October 20, 2026

The Honorable Board of Supervisors
County of Los Angeles
383 Kenneth Hahn Hall of Administration
500 West Temple Street
Los Angeles, CA 90012

Dear Supervisors:

ADOPTION OF THE LOS ANGELES COUNTY GENERAL HOSPITAL CAMPUS MASTER PLAN AND CERTIFICATION OF THE SUBSEQUENT ENVIRONMENTAL IMPACT REPORT (SUPERVISORIAL DISTRICT 1) (3 VOTES) FISCAL YEAR 2026-2027

SUBJECT:

Approval of the recommended actions will authorize the Director of the Department of Economic Opportunity (DEO), in coordination with the Chief Executive Officer (CEO), to proceed with activities related to the Los Angeles County General Hospital Campus Master Plan.

IT IS RECOMMENDED THAT THE BOARD:

1. Certify that the Final Subsequent Environmental Impact Report (SEIR) for the Los Angeles County General Hospital Campus Master Plan (Master Plan) has been completed in compliance with the California Environmental Quality Act (CEQA) and reflects the independent judgment and analysis of the County; find that the Board has reviewed and considered the information contained in the Final SEIR prior to approving the Project; adopt the Mitigation Monitoring and Reporting Program (MMRP), finding that the MMRP is adequately designed to ensure compliance with the mitigation measures during project implementation;

and determine that the significant adverse effects of the Project have either been reduced to an acceptable level or are outweighed by the specific overriding considerations of the Project, as outlined in the Environmental Findings of Fact and Statement of Overriding Considerations, which Findings of Fact and Statement of Overriding Considerations are adopted and incorporated by reference.

2. Approve and adopt the Master Plan, inclusive of the Master Plan's Use and Development Standards (Standards); authorize the Director or designee (collectively, Director) of DEO to update and/or amend the Standards as the Director deems necessary or appropriate to advance the goals of the Master Plan, subject to a determination by the Director finding that the proposed activity falls within the scope of the impacts analyzed in the SEIR and in accordance with the procedures detailed in the Standards; and, delegate authority to the Director to file Notices of Determination in connection with approvals in accordance with CEQA.

PURPOSE/JUSTIFICATION OF RECOMMENDED ACTION

The Los Angeles County General Hospital Campus Master Plan represents a comprehensive framework to reimagine the historic campus into a "Healthy Village" centered on wellness, housing, economic opportunity, open space, and community-serving uses anchored by a revitalized Historic General Hospital, which has served the region for nearly a century.

Background

Feasibility and Planning Activities

In November 2018, the Board unanimously adopted a motion directing the Chief Executive Office (CEO) to prepare a feasibility study for the adaptive reuse of General Hospital. In April 2022, the CEO provided the Board with the General Hospital and West Campus Feasibility Study (Feasibility Study). The Feasibility Study's Reuse Framework proposed a Public Private Partnership (P3) model to redevelop the site into a mixed-use campus, consistent with Supervisor Hilda L. Solis's vision for a "Healthy Village" serving the County's most vulnerable residents. On July 26, 2022, the Board adopted a motion directing the CEO and County departments to report back on financing strategies for the redevelopment.

On January 24, 2023, the Board authorized DEO to release a Request for Proposals (RFP) for a master development partner, which DEO issued on January 25, 2023. Following a competitive process, the Board selected Centennial Partners (Developer) and, on December 19, 2023, authorized and delegated authority to the Director of DEO to negotiate and execute an Exclusive Negotiating Agreement (ENA) with the Developer for the Los Angeles General Hospital Mixed Use Project. On June 25, 2024, the Board authorized a term modification of the ENA from 18 to 36 months, with options to extend for up to two

additional 180-day periods, and approved funding pursuant to the terms of the ENA in the amount of $2,688,000 for Phase 1: Project Definition phase activities, which included due diligence, site investigation, and preliminary architecture and engineering studies.

Subsequently, on July 29, 2025, the Board passed a motion titled “Next Steps to Implement the Proposed Centennial Project Master Plan on the General Hospital Medical Campus” authorizing the DEO Director to amend the ENA to provide up to $3,322,020, including $1,678,000 in First District Discretionary Funds, to support Planning Phase costs and community engagement.

Campus Stabilization

The Project Definition phase confirmed both the long-term redevelopment potential of the campus and the immediate need to address seismic, life-safety, and infrastructure deficiencies in the historic General Hospital building and portions of West Campus (Stabilization Project). In response, on June 17, 2025, the Board approved the Stabilization Project, with a budget of approximately $120,380,000, to address these deficiencies. The Stabilization Project remains ongoing and includes the following components:

- **Seismic Retrofit of General Hospital.** Structural upgrades to General Hospital, including interior cleanout and demolition of non-essential and non-historical elements, foundation upgrades, new structural walls, and strengthened columns and beams, consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties and subject to review by the State Historic Preservation Office.

- **Wellness Center Relocation.** In August 2026, the Wellness Center, a non-profit community-based organization previously located on the ground floor of General Hospital, relocated to the retrofitted Forecourt Buildings northwest of General Hospital. The Master Plan proposes multiple options for the Wellness Center's permanent relocation to a new space on campus as redevelopment proceeds.

- **West Campus Demolition of Buildings and Structures.** Phased demolition of up to 18 structurally compromised or functionally obsolete buildings and structures across West Campus, in coordination with the Department of Health Services (DHS), to reduce ongoing liability and streamline site logistics.

- **West Central Plant Decommissioning and Demolition and Installation of New Heating and Cooling Equipment.** Decommissioning and demolition of the West Central Plant, which is nearing the end of its useful life, and installation of new building-specific heating and cooling systems to serve General Hospital and adjacent buildings.

- **Demolition of Site Infrastructure, Remediation, and Accessibility Upgrades.** Reconfiguration and rerouting of aging site utilities, remediation of subsurface hazardous materials, and construction of new ADA-compliant circulation pathways across the campus.

Community Engagement

Recognizing the importance of public participation, DEO and the Developer, in collaboration with the Office of Supervisor Solis, CEO and DHS staff, and community partners including the Health Innovation Community Partnership (HICP), led a robust and multi-faceted community engagement program in English and Spanish to build upon prior visioning efforts over the last decade. This included 102 group meetings, 5 town halls, 26 forum presentations, 24 pop-up events, and 3 community-at-large meetings.

The Project team also established a digital presence through a project website, social media posts, and e-mail blasts, sharing information about the proposed Master Plan, SEIR, FAQs, project timeline, and previous Board actions. The multi-layered approach to community engagement has allowed the County and the Developer to engage with a diverse group of stakeholders and campus users since the Project's inception.

The Community Advisory Committee (CAC), convened by the Developer at the beginning of Phase 1, continued to meet monthly and played a meaningful role in shaping the master plan and associated documents, including participating in the creation of a video detailing the master plan by providing voice-over for both the English and Spanish versions.

Community Benefits Agreement Framework

In response to the July 29, 2025 motion directing DEO to continue its partnership with the Developer and LA General Medical Foundation to engage in a robust community engagement process and develop a Community Benefits Agreement (CBA), DEO entered into an agreement with HICP and The Wellness Center to convene a CBA Steering Committee to develop a CBA Framework (Framework).

The Framework process formally commenced on November 18, 2025, with the formation of a CBA Steering Committee (Committee), led by The Wellness Center. To establish the Committee, The Wellness Center conducted an open and inclusive outreach process, inviting members of the CAC, HICP, and the broader public to apply for participation. In parallel, DEO and the First Supervisorial District conducted targeted outreach to key community partners to ensure broad awareness of the opportunity. The Wellness Center received more than 20 applications and invited all applicants to participate, resulting in a Committee comprised of over 20 members representing a diverse cross-section of community residents, community-based organizations, and project stakeholders. The Committee met on a near-weekly basis, participating in over 35 meetings, reflecting a sustained and structured commitment to the process.

Through the Framework engagement process, the Committee worked with the County, the First Supervisorial District, and the Developer to establish a Framework inclusive of guiding principles, governance structures, and key commitments that will shape community benefits across all phases of the development. As each phase of the multi-phase development moves forward, a complementary Project-Specific CBA will be produced that affirms that the proposed project satisfies the commitments within the Framework and, as necessary, adds project specific details reflective of community priorities and market opportunities.

The Framework is anticipated to be included as an exhibit to the future Master Option Agreement. The County and Developer are actively refining the terms of the Master Option Agreement, and the County intends to return to the Board for consideration at a subsequent meeting.

Subsequent Environmental Impact Report (SEIR)

In the fall of 2025, the County initiated the process of developing a subsequent environmental document to replace the County's previously certified 2014 LAC+USC Medical Center Campus Master Plan EIR. The 2014 Master Plan EIR analyzed the environmental impacts associated with buildout of the 2014 Master Plan, which included the proposed construction of new and renovated medically related office, retail, open space, and parking uses and demolition of existing buildings and structures on the LAC+USC Medical Center Campus to accommodate new development. Under the 2014 Master Plan EIR, full buildout of the project could result in a total of approximately 1,725,000 square feet of development throughout the LAC+USC Medical Center Campus. The main elements of the master plan included inpatient facilities, outpatient facilities, medical center offices, central utility expansion, pedestrian circulation access, biotech research and on-campus housing, parking facilities, and campuswide community open space and landscape conceptual elements. There were three (3) Addenda to the 2014 Master Plan EIR including the Restorative Care Village Phase I EIR Addendum (Dec. 2017), Restorative Care Village Phases IV and V (Dec. 2023), and Stabilization Projects EIR Addendum (June 2025).

The 2014 Master Plan focused on improving medical service delivery, internal circulation, and the long-term functionality of the County’s Medical Center. In contrast, the proposed Master Plan contemplates a comprehensive, community-oriented vision for the Campus that extends beyond institutional healthcare uses. The proposed Master Plan introduces a diversified land use program that provides for a balance of housing and jobs and includes residential development, commercial and office uses, community-serving commercial uses, educational facilities, adaptive reuse of the historic General Hospital Building, and a connected network of public open spaces. These expanded land use types and development intensities were not contemplated under the 2014 Master Plan and introduce new environmental considerations, including, but not limited to, population and housing growth, public service demands, and transportation changes.

On September 26, 2025, the County issued a Notice of Preparation (NOP), beginning the 30-day public scoping period and hosted a public scoping meeting (Zoom webinar) on

October 8, 2025. Simultaneously, the County sent AB 52 tribal consultation notification letters to 12 Native American tribal leaders. Following requests from the public during the comment period, the public scoping period was extended from October 27, 2025 to November 21, 2025. The County also extended the 30-day period for tribes to request consultation to November 21, 2025 to align with the extended scoping period. At the meeting the County provided a presentation with information about the proposed Project known at the time and an overview of the CEQA process. All information was presented in simultaneous English and Spanish.

On September 26, 2025, following requests from the public during the comment period, the public scoping period was extended to November 21, 2025. The County also extended the 30-day period for tribes to request consultation to November 21, 2025 to coincide with the extended scoping period. The County received 12 comment letters during the NOP comment period and received 10 written comments and 5 verbal comments during the October 8, 2025 public scoping meeting.

On November 4, 2025, the Gabrieleño Band of Mission Indians–Kizh Nation requested to consult with the County on the proposed Project. The Kizh Nation provided recommended mitigation measures tailored to the tribe's cultural protocols. The County considered all information provided by the Kizh Nation during the consultation for the proposed Project. After acting in good faith and in consideration of the Tribe's requests and multiple rounds of emails and edits to the draft mitigation measures, the County concludes that a reasonable effort has been put forth and the County and the tribe have been unable to reach a mutual agreement regarding the mitigation measure language. Tribal consultation with the Gabrieleño Band of Mission Indians–Kizh Nation concluded on May 8, 2026 pursuant to PRC Section 21080.3.2(b). No responses from the other 11 Native American Tribal Leaders were received.

On May 15, 2026, DEO issued a Notice of Availability and released the Draft SEIR for public review. The public review period for the SEIR went from May 15, 2026 through June 29, 2026, a period of 45 days. The County hosted a virtual public informational meeting for the Draft SEIR on June 11, 2026. Following the close of public review, the County prepared formal responses to all comments received on the Draft SEIR, transmitted agency responses pursuant to Section 21092.5, and notified all interested stakeholders of the Final SEIR by e-mail.

While the SEIR provides a program-level CEQA analysis for the proposed Master Plan, all subsequent projects proposed under the Master Plan will be examined in light of this SEIR to determine whether additional documentation must be prepared (State CEQA Guidelines Section 15168 (c)(2)). The proposed Project as described and analyzed in the SEIR includes guidelines for a phased buildout over an estimated 25-year period.

Historic Preservation Designations

On May 7, 2026, the County submitted the nomination for the General Hospital Acute Unit to the California State Historical Resources Commission, which recommended the listing to the Keeper of the National Register. The Acute Unit was recognized under three criteria: Criterion A (Health/Medicine), for its 1933 opening as the largest single-unit hospital in the world; Criterion A (Social History), for its association with the 1975 *Madrigal v. Quilligan* case, a landmark in the Chicano civil rights movement; and Criterion C (Architecture), as a premier example of Art Deco institutional design. Following a successful nomination process led by the Developer and County, the General Hospital Acute Unit received designation in July 2026, whereby the historic General Hospital was officially listed in the National Register of Historic Places.

In parallel, the Developer, with authorization from the County, submitted a rehabilitation application to the National Park Service seeking federal Historic Tax Credit certification for the Acute Unit, detailing the proposed preservation and rehabilitation work. This application commits to retaining the building's character-defining features, including its primary and secondary masonry and concrete elevations, historic steel windows, the primary east-west corridors (with salvaged terrazzo wainscoting reinstalled), the Surgery Auditorium, Medical Library, historic Nurses' Station, and the historic entrance gateways, forecourt paving, and retaining walls along the National Register boundary. This application remains under active review by the California Office of Historic Preservation (OHP); OHP issued a first Request for Information in April 2026, and the Developer has since proposed rehabilitation work revisions to minimize impacts to historic fabric and sightlines. Final certification of the rehabilitation application remains outstanding, pending OHP's recommendation and subsequent approval by the National Park Service.

PROJECT DESCRIPTION

Los Angeles County General Hospital Campus Master Plan

The Master Plan translates Supervisor Solis' "Healthy Village" vision into a core design philosophy for the future campus: health-promoting strategies should be embedded seamlessly into the physical environment, so that wellbeing becomes a natural byproduct of daily life on campus. The Master Plan frames this concept as an evolution of the campus's original mission to provide care for the “acutely ill and suffering…without charge…in order that no citizen of the County shall be deprived of health or life for lack of such care and service” by expanding the meaning of health beyond clinical treatment to include the social determinants that shape it.

The 2014 LAC+USC Medical Center Campus Master Plan (2014 Master Plan) currently governs redevelopment on the full 81.9-acre campus. If approved, the proposed Los Angeles County General Hospital Campus Master Plan would guide redevelopment activities within the 30.8-acre redevelopment area identified in the Master Plan. The remaining 51.1-acres of the site would continue to be governed by the 2014 Master Plan and its associated development parameters.

Five Pillars of Health

The Master Plan organizes its programming around five interconnected dimensions of health, each treated as a distinct "ingredient" woven into the physical fabric of the site:

- **Wellness** will be advanced by embedding healthcare access into the fabric of daily life and providing dedicated recreation spaces, while directly redressing existing food desert conditions through the establishment of features such as a full-service grocery store, fresh food markets, and community food programs.

- **Economic Opportunity** will be fostered through a connected employment ecosystem that includes a range of new jobs in retail, food service, maintenance, childcare, and small business, supported by job training, mentorship, and certification programs designed to connect residents to higher-wage anchor employers in medical offices, professional services, research, and commercial enterprises.

- **Community** will be strengthened through a network of district-level "community commons" — including features such as plazas, parks, halls, and centers — located within a five-minute walk of residents, complemented by dedicated spaces for teens, young adults, and seniors.

- **Learning** will be embedded throughout the campus via distributed learning hubs, such as libraries, maker spaces, and flexible classrooms, that support tutoring, workforce training, and continuing education, alongside a "cultural path" of public art and murals woven through the site.

- **Ecology** will be prioritized through green spaces located within a five-minute walk of every home, biodiversity corridors that link habitats, climate-adaptive landscaping that manages stormwater, shade, and air quality, and everyday sustainability practices such as composting, recycling, and the maintenance of pollinator gardens.

The Ground Plane and "Common Ground"

Central to the Master Plan's design philosophy is the principle that the ground plane belongs to the public. Streets, plazas, gardens, corridors, and community-oriented ground-floor spaces are organized into a continuous "Common Ground" that prioritizes people over cars and daily life over isolated destinations. This public realm functions as the connective tissue of the campus, shaping how residents, patients, workers, and visitors arrive, move, gather, and experience the site. Architecture reinforces this approach through tall, flexible ground floors, indoor-outdoor transitions, and podium designs that let public life extend through and beneath buildings. Underlying this visible public realm is a coordinated infrastructure framework (grading, hydrology and water management, energy systems, mobility, and utilities) that supports long-term resilience as the campus evolves.

Three Hubs / Zones

The campus will be organized around three distinct but interconnected hubs, each anchored at a primary point of entry and connected by pedestrian-oriented corridors that bridge grade changes and stitch together a previously fragmented site:

- **The Medical Hub** will be centered on LA General Medical Center and will expand access to care through supporting services, wellness amenities, educational offerings, and continuity-of-care programs.

- **The Commerce Hub,** located on the West Campus, will be anchored by a public plaza and surrounded by local retail, small business, housing, food access, and cultural activity, establishing a new center of community life.

- **The Historic Hub** will reclaim the historic forecourt and the Historic General Hospital building as a living civic destination through adaptive reuse for housing, recreation, learning, culture, and shared community space.

Flexible Framework and Guiding Principles

The Master Plan is structured as a programmatic framework rather than a prescriptive design document. Rather than fixing unit counts, square footages, or exact land uses, it establishes site organization principles (the “common ground” and three hubs), an infrastructure strategy (a new internal road network and coordinated utilities), an open space system (a central spine of connected public spaces), and land use and density ranges illustrated through several conceptual massing scenarios spanning retail, residential, office, industrial, and community use categories. These are explicitly conceptual, with final designs and specific uses, scales, and intensities to be determined project-by-project over the plan's roughly 25-year build-out, guided by the CBA, and continued community engagement. This "flexible framework" approach allows individual projects to respond to evolving community needs, future innovations, and changing market conditions, while maintaining a consistent character, functionality, and public benefit across the campus.

The evolution of that framework will follow a set of Core Principles, developed through extensive community outreach and organized around a throughline of equity, opportunity, and belonging:

- **A Complete and Cohesive Campus:** The master plan site will be a financially viable, mixed-use campus balancing healthcare, housing, economic opportunity, and public realm investment, phased to maintain continuity of County operations.

- **A Regional Anchor for Health and Healing:** The design will ensure that LA

General Medical Center remains a flagship public medical campus, while integrating medical, behavioral health, and supportive services throughout the campus.

- **Historic Preservation & Adaptive Reuse:** The project will preserve and rehabilitate the General Hospital building as a civic and cultural anchor.

- **Sustainable & Resilient Infrastructure:** The campus will feature upgraded utilities and mobility systems, LEED Gold certification for new construction, all-electric development where feasible, and climate resilience strategies.

- **Community Spaces & Common Ground:** The site will be organized around a connected network of green, educational, cultural, and commemorative public spaces prioritizing walkability, safety, and multi-modal access.

- **Housing Opportunity & Stability:** The project will include inclusive, mixed-income, multigenerational housing, with a goal of a minimum of 600 units, aligned with anti-displacement and stabilization objectives.

Use and Development Standards

The Use & Development Standards are the regulatory framework of the Master Plan, establishing standards for what can be built and how, while remaining aligned with the Master Plan's flexible, performance-based approach. This document aims to create clarity for future entitlement while preserving flexibility. Key sections include:

- **Land Uses:** Establishes the type of allowable land uses and defines which uses are Permitted (P) by-right and which require Additional County Review (ACR) at either the staff-level (ACR-Tier 1) or Board-level (ACR-Tier 2).

    - Uses that are approved by-right include, but are not limited to: community gardens, kitchens and commercial kitchens, restaurants and other eating establishments (those requesting alcohol sales require ACR-1), barber/beauty shops, health clubs and gyms, open space, recreation, and playgrounds.

    - Uses subject to ACR-Tier 1 include, but are not limited to: patient and caregiver lodging, bars and cocktail lounges, medical or dental offices, veterinary clinics.

    - Uses subject to ACR-Tier 2 include, but are not limited to: hospitals, outpatient surgical facilities, utility service centers, and wholesale warehousing.

- **Performance Standards**: Sets operational baseline requirements across all development, such as a minimum number of housing units, commercial operating hours, loading and maintenance activity windows, and prohibitions on hazardous material storage in commercial spaces.

- **Development Standards:** High-level physical regulations governing all new construction (not applicable to rehabilitation of the historic General Hospital building), organized into fourteen subsections: Development Intensity; Height; Protected Viewsheds; Setbacks; Stepbacks; Active Ground Floor; Open & Recreational Space; Landscaping; Circulation, Parking & Loading; Stormwater; Screening; Security; General Hospital Acute Unit Historic District; West Campus Site Documentation

This action seeks to delegate authority to DEO for certain technical amendments and establishes procedures to amend the Standards as required in accordance with the goals of the Master Plan and subject to CEQA. More consequential amendments require Board approval, as detailed by the procedures in the Standards.

Redevelopment Framework

Pursuant to the ENA, DEO, in consultation with the CEO's Office and County Counsel, continues to negotiate a structure with the Developer for facilitating the redevelopment of the campus in a manner that is consistent with the proposed Master Plan. Specifically, the parties are considering a Master Option Agreement (Agreement) with a form of Ground Lease which would grant the Developer exclusive rights to redevelop the campus and execute phase-specific ground leases on the campus, subject to the requirements and conditions of the Master Plan and its Use and Development Standards, the SEIR, CBA Framework, financial feasibility and consistency with a broader schedule of performance that is anticipated to govern campus redevelopment efforts. DEO anticipates returning to the Board at a later date for authority to execute all required legal agreements.

FISCAL IMPACT/FINANCING

The total aggregate budget for the LA General Campus is estimated at $130,937,000. Prior committed project expenditures for activities are estimated at $10,557,000 for the Feasibility Study, structural improvements, due diligence activities, and other board-authorized activities funded by the General Hospital West Campus Project, Capital Project No. 87883 and Los Angeles General Medical Center General Hospital Structural Improvements Project, Capital Project No. 87958.

The approved budget for the active Stabilization Project is $120,380,000, funded with the following sources: $43,100,000 remaining from the $50,000,000 California State Department of Housing and Community Development Grant currently held in the County Trust Account TK7-7383 (TK7-7383); $55,000,000 from obligated fund balance Committed for American Rescue Plan Act (ARP)-Enabled Capital Programs; $1,678,000 of First

Supervisorial District Discretionary Funds (Community Project Funding); and an aggregated total of $20,602,000 net County cost (NCC), currently budgeted in the General Hospital West Campus Project, Capital Project No. 87883 and the LA General MC General Hospital Structural Improvements Project Capital Project No. 87958.

The Developer has estimated that the total development cost of the Project is $1.5 to $2 billion. This estimate reflects the full multi-phase buildout over an estimated 25-year horizon. Costs beyond the County's initial $130,937,000 investment will be financed by the Developer through combined public and private sector financing. No County General Funds are requested at this time and additional funds from the County General Fund are not currently anticipated.

FACTS AND PROVISIONS/LEGAL REQUIREMENTS

A Request for Proposal was authorized by the Board and issued by DEO on January 25, 2023. As a result of the RFP, the County received a total of two proposals. The proposals were evaluated based on the following criteria described in the RFP:

1. Proposer Qualifications
2. Financial Capacity & Capability to Implement Project
3. Project Design/Concept & Narrative Description
4. Project Financing Strategy
5. Interview
6. Developer Requirements

Centennial Partners' proposal received the higher score. A debrief was held with the non-selected proposer and no protests were filed over the selection process.

On December 19, 2023, the Board authorized and delegated authority to the DEO Director to negotiate and execute an Exclusive Negotiating Agreement (ENA) between the County and the Developer, regarding the mixed-use development at the Los Angeles County General Hospital Campus at 1200 North State Street, Los Angeles, CA 90033, (Project Site). On June 25, 2024, the Board authorized a term modification of the ENA from 18 to 36 months, with options to extend for up to two additional 180-day periods, to facilitate completion of preliminary studies, analysis, site investigation, and project management activities in furtherance of defining the scope, requirements, and priorities of the redevelopment.

On June 17, 2025, the Board certified that the Addendum to the previously certified Final Environmental Impact Report for the LAC+USC Medical Center Campus Master Plan was

completed in compliance with CEQA and reflects the independent judgment and analysis of the Board.

California Government Code §§ 25350 et seq. grants the Board the authority to purchase, lease, sell, or otherwise dispose of County-owned real property. Pursuant to Government Code Section 25371, the County is authorized to ground lease real property parcels to the Developer to implement the proposed Project in the most timely and cost-effective manner.

The Board declared the Project Site exempt from the Surplus Land Act, Government Code section 54200, et seq., in accordance with Government Code section 54221(f)(1)(F)(ii) because the County invited entities to participate in a competitive bid process for a mixed use development that is more than one (1) acre in area, that includes not less than 300 housing units, and that restricts at least 25 percent of the residential units to lower-income households, as defined in Health and Safety Code Section 50079.5 as affordable housing.

ENVIRONMENTAL DOCUMENTATION

A Final SEIR for the proposed Master Plan in compliance with CEQA, (California Public Resources Code (PRC) Section 21000, et seq.) and the State CEQA Guidelines (California Code of Regulations, Title 14, Chapter 3) to evaluate and disclose the potential environmental impacts associated with implementation of the proposed Master Plan has been prepared.

While the SEIR provides a program-level CEQA analysis for the Master Plan, no specific projects would be approved by approving the Master Plan. All subsequent projects proposed under the Master Plan will be examined in light of this SEIR to determine whether additional CEQA documentation must be prepared (State CEQA Guidelines Section 15168 (c)(2)). The proposed Master Plan Project as described and analyzed in the SEIR includes guidelines for a buildout in phases over an estimated 25-year period.

The County, acting through DEO, initiated the SEIR process in compliance with CEQA, issuing a Notice of Preparation (NOP) on September 26, 2025 beginning the 30-day public scoping period through October 27, 2025, and holding a public scoping meeting on October 8, 2025. The public scoping period was subsequently extended to November 21, 2025 following requests from the public during the comment period and to ensure additional opportunity for review and participation. On May 15, 2026, DEO filed a Notice of Availability (NOA) of the Draft SEIR, a subsequent document to the County's previously certified 2014 LAC+USC Medical Center Campus Master Plan EIR and made the Draft SEIR available for public review. Notice was provided to those who requested in writing to be notified, and notice was posted on the Project Site and off the Project Site in the community where the Project Site is located, pursuant to State CEQA Guidelines Section 15087. The Draft SEIR and appendices were also published to the County’s website for the proposed Project on May 15, 2026. The public review period closed on June 29, 2026, meeting the 45-day requirement under State CEQA Guidelines Section 15105.

In addition to receiving public comments, a public meeting was held to inform interested parties about the Draft SEIR's analysis of the project and to gather input from interested persons and agencies on the content of the Draft SEIR. The County held a virtual public informational meeting on June 11, 2026, in accordance with Assembly Bill 361, to review the Proposed Project and solicit oral and written comments on the environmental issues addressed in the Draft SEIR.

The County received 20 comments including 8 verbal comments and 1 written comment during the public meeting held on June 11, 2026; all received a formal response. Comments on the Draft SEIR addressed several themes: public outreach and duration of the comment period; transportation and parking methodology; scale and clarity of the project program; air quality and environmental analysis; and historic/cultural resources. Responses to the written and oral comments are included in the Final SEIR. Responses to all comments received from public agencies were sent to those agencies pursuant to Section 21092.5. All interested stakeholders were notified of the Final SEIR by e-mail.

All tribal cultural resources consultation requirements of CEQA have been met and documented. The County sent letters by certified mail to 12 Native American tribal leaders traditionally affiliated with the geographical area of the project that have requested notification of County projects under Assembly Bill 52. The consultation request period began on September 26, 2025, and the close of the request period was extended from its original end date of October 27, 2025, to November 21, 2025. A total of three tribes (San Manuel Band of Mission Indians, Fernandeño Tataviam Band of Mission Indians, Gabrieleño Band of Mission Indians–Kizh Nation) responded. The San Manuel Band of Mission Indians and Fernandeño Tataviam Band of Mission Indians stated no consultation with this tribe was requested. On November 4, 2025, the Gabrieleño Band of Mission Indians–Kizh Nation requested to consult with the County on the Proposed Project. The Kizh Nation provided recommended mitigation measures tailored to the tribe's cultural protocols. The County considered all information provided by the Kizh Nation during the consultation for the Proposed Project. After acting in good faith and in consideration of the Tribe's requests and multiple rounds of emails and edits to the draft mitigation measures, the County concludes that a reasonable effort has been put forth and the County and the tribe have been unable to reach a mutual agreement regarding the mitigation measure language. Tribal consultation with the Gabrieleño Band of Mission Indians–Kizh Nation concluded on May 8, 2026 pursuant to PRC Section 21080.3.2(b). Appendix K, *Tribal Consultation Responses*, of the Draft SEIR describes the County's tribal consultation outreach efforts.

Additionally, the County and Centennial Partners team conducted extensive public engagement and outreach throughout development of the Master Plan. Engagement was carried out in collaboration with a network of community stakeholders, which included community-based organizations, healthcare workers, labor groups, educational partners, and neighborhood leaders, as well as individuals who interact with the Project Site on a daily basis.

The Final SEIR consists of the comments and recommendations received on the Draft SEIR; a list of persons, organizations, and public agencies commenting on the Draft SEIR; the Lead Agency's responses to significant environmental points raised; and any other information added by the Lead Agency, and the circulated Draft SEIR. The Final SEIR, Findings of Fact, Statement of Overriding Considerations, and Mitigation Monitoring and Reporting Program have been prepared in compliance with CEQA and are on file with the Clerk of the Board. A copy of the Final SEIR, Findings of Fact, Statement of Overriding Considerations, and Mitigation Monitoring and Reporting Program are also available online at https://opportunity.lacounty.gov/general-hospital/ or at the Los Angeles County DEO's main office (510 S. Vermont Avenue, 11th Floor, Los Angeles, CA 90020).

As stated in the SEIR and Findings of Fact and Statement of Overriding Considerations, the Project will result in unavoidable significant impacts in the areas of air quality, cultural resources, greenhouse gas emissions, noise, recreation, transportation, utilities and service systems, but such impacts have been reduced to the extent feasible, and the benefits of the proposed project, some of which include but are not limited to economic, social, housing, healthcare, infrastructure, historic preservation, and sustainability benefits, outweigh these unavoidable adverse impacts.

The Mitigation Monitoring and Reporting Program (MMRP) provided with the Final SEIR has been adequately designed to ensure compliance with the mitigation measures during project implementation.

The location of the documents and materials constituting the record of the proceedings upon which the Board's decision is based in this matter is the Department of Economic Opportunity. The custodian of such documents and records is the Assistant Director, Capital Development, Department of Economic Opportunity, 510 South Vermont Avenue, 11th Floor, Los Angeles CA 90020. The environmental documents are also available at the following link: https://opportunity.lacounty.gov/general-hospital/.

The Project is not exempt from payment of a fee to the California Department of Fish and Wildlife pursuant to section 711.4 of the Fish and Game Code to defer the costs of fish and wildlife protection and management incurred by the California Department of Fish and Wildlife.

Upon the Board's certification of the Final SEIR, DEO will file a Notice of Determination with the County Clerk and with the State Clearinghouse in the Office of Climate Innovation in accordance with section 21152 of the California Public Resources Code, will pay the required fees to the County Clerk and will post the Notice to DEO's website in accordance with section 21092.2.

IMPACT ON CURRENT SERVICES (OR PROJECTS)

The Master Plan creates a cohesive framework for increasing overall housing supply, including affordable housing, restoring a historic County asset and community landmark,

and supporting broader revitalization efforts in a historically underserved community, all while ensuring uninterrupted operations at the Medical Center.

CONCLUSION

Should you have any questions, you or your staff may contact me directly, or Krystin Hence, Assistant Director of Capital Development, at (323) 578-5389 or khence@opportunity.lacounty.gov.

Respectfully submitted,

Kelly LoBianco, Director

County Counsel
Executive Office, Board of Supervisors

Los Angeles County General Hospital Campus Master Plan

Acknowledgements

Supervisor Hilda Solis

This Master Plan builds upon Supervisor Hilda L. Solis's leadership and vision for a "Healthy Village" centered on LAGMC and the surrounding community. She was an early champion of aligning public and private resources to support the rebirth of the LA General Hospital site as a Healthy Village. Through her enduring leadership and unflagging efforts, this public-private partnership and the resulting Master Plan vision were made possible.

County of Los Angeles

The Master Plan was made possible through the leadership and support of the County of Los Angeles, particularly the Department of Economic Opportunity, which led County guidance, coordination, and involvement throughout the planning process. Numerous County departments and site stakeholders also contributed invaluable knowledge, technical expertise, and guidance to the design team.

- **Department of Economic Opportunity (DEO)**
- **Chief Executive Office (CEO)**
- **Department of Health Services (DHS)**
- **Department of Mental Health (DMH)**
- **Department of Public Works (DPW)**
- **Facilities Management, DHS (FM)**
- **Medical Examiner (ME)**
- **Restorative Care Village (RCV)**
- **Angel Interfaith Network (AIN)**
- **Jhaelen Capital Projects**
- **Trifiletti Consulting**

Community Partners

This Master Plan would not have been possible without the community, including leadership from The Wellness Center, numerous local and community-based organizations, and the many individuals whose tireless efforts over the years helped shape this vision. Their participation through workshops, brainstorming and visioning sessions, community organizing, and ongoing engagement provided invaluable insight and grounded this Master Plan in the needs and aspirations of the community it serves.

- **LACGH Community Advisory Committee**
- **The Wellness Center**
- **Health Innovation Community Partnership**
- **LA General Medical Center Foundation**
- **Eastside LEADS**

Centennial Development

This effort was managed and led by Centennial Partners, a joint venture between Primestor Development and Bayspring, which orchestrated collaboration among public agencies, community members, and the design team to advance and implement the Master Plan vision through both the design and regulatory processes.

- **Primestor Development (80%)**
- **Bayspring Real Estate Partners (20%)**

Master Plan Design Team

The design of the Master Plan was led by RIOS, a multidisciplinary architecture and landscape design firm, with technical and engineering support provided by several design consultants.

- **RIOS**
- **Sherwood (Civil Engineering)**
- **Atelier 10 (Sustainability)**
- **Placeworks (Environmental Impact Report - EIR)**
- **Somos (Land Use Legal)**
- **Buro Happold (MEP Engineering)**
- **Fehr and Peers (Traffic Engineering)**
- **Chattel (Historic Preservation)**
- **ARG (Historic)**

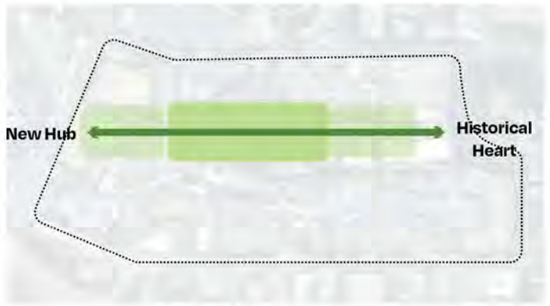
Executive Summary

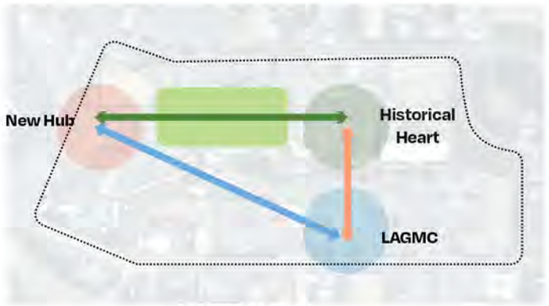
*This graphic illustrates the project site within its broader geographic context in Los Angeles.

Background, Context, and Vision



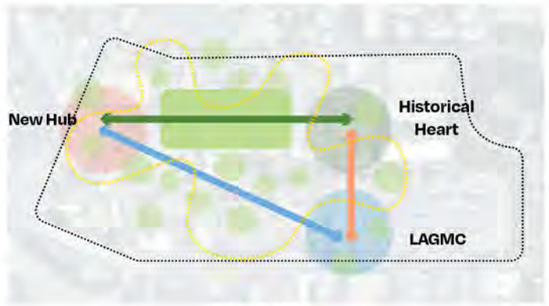
For more than a century, the Los Angeles County General Hospital campus has stood as a public promise: that healthcare, opportunity, and dignity should be accessible to all. Rising above the city's eastern neighborhoods, the Historic General Hospital is an unmistakable landmark, shaped by dramatic topography and defined by its bold Art Deco form. Together, the campus and its setting tell a powerful story of public investment, civic ambition, and care for generations of residents from Boyle Heights, Lincoln Heights, East Los Angeles, El Sereno, Chinatown, and Downtown Los Angeles.

Over time, the city grew around the campus in ways that changed this relationship. Freeways, rail lines, and institutional expansion gradually turned what was once a shared civic center into a place people traveled to, rather than through or within. The site's steep grades, along with piecemeal development, became barriers to access and connection. Yet even as the campus grew more internally disconnected, LA General Medical Center remained one of the region's most essential public institutions, serving more than one million patients each year and anchoring the site's enduring importance.



Years of technical study and sustained community engagement have revealed a clear and hopeful opportunity: to reconnect the campus to the neighborhoods it has long served and to reimagine its role for the next century. Community members, patients, advocates, and County partners consistently called for a future that honors the Historic General Hospital, transforms the site's topography into a strength, and expands the campus beyond episodic care into a place that supports daily life, opportunity, and belonging.

The Master Plan answers that call with a bold but grounded vision. Health is redefined not as something that happens only inside hospital walls, but as the product of everyday environments that support wellness, economic opportunity, community connection, learning, and ecology. Guided by this vision, the Plan reimagines the campus as a Healthy Village, restoring the Historic General Hospital as a living civic asset and transforming the site into a connected, inclusive place where people can heal, grow, and thrive together. This vision sets the direction for everything that follows, establishing a shared foundation for design, investment, and long-term stewardship.



Executive Summary

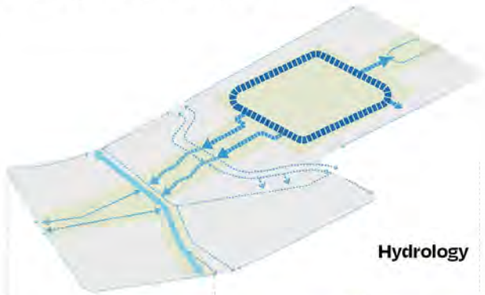
Gathering

Connectivity

Belonging

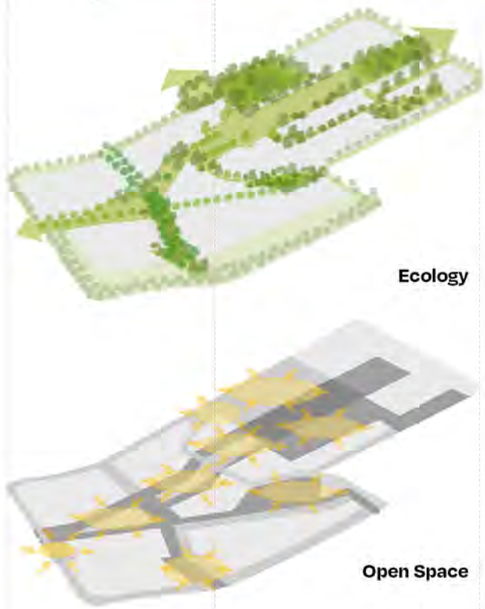
Design, Site Organization, and the Healthy Village Framework

The Master Plan translates vision into place through a clear, human-centered framework that organizes the campus as a cohesive yet varied Healthy Village. At its core is a simple and powerful idea: the ground plane belongs to the public. Streets, plazas, gardens, corridors, and community-oriented ground-floor spaces form a continuous Common Ground that prioritizes people over cars and daily life over isolated destinations. This public realm becomes the connective tissue of the campus, shaping how people arrive, move, gather, and experience the site throughout the day.



The campus is organized around three distinct yet interconnected hubs, each anchored at a primary point of entry and defined by a unique identity. The Medical Hub centers on LA General Medical Center and expands access to care through supporting services, wellness amenities, education, and continuity-of-care programs. The Commerce Hub on the West Campus creates a new center of community life, anchored by a public plaza and surrounded by local retail, small businesses, housing, food access, and cultural activity. The Historic Hub reclaims the forecourt and the Historic General Hospital as a living civic destination, blending adaptive reuse housing, recreation, learning, culture, and shared community spaces. Together, these hubs distribute activity across the site while reinforcing one another as parts of a unified whole.

Connecting the hubs are a series of pedestrian-oriented corridors that transform movement into experience. These corridors are not simply paths, but active public spaces lined with program, landscape, and gathering opportunities. They bridge dramatic grade changes, improve accessibility, and stitch together hubs that were once characterized by fragmented connectivity. By aligning circulation, open space, and program, the corridors ensure that the campus feels intuitive, legible, and welcoming for residents, patients, workers, and visitors alike.



Program across the campus is intentionally layered to support the five dimensions of health. Wellness, economic opportunity, community, learning, and ecology are embedded into the design of public spaces and buildings, often overlapping within the same place. A single plaza may host exercise, markets, performances, learning, and ecological infrastructure, allowing everyday environments to deliver multiple health benefits at once. Architecture reinforces this approach through tall and flexible ground floors, indoor-outdoor transitions, and podium designs that allow public life to extend through and beneath buildings.

Underlying this visible public realm is a robust framework of infrastructure designed to support long-term resilience and adaptability. Grading, water management, energy systems, mobility, and utilities are coordinated as living infrastructure that improves performance while enhancing experience. Together, these design strategies transform the campus from a collection of isolated facilities into a connected, inclusive, and resilient Healthy Village that supports daily life today and can evolve with the community over time.

Implementation, Flexibility, and Delivery

The Master Plan is designed not only to inspire, but to be built. From the outset, it establishes a clear pathway from vision to implementation, ensuring that the Healthy Village can be realized incrementally, responsibly, and in alignment with community priorities. Rather than prescribing a single fixed outcome, the Plan creates the conditions for long-term success by balancing certainty with flexibility, and ambition with practicality.

At the heart of this approach is a flexible programmatic framework. The Master Plan defines a balanced, mid-range mix of uses that reflects community priorities and County objectives, while allowing for adjustment within defined land use and density ranges. This flexibility enables the campus to respond to changing needs, emerging opportunities, and innovations in design and construction over time. Housing, employment, services, and amenities can evolve as the community evolves, while still reinforcing a cohesive identity and shared public realm.

Implementation is further enabled through phased development and comprehensive site investment. The Master Plan addresses aging infrastructure, seismic resilience, grading, and operational dependencies while maintaining continuity of care and daily operations. Together, these strategies ensure that development can move forward in coordinated phases, aligning public investment, private development, and community benefit over time.

Through this integrated approach, the Master Plan establishes more than a roadmap. It creates a durable framework for action, one that allows the Healthy Village to be built step by step, guided by community values, supported by regulatory clarity, and resilient to change. In doing so, it ensures that the vision for the Los Angeles County General Hospital campus can be delivered not just once, but sustained for generations to come.

The Master Plan articulates a long-term vision and framework for the campus, while allowing flexibility in how individual projects evolve. Specific uses, scales, and intensities will be determined on a project-by-project basis in response to community needs, planning processes, and market conditions. Through the Community Benefits Agreement, future development will provide meaningful community benefits and maintain continued engagement with the community before development plans are finalized.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA)

Introduction

1.1 Vision Statement
1.2 Project Summary
1.3 Process Summary
1.4 Master Plan Priorities
1.5 Campus Stakeholders

1.1 Vision Statement

Over the past century, Los Angeles County has demonstrated an unwavering commitment to public health. The General Hospital stands as its most visible testament: a monumental civic investment built on the belief that access to care is a public good. Today, as our understanding of health expands, so too must the role of this campus. We now recognize that health is shaped not only by medical intervention, but by the conditions of daily life, where people live, work, learn, and connect. Increasingly, evidence shows that place matters profoundly: neighborhood context, housing stability, and access to opportunity can shape health outcomes as much as, if not more than, medical care alone.

The plan embraces a simple truth: there is no neutral environment. Every space we create influences physiology, cognition, emotional wellbeing, and a sense of meaning.

Design decisions about housing, mobility, public space, and access to opportunity either constrain or expand people's capacity to thrive. In communities facing long-standing inequities in housing affordability, employment access, and environmental quality, these decisions carry even greater weight.

The Healthy Village vision positions the campus as a health-generating ecosystem, where architecture, landscape, mobility, and programming are deliberately shaped to enhance wellbeing across five interconnected dimensions: Wellness, Economic Opportunity, Community, Learning, and Ecology. Each element of the plan is conceived as a positive determinant of health, one that lowers stress, fosters belonging, supports safety, encourages movement, stimulates creativity, and strengthens social connection.

Extending care beyond traditional clinical settings and into everyday environments

In this vision, health is not an outcome housed solely inside clinical buildings. It is embedded into the everyday experience of the campus and shaped by proximity to care, to housing, to jobs, and to community resources.

Streets and plazas become places of coherence and meaning, anchored in intuitive circulation and legibility. Public spaces invite ritual, gathering, intergenerational exchange, and cultural expression, reinforcing identity and belonging. Buildings are shaped to support calm, dignity, and purpose through natural light, biophilic cues, material warmth, and human-scaled design.

Movement is encouraged through a walkable, 10-minute campus, fitness loops, shaded pedestrian streets, and accessible pathways that reduce barriers and increase vitality. At the same time, the plan prioritizes mixed-income, multi-generational housing through unit mixes that provide 3+ bedroom layouts, shared amenity spaces, flexible configurations with knock-out doors for expansion, and shared living infrastructure. Multigenerational living is also supported through site design, programming, and amenities that support aging in place. Spread throughout the campus, various housing and unit types, including affordable housing, are within walking distance of employment centers, medical services, and daily amenities, addressing housing stability as a core health strategy rather than a secondary land use.

Housing, childcare, workforce training hubs, and small business spaces are integrated to expand access to economic opportunity across a range of education and experience levels, from construction and skilled trades, to retail and restaurant employment, to institutional, cultural, educational, and medical uses. Together, these programs are designed to meet the daily needs of residents, workers, and visitors while strengthening long-term economic resilience in the surrounding community.

Taken together, these elements form an environment that is not passive. It interacts with people, shapes behavior, influences emotional and cognitive states, and provides the conditions for growth, recognizing that health is produced through everyday life as much as through clinical care.

The General Hospital campus will become a Healthy Village — a place where people come not only to heal, but to live, work, learn, connect, and thrive.

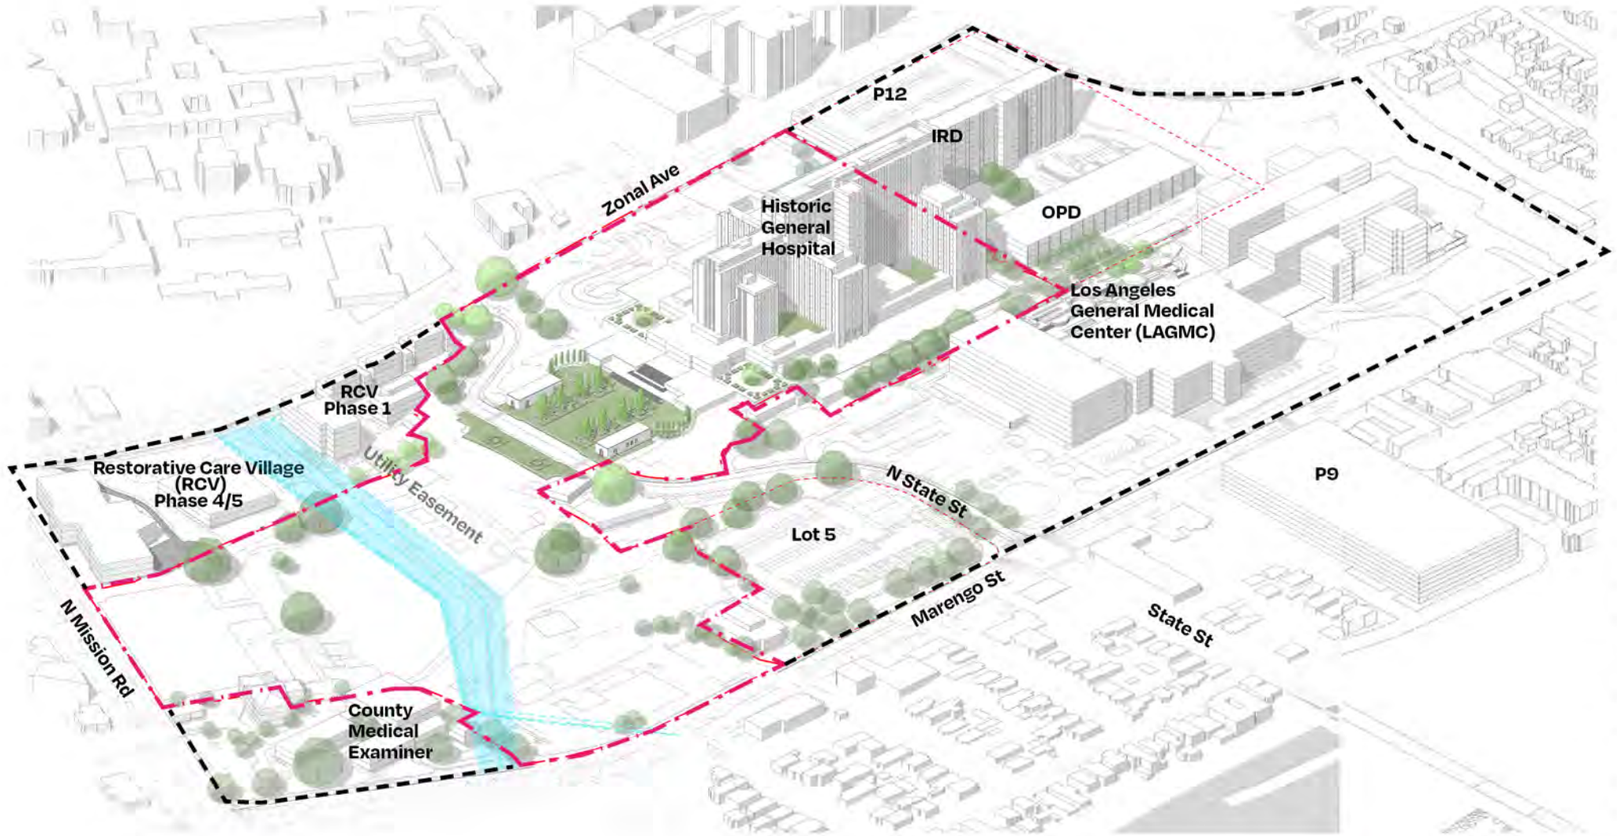
1.2 Project Summary

Project Area - ENA (Exclusive Negotiating Agreement) and Master Plan Boundary

While the Master Plan envisions the linkages and site organization throughout the ENA boundary and adjacent Areas of Consideration, the proposed future development determined by this Master Plan is within the ENA Boundary. The exact ENA boundary shown in this document is preliminary and subject to refinement.

Legend

ENA Boundary



The Los Angeles County General Hospital Campus Master Plan envisions the transformation of a County-owned 30.8-acre site, including the 1.2-million-square-foot historic General Hospital, into a vibrant, sustainable, and inclusive mixed-use neighborhood.

The project encompasses the restoration and adaptive reuse of the historic General Hospital, preserving its architectural and cultural significance while adding much-needed housing, commercial, and community amenity spaces. Surrounding the General Hospital and extending into West Campus, mixed-use development encompassing housing, retail, food & beverage, commercial, educational, community and cultural spaces are organized around landscaped plazas, gardens, and community open space.

This mixed-use development is linked throughout with a campus-wide circulation and infrastructure framework, including vehicular, pedestrian, bicycle, transit, emergency access, shared utilities, and water management systems that support phased development and growth.

The Master Plan establishes this shared framework to guide long-term reinvestment across the campus. It aims to facilitate a mixed-use, health-anchored community that responds to the needs of surrounding neighborhoods, visitors, patients, employees, and on-site County agencies by establishing ongoing community visioning, engagement, and delivery of community benefits in coordination with future development phases. New development is envisioned on a portion of the larger superblock and would be implemented over time; however, the Master Plan considers the campus as an interconnected whole. The framework accounts for operational dependencies, shared infrastructure, circulation, and public space networks, while reinforcing connections between existing County functions and future development areas. This approach allows individual projects to move forward incrementally while maintaining cohesion, flexibility, and alignment with community goals and County service needs.

1.3 Process Summary

Legend

ENA Boundary

From Vision to Construction

This Master Plan is the next step in a process that began in 2013 with early technical studies and extensive community engagement. That foundational work established a shared understanding of site conditions, constraints, and opportunities, while building consensus around the need for a more connected, community-centered campus. The Master Plan builds directly on that groundwork, revisiting and refining earlier findings and documenting, with greater clarity and resolution, both the technical criteria and the priorities voiced by stakeholders and community members. These inputs are synthesized into a cohesive vision, design framework, and comprehensive programmatic plan to guide the next phase of development.

Unlike prescriptive master plans that fix a single design outcome, this Master Plan functions as a programmatic master plan. It establishes a flexible framework rather than a fixed blueprint, defining performance criteria, land use and density ranges, program mix, community benefits, site organization, infrastructure strategy, and open space systems. This approach allows individual development projects to respond to evolving community needs, innovations in design and construction, and changing market conditions, while maintaining a consistent character, functionality, and public benefit across the campus.

A Master Plan is a guide for how a place can grow and change over time. It focuses on the big picture, how the site is organized, what types of uses are needed, and how people will move through and connect to the area.

This plan looks at the site layout (open space, streets, and connections), the program needs (such as housing, shops, and community spaces), and the infrastructure priorities (including transportation, access, and utilities). It sets the overall direction for the campus but does not include detailed building designs, construction drawings, or final development plans.

In simple terms, the Master Plan shows what is possible and how the site can work, while leaving room for future projects to be designed over time.

1.4 Master Plan Priorities

From the earliest conversations, the heart of this effort has been the people who live, work, and heal in and around the General Hospital campus. The planning process, progressing through multiple iterations, was shaped by extensive outreach, ongoing dialogue, and the shared conviction that those closest to the site should have the greatest influence in defining its future. Every workshop, interview, and community event added nuance and depth to a single, resonant message: this plan must respond to the real needs and lived experiences of community members and campus users.

Across these conversations, a powerful throughline emerged, a collective call for equity, opportunity, and belonging. Residents, patients, care givers, advocates, and local organizations voiced not only the challenges they face but also a clear vision of what a thriving community could be. The result is a set of priorities that reflect both pressing realities and aspirational goals.

These priorities are more than a list of functional and programmatic criteria; they are a core expression of the community shaping its own future. They articulate the essential conditions for a Healthy Village that are rooted in place and that support wellbeing in every dimension, physical, social, and economic, ensure that growth benefits those who have long sustained this neighborhood. They are both the foundation and the launchpad for a future defined by community voice, resilience, and shared purpose.

Core Principles
The following Core Principles establish the long-term framework for the evolution of the LACGH Campus. Together, they advance a unified vision for a Healthy Village, one that strengthens healthcare delivery, supports inclusive growth, preserves cultural heritage, and ensures long-term operational resilience. Implementation will require sustained collaboration among Centennial Partners, County departments, community stakeholders, and institutional partners over multiple phases of development. Site planning will also be coordinated to ensure continued access and uninterrupted operations for adjacent County stakeholders.

A Complete and Cohesive Campus
Advance a cohesive, mixed-use campus that balances healthcare excellence, housing, economic opportunity, and public realm investment within a financially viable and operationally resilient framework.

Strategies:

- Deliver a thoughtfully programmed mix of affordable and market-rate housing, commercial uses, community-serving spaces, open space, and supporting infrastructure.
- Ensure new development complements ongoing medical operations and campus circulation systems.
- Provide adequate parking and mobility strategies aligned with multi-modal access goals.
- Phase development to maintain continuity of County operations while enabling longterm campus transformation.

A Regional Anchor for Health and Healing
Reinforce the campus as a long-term center of excellence for community-serving healthcare while expanding access and adaptability.

Strategies:

- Maintain LA General Medical Center as a flagship public medical campus serving the region for the next century.
- Integrate medical, behavioral health, and supportive services to address the full spectrum of community health needs.
- Ensure long-term flexibility in campus design to accommodate evolving County operations, technologies, and healthcare delivery models.
- Support partnerships that enhance preventative care, community wellness, and health equity.

Historic Preservation & Adaptive Reuse
Preserve and celebrate the historic General Hospital while sensitively adapting it for contemporary and future uses.

Strategies:

- Preserve and rehabilitate defining architectural features of the General Hospital Building.
- Maintain the historic identity of the General Hospital façades and significant features.
- Integrate adaptive reuse strategies that balance preservation with modern safety, accessibility, and sustainability standards.
- Elevate the building as a civic and cultural anchor within the region.

Sustainable & Resilient Infrastructure
Modernize essential infrastructure while advancing sustainability and climate resilience outcomes.

Strategies:

- Upgrade utilities, mobility systems, and site infrastructure to support long-term campus growth.
- Achieve high-performance building standards, including LEED Gold certification for new construction.
- Incorporate progressive energy-efficient design and explore opportunities for all-electric development.
- Optimize reuse of existing materials where feasible.
- Explore climate resilience strategies, particularly for cooling.
- Explore design and programmatic features that could support future use as a community resilience hub.
- Promote multi-modal transportation strategies and campus connectivity.

Community Spaces & Common Ground
Create a connected network of vibrant green spaces, educational, cultural, and commemorative zones, prioritizing walkability and safety, enhancing livability, and promoting social interaction to create vibrant environments.

Strategies:

- Provide high-quality creatively-designed and people-friendly open spaces.
- Create community spaces for gathering, recreation, and performances.
- Create spaces across the campus for respite, recreation, beautification and open space.
- Integrate educational, cultural, and commemorative elements into the landscape. Promote multi-modal access for walking, biking, and transit.

Housing Opportunity & Stability
Expand access to inclusive, mixed-income housing that addresses critical regional needs while supporting long-term neighborhood stability.

Strategies:

- Deliver a range of affordability levels and unit sizes supportive of multigenerational housing integrated throughout the campus responsive to Surplus Land Act affordability requirements with a goal of a minimum of 600+ units of housing.
- Include supportive housing and services that address housing insecurity and health-related housing needs.
- Align housing development with anti-displacement and stabilization objectives.

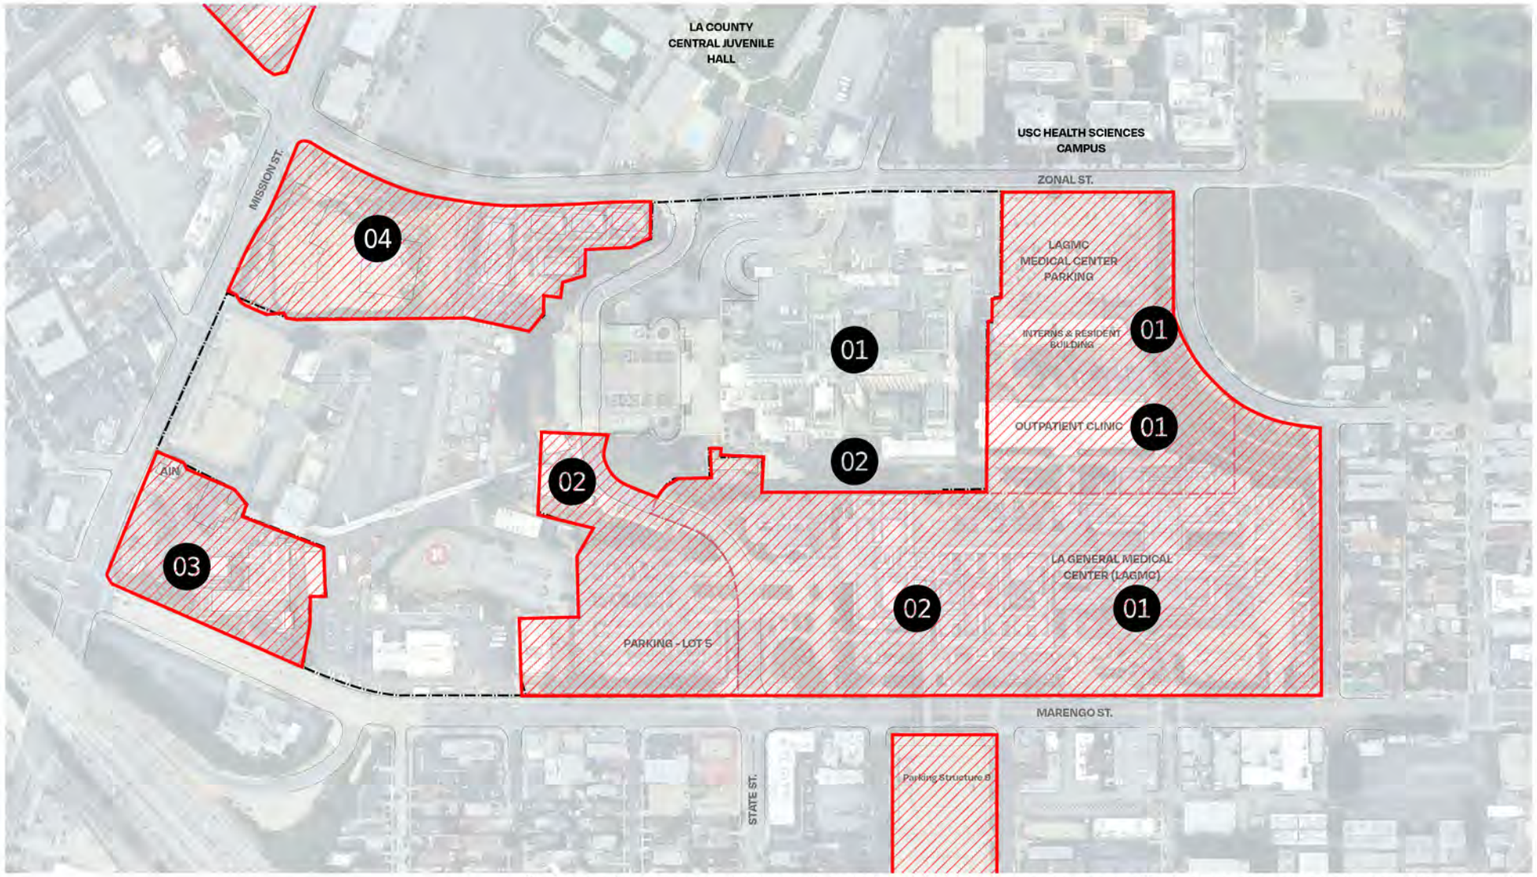
Arts, Culture, & Identity
Integrate meaningful civic art and cultural expression throughout the campus to reflect community identity and enhance the public realm.

Strategies:

- Incorporate murals, sculptures, and interactive installations in compliance with the County Civic Art Policy.
- Utilize construction fencing and interim activation opportunities for creative expression.
- Support partnerships that elevate local artists and cultural organizations.

Economic Vitality & Workforce Development
Strengthen the campus as an economic anchor by creating jobs across project construction and incorporate commercial spaces and innovation zones that support local businesses and workforce.

Strategies:



- Incorporate retail and commercial spaces that activate the campus and serve surrounding communities.
- Support participation in the County Community Business Enterprise Program.
- Facilitate opportunities for innovation and emerging businesses.
- Implement workforce development strategies that support labor protections during operations and address the priorities of LA County local and targeted hiring and prevailing wage policies.
- Support local small businesses and entrepreneurship connected to campus development and operations.
- Create workforce training and career pathway opportunities tied to project construction and long-term operations.
- Promote inclusive economic growth that benefits surrounding communities.

Community Care & Safety
Ensure the campus remains a safe, resilient, and coordinated environment for patients, residents, workers, and visitors.

Strategies:

- Develop a coordinated campus-wide public safety and operations framework.
- Align security strategies across County agencies and facilities.
- Integrate wrap-around supportive services addressing social determinants of health.
- Provide navigational and technological resources to assist residents and patients in accessing housing, healthcare, social, and emergency services.

1.5 Campus Stakeholders

*In future phases, as detailed design is undertaken for development within the Master Plan area, site planning will be coordinated with surrounding campus users to ensure continued access and uninterrupted operations for adjacent County stakeholders.

01 **DHS**

02 **THE WELLNESS CENTER / LAGMC MEDICAL CENTER FOUNDATION & CARES**

03 **LA COUNTY MEDICAL EXAMINER**

04 **RESTORATIVE CARE VILLAGE**

Restorative Care Village (RCV)
The Restorative Care Village (RCV) is a phased, County-led project on the LA General Medical Center campus that provides an integrated continuum of healthcare, behavioral health, recuperative care, and supportive housing to help vulnerable individuals, particularly those experiencing homelessness, stabilize, heal, and transition back into the community. The project includes five phases: Phase 1 (along Zonal Ave) opened in July 2022, providing housing and services for transitional patients; Phase 2 (at LAGMC) was completed in July 2025 and provided 58 acute Psychiatric beds; Phase 3 (along Griffin Ave and Mission Rd) will include 296 permanent supportive and affordable homes, led by Century and scheduled for completion in 2028; Phase 4 (along Zonal Ave) was completed November 2025 and provides a Mental Health Urgent Care Center as well as a Residential Withdrawal Management Facility with 32 beds; Phase 5 (along Zonal Ave and Mission Rd) is scheduled for completion in August 2026 and will provide 96 subacute beds. County agencies leading the operations and construction projects include the Department of Mental Health (DMH), the Department of Public Health (DPH), and the Department of Public Works (DPW).

Department of Health Services (DHS)
The Los Angeles County Department of Health Services (DHS) operates LA General Medical Center (LAGMC) as part of its large public health system, providing direct patient care, serving as a major teaching hospital (with the University of Southern California (USC) Medical School), managing the county's 911 emergency system (EMS), and caring for vulnerable populations, aiming to deliver high-quality, accessible healthcare across LA County.

The Wellness Center / LAGMC Medical Center Foundation & CARES
The Wellness Center is a nonprofit community hub that empowers East LA residents with free health, wellness, and advocacy services, working with several nonprofit partners. It is the flagship program of the LAGMC Medical Center Foundation and is currently located within the General Hospital Building. The LAGMC Foundation is a non-profit supporting LAGMC through fundraising, community programs, and patient care initiatives. CARES (Center Auxiliary for Recruitment, Education, and Service) is a nonprofit that supports patients and families through volunteer services, fundraising for patient programs, and running hospital shops, offering resources like free childcare, educational support, comfort items, and food distribution, especially for families visiting or working at the Medical Center.

Medical Examiner (ME)
The County of Los Angeles Medical Examiner (ME) is the County agency responsible for all medicolegal death investigations within its jurisdiction, determining identity, and cause and manner of death through forensic examination, evidence collection, and coordination with medical, legal, and law-enforcement partners to protect public health and support the justice system. ME occupies several buildings at the southwest corner of the campus near the intersection of Marengo Street and Mission Road.

Angel Interfaith Network (AIN)
The Angel Interfaith Network (AIN) is a collaborative project that provides urgent physical and spiritual support to vulnerable patients and their families at LA General Medical Center, connecting local faith groups, businesses, and individuals to offer neighbor-to-neighbor aid like food, housing assistance, and basic necessities to prevent homelessness and aid recovery. AIN occupies a building on campus along Mission Road, near the entrance to Medical Examiners.

Los Angeles County General Hospital Campus Master Plan
This Master Plan is [illegible] document that is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.1 History

The site is shaped by natural systems, including a historic creek corridor, and is part of the ancestral lands of the Tongva people.

Pre 1800s

The historic General Hospital building is completed, becoming one of the most advanced medical facilities of its time and a major civic and employment anchor for surrounding communities.

1930s

The new LA General Medical Center is constructed east of State Street to meet modern seismic and clinical standards, while the historic General Hospital is mostly vacated.

1990s to 2000s

Late 1800s

Los Angeles County establishes its first General Hospital on this site, affirming a public commitment to healthcare access for all residents.

1950s to 1970s

Construction of regional freeways, rail corridors, and large institutional landholdings fragments neighborhoods and physically isolates the hospital campus from its surroundings.

2010s to Present

County initiatives and community advocacy advance the Healthy Village vision, leading to feasibility studies, technical assessments, and the current Master Plan effort to reconnect the campus, restore the public realm, and reimagine the site as a community centered mixed use district.

The site now occupied by Los Angeles General Hospital sits at the geographic and cultural intersection of some of Los Angeles County's oldest communities. Long before the hospital was constructed, the area was shaped by natural systems, including a historic creek that flowed through the valley and sustained early indigenous Tongva communities. In the early 1800s the area supported a mix of agriculture including vineyards, produce, and cattle grazing. In the late nineteenth and early twentieth centuries, the surrounding neighborhoods developed as working-class residential areas closely tied to the growth of downtown Los Angeles, rail infrastructure, and early industrial activity along the Los Angeles River corridor.

Los Angeles County established its first General Hospital on this site in the late 1800s, reflecting a public commitment to providing care for all residents regardless of income. As the city grew, the hospital expanded repeatedly, culminating in the construction of the iconic Art Deco General Hospital building in the 1930s. At the time of its completion, the building was among the most advanced medical facilities in the world and symbolized the County's investment in public health, innovation, and social equity. The hospital functioned not only as a center for medical care, but also as a major employer and civic anchor for the surrounding communities.

Over the following decades, large-scale infrastructure projects dramatically altered the area. The construction of the I-5 and I-10 freeways, rail corridors, and expanding institutional landholdings physically and perceptually severed neighborhoods from one another and from the hospital campus. What had once been a connected urban fabric became fragmented, with limited access points and growing separation between the campus and its surrounding context. Incremental development within the campus prioritized operational needs over public space, further reducing permeability and diminishing the role of the campus as a shared civic realm.

By the late twentieth century, seismic standards and evolving healthcare delivery models led to the construction of the new LA General Medical Center east of State Street, while the historic General Hospital building was mostly vacated. Although medical care continued on site, the campus increasingly functioned as a solely medically-focused institutional zone rather than an integrated part of the surrounding neighborhoods. At the same time, adjacent communities experienced disinvestment, housing instability, and reduced access to services, even as they continued to rely on the hospital as a vital public resource.

This Master Plan builds on this layered history by recognizing the campus not only as a site of care, but as a place of reconnection and repair. By restoring the ground plane as a public commons, reweaving circulation, and introducing mixed-use programs that address long-standing community needs, the plan responds directly to the forces that shaped the site over the past century. In doing so, it honors the hospital's legacy as a public institution while reimagining the campus as a Healthy Village that reconnects neighborhoods, extends far beyond the boundary of the site, and serves Los Angeles County for generations to come.

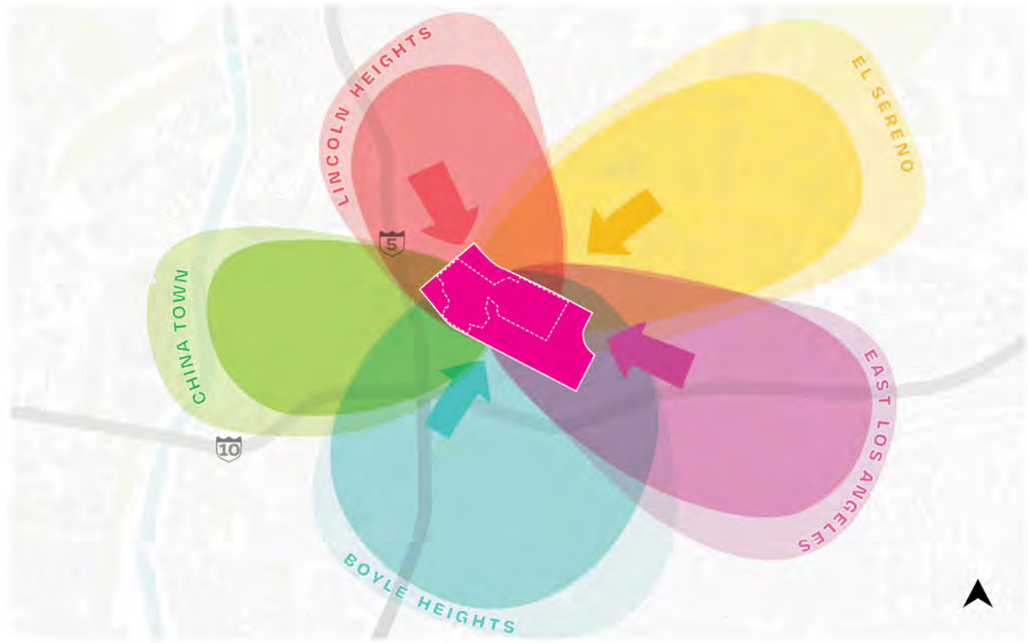
2.2 Regional Context

Boyle Heights

Chinatown

Boyle Heights

Lincoln Heights

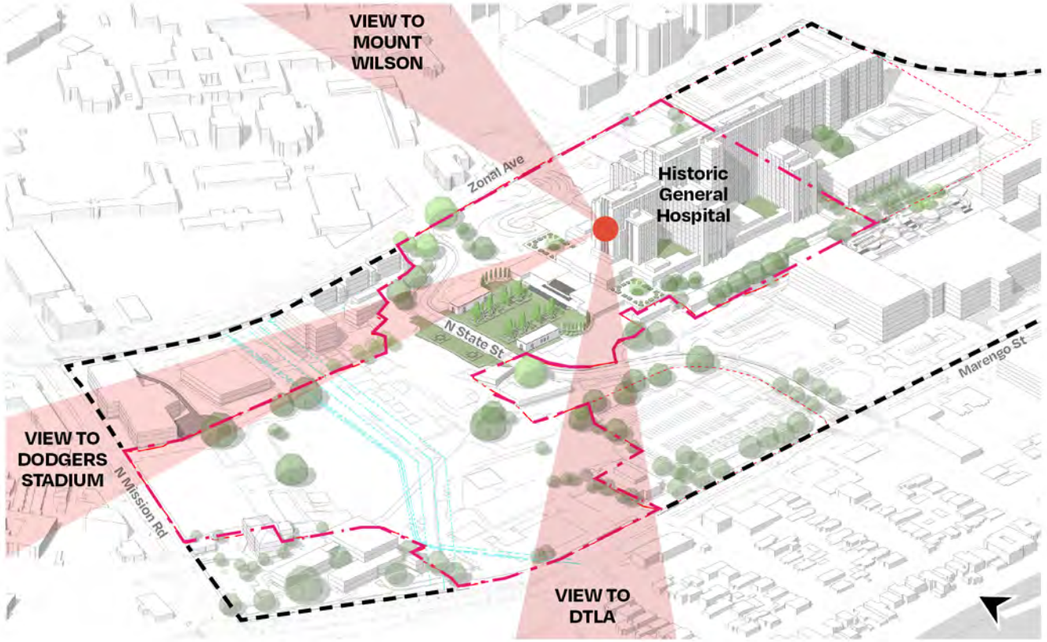


Lincoln Heights

El Sereno

East Los Angeles

Legend



- East Los Angeles
- El Sereno

- Boyle Heights
- Chinatown

Surrounding Community

The site is uniquely situated to tie together the surrounding neighborhoods of Boyle Heights, Lincoln Heights, East Los Angeles, and El Sereno and create a nexus of healing and wellness by restoring physical, cultural, and economic connections back to a site that a century of infrastructure and development (such as the 5 and 10 Freeways, the Union Pacific Rail Line, and large institutional land ownership) has largely cut off from those communities.

A sensitive response to the historic legacy of the site demands prioritizing and emphasizing the influences of these communities by weaving their shared and unique goals, culture, and participation into the foundation of the Master Plan.

2.2 Regional Context

Legend

- ENA Boundary
- Site Superblock

A View from Everywhere

Los Angeles County General Hospital sits on a raised plateau just east of Downtown Los Angeles, at the junction of the 5 and 10 freeways and the San Bernardino rail line, making it highly visible and easily accessible from across the region. This hilltop position combined with the General Hospital's 19 stories give the upper levels of the building a rare 360 degree panorama. The northeast view opens to the San Gabriel Mountains, with a continuous ridgeline that brings a strong natural horizon and a sense of distance beyond the urban fabric. Looking northwest, the view takes in Dodger Stadium and the surrounding residential hills, connecting the campus visually to one of Los Angeles's most recognizable civic venues and its historic neighborhoods. To the west, the skyline of Downtown Los Angeles is clearly visible, with its dense cluster of high-rises forming a dramatic urban backdrop with the LA basin stretching out beyond to the ocean. Together, these three vistas weave ecology, neighborhood, and downtown into an expansive and regional panoramic experience for the campus.

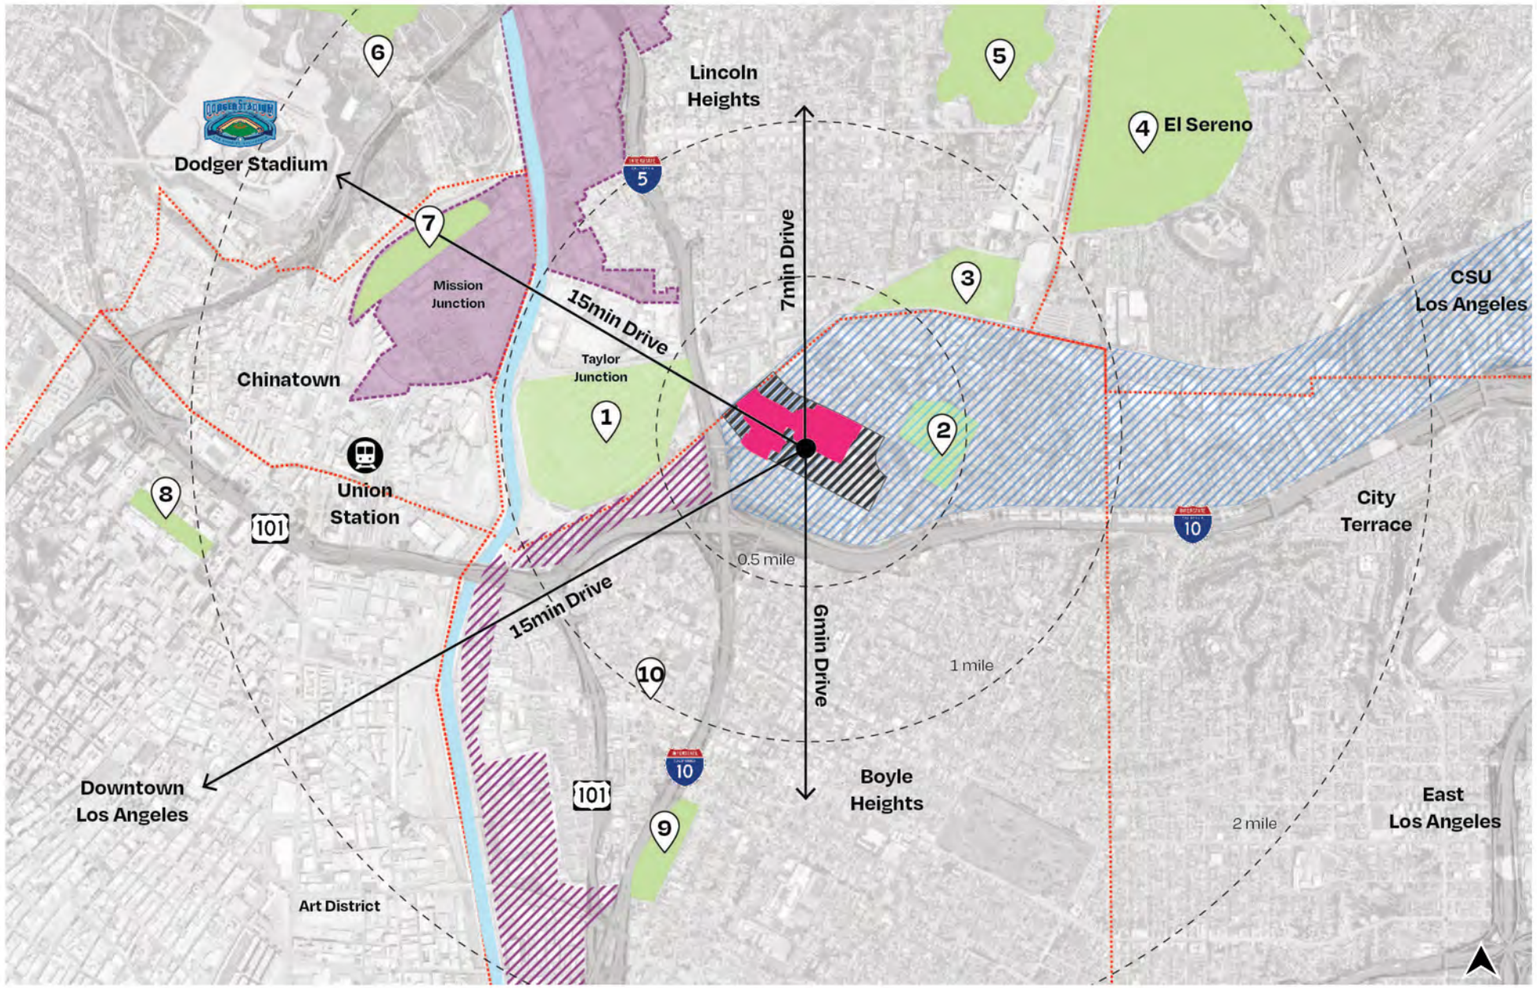
2.2 Regional Context

Legend



- ENA Boundary
- Site Superblock
- Site Radius

Regional Location

Just 10 minutes east of Downtown Los Angeles and right next to major transit corridors of the 5 and 10 freeways and the San Bernardino Metrolink Rail Line, the site's location is regionally significant and accessible to approximately 250,000 residents within 10 minutes. The site already hosts a large volume of daily visitors to the Los Angeles General Medical Center, which anchors the larger superblock that the site is a part of. It is one of the busiest public hospitals in the country with one million ambulatory care patients and 150,000 emergency visits per year. It is also a training facility with 1000 residents from the adjacent USC Keck School of Medicine. Major arterials accessible to the site include North Mission Road, Valley Boulevard, and North Soto Street, connecting transit and bus routes servicing multiple significant neighborhoods. The project site is central to the culturally-rich communities of Lincoln Heights, Boyle Heights, East LA, and El Sereno. The intersection of these neighborhoods has been the center for significant regional planning projects and economic development initiatives. Together, these neighborhoods act as a fulcrum point, hosting and supporting regional connections between Los Angeles, Glendale, and the Valley.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.2 Regional Context

Neighborhoods

Several significant regional planning and economic initiatives overlay or influence the site. However, these investments have often fallen short of the promises that were given to the local community at their inception – with added jobs, training, and resources often going to educated professionals who commute or move in from other areas, compounding the increased cost of housing and gentrification pressures. Additionally, spillover gentrification from Downtown LA, the Arts District, and Boyle Heights contributes to this stress on local communities. A recurring theme surfacing in community engagement is bringing economic development and housing options to the community already here while working to avoid displacement. Proximity to nearby recreational assets enhances the appeal and potential of the project site. Hazard Recreation Center offers a wide array of amenities, including sports fields, courts, and a universally accessible playground as well as the daylighting of the previously underground stream-bed at Hazard Park. Lincoln Park, a historic urban park, features a lake, picnic areas, and recreational facilities, including a skate park and tennis courts. These assets, along with the site's central location within culturally rich neighborhoods, highlight its potential to serve as a regional and community anchor.

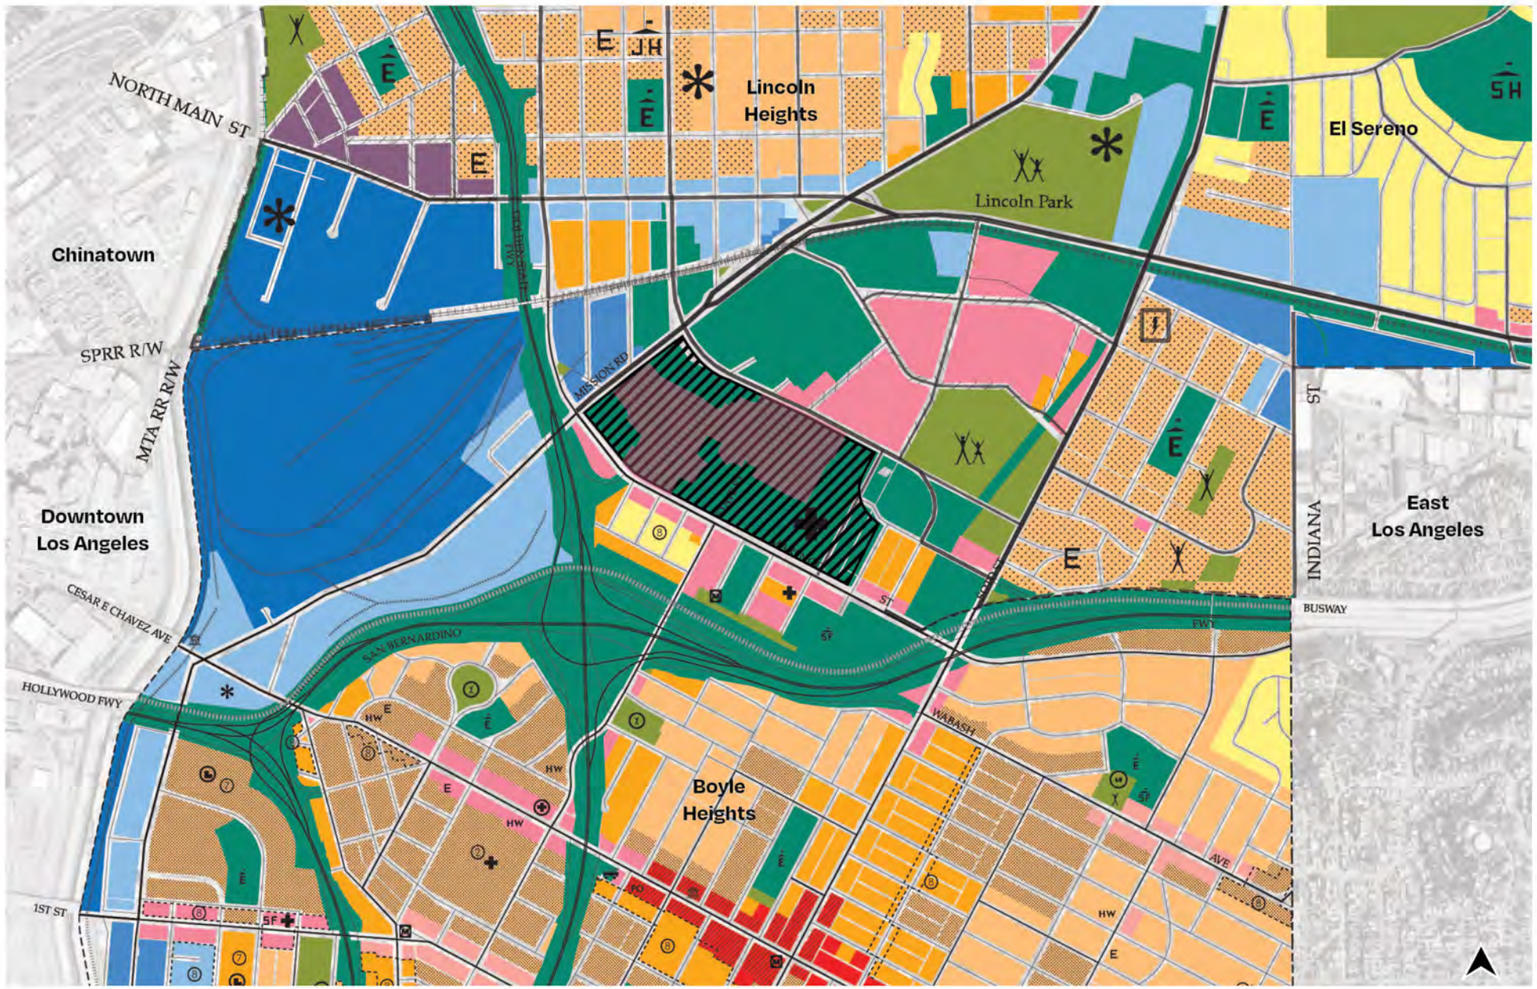
2.3 Transportation Context

Local Transit

The project site is accessible via Interstates 5 and 10, as well as major roads including North Mission Road, Valley Boulevard, and North Soto Street. Transit services running along the site include bus routes 76 (along Valley Boulevard), 78 (along North Mission road), and the El Monte Busway (Metro J Line bus rapid transit and route 487). DASH lines connect neighboring communities from Boyle Heights, East LA, Lincoln Heights, and Chinatown to the site. Shuttles for the Wellness Center and Medical Center are offered within the site superblock. The Metrolink San Bernardino line running along Interstate 10 to the south does not currently stop within walking distance of the project site. The First Supervisorial District is advocating for the Metrolink San Bernardino line to add a station adjacent to Parking Lot 9 that would improve transit services to West Campus. The site features a bike path running along North Mission Road connecting to Lincoln Heights to the north. Additional bike paths in the area are currently disconnected from the site by major infrastructural barriers, including Interstates 5 and 10.

2.3 Transportation Context



Master Plan - Road Circulation

The community road circulation network places the hospital within a clear street hierarchy. Freeways form the primary regional ring around the site, with multiple entry and exit ramps concentrating access at key interchanges. An orange Boulevard II corridor, Mission Road, cuts across the hill, linking Northeast LA, Boyle Heights, and East Los Angeles and acting as the main surface approach to the campus. This is supported by blue Avenue I and Avenue II streets that run north–south and east–west through surrounding neighborhoods, while green Avenue III and Collector streets distribute traffic more locally and connect to adjacent institutions and parks. A fine grain of light gray Local streets completes the grid, creating walkable blocks but frequently terminating at freeway or rail rights-of-way, which both connect the district to the wider city and fragment direct access between the hospital and nearby communities.

Community General Plan - Land Use

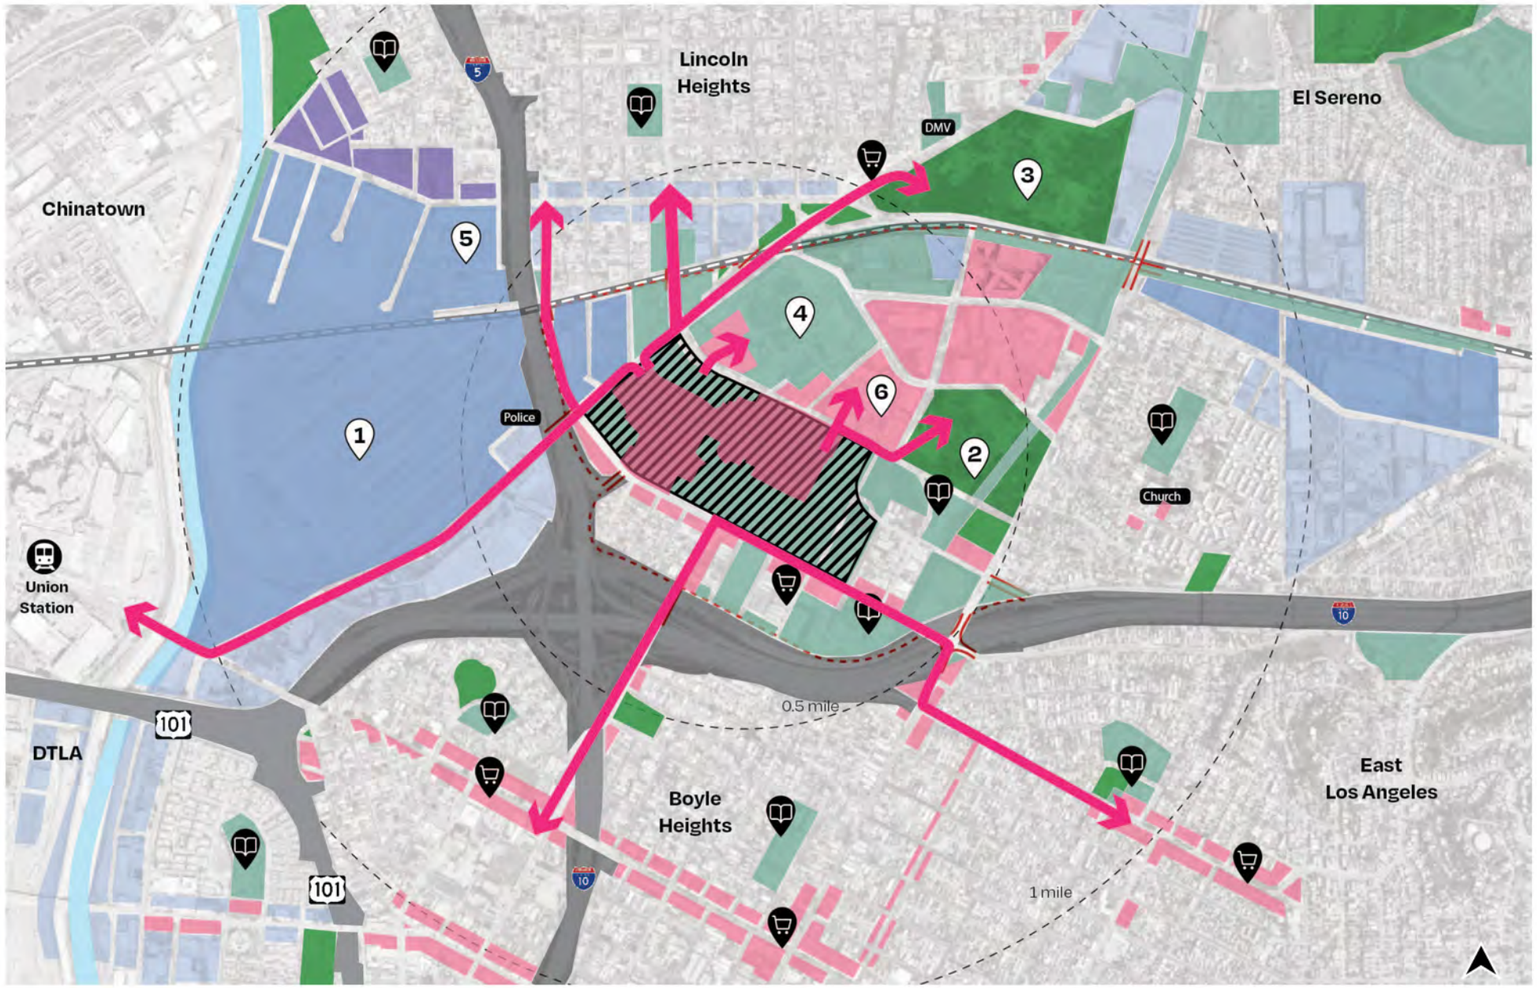
The Northeast Los Angeles Master Plan (adopted in 1999) envisions this area as a series of residential districts supported by commercial corridors, employment zones, and a connected open-space system. Low- to medium-density housing dominates Boyle Heights and the surrounding hills, while higher-intensity residential and mixed-use areas cluster along major arterials and near transit. Industrial and commercial-industrial uses line the river, rail right-of-way, and freeway edges, maintaining a significant employment base. Parks, schools, and public facilities are distributed throughout the plan area to anchor neighborhoods and provide daily community services, with larger recreational destinations such as Lincoln Park linked by green corridors along the river and freeway embankments. Overall, the plan balances housing, jobs, and open space while using key streets and river-adjacent land as organizing spines that connect Northeast LA, East Los Angeles, and the central city.

While the site is exempt from Los Angeles City code as it is owned by LA County, the PF zoning designates publicly owned land for essential government uses and services like schools, parks, recreation centers, libraries, utilities, transit facilities. More recent initiatives across the region are opening this zone for affordable housing development, particularly if the land is designated as surplus.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.4 Land Use Context

Legend



- City Boundary

- Opportunity Zone
- Hub Qualified
- Redesignated

Master Plan - Economic Development

Overlayed on the Master Plan are a series of federal and state incentives. Notably, the site is situated within an Opportunity Zone, which incentivizes investment in real estate development and businesses within the zone by providing substantial tax benefits for that investment.

The site also lies within the federally designated SBA HUBZone, which gives small businesses and local employees here preferential access to federal grants, encouraging job growth, and stimulating local investment.

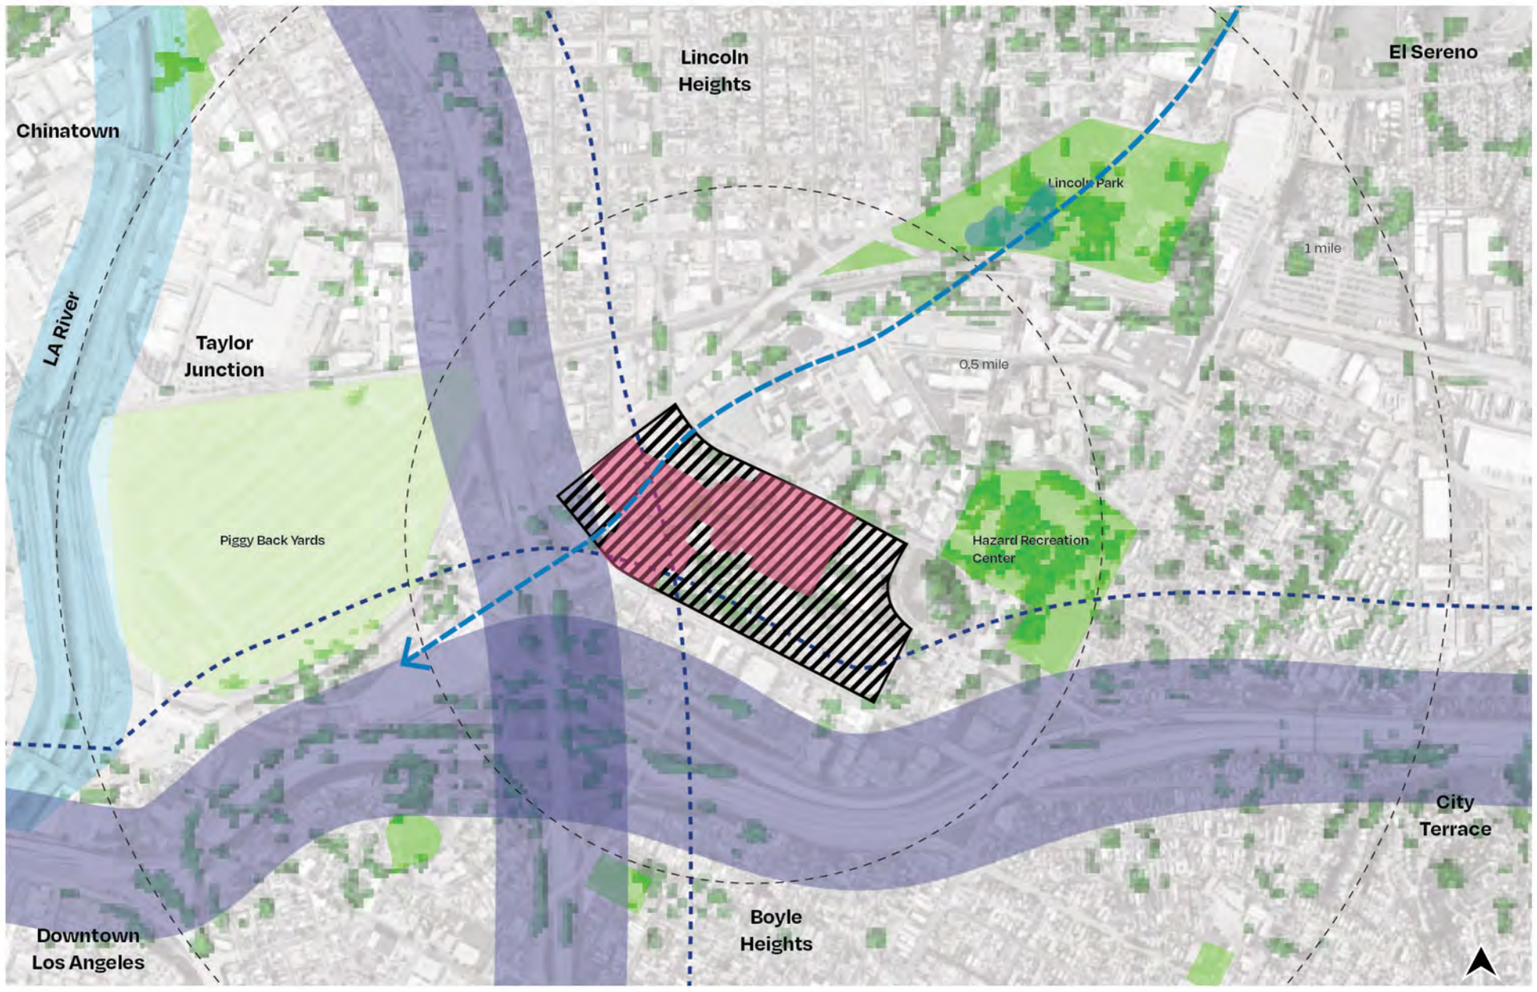
Local Context: 1-2 Mile Zone

Within a 1-mile radius, the hospital sits at the center of a larger urban ring that ties together several distinct neighborhoods, including Lincoln Heights to the north, El Sereno to the northeast, Boyle Heights to the south, and the edges of City Terrace and the Union Station/ river corridor to the west. This zone contains a rich mix of residential communities, schools, parks such as Lincoln Park, Hazard Recreation Center, courts and probation facilities, artist lofts, and neighborhood grocery and library destinations, creating a broad civic and community network around the campus. At the same time, major infrastructure, the 5, 10, and 101 freeways, rail lines, and the river, forms both strong regional connections and , paradoxically, physical barriers that shape access into the site. Together, these conditions position LACGMC as a central anchor linking multiple communities across the Eastside and downtown Los Angeles.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.4 Land Use & Land Ownership

Legend



- USC Health Sciences
- LA County
- LA City
- LAUSD
- State
- Federal
- Metro
- Parking

Land Ownership

Within a 0.5-mile radius, the LACGH campus sits in a dense mixed-use urban fabric. Immediately to the north and east it is surrounded by the USC Health Sciences and other LA County facilities, including courts and medical buildings, forming a continuous institutional district. Around this core are established residential neighborhoods with a network of everyday amenities, schools and libraries, churches, small commercial streets, and multiple parking areas, along with nearby parks and recreation spaces such as Hazard Recreation. Together, these uses create a walkable catchment where employment, healthcare, education, and community services are all concentrated within a short distance of the site. The proximity of the 5 and 10 freeways, regional bus routes, and local streets further reinforces the site's role as a daily destination for workers, patients, and residents. This concentration of civic and community assets positions the hospital as a key anchor within the broader neighborhood network.

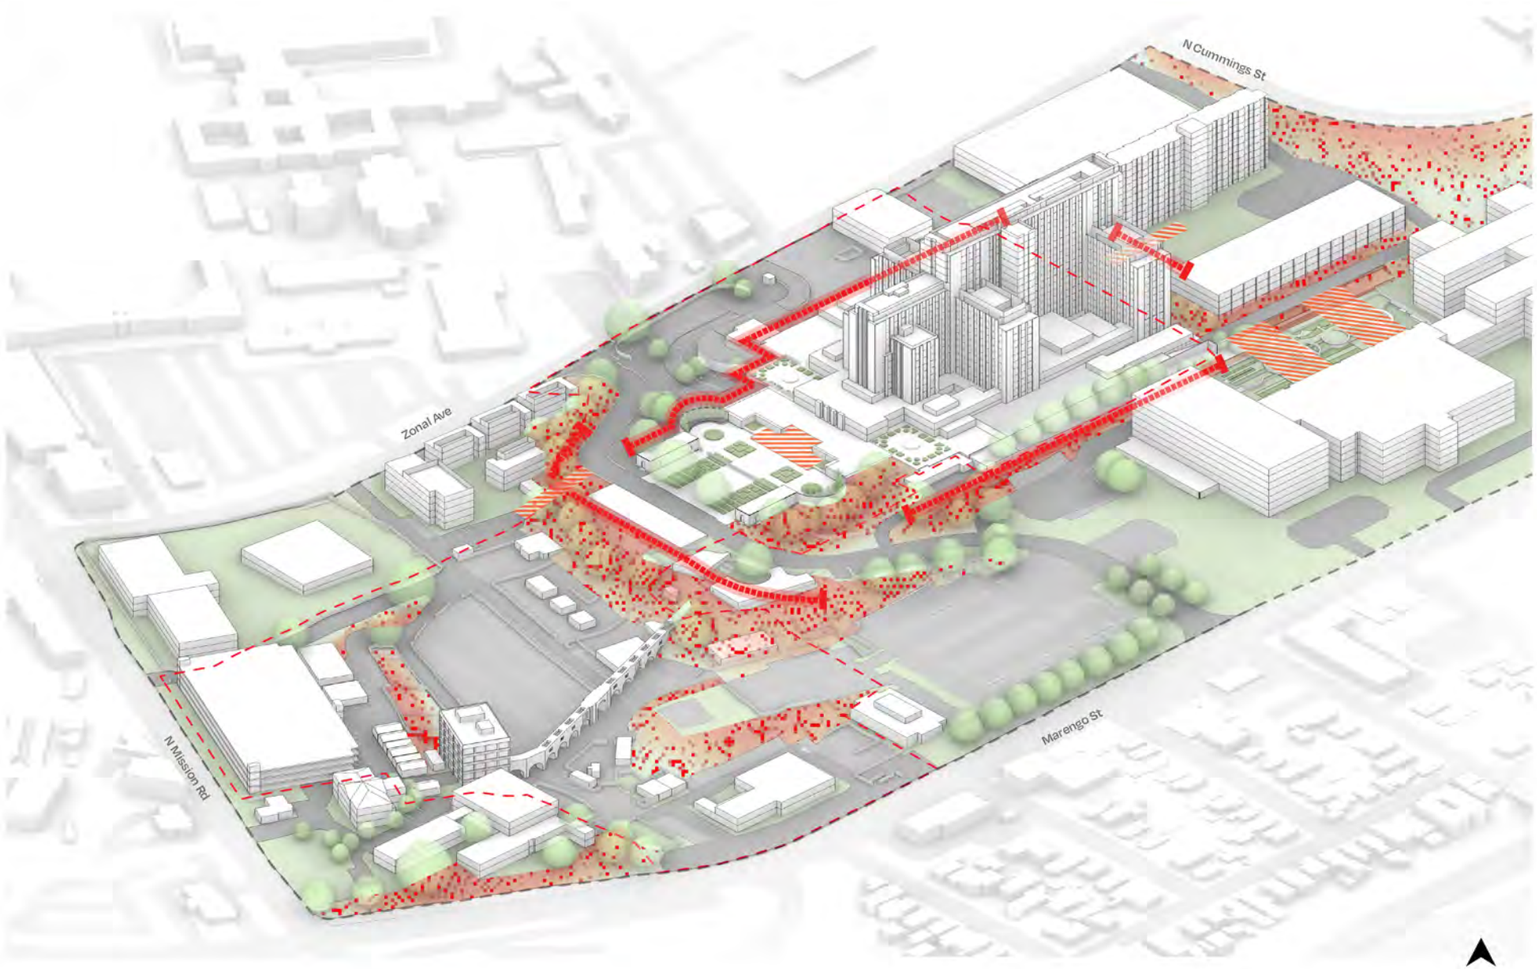
*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.5 Natural Context

Legend

- Canopy
- Park
- 500′ Air Quality Buffer
- 1000′ Air Quality Buffer
- Historic Creek Alignment (now a storm drain)

Site Ecology



The natural context of the site has many distinct features. The site, particularly the raised half of the site with the 19 story General Hospital building, is a local high point, sitting more than 60′ above the lower point of the site.

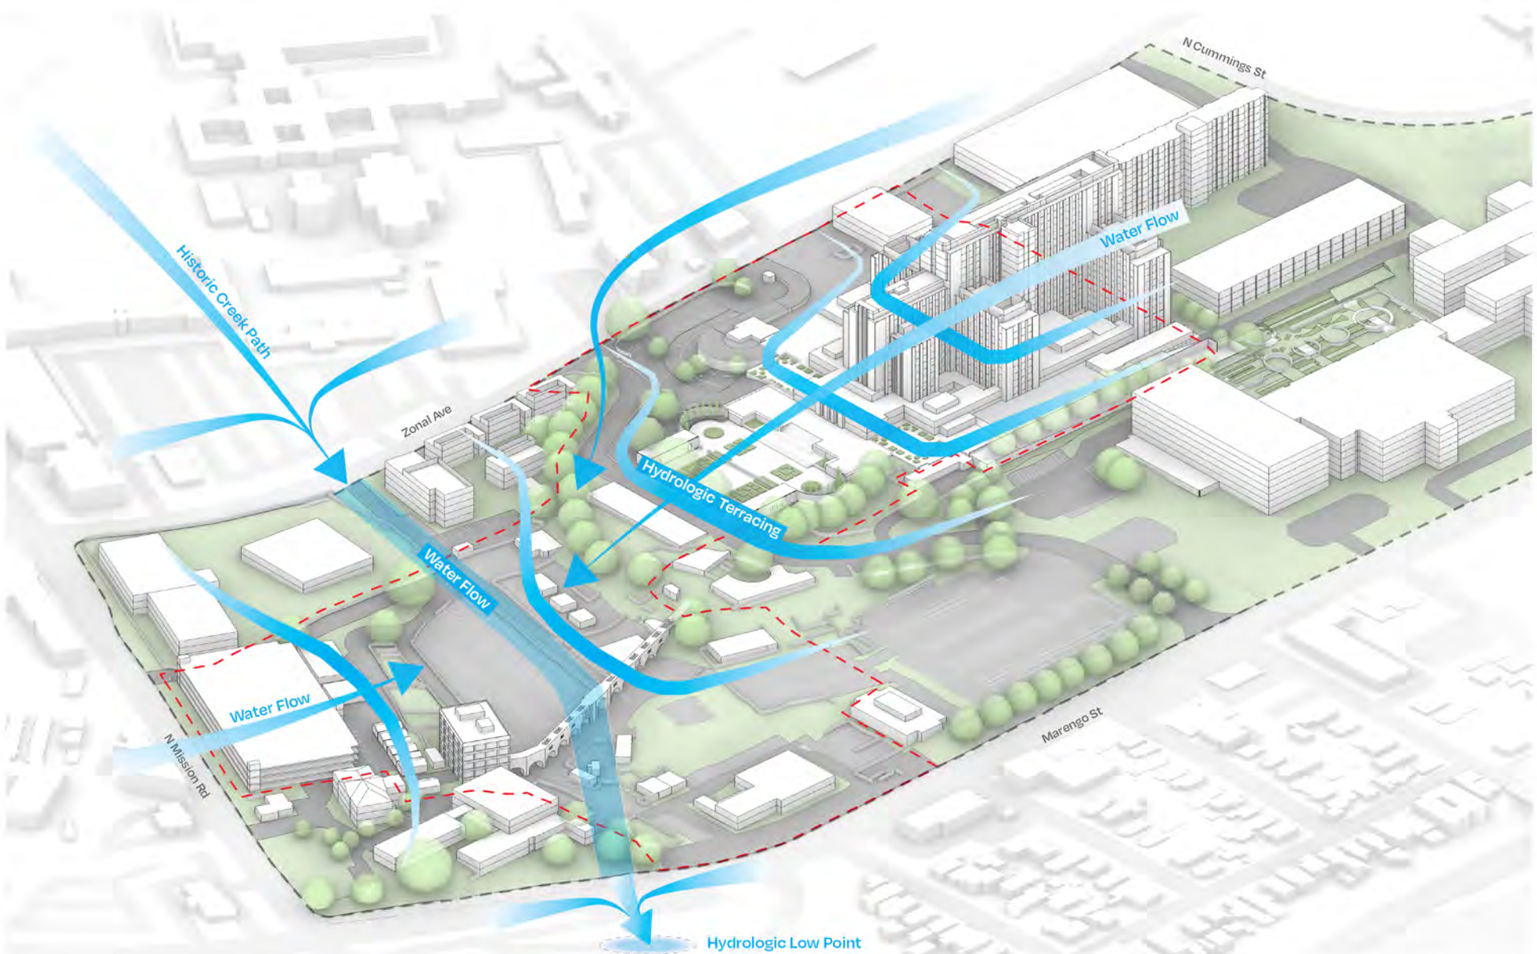
Nearby parks include Hazard Recreation Center and Lincoln Park, though enhanced connection to these resources is needed. The site itself has limited tree cover and shade, though there are several potentially significant specimen trees. This lack of shade coupled with large swaths of impervious concrete expanses leads to a heat island effect on the site and local area.

The proximity to major freeways on two sides of the site may impact air quality, with the California Air Resources Board recommending sensitive uses (such as housing) be built at least 500′ from freeways. The existing buildings have hazardous materials that need remediation and there is potentially ground water and soil contamination on site due to the century of medical and industrial use which, if present, would also need remediation for the intended uses.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.5 Natural Context

Legend



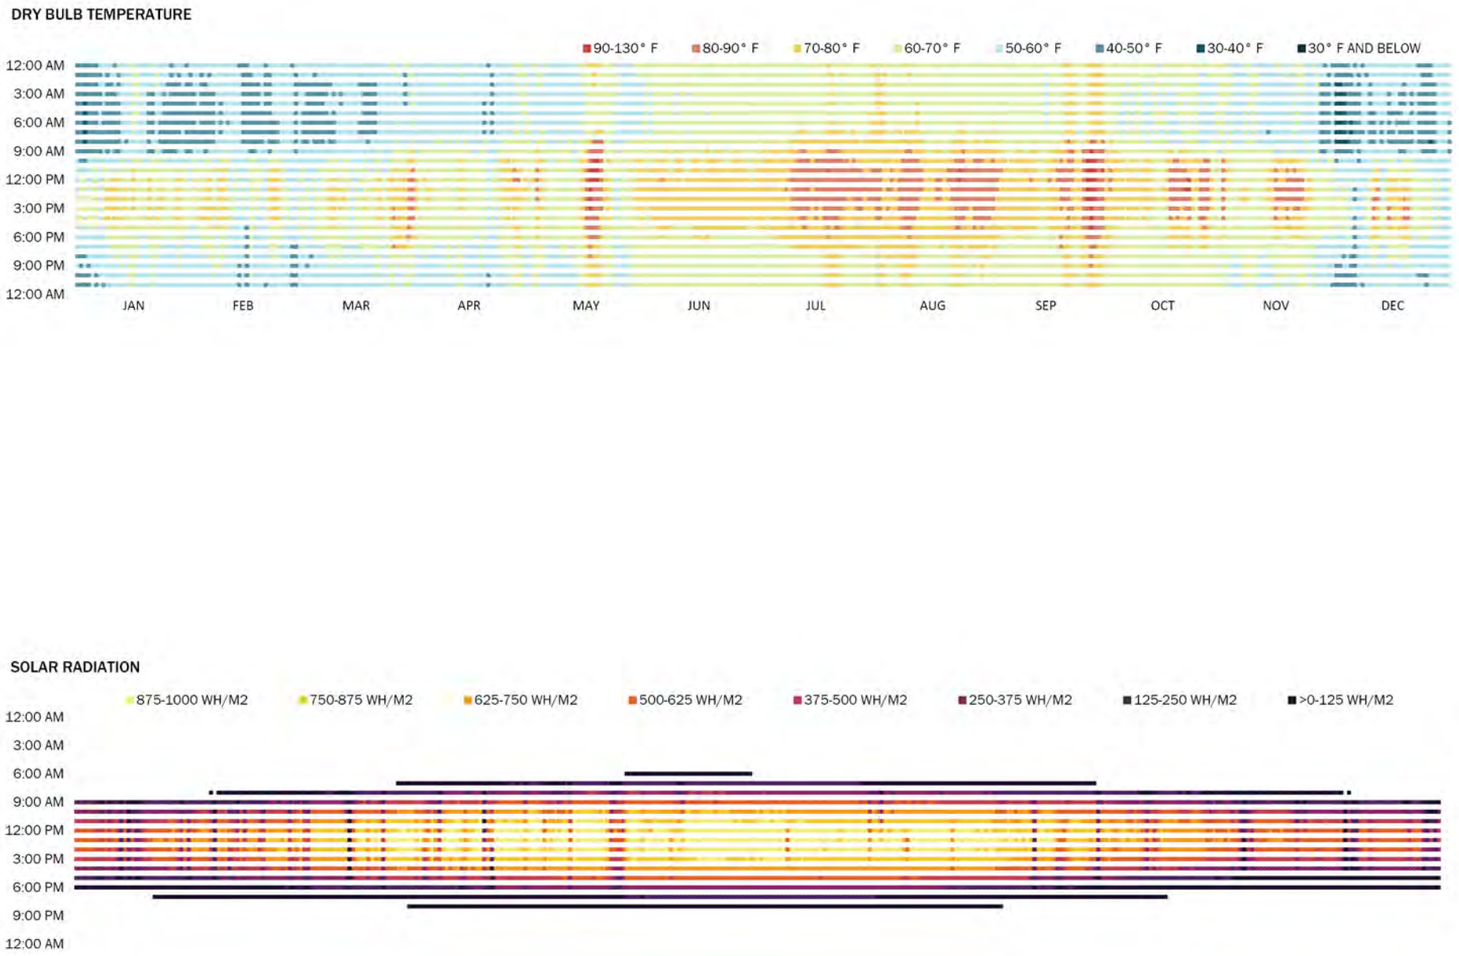
Limited Circulation

Terrain

The site's dynamic topography offers sweeping views of the surrounding city, mountains, and valleys - an extraordinary natural asset. Yet, in previous developments, other opportunities to embrace these grade changes as defining features for placemaking have often been overlooked. As a result, wherever dramatic grade changes occur throughout the site there are corresponding disconnections – making the site challenging to navigate and get around.

The Master Plan seeks to transform these elevation shifts from barriers into defining features, using them to shape distinctive public spaces, accessible pathways, and memorable experiences that celebrate the site's dramatic terrain and blend the varied mixed uses across the campus into a cohesive Healthy Village.

