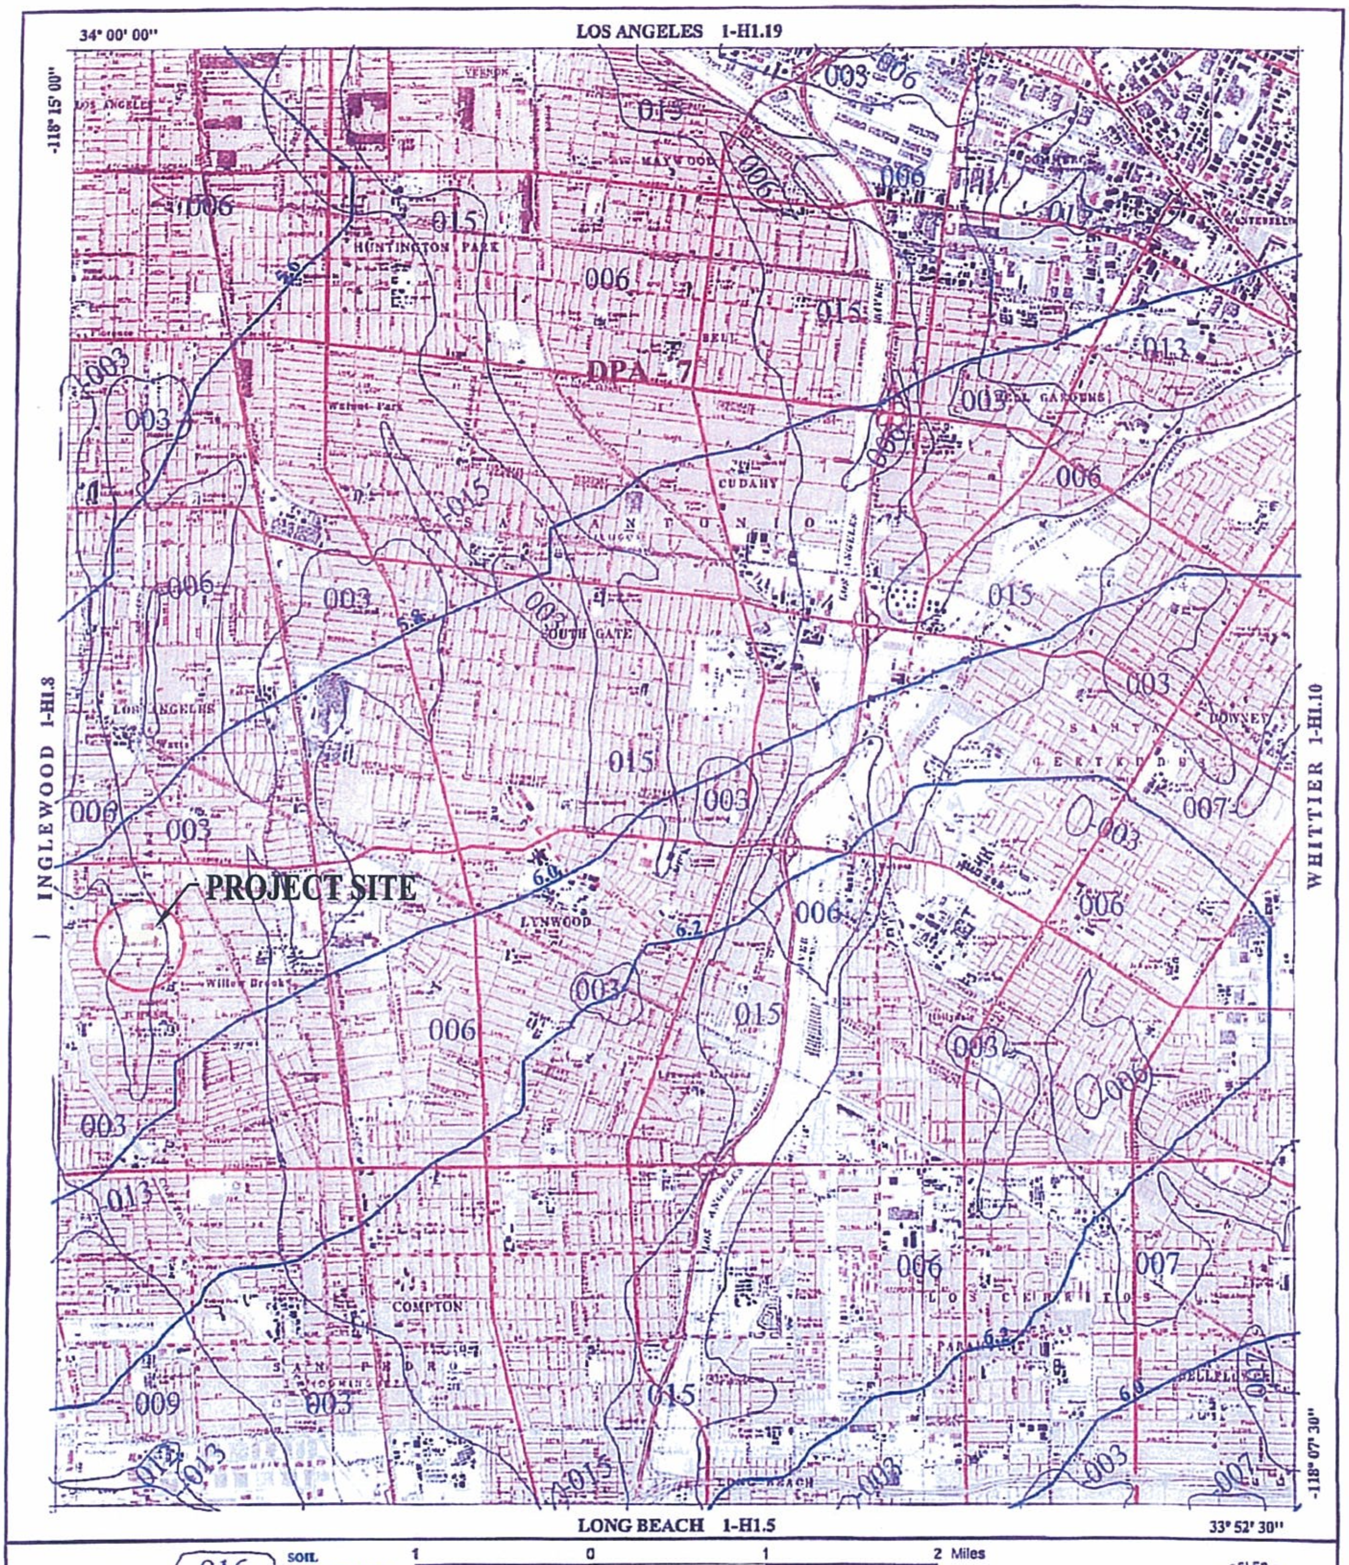
1) This analysis conforms to Los Angeles County Department of Public Works hydrology calculation methods.
The design is for a 2 year 24-hour storm,
The Soil type is 003
The 50-year 24-hour Isohyet is 5.9 in. => 2-year 24" Isohyet = 0.387x5.9=2.28 in

2) Subarea A, B, & C collected by on-site catch basins and drains to existing storm drain system in 120th Street and Compton Avenue.
$Q_A + Q_B + Q_C$ = 2.85+3.05+2.32 =8.22 cfs

3) Subarea D collected by catch basin and drains to storm drain system in the Alley and Compton Avenue
Q_D = 1.34 cfs

4) Subarea A, B & C Peak Runoff Volume, V_p = (43560)(2.28/12)(%imp)(Area)
$V_A + V_B + V_C$ = 29250+31806+23464 =84520 cu. ft
=>25% Vp = (0.25)(84520)=21130 cu. ft

5) Subarea D Peak Runoff Volume V_D = 13482 cu. ft
=>25% Vp = (0.25)(13482)=3370 cu. ft



25-YEAR 24-HOUR ISOHYET REDUCTION FACTOR: 0.878
10-YEAR 24-HOUR ISOHYET REDUCTION FACTOR: 0.714

TABLE III STORM FREQUENCY MULTIPLICATION FACTOR
(REF. Chapter 5 - Rainfall and Design Storm Characteristics)

Frequency	Multiplication Factor
2-yr	0.387
5-yr	0.584
10-yr	0.714
25-yr	0.878
50-yr	1.000
100-yr	1.122
500-yr	1.402

Appendix B contains isohyetal maps for the 50-year, 24-hour rainfall depth. The isohyetal contour lines are spaced at intervals of two-tenths of an inch. The spatial rainfall distributions for the county design storms were converted to grid data for use with Geographic Information System (GIS) compatible hydrologic models.

5.4 DESIGN STORM

The three components of the design storm include the IDF equation, the unit hyetograph curve, and the isohyets. These components are used to define the design storm for a particular location and frequency. As an example, consider the 25-year design storm for the Palmer Canyon watershed in Figure 5.4.1. Subarea 1A of this watershed, shown in Figure 5.4.2, will be used for the sample calculations.

1. Compute the area between successive isohyetal lines and multiply by the average of the isohyet values. Table 5.4.1 shows the areas between isohyets for Subarea 1A.

2. The sum of these precipitation-area values divided by the total subarea area provides the area weighted average rainfall depth. The average rainfall should be calculated to the nearest two-tenths of an inch. Table 5.4.1 contains the calculations for the isohyetal values in this subarea.

It may be noted that for small subareas, the isohyet nearest the centroid of the subarea usually equals the design depth. Selecting the isohyets nearest the subarea centroid is an acceptable method for determining the design rainfall for subareas of approximately 40 acres.

APPENDIX A

SS Credit 6.1: Stormwater Design—Quantity Control

1 Point

Intent

To limit disruption of natural hydrology by reducing impervious cover, increasing on-site infiltration, reducing or eliminating pollution from stormwater runoff and eliminating contaminants.

Requirements

CASE 1. Sites with Existing Imperviousness 50% or Less

OPTION 1

Implement a stormwater management plan that prevents the postdevelopment peak discharge rate and quantity from exceeding the predevelopment peak discharge rate and quantity for the 1- and 2-year 24-hour design storms.

OR

OPTION 2

Implement a stormwater management plan that protects receiving stream channels from excessive erosion. The stormwater management plan must include stream channel protection and quantity control strategies.

CASE 2. Sites with Existing Imperviousness Greater Than 50%

Implement a stormwater management plan that results in a 25% decrease in the volume of stormwater runoff from the 2-year 24-hour design storm.

Potential Technologies & Strategies

Design the project site to maintain natural stormwater flows by promoting infiltration. Specify vegetated roofs, pervious paving and other measures to minimize impervious surfaces. Reuse stormwater for non-potable uses such as landscape irrigation, toilet and urinal flushing, and custodial uses.

SS Credit 6.2: Stormwater Design—Quality Control

1 Point

Intent

To limit disruption and pollution of natural water flows by managing stormwater runoff.

Requirements

Implement a stormwater management plan that reduces impervious cover, promotes infiltration and captures and treats the stormwater runoff from 90% of the average annual rainfall[1] using acceptable best management practices (BMPs).

BMPs used to treat runoff must be capable of removing 80% of the average annual postdevelopment total suspended solids (TSS) load based on existing monitoring reports. BMPs are considered to meet these criteria if:

- They are designed in accordance with standards and specifications from a state or local program that has adopted these performance standards,

OR

- There exists infield performance monitoring data demonstrating compliance with the criteria. Data must conform to accepted protocol (e.g., Technology Acceptance Reciprocity Partnership [TARP], Washington State Department of Ecology) for BMP monitoring.

Potential Technologies & Strategies

Use alternative surfaces (e.g., vegetated roofs, pervious pavement, grid pavers) and nonstructural techniques (e.g., rain gardens, vegetated swales, disconnection of imperviousness, rainwater recycling) to reduce imperviousness and promote infiltration and thereby reduce pollutant loadings.

Use sustainable design strategies (e.g., low-impact development, environmentally sensitive design) to create integrated natural and mechanical treatment systems such as constructed wetlands, vegetated filters and open channels to treat stormwater runoff.

---

[1] There are 3 distinct climates in the United States that influence the nature and amount of annual rainfall. Humid watersheds are defined as those that receive at least 40 inches of rainfall each year. Semiarid watersheds receive between 20 and 40 inches of rainfall per year, and arid watersheds receive less than 20 inches of rainfall per year. For this credit, 90% of the average annual rainfall is equivalent to treating the runoff from the following (based on climate):

- Humid Watersheds — 1 inch of rainfall
- Semiarid Watersheds — 0.75 inches of rainfall
- Arid Watersheds — 0.5 inches of rainfall

EXECUTIVE SUMMARY

A detailed traffic study has been performed by Raju Associates, Inc. to assess the traffic impacts of the proposed Marin Luther King Jr. Medical Campus Center Redevelopment Project. This Project is located at 12021 Wilmington Avenue in the Willowbrook community of Los Angeles County, California.

The Proposed Project site is located on the existing 38-acre Martin Luther King Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles, California. The Proposed Project site is bounded on the north by 120th Street, on the west by Compton Avenue, on the east by Wilmington Avenue and on the south by an alley which separates the Proposed Project site from the residential neighborhood. Figure 1 illustrates the location of the Proposed Project in relation to the surrounding street system.

The existing Martin Luther King Jr. Medical Center Campus consists of 15 buildings containing a total of approximately 1,243,692 square feet. Table 1 includes a list of the existing buildings and their square footages. As indicated in the table, the multiservice ambulatory care center (MACC) building is the largest building on the campus at 495,335 square feet. Currently, the existing campus is not fully operational, but does provide various outpatient and administrative support services.

The Proposed Project consists of two tiers. Tier I involves construction of 156,700 square feet including a new MACC and ancillary buildings, tenant improvements in existing buildings, and site improvements. As proposed, the MACC building would be a four-story building consisting of approximately 132,000 square feet. The proposed ancillary building would be a two-story structure consisting of approximately 24,700 square feet. The tenant improvement would be performed in the North and South Support buildings, Interns and Physicians building and Plant Management building to provide support to the new MACC building. Additionally, Tier I would include site improvement consisting of a new parking terrace, new parking lots, and re-striping of existing lots.

The construction of Tier I would also include the removal of four structures containing approximately 506,485 square feet. These structures include the existing MACC building, emergency room, storage building and cooling towers and will be either reused or replaced under Tier II of the Project. It is anticipated that the Tier I Project would be completed by Year 2014.

Tier II of the Proposed Project would entail the development of a campuswide master plan. Tier II would have the potential to build out approximately 1,814,695 square feet of development on the Proposed Project site. As proposed, Tier II would consist of 1,134,695 square feet of hospital use, 80,000 square feet of retail use, 300,000 square feet of medical office use, 150,000 square feet of general office use, and 100 single family residential dwelling units (approximately 150,000 square feet). It is anticipated that the Tier II Project would be completed by Year 2020.

Current and future traffic analyses at 64 intersections within the County of Los Angeles and several other jurisdictions were conducted in this study. At these locations, traffic operations were studied prior to and after implementation of the proposed project, and deficiencies and impacts were identified. The following executive summary highlighting the key findings of this study is presented below.

- The Project study area encompasses a geographic area bounded by the Century Boulevard to the north, the I-110 Freeway to the west, the SR-91 Freeway to the south and Long Beach Boulevard to the east. The study area was established working closely with the County of Los Angeles by reviewing the travel patterns of the Proposed Project to ensure that all potential traffic impacts of the Martin Luther King Jr. Medical Center Campus Project would be addressed. Within the study area, 64 intersections have been selected for detailed study. These study intersections are located in the County of Los Angeles and Cities of Compton, Los Angeles, and Lynwood jurisdictions.

- Key elements of the traffic study include assessment of existing conditions, evaluation of future horizon year (2014) conditions without and with the Tier I Project, evaluation of future horizon year (2020) conditions without and with the Tier I and II Project, determination of the Proposed Project's trip generation, distribution and assignment on the roadway network, analysis of future conditions with the Proposed Project prior to mitigation, identification of significant impacts, testing of mitigation measures and documentation of significant impacts, if any.

