SANTA CLARITA VALLEY MH CENTER	COASTAL API FAMILY MHC

Table 1. IPT Status Since Inception to November 17, 2016

# of Clients Claimed to Practice	# of Clients Entered into PEI OMA	# of Tx Cycles in PEI OMA	Clients with Multiple Tx Cycles	Clients Completing Tx	Clients Dropping-Out of Tx	Clients Still in Tx
5583	72.52%	4118	1.65%	39.68%	34.82%	25.50%
n=	4049	n=	67	1634	1434	1050

Note 1: Clients Claimed was based on IPT being selected as the EBP in a PEI Plan and having ≥ 2 core services claimed to the practice starting July 1, 2011.

Note 2: Number of clients Completing Tx or Dropping-Out of Tx was determined by whether the EBP was said to be completed (e.g. answered “yes” or “no”) in the PEI OMA.

Table 2. Client Demographics - Clients Who Entered IPT

Total Number of Clients	Age	Gender		Ethnicity					Primary Language		
	Average	Female	Male	African-American	Asian / Pacific Islander	Caucasian	Hispanic / Latino	Other	English	Spanish	Other
4049	35	69.65 %	30.33 %	12.37 %	7.01 %	14.30 %	59.13 %	7.19 %	63.55 %	28.28 %	8.17 %
n=		2820	1228	501	284	579	2394	291	2573	1145	331

Note1: Age is calculated at the date of the first EBP.

Note2: Percentages may not total 100 due to missing data and/or rounding.

Table 3. Top 5 Most Frequently Reported DSM-IV Primary Axis Diagnosis - Clients Who Entered IPT

Total Tx Cycle	Depressive Disorder NOS	Dysthymic Disorder	Major Depressive Disorder, Recurrent, Moderate	Major Depressive Disorder, Single Episode, Moderate	Major Depressive Disorder, Rec., Severe W/O Psychotic Features	Other
4118	13.79%	9.62%	7.84%	6.24%	3.79%	58.72%
n=	568	396	323	257	156	2418

Note: The above table reflects diagnoses entered into PEI OMA from July 1, 2011 through October 27, 2015.

Note: As reported in PEI OMA beginning of treatment information.

Table 4. Program Process Data - Clients Who Entered IPT			
Outcome Measures Administered	Pre-Test with Scores	Post-test with Scores	Clients Who Completed both a Pre and Post Measure with Scores
Outcome Questionnaire – 45.2*	79.60%	50.03%	31.25%
n=	1811	791	711
Ackn=	2275	1581	2275
Patient Health Questionnaire (PHQ-9)	78.71%	49.66%	30.73%
n=	3084	1371	1204
Ackn=	3918	2761	3918
Youth Outcome Questionnaire - (YOQ) 2.01 (Parent)	67.14%	36.89%	21.62%
n=	1124	442	362
Ackn=	1674	1198	1674
Youth Outcome Questionnaire – Self Report – 2.0 (YOQ-SR)	76.81%	47.26%	29.17%
n=	1285	561	488
Ackn=	1673	1187	1673

Note 1: Number of acknowledged measures (Ackn=) is determined by the number of required measures that receive a score or an unable to collect reason code.

Note 2: The % indicated for Pre-test with scores, Post-test with scores, and both a Pre and Post-test with scores is calculated by dividing the (n=#) by the number acknowledged (Ackn=#) in the PEI OMA system for each measure. The number acknowledged (Ackn=#) for those with Pre and Post scores is an estimate based on the greatest number of matches that could be expected given the number of Pre scores acknowledged.

Table 5a. Top Reasons Given for "Unable to Collect"

Outcome Questionnaire – 45.2*	Total Pre 465	Administration date exceeds acceptable range	Client refused	Not available in primary language	Client unavailable	Clinician not trained in outcome measure	0
	Percent	28.82%	16.77%	15.27%	9.68%	8.17%	0.00%
	n	134	78	71	45	38	0

Table 6. Service Delivery Data – Clients Who Completed IPT						
Total Treatment Cycles 1402	Average Length of Treatment in Weeks	Range of Treatment Weeks		Average Number of Sessions	Range of Sessions	
		Min	Max		Min	Max
	32	0	182	20	1	195

Note: Completed IPT is defined as having a ‘yes’ for completion indicated in the PEI OMA.