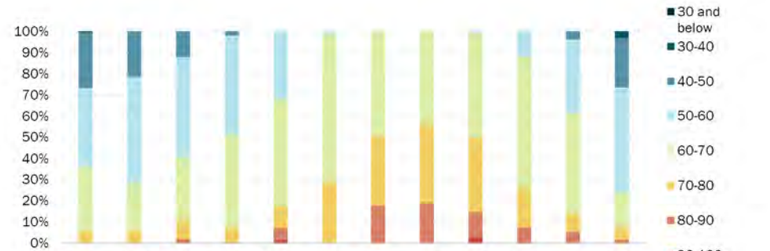
2.5 Natural Context



Legend

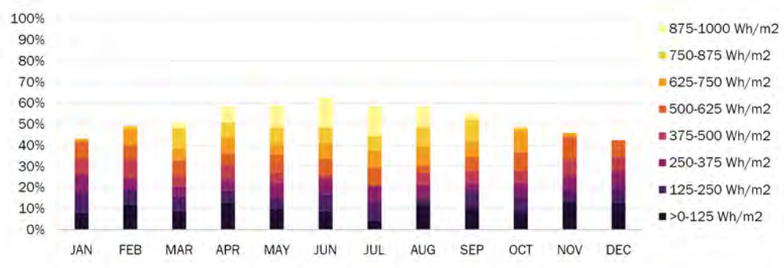
Hydrology / Water Flow

Existing Hydrology/ Watershed



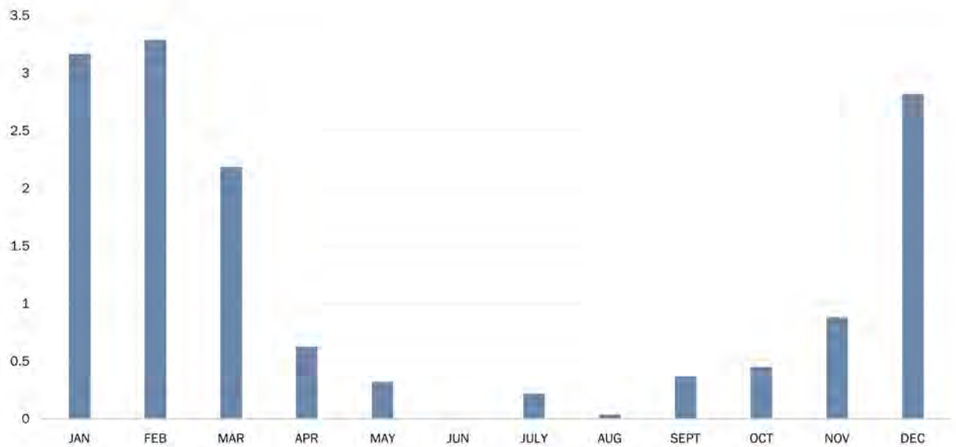
As previously mentioned, the distinct topography on site directly impacts the natural hydrology of the site, which historically had a seasonal creek that ran through the lower point of the site (now a buried stormwater pipe aligning with the utility easement). In general, water flows toward the valley of the site, located at the toe of the slope which leads down from the historic forecourt.

2.5 Natural Context



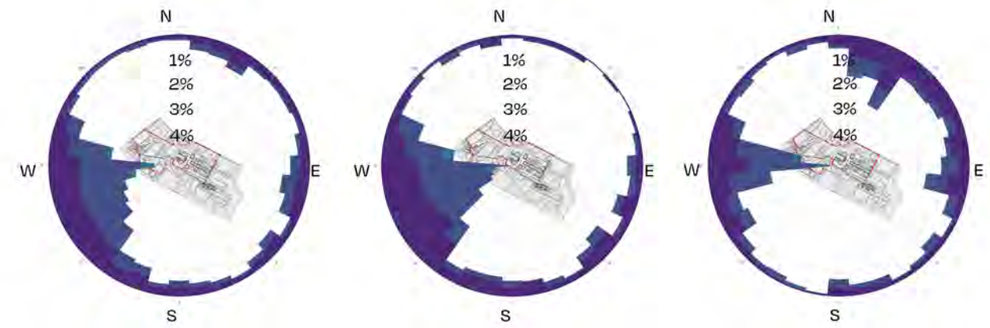
Temperature

Temperatures are in a comfortable range during the middle of the day in the winter months. Mornings and evenings cool down, which results in a daily temperature swing between twenty and thirty degrees. Passively using the cool nighttime air can help with managing heat buildup inside of the buildings. Temperatures are uncomfortably high in the summer months. Design strategies to reduce the heat island effect - such as shade, tree canopies, and high albedo surfaces would improve human comfort.



Solar Radiation

The level of solar radiation for the site is exemplary for energy production potential, due to the high levels of solar radiation for the entirety of the year. The expected decrease in the later hours of the day, is a challenge for renewable energy availability in the evening that can potentially be met with innovative energy storage solutions.



2.5 Natural Context

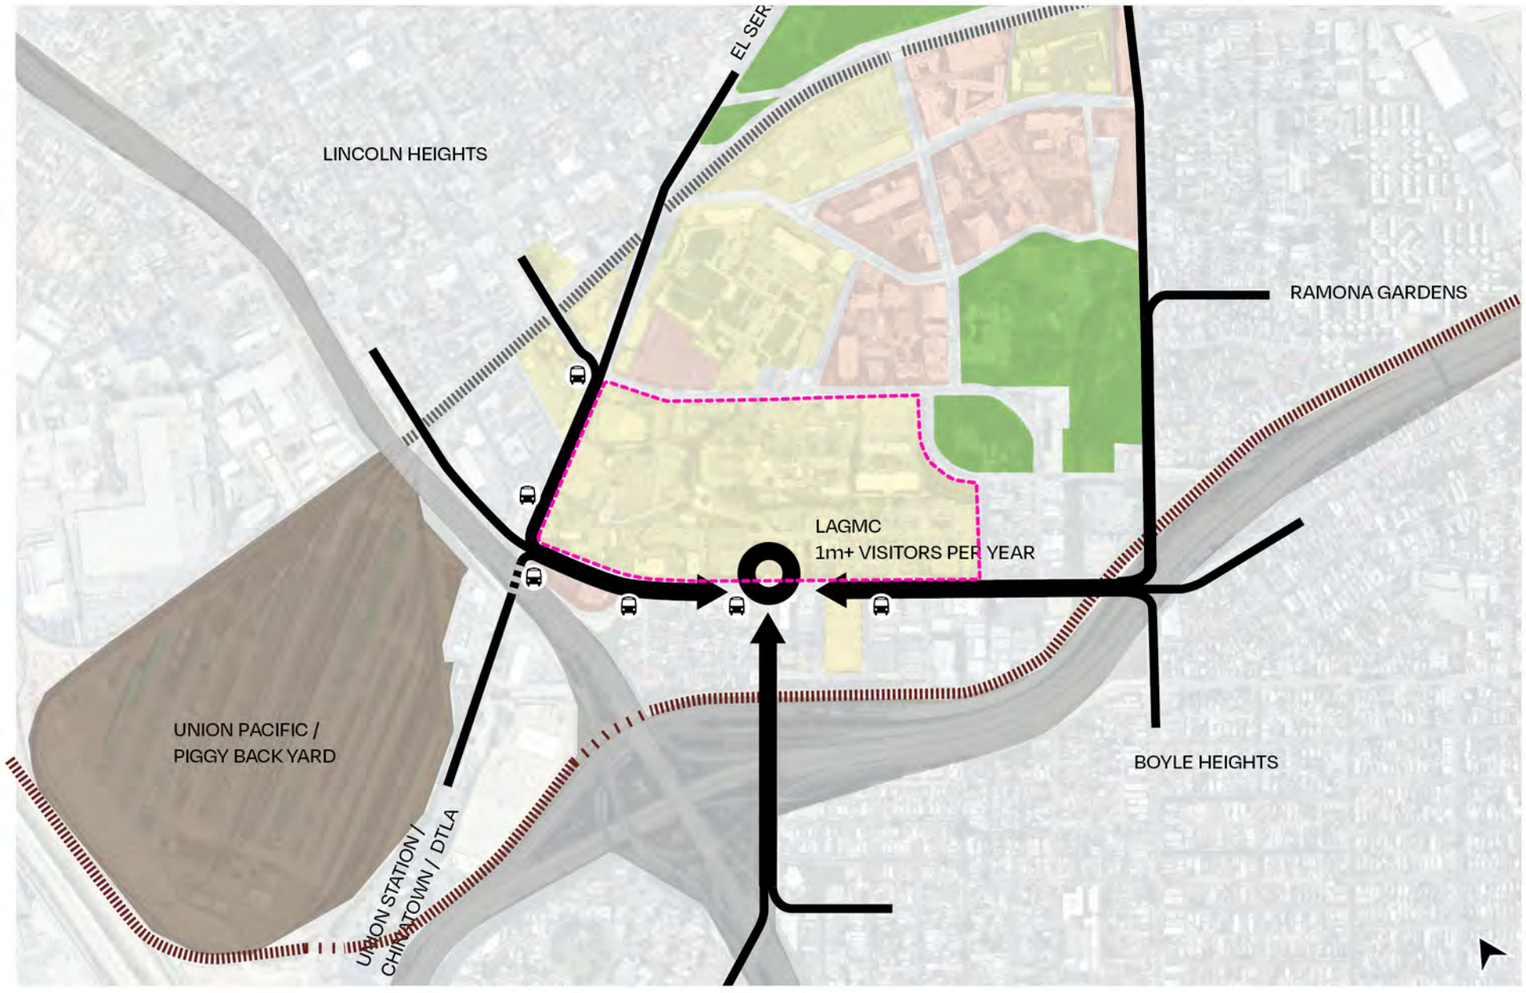
Precipitation

Looking at the distribution of monthly precipitation, in inches, there is not consistent rainfall throughout the year, therefore collected rainwater is not a reliable water source for year round water reuse on site. Stormwater volumes increase in the shoulder seasons, with the bulk of annual precipitation occurring during winter, both a design challenge and opportunity for creative stormwater management on site.

Prevailing Winds - Year Round

Prevailing Winds - Quarter 2

Prevailing Winds - Quarter 4



Legend

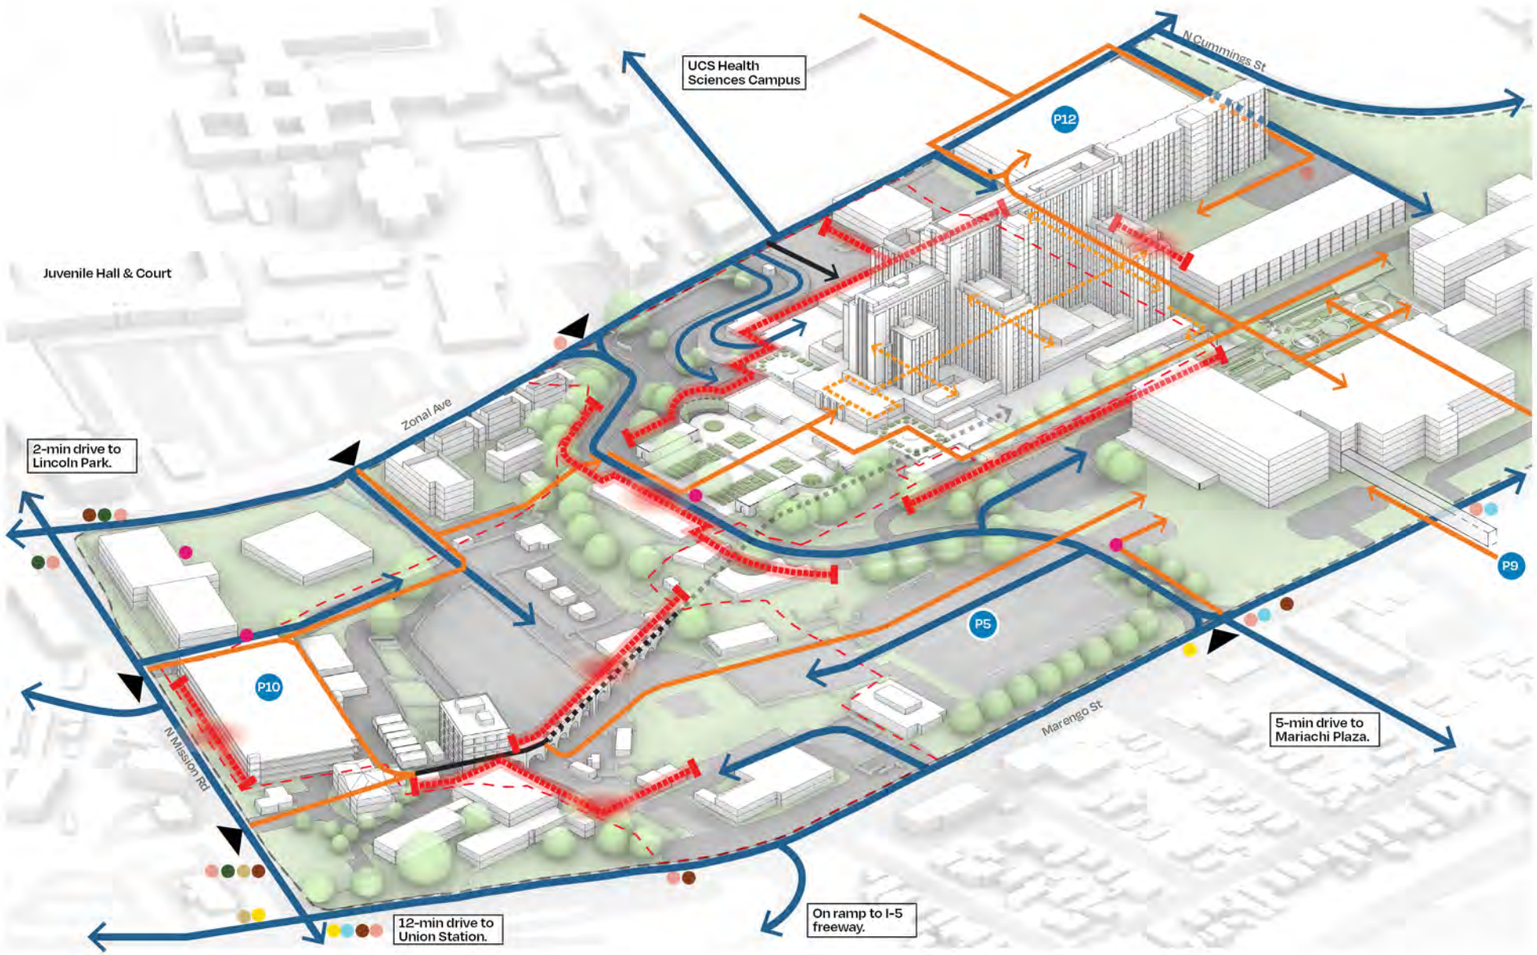
- Moderate Breeze (5.5 m/s)
- Fresh Breeze (8 m/s)
- Strong Breeze (10.8 m/s)

Wind

In general, winds blow from the west into the site. During winter months, eastbound Santa Ana winds also flow through the site, similar to wind patterns for the greater Los Angeles area.

2.6 Existing Site Context

Legend



- Bus Stop
- Railway
- Vehicular Circulation
- Access Point

Site Arrival

Freeways, rail lines, and large institutional landholdings physically and perceptually isolate the campus from surrounding neighborhoods, significantly limiting local access. Only a few roads cross these barriers, concentrating most visitor arrivals at the LA General Medical Center via the primary access point on Marengo Street. Other campus entry points are limited to small driveways that lack crosswalks, signals, or clear pedestrian priority. Parking resources are fragmented and insufficient, contributing to congestion and confusion, while public transit services are dispersed rather than centralized, further reinforcing reliance on private vehicles and constraining multimodal access.

At present, LA General Medical Center is the primary destination on campus, serving more than one million visitors annually. As additional development is introduced, the campus will require a more deliberate arrival strategy. Establishing distinct and legible entry points for different uses will be essential to clarify access, distribute traffic, and reduce congestion, ensuring that future growth enhances, rather than strains, campus circulation and accessibility.

2.6 Existing Site Context

- DASH - Lincoln Heights/ Chinatown Heights

Site Circulation

As the campus has evolved through multiple phases, its circulation and site organization have not kept pace with changing needs. Incremental additions, particularly modular buildings and service yards installed to address temporary demands, have disrupted connectivity, fragmenting pedestrian and vehicular routes and obscuring intuitive paths across the site. Today, most traffic enters via Marengo Street or Zonal Avenue, and aside from the P5 and P9 structures serving LAGMC, campus circulation is disjointed, with pedestrian routes that are indirect, uncomfortable, or terminate at dead ends. Parking demand exceeds capacity during peak hours, even as some facilities are underutilized or nearing the end of their useful life, and many parking areas lack clear, accessible connections to destinations.

These challenges are most acute on the West Campus, where limited street frontage, an inaccessible 40-foot grade change, and the accumulation of modular structures block intuitive approaches and sever connections to the rest of the campus and surrounding neighborhoods. As a result, outdoor gathering spaces remain difficult to access and underactivated, underscoring the need for a cohesive, campus-wide circulation strategy.

27	430	435	
28	435	440	
29	440	445	
30	445	450	

Elevation Analysis

The significant elevation difference along State Street separates the site into two different areas. State Street runs south to north bisecting the site and connecting Zonal Avenue and Marengo Street. State Street ranges in elevations from approximately 329′ near Marengo to 360′ near the historic courtyard to 333′ near Zonal Avenue. There are a series of staircases leading from the courtyard along State Street up to the General Hospital which is situated at an average elevation of 385′ with the main entry finished floor elevation at 377′. The elevation change from the General Hospital to Zonal Avenue ranges from 15′ to 50′, which is offset by a series of loading docks, offices, and vehicle ramps. Continuing east of the General Hospital is another grade change of 17′ which leads to the Out-Patient drop-off area and Resident Building, which are both outside of the project's limit of work.

On the West Campus, the existing Pharmacy Building and Parking Garage 10 are also slightly elevated at approximately 335′. However, the surface parking lot to the east is situated around 313′ which creates a low point for the entire site. This low point was once a historic creek that captured runoff from the North, East, and West, and is situated in a liquefaction zone.

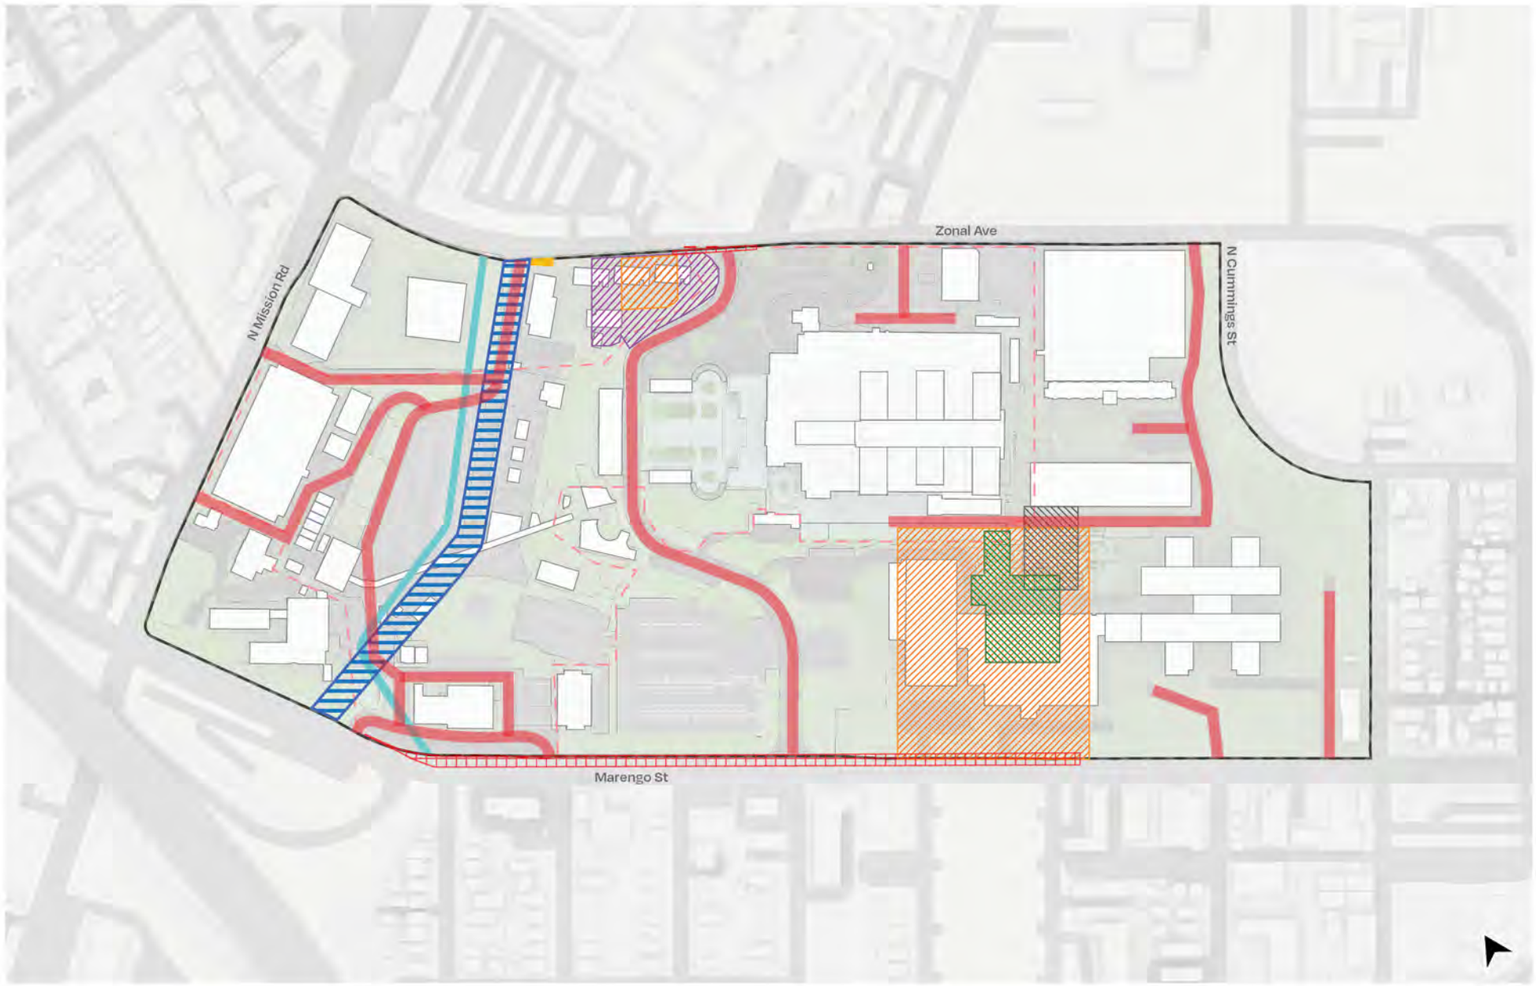
2.6 Existing Site Context - Site Topography

District Level Slope

While the public right of way is outside the area of study, extensive areas of Zonal Avenue, Marengo Street and select areas of North Mission Road do not meet accessibility requirements. As pedestrian arrival is explored, consideration for flat (less than 2% cross slope) sidewalks, smooth surfaces, curb ramps and striped cross walks should be considered.

2.6 Existing Site Context - Site Systems

Legend



- Storm Drain
- Sewer
- Central Plant Loads
- Trash
- Water
- Gas
- Steam
- Power

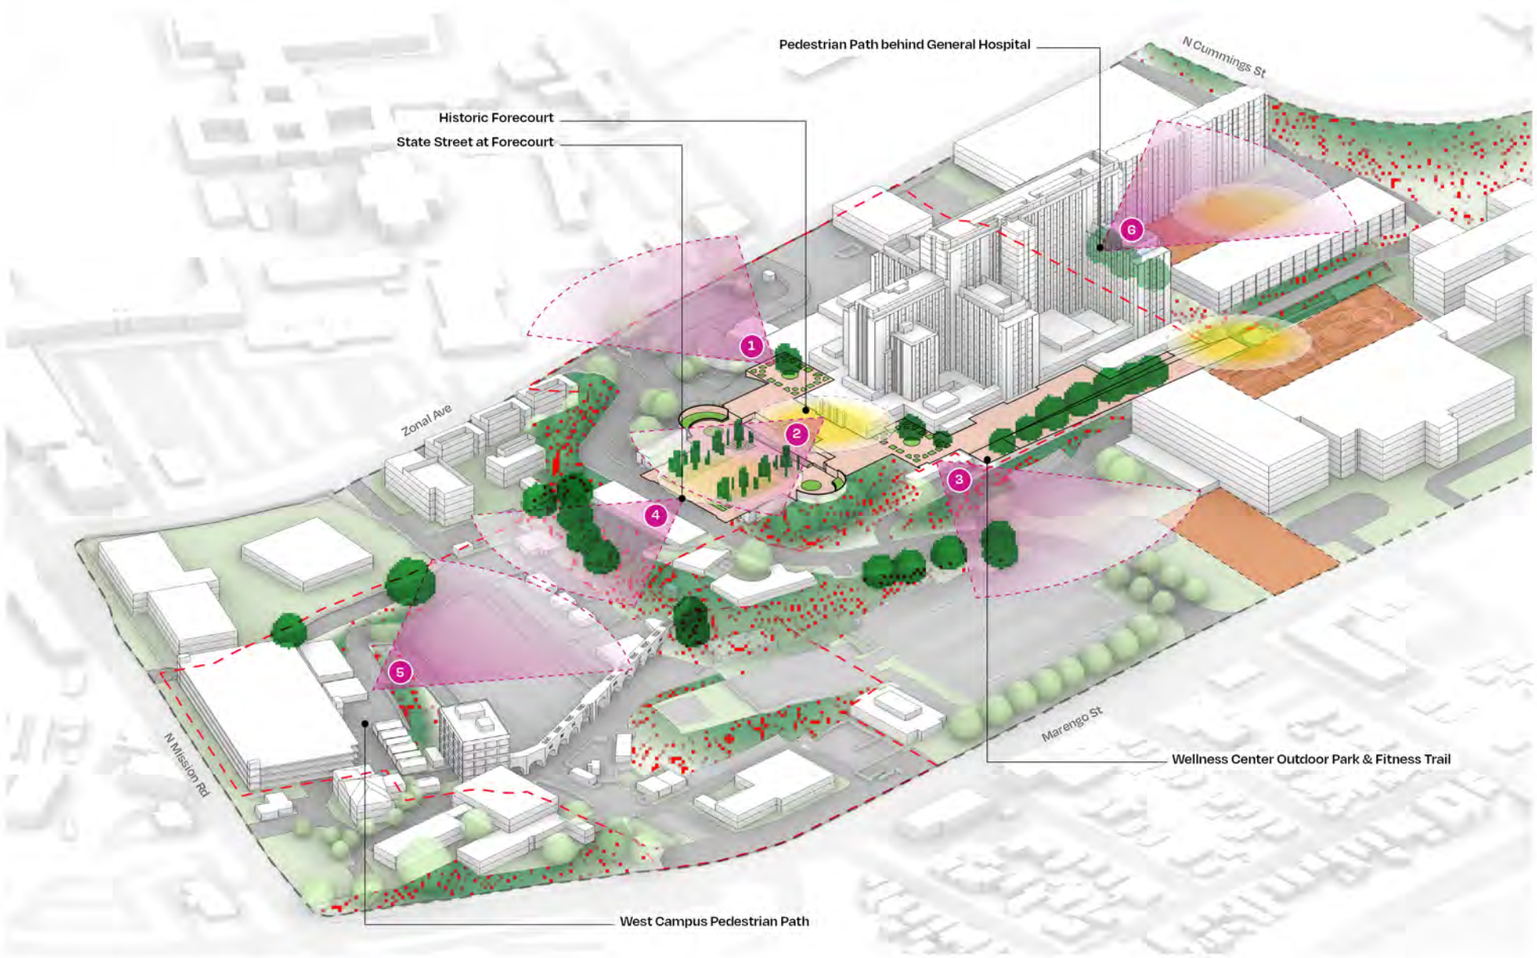
Site Utilities

Much of the utilities infrastructure on the site is aging and in need of repair or replacement. The existing below grade network connects several buildings both within and outside the site to the West Central Plant, which provides central heating and chilled water to several buildings. There is a lot of opportunity to drive efficiency in the MEP systems by leveraging complementary needs (i.e. using waste heat from one use to heat water for another) with a district-wide strategy, however this also creates dependencies between on and off-site buildings and entities that may create challenging operations and maintenance scenarios. The natural topography of the site collects local and regional water to a low point on the site – which coincides with the utilities easement (carrying both WCP utilities and County and City stormwater pipes) and a liquefaction zone. There is an opportunity to leverage the topography to create a new site-wide water management strategy – both for collecting, managing, and treating stormwater and recycling blackwater. Because the site was developed before LID was required, a comprehensive strategy is necessary to comply with current regulations.

The site's trash is currently centrally managed with a trash facility on West Campus that connects to the tunnel network.

2.6 Existing Site Context - Site Systems

Legend



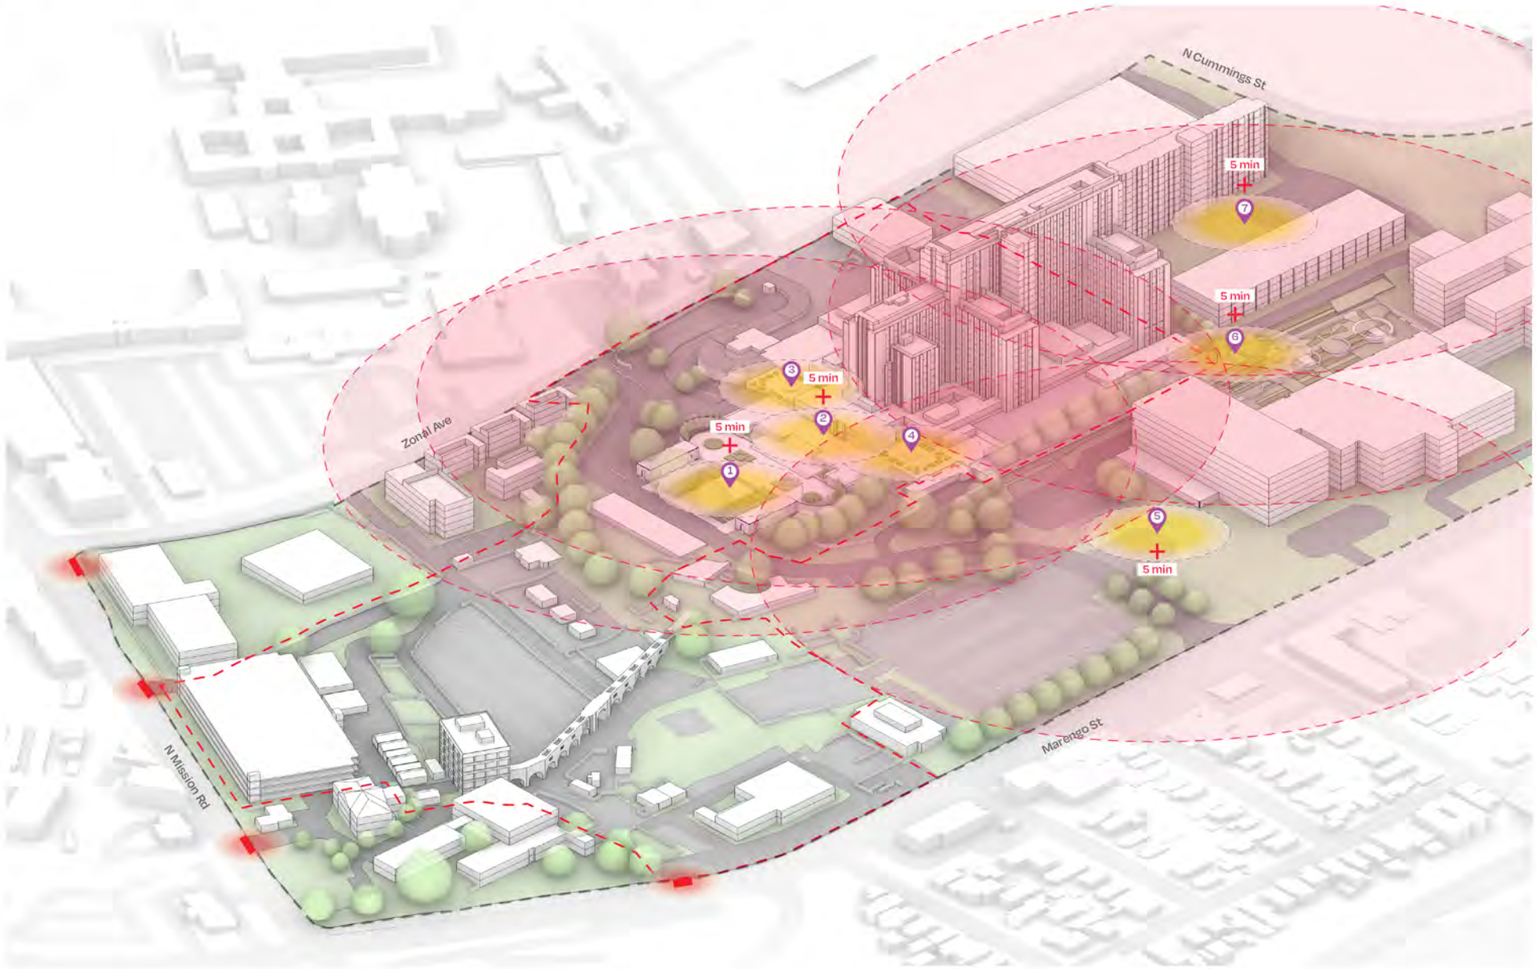
- Lien Easement
- Leased Easement
- Inducement Easement
- Right of Way Easement
- Storm Drain Easement
- Fire Access Roads
- Sewers & Storm Drain
- Poles, Conduits, Wires
- Private Roadways Easement

Existing Easements & Fire Access

The Utility Easement (a combined zone where both County and City storm drain and culverts are) is located at the low point of the site, following the original path of the historic creek that once traversed the site. This is a zone that cannot be built upon unless those storm drains are moved.

Fire Access will need to be reconfigured with a new site organization, but access to remaining structures must be maintained.

2.6 Existing Site Context - Site Landscape



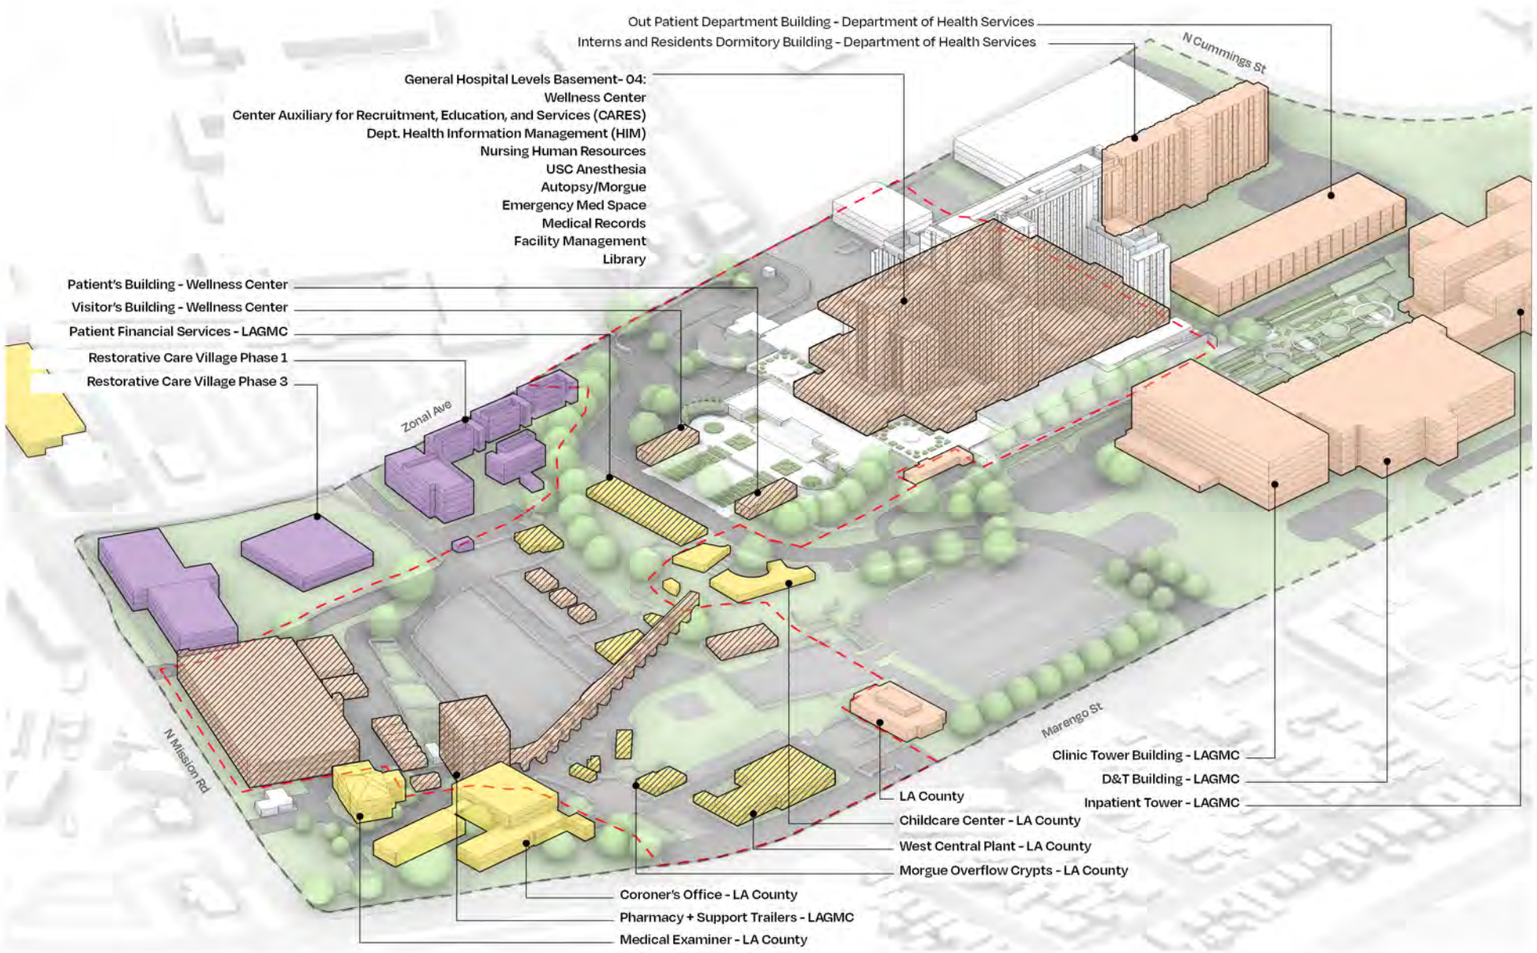
Legend

- Gathering Spaces
- Significant View Sheds
- Softscape with Significant Elevation Change
- Programmed Open Space
- Potentially Significant Tree
- General Hospital Forecourt

Existing Landscape and Hardscape

Currently, most landscape and open space within the campus includes varyingly activated but disconnected leftover spaces between existing buildings and topography. Certain zones like the historic General Hospital forecourt garden and terraces occasionally host events like farmers markets, movie screenings and community festivals. Drop-off areas in front of the LAGMC courtyard are well-used, though vehicular circulation takes precedent. During lunch hours, spaces like the Tranquility Garden, the Fitness Trail, and sloped lawns are filled with diners. The site is at a local high elevation point with dramatic views in all directions. These views, however, are only visible from a few hard-to-access vantage points and sometimes blocked by temporary structures. The site is sparsely landscaped with various, non-cohesive planting palettes. There is little shade and large expanses of concrete surfaces, particularly at West Campus, which contribute to a local heat island effect. With a more considered landscape design, shaded gathering spaces, and connected circulation, the site could be restored as a beacon and destination for the surrounding community.

2.6 Existing Site Context - Site Landscape



Legend

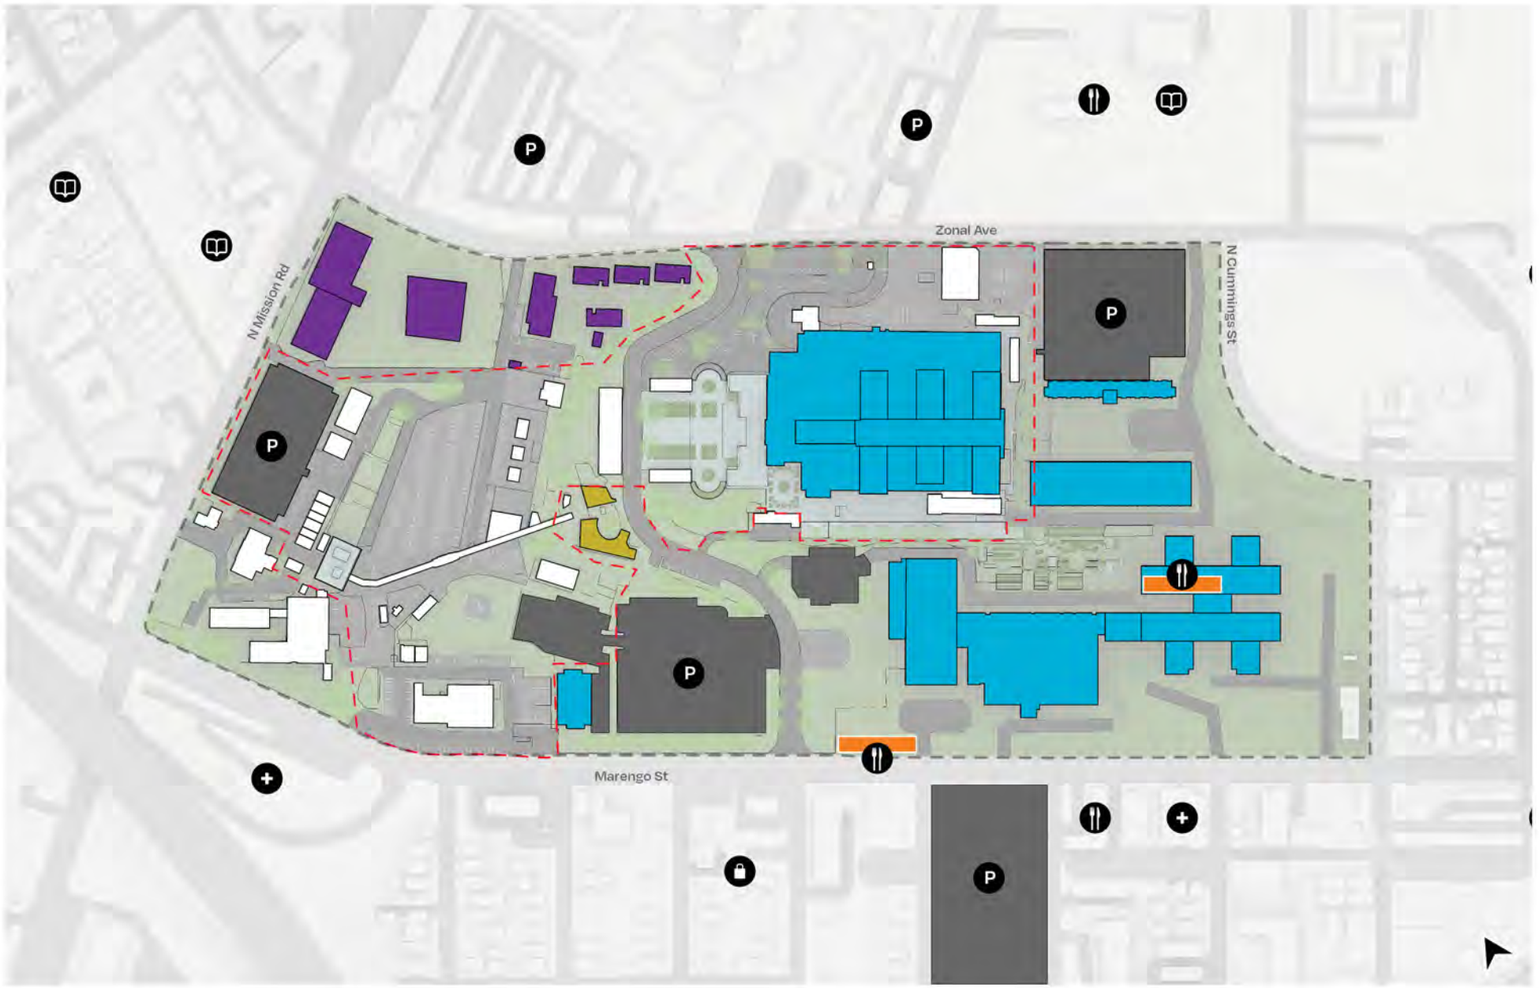
5 min Walking Radius

Open Space Connectivity

Overall, the campus landscape is not pedestrian oriented, lacks clarity and feels disconnected within and to adjacent areas. There is little clarity on where anything beyond hospital-specific amenities are located and how they are related to each other. Other than Wellness Center maps within the Outdoor Fitness Trail area, there are no maps of the area. Elevation change, inconsistent pathway scale and materiality, and scattered amenity placement contribute to poor connectivity and wayfinding within the site. Just beyond the campus, connection to neighboring amenities like Hazard Park, Bravo Medical Magnet School, and the surrounding neighborhoods are limited if not non-existent. While the existing topography currently contributes to these disconnections, it also provides opportunity for activation and place-making while leveraging views and adjacencies.

2.6 Existing Site Context - Site Program

Legend



- LA General Medical Center
- LA County
- Restorative Care Village
- Tenants to Move Out

Current Tenants

There are two main stakeholders on the Superblock – the County and the LA General Medical Center. The County, with the Restorative Care Village, Medical Examiner & Coroner, and various maintenance sheds and yards, anchors the West Campus and extends north to the County Juvenile Hall. LAGMC, its parking lots, OPD, IRD, and the USC Health Sciences Campus line Marengo St., wrap around the historic General Hospital on the east, and extend northward offsite into USC's campus. Currently the Wellness Center and Cares, occupy the first floor of the historic General Hospital, which straddles between these two stakeholders. They are disconnected, however, from the clients they serve at LAGMC due to the topography and inaccessibility of the circulation. The County has committed to moving 100% of all tenants currently within the ENA boundary out before work on the General Hospital and West Campus can begin. This is an important step as the historic General Hospital (with its forecourt, forecourt buildings, retaining walls, and gates), needs significant seismic retrofits, MEP upgrades, and renovations to be transformed to new uses.

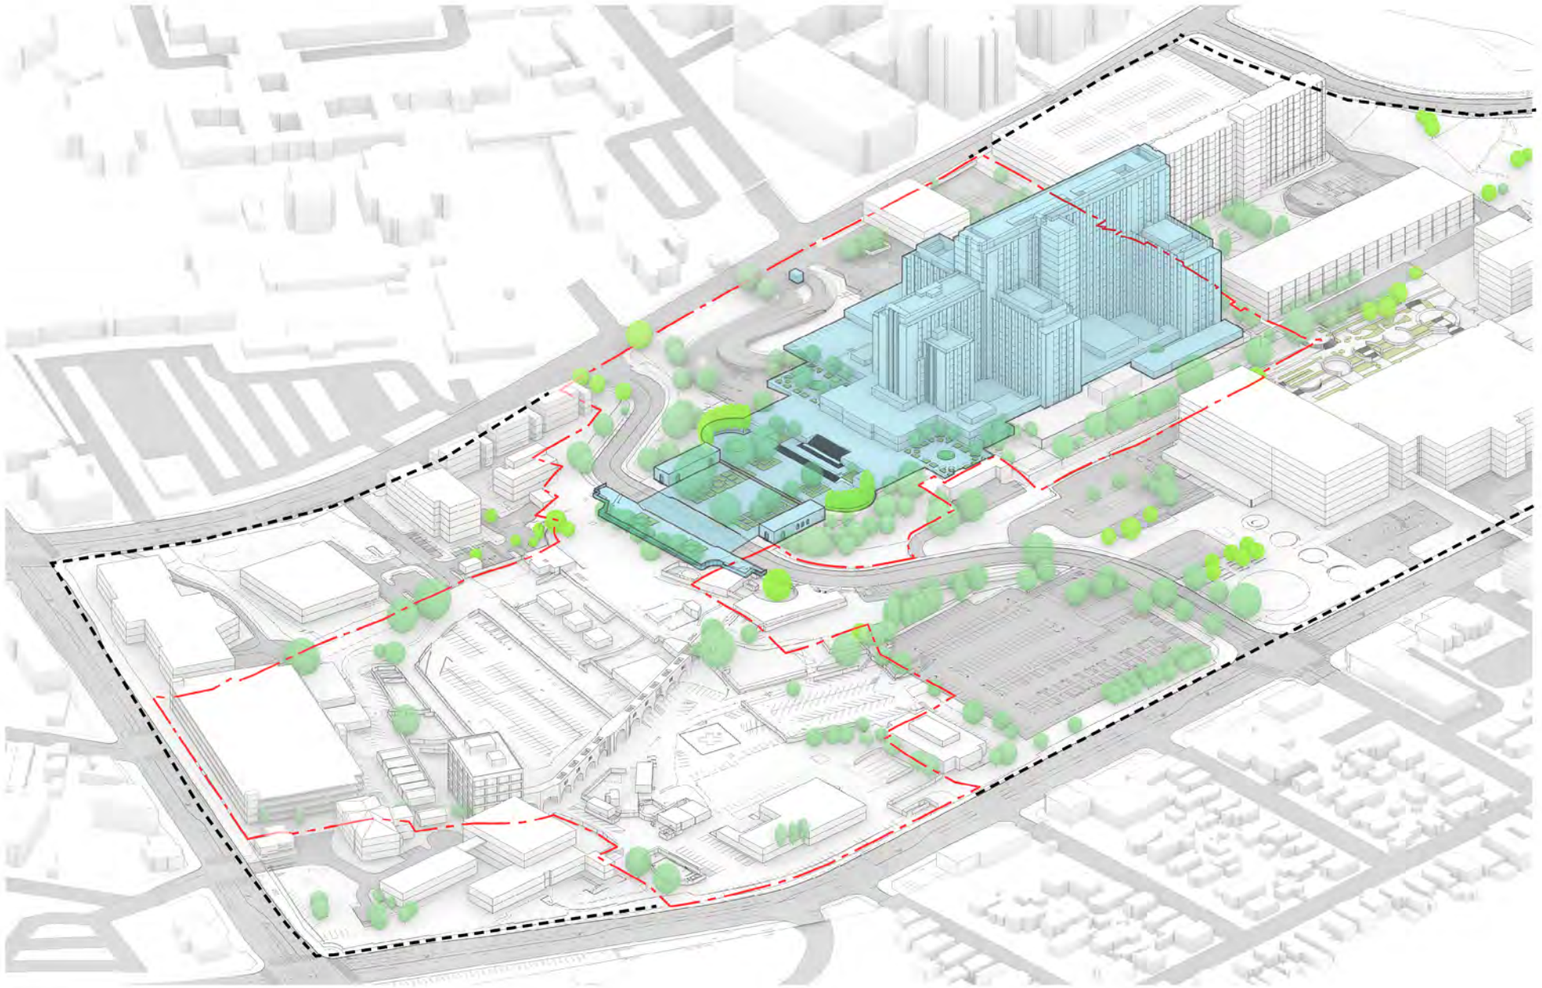
*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

2.6 Existing Site Context - Site Program

Legend

- Parking
- Health & Wellness
- Medical Services
- Childcare Services
- Food Trucks and Vendors

Program Gaps



- Residential
- Grocery Store
- Retail
- Office
- Advanced Industrial
- Food and Beverage
- Child Care
- Education & Training
- Community Center
- Arts & Culture
- Recreation

Program Gaps

To evolve from a primarily institutional campus into a vibrant, mixed-use Healthy Village, the site must support a far broader range of daily needs, activities, and opportunities. While the campus currently serves a large daytime population and surrounding community, it lacks the diversity and density of uses required to sustain a complete neighborhood, particularly as the plan anticipates thousands of future residents alongside patients, staff, visitors, and workers.

A healthy village depends on the close integration of housing, services, employment, and community amenities. Today, many of these elements are either absent, insufficiently scaled, or disconnected from one another. Addressing these gaps is essential to creating a balanced, walkable environment that supports health, equity, and economic vitality throughout the day and across user groups. The distribution and mix of new program must be carefully calibrated to serve existing users while enabling long-term growth into a complete mixed-use community.

2.6 Existing Site Context - History & Demo

Legend

Historic General Hospital

Historic Conditions

The Historic General Hospital building is under consideration for listing on the National Register of Historic Places. The boundary for this consideration includes the building, the forecourt and forecourt buildings, State Street, the gatehouses and other contributing features. Adjacent development within the boundary will need to be sensitive to preserving key viewsheds in addition to careful preservation and adaptive reuse of historic defining features within this zone.

2.7 Socio-Economic Anchors & Drivers

The Los Angeles County General Hospital campus holds a key position at the nexus of healthcare, education, and regional infrastructure. As the anchor of a major medical district comprising LA County Medical Center, Keck Hospital, and Adventist Health White Memorial, the campus concentrates ~20,000 healthcare workers within a one-mile radius. This density results in a jobs-to-households ratio of 1.54, nearly double the Los Angeles County average of 0.83, signaling a structural undersupply of local affordable housing.

Unlike traditional commercial districts, this institutional density generates a 24/7 economy. Shift-based medical employment, clinical training for 1,500+ residents and students, and year-round research activity create stable, non-cyclical consumer demand. The campus serves a dual economic role: providing essential safety-net care to a high-need population (75% living below the poverty level) while operating as one of the nation's largest academic medical centers.

Located at the convergence of I-10 and I-5, with direct proximity to Union Station and planned Metrolink expansions, the campus provides exceptional accessibility for a workforce drawn from across the County's 10 million residents. This connectivity positions the Master Plan to capture acute demand for housing, retail services, and recreational amenities.

Furthermore, the region faces a critical demographic inflection point: by 2030, the LA County senior population (65+) will exceed 1 million, representing nearly 25% of all Angelenos. The Master Plan anticipates this need this by integrating healthcare-proximate multi-generational housing within a multi-modal mixed-use environment.

The proposed mix of uses facilitates a comprehensive job spectrum, from entry-level service and skilled trades to clinical care and entrepreneurship. By co-locating housing, workforce training, and medical innovation, the campus creates a "live-work-heal-learn-innovate" ecosystem. This ensures economic value circulates locally, transforming geographic proximity into tangible social and economic opportunity for the surrounding community.

2.8 Existing Site Opportunities and Challenges

CHALLENGES

The site has been continuously operated as a county hospital, moving through many iterations of building, rebuilding, and reorganization, which at times has been careful and comprehensive, while at other times has been haphazard and rushed to meet pressing needs on the site. This and site context factors have left a patchwork of underperforming infrastructure and building assets as well as problematic conditions, including:

DISCONNECTED CIRCULATION

A highly disconnected site internally and externally with little to no activated street frontage

LEGACY INFRASTRUCTURE

Legacy infrastructure that no longer meets current operational, environmental, or community needs.

INSUFFICIENT PUBLIC SPACES

Lack of connected, secure, and useful community gathering spaces especially lacking in landscape and shade

LACK OF SYNERGY

A lack of synergetic uses that would support a thriving healthy village

CODE DEFICIENCIES

Existing conditions not meeting current code and/or best practices

PARKING INADEQUACY

Inadequate and inconvenient parking

OPPORTUNITIES

The site holds great potential, with key features and assets that, if leveraged, could transform it into a regional destination and community catalyst. Those include:

STRATEGIC LOCATION

Strategic location near vibrant neighborhoods, institutions, community assets, and major freeways which position the site for significant regional influence.

HIGH COMMUNITY DEMAND

Urgent community demand for services, jobs, and housing that could drive success of the development and provide extensive resources back to the community

HISTORIC ASSETS

Beautiful buildings and areas of historic significance that can strengthen the connection to the history and legacy of the site

DISTINCTIVE TOPOGRAPHY

Dramatic topography with potential for distinctive and uplifting placemaking and innovative site water management

MULTI-BENEFIT INFRASTRUCTURE

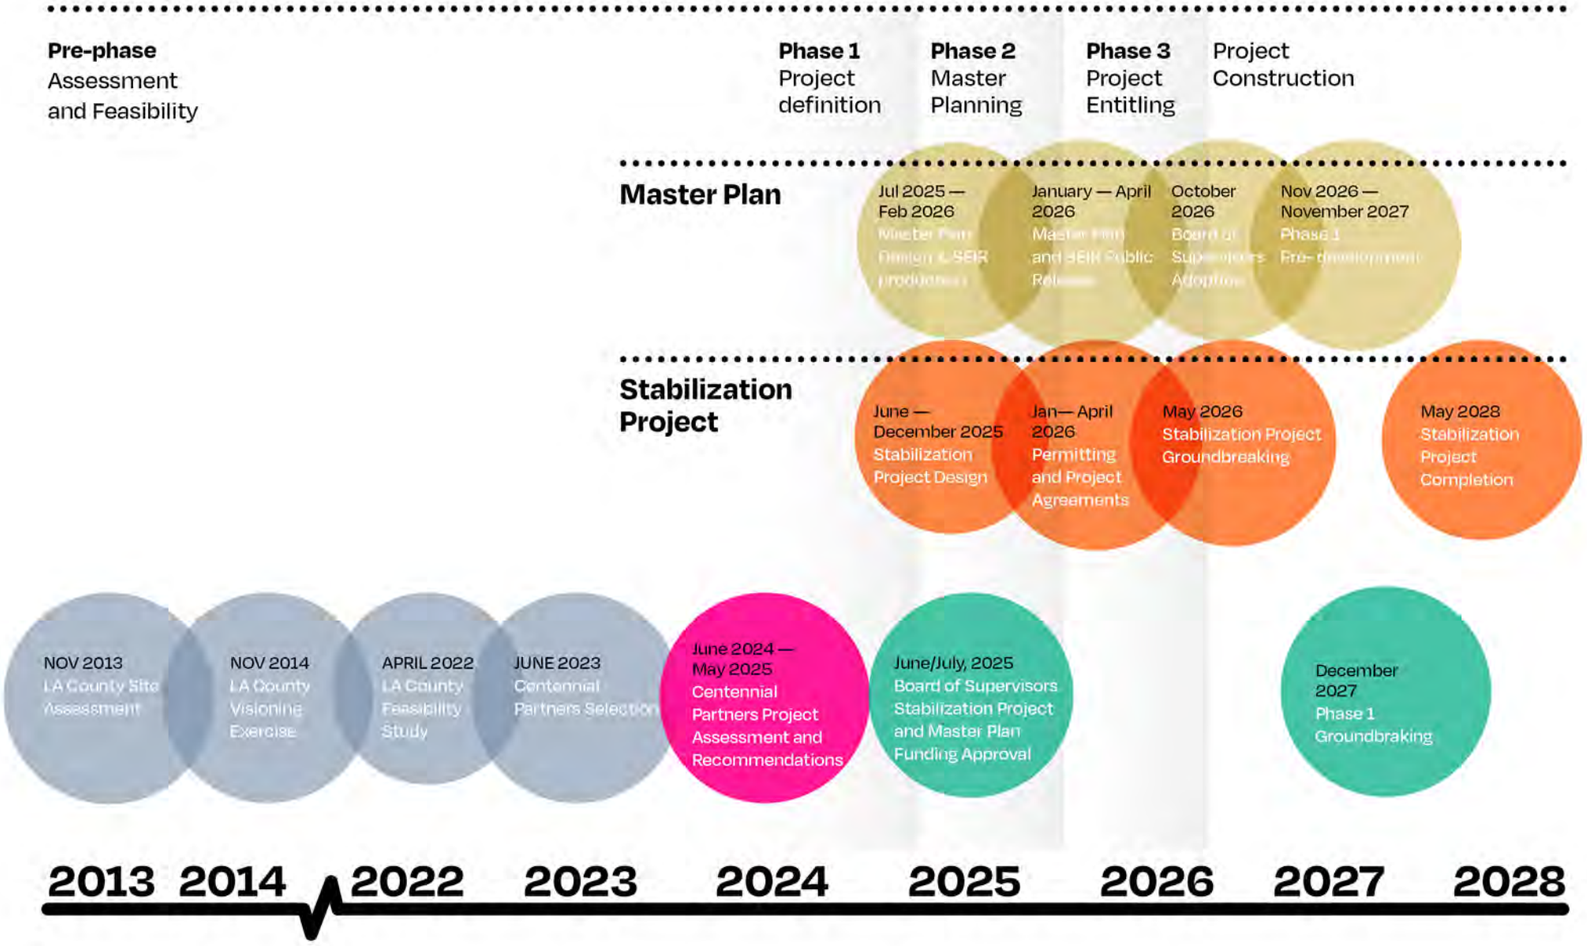
Integrated multi-benefit infrastructure to support the program

03

Community Engagement

3.1 Engagement Overview
3.2 Engagement Approach
3.3 Event Highlight - Bike Giveaway
3.4 Community At - Large Meetings
3.5 What the Master Plan Carries Forward
3.6 Looking Ahead

3.1 Engagement Overview



3.1.1 A Master Plan Shaped Over Time

Over more than a decade, East Los Angeles residents, advocates, and neighbors showed up again and again to articulate what this land should become: a place that heals, that houses, that nourishes, and that belongs to the people who live here.

These efforts, informed the County's decision to pursue a public-private partnership to implement a long-term Healthy Village vision for the site.

Following the selection of Centennial Partners in 2023, the first step was to synthesize all work completed over the previous decade into a Project Requirements Assessment, where community and stakeholder input, technical due diligence, and site recommendations were brought together to define a path forward. Today, that work continues through the Master Plan recommendation and concept design, reflecting a process that has consistently centered community voices while translating long-standing priorities into an actionable and implementable vision.

Project Overview and Timeline

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

3.1 Engagement Overview

3.1.2 Long-Standing Community Priorities

Over the past decade of planning and community engagement efforts, a shared set of priorities have consistently been identified for the campus. These include housing for a range of incomes, expanded mental health and supportive services, access to healthy and affordable food, safe and dignified public spaces, improved mobility, support for small businesses, and pathways to local jobs and job training.

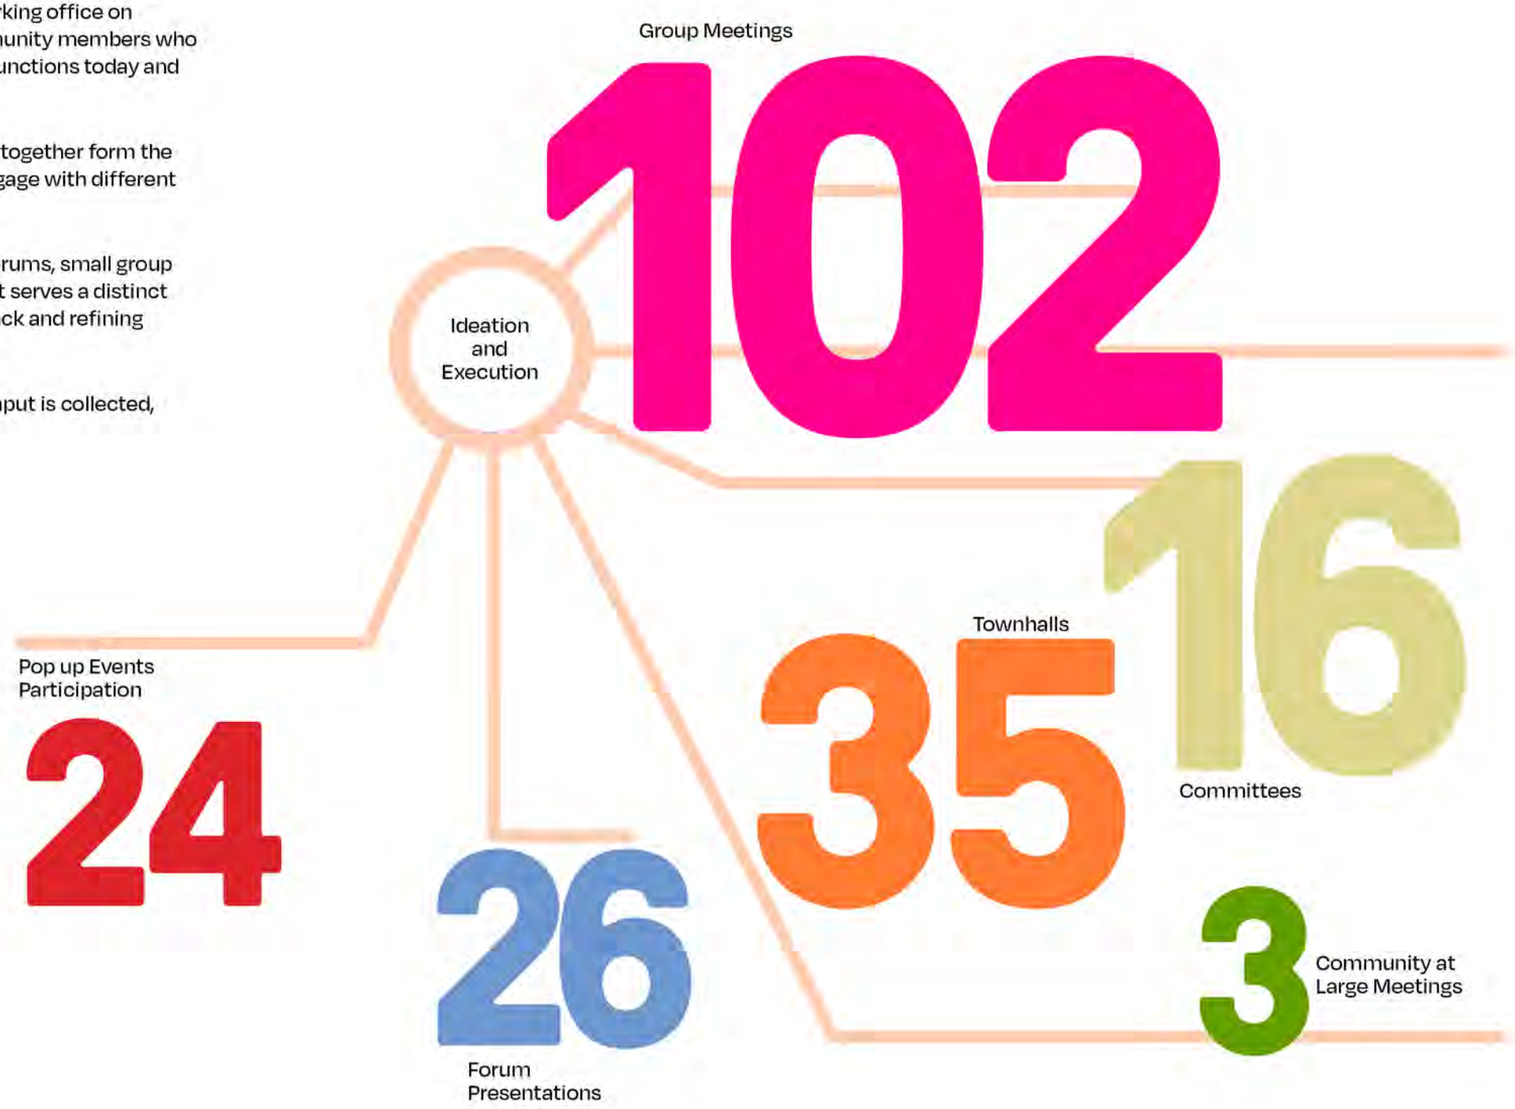
Centennial Partners entered this process not to redefine these priorities, but to understand them more deeply and translate them into a plan that can be implemented over time. The Master Plan reflects this approach by organizing long-standing community priorities into a cohesive framework that supports housing, community life, economic opportunity, and long-term health and wellbeing.

There are five essential priorities when creating a Healthy Village

Campus Infrastructure	Community Spaces	Affordable Housing
Adaptively reuses General Hospital and upgrades essential site infrastructure including utilities, parking, and accessibility combining historic value with modern	Integrates green spaces, educational, cultural, and commemorative zones, prioritizing walkability and safety, enhancing livability, and promoting social interaction to create vibrant	Provides housing units, with minimum 25% designated as affordable for lower-income households, addressing critical housing needs for families, seniors, and the workforce.

Economic Anchors	Supportive Services
Creates jobs across project construction and future operations and incorporates commercial spaces and innovation zones that support local businesses and workforce training.	Advances the "Healthy Village" vision by integrating wrap-around services, to address social determinants of health, and provide technological support to navigate housing

3.2 Engagement Approach



3.2.1 Centennial Engagement Toolkit

Centennial Partners has approached engagement as an ongoing presence on site rather than a series of isolated events. The team maintains an active on-site presence, including a working office on campus, allowing for regular interaction with healthcare staff, patients, and community members who use the site daily. These interactions have provided insight into how the campus functions today and the role it plays in people's lives.

Community engagement is structured through a range of engagement types that together form the Centennial Community Engagement Toolkit. This approach allows the team to engage with different audiences in ways that are appropriate to each setting.

Engagement has taken place through pop-up outreach, participation in existing forums, small group meetings, advisory committees, and community-at-large workshops. Each format serves a distinct purpose, from introducing the project and building awareness to gathering feedback and refining design decisions at key moments in the process.

Together, this toolkit creates a coordinated system of engagement that ensures input is collected, understood, and carried forward as the project evolves.

3.2 Engagement Approach

3.2.2 Toolkit in Action

The engagement approach has been carried out consistently across the project, with community engagement taking place regularly over time rather than at isolated moments.

These images reflect that effort: a continuous presence across the campus and surrounding community, with engagement occurring in many different settings and alongside a wide range of participants.

Centennial Partners strongly believes the engagement process should be active, ongoing, and embedded within the community. Engagement has not been limited to key milestones, rather it has remained a consistent part of how the project has been developed from early planning through today.

3.2 Engagement Process

3.2.3 Community Stakeholders & Partners

Engagement has been carried out in collaboration with a broad network of community stakeholders and partners who play an important role in shaping the project. These include community-based organizations, healthcare workers, labor groups, educational partners, and neighborhood leaders, as well as individuals who interact with the campus on a daily basis.

The Wellness Center has been a key partner in this process, providing a consistent on-site presence and serving as a point of connection to the surrounding community. Through this partnership, the project team has been able to maintain ongoing engagement, host meetings and events, and ensure that community members have accessible opportunities to participate and stay informed.

The Community Advisory Committee (CAC) has also played an important role throughout the process. Composed of representatives from a range of stakeholder groups, the CAC provides a forum for reviewing materials, sharing feedback, and helping to shape how information is communicated. This structure supports a process where engagement is not only broad, but also informed by ongoing input from groups with a direct connection to the community.

The Health Innovation Community Partnership (HICP) has also been an important forum for engagement, bringing together healthcare providers, institutions, and community-serving organizations connected to the campus. Through regular presentations and discussions, this group has provided valuable input on how the campus functions today and how it can better support patients, workers, and surrounding communities over time.

Together, these partnerships reflect an approach that values both reach and depth by engaging a wide range of voices while building sustained relationships that support meaningful and continuous input.

3.3 Event Highlight – Bike Giveaway

As part of early site preparation, a collection of abandoned bicycles were found on the campus. Rather than removing them, Centennial Partners worked with a local bike shop to refurbish the bikes and return them to the community.

The bikes were distributed through two community giveaways, one during the holidays and one on Earth Day, prioritizing families served by The Wellness Center and neighborhood youth. Together, the events provided something tangible back to the neighborhood while reinforcing the broader vision for the site. This effort reflects an approach that values sustainability, intentionality, and community benefit.

The effort also connects directly to the campus's future as a walkable, bike-friendly environment. What was once left behind on site is now part of a larger vision, one where community members can move through and experience the campus in new ways.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

3.4 Community At-Large Meetings

3.4.1 September 27, 2025 Community At-Large Meeting #1

On September 27, 2025, Centennial Partners kicked off Master Plan Visioning Engagement to inform the Master Plan Design process. At critical milestones, Centennial went to the community with progress to request feedback, collect data, and to make sure that designing was in-line with community priorities, goals, and visions.

This At-Large was hosted online and across partner locations including The Wellness Center, Alma Family Services, and EastSide Leads, bringing together over 200 participants to engage in the future of the campus. It invited the public to react to three distinct public realm approaches rather than a single pre-selected concept. Participants reviewed options titled Main Streets, Neighborhood Parks and Plazas, and Central Park, then responded through a structured workbook, Miro boards, and printed boards that asked them to assess each direction, identify priorities, and describe what would make the campus feel welcoming, useful, and community-serving.

The workbook format provided space for comparison, feedback, and dialogue to gather both quantitative and qualitative input. The value of this format was not only that it surfaced preferences, but that it ensured that feedback could be collected consistently across participants and translated into actionable insights. Across completed workbooks, several themes emerged with clarity and consistency.

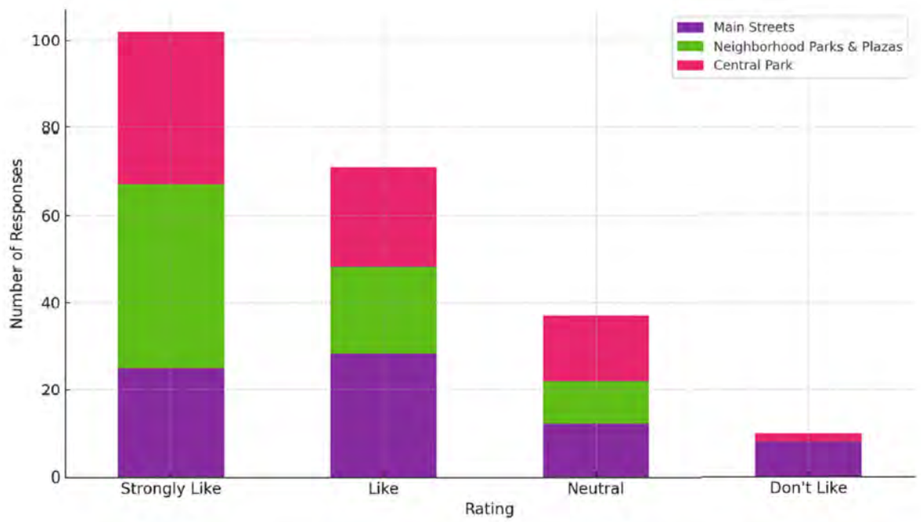
Desires expressed by Community Members:

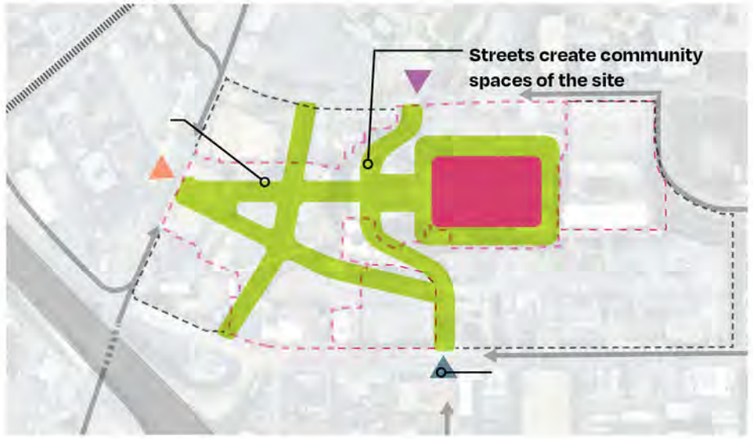
"To be safe and lead a healthy life."
"It's my neighborhood, I want to have a place to visit and to walk."
"More housing opportunities for younger generations."

Community at Large Breakout Session Workbook



3.4 Community At-Large Meetings

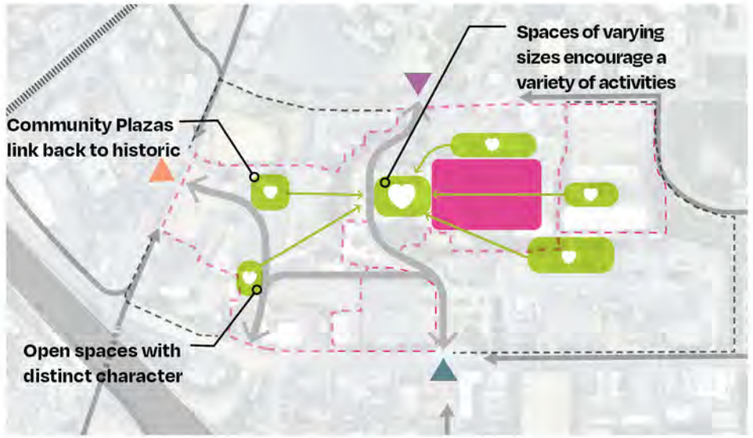
3.4.2 From Three Options to One Integrated Design



Rather than selecting one approach, the plan evolved by integrating these preferences into a unified framework. Neighborhood Parks and Plazas received the strongest overall support, Central Park also tested strongly, and Main Street remained broadly supported as a model for activity, edges, and everyday destinations. Together, these responses indicated that the future campus should not be organized around a single idea alone, but around a synthesis of neighborhood-scaled open space, an active public realm, and a larger shared destination.

This feedback directly informed the development of three guiding principles that structure the Master Plan. Gathering is anchored by a central axis that creates a strong public realm and shared civic space across the site. Connectivity organizes the campus around key activity hubs linked by safe, walkable connections that support access and movement. Belonging is reinforced through a network of parks, plazas, and open spaces that support everyday use and reflect the identity of the surrounding community.

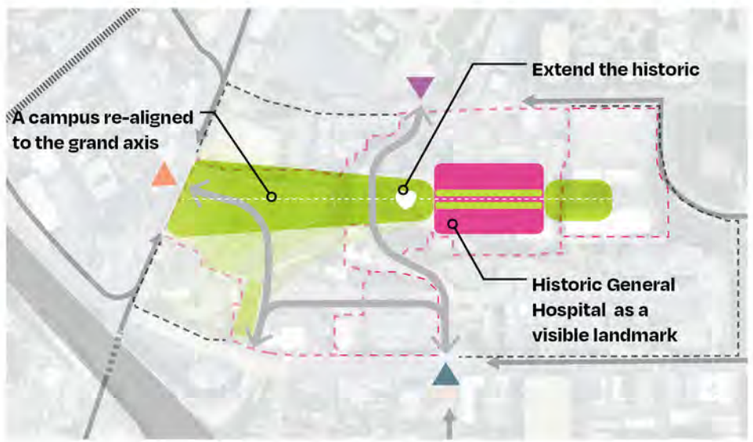
This is an important part of the story of the Master Plan as community engagement did not produce a symbolic endorsement of a concept, but directly informed how the plan evolved. The movement from three options to one integrated direction shows that community voices were not simply collected, but interpreted and built into the structure.



Community At Large Meeting #1 - Initial Concepts

Concept 1 - 'Main Streets'

Bring the city in



- Streets are the heart of public life.
- Each has a distinct character, yet all are multimodal.
- Community services and amenities line the streets.
- Streets support all modes of transportation.

Concept 2 - 'Neighborhood Parks'

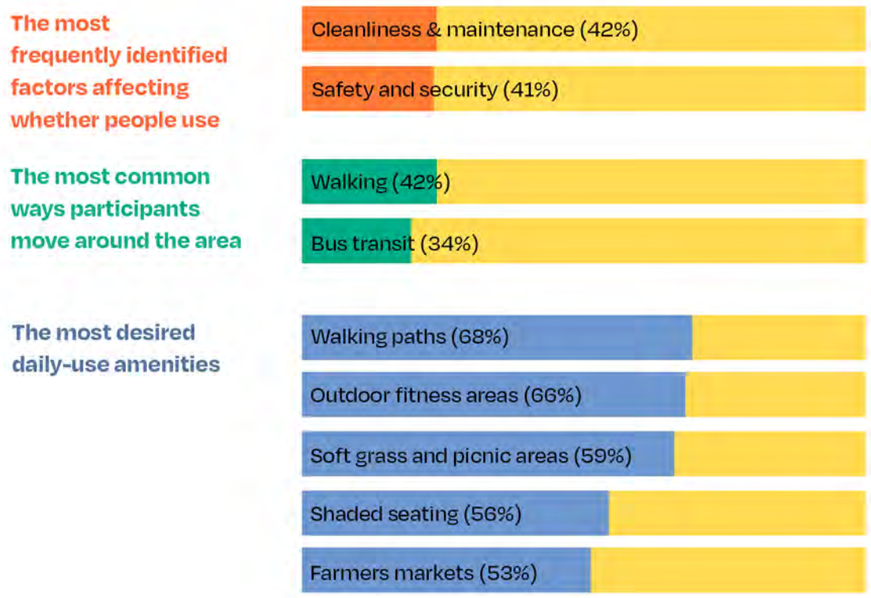
Plazas as Catalysts for Neighborhood Hubs

- Plazas are the core of public life.
- They define unique hubs within the site.
- Varied sizes support diverse activities.
- Community services cluster around plazas.
- All plazas and connections between them are pedestrian-only.

Concept 3 - 'Central Park'

A Grand Terraced Gathering Space

- A central spine organizes open space and community services.
- The spine is monumental and continuous.
- The site core is fully pedestrian-oriented.



3.4 Community At-Large Meetings

3.4.3 December 6, 2025 Community At-Large Meeting #2

Building on the results of the first meeting, the second Community At-Large meeting focused on refining the integrated concept and understanding how the campus would function in everyday life. On December 6, 2025, through one virtual workshop and two in-person watch parties, the second meeting, with a combined attendance of over 100, gathered participants to build on earlier feedback and better understand how the campus should function in everyday life rather than focusing on broad concepts. This phase of engagement invited participants to reflect on lived experience. Through an updated workbook and new interactive exercises, participants identified meaningful places within their community, shared personal stories about why those places matter, and described a "day in the life" on the campus for different users, including teenagers, hospital staff, and older adults. These exercises grounded the planning process in how people actually move through, use, and experience space on a daily basis.

Participants emphasized that successful public space is not defined only by special events or design, but by whether people feel comfortable lingering, returning, and seeing themselves reflected in the life of the campus. Feedback consistently pointed to the importance of shade, seating, lighting, cleanliness, and culturally relevant programming as essential components of everyday usability.

Together, this phase of engagement deepened the understanding of how the campus should function beyond concept by shaping a plan that responds to daily needs, supports community life, and creates a more welcoming and accessible environment for all users.

"From the beginning, we've brought community voices to the table, not just to be heard, but to shape what this space becomes. The Healthy Village is a vision born from our community members' lived experiences, and this next phase is a powerful step toward making that vision real: housing that's affordable, care that's accessible, and a place where our families can truly thrive." - Community Member

Community At-Large meeting at the Wellness Center

Community At-Large meeting at ALMA Family Services

Community at Large Breakout Session Workbook

3.5 What the Master Plan Carries Forward

3.5.1 Consistent Priorities

One of the clearest findings across all phases of outreach is the consistency of the community's priorities. Earlier County-led engagement, the feasibility process, and the recent community at-large workshops all point to a shared set of aspirations: housing that serves a range of incomes, stronger mental health and supportive services, healthier and more affordable food options, safe and dignified public space, support for small businesses and local entrepreneurs, and expanded opportunity through job creation and workforce development.

That consistency gives the Master Plan its strength. It demonstrates that the current vision is not reacting to short-term feedback, but responding to long-standing community needs that have been clearly and repeatedly expressed over time.

3.5.2 Community Priorities to Master Plan

The Master Plan carries these priorities forward in tangible ways. It establishes housing as a foundation for long-term health and community stability, including a commitment that no less than 25 percent of new residential units will be affordable. It supports a broader mix of health-related, community-serving, and neighborhood-serving uses across the campus. It creates space for local businesses, job creation, and workforce development. It prioritizes walkability, open space, mobility, and community amenities as part of a more connected and supportive daily environment.

Taken together, these commitments reflect a larger vision for a self-sustaining and thriving healthy community: one where housing, care, food access, employment, public life, and social connection are not treated as separate goals, but as mutually reinforcing parts of the same place-based strategy.

3.6 Looking Ahead

The continued participation of community members throughout this process is meaningful in itself. People have remained engaged because they care about the future of the site, because they want to shape what comes next, and because they believe the redevelopment can deliver something of lasting value. That sustained involvement is a form of trust, and it is one of the strongest indicators that the Master Plan is being built on genuine public investment rather than procedural outreach alone.

For Centennial Partners, engagement is not valuable only because it strengthens the plan. It is also essential to long-term stewardship. A project of this scale will succeed only if the community continues to recognize itself in the process, in the benefits delivered, and in the daily life of the campus as it evolves over time.

The community will be able to support the adoption of the Master Plan by the Los Angeles County Board of Supervisors. This milestone marks a transition from vision to implementation, not the end of community engagement.

As the campus advances through phased development, engagement will continue to focus on translating the plan into specific projects, programs, and public spaces. Ongoing collaboration with community partners, including organizations such as The Wellness Center, will support transparency and help align each phase with the broader Healthy Village vision.

Continued communication, public updates, and future workshops will ensure that community voices remain integrated as the campus evolves over time. Coordination across County departments will also ensure that development supports existing campus users.

04

Master Plan Guiding Principles

4.1 Master Plan Guiding Principles
4.2 Legacy and Continuity - Ingredients of a Healthy Village
4.3 Community-Driven Visioning
4.4 Site Organization - A Deeply Connected Site
4.5 Flexible Framework
4.6 Common Ground
4.7 Grounded Living Infrastructure

4.1 Master Plan Guiding Principles - Reimagining A Beacon for Healthy Living

Far too often, the pursuit of health is treated as an intentional act, something that demands extra time, money, and effort. But what if the design of this new Healthy Village embedded health-promoting strategies so seamlessly that wellbeing became a natural byproduct of simply living there?

The following pages establish the guiding principles for the design of the Master Plan demonstrating how healthy living can be woven directly into the physical fabric of the site, making health not an aspiration, but an inherent quality of place.

Hospital

Past 100 Years

Hospital as Health Anchor

A Place for Recovery

Next 100 Years

Expansion of the Meaning of Health

A Place to Thrive

4.2 Legacy & Continuity - an Evolution of Health

A century ago, Los Angeles County made a bold investment in public health, funding and building one of the most advanced medical facilities of its time and dedicating it to the people of Los Angeles so that everyone, regardless of income, could access state-of-the-art care.

Over the past hundred years, our understanding of what it means to be healthy has expanded. We now recognize that true wellbeing extends far beyond medical treatment, it is shaped by the social determinants of health: **Wellness, Economic Opportunity, Community, Learning, and Ecology.**

Through this Master Plan, we seek to carry forward the County's original spirit of public service and expand its promise from a place where people come when they are sick, to a place where they come to thrive.

Healthy Village Ingredients for WELLNESS

Mapping out and layering the above ingredients throughout the site weaves in the physical design features, spaces, and circulation below that infuse wellness into every day life.

Extensive public health research shows that regular physical activity and access to nutritious food are strongly associated with reduced rates of chronic disease, including cardiovascular disease, type 2 diabetes, and obesity, while also supporting improved mental health and longevity. Combined diet and physical activity interventions have demonstrated reductions in type 2 diabetes incidence of approximately 40 to 60 percent among high-risk populations. Even modest increases in daily movement and fruit and vegetable intake are consistently linked to improvements in blood pressure, metabolic indicators, and overall healthcare utilization, underscoring the value of environments that support everyday wellness behaviors.*

In the Healthy Village, wellness is designed into daily life rather than isolated within clinical settings. Accessible healthcare touchpoints, including clinics and small wellness kiosks integrated into housing and activity centers, bring prevention and care closer to residents. Active living routes, nearby recreation spaces, and restorative environments encourage movement and mental wellbeing throughout the day. Importantly, the Master Plan directly addresses existing food desert conditions by prioritizing visible, convenient access to healthy food through a full-service grocery store, fresh food markets, and community-oriented food programs, making healthy choices achievable within a short walk of every home and workplace.

Vibrant Walkable Public Space

Access to Healthy Food Choices

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Healthy Village Ingredients for ECONOMIC OPPORTUNITY

Mapping out and layering the above ingredients throughout the site weaves in the physical design features, spaces, and circulation below that infuse economic opportunity into every day life.

Strong evidence links stable employment and higher household income to improved health outcomes across the lifespan, including lower rates of infant mortality, reduced prevalence of depression and anxiety, and longer life expectancy. Economic stability improves health by reducing chronic stress, increasing access to healthcare and nutritious food, and supporting housing security. These findings position economic opportunity as a foundational determinant of population health, particularly in communities that have experienced long-term disinvestment.*

The Healthy Village advances economic opportunity through a connected employment ecosystem that supports growth from entry-level work to long-term careers. Community-serving jobs in retail, food, maintenance, childcare, and small business provide accessible points of entry, while on-site job training, mentorship, and certification programs help residents build skills and advance over time. These pathways intentionally connect to anchor employers and regional employment anchors, including medical offices, professional services, research, and commercial tenants that offer stable, higher-wage careers. Shared workspaces, incubators, and workforce partnerships help bridge these sectors, creating a visible talent pipeline that allows residents to live, work, and progress within the community.

Healthy Village Ingredients for COMMUNITY

Mapping out and layering the above ingredients throughout the site weaves in the physical design features, spaces, and circulation below that infuse community into every day life.

Loneliness and social isolation have reached epidemic levels in the United States, with roughly one in three adults reporting that they feel lonely or lack adequate social and emotional support. This widespread disconnection is associated with higher risks of depression, anxiety, cardiovascular disease, and premature mortality. At the same time, research consistently shows that social connection is one of the strongest predictors of health. Strong social relationships are associated with significantly lower all-cause mortality risk, comparable to other major health behaviors, and access to welcoming public spaces and shared activities has been shown to reduce loneliness and support healthier behaviors.*

Community is therefore foundational to the Healthy Village. Each district includes a community commons such as a plaza, park, hall, or center, supported by additional open spaces within a five-minute walk. This network of places supports everyday interaction, from informal connection and friendship-building to larger civic gatherings. Dedicated second spaces provide opportunities for teens, young adults, and seniors to belong, while transparent stewardship through neighborhood councils and shared governance models encourages participation and trust. Regular programming and signature events animate these spaces, creating a living network of connection and care that directly counters social isolation.

Community Events

Shared Community Space

Healthy Village Ingredients for LEARNING

Mapping out and layering the above ingredients throughout the site weaves in the physical design features, spaces, and circulation below that infuse learning into every day life.

Educational attainment and lifelong learning are strongly associated with improved health outcomes, including lower rates of chronic disease, better cognitive health in later life, and increased life expectancy. High-quality education and job training improve health through multiple pathways, higher income, improved health literacy, and greater employment stability, making learning environments long-term investments in both economic and population health resilience.*

In the Healthy Village, learning is embedded into daily life as a shared and continuous pursuit. Distributed learning hubs include libraries, reading rooms, maker spaces, and flexible classrooms that support tutoring, after-school programs, workforce training, and continuing education. Spaces for creative expression such as dance, art, and performance foster cultural exchange and intergenerational mentorship. A cultural path woven through the campus, lined with local art and murals, reinforces learning as both a personal journey and a collective act of storytelling. With childcare and adaptable learning spaces integrated into the neighborhood, the campus supports curiosity, creativity, and growth at every stage of life.

Healthy Village Ingredients for ECOLOGY

Mapping out and layering the above ingredients throughout the site weaves in the physical design features, spaces, and circulation below that infuse ecology into every day life.

Research indicates that the health benefits of living on a tree-lined street are significant, with some studies finding that increased tree canopy in urban neighborhoods provides health improvements equivalent to being seven years younger. These benefits stem from reduced stress, lower blood pressure, improved air quality, and increased physical activity, effectively serving as a passive, daily preventative health measure.*

Ecology is the connective tissue of the Healthy Village, restoring the relationship between people and the natural systems that sustain them. Green space is within a five-minute walk of every home, while biodiversity corridors thread through all districts, linking habitats and human experience. Climate-adaptive landscapes clean the air, infiltrate stormwater, buffer noise, and provide shade and cooling, making nature a daily ally in resilience. Sustainability is expressed not only through infrastructure (renewable energy, electrification, and integrated water systems) but also through everyday participation: composting, recycling, and caring for pollinator gardens. Together, these layers form a living ecology where environmental health and human wellbeing thrive as one.

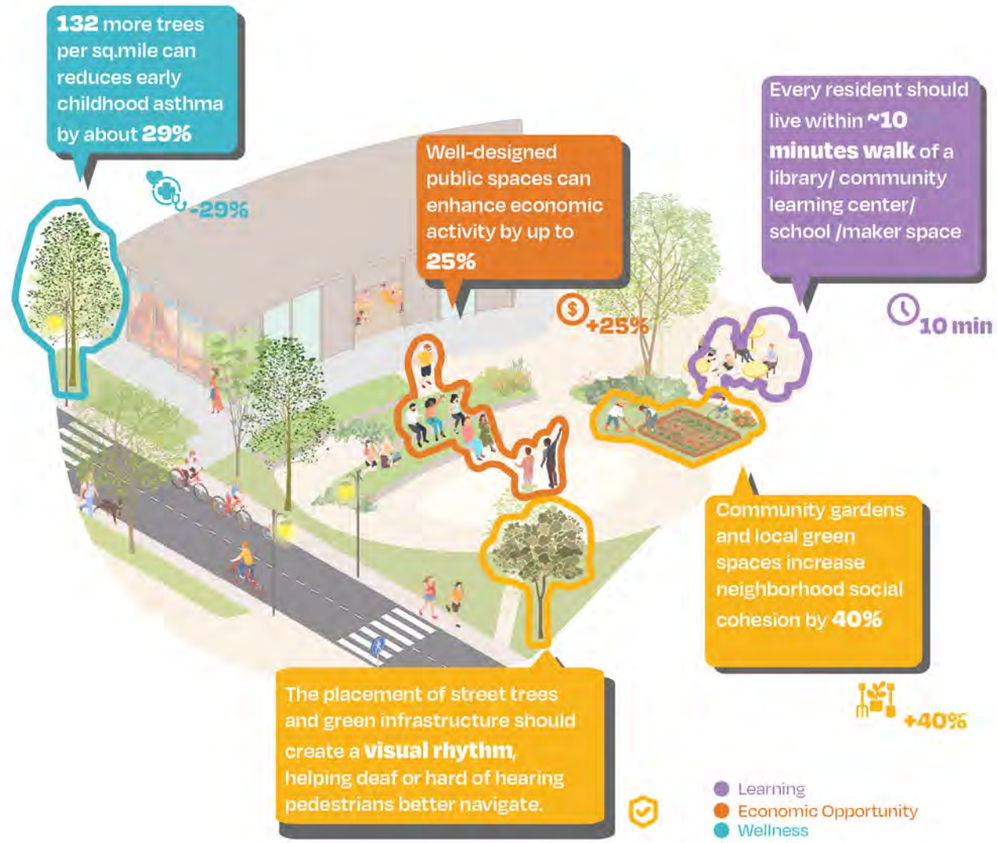
Healthy Vision to Lived Metrics:

Spaces that Promote All Kinds of Health

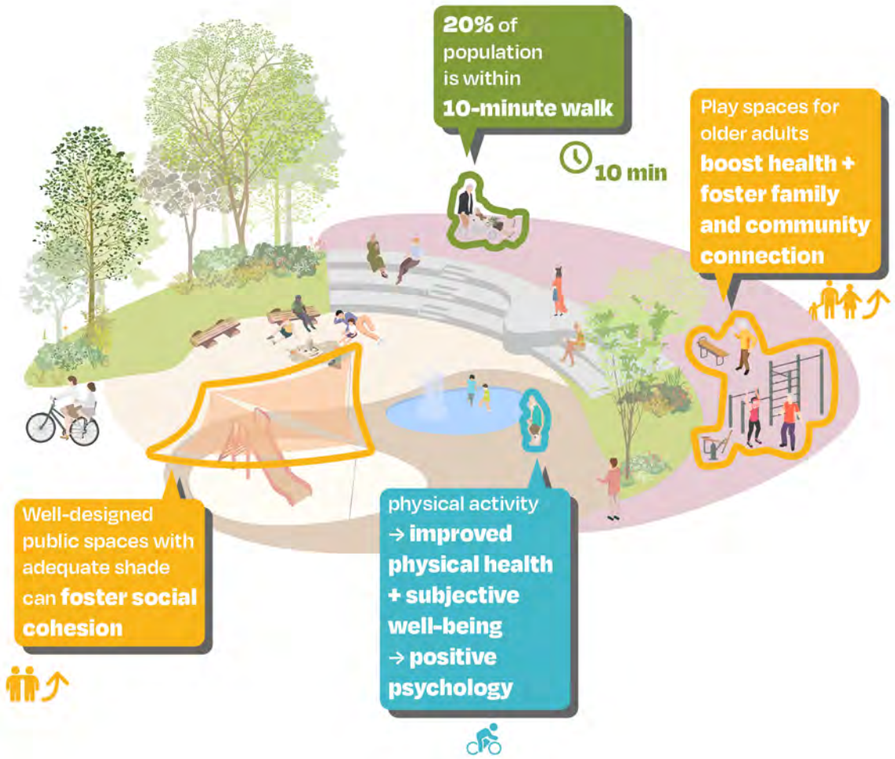


When the research on health-supportive environments is considered holistically, placemaking becomes an intentional layering of these multiple dimensions of health rather than a single-purpose design exercise. Wellness, Economic Opportunity, Community, Learning, and Ecology do not operate in isolation. The greatest health benefits emerge where these dimensions overlap in daily life. In the Healthy Village, every public space is conceived as an opportunity to integrate multiple health-supportive elements into the physical fabric of the campus.

The diagrams that follow illustrate how the ingredients outlined in the preceding sections can function as a flexible kit of parts for designing public space. A single plaza, corridor, or courtyard might simultaneously support physical activity through walkable paths, economic opportunity through small-scale retail or pop-up markets, community through gathering and programming, learning through cultural expression or informal education, and ecology through shade, planting, and water-sensitive design. These elements can be combined and scaled differently depending on context, allowing spaces to respond to local needs while remaining part of a cohesive whole.

Community and Learning

When deployed consistently across the campus, this layered approach transforms the public realm into a network of indoor and outdoor environments that actively support health. Rather than relying on isolated interventions, the Master Plan embeds multiple health benefits into everyday experiences, addressing both direct health outcomes and broader social determinants of health. Through this integrated design strategy, public spaces become places where individual wellbeing and collective resilience are strengthened together, reinforcing the Healthy Village as a lived, inclusive, and adaptable environment.



Community Stewardship

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Social Health in Nature

4.3 Community-Driven Visioning

"From the beginning, we've brought community voices to the table -- not just to be heard, but to shape what this space becomes. The Healthy Village is a vision born from our community members' lived experiences, and this next phase is a powerful step toward making that vision real: housing that's affordable, care that's accessible, and a place where our families can truly thrive."

- Rosa Soto, Executive Director of The Wellness Center at General Hospital

Through extensive community engagement, the community identified not only current challenges, but also a shared desire for a place that fosters **Gathering, Connectivity, and Belonging**. These aspirations reflect the need to strengthen social ties, restore access, and reestablish the General Hospital Campus as a welcoming nexus for the surrounding communities.

Belonging and Cultural Identity

Participants strongly associated belonging with spaces that reflect cultural history, support informal gathering, and allow people to linger without feeling rushed or excluded. Mariachi Plaza and Plaza de la Raza were repeatedly referenced as successful models due to their culturally relevant programming, music, arts, and accessibility. These spaces were valued for hosting low-cost or free events, supporting youth arts education, and fostering intergenerational interaction. Participants emphasized the importance of non-hostile architecture, including shade, seating, welcoming signage, and the absence of design elements that discourage gathering. Many noted the need to recognize the full cultural history of Boyle Heights, including Japanese, Armenian, Chinese, and other communities that have been overlooked, and to celebrate historic corridors such as Brooklyn Avenue as part of the area's identity.

Gathering and Community Life

Successful gathering spaces were described as flexible, multi-use environments that support both active and quiet uses. Participants highlighted the importance of plazas and parks that can host cultural events, music, dance, markets, health fairs, and family celebrations, while also providing calmer areas for rest and reflection. Evening and nighttime programming emerged as a consistent priority, particularly for working families and night-shift workers who are unable to participate in daytime events.

Connectivity and Mobility

Connectivity was identified as a foundational requirement for the campus to function as a true community asset. Participants emphasized the need for safe, walkable entrances from Marengo Street, Mission Road, and Zonal Avenue, noting that current barriers and car-centric design discourage pedestrian access. Significant grade changes across the site were described as challenge, particularly for seniors and people with disabilities. Participants supported improvements such as upgraded paths, ramps, landscaped stairways, and functioning elevators to ensure equitable access.

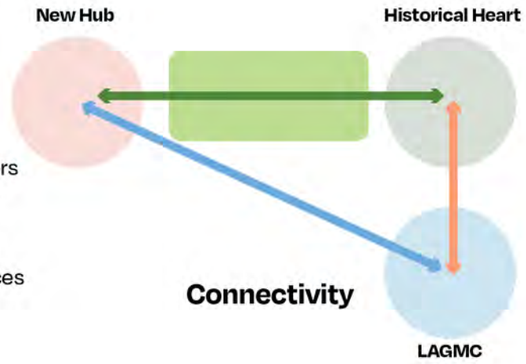
4.3 Community-Driven Visioning

Overlapping Community Input and Ingredients of a Healthy Village

In response, **Gathering, Connectivity, and Belonging** operate as macro-scale organizing ideas for the Master Plan. They structure how the layered healthy spaces described in the previous section are distributed, linked, and experienced across the campus, shaping a public realm that is social, legible, and deeply rooted in community life.

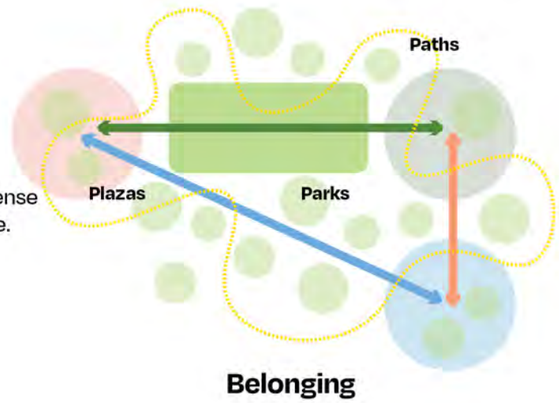
4.4 A Deeply Connected Site

To revitalize General Hospital, the key is to transform it into a true destination – reconnecting regional and local pathways while drawing in the community. This requires bold moves to reorganize the site around clear, intuitive circulation spines that navigate significant grade changes and existing building constraints while enhancing multimodal transportation and parking to support current stakeholders, neighboring communities, and future campus residents.



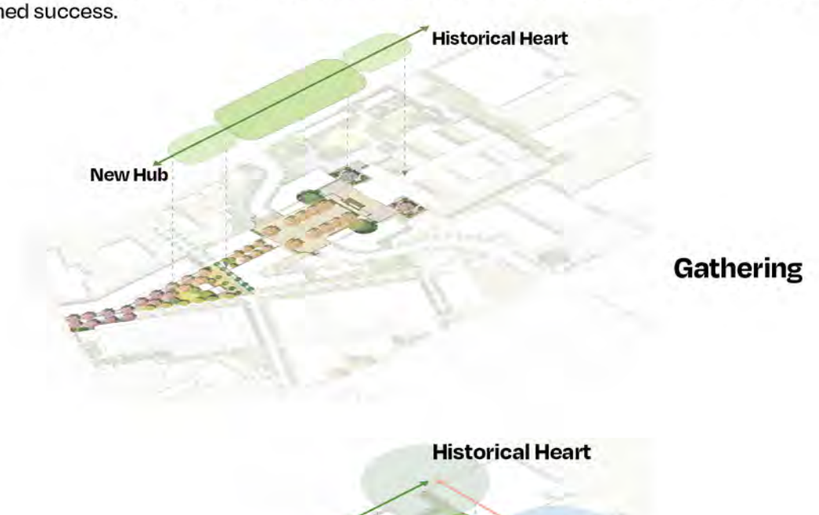
Gathering

A Central Park aligns a grand central axis that extends from the Historic General Hospital through West Campus, providing a central focus and gathering place for the community to catalyze coming together.



Connectivity

A diagonal road connects the three major anchors on the site: the Residential Hub, the Commerce Hub, and the Medical Services Hub, giving all residents, visitors, and staff clear, intuitive, and direct connection to all the amenities and services on the campus.



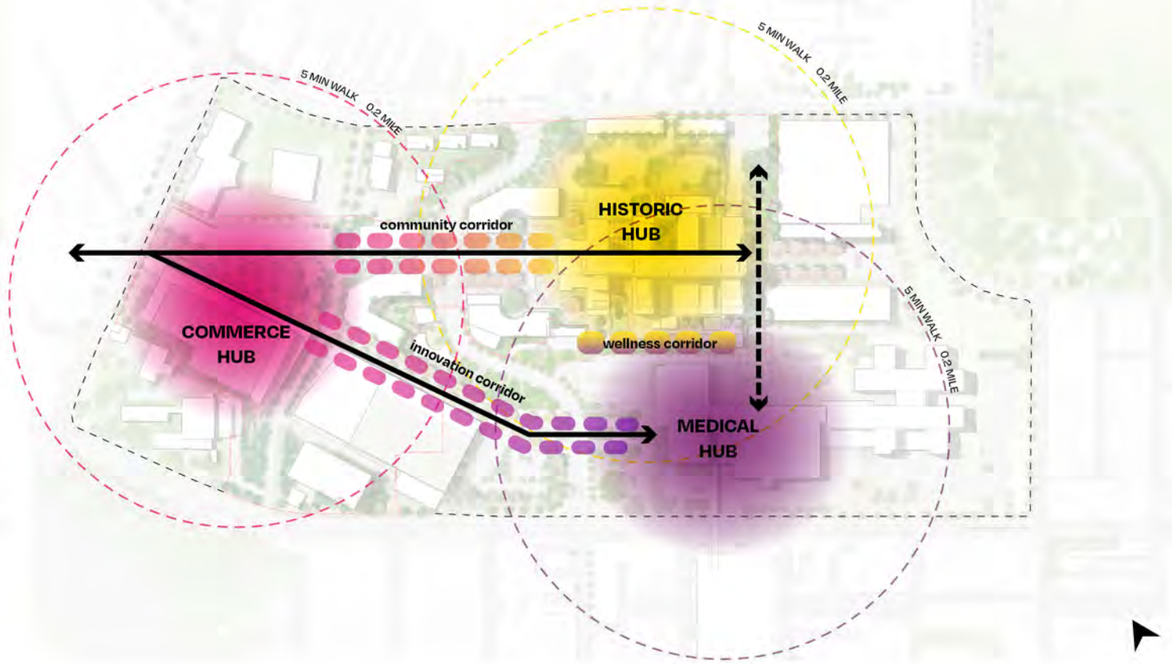
Belonging

Seeding public spaces – parks, plazas, and community services of varying scale and experience – throughout the site provides a sense of belonging and identity to the Healthy Village.

Additionally, strengthening connections between street frontages and internal destinations is crucial, especially given the site's limited exterior presence. By increasing foot traffic, activating community spaces, and driving economic activity, the campus can expand its network of amenities and public spaces, creating a vibrant, accessible environment that catalyzes a positive feedback loop for sustained success.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

4.5 Flexible Framework



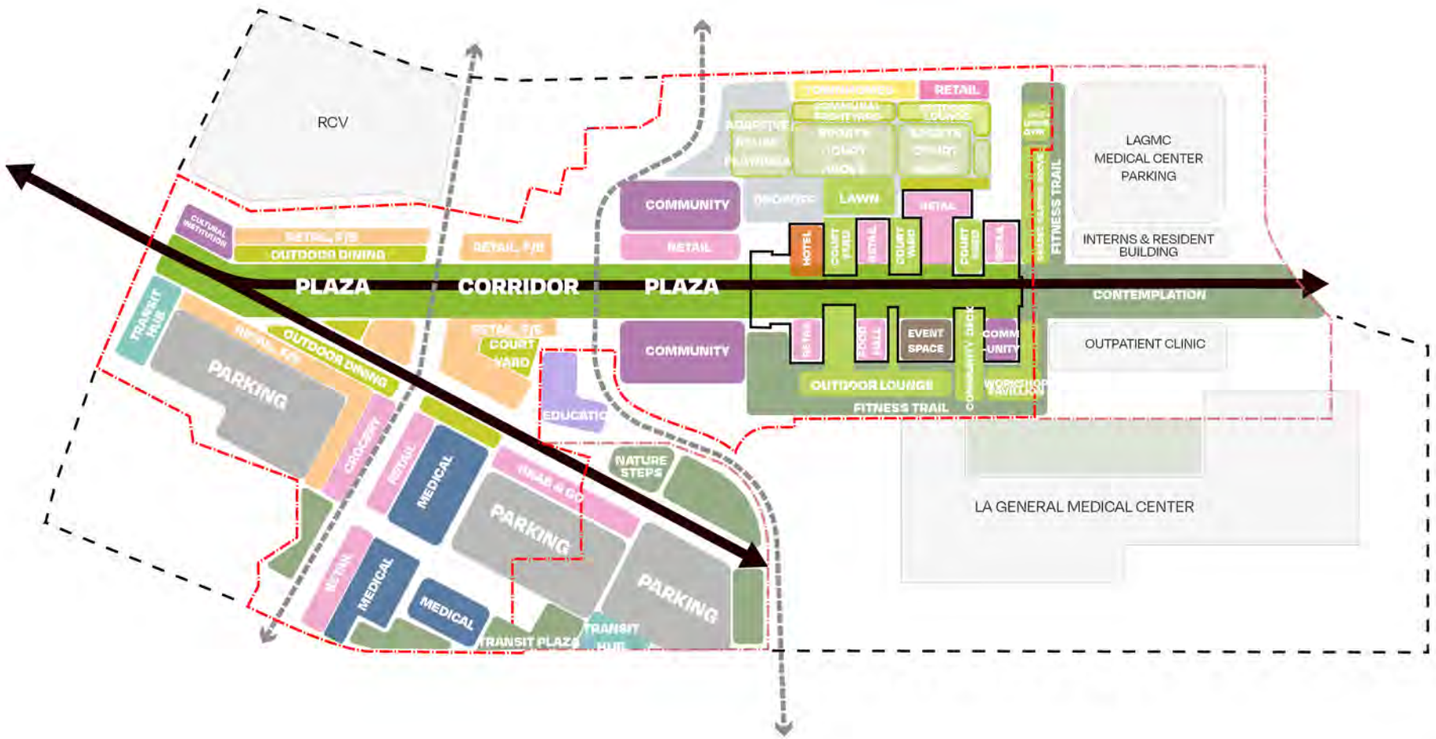
Guiding Frameworks

For this Master Plan to remain successful and adaptable to evolving community needs and shifting market conditions over time, its core elements, particularly the site organization, are structured around a flexible framework that can accommodate a range of development outcomes while maintaining a cohesive and enduring Healthy Village.

These guiding frameworks, are essential to the layout, cohesion, and experience of the site. They define the essential structure of the Healthy Village while allowing for multiple paths of realization, ensuring the concept remains resilient and relevant as the site evolves.

Framework Principle 1 - Five Minute Hubs

The framework is anchored by three primary arrival points, each forming a hub centered around a major use: the LA General Medical Center, the Historic General Hospital, and a new West Campus Hub. Each hub is supported by a district parking garage designed to intercept vehicles early, reducing congestion and promoting a pedestrian-oriented environment. Each hub should provide access to an ecosystem of Healthy Village amenities and services within a five-minute walking radius.



Framework Principle 2 - Hubs and Corridors

While the campus is unified with a cohesive mixed-use program throughout, within each hub's five-minute 'catchment' there is a distinct focus which informs its character, programmatic activation, and destination identity.

- The Medical Services Hub, centered on LAGMC and serving patients, visitors, doctors, nurses, and staff.
- The Historic Hub, centered on the adaptive reuse of the Historic General Hospital and its residential community.
- The Commerce Hub, anchored by the new West Campus Hub with mixed-use, residential, and employment opportunities.

Together, these hubs form the three points of a campus-wide triangle, each balancing and amplifying the activity, programming, and vitality of the others. Linking them are three primary corridors, the Wellness Corridor, the Community Corridor, and the Innovation Corridor, each lined with active ground-floor uses that connect and energize the public realm between the hubs.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Legend

- Retail
- Medical
- Transit Hub
- Community
- Retail
- Townhomes
- Education

Framework Principle 3 - Activating Program

Housing, commerce, and community-serving programs are distributed throughout the campus, creating an integrated environment, while each hub is anchored around a distinct theme.

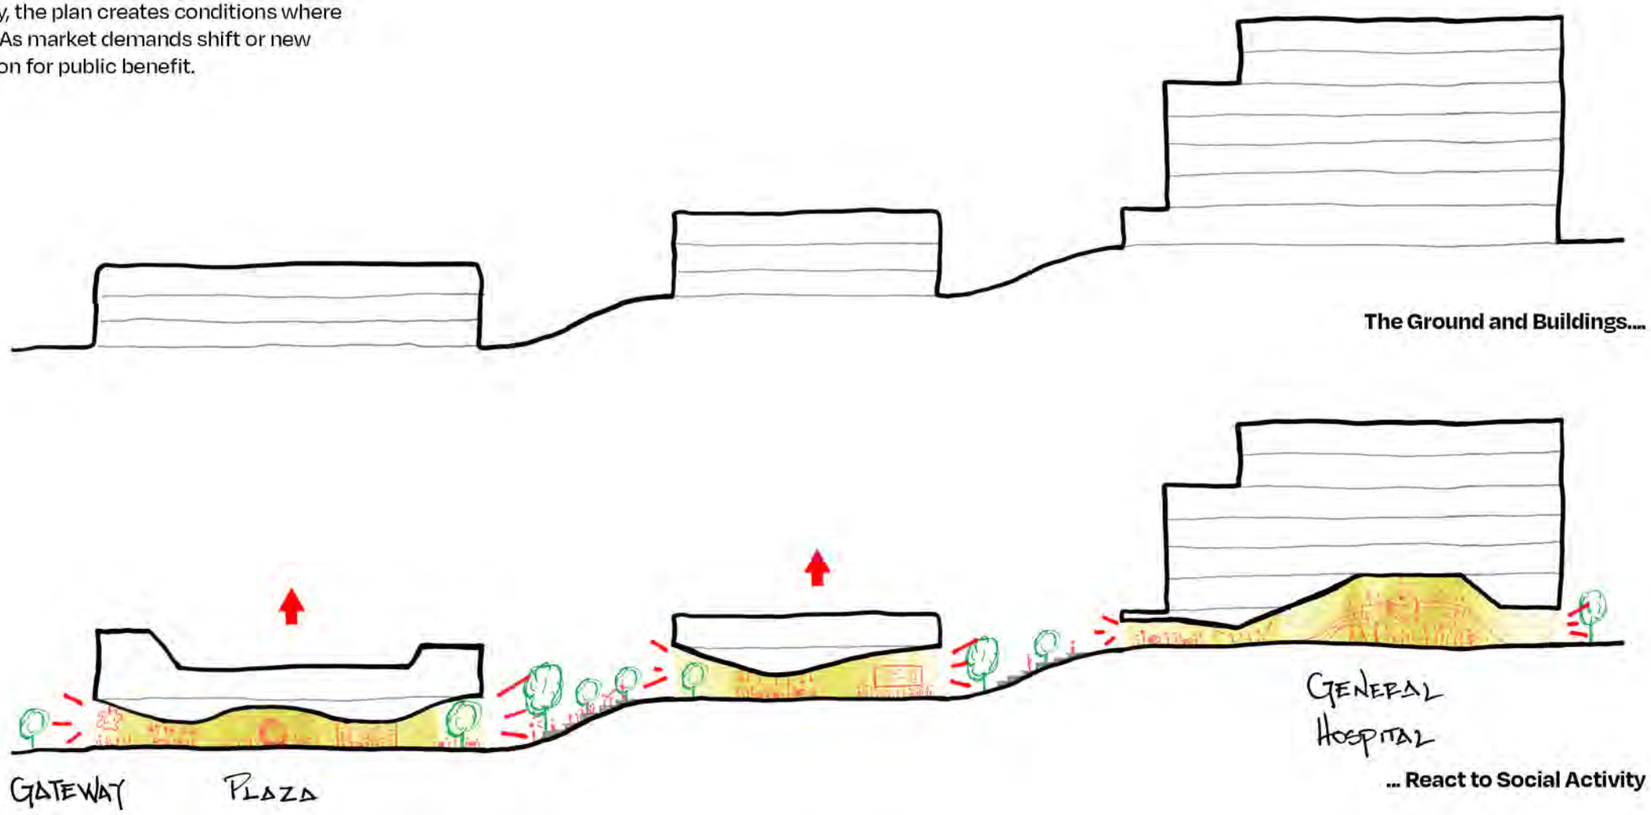
Each hub and corridor is seeded with programs that reflect community priorities, serve distinct user groups, and layer complementary "Healthy Village" components. These programs are designed to activate the site at multiple scales, from small, daily rituals to major civic gatherings, and to evolve over time as needs change.

In the Medical Services Hub, clinical and restorative functions are complemented by wellness amenities, green courtyards, and respite spaces for staff and visitors. The Historic Hub combines housing, cultural venues, and public gathering spaces within adaptive reuse of the historic hospital, fostering a lively, mixed use community anchored in heritage. The Commerce Hub integrates employment, education, and entrepreneurship with new housing and retail, creating a hub of innovation and economic vitality.

The connecting corridors further enrich this mix by introducing programs that blur the boundaries between hubs, public art, fitness loops, gardens, flexible event spaces, and pop-up retail, ensuring that the campus remains active and inclusive throughout the day and across the seasons. Together, these layers of program transform the framework into a living environment, one that continually adapts, learns, and grows with its community.

4.6 Common Ground

The Ground Belongs to the People



At the heart of the Healthy Village vision is the idea that the ground plane belongs to the public. It is the physical and symbolic layer that guarantees the community's enduring presence and influence, even as the site evolves through different phases of development, ownership, and investment. By reserving this shared foundation for civic life, the Master Plan safeguards a measure of collective ownership, ensuring that the community always has a foothold and a voice in shaping its own future.

Common Ground is not limited to parks and plazas; it extends into the thresholds of buildings themselves. Every ground-floor frontage is conceived as an active edge that connects interior and exterior life, architecture that participates in public experience rather than withdrawing from it. Tall, flexible ground-floor heights and transparent façades make room for community-serving programs of many scales, from small shops and clinics to resource centers, cafés, and multipurpose halls. Cross-connections through buildings at key gateways and beacon sites invite movement and visibility, turning the first floors of private projects into shared civic space.

These physical strategies are paired with a framework of stewardship. By embedding community uses at the ground level and designing for permeability and adaptability, the plan creates conditions where social infrastructure can evolve alongside physical development. As market demands shift or new partners arrive, the common ground endures as a stable foundation for public benefit.

The concept also functions as a guide for programming and activation. It shapes how events, cultural learning, and shared celebrations occupy the campus throughout the year, markets in plazas, performances spilling from lobbies, and workshops hosted in community halls. These activities reinforce trust, familiarity, and participation, transforming open space into a platform for cultural continuity and growth.

Ultimately, Common Ground is both a spatial principle and a civic contract. It binds the site's many actors to a shared responsibility: to keep the campus open, porous, and public at its base. In doing so, it translates design intent into daily experience, a landscape and architecture that visibly support connection, belonging, and the community's right to define its own future.

The Ground and Buildings....

... React to Social Activity

4.7 Grounded Living Infrastructure

To truly support a vibrant public realm and a connected "common ground," the site's underlying infrastructure must do the heavy lifting. While substantial regrading will be required to enhance accessibility and connectivity, the campus's naturally dramatic topography offers extraordinary opportunities to embed sustainable systems as functional assets.

The Master Plan envisions an integrated network of living infrastructure where the land itself participates in hydrology and resource management. This hard-working landscape goes beyond aesthetics: it mitigates heat-island effects, captures and stores stormwater, buffers noise, and extends ecological corridors that connect habitats and support pollinators.

To unlock the site's full potential, the Master Plan proposes a comprehensive infrastructure renewal that delivers sustainable, integrated, and reliable utilities while allowing for phased expansion over time. This strategy ensures resilience, embraces cross-disciplinary innovation, and provides uninterrupted service as the Healthy Village grows and adapts.