- A detailed inventory of the existing roadway and transit systems was assembled to define the existing transportation supply-side parameters. Detailed field surveys were conducted to compile the specific parameters.

- Detailed morning and evening peak period traffic counts on a commuter weekday were conducted and the peak hour traffic demands on the roadway system were identified.

- Currently, 63 of the 64 analyzed intersection locations are operating at acceptable levels of service (LOS D or better) both during the morning and evening peak hours.

<u>Future Year 2014 – Tier I Analysis</u>

- At the 27 intersections located in the County of Los Angeles, in the Existing (Baseline) with Ambient Growth (2014) conditions, i.e., future conditions without the implementation of the proposed project, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

- At the study intersections located in the other jurisdictions, in the Cumulative (2014) Base conditions, i.e., future conditions without the implementation of the proposed project, 36 of the 37 analyzed intersections in both the morning and evening peak hours are projected to operate at LOS D or better.

- The Proposed Tier I Project involves construction of 156,700 square feet including a new MACC and ancillary buildings, tenant improvements in existing buildings, and site improvements. The construction of Tier I would also include the removal of four structures containing approximately 506,485 square feet. The Tier I Project is estimated to generate a net total of -332 trips during the morning peak hour and -338 trips during the evening peak hour.

- At the County of Los Angeles locations, under the Existing (Baseline) with Ambient Growth (2014) plus Project conditions, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better. The Existing (Baseline) with Ambient Growth (2014) plus Project conditions indicate that the Proposed Tier I Project would not cause a significant traffic impact at any of the analyzed intersections.

- Under the cumulative (2014) with Tier I Project conditions, 63 of the 64 analyzed intersections in the morning peak hour are projected to operate at LOS D or better. During the evening peak hour, 62 of the 64 analyzed intersections are projected to operate at LOS D or better. At the 27 County of Los Angeles locations, 27 intersections during the morning peak hour and 26 intersections during the evening peak hour are projected to operate at LOS D or better. At the 37 locations in other jurisdictions, 36 intersections during both the morning and evening peak hours are projected to operate at LOS D or better.

- At the County of Los Angeles locations, the Existing (Baseline) with Ambient Growth (2014) plus Tier I Project and Related Projects traffic conditions indicate that the cumulative projects (including the Proposed Tier I Project) would not cause a significant traffic impact at any of the analyzed intersections.

- At the study intersections located in other jurisdictions, the Cumulative (2014) plus Tier I Project conditions indicate that the Proposed Tier I Project would not cause a significant traffic impact at any of the 37 analyzed intersections.

Future Year 2020 – Tier II Analysis

- At the County of Los Angeles locations, in the Existing (Baseline) with Ambient Growth (2020) conditions, i.e., future conditions without the implementation of the proposed project, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

- At the study intersections located in the other jurisdictions, in the Cumulative (2020) Base conditions, i.e., future conditions without the implementation of the proposed project, 36 of the 37 analyzed intersections during the morning peak hour are projected to operate at LOS D or better. During the evening peak hour, 34 of the 37 analyzed intersections during the morning peak hour are projected to operate at LOS D or better.

- The Proposed Tier II Project consists of 1,134,695 square feet of hospital use, 80,000 square feet of retail use, 300,000 square feet of medical office use, 150,000 square feet of general office use, and 100 single-family residential dwelling units. The Tier II Project is estimated to generate a net total of 1,572 trips during the morning peak hour and 2,091 trips during the evening peak hour.

- The overall Proposed Project (Tier I combined with Tier II) would have a total net trip generation of 1,240 trips (918 inbound, 322 outbound) during the morning peak hour and 1,753 trips (571 inbound, 1,182 outbound) during the evening peak hour.

- At the County of Los Angeles locations, under the Existing (Baseline) with Ambient Growth (2020) plus Tier I and II Project conditions, 25 of the 27 analyzed intersections in the morning peak hour and 22 of the 27 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

- The Proposed Tier II Project would cause a significant traffic impact at 7 of the 27 analyzed County of Los Angeles intersections (7 in the AM peak hour and 5 in the PM peak hour) and includes the following intersections:

    - Compton Avenue/Imperial Highway – AM Peak Hour
    - I-105 Westbound Ramps/Imperial Highway – AM Peak Hour
    - Wilmington Avenue/118th Street – AM and PM Peak Hours
    - Wilmington Avenue/120th Street-119th Street – AM and PM Peak Hours
    - Wilmington Avenue/I-105 Eastbound Ramps – AM and PM Peak Hours
    - Wilmington Avenue/MLK Jr. Hospital Dwy-120th Street – AM and PM Peak Hours
    - Wilmington Avenue/El Segundo Boulevard – AM and PM Peak Hours

- Under the cumulative (2020) with Tier II Project conditions, 59 of the 64 analyzed intersections during the morning peak hour and 53 of the 64 analyzed intersections during the PM peak hour are projected to operate at LOS D or better. At the 27 County of Los Angeles locations, 24 intersections during the morning peak hour and 19 intersections during the evening peak hour are projected to operate at LOS D or better. At the 37 locations in other jurisdictions, 35 and 34 intersections are projected to operate at LOS D or better during the morning and evening peak hours, respectively.

- At the County of Los Angeles locations, the Existing (Baseline) with Ambient Growth (2020) plus Tier I and II Project and Related Projects traffic conditions indicate that the cumulative projects (including the Proposed Tier II Project) would cause a significant traffic impact at 13 of the 27 analyzed intersections (10 in the AM peak hour and 12 in the PM peak hour) and includes the following intersections:

    - Alameda Street/103rd Street – AM and PM Peak Hours
    - Alameda Street/El Segundo Boulevard – PM Peak Hour
    - Alameda Street/Imperial Highway – AM and PM Peak Hours
    - Avalon Boulevard/El Segundo Boulevard – PM Peak Hour
    - Central Avenue/El Segundo Boulevard – AM and PM Peak Hours
    - Central Avenue/Rosecrans Avenue – PM Peak Hour
    - Compton Avenue/Imperial Highway – AM Peak Hour
    - I-105 Westbound Ramps/Imperial Highway – AM and PM Peak Hours.
    - Wilmington Avenue/118th Street – AM and PM Peak Hours
    - Wilmington Avenue/120th Street-119th Street – AM and PM Peak Hours
    - Wilmington Avenue/I-105 Eastbound Ramps – AM and PM Peak Hours
    - Wilmington Avenue/MLK Jr. Hospital Dwy-120th Street – AM and PM Peak Hours
    - Wilmington Avenue/El Segundo Boulevard – AM and PM Peak Hours

- At the study intersections located in the other jurisdictions, the Cumulative (2020) plus Tier I and II Project conditions indicate that the Proposed Tier II Project would cause a significant traffic impact at one of the 37 analyzed intersections. The intersection of Central Avenue/120th Street would be significantly impacted in both the morning and evening peak hours.

In order to address the Tier II Project's impacts, the following mitigation measures described in the section below are recommended for implementation by the Tier II Project:

- Compton Avenue/Imperial Highway – County of Los Angeles/City of Los Angeles: Restripe westbound approach to provide a separate right-turn lane.

- I-105 Westbound Ramps-Croesus Avenue/Imperial Highway – County of Los Angeles/City of Los Angeles/Caltrans: Provide a third northbound left-turn lane by widening off-ramp by 10' for approximately 150' to 200'.

- Wilmington Avenue/El Segundo Boulevard – County of Los Angeles/Compton: Restripe eastbound and westbound approaches to have separate right-turn lanes. Allow buses to go through the intersection from the right-turn lanes.

- Central Avenue/120th Street – City of Los Angeles: Restripe northbound approach to provide a separate right-turn lane. Also, widen the east leg by 3' on each curbside (i.e. reduce sidewalk along 120th street east of Central Avenue by 3' for approximately 120' and restripe westbound 120th Street approach to provide a left-turn, two through lanes and a separate right turn lane.

- Wilmington Avenue Corridor Improvements: Provide an additional southbound travel lane by widening 2’ on either side of Wilmington Avenue (reducing the sidewalk to 8’ from 10’) and restriping the travel lanes between 120th Street-119th Street and the I-105 Eastbound Off-Ramp and by just restriping the lanes (after reducing the central median) between MLK Jr. Hospital Driveway-120th Street and 120th Street-119th Street. The following intersection improvements would also be implemented as part of this corridor improvement:

- Wilmington Avenue/I-105 Eastbound Ramps – County of Los Angeles/Caltrans: Provide an additional eastbound lane by widening (reducing the raised median on the ramp) the off-ramp. The eastbound approach would have a left-turn lane, shared left-right turn lane and a separate right-turn lane. The sidewalks on either side of Wilmington Avenue (as noted above) would be reduced by 2’ and the Wilmington Avenue roadway would be widened by 2’ on either side (a total of 4’) from the south leg of this intersection.

  Provide an additional northbound left-turn lane by widening (reducing the medians). The northbound approach would have dual left-turn lanes and three through lanes.

- Wilmington Avenue/118th Street – County of Los Angeles: Widen Wilmington Avenue roadway by 2’ on either side and restripe to provide two through lanes, a shared through-right turn lane and dual left-turn lanes along the southbound approach. Restripe the westbound approach to provide a separate right-turn land and a share left-through lane. Northbound approach would have the same lane geometry as existing conditions. Under cumulative conditions, widen 118th Street roadway by 4’ and restripe to provide a separate right-turn lane and shared left-through lane along the eastbound approach.

- Wilmington Avenue/120th Street-119th Street – County of Los Angeles: Widen Wilmington Avenue roadway by 2’ on either side and restripe the southbound approach to provide a separate right-turn lane, three through lanes and a left-turn lane.

  Restripe northbound approach to provide a shared through-right turn lane, two through lanes and a left-turn lane. Remove median adjacent to northbound approach to facilitate three southbound receiving lanes. Restrict parking along Wilmington Avenue roadway during AM and PM peak periods along the eastside of Wilmington between 120th Street & MLK Jr. Hospital Driveway Entrance.

  Widen 120th Street west of Wilmington Avenue for 250’, on the south side by 2’ and restripe the eastbound approach to provide a separate right-turn lane, dual left-turn lanes, and a through lane. The westbound approach of 119th Street would have the same lane geometry as existing conditions.

- Wilmington Avenue/MLK Jr. Hospital Entrance-120th Street – County of Los Angeles: Restripe southbound approach to provide a separate right-turn lane, two through lanes and a left turn lane. Provide three northbound receiving lanes and restrict on-street curb parking along the eastside of Wilmington Avenue between MLK Jr. Hospital Driveway-120th Street and 120th Street-119th Street during morning and evening peak hours.

Remove median within the hospital entrance and restripe the driveway to provide dual left turn lanes, a through lane and a separate right-turn lane along the eastbound approach. Restripe to provide one receiving lane. The east-west signal phasing would operate as a split phase due to the lane configurations.

- The recommended improvements would fully mitigate the project-related impacts at the 8 impacted intersections.

In order to address the cumulative projects impacts determine using County of Los Angeles traffic study guidelines, the following mitigation measures described in the section below are recommended for implementation to alleviate the cumulative significant impacts. These improvements are needed in addition to the improvements identified above for the project-level mitigation measures.

- Avalon Boulevard/El Segundo Boulevard – County of Los Angeles: Widen NB approach by 2 feet and restripe the approach to provide a left turn lane, two through lanes and a separate right turn lane (10', 10', 10', 12'). The approach could be widened by narrowing the 5' median to a 3' median, or by reducing the 12' sidewalk to a 10' sidewalk. This widening would need to occur all the way to an alley located approximately 100' south of the intersection. The bus stop at this approach would continue to be located at the same location; however, buses would be allowed to go straight through the intersection.

- Alameda Street/El Segundo Boulevard – County of Los Angeles/Compton: Restripe northbound/southbound approaches and provide a SBR turn lane. The lanes along the north leg would be restriped to provide 13' and 11' receiving lanes; 10', 11', 10', 12' approach lanes for SBL, SBT, SBT, and SBR lanes, respectively. The lanes along the south leg would have 13' shared thru-right, 11' thru lane, 10' left turn lane, 12' receiving lane and a 20' receiving lane. Remove 2 on-street parking spaces along SB approach during peak hours.

- Alameda Street/103rd Street – County of Los Angeles/Lynwood: Restripe eastbound approach to provide a 10' left turn lane and a 12' left-right shared lane. The receiving lane would be restriped for 18.5'.

- Central Avenue/Rosecrans Avenue – County of Los Angeles/Compton: Restripe westbound approach to provide a separate right-turn lane. Allow buses to go through the intersection from the right-turn lane.

- Central Avenue/El Segundo Boulevard – County of Los Angeles/Compton: Restripe SB approach to provide a separate right-turn lane. Widen NB approach by reducing median by 1' to 2'. Provide restriping to show a separate NB right-turn lane. Allow buses to go through the intersection from the right-turn lane.

- Alameda Street/Imperial Highway – County of Los Angeles/City of Lynwood: Restripe southbound approach to provide the following roadway geometry: dual left-turn lanes, a through lane, a shared through-right turn lane, and a separate right turn lane.

- The recommended improvements would fully mitigate the cumulative projects-related impacts at the 13 impacted intersections.

I. INTRODUCTION

This report documents the assumptions, methodologies and findings of a study conducted by Raju Associates, Inc., to evaluate the potential traffic impacts of the proposed Marin Luther King Jr. Medical Campus Center Redevelopment Project. This Project is located at 12021 Wilmington Avenue in the Willowbrook community of Los Angeles County, California.

PROJECT DESCRIPTION

The Proposed Project site is located on the existing 38-acre Martin Luther King Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles, California. The Proposed Project site is bounded on the north by 120th Street, on the west by Compton Avenue, on the east by Wilmington Avenue and on the south by an alley which separates the Proposed Project site from the residential neighborhood. Figure 1 illustrates the location of the Proposed Project in relation to the surrounding street system.

The existing Martin Luther King Jr. Medical Center Campus consists of 15 buildings containing a total of approximately 1,243,692 square feet. Table 1 includes a list of the existing buildings and their square footages. As indicated in the table, the multiservice ambulatory care center (MACC) building is the largest building on the campus at 495,335 square feet. Currently, the existing campus is not fully operational, but does provide various outpatient and administrative support services.

The Proposed Project consists of two tiers. Tier I involves construction of 156,700 square feet including a new MACC and ancillary buildings, tenant improvements in existing buildings, and site improvements. As proposed, the MACC building would be a four-story building consisting of approximately 132,000 square feet. The proposed ancillary building would be a two-story structure consisting of approximately 24,700 square feet. The tenant improvement would be performed in the North and South Support buildings, Interns and Physicians building and Plant Management building to provide support to the new MACC building. Additionally, Tier I would include site improvement consisting of a new parking terrace, new parking lots, and re-striping of existing lots.