Table 7. Outcome Data* – Clients who Completed IPT					
		Percent Improvement from Pre to Post	Percent of Clients Showing Reliable Change* from Pre-IPT to Post-IPT		
			Positive Change	No change	Negative Change
Outcome Questionnaire – 45.2*	TOTAL	29.27% (n=521)	50.81%	44.68%	4.52%
			315	277	28
Patient Health Questionnaire (PHQ-9)	TOTAL	45.89% (n=849)	45.94%	49.66%	3.55%
			470	508	45
Youth Outcome Questionnaire – 2.01 (Parent)	TOTAL	46.68% (n=216)	61.85%	30.74%	7.41%
			167	83	20
Youth Outcome Questionnaire – Self Report – 2.0	TOTAL	46.09% (n=323)	59.54%	34.10%	6.36%
			234	134	25

*Please see Appendix A. for a description of the IPT outcome measures and the outcome indicators (percent improvement in average scores; and, percent of clients showing reliable change).

Note 1: Possible PHQ-9 scores can range from 0 – 27, with a clinical cutoff of 15.

Note 2: Possible YOQ-Parent Total Scores can range from -16 – 240, with a clinical cutoff of 46.

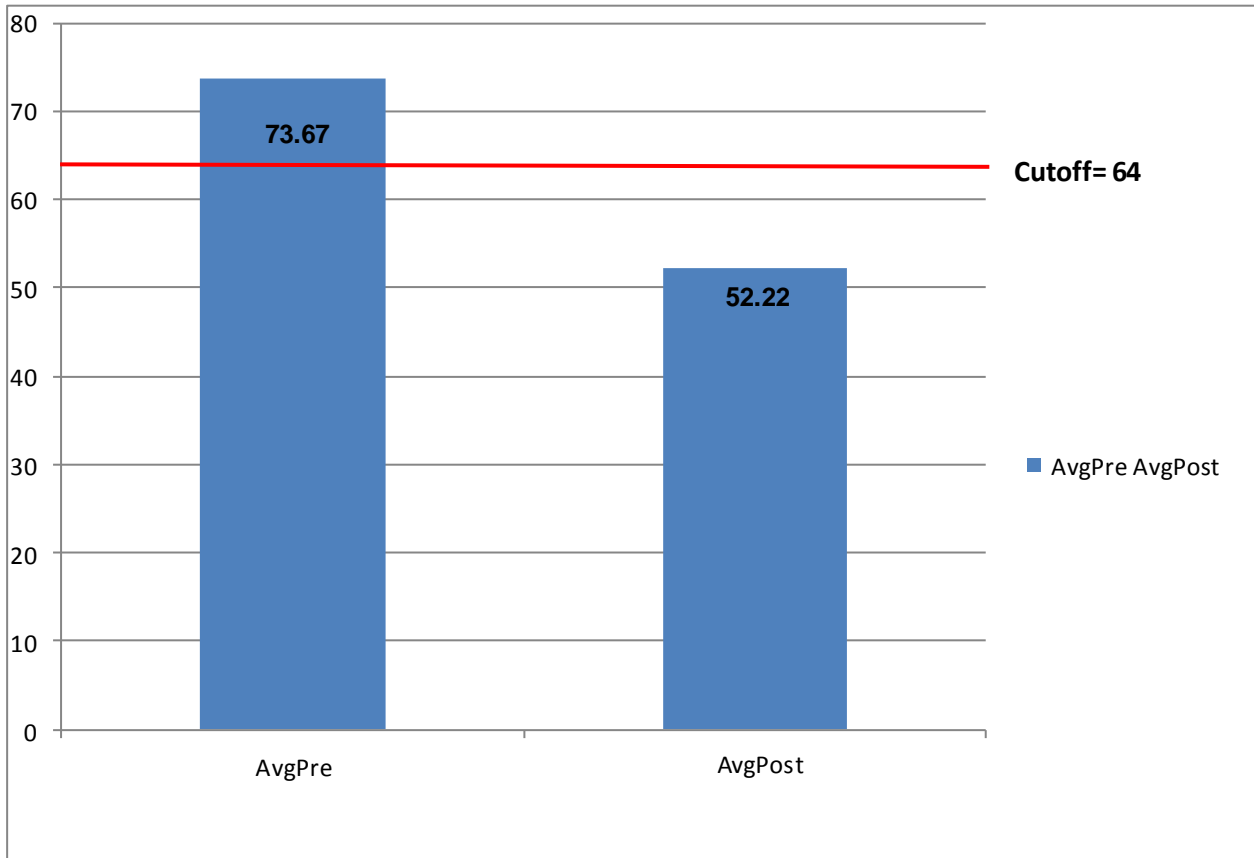

Note 3: Possible YOQ-SR Total Scores can range from -16 – 240, with a clinical cutoff of 47.

Note 4: Possible OQ Total Scorers can range from 0 – 180, with a clinical cutoff of 64.

Note 5: Aggregate outcome data based on fewer than 20 clients are not reported.

Note 6: Positive Change indicates that the scores decreased from the pre to the post measure.

(N=393)**

Appendix

PHQ-9

The Patient Health Questionnaire-9 (PHQ-9) is a specific outcome measure for clients participating in treatment focused on depression. This 9-item self-report measure for clients ages 12 and older assesses the overall frequency/severity of depressive symptoms experienced during the prior two weeks. Possible Total PHQ-9 scores range from 0-27, with scores of 15 or higher indicating moderately severe to severe depression.

Youth Outcomes Questionnaires (YOQ and YOQ-SR)

The Youth Outcome Questionnaire is a 64-item parent-report that assesses global distress in a child's/adolescent's life from 4-17 years of age. The YOQ-SR is the Self-report version of the YOQ and is completed by the child/adolescent him or herself. Total scores on both measures can range from -16 to 240. Total scores of 46 or higher are most similar to a clinical population on the YOQ. A total score of 47 is most similar to that of a clinical population on the YOQ-SR.