Healthy & Climate Responsive Public Realm

Shaded, walkable, and restorative outdoor environments that support physical and mental health.

Our county goal 1,6

Resilient Environments & Infrastructure

Landscape and infrastructure designed to withstand heat, wildfire, flooding, drought, and long-term climate stress.

Our county goal 2

Equitable & Sustainable Land Use Framework

An inclusive campus structure that ensures safe, comfortable, and equitable access to open space for all.

Our county goal 3,10

Clean Air, Clean Water, Living Systems

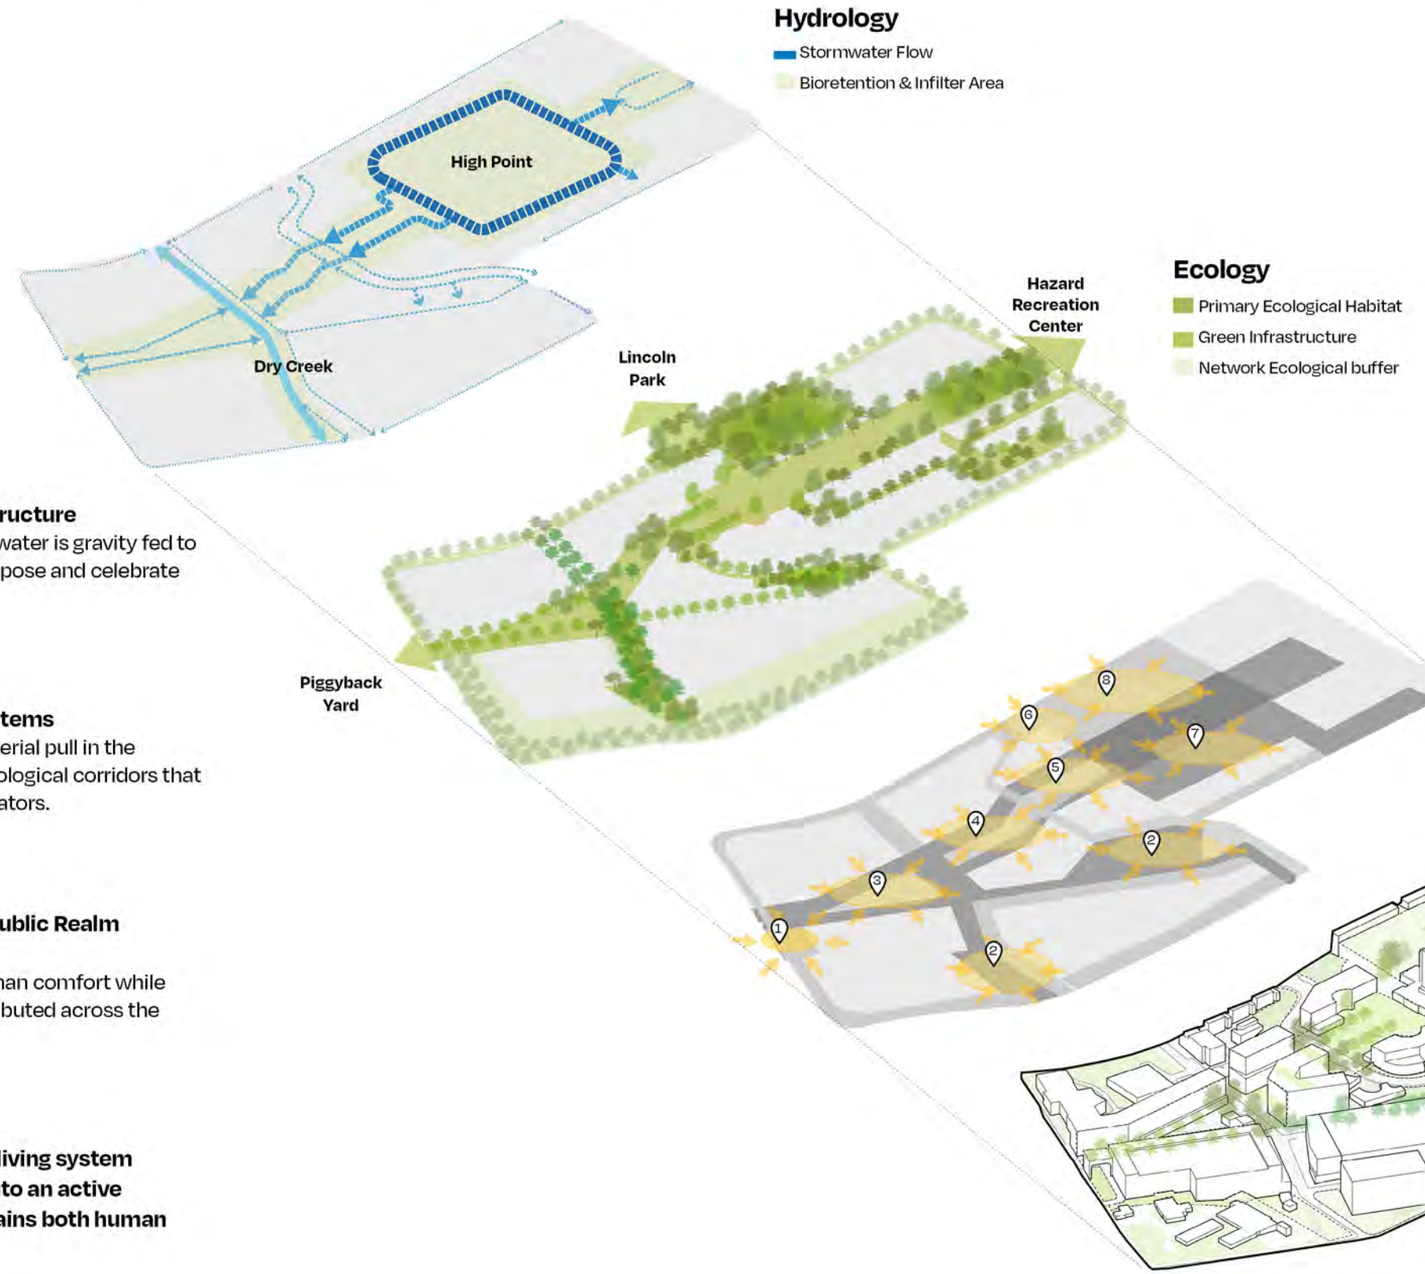
Improving air quality, water systems, and ecological health through living landscape systems.

Our county goal 5

Nature-Based Climate Mitigation & Adaptation

Using vegetation, soil, and water systems to reduce heat, store carbon, and adapt to climate change.

Our county goal 6



Low-Carbon, Durable & Circular Materials

Selecting materials that minimize embodied carbon, reduce waste, and support long-term durability.

Our county goal 8

Aligning Grounded Living Infrastructure with UN's Sustainability Development Goals & LA County Goals.

4.7 Grounded Living Infrastructure Landscape Framework

Resilient Environments & Infrastructure
Utilizing existing topography, stormwater is gravity fed to centralized collection points that expose and celebrate natural systems.

Clean Air, Clean Water, Living Systems
Native street trees and planting material pull in the adjacent open spaces to provide ecological corridors that connect habitats and support pollinators.

Equitable, Climate-Responsive Public Realm Framework
Gathering spaces that promote human comfort while reducing heat island effect are distributed across the campus for easy access.

Together, these layers support a living system that transforms infrastructure into an active environmental partner that sustains both human and natural communities.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

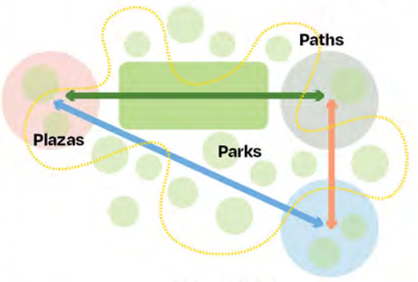
5.1 Site Diagram



The site framework organizes gathering, connectivity, and belonging across the Healthy Village. The Central Spine forms the primary organizing axis, linking West Campus to the heart of the historic General Hospital with a direct and visible pedestrian accessway and shaping the campus's most active public spaces. Surrounding it, a series of community-oriented services and activity plazas create everyday destinations for residents, staff, and visitors. Together with the scattered and unique gathering spaces and larger civic plazas, the framework establishes a connected, people-first public realm that supports belonging, wellness, and daily life.

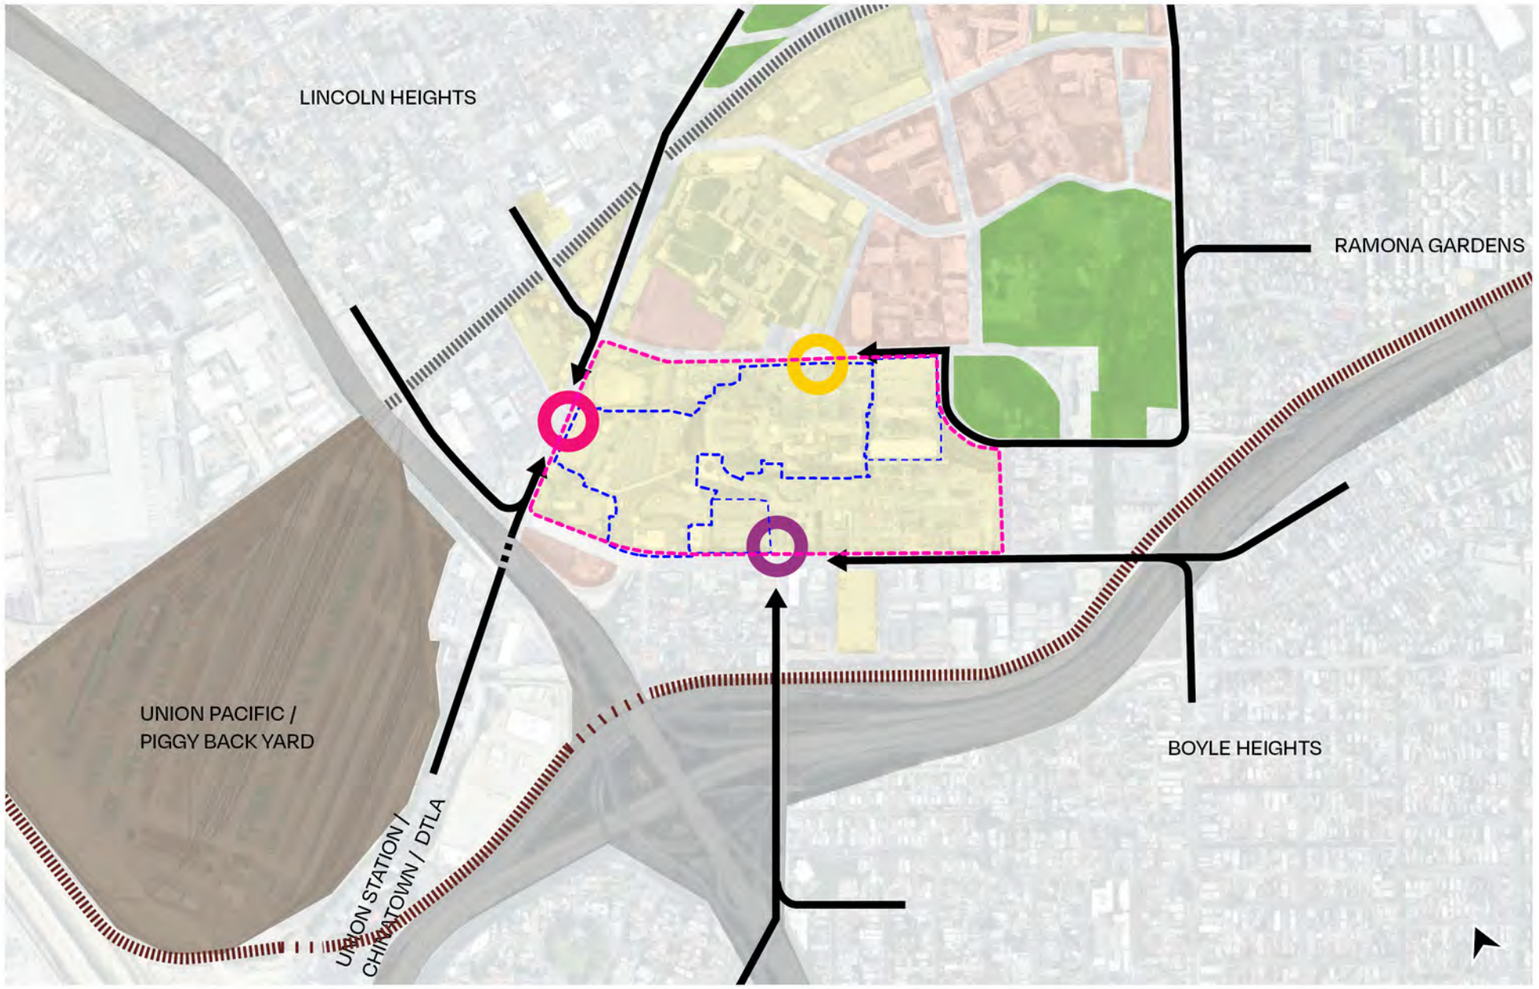
06

Master Plan Elements

6.1 Circulation + Access
6.2 Public Space as Common Ground
6.3 Program - Flexible Development
6.4 Design Principles & Character
6.5 Open Space and Landscape Framework
6.6 Neighborhood Identity
6.7 Daily Experiences
6.8 Sustainability at LACGH
6.9 Site Grading and Utility Strategy

6.1 Circulation & Access



Legend

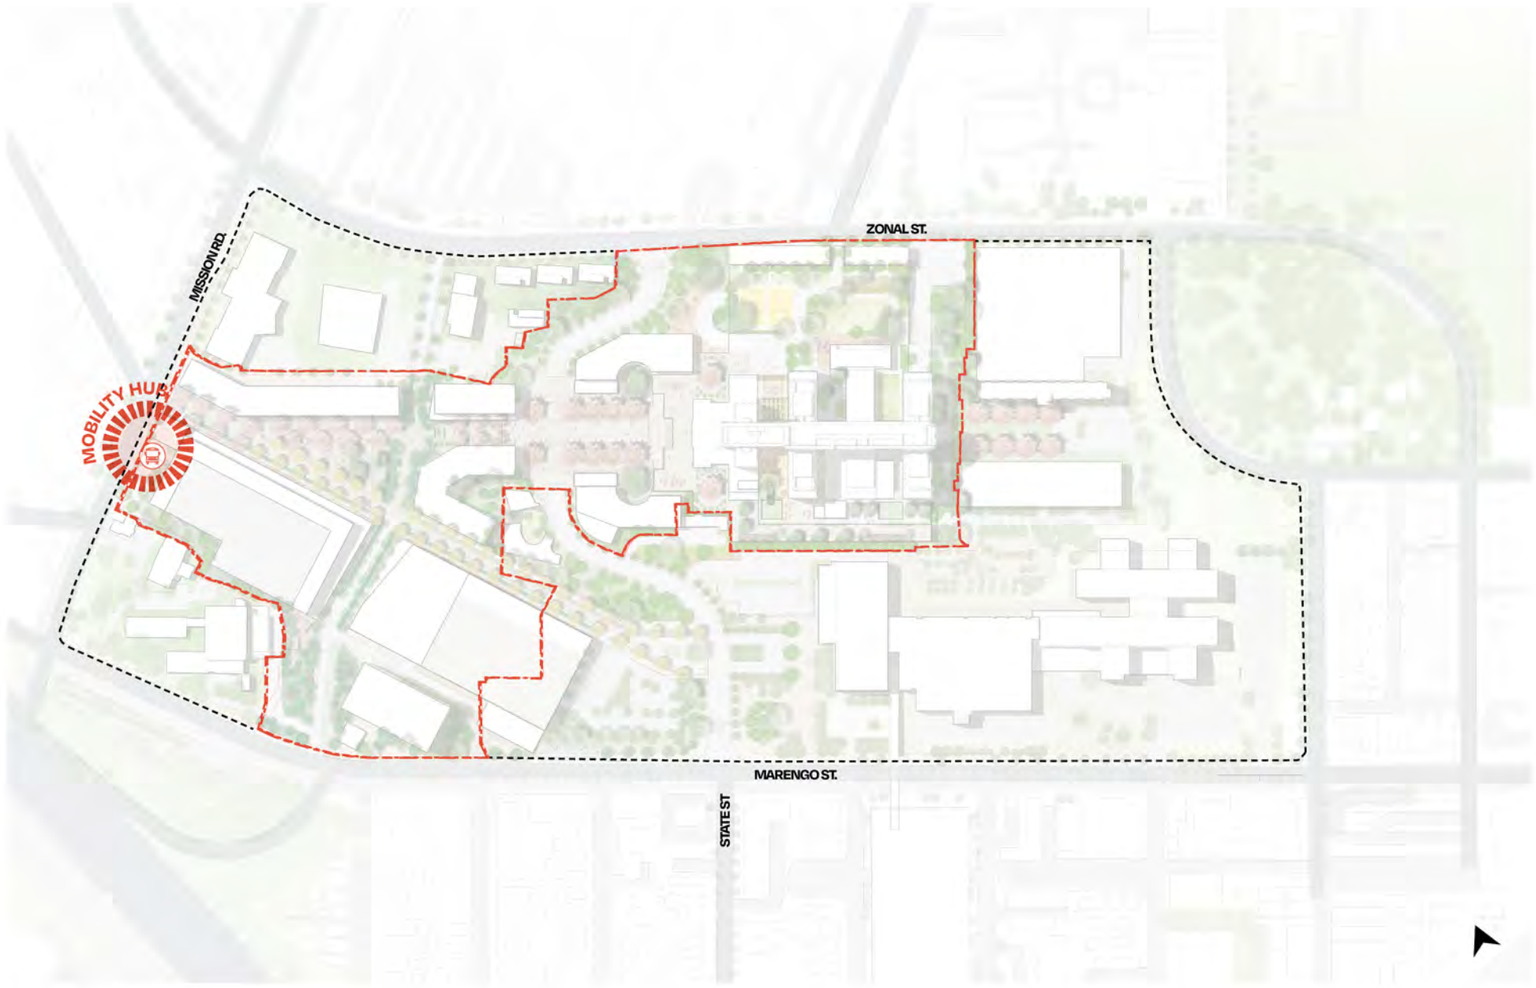
- Existing Main Entry

Existing Site Access

Freeways, rail lines, and large landholdings significantly restrict local access to the campus, with only a few roads able to cross these barriers. Most visitors arrive through the primary LAGMC access point on Marengo, while remaining entries are limited to small driveways lacking crosswalks or signals. Parking is fragmented and insufficient, and public transit connections are dispersed rather than centralized.

Legend

- Marengo St Entry
- Zonal Ave Entry
- Mission St Entry



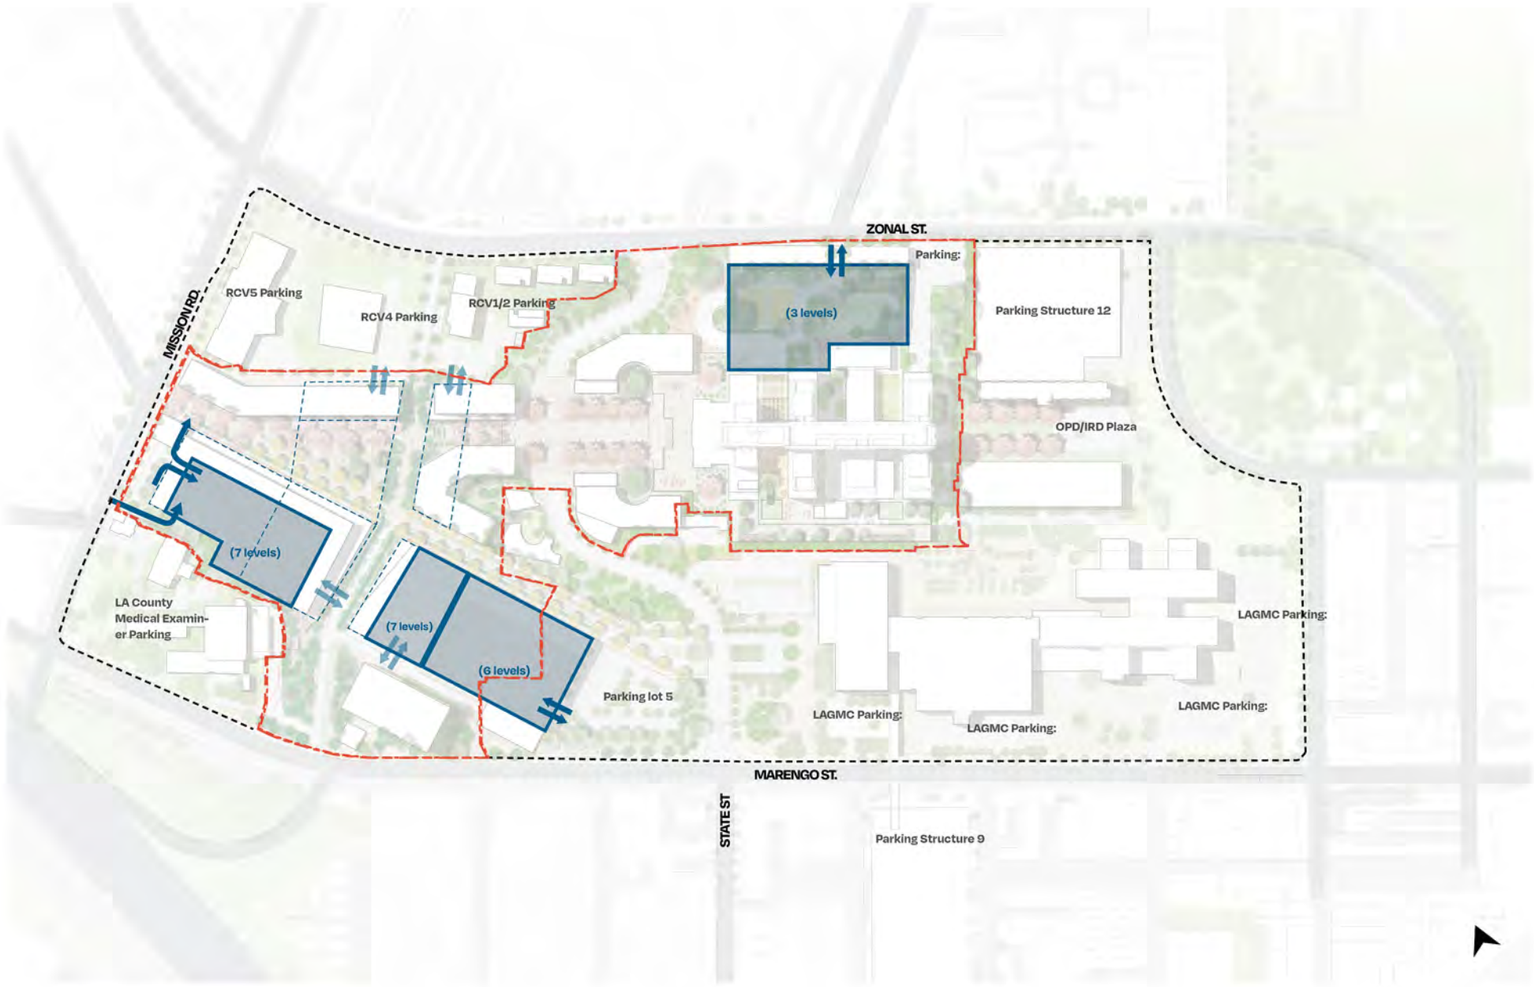
Arrival Strategy

The three major points of arrival in the Master Plan align with the existing regional road network, where local and regional traffic converge through limited crossings over the I-5 and I-10 freeways and the Union Pacific Freight Line. These access points define the entry thresholds into the site's three distinct hubs, effectively distributing traffic and reducing congestion across the campus.

These three points of access have been realigned to existing signalized intersections to reduce hazards and congestion from cueing and provide better pedestrian access to surrounding areas via existing crosswalks.

- Strengthen direct connections to major roads that cross infrastructure barriers.
- Establish three primary entry points to reduce congestion.
- Align entries with signalized intersections that include crosswalks.
- Provide parking at each entry point.
- Centralize public transit within 2 dedicated hubs aligned with entries.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).



Legend

Mobility Hub

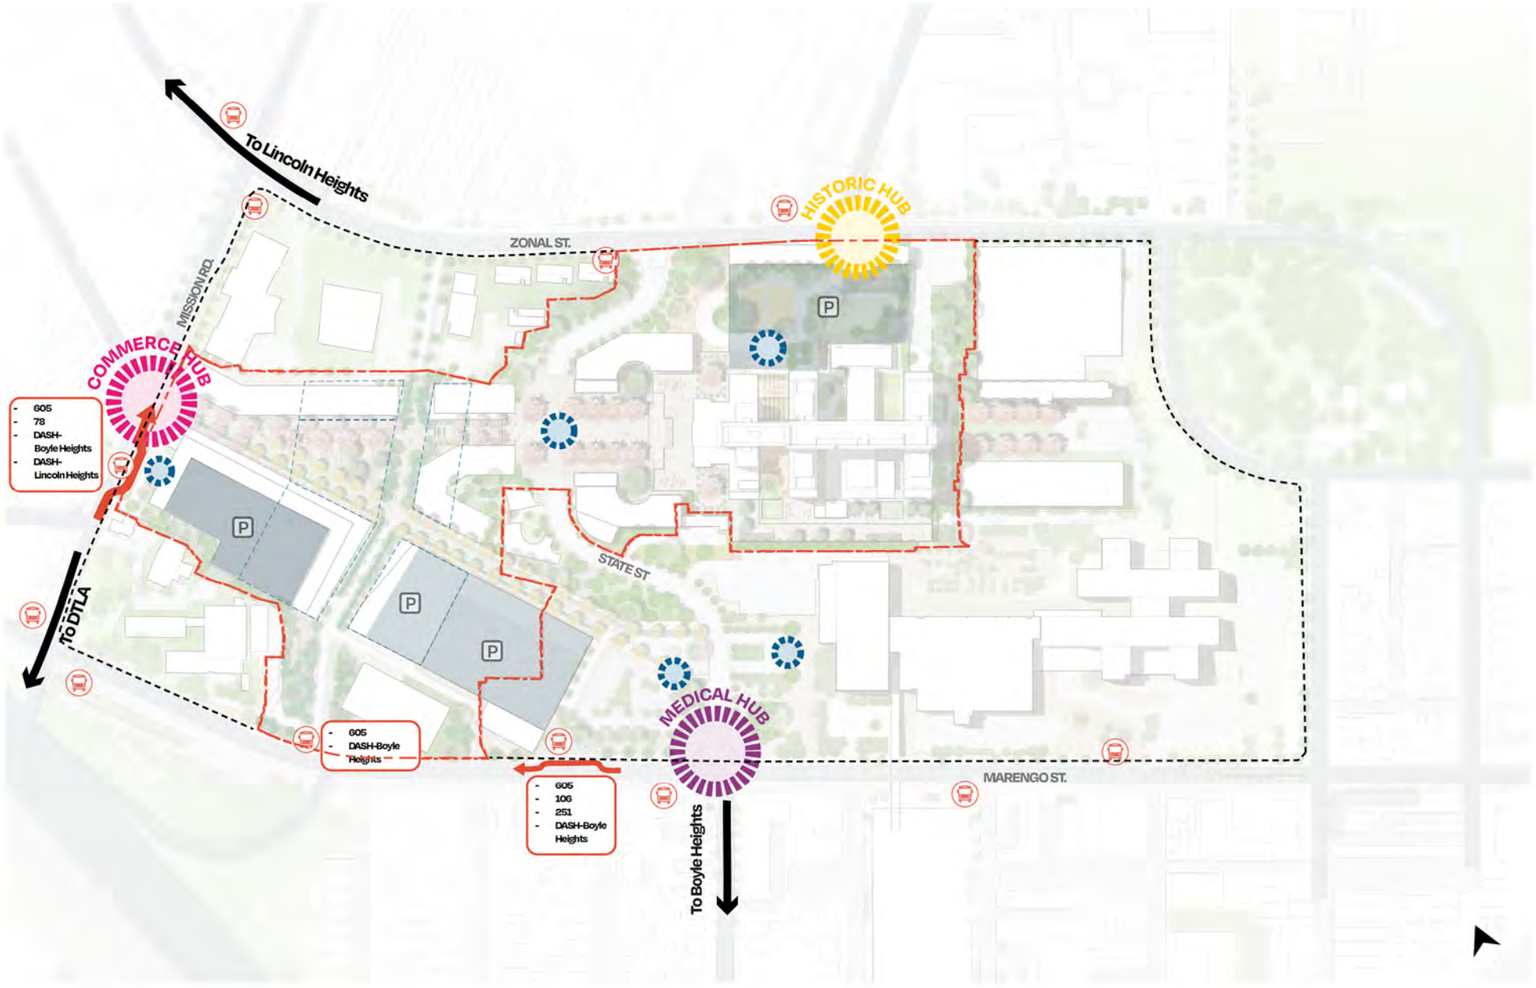
Transit Mobility Hubs

The Transit Mobility Hub at the Mission Street entry, centralizes public transit and shuttle access at clear and legible gateway to the campus. By consolidating bus stops and transit services at this location, the plan simplifies arrival, improves wayfinding. This strategy strengthens access for patients, staff, residents, and visitors while supporting a pedestrian focused environment throughout the Healthy Village.

The Transit Mobility Hub serves as a comprehensive multimodal gateway that integrates public transit with shared mobility services, including car share vehicles, bicycle parking and repair facilities, electric bus charging infrastructure, and an adjacent parking garage. Concentrating these services at the campus edge enables seamless transitions between modes, improves operational efficiency, and reduces reliance on single occupancy vehicles. The Transit Mobility Hub supports a more sustainable circulation system that enhances pedestrian comfort, reduces parking demand over time, and advances long term goals for accessibility, equity, and environmental performance.

Legend

- Above Grade Parking Structure
- Below Grade Parking



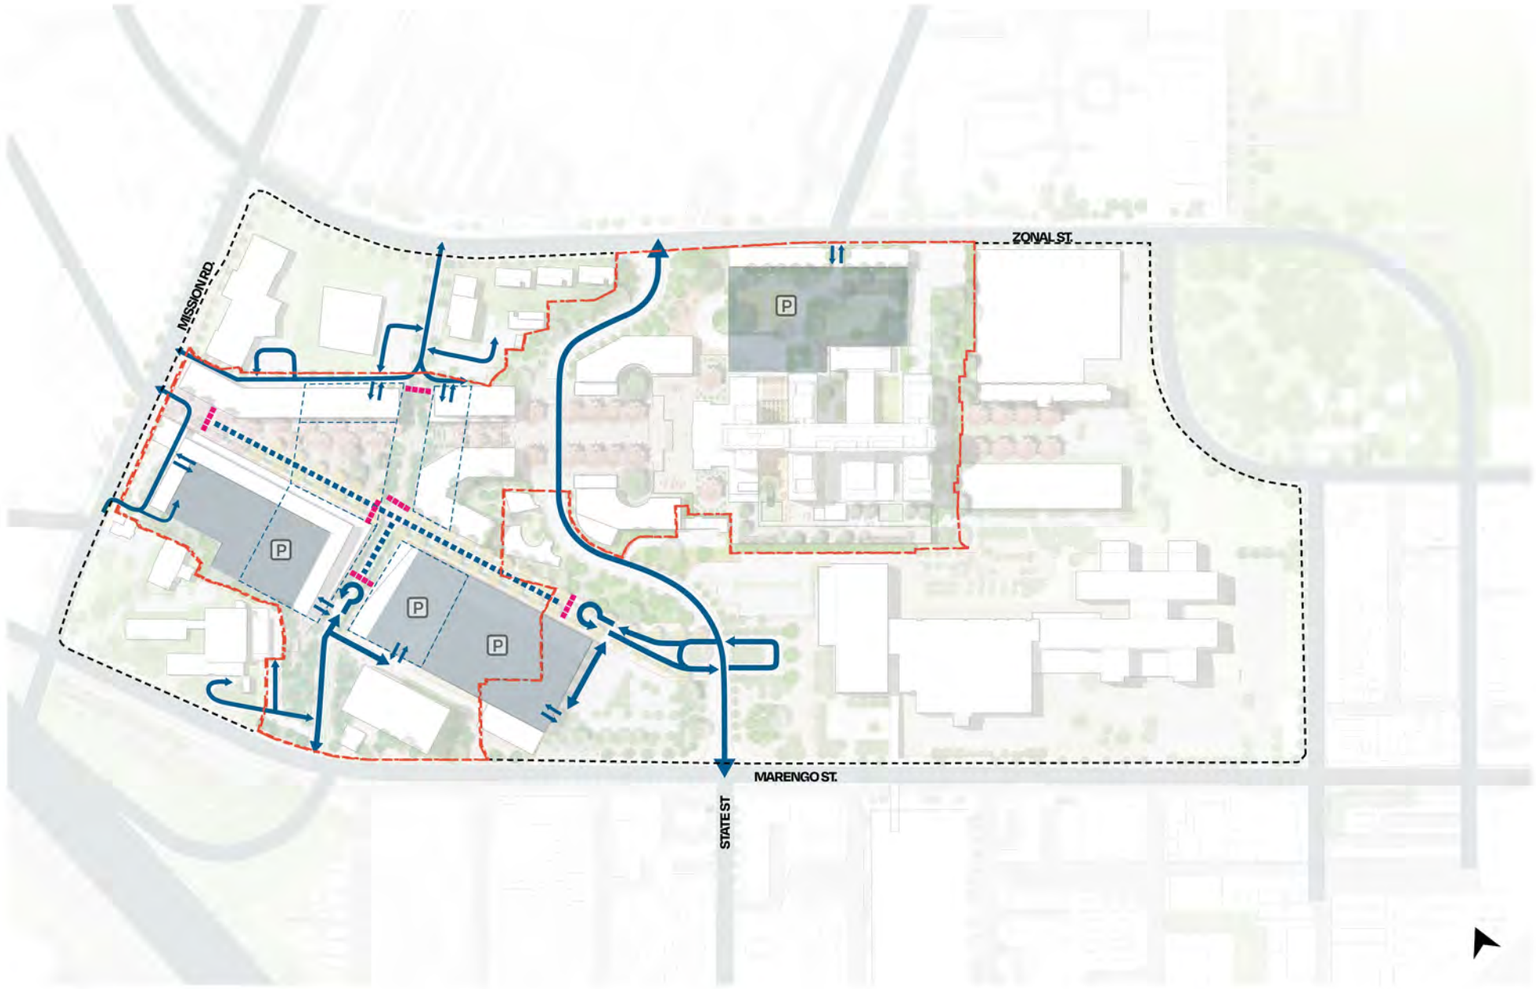
District Parking Strategy

The Master Plan consolidates parking into centralized district structures located at primary campus entries, allowing users to park once and continue by foot, shuttle, or other active modes. This reduces internal traffic, minimizes congestion, and preserves a pedestrian-focused campus core.

There is an opportunity to further optimize parking through a centralized District Parking Management (DPM) system to prioritize shared use, reduce overall demand and congestion,and support affordability.

Grading studies also revealed an opportunity to align earthwork and accessibility improvements with limited, cost-effective below-grade parking. Through strategic cut-and-fill, particularly in the Commerce District, select buildings can incorporate a single level of below-grade parking without additional excavation, improving accessibility while maintaining cost efficiency.

Together, these strategies create a flexible, efficient parking system that supports current mobility needs while allowing for future adaptation.



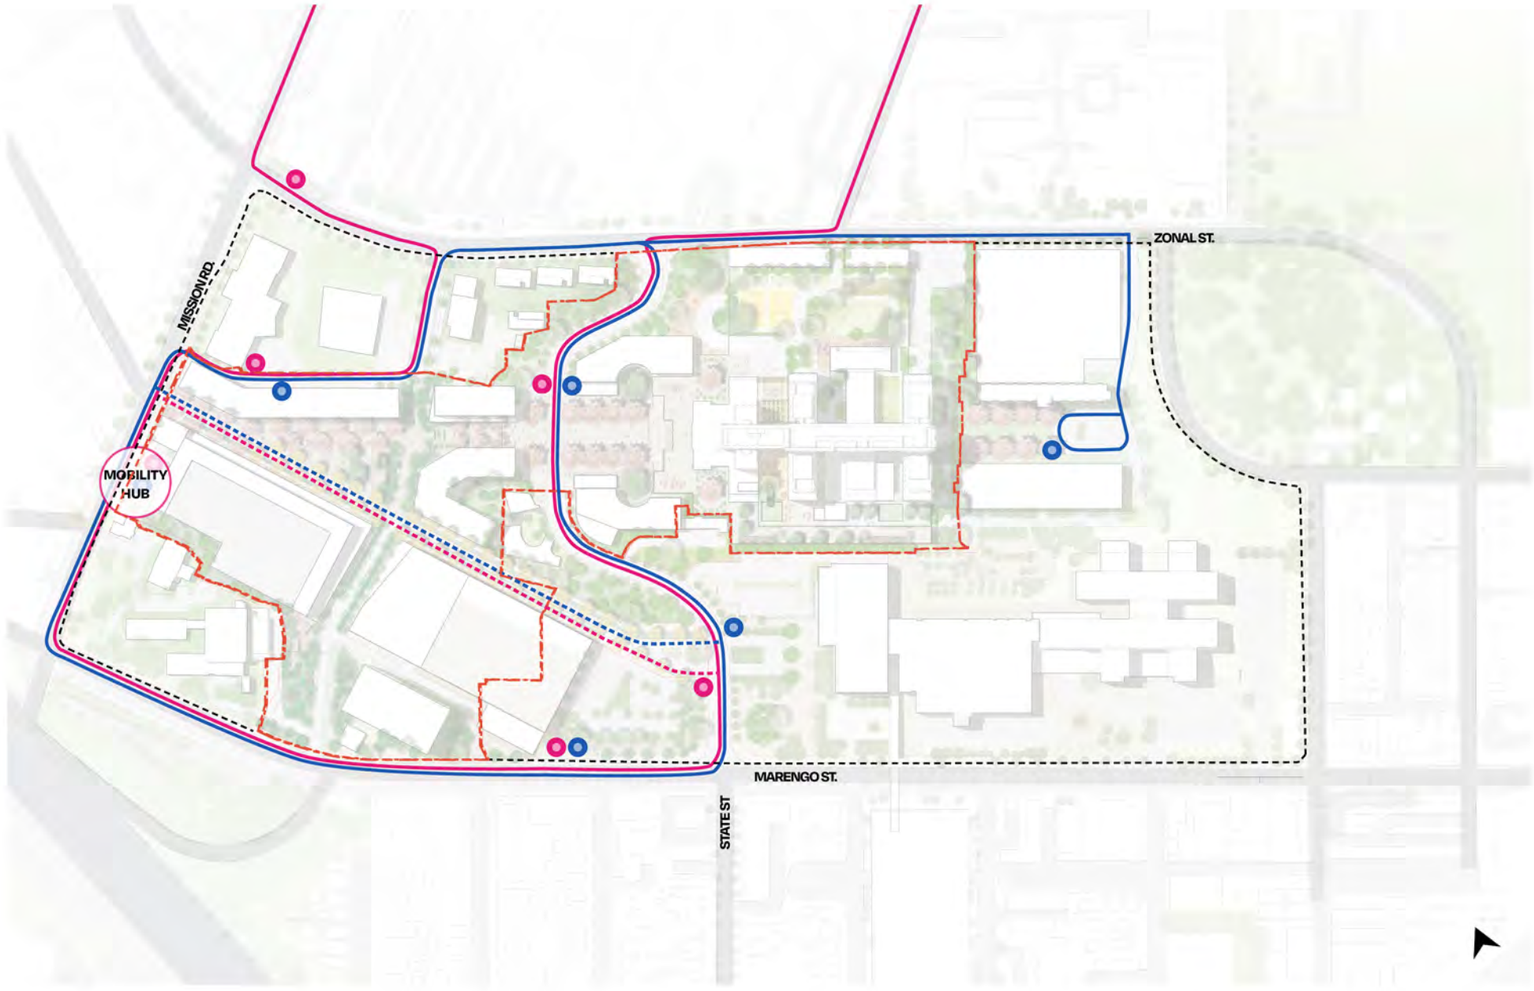
Access

Parking structures at each primary entry intercept vehicles early, allowing visitors, staff, and residents to transition quickly to pedestrian circulation. This strategy reinforces a walkable, pedestrian-oriented environment and minimizes internal vehicular movement.

Additional car and shuttle drop-off points are provided at The Forecourt and LAGMC entrance, completing a multi-modal circulation network that supports accessibility, efficiency, and a healthy, pedestrian-first campus experience.

Legend

- Rideshare Drop off
- Parking Garage
- Below Grade Parking
- Bus Stop
- Entry for General Hospital
- Entry for Central Campus/
- Entry for West Campus



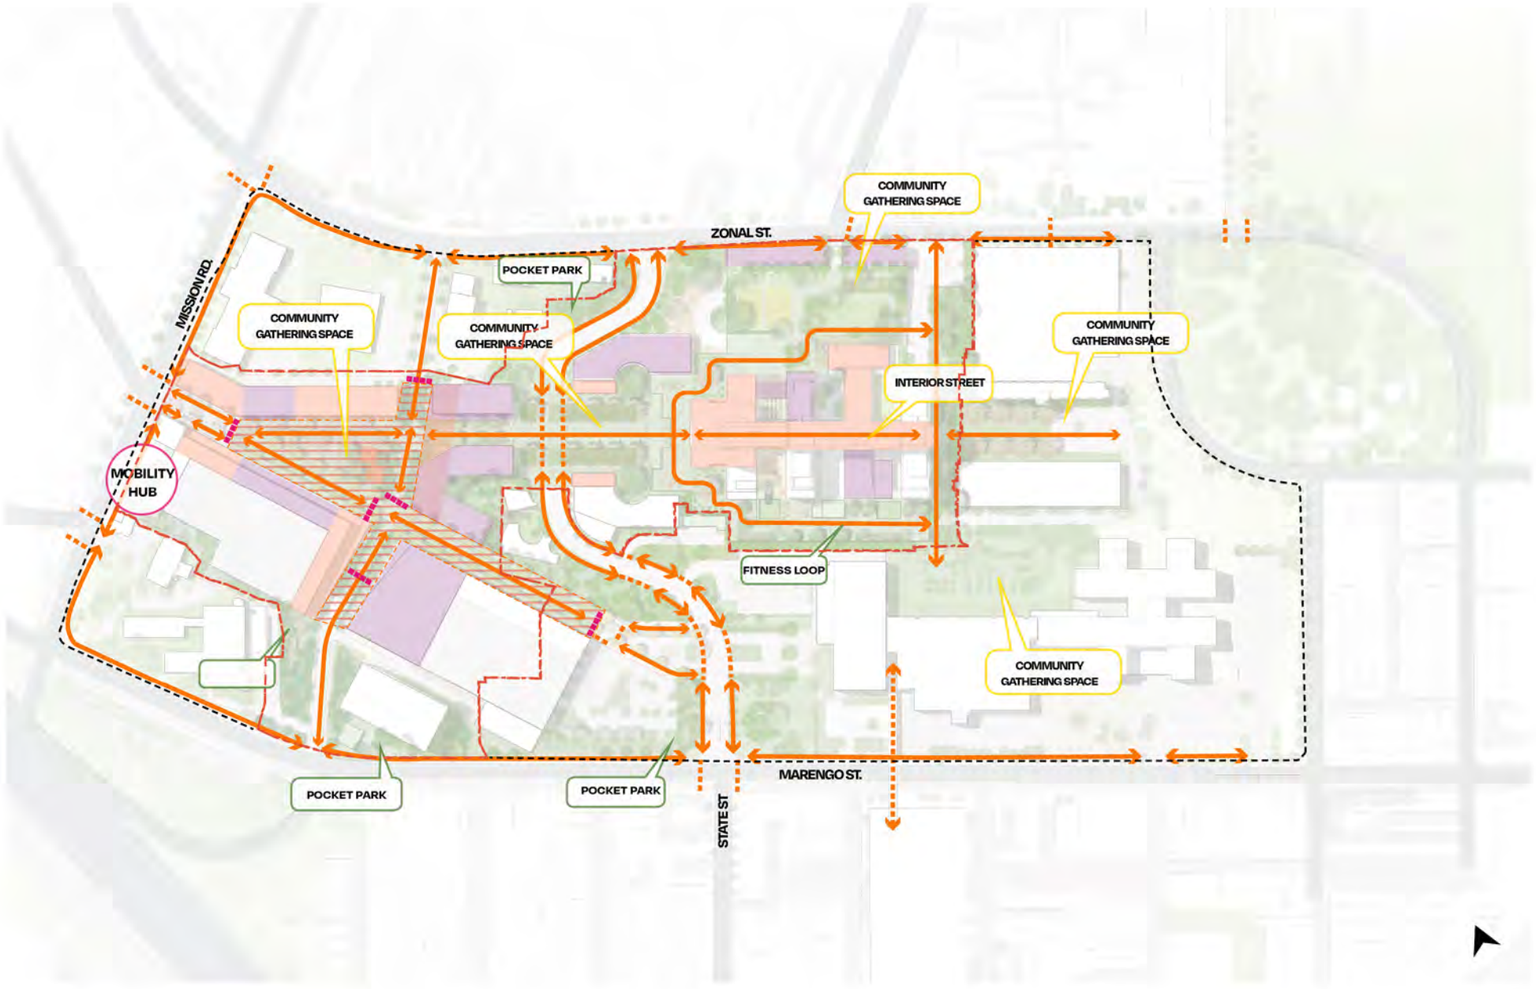
Vehicular Circulation

Vehicular circulation within the campus is intentionally limited and directed primarily toward designated drop-off areas, serving patients at LA General Medical Center, visitors to the Forecourt, and the three district parking garages. Motorized bollards restrict access to the main pedestrian plazas and corridors, preserving them as safe, walkable public spaces.

These controls also prevent through-traffic, ensuring that drivers arrive and park within the district they intend to visit rather than using the internal network as a shortcut. Once vehicles are parked, a comprehensive system of **campus shuttles, pedestrian pathways, and bicycle** routes provides convenient, barrier-free access to all parts of the site, reinforcing a calm, pedestrian-oriented environment at the heart of the Healthy Village.

Legend

- Motorized bollards
- Pedestrian Protected Road
- Primary Road
- Parking Garage
- Below Grade Parking
- Garage Entry Point



Shuttle Circulation

Two existing campus shuttle routes currently serve the site, and the system is proposed to be modestly expanded to improve circulation throughout the superblock. Shuttle stops are strategically aligned with key drop-offs, gateways, and destinations, and the upgraded street network provides a more intuitive and efficient flow.

A central shuttle branch is planned along the Wellness Corridor, offering the only authorized vehicular access within the bollard-protected pedestrian zone. This route ensures convenient service for mobility-impaired visitors and strengthens the connection between the campus districts while maintaining the pedestrian-first character of the Healthy Village.

Legend

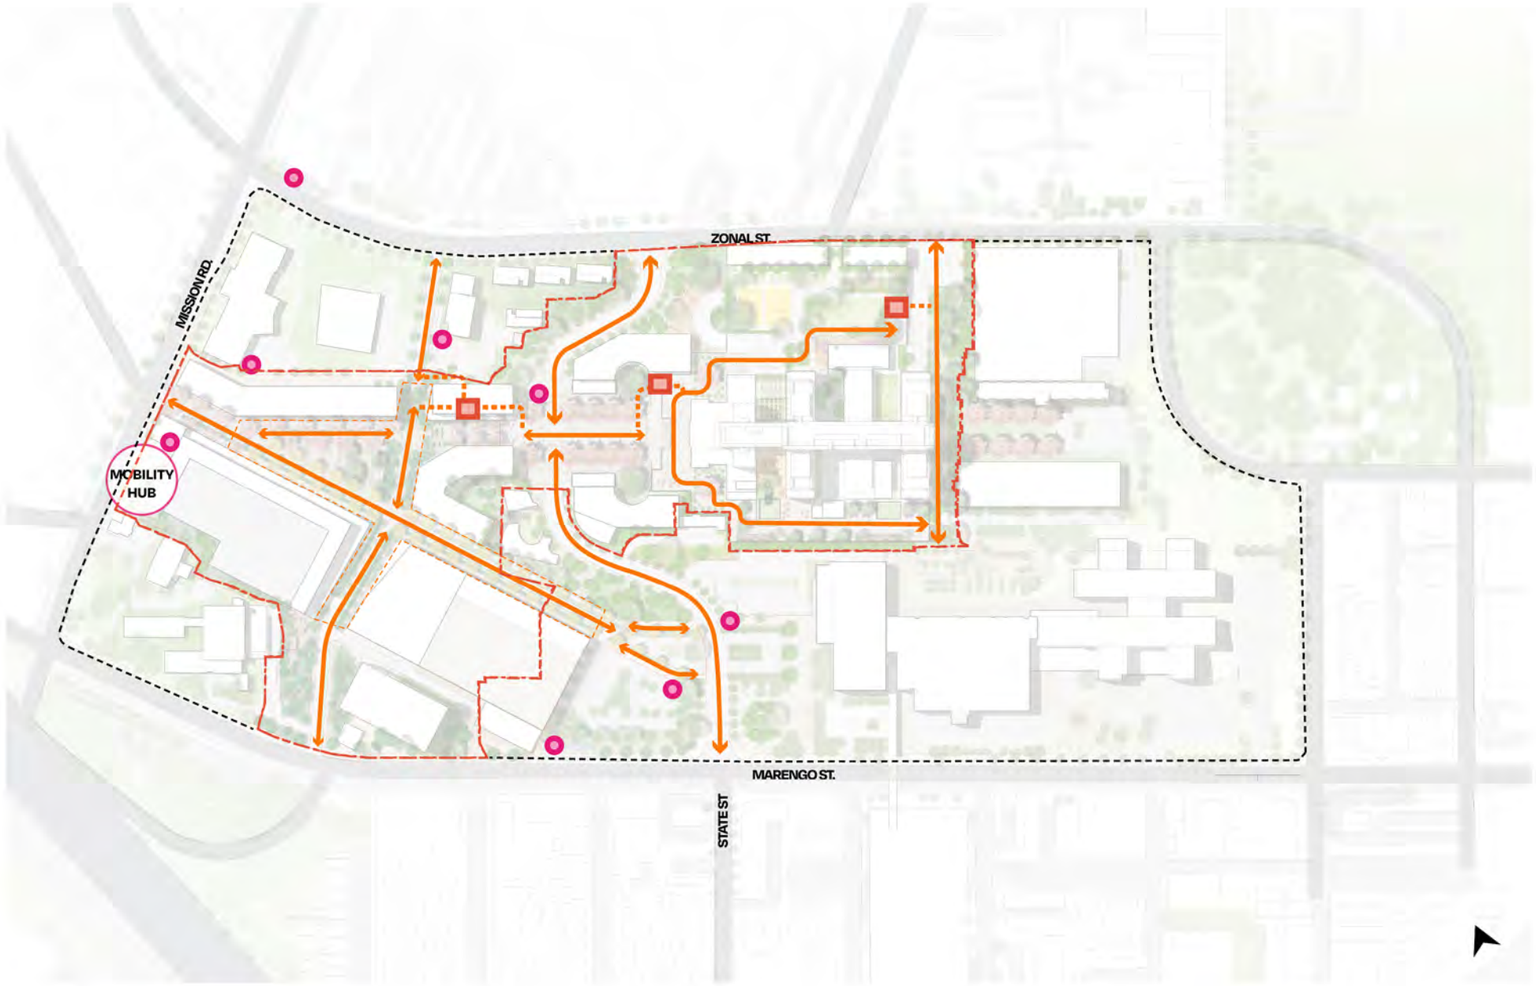
- Shuttle Route2 Stop
- Shuttle Line

Legend

- Activated Program
- Community Program
- Open Space
- Primary Pedestrian Circulation
- Crosswalk
- Pedestrian Bollard Separated Area



Pedestrian Circulation

A continuous network of pedestrian-oriented streets and pathways forms the backbone of the campus experience. Entrances and pedestrian paths are aligned with existing pedestrian routes and crosswalks. Once visitors arrive, by foot, bicycle, bus, shuttle, or car, all destinations within the site are connected through safe, accessible, and walkable routes.

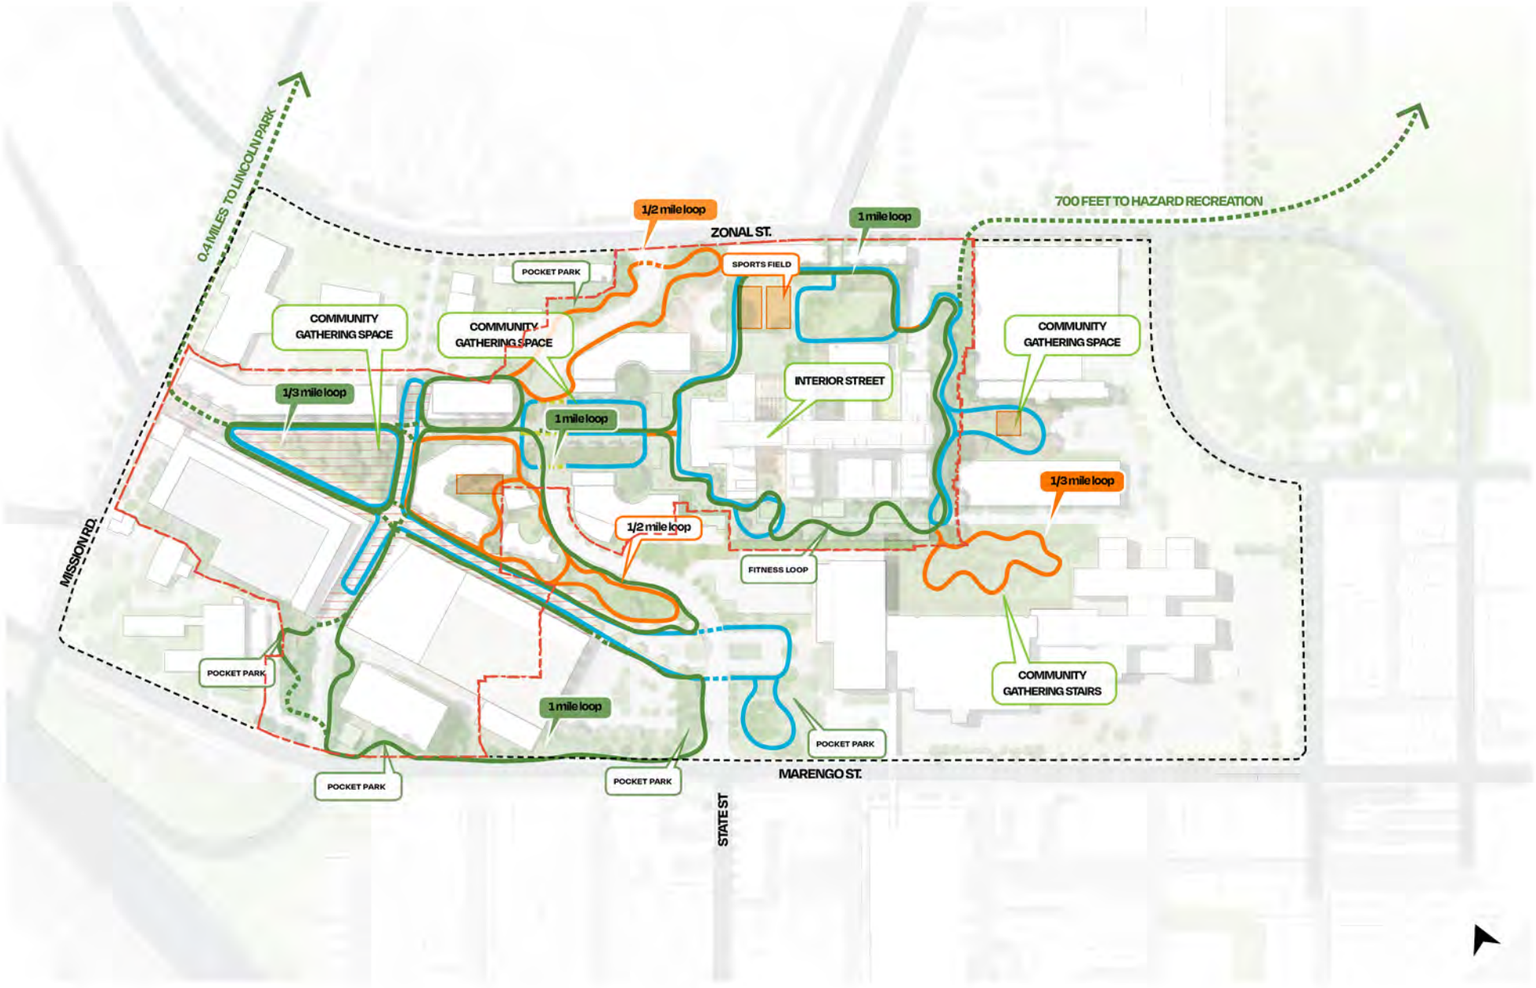
Motorized bollards protect key plazas and corridors from vehicular intrusion, preserving the heart of the campus as a pedestrian-priority zone. The ground plane itself is designed to encourage movement and comfort, with curbless streets, textured pavers, shade trees, lighting, seating, and landscape amenities that define a welcoming and intuitive public realm.

Together, these design elements establish a walkable environment that invites exploration, promotes health, and reinforces the Healthy Village's commitment to a people-first campus.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Legend

- ADA Friendly Route
- Shuttle Stop
- Public Elevator



Accessible Pathways

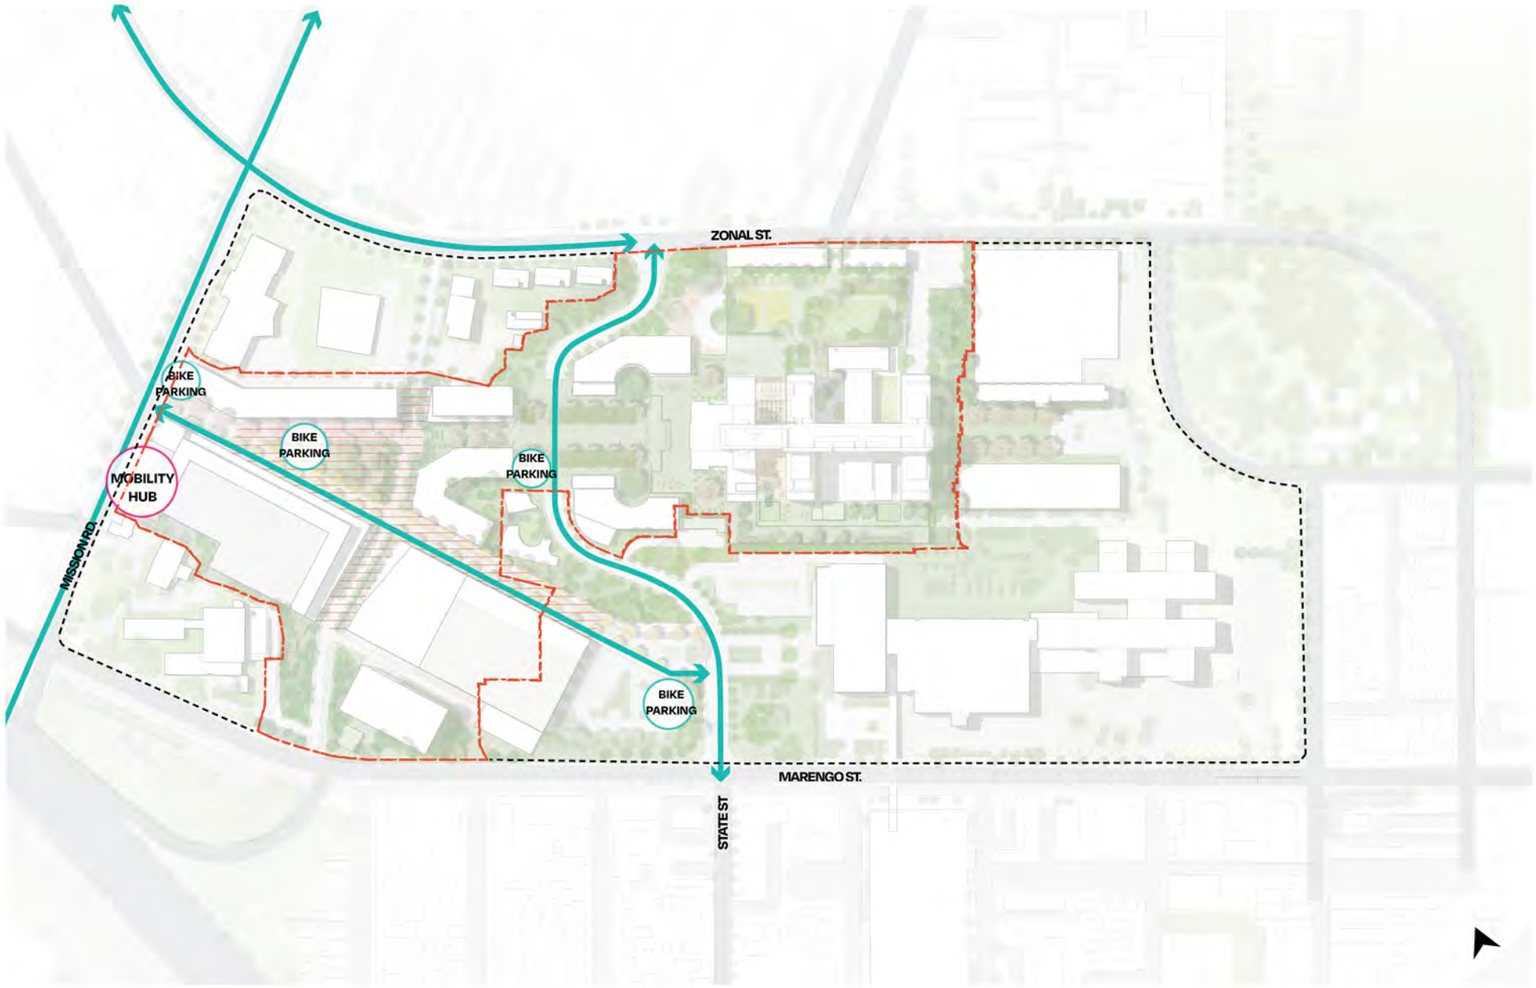
Accessibility across the campus is addressed through multiple, coordinated strategies that provide choice, convenience, and ease of movement for all users. Site grading has been strategically reshaped using excavated fill to reduce slopes along primary streets to less than five percent, improving comfort and compliance throughout the pedestrian network.

A **campus shuttle loop** connects all hubs, ensuring that any destination can be reached within ten minutes. **Public elevators** may be placed at key grade transitions further enhance accessibility between levels and across the topography.

Comprehensive **ADA and CASp assessments** of historic buildings identify high-priority improvements to adapt existing structures for universal access, ensuring that equity and inclusion are embedded in both new and legacy areas of the site.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Legend



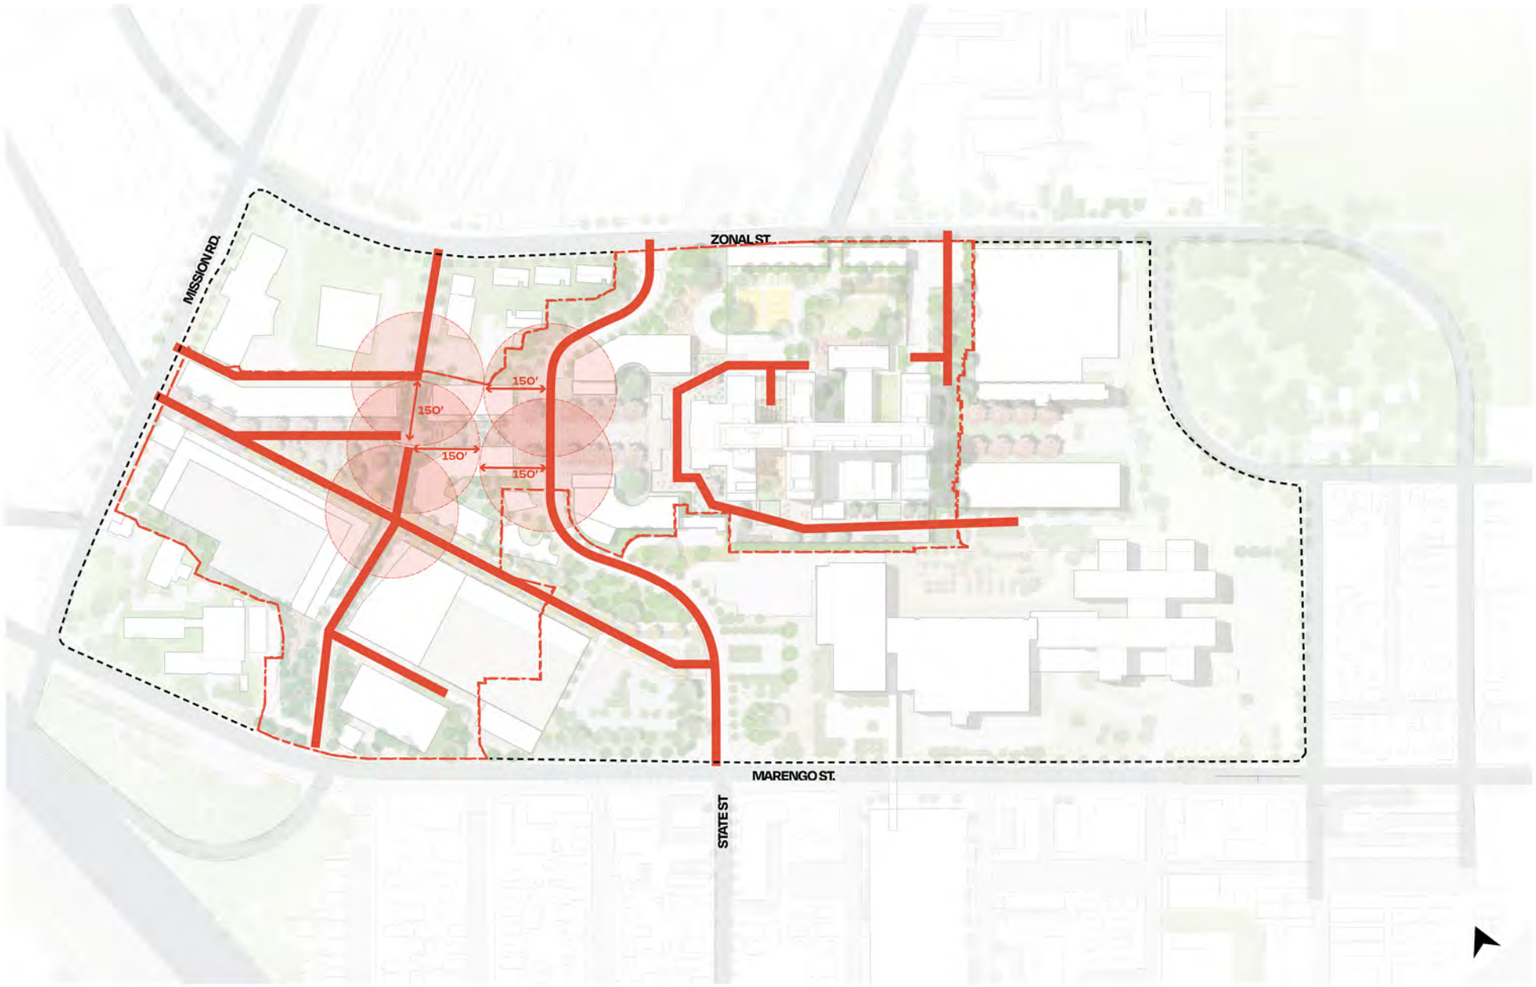
- Open Space
- Intense Loop
- Medium Loop
- Easy Loop
- Crosswalk

Fitness Loop

Whether you live, work, or are visiting the campus, a connected network of fitness pathways encourages movement and exercise Individually or in groups throughout the day. The site's dramatic topography creates opportunities for all levels of activity, from leisurely strolls to the playground or shaded bench for reading or conversation, to more vigorous climbs.

Along these routes, there are opportunities for exercise stations, pocket parks, and shaded rest areas offering options to increase intensity, stretch, or simply pause and recover. Together, they form a daily wellness loop that integrates fitness into the rhythm of campus life, allowing people of all ages and abilities to maintain and improve their health in a setting that inspires connection and vitality.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).



Legend

- Open Space
- Bike Path

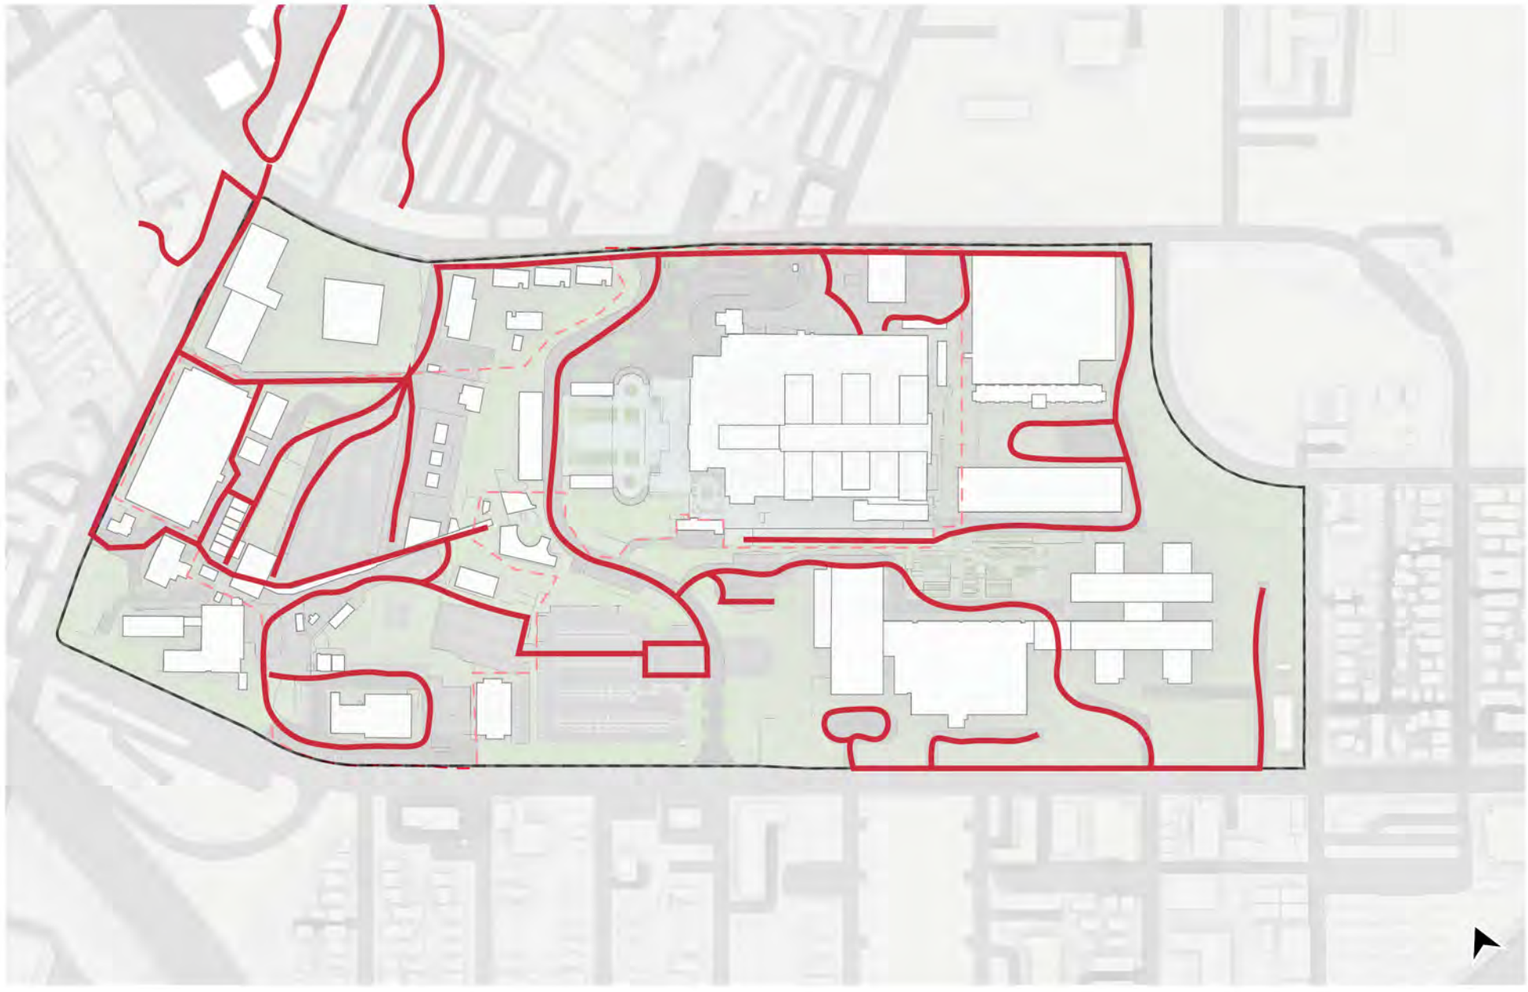
Bike Path

Bicycle circulation on the campus builds upon the existing bikeway along Mission Road that connects into networks along the LA river and towards downtown, expanding active mobility options and improving safety and convenience for riders. Public bike parking stations are provided at each campus entry, offering access to city bikes and scooters. The primary Mobility Hub on Mission Street includes additional amenities such as a tool station, lockers, and repair facilities to support daily riders.

Within the campus, dedicated bicycle lanes along the Wellness Corridor and State Street provide safe, direct routes through the site, physically separated from vehicular traffic where possible. Each residential building also includes secure, resident-only bicycle parking, ensuring that cycling is a convenient and reliable mode of everyday transportation.

Fire Access

The street network is designed to provide comprehensive fire and emergency access to all buildings on campus while preserving existing access lanes to facilities beyond the site boundary.



At the Historic General Hospital, the existing route is extended to circle the building on the west to access the north face over the new parking structure.

The motorized bollards provide access to internal streets of the campus ensuring life-safety requirements are fully met without compromising the pedestrian-oriented character of the campus.

Legend

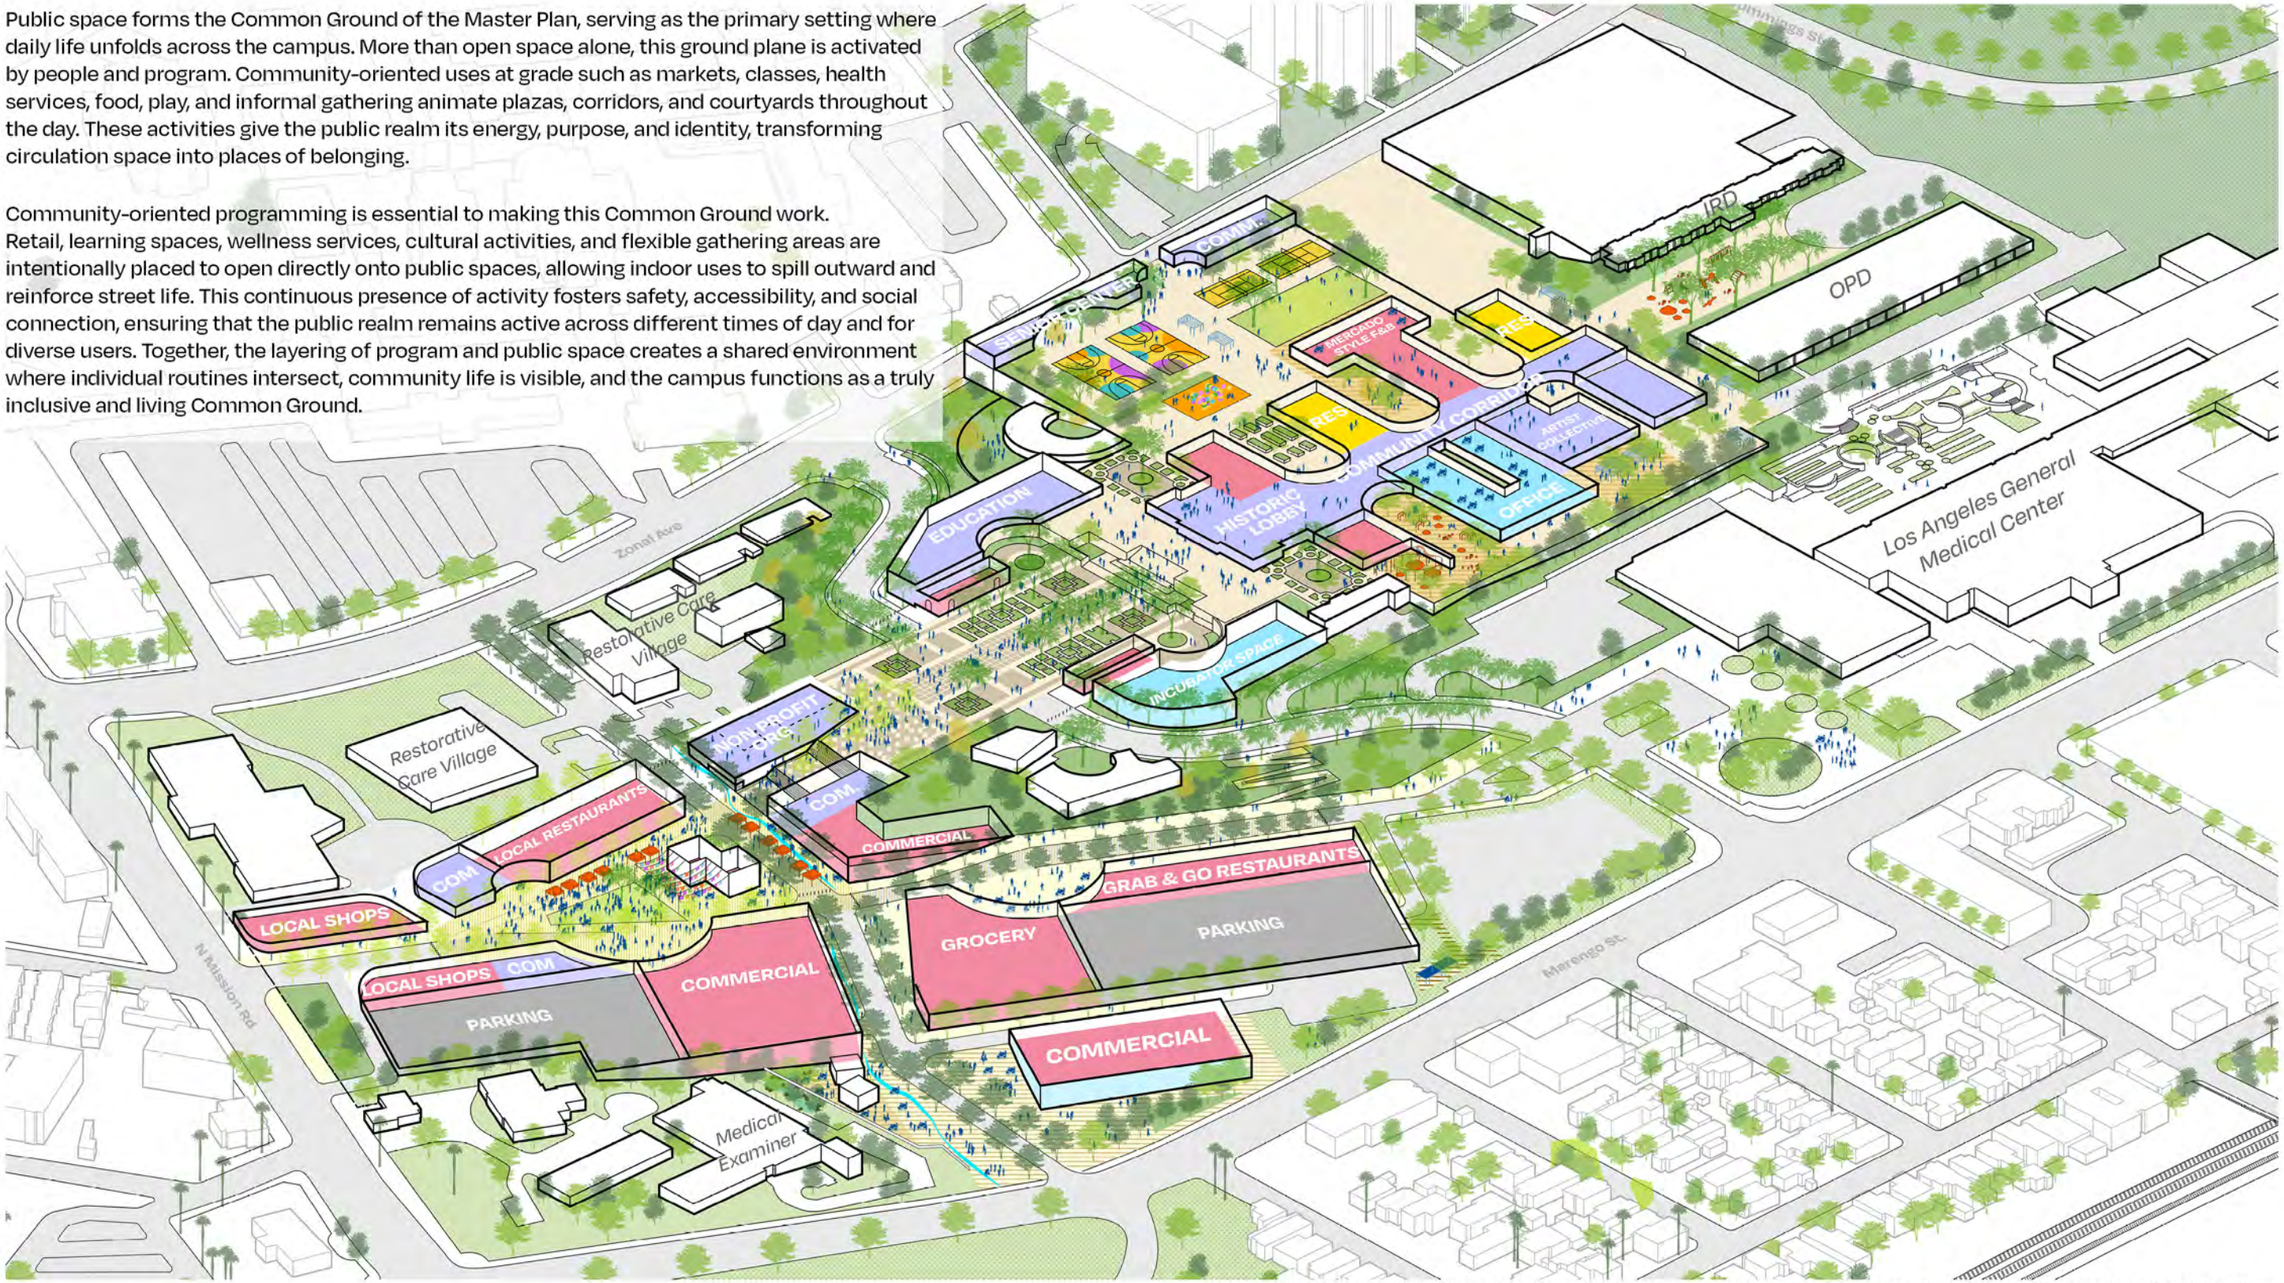
- Firelane
- Firelane Radius

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Legend

- Firelane
- Firelane Radius

DHS Tram Circulation



The County staff utilize a fleet of electric carts to transport supplies, construction and repair material, and tools throughout the campus. The County maintains a maintenance shop on West Campus. Currently a route from this maintenance building to the medical center and throughout the campus is needed to support operations as shown above. The Viaduct and tunnel are a part of this route.

As work on the Master Plan and development within the ENA boundary commences, these routes will need to be closely coordinated and adapted to support continued and uninterrupted operation of critical County uses.

6.2 Public Space as Common Ground

Public space forms the Common Ground of the Master Plan, serving as the primary setting where daily life unfolds across the campus. More than open space alone, this ground plane is activated by people and program. Community-oriented uses at grade such as markets, classes, health services, food, play, and informal gathering animate plazas, corridors, and courtyards throughout the day. These activities give the public realm its energy, purpose, and identity, transforming circulation space into places of belonging.

Community-oriented programming is essential to making this Common Ground work. Retail, learning spaces, wellness services, cultural activities, and flexible gathering areas are intentionally placed to open directly onto public spaces, allowing indoor uses to spill outward and reinforce street life. This continuous presence of activity fosters safety, accessibility, and social connection, ensuring that the public realm remains active across different times of day and for diverse users. Together, the layering of program and public space creates a shared environment where individual routines intersect, community life is visible, and the campus functions as a truly inclusive and living Common Ground.

*Axonometric diagrams illustrate potential development massing and are conceptual only, final designs will be developed at a later stage.

6.3 Program - Flexible Development

Mixed Use Target Density Example

Mixed Use High Density Example - Housing Focus

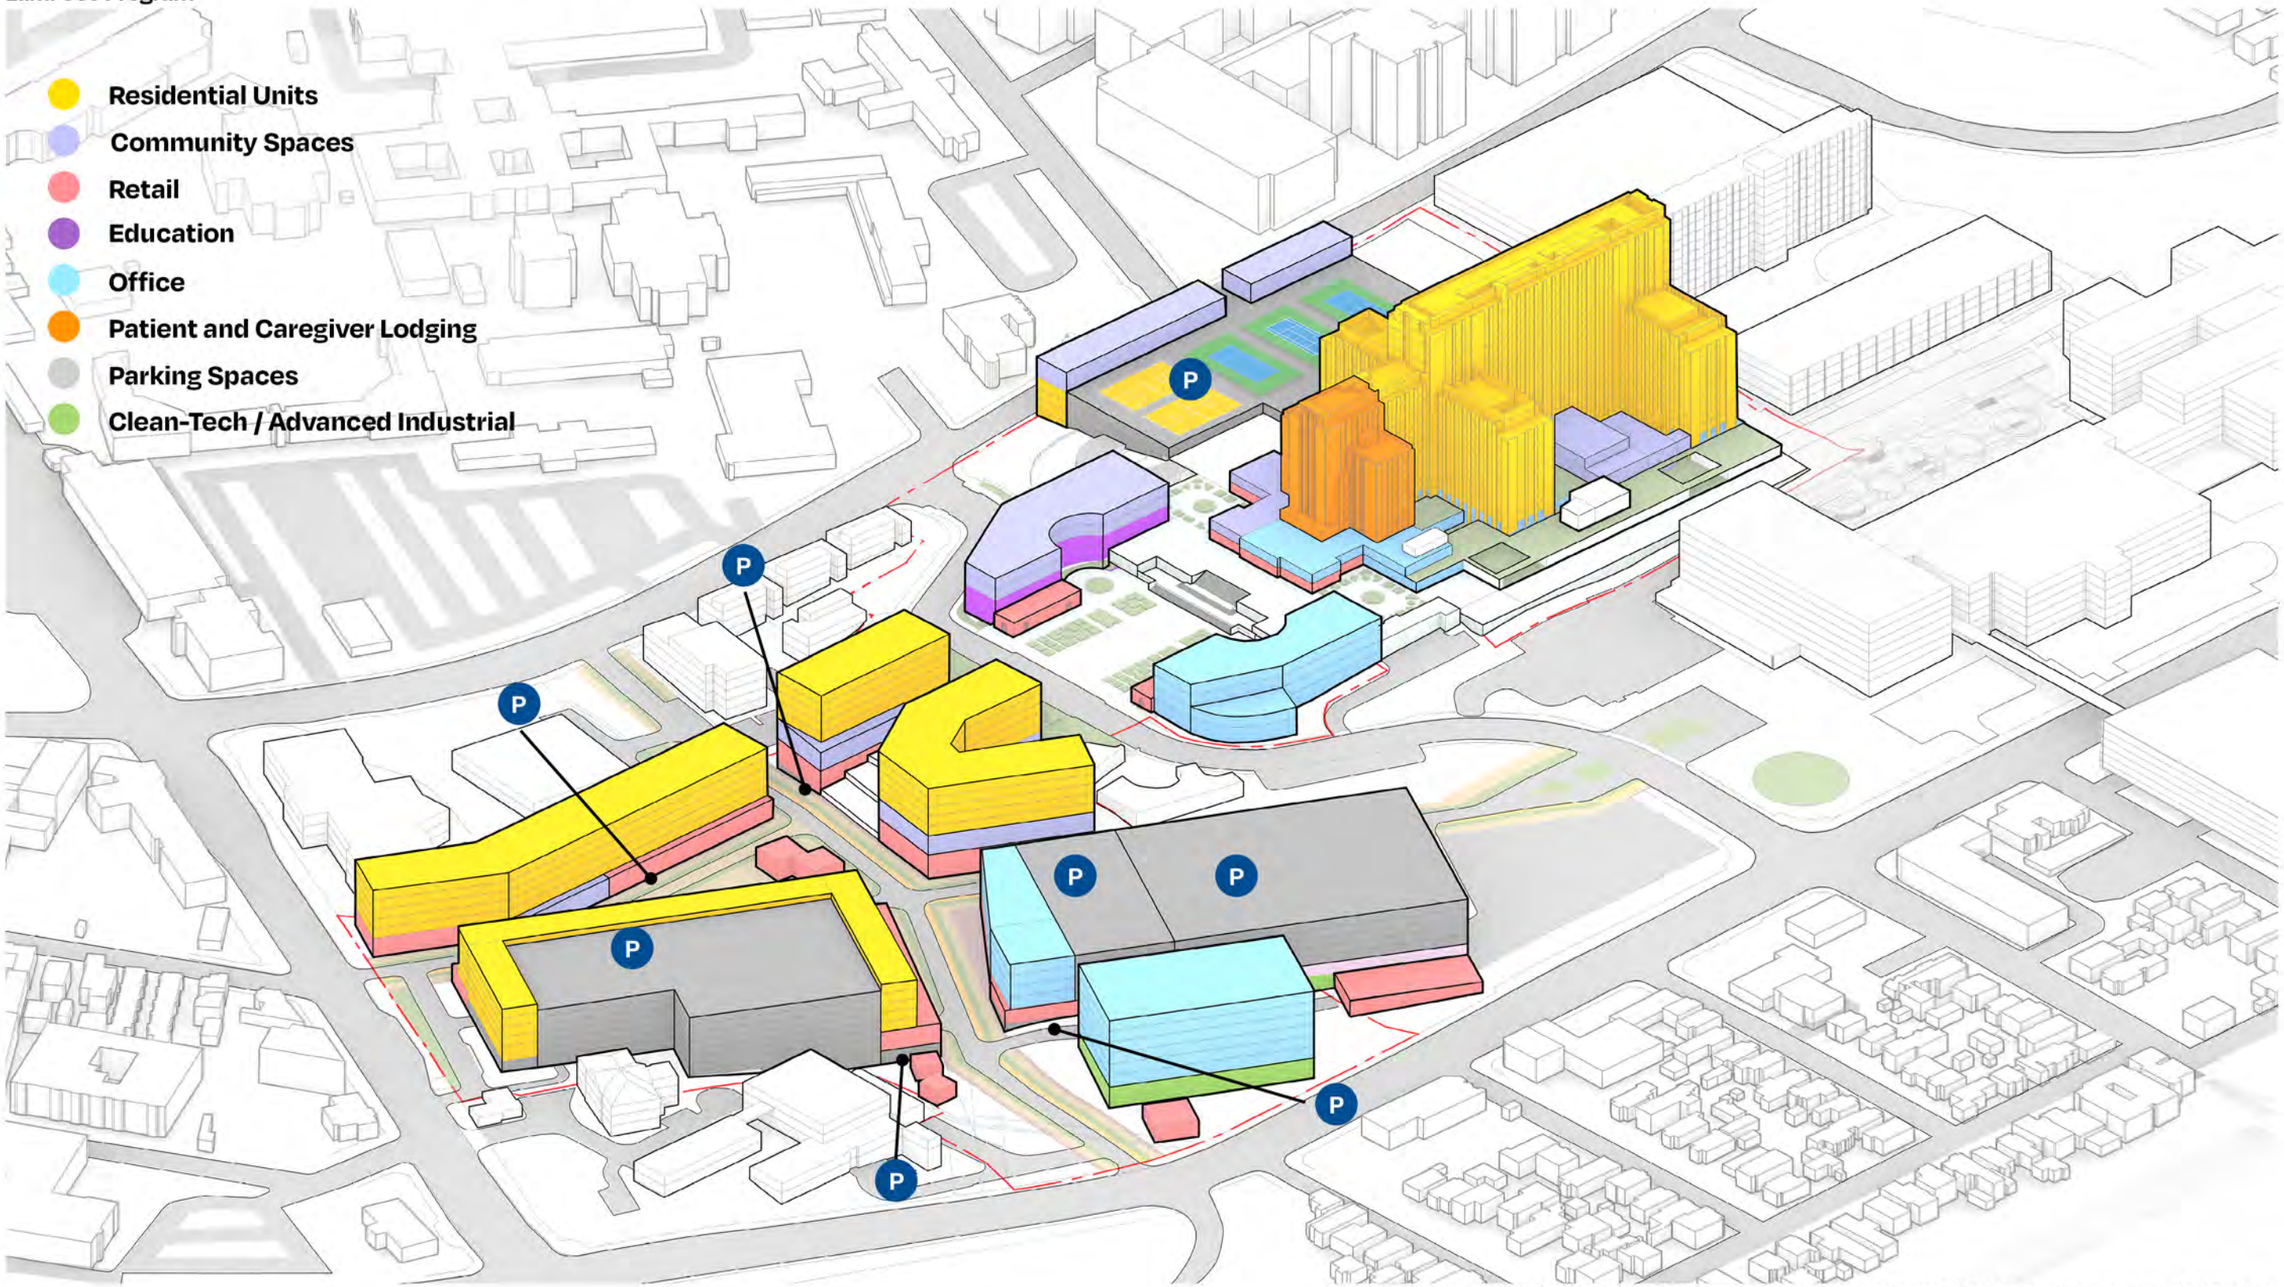
Mixed Use High Density Example - Jobs Focus

Mixed Use High Density Example

*Axonometric diagrams illustrate potential development massing and are conceptual only, final designs will be developed at a later stage.

Flexible Development over Common Ground

With the public realm, open space network, and site organization established at the ground plane, the Master Plan intentionally allows the developable area above to remain flexible. This enables individual buildings to be designed, phased, and constructed over time without compromising the integrity of the overall plan. By preserving the core ground plane features of public use program, open space, and circulation corridors, the full campus program mix can evolve incrementally while preserving continuity, access, and community benefit across all phases of development.



The Supplemental Environmental Impact Report (SEIR) evaluates the environmental impacts associated with the maximum buildout of development under the Master Plan through the planning horizon. The SEIR recommends mitigation measures that are intended to mitigate identified significant impacts associated with the assumed level of buildout under the Master Plan. The SEIR also recommends project-specific mitigation measures to mitigate project-level significant impacts.

By completing programmatic environmental review of the maximum buildout, future projects can proceed with streamlined entitlement processes and when necessary, subsequent environmental review. Such tiering under the California Environmental Quality Act (CEQA) eliminates the repetitive evaluation of the same environmental issues that were adequately addressed in the first-tier environmental impact report. Tiering of environmental documents streamline the environmental review process for future specific development projects, reducing uncertainty for future implementation. Implementation of the Master Plan is enabled through a companion regulatory framework for the phased development of the campus and early site investment.

Use	Approximate Range (SF)	Units / Keys (Range)
Residential	~1,200,000 – 2,300,000 SF	~1,600 – 3,200 units
Retail / Commercial	~240,000 – 320,000 SF	-

Program Overview
The program for the Healthy Village is shaped by community objectives and grounded in the mix of uses needed to support daily life on campus. Each component has been refined through the lens of the Dimensions of Health and the Ingredients of a Healthy Village, ensuring that every use contributes to physical, social, and economic wellbeing. Programs are curated across the site according to the unique identity and character of each hub, reinforcing both individual distinctiveness and campus-wide cohesion.

Hub Anchors and Major Program Components
Several larger program components serve as anchors for their respective hubs. A grocery store is envisioned as an anchor, located on the Commerce Hub plaza to activate the public realm and provide convenient access for patients, visitors, residents, and staff. Its placement offers both visibility and functionality, with efficient loading access from the service corridor.

Health and Wellness Infrastructure
The County health facilities can be positioned along the same service corridor to streamline distribution routes connecting to LAGMC, OPD/IRD, and other on- and off-site facilities. This location also preserves flexibility for future expansion of DHS and medical services, while allowing The Wellness Center to anchor the Innovation Corridor as the backbone of health and wellbeing on the campus.

Recreation and Active Wellness
Since recreation and active wellness are critical aspects of healthy living, the Master Plan envisions multiple areas for exercise, with the rooftops of new structures serving as ideal locations. A Recreation Center and sports facilities can take advantage of the rooftop of the new parking structure at the Historic General Hospital, creating an elevated community amenity that enriches daily life and promotes active wellness for residents and staff alike.

Mixed-Use Ground Plane Strategy
Throughout the Master Plan, in keeping with the Common Ground objective to reserve the ground plane for public uses, mixed use buildings provide high bay ground floor retail and community uses, with several levels of multifamily residential above.

A Balanced and Adaptable Framework
Together, these program elements establish a balanced and adaptable framework for the Healthy Village. Each use, whether civic, residential, or commercial strengthens its hub's identity while contributing to a shared ecosystem of wellness, opportunity, and connection. The program mix remains intentionally flexible, allowing the plan to evolve with the community while maintaining a cohesive vision for an inclusive, resilient, and thriving campus.

6.4 Design Principles and Character

*This graphic illustrates the project site within its broader geographic context in Los Angeles.

Common Ground: Healing Community, Ecology, and Site

The core design concept of the Healthy Village is rooted in reconnection. The plan seeks to reweave the surrounding communities into the campus and its natural landscape, transforming a historically inward facing institutional site into a shared, thriving place of health, opportunity, and belonging. The cornerstone of this approach is a deliberate commitment to dedicate the ground plane entirely to the public realm. This common ground becomes the primary setting for daily life, where people come to heal, grow, learn, gather, work, and thrive together.

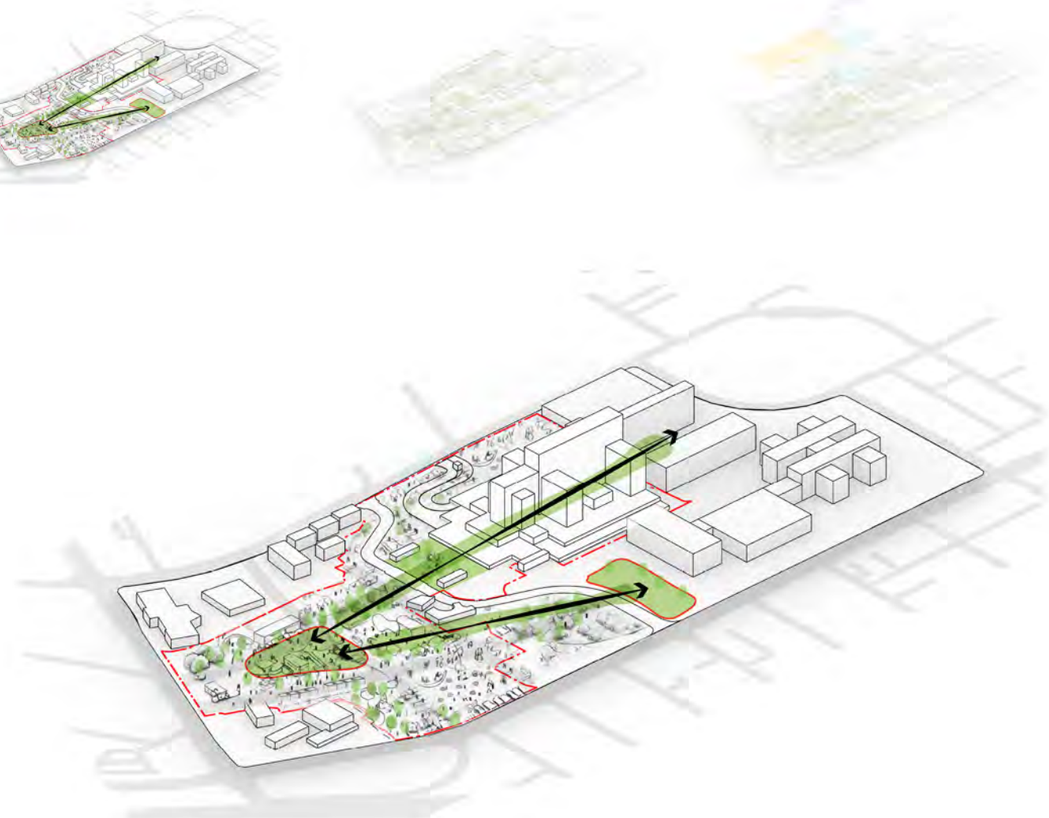
The ground plane is conceived as both a physical and cultural commons. It is a place where the community can honor its past, share its present, and collectively shape its future. By prioritizing public space at the base of every hub and building, the plan ensures that civic life remains visible, accessible, and protected over time. This approach responds directly to a century of gradual disconnection caused by freeways, incremental development, and institutional boundaries, reestablishing the campus as a connective center rather than a barrier.

Through this framework, surrounding neighborhoods are actively welcomed into the site, bringing their cultural identities, values, and goals with them. The continuous public ground plane blurs the boundaries between public and private and between indoor and outdoor space, while ensuring that all uses at grade are community facing. Programs and services that have long been absent or difficult to access are intentionally placed at these shared edges, allowing the campus to serve as a place of repair and renewal. In this way, the ground plane becomes the physical expression of healing, not only for individuals, but for the broader community that converges at this historic intersection.

Design Principles and Character - Context

Urban Fabric and Surrounding Ecology

Ground Plane Belongs to the Community



The entire ground plane is dedicated to community use, creating a continuous public realm of open spaces, gardens, pedestrian paths, plazas, and event areas. Community oriented programs such as retail, job training, childcare, senior centers, fitness facilities, restaurants, business incubators, and libraries are placed at grade to support daily life, access, and belonging.

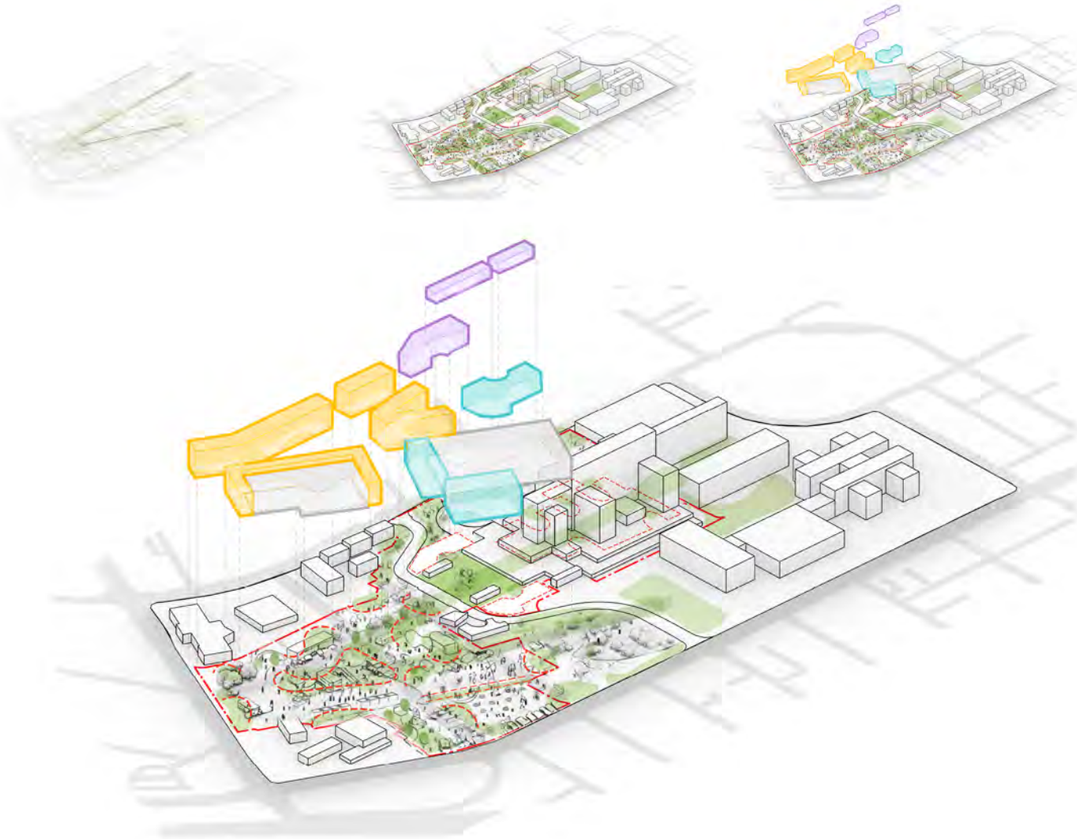
Design Principles and Character - Site Organization

Open Space Gathering Hubs

Central plazas anchor each hub, focusing community gathering, activity, and identity within the Common Ground.

Connect

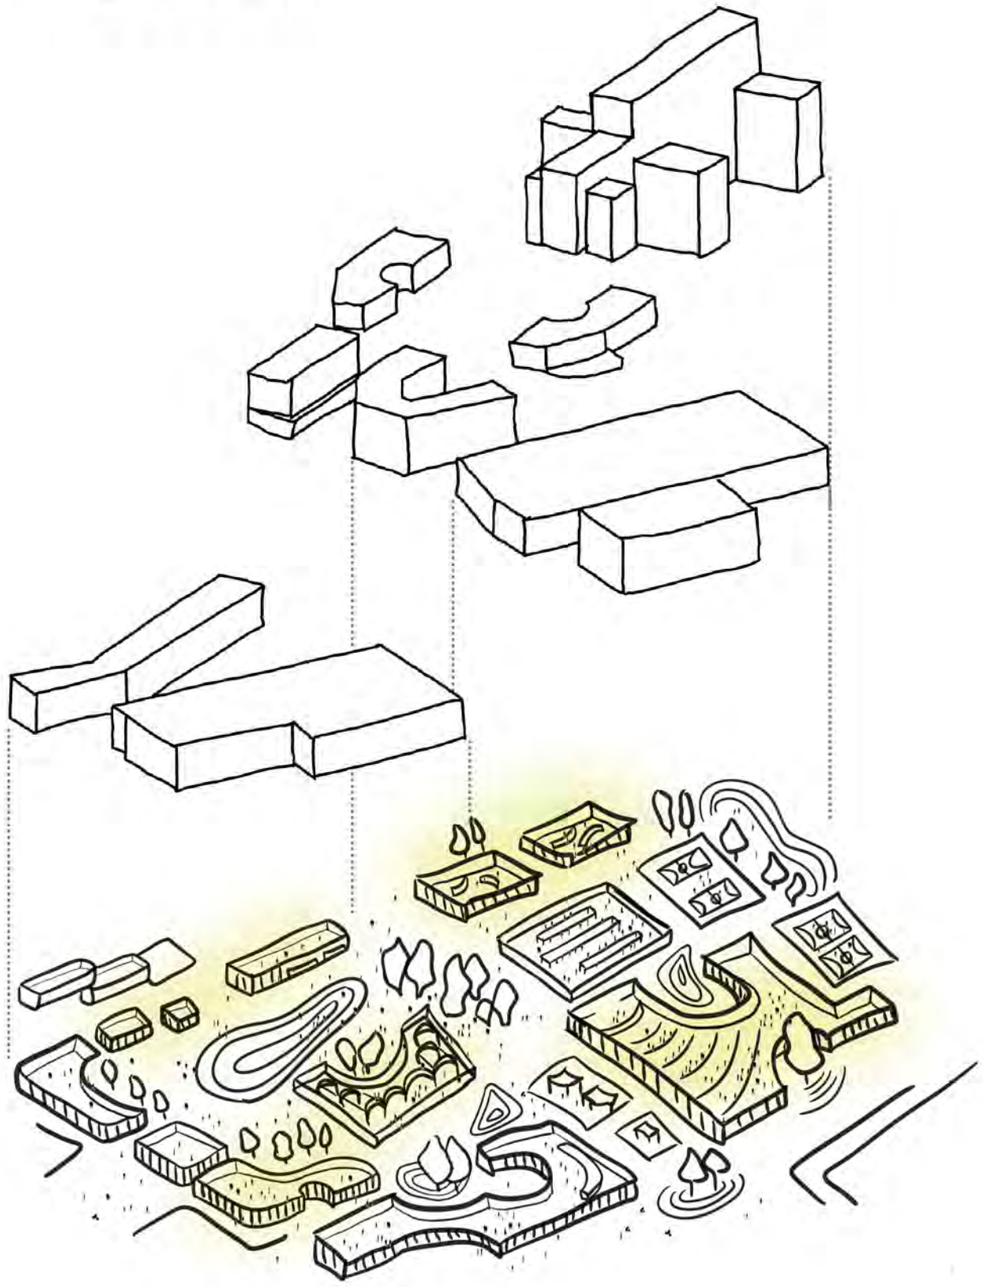
Pedestrian corridors connect the hubs, forming clear, direct routes that organize movement and community activity across the campus.



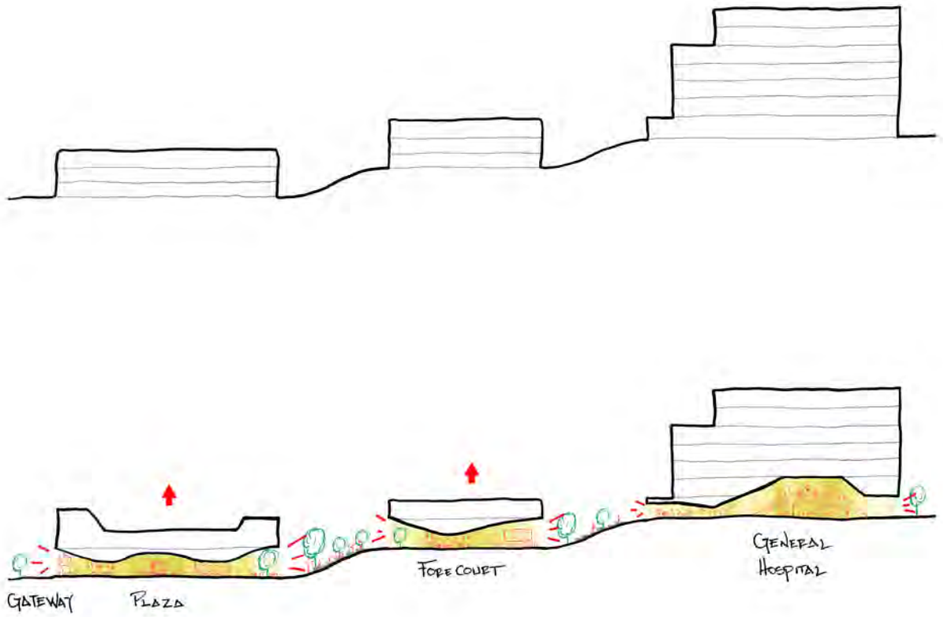
*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Design Principles and Character - Flexible Development

Soften Edges

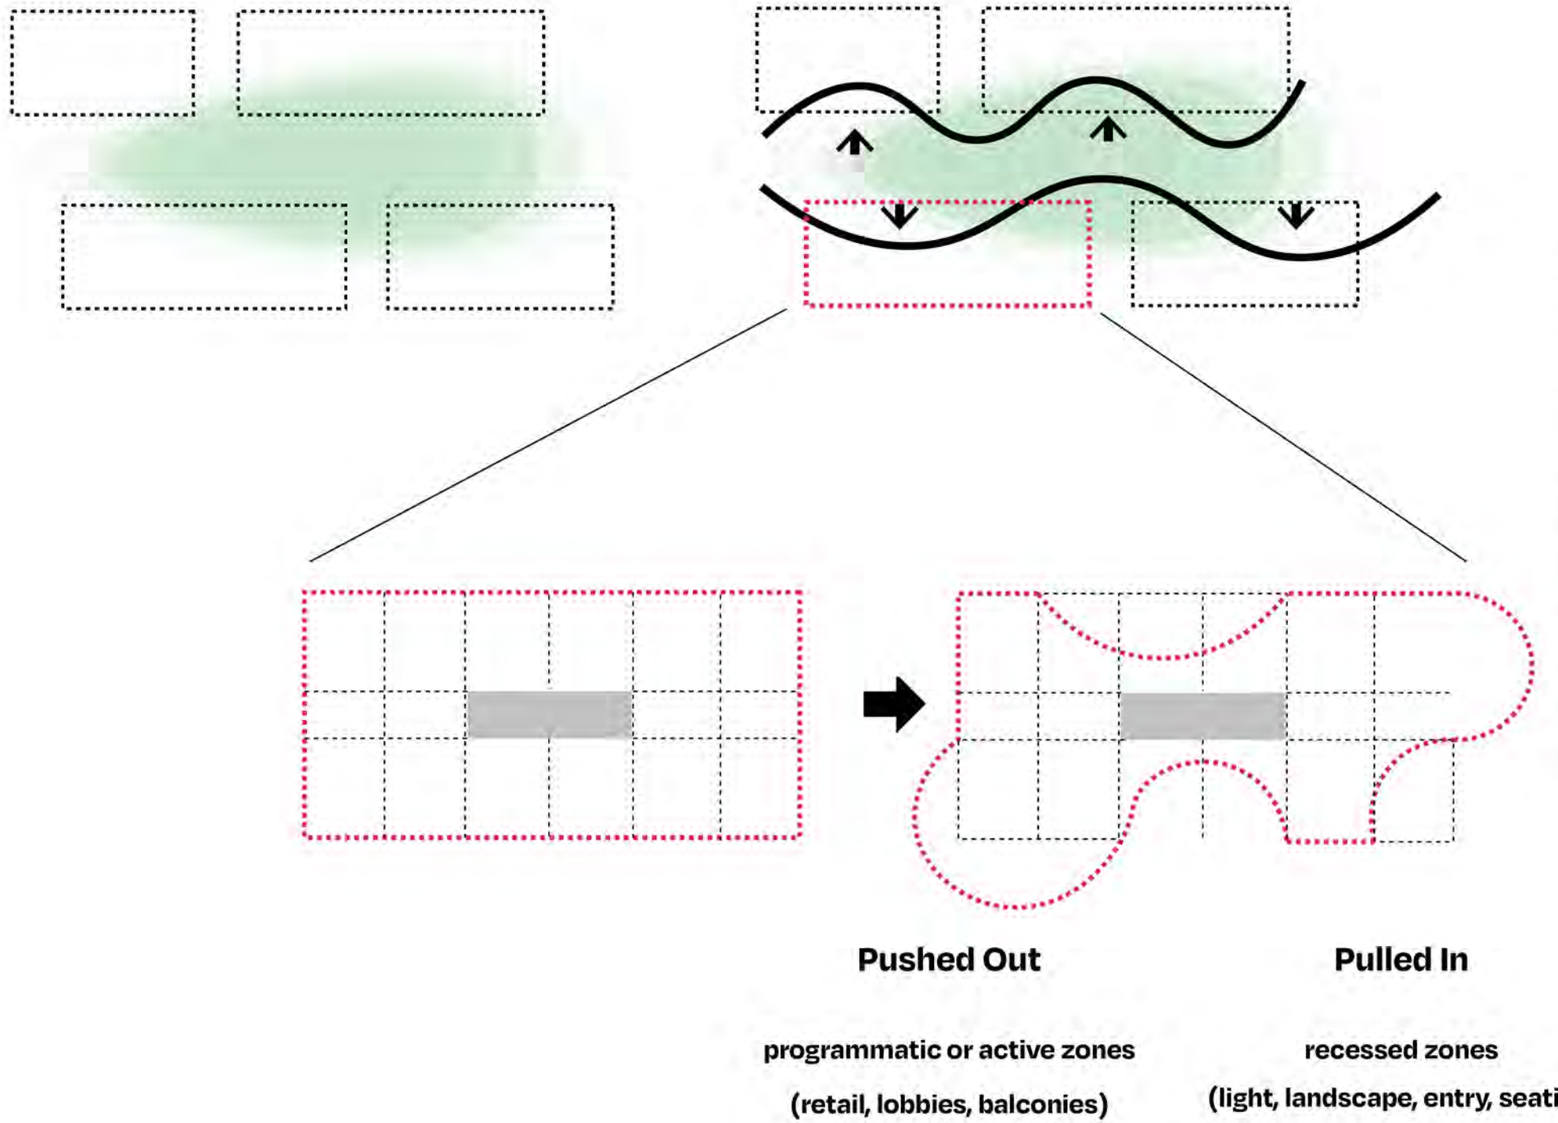


Open spaces extend seamlessly beneath, between, and beyond buildings, blurring edges at connections with streets and entries to create a continuous and inviting public realm.



Flexible Program

Above the continuous public realm, development is designed to remain flexible. Flexible Development is therefore not only a design strategy, but also a framework for long-term stewardship. It reflects an understanding that community needs, market forces, and public priorities will continue to evolve. By designing both the physical plan and the development process for adaptability, the Master Plan supports ongoing participation, responsiveness, and shared decision-making as the Healthy Village is realized over time.

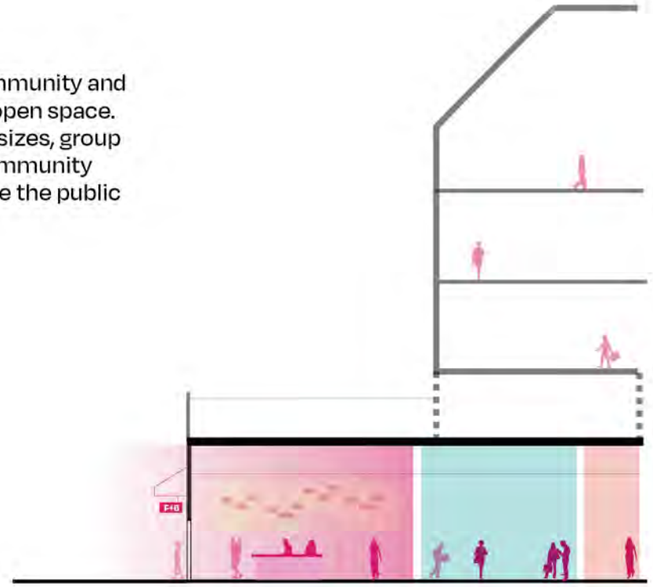


Massing and Form

With the ground plane dedicated to the public realm, the organization of open space and podium elements establishes a cohesive and continuous Common Ground that functions independently from the development above. This separation allows the public realm to remain intact and accessible across phases of development, even as individual buildings are delivered over time. Podium massing is designed to shape and support a rich network of public spaces, from intimate courtyards and gardens to large plazas and civic gathering areas, while maintaining flexibility in the form and use of upper-level development.At grade, architecture and massing respond directly to the intensity and diversity of public activity. Tall ground-floor stories of 20 feet or more create generous, adaptable spaces for community-oriented programs and allow interior uses to open seamlessly to the public realm. At key outdoor plazas and gathering spaces, building massing should step back to allow light and air to reach the ground plane and to bring the scale of the public realm down to a more human, comfortable proportion. Local pathways are intentionally woven through and between buildings, blending indoor and outdoor space and enabling private uses to spill out into plazas, terraces, and walkways. Landscape, shade structures, and planted areas are integrated throughout the podium to enhance comfort and microclimate, reinforcing the Common Ground as an inviting place for daily life and community connection.