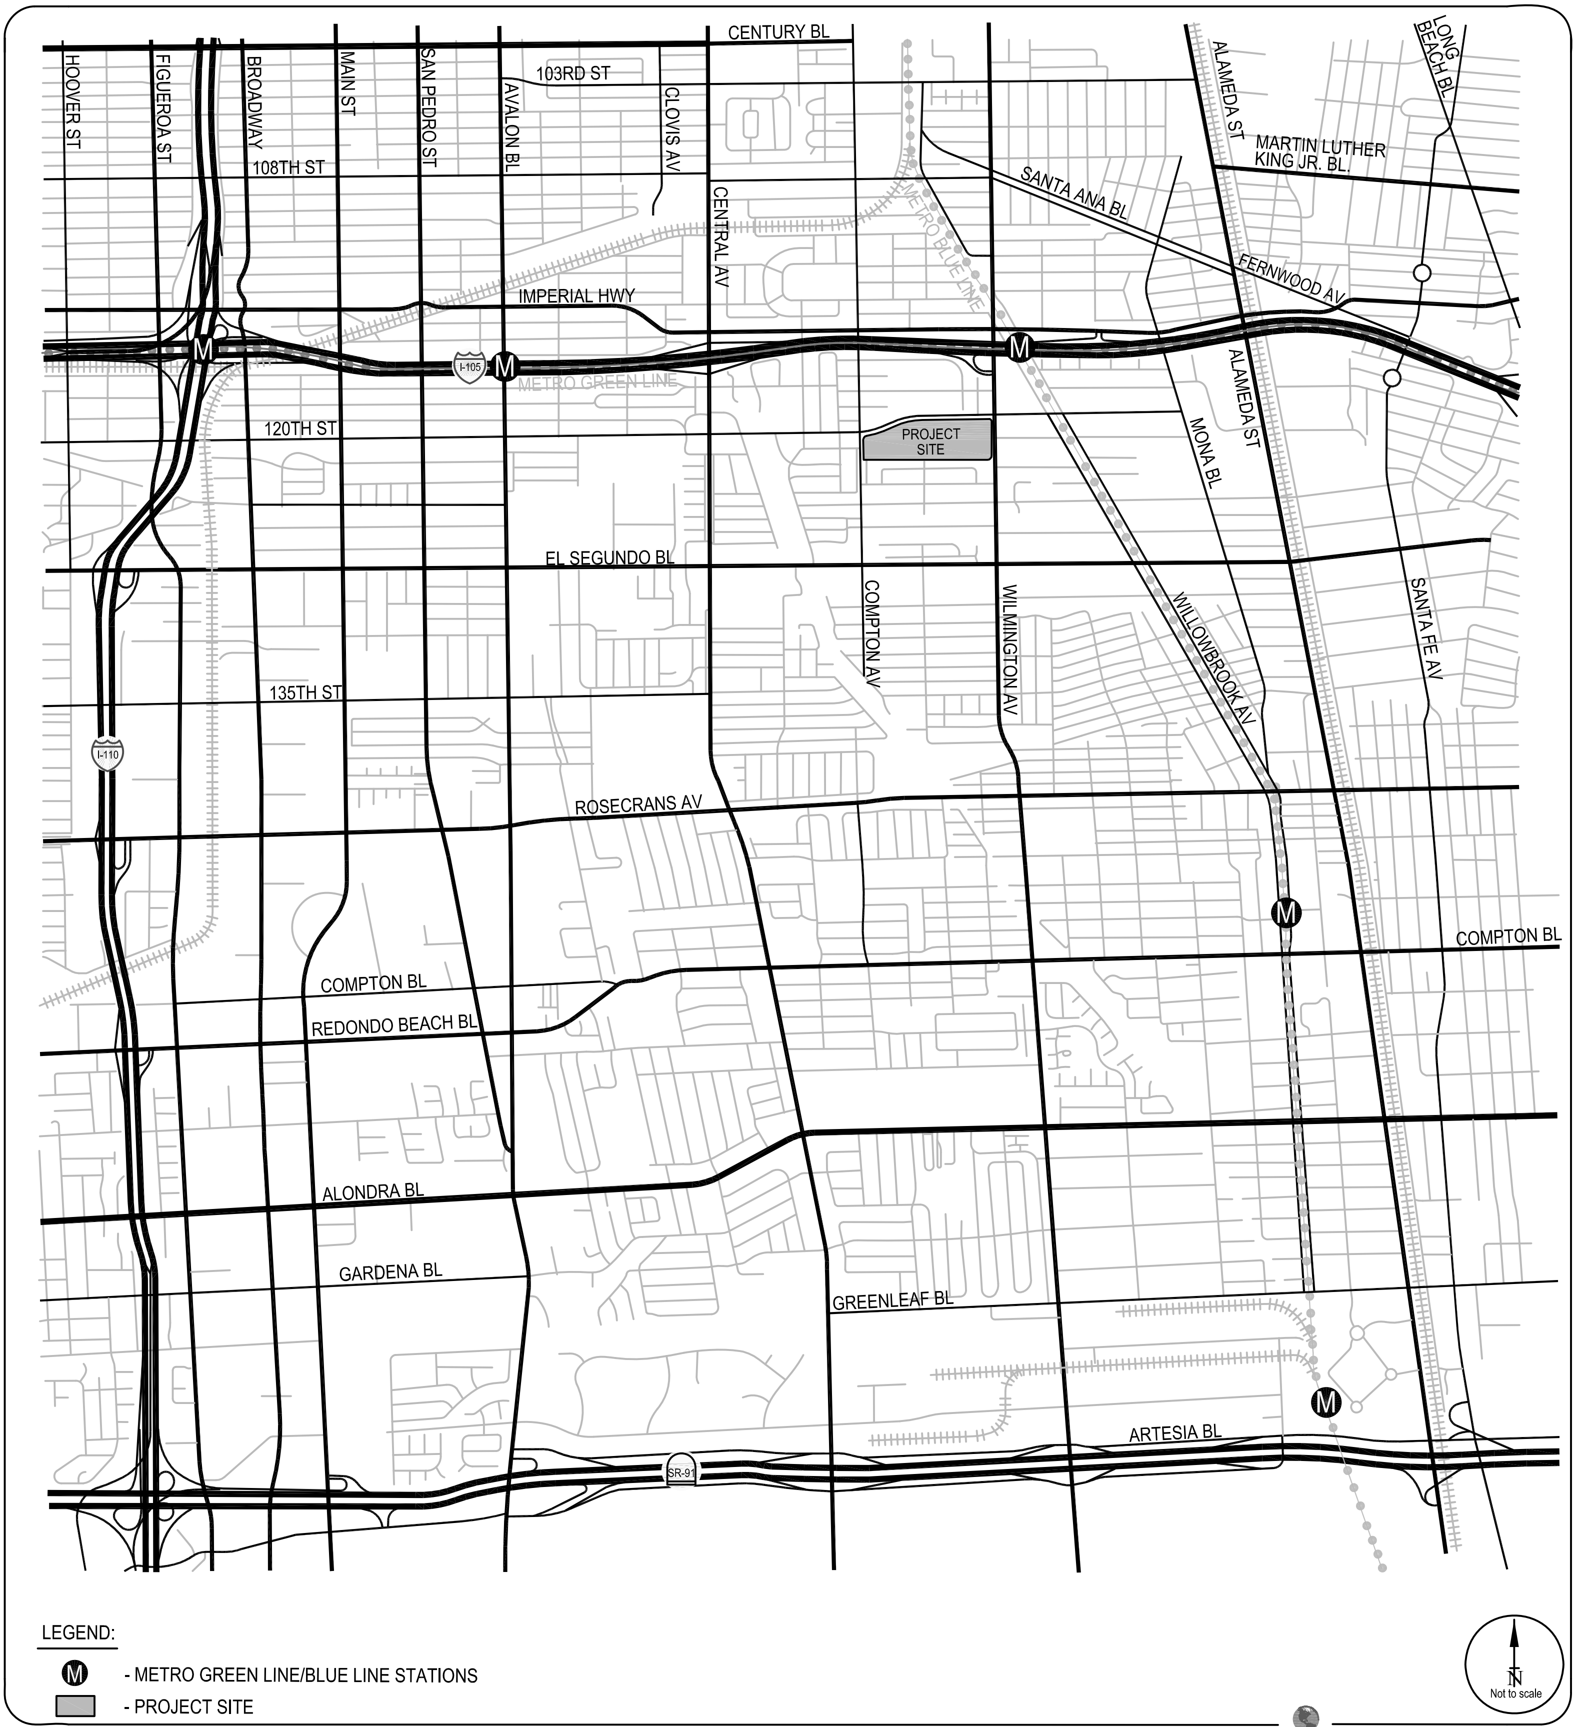

FIGURE 1
PROJECT LOCATION

TABLE 1
EXISTING MARTIN LUTHER KING JR. MEDICAL CENTER CAMPUS

Building #	Building Name	Current Total Floor Area (s.f.)
1	Geneses Clinic	2,100
2	Oasis Clinic (Old)	2,580
3	Oasis Clinic (New)	1,850
4	Registration Building	10,950
5	Augustus F. Hawkins Comprehensive Mental Health Center	226,818
6	Inpatient Tower	187,676
7	Existing MACC	495,335
8	Pediatric Acute Care	7,878
9	Medical Records and Laundry	26,355
10	Central Plant	24,103
11	Plant Management	15,648
12	North Support Building	52,276
13	South Support Building	34,762
14	Interns and Physicians Building	124,391
15	Emergency Room	3,300
16	Storage Building	1,060
17	MRI Building	1,100
18	Claude Hudson Auditorium	3,922
19	Cooling Towers [1]	6,790
20	Hub Clinic	12,265
21	Storage Building [2]	2,533

[1] These structures would likely be demolished following the reuse of replacement of the existing MACC building.

[2] This building is in the footprint of the Central Plant expansion but may just be incorporated during design and remain.

Source: *Martin Luther King, Jr. Medical Center Campus Redevelopment Project Initial Study*, Sapphos Environmental, Inc., March 8, 2010

The construction of Tier I would also include the removal of four structures containing approximately 506,485 square feet. These structures include the existing MACC building, emergency room, storage building and cooling towers and will be either reused or replaced under Tier II of the Project. It is anticipated that the Tier I Project would be completed by Year 2014. The Project site plan for Tier I and II is shown in Figure 2.

Tier II of the Proposed Project would entail the development of a campuswide master plan. Tier II would have the potential to build out approximately 1,814,695 square feet of development on the Proposed Project site. As proposed, Tier II would consist of 1,134,695 square feet of hospital use, 80,000 square feet of retail use, 300,000 square feet of medical office use, 150,000 square feet of general office use, and 100 single family residential dwelling units (approximately 150,000 square feet). It is anticipated that the Tier II Project would be completed by Year 2020.

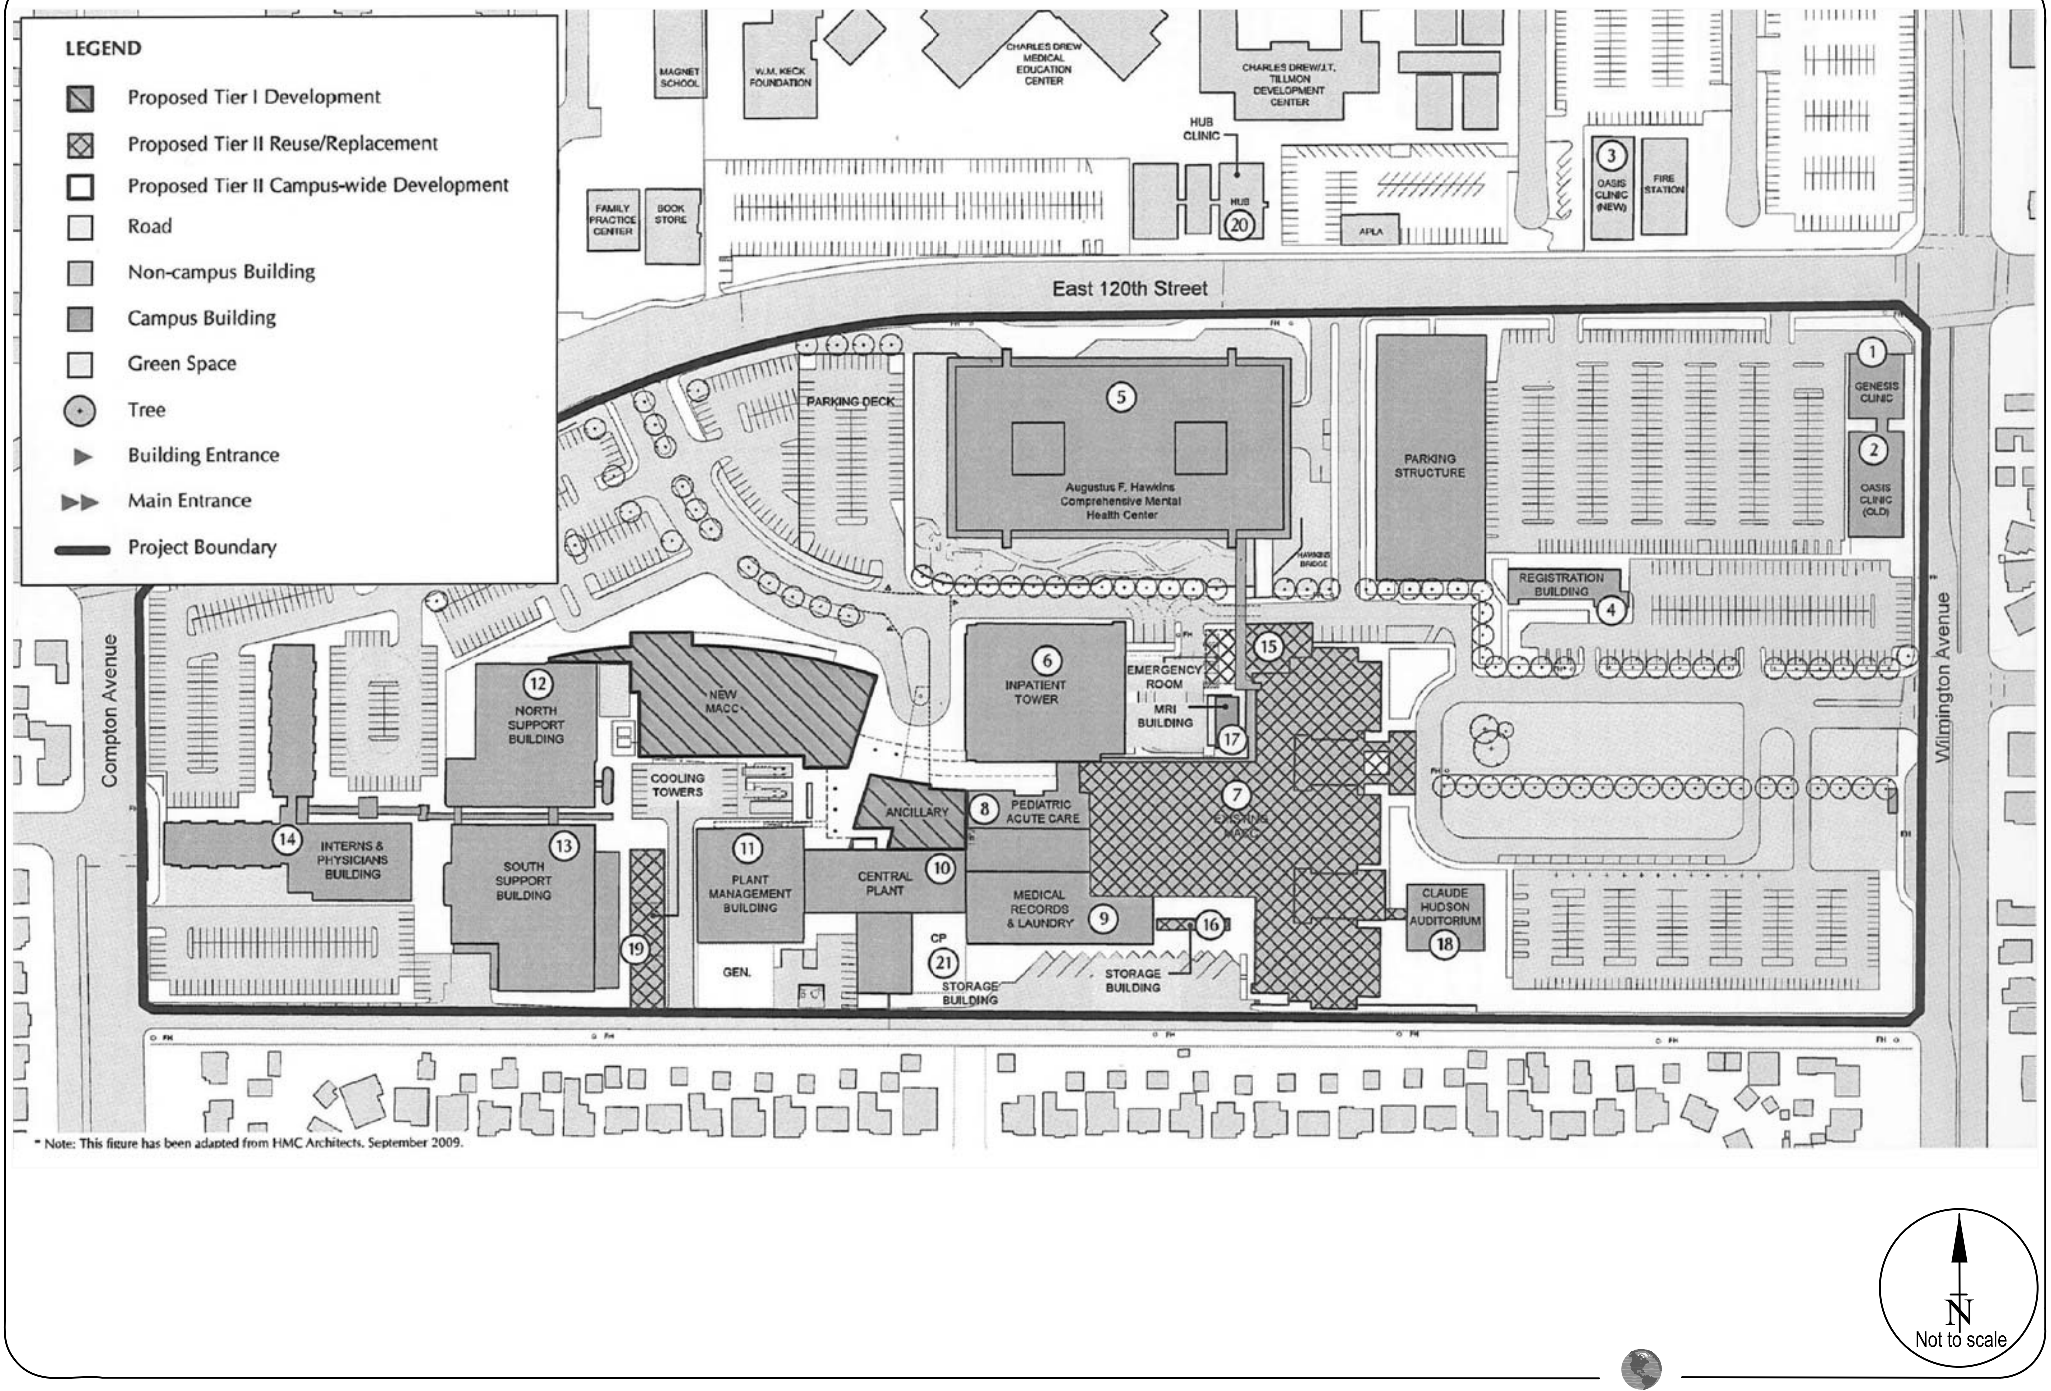
Currently several driveways located along 120th Street and one driveway along Wilmington Avenue provide access to the Project site.