Outcomes Questionnaires (OQ)

The Outcome Questionnaire is a 45-item self-report questionnaire that assesses global distress in a client's life from ages 19 and older. Total Scores on this measure can range from 0 to 180, with scores of 64 or higher indicating clinical significance.

Reliable Change Index

When comparing Pre and Post scores, it is very helpful to know whether the change reported represents the real effects of the treatment or errors in the system of measurement. The Reliability of Change Index (RCI) is a statistical way of helping to insure that the change recorded between pre and post assessments exceeds that which would be expected on the basis of measurement error alone. The RCI has been calculated using the Jacobson and Truax (1991) method and indicates when change exceeds that which would be expected on the basis of error at the $p < .05$ probability level. For a more in-depth discussion of Reliability of Change see Jacobson, N. S., & Truax, P. (1991). Clinical Significance: A statistical approach to defining meaningful change in psychotherapy research. *Journal of Consulting and Clinical Psychology*, 59, 12-19. Also see Wise, E. A. (2004). Methods for analyzing psychotherapy outcomes: A review of clinical significance, reliable change, and recommendations for future directions. *Journal of Personality Assessment*, 82(1), 50-59.

The number and percent of clients experiencing positive change, no change and negative change are recorded in table 7a. Healthful change in each of the measures cited here means that scores have decreased in value from pre to post test administrations (i.e. recorded a negative change on the RCI). To help avoid confusion, healthful reliable change is presented as positive while unhealthful reliable change is presented as negative change.

Supplemental Information for Table 3 “Other” Diagnosis Category

OTHER		
DSM-IV Primary Axis Diagnosis - Clients Who Entered IPT	n	Percent
Mood Disorder NOS	146	3.55%
Adjustment Disorder With Anxiety and Depressed Mood	146	3.55%