Massing and Form

Podium design plays a critical role in extending the public realm through and under buildings, allowing plazas and open spaces to flow seamlessly into architectural form. Public plazas are intentionally designed without hard or fixed edges, blurring the boundary between open space and the buildings that frame it. This approach creates a flexible transition zone where the public realm is supported by architecture, continuing beneath buildings above with generous overhangs, arcades, and ground-floor openings that invite movement, gathering, and pause.



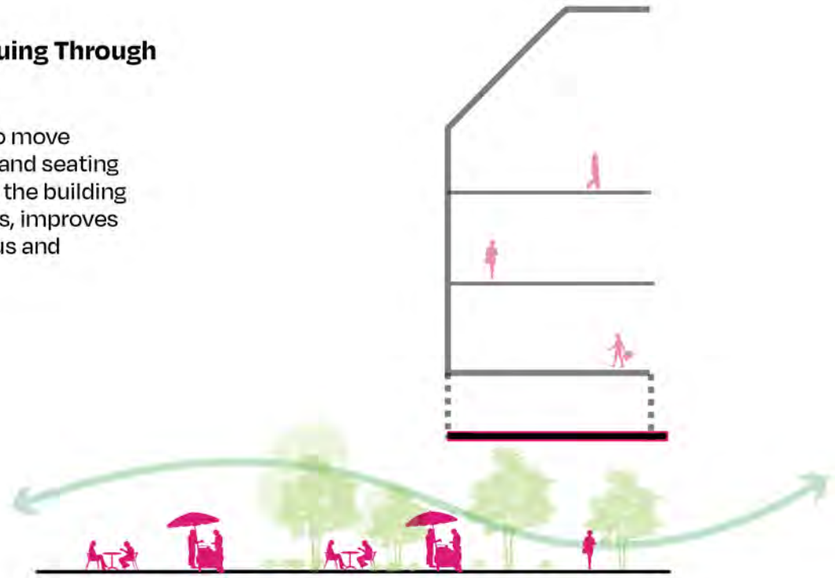
These flexible zones support a wide range of community-oriented uses that can adapt over time. Portions of the podium may open to create shaded outdoor rooms beneath buildings for seating, landscape, accessible retail displays, or outdoor dining, while other areas can extend activity outward into the plaza through storefronts, balconies, and spill-out spaces. Entries, pathways, and garden lounges are interwoven within these zones, creating an immersive public experience where buildings feel porous and inviting. By allowing public life to move fluidly under and through architecture, the podium becomes an active participant in the Common Ground, reinforcing a continuous, shaded, and accessible public realm across the site.

Massing and Form

Flex Zone: Podium Extension

The flex zone creates a dynamic edge where indoor community and commercial programs can extend into adjacent public open space. This flexibility supports outdoor dining, expanded class sizes, group exercise on pleasant days, pop-up health clinics, and community markets or fairs, allowing programs to adapt and activate the public realm as needs change.

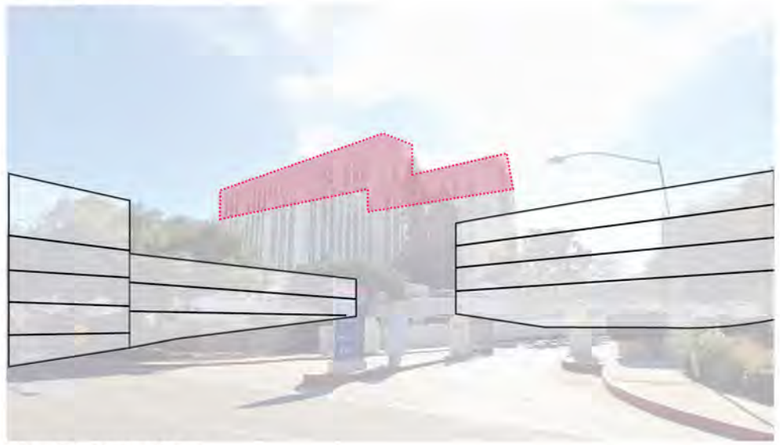
- Local entrepreneurs
- craftspeople
- community services
- clinics
- wellness center partners
- training and education
- daycare
- restaurant incubators
- pop-up shops

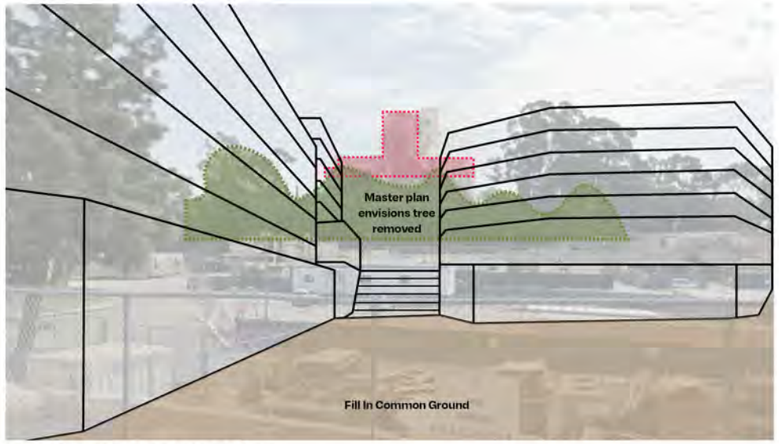


Flex Zone: Landscape and Open Space Continuing Through the Building

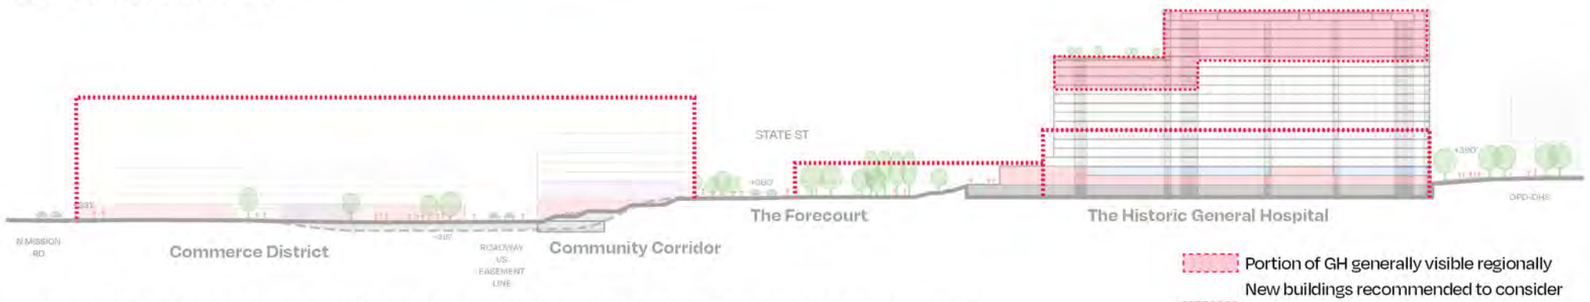
The flex zone also allows landscape and open space to move through and under buildings, bringing shade, planting, and seating beneath the podium. By extending outdoor space into the building fabric, this approach strengthens campus connections, improves comfort and microclimate, and reinforces a continuous and immersive public realm.

- outdoor dining
- seating and gathering nooks
- shade
- outdoor displays
- performances
- art
- classes that spill onto the plaza





Opportunities to Frame the General Hospital



View From State St

View From Zonal Ave

View From Commerce Plaza

The General Hospital is visible across the region due to its location on a prominent elevation, allowing for substantial vertical development on the West Campus while preserving regional views.

The Historic General Hospital is a defining civic landmark whose identity is shaped by its sweeping Art Deco façade and strong vertical massing that is prominently situated on an elevated plateau. To support this architectural heirarchy and sense of history throughout the site, the Master Plan preserves and elevates key views by framing the General Hospital with a calibrated composition of new development and open public spaces and circulation to continue to emphasize the building's scale, prominence, and architectural character. From a regional perspective, views that reveal at least the upper portion of the building maintain legibility of the General hospital as a historic icon within the broader city and landscape.

The Master Plan frames several views. The Marengo Boulevard entry at State Street establishes the primary procession into the campus and frames the approach to the Forecourt, reinforcing the General Hospital's stature and civic presence. The view from Mission Street aligns with the monumental historic axis and central spine, offering a clear reading of the building's symmetry and role as the heart of the campus. From the Zonal Avenue entry, views of the stepped façade help convey the scale and layered composition of the structure as it rises above the surrounding terrain.

Together, these framed views help anchor orientation, memory, and identity across the Master Plan. New building height and massing should remain responsive to the historic structure, particularly in close proximity.

New development near the Forecourt should remain limited to approximately four to five stories to preserve human scale and avoid competing with the historic façade. On West Campus, where the grade level is significantly below the plateau the General Hospital is situated on, there is room for significant vertical development without impeding regional views. By framing views through massing, setbacks, alignments, and placement, the Master Plan allows for thoughtful growth that honors the General Hospital's enduring civic and cultural significance.

General Hospital Historical Background and Context

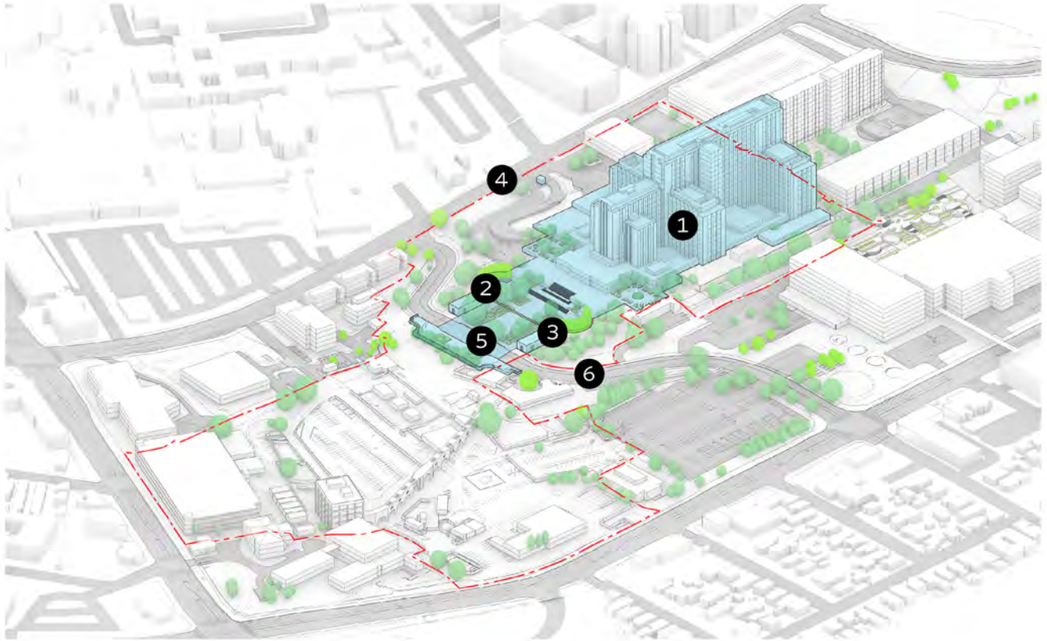
View of the General Hospital campus looking northeast, circa 1965 (Courtesy of LAC+USC)



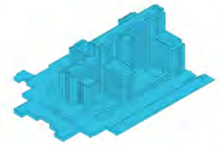
History of the Site

Southern California's climate and landscape played an important role in the area's growth in the late 19th and early 20th centuries. It was a popular winter destination for eastern and mid-western residents, who traveled to enjoy the mild winters and sunny weather. The region's increased popularity as a balmy winter retreat coincided with new discoveries in health and medicine. Los Angeles in particular became a destination for migrants seeking better health. A number of haphazardly planned medical facilities opened in the following decades, as well as more organized establishments of varying sizes. By the early 20th century, Los Angeles' reputation as a haven for health seekers was integral to its identity, growth, and development. Hospitals came to be seen as an integral part of improving cities and their residents. This represented a significant shift in the public's perception of hospitals. Hospitals evolved from charitable institutions to modern facilities with the latest technology. As Los Angeles grew in the decades after World War II, its hospital system expanded to keep up with patient demand.

History of General Hospital Architecture

The modern American hospital emerged in the mid-19th century and was shaped by rapid advances in medical science, sanitation standards, and urban growth. Before this period, American hospitals were often charitable almshouses and sanitariums intended for care of the poor and dying, rather than for patient recovery. Florence Nightingale's writings popularized new understandings of germ theory and hygiene that transformed late 19th century hospital design into a technical and architectural solution that emphasized cross-ventilation and access to natural light. Pavilion-style hospitals were characterized by low-scale detached or semi-detached wards arranged with linear or radial layouts and connected by corridors or breezeways. Buildings often had large operable windows and multiple entrances to promote airflow and minimize contagion. The evolution of hospital planning and construction in the early 20th century reflected both broader trends and regional necessity. Early 20th century hospital buildings evolved into multi-story steel- or concrete-framed buildings, typically six to seven stories in height, with separate floors dedicated to each medical ward. Hospital projects of the 1920s and 1930s reflected a new era of vertical architectural experimentation. The Los Angeles General Hospital's Acute Unit, completed in 1933, epitomized this shift with its monumental reinforced-concrete and steel structure, centralized core, and vertical circulation systems designed to minimize the spread of disease.

Legacy Buildings & Adaptive Reuse



Legend

Historic General Hospital

Historic Conditions

At the time of this writing, the Historic General Hospital building is under consideration for listing on the National Register of Historic Places. This designation would help recognize and preserve the building's historic significance. As the campus evolves, the General Hospital and other recognized historic resources are intended to be preserved and respectfully integrated with adjacent new development.

1. General Hospital, 1933 [101]

2. Patient's Building, 1933 [102]

3. Visitor's Building Administrative Offices, 1933 [103]

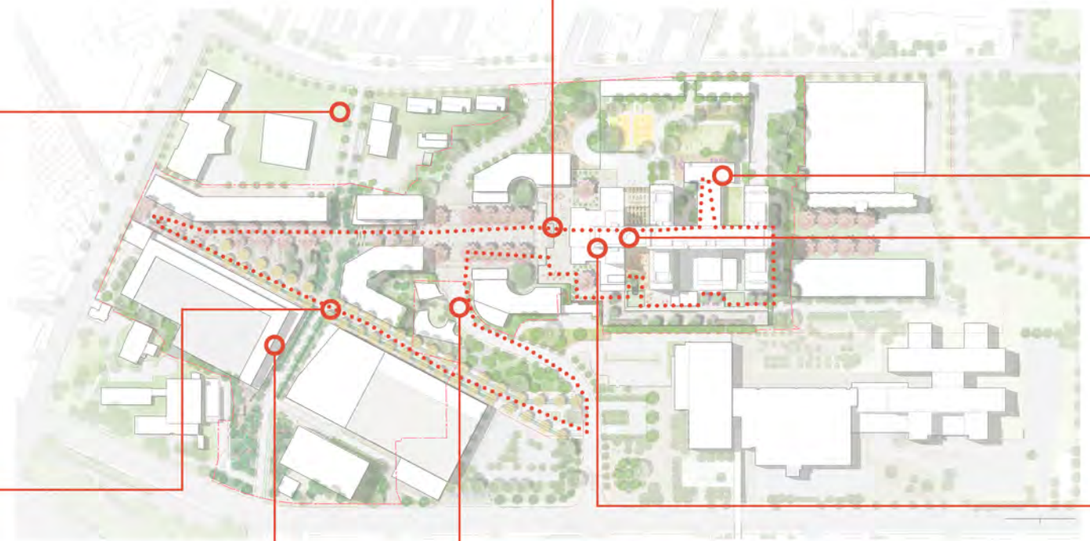
4. Control House, 1933 [136]

5. Forecourt

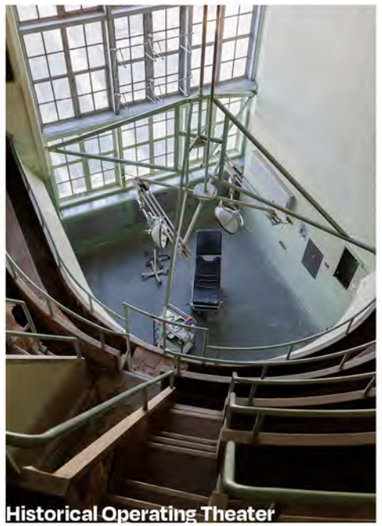
6. State Street

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Adaptive Reuse - Historic Site Interpretation



The site holds a rich and layered history, embedded with memories that continue to resonate within the community. This proposal highlights key features across the landscape, from the original hospital and operating theater to the kitchen, viaducts, and historic creek, framing them within an interpretive experience. Through a mapped tour supported by signage and exhibits, these elements are reintroduced and connected, allowing visitors to engage with the site's past in a meaningful way. By identifying and revisiting these spaces, the design opens opportunities to reinterpret original features, such as Dry Creek, while anchoring new interventions in the site's enduring narrative.



Main Entrance

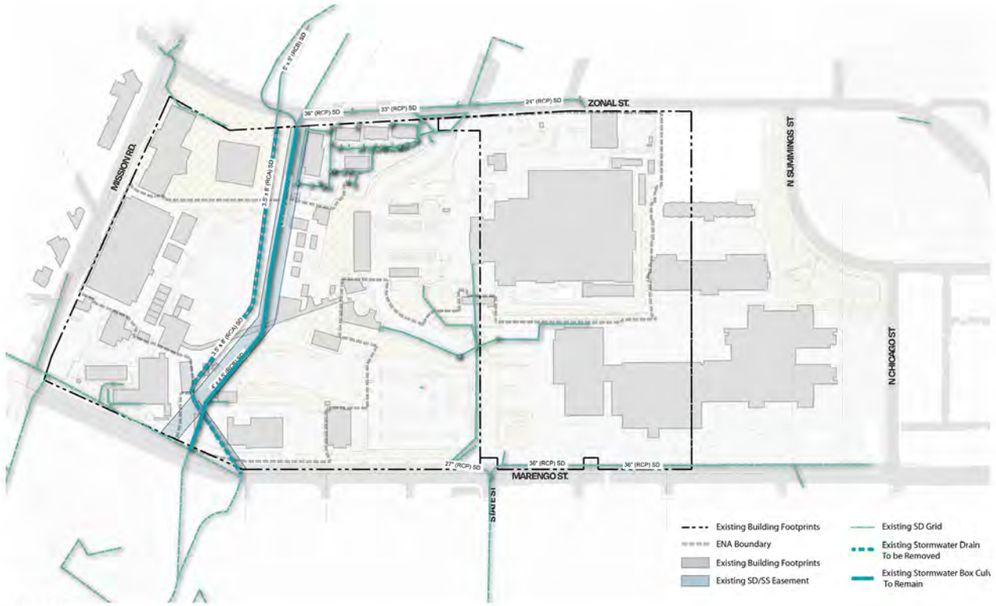
1/32" = 1'- 0"

Regrade Topography - Fill

OPTION1: Partial Preservation + New Program



OPTION2: Preserve Original Footprint Through Paving

OPTION3: Embedded Viaduct -- Void within New Architecture

Dry Creek

More than 100 years ago, the original creek was undergrounded and controlled by the County stormwater system, which roughly follows its original path.

A reinterpreted Dry Creek is treated as a landscape corridor and community main street, with restaurant terraces carefully nested along the creek edge and framed by shade trees. Active ground-floor uses and local retail engage the street while respecting the creek's historic alignment, reinforcing a pedestrian-scaled environment that celebrates both place and activity.

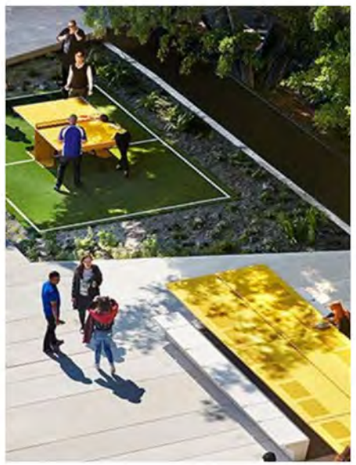
Materiality

Beyond reinterpreting significant original site features, the campus should express both its historic legacy and its shared cultural memory while establishing a cohesive new sense of place. Achieving this will require sensitive consideration of materiality, especially within the public spaces and Common Ground.

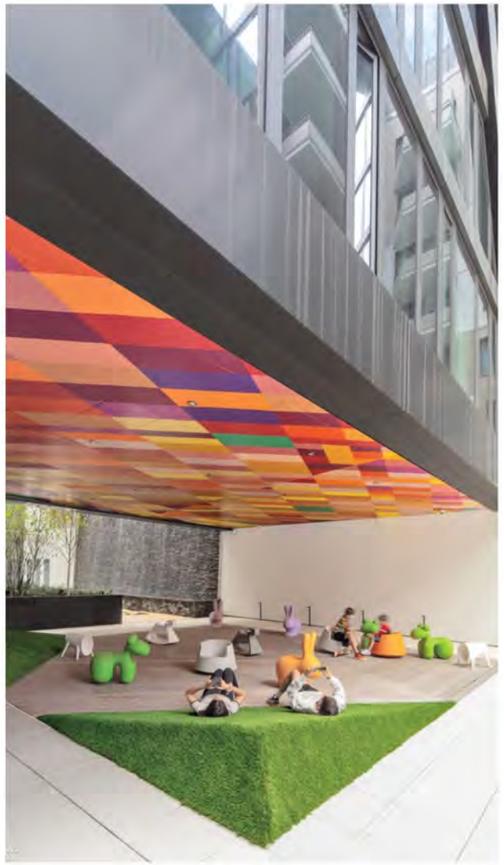
Forecourt Paving Pattern

The historic forecourt paving pattern employs a unique "forced perspective" by slightly converging pavement lines as they near the General Hospital. This enhances the perception of the main building's mass and civic presence when viewed in perspective. The scale and geometry of the pattern visually anchor the building at the ground plane and may be extended to other public areas to reinforce material continuity across the site.

Paving Continuity



The forecourt is expressed as a **formal, monumental**, and civic space, while the community plaza on the west campus adopts a **freer, more casual character** designed to support flexible programming and comfortable everyday use. Pedestrian and vehicular paving are clearly differentiated through material, texture, and pattern to establish hierarchy and legibility. Public spaces are designed as protected pedestrian areas, prioritizing accessibility, shared use, and seamless transitions. Across the broader campus, the material language of the forecourt is drawn through and reinterpreted, adapted to contemporary uses and varied spatial conditions, creating a cohesive yet flexible public realm.



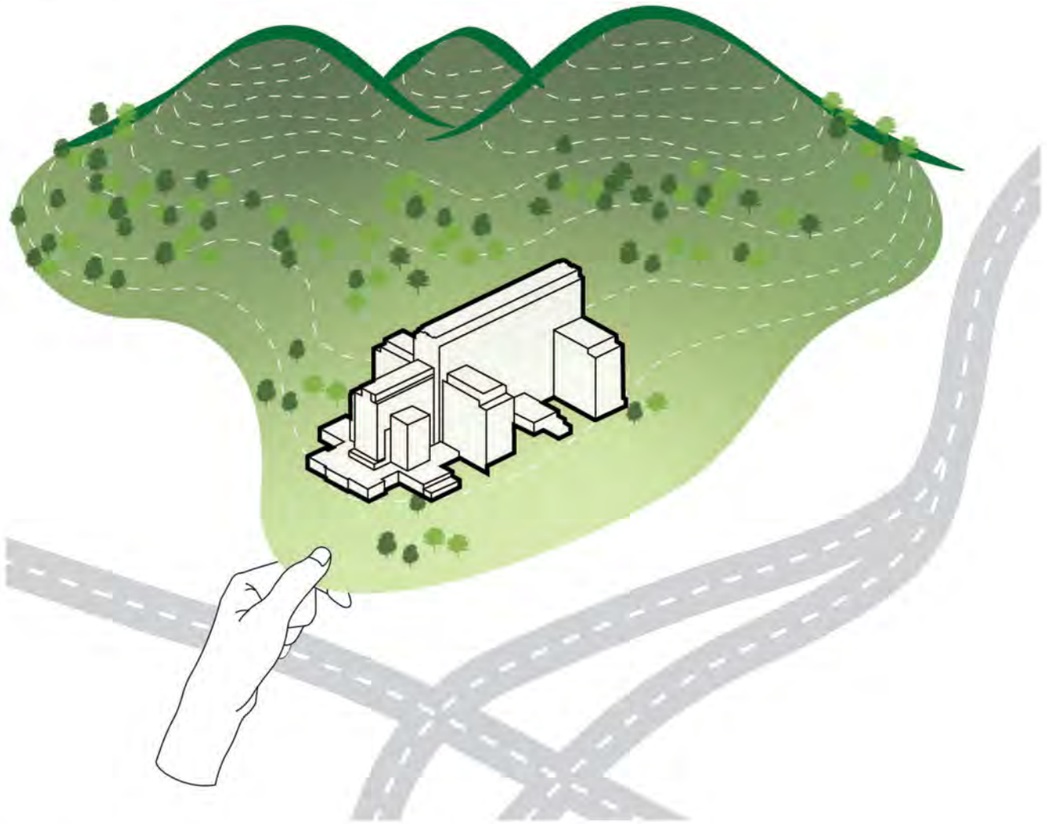
Street Furniture

Street furniture, public realm materials, and landscape elements are coordinated across all public areas to establish a cohesive and recognizable identity for the "Healthy Village". This integrated approach reinforces continuity between spaces while allowing for variation in character and use, supporting a legible, welcoming, and well-functioning public realm.

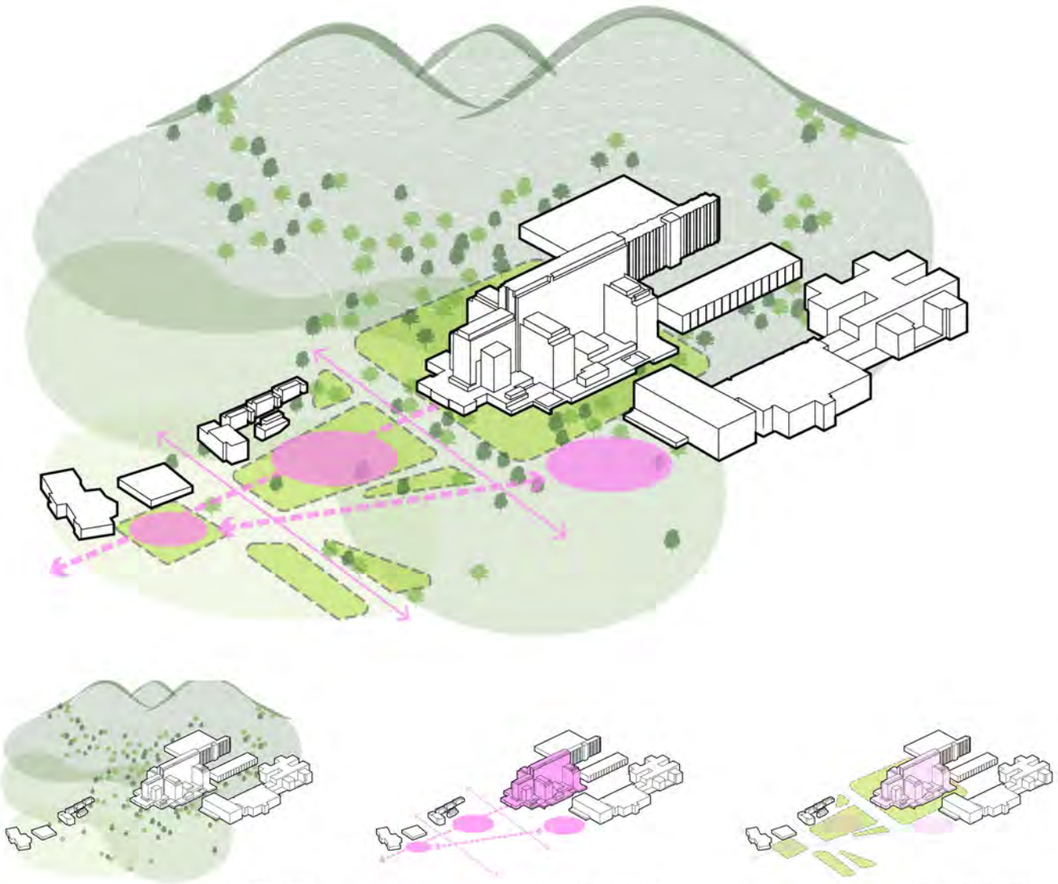
Materiality

Public Realm Extension Through the Podium

The ground plane texture and material motifs are extended vertically through the podium to reinforce the continuity of the public realm across the entire ground level. Ground-floor public and community-facing uses are characterized by a high degree of transparency, ensuring that public-oriented functions remain legible, visible, and inviting, and that the public realm is clearly expressed through both materiality and spatial engagement.



Architecture



Respect Historic Context:
Architectural detailing responds to the scale, material weight, and durability of the historic campus without direct replication of historic styles, employing high-quality, durable materials intended to endure for another century and beyond.

Recycle:
Demolition materials are salvaged and recycled where feasible, with concrete and aggregate reused to support sustainability and material continuity.

New Build in Contrast to Historic:
New construction is clearly expressed as contemporary in form and detail, maintaining a legible contrast between new and historic structures while reinforcing overall campus cohesion.

6.5 Open Space and Landscape Framework

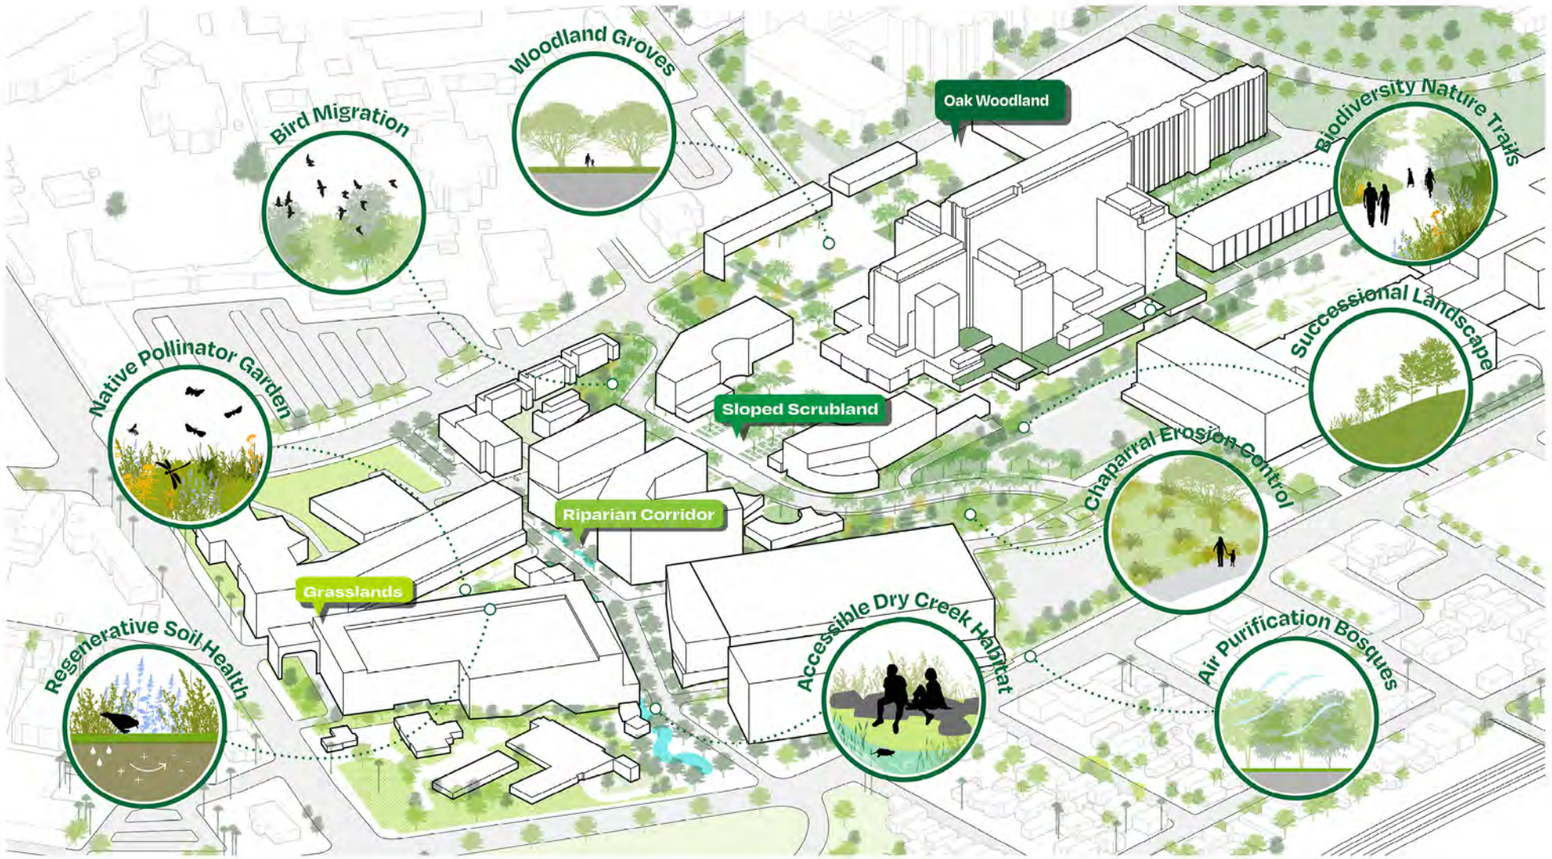
Pulling Los Angeles In

A Healthy Village promotes personal and community wellness through strong connection to nature and surrounding neighborhoods. Currently, the majority of landscape and open space within the campus is an assortment of varyingly activated but disconnected spaces. The disconnection extends outside the project boundary, isolating the campus from its neighbors. As part of the catalytic vision, the proposed landscape framework relies on reconnecting with the surrounding natural and cultural context to create a physical, emotional and psychological connection within the superblock, to the directly adjacent neighborhoods and to the greater Los Angeles area. Leveraging natural and urban open spaces to better connect destinations within the site and beyond the site boundaries to surrounding open spaces and neighborhood hubs, the landscape framework transforms the old hospital site into a healthy village for Angelenos to thrive.

Through pulling in the foothills of Lincoln Heights and Mount Washington into the campus, natural habitat is reintroduced onto site's existing topographically challenging conditions. In reconnecting to the larger regional ecology through restitching fragmented landscapes, these new natural open spaces allow for new opportunities for gathering and connection beyond the main axial connections. As urban and natural spaces intermix, open space becomes fertile common ground for various experiences that serve the community ecologically and socially. Through re-naturalizing, re-connecting and re-activating the campus, the open space and landscape framework builds on existing context to better serve the residents, workers and visitors of the campus and will hopefully spread beyond to reach adjacent neighborhoods and open spaces.

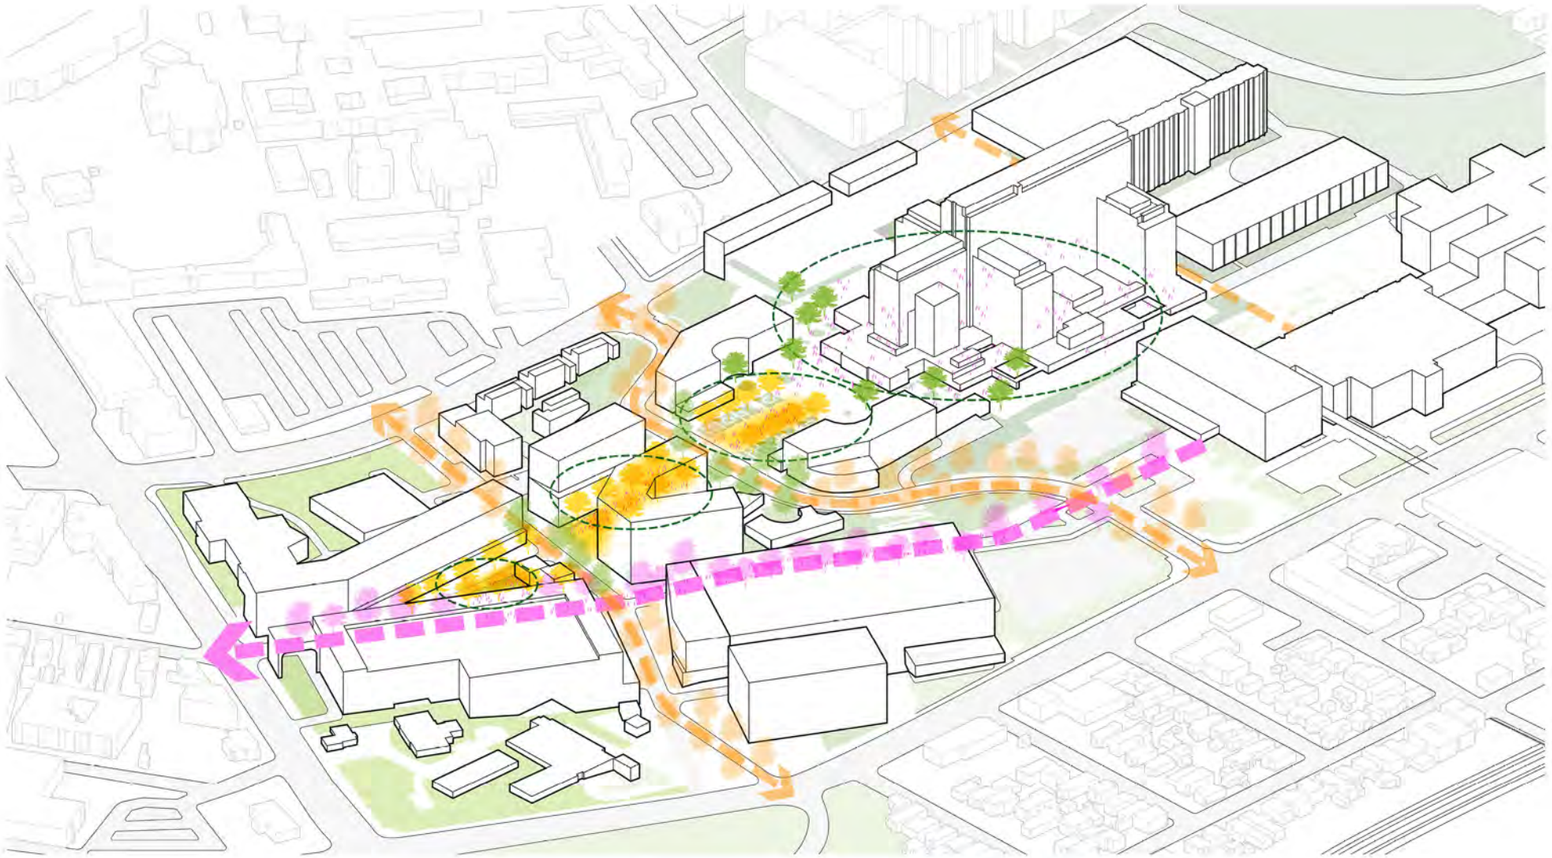
Legend

- Oak Woodland
- Chapparral Hillsides
- Riparian Grassland



Re-Naturalize: Engaging with Natural Systems

While the campus' existing hilled condition either acts as a barrier between spaces or are considered leftover spaces, the sloped zones provide opportunities to reintroduce naturalized buffer zones that function as ecologically and socially regenerative zones while celebrating and making more accessible the natural habitats of Los Angeles region. Mimicking the larger regional ecotones of sheltered Oak Woodlands on uplands, Chaparral Hillsides on main slopes from the General Hospital building and Riparian Grasslands and Groves along the historic creek, these spaces become green lungs for the community that filter air, create habitat and provide local residents tangible connection to natural spaces previously inaccessible.

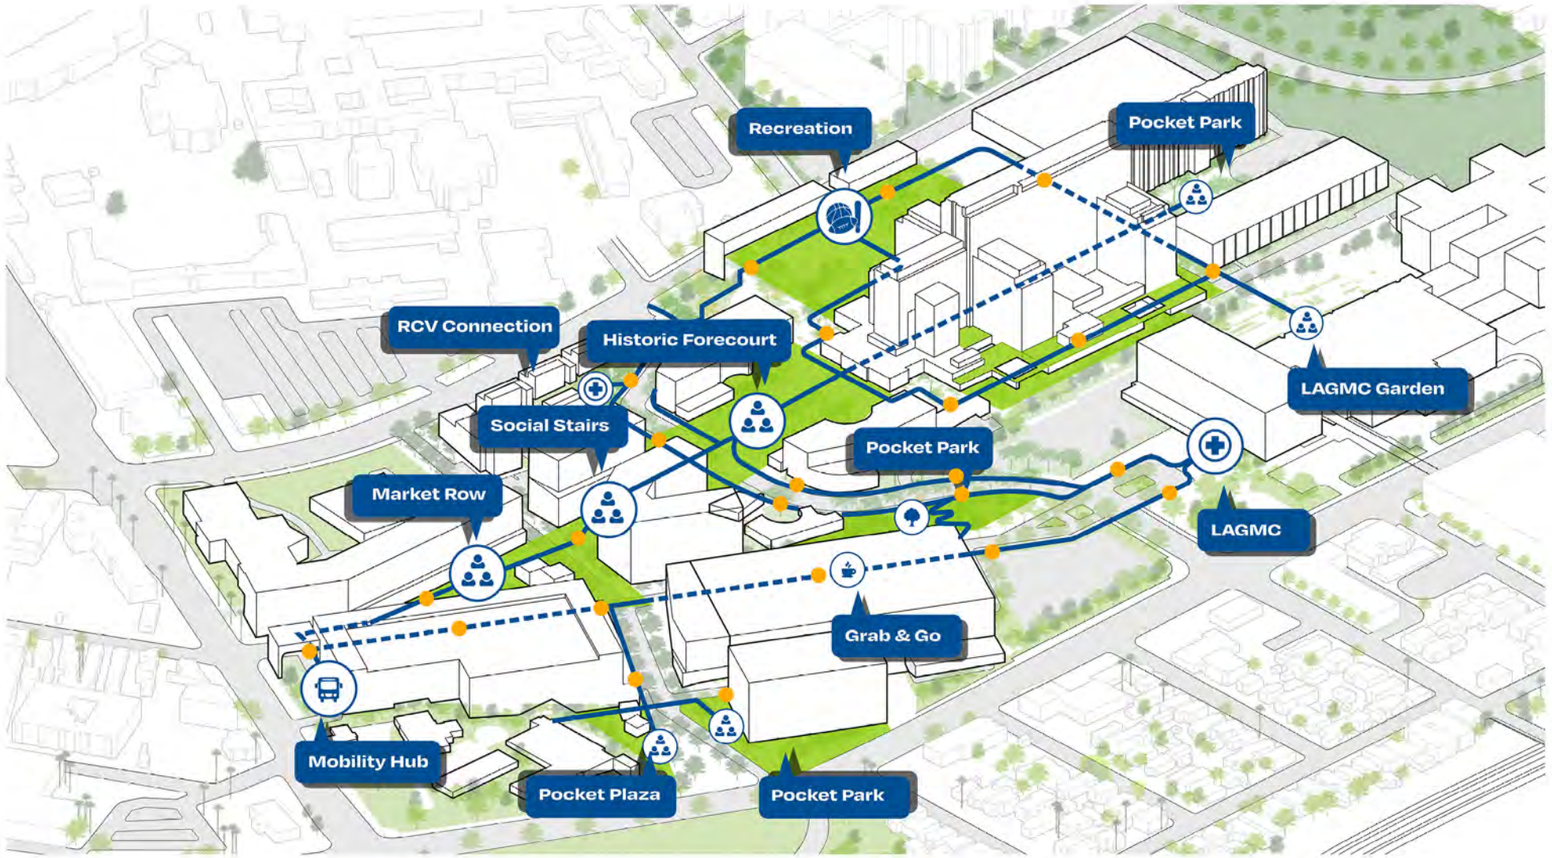


Re-Naturalize: Engaging with Natural Systems

Through revegetating underutilized sloped space as opportunities to reintroduce more naturalized spaces, the re-wilding of the campus also supports social wellbeing by providing more direct connection to natural spaces while upholding sustainability measures that benefit urban lifestyles. The Master Plan's integrated network of living infrastructural systems related to stormwater collection, urban heat island cooling and ecological corridors are celebrated to reveal how the campus itself works as a regenerative, integrated and community space that blends naturalized moments with the vibrant urban spirit of East LA.

Re-Connect: Gathering and Identity

As one of the underlying principles of the Master Plan, the central spine and diagonal road link the three major anchors of the site to provide clear access and wayfinding. To further reinforce these connections while also providing character, street trees and other vegetation help visually connect these connections while providing shade, areas for small and larger gathering spaces.

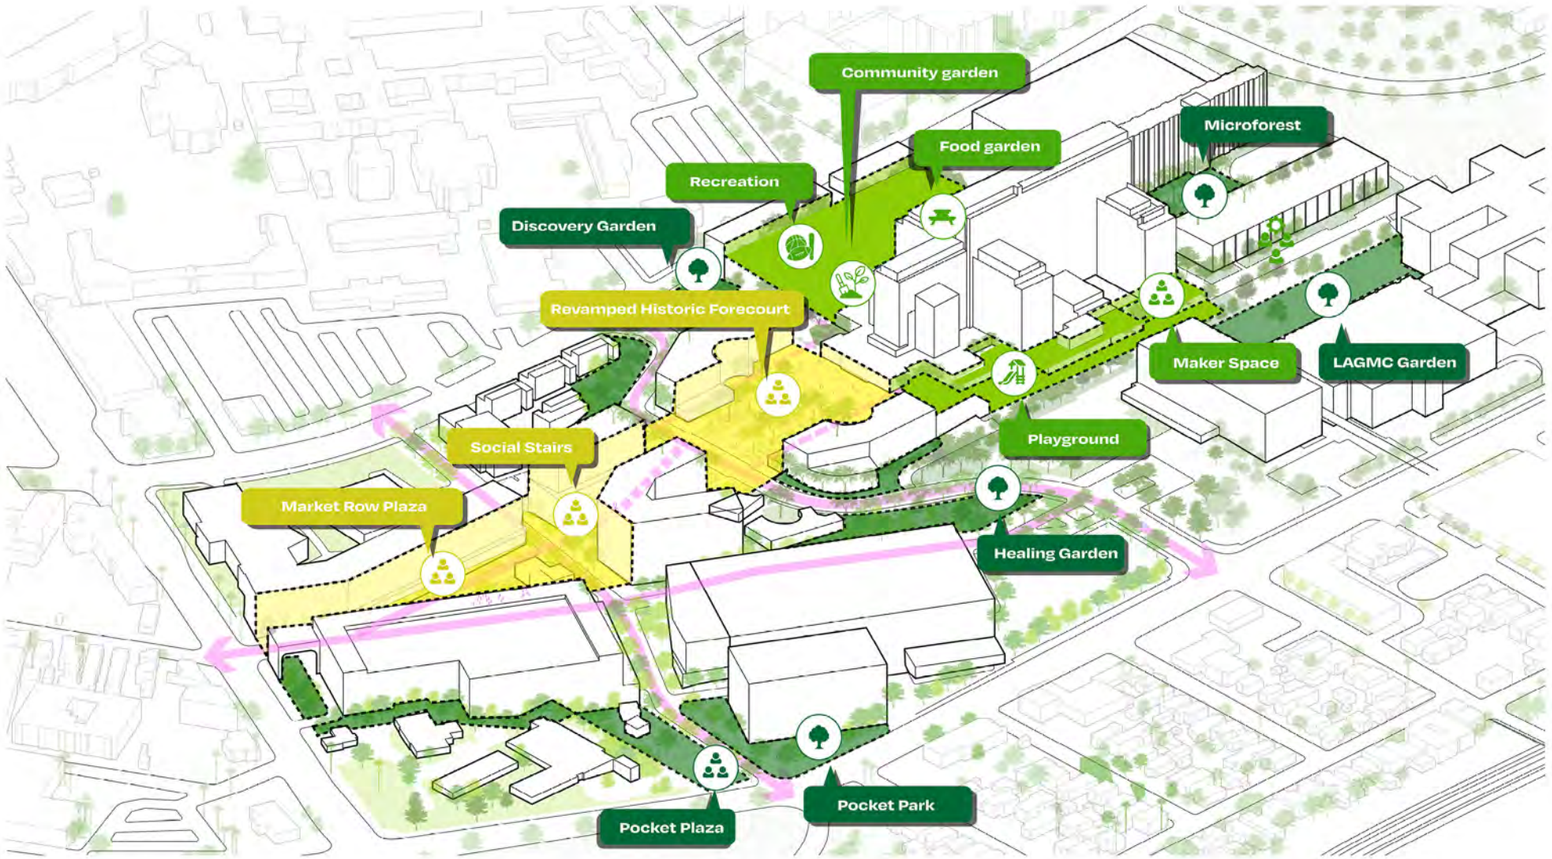


Wilded areas are the base condition of site, respectful of natural succession and evolution of wilderness over time, site as a component of larger regional ecology and restitching fragmented landscapes - common ground as inter-species.

Legend

- Gathering Spaces
- Main Street Connection
- Secondary Street Connection
- Gathering Space Trees
- Main Street Trees
- Secondary Street Trees
- Threshold Trees

Potential Street Trees:
Quercus agrifolia, Platanus racemosa, Quercus englemanii

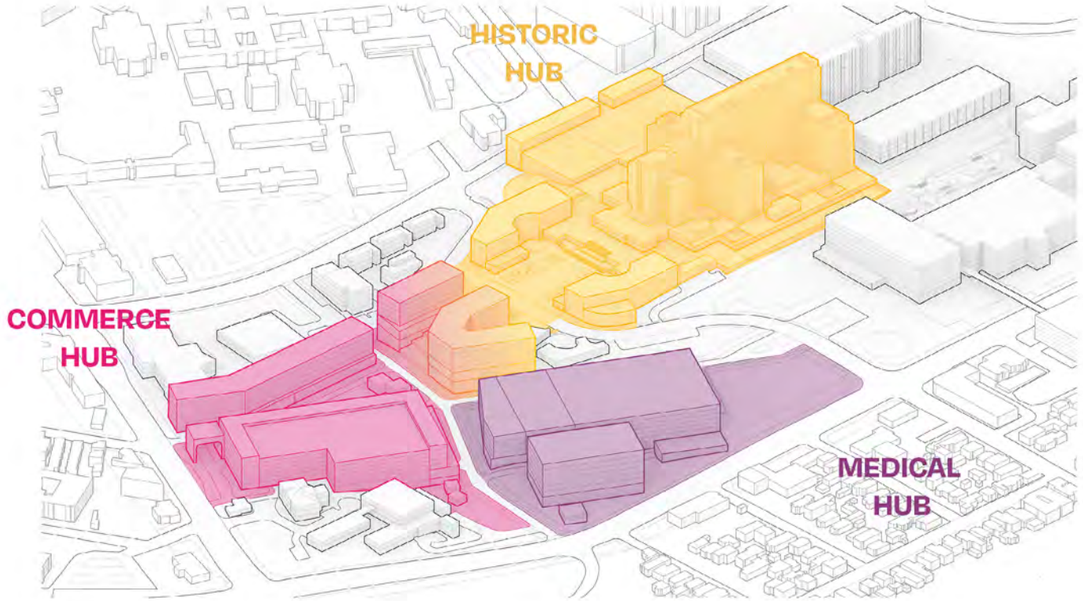


Legend

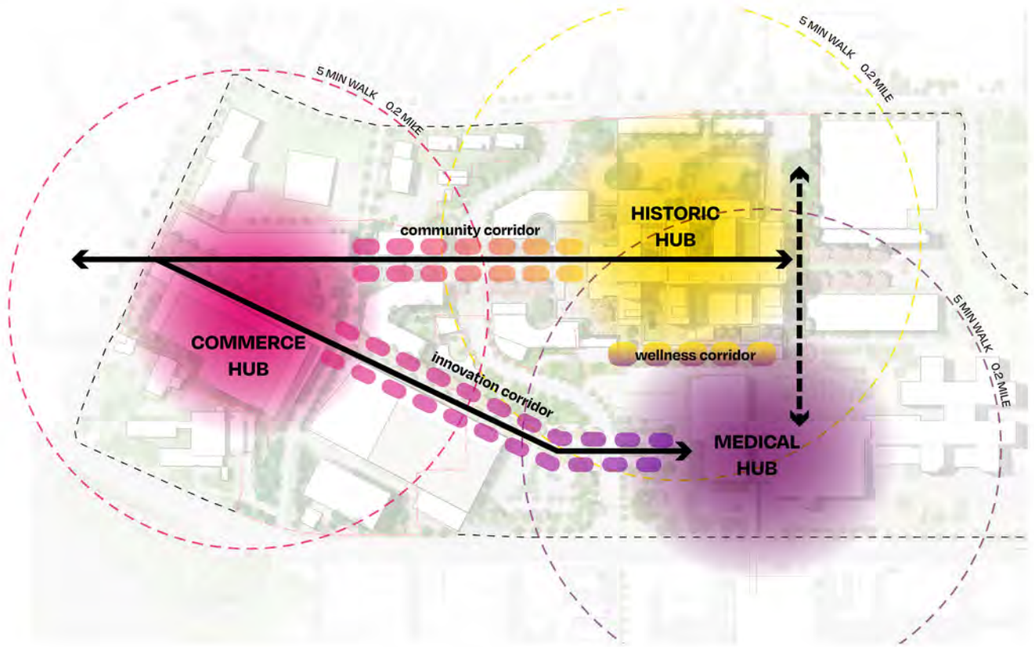
- Shaded Seating Every 300'
- Main Pedestrian Circulation

Re-Connect: Gathering and Identity

As program and main connection paths are overlaid onto the natural ecotones, various expressions of engagement and experiences arise within the various campus open spaces. Both introverted and extroverted open spaces emerge for the benefit of people, flora and fauna alike. Connections between open spaces are calibrated to provide optimum human comfort within Los Angeles' climate or all types of users. For example, areas with seating and shade will be provided at intervals of 300' or less.



Legend



- Urban Gathering Open Space
- Neighborhood Park
- Rewilded Open Space

Re-Activate: Open Spaces with Unique Character

Open space and the adjacent programming areas much be considered as inter-connected elements that depend on each other for the successful reactivation of the campus. Urban open space typologies align with the naturalized ecotones previously highlighted to focus where areas of extroverted community gathering versus more intimate, personal rejuvenation moments could occur.

6.6 Neighborhood Identity

The Master Plan organizes the campus around a clear and flexible framework of **three primary hubs** connected by **three pedestrian-oriented corridors**, establishing a legible structure for a mixed-use Healthy Village. This organization responds to the site's size, topography, and access constraints by concentrating activity at key points of entry and linking them through intuitive, walkable connections. Each hub anchors a distinct mix of uses that reflect its role on campus, while the corridors ensure continuity, access, and shared public life across the site.

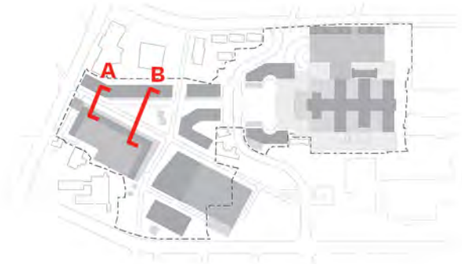
On the following pages is a more detailed exploration of how the hubs and corridors contribute to the immediate and site-wide identity through spatial qualities of public spaces and streets, program themes, and experiences.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

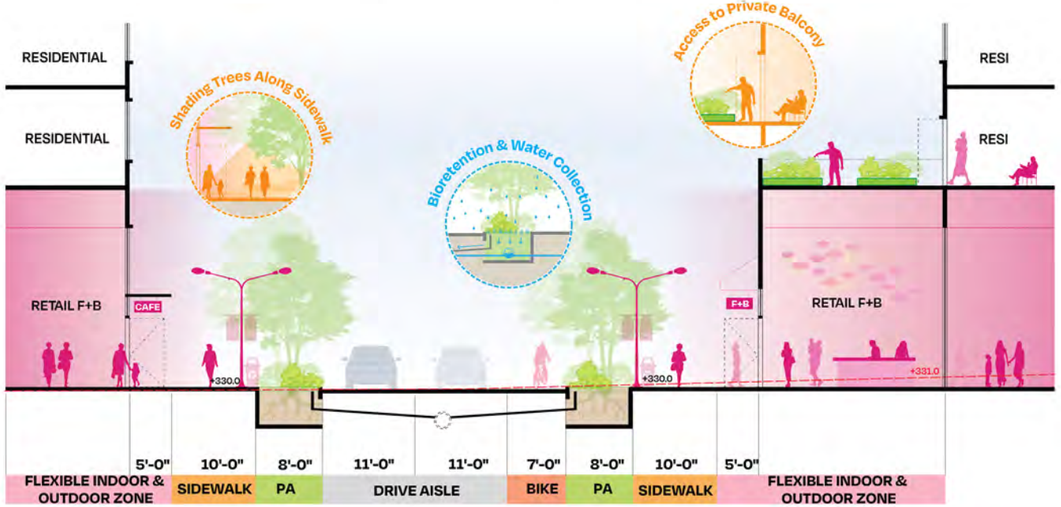
Commerce Hub

The **Commerce Hub**, located on the West Campus, serves as a vibrant, community-facing center of economic activity, cultural celebration, and daily life. Anchored by a central plaza designed to host markets, events, and informal gathering, the hub prioritizes visibility, accessibility, and activation at the ground plane. Surrounding mixed uses include community-oriented retail, small businesses, incubator spaces, and cultural uses that support local entrepreneurship and creative expression.

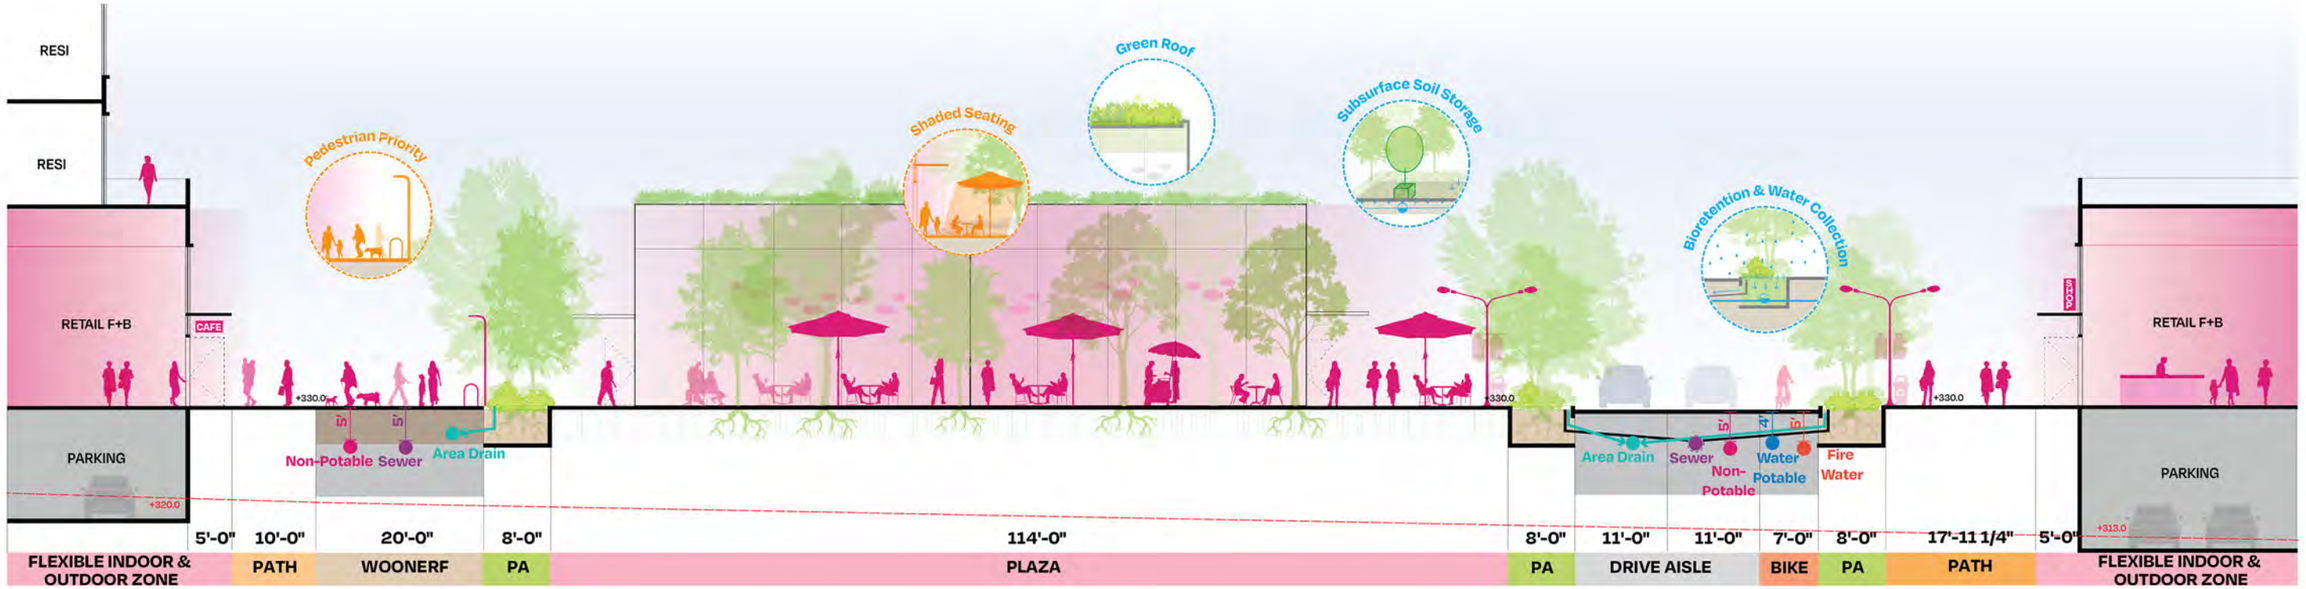
The Commerce Hub is activated by programs that support daily needs, entrepreneurship, and community life. Community-oriented retail could take the form of a **local market hall** showcasing neighborhood vendors, crafts, and food entrepreneurs, alongside small storefronts designed for flexible tenancy and local ownership. **A restaurant row** or café cluster could be nestled along dining terraces that overlook the reimagined dry creek or community plaza, creating an active edge for gathering and events.



Economic opportunity spaces might include **small business incubators**, shared maker spaces, or co-working studios supporting local entrepreneurs. The central plaza could host **farmers markets, night markets, cultural festivals, and pop-up retail**, while a full-service **grocery store** anchors the hub as a reliable daily destination. Residential buildings above with a range of unit types and layouts designed to support diverse household types bring consistent foot traffic and help sustain activity throughout the day and evening.

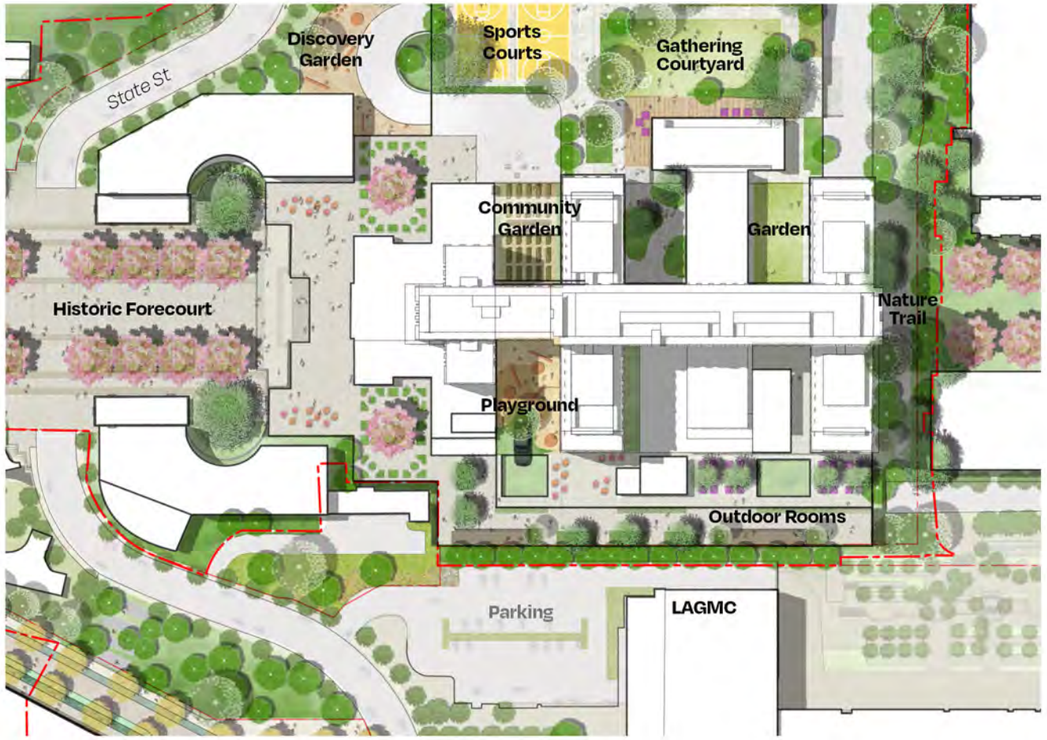


Commerce Hub Perspective



*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Commerce Hub Street Sections



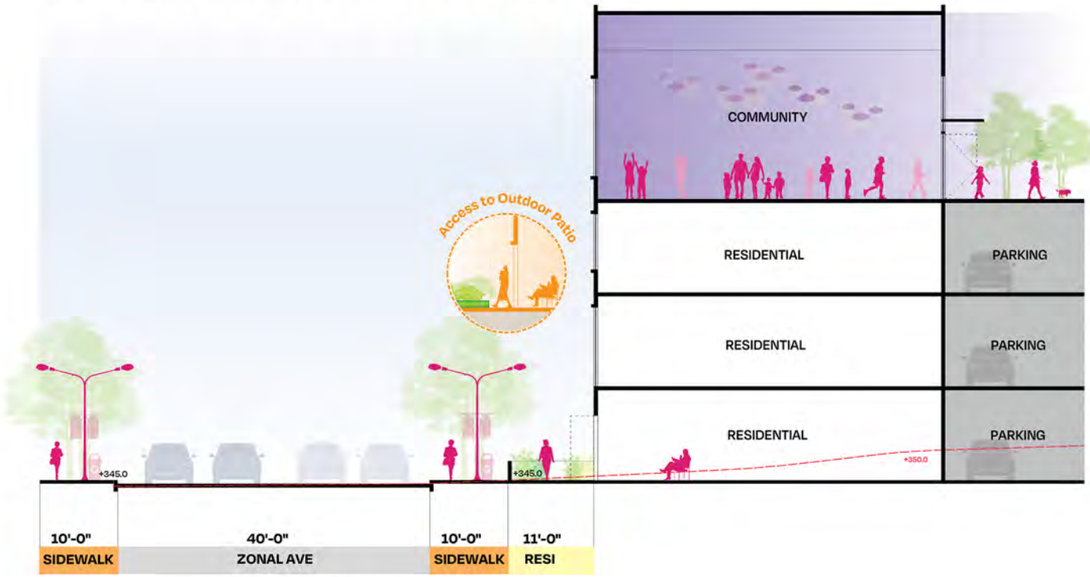
A. Street Section at Commerce Hub - Near West Entry

B. Street Section at Commerce Hub - Plaza

Historic Hub

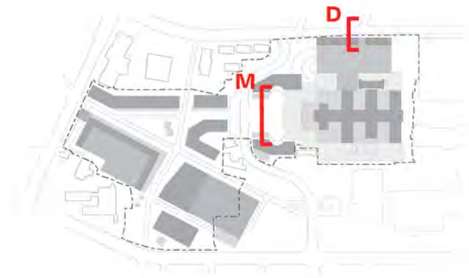
The **Historic Hub** is centered on the Forecourt and the adaptive reuse of the Historic General Hospital, forming the civic and cultural heart of the Master Plan. The landmark building is reimagined as multi-family residential community, complemented by ground-floor retail and community-serving uses that activate the Forecourt as a shared public space. The upper levels of the historic hospital floorplate is reconfigured to support a range of family types through unit mixes that provide a range of layouts including 3+ bedroom layouts, shared amenity spaces, flexible configurations with knock-out doors for expansion, and shared living infrastructure. Recreation facilities, open space, and food-oriented programs such as a kitchen and restaurant incubator or mercado food hall support daily life and community gathering.

The Historic Hub offers a rich mix of civic, cultural, and community-serving programs embedded within the adaptive reuse of the Historic General Hospital. Ground-floor spaces could include a **food hall or kitchen incubator** celebrating local cuisines, a café opening directly onto the Forecourt, and small neighborhood-serving shops. Community rooms and meeting spaces may support everything from neighborhood councils and workshops to conferences and public lectures.



Educational and intergenerational programs could include **childcare and early learning centers**, after-school programs, trade and workforce training classrooms, senior activity spaces, and lifelong learning studios. Cultural uses such as a **museum, art gallery, or historic interpretive center** anchor the Forecourt as a civic destination, while recreation facilities and open space support daily use by residents and visitors alike. These programs transform the historic building into a living, accessible community asset.

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).



Historic Hub Perspective

Historic Hub Street Sections

D. Street Section along Zonal Street

M. Street Section at Historic Forecourt

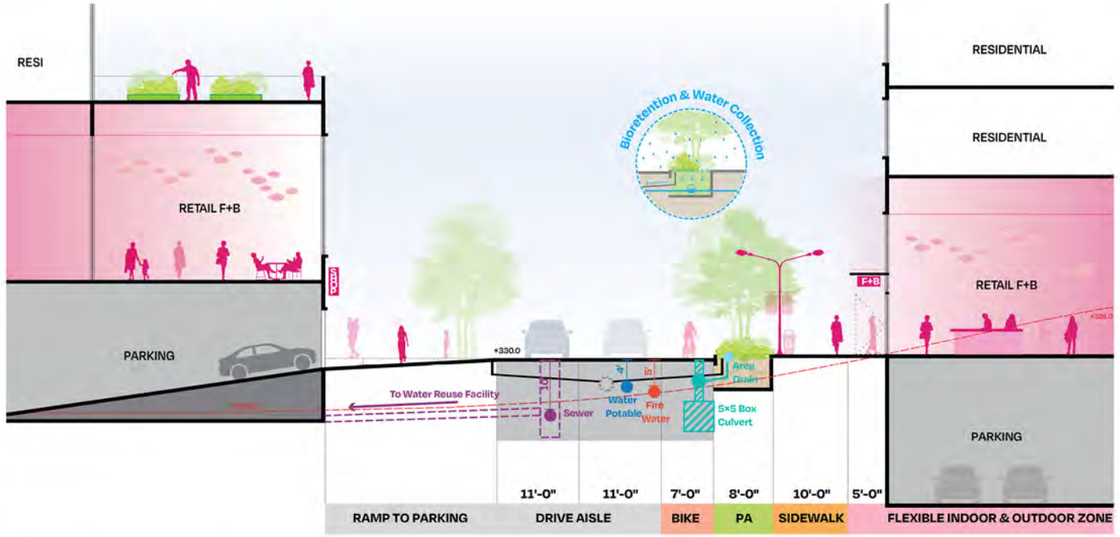
Medical Hub

The **Medical Hub**, centered on LA General Medical Center, builds upon the campus's historic role as a center for care while expanding access to community-oriented health services. In addition to medical services and clinics, the hub integrates continuity-of-care programs such as The Wellness Center, which connects patients and County residents to preventative care and services that address social determinants of health. Supporting amenities serve patients, visitors, doctors, nurses, and staff throughout the day.

Education and workforce development are also central to the Medical Hub's identity. Partnerships with charter schools, vocational training programs, nursing education, and satellite programs affiliated with local colleges and universities create pathways into healthcare and wellness careers. These programs strengthen the local talent pipeline while reinforcing the campus as a place of learning, opportunity, and long-term community investment.

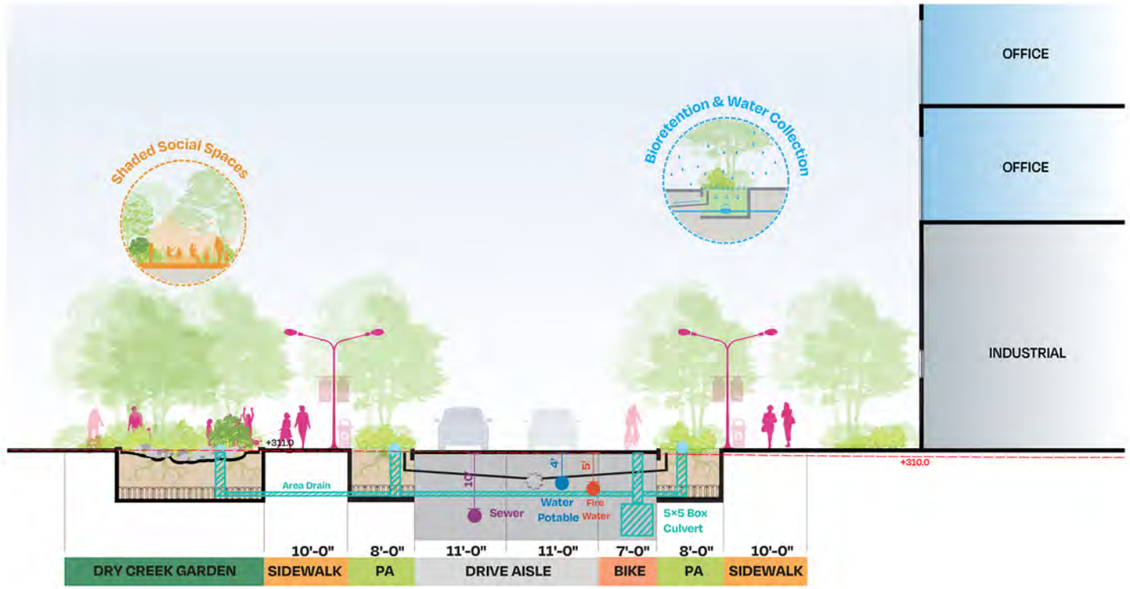
At the Medical Hub, community-oriented programs extend care into everyday life. Ground-floor retail and service spaces could include a **healthy grab-and-go café**, pharmacy-adjacent wellness retail, or a small medical supply and mobility shop serving patients and caregivers. **A community health resource center** might offer navigation services, group education rooms, and flexible spaces for wellness classes or support groups.

Outdoor spaces could be activated by **healing gardens**, shaded walking loops, and quiet courtyards for respite and reflection. Educational uses may include **nursing and allied health training classrooms**, simulation labs, or shared teaching spaces operated in partnership with local colleges, universities, or healthcare institutions. Together, these programs create a seamless continuum between treatment, education, prevention, and daily wellness.



*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Medical Hub Perspective



*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors.
Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

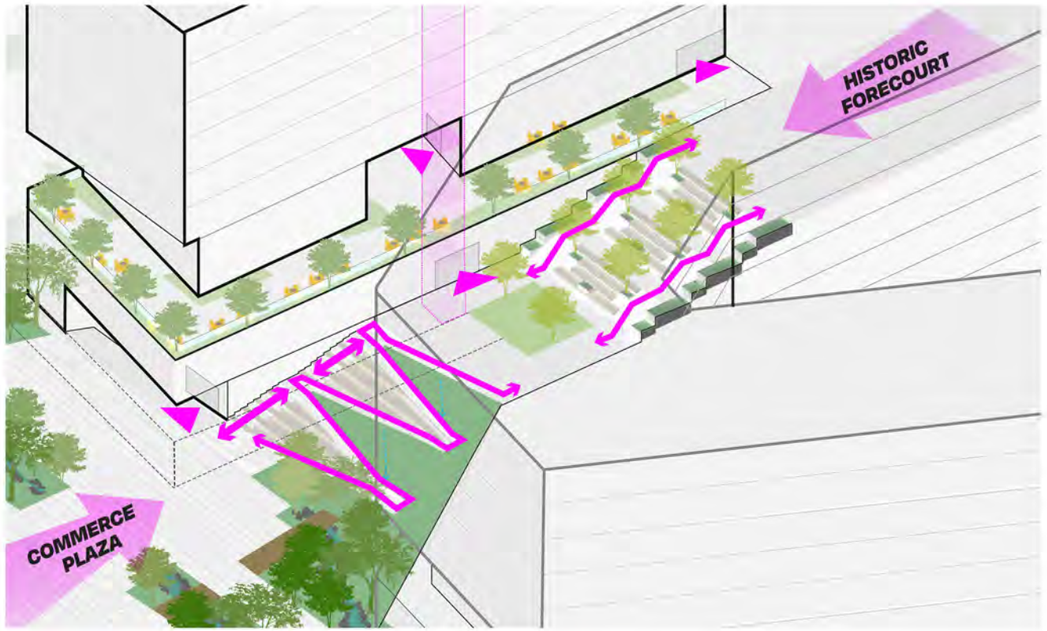
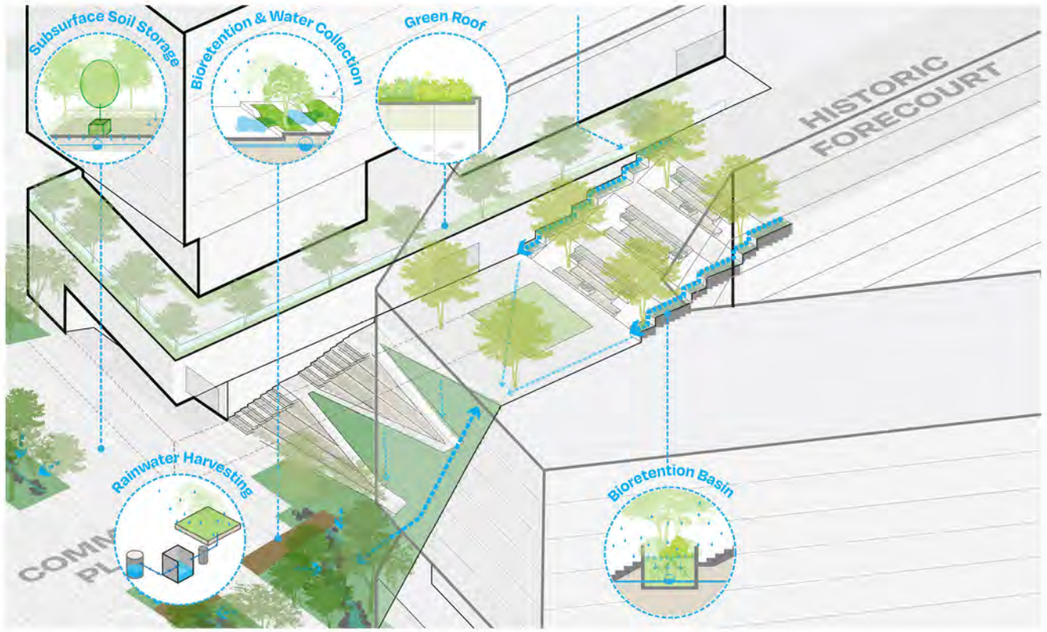
Community Corridor

Social Stairs

Playground

Community Retail





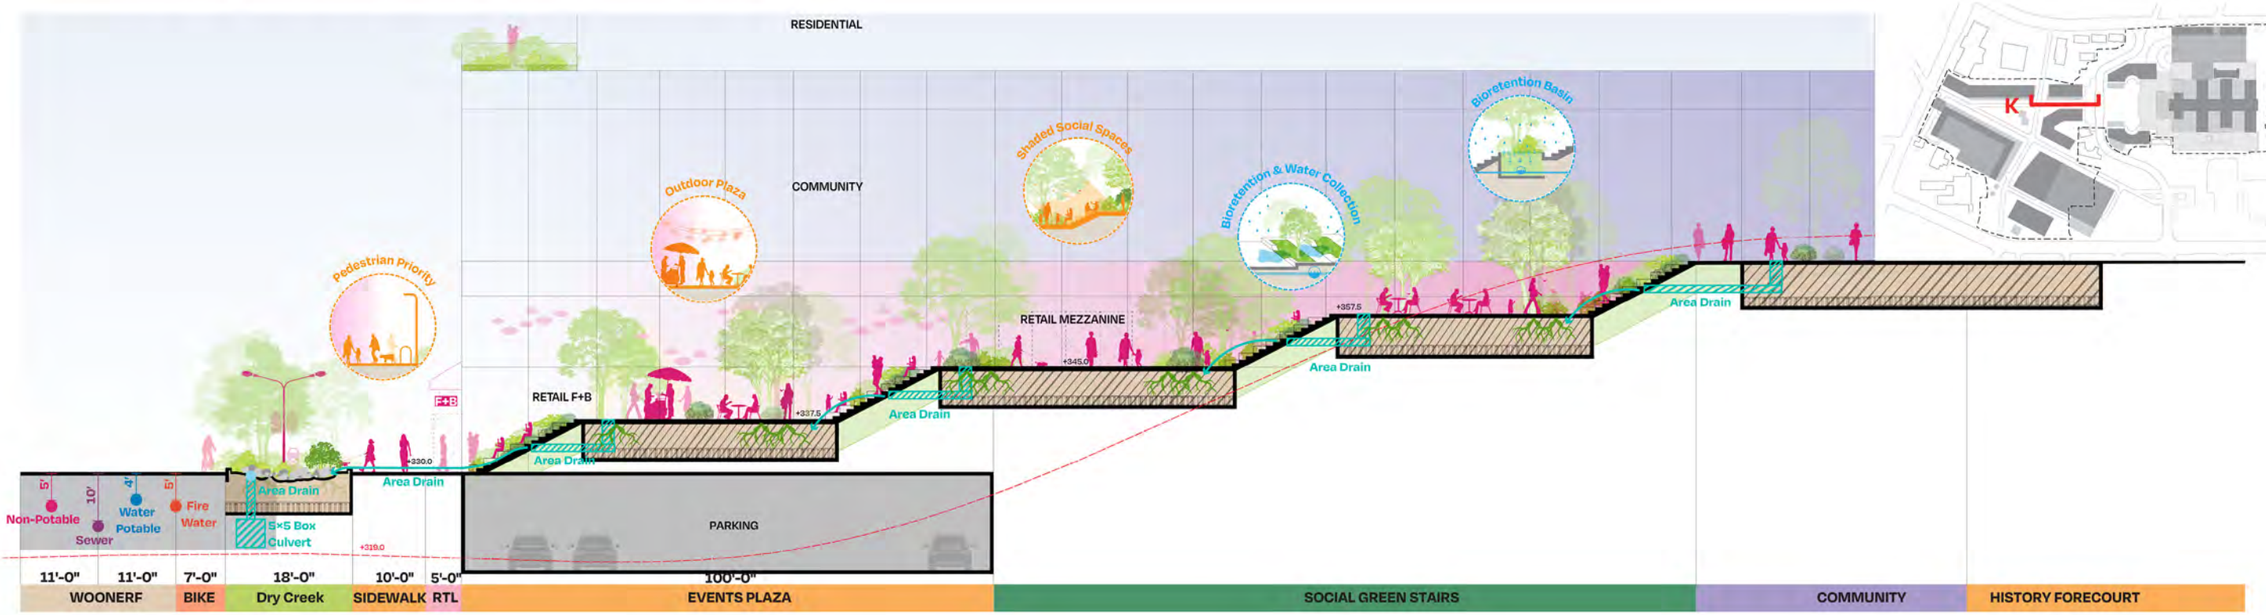
Food Stalls

The Community Corridor forms the central civic spine of the Master Plan, linking the Commerce Hub and the Historic Hub through a sequence of open spaces designed for gathering, celebration, and everyday social life. As the most prominent public space on campus, the corridor supports a wide range of community activities, from markets and festivals to informal daily use. Its scale and visibility establish it as a shared destination that brings together residents, visitors, and surrounding neighborhoods, reinforcing the campus as an open and welcoming place.

A defining feature of the Community Corridor is the **social stair**, which transforms a significant grade change into a legible, accessible, and highly active public space. The terraced steps provide a clear and intuitive connection between elevations while offering flexible platforms for community use throughout the day. At times, the stair functions as an amphitheater for performances, public speeches, and movie nights. At other moments, it becomes casual seating for lunch and conversation, a place for children to gather, or a challenging stair climb for exercise. By combining accessibility, movement, and programming, the social stair serves as both connective infrastructure and a dynamic public room that adapts to the rhythms of community life.

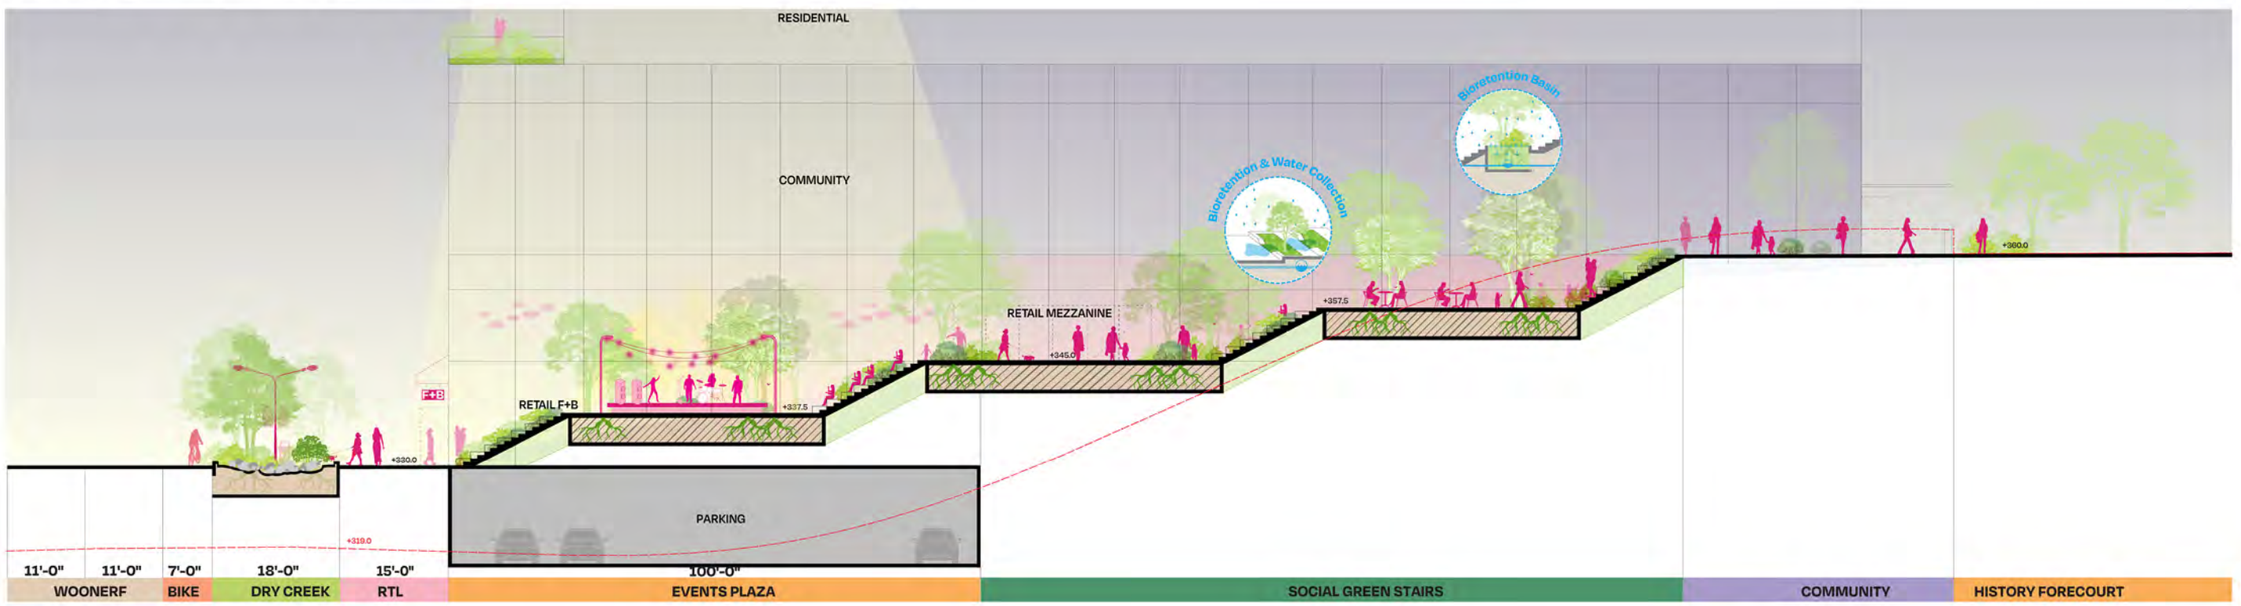
Community Corridor

Community Gardens



Corner Grocery

The social stair is designed first and foremost as an inclusive and legible connection across the campus's dramatic grade change. An integrated public elevator provides direct, intuitive access between key datums, including district parking, the community plaza, retail mezzanine levels, and the Forecourt. This vertical connection ensures that all users can move efficiently and independently across elevations, reducing travel distance and making the campus accessible for people of all ages and abilities. The elevator is highly visible and centrally located, reinforcing accessibility as a primary design feature.



Complementing the elevator, **a stair and ramp combination** weaves accessibility directly into the public realm. Gently sloped ramps are integrated alongside terraced steps, activating multiple levels of gathering space. These terraces support a variety of programmed and informal uses, including seating, gardens, shaded lounge areas, and overlooks, allowing accessible routes to pass through and animate the heart of the corridor. By embedding accessible movement within places of activity, the social stair reinforces inclusion while encouraging interaction, rest, and choice in how people move through the space.

The landscape of the social stair also functions as a critical component of the site's living infrastructure. Terraced planting beds and sub-surface soil systems are designed to store and infiltrate stormwater, supporting bioretention and on-site water collection during rain events. Rainwater harvesting systems feed planted areas and reduce runoff, while layered soils improve water quality and support healthy vegetation. Shade canopies, trees, and planted terraces mitigate heat island effects, creating a cooler and more comfortable microclimate throughout the stair. Together, these strategies transform the social stair into a hard-working landscape that manages water, improves comfort, and demonstrates sustainability as an everyday, visible part of community life.

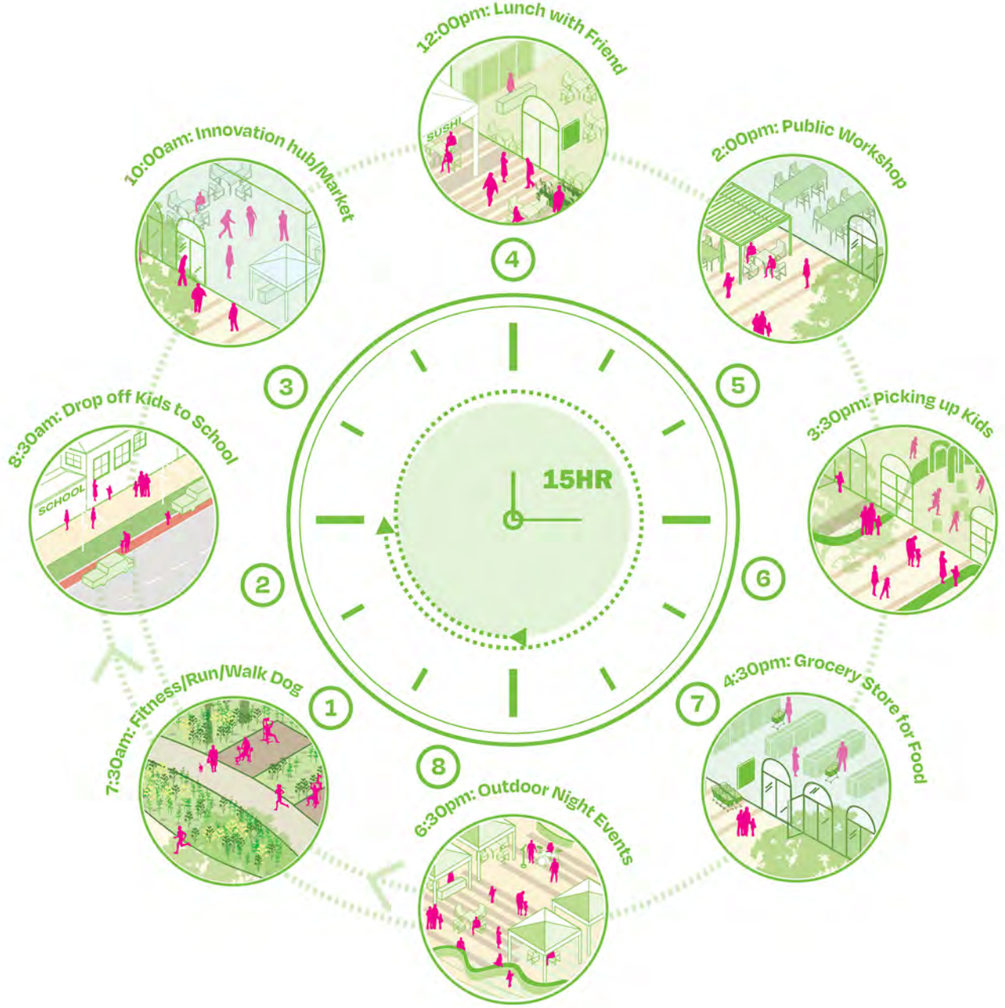
6.7 Daily Experiences

Several community workshops focused on what daily experiences members of the community are likely to engage in and how the design can support healthy living. Participants shared their favorite places within their neighborhoods and identified what aspects made them so successful. They also examined the site through the lens of potential activities and ranked them.

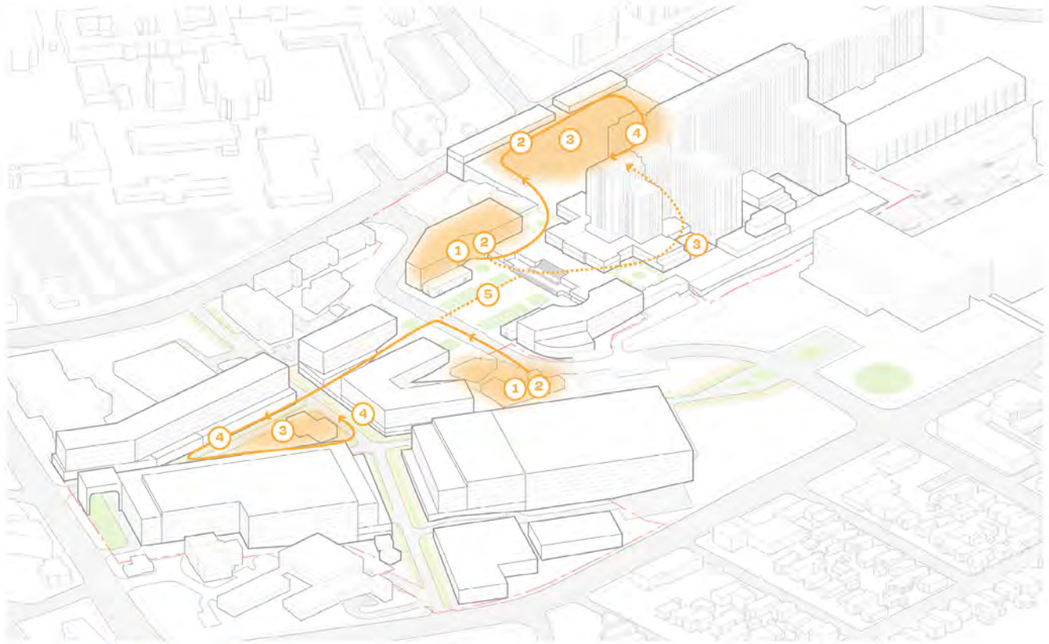
This feedback enriched the design of the Master Plan with a specificity of experiences that would support the rhythms of every day life for a wide range of people who live, work, learn, and receive care on the campus. Residents, children, teens, seniors, patients, and medical staff each experience the Healthy Village differently, yet their daily paths intersect through shared spaces, services, and activities. The following "Day in the Life" diagrams illustrate how the campus supports these overlapping routines, showing how people of different generations and walks of life move through the public realm, access amenities, and engage with one another over the course of a typical day.

Community Identified Spaces and Experiences

Response	Count	Share
Walking path	54	68%
Outdoor gym	52	66%
Soft grass picnic areas	47	59%
Shaded areas with seating	44	56%
Farmers market	42	53%
Outdoor movie theater	39	49%
Murals by local artists	37	47%
Music garden	37	47%
Native plants	37	47%
Food vendors	36	46%
Vegetable garden	35	44%
Butterfly garden	34	43%
Adult swing set	30	38%
Dog park	28	35%
Bike paths	25	32%



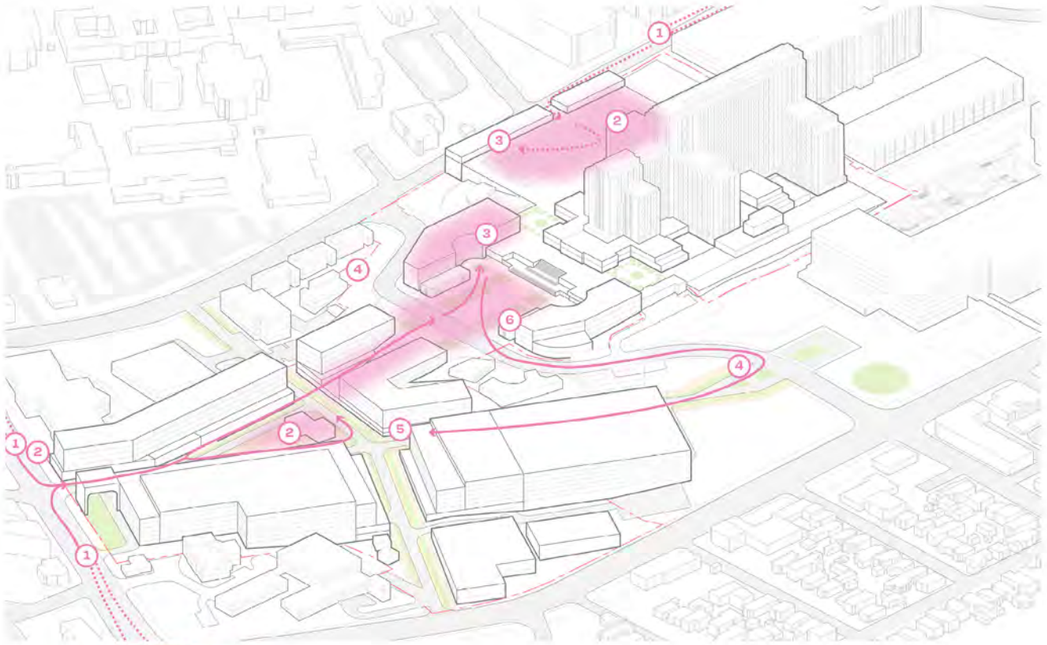
6.7 Day in the Life - Residents



Residents

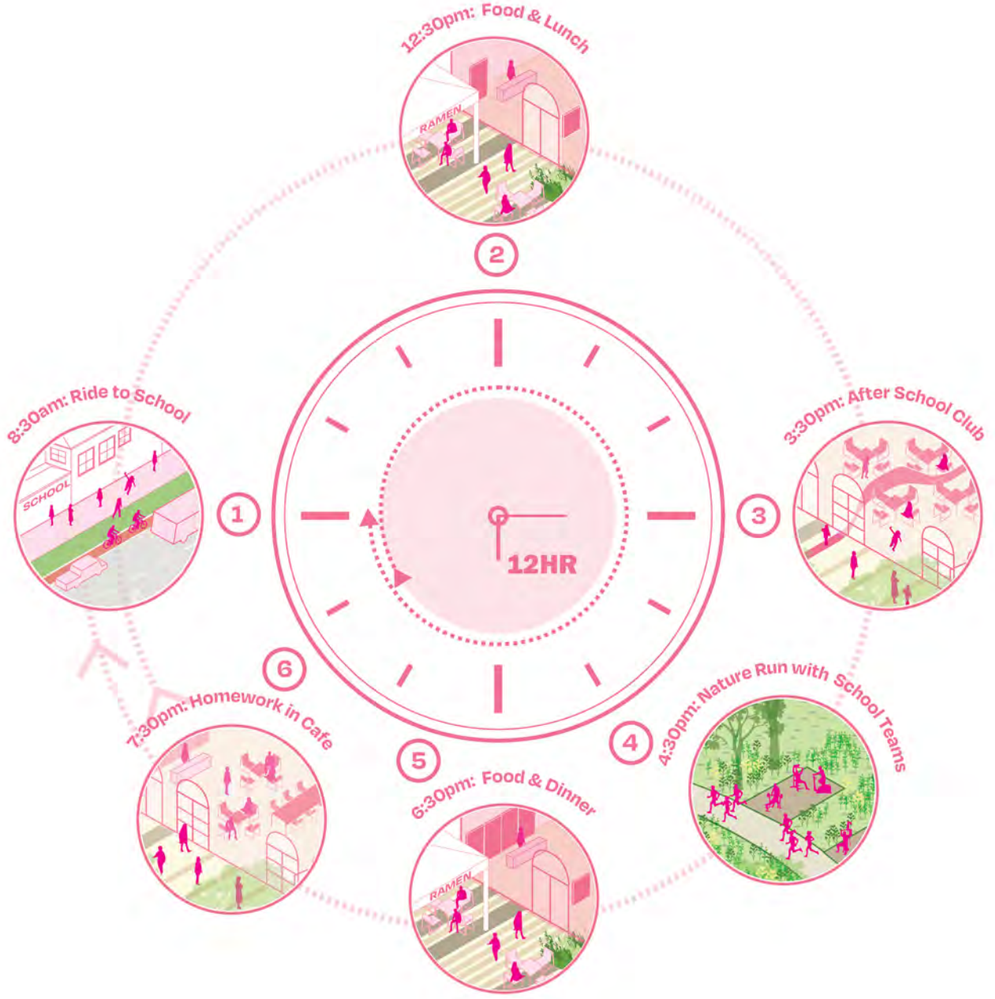
The future residents of the project site will have various amenities within walking distance. Daily activities like work, school drop-off, shopping, socializing and exercise can all happen within the site. Through activation, density and well-designed lighting to promote safety and visibility, the pedestrian experience would encourage residents to spend much of their day out and about within the campus.

6.7 Day in the Life - Children

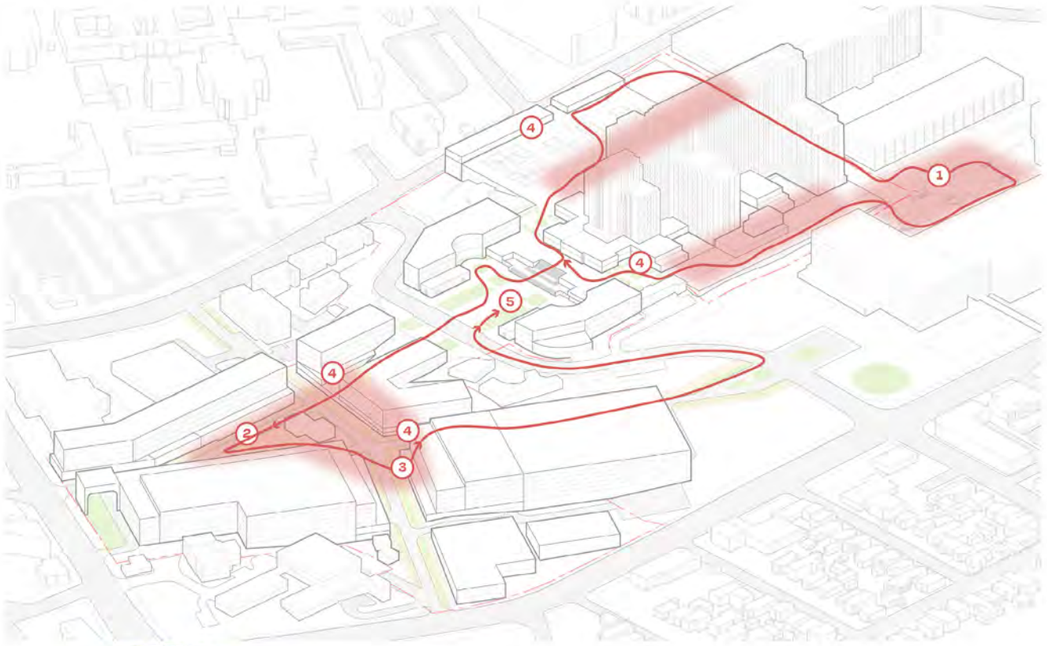


Children

Beyond school hours, children residing within and around the project site will congregate at the various community spaces within the campus. The cluster of educational intuitions, after-school programs, play spaces, and safe open spaces will promote daily engagement and routine that supports healthy childhood development.

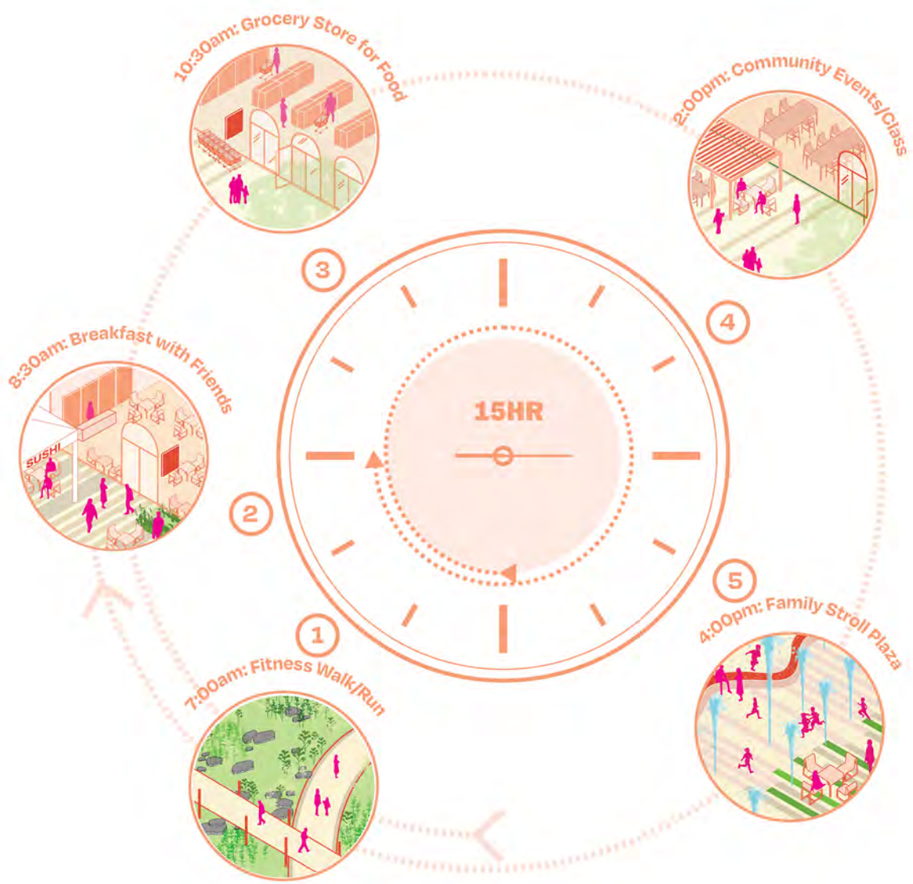


6.7 Day in the Life - Teenagers

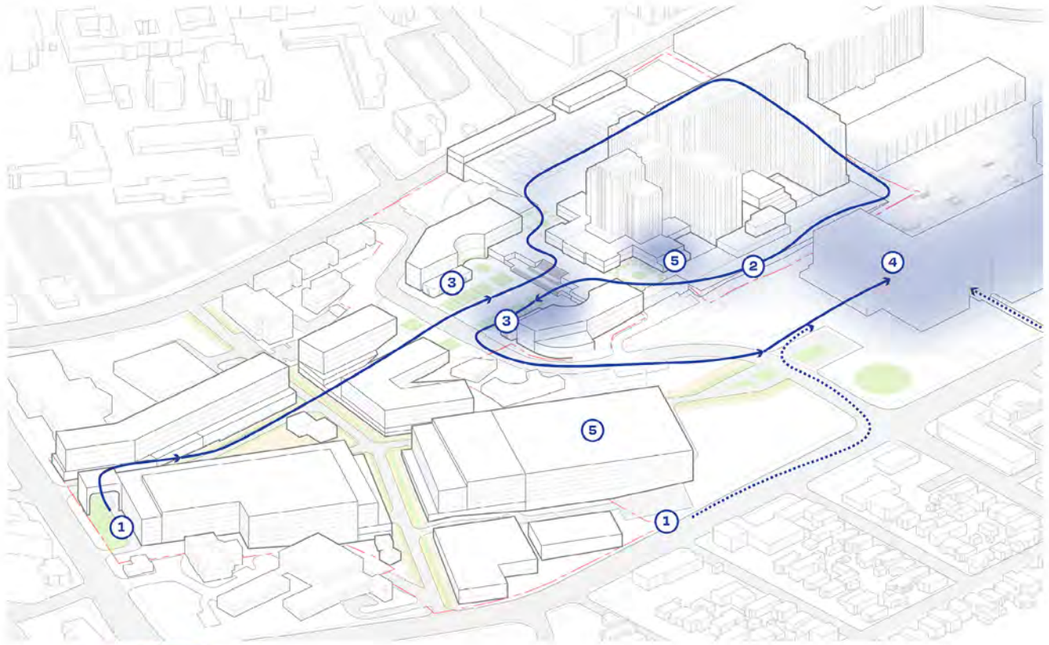


Teenagers

Key to creating Common Ground is the creation of physical third spaces for the community, particularly for teenagers. Old enough to need independence but not old enough to fully experience it, teenagers can interact within the project site through navigating the safe, accessible and inclusive spaces for teens to inhabit and explore. Particularly with the prevalence of social media, having physical spaces for teenagers to experience autonomy and separation are key to healthy development and community connection as they mature into adulthood.

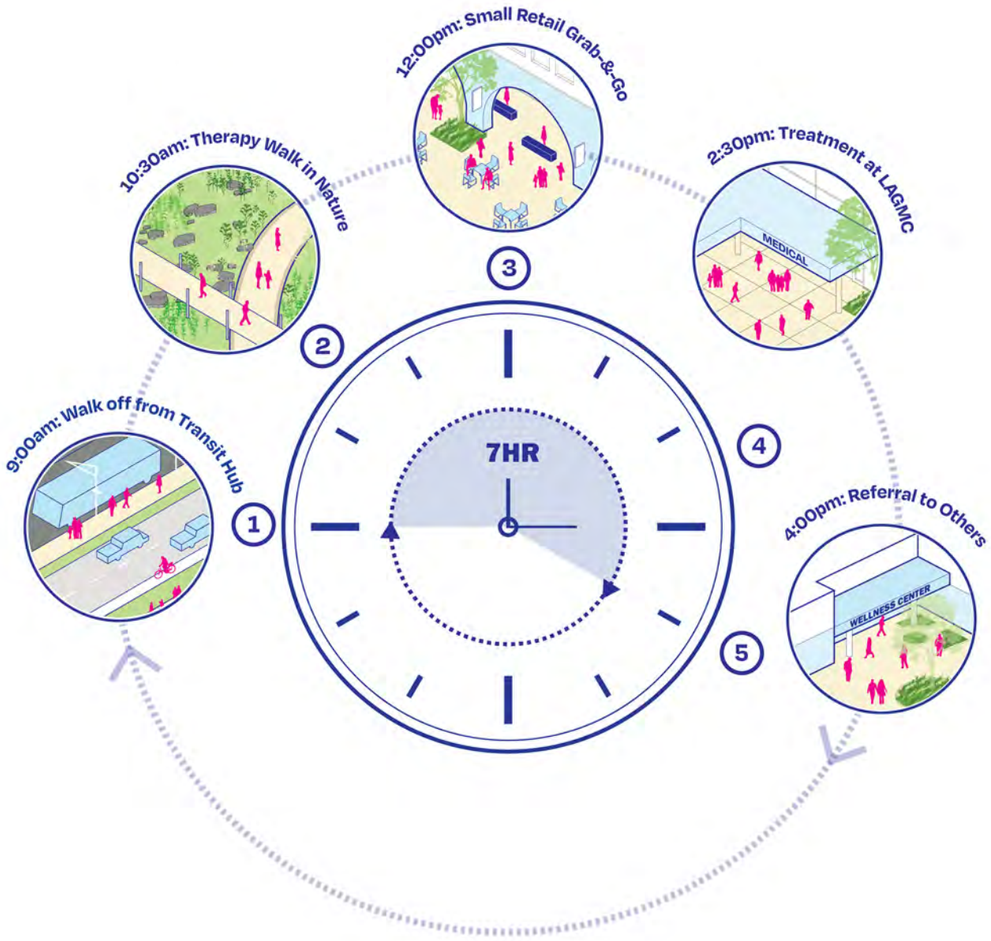


6.7 Day in the Life -Seniors



Seniors

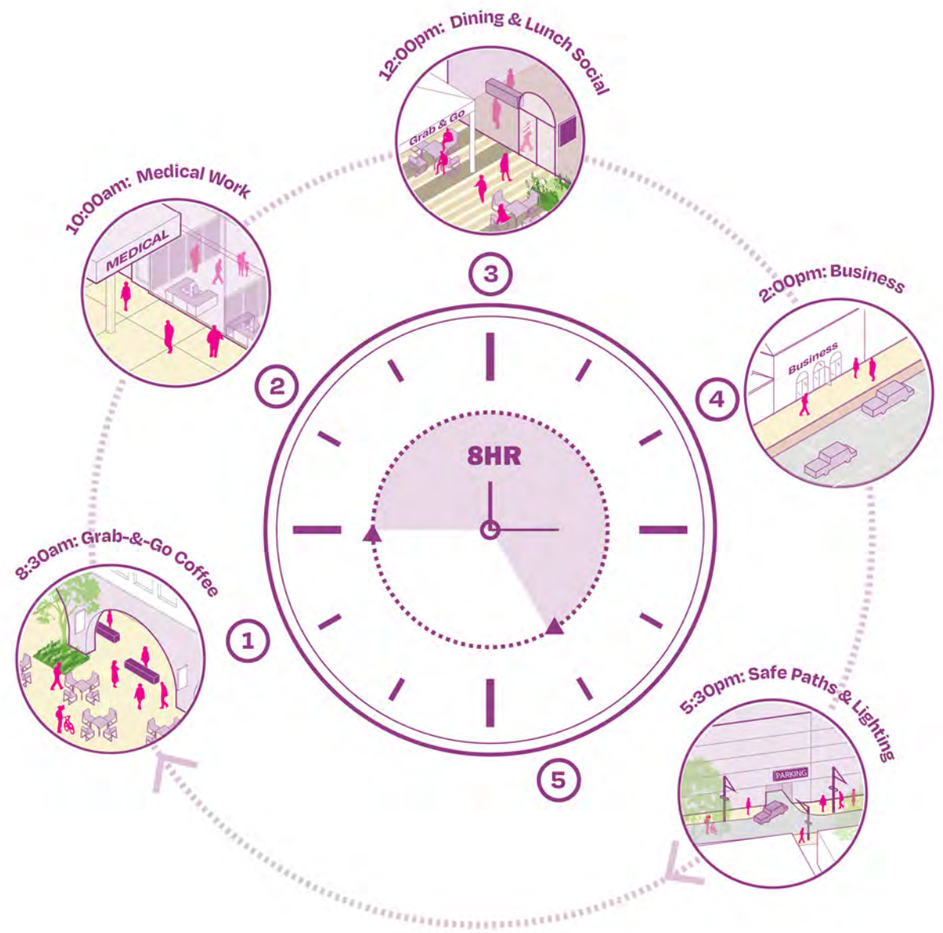
With global demographic patterns highlighting the rise in the number of seniors, it is imperative to provide an enhanced quality of life that promotes healthier lifestyles for the older generation. The campus' inclusive design fosters connection and ready access to care and long-term services that are integrated to support physical and mental wellness, social interaction and continued personal growth even at later parts of people's lives. Safe, accessible and comfortable outdoor spaces supplement consolidated community amenities to provide seniors with space to regularly independently venture alone or come together through active and regular routines like walks around the campus or resting on a bench under a large, shaded tree with friends.



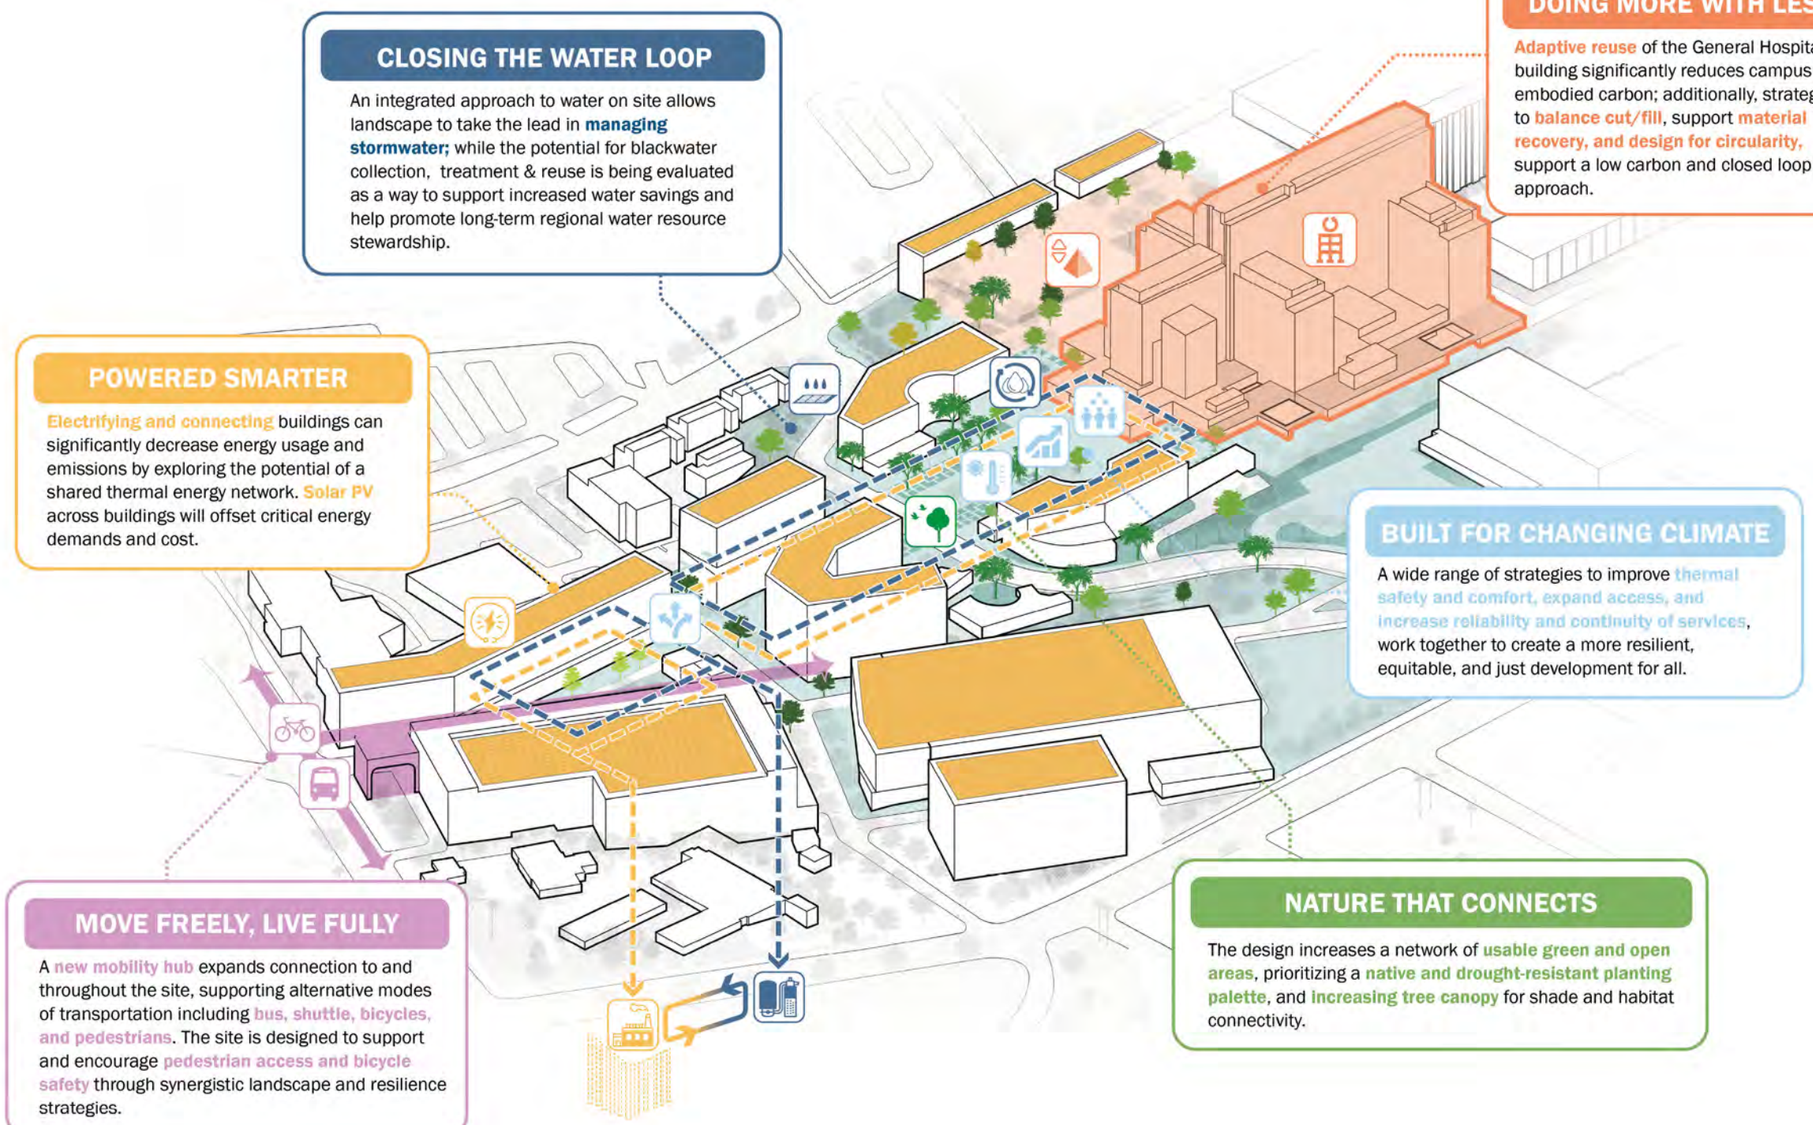
6.7 Day in the Life - Patients

Patients

Patients either visiting the site to receive treatment or recovering within the various health institutions have traditionally been isolated within specific buildings. The future of patient recovery and preventative measures relies on a more integrated community-approach that encourages healing through connection to nature, community support and regular social interaction.