STUDY SCOPE

The scope of work for this study was developed in conjunction with the County of Los Angeles Department of Public Works staff. The base assumptions, technical methodologies and geographic coverage of the study were all identified as part of the study approach. For this traffic study, a total of 64 intersections within four jurisdictions are analyzed as part of this study. A listing of these intersections by jurisdiction is presented in Table 2 and their locations are illustrated in Figure 3. Of these study locations, 27 are in the County of Los Angeles (with 10 intersections sharing joint jurisdiction with the other cities), 20 are in the City of Los Angeles, 12 are in the City of Compton, and 5 are in the City of Lynwood.

The study is directed at the analysis of potential traffic impacts on the street system produced by the Proposed Project and includes an analysis of the following scenarios:

- Existing (2010) Conditions - The analysis of existing traffic conditions is intended to provide a basis for the remainder of the study. The existing conditions analysis includes an assessment of streets, traffic volumes, and operating conditions.



* Note: This figure has been adapted from HMC Architects, September 2009.

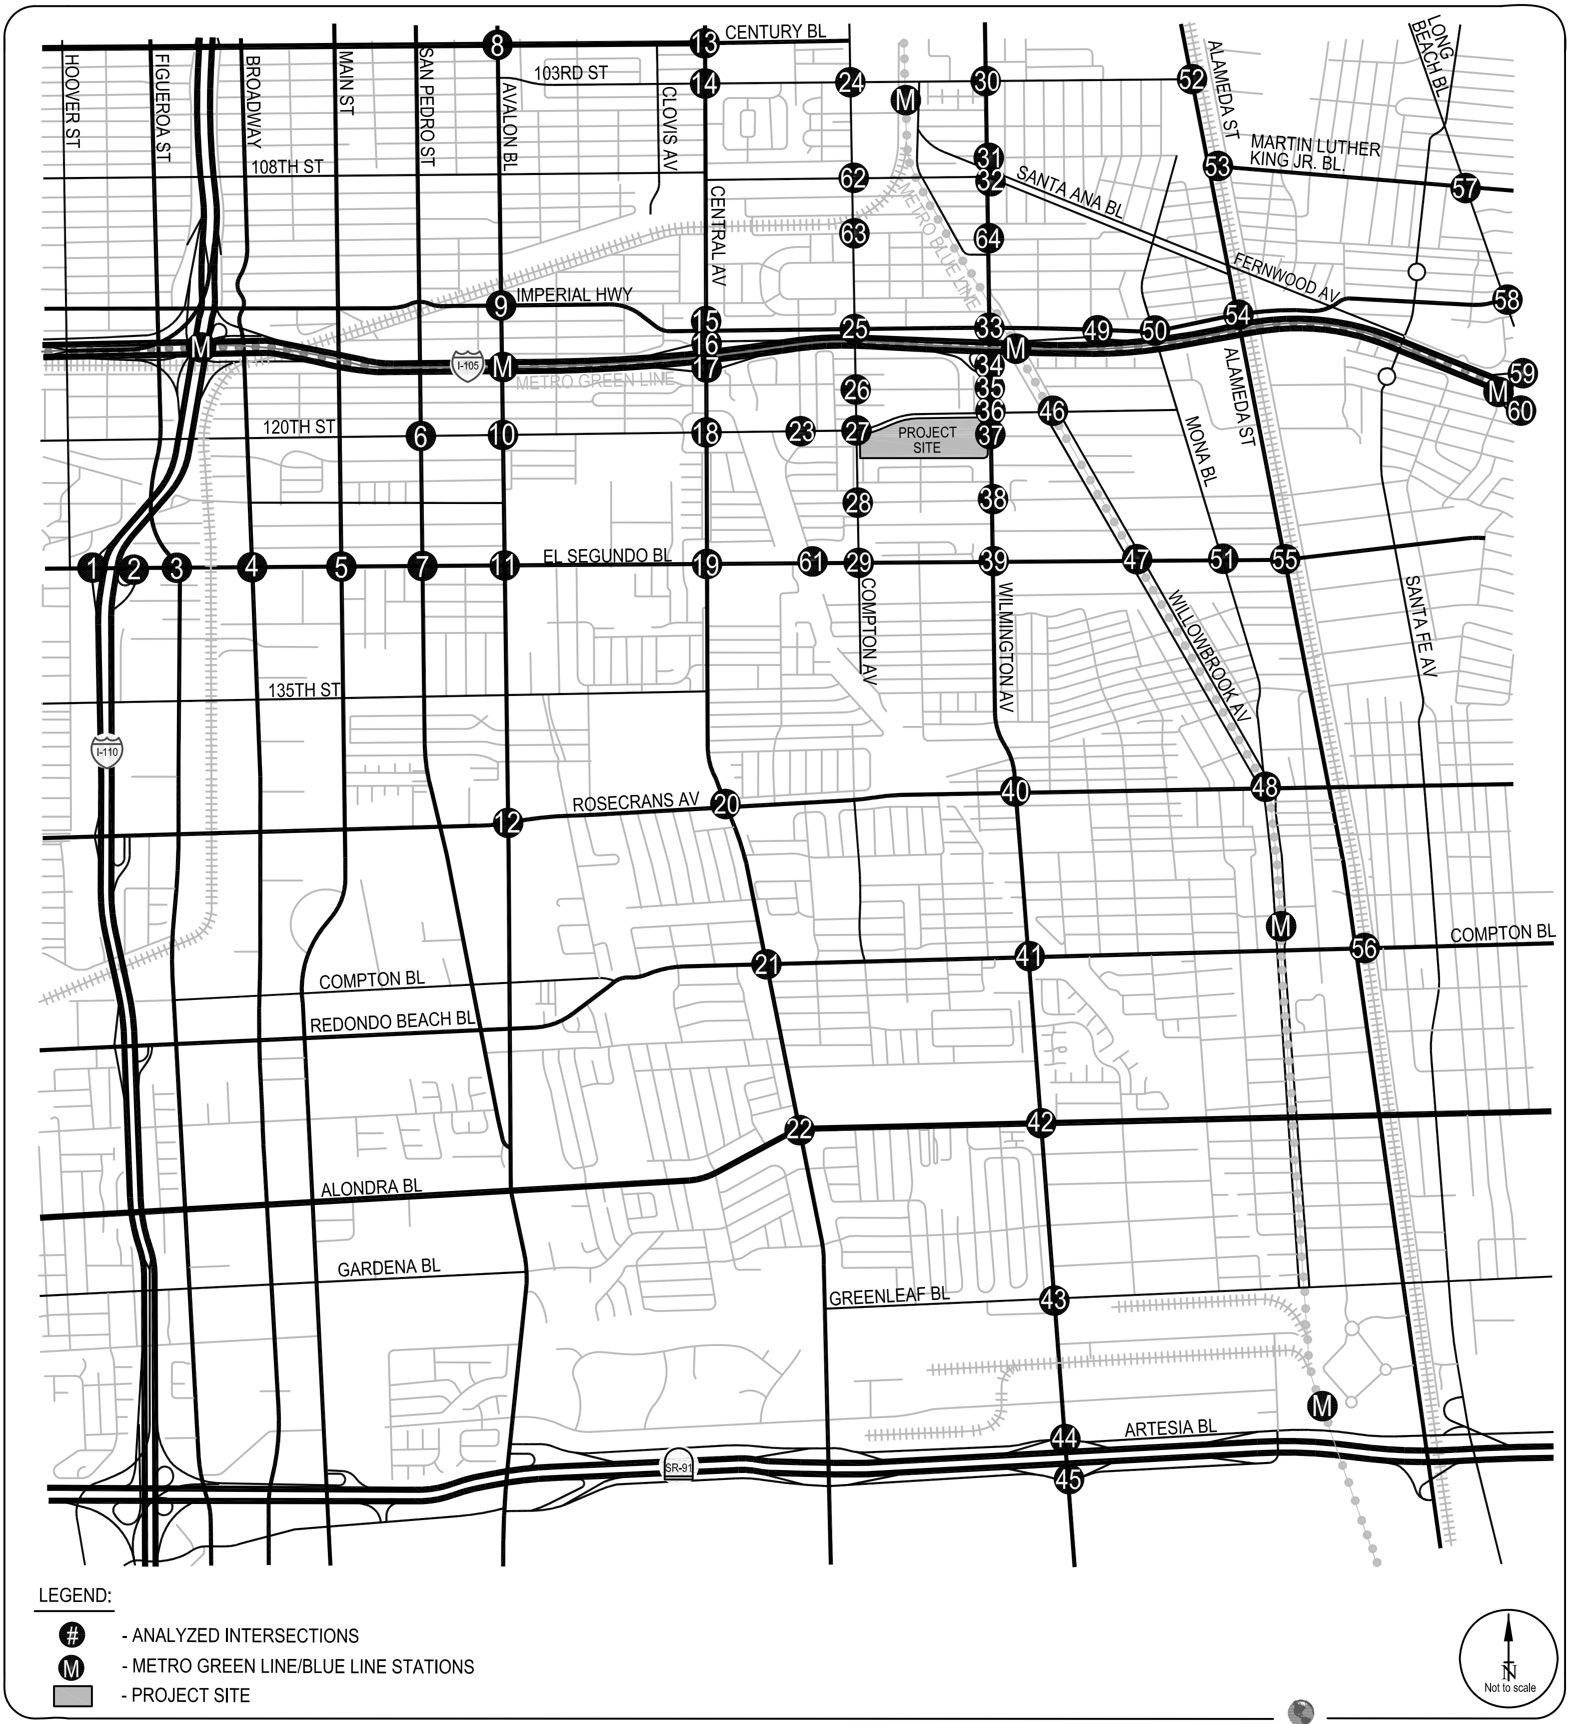

FIGURE 3
LOCATION OF ANALYZED INTERSECTIONS

RAJU Associates, Inc.

Future Year 2014 Conditions – Tier I Analysis

Traffic analysis scenarios for County of Los Angeles study locations, based on County of Los Angeles traffic study guidelines:

- Existing Baseline with Ambient Growth (2014) Conditions - Future traffic conditions without the proposed project have been developed for the year 2014. The objective of this analysis is to project future traffic growth and operating conditions, which could be expected to result from regional growth in the vicinity of the study area by the year 2014. This scenario serves as the point of reference to compare the Tier I Project conditions to, for estimation of traffic impacts.

- Existing Baseline with Ambient Growth (2014) plus Tier I Project Conditions - The net traffic expected to be generated by the Proposed Tier I Project is estimated and added to the Existing Baseline with Ambient Growth (2014) traffic forecasts. The impacts of the Proposed Tier I Project on future traffic operating conditions are then identified.

- Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects Conditions – The net traffic expected to be generated by the Proposed Tier I Project and related projects is estimated and added to the Existing Baseline with Ambient Growth (2014) traffic forecasts. The impacts of the cumulative projects (including the Proposed Tier I Project) on future traffic operating conditions are then identified.

Traffic analysis scenarios for Cities of Los Angeles, Compton and Lynwood study locations, based on the other jurisdictions and Congestion Management Program for Los Angels County traffic study guidelines:

- Cumulative (2014) Base Conditions - Future traffic conditions without the proposed project has been developed for the year 2014. The objective of this analysis is to project future traffic growth and operating conditions, which could be expected to result from regional growth and related projects in the vicinity of the study area by the year 2014. This scenario serves as the point of reference to compare the Tier I Project conditions to, for estimation of traffic impacts.

- Cumulative (2014) Plus Tier I Project Conditions – Same as Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects Conditions. The impacts of the Proposed Tier I Project on future traffic operating conditions are then identified.

Future Year 2020 Conditions – Tier II Analysis

Traffic analysis scenarios for County of Los Angeles study locations, based on County of Los Angeles traffic study guidelines:

- Existing Baseline with Ambient Growth (2020) Conditions - Future traffic conditions without the proposed project have been developed for the year 2020. The objective of this analysis is to project future traffic growth and operating conditions, which could be expected to result from regional growth in the vicinity of the study area by the year 2020. This scenario serves as the point of reference to compare the Tier II Project conditions to, for estimation of traffic impacts.

- Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Conditions - The net traffic expected to be generated under Proposed Tier II Project conditions is estimated and added to the Existing Baseline with Ambient Growth (2014) traffic forecasts. The impacts of the Proposed Tier II Project on future traffic operating conditions are then identified.

- Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects Conditions – The net traffic expected to be generated by the Proposed Tier I and Tier II Project and related projects is estimated and added to the Existing Baseline with Ambient Growth (2014) traffic forecasts. The impacts of the cumulative projects (including the Proposed Tier II Project) on future traffic operating conditions are then identified.

- Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects Conditions and Mitigations – Future Year 2020 traffic conditions with the Tier I and II Project and related projects and its mitigation measures to address the significant impacts of the Proposed Tier II Project are analyzed in this scenario. Residual significant impacts, if any, are identified in this evaluation.