6.7 Day in the Life - Staff



Staff

Currently, hospital staff have limited time and options for necessary food and work breaks through their long and often intense work shifts. The clustering of fast, walkable, and healthy dining and amenity options allows more choice and flexibility for staff. Rather than ordering food to be delivered to site, staff can physically step away to eat, getting some exercise while physically allowing a metal separation from the stress of their days.

6.8 Sustainability at LACGH

CLOSING THE WATER LOOP

An integrated approach to water on site allows landscape to take the lead in **managing stormwater;** while the potential for blackwater collection, treatment & reuse is being evaluated as a way to support increased water savings and help promote long-term regional water resource stewardship.

DOING MORE WITH LESS

Adaptive reuse of the General Hospital building significantly reduces campus embodied carbon; additionally, strategies to **balance cut/fill**, support **material recovery, and design for circularity,** support a low carbon and closed loop approach.

POWERED SMARTER

Electrifying and connecting buildings can significantly decrease energy usage and emissions by exploring the potential of a shared thermal energy network. **Solar PV** across buildings will offset critical energy demands and cost.

BUILT FOR CHANGING CLIMATE

A wide range of strategies to improve **thermal safety and comfort, expand access, and increase reliability and continuity of services,** work together to create a more resilient, equitable, and just development for all.

MOVE FREELY, LIVE FULLY

A **new mobility hub** expands connection to and throughout the site, supporting alternative modes of transportation including **bus, shuttle, bicycles, and pedestrians**. The site is designed to support and encourage **pedestrian access and bicycle safety** through synergistic landscape and resilience strategies.

NATURE THAT CONNECTS

The design increases a network of **usable green and open areas**, prioritizing a **native and drought-resistant planting palette**, and **increasing tree canopy** for shade and habitat connectivity.

Contributing to a future LA built for resilience, equity, and well-being, the new Los Angeles County General Hospital campus will feature Nature that Connects, enabling users to Move Freely and Live Fully in a space Built for a Changing Climate, Powered Smarter, and Designed to Close the Water Loop, all while Doing More with Less.

Sustainable and Regenerative Design Approach

Introduction

Sustainability, health, and well-being are central to the vision for LA County General Hospital. The project team has identified key drivers that shape the Master Plan, ensuring these principles are fully integrated into the campus design. Using a comprehensive framework approach, the team established sustainable, resilient, and equitable guidelines that inform the design strategies outlined in this section.

Horizontal and Vertical Framework

Horizontal infrastructure planning for the site is currently underway, and this sustainability framework establishes guidelines and recommended strategies to inform future vertical development. The Master Plan team focuses on designing horizontal infrastructure that support future vertical development passive design strategies and optimized building massing, while strategically identifying keystone buildings to accommodate strategies such as district energy systems, battery storage, and community resilience centers. This approach pinpoints buildings that are critical to the sustainability vision across the

Sustainability Drivers

These six sustainability drivers are used to categorize intended sustainability outcomes for the Master Plan. These categories will allow the design and team to formulate goals and track key strategies in an organized framework.

Equitable and Resilient Outcomes

While six categories are used to organize sustainability goals and strategies, all aspects of the Master Plan's sustainability approach center around resilient and equitable outcomes. Therefore, resilience and equity are placed at the heart of the graphic and the team's approach.

The following pages elaborate on each of the six sustainability drivers, as well as the resilient and equitable outcomes associated with each category.

Powered Smarter: Toward a Zero Energy Hub

Project Intent

Leverage infrastructural connection between the campus's diversity of uses to reduce energy use and costs for hub users.

Resilient & Equitable Outcome

High performance design centers affordability, while on-site renewables enable security in the face of power outages and other hazard events.

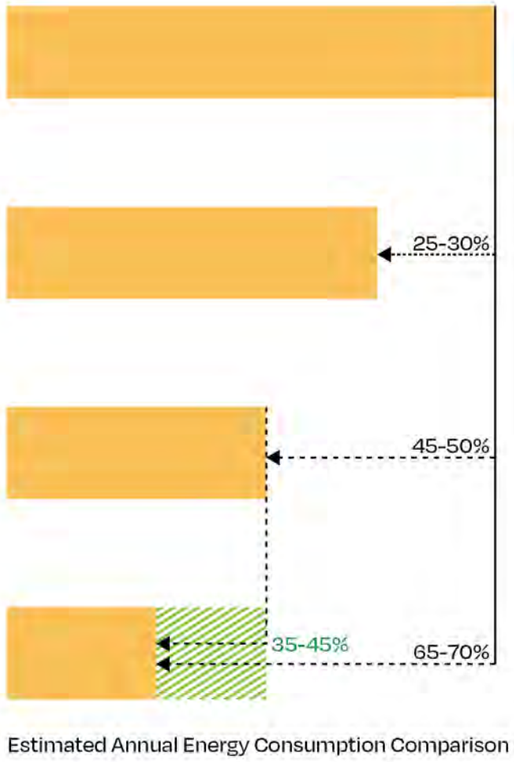
The LACGH campus has the potential to demonstrate significant reductions in energy use, energy cost, and operational carbon emissions.

To achieve a path toward zero energy use, a range of strategies is being actively explored. At the campus scale, **streamlined utility infrastructure** and keystone building placement can help optimize energy performance and support future development. Connections between program areas, such as shared **thermal energy networks, distributed energy resources, and centralized energy hubs**, may improve load management and increase the effective use of on-site renewable generation. **Electrification** of building systems is also being considered to support renewable energy integration and reduce operational carbon as the grid continues to decarbonize. These campus-level strategies are informing building placement, orientation, and passive design approaches to strengthen long-term performance. Future work will explore guidelines for high-performance vertical development to support sustainable growth across the campus. All strategies are being evaluated with careful consideration of long-term affordability, operational complexity, and future market conditions to guide responsible decision-making.

ELECTRIFICATION

Electrification is being evaluated as an approach that aligns the campus with Los Angeles' decarbonization goals. Electrification also improves indoor air quality in residential spaces by reducing reliance on gas appliances, which reduces the need for on-site gas infrastructure. High-efficiency electric building systems can integrate with on-site renewable energy, battery storage, and microgrids, supporting reduced energy demand and resilient backup power.

CENTRALIZATION AND THERMAL ENERGY NETWORKS



Given the diversity of program types, a thermal energy network is being explored as a potential approach to allow buildings to share and offset heating and cooling loads. This strategy may help reduce overall energy demand while supporting energy efficiency, resilience, and load-sharing capabilities. It could also contribute to lower operational costs, reduced emissions, and improved resource efficiency, and is identified as an important strategy under evaluation for the campus vision.

MICROGRID AND ON-SITE RENEWABLES

The Master Plan identifies rooftops and parking canopies as potential opportunities for on-site renewable energy generation, while prioritizing other site areas for open space and infrastructure. A campus-wide microgrid, integrated with battery energy storage systems, smart controls, and on-site renewables, is being explored as a framework to support efficient use of distributed energy resources during normal operations and to enhance resilience during outages.

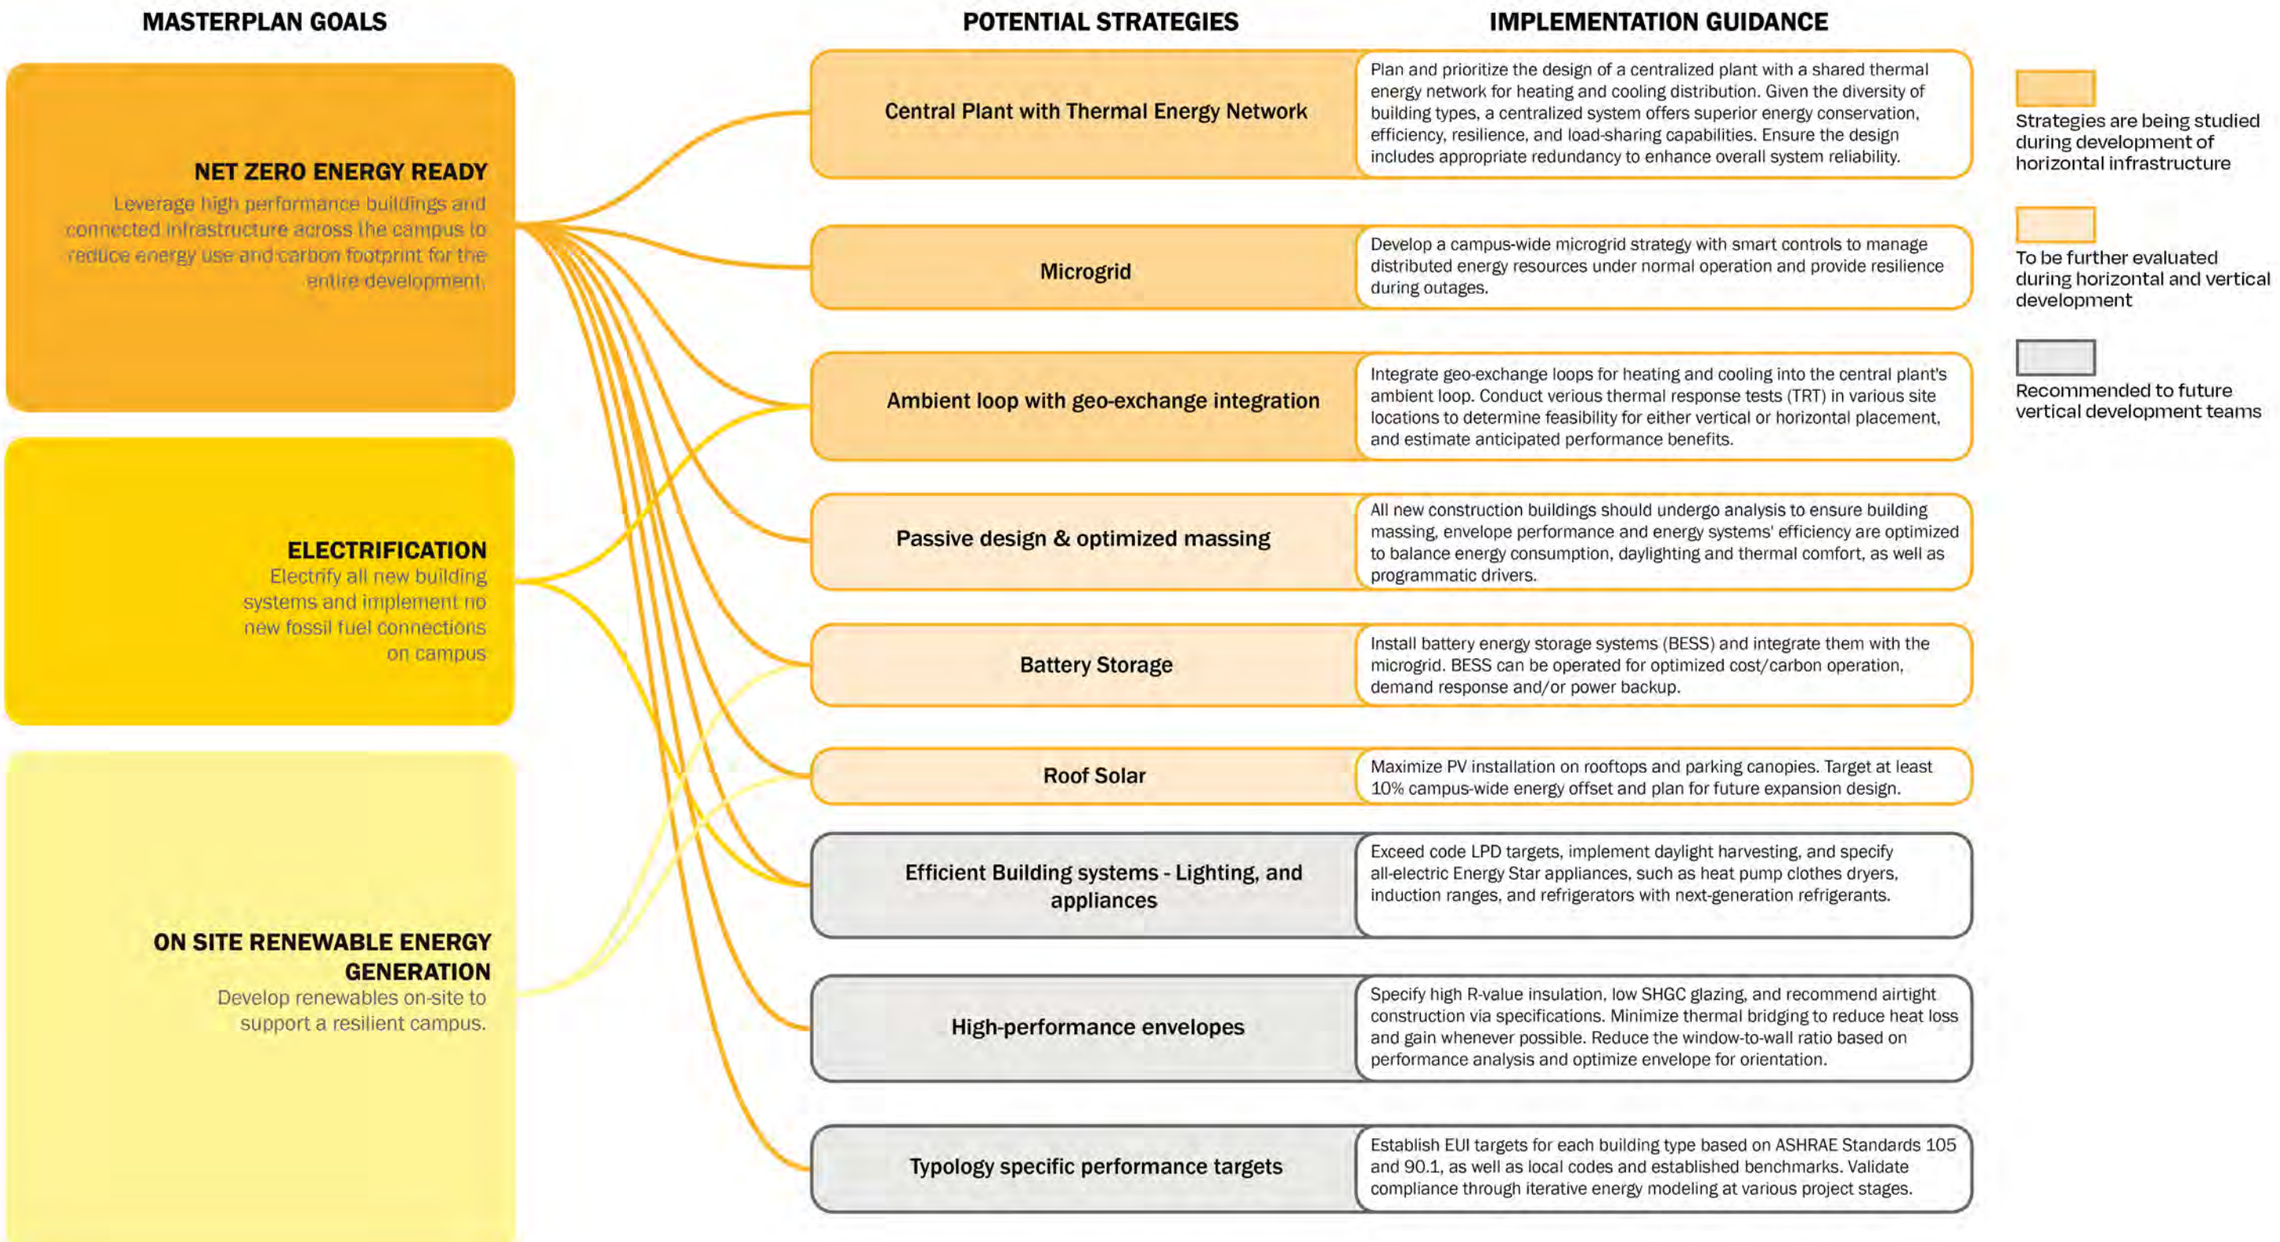
This integrated approach is intended to reduce greenhouse gas emissions, and enhances operational resilience, while allowing flexibility for future expansion and refinement by subsequent design teams.

The following page outlines potential strategies that will be explored to meet the Master Plan's targeted goals, and provides guidance for implementation of these strategies in design and beyond.

Estimated Annual Energy Consumption Comparison

Business as Usual Design
Code Compliant Buildings

Optimized High
Performance Buildings



Thermal Energy Network

Solar PV on Roofs

Powered Smarter: Toward a Zero Energy Hub

Closing the Water Loop: Toward Zero Water Waste

Project Intent

Utilize the site's natural grade to collect and treat blackwater, eliminating non-potable water demands and responsibly stewarding regional water supply.

Resilient & Equitable Outcome

Investing in infrastructure for water collection and reuse protects occupants from the cost escalation and risks that come from drought and water scarcity.

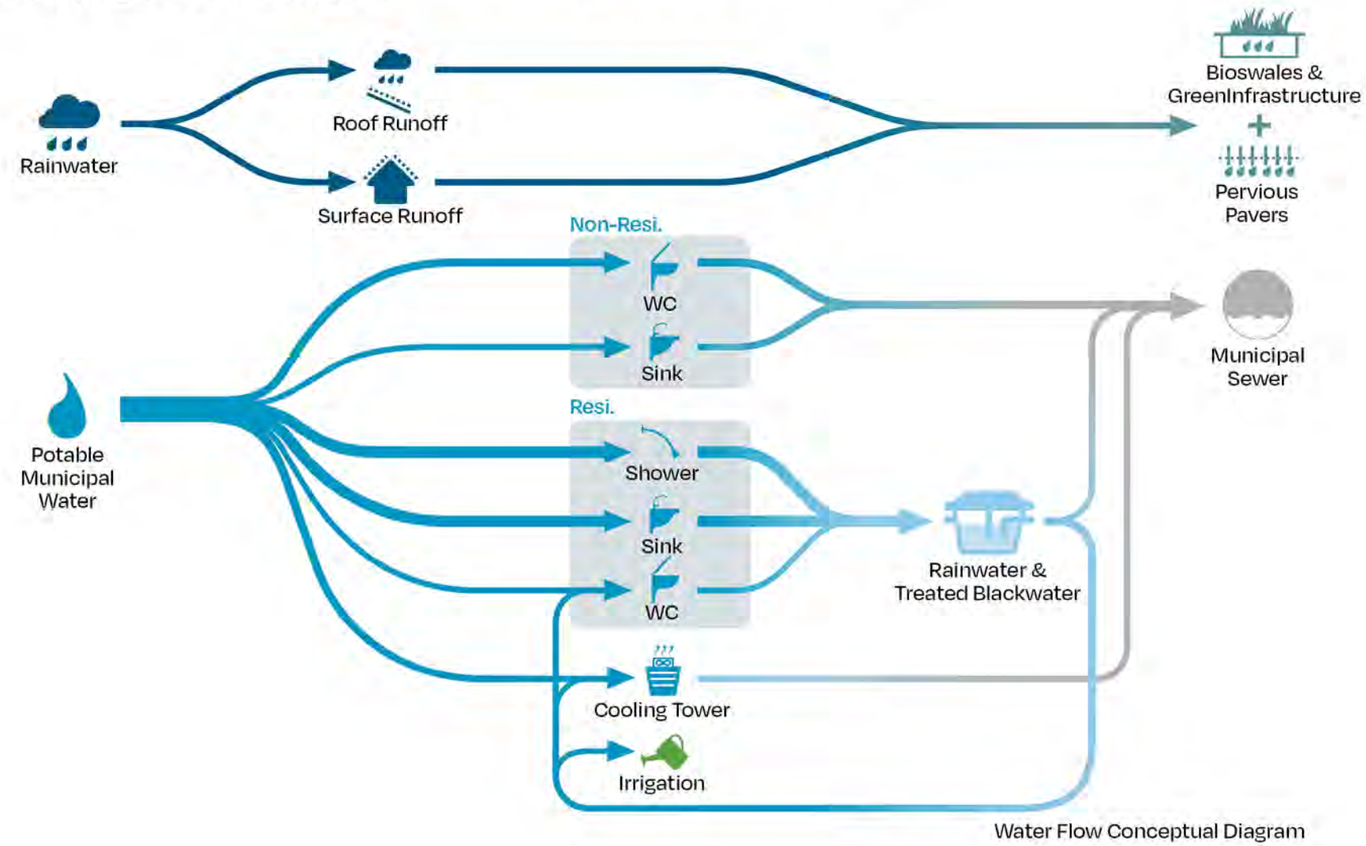
An integrated approach to water at the LACGH campus allows buildings and the site to together work toward reducing water waste.

By prioritizing water conservation through **efficient fixtures, drought-tolerant plantings, and high-performance landscape design,** overall water demand can be significantly reduced. **Site-integrated stormwater** management is intended to lessen the need for buildings to manage precipitation while enhancing landscape amenities for users. These strategies also inform a potential **blackwater collection** approach that relies on simplified infrastructure to offset non-potable demands across building programs and can further supports campus energy goals and streamlines utilities.

This holistic approach to water strategies not only helps **mitigate potential challenges associated with water stewardship,** but also **reduce regional stresses** on water resources, amplifying the benefits of these strategies for both LACGH users and the surrounding community. Future work will focus on establishing guidelines for reduced water consumption to promote sustainable campus growth. All strategies are assessed with consideration for long-term costs, operational feasibility, and shifting market conditions, supporting informed and responsible decision-making.

INTEGRATED STORMWATER MANAGEMENT

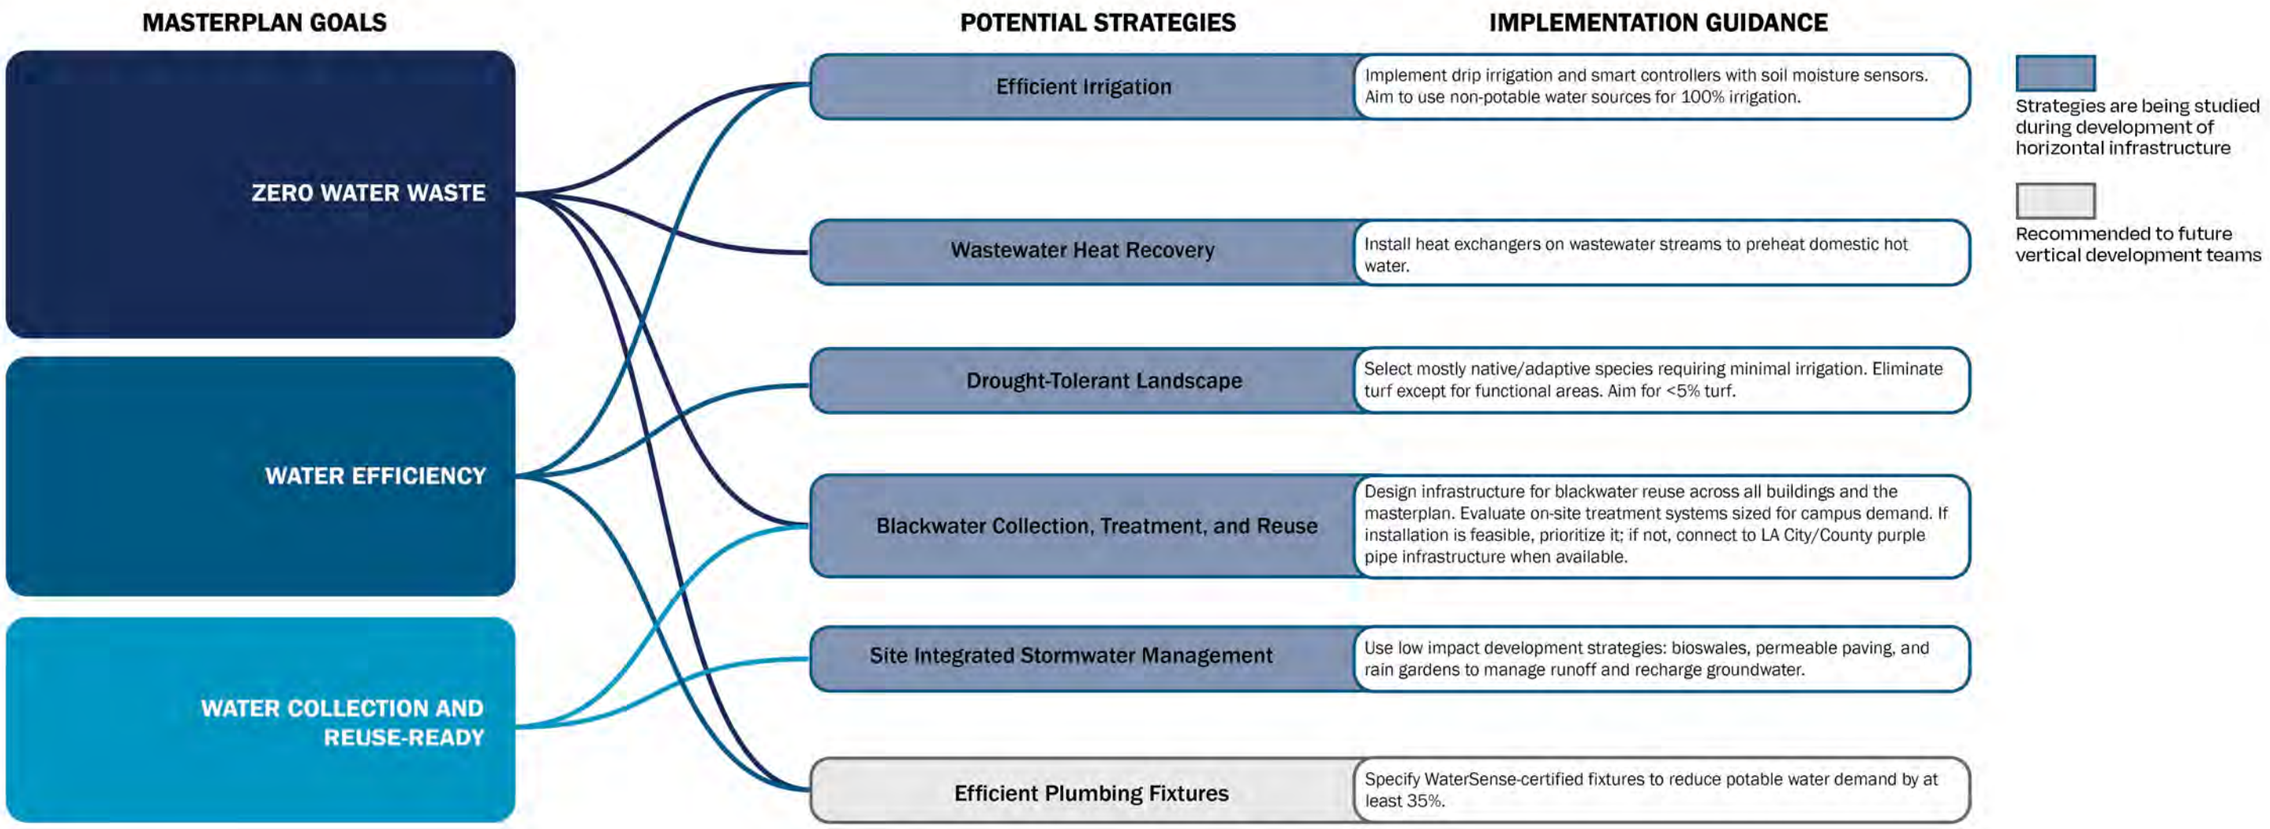
Site landscape is designed for integrated stormwater management to minimize reliance on greywater infrastructure. Low-impact development strategies, including bioswales, permeable paving, and rain gardens, capture and treat runoff on-site, promote groundwater recharge, and support a resilient, ecologically responsive campus.



WATER EFFICIENCY

Landscape systems can be designed for high water efficiency to minimize potable water demand. Drip irrigation and smart controllers with soil moisture sensors can optimize outdoor watering, supporting sustainable water management. WaterSense-certified fixtures are also recommended to reduce indoor water use of buildings.

BLACKWATER COLLECTION AND REUSE



Blackwater collection and reuse is particularly appropriate for this campus, given the mix of residential and non-residential buildings that provide a consistent source of wastewater for treatment and reuse. The site's terrain allows for gravity-assisted collection, helping to reduce energy demand, and its location outside the LA City greywater system allows on-site infrastructure to be tailored specifically to campus users. This approach is being actively explored to support water conservation and lessen reliance on municipal potable water.

The following page outlines the strategies required to meet the Master Plan's targeted goals, and provides guidance for implementation of these strategies in design and beyond.

Water Flow Conceptual Diagram

Closing the Water Loop: Toward Zero Water Waste

Doing More with Less:
Circularity and Low Embodied Carbon Design

Project Intent

Adaptive reuse of the general hospital building sets the stage for the site to become for a hub of material circularity innovation.

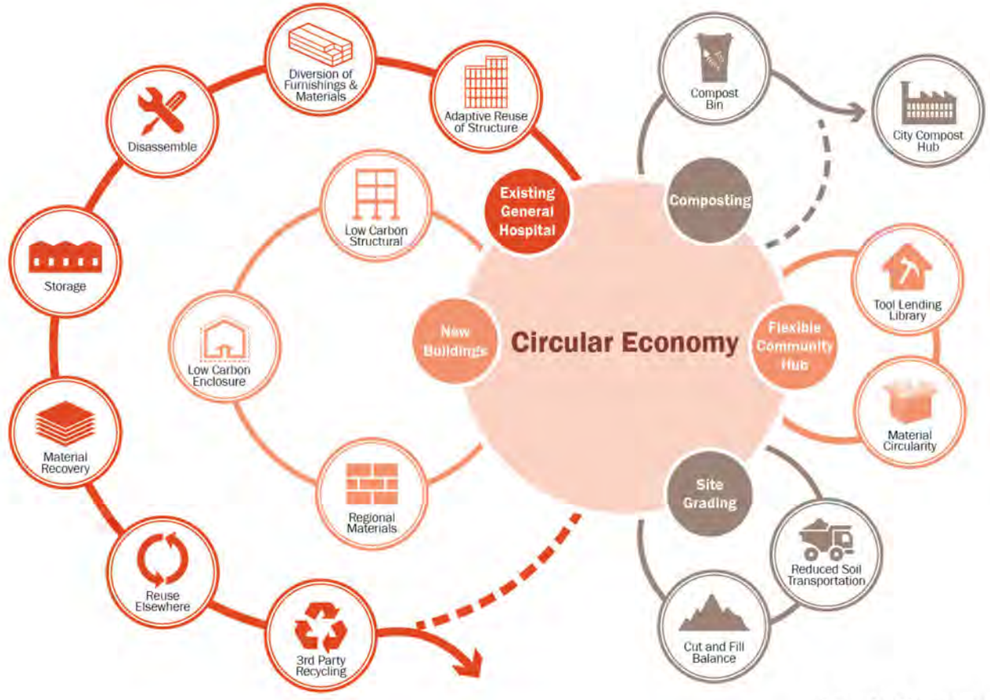
Resilient & Equitable Outcome

The local economy is supported through regional sourcing of materials and jobs, while reducing emissions helps break the cycle of marginalized communities bearing the brunt of the climate crisis, paving the way for a better future

DOING MORE WITH LESS

Adaptive reuse of the General Hospital positions the LACGH campus to be a leader in responsible and circular design, construction, and operations.

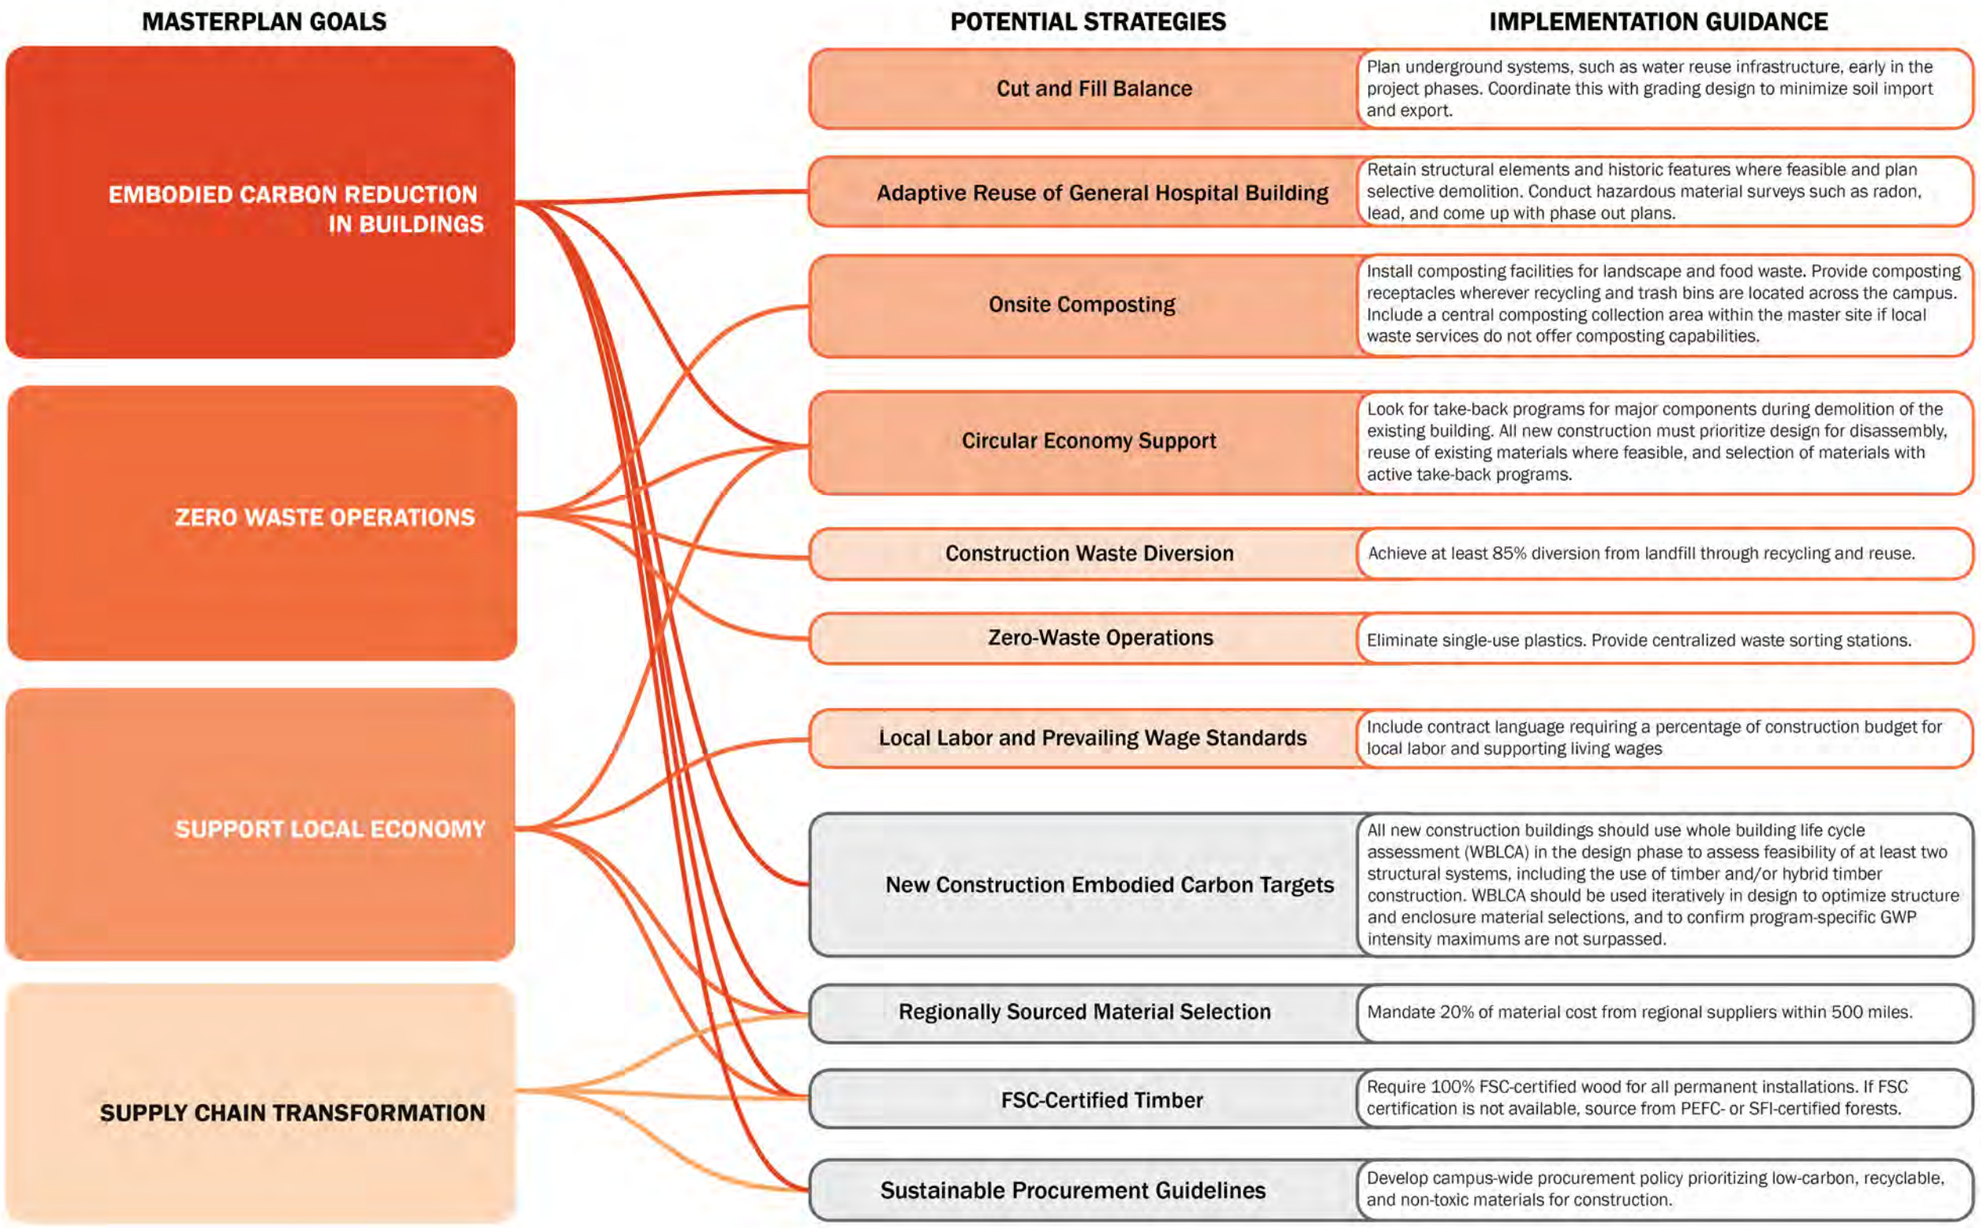
Converting the existing hospital building to affordable housing is a key strategy that supports **emission reductions and preserves the site's history**, while the campus also explores additional opportunities for sustainable development. Site and infrastructure planning seeks to **balance cut and fill** where feasible, helping to reduce the costs and emissions associated with moving soils and materials. Construction and operational waste can be managed with programs aimed at **diverting materials from landfills.** Through these intentional decisions, the campus is intended to foster a more equitable and sustainable future for residents and the wider community. All strategies are being evaluated with careful consideration of long-term affordability, operational complexity, and future market conditions to guide responsible decision-making.



The following page outlines the strategies required to meet the Master Plan's targeted goals, and provides guidance for implementation of these strategies in design and beyond.

ADAPTIVE REUSE

The Master Plan prioritizes adaptive reuse of the existing general hospital building to conserve embodied carbon. Structural elements and historic features are retained, while selective demolition is planned to minimize waste. This approach demonstrates sustainable material use and sets a precedent for the rest of the campus.



CUT AND FILL BALANCE

Optimize cut and fill balance to minimize the need to transport soils on or off-site. This approach significantly lowers construction transportation emissions and supports a more sustainable earthwork strategy for the campus.

Circular Economy

Doing More with Less:
Circularity and Low Embodied Carbon Design

Nature that Connects:
Greater Green Space and Habitat Connectivity

Project Intent

Increased access to green space within the campus supports positive health and wellness outcomes, while also strengthening linkages to regional green networks.

Resilient & Equitable Outcome

A biophilic design approach across the site supports equitable access to nature and outdoor amenities and encourages physical activity and rewilding.

Revitalizing the landscape at the LACGH campus supports both ecosystem regeneration as well as a biophilic environment for its users.

The campus landscape approach creates thriving open and green spaces. **Increased green and vegetated areas** are designed sustainably with **native and adaptive plantings** and increase **tree canopy cover** and **carbon sequestration.** This approach is expanded to intentionally create **habitat corridors and connectivity** with other major vegetative resources in the region. **Dark Sky-compliant lighting** design further supports habitat integrity. The site is also designed to promote access to **outdoor, open, and comfortable spaces**, promoting physical activity and wellness in a variety of ways. **Biophilic design** and **wellness amenities** integrated into the landscape support a healthful approach to the outdoors. Future work will focus on establishing guidelines for high-performance vertical development to promote green space and habitat connection. All strategies are assessed with consideration for long-term costs, operational feasibility, and shifting market conditions, supporting informed and responsible decision-making.

GREEN SPACE

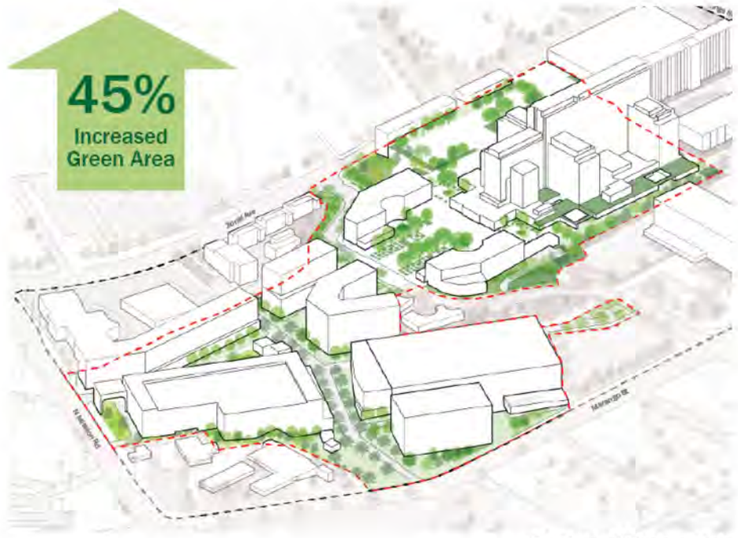
The Master Plan significantly increases vegetated areas, including both accessible open spaces and non-accessible vegetated zones. Green spaces are designed to maximize access to nature, supporting wellness and mental health, and are made equitable through ADA-compliant pathways and seating. The plan incorporates places of respite, restorative gardens, and quiet corners throughout the campus, providing opportunities for relaxation and well-being.

BIODIVERSITY AND VEGETATION

The landscape design emphasizes biodiversity and encourages re-wilding through the use of native and adaptive plant species, promoting drought-resistant plantings, ecosystem regeneration, and habitat integrity. This approach can strengthen ecological function, reduces irrigation demand, and contributes to a resilient, nature-rich campus environment.

HABITAT CONNECTIVITY

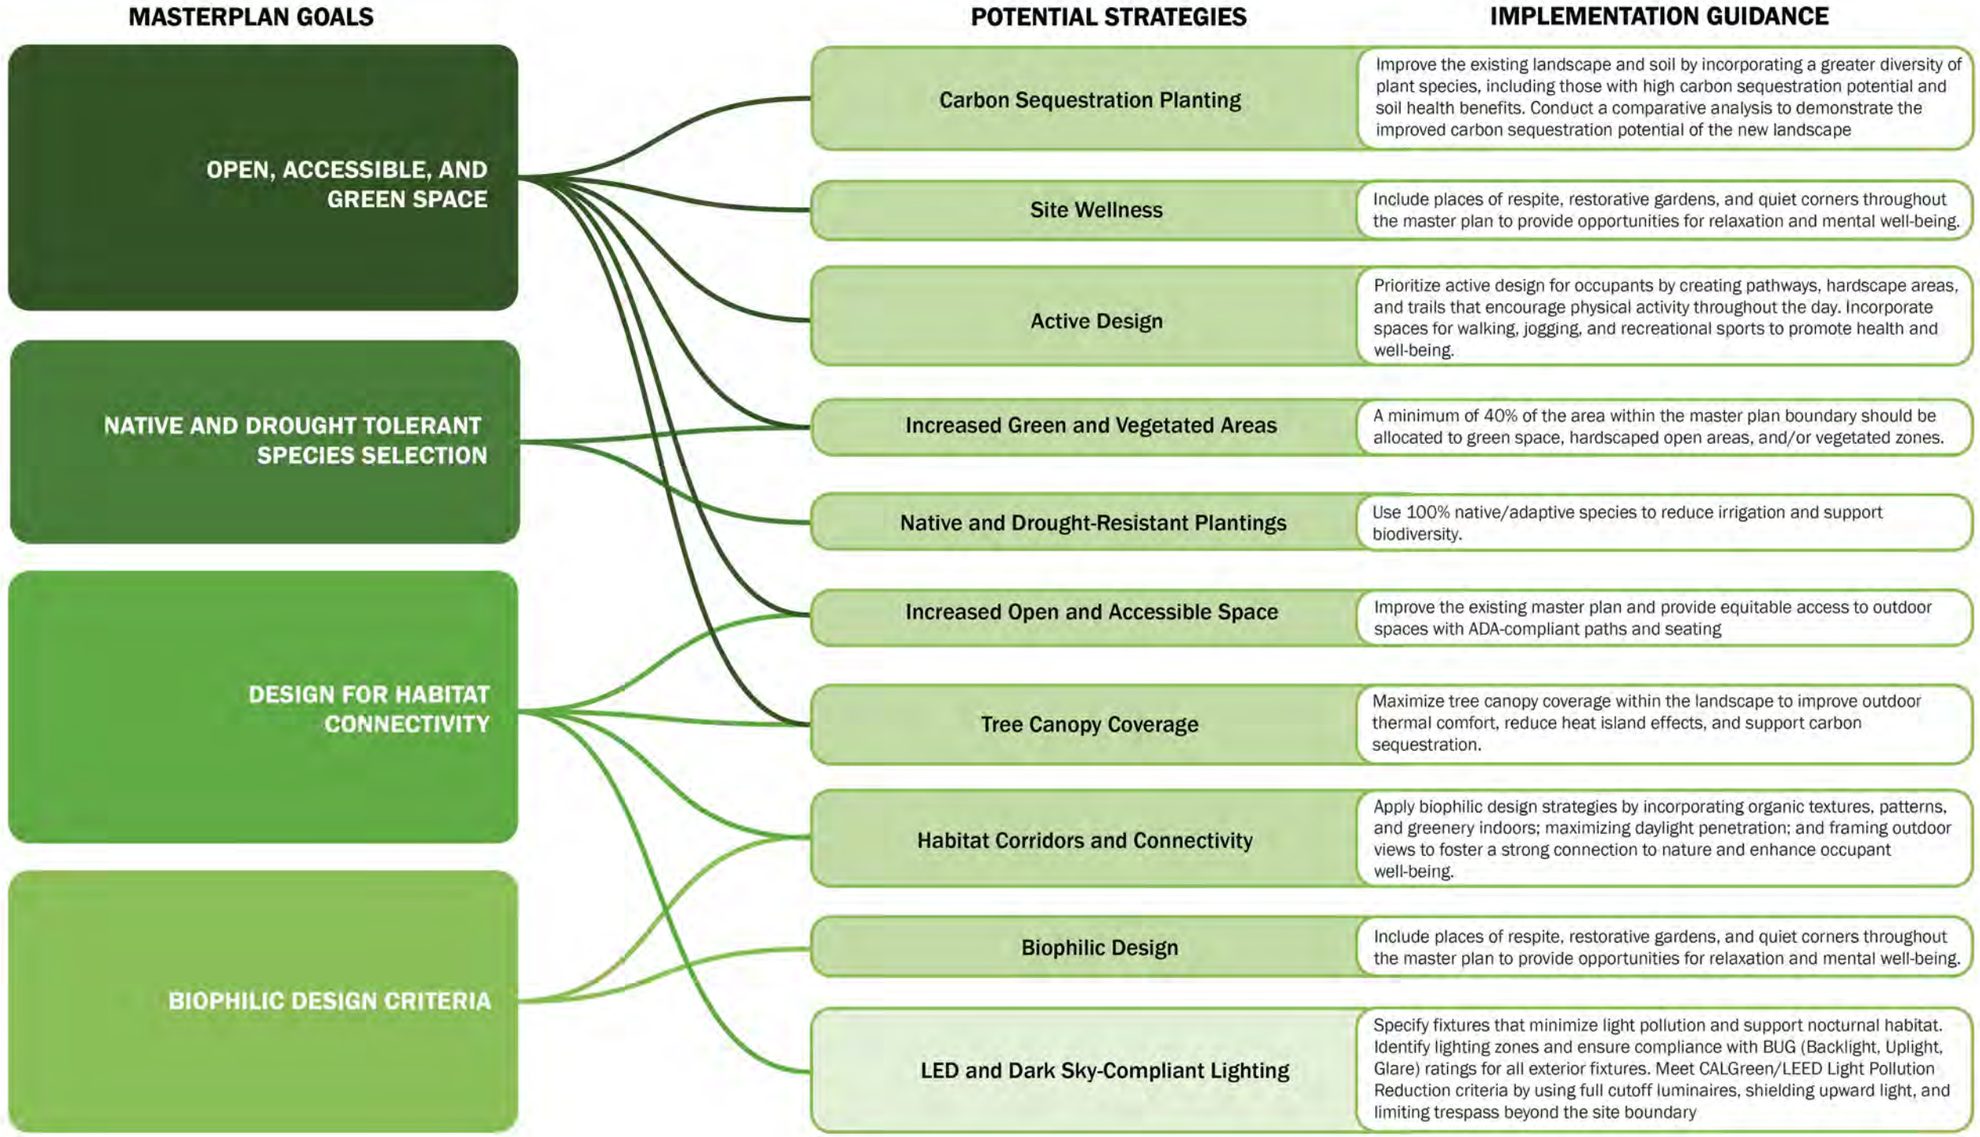
The site's proximity to surrounding green and vegetated areas enhances habitat connectivity. Landscape design creates corridors that support both human access to nature and safe movement for wildlife. Dark sky-compliant lighting further protects nocturnal species, ensuring that pathways and open spaces contribute to ecological connectivity and a biodiverse campus.



BIOPHILIC DESIGN

Biophilic design is the integration of natural elements and processes into the built environment to foster human connection with nature. The design enhances biophilia by providing access to nature, supporting ecological health, and creating restorative, resilient environments.

The following page outlines the strategies required to meet the Master Plan's targeted goals, and provides guidance for implementation of these strategies in design and beyond.



Existing Green Area

Designed Green Area

Nature that Connects:
Greater Green Space and Habitat Connectivity

Built for Changing Climate: Preparing for Future Stresses

Project Intent

Design for thermal safety in response to rising temperatures throughout the site and buildings to create more livable, usable spaces for decades to come.

Resilient & Equitable Outcome

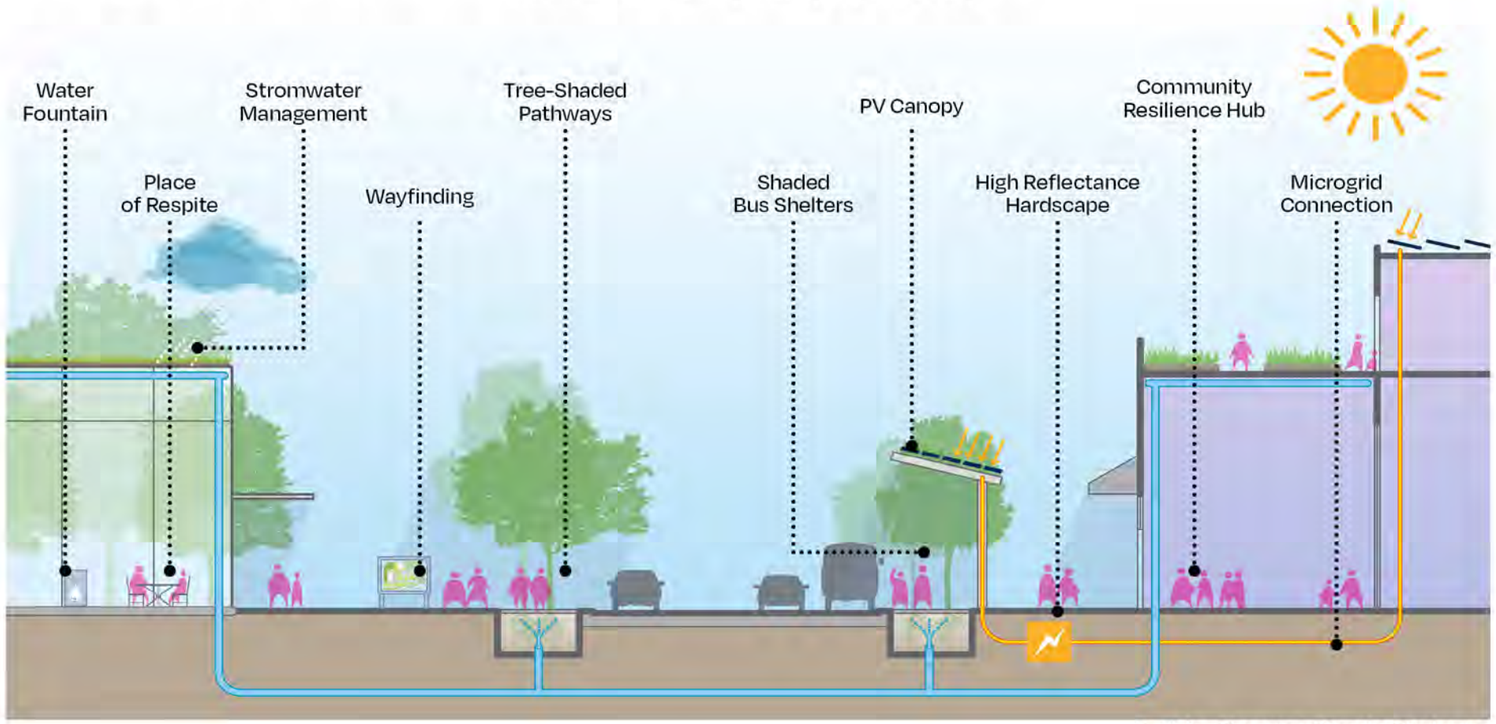
Thermally comfortable outdoor microclimates, paired with buildings designed to support passive survivability protect vulnerable site users and increase safety during hazard events.

A resilient design approach extends across buildings and landscape to create a safe campus that supports continuity and livability.

The LACGH campus holistically aims to integrate design strategies that support its users in a climate that continues to change. While increasing temperatures can impact comfort and ability to be outdoors, measures such as **expanded tree canopy, shading, high-reflectance hardscapes**, and thoughtfully planned **access to amenities** are being explored to support walkability and safety for users of all ages. Buildings can be designed for **passive survivability** so residents are safe to withstand hazard events in the comfort of their homes. **Battery-supported backup power and water treatment infrastructure** are being considered to enhance reliable energy and water supply. A **community resilience hub** creates a central place for resource and information distribution, strengthening the community bonds that underpin a truly resilient neighborhood. Future phases will further define guidelines for high-performance vertical development that support sustainable campus growth, with all strategies reviewed through the lens of long-term affordability, operational complexity, and evolving market conditions to guide responsible decision-making.

OUTDOOR THERMAL COMFORT

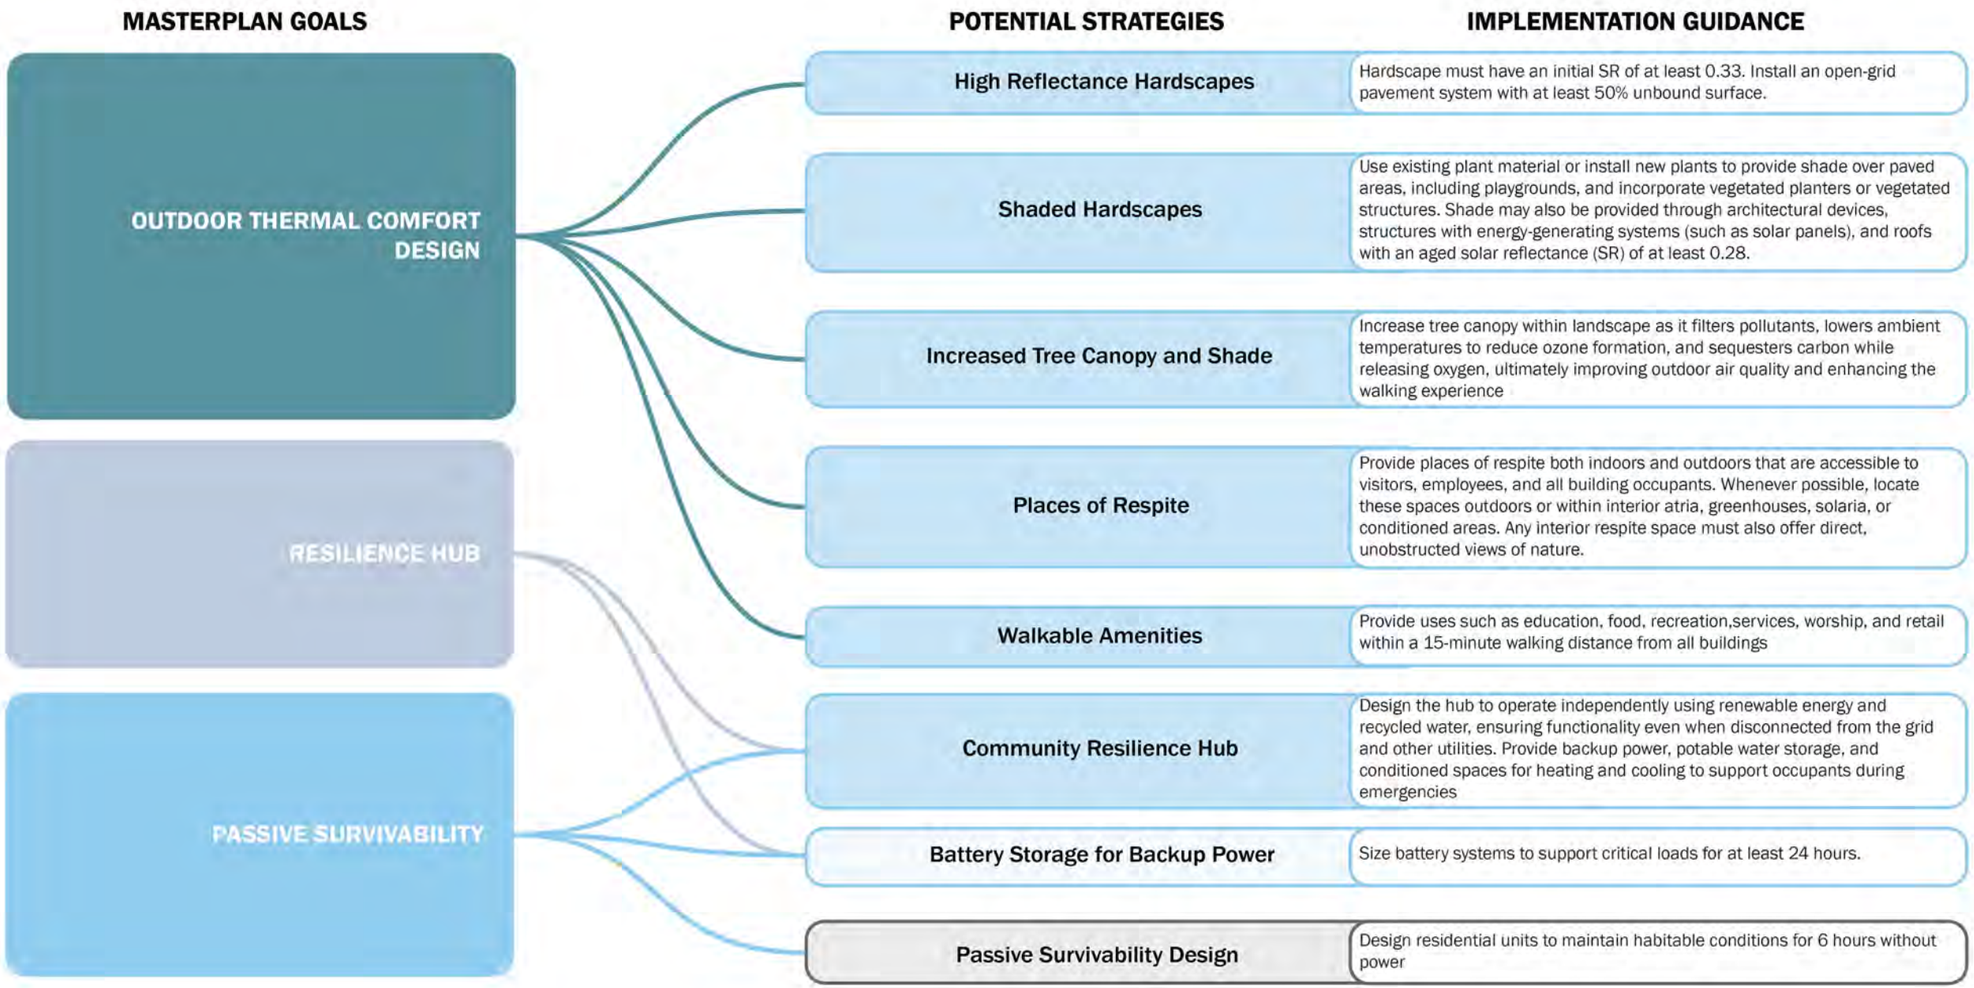
The design integrates multiple outdoor thermal comfort strategies to support safe use of the campus. Shaded bus shelters and rest areas, shaded pathways, and high-reflectance hardscape materials can be strategically implemented to reduce heat gain and thermal stress. These measures are expected to improve pedestrian comfort, support active mobility, mitigate heat island effects, and contribute to healthier outdoor environments across the site.



PASSIVE SURVIVABILITY

Passive survivability is intented to help buildings remain safe and habitable during power outages or hazard events without active systems. Residential buildings are planned with amenity accessibility, resilient energy and water infrastructure, and backup systems to maintain operational continuity. Together with outdoor thermal comfort strategies, these approaches contribute to a holistic approach to thermal safety and campus resilience.

COMMUNITY RESILIENCE INFRASTRUCTURE



Community resilience infrastructure combines social and physical strategies to strengthen community ability to respond to hazards. A central community resilience hub can potentially provide a reliable source of power and water during emergencies, serve as a known location for resource and information distribution, and offer flexible space for gatherings. By supporting both emergency preparedness and social interaction, these hubs enhance the overall resilience and connectivity of the community.

The following page outlines the strategies required to meet the Master Plan's targeted goals, and provides guidance for implementation of these strategies in design and beyond.

Built for Changing Climate Strategies

Built for Changing Climate: Preparing for Future Stresses

Move Freely, Live Fully:
Expanded Multi-Modal Connectivity & Access

Project Intent

Creating a mobility hub at the campus expands necessary access to the region, while also providing key amenities on-site to support a thriving local community.

Resilient & Equitable Outcome

Improving and expanding access to community services and the larger region, while reducing reliance on single occupancy vehicles, bridges socioeconomic gaps and promotes equitable success.

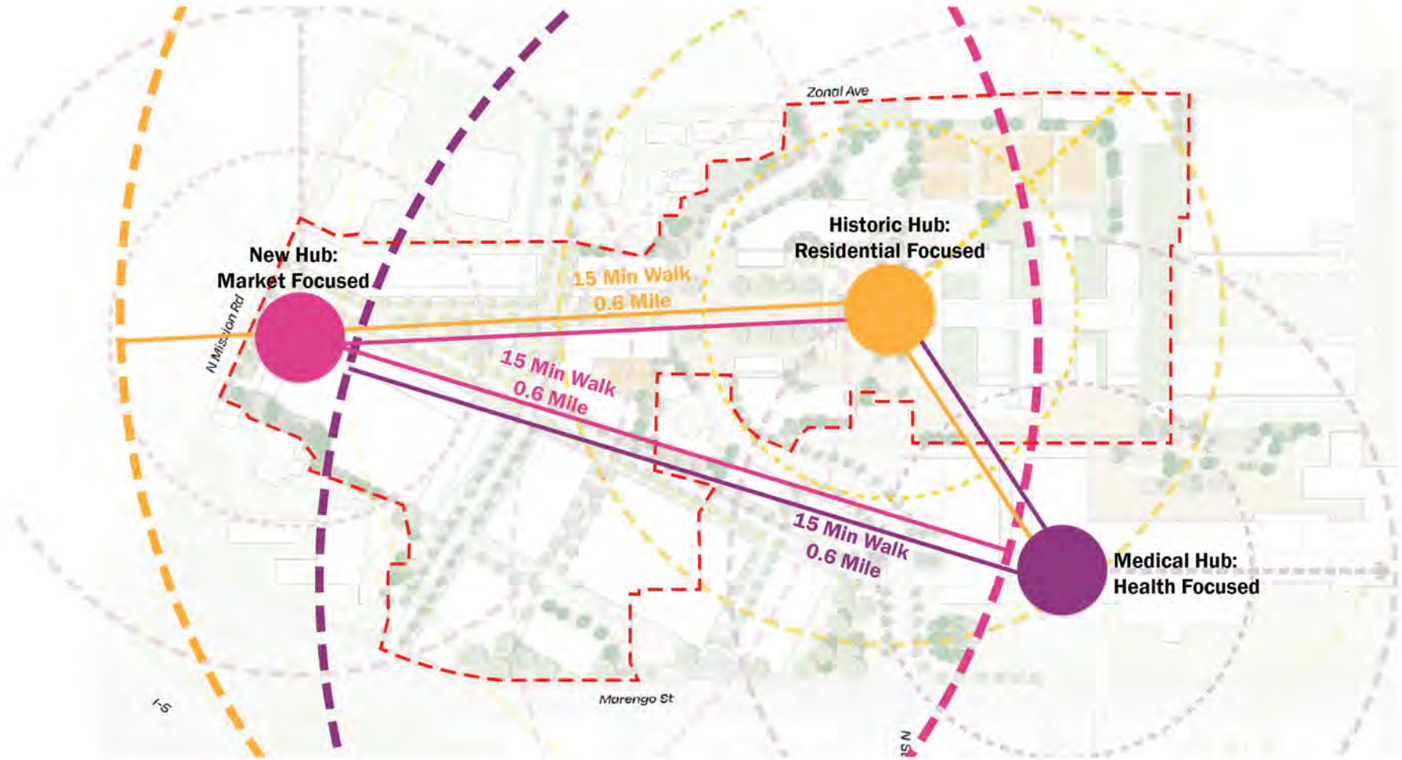
The LACGH campus expands access to vital resources both on-site and to the greater region, changing how we move and live.

The creation of a **mobility hub** at the campus is being explored to expands users' ability to travel in ways that improve health and wellness, reduce cost, and enhance quality of life. Bicycle use is being considered for site safety and connectivity, with elements such as **bicycle storage, bike share, and repair stations** anticipated to be incorporated through future development. **Local, regional, and rapid transit** options converge at the campus to bridge gaps across Los Angeles; these alternative transit options are supported by **accessible wayfinding** and **thermally comfortable transit connections.** The campus is also intended to encourage increased **density and diversity of amenities** to reduce the need for travel to access necessary resources. When vehicles are required, increased **electric vehicle parking and charging** supports lower emission car activity, supporting campus energy goals and reducing harmful local air pollutants. These mobility strategies aim to guide long-term performance, while future work will further explore guidelines for high-performance vertical development that support sustainable growth.

BICYCLE INFRASTRUCTURE + WALKABILITY

The Master Plan prioritizes bicycle infrastructure and walkability as primary mobility systems. Cluster amenities support a 15-minute city concept. A connected bicycle network with safe lanes, secure storage, bike-share and repair facilities is integrated with shaded, well-connected pedestrian routes, clear wayfinding, access to water, and a compact distribution of daily amenities. This strategy reduces vehicle dependence and associated emissions, optimizes land use and parking demand, and supports user health and campus resilience.

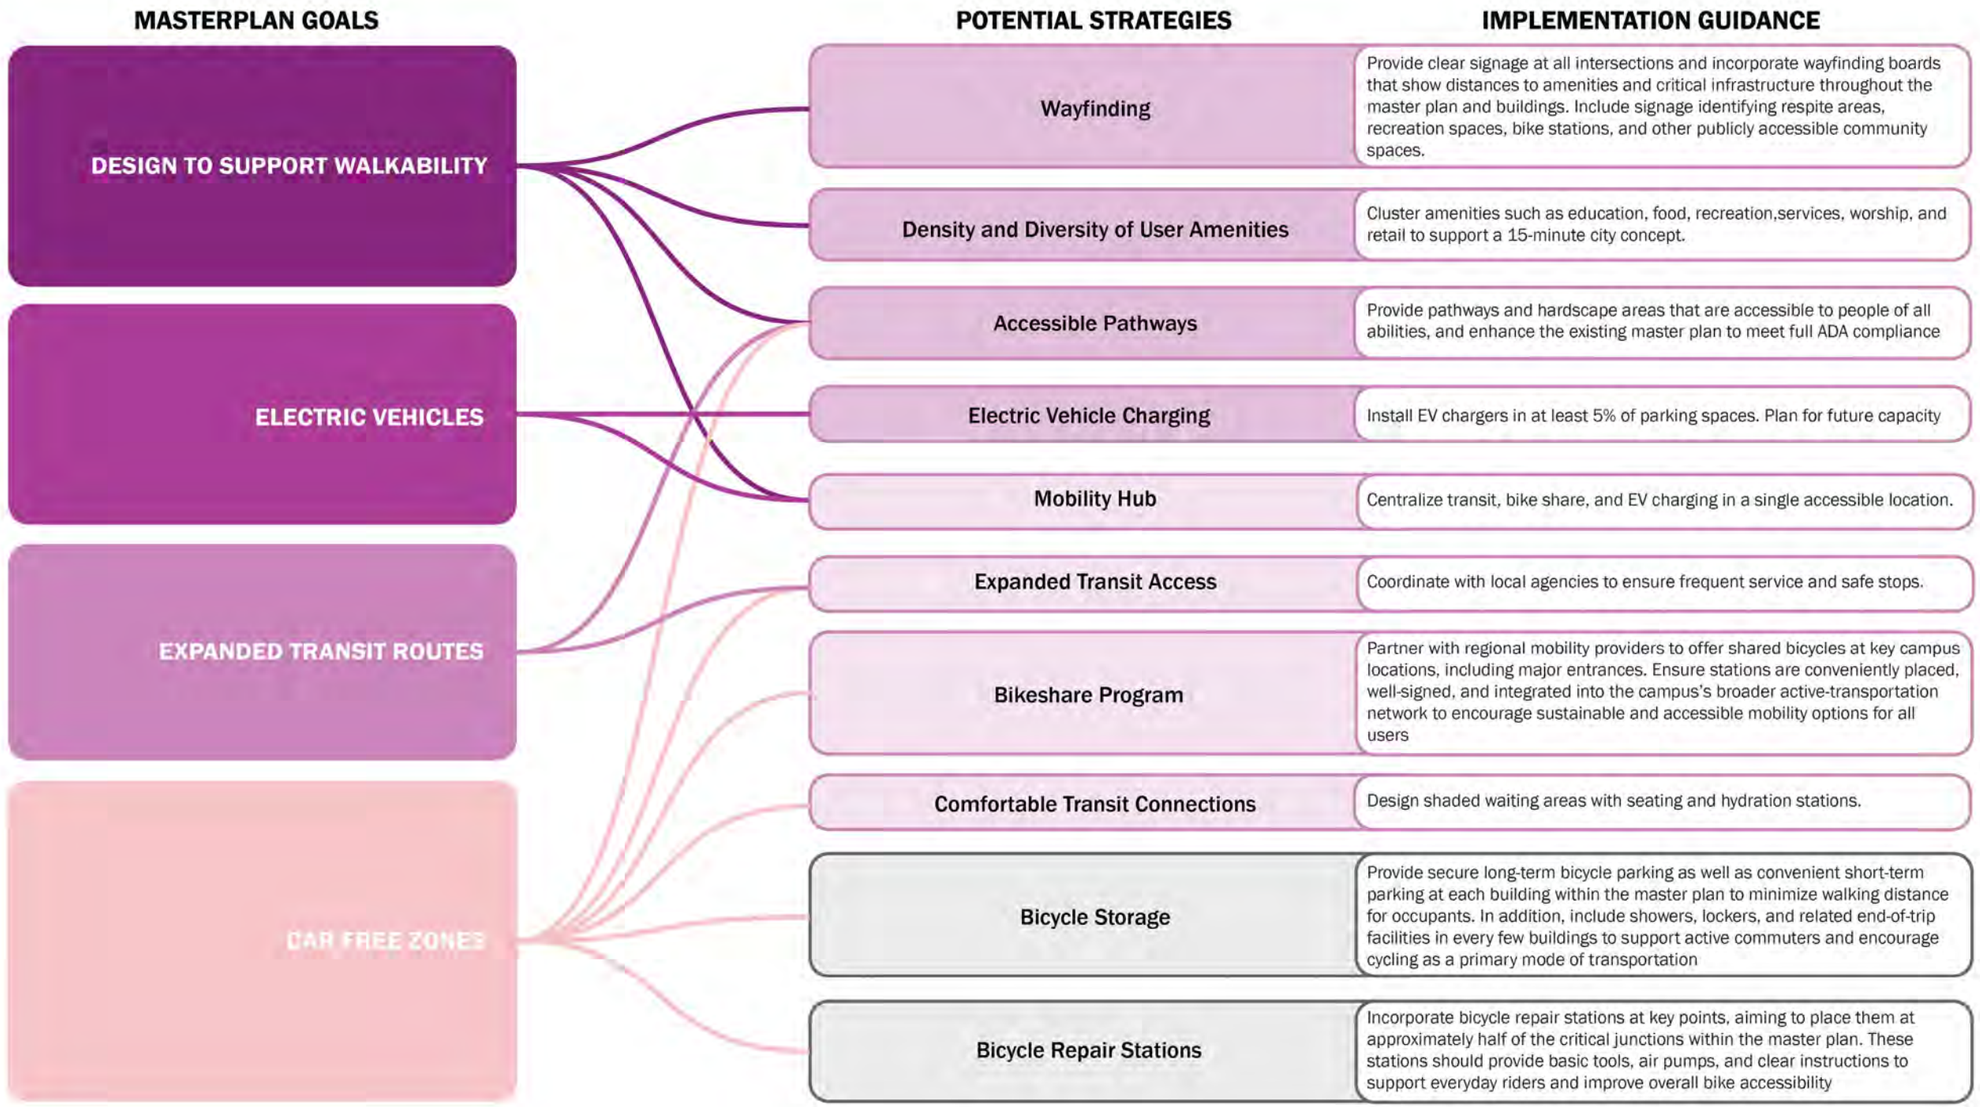
MOBILITY HUB



The Master Plan incorporates a centralized mobility hub as a key connector between the site and the broader city. This strategy provides connection points for multiple kinds of transit and transportation methods, reduces reliance on single-occupant vehicles, and is essential to achieving a low-carbon, efficient, and integrated transportation framework for the development.

ELECTRIC VEHICLES

The Master Plan considers electric vehicles through EV-ready and EV-charging parking infrastructure distributed across the campus.



This approach supports the transition away from fossil-fuel vehicles, reduces transportation-related emissions and local air pollution, and aligns parking design with long-term decarbonization and sustainability goals.

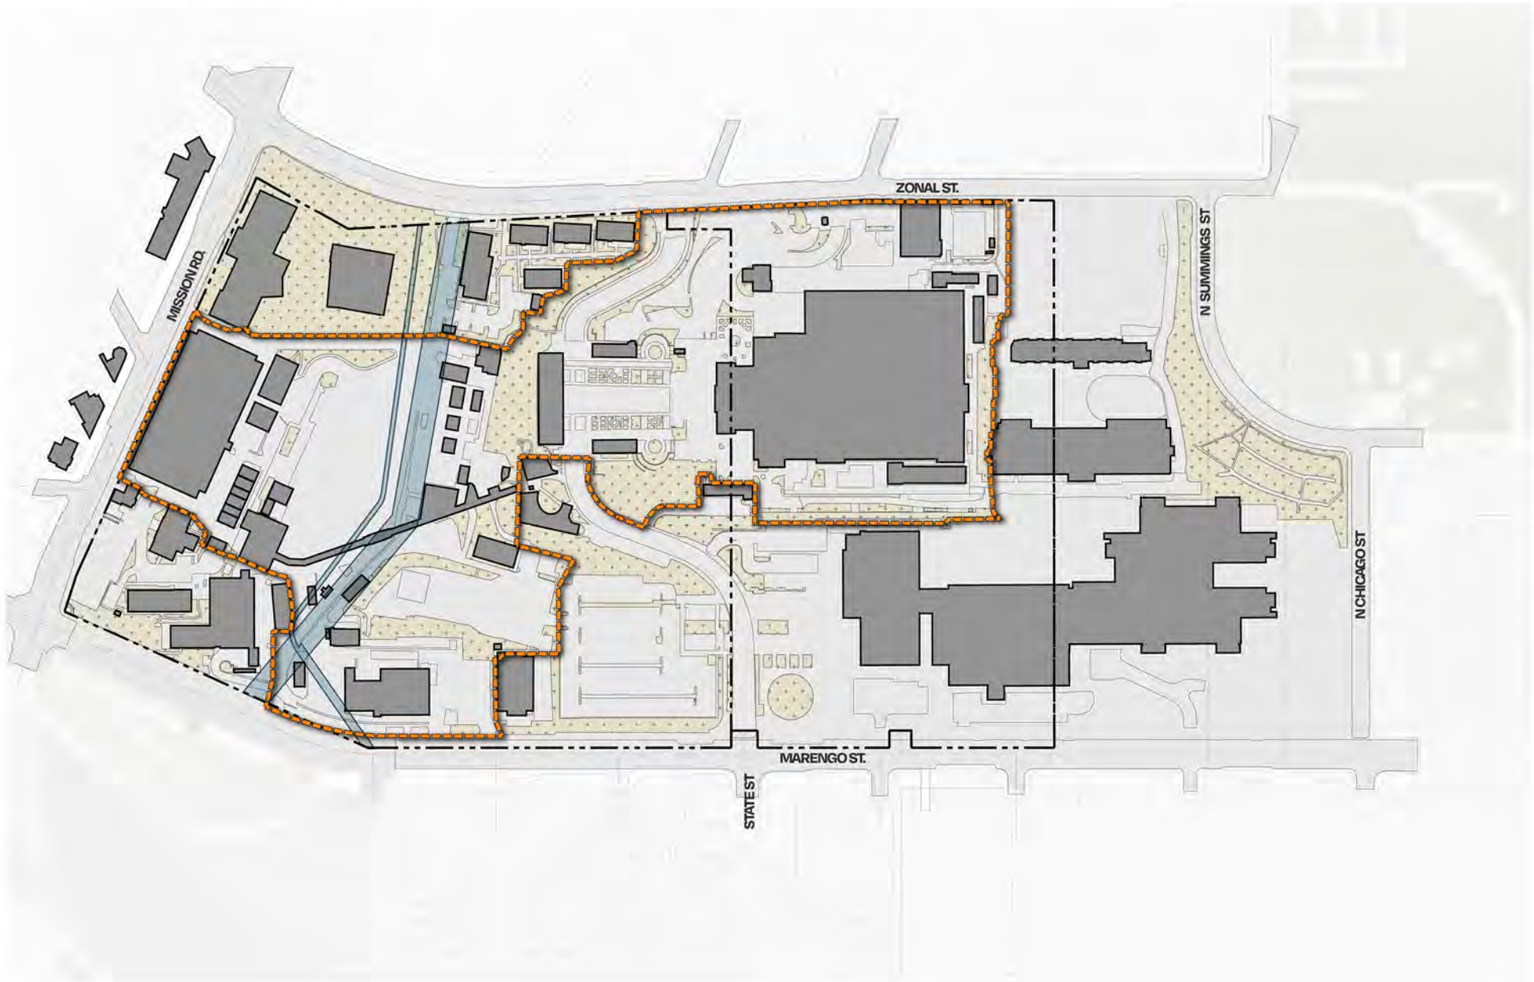
The following page outlines the strategies required to meet the Master Plan's targeted goals, and provides guidance for implementation of these strategies in design and beyond.

Cluster amenities to support a 15-minute city concept

Move Freely, Live Fully:
Expanded Multi-Modal Connectivity & Access

6.9 Site Grading and Utility Strategy

Executive Summary



The overall Master Plan for the project site has been developed with a resilient, sustainable infrastructure backbone that enables long-term development while responding directly to the site's elevation change, existing conditions and surrounding uses. The plan establishes a clear alignment of streets, utilities, and open-space systems that work together to ensure safe, efficient, and inclusive pedestrian and emergency vehicle access across the site. Grading, roadway alignments, and utility corridors are strategically coordinated to minimize cut and fill where feasible, protect existing landform character, and create logical development pads while maintaining flexibility for future phases.

Universal access and mobility are central to the infrastructure approach. A comprehensive ADA circulation network is integrated into the overall grading strategy, using a combination of gently sloped primary routes, terraced landings, and vertical transitions where appropriate. Vehicular circulation is designed to balance everyday use with life-safety needs, ensuring that emergency vehicles can reach all areas of the site without compromising pedestrian comfort or open-space quality.

Sustainability goals are embedded within the project's core infrastructure systems rather than treated as add-ons, with water strategies framed as aspirational targets that will be refined through ongoing study and analysis. The project presents a meaningful opportunity to reduce potable water demand by exploring how non-potable needs, such as irrigation, cooling, and toilet flushing, could be met through alternative water sources. In response to increasing pressure on the state's water resources and anticipated rises in water and sewer costs, a range of conservation and reuse approaches will be evaluated to understand their feasibility, benefits, and long-term operational implications. The plan is exploring pathways toward net-zero water outcomes through an integrated approach that prioritizes flexibility and adaptability rather than reliance on any single system.

Stormwater management is being considered as both a water quality and flood resilience asset, with green infrastructure strategies studied for integration into streetscapes and open space systems to slow, treat, and potentially reuse runoff while reducing impacts to downstream conveyance systems. The scale of the site allows utility and circulation networks to evolve incrementally with each phase, supporting continued evaluation and refinement of infrastructure strategies as development progresses and sustainability objectives are further defined.

Existing Conditions

Legend

- Property Line
- ENA Boundary
- Existing Building Footprints
- Landscape Zone
- Hardscape
- Existing SD/SS Easement

The Los Angeles County General Hospital site sits within hilly terrain adjacent to the valley of the Los Angeles River corridor, just north and east of downtown. The elevation changes across the site are significant with several different tiers that generally rise to the north and east and fall to the south and west. The tiers range in elevation change from 20 to 60 feet. Roadway access lanes wrap along these contours and parking and building pads are situated within many of the tiers. Uniquely, the site's elevation change allows for natural view corridors to downtown and the San Gabriel Mountains but also constrains the site as it relates to vehicular and pedestrian circulation. Today the site consists of the historic general hospital building situated at the high point with an historic forecourt flanked by vehicular and pedestrian access routes to the adjacent streets located north and south. The lower levels of the site consist of parking decks, surface parking lots and a collection of smaller buildings that are linked to the historic hospital use. In addition, in the valley of the site (located at the toe of the slope which leads down from the historic forecourt) a 12″ diameter sanitary sewer, a 48″ x 96″ reinforced concrete arch culvert and a 48″ x 54″ reinforced box culvert bisect the site and extend from Zonal Avenue through the site to Marengo Street. Due to the material and depth of this infrastructure, the fill within this zone is limited and building construction within the easement is restricted.

Existing Topography

In addition to these on-site conditions, the surrounding context to the north and west introduces similar topographic, infrastructural, and connectivity considerations that will influence how the site evolves. Adjacent neighborhoods and developments are situated along comparable slopes and elevation transitions, requiring careful alignment of access points to ensure logical and efficient connections for both vehicles and pedestrians. These off-site relationships will play a key role in determining how circulation networks tie into the existing street grid, particularly where grade changes may limit direct connections or necessitate switchbacks, ramps, or other design interventions. Likewise, existing utility systems serving these areas must be considered in tandem with on-site infrastructure, as capacity, invert elevations, and connection points may either constrain or inform feasible extension strategies. Together, these factors reinforce the need for a coordinated approach that responds to the broader terrain and built environment, ensuring that access, grading, and infrastructure improvements are integrated seamlessly with both the site and its surrounding context.

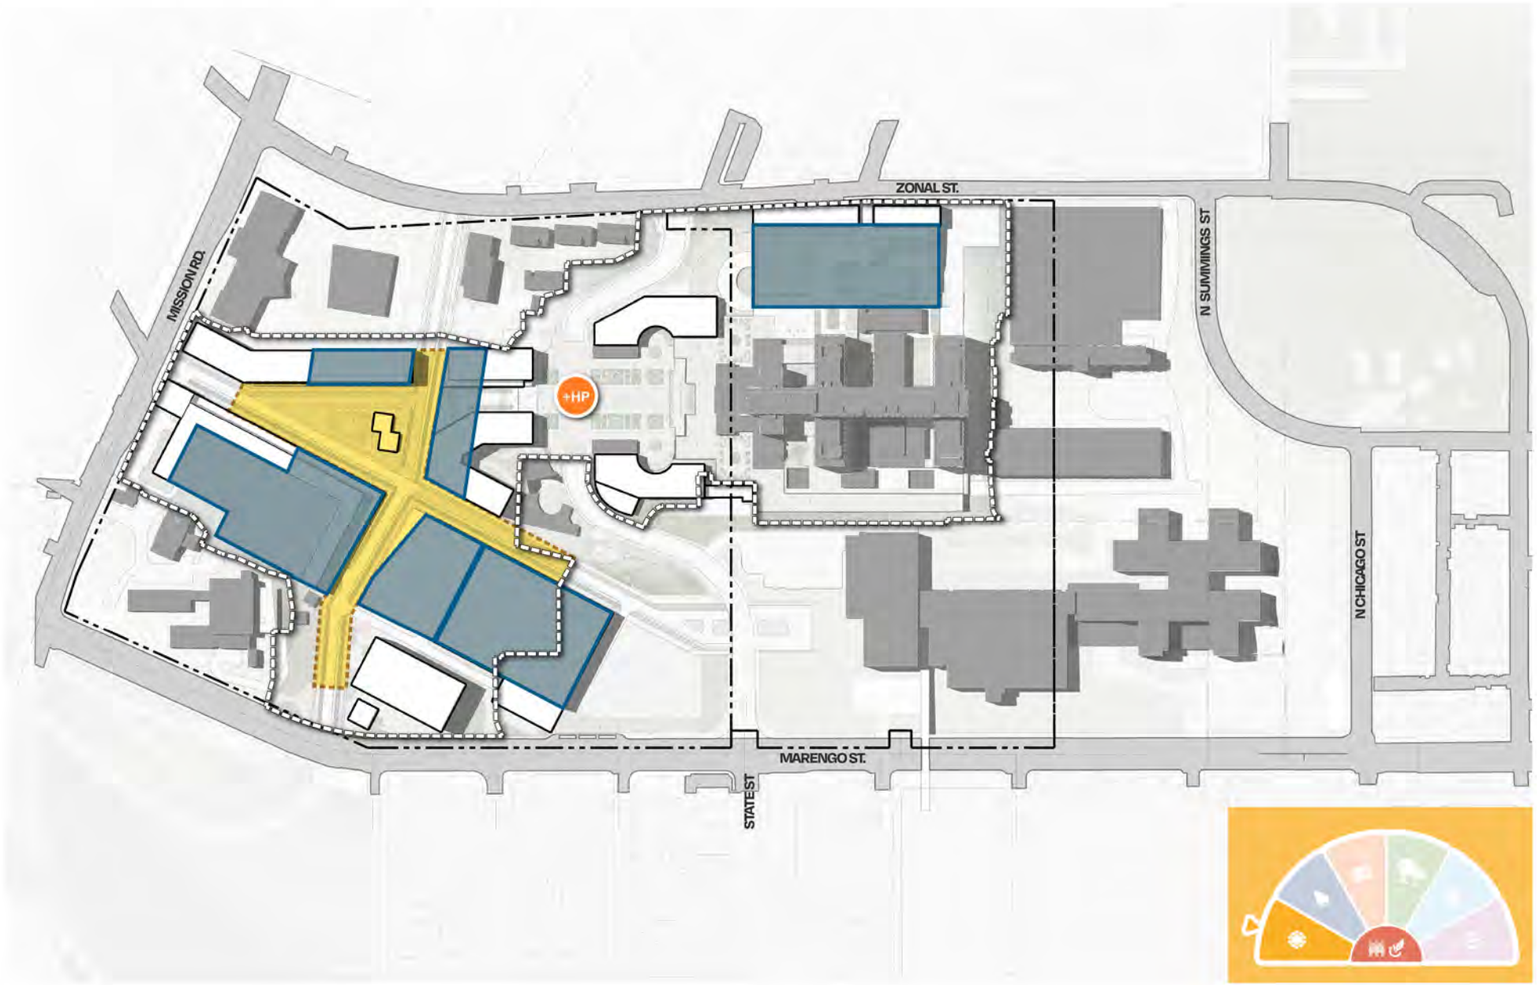
Development Framework



Legend

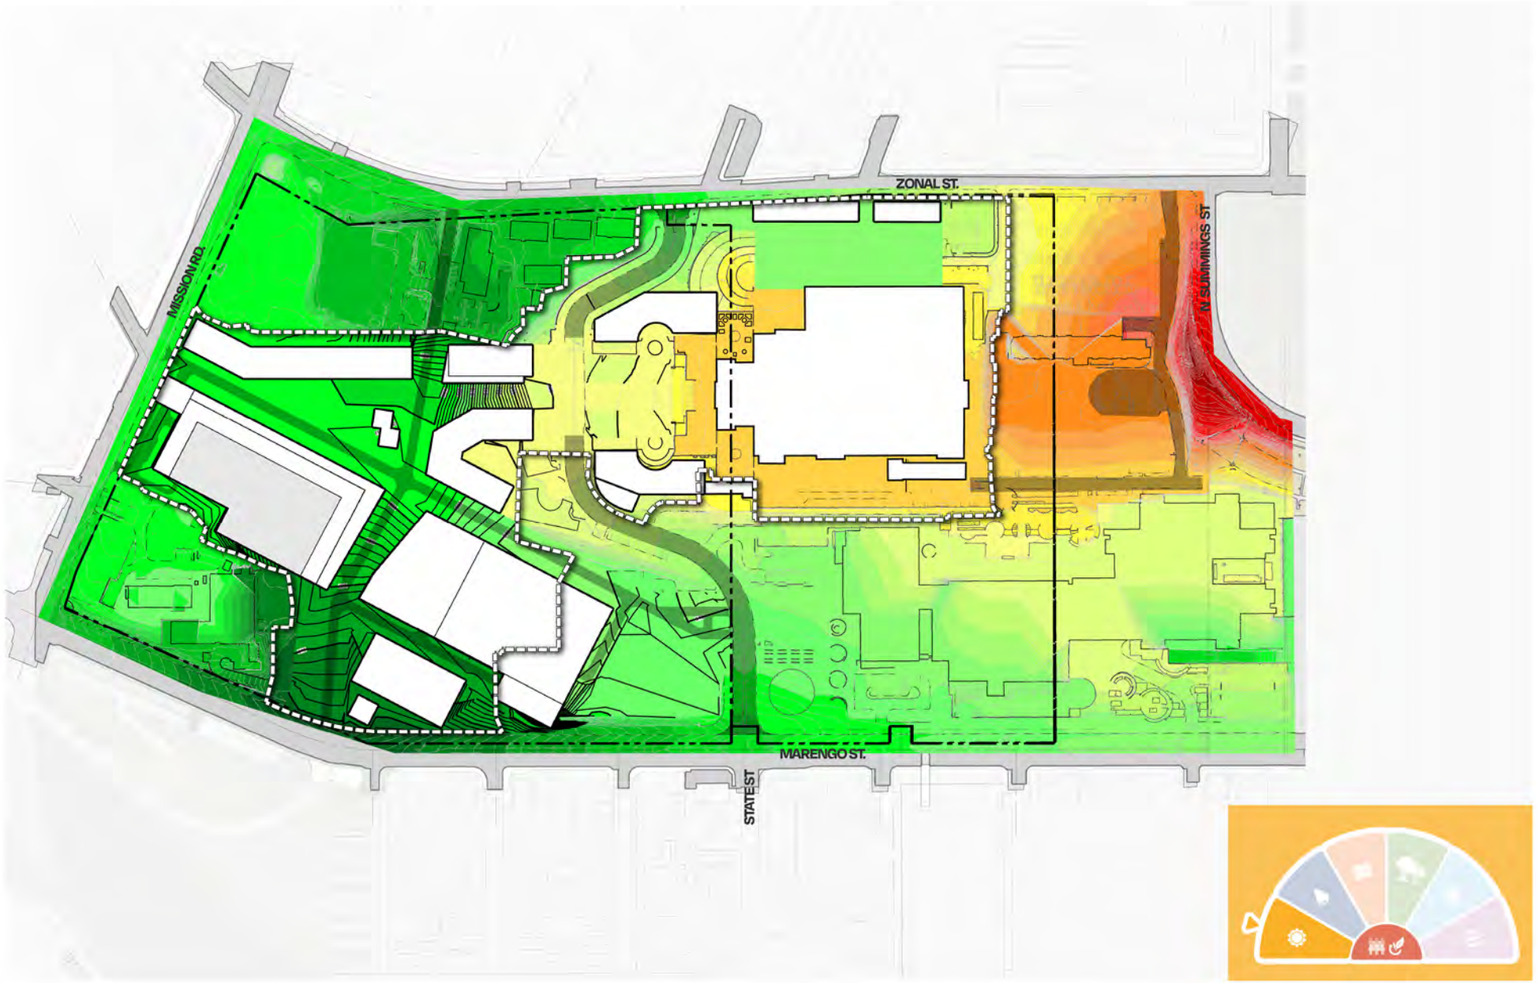
- Property Line
- ENA Boundary
- Existing Building Footprints
- Proposed Building Footprints
- Proposed Roadways
- Proposed Landscape/Plaza
- Proposed Stairs

The dominant design elements of the site are the street extensions, building massing, stairs and the landscape, which is closely linked to structured plazas and stairs. On this site the system of landscape is highly focused on performance for stormwater management, air quality, shade and human comfort.

The proposed street extensions provide both vehicular and pedestrian access along the site edges, transitioning toward limited vehicular circulation and a more plaza-oriented pedestrian environment that connects visitors to at-grade building programs and services. The circulation framework is designed to maintain required maintenance and emergency vehicle access while prioritizing walkability through tree-lined streets, integrated landscape elements, and naturalized stormwater features that promote health and environmental performance. To address the grade change between the upper and lower plazas, a combination of new stairs and fully ADA-compliant accessible routes will be introduced, including gently sloped walkways, building integrated elevators and landings that meet accessibility standards. These tiered transitions create usable pedestrian spill-out zones along building edges and incorporate landscape areas that function as stormwater quality features while extending tree canopy coverage between the primary open space plazas.

Illustrative Grading Strategy

Legend



- Property Line
- ENA Boundary
- Existing Building Footprints
- Proposed Building Footprints
- Site High Point
- Below Grade Parking Structure
- Fill Extents in Valley

The grading strategy for the proposed Master Plan development is designed to closely balance the tiered grades of the existing site, accommodate the needs of the building program and provide ADA access throughout.

As a way to balance the elevation difference between the middle of the site and the high point, and to allow for a smooth transition from Mission Street to the central plaza, it will be necessary to strategically introduce fill within the existing valley. This fill will help moderate grade changes, reduce the need for retaining structures, and create a more universally accessible circulation pathway that ties the street edge to the primary public spaces. In addition, the plaza-fronting buildings can align their first-floor elevations with the plaza grade, enabling an active and continuous ground-level experience. Below-grade parking can be tucked beneath these structures, with garage access provided from the lower-elevation circulation streets so that all vehicular movements remain separate from the pedestrian-focused plaza.

Lastly, the circulation patterns and associated grading have been designed to reduce vehicular and pedestrian conflicts where feasible and allow for a network of streets and pathways that provide ADA access throughout the lower and upper levels of the site.

Illustrative Grading

Lastly, the circulation patterns and associated grading have been designed to reduce vehicular and pedestrian conflicts where feasible and allow for a network of streets and pathways that provide ADA access throughout the lower and upper levels of the site.

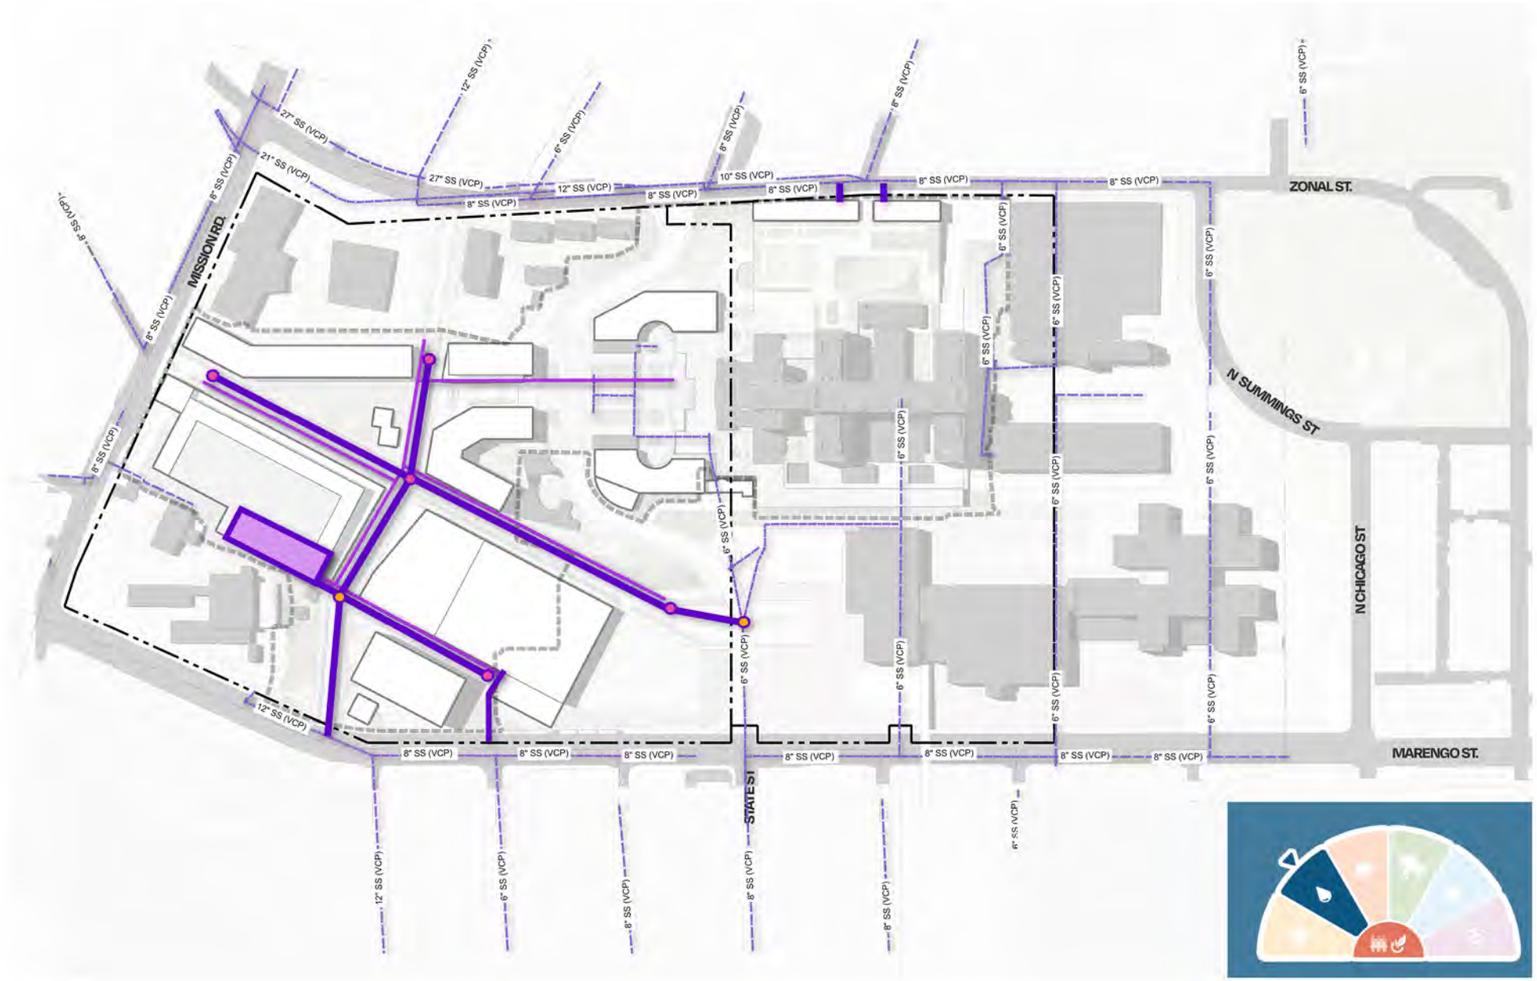
Existing Sanitary Sewer Network



The existing sanitary sewer collection and conveyance system is designed to convey sewer flows by gravity from buildings to sewer mains located within the surrounding street network. The surrounding site consists of multiple sewer mains ranging in size from 8″ to 27″ diameter within Zonal Avenue, 8″ diameter sewer service mains within Mission Street and 8″ to 12″ diameter sewer service mains within Marengo Street. The existing 12″ diameter sewer main located on the project site, within the valley and bisecting the site, has been determined to no longer be servicing the area and will be removed during the stabilization phase of the project.

Legend

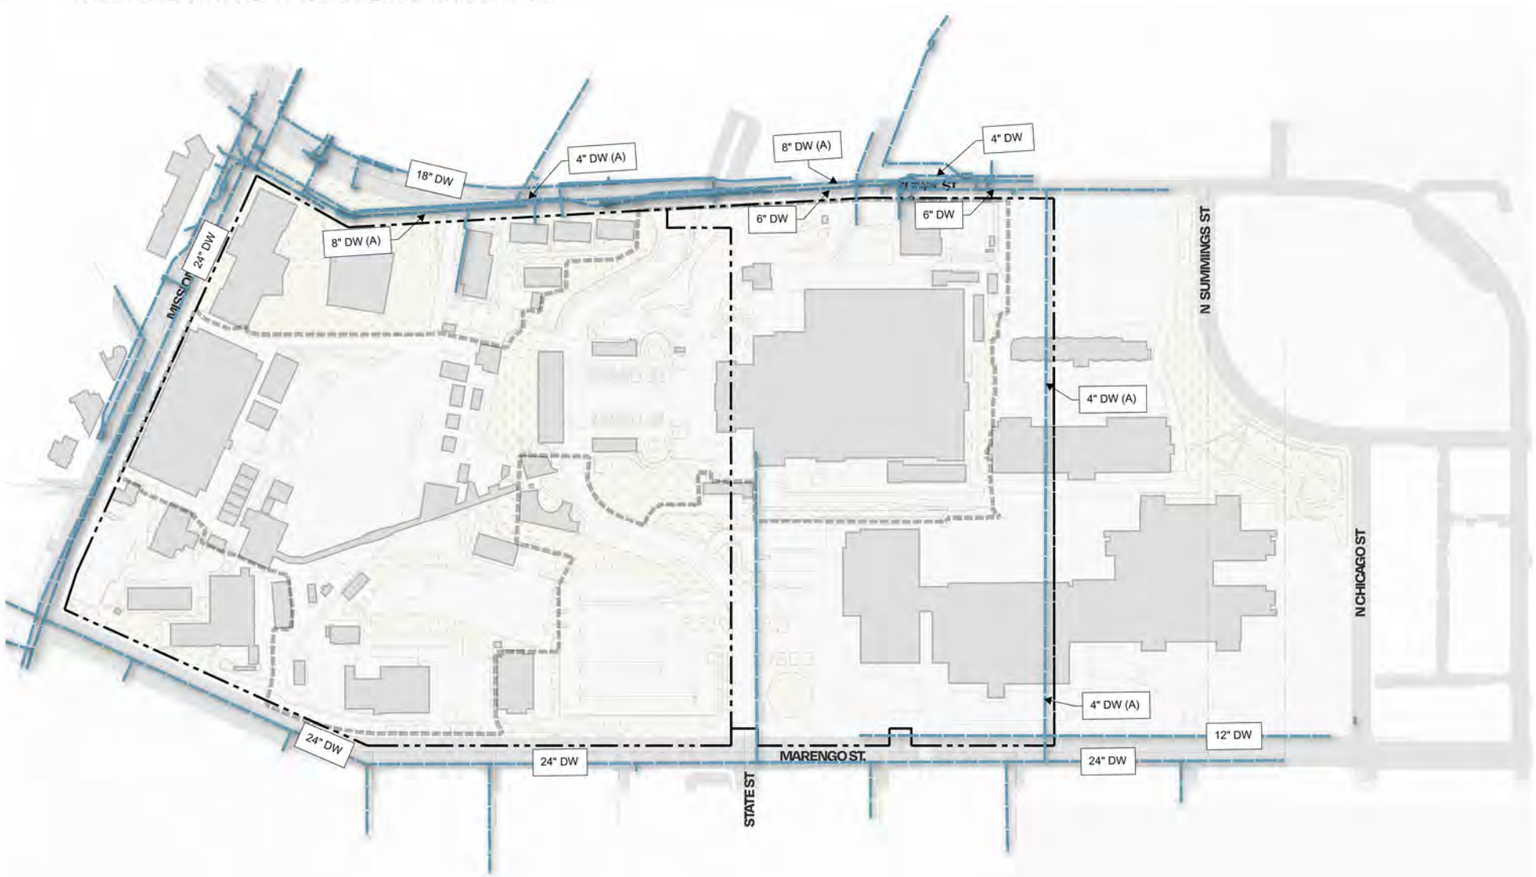
- Existing Sanitary Line To be Removed
- Existing Manholes

Illustrative Sanitary Sewer and Non-Potable Network



To support coordination of sanitary sewer collection and phased development, the proposed sewer network is designed to maximize gravity wastewater conveyance as new phases are advanced. The system includes sewer mains ranging from 8″ to 18″ in diameter, generally aligned beneath planned streets and plaza spaces. The layout and sizing of these on-site mains are intended to accommodate future connections and provide flexibility to serve evolving program needs over time.

A diversion manhole is proposed at the lower end of the sewer trunk lines to provide operational flexibility in managing flows as infrastructure strategies are further evaluated. Overall, the sewer network is planned to integrate with the broader street and plaza framework, allowing infrastructure to be implemented incrementally and adapted as development progresses and long-term utility approaches are refined.

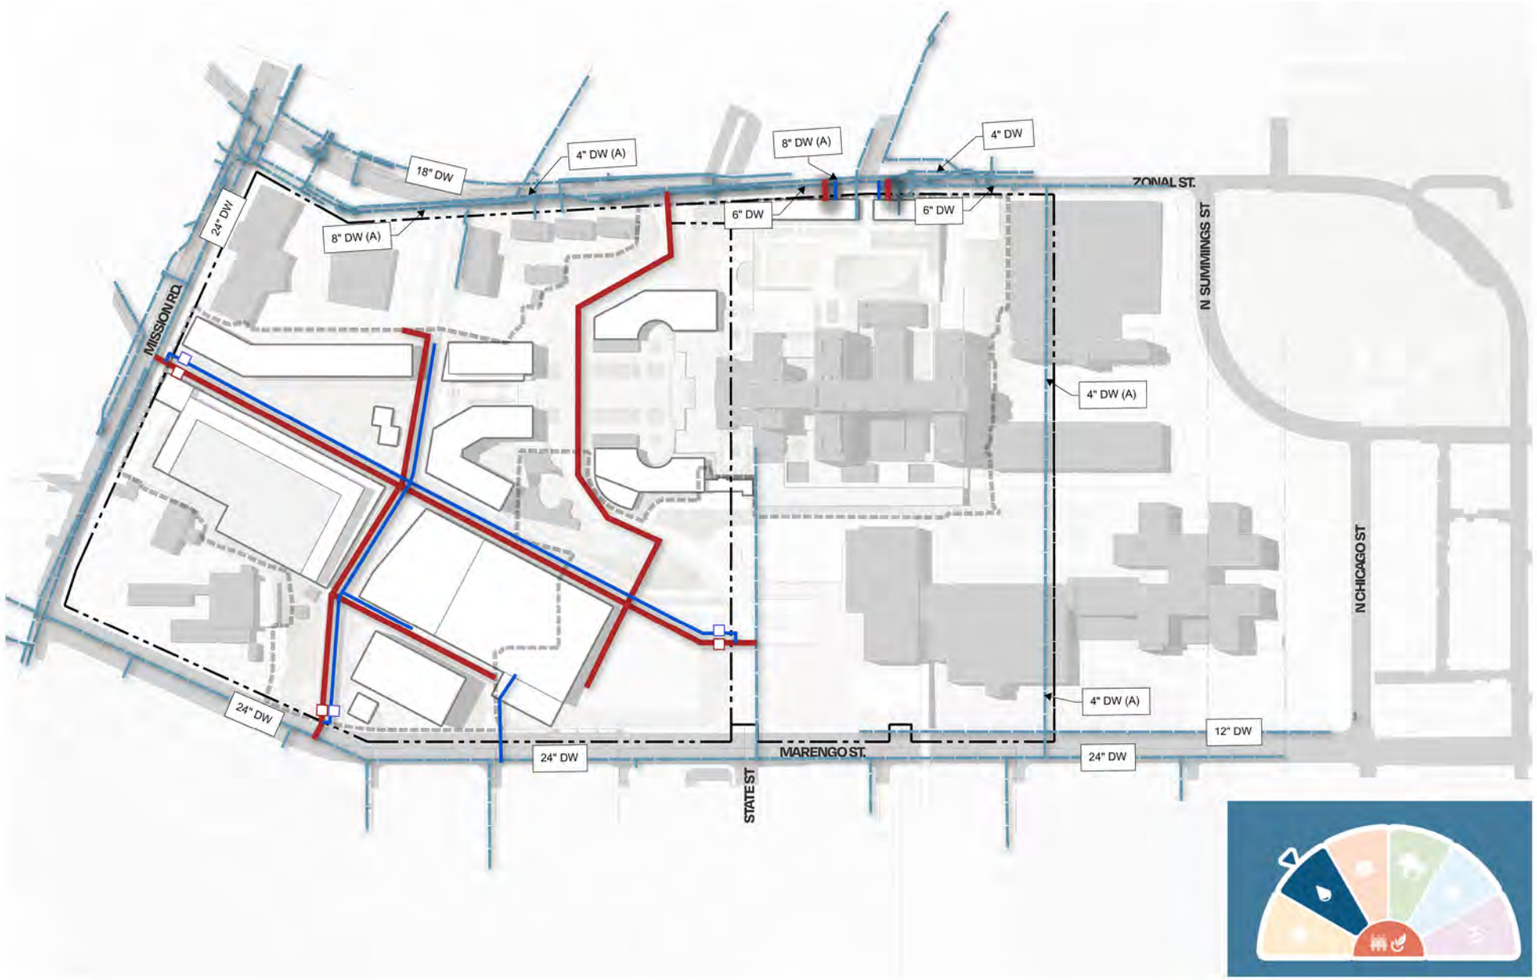
Existing Potable Water Network

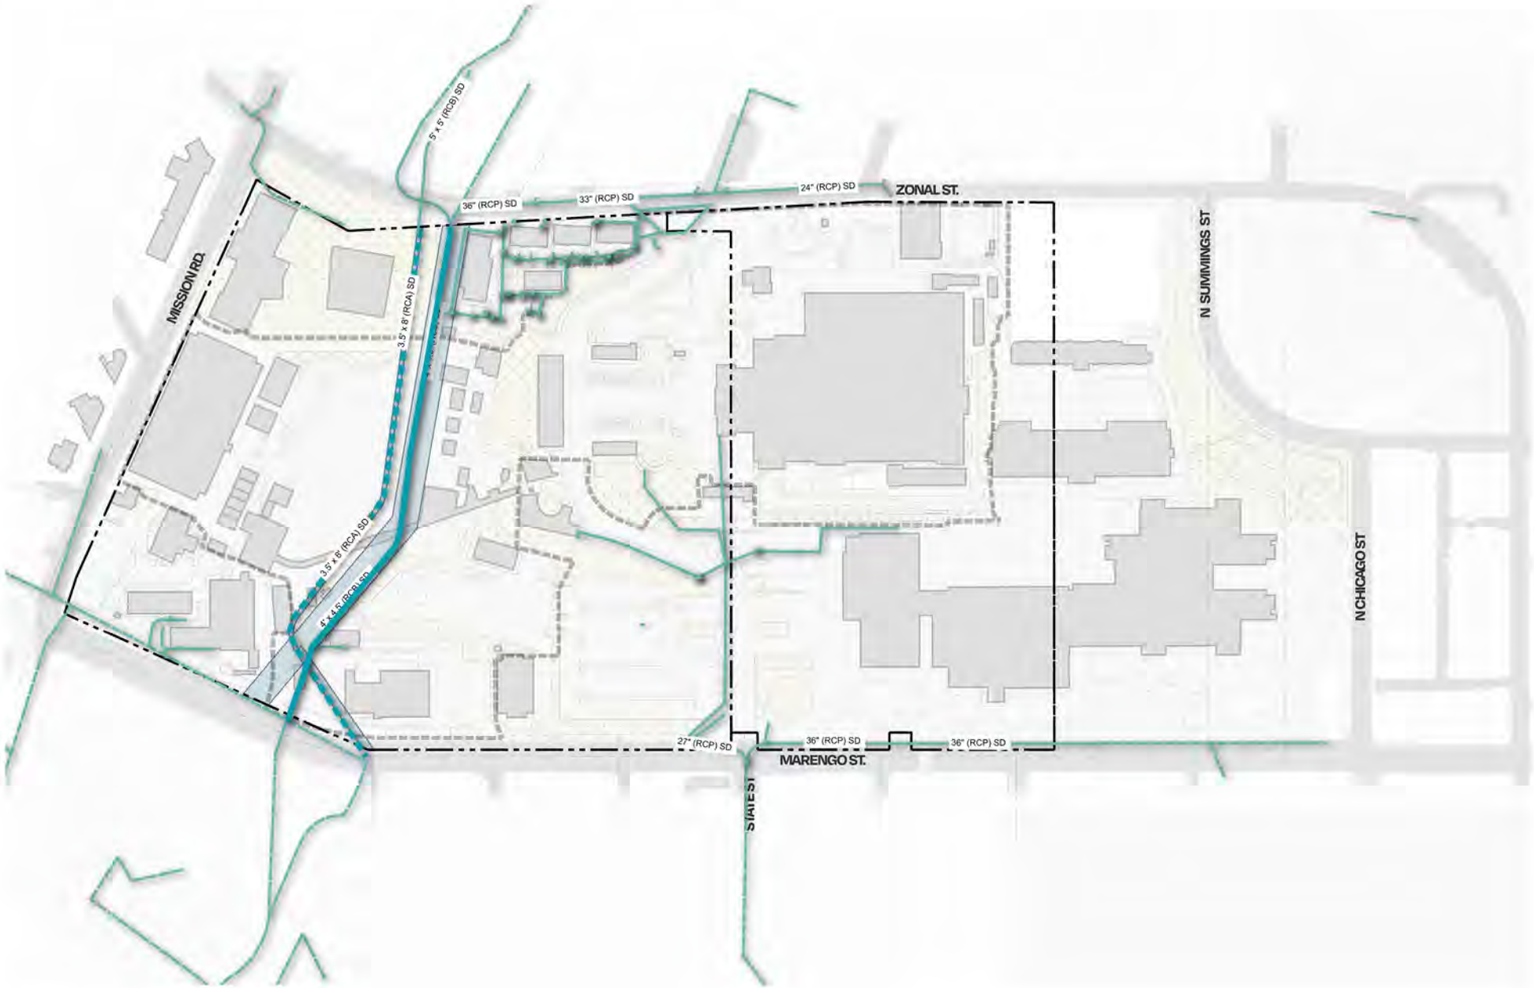


Under existing conditions the project site and associated buildings are primarily served by domestic water service mains that extend from the adjacent streets of Zonal, Mission and Marengo and into the site. Here they branch out to service buildings and fire hydrants throughout the site. During the stabilization phase, much of the potable water service network located on-site will be demolished and removed, aside from specific areas where buildings and fire hydrants are to remain. The surrounding site consists of a 8" - 18" diameter service main within Zonal Avenue, a 24" diameter service main within Mission Street and a 24" diameter service main within Marengo Street.

Legend

- Property Line
- Existing Building Footprints
- Proposed Building Footprints
- Existing Potable Water Grid

Illustrative Potable and Fire Water Network



The new water service network designed for the Master Planned development will consist of 10" diameter fire water main connections which will extend from Marengo and Mission Street onto the site. At each connection point backflow prevention will be provided and a 6" diameter potable water connection, with associated backflow prevention, will tee off of the fire water main. From here, fire and potable water service will extend into the site following the routes of the circulation for ease of future connection, maintenance and installation. The potable and fire water distribution network will be phased and sized to align with future development programming assumptions. It is assumed that this new system of distribution will coincide with proposed roadway circulation patterns to create ease of future connections and connected loops to help improve long term infrastructure resilience.

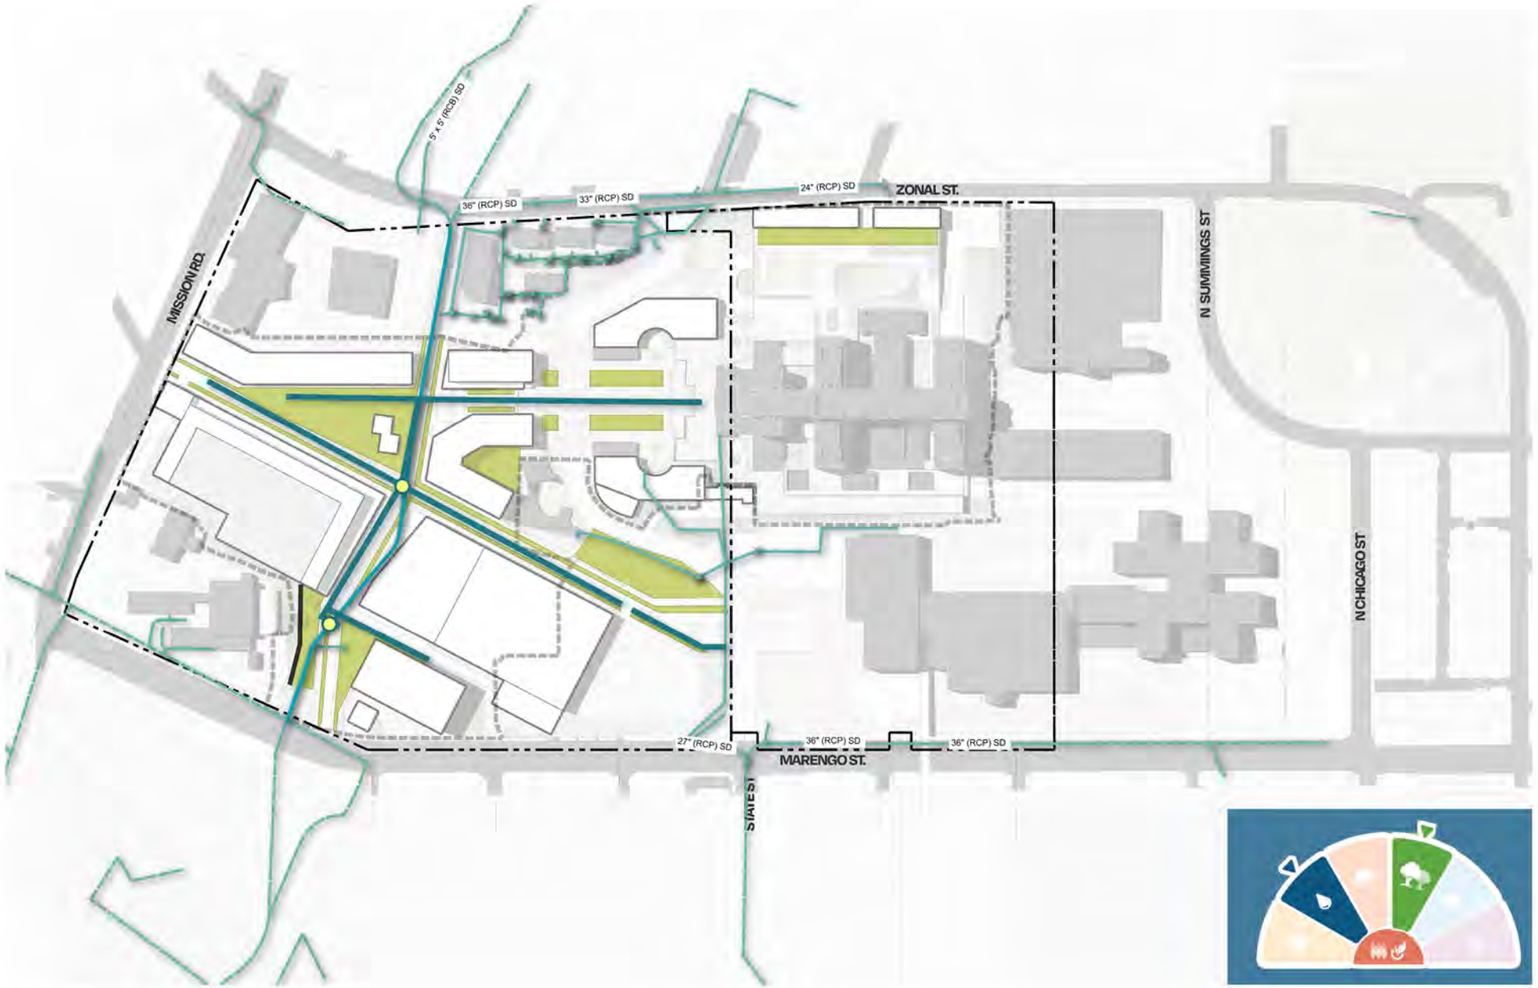
Existing Stormwater Collection System

Legend



- Property Line
- ENA Boundary
- Existing Building Footprints
- Existing SD/SS Easement
- Existing SD Grid
- Existing Stormwater Drain To be Removed
- Existing Stormwater Box Culvert To Remain

The project area is located within a fully urbanized portion of the City of Los Angeles and is characterized by dense commercial, hospital, university and multi-family development, roadway networks, and extensive paved surfaces. Impervious cover accounts for approximately 70–80% of the total site area, with limited vegetated or pervious open space. The small remaining landscaped areas consist of compacted urban soils with minimal infiltration potential. Additionally, on-site stormwater infiltration is not recommended due to subsurface conditions across the project site. The presence of deep uncertified fill, low-permeability native silts and clays, relatively impervious bedrock, and expansive soils would likely result in perched water conditions. As a result, infiltration is not considered a feasible or appropriate stormwater management strategy for this site.

Existing drainage patterns are controlled primarily by curb-and-gutter systems and parking lot grades which direct sheet flow runoff into the municipal storm drain network. Overland flow paths are short, and runoff typically drains quickly into existing catch basins located along interior streets and parking zones. Due to the high degree of imperviousness and the inability for infiltration due to existing soil characteristics, stormwater quality and quantity are not currently managed.

In addition to the on-site collection and conveyance system, there are two existing conveyance culverts that run along the lower portion of the site. One is a 48″ high by 96″ wide arch reinforced concrete culvert and the other is a 60″ by 60″ reinforced concrete box culvert. The arch culvert is currently abandoned and will be removed during the stabilization phase of the project.

Illustrative Stormwater Management Approach

Legend

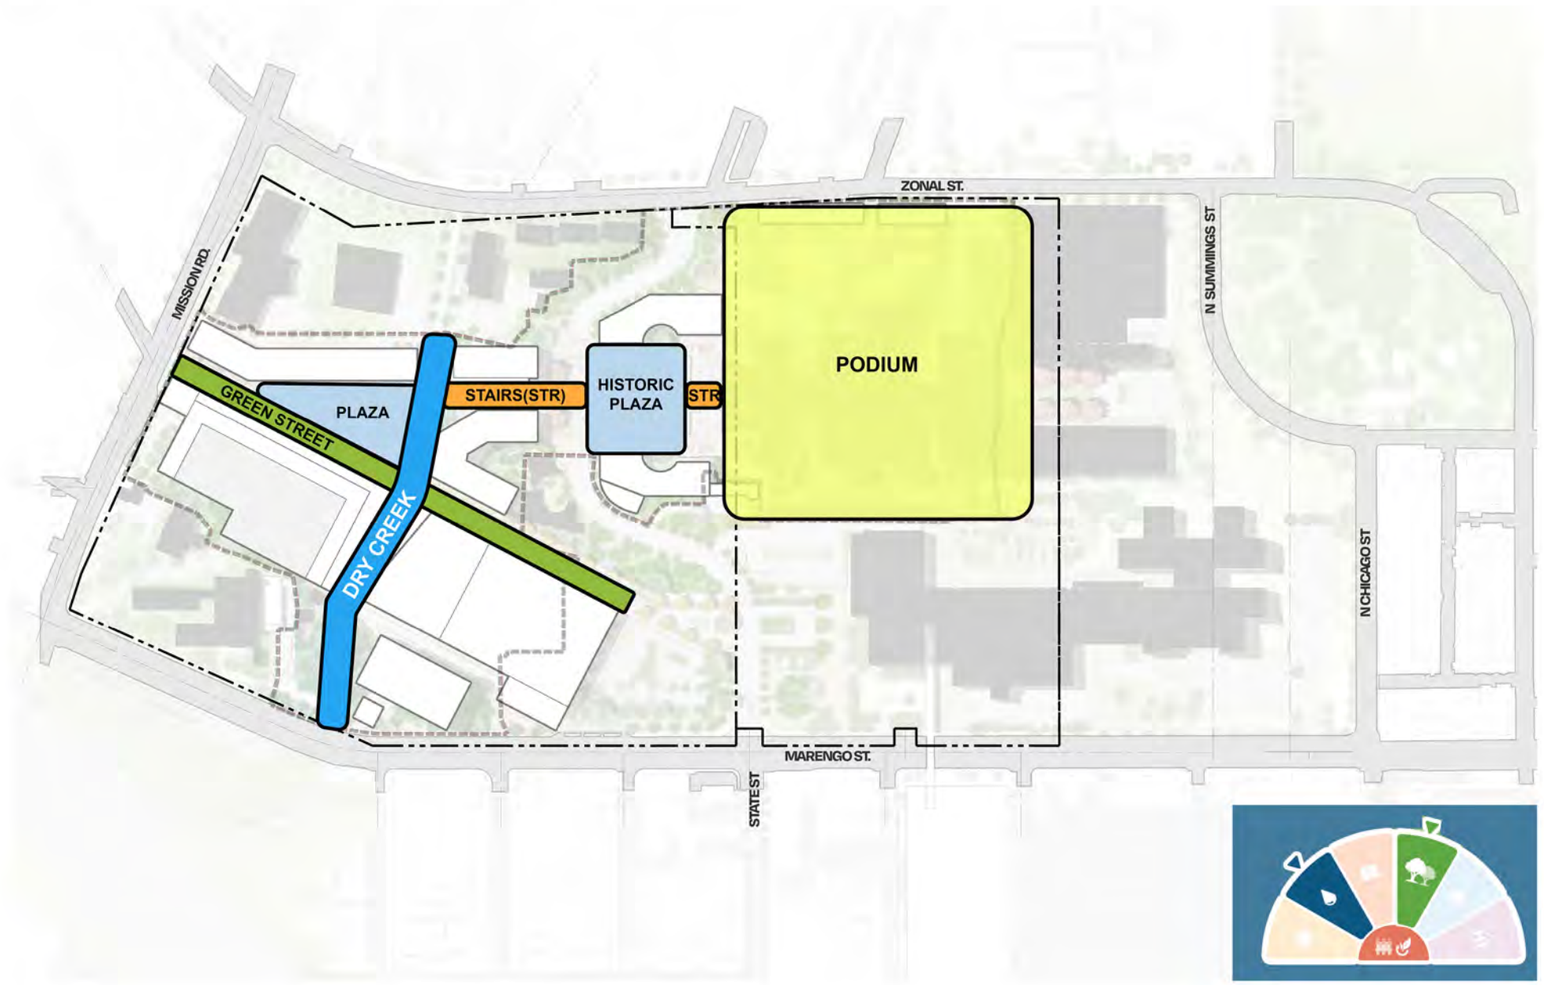
- Existing SD Grid
- Existing Stormwater Box Culvert
- Proposed Stormwater Pipes
- Box Culvert Connection

The stormwater management system for the proposed master-planned development is designed to support the project's broader goals of improving water quality, integrating landscape systems as functional capture and conveyance networks, and reinforcing the site's historic hydrologic patterns. Because infiltration is not feasible across the site, the system is organized to retain or treat the Stormwater Quality Design Volume (SWQDv) through a suite of Low-Impact Development (LID) best management practices (BMPs). These include capture-and-reuse strategies using modular cell systems, biofiltration through bioretention soils and underdrains, and, where necessary, below-grade storage cisterns. Reflecting the site's historic water movement and ecology, the overall approach to stormwater capture, treatment, and conveyance is aligned with the path of the former creek that once flowed through the central valley.

The lower plaza streetscape incorporates a dry creek bed segment that provides additional storage and conveyance capacity while also highlighting the site's history by creating an analog of the historic creek alignment. At the upper forecourt, the re-imagined design preserves key historic patterns while the adjacent landscape zones are developed as high-performing green infrastructure areas. Together, these elements improve water quality, increase tree canopy, and support a more functional and resilient plaza environment. The central stair network connects the upper forecourt and lower plaza, supporting circulation while also serving as an ecological and stormwater spine. The planted zones are interwoven into the central stair design as a series of cascading planters that allows stormwater runoff to flow downhill in a performative manner that also slows, filters and manages runoff before it reaches the lower plaza.

The stormwater "kit of parts" is organized to seamlessly integrate BMPs into the streetscape, plazas, building edges, and stair systems. Landscape zones will be designed to capture and treat runoff, while larger storm events will be safely conveyed to the municipal drainage system downstream. This network of high-performing landscape systems will improve water quality, reduce irrigation demand, and increase tree canopy and plant diversity throughout the development.

Illustrative Watershed Drainage Areas



The proposed watershed drainage areas are broken up in a similar pattern to the existing conditions, as a way to mimic flows to the greatest extent possible and also to align capture, treatment and conveyance with the future phasing and grading of the project. The watershed breakdown as depicted highlights where runoff from larger areas of the site are intended to flow in the future condition. Drainage Area 7 which is the central drainage area, is the spine of the development and is the link for how circulation, stormwater, utilities and ecology transition through the site. In this watershed, landscapes within streetscapes, stairs and plaza spaces will be highly utilized to manage stormwater and improve water quality. Since this spine interconnects two large plaza areas it should be designed to perform as one large area, such that conveyance and treatment at the high elevation is factored into the sizing and conveyance considerations for the lower plaza.

Stormwater Strategy Zones

As a way to enhance the user experience, connect the design to historic patterns on the site and integrate health and wellness, the project's landscape and stormwater management framework knits together the open space podium, historic forecourt, lower plaza, green streets and stairs by integrating high performing landscapes and green infrastructure elements at each transition. By doing so the landscape systems are supported by on-site stormwater runoff, irrigation demands are reduced, systems of ecology are restored and water quality is improved. A series of stormwater BMPs and green infrastructure elements have been identified as integral to help meet the water quality volume requirement and reduce the overall potable water demand for the project via capture and reuse.

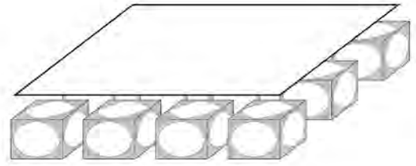
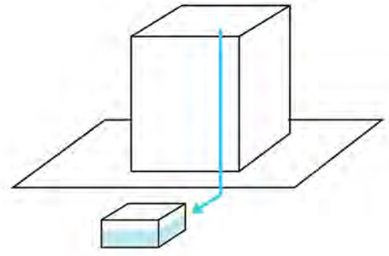
Green Infrastructure Toolkit



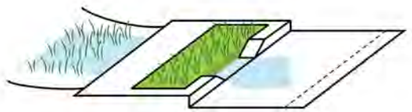
Bioswale

Vegetated open channels that are designed to capture and convey stormwater runoff downstream, while also filtering stormwater through engineered soils for treatment.



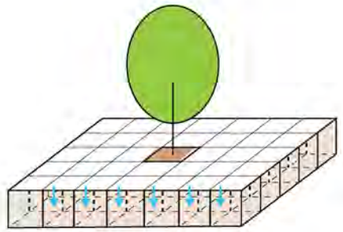
Bioretention

Shallow stormwater basins or landscaped areas that utilize vegetation and engineered soils to capture and treat stormwater runoff through filtration. May be designed with perforated pipes that convey runoff downstream from bioretention.



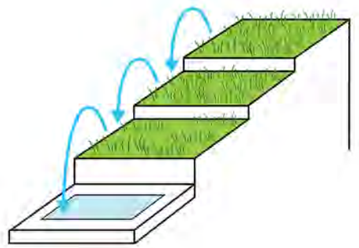
Below Grade Detention

Utilizing the sub-grade below programmable spaces to capture and detain stormwater runoff. Captured runoff can be utilized for non-potable demands.



Building Integrated

Underutilized spaces within buildings that can provide opportunities for stormwater storage solutions. Example spaces include basements and parking garages that have awkward dimensions that are not suitable for typical uses.



Curb Cuts

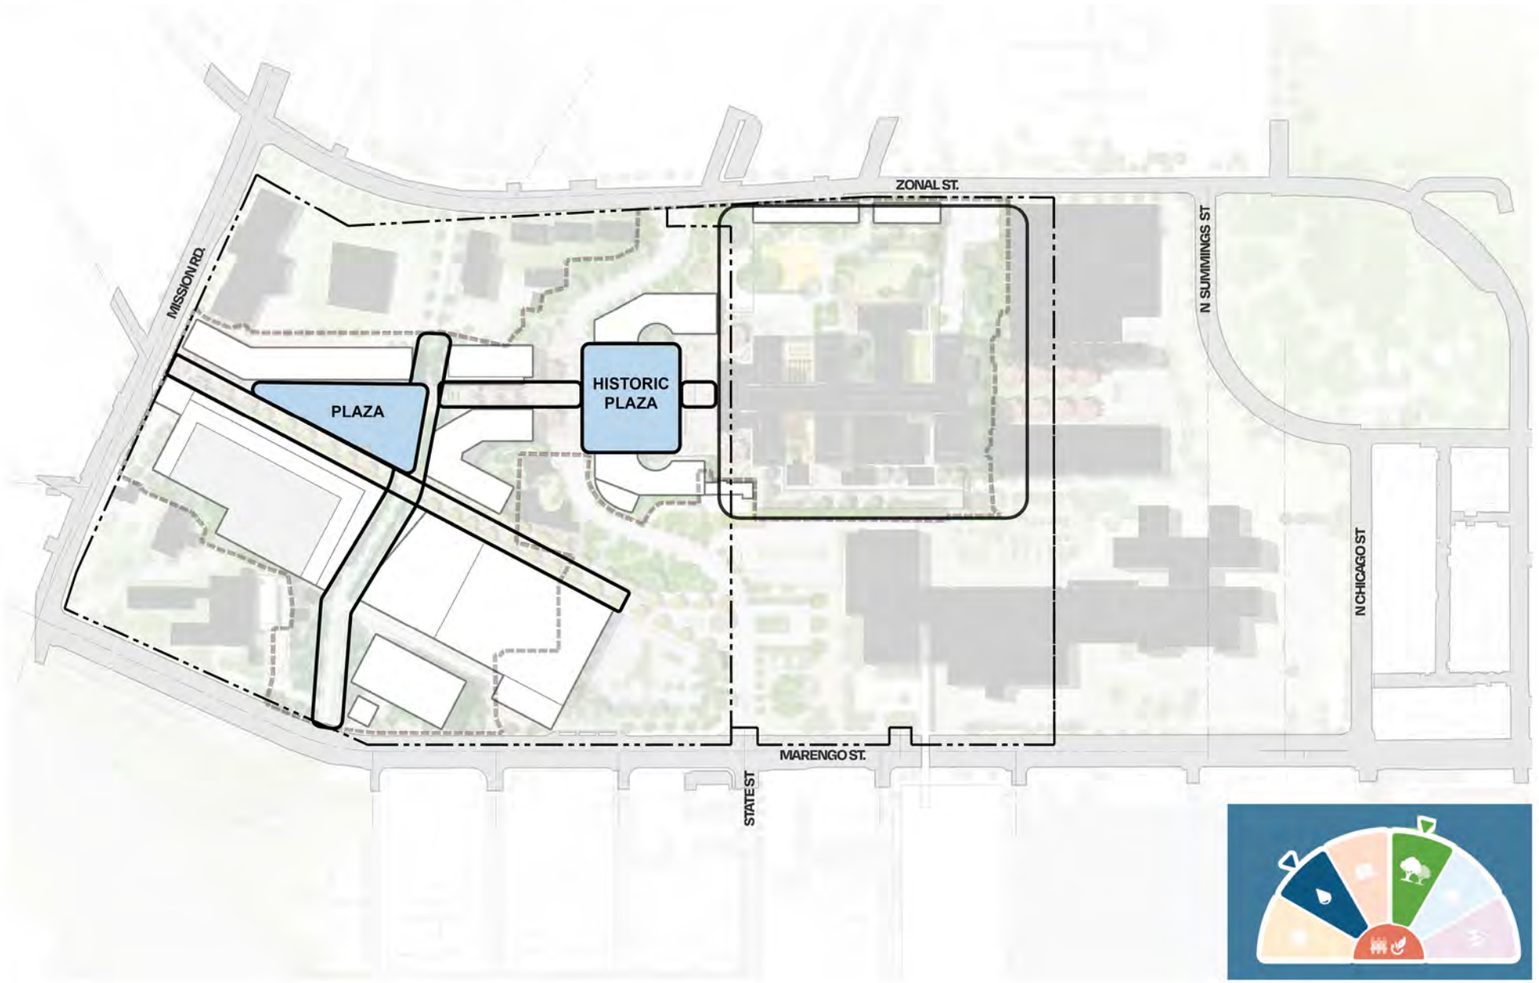
A depression or gap in a roadside curb that is intentionally placed next to stormwater management infrastructure to allow for an opening where road stormwater can convey towards for capture, conveyance, and treatment.

Soil Cells + Suspended

Sub-grade soil cells beneath paved surfaces provide expanded soil volumes that allow for appropriate root growth to promote tree health and improved stormwater quality.

Tiered Planters

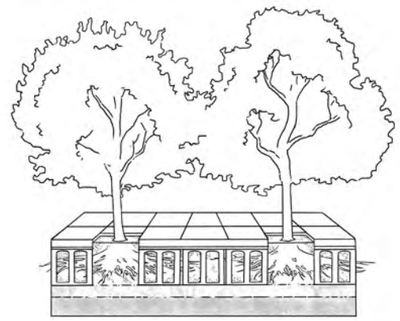
A series of cascading LID planters that progressively treat runoff and showcase stormwater performance to the design of outdoor space.



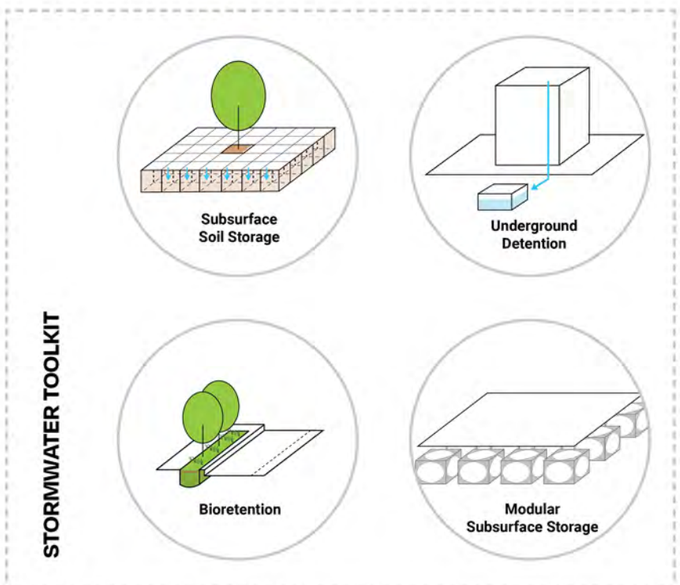
The tiered planters can range in size, and be as small as 2-3 feet wide and deep. The geometry and dimensions of the tiered planters is flexible and can integrate with the circulation patterns of the core stairway and ADA ramps.

Dry Creek Bed

Creek analog that remains dry for the majority of the year and is activated by larger stormwater events. Planted with native drought-tolerant plants that can also withstand brief periods of inundation.



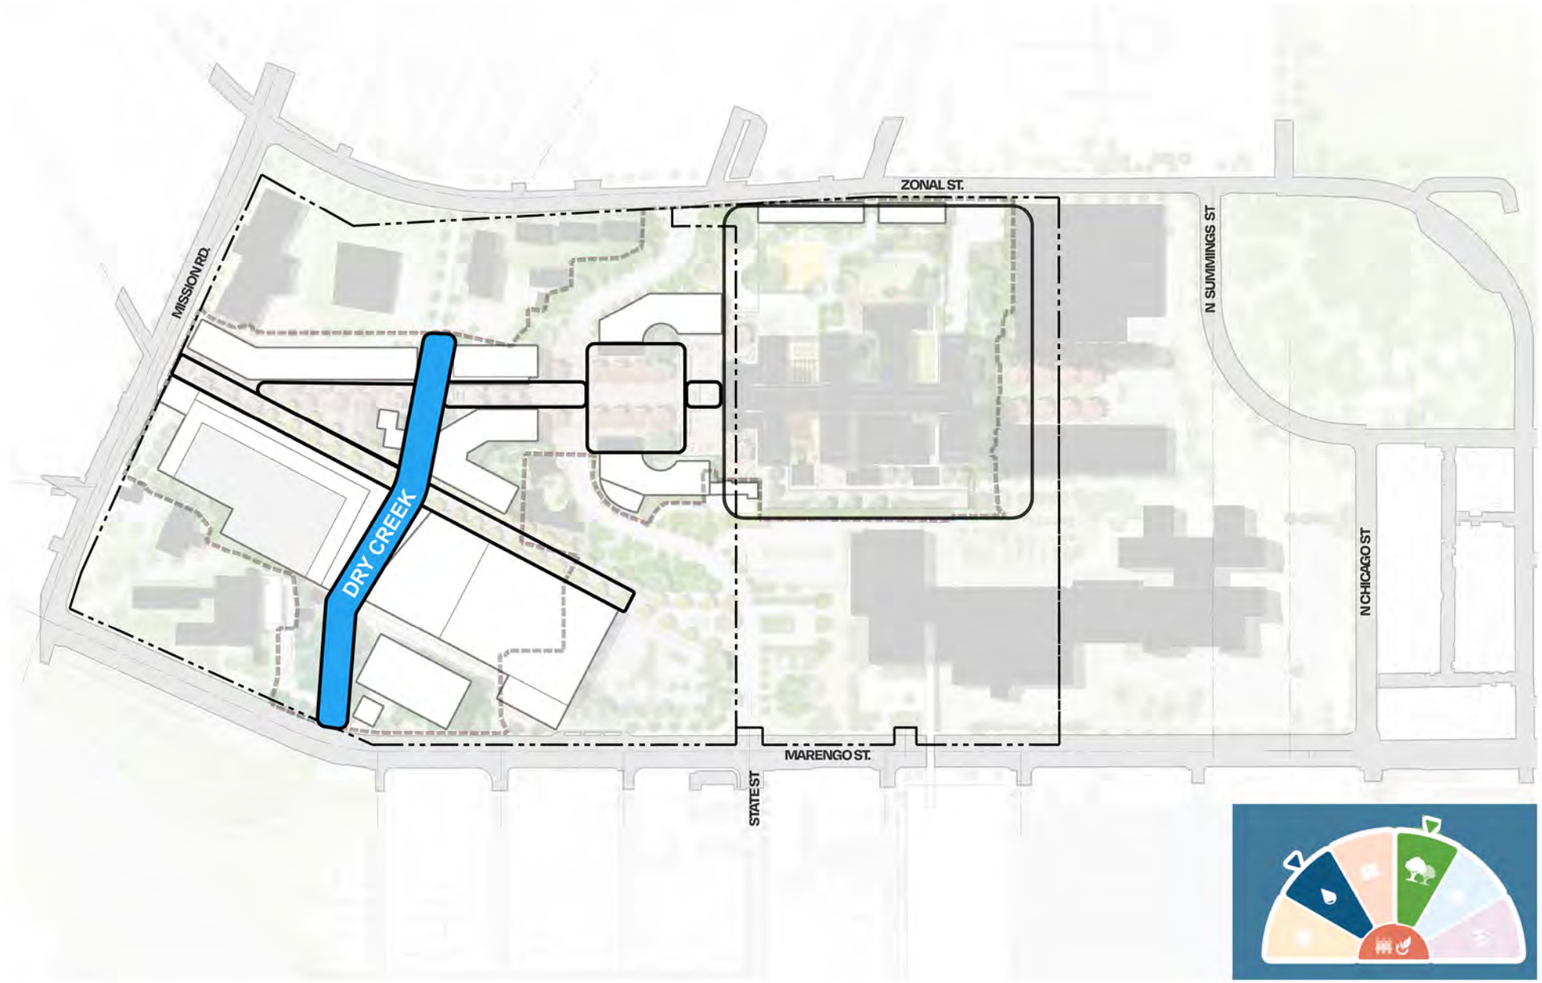
Stormwater Strategy Zones - Plaza



Legend

- Property Line
- ENA Boundary
- Existing Building Footprints
- Proposed Building Footprints

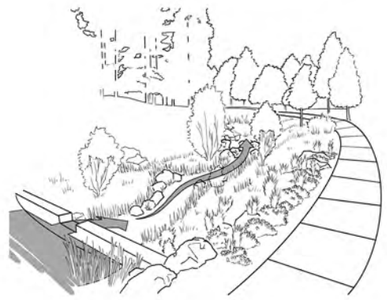
Plaza space is intended to support commercial program and celebrate historic design, while also providing embedded stormwater performance above and below the surface. Stormwater infrastructure will utilize materials and patterns (e.g., pavers) that match the historic design to better integrate into the existing landscape and celebrate the legacy of the place.



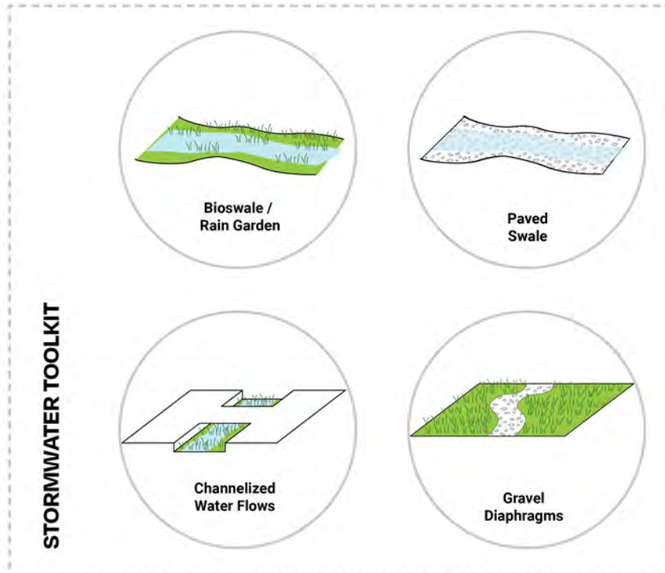
SUBSURFACE SOIL STORAGE

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

Stormwater Strategy Zones - Dry Creek



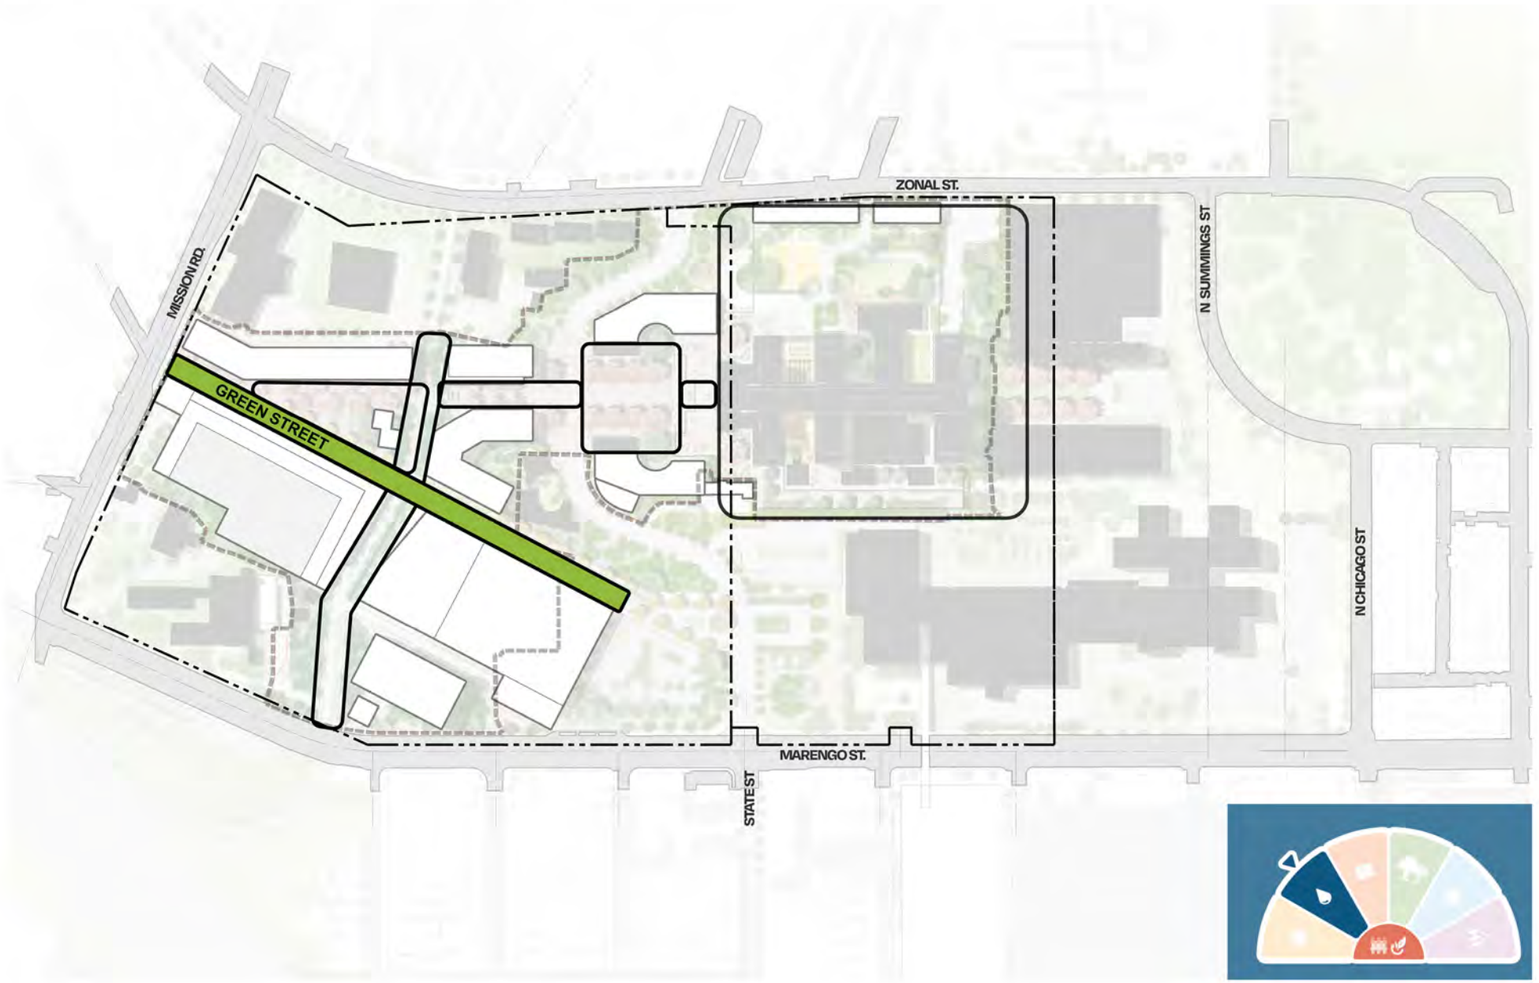
Legend



- Property Line
- ENA Boundary
- Existing Building Footprints
- Proposed Building Footprints

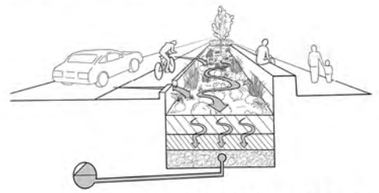
The dry creek alignment coincides with a box culvert that will remain in place. Not practical to daylight the creek since it flows 15 feet below grade, but above ground swales can capture surface runoff and celebrate the alignment of the creek, before slowly releasing detained waters to the box culvert.

- The minimum width of a bioswale is approximately 7 feet

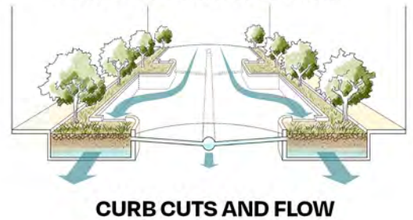


CHANNELIZED SWALE AND CHECK DAMS

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

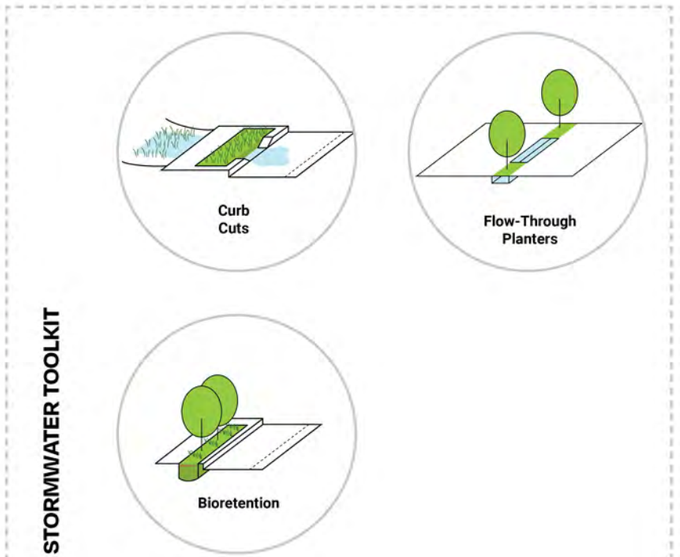


Stormwater Strategy Zones - Green Street

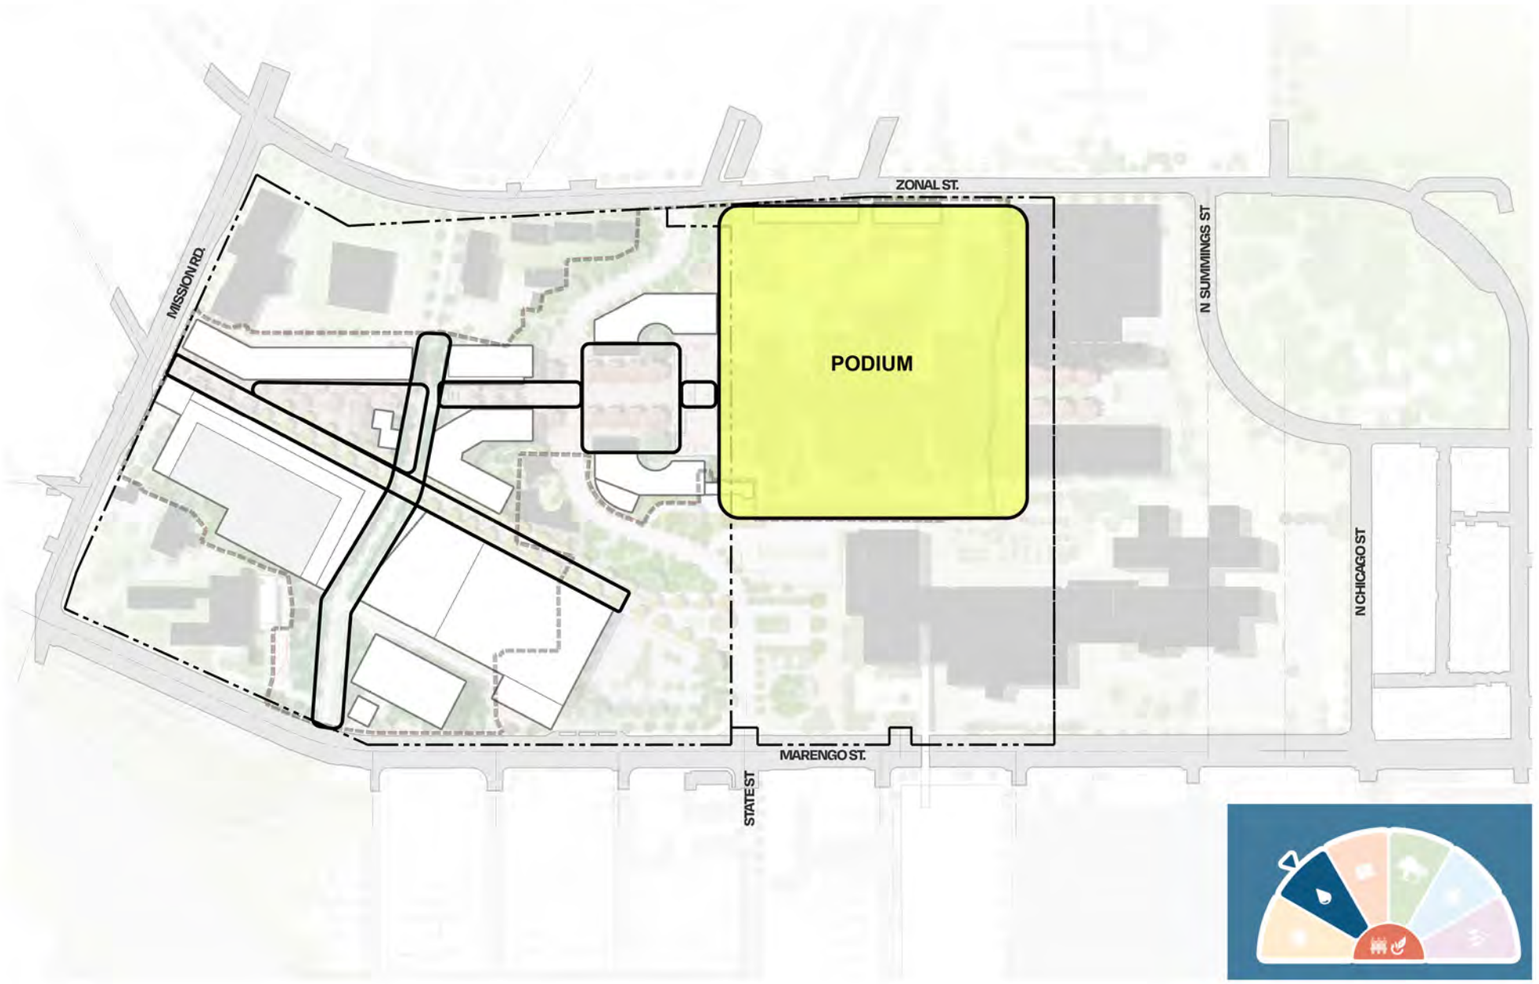


Legend

- Property Line
- ENA Boundary
- Existing Building Footprints
- Proposed Building Footprints

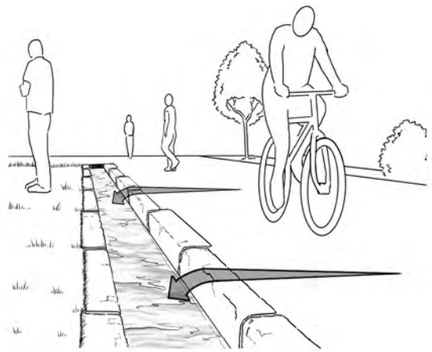


Since this particular street alignment is envisioned to be a pedestrian zone, with EVA access via removal of bollards, this allows for more aspirational stormwater strategies to be integrated. The goal is to allow for flexibility in the design of the street such that pedestrian movements are prioritized and landscape spaces are high performing by providing water quality measures that capture and treat the 85th percentile storm event.

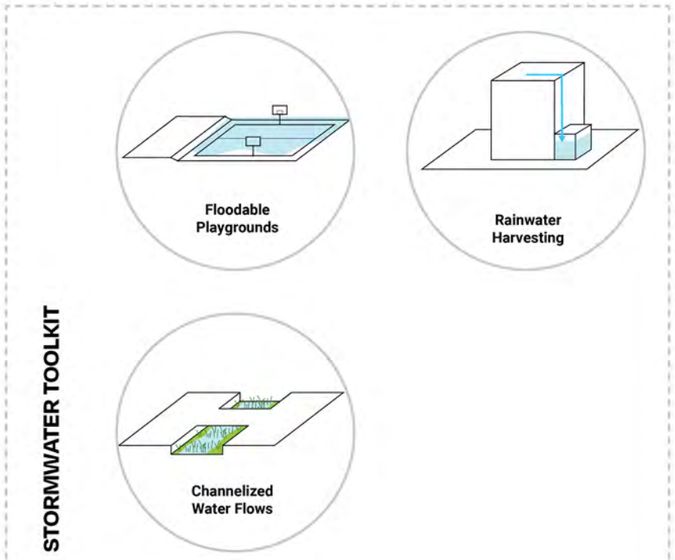


CURB CUTS AND BIOSWALE

CURB CUTS AND FLOW THROUGH PLANTERS



Stormwater Strategy Zones - Podium



Legend

- Property Line
- ENA Boundary
- Existing Building Footprints
- Proposed Building Footprints

Integrating stormwater LID strategies onto podium is challenging due to lack of native soils, limited load-bearing capacity, and often thin architectural profile. Surface-based strategies that capture or convey runoff are most appropriate.

STORMWATER RUNNEL

*This Master Plan is a draft document and is subject to approval by the County of Los Angeles Board of Supervisors. Final adoption will require full compliance with all applicable requirements under the California Environmental Quality Act (CEQA).

07

Appendix

7.1 Glossary & Terms

7.2 Use and Development Standards

7.3 Bibliography

7.1 Glossary & Terms

Glossary

Areas of Consideration – The two site areas that currently contain Parking Lot 5 and contain the OPD & IRD and Parking Structure 12

Big Blue – Los Angeles County DHS storage facility on Eastlake Avenue

Child Care Center – LA CARES day care providing services for families of patients of LAGMC qualifying LAGMC employees' children

Master Plan Boundary – The ENA Boundary plus Areas of Consideration

ENA Boundary – The portion of the superblock dedicated for future development by Centennial Partners

ENA – Refers to an agreement between Centennial Partners and the County of Los Angeles regarding the future development of the site according to the areas within the ENA Boundary

The Forecourt – The formal historic plaza leading from State Street to the entrance to the Historic General Hospital

Historic General Hospital – the 19 story historic art deco building that used to hold the hospital medical services before being replaced by LAGMC

- ***Curved Ramp*** – an access ramp and curved retaining wall that served the ambulance access to the Historic General Hospital
- ***Forecourt Buildings*** – two small historic buildings flanking the Forecourt

IRD – A building to the east of the Historic General Hospital housing DHS clinics

Los Angeles County General Hospital Campus Master Plan (Master Plan) – The Master Plan of the site inscribed by the ENA Boundary and Areas of Consideration

Los Angeles County Central Juvenile Hall (Central Juvenile Hall) – A county owned facility to the north of the superblock that no longer houses incarcerated youth, but provides other interim services

Los Angeles County Medical Examiner – The buildings at the corner of Mission and Marengo that house the County Department of Medical Examiner and Coroner

Los Angeles General Medical Center (LAGMC) – The Los Angeles County teaching hospital and one of the busiest ER and outpatient hospitals in the country

LAGMC Foundation, Inc. – The nonprofit organization supporting LAGMC and the Wellness Center

LAGMC Supplemental Chiller – A chiller plant adjacent to the Historic General Hospital that serves LAGMC

OPD – A building to the east of the Historic General Hospital housing DHS clinics

The Pharmacy – A building formerly used as a Pharmacy on West Campus now housing DHS Facilities Management

Regulatory Framework - A regulatory document that establishes a process by which to evaluate future proposed developments for conformance with the Master Plan

Restorative Care Village (RCV) – A series of phased buildings providing comprehensive and wraparound support for individuals experience substance abuse, mental health, and homelessness issues, located on the corner of Mission and Zonal on the north corner of the superblock

Superblock – The entire block bordered by Marengo St., N. Mission Rd., Zonal Ave., N. Cummings St., and N. Chicago St. owned by Los Angeles County

USC Health Sciences Campus – USC Campus to the north of the site with graduate medical programs. Professors, students, residents, and doctors serve at LAGMC

Viaduct / Tunnel – An existing services bridge and tunnel connecting the West Campus to the basement level of the Historic General Hospital

The Wellness Center – A partnership between the LA General Medical Center Foundation and a network of nonprofit organizations, advances community health by connecting County residents and LAGMC patients to medical care, social services, and wellness resources that address the social determinants of health.

West Campus – The portion of the Superblock to the west of N. State St

West Central Plant – The current central plant providing steam and chilled water to various buildings on campus

Abbreviations

CEO – Chief Executive Office, County of Los Angeles

Central Juvenile Hall – Los Angeles County Central Juvenile Hall

Master Plan - Los Angeles County General Hospital Campus Master Plan

DHS – Department of Health Services, County of Los Angeles

DEO – Department of Economic Opportunity, County of Los Angeles

DMH - Department of Mental Health, County of Los Angeles

DPW – Department of Public Works, County of Los Angeles

EIR – Environmental Impact Report

ENA - Exclusive Negotiation Agreement

FM – Facilities Management, DHS, County of Los Angeles

IRD – Interns and Residents Dormitory Building

LAGMC – Los Angeles General Medical Center

OPD – Out Patient Department Building

RCV – Restorative Care Village

USC – University of Southern California

WCP – West Central Plant

7.2 Use and Development Standards

1 Introduction

This Master Plan is supported by the following allowable uses, development standards, and performance standards, which will be the basis for future development review.

Although the Master Plan Area is in the City of Los Angeles, it consists of County-owned property. The County will review future development proposals in accordance with its "sovereign immunity," which is based on Government Code Sections 53090 through 53095 and allows the County to review development proposals on County-owned land instead of the relevant incorporated city. Although County Code Title 22 (Planning and Zoning) does not apply to a development proposal in an incorporated city, the County used Title 22's requirements for guidance when creating this document, and it includes references to certain Title 22 Chapters and Sections.

1.1 Applicable Area

These allowable uses, development standards, and performance standards apply to the area covered by the boundary outlined in red in Exhibit 1: Applicable Area, which is defined as that portion of the General Hospital Campus dedicated for future development within the Exclusive Negotiating Agreement (ENA). Areas within the boundary include portions of the superblock between Zonal Avenue, Mission Road, and Marengo Street. The boundary also includes the historic general hospital building, as well as areas immediately to the north and west of this structure. West of N State Street, which bifurcates the Master Plan Area, the boundary excludes the Restorative Care Village, County Medical Examiner Site, and Lot 5, as shown on Exhibit 1: Applicable Area (Project Site).

Exhibit 1: Applicable Area

Applicable Area subject to refinement.

1.2 Amendments to Use & Development Standards

These Use & Development Standards (Standards) may be amended over time as the Master Plan is implemented to address changes in context, conditions, or desirable land uses. Amendments may be requested by the Master Developer or initiated by the County of Los Angeles (County), through its Department of Economic Opportunity (DEO) serving as the lead County department. Defined terms are provided in Section 5.

1.2.1 Staff-Level Amendments

Staff-Level Amendments (Technical). DEO staff, following delegation of authority by the County Board of Supervisors (Board) and receipt of written approval from the Department of Regional Planning (DRP), may approve amendments to these Standards (Staff-Level Amendment) that make de minimis Minor or technical corrections and/or clarify ambiguous language (defined in Section 5). The Staff-Level Amendment determination will be final and any dispute resolution will be handled in accordance with the ground lease documents executed between the parties.

1.2.2 Board-Level Amendments

Any other amendments to these Standards require a CEQA analysis and approval by the County Board of Supervisors (Board), including amendments that: (a) add a use to Table 1, provided that the use is already codified in Title 22; (b) eliminate an affordability requirement set forth in Section 3; or (c) any other subsequent changes not delegated to the DEO under Staff-Level Amendments (Technical). Nothing in this Section limits the Board's continuing legislative authority to consider and act on any amendments to these Standards.

- Proposed Board-Level Amendments falling under the above categories may be requested by the Master Developer and initiated only by DEO.
- If Developer is proposing a change that DEO determines requires a Board-Level Amendment, DEO will work with the Master Developer, who must provide the following materials to DEO staff either as part of its application for a parcel release or as a standalone amendment request:
    - Finding of consistency with Master Plan: a written statement demonstrating that the proposed change is consistent with the overall goals, vision, and guiding principles of the Master Plan. If the change includes adding use(s) to Table 1, the finding shall address:
        - How the proposed use(s) advances one or more of the Master Plan's stated goals;
        - Why the proposed use(s), though not expressly contemplated by the existing Use and Development Standards, is nonetheless compatible with the intent of the Master Plan.

7.2 Use and Development Standards

- Requirements for CEQA analysis, Board letter, noticing, and public hearing:
    - DEO staff will oversee preparation of draft findings and a CEQA determination, to be prepared and paid for by the Developer, for the Board's consideration, with a recommendation for approval or denial. If DEO staff recommends approval, staff may additionally prepare draft conditions for the Board's consideration as attachments to the Board Letter. Before making its recommendation to the Board, DEO staff must consult with the DRP, obtain DRP's written comments, and attach the comments to the Board Letter.
    - After CEQA analysis is complete, DEO staff will publish a public hearing notice on County website(s) and directly provide it to the Master Developer and other specified stakeholders with a description of the proposed amendment as well as contact information for questions and comments, with a 30-calendar day comment period. If the amendment includes adding use(s) to Table 1, the notice shall also include a description of the proposed use(s).
        - Stakeholders receiving public hearing notice will include residents, businesses, and tenants within a 1,000-foot radius, other property owners, neighborhood and community organizations, business organizations, public agencies, special districts, and other persons or entities that have requested notice or that DEO staff determines are likely to be directly affected by the proposed amendment.
- Requirements for Board decision and adoption / certification:
- Following the public hearing, the Board will determine whether to approve recommendation(s) under CEQA. Additional findings for amendments to permitted uses:
    - A decision by the Board approving or denying an amendment to the permitted uses shall include findings addressing the following:
        - Permitted Use Tier. Whether the proposed additional use(s) will be permitted as a P use, an ACR Tier 1 use, or an ACR Tier 2 use, if the amendment is approved.
        - Consistency with Applicable Plans and Regulations. Whether the proposed amendment is consistent with the applicable County General Plan policies, Master Plan provisions, other applicable provisions of these Standards, and Title 22 provisions that apply to the proposed additional use(s).
        - Compatibility and Public Welfare. Whether the proposed amendment is compatible with the surrounding area and will promote the public health, safety, and general welfare.
        - Land Use Impacts. Whether each proposed additional use is appropriate in light of the physical characteristics of the area, existing and planned land uses, and any material effects associated with each proposed additional use.
- Additional findings for amendments that eliminate an affordability requirement:
    - A decision by the Board approving or denying an amendment that eliminates an affordability requirement shall include findings addressing the following:
        - Nature of the Requirement. The affordability requirement that would be eliminated and the housing or other public policy objective served by that requirement.
        - Justification for Elimination. The circumstances supporting elimination of the affordability requirement and the reasons the Board determines that elimination is appropriate.
        - Consistency with Housing Policies. Whether elimination of the affordability requirement is consistent with applicable County General Plan policies, housing policies, and other applicable County housing requirements, including continued compliance with the Surplus Land Act.
        - Public Interest. Whether elimination of the affordability requirement is consistent with the public health, safety, and general welfare, taking into consideration the County's housing and affordability objectives.

Any amendment approved under this Section shall be documented in writing and incorporated into a revised version of these Standards, which shall be maintained by DEO, with copies to DRP, as the operative version for purposes of future development review.

2 Permitted Uses

The following uses are intended to guide future development within the Applicable Area. Individual development proposals will be reviewed for consistency with these standards. This document permits a mix of residential, commercial, and limited light industrial uses. This framework supports a range of housing types and densities, alongside commercial, office, and service-oriented uses that serve residents, employees, and visitors. Table 1 (Use Table) lists the permitted uses within the Applicable Area.

If a use is not listed in Table 1, it is not permitted. However, the table of permitted uses may be amended following the procedures described in Section 1.2.

2.1 Use Standards

Abbreviation	Permit or Review Requirement
P	Permitted subject to County's ministerial review process
ACR	Permitted subject to Additional County Review (ACR), which is defined in Section 5.

7.2 Use and Development Standards

A new mixed-use development with residential and commercial components can include several uses listed in Table 1. If any use in the new mixed-use development is permitted subject to ACR, the entire development is permitted subject to ACR. After the mixed-use development is approved, if a subsequent change in use, tenancy, or intensity of use includes a use that requires an ACR, the ACR is required only for that use.

Table 1 Use Table

Uses	Permit or Review Requirement within Applicable Area Boundary	Additional Regulations
Agricultural and Resource-Based Uses		
Community gardens	P	Storage structures for materials and equipment shall be completely enclosed and shall be located at least six feet from any habitable structure. The sale of products on-site at a community garden is prohibited.
Cultural, Educational, and Institutional Uses		
Auditoriums and event spaces	P	
Churches, temples, or other places used exclusively for religious worship, including accessory educational and social activities	P	
Libraries	P / ACR (Tier 2)	Private library - P Municipal library - ACR
Museums	P	
Schools, business and professional, including art, cooking, dance, drama, martial arts, music, and professional education	P	
Schools, grades K-12, accredited by the State of California, including charter schools and excluding trade or commercial schools	ACR (Tier 2)	
Lodging		
Patient and Caregiver Lodging	ACR (Tier 1)	
Recreational Uses		
Health Clubs	P	
Gymnasium	P	
Open space, playgrounds, and recreational areas, including accessory facilities	P	
Recreation clubs, commercial	P	Excludes gun clubs Section 22.140.480
Riding and hiking trails, excluding trails for motor vehicles	P	
Sauna and steam baths	P	
Swimming pools	P	
Residential Uses		
Adult residential facilities	P	
Foster family homes	P	
Group homes for children	P / ACR (Tier 1)	6 or fewer persons – P 7 or more persons - ACR
Joint live and work units	P	
Residential dwelling units (Single-family residences and multi-family housing)	P	
Residential substance use recovery facilities	P / ACR (Tier 1)	6 or fewer persons – P 7 or more persons - ACR
Rooming and boarding houses	P	
Small family homes for children	P	
Retail and Service Uses		
Banks, savings and loans, credit unions, and finance companies	P	Excludes alternative financial services, as defined in Section 22.14.010 – A
Barber and beauty shops	P	
Bars and cocktail lounges	ACR (Tier 1)	Section 22.140.030
Bicycle rentals	P	
Day care	P / ACR (Tier 1)	P – children ACR - adults
Domestic Violence Shelter	P	Section 22.140.180
Dry cleaning drop-off and pick-up services	P	Excludes on-site processing
Emergency Shelter	P	Section 22.140.180
Family child care homes, large and small in an approved residential use	P	
Farmers' markets	P	
Hospitals	ACR (Tier 2)	
General retail, including grocery stores / supermarkets, foodstuffs, beverages, secondhand, and specialty goods.	P / ACR (Tier 1)	Gun dealers prohibited. Cannabis sales prohibited. Alcohol sales subject to ACR (Tier 1) and provisions of Section 22.140.030
Medical and dental offices, including accessory laboratories	ACR (Tier 1)	
Outpatient surgical facilities	ACR (Tier 2)	

7.2 Use and Development Standards

Movie theatres	P	
Offices, business or professional	P	
Pet grooming services, excluding overnight boarding	P	
Photocopying and duplicating services	P	
Photography studios	P	
Printers and publishers	P	
Repair shops, including electricity, plumbing, locksmiths, tailoring, and shoe repair, etc.	P	
Restaurants and other eating establishments, including outdoor dining	P / ACR (Tier 1)	Alcohol sales subject to ACR (Tier 1) and provisions of Section 22.140.030
Tourist information centers	P	
Veterinary clinics, small animals, excluding overnight boarding	ACR (Tier 1)	
Clean Tech and Advanced Industrial		
Battery Energy Storage Systems (BESS), front-of-the-meter, utility scale facilities serving multiple buildings that connect directly to the distribution/transmission grid	ACR (Tier 2)	Serving multiple buildings within the Applicable Area only
Data centers	ACR (Tier 2)	County uses only, limited to 10MW each. Generative or hyperscale facilities not permitted.
Kitchens and commercial kitchens, including commissary kitchens and shared kitchen complexes	P	
Laboratories, research and testing	P	Requires a 200-foot buffer from residential uses
Light manufacturing, artistic and artisanal goods	P	
Light manufacturing, alcoholic beverages	ACR (Tier 1)	Requires a 200-foot buffer from residential uses
Light manufacturing, cosmetic & pharmaceutical	ACR (Tier 1)	Requires a 200-foot buffer from residential uses
Light manufacturing, food and drink	ACR (Tier 1)	Requires a 200-foot buffer from residential uses
Light manufacturing, garment and accessory	P	Requires a 200-foot buffer from residential uses
Light manufacturing, general	ACR (Tier 1)	Requires a 200-foot buffer from residential uses
Light manufacturing, textile	ACR (Tier 1)	Requires a 200-foot buffer from residential uses
Storage		
Warehousing, County	P	If the County vacates the warehouse, DEO staff, after receiving written approval by DRP, may allow the space to be converted to a non-County warehouse subject to an ACR Tier 2 review.
Wholesale	ACR (Tier 2)	
Transportation, Electrical, Gas, Communications, Utilities, and Public Service Uses		
Fire and police stations	ACR (Tier 2)	
Parking lots and parking garages	P	
Post offices	P	
Public or private utility service centers	ACR (Tier 2)	
Stations, bus, and taxi	ACR (Tier 1)	
Wireless facilities	ACR (Tier 1)	Section 22.140.760

Table 2 Accessory Use Table

Uses identified in Table 2 Accessory Use Table are allowed only where a principal use identified in Table 1 is established.

Uses	Within Applicable Area Boundary	Additional Regulations
Accessory Storage	P	Floor area limited to 49% of the floor area of the principal use
Battery Energy Storage Systems (BESS), behind-the-meter	P	
Data servers and data processing	P	

Hazardous Materials

If a principal use requires a Major Handler Permit or above, it requires an ACR Tier 2 review. The purpose of the ACR Tier 2 review is to determine whether that quantity of hazardous materials is appropriate from a land use perspective, and if appropriate, what conditions should be imposed.

3 Performance Standards

3.1 General

General. Projects are subject to the performance standards that apply to projects in the MXD Zone of the County Code (Section 22.26.030) unless there is a performance standard in this document addressing the same matter. In case of conflict, the performance standard found in this document shall prevail.

7.2 Use and Development Standards

Residential. At full build-out of the Project Site, as shown in Exhibit 1 Applicable Area, a minimum of 600 housing units shall be provided across the Project Site, including at least 25 percent of the total units covenanted as Affordable Housing with incomes below 50% of the AMI and Very Low Income (31-50% of AMI) affordability levels additionally 5% of units set aside for moderate workforce housing (80-120% AMI). The Project shall comply with the requirements of the Surplus Land Act. Affordable housing units may be provided either (a) integrated within a building that also contains market-rate or workforce units, or (b) within a stand-alone building consisting entirely of affordable units.

West Campus Residential Mix. Within the West Campus area, as shown in Exhibit 2, upon the issuance of a Certificate of Occupancy for any new non-residential floor area, residential uses shall comprise not less than twenty-five percent (25%) of the cumulative habitable floor area constructed within the West Campus.

General Hospital Residential Mix. Where residential uses are provided within the General Hospital Building, a minimum of twenty-five percent (25%) of the dwelling units shall be provided as Affordable units.

Exhibit 2: West Campus

Hours of Operation. The hours of operation for commercial uses shall be no earlier than 6:00 a.m. and no later than 11:00 p.m. daily, unless modified with ACR Tier 1.

Loading. Loading, unloading, and all maintenance activities shall be conducted between 6:00 a.m. and no later than 8:00 p.m., and in such fashion to prevent annoyance to adjacent residents and tenants.

- Medical uses are exempt from this requirement.

Operating Activities Prohibited. The following operating activities shall be prohibited in commercial uses located within mixed-use developments:

- Storage or shipping of flammable liquids or hazardous materials beyond quantities generally associated with a residential use; and
- Welding, machining, or open flame work.

Graffiti. To encourage the maintenance of exterior walls free from graffiti that would impact pedestrian views, the following shall apply to all properties:

- All structures, walls, and fences open to public view shall remain free of graffiti; in the event of such graffiti occurring, the property owner, tenant, or their agent shall remove or cover said graffiti within 72 hours, weather permitting. Paint utilized in covering such graffiti shall be a color that matches, as closely as possible, the color of the adjacent surfaces.

4 Development Standards

The following development standards apply to new construction and additions within the applicable area as defined in Section 1.1 and do not apply to the alteration, rehabilitation, or adaptive reuse of the General Hospital Building. Projects are subject to the development standards that apply to projects in the MXD Zone of the County Code (Section 22.26.030) unless there is a development standard in this document addressing the same matter. In case of conflict, the development standard found in this document shall prevail.

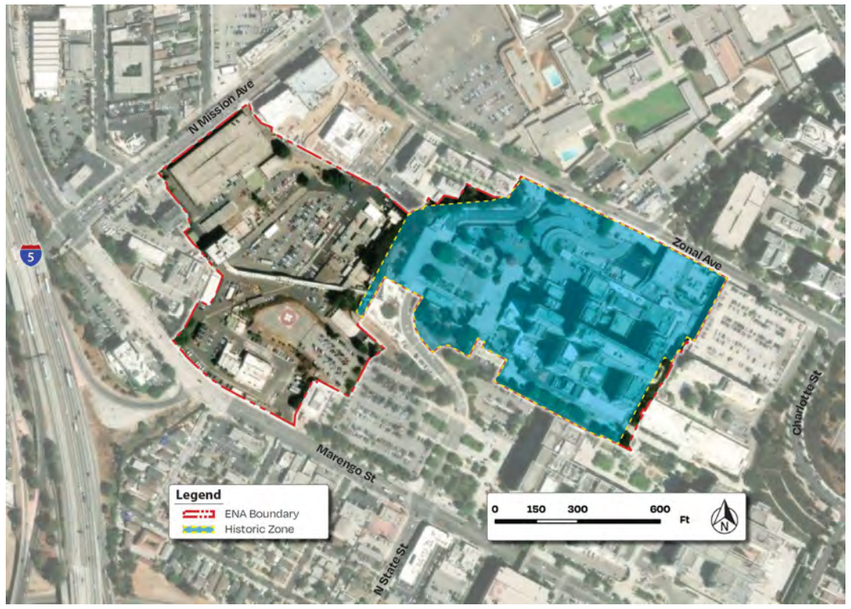
4.1 Intensity

The total Floor Area Ratio (FAR) for all new construction within the Applicable Area, as illustrated in Exhibit 1, shall not exceed 4.0. Residential density shall only be limited by permitted floor area.

When calculating FAR, gross floor area shall be the total building area including residential, measured from the exterior of the building walls, of all floors of a building expressed in square feet. Gross floor area shall exclude:

- Parking structures, garages, carports, or other areas designated for parking and loading, or vehicular access to parking and loading spaces, because these structures shall be counted separately.
- Exterior balconies, decks, porches, courts, and stairs.
- Buildings or structures for housing building operating equipment or machinery.
- Cellars.
- Attics, if not a habitable room as defined by Title 26 (Building Code) of the County Code.

4.2 Height



Height for new buildings shall be regulated based on both the building's height relative to the General Hospital building and key views to the General Hospital building from onsite locations and surrounding roadways.

7.2 Use and Development Standards

No structure or projections outside of the Historic Zone illustrated in Exhibit 3 shall exceed 30’ below the highest elevation point of the roof structure or parapet wall of the historic General Hospital building.

Structures within the Historic Zone illustrated in Exhibit 3 shall be subject to additional review in accordance with Section 4.13. General Hospital Acute Unit Historic District.

Exhibit 3: Historic Boundary

4.3 Viewsheds

Intent. Campus development shall be designed to protect and enhance public views of the General Hospital Building to the maximum extent feasible.

Protected View Corridors. The two view corridors identified in this Section shall be protected view corridors of the General Hospital Building. No new building, structure, or portion thereof shall intrude into a protected view corridor, defined as a continuous vertical plane extending from the ground plane at each designated viewpoint along the centerline shown in Exhibit 4, Key Viewsheds, to the façade of the General Hospital Building. In the event of a conflict between this written description and Exhibit 4, the written description shall control.

View Corridor 1. A protected view corridor of uniform 30-foot horizontal width shall be maintained from the General Hospital Building primary entrance to the terminus point located 900 feet along the central corridor, as shown in Exhibit 4.

View Corridor 2. A protected view corridor of uniform 30-foot horizontal width shall be maintained from the intersection of Zonal Avenue and State Street to the General Hospital Building, preserving unobstructed views of the building's uppermost four stories, as shown in Exhibit 4.

Exhibit 4: Key Viewshed

4.4 Setbacks

Minimum building setbacks from public right-of-way – 0 feet

Minimum building setbacks internal drives and private streets – 0 feet

Building-to-building setbacks – per California Building Code

4.5 Stepbacks

Stepbacks on upper floors are not required for any new building.

4.6 Active Ground Floor

Transparency. At least 50 percent of any building's ground floor facade that is oriented towards the Central and Wellness Corridors shall be composed of active commercial uses with windows without reflective coating or dark tinting. Lightly tinted glazing less than 15% is acceptable.

4.7 Open & Recreational Space

General. A minimum of 10% of building footprint area shall be provided for private or common recreational space. At least 20% of any outdoor lot amenity space shall be shaded by using shade trees

7.2 Use and Development Standards

or shade structures. Any area that is covered by a shade structure or a shade tree canopy spread at maturity shall be considered as being shaded.

Off-street parking and loading areas, driveways, and other vehicular access areas, service areas, and perimeter landscaping shall not count as usable recreational space.

Common Recreational Space. Where a rooftop is used for common recreational space, the rooftop shall incorporate landscaping, decorative paving and materials, and recreational amenities. Mechanical equipment storage areas on roof tops shall not be counted towards recreational space.

4.8 Landscaping

A minimum of 10% of the project area shall be landscaped with drought-tolerant lawn, shrubbery, flowers, or trees, which shall be continuously maintained in good condition. Incidental walkways may be developed in the landscaped area. Landscaping may be a part of the building, such as internal atriums and ground-floor planters.

4.9 Circulation, Parking & Loading

Circulation Plan

The redevelopment of the project area shall provide three primary arrival points: LA General Hospital, Central Campus, and West Campus.

Parking

Minimum provision of parking is not required for any use on the site and the provision of parking is not limited by maximums. If provided, parking lots and parking spaces shall meet the standards of Section 22.112.080, Parking Design.

Parking structure treatment. All faces of a parking structure, which are visible from a roadway, shall receive design treatment. The design may be unique in style and character, incorporating the color of use, screening, art, green walls, or supergraphics.

Loading

Loading areas shall be located away from primary pedestrian ingress and egress areas by at least 20 feet. Wherever feasible, loading areas shall be located at the rear of the building.

Under refinement based on technical studies. Existing county standards as follows:

Gross Floor Area (square feet)	Number of Spaces
Office	
5,000—36,000	1 Type A
36,000 +	2 Type A
Commercial	
5,000—24,000	1 Type A
24,000—60,000	2 Type A
60,001 +	3 Type A
Industrial	
0—18,000	1 Type B
18,001—36,000	2 Type C
36,001—90,000	3 Type C
90,001—150,000	4 Type C
150,001 +	5 Type C

Type of Loading Space Required	Minimum Length (feet)	Minimum Width (feet)	Required Vertical Clearance (feet)	Length of Maneuvering Space (feet)
Type A	24	12	None	36
Type B	30	12	None	45
Type C	40	12	14	60

4.10 Stormwater

Projects must adhere to the County's Low Impact Development Standards (Chapter 12.84 of the County Code) or seek alternative approval under the protocols of the LACGH LID Master Plan upon adoption.

4.11 Screening

Trash enclosures for refuse and recycling bins shall be:

- Located within parking structures, at the rear or side of buildings, or between buildings, and shall not be between a building and a street or highway;
- Located not farther than 150 feet from the building;
- Not placed in any public right-of-way;
- Screened by solid masonry walls between five and six feet in height, if located outside.
- Feature an opaque, self-latching metal gate.
- Covered by a trellis, roof, or shade structure.

4.12 Security

Chain-link, barbed, and concertina wire fences are prohibited.

Security bars and accordion folding grilles installed on the exterior of a storefront are prohibited.

7.2 Use and Development Standards

Building security grilles may be placed within the interior of the building if the grilles are concealed so that they are not visible from the exterior of the building when not in use during business hours.

4.13 General Hospital Acute Unit Historic District

The General Hospital Campus includes significant historic resources, most notably the Los Angeles General Hospital – Acute Unit Building and the Acute Unit Historic District. The following requirements are established to ensure the preservation, rehabilitation, and appropriate treatment of these resources.

All work within the Los Angeles General Hospital – Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to conform with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Prior to commencement of any construction activities associated with the Los Angeles General Hospital – Acute Unit Building's exterior or interior character-defining features, or the Acute Unit Historic District's contributing features (Patient's and Visitor's buildings, retaining walls, gateways, State Street, forecourt, tunnel), a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to monitor all disassembly, construction and rehabilitation activities, to ensure appropriate treatment of exterior and interior character-defining features, materials, and spaces during the construction project.

Prior to undergoing any demolition activities at the Los Angeles General Hospital – Acute Unit Building and any other contributing features within the Acute Unit Historic District (Patient's and Visitor's buildings, retaining walls, gateways, State Street, forecourt, tunnel), that would result in the removal of interior or exterior character-defining features (or portions thereof), Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards. HABS/HAER Level II drawings and historical narrative may follow after construction commences. To ensure public access, the Applicant shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- Drawings: Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- Photographs: Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- Historical Narrative: An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

4.14 West Campus Site Documentation

Prior to demolition of the Pharmacy Building and Viaduct, Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards and a qualified structural engineer with at least five years of demonstrated, related experience. HABS/HAER Level II drawings and historical narrative may follow after demolition. To ensure public access, the Applicant shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- Drawings: Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- Photographs: Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- Historical Narrative: An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

7.2 Use and Development Standards

5 Definitions

- Accessory use. A use customarily incidental to, related, and clearly subordinate to a principal use established on the same lot that does not alter said principal use nor serve property other than the site on which the principal use is located.
- Accessory storage. The storage of goods, materials, equipment, or personal property that is incidental to, related, and clearly subordinate to a permitted principal use established in the same building.
- Active commercial use. A use that activates the ground floor of a structure, with transparent features such as doors and windows that interface with the adjacent streetscape and the interior of the building. Examples include retail, restaurants, office space, and outdoor dining.
- Additional County Review (ACR). A discretionary process in which the County decides to allow a use without conditions, allow a use with conditions, or deny a use.
    - **ACR Tier 1**: Proposed uses subject to ACR Tier 1 review require approval by DEO staff, in accordance with delegation of authority by the Board, coordination with other applicable County departments, and receipt of written concurrence from the DRP.
        - Requirements for noticing:
            - After CEQA review is complete, DEO staff will publish a notice on County website(s) and directly provide it to the Master Developer and other specified stakeholders with a description of the proposed project site(s), proposed project(s), and proposed use(s) as well as contact information for questions and comments, with a 30-calendar day comment period.
            - Stakeholders receiving notice will include residents, businesses, and tenants within a 1,000-foot radius, other property owners, neighborhood and community organizations, business organizations, public agencies, special districts, and other persons or entities that have requested notice or that DEO staff determines are likely to be directly affected by the proposal.
            - DEO staff will review public comments, draft findings, draft conditions (if applicable), obtain written concurrence from the DRP, and issue a decision within 90 calendar days after notice issuance.
            - DEO staff will publish notice of the decision on County website(s) and directly provide it to the Master Developer and the same residents / businesses / tenants and other specified stakeholders that were previously notified, with the findings and the conditions (if applicable) attached to the notice.
        - Requirements for DEO's decision:
            - DEO staff's issued decision to approve or deny the application must include the following findings:
                - Consistency with Applicable Plans and Regulations. Whether the proposed use is consistent with the applicable County General Plan policies, the overall goals, vision, guiding principles, and other provisions of the Master Plan, other applicable provisions of these Standards, and Title 22 provisions that apply to the proposed use.
                - Compatibility and Public Welfare. Whether the proposed use is compatible with the surrounding area and will promote the public health, safety, and general welfare.
                - Land Use Impacts. Whether the proposed use is appropriate in light of the physical characteristics of the area, existing and planned land uses, and any material effects associated with the proposed use.
            - DEO staff may also impose conditions of approval to substantiate the findings.
    - **ACR Tier 2**: Proposed uses subject to ACR Tier 2 review require approval or denial by the County Board of Supervisors.
        - Requirements for noticing and public hearing:
            - After CEQA review is complete, DEO staff will publish a public hearing notice on County website(s) and directly provide it to the Master Developer and other specified stakeholders with a description of the proposed project site(s), proposed project(s), and proposed use(s) as well as contact information for questions and comments, with a 30-calendar day comment period.
            - Stakeholders receiving public hearing notice will include residents, businesses, and tenants within a 1,000-foot radius, other property owners, neighborhood and community organizations, business organizations, public agencies, special districts, and other persons or entities that have requested notice or that DEO staff determines are likely to be directly affected by the proposal.
            - DEO staff will recommend a proposed CEQA finding(s) and recommend approval or denial of the application at the public hearing. If DEO staff recommends approval, draft conditions will be attached to the Board Letter. Before making its recommendation to the Board, DEO staff must consult with the DRP and obtain DRP's written comments, which will be attached to the Board Letter.
        - Requirements for the Board's decision:
            - Following the public hearing, the Board will determine whether to approve recommended finding(s)pursuant to CEQA. The Board's issued decision to approve or deny the application must include the following findings:
                - Consistency with Applicable Plans and Regulations. Whether the proposed use is consistent with the applicable County General Plan policies, the overall goals, vision, guiding principles, and other provisions of the Master Plan, other applicable provisions of these Standards, and Title 22 provisions that apply to the proposed use.
                - Compatibility and Public Welfare. Whether the proposed use is compatible with the surrounding area and will promote the public health, safety, and general welfare.
                - Land Use Impacts. Whether the proposed use is appropriate in light of the physical characteristics of the area, existing and planned land uses, and any material effects associated with the proposed use.
            - The Board may also impose conditions of approval to substantiate the findings.
- Adult day care center. As defined by Section 1502(a)(2) of the California Health and Safety Code, a licensed facility that provides non-medical care and supervision for adult clients on less than a 24-hour basis. This term includes "adult day program" and "respite care."
- Adult residential facility. Any facility that provides 24-hours-a-day nonmedical care and supervision to adults, as defined and licensed under the regulations of the State of California.
- Bar or cocktail lounge. Any premises where alcoholic beverages are sold for on-site consumption and is not accessory to a restaurant. This term includes tavern.
- Battery Energy Storage System (BESS). Electrochemical devices that charge or collect energy from the grid or a generation facility, store that energy, and then discharge that energy at a later time to provide electricity or other grid services.

7.2 Use and Development Standards

- Boarding house. As defined in Section 7.50.010 of Title 7 (Business Licenses) of the County Code, a lodging house or other facility maintained, advertised or held out to the public as a place where sleeping or rooming accommodations are available, with or without meals. This term includes "rooming house" and "fraternity and sorority houses."
- Building. A structure that has a roof supported by columns or by walls and intended for the shelter, housing or enclosure of persons, animals, belongings, or property.
- Building frontage. The exterior building wall of a ground floor business establishment on the side of the building that fronts or is oriented towards a public street, highway, or parkway. "Building frontage" shall be measured continuously along the building wall for the entire length of the business establishment, including any portion not parallel to the remainder of the wall.
- Cellar. The portion of a building between floor and ceiling which is wholly or partly below grade but so located that the vertical distance from grade to the floor below is equal to or greater than the vertical distance from grade to ceiling.
- Central Corridor. The main axis of the General Hospital Campus, containing one of two key viewsheds, as depicted in Exhibit 4.
- Clarification of Ambiguous Language. A change that resolves language that is reasonably susceptible to more than one interpretation in a manner consistent with the purpose, structure, and other provisions of the project's Master Option Agreement, without altering the underlying rights, obligations, timelines, or financial terms of either party as documented in the project's Master Option Agreement, and the County determines prior to approval that the proposed changes do not constitute a project under CEQA.
- Community garden. A garden for multiple users established on a single or multiple plots of land for the cultivation of fruits, vegetables, plants, flowers, and/or herbs for the collective benefit of its users.
- Condition. A development standard or performance standard determined to be necessary to allow a use subject to ACR.
- City. The City of Los Angeles.
- County Code. The Los Angeles County Code.
- County. The County of Los Angeles.
- Data Center. A building, structure, or portion thereof used principally for the housing, operation, and maintenance of computer servers, data storage equipment, networking equipment, and associated electrical, mechanical, cooling, and security infrastructure for the electronic processing, storage, transmission, or retrieval of data. A Data Center is a principal use and is typically characterized by high-capacity electrical service, dedicated cooling systems, backup power generation, restricted public access, and low employment density. This use does not include Data Server and Data Processing as defined herein.
- Data Server and Data Processing. The operation of computer servers, data storage equipment, and related information technology infrastructure for the electronic processing, storage, transmission, or retrieval of data, where such use is incidental and subordinate to a principal use in the same building on the same site and only serves the operations, tenants, or occupants of that building.
- Day care. A facility licensed by the California Department of Social Services that provides non-medical care and supervision of adults or children for periods of less than 24 hours.
- Density. The number of dwelling units per unit of land area.
- Domestic violence shelter. Housing that offers temporary accommodations and services to survivors of domestic violence, as defined in Section 18291(c) of the California Welfare and Institutions Code.
- Dwelling unit. One or more habitable rooms in a building, or portion thereof, designed or intended to be used or used for occupancy by one family for living and sleeping quarters and containing only one kitchen.
- Emergency shelter. Housing that offers temporary accommodations and services to people experiencing homelessness, as defined in Section 50801(e) of the California Health and Safety Code. As used herein, "temporary accommodations" means that persons may reside at the shelter for a period not to exceed six months.
- Façade. A building's exterior face that expresses the character of the building and serves as the primary form of protection against external weather elements.
- Family child care home, large. A home that regularly provides non-medical care, protection, and supervision for nine to 14 children in the provider's own home, for periods of less than 24 hours per day as defined and licensed under the regulations of the State of California.
- Family child care home, small. A home that regularly provides non-medical care, protection, and supervision for eight or fewer children in the provider's own home for periods of less than 24 hours per day, as defined and licensed under the regulations of the State of California.
- Farmers' market. A California certified farmers' market, as defined in Section 113742 of the California Health and Safety Code, where producers sell farm products or value-added farm products directly to consumers.
- Floor Area Ratio. Floor area ratio shall be the numerical value obtained through dividing the above ground gross floor area of a building or buildings located on a lot by the total applicable area illustrated in Exhibit 1. Floor area ratio is expressed as a decimal number and shall be rounded to the tenths place.
- Foster family home. A residential facility providing 24-hour care for six or fewer foster children which is the residence of the foster parents, including their family, in whose care the foster children have been placed, as defined and licensed under the regulations of the County.
- Gross Floor Area. Gross floor area shall be the total gross area of all floors of a building expressed in square feet.
- Group home for children. A facility that provides 24-hours-a-day, non-medical care and supervision to children in a structured environment, with services provided at least in part by staff employed by the licensee, as defined and licensed under the regulations of the State of California. For the purpose of this term, a licensee means the adult, firm, partnership, association, corporation, county, city, or other public agency having the authority and responsibility for the operation of a licensed community care facility.
- Habitable Floor Area. Floor area within a building designed or intended for regular human occupancy, including residential, commercial, office, institutional, educational, hospitality, and community-serving uses, but excluding parking areas, loading areas, storage, mechanical and utility rooms, service corridors, elevator shafts, stairwells, and other areas not intended for regular occupancy.

7.2 Use and Development Standards

- Hazardous materials. As defined by the County Environmental Protection Code (Title 12) and the County Fire Code (Title 32).
- Historic resource. A district, structure, site, place, object, tree, landscape, or natural land feature significant in American archeology, architecture, culture, engineering, or history, that is either designated or eligible for designation as an historic landmark, natural landmark, historic district, or comparable designation under federal, State, or County law or regulation.
- Historic Zone. The area depicted in Exhibit 3, where additional historic review of new construction will be required.
- Joint live and work unit. A dwelling unit comprised of both living space and work space, where either a residential use or a commercial use can be the principal use. At least one resident of the living space shall be responsible for the commercial activity performed in the work space. The terms "living space" shall mean the area for the residential use, and "work space" shall mean the area for the commercial use.
- Kitchen. A room or space used, intended, or designed for cooking or the preparation of food, or that contains a bar sink or gas, electrical, or water outlets used, intended, or designed for cooking facilities.
- Lot. A contiguous quantity of land, owned by or recorded as the property of the same claimant or person, or in the possession of the same claimant or person pursuant to a recorded lease with a term of not less than 20 years, including legally defined real property or a parcel of land established by a recorded map. "Lot" and "parcel of land" may be used synonymously.
- Manufacturing, Light. Any light industrial use involving the making or processing of materials or components into new products.
- Manufacturing, Light: Alcoholic Beverage. Any manufacturing, light use where beer, wine, or other alcoholic beverages are fermented, distilled, and/or processed for distribution and sale on a wholesale basis
- Manufacturing, Light: Artistic & Artisanal. A small-scale manufacturing, light use where skilled craftspersons are integral to the creation of each product, materials, substances, or components, and may include, but are not limited to the use of hand tools or light mechanical equipment such as commercial mixers, sewing machines, wax melters, bottle sealers, paste filling machines, and button press machines. Manufacturing, light: artistic & artisanal uses are equal to or less than 15,000 square feet in area.
- Manufacturing, Light: Cosmetic & Pharmaceutical. Any manufacturing, light use where cosmetics, soaps, or pharmaceutical drugs are produced. This use includes, but is not limited to, manufacturing of makeup products, deodorants, shampoos, hair dyes, perfumes, skin moisturizers, medications, or supplements.
- Manufacturing, Light: Food & Drink. Any manufacturing, light use where food or drink products are processed or manufactured. The food and beverage products manufactured in these facilities are typically sold to wholesalers or retailers for distribution to consumers. This use includes, but is not limited to, the processing and packaging of the following: sodas & juices, coffee & tea, ice, dairy products, fruit, nut, & vegetable products, grain & oilseeds, baked or fried goods, sugar and confectionery products, animal food, and tobacco products. This use includes food & drink products composed of previously rendered animal products. This use does not include meat processing, the rendering of animal products, or animal slaughtering, for such uses. This use does not include breweries, distilleries, and wineries.
- Manufacturing, Light: Garment & Accessory. Any manufacturing, light use involving the cutting, stitching or assembly of materials to produce finished clothing, footwear, and accessories. Specific activities include, but are not limited to, sewing of finished textiles, printing or stenciling of designs on garments, assembly of accessories or footwear, or the knitting of finished garments.
- Manufacturing, Light: General. The manufacturing of finished goods intended to be sold as consumer goods to the general public, including devices and instruments used in a workplace. This use includes, but is not limited to, the manufacturing and assembly of the following: medical equipment and supplies; semiconductors and electronic instruments; signs and printed material; musical instruments; jewelry; toys; furniture; crates; boxes; and barrels.
- Manufacturing, Light: Textile. Any manufacturing, light use involving mechanized production of fibers and fabrics used to create materials for the production of garments and accessories. Specific activities include, but are not limited to, textile spinning, weaving, dying, printing, or finishing.
- Minor or technical correction: an amendment that corrects a typographical, spelling, grammatical, punctuation, or formatting error, or a manifest arithmetic or cross-reference error, where the correction does not alter the substantive rights, obligations, or intent of the parties as evidenced by the document as a whole and the County determines prior to approval that the proposed changes do not constitute a project under CEQA.
- Mixed use development. A development that combines residential and commercial uses, unless otherwise specified.
- Multi-family housing. This term includes "supportive housing" and "transitional housing."
    - Multi-family residential building. A building containing three or more dwelling units.
    - Townhouse. A single-family dwelling unit sharing a common wall with other single-family dwelling units on one or two sides and capable of being placed on a separate lot. This term includes "row house."
    - Two-family residence. A building containing two dwelling units, other than a single-family residence with an attached accessory dwelling unit. This term includes "duplex."
- Office. General, professional, or medical office building developments.
- Outdoor dining. A restaurant or other eating establishment, including food take-out, where food or beverage are served on private property, and where there is not a roof and walls on all sides.
- Parking areas, buildings, facilities, or lots. Any readily accessible area within structures or surface parking areas, exclusive of aisles, driveways, ramps, and columns, maintained exclusively for the parking of vehicles, not including areas for the parking or storage of commercial vehicles with registered net weights in excess of 5,600 pounds, unladen.
- Patient and Caregiver Lodging. A lodging establishment containing six or more guest rooms or suites and offering temporary overnight accommodations.
- Project. Any activity which requires approval by the County resulting in the issuance of a building permit for public, residential, commercial, office, recreational, medical, industrial, and storage uses, as listed in Table 1, Use Table.

7.2 Use and Development Standards

- Public or private utility service center. Any building or premises used for the administration of public or private utility repair, dispatch of maintenance and installation crews, and includes parking for vehicles not to exceed two tons rated capacity, but does not include warehouses or storage yards.
- Recreation club, commercial. A commercial enterprise that offers the use of outdoor recreational facilities to the public.
- Recreational space, common. Open space associated with multiple residential units, such as pool areas, clubhouses, and courtyards.
- Recreational space, private. Open space associated with a single residential unit, such as a patio, balcony, or roof deck.
- Residential substance use recovery facility. An "alcoholism and drug abuse recovery or treatment facility," as defined by Section 11834.02 of the California Health and Safety Code, and licensed and regulated by the California Department of Health Care Services. This term does not include "sober living facilities."
- Shared kitchen complex. As defined in County Code Section 8.04.425 (Shared Kitchen Complex) and subject to all applicable provisions in County Code Chapter 11.09 (Shared Kitchen Complex). For the purposes of this document, food prepared or handled in a shared kitchen complex shall be for off-site sale and consumption only. A shared kitchen complex is not an eating establishment.
- Single-family residence. A building that contains one dwelling unit, a mobilehome comprising one dwelling unit manufactured and certified under the National Mobilehome Construction and Safety Standards Act of 1974 (1974 Mobilehome Act) on a permanent foundation system approved by the Director of Public Works, or a manufactured home constructed on or after June 15, 1976. This term includes "supportive housing" and "transitional housing."
- Small family home for children. As defined in Section 1502(a)(6) of the California Health and Safety Code, any state-licensed facility within a licensee's residence providing 24-hour-a-day care for six or fewer children with developmental, or physical disabilities, or mental disorders, who require special care and supervision as a result of such disabilities.
- Substantially similar in character, intensity, and impact. Defined according to the following criteria:
    - Character: Similarity of primary purpose and function, and similarity of regulatory characteristics.
    - Intensity and Impact: All impacts of the proposed amendment are determined by the County to be within the scope of the County's certified Supplemental EIR.
- Supportive housing. Housing that is occupied by the target population (as defined in Section 22.14.200), with no limit on length of stay, and with on-site or off-site supportive services (as defined in this Section, below) that assist its residents in retaining housing, improving their health status, and maximizing their ability to live and, when possible, work.
- Transitional housing. Housing that offers temporary accommodations and services to people experiencing homelessness until placement in permanent housing. Transitional housing is not limited to housing funded by the United States Department of Housing and Urban Development. Transitional housing may be a dwelling unit or units, or may have a room or rooms that accommodate more than one person with shared bathroom(s), kitchen, and dining area.
- Use. This term means and includes construction, establishment, maintenance, alteration, moving onto, enlargement, and occupation. Wherever this document prohibits the use of any premises for any purpose, such premises and any building, structure, or improvement on such premises shall not be used, occupied, altered, or improved for such purpose. No building, structure, or improvement on such premises where prohibited shall be erected, constructed, established, maintained, allowed to remain, altered, moved onto, or enlarged which is designed, arranged, or intended to be occupied, or used for such purpose.
- Warehousing, County. A building that utilizes the floor area for storage or warehousing of goods required by the County.
- West Campus. The portion of the General Hospital Campus west of State Street.

7.3 Bibliography - Wellness (Exercise, Nutrition, Access to Healthy Food)

1. Diabetes Prevention Program (DPP)
Diabetes Prevention Program Knowler WC et al., New England Journal of Medicine, 2002.
Randomized controlled trial of >3,200 high-risk adults

- Lifestyle intervention (diet, weight loss, 150 min/week exercise
- 58% reduction in type 2 diabetes incidence

One of the most influential prevention trials ever conducted, demonstrating that lifestyle change can dramatically reduce diabetes risk.

https://www.nejm.org/doi/full/10.1056/NEJMoa012512

2. DASH Diet Trial
Dietary Approaches to Stop Hypertension Trial Appel LJ et al., New England Journal of Medicine, 1997.

- Diet rich in fruits, vegetables, and low-fat dairy
- Significant reductions in systolic and diastolic blood pressure
- Effects comparable to some medications

Landmark proof that diet alone can substantially reduce hypertension.

https://www.nejm.org/doi/full/10.1056/NEJM199704173361601

3. Nurses' Health Study
Nurses' Health Study Harvard T.H. Chan School of Public Health, launched 1976.

- One of the largest long-term cohort studies in medicine - 120,000 participants followed for decades
- Demonstrated strong associations between diet, physical activity, and risk of cardiovascular disease, diabetes, and cancer

Foundational evidence linking lifestyle behaviors to chronic disease outcomes at population scale

https://nurseshealthstudy.org/

4. Harvard Alumni Health Study
Harvard Alumni Health Study Paffenbarger RS et al., New England Journal of Medicine, 1986.

- Long-term cohort of Harvard alumni
- Demonstrated that higher physical activity levels were associated with substantially lower all-cause mortality

One of the first major studies proving the longevity benefits of physical activity.

https://www.nejm.org/doi/full/10.1056/NEJM198603063141003

5. Mediterranean Diet Trial (PREDIMED)
PREDIMED Trial Estruch R et al., New England Journal of Medicine, 2013.

- Randomized trial in Spain
- Mediterranean diet supplemented with olive oil or nuts
- ~30% reduction in major cardiovascular events

https://www.nejm.org/doi/full/10.1056/NEJMoa1200303

6. Global Physical Activity Mortality Study
Lancet Physical Activity Series Lee IM et al., The Lancet, 2012.

- Global analysis of physical inactivity
- Estimated that inactivity accounts for ~9% of premature mortality worldwide

Quantified physical inactivity as a major global public health risk comparable to smoking.

https://www.thelancet.com/journals/lancet/article/PIIS0140-6736(12)61031-9/abstract

7.3 Bibliography - Economic Opportunity (Income Stability, Employment, Financial

1. Income and Life Expectancy in the United States
The Association Between Income and Life Expectancy in the United States Chetty R. et al., JAMA, 2016.

- Large national analysis of tax and mortality data covering ~1.4 billion person-years Examined the relationship between income and life expectancy across U.S. counties Found life expectancy differs by 10–15 years between the highest and lowest income groups

One of the most influential modern studies demonstrating the strong gradient between income and longevity in the United States, highlighting economic conditions as a major driver of health outcomes.

https://jamanetwork.com/journals/jama/fullarticle/2513561

2. Social Determinants of Health and Life Expectancy
Social Determinants of Health and Life Expectancy in US Adults Wang Q. et al., JAMA Network Open, 2023.

- Large population-based cohort study examining multiple social determinants Evaluated factors including employment, income, housing stability, and education Found that individuals with multiple adverse social determinants experienced over 10 years shorter life expectancy

Provides strong evidence that economic and social conditions combine to shape long-term health and mortality risk.

https://pmc.ncbi.nlm.nih.gov/articles/PMC12781748/

3. Poverty and Health Outcomes Literature Review
Poverty Literature Summary – Social Determinants of Health U.S. Department of Health and Human Services, Healthy People 2030.

- Comprehensive synthesis of public health and epidemiological research Examines relationships between poverty, employment status, and health outcomes Finds strong associations between poverty and higher rates of chronic disease, mental illness, and premature mortality

Federal public health framework demonstrating that economic stability is a foundational determinant of population health.

https://odphp.health.gov/healthypeople/priority-areas/social-determinants-health/literature-summaries/poverty

4. Income Inequality and Mortality Gradients
Income Inequality and Socioeconomic Gradients in Mortality Wilkinson R. & Pickett K., American Journal of Public Health, 2008.

- Analysis of mortality patterns across socioeconomic groups Demonstrated a clear social gradient in health outcomes tied to income and economic inequality
- Lower socioeconomic groups consistently experience higher mortality and poorer health indicators

A widely cited study showing that income distribution and economic inequality influence population health outcomes.

https://pmc.ncbi.nlm.nih.gov/articles/PMC2376999/

5. World Health Organization Social Determinants Framework
Social Determinants of Health
World Health Organization.

- Global synthesis of research examining how economic and social conditions influence health outcomes
- Highlights pathways including employment conditions, income security, housing stability, and access to services
- Shows consistent global evidence that lower socioeconomic status is associated with higher disease risk and shorter life expectancy

Forms the foundation of modern public health approaches recognizing economic opportunity as a central determinant of health.

https://www.who.int/health-topics/social-determinants-of-health

7.3 Bibliography - Community (Social Connection, Public Space, Civic Life)

1. Neighborhood Design and Social Capital
Social Capital and the Built Environment: The Importance of Walkable Neighborhoods Leyden K., American Journal of Public Health, 2003.

Study examining how neighborhood walkability affects social interaction and civic engagement.

- Residents of walkable neighborhoods reported significantly higher levels of social capital
- Walkable areas were associated with greater neighborly trust, participation in community activities, and social interaction
- Automobile-oriented environments were linked to lower levels of social engagement

This landmark study demonstrates that street design and walkability can meaningfully influence social connection and community cohesion.

https://ajph.aphapublications.org/doi/10.2105/AJPH.93.9.1546

2. Third Places and Community Life
The Great Good Place Oldenburg R., 1989.
Foundational sociological research examining the role of informal gathering spaces in community life.

- Identifies cafés, parks, plazas, and community venues as "third places" that foster social interaction outside home and work
- Shows that accessible informal gathering spaces support social networks and civic engagement
- Demonstrates that communities with strong third places exhibit greater social cohesion and well-being

This influential work established the concept that shared public spaces are essential infrastructure for social connection.

3. Social Infrastructure and Community Resilience
Palaces for the People: How Social Infrastructure Can Help Fight Inequality, Polarization, and the Decline of Civic Life Klinenberg E., 2018.

Research examining how civic spaces shape social connection and community resilience.

- Identifies libraries, parks, community centers, and playgrounds as "social infrastructure" that supports everyday interaction
- Shows that neighborhoods with stronger social infrastructure experience greater social cohesion and resilience
- Demonstrates how public gathering spaces reduce isolation and strengthen community networks

This widely cited work reframes public space as essential infrastructure for social and public health.

4. Neighborhood Design, Walkability, and Social Interaction
Sense of Community and Its Relationship with Walking and Neighborhood Design Wood L., Frank L., Giles-Corti B., Social Science & Medicine, 2010.
Study exploring links between urban design, walkability, and neighborhood social networks.

- Residents of walkable neighborhoods reported more frequent interactions with neighbors
- Walkability was associated with stronger neighborhood ties and social cohesion
- Increased walking environments were linked to greater community participation and healthier behaviors

Provides strong evidence that urban form and street design influence social connection and community health outcomes.

7.3 Bibliography - Learning (Education, Lifelong Learning, Job Training)

1. Education and Life Expectancy
The Association Between Education and Life Expectancy in the United States Meara E., Richards S., Cutler D., Health Affairs, 2008.

Large national study examining the relationship between educational attainment and mortality.

- Analyzed national mortality and education data across multiple decades
- Found that individuals with higher levels of education live substantially longer than those with lower educational attainment
- Documented a widening life expectancy gap between more and less educated Americans

One of the most influential studies demonstrating that education is a major determinant of longevity and population health.

https://www.healthaffairs.org/doi/10.1377/hlthaff.27.2.350

2. Education and Adult Health Outcomes
Why Education Matters to Health: Exploring the Causes Cutler D., Lleras-Muney A., National Bureau of Economic Research, 2006.

Comprehensive analysis examining the pathways linking education and health.

- Shows that higher educational attainment is associated with lower rates of chronic disease and mortality
- Identifies mechanisms including higher income, improved health literacy, and healthier behaviors
- Demonstrates that education influences health through multiple economic and behavioral pathways

A widely cited economic and public health analysis explaining why education strongly predicts health outcomes.

https://www.nber.org/papers/w12352

3. Education and Population Health
Education: It Matters More to Health Than Ever Before Zimmerman E., Woolf S., Haley A., Health Affairs, 2015.

Policy-focused review examining education as a determinant of health.

- Demonstrates strong associations between educational attainment and lower rates of chronic disease
- Links higher education levels with greater life expectancy and improved overall health
- Identifies education as one of the most powerful predictors of long-term health outcomes

This widely cited article frames education as a central driver of population health and health equity.

https://nam.edu/wp-content/uploads/2015/06/BPH-UnderstandingTheRelationship1.pdf

4. Education and Cognitive Health in Aging
Education and Dementia Risk: A Systematic Review and Meta-analysis Livingston G. et al., The Lancet Commission on Dementia Prevention, 2020.

Global analysis of dementia risk factors across the life course.

- Identifies low educational attainment as one of the largest modifiable risk factors for dementia
- Estimates that improving education could significantly reduce dementia risk globally
- Shows that education contributes to cognitive reserve that protects brain health later in life

This landmark global report demonstrates that education plays a critical role in lifelong cognitive health. https://www.thelancet.com/commissions/dementia2020

5. Early Childhood Education and Long-Term Health
Lifetime Effects: The HighScope Perry Preschool Study Through Age 40 Schweinhart L. et al., HighScope Educational Research Foundation, 2005.

Longitudinal study examining long-term impacts of early childhood education. Global analysis of dementia risk factors across the life course.

- Followed participants from early childhood into adulthood
- Found that early education participants had higher educational attainment, employment, and income
- Associated with better long-term health and reduced social and economic risk factors

One of the most influential longitudinal studies showing that early education produces lasting improvements in social, economic, and health outcomes.

https://highscope.org/wp-content/uploads/2024/07/perry-preschool-summary-40.pdf

7.3 Bibliography - Ecology (Tree Canopy, Green Space, Environmental Quality)

1. Tree Canopy and Health Perception
Neighborhood Greenspace and Health in a Large Urban Center Kardan O. et al., Scientific Reports (Nature), 2015.

Large urban study examining the relationship between street trees and health outcomes in Toronto.

- Analyzed over 30,000 residents and detailed street-tree inventory data
- Found that 10 additional trees per city block improved health perception equivalent to a $10,000 increase in income
- The same increase was also associated with health improvements equivalent to being about seven years younger

This landmark study provides one of the clearest demonstrations that urban tree canopy is strongly associated with measurable health benefits.

https://www.nature.com/articles/srep11610

2. Green Space and Mortality
Exposure to Greenness and Mortality in a Nationwide Prospective Cohort Study James P. et al., Environmental Health Perspectives, 2016.

Large prospective cohort study examining long-term health impacts of residential green space.

- Followed over 100,000 women across the United States
- Found that higher exposure to residential green space was associated with significantly lower all-cause mortality
- Identified pathways including reduced air pollution exposure, improved mental health, and increased physical activity

This widely cited study demonstrates that access to green environments is associated with longer life expectancy. https://pubmed.ncbi.nlm.nih.gov/27074702/

3. Urban Green Space and Health Outcomes
Green Space Exposure and Health: A Systematic Review Twohig-Bennett C., Jones A., Environmental Research, 2018.

Comprehensive systematic review examining health effects of green space exposure.

- Reviewed over 140 studies from multiple countries
- Found that green space exposure was associated with lower risk of cardiovascular disease, type 2 diabetes, and premature mortality
- Also linked to improved mental health and reduced stress levels

This major evidence synthesis confirms that access to green space is consistently associated with improved population health outcomes.

https://pmc.ncbi.nlm.nih.gov/articles/PMC8582763/

4. Trees and Mental Health
Residential Green Space and Mental Health Alcock I. et al., Environmental Science & Technology, 2014.

Longitudinal study examining the mental health benefits of living near green space.

- Followed residents who moved to neighborhoods with different levels of green space
- Found that individuals moving to greener areas experienced sustained improvements in mental health
- Mental health benefits persisted for at least three years after relocation

Provides strong evidence that urban greenery has measurable and lasting mental health benefits.

https://pubs.acs.org/doi/10.1021/es403688w

5. Green Space, Stress, and Physiological Health
Nature Experience Reduces Rumination and Subgenual Prefrontal Cortex Activation Bratman G. et al., Proceedings of the National Academy of Sciences (PNAS), 2015.

Experimental study examining physiological responses to natural environments.

- Participants who walked in natural environments showed reduced neural activity linked to stress and depression
- Demonstrated measurable psychological and neurological benefits of exposure to nature
- Provides biological evidence for the stress-reducing effects of green environments

This study provides experimental evidence that exposure to nature directly improves mental and physiological health.

https://www.pnas.org/doi/10.1073/pnas.1510459112

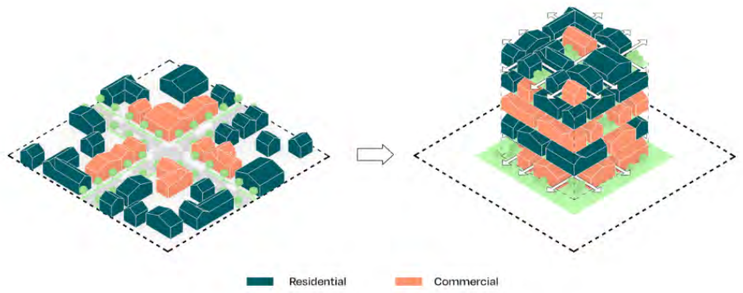
https://odphp.health.gov/healthypeople/priority-areas/social-determinants-health/literature-summaries

Family (Children&Parents) with Social Community Connection

Recent studies highlight how everyday interactions between family, community, and the natural environment shape mental and physical wellbeing. Access to outdoor space has been linked to children's cognitive growth and stress recovery (Children & Nature Network), while time spent together in shared green or cultural settings strengthens family bonds and improves parental happiness (UCL Wellbeing Study). The role of public playgrounds and neighborhood gathering spaces extends beyond recreation, they nurture empathy, collaboration, and belonging among residents.

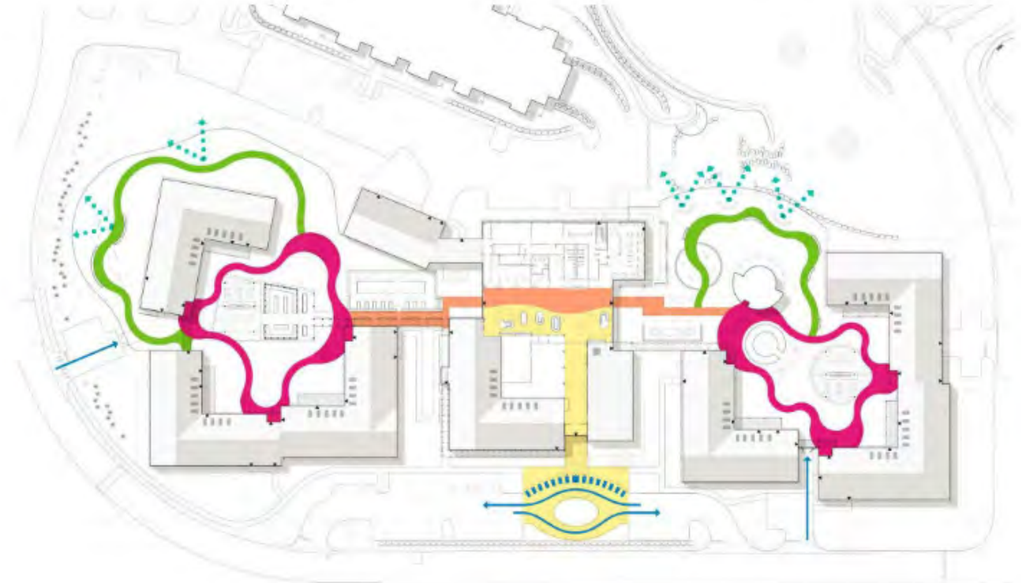


At a broader level, social and spatial determinants of health (ODPHP) reveal that well-designed community environments are key drivers of equity and wellness. Artistic expression, public art, and healing spaces contribute to emotional resilience (NIH Art & Health), demonstrating that a connected public realm, where families, children, and nature meet, can profoundly elevate both individual wellbeing and collective urban vitality.

7.3 Senior Living Research - RIOS

Daily rituals and 15-hour active schedules improve cognitive health and wellbeing.

Applying mixed-use programs and urban design to vertical communities strengthens social connections, walkability, and cognitive health for aging in place.



Longevity Ecology for Future Senior Living

RIOS' concept of "longevity ecology" draws on the qualities of great cities, walkability, mobility, proximity to services, and a sense of belonging, while grounding design in evidence-based research. A 2023 report by South African scientists Elizabeth Jane Earl and Debbie Marais emphasized how older adults feel better when they can support others, linking engagement to autonomy and self-agency. Similarly, a JAMA Psychiatry study found that daily routines and rituals improve cognitive health, noting that older adults with 15 hours of daily activity enjoyed better emotional wellbeing, even if the activities were low intensity. Together, these findings underscore how rituals, intergenerational interactions, and active routines promote both physical and cognitive resilience.

Connecting to Nature for Cognitive Wellness

Guiding our efforts is the 3+30+300 rule, a tree-based metric developed by urban forestry expert Cecil Konijnendijk in 2021. The rule presents three guidelines for increasing the health and climate resilience of our cities. It suggests that people should be able to see three mature trees from their home or office, that neighborhoods have a 30% urban tree canopy, and that public green spaces should be within 300 meters.

7.3 Senior Living Research - RIOS

Applying mixed-use programs

This philosophy is embodied in real projects such as Echo Street West, an 18-acre mixed-use district in Atlanta. Here, RIOS reintroduces nature to a former industrial site, linking the Atlanta Beltline with neighborhoods through multi-modal trails and greenways. Nearly 300 multi-family residential units, combined with office spaces, retail, dining, artist workshops, and event spaces, form a flexible ecosystem of daily rituals. Landscaped plazas, "urban porches," event lawns, and a woodland park create inclusive, intergenerational hubs for mobility, connection, and cultural exchange.

The Dunbar's number guides our proposal for an Austin-based Student Housing Competition, a prototypical precedent for our senior living concepts. The challenge of the 331-unit project was how to generate a close-knit community within a 317,000 square-foot (29,450-square-meter) scheme. Our vertical concept rethinks traditional campus housing by creating a series of smaller stacked neighborhoods. We alternated the layout every four or five floors, and we were able to create outdoor sky terraces where smaller cohorts of residents could find amenities and have a shared experience. The lessons of student housing apply to senior living architecture: by creating smaller villages within the larger ecosystem we can strengthen the community and, by extension, overall wellbeing.

Plan support mobility and wayfinding

From plant to park, nature is important at all scales of senior living and cognitive design. With our design for the interiors and landscape of Willow Valley Senior Housing, a residential project in Pennsylvania that exemplifies RIOS' Main Street model. We maximized the connection to nature by organizing the living units around lushly landscaped courtyards, creating restorative views from the inside. By integrating the landscape and plants into the overall architecture and interior design, we were able to use plants and clear, bright material expression as part of a wayfinding system that helps seniors safely navigate through buildings.

The Marlin and Doris Thomas Memory Center at Willow Valley Communities exemplifies how a longevity ecosystem amplifies the benefits of linking people and the built environment to the natural world. As demographic shifts accelerate, RIOS' longevity ecosystem redefines senior living by moving beyond outdated, isolated models to create inclusive, intergenerational, and nature-connected environments that foster dignity, autonomy, and joy. Grounded in research on aging, wellness, and mental acuity, this approach integrates health and vitality at every scale, from master Plan to detail, through walkable communities, daily rituals, and shared spaces that promote connection and purpose.

1. INTRODUCTION

This Final Subsequent Environmental Impact Report (SEIR) has been prepared by the County of Los Angeles (County) in accordance with the California Environmental Quality Act (CEQA), as amended (Public Resources Code Sections 21000 et seq.), and the State CEQA Guidelines (California Code of Regulations Sections 15000 et seq.).

According to the CEQA Guidelines, Section 15132, the Final EIR shall consist of:

(a) The draft EIR or a revision of the draft.

(b) Comments and recommendations received on the draft EIR either verbatim or in summary.

(c) A list of persons, organizations, and public agencies comments on the draft EIR.

(d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process.

(e) Any other information added by the Lead Agency.

This document contains responses to comments received on the Draft SEIR for the Los Angeles County General Hospital Campus Master Plan (Proposed Project) during the public review period, which began on May 15, 2026, and closed on June 29, 2026, at 5:00 pm. This document has been prepared in accordance with CEQA and the State CEQA Guidelines and represents the independent judgment of the County of Los Angeles as the Lead Agency. This document, which includes comments and recommendations received on the Draft SEIR; a list of persons, organizations, and public agencies commenting on the Draft SEIR; the Lead Agency's responses to significant environmental points raised; and any other information added by the Lead Agency, and the circulated Draft SEIR comprise the Final SEIR, in accordance with State CEQA Guidelines, Section 15132.

1.1 FINAL SEIR ORGANIZATION

This document is organized as follows:

Chapter 1, Introduction. This chapter describes CEQA requirements and the content of this Final SEIR.

Chapter 2, Response to Comments. This chapter provides a list of agencies, organizations, and individuals commenting on the Draft SEIR; comments received during the public review period; and responses to comments. This chapter also includes responses to verbal and written comments received at the virtual public information meeting held by the County on June 11, 2026, regarding the Proposed Project and Draft SEIR. To facilitate review of the responses, each commenter has been assigned a number (refer to Table 2-1, *Commenters*, for the list of comments and assigned number). Individual comments within each letter have been numbered for each letter, and the letter is followed by responses with reference to the corresponding comment number. All original comments are included in this chapter.

Chapter 3, Revisions to the Draft SEIR. This chapter contains revisions to the Draft SEIR as a result of the comments received by agencies and interested persons, as described in Chapter 2, and/or errors and omissions discovered subsequent to release of the Draft SEIR for public review.

The document contains material (e.g., additional supporting information) and revisions that have been made to the text of the Draft SEIR and are part of the Final SEIR. The County has reviewed this material and determined that revisions to the Draft SEIR do not constitute the type of significant new information that requires recirculation of the Draft SEIR for further public comment under State CEQA Guidelines Section 15088.5(a). According to State CEQA Guidelines Section 15088.5(a), recirculation would be required if:

- A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- A feasible project alternative or mitigation measure considerably different from other previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
- The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (*Mountain Lion Coalition v. Fish and Game Com.* (1989) 214 Cal.App.3.d 1043)

None of the comments provided or responses to those comments have resulted in a significant new environmental impact not previously disclosed in the Draft SEIR. Additionally, the County has determined that none of the additional supporting information or revisions to the Draft SEIR that are included in this Final SEIR indicates that there would be a substantial increase in the severity of a previously identified environmental impact that will not be mitigated, or that there would be any of the other circumstances requiring recirculation described in State CEQA Guidelines Section 15088.5.

1.2 ENVIRONMENTAL REVIEW PROCESS

The County completed a Notice of Preparation (NOP) for the Proposed Project for circulation to the Governor's Office of Land Use and Climate Innovation (LCI) State Clearinghouse, for distribution to potentially affected State agencies, responsible agencies, local agencies, and other interested parties. The public review for the NOP began on September 26, 2025, and originally ended on October 27, 2025. In response to requests received during the comment period, the close of the comment period was extended from October 27, 2025, to November 21, 2025. The NOP was posted on the Project Site, published on the County's social media outlets, including the County's social media account and was published on DEO's website for the Proposed Project. A public scoping meeting was held virtually via a Zoom webinar on October 8, 2025, to provide information to the public about the Proposed Project and the CEQA process, and to collect oral and written comments from those in attendance. The County received 12 comment letters during the NOP comment period and received 10 written comments and 5 verbal comments during the October 8, 2025, public scoping meeting. All comments received during the NOP comment period were considered during preparation of the Draft SEIR and can be found in Appendix A to that document.

In addition to the NOP, the County distributed tribal consultation notification letters, in accordance with Assembly Bill (AB) 52, to tribes identified by the Native American Heritage Commission and the County's notification list, which includes tribes that have formally requested notification through the County's Department of Regional Planning when the County, as the lead agency under CEQA, considers projects in the geographic area that is traditionally and culturally affiliated with the tribe. As with the NOP, the 30-day AB 52 consultation request period began on September 26, 2025, and the close of the AB 52 tribal consultation request period was extended from its original end date of October 27, 2025, to November 21, 2025. During this period, the County received responses from three tribes, which included the San Manuel Band of Mission Indians-Yuhaaviatam Nation, Fernandeño Tataviam Band of Mission Indians, and Gabrieleno Band of Mission Indian-Kizh Nation. Only one tribe, Gabrieleño Band of Mission Indians–Kizh Nation, requested consultation under AB 52. Consultation with the Gabrieleno Band of Mission Indians–Kizh Nation was completed on May 8, 2026. The County sent an email confirming closure to the Kizh Nation of the consultation on May 8, 2026. None of the tribes that were contacted provided comments related to the scope of the Draft SEIR in response to the NOP that was also circulated.

The Draft SEIR was submitted to the State Clearinghouse and, in compliance with CEQA, was circulated for a 45-day public review period from May 15, 2026, to June 29, 2026. The County held a virtual public informational meeting regarding the Draft EIR via a Zoom webinar on June 11, 2026. Following the close of the public review period, written responses were prepared to all comments received, and these comments and responses are incorporated into this Final SEIR. Following the close of the public review period, the Lead Agency received comment letters

from the City of Los Angeles Department of Transportation and the California Highway Patrol. Although these letters were received after the close of the public review period, the County has elected to include the letters in the Final SEIR and provide responses in the interest of providing transparency about the project and to reflect a complete administrative record.