Traffic analysis scenarios for Cities of Los Angeles, Compton and Lynwood study locations, based on the other jurisdictions and Congestion Management Program for Los Angels County traffic study guidelines:

- Cumulative (2020) Base Conditions - Future traffic conditions without the proposed project has been developed for the year 2020. The objective of this analysis is to project future traffic growth and operating conditions, which could be expected to result from regional growth and related projects in the vicinity of the study area by the year 2020. This scenario serves as the point of reference to compare the Tier II Project conditions to, for estimation of traffic impacts.

- Cumulative (2020) Plus Tier I and II Project Conditions – Same scenario as Existing Baseline with Ambient Growth (2020) plus Tier I and Tier II Project and Related Projects Conditions. The impacts of the Proposed Tier II Project on future traffic operating conditions are then identified.

- Cumulative (2020) Plus Tier I and II Project Conditions and Mitigations – Same scenario as Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects Conditions and Mitigations. Residual significant impacts, if any, are identified in this evaluation.

As part of the Congestion Management Program and Caltrans analysis, 12 freeway segments are also analyzed. These locations include segments of the Century (I-105) Freeway, Harbor (I-110) Freeway, Long Beach (I-710) Freeway and Artesia (SR-91) Freeway.

A detailed Memorandum of Understanding (MOU) was prepared in coordination with the County of Los Angeles Department of Public Works. The MOU includes among other details, a description of the Proposed Project and its trip generation characteristics. Since obtaining the county-approved MOU, the Proposed Tier I Project size has slightly increased and is reflected in this traffic study report and traffic impact analysis. A copy of the County-approved MOU is attached in Appendix A of this report.

ORGANIZATION OF REPORT

An executive summary presenting key details of the study is provided at the beginning of this report. The rest of the report is divided into seven chapters. Chapter I presents an introduction and provides details of the various elements of the study. Chapter II describes the existing circulation system, traffic volumes, and traffic conditions within the study area. Chapter III presents the methodology to obtain Future Year 2014 traffic volumes and the assessment of traffic conditions with and without the Tier I Project and the potential traffic impacts due to the Proposed Tier I Project (and related projects). Chapter IV presents the methodology to obtain Future Year 2020 traffic volumes and the assessment of traffic conditions with and without the Tier II Project and the potential traffic impacts due to the Proposed Tier II Project (and related projects). The results of the analysis of the Proposed Project's impacts on the Congestion Management Program (CMP) regional transportation system are provided in Chapter V. Chapter VI discusses the Project alternatives analyses. A summary of the analysis and conclusions is included in Chapter VII. Appendices to this report include details of the technical analysis.

II. EXISTING CONDITIONS

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions within the study area. The assessment of conditions relevant to this study includes an inventory of the street system, traffic volumes on these facilities, and operating conditions at key intersections. A detailed description of these elements is presented in this chapter.

STUDY AREA

The Proposed Project site is located on the existing 38-acre Martin Luther King Jr. Medical Center Campus, at 12021 Wilmington Avenue in the unincorporated area of Willowbrook, County of Los Angeles, California. The Proposed Project site is bounded on the north by 120th Street, on the west by Compton Avenue, on the east by Wilmington Avenue and on the south by an alley which separates the Proposed Project site from the residential neighborhood. The street system within immediate vicinity of the Project site is under the jurisdiction of the County of Los Angeles.

The Proposed Project is located approximately 3 miles north of Artesia (SR-91), approximately 2 miles east of the Harbor (I-110) Freeway, approximately one-quarter mile south of the Century (I-105) Freeway and approximately 3 miles northeast of the Long Beach (I-710) Freeway.

The Project study area encompasses a geographic area bounded by Century Boulevard to the north, the I-I10 Freeway to the west, the SR-91 Freeway to the south and Long Beach Boulevard to the east. The study area was established by working closely with the County of Los Angeles staff. Within the study area, 64 intersections have been selected for detailed study within the County of Los Angeles and Cities of Los Angeles, Compton, and Lynwood. Fourteen freeway segments located along the Harbor (I-110) Freeway, Artesia (SR-91) Freeway, Century (I-105) Freeway and Long Beach (I-710) Freeway have also been selected for evaluation in this study.

EXISTING STREET SYSTEM

The existing street system within the study area consists of a regional highway system including major arterials and a local street system including secondary arterials, collectors and local streets. A description of the regional and local access and circulation offered by the various roadways follows.

Primary regional access to the Project site is provided by the Century (I-105) Freeway, the San Harbor (I-110) Freeway, the Long Beach (I-710) Freeway and the Artesia (SR-91) Freeway. The I-105 Freeway, which runs in the east-west direction, south of the project site, connects with the I-110 and I-710 Freeways, which run north-south. The SR-91 Freeway, which also runs east-west south of the Project site, connects with the I-110 and I-710 Freeways.

The arterials in the vicinity of the study area providing regional and sub-regional access to the project site include Imperial Highway, Wilmington Avenue, Central Avenue, El Segundo Boulevard, Alameda Street, 108th Street, 111th Street, 119th Street, 120th Street, Compton Avenue, Avalon Avenue, Willowbrook Avenue, Mona Boulevard, Rosecrans Avenue, Slater Street and Success Avenue.

Local and sub-regional access and circulation opportunities within the project study area are provided by a grid network of major highways, secondary highways, collector streets and selected local streets. These facilities generally provide two to four travel lanes and allow parking on either side of the street. Typically, the speed limits range between 25 mph and 35 mph.

Brief descriptions of facilities serving the immediate vicinity of study area are included in the following section (the street classifications are per the County of Los Angeles' and City of Los Angeles' General Plan designation):

- Compton Avenue – Compton Avenue is a secondary arterial roadway. It runs in a north-south direction across several jurisdictions and defines the western boundary of the Project site. The posted speed limit is 35 miles per hour in the vicinity of the study area. Within the study area, the roadway generally offers four travel lanes, two lanes in each direction with a double yellow median. Parking is generally allowed along this roadway.

- 120th Street – 120th Street is a secondary arterial roadway that traverses in an east-west direction and defines the northern boundary of the Project site. This roadway provides four travel lanes, two lanes in each direction with a double yellow median. The posted speed limit is 25 miles per hour. In the vicinity of the Project site, parking is allowed along this roadway. At Wilmington Avenue, this roadway becomes 119th Street. The 120th Street roadway continues east of Wilmington Avenue, south of 119th Street. This segment of 120th Street is a local street and provides two lanes, one lane in each direction. Parking is allowed along this roadway.

- <u>119th Street</u> – 119th Street begins east of Wilmington Avenue and is a continuation of 120th Street. 119th Street is a secondary arterial roadway that traverses in an east-west direction. This roadway offers two travel lanes, one lane per direction with a center left-turn median. Parking is allowed along this roadway. The posted speed limit along this facility is 25 miles per hour.

- <u>Wilmington Avenue</u> – Wilmington Avenue is a major arterial roadway that runs in a north-south direction and defines the eastern boundary of the Project site. This roadway offers four travel lanes, two lanes per direction and provides connection to the I-105 Freeway eastbound on-off ramps. Parking is allowed along this roadway. North of El Segundo Boulevard, the posted speed limit is 35 miles per hour.

- <u>El Segundo Boulevard</u> – El Segundo Boulevard is an east-west major arterial roadway. The posted speed limit varies from 35 to 40 miles per hour. The roadway generally offers six travel lanes, three lanes in each direction, with a central left-turn median. Parking is generally allowed along many stretches of this roadway within the study area. This roadway provides on- and off-ramps to the I-110 Freeway.

- <u>Imperial Highway</u> – Imperial Highway is classified as a major arterial roadway and runs in an east-west direction north of the Project site. The posted speed limit is 40 miles per hour. The roadway generally offers six travel lanes, three lanes in each direction, with a central left-turn median. Restricted on-street parking is allowed along this roadway. This roadway provides on- and off-ramps to the I-105 Freeway.

- <u>Rosecrans Avenue</u> – Rosecrans Avenue is a major arterial roadway that traverses in an east-west direction. This roadway offers four travel lanes, two lanes per direction with a raised median. This roadway provides connection to both the I-110 Freeway and I-710 Freeway on-off ramps. Parking is allowed along this roadway. The posted speed limit is 40 miles per hour.

- <u>Avalon Boulevard</u> – Avalon Boulevard is a major arterial roadway that runs in a north-south direction and offers four travel lanes, two lanes per direction. Parking is allowed along many stretches of this roadway. The posted speed limit is 35 miles per hour.

- <u>Central Avenue</u> – Central Avenue is classified as a major arterial roadway that traverses in a north-south direction. The posted speed limit is 35 miles per hour. The roadway generally offers four travel lanes, two lanes in each direction, with a central left-turn median and provides on- and off-ramps to the I-105 Freeway. Parking is allowed along this roadway within the study area.

- Willowbrook Avenue (West) – Willowbrook Avenue (West) is classified as a secondary arterial roadway that traverses in a north-east to south-west direction. The posted speed limit is 35 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with a single dashed yellow median. Parking is allowed along the east side of this roadway within the study area.

- Willowbrook Avenue (East) – Willowbrook Avenue (East) is classified as a secondary arterial roadway that traverses in a north-east to south-west direction. The posted speed limit is 35 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with a single dashed yellow median. Parking is allowed along the west side of this roadway within the study area.

- Mona Boulevard – Mona Boulevard is classified as a secondary arterial roadway that runs in a north-east to south-west direction. The posted speed limit is 40 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with undivided median. Parking is allowed along this roadway within the study area.

- Alameda Street – Alameda Street is classified as a secondary arterial roadway that traverses in a north-east to south-west direction. The posted speed limit is 40 miles per hour. The roadway generally offers four travel lanes, two lanes in each direction, with central left-turn median. Parking is allowed along many stretched of this roadway within the study area.

- 108th Street – 108th Street is classified as a secondary arterial roadway that traverses in east-west direction. The posted speed limit is 35 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with central left-turn median. Restricted on-street parking is allowed along this roadway within the study area.

- 111th Street – 111th Street is classified as a collector roadway that traverses in an east-west direction. The posted speed limit is 25 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with undivided median. Restricted on-street parking is allowed along this roadway within the study area.

- Success Avenue – Success Avenue is a local street that runs in a north-south direction. The speed limit is 25 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with single dashed median. Restricted on-street parking is allowed along this roadway within the study area.

- Slater Avenue – Slater Avenue is a local street that runs in a north-south direction. The speed limit is 25 miles per hour. The roadway generally offers two travel lanes, one lane in each direction, with single dashed median. Restricted on-street parking is allowed along this roadway within the study area.

The roadway segment characteristics and existing lane configurations at each of the analyzed intersections are included in Appendix B.

EXISTING TRAFFIC VOLUMES AND LEVELS OF SERVICE

The following sections present the existing intersection peak hour traffic volumes, a description of the methodology utilized to analyze the intersection operating conditions, and the resulting level of service conditions at each of the study locations.

Existing Traffic Volumes

Weekday morning and evening peak hour traffic counts were compiled from data collected at the 64 analyzed intersections in January and April 2010. These traffic volumes reflect typical weekday operations during current year 2010 conditions. The traffic volumes in Figure 4A-4E represent, for the purposes of this analysis the Existing 2010 AM and PM peak hour conditions, respectively. The raw data showing the counts are attached in Appendix C.

Existing on-site peak hour traffic counts were conducted at the existing driveways along 120th Street and Wilmington Avenue. Based on the observed driveway counts, the existing Project site generates a total of 706 trips (528 inbound, 178 outbound) during the morning peak hour and 527 trips (124 inbound, 403 outbound) during the evening peak hour. Raw driveway traffic counts are also included in Appendix C.

Level of Service Methodology

Level of Service (LOS) is a qualitative measure used to describe the condition of traffic flow, ranging from excellent conditions at LOS A to overloaded conditions at LOS F. LOS D is typically recognized as the minimum acceptable level of service in urban areas. The Level of Service definitions for signalized intersections is provided in Table 3. All of the analyzed intersections are controlled by traffic signals.

The Intersection Capacity Utilization (ICU) method of intersection analysis, per the County of Los Angeles traffic impact study guidelines for analyzing intersection conditions, was used to determine the intersection volume to capacity (V/C) ratio and corresponding level of service at each study intersection. A capacity of 1,600 vehicles per lane per hour and 2,880 for dual left-turn lanes was assumed in the capacity calculations in accordance with the guidelines. Table 3 defines the ranges of V/C ratios and corresponding levels of service for signalized intersections.

TABLE 3
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	EXCELLENT. No Vehicle waits longer than one red light and no approach phase is fully used.
B	>0.600 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	>0.700 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	>0.800 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	>0.900 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

Source: Transportation Research Board, *Transportation Research Circular No. 212, Interim Materials on Highway Capacity* , 1980.

Nine of the 64 signalized study intersections are currently controlled by the City of Los Angeles' Automated Traffic Surveillance and Control (ATSAC) System and Adaptive Traffic Control System (ATCS) and are part of the Harbor-Gateway ATSAC system. A capacity increase of 10% (0.07 V/C adjustments for ATSAC and 0.03 V/C adjustments for ATCS) was applied to reflect the benefits of ATSAC/ATCS control at these intersections. This includes the following 9 locations:

- I-110 Northbound Ramps/El Segundo Boulevard
- I-110 Southbound Ramps/El Segundo Boulevard
- Avalon Boulevard/Imperial Highway
- Central Avenue/Century Boulevard
- Central Avenue/103rd Street
- Central Avenue/Imperial Highway
- Compton Avenue/Imperial Highway
- Compton Avenue/103rd Street
- Wilmington Avenue/Imperial Highway

LADOT has indicated that an additional 9 of the study intersections will become part of the Harbor-Gateway ATSAC system in mid-2010 as part of the Harbor-Gateway Phase 1B Project. A capacity increase of 10% will be applied to the future 2014 and 2020 conditions to reflect the benefits of ATSAC/ATCS control at these intersections. This includes the following 9 locations:

- Avalon Boulevard/Century Boulevard
- Avalon Boulevard/120th Street
- Central Avenue/I-105 Westbound Ramps
- Central Avenue/I-105 Eastbound Ramps
- Central Avenue/120th Street
- Compton Avenue/108th Street
- Compton Avenue/111th Street
- I-105 Westbound Ramps/Imperial Highway
- Mona Avenue/Imperial Highway

Existing Levels of Service

The existing traffic volumes presented in Figures 3A-3E for AM and PM peak hours, respectively, were used in conjunction with the level of service methodologies described above, and the current intersection characteristics illustrated in Appendix B, to determine the existing operating conditions at the analyzed intersections.

Existing intersection operations for the AM and PM peak hours are shown in Table 4. Table 4 summarizes the V/C ratios and corresponding LOS at each location. From Table 4, the following observations can be made. Sixty-three of the 64 study intersections in both the morning and evening peak hours are currently operating at satisfactory levels of service (i.e., LOS D or better). At these locations, motorists experience little to tolerable amounts of delay. The remaining study intersection, Long Beach Boulevard and Imperial Highway, is operating at LOS E in the morning peak hour and is operating at LOS F in the evening peak hour.

Capacity calculation worksheets for Existing (2010) conditions are provided in Appendix D of the report.

EXISTING TRANSIT CONDITIONS

Both bus and Metro rail transit service (Metro Green Line and Blue Line) are available as part of the public transit system in the Study Area. Twenty-four bus lines, including a ‘Rapid Bus Line’, currently serve the study area. These bus lines are operated by Los Angeles County Metropolitan Transportation Authority (Metro or MTA), City of Los Angeles Dash Watts (DWTS), City of Compton Renaissance Transit System (CRT), City of Gardena Municipal Bus Line (GMB), Hahn Trolley and Shuttle Service (HTSS) and Rosewood Smart Shuttle (RSS).