Before approving the Proposed Project, the County of Los Angeles Board of Supervisors, as the governing body of the Lead Agency for the Proposed Project, must consider the final SEIR and certify the Final SEIR has been completed in compliance with CEQA and reflects the independent judgment and analysis of the County. T Should it elect to do so, the County will certify the Final SEIR using independent judgment and analysis. In consideration of the findings of the Final SEIR, the County will consider approval of the Proposed Project or an alternative thereof through a written Finding of Fact and a Statement of Overriding Consideration for each identified significant adverse environmental impact and any significant and unavoidable impact identified in the Final SEIR. Because certain environmental impacts have been found to be significant, the County would adopt mitigation measures that either avoid or reduce those impacts to less than significant levels, where feasible. These mitigation measures are identified in the Mitigation Monitoring and Reporting Program (MMRP). Dates of the public hearing that will consider approval of the Proposed Project will be published and officially noticed in accordance with all legal requirements. If the Proposed Project is approved, the County will file a notice of determination (NOD) with the State Clearinghouse in the Governor's Office of Land Use and Climate Innovation and the County Clerk-Recorder as required by CEQA.

2. RESPONSE TO COMMENTS

Section 15088 of the California Environmental Quality Act (CEQA) Guidelines requires the lead agency to evaluate comments on environmental issues received from public agencies and interested parties who reviewed the Draft Environmental Impact Report (EIR) and to prepare written responses.

This chapter provides all comments received on the Draft SEIR and the lead agency's responses to each comment. Comment letters and specific comments are given letters and numbers for reference purposes.

The transcript from the June 11, 2026 public information meeting includes verbal comments received for the Proposed Project, and are provided in Appendix A, *Public Meeting Transcript*, to this Final SEIR. The chat log from the June 11, 2026 public information meeting is provided in Appendix B, *Public Meeting Chat Log*, to this Final SEIR.

Information to support the response to comments regarding transportation is provided in Appendix C, *Supporting Transportation Information*, to this Final SEIR.

2.1 LIST OF COMMENTERS

Table 2-1, *Commenters*, lists the agencies, organizations, and individuals that provided comments on the Draft EIR during the public review period. Copies of the original letters are included in this chapter.

Table 2-1 Commenters

Number Reference	Commenter	Date of Comment

2.2 CEQA REQUIREMENTS REGARDING COMMENTS AND RESPONSES

State CEQA Guidelines Section 15204(a) outlines parameters for submitting comments, and reminds persons and public agencies that the focus of review of and comment on Draft EIRs should be

> . . . on the sufficiency of the document in identifying and analyzing possible impacts on the environment and ways in which significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible. . . . CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR.

The State CEQA Guidelines further advises,

> Reviewers should explain the basis for their comments, and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to Section 15064, an effect shall not be considered significant in the absence of substantial evidence. (Section 15204[c])
>
> Each responsible agency and trustee agency shall focus its comments on environmental information germane to that agency's statutory responsibility. (Section 15204[d])
>
> This section shall not be used to restrict the ability of reviewers to comment on the general adequacy of a document or of the lead agency to reject comments not focused as recommended by this section. (Section 15204[e])

In accordance with CEQA, Public Resources Code Section 21092.5, copies of the written responses to public agencies will be provided to those agencies at least 10 days prior to certifying the Final SEIR.

2.3 COMMENTS AND RESPONSES

This section includes a reproduction of and response to each comment received during the public review period for the Draft SEIR. Comments are presented in their original form in this section and annotated to identify each comment number.

Responses to individual comments are provided in this chapter following the text of each corresponding comment. Comments are arranged by category, date received, and name. Categories and their corresponding abbreviations are:

- Agencies (A)
- Organizations (O)
- Verbal Commenters (V)
- Written Comments from Public Meeting (PM)

2.3.1 Comments From Agencies

Follow Up Flag: Flag for follow up
Flag Status: Flagged

CAUTION: External Email. Proceed Responsibly.

Good afternoon,
We are in receipt of your project and would like to consult when the time comes to have the mitigation reports developed. This APE is in the footprint of 3 recorded sites and we will need to monitor the ground disturbances. A1-1

Thank you,
Christina

<LA-Gen-Hosp-MasterPlanSEIR-NOA-Final_05.15.26_OPT.pdf><LA-Gen-Hosp-MasterPlanSEIR-NOA-Final[SPA]_05.15.26_OPT.pdf>

Response A1-1

Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

Refer to page 3.16-10 through 3.16-11 of Chapter 3.16, Tribal Cultural Resources, of the Draft SEIR for a discussion of the Proposed Project's Native American Consultation process. The County issued "request to consult" letters to California Native American tribes with potential significance in the area, including the Gabrielino Tongva Indians, on September 26, 2025, in accordance with Assembly Bill 52 (AB 52); the comment period was extended from October 27, 2025, to November 21, 2025, and the notice of this extension was provided via email on November 4, 2025. The Gabrielino Tongva Indians did not provide a response during the AB 52 notification period. A follow up email was sent to the Gabrielino Tongva Indians on June 23, 2026, reminding the tribe of the statutory deadlines related to requesting consultation. The Native American tribes, including the Gabrielino Tonga Indians, also received a Notice of Availability for the Proposed Project to solicit comments on the Draft SEIR.

Chapter 3.16, Tribal Cultural Resources, identifies the potential for encountering tribal cultural resources during ground-disturbing activities resulting from phased implementation of the Proposed Project, and documents the County's process for Native American consultation pursuant to AB 52. Mitigation Measure TCR-1a has been included, which requires that Project Applicant(s) invite the consulting Native American Monitoring tribe, the Gabrieleño Band of Mission Indians–Kizh Nation, to monitor ground-disturbing activities. The invitation to monitor and provisions in Mitigation Measure TCR-1a through TCR-1c would reduce potential impacts to tribal cultural resources to less than significant. The comment, which requests an additional monitor from the Gabrielino Tongva tribe, does not identify any deficiencies within the Draft SEIR. As previously discussed, Mitigation Measure TCR-1a through TCR-1c would include monitoring of ground-disturbing activities by a tribe and the appropriate protocols would be followed. The mitigation measure would be implemented during applicable ground-disturbing activities regardless of the commenter's request for an additional tribal monitor. Monitoring by an additional tribe would not materially alter the Proposed Project potential impact or the effectiveness of the required mitigation; therefore, additional monitoring is not required. No further response is required, and no revisions to the SEIR are warranted to respond to this comment.

A2. San Gabriel Valley Council of Governments, May 19, 2026

A2

From: Enya Lowe <elowe@sgvcog.org>
Sent: Tuesday, May 19, 2026 9:41 AM
To: General Hospital Project <generalhospital@opportunity.lacounty.gov>
Subject: Request for Contact about Presentation on the LA County General Hospital Campus Master Plan

CAUTION: External Email. Proceed Responsibly.

Hello,

I'm reaching out to see if you might be able to point me toward a contact who could provide a 20 minute presentation on the 2026 Los Angeles County General Hospital Campus Master Plan at our upcoming Homelessness Committee meeting on Wednesday, June 3 at 8:30 AM. The committee is interested in learning more about the plan and having a discussion around it.

A2-1

Thank you!

Response A2-1

The comment requesting a presentation by the County for the San Gabriel Valley Council of Governments Homeless Committee is noted. The County will continue to coordinate with the San Gabriel Valley Council of Governments regarding their request. The County is scheduled to present to the San Gabriel Valey Council of Governments on October 7, 2026. This comment does not raise environmental concerns. No further response is required and no revisions to the SEIR are warranted to respond to this comment. Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

PROJECT LOCATION: Los Angeles General Hospital Campus
PROJECT: General Hospital Campus Master Plan

Presented below are comments submitted on behalf of the Los Angeles Unified School District (LAUSD) regarding the Los Angeles General Hospital Campus Master Plan Project. LAUSD is concerned about the potential negative impacts of the project on our students, staff, and parents and guardians of students attending the following schools close to the project site. The Project's study area includes three (3) District sites and schools located around Project area. Closest to the Project sites are located east of the Project area: A3-2

- Bravo Medical Magnet School, 1200 Cornwall Street #1417, Los Angeles, CA
- Newman Nutritional Center, 2310 Charlotte Street, Los Angeles, CA
- East Los Angeles Occupational Center, 2100 Marengo Street, Los Angeles, CA

Based on the extent/location of the proposed development, it is our opinion that significant environmental impacts on the surrounding community may occur. Since the project may have an environmental impact on LAUSD schools, recommended measures and conditions designed to help reduce or eliminate potential impacts are included in this response.

The Proposed Project involves implementation of the proposed Master Plan and would guide the redevelopment of approximately 31 acres of the Project Site. The Proposed Project includes the demolition of existing buildings, pavement, utilities, and landscaping. The Proposed Project would not limit access to trails, parking lots, or any other public access components, nor would it remove any vegetation. Construction activities are anticipated to be long-term and ongoing until Master Plan is implemented. A3-3

The District requests that our schools and housing sites be recognized as sensitive receptors and that the analysis in the SEIR specifically addresses potential impacts to our school communities. Specific areas of concern where the Project's construction and operation would have a significant effect on District's sites include Air Quality, Hazards, Noise, and Transportation/Traffic (including pedestrian safety). Based on the extent/location of the proposed development, it is our opinion that environmental impacts on the surrounding area will likely occur. Since the project may have an environmental impact to students and residents recommended measures designed to help reduce or eliminate potential impacts are included in this response. A3-4

Work with LA Unified A3-5

333 South Beaudry Avenue, 21st Floor, Los Angeles, CA 90017 • Telephone (213) 241-3199

Our Mission: To ensure a safe and healthy environment for students to learn, teachers to teach, and employees to work.
Our Vision: To eliminate all environmental health and safety risks at schools.

A3

Project proponents must coordinate any construction activities with LA Unified to ensure safety of students and their families and minimize disruptions to school activities and access to campus. Effective strategies of avoiding significant impacts on school operations include:

- Completing construction activities such as demolition and excavation when the schools are not in session (summer and winter breaks, holidays, weekends, and after hours).
- Including school and District representatives to review construction management plans, construction outreach plans, and participation in weekly construction meetings.
- Obtaining prior authorization from the District for any easements and project activities on or surrounding District properties.
- Working with the District in identifying appropriate construction mitigation programs.

A3-5 Cont.

Air Quality

District students and school staff should be considered sensitive receptors to air pollution impacts. To ensure that effective measures are applied to further reduce construction air pollutant impacts, we ask that the City incorporate into the project's conditions or mitigation measures the following language:

- Implement all applicable provisions of Rule 403 for fugitive dust control during construction of the Project.
- Implement all applicable provisions of Rule 1446
- Utilize low emission "clean diesel" equipment with new or modified engines manufactured to meet Tier 4 specifications or retrofitted to comply with CARB's verified diesel emission control strategy (VDECS).
- Construction vehicles shall not idle in excess of five minutes.
- Ensure that construction equipment is properly tuned and maintained in accordance with manufacturer's specifications.
- Water/mist soil as it is being excavated and loaded onto the transportation trucks.
- Water/mist and/or apply surfactants to soil placed in transportation trucks prior to exiting the site.
- Minimize soil drop height into transportation trucks or stockpiles during dumping.
- Cover the bottom of the excavated area with polyethylene sheeting when work is not being performed.
- Place stockpiled soil on polyethylene sheeting and cover with similar material.
- Place stockpiled soil in areas shielded from prevailing winds.
- Sweep streets at the end of the day if visible soil material is carried onto adjacent public paved roads (recommend water sweepers).
- Install wheel washers (or steel shaker plates) where vehicles enter and exit unpaved roads onto paved roads or wash off trucks and any equipment leaving the site each trip.
- Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 miles per hour (mph).
- Excavation and transportation of soil known to contain hazardous substances should be limited to periods when school is not in session.

A3-6

Hazards and Hazardous Materials

The Project has the potential to transport hazards and hazardous materials during construction and operation. The following language is recommended for potential impacts related to hazards and hazardous materials.

- During construction, ingress/egress routes to the construction site should be designed to ensure that trucks and construction vehicles carrying hazards and hazardous materials are routed away from District school sites. Additional recommendations are provided in this letter under the Transportation/Traffic section.

A3-7

A3

Noise and Vibration

Noise and vibration created by construction and operation activities may impact District schools that are adjacent to the Project corridor. CEQA requires that such impacts be quantified and eliminated or reduced to a level of insignificance. LAUSD established maximum allowable noise levels to protect students and staff from noise impacts generated in terms of Leq. These standards were established based on regulations set forth by the California Department of Transportation. LAUSD's exterior noise standard is 67 dBA Leq and the interior noise standard is 45 dBA Leq. A noise level increase of 3 dBA or more over ambient noise levels is considered significant for existing schools and would require mitigation to achieve levels within 2 dBA of pre-project ambient level. To ensure that effective measures are employed to reduce construction related noise impacts on the campus, we ask that that the City incorporate into the project's conditions or mitigation measures the following language:

- Provisions shall be made to allow the school and or designated representative(s) to notify the project applicant when noise impacts to the schools exceed the District's noise standards.
- All pile driving equipment shall be equipped with noise control devices and/or shall implement noise buffers with minimum quieting factor of 10dBA, to the extent feasible. If possible, drilled piles are preferred to driven piles.
- Demolition activities shall be scheduled for when school is not in session.

A3-8

In addition, to ensure that effective measures are employed to reduce construction and operation related noise impacts on District sites, LAUSD asks that the following language be included in the control measures for noise impacts:

- A temporary noise barrier capable of reducing construction noise levels on all campuses located along the proposed rail ROW and Randolph Street to 67 dBA Leq shall be installed between the rail corridor and the schools.
- Provisions shall be made to allow school administrators and/or their designated representative(s) to notify the contractor if construction noise levels are adversely impacting the learning environment. In this event, the contractor must implement additional noise attenuation measures or reschedule noise-generating activities to a time when school is not in session

A3-9

Traffic/Transportation

LAUSD's Transportation Branch **must be contacted** at (213) 580-2950 regarding the potential impact upon existing school bus routes. The Project Manager or designee will have to notify the LAUSD Transportation Branch of the expected start and ending dates for various portions of the project that may affect traffic within nearby school areas. To ensure that effective conditions are employed to reduce construction and operation related transportation impacts on District sites, including the net increase of 1,000 or more daily vehicle trips, we ask that the following language be included in the recommended conditions for traffic impacts:

- School buses must have unrestricted access to schools.
- During the construction phase, truck traffic and construction vehicles may not cause traffic delays for our transported students.
- During and after construction changed traffic patterns, lane adjustment, traffic light patterns, and altered bus stops may not affect school buses' on-time performance and passenger safety.
- Construction trucks and other vehicles are required to stop when encountering school buses using red-flashing-lights must-stop-indicators per the California Vehicle Code.
- Contractors must install and maintain appropriate traffic controls (signs and signals) to ensure vehicular safety.

A3-10

A3

- Contractors must maintain ongoing communication with LAUSD school administrators, providing sufficient notice to forewarn children and parents when existing vehicle routes to school may be impacted.
- Parents/guardians dropping off their children must have access to the passenger loading areas.

A3-10 Cont.

During construction, detour route(s) will be necessary to divert traffic from the project area and continue to provide access to Marengo Street, Zonal Avenue, and east/west corridors for the traveling public. The SEIR should evaluate the impact of additional vehicular and truck traffic to District sites that are located along detour routes. Adequate impact analysis should incorporate discussion on school pedestrian safety and potential disruptions to school operations and access to schools.

Pedestrian Safety

Construction activities that include street closures, the presence of heavy equipment and increased truck trips to haul materials on and off the project site can lead to safety hazards for people walking in the vicinity of the construction site. To ensure that effective conditions are employed to reduce construction and operation related pedestrian safety impacts on District sites, we ask that the City incorporate into the project's conditions or mitigation measures the following language:

- Contractors must maintain ongoing communication with LAUSD school administrators, providing sufficient notice to forewarn children and parents when existing pedestrian routes to school may be impacted.
- Contractors must maintain safe and convenient pedestrian routes to all nearby schools.
- Contractors must install and maintain appropriate traffic controls (signs and signals) to ensure pedestrian and vehicular safety.
- Haul routes are not to pass by ***any*** school, except when school is ***not*** in session.
- No staging or parking of construction-related vehicles, including worker-transport vehicles, will occur on or adjacent to a school property.
- Funding for crossing guards and flaggers at the contractor's expense is required when safety of children may be compromised by construction-related activities at impacted school crossings.
- Barriers and/or fencing must be installed to secure construction equipment and to minimize trespassing, vandalism, short-cut attractions, and attractive nuisances.
- Contractors are required to provide security patrols (at their expense) to minimize trespassing, vandalism, and short-cut attractions.

A3-11

The District's charge is to protect the health and safety of students and staff, and the integrity of the learning environment. The comments presented above identify potential environmental impacts related to the Proposed Project that must be addressed to ensure the welfare of the students attending schools, their teachers and staff, as well as to inform parents and guardians of these students.

A3-12

Thank you for your attention to this matter. If you need additional information, please contact me at (213) 241-3432 or at zulema.renteria@lausd.net.

Sincerely,

A3-13

Zulema Renteria
Environmental Planning Specialist
Los Angeles Unified School District (LAUSD)
Office of Environmental Health and Safety (OEHS)
333 S Beaudry Ave., 21st Floor, Los Angeles, CA 90017

Response A3-1

This comment is noted; the County has received the Los Angeles Unified School District's comment letter regarding the Proposed Project. This comment does not raise environmental concerns. No further response is required. Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

Response A3-2

The Draft SEIR evaluates the Proposed Project's environmental impacts under all the environmental topics identified in State CEQA Guidelines Appendix G. The County acknowledges that the Bravo Medical Magnet School, East Los Angeles Occupational Center, and Newman Nutritional Center are the closest LAUSD-owned and -operated sites. Two of these sites, Bravo Medical Magnet School and East Los Angeles Occupational Center, are included in the Draft SEIR (see Table 3.13-6, *Other Surrounding LAUSD Schools*). The Bravo Medical Magnet School and East Los Angeles Occupational Center function as instructional campuses where students, staff, and teachers are likely to be present. The third District-owned site mentioned, Newman Nutritional Center, is located approximately 0.1 mile southeast of the Project Site and is an off-site food preparation and distribution facility that provides meals to LAUSD schools with limited or no cooking facilities. The operational characteristics of the Newman Nutritional Center differ substantially from the Bravo Medical Magnet School and East Los Angeles Occupational Center, where students regularly attend classes. Students would not be regularly present at the Newman Nutritional Center; therefore, this district-owned facility is not considered a sensitive receptor. The Draft SEIR identifies and evaluates representative sensitive receptors in the vicinity of the Project Site, including nearby schools, residences, and places of worship. The environmental analyses are based on the location and context of potential impacts rather than on an exhaustive inventory of every individual facility near the Project Site.

Although the Newman Nutrition Center is near the Project Site, its inclusion as an identified sensitive receptor would not alter the environmental analyses, significance determinations, or mitigation measures presented in the Draft SEIR.

The Draft SEIR evaluates the Proposed Project's impacts under all the environmental topics identified in State CEQA Guidelines Appendix G. This comment does not identify deficiencies of the Draft SEIR with respect to environmental impacts. No further response is required, and no revisions to the Draft SEIR are warranted to respond to this comment. Specific responses to concerns raised in the detailed letter are provided below.

Response A3-3

The comment summarizes the Proposed Project and does not identify deficiencies of the Draft SEIR. It should be noted that the comment incorrectly states that no vegetation would be removed. Please see Chapter 3.3, *Biological Resources*, of the Draft SEIR, which describes potential removal of landscaping, including trees. No further response is required and no revisions to the SEIR are warranted to respond to this comment.

Response A3-4

Sensitive receptors, including schools and residences as suggested by the commenter, are considered and evaluated at length in the Draft SEIR. See page 3.2-25 (Air Quality), pages 3.8-54 through 3.8-56 (Hazards and Hazardous Materials), pages 3.11-23 and 24 (Noise), and Figure 3.11-2, *Noise Sensitive Receptors*, which explicitly identify the types of receptors mentioned.

The Draft SEIR evaluates the Proposed Project's impacts under all the environmental impact topics identified in State CEQA Guidelines Appendix G. The comment does not identify specific deficiencies in the analysis in the Draft SEIR or provide substantial evidence demonstrating that the impact conclusions are incorrect. The SEIR evaluates the Proposed Project's environmental effects in accordance with the requirements of CEQA and identifies the significance of impacts based on the evidence in the record, including modeling data. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A3-5

The Draft SEIR evaluates the Proposed Project's construction-related environmental impacts, and identifies feasible mitigation measures, where appropriate, to reduce significant environmental impacts. As described in Chapter 2, *Project Description*, of the Draft SEIR, the Proposed Project will be implemented in phases and will require subsequent project-specific permits, approvals, and other discretionary actions, as necessary, to facilitate. Detailed construction planning, scheduling, and implementation measure, as necessary, will be developed during subsequent phases of Proposed Project implementation as further information is developed.

The Lead Agency acknowledges LAUSD's recommendations regarding coordination during construction to avoid significant impacts on school operations. It should be noted that the Proposed Project would implement Mitigation Measure TRA-1, which requires the development and implementation of a Worksite Traffic Control Plan to reduce impacts to the circulation system. Additionally, as identified in Chapter 3.11, *Noise*, of the Draft SEIR, the Proposed Project's construction activities would not exceed the County's exterior noise threshold of 85 A-weighted decibels (dBA) and would not result in a 3 dBA increase over ambient noise levels at LAUSD facilities. However, because the Proposed Project's construction activities would result

in significant noise levels near other sensitive receivers, the Proposed Project would implement Mitigation Measure NOI-1 to reduce construction noise.

The first recommendation is to complete construction activities such as demolition and excavation when the schools are not in session (summer and winter breaks, holidays, weekends, and after hours). However, LAUSD schools are generally in session for approximately 180 instructional days over a 10-month school year (not including summer school), which would limit construction activities to approximately 3 months each year during school recess periods. This request would render the Proposed Project infeasible and would also result in the overall extended duration of construction impacts to sensitive receptors. Chapter 4.0, *Alternatives*, includes consideration of a delayed/phased construction scenario (see specifically Section 4.4.3), which was determined infeasible. Therefore, addition of this recommended measure is infeasible.

The second recommendation is to include school and LAUSD representatives in the review of construction management plans and construction outreach plans and in weekly construction meetings. LAUSD is on the Proposed Project's distribution list and will be included in all future public communications regarding future projects and activities, including construction. Construction notification will be posted on the Project Site. The recommendation that LAUSD representatives review construction management documents and participate in weekly construction meetings would apply to future Proposed Project implementation and construction coordination. It does not identify a deficiency in the environmental analysis in the Draft SEIR. The County would coordinate with affected agencies and property owners during Proposed Project implementation, as appropriate and consistent with applicable permits, approvals, and project requirements. Therefore, addition of this recommended measure is unwarranted.

The third recommendation is to obtain authorization from LAUSD for any easements and project activities surrounding LAUSD properties. The Proposed Project does not include any construction activities within any LAUSD easements or any construction activities surrounding LAUSD properties. Therefore, addition of this recommended measure is unwarranted.

The fourth recommendation is to work with LAUSD to identify appropriate construction mitigation programs. LAUSD, along with other interested parties and agencies, reviewed the Draft SEIR and mitigation measures during the public review period. Where applicable and appropriate, mitigation measures have been revised as a result of comments received. Refer to Chapter 3, *Revisions to the Draft SEIR*, of this Final SEIR for a complete description of revised mitigation measures. Therefore, addition of this recommended measure is unwarranted.

The comment does not identify a deficiency in the environmental analysis in the Draft SEIR or provide substantial evidence demonstrating that revisions to the SEIR are warranted. No further response is required, and no revisions to the SEIR are warranted to respond to this comment.

Response A3-6

The following addresses each of the specific measures recommended by the commenter for reducing impacts from mobile sources.

- *Implement all applicable provisions of Rule 403 for fugitive dust control during construction of the Project.* It is assumed that "Rule 403" refers to South Coast Air Quality Management District (South Coast AQMD) Rule 403. The Proposed Project is required to comply with all applicable federal, State, regional, and local regulatory requirements, which include any applicable rules established by South Coast AQMD, such as Rule 403. Thus, addition of this measure as a CEQA mitigation measure is unwarranted.

- *Implement all applicable provisions of Rule 1446.* There is currently no adopted South Coast AQMD Rule 1446 and it is assumed that "Rule 1446" refers to South Coast AQMD Rule 1466. In general, the Proposed Project is required to comply with all applicable federal, State, regional, and local regulatory requirements, which include any applicable rules established by South Coast AQMD, such as Rule 1466. Thus, addition of this measure as a CEQA mitigation measure is unwarranted.

- *Utilize low emission "clean diesel" equipment with new or modified engines manufactured to meet Tier 4 specifications or retrofitted to comply with CARB's verified diesel emission control strategy (VDECS).* The Proposed Project includes Mitigation Measure AIR-1b, which requires that diesel-powered off-road construction equipment with engines of 25 horsepower or higher meet Tier 4 Final emission standards, or alternately, that off-road construction equipment achieve equivalent emissions reductions as Tier 4 Final equipment. Therefore, this request has already been included in the Draft SEIR and no changes are warranted.

- *Construction vehicles shall not idle in excess of five minutes.* The Proposed Project includes Mitigation Measure AIR-1c, which restricts construction haul and delivery truck idling to three minutes or less when not in use. In addition, the California Air Resources Board Off-Road Diesel-Fueled Fleets Regulation (13 CCR Chapter 10 Section 2449) restricts non-essential idling of off-road construction equipment to no more than five consecutive minutes. Since the Proposed Project is required to comply with applicable regulatory requirements, addition of this recommended measure is unwarranted.

- *Ensure that construction equipment is properly tuned and maintained in accordance with manufacturer's specifications.* This measure is already included under Mitigation Measure AIR-1b. Therefore, addition of this recommended measure is unwarranted.

- *Water/mist soil as it is being excavated and loaded onto the transportation trucks.* The actions in this measure are standard best available control measures required under South

Coast AQMD Rule 403 (see Table 1 of the Rule), with which the Proposed Project would be required to comply during construction. These actions would contribute to minimizing coarse particulate matter and fine particulate matter (PM_{10} and $PM_{2.5}$, respectively). As shown in Table 3.2-11, *Maximum Daily Regional Construction Emissions*, of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as shown in Table 3.2-14 of the Draft SEIR, the Proposed Project construction activities would also not generate PM_{10} and $PM_{2.5}$ emissions that result in an exceedance of the South Coast AQMD PM_{10} and $PM_{2.5}$ localized significance thresholds. Per State CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Water/mist and/or apply surfactants to soil placed in transportation trucks prior to exiting the site.* The response to the previous measure that recommended watering/misting of soil is also applicable here.

- *Minimize soil drop height into transportation trucks or stockpiles during dumping.* The response to the measure, above, recommending watering/misting of soil is also applicable here.

- *Cover the bottom of the excavated area with polyethylene sheeting when work is not being performed.* The Proposed Project would be required to comply with South Coast AQMD Rule 403 during construction. Though required Rule 403 best available control measures do not specifically identify use of a tarp or sheeting to cover an excavated area, the rule overall contains a variety of control measures to reduce PM_{10} and $PM_{2.5}$ fugitive dust emissions associated with an excavated area. In addition, as shown in Table 3.2-11 of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as shown in Table 3.2-14 of the Draft SEIR, the Proposed Project construction activities would not generate PM_{10} and $PM_{2.5}$ emissions that exceed the South Coast AQMD localized significance thresholds. Per State CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Place stockpiled soil on polyethylene sheeting and cover with similar material.* The Proposed Project would be required to comply with South Coast Air Quality Management District Rule 403 during construction. Though the required Rule 403 best available control measures do not specifically identify use of a tarp or sheeting to cover stockpiled soil, the rule overall contains a variety of control measures to reduce PM_{10} and $PM_{2.5}$ fugitive dust emissions associated with stockpiles. In addition, as shown in Table 3.2-11 of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as

shown in Table 3.2-14 of the Draft SEIR, the Proposed Project construction activities would not generate PM_{10} and $PM_{2.5}$ emissions that exceed the South Coast AQMD localized significance thresholds. Per CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Place stockpiled soil in areas shielded from prevailing winds.* The Proposed Project would be required to comply with South Coast AQMD Rule 403 during construction. Though the required Rule 403 best available control measures do not specifically identify measures related to shielding stockpiled soils from prevailing winds, the rule overall contains a variety of control measures to reduce PM_{10} and $PM_{2.5}$ fugitive dust emissions associated with stockpiles. In addition, as shown in Table 3.2-11 of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as shown in Table 3.2-14, *Localized Construction Concentrations*, of the Draft SEIR, the Proposed Project construction activities would not generate PM_{10} and $PM_{2.5}$ emissions that exceed the South Coast AQMD localized significance thresholds. Per State CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Sweep streets at the end of the day if visible soil material is carried onto adjacent public paved roads (recommend water sweepers).* The action in this measure is addressed under South Coast AQMD Rule 403 (see Section 403(d)(4)), with which the Proposed Project would be required to comply during construction. In addition, this action would contribute to minimizing PM_{10} and $PM_{2.5}$ fugitive dust emissions. As shown in Table 3.2-11 of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as shown in Table 3.2-14 of the Draft SEIR, the Proposed Project construction activities would not generate PM_{10} and $PM_{2.5}$ emissions that exceed the South Coast AQMD localized significance thresholds. Per CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Install wheel washers (or steel shaker plates) where vehicles enter and exit unpaved roads onto paved roads or wash off trucks and any equipment leaving the site each trip.* This recommended measure is one of the potential measures to implement under Section 403(d)(5)(D) of South Coast AQMD Rule 403 for active operations with a disturbed surface area of five or more acres or with a daily import or export of 100 cubic yards or more. Overall, this action would contribute to minimizing PM_{10} and $PM_{2.5}$ fugitive dust emissions. However, as shown in Table 3.2-11 of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as shown in Table 3.2-14 of the Draft

SEIR, the Proposed Project construction activities would not generate PM_{10} and $PM_{2.5}$ emissions that exceed the South Coast AQMD localized significance thresholds. Per State CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 miles per hour (mph).* The Proposed Project would be required to comply with South Coast AQMD Rule 403 during construction. Rule 403 contains a variety of basic available control measures to generally control and minimize PM_{10} and $PM_{2.5}$ fugitive dust emissions from construction activities. If applicable, Rule 403 also includes specific control measures for minimizing high-wind-driven fugitive emissions for construction activities that qualify as large operations. Furthermore, if construction activities would involve soils contaminated with toxic air contaminants, the Proposed Project would be required to suspend earth-moving activities if the wind speed is greater than 15 mph averaged over a 15-minute period, or instantaneous wind speed exceeds 25 mph, pursuant to South Coast AQMD Rule 1466. As shown in Table 3.2-11 of the Draft SEIR, the Proposed Project would not generate construction-related PM_{10} and $PM_{2.5}$ that would exceed their respective South Coast AQMD regional significance thresholds. Similarly, as shown in Table 3.2-14 of the Draft SEIR, the Proposed Project construction activities would not generate PM_{10} and $PM_{2.5}$ emissions that exceed the South Coast AQMD localized significance thresholds. Per CEQA Guidelines Section 15126.4(3), mitigation measures are not required for effects that are not found to be significant. Therefore, addition of this recommended measure is unwarranted.

- *Excavation and transportation of soil known to contain hazardous substances should be limited to periods when school is not in session.* The Proposed Project would comply with any applicable provisions and requirements of South Coast AQMD Rules 403, 1166, and 1466. Rule 403 requires implementation of best management practices to control general fugitive dust emissions during construction. Rule 1466 would apply for soils contaminated with toxic air contaminants (e.g., arsenic, lead, and cadmium) and would provide an additional level of controls above Rule 403 in minimizing emissions of fugitive dust that may contain hazardous substances during excavation, handling, loading, and transport. Furthermore, if applicable, Rule 1166 would require preparation of a mitigation plan that sets requirements for the excavation, handling, loading, and treatment of soils contaminated with volatile organic compounds. Implementation of the requirements of Rule 403 and Rule 1166 are included in the Soil Management Plan (Appendix G.5 of the Draft SEIR). All future development on the Project Site would implement these requirements.

Response A3-7

The Draft SEIR evaluates the Proposed Project's potential impacts related to hazards and hazardous materials, including the transport, use, and handling of hazardous materials during

construction and operation. Chapter 3.8, *Hazards and Hazardous Materials*, of the Draft SEIR, identifies mitigation measures (Mitigation Measures HAZ-1a-d and HAZ-2) to reduce potentially significant impacts associated with hazardous materials to less than significant levels. For a full description of the mitigation measures refer to Table ES-2, *Summary of Significant Environmental Impacts and Mitigation Measures*, and Chapter 3.8, *Hazards and Hazardous Materials*, of the Draft SEIR. In addition, Chapter 3.15, *Transportation*, of the Draft SEIR includes mitigation requiring preparation and implementation of a Worksite Traffic Control Plan (Mitigation Measure TRA-1). Among other elements, the plan may identify construction activity areas, roadway layouts, haul and detour routes, temporary traffic control measures, and coordination with the City of Los Angeles Department of Transportation, the agency responsible for safety and conditions of roadways accessing the Project Site, to minimize disruptions to surrounding roadways and maintain safe traffic operations during construction.

The commenter's recommendation regarding construction vehicle routing is consistent with the objectives of the mitigation measures in the Draft SEIR, which addresses the safe handling of hazardous materials and the management of construction traffic during Proposed Project implementation; therefore, modifications to the Proposed Project's mitigation measures are not warranted. The comment does not identify a deficiency in the Draft SEIR's hazards or transportation analyses or provide substantial evidence demonstrating that additional mitigation is necessary. No revisions to the Draft SEIR are warranted.

Response A3-8

Chapter 3.11, *Noise*, of the Draft SEIR analyzes the Proposed Project's impacts related to noise and vibration. The commenter incorrectly states that CEQA requires impacts to be quantified and eliminated or reduced to a level of insignificance. According to State CEQA Guidelines Section 15370, *Mitigation*, "mitigation" includes, "1) avoiding the impact altogether by not taking a certain action or parts of an action; 2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; 3) rectifying the impact by repairing, rehabilitating, or restoring the impacted environment; 4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and 5) compensating for the impact by replacing or providing substitute resources or environments, including through permanent protection of such resources in the form of conservation easements." The Draft SEIR includes all feasible mitigation measures that reduce the Proposed Project's environmental impacts; however, the Proposed Project would result in significant and unavoidable impacts.

Page 3.11-10 of Chapter 3.11, *Noise*, of the Draft SEIR identifies that LAUSD utilizes Caltrans' benchmark for assessing roadway noise exposure; the Draft SEIR identifies the 67 dBA L_{eq} exterior noise standard and 45 dBA L_{eq} interior noise standard. Page 3.11-34 of the Draft SEIR states that the analysis uses the County of Los Angeles construction noise thresholds because the County is the lead agency and owner of the Project Site. The Draft SEIR discloses that if pile

driving activities occur on the Project Site, the Proposed Project's construction activities would result in significant and unavoidable impacts related to construction noise, even with the implementation of Mitigation Measure NOI-1. Mitigation Measure NOI-1 includes a measure stating that, where feasible, impact pile driving shall be replaced with other piling techniques, such as vibratory pile driving and poured-in-place piles; additionally, to the extent feasible, temporary barriers shall be employed around the Project Site and/or around noise construction equipment, specifically pile driving equipment. Page 3.11-35 the Draft SEIR states that LAUSD utilizes a noise level increase of 3 dBA or more over ambient noise levels as a significance threshold and would require mitigation to achieve levels within 2 dBA of pre-project ambient levels. As identified in Table 3.11-12, *Temporary Construction-Related Noise Level Increases, dBA* L_{eq}, the Proposed Project's peak construction noise levels would not result in an increase over ambient noise levels at the Francisco Bravo Medical Magnet School and East Los Angeles Occupational Center.

The commenter suggests three mitigation measures to reduce construction noise at school facilities. The Proposed Project would implement Mitigation Measures NOI-1 through NOI-4, identified in Chapter 3.11, to reduce impacts related to noise and vibration.

- *Notification regarding exceedance of District Noise Standards*. See response to comment A3-5, which indicates that LAUSD is on the Proposed Project's distribution list and will be alerted to future project activity, and signage will be posted on the Project Site. Additionally, the County's noise standards are the applicable noise standards for the Proposed Project.

- *Noise control devices.* Mitigation Measure NOI-4 ensures that potential vibration impacts from pile driving are addressed. Refer to Table ES-2, *Summary of Significant Environmental Impacts and Mitigation Measures,* and Chapter 3.11, *Noise*, for a discussion of the Proposed Project's feasible noise mitigation measures.

- *Demolition activities*. See response to comment A3-5.

No revisions to the Proposed Project's mitigation measures to address significant noise impacts to the sites owned and operated by LAUSD would be required. No revisions to the Draft SEIR are warranted.

Response A3-9

Chapter 3.11, *Noise*, of the Draft SEIR identifies mitigation measures to reduce both construction- and operation-related noise.

- *Temporary noise barrier.* The commenter recommends noise barriers along Randolph Street and a rail corridor. The roadways surrounding the main campus of Project Site are Marengo Street, Mission Road, Zonal Avenue, and Chicago Street. Randolph Street is not in the vicinity of the Project Site but approximately five miles to the southeast. The nearest railway

corridor is approximately 0.14 miles southeast of the Project Site. The Proposed Project does not involve any changes to the operational characteristics of this railway and would result in no impacts. Therefore, incorporation of the suggested mitigation measure language is not warranted.

- *Construction noise impacting the learning environment*. The Draft SEIR discloses that the Proposed Project would result in significant and unavoidable construction noise impacts, and no feasible mitigation measures are available to reduce construction for uses within 360 feet of the Project Site boundaries. However, as discussed on page 3.11-41 of Chapter 3.11, *Noise*, of the Draft SEIR, typical project construction noise levels at off-site sensitive receptor properties, including the Bravo Medical Magnet High School and East Los Angeles Occupational Center, would be below the County's threshold of 85 dBA L_{eq}. Uses under Proposed Project operational conditions would result in less than significant impacts with the implementation of Mitigation Measure NOI-3a and NOI-3b. As discussed in response to comment A3-5, LAUSD will be on the mailing list for future projects and activities associated with the Proposed Project. As discussed in Response A3-5, LAUSD would continue to be on the Proposed Project's mailing list for updates related to the Proposed Project. Therefore, no revisions to the analysis or the Proposed Project's mitigation measures are warranted.

Response A3-10

The Draft SEIR evaluates the temporary transportation impacts associated with construction activities, including construction traffic, temporary lane closures, and detour routes. As discussed in Chapter 3.15, *Transportation* of the Draft SEIR, implementation of Mitigation Measure TRA-1 requires preparation and implementation of a Worksite Traffic Control Plan prior to construction. Among other requirements, the Worksite Traffic Control Plan includes roadway layouts identifying construction activity areas and detour routes; coordination with the City of Los Angeles to establish detour routes that minimize disruptions to surrounding roadways; coordination with the Los Angeles Department of Transportation, Los Angeles County Sheriff's Department, Los Angeles County Fire Department, and Los Angeles Police Department to minimize construction-related disruptions and maintain emergency access; maintenance of access to existing residences, transit facilities, and pedestrian and bicycle facilities; and implementation of appropriate traffic control measures during construction.

The following paragraphs address each of the specific conditions recommended by the commenter for reducing traffic impacts.

- *School buses must have unrestricted access to schools.* The County acknowledges LAUSD's recommended condition. As described in Chapter 3.15, construction traffic would be managed through implementation of the Proposed Project's construction traffic control measures, identified in Mitigation Measure TRA-1, which are intended to maintain safe and efficient circulation to the extent feasible and impacts would be less than significant.

Construction activities would be managed, as described on pages 3.15-18 through 3.15.19 of Chapter 3.15, *Transportation*, the Draft SEIR, to minimize disruptions to the surrounding roadway uses, including school transportation services. Therefore, addition of this recommended condition is unwarranted.

- *Construction traffic may not cause delays for transported students.* The County acknowledges LAUSD's recommended condition. The Draft SEIR evaluates the Proposed Project's temporary construction traffic impacts and identifies Mitigation Measure TRA-1 to reduce impacts to less than significant levels. Therefore, addition of this recommended condition is unwarranted.

- *Construction trucks must stop for school buses.* The County acknowledges LAUSD's recommended condition. Contractors are required to comply with all federal, State, and local laws and regulations during the Proposed Project construction, including applicable provisions of the California Vehicle Code, which requires that all vehicles stop for busses when stop indicators are on (California Vehicle Code 22454). Compliance with the California Vehicle Code is independent of the Proposed Project. The Proposed Project's construction activities are anticipated to include typical construction vehicles that are subject to this requirement. Thus, addition of this recommended condition is unwarranted.

- *Contractors must install traffic controls.* The County acknowledges LAUSD's recommended condition. The Draft SEIR identifies Mitigation Measure TRA-1, which identifies construction traffic control measures to facilitate safe vehicle, bicycle, and pedestrian circulation during construction activities. Traffic control devices would be installed and maintained in accordance with applicable standards and permit requirements, as appropriate. Therefore, addition of this recommended condition is unwarranted.

- *Maintain communication with LAUSD.* The County acknowledges LAUSD's recommended condition. As identified in response to comment A3-5, public communications regarding future projects and construction activities will be posted at the Project Site, as appropriate, and distributed to the Proposed Project's distribution list. Accordingly, no revisions to the Draft SEIR are warranted.

- *Parent drop-off access to passenger loading areas.* The County acknowledges LAUSD's recommended condition. The Proposed Project's construction traffic control measures are intended to maintain safe access and circulation along the surrounding roadways and adjacent properties during construction activities. The temporary construction traffic control measures would be implemented as necessary to minimize disruptions to surrounding roadway users. Therefore, addition of this recommended condition is unwarranted.

The commenter does not provide specific comments regarding the adequacy of Mitigation Measure TRA-1; this mitigation adequately addresses LAUSD's concerns regarding construction

traffic management because LAUSD's recommendations are consistent with the objectives of the Worksite Traffic Control Plan and would be considered during development and implementation of that plan, as appropriate. The transportation analysis in the Draft SEIR demonstrates that significant impacts to nearby schools or school operations would not occur. No further response is required, and no revisions to the SEIR are warranted to respond to this comment.

Response A3-11

The following paragraphs address each of the specific conditions recommended by the commenter for reducing impacts related to pedestrian safety.

- *Ongoing communication regarding pedestrian routes.* The County acknowledges LAUSD's recommended condition. As identified in response to comment A3-5, public communications regarding future projects and construction activities would be posted at the Project Site, as appropriate, and distributed to the Proposed Project's distribution list. LAUSD would continue to receive public communications regarding future Project activities, as will other interested agencies and stakeholders. In accordance with Mitigation Measure TRA-1, the Project Applicant(s) would work with the City of Los Angeles to maintain the continuity and operations of existing pedestrian and bicycle facilities during construction. Additionally, as discussed in Chapter 3.15, *Transportation*, the Proposed Project's construction would be phased, and necessary adjustments would be included in accordance with the location of current and planned construction activities. Accordingly, no revisions to the Draft SEIR are warranted.
- *Maintain safe pedestrian routes.* The Draft SEIR evaluates the temporary transportation impacts associated with construction activities, including construction traffic, temporary lane closures, and detour routes. As discussed in Chapter 3.15, *Transportation,* of the SEIR, Mitigation Measure TRA-1 requires preparation and implementation of a Worksite Traffic Control Plan prior to construction. The Worksite Traffic Control Plan includes measures to maintain continuity and operation of existing pedestrian and bicycle facilities during construction, identify roadway layouts and detour routes, implement appropriate traffic control measures, and coordinate with the City of Los Angeles and applicable public agencies to minimize disruptions associated with construction activities. Accordingly, no revisions to the Draft SEIR are warranted.
- *Install traffic controls.* The County acknowledges LAUSD's recommended condition. The Draft SEIR includes Mitigation Measure TRA-1, which identifies construction traffic control measures to facilitate safe vehicle, bicycle, and pedestrian circulation during construction activities. Traffic control devices would be installed and maintained in accordance with applicable standards and permit requirements, as appropriate. Therefore, addition of this recommended condition is unwarranted.

- *Haul routes should avoid schools.* The County acknowledges LAUSD's recommendation. Construction haul routes would be identified and managed through the Proposed Project's Worksite Traffic Control Plan (Mitigation Measure TRA-1). Given the urban setting of the Project Site and surrounding roadway network, avoiding all schools throughout the duration of the Proposed Project construction may not be feasible. The Draft SEIR evaluates construction traffic impacts with the assumption that construction may be going on while nearby schools are in session and identifies Mitigation Measure TRA-1 to minimize temporary construction-related traffic impacts; specifically, provide a roadway layout that shows the locations of construction activity and surrounding roadways to be used as detour routes, including special signage and establish detour routes in coordination with the City of Los Angeles to minimize disturbances to local roadway conditions. No revisions to the Draft SEIR are warranted.
- *No staging adjacent to schools.* The County acknowledges LAUSD's recommendation. As discussed in Chapter 2, *Project Description*, on page 2-34 of the Draft SEIR, construction staging and parking would be within the Project Site. The East Los Angeles Occupational Center is located approximately 0.1 mile southwest, and the Bravo Medical Magnet High is located approximately 0.2 mile west. The Proposed Project would not stage construction equipment off-site, and no schools are located on-site. No revisions to the Draft SEIR are warranted.
- *Crossing guards and flaggers.* The County acknowledges LAUSD's recommendation. Construction traffic control measures (Mitigation Measure TRA-1) would be implemented as appropriate to maintain safe pedestrian and vehicular circulation. Traffic control personnel, including flaggers, may be utilized where warranted by construction activities and applicable traffic control requirements. The comment does not demonstrate that crossing guards are necessary to avoid or reduce a significant environmental effect. No revisions to the Draft SEIR are warranted.
- *Barriers and fencing.* The County acknowledges LAUSD's recommendation. As discussed in Chapter 2, on page 2-34 of the Draft SEIR, construction fencing would be installed to prevent disturbance and safety hazards. No revisions to the Draft SEIR are warranted.
- *Security patrols.* As discussed in Chapter 2 and Chapter 3.13, Public Services, of the Draft SEIR, private security and security monitoring features would continue on the Project Site. Additional site security measures during construction would be determined by the contractor, consistent with applicable safety requirements and standard construction practices. No revisions to the Draft SEIR are warranted.

The commenter's recommendation regarding communication with LAUSD and pedestrian safety is consistent with the objectives of the Worksite Traffic Control Plan and may be considered during development and implementation of construction management procedures, as appropriate. The commenter does not provide specific comments regarding the adequacy of Mitigation Measure TRA-1; this mitigation adequately addresses LAUSD's concerns regarding construction traffic management because LAUSD's recommendations are generally consistent

with the objectives of the Worksite Traffic Control Plan and may be considered during development and implementation of that plan, as appropriate. No further response is required, and no revisions to the SEIR are warranted to respond to this comment.

Response A3-12

The SEIR analyzes the Proposed Project's impacts under all environmental topics identified in State CEQA Guidelines Appendix G. Specific thresholds related to the well-being of persons surrounding the Project Site are analyzed in Chapters 3.2, *Air Quality*; 3.8, *Hazards and Hazardous Materials*; 3.11, *Noise*; and 3.15, *Transportation*, of the SEIR. The SEIR has identified all feasible mitigation measures to reduce impacts; however, some impacts remain significant and unavoidable. No revisions to the SEIR are warranted to respond to this comment.

Response A3-13

The County acknowledges the commenter's contact information. This comment does not raise environmental concerns. No further response is required, and no revisions to the SEIR are warranted to respond to this comment.

Vic. LA-5/PM 18.78, LA-10/PM 19.07
GTS # LA-2025-05076-Subsequent EIR

Dear Krystin Hence:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above-referenced environmental document. The Proposed Project involves implementation of the proposed Master Plan, which would guide the long-term redevelopment of approximately 30.8 acres of the Project Site, including adaptive reuse of the 1.2-million-square-foot General Hospital Building. The Proposed Project seeks to maintain flexibility for the County to redevelop other parts of the Project Site (the approximately 51.1 acres outside of the Master Plan area) with potential County-initiated projects in the future. The Proposed Project includes the demolition of existing buildings, structures, storage containers, modular buildings, pavement, utilities, and landscaping to allow for the development of 8,060,978 square feet of new uses including 3,200 housing units, 450 hospital beds, 200 patient and caregiving lodging rooms, and more than 3 million square feet of parking (8,588 parking spaces). A4-1

The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment. Senate Bill 743 (2013) has codified into CEQA law and mandated that CEQA review of transportation impacts of proposed development be modified by using Vehicle Miles Traveled (VMT) as the primary metric in identifying transportation impacts for all future development projects. As a reminder, all environmental documents should include Vehicle Miles Traveled. You may reference the Governor's Office of Land Use and Climate Innovation webpage for more information: A4-2

https://www.lci.ca.gov/ceqa/#guidelines-updates

A4

Krystin Hence, Assistant Director, Capital Development
June 24, 2026
Page 3

To effectively reduce traffic impacts and support transit-oriented objectives, the County should reconsider prioritizing automobile infrastructure. Caltrans recommends strategies include reducing the overall number of parking spaces to discourage driving, charging separately for parking so residents and workers understand the true cost, offering free transit passes to make public transportation more attractive, and repurposing parking stalls as hubs for bike, scooter, and carpool sharing. These measures can help shift travel behavior toward sustainable modes and align the project more closely with its transit-friendly vision. A4-7 Cont.

Transportation Appendix

Caltrans acknowledges that the transportation analysis was integrated directly into the SEIR Transportation Chapter, rather than provided as a standalone traffic study appendix. The Transportation Chapter, along with the CEQA transportation excerpt dated March 20, 2026, which was previously shared with the Caltrans team by the consultant, incorporates the off-ramp queuing analysis, turning movement counts, Synchro calculation sheets, and signal timing information. Caltrans recommends that these materials be included as an appendix to ensure full transparency and facilitate meaningful public review and comment. We understand that following our consultation, portions of the analysis have been updated in the final Transportation Chapter. A4-8

VMT

While the project is described as a "transit-friendly" development, Caltrans notes that the proposed 8,588-space parking footprint raises concerns about alignment with transit-oriented goals. According to the Draft SEIR (page 3.15-23 and Table 3.15-3), the parking infrastructure is expected to generate 63,927 daily trips, comparable to the traffic of a small city, and the reported residential VMT of 7.6 per capita and work VMT of 10.6 per employee are not supported by substantial evidence. These metrics were calculated using travel data from a low-density, single-family neighborhood in Lincoln Heights rather than a high-density urban campus, and the population denominator was inflated to 9,634 residents instead of the actual cap of 8,000. This methodology may underestimate the true vehicle miles traveled and overstate the project's compatibility with transit. A4-9

Caltrans recommends that the County revisit the travel demand modeling, specifically analyzing how the extensive parking facility encourages additional car use, and consider reducing the proposed parking supply to ensure impacts are properly disclosed and mitigated. This master plan will serve as the basis for establishing the local VMT for that area, and as such, it is essential that the analysis accurately reflects the project's influence on travel patterns and complies with CEQA disclosure requirements. A4-10

A4

Krystin Hence, Assistant Director, Capital Development
June 24, 2026
Page 4

Queuing Analysis
To ensure transparency and compliance with CEQA, the queue analysis must clearly compare "Existing" and "Existing plus Project" conditions. This side-by-side assessment is critical for disclosing incremental impacts, allowing stakeholders to evaluate project effects on off-ramp operations and supporting the identification of effective mitigation measures. A4-11

Impact TRA-3: Caltrans concurs with the identification of four freeway off-ramp locations where operation of the Proposed Project is anticipated to result in significant traffic impacts and geometric hazards due to queuing. These locations include the I-5 southbound off-ramp to Mission Road, I-5 northbound off-ramp to Cesar Chavez Avenue, I-10 westbound off-ramp to State Street, and I-10 westbound off-ramp to Soto Street. Caltrans acknowledges that queuing at these sites may cause operational and safety concerns consistent with CEQA analysis. A4-12

Proposed Mitigation Measures

- **TRA-3a:** Re-stripe the I-5 southbound off-ramp to Mission Road from a left turn lane, shared through-left lane, and right lane to two left turn lanes and one shared through-right lane. Optimize signal timing along Mission Road, including cycle length, offset, and phase splits. Apply Caltrans' Intersection Safety Operational Assessment Process (ISOAP) methodology as appropriate for intersection improvements. A4-13
- **TRA-3b:** Re-stripe the I-10 westbound off-ramp to State Street from a left turn lane and right turn lane to a shared left-right turn lane and a right turn lane. Optimize signal timing and apply ISOAP methodology as needed. A4-14
- **TRA-3c:** Re-stripe the I-10 westbound off-ramp to Soto Street from a left turn lane, shared through-left lane, and two right turn lanes to two left turn lanes, one through lane, and one right turn lane. Optimize signal timing and apply ISOAP methodology for intersection improvements. A4-15
- **TRA-3d:** Optimize signal timing at the I-5 northbound off-ramp to Cesar Chavez Avenue. Apply ISOAP methodology as appropriate for intersection improvements. A4-16
- **TRA-3e:** Implement a comprehensive Transportation Demand Management (TDM) program to reduce vehicle trips to the Project Site, which may help mitigate freeway off-ramp queuing hazards. TDM strategies include commute trip reduction programs, ridesharing, subsidized transit, bicycle facilities, employer-sponsored vanpools, parking management, school bus programs, and promoting active transportation for youth. A4-17

Caltrans acknowledges the proposed mitigation measures TRA-3a through TRA-3e. All proposed mitigation measures must be field verified to ensure technical and physical feasibility within the State Right-of-Way. However, these measures will not reduce A4-18

A4

Krystin Hence, Assistant Director, Capital Development
June 24, 2026
Page 5

Impact TRA-3 to a less-than-significant level. While the measures would help decrease geometric hazards caused by freeway off-ramp queuing, analysis shows that queues will still exceed available storage during at least one peak hour at each location. This means the impact remains significant and unavoidable. A4-18 Cont.

TRA-3b recommends restriping the westbound I-10 off-ramp to State Avenue from separate left and right turn lanes to a shared left/right turn lane and a right turn only lane. Caltrans requests confirmation that this configuration is feasible, given space constraints for dual right turn lanes. The turning radius for right turns should be evaluated to ensure safe and efficient operations. Caltrans further recommends assessing alternative designs, including intersection widening, to accommodate required turning movements. A4-19

While mitigation measures TRA-3a through TRA-3d aim to optimize intersection operations, significant traffic impacts remain due to excessive queue lengths and limited storage at freeway off-ramps. Caltrans recommends the County evaluate increasing storage length, as **Aerial Photo #1 to #4** indicate sufficient right-of-way may exist. A collaborative review with Caltrans is advised to confirm feasibility. Consistent with CEQA Guidelines §§ 15091 and 15126.4, Public Resources Code § 21002, and § 15092(b)(2), a project cannot be approved if feasible mitigation measures are available that would substantially reduce or avoid significant impacts. A4-20

Additional TDM

For **TRA-3e**, we recommend the County to enhance its efforts by adopting additional TDM strategies from Caltrans' Local Development Review Transportation Demand Management Toolbox. These measures include dynamic congestion pricing, advanced traffic signal systems, and promoting telecommuting and flexible work hours. Implementing these strategies will further reduce Vehicle Miles Traveled (VMT) and greenhouse gas (GHG) emissions, contributing to a healthier, more resilient community. A4-21

https://dot.ca.gov/-/media/dot-media/district-4/documents/d4-transportation-planning-local-assistance/ldr/final-draft-2023-ldr-tdm-toolbox-071923-a11y.pdf

The following remarks were presented to County staff and consultants during a virtual meeting held on June 6, 2026:

1. On Page 3.15-27, under the Queuing Analysis Methodology section, it is indicated that the HCM 7th Edition was utilized to determine queue lengths. However, some Synchro worksheets previously shared with Caltrans referenced HCM 2000 as the basis for calculations in the Draft CEQA Chapter Excerpt dated March 20, 2026. Please ensure that all analyses are conducted using the HCM 7th Edition and submit updated Synchro worksheets to Caltrans for review and record. Additionally, SimTraffic should be A4-22

A4

Krystin Hence, Assistant Director, Capital Development
June 24, 2026
Page 6

employed to evaluate closely spaced and congested intersections for safety reasons, specifically at the I-10 ramps and Marengo Street intersections with Soto Street. A4-22 Cont.

2. On Page 3.15-28, under Operational Improvements section, it stated that more extensive measures, such as added lanes or turn pockets, were assumed infeasibility due to right-of-way constraints and the potential negative effect on multimodal experience. Caltrans does not concur. Due to the significance of added queue to the freeway mainline that may result in safety issues, all mitigation measures should be explored and evaluated. Caltrans does not anticipate improvement on freeway mainline or ramp termini to result in negative impacts on multimodal travels. A4-23

3. The storage lengths presented in the tables under Section 3.15 are calculated as the sum of all lane-feet from the terminal intersection stop bar to the gore point. Caltrans does not concur with this methodology. Available storage length should be measured solely for the critical turning movement that has the potential to generate extensive queues onto the freeway mainline. Adopting this approach may identify additional ramps with potential safety concerns. A4-24

4. Given the substantial queue lengths and associated safety concerns, it is essential to evaluate mitigation measures beyond signal timing optimization, lane reassignments, and Transportation Demand Management (TDM) strategies. Comprehensive intersection improvement analyses should be thoroughly explored and documented within ISOAP, ensuring all feasible options are considered in accordance with CEQA requirements. A4-25

Other Comments

Please be reminded that any work performed within the State Right-of-way will require an Encroachment Permit from Caltrans. Any modifications to State facilities must meet all mandatory design standard and specifications. A4-26

Any transportation of heavy construction equipment and/or materials that require the use of oversized transport vehicles on State highways will need a Caltrans transportation permit. Any large-size truck trips should be limited to off-peak commute periods for the construction phase and operation phase. Construction truck loads should be covered with a tarpaulin cover. A4-27

Storm water run-off is a sensitive issue for Los Angeles County. Please be mindful that projects should be designed to discharge clean run-off water. A truck and construction traffic management plan may be required for projects near I-5/I-10 on/off-ramps, and any lane closures/detours impacting freeway access must coordinate with Caltrans. A4-28

Krystin Hence, Assistant Director, Capital Development
June 24, 2026
Page 7

Given the scale of this project and its considerable impact on State facilities, Caltrans kindly requests that the Lead Agency and traffic consultants engage in ongoing discussions regarding direct traffic impacts and potential mitigation strategies. In follow-up to Caltrans' comment letters dated October 20, 2014 and November 19, 2014 (**Attachment #4**), we look forward to working collaboratively to identify effective solutions that address these concerns. A4-29

While Caltrans did not have early input on this project, we are committed to working with the County to ensure transparent disclosure and effective mitigation of traffic impacts in line with CEQA requirements. We welcome continued collaboration to address traffic concerns and support the public interest. If you have any questions, please feel free to contact Mr. Alan Lin, the project coordinator, on (213) 269-1124 and refer to GTS # LA-2025-05076-Subsequent EIR. A4-30

Sincerely,

Anthony Higgins

October 20, 2014

Mr. Clarice Nash
County of Los Angeles
Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803

RE: LAC+USC Medical Center Campus
Master Plan
Vic. LA-05/PM 18.78, LA-10/PM 19.07
SCH # 2014051061
IGR/CEQA No. 140915AL-DEIR

Dear Mr. Nash:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project. The proposed project is a master plan on the medical campus over a period of 25 years including 450 new hospital beds, medical offices, laboratories and other supporting functions. Full buildout of the master plan could result in a total of approximately 1,725,000 square feet of development throughout the campus. 1

Appendix D from the Traffic Impact Study (TIS), prepared in August 2014, indicates that a freeway screening analysis is used per the Agreement between City for Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures. This agreement only applies when the projects are developed and reviewed by the City of Los Angeles Department of Transportation. 2

In addition, Caltrans sent a comment letter dated August 1, 2014 for the Los Angeles County General Plan Update and met with County staff regarding consultation with Caltrans when preparing a traffic study to determine the impacts that a local development project would have on State facilities. 3

Although the lead agency is required to comply with Los Angeles County Congestion Management Program (CMP) standards and thresholds of significance, Caltrans does not consider the Los Angeles County's CMP criteria alone to be adequate for the analysis of transportation impacts pursuant to a CEQA review. CMP requirements were developed by Los Angeles County in the context of CMP goals and objectives; it does not supersede the criteria from the responsible agency under CEQA. Caltrans' Guide directs preparers of traffic impact analysis to consult with the local District as early as possible to determine the appropriate requirements and criteria of significance to be used in the traffic impact analysis. The CMP analysis may not include site-specific safety considerations, or may not be based on an appropriate measure of effectiveness for site-specific considerations. 4

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability"

A4-Attachment #1

Mr. Clarice Nash
October 20, 2014
Page 2

On page 27 of the TIS, "A trip distribution pattern was developed for the project based on two sources. Home zip code data of existing LAC+USC patients and employees was supplied by Los Angeles County staff and then mapped. This data was supplemented with a select zone analysis using the City of Los Angeles' Transportation Demand Model (Year 2010) to inform the general distribution pattern for this study." Caltrans would like to review the select zone analysis so the potential traffic impact on the freeways can be identified properly. 5

On Table 5, Proposed Project Trip Generation, the Lead Agency should verified and validate each existing land use for its accurate trip generation. For example, Laboratory and Clinic Buildings trip generation should be separated and how many existing bed is in operation need to be disclosed properly in order to calculate an accurate trips generation. The usage of trips credit for internal (15%), transit (15%), and pass-by trips (20%) needs to be conservative and justified even when using the City of Los Angeles' criteria. Otherwise, the trip generation as shown does not provide sufficient data. Based on this information, it appears that 3,944 daily trips and, 711/502 AM/PM peak hour trips are low. 6

Caltrans would like the County to disclose the traffic impact to the off-ramps by preparing a queuing analysis using 85th percentile. For a more accurate off-ramp queuing analysis, capacity of the off-ramp should be calculated by the actual length of the off-ramp between the terminuses to the gore point with 30 feet per car. Generally, the demand of the off-ramp should be calculated from the traffic counts, actual signal timing percent of truck assignment on the ramp with a passenger car equivalent factor of 3.0. 7

When the level of service is changing from one level to another level and at least 50 trips will be assigned to the study location. Potentially, an improvement will be needed for the following ramps:

Location # 2, SB I-5 off-ramp to Mission Rd.
Location #14, NB I-5 off-ramp to Ceasar E Chavez Ave.
Location # 18, EB I-10 off-ramp to Soto St.
Location # 20, WB I-10 off-ramp to Soto St. 8

On Table 6, Trip Generation Estimates for Related Projects, there will be 43,379 daily trips, 3,335/4,101 AM/PM peak hour trips. In the project vicinity, the Level of Service for I-10 and I-5 are operating at LOS E and F. Many of the related trips will be utilizing the State facilities. Therefore, we believe a cumulative traffic impact will occur. The decision maker should be aware of this issue and be prepared to mitigate cumulative project impact in the future. We recommend the County establish a mechanism to address cumulative transportation impacts. 9

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability"

A4-Attachment #1

Storm water run-off is a sensitive issue for Los Angeles and Ventura counties. Please be mindful that projects should be designed to discharge clean run-off water. Additionally, discharge of storm water run-off is not permitted onto State highway facilities without any storm water management plan. 10

Transportation of heavy construction equipment and/or materials, which requires the use of oversized-transport vehicles on State highways, will require a transportation permit from Caltrans. It is recommended that large size truck trips be limited to off-peak commute periods. 11

If you have any questions, please feel free to contact Alan Lin the project coordinator at (213) 897-8391 and refer to IGR/CEQA No. 140915AL.

Sincerely,

DIANNA WATSON
Branch Chief
Community Planning & LD IGR Review

A4-Attachment #1

Responses to the October 20, 2014, Comment Letter from the California Department of Transportation

Response to Comment A3-1

This comment summarizes the overall level of development allowed for under full buildout of the proposed Master Plan and thanks the County for including Caltrans in the environmental review process. No further response is necessary.

Response to Comment A3-2

The comment acknowledges that a Freeway Screening Analysis was prepared for the proposed project and was included in the draft EIR, per an agreement between the City of Los Angeles and Caltrans District 7, and notes that the agreement only applies when projects are developed and reviewed by the City of Los Angeles Department of Transportation.

The lead agency for the environmental analysis of the proposed project, a Master Plan to guide the long-term development of the LAC+USC Medical Center Campus, is Los Angeles County. The site is owned by the County and the facilities there are operated by the County. Because the project is wholly surrounded by the City of Los Angeles, however, the County and the City jointly scoped the traffic study and agreed at the outset that the procedures outlined in the Traffic Study Policies and Procedures developed by the City of Los Angeles Department of Transportation would be applied in the analysis of city-maintained facilities.

The screening criteria listed below were applied to the proposed project to determine if the proposed project would require an impact analysis on the freeway system beyond the freeway analysis required under the Los Angeles County Metropolitan Transportation Authority (Metro) Congestion Management Program (CMP).

- *The screening criteria state that freeway mainline segments should be evaluated if a project adds traffic equivalent to 1% or more of capacity when a segment or off-ramp operates at LOS E or F, or 2% or more of capacity when a segment or off-ramp operates at LOS D, and further specifies that a capacity value of 2,000 vehicles per hour (vph) per lane for freeway segments and 1,500 vph per lane for off-ramps should be used in this screening.*

This detailed screening analysis is documented in a memorandum attached as Appendix D of Appendix G of the draft EIR, the Traffic Study prepared by Fehr & Peers dated August 2014.

The screening analysis and evaluation included seven freeway segments and six freeway off-ramps in the vicinity of the project site (and thus likely to carry the highest number of project trips). The evaluation calculated freeway segment level of service using both volume data from PeMS and speed data from INRIX and conservatively used the worst – case level of service in the segment screening analysis. Baseline turning movement counts collected for the draft EIR traffic study and observations of the existing signal timing and phasing were used in the off-ramp screening analysis.

A4-Attachment #1

In Appendix D of the Traffic Study in Appendix G of the draft EIR, Table 2 summarizes the Freeway Segment screening analysis for the a.m. and p.m. peak hours, and Table 3 summarizes the screening analysis for off-ramps during the a.m. and p.m. peak hours. The screening analysis concluded that the proposed project would not require freeway traffic impact analysis beyond the freeway analysis that was prepared under the requirements of the CMP.

Response to Comment A3-3

The comment states that comment letter was sent by Caltrans to Los Angeles County regarding another project in August 1, 2014 and that a meeting was subsequently held between the County and Caltrans staff regarding interagency coordination.

This comment is noted. However, the Memorandum of Understanding for conducting the traffic impact analysis was executed by the project team and the County on June 19, 2014. This Memorandum of Understanding required the project to analyze the potential traffic impact on the following freeway segments:

- I-10 Freeway at East LA City Limit
- State Route 60 east of Indiana Street
- US-101 north of Vignes Street
- State Route 110 at Pasadena Avenue
- I-5 Freeway at Stadium Way

Consultation with Caltrans was conducted at the outset of the study process through the CEQA process. A comment letter during the scoping period, dated May 27, 2014, was received from Caltrans, and is included in Appendix A of the draft EIR.

The NOP comment letter states that a traffic study should be prepared in advance of the draft EIR, and references the general "Guide for the Preparation of Traffic Impact Studies" (Caltrans, December, 2002). The letter lists some elements that should be included in the traffic study, including the methods used to estimate trip generation, distribution, mode choice, and assignment of trips to I-10 and I-5 and the nearest freeway ramps. Each of these elements was included in the study and is described in detail in Chapter III of Appendix G to the draft EIR.

The NOP comment letter recommends consistency with regional and local modeling forecasts, which was addressed through the use of an ambient growth factor for this area that was drawn from the regional (Metro) model, which was found to be slightly more conservative than the growth forecast from the City of Los Angeles model.

The NOP comment letter requests analysis of daily traffic volumes, and AM and PM peak hour volumes on freeways, interchanges, intersections, and HOV facilities, and requests the use of the HCM 2000 methodology, make realistic estimates of transit use and include traffic growth related to other development projects in the area. The draft EIR analysis analyzed existing conditions at six freeway off-ramps at nearby interchanges using the HCM 2000 method, as requested. Additional analysis was conducted of freeway mainline segments and intersections using other methods specified by the lead agency and a local responsible agency, the City of Los Angeles. The intersection analysis methods were consistent with what is specified in the traffic impact analysis guidelines used by Los Angeles County and the City of Los Angeles. Two approaches to conducting

A4-Attachment #1

freeway mainline analysis were used in the draft EIR following consultation with County and city staff: one was the threshold-test specified in the CMP (discussed further in response to Comment A3-4) and the other was the screening criteria analysis mentioned in response to Comment A3-2. These freeway analyses are presented in Chapter V of Appendix G of the draft EIR.

The NOP comment letter requests analysis of all appropriate traffic volumes, specifying Existing + Project + Other Projects + Other Growth. Each of these elements was included in the growth projections described and presented in Chapter IV of Appendix G of the draft EIR. Because neither the County nor Caltrans has an applicable defined threshold of significance for daily traffic volumes, forecasting and analysis was limited to the AM and PM peak hour volumes. Estimated daily traffic volumes were, however, reported for the proposed project and for other planned development projects in the area.

The NOP comment letter requests that the study include a discussion of "mitigation measures appropriate to alleviate anticipated traffic impacts." A detailed discussion of identified impacts and mitigation measures is provided in Chapter IV of Appendix G of the draft EIR. As requested in the NOP comment letter, mitigation involving TDM was conservatively estimated.

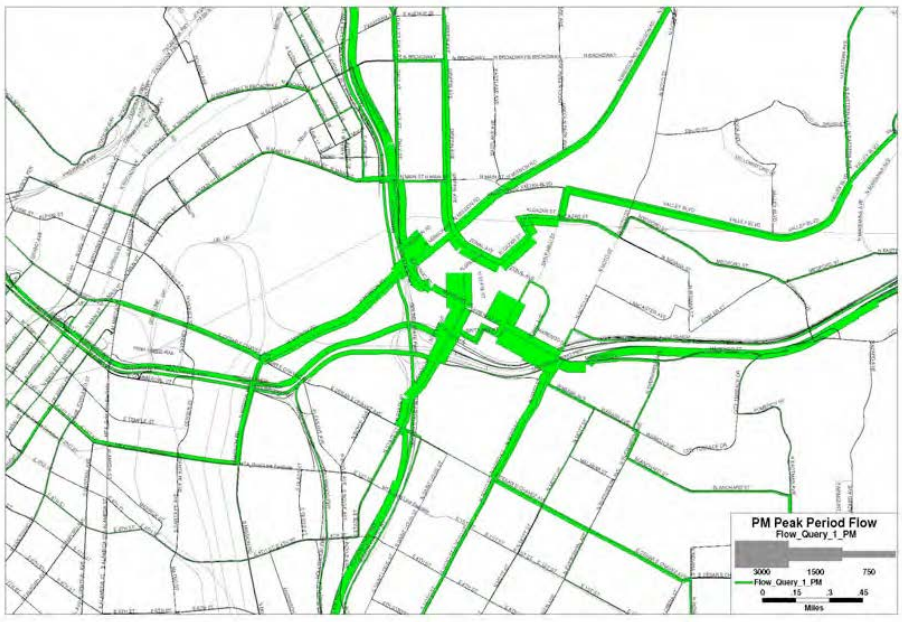
The NOP comment letter requests that the study include specification of the developer's percent share of the cost of realistic mitigation measures. As stated in the Mitigation Monitoring and Reporting Plan included in the Final EIR, Los Angeles County would be responsible for 100% of the cost of the identified mitigation measures.

The NOP comment letter concludes by recognizing that Caltrans will receive a copy of the draft EIR from the State Clearinghouse and extending an offer to meet with the County and its consultant. This offer was not accepted, as the analysis conducted in the draft EIR did not identify impacts to the regional transportation system.

Response to Comment A3-4

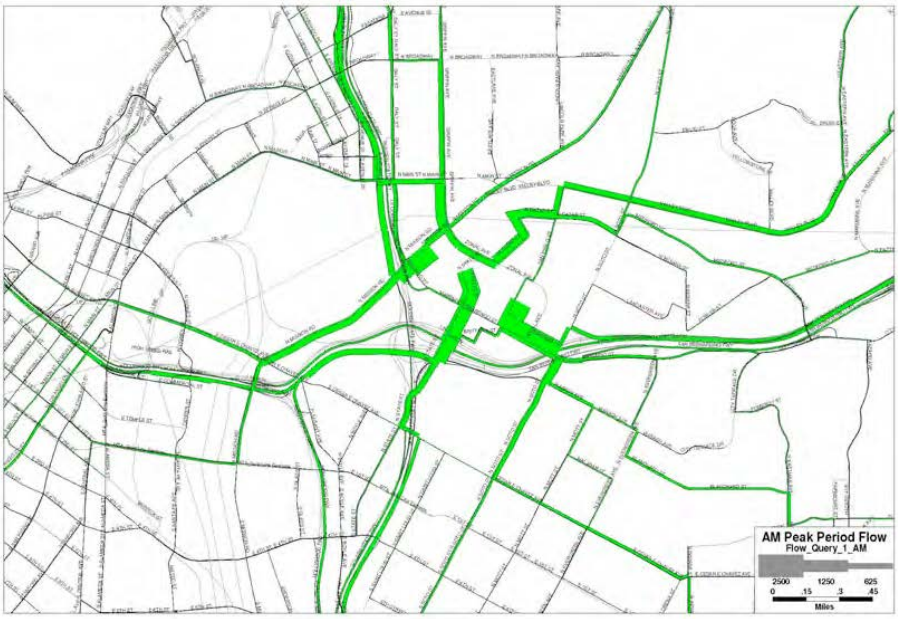
The comment states that Caltrans does not consider CMP criteria alone to be adequate for the analysis of transportation impacts under CEQA, noting that CMP requirements do not supersede other applicable criteria established by responsible agencies. The comment states that Caltrans' normal requirements are that it be consulted early in the study process to determine what analysis and impact criteria should be used for assessing impacts to the State Highway System.

The traffic impact study included in the draft EIR was prepared in a manner consistent with the City of Los Angeles traffic study policies in effect when the study was begun, which include analysis to comply with the local Congestion Management Program, and application of the Freeway Screening Analysis described above in Response to Comment A3-2. The CMP, which is a statutory requirement administered by the Los Angeles County Metropolitan Transportation Authority (Metro) that became effective with the passage of Proposition 111 in 1990, includes procedures for measuring a project's impacts on the freeway system. Both the city's and Metro's guidelines clearly define what constitutes a significant traffic impact and both were used to assess the project's traffic impacts. The Caltrans Guide for the Preparation of Traffic Impact Studies (December 2002) does not define significant impact thresholds. Since Caltrans has not



A4-Attachment #1

adopted generally applicable thresholds of significance, the analysis methods described in the Metro CMP and the screening analysis described in the response to Comment A3-2 were utilized to assess freeway and off-ramp impacts. The Metro CMP provides clear and consistent evaluation procedures for evaluating freeway impacts.



Response to Comment A3-5

The comment notes that the overall trip distribution pattern used in the draft EIR traffic analysis was based, in part, on use of the City of Los Angeles travel demand forecasting model and asks to review the select zone analysis to properly identify the project's potential traffic impact on the freeways.

The trip distribution and trip assignment patterns were among the basic elements of the traffic study that were determined in consultation with LADOT and Los Angeles County staff at the outset of the study process. As noted in the comment, and as stated on page 3.14-12 of the draft EIR and on page 27 of the traffic study, the overall trip distribution pattern was developed for the project using several sources. Initially home zip code data for existing patients and employees was mapped. As a supplemental input, a select zone analysis was conducted using the City of Los Angeles model. The select zone run plots for the AM and PM peak periods, which depict the raw unadjusted model output, are provided below as requested in the comment. These inputs were used, together with local knowledge of the surrounding street system and professional judgment, to assign project traffic to the surrounding street and freeway system. It is important to recognize that the data in these plots was not used blindly but, as discussed above and as explained in the draft EIR, it was used as one of several factors in assigning project-related traffic to the freeways.

A4-Attachment #1

Response to Comment A3-6

The comment recommends that the Lead Agency verify and validate the trip generation of existing land uses and suggests that a more discrete breakdown of on-site land uses be used in calculating existing trip generation, and that the number of occupied beds be disclosed. The comment states that adjustments for internal, transit, and passer-by trips should be made conservatively to avoid underestimating site-generated trips and concludes by expressing an opinion that the net trip generation estimates presented in the draft EIR appear low.

The draft EIR includes information on the size of existing buildings housing active on-site uses that would be removed as part of the proposed master plan, as well as the proposed development program. Information is also provided in the draft EIR on vacant buildings, such as the Women's and Children's Hospital, that would be removed. The summaries presented in Table 2-1 on page 2-15 of the draft EIR and in Table 5 of Appendix G to the draft EIR include a detailed breakdown of the relevant land uses, including Medical Office, General Office, Heavy Industrial, Utilities, Warehousing, Hospital, Specialty Retail, Research & Development, and Recreational Community Center. Of these land use types, the first five were applied to occupied buildings that would be removed under the proposed master plan project.

The sizes and uses of the existing active buildings to be removed were based on detailed building-by-building data gathered during the master plan process and compiled in the "Building & Site Assessment Report." The tables cited above do not include vacant buildings or vacant portions of buildings, such as the upper floors of the former General Hospital building, nor do they include occupied buildings or areas where no change is proposed as part of the project, such as the new General Hospital inpatient tower; those

A4-Attachment #1

site elements were not included in the overall net trip generation estimates for the project. Trip credits were only taken for existing, active uses that would be removed by the project.

Each of the land use categories listed above is included in the "Trip Generation Manual, 9th Edition," which provides specific trip generation factors based on empirical studies of similar facilities throughout the country. Responding to the comment, the Medical Office land use was used to estimate existing and future trips associated with laboratories and clinics, consistent with the land use description in "Trip Generation Manual, 9th Edition," which says that a medical office building is a "facility that provides diagnoses and outpatient care on a routine basis but is unable to provide in-house medical and surgical care." No trip generation rates are provided for Laboratories alone. Very limited data is provided for a separate Clinic land use category but it was not used because it is based on a very small data set, and because the Medical Office rates were appropriate.

As stated on page 1 of "Trip Generation Manual, 9th Edition," the data was "primarily collected at suburban locations having little or no transit service, nearby pedestrian amenities or travel demand management (TDM) programs" and notes that it is appropriate to adjust the published trip generation rates to reflect "the presence of public transportation service, ridesharing, or other TDM measures; enhanced pedestrian or bicycle trip-making opportunities; or other special characteristics of the site or surrounding area." Such adjustments were made in the draft EIR to reflect the characteristics of the LAC+USC Medical Center Campus Master Plan project and its surroundings, and were reviewed and approved by both County and city staff during the scoping of the traffic study.

The 15% adjustment to the trip generation estimates to account for trips between the various uses on the site was made to acknowledge the fact that the facilities on the campus do not stand alone, and is consistent with the internal trip adjustment made in previous studies for similar projects in the immediate area. A further 15% adjustment was then made for transit use at existing and proposed facilities, because the site is well-served by transit and this adjustment is consistent with LADOT's "Traffic Study Policies and Procedures." In addition, the pass-by trip adjustment was made only to the proposed community-serving uses. The adjustments of 20% to the proposed Wellness-Oriented Community Meeting Space and Community-Serving Use and 10% to the Wellness-Oriented Community Retail Space were based on the pass-by rates specified in Attachment I of LADOT's "Traffic Study Policies and Procedures." While some patrons of the Community-Serving uses may be walk-ins from the surrounding area, a separate discount was not made for this phenomenon, but rather the pass-by adjustment in essence conservatively reflects the combined effect of both pass-by and walk-in trips (a total reduction of only 26 trips in the AM peak hour and 35 trips in the PM peak hour). In all, the draft EIR study estimates for future trip generation are approximately 30% lower than they would have been without adjustments for transit, internal, and pass-by trips.

A4-Attachment #1

Response to Comment A3-7

The comment states that Caltrans would like the County to disclose traffic impacts to off-ramps by preparing a queuing analysis, and suggests some techniques for doing so.

As discussed in the response to Comment A3-2, the traffic impact study was prepared following initial consultation with Caltrans and under close coordination with the Los Angeles County Department of Public Works and LADOT, and in a manner consistent with LADOT's traffic study guidelines and the Metro CMP. This provides clear and consistent evaluation procedures for evaluating freeway impacts. The draft EIR includes the results of a Freeway Impact Screening Analysis that concluded that the proposed project would not require freeway traffic impact analysis beyond the freeway analysis that was prepared under the requirements of the CMP.

This comment letter does not define significant impact thresholds, either for freeway off-ramps or for other facilities, nor does Caltrans' "Guide for the Preparation of Traffic Impact Studies." This is clearly stated in Caltrans' recent environmental impact report for the 1-710 Corridor Project: "Caltrans has not adopted specific thresholds of significance for determining whether an impact is significant." Since Caltrans has not adopted thresholds of significance, the process of determining traffic impacts at off-ramps (beyond what is presented in the draft EIR) and mitigation is subjective and questionable. The Metro CMP provides clear and consistent evaluation procedures and has been adopted by the County.

Response to Comment A3-8

The intent of this comment is unclear. It mentions changing levels of service and "at least 50 trips assigned to one study location." The comment concludes by stating that unspecified improvements may be needed at four particular freeway off-ramps.

As shown in Section 3.14 and Appendix D of Appendix G to the draft EIR, fewer than 50 net new trips are expected to use the off-ramps listed in the comment. The addition of project traffic was found to result in a change in level of service at only one of these locations, I-5 Northbound Off-Ramp & Cesar E. Chavez Avenue under Existing plus Project conditions; the change from LOS B to LOS C is not considered significant under any applicable thresholds. The detailed traffic impact analysis presented in the draft EIR includes six freeway off-ramps in the vicinity of the project site and determined that the project would contribute to a cumulative significant impact at one of them, the westbound off-ramp to Soto Street from I-10 in the AM peak hour, based on the applicable criteria, and identified mitigation to address that impact (mitigation measures MM-TRAF-3). As a point of information, this off-ramp was widened within the last three years to provide an additional westbound right-turn lane.

Response to Comment A3-9

The comment restates data presented in the draft EIR regarding the estimated number of trips generated by several other projects within approximately 1.5 miles of the project site and concludes that a cumulative traffic impact will occur. This is consistent with the findings of the draft EIR, which identified significant impacts under Cumulative plus Project conditions, and identified mitigation measures where feasible. It should be

A4-Attachment #1

noted that two of the nine related projects, the Wyvernwood Boyle Heights Project and the Sears Building Adaptive Reuse Project, when combined represent over 70% of the total growth in traffic attributable to specific related projects.

The comment also recommends that the County establish a mechanism to address cumulative transportation impacts on the I-10 and I-5 Freeways. Since the County does not maintain these facilities, the County will direct project applicants to consult with Caltrans.

Response to Comment A3-10

The proposed project would incorporate post-construction mitigation measures for stormwater as described in mitigation measures MM-HYD-2, MM-HYD-5, and MM-HYD-6 in Section 3.8 of the EIR.

Response to Comment A3-11

The comment advises that oversized vehicles traveling on State highways must obtain a transportation permit from Caltrans and recommends that large truck trips be limited to off-peak commute periods.

As indicated in this comment, if the use of oversized-transport vehicles on State highways becomes necessary during project construction, the project would be required to obtain a Caltrans transportation permit. Construction truck trips could occur during peak periods. However, Mitigation Measure MM-TRAF-1 in Section 3.14, Transportation/Traffic of the draft EIR requires the County to devise a Traffic Control Plan to be implemented during construction of the project. As part of that plan, haul routes for deliveries and pick-ups of construction materials would be defined as well as appropriate restrictions on travel times.

A4-Attachment #2

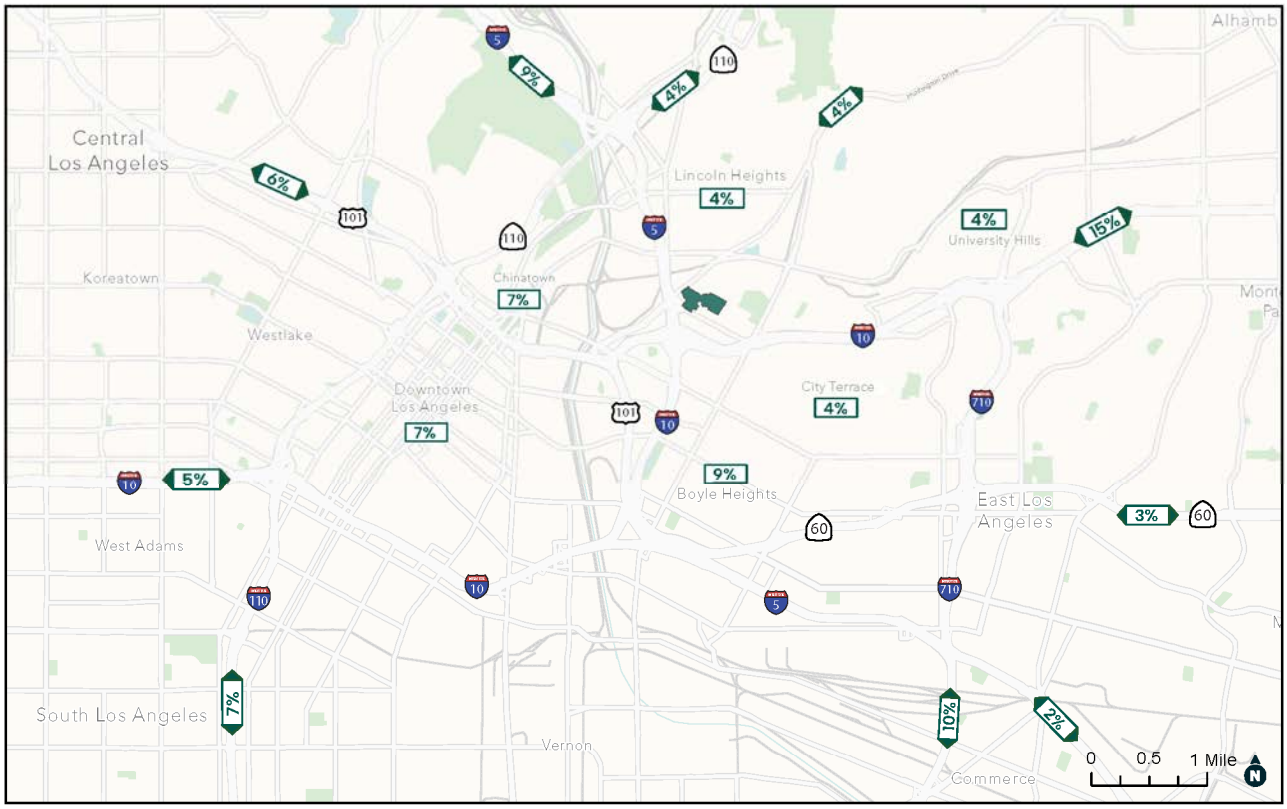
Notes:

[a] KSF = thousand square feet, DU = dwelling units

[b] Institute of Transportation Engineers (ITE) 12th Generation



[c] Internal capture of 7% was calculated using Fehr & Peers' mixed-use trip generation (MXD) tool, developed in coordination with the United States EPA.
Walk/Bike/Transit trip credit of 15% applied to account for the percentage of Project trips that would occur by walking, biking, or transit (CAPCOT TAC-defined maximum based on Project location)
Pass-by trip adjustment of 30% applied to the retail mid-point between the 15% and 50% reductions defined in the TAG (Attachment J of TAG), as the Project would include a combination of all such uses.

[d] ITE 12th Edition does not define daily rates for 936. A value to ten-times the PM peak hour rate was used.

[e] ITE 12th Edition does not define rates for auditoriums. The "movie theater" rate was used to estimate the land use, and no AM peak hour events were assumed.

[f] Trip totals by time period may differ from Exhibit A in "Draft CEQA Chapter Excerpt" by 1-4 trips (no more than 0.2% of trips) due to rounding at the detailed land use component level versus the campus area level.
The values shown in Exhibit A were utilized in the queuing analysis.

Ms. Clarice Nash
County of Los Angeles
Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803

RE: LAC+USC Medical Center Campus
Master Plan
Vic. LA-05/PM 18.78, LA-10/PM 19.07
SCH # 2014051061
Ref. IGR/CEQA No. 140915AL-DEIR
IGR/CEQA No. 141123-FEIR

Dear Ms. Nash:

This is a follow-up to Caltrans' comment letter dated October 20, 2014. After review of the Response to Comment, prepared November 2014 for the above mentioned project, Caltrans has further comments.

As mentioned in Caltrans letter dated October 20, 2014, the Freeway Impact Analysis Procedure Agreement (Agreement) between the City of Los Angeles and Caltrans District 7 only applies when the project is being developed and reviewed by the City for Los Angeles Department of Transportation (LADOT). During a telephone conference between Caltrans District 7 staff and Los Angeles County Department of Public Works staff on October 29, 2014, the County concurred with Caltrans, that the Agreement would not be used for Los Angeles County projects and the traffic consultant would be instructed to respond accordingly.

We would like to remind the County that the intent of the CMP is to assist federal, state and local agencies in developing and implementing comprehensive planning strategies to handle traffic congestion. (Gov. Code, § 60588) Unfortunately, the CMP process does not adequately evaluate the impacts to the State Highway System (SHS), nor does it make the Lead Agency the final authority over highway safety issues. As the owner and operator of the SHS facilities, Caltrans provides comments on environmental documents and the analysis of impacts to the SHS.

On page 1 of Caltrans' guide, "The level of service (LOS) for operating State highway facilities is based upon measures of effectiveness (MOEs).....If an existing State highway facility is operating at less than the appropriate target LOS, the existing MOE should be maintained." Per

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability"

A4-Attachment #4

CEQA, it is the Lead Agency's responsibility to define significant thresholds. However for this project, MOE must be maintained.

In the Response to Comment A3-9, we concur that this project will have significant impact under Cumulative plus Project conditions. Any proposed mitigation on the State facilities needs to be reviewed and approved by Caltrans.

After careful review of the Response to Comments, there are some outstanding traffic issues that Caltrans is concerned with. As a follow up to your November 18, 2014 telephone conversation with Mr. Alan Lin of my staff, we would like to formally invite the Lead Agency and the traffic consultants to discuss traffic direct/cumulative impacts and possible traffic mitigation alternatives for this project. Please contact this office at your earliest convenience to schedule a meeting in the near future.

If you have any questions, please feel free to contact Alan Lin the project coordinator at (213) 897-8391 and refer to IGR/CEQA No. 141123AL.

Sincerely,

DIANNA WATSON
Branch Chief
Community Planning & LD IGR Review

Response A4-1

Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project. The County notes that it engaged in coordination with Caltrans throughout the Draft SEIR process. This includes two meetings (December 8, 2025, and March 5, 2026) that occurred prior to public circulation of the Draft SEIR, and two following the release of the Draft SEIR (June 9 and August 13, 2026).

Response A4-2

The comment related to the mission of Caltrans and the State California Environmental Quality Act (CEQA) law regarding the evaluation and disclosure of transportation impacts is noted and no further response is required.

Response A4-3

The County confirms the commenter's statement that the exact quantities (units/square feet) of land uses proposed through the Master Plan were not available at the time the Notice of Preparation (NOP) was circulated for public review. The NOP was issued on September 26, 2025, immediately after the County (Lead Agency) determined that an EIR was required for the Proposed Project, consistent with State CEQA Guidelines Section 15082.

Page 4 of the NOP states:

"The Proposed Project includes implementation of a new Master Plan that would guide future redevelopment of the Project Site into a mixed-use community. This would include development of residential uses, including affordable housing. Commercial/retail, hospitality, community benefits, educational facilities, warehouse, general office, medical office, hospital, and industrial uses would also be developed across the Campus. Implementation of the Master Plan would include adaptive reuse of the 1.2-million-square-foot General Hospital to accommodate a range of uses, as listed previously. Parking, open spaces, and infrastructure improvements would be implemented across the Project Site".

These uses, particularly residential, mixed-uses, and adaptive reuse of the 1.2 million square foot General Hospital Building, are not included in the previously adopted 2014 Master Plan, therefore the NOP provided sufficient information to indicate to the public that the scope of the Proposed Project was greater than that in the 2014 Master Plan EIR. While precise quantities were not known at the time of the NOP, the County was clear in informing the public that additional uses and development beyond that previously evaluated in the 2014 Master Plan EIR were proposed. The commenter provides a comment letter in response to the 2014 Master Plan EIR for reference. This letter is acknowledged and was considered during preparation of the

Draft SEIR. However, the County undertook a new evaluation of transportation analysis for the Draft SEIR as appropriate given changes in the Proposed Project, regulatory requirements, and baseline conditions.

Additionally, prior to release of the Draft SEIR, on March 5th, 2026, and when this information was available, the County met with Caltrans to provide an overview of the proposed land use quantities and preview a draft off-ramp queuing analysis, which was reviewed by Caltrans. That analysis specified the types and quantities of the Proposed Project's land uses, as well as estimated trip generation for the Proposed Project. The land use quantities shared at that March 5th meeting constituted the same information that was included in the Draft SEIR. Therefore, the details of the Proposed Project were shared with Caltrans approximately two months prior to release of the Draft SEIR. Timely notification and coordination with Caltrans regarding the details of the Proposed Project were provided prior to circulation of the Draft SEIR in May 2026.

Response A4-4

The differences in project scale and land use types are a primary reason for this analysis. Preparation of a Subsequent EIR (SEIR), as required by State CEQA Guidelines Section 15162, is the appropriate level of review when substantial changes, major revisions, new significant impacts, and increased severity of impacts could occur. The comment is noted and no further response is required.

Response A4-5

Travel surveys, as suggested by the commenter, can be useful for evaluating the trip capture and generation of existing mixed-use districts or campuses; however, the Master Plan is proposing a mix of uses (including residential, commercial, office, and medical office) that is not reflective of the existing campus. There are considerable differences in the proposed land uses from current conditions, and it is expected that the new uses would have a different trip capture dynamic that is not currently represented today. Collecting data on current levels of internal capture, pass-by trips or from the active transportation environment would not appropriately estimate the trip credits/reductions that would be in effect with the proposed, more diverse mix of uses as well as the improved transportation facilities proposed under the Master Plan, including bike lanes, mobility hubs, and new pedestrian connections across the campus. Therefore, the use of travel survey methodology would not be a defensible approach for the Proposed Project traffic evaluation and would result in an inaccurate estimate of the traffic generation and trip patterns.

The analysis employed in Chapter 3.15, *Transportation*, of the Draft SEIR assumes trip reductions/credits based on the proposed land uses, which are shown in Appendix C of this Final SEIR, *Supporting Transportation Data*, as requested by the commenter. The addition of this material does not constitute new information that triggers recirculation of the Draft SEIR, as it

merely clarifies or amplifies information already included in the Draft SEIR (see State CEQA Guidelines 15088.5(b)).

Response A4-6

The explanation provided to Comment A4-5, which describes the limited effectiveness of the comment-proposed methodology based on the dissimilarity between existing and Proposed Project land use mix, holds for trip distribution too. Adopting the Caltrans suggestion to validate trip distribution through a trip survey under current conditions and based on empirical data would lead to different trip patterns than could be expected under the proposed uses in the Master Plan. The trip distribution analyzed in Chapter 3.15, *Transportation*, of the Draft SEIR (see specifically page 3.15-27 and Appendix C of this Final SEIR, *Supporting Transportation Data*) was developed using the most recent iteration of the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Activity-Based travel demand model, knowledge of the local street system, and the location of the proposed land uses. This methodology follows typical industry standard trip distribution procedures aimed at estimating trip distribution and assignment as accurately as possible over a buildout period of 25 years.

Response A4-7

While the comment refers to 8,588 parking spaces as a large parking footprint, it does not provide any justification for this statement as it relates to the type and scale of the Proposed Project. As stated on page 2-20 of the Draft SEIR, parking would be delivered concurrently with the uses it is intended to serve, and parking demand would be evaluated on a project-by-project basis to account for changes in travel behavior, including reduced reliance on automobiles through transportation demand management measures implemented as part of this project.

The proposed parking supply is already below the minimum parking requirement that would otherwise apply under the Los Angeles County Municipal Code, if the Proposed Project Site were subject to Countywide parking code requirements. Based on the values shown in Los Angeles County Code Table 22.112.070-A “Minimum Required Parking Spaces”, the Proposed Project land use would translate to over 10,000 code-required parking spaces from the residential, office, retail, and medical office uses alone, plus an additional 1,000 spaces for the community benefits, hotel, education, warehouse, and clean technology uses combined, resulting in over 11,000 spaces to be required. Thus, the Proposed Project provides multiple thousand fewer parking spaces than would be required by County Code. See also page 2-20 of the Draft SEIR which provides a narrative of the proposed parking included in the Project.

The County took a two-pronged approach to determining the vehicle miles traveled (VMT) efficiency of the Proposed Project. First, the Proposed Project screened out of further VMT analysis due to its proximity to high quality transit service (see pages 3.15-20 through 25 of the

Draft SEIR for the County's adopted screening criteria for determining significant VMT impacts under CEQA). Second, the Draft SEIR further validated the appropriateness of applying the screening criteria by quantifying VMT impacts through modeling VMT/capita and VMT/employment, and net change in regional VMT (related to retail). While not required by the County's adopted VMT guidelines, the modeling further demonstrates that VMT for all measures would be below applicable thresholds. The Draft SEIR does not claim that the Proposed Project relies on public transit while simultaneously providing parking; rather, it is a transit accessible project that will be VMT efficient, as shown through use of the regional travel model analysis.

Regarding the implementation of travel demand management (TDM) strategies to discourage driving, the Draft SEIR includes a programmatic menu of potential Transportation Demand Management Measures such as Mitigation Measure TRA-3e (pages 3.15-34 through 3.15-36 of the Draft SEIR). This is in addition to the Proposed Project's inclusion of a Mobility Hub that is intended to serve as the Campus's primary multimodal interface and, thus, could further reduce dependence on private automobiles. The purpose of the TDM measures in Mitigation Measure TRA-3e are to reduce vehicle trips to the Los Angeles General Hospital Campus area and, consequently, reduce the number of Proposed Project vehicles using nearby freeway off-ramps, as well as the demand for parking. The TDM strategies fall into four categories:

- Employee and commute trip-reduction measures
- Parking-management strategies
- School-related strategies
- Supporting multimodal improvements

As part of the Final SEIR and in response to comments received, Mitigation Measure TRA-3a has been revised to clarify the proposal and evaluation process of TDM measures at the development project level (see Chapter 3, *Revisions to the Draft EIR*, of this Final SEIR). These revisions present minor clarifications and do not constitute significant new information, as defined in CEQA Guidelines Section 15088.5; therefore, the Draft SEIR does not need to be recirculated given this change.

Response A4-8

Data, inputs, and outputs related to the off-ramp queueing analysis, including detailed trip generation calculations, a trip distribution map, queuing calculation sheets, observed turning movements counts, and signal timing sheets are included in Appendix C of the Final SEIR, *Supporting Transportation Data*. These include detailed input data and software output sheets which informed the results shown in the Draft SEIR and shared with Caltrans prior to release of the Draft EIR. The addition of this material as part of the Final SEIR does not constitute new

information that triggers recirculation of the Draft SEIR, as it merely clarifies or amplifies information already included in the Draft SEIR (see State CEQA Guidelines 15088.5(b)).

Response A4-9

Please refer to response to comment A4-7 for information relating to parking and transit.

Chapter 3.15, *Transportation*, of the Draft SEIR discusses and determines that the Proposed Project screens out from the VMT analysis based on its proximity to transit and, thus, would have a less than significant VMT impact (see specifically pages 3.15-14-15 and pages 3.15-20-22). This screening analysis serves as the legal basis for CEQA determination. To further substantiate the less than significant VMT impact of the Proposed Project, a quantitative VMT assessment was performed as an independent check showing that the Proposed Project would also perform well under quantitative metrics (see specifically pages 3.15-22-25). The VMT efficiency metrics were analyzed using the SCAG Activity Based Model (ABM), as would be done for other land use or development projects, which serves as substantial evidence.

Regarding the comment's consideration of Lincoln Heights' applicability for use in developing ABM metrics, as noted in the Draft SEIR (see pages 3.15-23 and 24), population is not an explicit input to the SCAG ABM. Demographic profiles are developed within the model based on the input of "number of households" and the demographics of the surrounding area. Proximity to the Proposed Project's Transportation Analysis Zone (TAZ) is required for the SCAG ABM in-model residential demographic profile development. The nearby community of Lincoln Heights was not used for "travel data" explicitly as the comment states, but was instead used as a profile for the residential household demographics only (such as household size and age profile and economic characteristics). This profile usage is appropriate due to the Proposed Project's proximity to that existing neighborhood. The SCAG ABM then uses these socioeconomic factors, combined with inputs for the Proposed Project's various land use components to model travel characteristics. Additionally, the Lincoln Heights household profile information is not used for office, medical office, or retail profiles within the model. This residential household profile process is typical for estimating VMT using the SCAG ABM. The methodological approach used in the Draft SEIR to develop VMT metrics reflective of common practice within the calibrated ABM travel demand modeling and thus constitutes substantial evidence and therefore no changes to the Draft SEIR are warranted.

Response A4-10

The SCAG regional travel demand model reflects parking conditions indirectly through regional travel behavior, socioeconomic characteristics, land use patterns, transportation network characteristics, and generalized travel costs. Regional travel demand models generally do not explicitly account for the influence of Proposed Project specific parking supply unless they are enhanced with parking supply variables.

The commenter recommends reducing the Proposed Project's parking supply to encourage greater use of alternative travel modes. The County incorporated a TDM program (Mitigation Measure TRA-3e) into the Master Plan that includes parking management strategies intended to encourage travel by transit, walking, bicycling, ridesharing, and other alternative modes. This measure was revised as part of this Final SEIR to clarify the proposal and evaluation process of TDM measures at the development project level (see Chapter 3, *Revisions to the Draft SEIR*). The transportation analysis contained int the Draft SEIR evaluated the Proposed Project and concluded that the Proposed Project's transportation impacts would be less than significant under the applicable CEQA VMT significance criteria, as documented in the Draft SEIR (see specifically page 3.15-19 through 25). In addition, the proposed parking supply is already below the minimum parking requirement that would otherwise apply under the Los Angeles County Municipal Code, if the Proposed Project Site were subject to Countywide parking code requirements. As stated on page 2-20 of the Draft SEIR, parking would be delivered concurrently with the uses it is intended to serve, and parking demand would be evaluated on a project-by-project basis to account for changes in travel behavior, including reduced reliance on automobiles through transportation demand management measures implemented as part of this project. The Proposed Project's provision of fewer parking spaces than would be required by County Code are described in response to comment A4-7. While reducing parking supply could be considered as a planning or policy decision, CEQA does not require an EIR to evaluate alternative parking supply scenarios where the transportation analysis adequately evaluates the project as proposed and demonstrates a less than significant VMT impact.

The commenter also states that adoption of the Master Plan will establish the local VMT for the area. This statement is incorrect as the Master Plan establishes the long-term land use framework for redevelopment of the General Hospital Campus and evaluates the transportation impacts associated with that framework. Adoption of the Master Plan does not establish future VMT conditions or define the methodology that will be used for subsequent CEQA analyses. Future development facilitated by the Proposed Project will be evaluated pursuant to the CEQA requirements, significance thresholds, and analytical methodologies applicable at the time environmental review is undertaken.

The County agrees that the transportation analysis should accurately reflect the Proposed Project's influence on travel patterns and comply with CEQA's informational requirements. Chapter 3.15, *Transportation*, of the Draft SEIR satisfies these requirements by disclosing the transportation analysis methodology, including application of the SCAG regional travel demand model, the Proposed Project's proposed land use program, parking supply, transit accessibility, TDM measures, and both transit screening and quantitative VMT analyses. The comment does not identify a factual error or methodological deficiency demonstrating that the transportation analysis or its conclusions are unsupported by substantial evidence.

Response A4-11

The purpose of the freeway off-ramp queue analysis is to evaluate whether implementation of the Proposed Project would materially increase freeway off-ramp queue lengths or result in hazardous queue spillback under the traffic conditions that could occur under full buildout of the land uses included in the Proposed Project. Because the Proposed Project would be implemented over a 25-year buildout horizon (with full buildout expected in 2050), the analysis compares "Future No Project" and "Future Plus Project" conditions, which isolate the incremental contribution of Proposed Project-generated traffic to forecast freeway off-ramp queue lengths. As Proposed Project traffic would be added to future background traffic (over the next 25), this comparison provides a more appropriate basis for evaluating the effect of Proposed Project traffic on off-ramp queuing, determining whether implementation of the Proposed Project would result in significant hazardous traffic conditions resulting from freeway off-ramp queuing impacts, and whether mitigation is warranted. The following paragraph further clarifies why, in addition to being more practically appropriate due to the long-term buildout, the "Future with Project" analysis is more conservative in identifying impacts than "Existing Plus Project".

The off-ramps analyzed in the Draft SEIR for queuing impacts are within the jurisdiction of the City of Los Angeles and intersect with streets operated by the Los Angeles Department of Transportation (LADOT). LADOT Transportation Assessment Guidelines (TAG) (2022) state in Section 2.4.4 that the off-ramp queuing study should use the "Future with Project" conditions. The analysis presents both "Future No Project" and "Future Plus Project" queue lengths for each analyzed freeway off-ramp, allowing readers to directly evaluate the Proposed Project's incremental effect on future ramp operations when the Proposed Project is built. Furthermore, consistent with the LADOT TAG section 2.4.4, the off-ramp queuing analysis on pages 3.15-26-32 of the Draft SEIR identifies an impact at locations where the queuing exceeds ramp storage and for which the Proposed Project would add two car-lengths of queuing. At every off-ramp where forecast queuing was determined to exceed available storage, the Proposed Project would add more than two car-lengths of queuing relative to the "Future without Project" condition. The two car-length threshold, therefore, was not relied upon to confirm or dismiss a significant impact at any analyzed location. Instead, a significant impact was identified at every location where forecast queuing extends to the freeway mainline, regardless of whether Proposed Project traffic caused the storage exceedance. Because the "Future with Project" scenario includes ambient traffic growth through the 2050 buildout year, off-ramp volumes under that scenario are higher than they would be under an "Existing with Project" scenario, which would add Proposed Project traffic to current-year volumes only. Forecast queues are correspondingly longer, are more likely to exceed available ramp storage, and thus are more likely to result in a significant impact. The "Future with Project" comparison is, therefore, the more conservative of the two approaches and does not understate the Proposed Project's contribution to off-ramp queuing. Thus, the analysis sufficiently discloses the effects of the Proposed Project on off-ramp

queuing. Accordingly, the Draft SEIR provides sufficient information to disclose the Proposed Project's impacts, support informed decision making, and determine whether mitigation is required.

Response A4-18

The comment is noted and no further response is required.

Response A4-19

As ramp terminal intersections are connected to City of Los Angeles streets, feasibility (including approval from LADOT) will be coordinated with the County, City and Caltrans as appropriate. Mitigation Measure TRA-3 language is updated in the Final SEIR (see Chapter 3, *Revisions to the Draft SEIR*, of this Final SEIR). Additionally, response to comment A4-19 describes the geometric feasibility of a particular improvement noted by Caltrans in Comment A4-19.

Response A4-20

Please refer to Figure 4 in Appendix C of the Final SEIR, *Supporting Transportation Information*. The conceptual drawing shows that dual right turn lanes proposed in MM TRA-3b (for truck and passenger vehicle turning radii and receiving lanes) can be accommodated within the existing right of way. While this conceptual design would be refined and undergo review and approval to support issuance of encroachment permits from Caltrans and the City of Los Angeles, the concept drawings provided indicate that the mitigation measure TRA-3b is potentially feasible. The mitigation measure has been updated in the Final SEIR to further clarify this notion (see Chapter 3, *Revisions to the Draft SEIR*).

The following options were described in the comment letter, referred to as "Aerial Photo #1 to #4", where sufficient right of way "may exist".

Aerial Photo #1, I-5 SB to Mission Road

This comment suggests expanding ramp storage using concrete/landscaped area in-between existing off-ramp and freeway mainline. This modification was conceptually evaluated based on geometric and lane-taper requirements as shown in Figure 1.

This modification was tested in the queuing analysis and was determined to add approximately 250 feet of queue storage capacity, equal to approximately ten (10) passenger vehicles. This modification would, thus, reduce spillback to the mainline by approximately 250 feet, though would still result in a significant impact to ramp queuing.

Mitigation Measure TRA-3a has been revised accordingly; see Chapter 3, Revisions to the Draft EIR. These revisions present minor clarifications and do not constitute significant new information, as defined in CEQA Guidelines Section 15088.5; therefore, the Draft SEIR does not need to be recirculated given this change.

Aerial Photo #2, I-5 NB to Cesar Chavez Avenue

This comment suggests adding additional northbound right turn lane using concrete area to the east of existing off-ramp. This modification was conceptually evaluated based on geometric and lane-taper requirements as shown in Figure 2.

This modification proposes a dual-right turn lane over an existing crosswalk, which requires that the pedestrian movement be phase-separated from the right turn movements, and additional requires that right-turn-on-red for that movement be restricted. These changes would be necessary to preserve the pedestrian environment while accommodating the additional lane. The signal modification would require approval from the City of Los Angeles Department of Transportation (LADOT).

These modifications were tested in the queuing analysis, and due to these necessary changes to the signal operation, the suggested modification would worsen vehicle queuing by approximately 400 feet in the AM peak hour (identified impacted period in Draft SEIR) and would, thus, worsen the severity of the significant queuing impact identified in the Draft SEIR. Therefore, the modification shown in Aerial Photo #2 would not reduce an identified impact and is, thus, not included as a mitigation measure.

Aerial Photo #3, I-10 WB to State Street

This comment suggests expanding ramp storage using landscaped slope area in-between existing off-ramp and freeway connector (north side of off-ramp). This modification was conceptually evaluated based on geometric and lane-taper requirements as shown in Figure 3.

This modification was tested in the queuing analysis and was determined to add approximately 100 feet of queue storage capacity, equal to approximately four (4) passenger vehicles. This modification would thus reduce spillback to the mainline by approximately 100 feet, though would still result in a significant impact to ramp queuing.

Mitigation Measure TRA-3b has been revised accordingly; see Chapter 3, Revisions to the Draft EIR. These revisions present minor clarifications and do not constitute significant new information, as defined in CEQA Guidelines Section 15088.5; therefore, the Draft SEIR does not need to be recirculated given this change.

Aerial Photo #4, I-10 WB to Soto Street

This comment suggests expanding ramp storage using striped shoulder area along north side of existing off-ramp. This modification was conceptually evaluated based on geometric and lane-taper requirements as shown in Figure 4.

This modification was tested in the queuing analysis and was determined to add approximately 250 feet of queue storage capacity, equal to approximately ten (10) passenger vehicles. This modification would, thus, reduce spillback to the mainline by approximately 250 feet, though would still result in a significant impact to ramp queuing.

Mitigation Measure TRA-3c has been revised accordingly; see Chapter 3, Revisions to the Draft EIR. These revisions present minor clarifications and do not constitute significant new information, as defined in CEQA Guidelines Section 15088.5; therefore, the Draft SEIR does not need to be recirculated given this change.

Response A4-21

The Draft SEIR includes a programmatic menu of TDM strategies such as Mitigation Measure TRA-3e (Chapter 3.15, pages 3.15-34 through 3.15-36, of the Draft SEIR, and as revised in

Chapter 3, *Revisions to the Draft SEIR* of this Final SEIR). Its purpose is to reduce vehicle trips to the Los Angeles General Hospital Campus and, consequently, reduce the number of Proposed Project vehicles using nearby freeway off-ramps, as well as the demand for parking. The strategies fall into four categories:

- Employee and commute trip-reduction measures
- Parking-management strategies
- School-related strategies
- Supporting multimodal improvements

Additionally, the Proposed Project is proposing a Mobility Hub that is intended to serve as the campus' primary multimodal interface and, thus, would reduce dependence on private automobiles.

The TDM strategies included in the Draft SEIR are extensive given the programmatic and long-term buildout nature of the Proposed Project. Additionally, the strategies relate directly to the land uses and proven trip/VMT reduction as shown in CAPCOA. These TDM measures are focused on strategies that are realistically feasible to implement from a master plan at a programmatic level. Dynamic congestion pricing and advanced traffic signal systems, which are suggested by the commenter, require network-wide infrastructure upgrades that are typically implemented by roadway network managers, such as cities or counties. Additionally, promoting telecommuting and flexible work hours could be a specific sub-strategy under the "Implement Commute Trip Reduction Program" strategy described in MM TRA-3e. Should there be additional measures within the Caltrans Toolbox that could be included, the County will review their applicability and consider adding them to the TDM program. Applicants of development projects proposed under the Master Plan will consult with the County and relevant appropriate agencies as described in the TRA-3 Mitigation Measure introduction. As described in the TRA-3 Mitigation Measure language, the applicant will prepare a TDM plan and show the reduction in development project trips due to those measures.

Response A4-22

The analysis presented in the Draft SEIR utilizes HCM 7th Edition for intersections with standard National Electrical Manufacturers Association (NEMA) signal phase numbering, as suggested by the commenter. For intersections with non-standard phase numbering, a combination of HCM 2000/Synchro Queue reports are utilized. This process, in which HCM 2000/Synchro Queue reports are used when intersection conditions do not comply with HCM 7th input requirements, is industry standard. Therefore, no revisions to the methodology or analysis presented in the Draft SEIR are warranted.

All off-ramps analyzed for queuing impacts are within the City of Los Angeles and intersect with streets operated by LADOT. The LADOT Transportation Assessment Guidelines (TAG) (2022) state

in section 2.4.4 that the 95th percentile queue provided from the Synchro results worksheet should be used for the off-ramp queuing analysis. The analysis in Chapter 3.15 of the Draft SEIR (pages 3.15-15 and 16) is consistent with that methodology and is an appropriate planning level approach for a programmatic level SEIR with a 25-year buildout.

A variety of traffic operations tools exist for various applications, including Synchro, SimTraffic, PTV Vissim, PTV Vistro, Transmodeler, Sidra, and others. SimTraffic microsimulation can be a useful tool for understanding granular traffic operations, including interactions between vehicles, the effects of driver behavior, signal coordination, vehicle queue spillback, and demand starvation interactions between intersections. This tool is useful for a variety of applications, including determining timing and coordination plans, travel time along corridors, among other applications. As an analysis meant to assess the effects of a long-term, 2050 master plan buildout, Synchro is an appropriate tool for estimating potential queuing effects of the Proposed Project. Therefore, no revisions to the methodology or analysis presented in the Draft SEIR are warranted.

Response A4-23

After the Draft SEIR was released, Caltrans indicated that some of the paved and unpaved ramp/mainline areas around the impacted locations have the potential to increase the available ramp storage capacity. However, there is still much uncertainty as to the feasibility of the options shown in Aerial Photos #1 through #4 that are provided in the comment letter. See also response to comment A-20.

The options from Aerial Photos #1 through #4 in the comment letter were subsequently evaluated and potential additional storage are identified in Appendix C of the Final SEIR, *Supporting Transportation Information* (see Figures 1 through 4). The County will continue to coordinate with Caltrans to ascertain the feasibility of the additional storage space. Mitigation Measure TRA-3 has been revised accordingly; see Chapter 3, *Revisions to the Draft EIR*. These revisions present minor clarifications and do not constitute significant new information, as defined in CEQA Guidelines Section 15088.5; therefore, the Draft SEIR does not need to be recirculated given this change.

Response A4-24

All off-ramps analyzed for queuing impacts are within the City of Los Angeles and intersect with streets operated by LADOT. Section 2.4.4 of the LADOT TAG states the following methodology for evaluating storage length: “To evaluate the adequacy of the existing and future storage lengths, use the 95th percentile queue provided from the Synchro results worksheet, and use 100 percent of the storage length on each lane of the ramp from the stop line to the gore point. If an Auxiliary Lane exists, add 50 percent of the length of the auxiliary lane to the ramp storage area.” The analysis in the Draft SEIR therefore utilizes this approved methodology, with the

following modification described below, which was updated following Caltrans' pre-Draft SEIR review of the analysis document.

Prior to publication of the Draft SEIR, the off-ramp queuing analysis was shared with Caltrans, and the following comment was provided related to storage length: "Storage Length Definition: Storage length must be measured from the stop bar to the gore point. Please verify and validate all off-ramp storage lengths; auxiliary lanes must not be included in these measurements. Inaccurate measurements compromise the validity of the queuing analysis and may result in unaddressed public safety concerns." Following this coordination and in response to Caltrans' suggestion, prior to Draft SEIR publication, the analysis was updated to exclude the auxiliary lane, where applicable, from the storage capacity, despite the LADOT TAG's allowance of this.

Response A4-25

While the analysis conducted in the Draft SEIR was as comprehensive as possible given the programmatic nature of the Proposed Project and 25-year buildout horizon, the County has already stated in the Draft SEIR (as revised in this Final SEIR) that mitigation measures TRA-3a through TRA-3d will apply the ISOAP methodology as appropriate to design and implement intersection improvements.

Response A4-26

The comment is noted and no further response is required.

Response A4-27

A worksite traffic management control plan would be developed as part of mitigation measure TRA-1, which will include all appropriate worksite controls applicable to each phase at the time, which could include but not be limited to a Caltrans permit, commute periods, and tarpaulin requirements. The comment is noted, and no further response is required.

Response A4-28

A worksite traffic management control plan will be developed as part of mitigation measure TRA-1. See also Chapter 3.9, *Hydrology and Water Quality*, that evaluates potential impacts related to stormwater runoff. The comment is noted, and no further response is required.

Response A4-29

The County would like to thank Caltrans for their feedback and is committed to continuing to coordinate with Caltrans as part of the environmental process.

Response A4-30

The comment states that Caltrans did not have early input on the Proposed Project and that they are committed to working with the County to ensure transparent disclosure and effective traffic mitigation of impacts in line with CEQA. The County met with Caltrans on December 8, 2025 and March 5, 2026 (during the scoping period, prior to public circulation of the Draft SEIR), and as well as on June 9, 2026 and August 13, 2026 following the release of the Draft SEIR. The County appreciates Caltrans for their valuable input and feedback and will have continued coordination efforts with Caltrans as part of the environmental process.

See also response to comment A4-1.

Draft Subsequent Environmental Impact Report (SEIR) for the Los Angeles County General Hospital Campus Master Plan (Proposed Project) (SCH No.: 2014051061)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The County of Los Angeles Department of Economic Opportunity is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff have provided a brief summary of the project information and prepared the following comments, organized by topic of concern.