Bus transit service in the Project vicinity is available along the following travel corridors:

- Rosecrans Avenue travel corridor
- Avalon Boulevard travel corridor
- Central Avenue travel corridor
- Wilmington Ave travel corridor
- Willowbrook Avenue travel corridor
- 120th Street travel corridor
- Imperial Highway travel corridor
- El Segundo Boulevard travel corridor

The following provides a brief description of the bus lines providing service in the vicinity of the Project Site:

- MTA 26 - Line 26 is a local north/south line that provides service from Los Angeles to Gardena and travels primarily along Avalon Boulevard within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 10 minutes. The northern terminus is at the intersection of Hollywood Boulevard and Rodney Drive in Los Angeles. The southern terminus is at the Artesia Transit Center in Gardena.

- MTA 51/52/352 - Lines 51/52/352 are local north/south lines that provide service from Los Angeles to Compton and travels primarily along Avalon Boulevard within the study area. These lines run everyday, including holidays, at a peak frequency of approximately 10 minutes. The northern terminus is at the intersection of Wilshire/Vermont Metro Station in Los Angeles. The southern terminus is at MLK Jr. Transit Center Station in Compton.

- MTA 48 - Line 48 is a local north/south line that provides service from Downtown Los Angeles to Willowbrook and travels primarily along 120th Street, Avalon Boulevard and Imperial Highway within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 10 minutes. The northern terminus is at the intersection of Temple Street and Figueroa Street in Downtown Los Angeles. The southern terminus is at the Avalon Green Line Station in Willowbrook.

- MTA 53 - Line 53 is a local north/south line that provides service from Carson to Downtown Los Angeles and travels primarily along Central Avenue, 120th Street, Avalon Boulevard and Imperial Highway within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 10 minutes. The northern terminus is at the intersection of Beaudry Avenue and 5th Street in Downtown Los Angeles. The southern terminus is CSU Dominguez Hills in Carson.

- MTA 55/355 - Line 55/355 is a local north/south line that provides service from Downtown Los Angeles to Willowbrook and travels primarily along Compton Avenue, 120th Street and Wilmington Avenue within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 15 minutes during peak commute hours. The northern terminus is at the intersection of Sunset Boulevard and Figueroa Street in Downtown Los Angeles. The southern terminus is at the Imperial/Wilmington/Rosa Parks Green Line Station in South Los Angeles.

- MTA 121 - Line 121 is a local east/west line that provides service from Willowbrook to Whittier and travels primarily along Willowbrook Avenue and 119th Street within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 20 minutes. The eastern terminus is at the Whittwood Center in Whittier. The western terminus is at the Imperial/Wilmington Station.

- MTA 125 - Line 125 is a local east/west line that provides service from Norwalk to El Segundo and travels primarily along Rosecrans Avenue within the study area. This line runs everyday, including some holidays, at a peak frequency of approximately 15 minutes.

The eastern terminus is at the Norwalk Station in South Los Angeles. The western terminus is at El Segundo Plaza in El Segundo.

- MTA 202 - Line 202 is a local north/south line that provides service from Willowbrook to Wilmington and travels primarily along Willowbrook Avenue within the study area. This line runs Monday through Friday, including some holidays, at a peak frequency of approximately 30 minutes. The northern terminus is at the Imperial/Wilmington/Rosa Parks Green Line Station in South Los Angeles. The southern terminus is at the intersection of Avalon Boulevard and D Street in Wilmington.

- MTA 205 - Line 205 is a local north/south line that provides service from Willowbrook to San Pedro and travels primarily along Wilmington Avenue within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 20 minutes. The northern terminus is at the Imperial/Wilmington/Rosa Parks Green Line Station in South Los Angeles. The southern terminus is at the intersection of Gaffey Street/13th Street in San Pedro.

- MTA 305 - Line 305 is a local north/south line that provides service from Willowbrook to Westwood and travels primarily along Wilmington Avenue, 119th Street and Willowbrook Avenue within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 40 minutes. The northern terminus is at the UCLA Ackerman Loop in Westwood. The southern terminus is at the Imperial/Wilmington/Rosa Parks Green Line Station in South Los Angeles.

- MTA 612 - Line 612 is a local circulator route that provides service around Willowbrook area and primarily travels along Wilmington Avenue and Imperial Highway within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 45 minutes.

- MTA 753 - Line 753 is a north/south 'Rapid Bus Line' that provides service from Willowbrook to Downtown Los Angeles and travels primarily along Wilmington Avenue, 190th Street, Willowbrook Avenue and Imperial Highway within the study area. This line runs Monday through Friday at a peak frequency of approximately 15 minutes. The northern terminus is at the intersection of Beaudry Avenue and 5th Street in Downtown Los Angeles. The southern terminus is at the Imperial/Wilmington Green Line Station in South Los Angeles.

- LADOT Dash Watts – This is a LADOT Dash line that provides service to the Watts area of Los Angeles. This line is a local circulator route that travels primarily along 120th Street within the study area. This line runs Monday through Saturday, including some holidays, at a peak frequency of approximately 20 minutes. The terminus is at the Kenneth Hahn Plaza in Willowbrook.

- HTSS 1 – Line 1 is a local circulator route that provides service around the Willowbrook area and travels primarily along Wilmington Avenue within the study area. This line runs Monday through Saturday, including some holidays, at a peak frequency of approximately 30 minutes. The terminus is at the Kenneth Hahn Plaza in Willowbrook.

- HTSS 2 – Line 2 is a local circulator route that provides service around the Willowbrook area and travels primarily along Wilmington Avenue and 120th Street within the study area. This line runs Monday through Saturday, including some holidays, at a peak frequency of approximately 30 minutes. The terminus is at the Kenneth Hahn Plaza in Willowbrook.

- HTSS 3 – Line 3 is a local circulator route that provides service around the Willowbrook area and travels primarily along Wilmington Avenue and 120th Street within the study area. This line runs Monday through Saturday, including some holidays, at a peak frequency of approximately 10 minutes. The terminus is at the Kenneth Hahn Plaza in Willowbrook.

- CRT ROUTE 1 – Route 1 is a local circulator route that provides service around the Willowbrook and Compton area and travels primarily along Rosecrans Avenue, Central Avenue and El Segundo Boulevard within the study area. This line runs Monday through Saturday, at a peak frequency of approximately 30 minutes. The terminus is at the transit center in Downtown Los Angeles.

- CRT ROUTE 3 – Route 3 is a local circulator route that provides service around the Willowbrook area and travels primarily along Central Avenue and El Segundo Boulevard within the study area. This line runs Monday through Saturday, at a peak frequency of approximately 30 minutes. The terminus is at the transit center in Downtown Los Angeles.

- CRT ROUTE 5 – Route 5 is a local circulator route that provides service around the Willowbrook area and travels primarily along Alameda Street and El Segundo Boulevard within the study area. This line runs Monday through Saturday, at a peak frequency of approximately 60 minutes. The terminus is at the transit center in Downtown Los Angeles.

- RSS – Rosewood Smart Shuttle is a local circulator route that provides service around the Willowbrook area and travels primarily along Avalon Boulevard and Imperial Highway within the study area. This line runs Monday through Friday, at a peak frequency of approximately 30 minutes. The terminus is at the Campanella Park (Stanford Avenue and Santa Rita Street) in South Los Angeles.

- GMB LINE 5 - Line 5 is a local east/west line that provides service from Willowbrook to El Segundo and travels primarily along El Segundo Boulevard within the study area. This line runs Monday through Friday, at a peak frequency of approximately 30 minutes. The eastern terminus is at the Imperial/Wilmington Station in South Los Angeles. The western terminus is at the intersection of El Segundo Boulevard and Sepulveda Boulevard in El Segundo.

In addition to the bus lines that currently serve the Project Site vicinity, the Metro Green Line and Blue Line operate in the study area operated by Los Angeles County Metropolitan Transportation Authority (LACMTA). These rail lines are described below:

- MTA Green Line – Green Line is a local east/west line that provides service from Norwalk to Redondo Beach and travels primarily along Glenn Anderson Freeway within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 8 minutes during peak commute hours. The eastern terminus is at Norwalk Green line station. The western terminus is at Redondo Beach Green line station.

- MTA Blue Line – Blue Line is a local north/south line that provides service from Long Beach to Los Angeles and travels primarily along Willowbrook Avenue within the study area. This line runs everyday, including holidays, at a peak frequency of approximately 10 minutes during peak commute hours. The northern terminus is at the intersection of 7th Street/Metro Center in Downtown Los Angeles. The southern terminus is at the Long Beach Transit Mall in Long Beach.

These transit lines along with all the other lines within the study area are illustrated in Figure 5. Table 5 includes a summary of all transit lines and rail service serving the study area. Information on the service provider line number, service area, service type, hours of operations and AM, Mid-day, and PM frequencies of service have been compiled in Table 5.

III. FUTURE YEAR 2014 TRAFFIC CONDITIONS - TIER I ANALYSIS

This Chapter provides details of the development of travel forecasts for future year 2014 conditions and describes the findings of the analysis of the transportation system within the Study Area with the Tier I development of the Project under the assumptions and methodologies required by County of Los Angles, and Cities of Los Angeles, Compton and Lynwood. This results in the assessment of a conservative set of conditions based on the projections and assumptions outlined in this study. The planning horizon for these analyses is the year 2014 corresponding with the buildout year of the Tier I Project.

EXISTING BASELINE WITH AMBIENT GROWTH (2014) TRAFFIC CONDITIONS

This section contains the evaluation of the Existing Baseline with Ambient Growth (2014) Traffic Conditions. The assessment of Existing Baseline with Ambient Growth (2014) Traffic Conditions involved the following tasks:

- Existing Baseline with Ambient Growth (2014) Traffic projections at all study intersections
- Analysis of Existing Baseline with Ambient Growth (2014) Traffic Conditions at study intersections located in the County of Los Angeles

A brief discussion of each of the tasks follows:

Existing Baseline with Ambient Growth (2014) Traffic Projections

The Existing Baseline with Ambient Growth (2014) traffic projections reflect growth in traffic from two primary sources: Firstly, the background, or ambient growth, to reflect the effects of overall area-wide regional growth both within and outside the study area; and secondly, from traffic generated by existing “entitled” site trips that are currently not accounted for on the existing street system since the existing site is not currently fully operational. Each of these components is described below.

The traffic in the vicinity of the study area has been estimated to increase at a rate of about 0.72% per year. This growth rate was obtained from the 2004 Congestion Management Program (CMP) for Los Angeles County. Future increases in background traffic volumes due to regional growth and development are expected to continue at this rate. With the assumed completion date of 2014, the existing 2010 traffic volumes were adjusted upward by a factor of 2.88% to reflect this area-wide regional growth.

The existing Martin Luther King Jr. Medical Center Campus consists of approximately 1,243,692 square feet. Utilizing the rates provided in the ITE, Trip Generation Informational Report (8th Edition), the existing site trip generation was determined. Table 6 presents details of the existing “baseline” site trip generation estimates including type of use, size, and applicable rate.

From Table 6, it can be observed that the existing “baseline” site’s trip generation results in a net total of approximately 17,443 daily trips of which 1,184 trips (699 inbound, 485 outbound) occur during the morning peak hour and 1,206 trips (507 inbound, 699 outbound) during the evening peak hour. Since the existing site is not fully operational, only a portion of these trips are currently on the street system. These trips are accounted for in the existing traffic counts.

Existing on-site peak hour traffic counts were conducted at the site driveways located along 120th Street and Wilmington Avenue to determine the existing trip generation currently occurring on-site. Based on the observed driveway counts, it was determined that the existing site is generating a total of 706 trips (528 inbound, 178 outbound) during the morning peak hour and 527 trips (124 inbound, 403 outbound) during the evening peak hour. Therefore, the remaining 478 trips in the morning and 679 trips in the evening of the existing site would need to be added to the existing with ambient growth traffic volumes to account for the operation of the existing facility at full capacity. These existing “baseline” peak hour trips are included in Appendix E and are added to the existing with ambient growth peak hour traffic volumes. The resulting Existing Baseline with Ambient Growth (2014) traffic volumes are illustrated in Figure 6A-6E.

Existing Baseline with Ambient Growth (2014) Traffic Conditions

The Existing Baseline with Ambient Growth (2014) without proposed project peak hour traffic volumes were analyzed at each of the County of Los Angeles study intersections to determine the V/C ratio and corresponding level of service. Table 7 presents the results of the Future Existing Baseline with Ambient Growth (2014) (without project) traffic analysis.

[4] Shares jurisdiction with Caltrans.

As indicated in the Table 7, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better. The remaining intersection, Central Avenue/Rosecrans Avenue, in the evening peak hour is projected to operate at LOS E.

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2014) conditions are attached in Appendix F of the report.

RELATED PROJECTS TRAFFIC GENERATION AND ASSIGNMENT

A second potential source of traffic growth in the study area was that expected from other future development projects in the vicinity. These "cumulative" or related projects are those developments that are planned and expected to be in place within the same timeframe of the Proposed Tier Project. Data describing related projects in the area was obtained from the County of Los Angeles and Cities of Los Angeles, Compton, Lynwood and South Gate. Forty related projects were identified within the study area. The related projects included in this study are described in Table 8. The locations of these related projects are shown in Figure 7.

The trip generation estimates for the related projects were developed using trip generation rates contained in the Institute of Transportation Engineers (ITE), Trip Generation Informational Report, 8th Edition. These rates are summarized in Table 8. Table 8 furthers indicates the location, type of use, size and these related projects' trip generation. As indicated in Table 8, the related projects are expected to generate approximately 2,827 trips during the morning peak hour and 2,191 trips during the evening peak hour.

The geographic distribution (based existing traffic patterns and methodology for determining trip distribution contained in the 2004 CMP) and the traffic assignment of the related projects were performed and the resulting volumes at each of the analysis intersections during both AM and PM peak hours are shown in Figure 8A-8E. The traffic volumes presented in Figure 8A-8E represent the Related Project only peak hour traffic volumes.

[9] Source: *ITE Trip Generation Manual, 8th Edition, 2008*

[10] Trip generation for single-family residential was calculated using the following formulas:

Daily: $\mathrm{Ln}(T) = 0.92\,\mathrm{Ln}(X) + 2.71$
AM Peak Hour: $T = 0.70\,(X) + 9.74$
PM Peak Hour: $\mathrm{Ln}(T) = 0.90\,\mathrm{Ln}(X) + 0.51$

Where:
Ln = Natural logarithm
T = Two-way volume of traffic (total trip-ends)
X = Number of dwelling units

[11] Trip generation for condominium/townhouse was calculated using the following formulas:

Daily: $\mathrm{Ln}(T) = 0.87\,\mathrm{Ln}(X) + 2.46$
AM Peak Hour: $\mathrm{Ln}(T) = 0.80\,\mathrm{Ln}(X) + 0.26$
PM Peak Hour: $\mathrm{Ln}(T) = 0.82\,\mathrm{Ln}(X) + 0.32$

Where:
Ln = Natural logarithm
T = Two-way volume of traffic (total trip-ends)
X = Number of dwelling units

[12] Trip generation for medical office was calculated using the following formulas:

Daily: $T = 40.89\,(X) - 214.97$
PM Peak Hour: $\mathrm{Ln}(T) = 0.88\mathrm{Ln}(X) + 1.59$

Where:
Ln = Natural logarithm
T = Two-way volume of traffic (total trip-ends)
X = Area in 1,000 gross square feet of leasable area

CUMULATIVE (2014) BASE TRAFFIC CONDITIONS

This section contains the evaluation of the Cumulative (2014) Base (or Existing Baseline with Ambient Growth (2014)) Traffic Conditions. The assessment of Cumulative (2014) Base Traffic Conditions involved the following tasks:

- Cumulative (2014) Base Traffic projections at all study intersections
- Analysis of Cumulative (2014) Base Traffic Conditions at study intersections located in the Cities of Los Angeles, Compton, and Lynwood

A brief discussion of each of the tasks follows:

Cumulative (2014) Base Traffic Projections

The Cumulative (2014) Base traffic projections consist of traffic growth due to two primary sources: background ambient traffic growth and growth due to related projects within and in the vicinity of the Project study area. The existing baseline with ambient growth and related projects traffic volumes were estimated as described above.

The related projects' traffic estimates, shown in Figures 8A-8E, were added to the Existing Baseline with Ambient Growth (2014) traffic, shown in Figure 6A-6E, to obtain the Cumulative (2014) Base traffic volumes. The traffic volumes presented in Figures 9A-9E represent the Future Cumulative (2014) Base (without project) conditions.

Cumulative (2014) Base Traffic Conditions

The Cumulative (2014) Base Conditions peak hour traffic volumes were analyzed at each of the Cities of Los Angeles, Compton and Lynwood study intersections to determine the V/C ratio and corresponding level of service. Table 9 presents the results of the Cumulative (2014) Base traffic analysis. As indicated in the table, 36 of the 37 analyzed intersections in both the morning and evening peak hours are projected to operate at LOS D or better. The remaining intersection, Long Beach Boulevard/Imperial Highway, is projected to operate at LOS E and LOS F in the morning and evening peak hours, respectively.

Capacity calculation worksheets for Cumulative (2014) Base conditions are attached in Appendix G of the report.

[1] Demolition of this facility would occur in Tier II.
[2] ITE Trip Generation, Informational Report, 8th Edition, 2008

PROJECT TRAFFIC VOLUMES

The implementation of the Proposed Tier I Project involves construction of 156,700 square feet including a new MACC and ancillary buildings, tenant improvements in existing buildings, and site improvements. As proposed, the MACC building would be a four-story building consisting of approximately 132,000 square feet. The proposed ancillary building would be a two-story structure consisting of approximately 24,700 square feet. The construction of Tier I would also include the removal of four structures containing approximately 506,485 square feet. These structures include the existing MACC building, emergency room, storage building and cooling towers and will be either reused or replaced under Tier II of the Project. It is anticipated that the Tier I Project would be completed by Year 2014.

Project Trip Generation

Utilizing the rates and equations from the ITE Trip Generation 8th Edition Informational Report, the Proposed Tier I Project's trip generation was determined. Table 10 presents details of the Proposed Tier I Project's trip generation including type of use, size, applicable rate and trip generation estimates. Other calculations within the table also provide for trip generation adjustments due to transit and removal of existing uses.

From Table 10, it can be observed that the Proposed Tier I Project's trip generation would result in 2,586 daily trips of which 176 trips would occur in the morning peak hour and 179 trips would occur in the evening peak hour. Since Tier I also involves removal of existing uses, a net reduction in trips of approximately 4,905 daily trips, 332 A.M. trips (-196 inbound, -136 outbound) and 338 P.M. trips (-142 inbound, -196 outbound) would occur.

Project Trip Distribution

The trip distribution for the project trips was determined using the methodology described in *Appendix B of the 2004 CMP* as well as existing traffic patterns and engineering judgment. Exhibit B-5: General Procedure for Calculating Trip Distribution from *Appendix B of the 2004 CMP* contains detailed procedures for determining trip distribution. Below is a summary of the procedures from Exhibit B-5:

1. Determine the proportion of project trip generation which is work versus non-work trips. This is based on a table (Exhibit B-2: Daily Trip Purpose Breakdown By Land Use Type) provided in the 2004 CMP.

2. Determine the Regional Statistical Area (RSA) in which the project is located using the table and figures contained in Exhibit B-4: Regional Statistical Areas of the 2004 CMP. It was determined that the Martin Luther King Jr. Medical Center Campus Project is in RSA 21.

3. Determine the RSA-level work and non-work trip distributions for the project using the Exhibit B-3: Regional Daily Trip Distribution Factors.

4. While specific characteristics of the project and study area must be considered, traffic assignment should be conducted according to the following guidelines:

   a. Trips internal to the project RSA may be primarily assigned to the non-CMP routes:

   b. Trips from the project RSA to adjacent RSAs should be primarily assigned to CMP arterials or freeways, if present; and

   c. Trips from the project RSA to RSAs not adjacent to the project RSA should be primarily assigned to freeways, if present.

Appendix H of the report documents the trip distribution calculations including the breakdown of trips, work versus non-work trips, by land use type and the exhibits used from the 2004 CMP. The resulting individual intersection work and non-work trip distribution percentages for both the morning and evening peak hours are also included in Appendix H. Based on these distribution assumptions, location and points of access of the project driveways, and net trip generation from the Proposed Project, traffic estimates of net project-only trips were developed. These Tier I Project-only peak hour trips are presented in Figures 10A-10G. Based on the overall general project distribution patterns, it can be observed that the project trips will utilize the following key travel corridors within the study area as listed below:

- Wilmington Avenue Corridor to/from points north – 35%
- Wilmington Avenue Corridor to/from points south – 20%
- 120th Street-119th Street Corridor to/from points east – 3%
- 120th Street-119th Street Corridor to/from points west – 11%
- El Segundo Boulevard Corridor to/from points east – 3%
- El Segundo Boulevard Corridor to/from points west – 4%
- Central Avenue Corridor to/from points north – 11%
- Central Avenue Corridor to/from points south – 5%
- Compton Avenue Corridors to/from points north – 6%
- Compton Avenue Corridors to/from points south – 2%

Due to the mixed-use nature of the project, some of the project trips remain internal to the MLK. The majority of the Martin Luther King Jr. Medical Center Campus traffic effects are felt close to the project, and the effects drop off quickly farther away from the project.

EXISTING BASELINE WITH AMBIENT GROWTH (2014) PLUS TIER I PROJECT TRAFFIC CONDITIONS

This section contains the evaluation of the Existing Baseline with Ambient Growth (2014) plus Tier I Project Traffic Conditions. The assessment of Existing Baseline with Ambient Growth (2014) plus Tier I Project Traffic Conditions involved the following tasks:

- Existing Baseline with Ambient Growth (2014) plus Tier I Project Traffic projections at all study intersections
- Analysis of Existing Baseline with Ambient Growth (2014) plus Tier I Project Traffic Conditions at study intersections located in the County of Los Angeles

A brief discussion of each of the tasks follows:

Existing Baseline with Ambient Growth (2014) plus Tier I Project Traffic Projections

Utilizing the project-only traffic estimates developed for both AM and PM peak hours, traffic forecasts for the Existing Baseline with Ambient Growth (2014) plus Tier I Project conditions were developed. The Existing Baseline with Ambient Growth (2014) Base traffic forecasts were combined with the Tier I Project-only traffic volumes to obtain the Existing Baseline with Ambient Growth (2014) plus Project traffic volume forecasts. The Existing Baseline with Ambient Growth (2014) plus Tier I Project traffic volumes during both A.M. and P.M. peak hours are presented in Figures 11A-11E.

Existing Baseline with Ambient Growth (2014) plus Tier I Project Traffic Conditions

The Existing Baseline with Ambient Growth (2014) plus Tier I Project peak hour traffic volumes were analyzed at each of the County of Los Angeles study intersections to determine the V/C ratio and corresponding level of service. Table 11 presents the results of the Future Existing Baseline with Ambient Growth (2014) plus Tier I Project traffic analysis.

[4] Shares jurisdiction with Caltrans.

As indicated in the Table 11, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better. The remaining intersection, Central Avenue/Rosecrans Avenue, in the evening peak hour is projected to operate at LOS E. Overall, since Tier I Project result in the reduction of trips, all of the intersections would experience better operating conditions under Tier I Project conditions compared to without project conditions.

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2014) plus Tier I Project conditions are attached in Appendix I of the report.

EXISTING BASELINE WITH AMBIENT GROWTH (2014) PLUS TIER I PROJECT AND RELATED PROJECTS/CUMULATIVE (2014) PLUS TIER I PROJECT TRAFFIC CONDITIONS

This section contains the evaluation of the Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects or Cumulative (2014) plus Tier I Project Traffic Conditions. The assessment of Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects Traffic Conditions involved the following tasks:

- Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects (same as Cumulative (2014) plus Tier I Project) Traffic projections at all study intersections.
- Analysis of Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects (same as Cumulative (2014) plus Tier I Project) Traffic Conditions at all study intersections.

A brief discussion of each of the tasks follows:

Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects (Cumulative (2014) plus Tier I Project) Traffic Projections

The Existing Baseline with Ambient Growth (2014) traffic forecasts were combined with the Tier I Project-only traffic volumes and related projects traffic volumes to obtain the Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects traffic volume forecasts. The Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Project (or Cumulative (2014) plus Tier I Project) traffic volumes during both A.M. and P.M. peak hours are presented in Figures 12A-12E.

Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects (Cumulative (2014) plus Tier I Project) Traffic Conditions

The Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects (or Cumulative (2014) plus Tier I Project) peak hour traffic volumes were analyzed at each of the study intersections to determine the V/C ratio and corresponding level of service.

Table 12 presents the results of the Future Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects traffic analysis. As indicated in the table, 63 of the 64 analyzed intersections in the morning peak hour are projected to operate at LOS D or better. The remaining intersection, Long Beach Boulevard/Imperial Highway, is projected to operate at LOS E.

During the evening peak hour, 62 of the 64 analyzed intersections are projected to operate at LOS D or better. The remaining intersections, Central Avenue/Rosecrans Avenue and Long Beach Boulevard/Imperial Highway, are projected to operate at LOS E and LOS F, respectively.

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Projects conditions are attached in Appendix J of the report.

TRAFFIC IMPACT ANALYSIS – TIER I PROJECT

The Future Year 2014 conditions were analyzed utilizing the methodologies and assumptions per the County of Los Angeles, City of Los Angeles, and Los Angeles County CMP traffic study guidelines. The results were then used to assess the potential impact of the Proposed Tier I Project as well as the cumulative impacts including Tier I Project on the local street system.

County of Los Angeles Traffic Impact Analysis

This section includes the traffic impact analysis for the study intersection in the County of Los Angeles determined using the specified significant impact criteria included in County's traffic study guidelines. The traffic impact analysis compares the volume to capacity (V/C) ratios at each study location under the future base and future plus project conditions to determine the incremental difference in V/C ratios caused by the Proposed Tier I Project.

[4] Shares jurisdiction with Caltrans.

An additional analysis compares the future base and future plus project with related projects to determine the cumulative impacts. This provides the information needed to assess the potential Tier I Project impacts (and cumulative impacts) using significance criteria established by the County of Los Angeles.

Significant Traffic Impact Criteria. The County of Los Angeles Department of Public Works has established threshold criteria that determine if a project has a significant traffic impact at a specific intersection. According to the criteria provided by the County of Los Angeles, a project impact is considered significant if the following conditions are met:

Pre-Project Conditions		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
C	0.71 – 0.80	equal to or greater than 0.040
D	0.81 – 0.90	equal to or greater than 0.020
E, F	> 0.91	equal to or greater than 0.010

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS D after the addition of project traffic and the incremental change in the V/C ratio is less than 0.020. However, if the intersection is operating at a LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.010 or greater, the project would be considered to have a significant impact.

Tier I Project Impacts. Using the specified significant impact criteria, the traffic impacts at the 27 analysis locations in the County of Los Angeles were determined for Existing Baseline with Ambient Growth (2014) plus Tier I Project conditions. Table 13 summarizes the V/C ratio and corresponding level of service and identifies the individual impacts during both A.M. and P.M. peak hours at each of the analysis locations. It can be observed that none of the 27 analyzed intersections would be significantly impacted by the Proposed Tier I Project. Therefore, no mitigation measures would be required for the Proposed Tier I Project.

Cumulative Projects Impacts. Using the specified significant impact criteria, the traffic impacts at the 27 analysis locations in the County of Los Angeles were determined for cumulative conditions (i.e. Existing Baseline with Ambient Growth (2014) plus Tier I Project and Related Project conditions.

* Los Angeles County Congestion Management Program (CMP) monitoring location

** City of Los Angeles ATSAC/ATCS location. V/C ratio includes ATSAC/ATCS reduction of 0.10

[1] Shares jurisdiction with City of Lynwood

[2] Shares jurisdiction with City of Compton

[3] Shares jurisdiction with City of Los Angeles

[4] Shares jurisdiction with Caltrans.

Table 13 summarizes the V/C ratio and corresponding level of service and identifies the individual impacts during both A.M. and P.M. peak hours at each of the analysis locations. It can be observed that none of the 27 analyzed intersections would be significantly impacted by the effects of Proposed Tier I Project and related projects. Therefore, no mitigation measures would be required under cumulative conditions.

Other Jurisdictions Traffic Impact Analysis

This section includes the traffic impact analysis for the study intersections in the Cities of Compton and Lynwood determined by using the specified significant impact criteria included in the Los Angeles County Congestion Management Program (CMP) traffic study guidelines. Also included in this section is the traffic impact analysis for study intersections within the City of Los Angeles. City of Los Angeles significant impact criteria were utilized to assess significant impacts for these City of Los Angeles locations.

The traffic impact analysis compares the volume to capacity (V/C) ratios at each study location under the future base and future plus project conditions to determine the incremental difference in V/C ratios caused by the Proposed Tier I Project. This provides the information needed to assess the potential Tier I Project impacts at various locations in each of these jurisdictions using significance criteria acceptable in these jurisdictions.

City of Los Angeles Significant Traffic Impact Criteria. The City of Los Angeles Department of Transportation (LADOT) has established threshold criteria that determine if a project has a significant traffic impact at a specific intersection. According to the criteria provided by the City of Los Angeles, a project impact is considered significant if the following conditions are met:

Intersection Condition With Project Traffic		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
C	0.701 – 0.800	equal to or greater than 0.040
D	0.801 – 0.900	equal to or greater than 0.020
E, F	> 0.901	equal to or greater than 0.010

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the V/C ratio is less than 0.040. However, if the intersection is operating at a LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.010 or greater, the project would be considered to have a significant impact.

Los Angeles County Congestion Management Program Significant Traffic Impact Criteria. The Cities of Compton and Lynwood locations have been evaluated based on the criteria from the Los Angeles County Congestion Management Program (CMP) to determine if a project has a significant traffic impact at a specific intersection. A project impact is considered significant if the following conditions are met:

Intersection Condition With Project Traffic		Project-Related Increase in V/C Ratio
LOS	V/C Ratio	
F	> 1.000	equal to or greater than 0.020

Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the V/C ratio is less than 0.040. However, if the intersection is operating at a LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.020 or greater, the project would be considered to have a significant impact.

Tier I Project Impacts. Using the specified significant impact criteria, the traffic impacts at the 37 analysis locations in the Cities of Los Angeles, Compton and Lynwood were determined for Cumulative (2014) plus Tier Project conditions. Table 14 summarizes the V/C ratio and corresponding level of service and identifies the individual impacts during both A.M. and P.M. peak hours at each of the analysis locations. It can be observed that none of the 37 analyzed intersections would be significantly impacted by the Proposed Tier I Project. Therefore, no mitigation measures would be required for the Proposed Tier I Project.

IV. FUTURE YEAR 2020 TRAFFIC CONDITIONS – TIER II ANALYSIS

This Chapter provides details of the development of travel forecasts for future year 2020 conditions and describes the findings of the analysis of the transportation system within the Study Area with the Tier II development of the Project under the assumptions and methodologies required by County of Los Angles, and Cities of Los Angeles, Compton and Lynwood. This results in the assessment of a conservative set of conditions based on the projections and assumptions outlined in this study. The planning horizon for these analyses is the year 2020 corresponding with the buildout year of the Proposed Tier II Project.

EXISTING BASELINE WITH AMBIENT GROWTH (2020) TRAFFIC CONDITIONS

This section contains the evaluation of the Existing Baseline with Ambient Growth (2020) Traffic Conditions. The assessment of Existing Baseline with Ambient Growth (2020) Traffic Conditions involved the following tasks:

- Existing Baseline with Ambient Growth (2020) Traffic projections at all study intersections
- Analysis of Existing Baseline with Ambient Growth (2020) Traffic Conditions at study intersections located in the County of Los Angeles

A brief discussion of each of the tasks follows:

Existing Baseline with Ambient Growth (2020) Traffic Projections

The Existing Baseline with Ambient Growth (2020) traffic projections reflect growth in traffic from two primary sources: Firstly, the background, or ambient growth, to reflect the effects of overall area-wide regional growth both within and outside the study area; and secondly, from traffic generated by existing “entitled” site trips that are currently not accounted for on the existing street system since the existing site is not currently fully operational. Each of these components was described earlier in Chapter III.

The traffic in the vicinity of the study area has been estimated to increase at a rate of about 0.72% per year. This growth rate was obtained from the 2004 Congestion Management Program (CMP) for Los Angeles County. Future increases in background traffic volumes due to regional growth and development are expected to continue at this rate. With the assumed completion date of 2020, the existing 2010 traffic volumes were adjusted upward by a factor of 7.2% to reflect this area-wide regional growth.

The existing “baseline” peak hour trips which are included in Appendix E and are added to the existing with ambient growth peak hour traffic volumes. The resulting Existing Baseline with Ambient Growth (2020) traffic volumes are illustrated in Figure 13A-13E.

Existing Baseline with Ambient Growth (2020) Traffic Conditions

The Existing Baseline with Ambient Growth (2020) without proposed project peak hour traffic volumes were analyzed at each of the County of Los Angeles study intersections to determine the V/C ratio and corresponding level of service. Table 15 presents the results of the Future Existing Baseline with Ambient Growth (2020) (without project) traffic analysis.

As indicated in the Table 15, all 27 analyzed intersections in the morning peak hour and 26 analyzed intersections in the evening peak hour are projected to operate at LOS D or better. The remaining intersection, Central Avenue/Rosecrans Avenue, in the evening peak hour is projected to operate at LOS E.

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2020) conditions are attached in Appendix K of the report.

RELATED PROJECTS TRAFFIC GENERATION AND ASSIGNMENT

Forty-one related projects from the County of Los Angeles and Cities of Los Angeles, Compton, Lynwood and South Gate were identified within the study area under 2020 conditions. The related projects are described in Table 16. The locations of these related projects are shown in Figure 14.

[10] Trip generation for single-family residential was calculated using the following formulas:

Where:
Daily: $Ln(T) = 0.92\ Ln(X) + 2.71$ Ln = Natural logarithm
AM Peak Hour: $T = 0.70\ (X) + 9.74$ T = Two-way volume of traffic (total trip-ends)
PM Peak Hour: $Ln(T) = 0.90\ Ln(X) + 0.51$ X = Number of dwelling units

[11] Trip generation for condominium/townhouse was calculated using the following formulas:

Where:
Daily: $Ln(T) = 0.87\ Ln(X) + 2.46$ Ln = Natural logarithm
AM Peak Hour: $Ln(T) = 0.80\ Ln(X) + 0.26$ T = Two-way volume of traffic (total trip-ends)
PM Peak Hour: $Ln(T) = 0.82\ Ln(X) + 0.32$ X = Number of dwelling units

[12] Trip generation for medical office was calculated using the following formulas:

Where:
Daily: $T = 40.89\ (X) - 214.97$ Ln = Natural logarithm
PM Peak Hour: $Ln(T) = 0.88Ln(X) + 1.59$ T = Two-way volume of traffic (total trip-ends)
X = Area in 1,000 gross square feet of leasable area

● - RELATED PROJECTS

▬ - PROJECT SITE

FIGURE 14
LOCATION OF RELATED PROJECTS (FUTURE YEAR 2020 CONDITIONS)

RAJU Associates, Inc.

The trip generation estimates for the related projects were developed using trip generation rates contained in the Institute of Transportation Engineers (ITE), Trip Generation Informational Report, 8th Edition. These rates are summarized in Table 16. Table 16 furthers indicates the location, type of use, size and these related projects' trip generation. As indicated in Table 16, the related projects are expected to generate approximately 3,986 trips during the morning peak hour and 4,223 trips during the evening peak hour.

The geographic distribution (based existing traffic patterns and methodology for determining trip distribution contained in the 2004 CMP) and the traffic assignment of the related projects were performed and the resulting volumes at each of the analysis intersections during both AM and PM peak hours are shown in Figure 15A-15E. The traffic volumes presented in Figure 15A-15E represent the Related Project only peak hour traffic volumes for future year 2020 conditions.

CUMULATIVE (2020) BASE TRAFFIC CONDITIONS

This section contains the evaluation of the Cumulative (2020) Base (or Existing Baseline with Ambient Growth (2020)) Traffic Conditions. The assessment of Cumulative (2020) Base Traffic Conditions involved the following tasks:

- Cumulative (2020) Base Traffic projections at all study intersections
- Analysis of Cumulative (2020) Base Traffic Conditions at study intersections located in the Cities of Los Angeles, Compton, and Lynwood

A brief discussion of each of the tasks follows:

Cumulative (2020) Base Traffic Projections

The Cumulative (2020) Base traffic projections consist of traffic growth due to two primary sources: background ambient traffic growth and growth due to related projects within and in the vicinity of the Project study area. The existing baseline with ambient growth and related projects traffic volumes were estimated as described above.

FIGURE 15E
RELATED PROJECTS (2020) PEAK HOUR TRAFFIC VOLUMES

RAJU Associates, Inc.

The related projects' traffic estimates, shown in Figures 15A-15E, were added to the Existing Baseline with Ambient Growth (2020) traffic, shown in Figure 13A-13E, to obtain the Cumulative (2020) Base traffic volumes. The traffic volumes presented in Figures 16A-16E represent the Future Cumulative (2020) Base (without project) conditions.

Cumulative (2020) Base Traffic Conditions

The Cumulative (2020) Base Conditions peak hour traffic volumes were analyzed at each of the Cities of Los Angeles, Compton and Lynwood study intersections to determine the V/C ratio and corresponding level of service. Table 17 presents the results of the Cumulative (2020) Base traffic analysis. As indicated in the table, 36 of the 37 analyzed intersections during the morning peak hour are projected to operate at LOS D or better. During the evening peak hour, 34 of the 37 analyzed intersections are projected to operate at LOS D or better. The remaining intersections are projected to operate at LOS E or LOS F and are listed below:

- Wilmington Avenue/Rosecrans Avenue: PM Peak Hour – LOS E
- I-110 Northbound Ramps/El Segundo Boulevard: PM Peak Hour – LOS E
- Long Beach Boulevard/Imperial Highway: AM and PM Peak Hours – LOS F

Capacity calculation worksheets for Cumulative (2020) Base conditions are attached in Appendix L of the report.

PROJECT TRAFFIC VOLUMES

The implementation of the Proposed Tier II Project involves the development of a campuswide master plan. Tier II would have the potential to build out approximately 1,814,695 square feet of development on the Proposed Project site. As proposed, Tier II would consist of 1,134,695 square feet of hospital use, 80,000 square feet of retail use, 300,000 square feet of medical office use, 150,000 square feet of general office use, and 100 single-family residential dwelling units (approximately 150,000 square feet). It is anticipated that the Tier II Project would be completed by Year 2020.

Project Trip Generation

Utilizing the rates and equations from the ITE Trip Generation 8th Edition Informational Report, the Proposed Tier II Project's trip generation was determined. Tables 18 presents details of the Proposed Tier II Project's trip generation including type of use, size, applicable rate and trip generation estimates. Other calculations within the table also provide for trip generation adjustments due to transit, internal capture and pass-by as approved by the County of Los Angeles.

From Table 18, it can be observed that the Proposed Tier II Project's trip generation would result in a net total of approximately 24,511 daily trips of which 1,572 trips (1,114 inbound, 458 outbound) would occur during the morning peak hour and 2,091 trips (713 inbound, 1,378 outbound) during the evening peak hour.

The overall Proposed Project (Tier I combined with Tier II) would have a total net trip generation of approximately 19,606 daily trips of which 1,240 trips (918 inbound, 322 outbound) would occur during the morning peak hour and 1,753 trips (571 inbound, 1,182 outbound) during the evening peak hour.

Project Trip Distribution

The trip distribution for the project trips was determined using the methodology described above in Chapter III. Appendix H of the report documents the trip distribution calculations including the breakdown of trips, work versus non-work trips, by land use type and the exhibits used from the 2004 CMP. The resulting individual intersection work and non-work trip distribution percentages for both the morning and evening peak hours are also included in Appendix H. Based on these distribution assumptions, location and points of access of the project driveways, and net trip generation from the Proposed Tier I and II Project, traffic estimates of net project-only trips were developed. These net Tier I and II Project-only peak hour trips are presented in Figures 17A-17E.

Due to the mixed-use nature of the project, some of the project trips remain internal to the MLK. The majority of the Martin Luther King Jr. Medical Center Campus traffic effects are felt close to the project, and the effects drop off quickly farther away from the project.

[1] ITE Trip Generation, Informational Report, 8th Edition, 2008

[2] Daily, AM and PM peak hour trip generation for single-family residential was calculated using the following formulas:

Daily: $\ln(T) = 0.92 \ln(X) + 2.71$
AM Peak Hour: $\ln(T) = 0.70 \ln(X) + 9.74$
PM Peak Hour: $\ln(T) = 0.90 \ln(X) + 0.51$

Where:
Ln = Natural logarithm
T = Two-way volume of traffic (total trip-ends)
X = Number of dwelling units

[3] Daily, AM and PM peak hour trip generation for retail was calculated using the following formulas:

Daily: $\ln(T) = 0.65 \ln(X) + 5.83$
AM Peak Hour: $\ln(T) = 0.59 \ln(X) + 2.32$
PM Peak Hour: $\ln(T) = 0.67 \ln(X) + 3.37$

Where:
Ln = Natural logarithm
T = Two-way volume of traffic (total trip-ends)
X = Area in 1,000 gross square feet of leasable area

[4] Daily, AM and PM peak hour trip generation for office was calculated using the following formulas:

Daily: $\ln(T) = 0.77 \ln(X) + 3.65$
AM Peak Hour: $\ln(T) = 0.80 \ln(X) + 1.55$
PM Peak Hour: $T = 1.12 (X) + 78.81$

Where:
Ln = Natural logarithm
T = Two-way volume of traffic (total trip-ends)
X = Area in 1,000 gross square feet of floor area

TIER 1 AND 2 PROJECT ONLY PEAK HOUR TRAFFIC VOLUMES

EXISTING BASELINE WITH AMBIENT GROWTH (2020) PLUS TIER I AND II PROJECT TRAFFIC CONDITIONS

This section contains the evaluation of the Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Traffic Conditions. The assessment of Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Traffic Conditions involved the following tasks:

- Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Traffic projections at all study intersections
- Analysis of Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Traffic Conditions at study intersections located in the County of Los Angeles

A brief discussion of each of the tasks follows:

Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Traffic Projections

Utilizing the project-only traffic estimates developed for both AM and PM peak hours, traffic forecasts for the Existing Baseline with Ambient Growth (2020) plus Tier I and II Project conditions were developed. The Existing Baseline with Ambient Growth (2020) Base traffic forecasts were combined with the Tier I and Tier II Project-only traffic volumes to obtain the Existing Baseline with Ambient Growth (2020) plus Project traffic volume forecasts. The Existing Baseline with Ambient Growth (2020) plus Tier I and II Project traffic volumes during both A.M. and P.M. peak hours are presented in Figures 18A-18E.

Existing Baseline with Ambient Growth (2020) plus Tier I and II Project Traffic Conditions

The Existing Baseline with Ambient Growth (2020) plus Tier I and II Project peak hour traffic volumes were analyzed at each of the 27 study intersections located with the County of Los Angeles to determine the V/C ratio and corresponding level of service. Table 19 presents the results of the Future Existing Baseline with Ambient Growth (2020) plus Tier I and II Project traffic analysis.

As indicated in the Table 19, 25 of the 27 analyzed intersections in the morning peak hour and 22 of the 27 analyzed intersections in the evening peak hour are projected to operate at LOS D or better.

[2] Shares jurisdiction with City of Compton.
[3] Shares jurisdiction with City of Los Angeles.
[4] Shares jurisdiction with Caltrans.

The remaining five intersections are projected to operate at LOS E and include the following:

- Central Avenue/Rosecrans Avenue: PM Peak Hour – LOS E
- Wilmington Avenue/120th Street-119th Street: AM and PM Peak Hours – LOS E
- Wilmington Avenue/I-105 Eastbound Ramps: AM and PM Peak Hours – LOS E
- Wilmington Avenue/MLK Hospital Driveway-120th Street: PM Peak Hour – LOS E
- Wilmington Avenue/El Segundo Boulevard: PM Peak Hour – LOS E

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2020) plus Tier I and II Project conditions are attached in Appendix M of the report.

EXISTING BASELINE WITH AMBIENT GROWTH (2020) PLUS TIER I AND II PROJECT AND RELATED PROJECTS/CUMULATIVE (2020) PLUS TIER I AND II PROJECT TRAFFIC CONDITIONS

This section contains the evaluation of the Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects or Cumulative (2020) plus Tier I and II Project Traffic Conditions. The assessment of Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects Traffic Conditions involved the following tasks:

- Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (same as Cumulative (2020) plus Tier I and II Project) Traffic projections at all study intersections.

- Analysis of Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (same as Cumulative (2020) plus Tier I and II Project) Traffic Conditions at all study intersections.

A brief discussion of each of the tasks follows:

Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (Cumulative (2020) plus Tier I and II Project) Traffic Projections

The Existing Baseline with Ambient Growth (2020) traffic forecasts were combined with the Tier I and II Project-only traffic volumes and related projects traffic volumes to obtain the Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (or Cumulative (2020) plus Tier I and I Project) traffic volume forecasts. The Existing Baseline with

Ambient Growth (2020) plus Tier I and II Project and Related Projects traffic volumes during both A.M. and P.M. peak hours are presented in Figures 19A-19E.

Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (Cumulative (2020) plus Tier I and II Project) Traffic Conditions

The Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (or Cumulative (2020) plus Tier I and II Project) peak hour traffic volumes were analyzed at each of the study intersections to determine the V/C ratio and corresponding level of service. Table 20 presents the results of the Future Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects traffic analysis.

As indicated in the Table 20, 59 of the 64 analyzed intersections during the morning peak hour and 53 of the 64 analyzed intersections during the PM peak hour are projected to operate at LOS D or better. The remaining intersections are projected to operate at LOS E or LOS F and are listed below:

- Alameda Street/103rd Street: PM Peak Hour – LOS E
- Alameda Street/Imperial Highway: PM Peak Hour – LOS E
- Central Avenue/El Segundo Boulevard: PM Peak Hour – LOS E
- Central Avenue/Rosecrans Avenue: PM Peak Hour – LOS E
- Compton Avenue/Imperial Highway: AM Peak Hour – LOS E
- Wilmington Avenue/120th Street-119th Street: AM Peak Hour – LOS E, PM Peak Hour – LOS F
- Wilmington Avenue/I-105 Eastbound Ramps: AM Peak Hour – LOS E, PM Peak Hour – LOS F
- Wilmington Avenue/MLK Driveway-120th Street: PM Peak Hour – LOS E
- Wilmington Avenue/El Segundo Boulevard: PM Peak Hour – LOS E
- Wilmington Avenue/Rosecrans Avenue: AM and PM Peak Hours – LOS E
- I-110 Northbound Ramps/El Segundo Boulevard: PM Peak Hour – LOS E
- Long Beach Boulevard/Imperial Highway: AM and PM Peak Hours – LOS F

Capacity calculation worksheets for Existing Baseline with Ambient Growth (2020) plus Tier I and II Project and Related Projects (or Cumulative (2020) plus Tier I and II Project) conditions are attached in Appendix N of the report.

TRAFFIC IMPACT ANALYSIS – TIER II PROJECT

The Future Year 2020 conditions were analyzed utilizing the methodologies and assumptions per the County of Los Angeles, City of Los Angeles and Los Angeles County CMP traffic study guidelines. The results were then used to assess the potential impact of the Proposed Tier II Project as well as the cumulative impacts including Tier II Project on the local street system.

County of Los Angeles Traffic Impact Analysis