Summary of Project Information in the Draft SEIR

Based on the Draft SEIR, the Proposed Project involves development within approximately 30.8 acres of the 81.9-acre Project Site located at 1200 State Street.[1] The Proposed Project would include up to 3,200 residential units, 450 hospital beds, 200 patient and caregiver lodging rooms, 8,588 parking spaces, 735,300 square feet (sf) of medical office space, 400,000 sf of general office space, 320,000 sf of retail uses, 350,000 sf of community facilities, 110,000 sf of educational facilities, 160,000 sf of warehouse/storage facilities, and 200,000 sf of clean technology/light industrial uses, totaling approximately 8,060,978 sf of new development.[2] The Proposed Project would be organized into three conceptual development hubs: the Commerce Hub, the Historic Hub, and the Medical Hub, which would be interconnected by three conceptual corridors.[3] The community facilities, clean technology/light industrial uses, medical office , general office , and hospital components were previously approved under the 2014 master Plan (referred to as the LAC+USC Medical Center Master Plan) but have not been implemented to date. These previously approved land uses have been carried forward and incorporated into the Draft SEIR.[4]

A5-2

In addition, the Proposed Project would include the adaptive reuse of approximately 1.2 million sf within the Los Angeles General Hospital - Acute Unit Building and its associated ancillary structures and features, which have remained largely vacant since 2008.[5] The adaptive reuse

[4] *Ibid.* p. 2-10.
[5] *Ibid.* p. 2.20.

A5

Krystin Hence, Assistant Director June 26, 2026

program would provide approximately 615 residential units, up to 90,000 sf of commercial, office, and community facility uses, and up to 200 patient and caregiver lodging rooms.[6] Project buildout is anticipated to occur over an approximately 25-year planning horizon.[7]

A5-2 Cont.

South Coast AQMD Comments

Unavailability of Incorporated Documents Referenced in the Draft SEIR

Section 1.4 (Incorporation by Reference) of the Draft SEIR identifies documents incorporated by reference pursuant to State CEQA Guidelines Section 15150.[8] However, the hyperlink provided in the Draft SEIR does not appear to be functioning, and the referenced documents are therefore not readily accessible for public review.

As a result, South Coast AQMD staff is unable to verify the project descriptions, environmental analyses, and conclusions contained in the certified 2014 Master Plan EIR and compare them with those presented in the Draft SEIR. Therefore, the Lead Agency is recommended to ensure that all documents incorporated by reference are publicly available and accessible throughout the review period. This will allow reviewing agencies and interested parties to evaluate the relationship between the approved 2014 Master Plan EIR and the current Draft SEIR, including identifying which analyses have been incorporated, updated, or carried forward.

A5-3

Given the current unavailability of the incorporated reference documents, South Coast AQMD staff cannot determine whether the analyses and conclusions from the certified 2014 Master Plan EIR have been appropriately incorporated into, updated by, or relied upon in the Draft SEIR. Making these documents available is necessary to facilitate a complete and informed review of the environmental analysis presented in the Draft SEIR.

Potential of Underestimated Construction Analysis

Section 3.2 (Air Quality) of the Draft SEIR states that construction-related emissions of volatile organic compounds (VOCs) and nitrogen oxides (NOx) exceed applicable significance thresholds prior to mitigation.[9] The Draft SEIR concludes that implementation of Mitigation Measures AIR-1a and AIR-1b would reduce these impacts to a less-than-significant level.[10]

However, it is unclear whether the construction emissions analysis accounts for both the newly proposed development evaluated in the Draft SEIR and the previously approved project components analyzed in the certified 2014 Master Plan EIR. If the analysis quantifies emissions solely from the proposed modifications and does not consider the potential for concurrent construction activities associated with previously approved development, the analysis may underestimate total construction emissions and associated air quality impacts.

A5-4

Therefore, the Lead Agency is recommended to clarify the scope of the construction emissions analysis and identify the emissions attributable to previously approved project components

[6] *Ibid.* p. 2-21.
[7] *Ibid.* p. 2-12.
[8] *Ibid.* p. 1-16.
[9] *Ibid.* p. 3.2-42.
[10] *Ibid.* p. 3.2-44.

A5

Krystin Hence, Assistant Director June 26, 2026

separately from those associated with the proposed development analyzed in the Draft SEIR. The Lead Agency is also recommended to evaluate whether overlapping or concurrent construction activities could result in higher peak emissions than those presented in the Draft SEIR and whether such emissions would continue to be reduced to less than significant levels following mitigation. Any revisions to the construction emissions analysis, including supporting assumptions, calculations, and evidence demonstrating the effectiveness of the proposed mitigation measures, should be provided in the Final SEIR. **A5-4 Cont.**

Unclear Information Regarding Permitted Stationary Sources

Section 3.2 (Air Quality) of the Draft SEIR states that installation of additional boilers, chillers, emergency generators, and other stationary sources would require permits from South Coast AQMD and concludes that the potential operational impacts are less than significant.[11] However, the Draft SEIR does not provide sufficient detail on the specific stationary emission sources required to support the Proposed Project, such as the equipment type, fuel type, rated capacity, operational characteristics, expected hours of operation, nor does it quantify operational emissions from such equipment. In the absence of this information, the basis for the less-than-significant impact conclusion cannot be independently evaluated. Therefore, the Lead Agency is recommended to identify and describe all stationary emission sources anticipated to be installed and operated as part of the Proposed Project, including any components of previously approved development evaluated in the 2014 Master Plan EIR that are being carried forward in the Draft SEIR. At a minimum, the Final SEIR should disclose the equipment type, fuel type, rated capacity, operational characteristics, expected hours of operation, and applicable South Coast AQMD permit requirements for each stationary source. The Lead Agency is also recommended to revise the air quality analysis to quantify emissions from these sources and provide the supporting assumptions, calculations, emission factors, and technical documentation necessary to substantiate the conclusions presented. Additional detail regarding these regulatory requirements is provided in the South Coast AQMD Air Permits and Role as a Responsible Agency comment of this letter. **A5-5**

South Coast AQMD Air Permits and Role as a Responsible Agency

As stated in the aforementioned comment of this letter, the information regarding the use of stationary sources is unclear. Therefore, if implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, etc., air permits from South Coast AQMD will be required. The Final SEIR should include a discussion about the South Coast AQMD rules that may be applicable to the Proposed Project. Those rules may include, for example, Rule 201 – Permit to Construct,[12] Rule 203 – Permit to Operate,[13] Rule 401 – Visible Emissions,[14] Rule 402 – Nuisance,[15] Rule 403 – Fugitive Dust,[16] Rule 1110.2 – Emissions from Gaseous and Liquid Fueled Engines,[17] Rule 1113 **A5-6**

[11] *Ibid.* p. 3.2-54.

Krystin Hence, Assistant Director June 26, 2026

– Architectural Coatings,[18] and Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines,[19] etc.

It is important to note that if air permits from the South Coast AQMD are required, South Coast AQMD's role under CEQA will become the Responsible Agency of the Proposed Project. Per CEQA Guidelines Section 15086, the Lead Agency is required to consult with South Coast AQMD. CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of the process for conducting a review of the Proposed Project and issuing discretionary approvals. Also, as set forth in CEQA Guidelines Section 15096(h), the Responsible Agency is required to make Findings in accordance with CEQA Guidelines Section 15091 for each significant effect of the project and issue a Statement of Overriding Considerations in accordance with CEQA Guidelines Section 15093, if necessary. Lastly, as set forth in CEQA Guidelines Section 15096(i), the Responsible Agency may file a Notice of Determination.

CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of the process for conducting a review of the Proposed Project and issuing discretionary approvals. Moreover, it is important to note that if a Responsible Agency determines that a CEQA document is not adequate to rely upon for its discretionary approvals, the Responsible Agency must take further actions listed in CEQA Guideline Section 15096(e), which could have the effect of delaying the implementation of the Proposed Project. In its role as CEQA Responsible Agency, the South Coast AQMD is obligated to ensure that the CEQA document prepared for this Proposed Project contains a sufficient project description and analysis to be relied upon in order to issue any discretionary approvals that may be needed for air permits.

A5-6 Cont.

For these reasons, the final CEQA document should be revised to include a discussion about any and all new stationary and portable equipment requiring South Coast AQMD air permits, provide the evaluation of their air quality and greenhouse gas impacts, and identify South Coast AQMD as a Responsible Agency for the Proposed Project as this information will be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at https://www.aqmd.gov/home/permits.

Potential of Underestimated Modeling Results for Operational Impacts Due to the Lack of Stationary Sources

Section 3.2 (Air Quality) of the Draft SEIR states that a central utility plant could be developed and that associated power generation and plant equipment would be subject to the South Coast AQMD New Source Review permitting requirements, including Rule 1401.[20] Based on this assumption, the Draft SEIR concludes that impacts associated with stationary sources would be less than significant.[21] However, given the uncertainty regarding the type, size, and operational

A5

Krystin Hence, Assistant Director June 26, 2026

characteristics of the stationary sources that may ultimately be required, the conclusion of less than significant impact is not adequately supported by substantial evidence. Therefore, the Lead Agency is recommended to identify the stationary sources expected to be required for operation and perform the health risk assessment accordingly, and include it in the Final SEIR with the evaluation of potential health risks associated with these sources and provide supporting analyses, assumptions, calculations, and technical evidence necessary to demonstrate that the impact conclusions are supported by substantial evidence in the record. **A5-7 Cont.**

Information on the CERP for the Designated AB 617 East Los Angeles, Boyle Heights, West Commerce (ELABHWC) Community

The Proposed Project area is heavily impacted by air pollution generated from sources such as heavy-duty diesel trucks, warehouses, and railroad activities, and includes the AB 617-designated ELABHWC community. An AB 617-designated community requires South Coast AQMD to work with a Community Steering Committee (CSC) to develop a Community Emissions Reduction Plan (CERP) that identifies air quality priorities and actions to reduce air pollution in the community. The South Coast AQMD's Governing Board adopted the AB 617 ELABHWC Community CERP on September 6, 2019.[22] The Draft SEIR for the Proposed Project serves as the first-tier, programmatic-level environmental analysis that can provide guidance to subsequent, project-level environmental analyses. South Coast AQMD staff recommends that the Lead Agency review the actions included in Chapter 5 of the adopted CERP and continue working with South Coast AQMD's AB 617 staff to explore whether additional mitigation measures can be identified and implemented by future development projects at the Proposed Project site. **A5-8**

Recommended Air Quality and Greenhouse Gas Mitigation Measures and Project Design Features for Consideration

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. To further reduce the Proposed Project's air quality impacts, the following mitigation measures and project design considerations are recommended to be incorporated into the Final SEIR.

Mitigation Measures to Reduce Operational Air Quality Impacts from Mobile Sources **A5-9**

1. Require ZE or NZE on-road haul trucks, such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible.

   Note: Given CARB's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks, such as the Advanced Clean Trucks Rule and the Heavy-duty Low NOx Omnibus Regulation, ZE and NZE trucks will become increasingly more available for use.

[22] South Coast AQMD. September 2019. Assembly Bill 617 East Los Angeles, Boyle Heights, West Commerce Community Emissions Reduction Plan. Accessed at: http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/east-la/cerp/carb-submittal/final-cerp.pdf

A5

Krystin Hence, Assistant Director June 26, 2026

2. Require a phase-in schedule to incentivize the use of cleaner operating trucks to reduce any significant adverse air quality impacts.

   Note: South Coast AQMD staff are available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency.

3. Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.

4. Provide electric vehicle (EV) charging stations or, at a minimum, provide electrical infrastructure, and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

A5-9 Cont.

Mitigation Measures to Reduce Operational Air Quality Impacts from Other Area Sources

1. Maximize the use of solar energy by installing solar energy arrays.
2. Use light-colored paving and roofing materials.
3. Utilize only Energy Star heating, cooling, and lighting devices and appliances.

A5-10

Design Considerations for Reducing Air Quality and Health Risk Impacts

1. Clearly mark truck routes with trailblazer signs so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, daycare centers, etc.).
2. Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors, and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.
3. Design the Proposed Project such that any truck check-in point is inside the Proposed Project site to ensure no trucks are queuing outside.
4. Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.
5. Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

A5-11

Lastly, the South Coast AQMD also suggests that the Lead Agency conduct a review of the following references and incorporate additional mitigation measures as applicable to the Proposed Project in the Final EIR:

A5-12

A5-12 Cont.

Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

On May 7, 2021, South Coast AQMD's Governing Board adopted Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program,[26] and Rule 316 – Fees for Rule 2305.[27] Rules 2305 and 316 are new rules that will reduce regional and local emissions of NOx and particulate matter (PM), including DPM. These emission reductions will reduce public health impacts for communities located near warehouses from mobile sources that are associated with warehouse activities. Also, the emission reductions will help the region attain federal and state ambient air quality standards. Rule 2305 applies to owners and operators of warehouses greater than or equal to 100,000 sf. Under Rule 2305, operators are subject to an annual WAIRE Points Compliance Obligation that is calculated based on the annual number of truck trips to the warehouse. WAIRE Points can be earned by implementing actions in a prescribed menu in Rule 2305, implementing a site-specific custom plan, or paying a mitigation fee. Warehouse owners are only required to submit limited information reports, but they can opt to earn Points on behalf of their tenants if they choose, because certain actions to reduce emissions may be better achieved at the warehouse development phase, for instance, the installation of solar and charging infrastructure. Rule 316 is a companion fee rule for Rule 2305 to allow South Coast AQMD to recover costs associated with Rule 2305 compliance activities. Since the Proposed Project consists of the development of 160,000 sf of warehouse, the Proposed Project's warehouse owners and operators will be required to comply with Rule 2305 once the warehouse is occupied. Therefore, South Coast AQMD staff recommends that the Lead Agency review South Coast AQMD Rule 2305 to determine the potential WAIRE Points Compliance Obligation for future operators and explore whether additional project requirements and CEQA mitigation measures can be identified and implemented at the Proposed Project that may help future warehouse operators meet their compliance obligation. South Coast AQMD staff is available to answer questions

Conclusion

As set forth in Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on environmental issues and prepare a written response at least 10 days prior to certifying the Final SEIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final SEIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided. **A5-14**

Thank you for the opportunity to provide comments. South Coast AQMD staff are available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Response A5-1

This comment indicating that the commenter's primary comments are found in the attachment file is noted and acknowledged. This comment does not raise environmental concerns. No further response is required and no revisions to the Draft Subsequent Environmental Impact Report (SEIR) are warranted to respond to this comment. Your comments and the County's responses thereto will be included in the Final SEIR considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

Response A5-2

This comment accurately summarizes the proposed project description provided in the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A5-3

The County acknowledges that documents incorporated by reference in the Draft SEIR were unavailable because the hyperlink identified in the Draft SEIR was not functional. During the public review period, the Notice of Availability (NOA), for the Draft SEIR also provided a link to the Proposed Project's website, where the 2014 Draft EIR was made available for public review. These materials remained accessible through the Proposed Project website during the public review period. To improve clarity and ease of access, the hyperlink included in the Final SEIR has been corrected, as applicable.

The Draft SEIR identifies the prior environmental documents incorporated by reference and explains the extent to which those documents are relied upon in accordance with CEQA. For air quality, see for example Table 3.2-10, *Summary of Air Quality Impact Conclusions in the 2014 Master Plan EIR*. For the air quality evaluation, the Draft SEIR provides a comprehensive update to the prior analyses based on the Proposed Project, changes in circumstances, and new information. While it can be helpful for general context, a detailed review of the 2014 Master Plan EIR is not necessarily required to understand air quality impacts determinations contained in the Draft SEIR, as it provides a new detailed assessment of impacts associated with the Proposed Project. The South Coast AQMD had separately requested the detailed modeling support files used in the Draft SEIR. These were provided by the County per request, and are the appropriate files needed to confirm the impact determinations made in the Draft SEIR.

The comment does not identify a specific deficiency in the environmental analysis or identify any analysis or conclusion that was improperly incorporated by reference, updated, or relied upon. Accordingly, no revisions to the environmental analyses or conclusions of the Draft SEIR are warranted.

Response A5-4

As discussed on page 2-11 of the Draft SEIR, previously approved land uses that were identified in the 2014 Master Plan that have not yet been implemented were carried forth into and analyzed in the Draft SEIR. These previously approved uses include Community Facilities, Clean Tech/Light Industrial, Medical Office, General Office, and Hospital land uses, all of which are included in Table 2-1, *Proposed Project Land Uses*, of the Draft SEIR. The Proposed Project construction emissions modeling accounts for all of the land uses shown in Table 2-1. Therefore, the Proposed Project-related construction emissions shown and analyzed in Chapter 3.2, *Air Quality*, of the Draft SEIR, accounts for construction-related emissions associated with development of the previously approved land uses identified in the 2014 Master Plan that have not yet been implemented. Thus, the impact conclusions and mitigation measures provided in the Draft SEIR are supported, and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A5-5

The Proposed Project is a programmatic master plan document that would guide future development of the Project Site. The Proposed Project could include future infrastructure improvements, which could result in the installation of stationary equipment that generate emissions and require permitting through South Coast AQMD. However, due to the programmatic nature of the Proposed Project and as described on page 2-30 and stated on page 3.2-54 of the Draft SEIR, the specific infrastructure improvements needed, including boilers, chillers, emergency generators, and other stationary sources, are currently unknown. Thus, specific stationary equipment that may be needed for any infrastructure improvements is also currently unknown. Overall, no stationary-source equipment that may require or subject to South Coast AQMD permitting is included as part of the discretionary action for the Proposed Project. However, as stated on page 3.5-54 of the Draft SEIR, future stationary-source equipment that may be needed as part of any future infrastructure improvements, once determined, would be subject to the permitting requirements of South Coast AQMD, consistent with the comment. Additionally, as stated, this permitting process would be separate from the general occupancy permits issued by the County and would provide controls for emissions associated with any new or modified future stationary equipment. The permitting process for future stationary-source equipment would ensure that applicable emissions standards are met as it is presumed that any future stationary-source equipment subject to permitting that does not meet the applicable permitting emissions standards would not be issued a permit to construction and/or permit to operate by South Coast AQMD. Thus, no revisions to the SEIR are warranted to respond to this comment.

Response A5-6

The commenter's description of its role as a Responsible Agency is acknowledged. Per the comment, the list of South Coast Air Quality Management District rules and regulation on page 3.2-15 of Section 3.2, *Air Quality*, of the Draft SEIR has been revised to include additional South Coast Air Quality Management rules and regulations identified by the commenter (see Chapter 3, *Revisions to the Draft EIR*, of the Final SEIR). Regarding potentially new stationary-source equipment, as discussed in response to comment A5-5, due to the programmatic nature of the Proposed Project, specific infrastructure improvements that may result in installation of new stationary-source equipment subject to South Coast AQMD permitting requirements have yet to be determined. Thus, no specific stationary-source equipment that may be subject to South Coast AQMD permitting requirements are proposed under the Proposed Project at this time. Accordingly, it would be speculative to assume the levels of specificity needed (e.g., specific equipment type, equipment operating schedule, and location of equipment relative to nearby receptors) to provide a detailed assessment and health risk evaluation of stationary-source equipment information.

As stated on page 3.5-54 of the Draft SEIR, future stationary-source equipment that may be needed as part of any proposed future infrastructure improvements, once determined, would be subject to the permitting requirements of South Coast AQMD. Additionally, as stated, this permitting process would be separate from the general occupancy permits issued by the County and would provide controls for emissions associated with any new or modified future stationary equipment. The permitting process for future stationary-source equipment would ensure that applicable emissions standards are met as it is presumed that any future stationary-source equipment subject to permitting that does not meet the applicable permitting emissions standards would not be issued a permit to construction and/or permit to operate by South Coast AQMD. South Coast AQMD is not included as a responsible agency in Table 2-2, *Anticipated Actions Required*, as these detailed processes are forthcoming. Thus, the less-than-significant impact conclusions are supported by substantial evidence and available project information at the programmatic level. No revisions to the SEIR are warranted to respond to this comment.

Response A5-7

Please see responses to comments A5-5 and A5-6 above.

Response A5-8

The strategies and actions identified in an AB 617 community emissions reduction plan (CERP) are to be implemented by the local air district and/or California Air Resources Board (CARB), and involve the creation of new regulations, incentive programs, or enhanced enforcements. The East Los Angeles, Boyle Heights, and West Commerce (ELABHWC) CERP is discussed

appropriately on page 3-2.13 of the Draft SEIR, and its actions were considered in development of appropriate mitigation measures. Overall, the primary responsible parties to enact the actions identified in Chapter 5 of the ELABHWC CERP including those related to heavy-duty trucks, warehouses, and rails are South Coast AQMD and CARB. The Project would be subject to any new applicable regulations or programs resulting from implementation of the ELABHWC CERP.

Additionally, the Draft SEIR includes mitigation to address reducing emissions and impacts associated with heavy-duty trucks and warehousing. For example, Mitigation Measure AIR-4a would require off-road equipment used in daily business operations of any new future development/facility to be electric-powered. Mitigation Measure AIR-4b would require transport refrigeration units associated with any new future development/facility to be electric and/or hybrid electric. In addition, Mitigation Measure AIR-4c would prohibit nonessential idling of diesel trucks to no more than two consecutive minutes (compared to five minutes under CARB Rule 2485) and require new warehousing or general industrial projects accommodated under the Proposed Project to install anti-idling signage at their access gates, loading docks, and truck parking areas.

Furthermore, the Draft SEIR includes Mitigation Measure GHG-1a, which would require proposed future development projects under the Proposed Project to comply with the voluntary Tier 2 electric vehicle (EV) parking provisions of the California Green Building Standards Code (CALGreen), which would result in a greater number of parking spaces that accommodate EV charging infrastructure compared to the mandatory EV requirements under CALGreen. These mitigation measures would be consistent with the identified strategies and actions of the ELABHWC CERP to help reduce emissions and air quality impacts associated with warehouses, heavy-duty trucks, and automobiles.

Thus, all appropriate recommendations from Chapter 5 of the ELABHWC CERP were included in the Draft SEIR and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A5-9

The following addresses each of the specific measures recommended by the commenter towards reducing impacts from mobile sources. As detailed below, certain recommendations for additional mitigation or revision to existing mitigation measures have been included to respond to South Coast AQMD comments. In these instances, the proposed text changes and new mitigation measures added do not require recirculation of the Draft SEIR because it does not provide significant new information that would give rise to a new significant environmental impact; a substantial increase in the severity of an environmental impact; or suggest a Project alternative or mitigation measure considerably different from others previously analyzed that would clearly lessen the environmental impacts of the Proposed Project, but the Project proponents decline to adopt it. The inclusion of Mitigation Measure AIR-2 and Mitigation AIR-4d

serve to further ensure that operational criteria air pollutant, toxic air contaminant, and/or greenhouse gas emissions are reduced to the extent feasible, and provide additional mitigation to reduce a significant impact that was already identified in the Draft SEIR. Inclusion of these new mitigation measures would not change a significant impact identified in the Draft SEIR to less than significant.

1. Require ZE or NZE on-road haul trucks, such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. Based on this comment, Mitigation Measure AIR-2 has been added as a mitigation measure as follows (see Chapter 3, Revisions to the Draft EIR, of the Final SEIR).

> **Mitigation Measure AIR-2:** Future private tenants/business entities (i.e., non-County of Los Angeles owned or operated businesses) for new development projects that own their own truck fleets for daily business operations shall only operate trucks that are either zero-emission (Z/E) and/or meet the California Air Resources Board NO_X emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr) for Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds. The Project Applicant/Contractor shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the truck requirements under this mitigation measure shall be included in all leasing agreements.
>
> Prior to issuance of a Business License for a new tenant/business entity, the Project Applicant/Contractor and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement that any owned Class 2b through Class 8 vehicles with a GWVR over 8,500 pounds used for daily business operations shall be either Z/E and/or meet the NO_X emissions standard of 0.02 g/bhp-hr. This verification document shall be signed by authorized agents for the Project Applicant/Contractor and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase agreement) to the County to verify, to the County's satisfaction, that any owned vehicle subject to the requirements under this mitigation measure comply.

As shown above, it requires that private businesses (i.e., non-County of Los Angeles owned or operated businesses) for future land use developments accommodated under the Proposed Project which own their own truck fleets, only operate trucks that are either zero-emission and/or meet the CARB nitrogen oxides (NO_X) emissions standard of 0.02 grams per brake horsepower-hour for fleet Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds.

As for County-operated facilities that may result in operation of trucks, the County is and would continue to be subject to the general requirements of CARB's Advanced Clean Fleet (ACF), as the ACF provisions and requirements pertaining to state and local governments are still in effect. Compliance with ACF would oversee County-owned and/or operated truck fleets transition to zero-emission vehicles.

2. Require a phase-in schedule to incentivize the use of cleaner operating trucks to reduce any significant adverse air quality impacts. As stated above, Mitigation Measure AIR-2 has been added as a mitigation measure (see Chapter 3, Revisions to the Draft EIR, of the Final SEIR). It would require that private businesses (i.e., non-County of Los Angeles owned or operated businesses) for future land use developments accommodated under the Proposed Project which own their own truck fleets, only operate trucks that are either zero-emission and/or meet the CARB NO_X emissions standard of 0.02 grams per brake horsepower-hour for fleet Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds. The inclusion of Mitigation Measure AIR-2 serves to further ensure that operational NOx emissions are reduced to the extent feasible, to further reduce a significant impact that was already identified in the Draft SEIR (operational NOx emissions).

As for County-operated facilities that may result in operation of trucks, the County is and would be subject to the general requirements of CARB's ACF provisions and requirements pertaining to state and local governments, which are still in effect. Compliance with ACF would oversee County-owned and/or operated truck fleets transition to zero-emission vehicles.

3. Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.

The Draft SEIR quantifies emissions resulting from truck trips associated with full buildout of the proposed land uses. These truck trips were developed based on output from the Southern California Association of Governments (SCAG) model, which is what is used for the VMT analysis, and has a truck model built into it. It performs truck trip generation (across light, medium, and heavy) based on land use and socioeconomic data. Truck trips are generated by all proposed land uses, though the rate is higher for warehousing. Given this is a proposed Master Plan programmatic analysis based on a number of land uses with differing truck generation rates, it assumes a maximum quantification of potential trucks. It is not feasible nor possible from an implementation standpoint, to enforce and monitor a truck trip cap for the variety of land uses proposed. Additionally, the amount of criteria pollutants generated by trucks are only between 1 to 21 percent of the total (see Table 3.2-13 of the Draft SEIR) and therefore do not represent the vast majority of emissions. Furthermore, as recommended by the Commenter, Mitigation Measure AIR-2 has been added. As discussed above, Mitigation Measure AIR-2 would require that private businesses (i.e., non-County of Los Angeles owned or operated businesses) for future land use developments accommodated under the Proposed Project which own their

own truck fleets, only operate trucks that are either zero-emission and/or meet the CARB NO_X emissions standard of 0.02 grams per brake horsepower-hour for fleet Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds. Also as discussed above, the County is and would continue to be subject to the general requirements of CARB's ACF provisions and requirements pertaining to state and local governments as these are still in effect. Compliance with ACF would oversee County-owned and/or operated truck fleets transition to zero-emission vehicles. Moreover, future individual development projects accommodated under the Proposed Project that are subject to CEQA would be analyzed for potential impacts based on their operational characteristics, including the number of trucks accessing the site. Therefore, no application of this mitigation measure is warranted or proposed.

4. Provide electric vehicle (EV) charging stations or, at a minimum, provide electrical infrastructure, and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

Proposed future development projects under the Master Plan would be required via CALGreen to install electric vehicle charging infrastructure according to the off-street parking supply provided and the project's occupancy type, for both passenger vehicles and trucks. For example, Section 5.106.5.3 of the January 2026 Errata of the 2025 CALGreen code specifies mandatory standards for electric vehicle capable space and electric vehicle charging infrastructure installation in new nonresidential construction. Moreover, Section 5.106.5.5 of the January 2026 Errata of the 2025 CALGreen code specifies mandatory standards for new facilities that accommodate truck activities, including warehouses, grocery stores, office buildings, manufacturing facilities, and retail stores with planned off-street loading spaces. Furthermore, the Draft SEIR includes Mitigation Measure GHG-1a, which would require future development projects accommodated under the Proposed Project to comply with the voluntary Tier 2 electric vehicle (EV) parking provisions of the California Green Building Standards Code (CALGreen), which would result in a greater number of parking spaces that accommodate EV charging infrastructure compared to the mandatory EV requirements under CALGreen. However, based on this comment, Mitigation Measure AIR-4d, which would require loading bays of future proposed facilities that accommodate cold storage be electrified, has been added as follows (see Chapter 3, *Revisions to the Draft EIR*, of the Final SEIR). The inclusion of Mitigation Measure AIR-4d serves to further ensure that operational criteria air pollutant and toxic air contaminant emissions are reduced to the extent feasible, to further reduce a significant impact that was already identified in the Draft SEIR (i.e., Impact AIR-4, AIR-5, and AIR-8). However, inclusion of Mitigation Measure AIR-4d would not result in reducing significant impacts identified in the Draft SEIR to less than significant.

> **Mitigation Measure AIR-4d**: All truck/dock bays for new proposed cold storage facilities shall be electrified to facilitate plug-in capability and support use of electric standby and/or hybrid electric transport refrigeration units. All site and architectural plans

submitted to the Los Angeles County Building & Safety Division shall note all the truck/dock bays designated for electrification. Prior to the issuance of a Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify electrification of the designated truck/dock bays.

Response A5-10

The following addresses each of the specific measures recommended by the commenter towards reducing impacts from area sources.

1. Maximize the use of solar energy by installing solar energy arrays.

Future developments accommodated under the Proposed Project would, at minimum, be subject to the current 2025 and future iterations of the Building Energy Efficiency Standards. The current 2025 Building Energy Efficiency Standards have prescriptive photovoltaic system and battery requirements for high-rise, multifamily buildings (i.e., more than three stories) and noncommercial buildings such as hotels, offices, medical offices, restaurants, retail stores, schools, warehouses, theaters, and convention centers (see page 3.7-16 of the Draft SEIR). In addition, the Draft SEIR includes Mitigation Measure GHG-1b, which would require the Proposed Project to demonstrate a minimum 10 percent reduction in energy consumption below energy baselines. Measures implemented to achieve this minimum energy consumption reduction target could include installation of PV arrays beyond minimum PV requirements under the Building Energy Efficiency Standards. Thus, no revisions to the Draft SEIR are warranted to respond to this comment.

2. Use light-colored paving and roofing materials.

Future individual projects would be required via the California Building Standards Code, Part 11 (CALGreen) to meet specified roof solar reflectance performance requirements depending on the occupancy type and proposed roof assembly design. In addition, the Draft SEIR includes Mitigation Measure GHG-1b, which would require the Proposed Project to demonstrate a minimum 10 percent reduction in energy consumption below energy baselines. Measures implemented to achieve this minimum energy consumption reduction target could include incorporating cool roof and solar reflectance designs that perform beyond minimum requirements under CALGreen.

3. Utilize only Energy Star heating, cooling, and lighting devices and appliances.

Title 20 of the California Code of Regulations regulates the energy efficiency of newly manufactured appliances that would be used in future development projects accommodated under the Proposed Project. In addition, the Draft SEIR includes Mitigation Measure GHG-1b, which would require the Proposed Project to demonstrate a minimum 10 percent reduction in energy consumption below energy baselines. Measures implemented to achieve this minimum

energy consumption reduction target could include installation of Energy Star appliances and equipment. Thus, no revisions to the SEIR are warranted to respond to this comment.

Response A5-11

The following addresses each of the specific measures recommended by the commenter towards reducing health risk impacts.

1. Clearly mark truck routes with trailblazer signs so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, daycare centers, etc.).

Based on this comment, additional language has been added to Chapter 2, *Project Description*, of the Draft SEIR to clarify that signage would be installed on-site for vehicular wayfinding, as appropriate, to direct vehicles traveling within the Project Site to designated access points, loading areas, and circulation routes, as follows (see Chapter 3, *Revisions to the Draft SEIR*, of this Final SEIR).

> **Vehicular Wayfinding:** The Proposed Project would include internal vehicular wayfinding signage, as appropriate, to direct passenger vehicles, service vehicles, and delivery vehicles to designated access points, loading areas, and circulation routes within the Project Site. Any signage located within the public right-of-way outside the Project Site would be subject to approval and jurisdiction of the applicable roadway agency.

The County's authority to install or require trailblazer signs is limited to areas within its jurisdiction. Roadways and public rights-of-way outside the Project Site are under the jurisdiction of the applicable roadway agency, such as the City of Los Angeles. Accordingly, the County cannot require or install off-site trailblazer signage within those public rights-of-way. The recommendation may be considered through future coordination with the City of Los Angeles, as appropriate. However, implementation of off-site signage is outside the County's authority and is not required to support the environmental analysis in the Draft SEIR. The revision in Chapter 2 of the Draft SEIR clarifies the extent of the County's authority regarding vehicular wayfinding. No additional revisions to the Draft SEIR are warranted.

2. Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors, and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.

Specific locations of future warehousing and light industrial development projects within the Project Site that would be accommodated under the Proposed Project are not known at this time; therefore, it would not be feasible to specify required site orientation and design, such as designating specific truck routing within the Project Site, at this time. However, the Use and

Development Standards for the Proposed Project would require any loading docks to be at the rear of a building where feasible.

Furthermore, future warehousing and logistics development projects that are accommodated under the Proposed Project may be subject to the requirements of Assembly Bill 98 and Senate Bill 415. For example, under California Government Code Section 65098.1(b), future warehouses on a non-industrial zoned site and where the loading docks would be within 900 feet of sensitive receptors would be required to orient truck loading bays on the side of the facility that is away from the nearest sensitive receptor to the extent feasible. Another requirement under Section 65098.1(b) includes locating truck loading bays a minimum of 500 feet from the property line of the nearest sensitive receptor to the nearest truck loading bay opening using a direct straight-line method. Additionally, AB 98 would require submittal of a truck routing plan by a logistics use development operator prior to issuance of a certificate of occupancy. The truck routing plan would be required to describe the operational characteristics of the logistic use including identification of truck routing that avoids passing sensitive receptors. Furthermore, the truck routing plan would be required to include a queuing analysis for preventing truck queuing, circling, stopping, and parking on public streets. Future Project compliance with AB 98 requirements, as applicable, would assist in reducing potential impacts to sensitive receptors with respect to distancing internal truck traffic from nearby sensitive receptors. In general, the Proposed Project would comply with all applicable federal, State, regional, and local regulatory requirements. Thus, because the measure suggested under this comment is generally addressed under AB 98 requirements, addition of this measure as a CEQA mitigation measure is unwarranted.

3. Design the Proposed Project such that any truck check-in point is inside the Proposed Project site to ensure no trucks are queuing outside.

Future warehousing and light industrial development projects accommodated under the Proposed Project are not known at this time; therefore, it would not be feasible to specify required site design, such as designating the specific truck check-in point within the Project Site, at this time. However, Assembly Bill 98, which was signed into law in 2024, includes provisions incorporated under California Government Code Section 65098.4 that requires submittal of a truck routing plan by a logistics use development operator prior to issuance of a certificate of occupancy for projects subject to AB 98. The truck routing plan would be required to describe the operational characteristics of the logistics use and include a queuing analysis for preventing truck queuing, circling, stopping, and parking on public streets. In general, the Proposed Project would comply with all applicable federal, State, regional, and local regulatory requirements. Thus, because the measure suggested under this comment is generally addressed under California Government Code Section 65098.4, for future developments under the Proposed Project that are subject to this requirement, the addition of this measure as a CEQA mitigation measure is unwarranted.

4. Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.

Future warehousing and light industrial development projects accommodated under the Proposed Project are not known at this time; therefore, it would not be feasible to specify required site orientation and design, such as designating specific truck routing interior to a Project Site, at this time. However, as stated above, AB 98 may apply, which would require submittal of a truck routing plan by a logistics use development operator prior to issuance of a certificate of occupancy. The truck routing plan would be required to describe the operational characteristics of the logistics use and include a queuing analysis for preventing truck queuing, circling, stopping, and parking on public streets. Furthermore, AB 98 requires logistics projects with loading bays within 900 feet of sensitive receptors where the site is not zoned industrial, to orient loading bays away from nearby sensitive receptors to the extent feasible; locate loading bays a minimum of 500 feet from the property line of the nearest sensitive receptor; have separate entrances for heavy-duty trucks accessible via a truck route; locate truck entrances, exits, and internal circulation away from sensitive receptors; and include property perimeter screening and buffering. Future project compliance with AB 98 requirements, as applicable, will assist in reducing potential impacts to sensitive receptors with respect to distancing internal truck traffic from nearby sensitive receptors. In general, the Proposed Project would comply with all applicable federal, State, regional, and local regulatory requirements. Thus, because the measure suggested under this comment is generally addressed under AB 98 requirements, addition of this measure as a CEQA mitigation measure is unwarranted.

5. Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

Potential future warehousing and light industrial development projects that may be accommodated under the Proposed Project are not known at this time; therefore, it would not be feasible to specify required site design, such as designating specific truck parking for future facilities under the Proposed Project, at this time. However, as stated above, future projects subject to AB 98 would be required to submit a truck routing plan prior to issuance of a certificate of occupancy. The truck routing plan would be required to describe the operational characteristics of the logistics use and include a queuing analysis for preventing truck queuing, circling, stopping, and parking on public streets. Future project compliance with AB 98 requirements, as applicable, will assist in reducing potential impacts to sensitive receptors with respect to limiting truck parking to within the Project Site only. The Proposed Project would be required to comply with all applicable federal, State, regional, and local regulatory requirements, which would apply to future development projects under the Proposed Project that are subject to the requirements of AB 98. Thus, because the measure suggested under this comment is addressed under AB 98 requirements, addition of this measure as a CEQA mitigation measure is unwarranted.

Response A5-12

The commenter does not identify any specific additional recommended measures from the list of sources referenced. Overall, the Draft SEIR prescribed mitigation measures to address identified potentially significant impacts. As a result of comments provided by South Coast AQMD, additional mitigation measures have also been prescribed such as Mitigation Measure AIR-2 and Mitigation Measure AIR-4d (see Response A5-9). The provided mitigation measures cover reducing emissions through measures such as requiring use of cleaner construction equipment, requiring use of electric-powered off-road equipment used in daily operations, increasing use of renewable electricity, increasing building energy efficiency and decreasing energy consumption, and installation of electric vehicle charging stations and infrastructure. No revisions to the Draft SEIR are warranted to respond to this comment.

Response A5-13

South Coast AQMD comments regarding South Coast AQMD Rule 2305, *Warehouse Indirect Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE)*, are not comments on the physical environmental impacts associated with the Proposed Project. Future warehouses within the Project Site that are subject to South Coast AQMD Rule 2305 would need to comply with the WAIRE program requirements. Information about the WAIRE was included on page 3.2-16 of the Draft SEIR. This comment is noted and no changes to the Draft SEIR are warranted.

Response A5-14

This comment does not address the adequacy of the analysis in the Draft SEIR and no further response is necessary. Responses to comments will be sent to all agencies who commented during the public review period in accordance with State CEQA Guidelines Section 15088(b).

OFFICE OF THE SHERIFF

COUNTY OF LOS ANGELES
HALL OF JUSTICE

ROBERT G. LUNA, SHERIFF

June 29, 2026

Ms. Krystin Hence
Assistant Director, Capital Development
Department of Economic Opportunity
510 S. Vermont Avenue, 11th Floor
Los Angeles, CA 90020

Dear Ms. Hence:

**LOS ANGELES COUNTY GENERAL HOSPITAL CAMPUS COMMUNITY PLAN
NOTICE OF AVAILABLITY OF A SUBSEQUENT
ENVIRONMENTAL IMPACT REPORT AND PUBLIC INFORMATION MEETING
REVIEW COMMENTS**

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to review and comment on the May 16, 2026, Notice of Availability (NOA) of a Draft Subsequent Environmental Impact Report (DSEIR) for Los Angeles County General Hospital Campus Community Plan (Project). The proposed Project encompasses approximately 31acres within the approximate County-owned 82-acre property located in the City of Los Angeles. The Project site includes the main Campus and four surrounding areas bounded by Zonal Avenue, North Mission Road, Marengo Street, and North Chicago Street. The Project proposes the development of approximately 3,200 housing units, 450 hospital beds with 200 patient and caregiver rooms, and 8,588 parking spaces. Additional planned uses throughout the Campus include community facilities, clean tech/light industrial, medical offices, general offices, educational facilities, and/or warehouse space. The Master Plan also focuses on the adaptive reuse of the approximate 1-million-square-foot historic General Hospital building to support multiple future functions. Additional improvements are proposed to include new parking facilities, open space, infrastructure upgrades, and demolition of select existing structures. The

A6-1

211 WEST TEMPLE STREET, LOS ANGELES, CALIFORNIA 90012

A Tradition of Service
Since 1850

A6

Master Plan will serve as development guidelines for the long-term re-development of the Campus. A6-1 Cont.

When the new LAGMC was completed in the approximate year 2010, the facility included a partial design to accommodate the Department's operations related to the jail ward, however, ancillary space for jail ward and full security services personnel were not adequately accounted for and most of the operations remained in the historic General Hospital building. A6-2

The Department previously provided comments on October 27, 2025, during the Notice of Preparation review. Further information added to the statement on DSEIR Chapter 13.3 Public Service, page 3.13-10-13, the Department noted that the County Services Bureau (CSB) provides on-site security services for the Campus and will continue as contracted by the County Department of Health Services. In addition, currently the Access to Care Bureau (ACB) provides security for the jail ward at the LA General Medical Center (LAGMC). ACB also occupies a designated area in the basement of the historic General Hospital for ancillary support space and maintains a staff of approximately 115. CSB occupies a designated area on the first floor of the historic General Hospital with a staff of approximately 30 and shares a portion of the space with ACB. Both CSB and ACB staff currently park in a secure parking structure adjacent to the historic General Hospital. The Los Angeles County General Hospital Campus Master Plan (pages 6 and 72) and DSEIR (page 2-14) proposes new residential, retail, and community-service uses within the historic General Hospital building. These proposed uses would displace the existing Department spaces for both Bureaus without a permanent location identified. To ensure continued security services for LAGMC and the Campus, the Department would require new permanent, designated ancillary support spaces and parking for CSB and ACB to accommodate the operational needs. A6-3

Page ES-9 of the DSEIR states that detailed site plans and architectural designs will be developed during future project-level approvals and will align with the guiding principles of the Master Plan. The Executive Summary also notes that the project is anticipated to be developed over a period of 25 years. The Department requests that consideration be given to require that Department operational space for ACB and CSB, as needed, be incorporated into the Master Plan and implemented in the first phase to ensure continuity of services now and throughout the Project's anticipated 25-year buildout. A6-4

The existing LAGMC operates primarily as a medical facility with after-hours controlled access, which limits daily visitor activity. While no specific development applications have been submitted at this time, once the proposed mixed-use program is fully built out which is anticipated to include retail, A6-5

A6

Ms. Hence - 3 - June 29, 2026

community facilities, and publicly accessible open spaces, the development will substantially increase the number of employees, residents, and visitors to the area. These changes are expected to increase the demand for law enforcement services and may require expansion of Department resources and operations as the Department currently is the law enforcement agency to a majority of the proposed master plan area. Additionally, the existing law enforcement services agreement with our Department may need to be re-evaluated as development occurs. A6-5 Cont.

To the extent, the Department is being considered as the provider of these law enforcement services, it should be noted/understood that we may not have the capacity to provide the necessary staff resources when a project is contemplated or completed. We recommend that your agency evaluate the law enforcement service needs of the community, as well as the availability of local law enforcement agencies to provide these services prior to approving a project. A6-6

It is highly recommended to use the DSEIR and the Master Plan design to implement CPTED (Crime Prevention through Environmental Design), which will assist to mitigate the impacts. A6-7

For future reference, the Department provides the following updated address and contact information for all requests for reviews, comments, law documents, and other related correspondence: A6-8

Jennifer Fang, Bureau Director
Facilities Planning Bureau, SBB, 4th Floor
Los Angeles County Sheriff's Department

Los Angeles, California 90012

Attention: Planning Section

Should you have any questions regarding this matter, please contact me, at (323) 526-5756, or your staff may contact Ms. Yu Chun Teresa Ou, of my staff, at (323) 526-5568.

A6

Ms. Hence - 4 - June 29, 2026

Sincerely,

ROBERT G. LUNA, SHERIFF

A6-8 Cont.

Jennifer Fang, Bureau Director
Facilities Planning Bureau

Response A6-1

This comment is noted and the County has received the County of Los Angeles Sheriff's Department's comment letter regarding the Proposed Project. This comment does not raise environmental concerns. No further response is required and no revisions to the Draft Subsequent Environmental Impact Report (SEIR) are warranted to respond to this comment. Your comments and the County's responses thereto will be included in the Final SEIR considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

Response A6-2

This comment summarizing the Proposed Project as presented in the Draft SEIR is noted. This comment does not raise environmental concerns or identify deficiencies of the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A6-3

The County acknowledges the operational conditions identified by the commenter. Further information about the County Sheriff's Department facilities on the Project Site is provided on page 3.13-10 of the Draft SEIR, which is based on information provided by the commenter in response to the NOP. The comment acknowledges that proposed adaptive reuse of the General Hospital Building would displace on-site County and private security facilities as well as parking. This comment does not identify deficiencies of the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A6-4

The commenter's recommendation regarding the incorporation and timing of replacement operational space for the Sheriff's Department in the first phase of redevelopment is acknowledged. As noted by the commenter, the Draft SEIR explains that detailed site planning, architectural design, and other project-specific design elements will be developed during subsequent project-level review and approvals. As a programmatic Draft SEIR, the analysis evaluates the reasonably foreseeable environmental effects of the Proposed Project based on the level of detail available at the time the Draft SEIR was prepared and establishes the applicable, feasible mitigation framework. The subsequent refinement of site planning, architectural design, and other project-specific elements does not prevent the Draft SEIR from identifying and evaluating the environmental effects of the Proposed Project at the programmatic level.

The County acknowledges the Sheriff's Department's recommendation that replacement operational space and associated parking, as needed, be considered during master planning and Proposed Project phasing to support the continuity of security services at the Project Site. The operational needs identified by the Sheriff's Department would be addressed through these subsequent planning, design, and approval processes, as appropriate.

The Sheriff's Department's recommendation pertains to project planning, design, and implementation and does not identify a deficiency in the environmental analysis presented in the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A6-5

Chapter 3.13, *Public Services*, of the Draft SEIR, evaluates the Proposed Project's potential impacts on public services, including law enforcement, in accordance with CEQA. The analysis considers the anticipated increase in residents, employees, and visitors associated with implementation of the Proposed Project in evaluating the potential demand for public services. The Draft SEIR discussed the Proposed Project's impacts on law enforcement, including the County of Los Angeles' Sheriff's Department; refer to page 3.13-28 through 3.13-30 of Chapter 3.11, *Public Services*, of the Draft SEIR. Accordingly, the potential for increased demand on law enforcement services was considered as part of the environmental analysis presented in the Draft SEIR, and operational impacts were determined to be less than significant. As identified in Chapter 2, *Project Description*, of the Draft SEIR, implementation of the Proposed Project would occur over time and would require subsequent permits and approvals, as necessary, to facilitate Proposed Project implementation. The Sheriff's Department's comments regarding future operational needs, resource allocation, and potential modifications to existing service agreements provide information that may be considered during future project planning and implementation.

The comment does not identify a deficiency in the Draft SEIR's environmental analysis or provide substantial evidence demonstrating that the impact analysis related to public services is inadequate. No further response is required and no revisions to the SEIR are warranted to respond to this comment.

Response A6-6

As described in Chapter 3.13, *Public Services*, of the Draft SEIR, in addition to being served by the County of Los Angeles Sheriff's Department, the Project Site is located within the service area of the Los Angeles Police Department (LAPD) Hollenbeck Division and is also served by existing private security services. The analysis evaluates the Proposed Project based on the existing law enforcement service environment and considers the anticipated increase in residents, employees, and visitors associated with project implementation.

The commenter's concern regarding the future availability of staffing resources for a particular law enforcement agency relates to future operational and administrative decisions regarding the provision of law enforcement services. The comment does not indicate that the Draft SEIR's public services analysis is inadequate or identify a deficiency in the methodology or conclusions presented in the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A6-7

The commenter's recommendation that the Proposed Project and Master Plan incorporate Crime Prevention Through Environmental Design (CPTED) principles is acknowledged. As discussed in Chapter 3.13, *Public Services*, of the Draft SEIR, the Proposed Project includes design characteristics that are consistent with CPTED concepts. Specifically, the proposed mix of land uses would activate the Project Site, increasing visibility and opportunities for natural surveillance throughout the area. In addition, redevelopment of the Project Site would remove existing vacant buildings, thereby reducing opportunities for unauthorized access and criminal activity associated with vacant structures. These Proposed Project characteristics were considered as part of the Draft SEIR's evaluation of operational impacts on public services, including law enforcement services, which concluded that operational impacts would be less than significant.

The comment does not provide substantial evidence demonstrating that the Draft SEIR's public services analysis is inadequate or identify a deficiency in the methodology or conclusions presented in the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response A6-8

This comment is noted. This comment does not raise environmental concerns or identify deficiencies of the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

A7. City of Los Angeles Department of Transportation, June 30, 2026

From: Russell Hasan
To: General Hospital Project
Cc: LADOT DevReview CEN; Robert Sanchez; Jesus Serrano
Subject: LADOT Comments: Draft SEIR, LA County General Hospital Campus Master Plan (SCH No. 2014051061)
Date: Tuesday, June 30, 2026 4:01:59 PM

CAUTION: External Email. Proceed Responsibly.

Dear Ms. Hence,

Please find attached the City of Los Angeles Department of Transportation (LADOT) comments on the Draft Subsequent Environmental Impact Report for the Los Angeles County General Hospital Campus Master Plan (SCH No. 2014051061), submitted within the public review period.

The attached materials include LADOT's comment letter and a comment matrix detailing our comments on Chapter 3.15, Transportation, with corresponding references to the LADOT Transportation Assessment Guidelines and applicable City standards. A7-1

The Project Site is located entirely within the City of Los Angeles, and the streets serving the site are City public rights-of-way with traffic signals operated by LADOT. LADOT will be a permitting and approving agency for off-site improvements, driveway access, and signal modifications associated with the Master Plan, and requests that the Final SEIR respond to each of the attached comments.

Please confirm receipt. Feel free to contact me with any questions.

--

LADOT Comment Matrix — Draft SEIR, LA County General Hospital Campus Master Plan (SCH No. 2014051061) — Chapter 3.15, Transportation
Draft SEIR circulated May 15, 2026 | Public review closes June 29, 2026 | Lead Agency: LA County DEO

DOT Section	No.	Draft SEIR Statement / Finding (County)	Draft SEIR Section / Page	LADOT Comment	Applicable LADOT TAG / Code / Plan Reference	Driveway & Access Design Guidelines Reference (LADOT MPP Sec. 321, 2024)	
DOT Development Review	1	MM TRA-3a through TRA-3d direct off-ramp restriping and signal timing optimization (cycle length, offset, phase splits) along the Mission Road, State Street, Soto Street, and Cesar Chavez Avenue corridors. Stated as "shall be implemented" with no City approval condition.	pp. 3.15-33 to 3.15-34 (MM TRA-3a–3d)	Revise TRA-3a through TRA-3d to require LADOT review and approval for any City street signal timing changes, Caltrans review where freeway ramp geometry is affected, clear funding responsibility, and a County-City-Caltrans coordination/timing mechanism. Signal timing must remain under LADOT operational control. TRA-3a restriping at the I-5 SB off-ramp/Mission Road must preserve existing Class II bike lanes and avoid degrading bicycle and pedestrian operations.	TAG §2.2 (CEQA VMT framework context); LAMC §12.37 (ROW dedication/improvement to Mobility Plan standards); Mobility Plan 2035 Complete Streets policies; LADOT jurisdiction over signal operations & striping	N/A (off-ramp/signal operations — not driveway design)	A7-2
DOT Development Review	2	Off-ramp queuing concludes "No" safety issue at I-10 EB off-ramps to State St and Soto St using static Synchro 95th-percentile queues, at ramps where V/C > 1.0 and queue lengths are noted as "technically undefined." SEIR states microsimulation "would be required" to capture such queues.	pp. 3.15-27 to 3.15-32 (methodology; Tables 3.15-5 to 3.15-8)	Conclusion is unsupported by the SEIR's own stated methodology. Require SimTraffic (or equivalent) microsimulation for all six study off-ramps under 2050-with-Project, with and without operational improvements, to verify storage adequacy and post-mitigation conclusions. Validate StreetLight speed-differential data drawn from only two weekdays (Dec 3–4, 2025).	TAG §3 (study methodology — HCM/Synchro/SimTraffic); TAG off-ramp queuing criteria (Future-with-Project volumes, 50% auxiliary lane storage); Caltrans LDR Safety Review Guidance (2024)	N/A (freeway off-ramp analysis)	A7-3
DOT Development Review	3	Quantitative VMT (informational): residential 7.6 VMT/capita (54% below countywide avg 16.6); work 10.6 VMT/employee (26% below countywide avg 14.3). Per-capita denominator uses 9,634 residents vs. SEIR's own population projection of 8,000 (Table 3.12-7). Synthetic population copied from adjacent single-family Lincoln Heights TAZ.	pp. 3.15-22 to 3.15-25 (Tables 3.15-2 to 3.15-4; Table 3.15-3 fn. 3)	Site is within the City of LA. Under City thresholds (East LA APC: 7.2 residential VMT/capita), the project's 7.6 exceeds the threshold and would be a potentially significant residential VMT impact. Disclose this comparison. Provide sensitivity analysis using the SEIR's own 8,000 population (≈9.1 VMT/capita). Address synthetic-population representativeness for a 3,200-unit multifamily project.	TAG §2.2.3 & Table 2.2-1 (VMT impact criteria — East LA APC: 7.2 residential / 12.7 work); TAG §2.2.4 (methodology); Threshold T-2.1	N/A (VMT analysis)	A7-4
DOT Development Review	4	Transit-proximity screening relies in part on the finding that the project "provides less parking than required by County Code." No supporting calculation provided. Project includes 8,588 parking spaces / ~3.0M sq ft of parking.	p. 3.15-22 (Proximity to Transit screening); Project Description Table 1	Document the County Code parking requirement calculation and proposed supply by land use. Evaluate whether an 8,588-space supply is consistent with the transit-proximity screening presumption and with the project's stated multimodal/VMT-reduction objectives. Plentiful parking can rebut the near-transit less-than-significant presumption (OPR Technical Advisory).	TAG §2.2.2 (screening criteria); TAG §2.2.4 (methodology); LCI/OPR Technical Advisory (Dec 2018)	N/A (parking supply policy / VMT screening)	A7-5

LADOT Comment Matrix — Draft SEIR, LA County General Hospital Campus Master Plan (SCH No. 2014051061) — Chapter 3.15, Transportation
Draft SEIR circulated May 15, 2026 | Public review closes June 29, 2026 | Lead Agency: LA County DEO

DOT Section	No.	Draft SEIR Statement / Finding (County)	Draft SEIR Section / Page	LADOT Comment	Applicable LADOT TAG / Code / Plan Reference	Driveway & Access Design Guidelines Reference (LADOT MPP Sec. 321, 2024)	
DOT Development Review	5	MM TRA-3e presents a TDM "menu" the project "could implement"; states benefits "cannot be quantified with a reasonable degree of certainty." Lists "Limit Residential Parking Supply" and "Unbundle Residential Parking" while project proposes 8,588 spaces.	pp. 3.15-34 to 3.15-36 (MM TRA-3e)	The "cannot be quantified" framing is not supportable: the City's own adopted VMT Calculator quantifies each of the strategies TRA-3e lists, with defined percentage reductions (e.g., Required Commute Trip Reduction Program up to 21% of commute VMT), dampening, and place-type caps (TAG Attachment G). The City also has an established enforcement mechanism — a recorded TDM covenant with annual commuter surveys, annual status reporting, and non-compliance penalties (LAMC §19.15; specific-plan TDM provisions). Revise MM TRA-3e to commit to a defined TDM program with quantified peak-hour trip-reduction targets, phase-by-phase plans, annual monitoring/reporting, a named responsible entity, and an enforcement mechanism. Reconcile the parking-reduction strategies with the 8,588-space project description.	CEQA Guidelines §15126.4(a)(1)(B) (deferred mitigation w/ performance standards); TAG Attachment G (TDM Strategies in LA VMT Calculator — quantified reductions, dampening, caps); LAMC §19.15 (TDM compliance, monitoring & enforcement fees); CAPCOA Handbook (2024)	N/A (TDM program); see Comment 8 re: parking supply / drop-off design	A7-6
DOT Development Review	6	MM TRA-1 requires a single Worksite Traffic Control Plan for a 25-year, multi-phase, 81.9-acre buildout. Coordinates with City "as appropriate."	pp. 3.15-18 to 3.15-19 (MM TRA-1)	Strengthen to require a phase-specific Worksite Traffic Control Plan submitted to LADOT for review/approval before each phase affecting City streets, sidewalks, bike facilities, or transit stops. Truck haul routes, temporary signal mods, and transit detours (Metro 106/251/605, DASH Boyle Heights/East LA) subject to LADOT review. Address construction worker parking to prevent residential spillover.	TAG construction/worksite traffic control provisions; CA-MUTCD (temporary traffic control); LADOT B-permit / haul route review	N/A (construction phase TMP)	A7-7
DOT Development Review	7	Operational improvements rely on longer signal cycles that "could increase pedestrian delay and degrade pedestrian LOS." Marengo St is on the HIN. HIN described as "eight percent of street miles but ... approximately six percent of fatalities and serious injury collisions."	p. 3.15-35 (TDM/pedestrian discussion); p. 3.15-6 & p. 3.15-14 (HIN)	Evaluate pedestrian crossing effects of proposed retiming at each affected ramp-terminal intersection and demonstrate Vision Zero / Mobility Plan Policy 1.1 consistency before improvements advance. LADOT will not approve timing changes that degrade pedestrian safety on/near the HIN without offsetting measures. Correct the HIN statistic, which understates collision concentration.	Mobility Plan 2035 Goal 1.1 (Roadway User Vulnerability), Goal 2.3 (Pedestrian Infrastructure); Vision Zero Action Plan; A Plan for a Healthy LA	Sec. VI.G (Driveway Access on High Injury Network) — apply HIN considerations to site access points on Marengo St / HIN	A7-8
DOT Development Review	8	Up to seven vehicular entrances proposed: 2 on State St (incl. rideshare drop-off), 1 on Marengo St, 2 on Mission Rd, 2 on Zonal Ave. "All roadway entrances ... designed to relevant roadway standards."	p. 3.15-26 (Operations — geometric design / access)	All driveways, drop-off zones, and access modifications on City streets are subject to LADOT project-level review for number, location, spacing, width, sight distance, truck turning paths, queuing capacity, and ped/bike conflict management. LADOT driveway-approval clearance is triggered for new construction adjacent to Boulevard/Avenue roadways (Mission Road = Boulevard II; State, Marengo, Zonal, Soto = Avenue), and Internal Circulation clearance is triggered where vehicles must use a public street to move between on-site parking areas. Final SEIR and MMRP should state that driveway locations/counts are conceptual until approved by LADOT at each project-level approval, and that Bureau of Engineering permits are required.	LAMC §12.21 A-5(e) (driveway location), A-5(j) (internal circulation), C-6(a) (loading); LAMC §62.105.1–.3 (driveway approaches/width/curb space); LADOT Clearance Handbook §IID (DOT clearance triggers); Mobility Plan 2035	Sec. V.A (Number of Driveways); V.C (Intersection Adjacency); V.J (Spacing); VI.B (Width); VI.D (Truck Turning Path); VI.E (Queuing Capacity); VI.L (Pick-Up/Drop-Off Zones); VII (Internal Circulation)	A7-9

LADOT Comment Matrix — Draft SEIR, LA County General Hospital Campus Master Plan (SCH No. 2014051061) — Chapter 3.15, Transportation
Draft SEIR circulated May 15, 2026 | Public review closes June 29, 2026 | Lead Agency: LA County DEO

DOT Section	No.	Draft SEIR Statement / Finding (County)	Draft SEIR Section / Page	LADOT Comment	Applicable LADOT TAG / Code / Plan Reference	Driveway & Access Design Guidelines Reference (LADOT MPP Sec. 321, 2024)	
DOT Development Review	9	Mobility Plan 2035 identifies planned Class II bike lane extension on Zonal Ave to Soto St and a Class III route on State St (Marengo–E. 4th). Mobility Hub described as a "potential" component yet cited in support of the TRA-1 less-than-significant consistency finding.	p. 3.15-9 (planned bikeways); pp. 3.15-19 & 3.15-26 (Mobility Hub)	Given reliance on multimodal access for the consistency/VMT conclusions, the County should commit to the planned frontage bikeway improvements (in coordination with LADOT). If the Mobility Hub is relied upon for the consistency finding, commit to it with a defined scope, location, and timing; otherwise revise the analysis to exclude it.	Mobility Plan 2035 Goal 2.6 (Bicycle Networks), Goal 3.5 (First/Last-Mile); LAMC §12.37 (frontage improvements)	Sec. VI.A (Basic Principles — bike facility conflicts); Sec. II (Policy Framework — Complete Streets Design Guide §6.9 driveway/bikeway)	A7-10
DOT Development Review	10	Zonal Avenue classified as "Avenue III" (p. 3.15-6) and "Avenue II" (p. 3.15-7). References cite LADOT TAG as "2022" while linking the July 2020 publication.	p. 3.15-6 & p. 3.15-7 (street classification); p. 3.15-44 (References)	Correct the Zonal Avenue functional classification to a single consistent designation per Mobility Plan 2035. Correct the TAG citation to identify the version actually relied upon.	Mobility Plan 2035 (street designations); LADOT TAG (cite correct edition)	N/A (editorial)	A7-11
DOT Development Review	11	Project includes a 450-bed hospital, 160,000 sq ft warehouse, 200,000 sq ft clean tech/light industrial, 735,300 sq ft medical office, and 320,000 sq ft retail — all truck-trip-generating uses. The operational geometric-hazard discussion addresses driveways and queuing but does not present on-site loading dock design, truck circulation, or off-street loading adequacy.	p. 3.15-26 (Operations — access/geometric design); Project Description Table 1	Request that the Final SEIR (or the project-level submittals it tiers to) address off-street loading and goods-movement circulation: number/location of loading docks, design vehicle and turning-path analysis for the hospital, warehouse, and light-industrial uses, and confirmation that loading occurs off-street without using public streets to maneuver. These elements are subject to LADOT and LAMC loading requirements at project-level review.	LAMC §12.21 C-6(a) (off-street loading); Mobility Plan 2035 Goal M-6 / Goal 2.7 (goods movement)	Sec. VI.D (Truck Turning Movement Path Evaluation); Sec. VII (Internal Circulation); Sec. VIII (Loading Docks)	A7-12
DOT Development Review	12	SEIR cites Northeast LA Community Plan Policy 10-1.1 (maintain LOS not to exceed D on avenues/collectors/local streets, E on boulevards) in the consistency review, but performs no LOS analysis because LOS is no longer the CEQA metric under SB 743.	p. 3.15-13 (NELA Community Plan policies); Appendix J (consistency)	LADOT concurs that LOS is not a CEQA significance metric (SB 743; CEQA Guidelines §15064.3(a)). This comment is for completeness: the omission of LOS analysis is correct under CEQA and LADOT does not request LOS analysis as a CEQA matter. To the extent the County relies on the Community Plan consistency finding, the Final SEIR should clarify that the cited LOS policy is a non-CEQA local policy and that its discretionary application rests with the City, not the SEIR.	SB 743; CEQA Guidelines §15064.3(a) (auto delay not a significant impact); TAG §2 (VMT framework); Northeast LA Community Plan Policy 10-1.1 (non-CEQA)	N/A (consistency / non-CEQA LOS)	A7-13
DOT District	13			Please ensure that any traffic impact study includes the Mission/Huntington Blvd Multimodal Project scope. Here is a fact sheet on the project (2 years old) (https://www.710mobilityla.org/wp-content/uploads/2024/04/LA-BOE-Huntington-Dr-Fact-Sheet-Spring-2024-v4.pdf). BOE are the project managers.			A7-14

Response A7-1

Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project. The comment is noted, and no further response is required.

Response A7-2

The comment regarding request to coordination with City of Los Angeles Department of Transportation (LADOT) for review and approval of mitigation measures TRA-3a through TRA-3d is noted, and the County is committed to continued coordination with LADOT as part of the environmental process and the design and construction of mitigation measures within LADOT's jurisdiction. Furthermore, impact TRA-3 language is updated in the Final SEIR, as shown in Chapter 3, *Revisions to the Draft SEIR*.

Response A7-3

The analysis in Chapter 3.15, *Transportation*, of the Draft SEIR (see specifically pages 3.15-26 through 27, uses the LADOT queuing methodology specified in the Transportation Assessment Guidelines (TAG, 2022). Given what is known about the Proposed Project land uses and that the Draft SEIR is a programmatic level SEIR with a 25-year buildout, the use of Synchro is an appropriate planning level methodology for the Master Plan. This approach resulted in the identification of significant queuing impacts, as documented in Chapter 3.15 of the Draft SEIR.

A variety of traffic operations tools exist for various applications, including Synchro, SimTraffic, PTV Vissim, PTV Vistro, Transmodeler, Sidra, and others. SimTraffic microsimulation can be a useful tool for understanding granular traffic operations, including interactions between vehicles, the effects of driver behavior, signal coordination, vehicle queue spillback, and demand starvation interactions between intersections. This tool is also useful for a variety of applications, including determining timing and coordination plans, travel time along corridors, among other applications. As an analysis meant to assess the effects of a long-term, 2050 master plan buildout, Synchro is an appropriate tool for estimating potential queuing effects of the Proposed Project.

As described in Chapter 3.15 of the Draft SEIR, the speed differential was determined using StreetLight "Big Data" from December 3 and 4, 2025. The typical StreetLight user portal is limited in the availability of days for freeway speed data. The days (a Wednesday and a Thursday) chosen are representative of typical days. Additionally, it is standard practice for traffic studies to be conducted based on one day of counts, such as intersection turning movement counts, so long as the day is representative of typical conditions; whereas this speed analysis accounts for two days. Furthermore, the speed data yielded greater than 30 mile-per-

hour speed differentials for all four ramp locations at which queue spillback to the mainline was expected. As such, additional days of data would not increase the number of locations for which an impact was identified, as the speed data was not a factor in determining an over-storage location to be a less than significant impact. Given these limitations, the data used in the Draft SEIR is the best available information to represent weekday conditions.

Response A7-4

Under State CEQA Guidelines Section 15064.3(b)(4), the Lead Agency (the County) is responsible for determining the methodology used to evaluate the environmental impacts of the Proposed Project. In this case, although the Project Site is located in the City of Los Angeles, the Lead Agency owns and controls the Project Site and is responsible for certifying the SEIR, while the surrounding jurisdiction (City of Los Angeles) owns and operates the adjacent roadway transportation network. State CEQA Guidelines Section 15064.3 provides flexibility and does not require one jurisdiction to adopt another jurisdiction's thresholds. Therefore, it is appropriate for the County, as the Lead Agency and owner of the Project Site, to utilize their adopted methodology and thresholds, in this case, the Los Angeles County Transportation Impact Analysis Guidelines (LA County TIA Guidelines) (Los Angeles County Public Works 2020). Additionally, Chapter 3.15, *Transportation*, of the Draft SEIR goes beyond what is typically required in CEQA to provide the modeled vehicle miles traveled (VMT) values, given the Proposed Project screens out of a VMT analysis consistent with the LA County TIA Guidelines. The quantitative VMT results serve as an independent check that further demonstrates that the Proposed Project would also perform well under quantitative metrics using the County's adopted VMT thresholds of significance and, thus, does not solely rely on a qualitative transit screen.

Regarding the population metrics, as noted in the Draft SEIR (see page 3.15-27), population is not an explicit input to the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Activity-Based travel demand Model (ABM). Demographic profiles are developed within the model based on the input of "number of households" and the demographics of the surrounding area. Proximity to the Proposed Project TAZ is required for the SCAG ABM in-model residential demographic profile development. The Lincoln Heights community was used as a profile for the residential household demographics only, due to its proximity, which is an important requirement for this in-model program. This process is typical for estimating VMT using the SCAG ABM. As such, both the total residential VMT and the residential population described in the Draft SEIR are generated from and based upon this synthetic population and, thus, the numerator and denominator in the residential VMT/capita are still representative of VMT per capita expected to be generated by the Proposed Project.

Response A7-5

As stated on page 2-20 of the Draft SEIR (Chapter 2, *Project Description*), for the purposes of the analysis in this Draft SEIR, a conservative parking assumption was used, consistent with the broader buildout scenario. Specifically, 3,005,678 square feet of parking uses were assumed, equivalent to approximately 8,588 parking stalls, which includes replacement parking as a result of any existing parking to be removed as part of Proposed Project. The Draft SEIR assumes a conservative buildout scenario reflecting maximum allowable uses on the Project Site, and development would occur in multiple phases over an extended period. Parking would be delivered concurrently with the uses it is intended to serve, and parking demand would be evaluated on a project-by-project basis to account for changes in travel behavior, including reduced reliance on automobiles through transportation demand management measures implemented as part of this project. The table below shows the assumptions behind the parking supply provision for the Proposed Project and are less than Los Angeles County Municipal Code requirements.

Based on the values shown in Los Angeles County Code Table 22.112.070-A “Minimum Required Parking Spaces”, the Proposed Project land use would translate to over 10,000 code-required parking spaces for the residential, office, retail, and medical office uses alone, plus an additional 1,000 spaces for the community benefits, hotel, education, warehouse, and clean technology uses combined, resulting in over 11,000 spaces to be required. Thus, the Proposed Project provides multiple thousand fewer parking spaces than would be required by County Code.

The County took a two-pronged approach to determine the VMT efficiency of the Proposed Project. While the Proposed Project screened out of further VMT analysis due to its proximity to high-quality transit service (see pages 3.15-20-22 of the Draft SEIR), the criterion was proven to be an applicable approach to determining the significance of Proposed Project VMT impacts as demonstrated quantitatively by modeling VMT/capita and VMT/employment, and net change in regional VMT (related to retail), and showing that the VMT values were below applicable thresholds. Additionally, Chapter 3.15 of the Draft SEIR does not make a claim that the less than significant VMT impact statement relies on public transit while simultaneously providing parking, rather it is a transit accessible project that independently verifies it will be VMT efficient through use of the regional travel model data.

Regarding the implementation of travel demand management (TDM) strategies to discourage driving, the Draft SEIR includes a programmatic menu of potential Transportation Demand Management measures such as Mitigation Measure TRA-3e (see Draft SEIR pages 3.15-34 through 3.15-36, and as revised in Chapter 3, *Revisions to the Draft SEIR*, in this Final SEIR). Its purpose is to reduce vehicle trips to the Los Angeles General Hospital Campus area and, consequently, reduce the number of Proposed Project vehicles using nearby freeway off-ramps. The strategies fall into four categories:

- Employee and commute trip-reduction measures
- Parking-management strategies
- School-related strategies
- Supporting multimodal improvements

Additionally, the Proposed Project includes a Mobility Hub that is intended to serve as the Campus's primary multimodal interface and, thus, reduce dependence on private automobiles.

Response A7-6

Under CEQA, the Lead Agency (the County) is responsible for determining the methodology used to evaluate the environmental impacts of the Proposed Project. In this case, the Lead Agency owns and controls the Proposed Project Site and is responsible for certifying the Draft SEIR while the surrounding jurisdiction (City of Los Angeles) owns and operates the adjacent roadway transportation network. The CEQA analysis in Chapter 3.15 of the Draft SEIR determined that the Proposed Project would be screened out of further VMT analysis due to its proximity to high-quality transit. Additionally, the quantitative modeling undertaken showed that the VMT/capita and VMT/employment metrics were below applicable thresholds, showing that the Proposed Project performed well from a VMT efficiency perspective. As a result, impacts related to VMT are appropriately determined to be less-than-significant, and no Proposed Project trip reduction for VMT mitigation is required.

Nevertheless, and related to impacts related to transportation hazards resulting from queuing on facilities operated by the California Department of Transportation (Caltrans), the Draft SEIR includes a programmatic menu of Transportation Demand Management (TDM) strategies such as Mitigation Measure TRA-3e (pages 3.15-34 through 3.15-36, and as revised in Chapter 3, *Revisions to the Draft SEIR*, in this Final SEIR). Its purpose is to reduce vehicle trips to the Los Angeles General Hospital Campus and, consequently, reduce the number of Proposed Project vehicles using nearby freeway off-ramps and thus reduce the geometric hazard impact related to off-ramp queuing. See also response to comment A7-5.

As a programmatic Draft SEIR for a 2050 master plan buildout, there is inherent uncertainty associated with the specific phasing, developers, operators, and tenants of the proposed uses. Incremental developments under the Master Plan could be implemented decades in the future. Given the programmatic nature of the Master Plan, the VMT and trip-reduction benefits of MM TRA-3e cannot be quantified with a reasonable degree of certainty. Accordingly, MM TRA-3e is appropriately not quantified, and the potential extent of off-ramp queuing is not claimed to be lessened by this measure. Impacts are thus appropriately, and conservatively, presumed to be significant and unavoidable. The strategies included in the Draft SEIR are extensive given the programmatic and long-term buildout nature of the Proposed Project. Additionally, the strategies relate directly to the land uses and proven trip/VMT reduction established by the

California Air Pollution Control Officers Association (CAPCOA). These TDM measures are focused on strategies that are realistically feasible to implement from a master plan, programmatic level.

As described in Section 2.4.3 of the Draft SEIR, the Proposed Project is also proposing a Mobility Hub, shuttles, and bicycle and pedestrian facilities, thus reducing dependence on private automobiles.

Response A7-7

Mitigation Measure TRA-1 (Worksite Traffic Control Plan) addresses this issue directly and includes coordination with LADOT during the design and construction phases of the Proposed Project.

As a programmatic SEIR for a 2050 master plan buildout, there is inherent uncertainty associated with the specific phasing. Thus, it is not reasonable to develop a phase-by-phase traffic control plan at this time. Once further details of the Proposed Project phasing, design, and construction have been determined, the County will work with the City of Los Angeles to develop the appropriate level of construction traffic management plans aimed at (but not limited to) addressing items such as construction traffic, haul routes, worker parking and the general multimodal transportation environment surrounding the Proposed Project.

Response A7-8

Mitigation measures TRA-3a through TRA-3d, as set forth in Chapter 3.15 of the Draft SEIR and as revised in this Final SEIR (see Chapter 3, *Revisions to the Draft SEIR*), include signal timing updates that are aimed at optimizing the components such as the cycle length, offsets, and maximum green times. Pedestrian safety is considered during the planning and design of the Proposed Project. The mitigation measures are not aimed at prioritizing vehicular operations at the expense of pedestrian safety, given the sensitivity of use associated with the fully operational Los Angeles County Medical Center that must remain accessible at all times by various modes of access. Implementation oof the mitigation measures will require either maintaining or updating the pedestrian crossing timing as necessary to comply with the California Manual on Uniform Traffic Control Devices (MUTCD), ADA and agency standards. Regarding the signal operations and mitigation measures, the County will continue coordinating with LADOT during the design and construction phases of the Proposed Project as to not degrade pedestrian safety.

The commenter's note about the HIN statistics refers to a quote in the Regulatory Framework section of Chapter 3.15 of the Draft SEIR. In the description of the City of Los Angeles Vision Zero Action Plan, the chapter states that the High Injury Network (HIN) "represents eight percent of the City's street miles but accounts for approximately *six* percent of all fatalities and serious injury collisions." "Six percent" in this statement should instead be "60 percent". This

metric is a description of that document and is not used in any of the impact findings in the Draft SEIR and has been corrected in Chapter 3, *Revisions to the Draft SEIR*, of the Final SEIR.

Response A7-9

Given the nature of the Master Plan, all design elements are conceptual, including locations for future driveways, and this is described throughout the Draft SEIR. Given that this type of construction would typically require LADOT review along with the applicable City of Los Angeles Bureau of Engineering approval and permits (such as A or B Permits), the County will coordinate with the City of Los Angeles during the design and construction phases of the Proposed Project. Appropriately, LADOT is included as a responsible agency in Table 2-4, *Anticipated Actions Required*, of the Draft SEIR, specifically regarding approval of off-site roadway improvements.

Response A7-10

Chapter 3.15 of the Draft SEIR does not rely purely on multimodal access for the VMT conclusions, rather it is located close to high-quality transit service and hence can be presumed to have a less than significant VMT impact, consistent with the County's adopted transportation guidelines. The quantitative modeling provided in Chapter 3.15 of the Draft SEIR further demonstrates that the VMT/capita and VMT/employment metrics were below applicable thresholds, showing that the Proposed Project performed well from a VMT efficiency perspective (below the County's VMT significance thresholds). See also response to comment A7-4.

As described in Chapter 3, *Project Description* (see Draft SEIR Section 2.4.3, *Circulation and Access*) and Chapter 3.15 of the Draft SEIR (see page 3.15-19 and Appendix J of the Draft SEIR), active transportation is prioritized throughout the Project Site with proposed bicycle and pedestrian-oriented and pedestrian-only pathways and trails, and by aligning new entrances and pedestrian paths with existing pedestrian routes and crosswalks. The County has not committed to the design and construction of any planned City of Los Angeles bike lanes; rather, it refers to them in the Draft SEIR and acknowledges that the Proposed Project would not conflict with their implementation.

In addition, as stated on page 2-27 of the Draft SEIR, a Mobility Hub could be strategically located to enhance access to existing surrounding bus lines and the existing internal Campus shuttle. The comment incorrectly links the Mobility Hub to TRA-1 in support of the less-than-significant finding. Mitigation Measure TRA-1 is related to the construction effects of the Proposed Project. While the Mobility Hub would likely support multimodal access and offer alternatives to driving, the analysis in Chapter 3.15 of the Draft SEIR does not rely on the Mobility Hub for plan consistency or VMT findings.

Response A7-11

The suggested correction to Avenue III has been included in Chapter 3, *Revisions to the Draft SEIR*, of the Final SEIR.

Response A7-12

As this is a programmatic Draft SEIR, full details have not yet been defined for the design and final location of the loading/unloading areas for each land use/building. As described in further detail on page 2-28 of the DEIR, the Proposed Project would include a service loop for County of Los Angeles Department of Health Services (DHS) trams, waste transfer, loading, and deliveries. Service and loading operations would be consolidated along a proposed dedicated service entry. Loading areas would be designed to be located away from primary pedestrian ingress and egress areas by at least 20 feet. The Proposed Project's street network would be designed to provide comprehensive fire and emergency access to all buildings within the main Campus while preserving the existing access lanes to facilities outside the main Campus. Given that the Proposed Project is located on County land, the loading requirements are subject to the guidance specified in the County of Los Angeles Municipal Code (LAMC). Therefore, the loading areas are not subject to LADOT review or LAMC requirements.

Response A7-13

Appendix J, "Plans, Programs, Ordinances, Policies Review" of Chapter 3.15 of the Draft SEIR identifies the following policy from the Northeast Los Angeles Community Plan: "Policy 10-1.1: Maintain Levels of Service for streets and not to exceed LOS "D" for avenues, collector streets, and local streets; not to exceed LOS "E" on Boulevards or in the community's major business districts". The "consistency finding" section of Appendix J table notes that as a result of SB 743, intersection delay (LOS) is no longer a criterion used to assess transportation impacts under CEQA" and as such, there is no conflict with this policy under CEQA. The Final SEIR has been updated to include language to further clarify the discretionary approval responsibility on this item, and that it rests with the City rather than the SEIR (see Chapter 3, *Revisions to the Draft SEIR*, of this Final SEIR).

Response A7-14

The Mission/Huntington Boulevard Multi-Modal project stated in the comment is currently in the environmental and preliminary engineering phase and extends almost four miles from North Mission Road, just north of the Hospital Campus to the Alhambra/South Pasadena City limits. The draft environmental impact report (DEIR) for the Mission/Huntington Boulevard Multi-Modal project was not publicly circulated as of time of the publication of the Draft SEIR; however, the Mission/Huntington Boulevard Multi-Modal project does not change the impact findings of the Proposed Project's Draft SEIR. The Mission/Huntington Boulevard Multi-Modal

project is likely to include priority bus treatments, bicycle facilities and an improved pedestrian environment that will result in changes to the traffic operations and multimodal access of the transportation network adjacent to the Hospital Campus which is in line with the mobility goals and objectives of the Proposed Project. The County reserves the right to provide comments during the City's environmental review of the Mission/Hunting Boulevard Multi-Modal project to ensure the final project is compatible with the Campus's long-term circulation and access needs.

Subject: Environmental Document Review - SCH # 2014051061 - Due to Lead Agency by 07/1/2026

Good morning,

Special Projects Section (SPS) recently received the referenced Notice of Environmental Impact document from the State Clearinghouse (SCH) outlined in the following Web site:

Los Angeles County General Hospital Campus Master Plan

We had sent the Notice of Preperation of a Draft EIR back in September of 2025 and it was annotated that there would be no impact to the Central Los Angeles Area. CHP was listed as a reviewer for the Supplemental EIR package and if there is still no impact to your command, we can annotate it and continue to monitor the EIR until it reaches the final stages. If impact is determined, a response letter should be e-mailed directly to the Lead Agency with a cc to SCH and myself.

For more information on the EIR review process, please check out: Commanders EIR Training.pdf.

Date: June 10, 2026

To: Central Los Angeles Area

From: **DEPARTMENT OF CALIFORNIA HIGHWAY PATROL**
Special Projects Section

File No.: 063.A15083.A20420.NoC.Doc

Subject: ENVIRONMENTAL DOCUMENT REVIEW AND RESPONSE
SCH# 2014051061

The Special Projects Section (SPS) recently received the referenced Notice of Completion environmental impact document from the State Clearinghouse (SCH).

Please use the attached checklist to assess its potential impact to local Area operations and public safety. If it is determined that departmental input is advisable, your written comments referencing the above SCH number must be sent to the lead agency and emailed to state.clearinghouse@lci.ca.gov. Your written comments must be received by the SCH no later than **July 1, 2026.** For reference, additional information can be found in General Order 41.2, Environmental Impact Documents.

For project tracking purposes, the SPS must be notified of the assessment of the project (including negative reports). Please e-mail a copy of the response to EIR@chp.ca.gov. For questions or concerns, please contact the Transportation Planning Unit at (916) 843-3370.

Los Angeles General Medical Center Campus/Public Facilities/Public Facility

Project Description: *(please use a separate page if necessary)*

The Proposed Project includes implementation of a new Master Plan including Use and Development Standards, which would guide long-term redevelopment of parts of the Project Site, including adaptive reuse of the General Hospital Building. The Proposed Project includes the demolition of existing buildings, structures, storage containers, modular buildings, pavement, utilities, and landscaping to allow for the development of approximately 8.1 million square feet of new uses, including residential, general office, medical office, retail, patient and caregiver lodging, community facilities, education, warehouse, clean tech/light industrial, and hospital uses. The Proposed Project includes other related improvements related to infrastructure, including utilities, circulation and transportation demand management strategies, parking, and open space and landscaping.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

Response A8-1

The comment that there is no impact to the Central Los Angeles Area's local operations and/or public safety is noted. This comment does not raise environmental concerns. No further response is required and no revisions to the Subsequent Environmental Impact Report (SEIR) are warranted to respond to this comment. Your comments and the County's responses thereto will be included in the Final SEIR considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

2.3.2 Comments from Organizations

O1. Alma Family Services, June 28, 2026

O1

From: Diego Rodrigues
To: General Hospital Project
Subject: Los Angeles County General Hospital Campus Master Plan - Subsequent EIR Comment
Date: Sunday, June 28, 2026 2:41:18 PM
Importance: High

CAUTION: External Email. Proceed Responsibly.

Good afternoon,

My name is Diego Rodrigues, Executive Vice President and Chief Operating Officer of Alma Family Services.

Alma has proudly served Los Angeles County for more than 50 years, and since 2014 we have provided integrated behavioral health services on the historic General Hospital campus. We are pleased to express our strong support for the Los Angeles County General Hospital Campus Master Plan.

For generations, this campus represented hope, healing, and compassionate care for millions of Angelenos, particularly those who otherwise faced significant barriers to healthcare. The proposed adaptive reuse honors that legacy by transforming a historic landmark into a place that once again promotes health, dignity, opportunity, and community. We are especially encouraged by the vision of a Healthy Village that integrates affordable housing, behavioral health and supportive services, economic opportunity, open space, and community-serving uses while preserving the historic character of this iconic campus. This project reflects the original purpose of this place; not simply as a collection of buildings, but as a center of healing, restoration, and public service.

O1-1

We also appreciate the years of thoughtful community engagement that have shaped this vision and encourage the County to continue prioritizing multilingual, culturally responsive engagement as implementation moves forward. As an organization that serves thousands of children, families, older adults, and vulnerable residents each year, Alma knows firsthand how transformative it is when healthcare, housing, community services, and economic opportunity are intentionally brought together in one place.

Best,

Diego H. Rodrigues, M.A., LMFT, Ph.D Candidate

RE: Eastside LEADS's Public Comment for Draft Subsequent Environmental Impact Report (SEIR) for the General Hospital Centennial Development Project

On behalf of the Eastside LEADS coalition, the undersigned organizations write to submit a public comment in response to the Draft Subsequent Environmental Impact Report (SEIR) for the General Hospital Centennial Redevelopment Project, released on May 15, 2026. O2-1

Project Changes from 2014 Draft SEIR to 2026 Draft SEIR

Upon review of the 2026 Draft SEIR, the Eastside LEADS Coalition holds concerns about changes to the project scope that are important to note on record. The 2026 SEIR addresses 6.8 million acres of land. This represents a 5.6 million-acre difference from what was initially assessed in the 2014 Draft SEIR. Moreover, the proposed project would increase the site's daytime population by 16,704, comprising 8,000 residents, 1,222 students, and 7,482 employees. In addition to the 12,850 existing employees on the project site, at buildout, the site could have a total daytime population of approximately 29,554 people. Consequently, the coalition has determined that the environmental impacts considered in the 2026 draft SEIR are fundamentally different from those of the 2014 SEIR. O2-2

Given the substantial increase in acreage of land and population being considered in this revision to the SEIR, the Eastside LEADS coalition holds reservations about the relevance and accuracy of the impacts discussed in the 2014 draft SEIR. Accounting for these significant changes, the coalition questions whether it is appropriate to integrate the 2014 draft SEIR into the 2026 draft SEIR.

Infrastructure Needs

The coalition also holds concerns about the infrastructure needed to sustain this redevelopment at completion. Given the proposed scale of the residential community, a potential 8,000 residents, parking will need to be available for households (who have more than one vehicle) and the other populations that will frequent this campus (patients, workers, students, families, children, etc). O2-3

O2

Parking should also be free for residents living in affordable housing units, and potentially low-cost for other groups. It is the opinion of the coalition that the 8,588 parking spaces considered in the Draft SEIR does not appropriately address the parking need generated by the increase of residents, employees, and students. In addition, our Coalition is concerned about the potential impact on the quality and cost of water, electric, gas, and sanitation services for surrounding tenants caused by the demand of this redevelopment. An increased cost to these utilities would be a difficult and unexpected cost for many working-class families in the community, including members of our coalition.

O2-3 Cont.

O2-4

Affordable and Social Housing

The Eastside LEADS coalition remains steadfast in our commitment to advocate for 100% affordable housing and is excited to maximize the opportunity for social housing via the potential 3,200 units proposed by this project. The coalition, however, has determined that the assessment of the current and future housing needs included in section 3.12 of the 2026 Draft SEIR excludes a localized lens; by assessing housing needs at the county level, the specific needs of the neighborhood immediately surrounding the LA General Hospital, like Boyle Heights, Lincoln Heights, and East LA, are not accurately captured.

O2-5

Our coalition has consistently uplifted that the AMI of these neighborhoods is substantially lower than county-level AMIs. This localized assessment elucidates the need for robust social housing in this redevelopment project that sets aside affordable housing for households in the lowest AMI categories (including acutely low, extremely low, very low- and low-income).

Social housing proposals, including options such as a Limited Equity Housing Cooperative, involvement of a Community Land Trust, and ownership opportunities for tenants, are not addressed at all. We would like to see the County and Developers pursue these options as well. Because of the striking need for housing in our communities, The Eastside LEADS coalition requests that the proposed project, and any project alternatives–including alternatives A,B,and C–seriously consider incorporating a social housing system.

O2-6

Tracking and Reporting

A transparent and accountable tracking and reporting system of the environmental impacts of this redevelopment project and mitigation strategies will be crucial to ensuring equitable development. The proposed project would result in significant and unavoidable environmental impacts felt by residents living directly on and around this campus. These unavoidable impacts include things such as changes to the air quality (construction vehicle exhaust, paint for building, pollutants caused by hospital operation, odor nuisance, etc). The Eastside LEADS coalition requests that all mitigation measures aimed to reduce significant unavoidable impacts, like mitigation measures AIR-1a, AIR 1b, and AIR-4c, be tracked and reported publicly, including

O2-7

O2

regular updates to the Health Innovation & Community Partnership (HICP). In addition to mitigation efforts, the Developer(s) shall track and report the ongoing and future environmental impact of their project to the HICP. This transparency will be key to holding developers accountable, particularly for a project of this scale.

O2-7 Con

The Coalition would like to briefly note that while the SEIR describes the scope of the community benefits this project hopes to deliver—like housing, healthcare access, transportation equity, economic & workforce development, etc.—it does not properly address how the legally binding Community Benefits Agreement (CBA) will be enforced as this project unfolds through a phased process of project-level CBAs and how that process will modify the environmental impacts.

O2-8

Lack of Outreach and Time in the Public Engagement Process

Lastly, the Eastside LEADS Coalition would like to state our concern about the public engagement spearheaded by the Department of Economic Opportunity (DEO) during the 45 day public comment period following the public release of the Master Plan and Draft SEIR. It is the opinion of the Coalition that, during this 45 day period, substantive public comment was not collected from the local residents who would be most impacted by this project. We believe more robust efforts should have been taken to engage community members in the public comments process.

Although a notification was made to the public (via General Hospital newsletter email) about the virtual public meeting and release of the Master Plan and draft SEIR on May 15, 2026, the Eastside LEADS Coalition believes more active effort should have been done to uplift the virtual public comment on June 11, 2026 and the June 29th, 2026 public comment deadline to the Health Innovation Community Partnership (HICP), the Community Advisory Committee (CAC), and other heavily trafficked public spaces online and in-person. We believe the low engagement during virtual public comment and the lack of written public comments are a consequence of these efforts that were lacking.

O2-9

It is our recommendation that, moving forward, the bodies involved in engaging the public for input —including the Department of Economic Opportunity (DEO), the office of Supervisorial District 1 (Hilda Solis), and Centennial Partners—commit to more robust efforts to: (1) publish key updates about the project on in person and digital public platforms that are easily accessible (both in location and language) (2) increase in person AND digital efforts to encourage participation in in-person and online public comments submission (canvassing, newsletter publications, collaborations with local gov offices and NGOs) (3) when possible, host both in-person and online opportunities to submit public comments in sites frequented by community members (i.e. city hall, recreation center, public school).

O2

Impact of the Lineage Fire on Public Comment and Engagement

Critically, we must acknowledge that Boyle Heights and the Eastside at large were devastated by the Lineage Fire in the last two weeks before the close of this public comment period. As a result, community leaders and involved residents who would typically engage in public comment for a local project had severely limited capacity, and we ask for additional comment time to acknowledge this impact. O2-10

Sincerely,
The Eastside LEADS coalition

The following coalition partners have endorsed this letter: O2-11

- InnerCity Struggle
- Latino Equality Alliance
- Legacy LA
- Public Counsel
- Self Help Graphics & Art

Response O2-1

This comment is noted and the County has received the Eastside LEADS coalition's comment letter regarding the Proposed Project. The County's responses to the Eastside LEADS coalition's comments are provided below. Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

Response O2-2

It should be noted that the commenter incorrectly states that the Draft SEIR addresses 6.8 million acres of land, a 5.6 million acre increase from the 2014 Certified EIR. The Project Site encompasses 81.9 acres and the development of 8,060,978 square feet of new development with the adaptive reuse of approximately 1.2 million square feet within the General Hospital Building. The 2014 Master Plan proposed 1,245,000 square feet of new development. The Draft SEIR and the 2014 Certified EIR have the same Project Site boundaries and acreage of 81.9 acres (see page 2-2 of the Draft SEIR). As discussed in Chapter 1, *Introduction*, of the Draft SEIR, the County determined that the current Proposed Project includes substantial changes from the previously approved project that could result in new or more severe significant environmental effects. Accordingly, consistent with State CEQA Guidelines Section 15162, the preparation of a Draft SEIR was determined to be appropriate.

The Draft SEIR identifies and summarizes the environmental review history for the Project Site, including the 2014 Certified EIR, to provide the necessary CEQA context and document the basis for subsequent environmental review. However, the impact analyses in the Draft SEIR evaluate the environmental effects of the current Proposed Project based on existing environmental conditions and the current project description. The analyses do not rely on the previous 2014 Master Plan buildout assumptions as the baseline for determining environmental impacts, nor do they compare the environmental effects of the current project to those associated with the previously approved project except where such comparisons are relevant to explaining the project's environmental review history or the basis for preparing a Draft SEIR.

Accordingly, the incorporation of the previous EIR into the Draft SEIR is consistent with CEQA and serves to document the environmental review history of the Project Site. The environmental analyses presented in the Draft SEIR reflect an independent evaluation of the current Proposed Project and provide the information necessary for decision-makers to consider its environmental effects.

While the prior Certified 2014 Master Plan EIR evaluated a project that included less development, it remains part of the Proposed Project's environmental review history and is appropriately identified and incorporated by reference as required by CEQA. The environmental conclusions and impacts determinations in the Draft SEIR are based on the current Proposed

Project rather than the previously approved project. The comment does not identify a deficiency in the environmental analysis. Revisions to the Draft SEIR are not required to respond to this comment.

Response O2-3

As described in the Draft SEIR, the Proposed Project would include on-site parking facilities. The specific management, operation, and pricing of parking facilities, including whether parking would be provided free of charge to residents or other users, are operational and policy considerations that are outside the scope of CEQA's environmental review. Pursuant to CEQA, the adequacy of parking is generally considered a planning and land use issue rather than a physical environmental impact. State CEQA Section 15131 states that social effects, such as parking shortages, do not constitute significant environmental impacts unless they would result in a physical change to the environment.

As stated on page 2-20 of the Draft SEIR,

> For the purposes of this analysis in this Draft SEIR, a conservative parking assumption was used consistent with the broader buildout scenario. Specifically, 3,005,678 square feet of parking uses were assumed, equivalent to approximately 8,588 parking stalls, which includes replacement parking as a result of any existing parking to be removed as part of Proposed Project.

The purpose of the Draft SEIR is to evaluate the physical environmental effects of the Proposed Project pursuant to CEQA. Parking-related considerations will continue to be evaluated as the Proposed Project moves forward through subsequent planning and implementation. Eastside LEADS is on the Proposed Project's distribution list and will be included in all future public communications regarding future projects and activities, including project design and parking provisions when specific projects are proposed. The comment does not provide substantial evidence demonstrating that parking associated with the Proposed Project would result in physical environmental impacts beyond those evaluated in the Draft SEIR or that the Draft SEIR's analyses are inadequate. No revisions to the Draft SEIR are warranted to respond to this comment.

Response O2-4

The Draft SEIR evaluates the Proposed Project's potential impacts related to utilities, including energy, water supply, wastewater, solid waste, and other infrastructure, based on anticipated demand resulting from implementation of the Proposed Project. The Draft SEIR concluded that the Proposed Project would result in less than significant impacts on utilities and service systems with the implementation of mitigation. While utility rates and service costs are important considerations for Proposed Project implementation and community members, the

purpose of the Draft SEIR is to evaluate the physical environmental impacts associated with providing utility services pursuant to CEQA. The comment does not provide substantial evidence demonstrating that the analyses presented in the Draft SEIR are inadequate or that the Proposed Project would result in physical environmental impacts related to utility or sanitation services beyond those evaluated in the Draft SEIR. Accordingly, no revisions to the Draft SEIR are warranted to respond to this comment.

Response O2-5

The methodology section of Chapter 12, *Population and Housing*, of the Draft SEIR, states that because the Project Site is owned by the County of Los Angeles but is located within the City of Los Angeles, the study area for the Proposed Project's analysis is the City of Los Angeles. Accordingly, the Draft SEIR evaluates the Proposed Project's potential population and housing impacts within the local jurisdiction where the Proposed Project would be. Consistent with this methodology, the Draft SEIR evaluates the Proposed Project's population and housing impacts using applicable local and regional data, including Southern California Association of Governments (SCAG) population, housing, and employment projections for the City. These data provide the basis for evaluating project-specific impacts within the local jurisdiction. In addition, the Draft SEIR also provides housing data for specific census tracts within approximately one mile of the Project Site, which include the Northeast Los Angeles Community Plan Area and Boyle Heights (see page 3.12-6 and Table 3.12-4 of the Draft SEIR).

Where appropriate, the Draft SEIR also references County-level information to provide regional context and to evaluate cumulative conditions consistent with CEQA. The use of regional data for cumulative impact analysis does not replace or supersede the project-specific analysis conducted at the City level. Rather, it provides additional context for evaluating the proposed project's contribution to cumulative housing and population conditions. No revisions to the SEIR are warranted to respond to this comment.

Response O2-6

The commenter expresses concern related to Area Median Income (AMI). The County acknowledges that AMI and housing affordability are important considerations in evaluating housing needs and developing housing policy. However, the purpose of the Draft SEIR is to evaluate the Proposed Project's physical environmental effects pursuant to CEQA. The analysis presented in the Draft SEIR does not rely on AMI to determine the significance of environmental impacts.

The Draft SEIR evaluates the environmental impacts of the Proposed Project in accordance with CEQA. Chapter 12, *Population and Housing*, analysis evaluates the Proposed Project's potential environmental impacts using the methodology described in the Draft SEIR, including the City of Los Angeles as the study area and applicable local and regional demographic information. The

purpose of the Draft SEIR is to evaluate the physical environmental effects of the Proposed Project and any feasible alternatives that would avoid or substantially lessen significant environmental impacts.

As stated on page 2-9 of the Draft SEIR, the provision of new housing, including affordable, supportive, workforce, market rate, and other needed housing types, is a key objective of the Proposed Project. Of the up to 3,200 housing units provided, a minimum of 25 percent would be designated affordable (see page 2-14 of the Draft SEIR). The inclusion of a social housing program, affordable housing requirements, or income-based housing set-asides constitutes a project design and policy consideration rather than an environmental issue requiring analysis under CEQA. CEQA does not require the Draft SEIR to evaluate or incorporate alternative housing policies that are unrelated to the identification or mitigation of significant environmental impacts. No revisions to the Draft SEIR are warranted to respond to this comment.

Response O2-7

As disclosed in the Draft SEIR, the Proposed Project would result in significant and unavoidable environmental impacts, notwithstanding the incorporation of all feasible mitigation measures. Consistent with State CEQA Guidelines Section 15097, the County will prepare and adopt a Mitigation Monitoring and Reporting Program (MMRP) in conjunction with Proposed Project approval. The MMRP identifies each adopted mitigation measure, the party responsible for implementation, the timing of implementation, and the monitoring party to ensure that mitigation measures are implemented as required.

The request that project updates be provided to the Health Innovation & Community Partnership (HICP) is an administrative recommendation that is outside the scope of the Draft SEIR. Neither CEQA nor the State CEQA Guidelines require a lead agency to provide periodic mitigation monitoring reports to a particular organization. The County will implement the adopted MMRP in accordance with applicable CEQA requirements. The Proposed Project team may elect to provide the requested updates as part of the Proposed Project's community outreach; however, the request is outside of the requirements of CEQA. No revisions to the SEIR are warranted to respond to this comment.

Response O2-8

As described in Chapter 2, *Project Description*, of the Draft SEIR, the Community Benefits Agreement (CBA) is identified as an anticipated action associated with Proposed Project implementation and would be subject to separate review and approval by the County (see specifically Table 2-4, *Anticipated Actions Required*). The purpose of the Draft SEIR is to evaluate the Proposed Project's potential physical environment impacts in accordance with CEQA. The legal provisions governing the implementation, administration, and enforcement of the CBA are

matters that are addressed through the applicable agreements and project approval process rather than through the Draft SEIR.

This comment does not identify a deficiency in the Draft SEIR's environmental analysis or provide substantial evidence demonstrating that the analysis is inadequate. No revisions to the Draft SEIR are warranted to respond to this comment.

Response O2-9

Refer to Topical Response 1: Public Review Process and Community Outreach for a detailed discussion of the noticing and outreach undertaken for the Proposed Project.

The County provided the required public notice and made the Draft SEIR available for review during the identified public review period, thereby providing interested agencies, organizations, and members of the public with an opportunity to review the document and submit comments.

The commenter's recommendation that additional community outreach or public engagement efforts should have been conducted reflects a preference regarding the public participation process but does not identify a deficiency in the Draft SEIR's environmental analysis or demonstrate that the environmental review process failed to comply with applicable CEQA requirements.

A Community Advisory Committee (CAC) was established to review and provide input into the development of the Master Plan and included representatives from a range of local stakeholder groups. The CAC provides a forum for reviewing Master Plan materials, sharing feedback, and helping shape how information is communicated. Additionally, a Health Innovation Community Partnership (HICP) was established and facilitated engagement of healthcare providers, institutions, and community-serving organizations connected to the Project Site.

Engagement was enacted through pop-up outreach, participation in existing forums, small group meetings, advisory committees, and community-at-large workshops. Over the course of the community engagement process, beginning in June 2025, there were 102 group meetings, 24 pop-up participation events, 26 forum presentations, 35 townhall meetings, and 3 community-at-large meetings.

Engagement has taken place regularly throughout the Master Plan development process and has not been limited to key milestones, providing for engagement with different stakeholders. Engagement was carried out by County's development partner, the Centennial Partners team (Applicant), in collaboration with a network of stakeholders, which included community-based organizations, healthcare workers, labor groups, educational partners, and neighborhood leaders, as well as individuals who interact with the Project Site on a daily basis. Outreach was conducted in multiple languages to engage with different audiences throughout East Los Angeles. The Applicant team also maintains an active on-site presence, that includes a working

office on the Project Site, which allows for regular interaction with those who use the Project Site daily.

The County conducted a virtual public informational meeting on June 11, 2026, during the 45-day public review period for the Draft SEIR as part of its outreach regarding the Proposed Project. All information was provided in simultaneous English and Spanish. The commenter's opinion regarding the level of participation at the June 11, 2026, informational meeting and the effectiveness of the County's outreach efforts do not demonstrate that the environmental review process failed to comply with CEQA or identify a deficiency in the Draft SEIR's environmental analysis.

The Draft SEIR was circulated for public review in accordance with the requirements of CEQA and the State CEQA Guidelines, and the County provided opportunities for interested agencies, organizations, and members of the public to review the Draft SEIR and submit comments during the public review period. The County has considered the commenter's recommendations regarding enhanced public outreach and public participation. These recommendations are related to the manner in which future public engagement activities may be conducted and do not identify deficiencies in the environmental analysis presented in the SEIR or demonstrate noncompliance with CEQA's public review requirements.

No further response is required and no revisions to the Draft SIER are warranted to respond to this comment.

Response O2-10

The County acknowledges the commenter's concerns regarding the impact of the fire on June 19, 2026, on the surrounding communities. The Draft SEIR was circulated for public review on May 15, 2026 for 45 days in accordance with the requirements of CEQA and the State CEQA Guidelines. Additionally, a virtual public information meeting was held on June 11, 2026. The close of the comment period was June 29, 2026. Adequate time was provided during the public review period for interested agencies, organizations, and members of the public to review the Draft SEIR and submit written comments as required by CEQA. The County has considered all comments received during the public review period and has prepared responses to those comments in accordance with CEQA.

The commenter's request for an extension of the public review period concerns the administration of the environmental review process and does not identify a deficiency in the environmental analysis presented in the Draft SEIR. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

Response O2-11

The commenter provides their signature and identifies the coalition partners that have endorsed the comment letter. This comment is noted. This comment does not raise environmental concerns. No further response is required and no revisions to the SEIR are warranted to respond to this comment.

RE: Comments on the Draft Subsequent Environmental Impact Report (SEIR) for the Los Angeles County General Hospital Campus Master Plan (SCH No. 2014051061)

Dear Ms. Hence,

Thank you for the opportunity to comment on the Draft Subsequent Environmental Impact Report (Draft SEIR) for the Los Angeles County General Hospital Campus Master Plan. The Conservancy supports the Master Plan's vision of expanding the campus beyond episodic care into a place that supports daily lives, opportunity, and belonging. We believe the Master Plan can balance a mix of uses that reflect community priorities and County objectives. We enthusiastically support the adaptive reuse of the National Register Los Angeles County General Hospital – Acute Unit and the creation of needed community resources, as this will be truly transformative and bring much-needed housing to Los Angeles. We however do have some questions regarding the current scope of impacts on historic and cultural resources. O3-1

To satisfy the requirements of the California Environmental Quality Act (CEQA), the Draft SEIR must account for changes in the project, changed circumstances, and new information that impacts the integrity of the historic campus. To ensure compliance with CEQA Guidelines Section 15162 and 15164, we request that the following four major comments regarding the Draft SEIR's cultural resources analysis be addressed.

I. New mitigation measure is needed to address significant environmental impacts of the updated 2026 Master Plan on the Viaduct (604). O3-2

O3

2

The 2026 Master Plan treatment of the Pharmacy Building (502) and Viaduct (604) and recommended Project Design Features (PDFs) 4 and 5 rely on an analysis that the Pharmacy Building and Viaduct are not historic resources pursuant to CEQA because they were contributors to a largely demolished eligible Support Services historic district and do not appear to be individually eligible historic resources. The Draft SEIR fails to fully analyze the structural and aesthetic impacts of adjacent grading, demolition, or new construction on these historic resources because they were analyzed and treated as non-historic resources pursuant to CEQA in the 2026 Los Angeles County General Hospital Campus Master Plan.

According to the 2014 Los Angeles County General Hospital Campus Master Plan, the Pharmacy Building had been determined individually eligible for the National Register of Historic Places in 1976 and given a 3S status code. The Viaduct was also determined eligible for the National Register in 1976, with a 3D status code, for its associations with the General Hospital - Acute Unit. Having both been determined eligible for the National Register, they were listed on the California Register of Historical Resources. These eligibility determinations were reconfirmed in 1999.[1]

Despite the loss of integrity to the Support Services historic district, the Conservancy believes both resources should be treated as historic resources; the Pharmacy building is an early, rare and intact example of an institutional resource associated with the theme of "Public and Private Health & Medicine"[2] in the Adelante Eastside Redevelopment Agency Area, and the Viaduct is a character-defining feature of the General Hospital – Acute Unit.[3]

O3-2 Cont.

By way of background, mitigation measures approved for the Pharmacy Building and Viaduct in 2014 were:

- MM-CR-3: A protection plan for the viaduct/tunnel shall be prepared prior to the construction of any master plan project that would occur in the immediate vicinity of the viaduct/tunnel. This protection plan shall be prepared by a qualified historic preservation specialist who shall document the current condition of this structure before any construction begins and monitor the structure during construction.

- MM-CR-4: A historic structures report shall be prepared that identifies the character-defining features of the old Administration Building and the Pharmacy/Service Building, which will provide the basis for preparation of a protection and preservation plan for these buildings. The preservation and protection plan shall be prepared by a qualified historic preservation consultant who will document the current condition of the buildings and monitor the condition of the buildings during any construction activities.

O3

3

The 2026 Master Plan requires PDFs 4 and 5, which call for HABS/HAER Level II documentation for the Pharmacy Building and Viaduct and an Interpretation plan for the Viaduct.[4]

Considering the need to balance County priorities and community needs, we understand the rationale in updating mitigation measures related to the Pharmacy Building and Viaduct provided in the 2014 Master Plan FEIR. In lieu of carrying over the approved 2014 mitigation measures for these resources, we support PDFs 4 and 5, and appreciate that the County has prepared concept plans for interpreting the Viaduct as part of the 2026 Master Plan SEIR. While none of these options include full preservation, the Conservancy supports formalizing Option 1: Partial Preservation + New Program as an additional required mitigation measure associated with the Viaduct. Further, we support preserving as much of the Viaduct structure as feasible to incorporate into the County's interpretative plan. Doing so will lessen the impact to a rare historic resource and offers a unique opportunity to interpret history and operations of Los Angeles County General Hospital, while creating a unique public amenity to be enjoyed by future residents and guests. O3-2 Cont.

Action: Add PDF 6 Partial Preservation + New Program. A qualified historic preservation specialist will be hired to develop the preservation plan and will document the current condition of the structure before any construction begins and monitor the structure during construction.

II. Visual and Spatial Encroachment on contributing features including Los Angeles County General Hospital - Acute Unit (101), Patient's Building (102), Visitor's Building (103), and Entrance Forecourt.

The proposed placement, massing, and height of up to four stories of proposed new development surrounding the Patient's Building (102) and Visitor's Building (103) encroaches upon contributing features of the National Register Los Angeles County General Hospital– Acute Unit historic district. The Conservancy believes the historic setting and viewsheds of the Los Angeles County General Hospital – Acute Unit (101) must be protected. O3-3

Encroachment that significantly alters spatial relationships or obstructs historic viewsheds associated with the Acute Unit and contributing resources may not be consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. To help ensure compatibility, the Draft SEIR should incorporate clear design guidelines, including appropriate height limits and setback requirements for any new construction surrounding contributing structures. New development should be carefully designed to remain subordinate in scale, height, and massing, thereby supporting the continued integrity of the historic district. Existing grade differences can be creatively leveraged to minimize visual impact while still achieving project goals.

Action: Pursue alternatives and include diagrams and views that show proposed maximum development at the Patient's Building and Visitor's Building from all

[4] See PDFs 4 and 5 in *Los Angeles County General Hospital Campus Master Plan Draft Subsequent EIR 2026*, page 2-26.

O3

4

directional views to understand and minimize the impacts on contributors, the Acute Unit, and associated historic district.

O3-3 Cont.

III. Insufficient analysis of impacts to Historic Marengo Street and Zonal Avenue Gateways (137) and Control House (136).

The Draft SEIR lacks clarity regarding the physical and operational fate of the historic gateways identified as structures 136 and 137. These entryways serve as literal and symbolic thresholds to the historic campus. The Final SEIR must explicitly clarify whether the proposed development, utility routing, or circulation adjustments will alter, damage, or relocate these gateways. The plan currently states that the historic central gateway may be relocated further along Zonal Avenue.[5] We request the County study the impacts relocation will have on the integrity of the contributor and historic district. Additionally, we request alternative preservation strategies to retain the historic central gateway in place to avoid jeopardizing the integrity and status of the National Register historic district.

O3-4

Actions: Clarify and provide 1) How the relocation impacts the historic resource and historic district's integrity; and 2) Pursue alternatives to relocating the contributing resource. The County will also provide diagrams and views from all directional views showing how proposed development will impact these historic resources.

IV. Failure to Identify Hazard Park as a Historic Resource in the Vicinity of the Project Site.

The Draft SEIR does not appear to identify adjacent Hazard Park, located at 2230 Norfolk Street as a significant historic resource within close geographic proximity to the project site. Established in 1892, Hazard Park has been recognized in the *Adelante Eastside Redevelopment Area Historic Resources Survey* and assigned a 5S3 status code.[6]

O3-5

In addition to its importance as a late 19th/early 20th century landscape design, Hazard Park holds cultural and historical significance under SurveyLA themes of Education 1930-1980 and Civil Rights Movement 1920-1980. Notable, the park is associated with the 1968 Chicano Student Walkouts, during which high school students from five LAUSD schools (including nearby Roosevelt High School in Boyle Heights and Lincoln High School in Lincoln Heights) walked out of their schools to demand educational reform. Hazard Park became a vital staging ground and community sanctuary during the height of these protests.[7]

O3

5

Action: The Final EIR shall formally recognize Hazard Park as a historic resource and study indirect and cumulative impacts to the resource pursuant to CEQA. O3-5 Cont.

In conclusion, the Conservancy strongly supports the adaptive reuse of Los Angeles County General Hospital for housing, as it will activate this historic place and truly transform this area of Los Angeles. Through our comments, the Conservancy has identified concerns regarding the Draft SEIR's treatment of historic resources and the evaluation of potential project impacts, which suggest areas where the analysis could be further strengthened. We urge the County to address these considerations and gaps in the Final SEIR to help ensure the Los Angeles County General Hospital Campus Master Plan appropriately recognizes its historic significance while thoughtfully planning for the future. O3-6

About the Los Angeles Conservancy:

The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 5,000 member households throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Sincerely,

Andrew Salimian
Director of Advocacy

Response O3-1

The County acknowledges the commenter's support for the Proposed Project and the commenter's questions regarding the scope of impacts on historic and cultural resources on the Project Site. The County's responses to the commenter's questions are provided below. Your comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the proposed Project.

The Draft SEIR prepared for the Proposed Project thoroughly evaluates the changes in the project, changed circumstances, and new information related to the historical integrity of the Campus through an updated Historic Resources Technical Report that was included as Appendix E to the Draft SEIR. The commenter raises four specific comments that are addressed below in responses to comments O3-2 through O3-5.

Response O3-2

I. New mitigation measure is needed to address significant environmental impacts of the updated 2026 Master Plan on the Viaduct (604).

The Pharmacy Building and Viaduct were previously identified as contributors to an eligible historic district (known as the Support Services Site) by Historic Resources Group (HRG) in 1994.[1] The Support Services Site comprised the area to the west of the General Hospital–Acute Unit (see Draft SEIR, pages 3.4-20 to 3.4-24). However, 12 out of the 14 buildings/structures that were previously identified by HRG as contributors to the Support Services Site were demolished in the late 1990s and 2000s. Given the nearly complete demolition of buildings that comprised the Support Services Site, the previously identified potential historic district no longer retains a significant concentration of buildings and structures from General Hospital's early 20th century development. Thus, it does not retain sufficient integrity to convey its significance as a historic district under federal, state, or local designation criteria, and the Pharmacy Building and Viaduct are not contributors to the district, since the district no longer exists (see Draft SEIR, page 3.4-28).

Neither the Pharmacy Building nor the Viaduct was previously identified as individually eligible for listing in the National Register of Historic Places, California Register of Historical Resources, or under local designation criteria.[2] As discussed in Chapter 3.4, *Cultural Resources,* of the Draft

[1] The Support Services Site was not re-evaluated for historic significance during preparation of the 2014 EIR.

[2] The 2014 EIR did not re-evaluate any buildings, structures, or sites/historic districts that had been previously identified through earlier survey efforts, including those conducted in 1976 (Natural History Museum), 1994 (Historic Resources Group) and 1999 (Mellon & Associates). Rather, the 2014 EIR summarized previous survey findings in Section 3.4.3.5, "Historical and Archaeological Resources," and Table 3.4-2, "Properties Previously Determined Eligible for the NRHP and Listed in the CRHR" (2014 EIR, pages 3.4-13 to 3.4-16). While Table 3.4-2

SEIR, both the Pharmacy Building and Viaduct were analyzed to determine individual eligibility under the National Register, California Register, and Los Angeles County criterion and were found to be ineligible for designation at any level, under any criteria (see Draft SEIR, pages 3.4-51 to 3.4-54).

Additionally, the Los Angeles General Hospital–Acute Unit Historic District was listed in the National Register on July 23, 2026. The historic district's National Register nomination excludes the Pharmacy Building and Viaduct from the district boundary due to visual and physical obstructions that separate the district and the two structures. Given the California Office of Historic Preservation's and National Park Service's approval of the nomination and district boundary,[3] there is state and federal concurrence that the two structures are ineligible as contributors to the Los Angeles General Hospital – Acute Unit Historic District. For these reasons, the Pharmacy Building and Viaduct are not eligible, either individually or as contributors to a potential historic district. Thus, neither are treated as historical resources requiring mitigation under CEQA.

Furthermore, an assessment found that the structural integrity of the Viaduct has been extremely compromised (Structural Focus 2025).[4] Visual observation and material testing found significant concrete spalling, delamination, and cracking; exposed corroded reinforcing; and severe carbonation. Additionally, the structure appears to be located on soil that has been preliminarily identified as liquefiable. Significant seismic strengthening would be needed to meet required safety and performance objectives, which would result in significant changes to the structure, compromising its historic appearance and integrity.

Draft SEIR PDF-5 (Interpretation Plan) has been modified as follows to include the exploration of design options for a viewing platform as a potential additional option for the Support Service Site's interpretation (see Chapter 3, *Revisions to the Draft SEIR*).

> An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic

of the 2014 EIR indicates that the Pharmacy Building was "Determined eligible for listing in the NRHP as a separate property" in 1976, this appears to be an error. In the historical resources records search conducted for the Draft SEIR, including through the South Central Coastal Information Center (SCCIC), California Built Environment Resource Directory (BERD), and Historic Places LA, no documentation was found to substantiate this previous finding of individual eligibility for the Pharmacy Building.

[3] The Los Angeles County General Hospital – Acute Unit historic district was officially listed in the National Register of Historic Places on July 23, 2026 (Los Angeles County, Los Angeles County General Hospital – Acute Unit, 1200 N. State Street, Los Angeles, SG100013242).

[4] Structural Focus, "Tunnel Structural Findings, Los Angeles County General Hospital Campus Tunnel, Los Angeles, California," January 16, 2025.

> maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

No additional revisions to the Draft SEIR are warranted.

Response O3-3

II. Visual and Spatial Encroachment on contributing features including Los Angeles County General Hospital - Acute Unit (101), Patient's Building (102), Visitor's Building (103), and Entrance Forecourt.

All work impacting the General Hospital–Acute Unit and within the Los Angeles General Hospital-Acute Unit Historic District is required to comply with the Secretary of the Interior's Standards for Rehabilitation as part of the ongoing federal historic preservation tax credit application process for the property. Per PDF-1, all new construction within the historic district shall be designed to meet the Standards as they relate to their compatibility with the historic district. Additionally, as defined on pages 2-31 and 2-32 of the Draft SEIR, use and development standards are included as part of the proposed Master Plan, which address height and views, step backs and terracing, and parking structure design. They are intended to guide future development, and individual development projects would be reviewed for consistency with these standards.

PDF-1 will be modified to include an assessment of views as projects are proposed, as follows (see Chapter 3, *Revisions to the Draft SEIR*).

> All work within the Los Angeles General Hospital–Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to ensure continued conformance with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere

to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

No additional revisions to the Draft SEIR are warranted.

Response O3-4

III. Insufficient analysis of impacts to Historic Marengo Street and Zonal Avenue Gateways (137) and Control House (136).

The Marengo Street and Zonal Avenue gateways are contributors to the Los Angeles County General Hospital–Acute Unit Historic District, which was listed in the National Register on July 23, 2026. As part of the ongoing federal historic tax credit application process for the property, all work within the historic district, including proposed improvements to district contributors, must comply with the Standards. Compliance with the Standards will ensure the historic integrity of the district is retained. The General Hospital Part 2 (Description of Rehabilitation) application for historic tax credits is anticipated to receive conditional approval from the National Park Service in the near future. Per the Part 2 application, the central gateway, including the Control House, pilasters, lanterns, and gates, will be retained and relocated west from its existing location, but will remain along Zonal Avenue as an entrance to the hospital campus. While relocated further north along Zonal Avenue, the gateway will retain its original design as an entrance feature to the campus as well as its relationship to the street. Thus, its historic integrity and significance as a contributor to the Los Angeles County General Hospital–Acute Unit Historic District will remain following relocation. Furthermore, the Marengo Street gateway pilasters, gates, and lanterns were moved from their original locations in 2008 to accommodate the widening of State Street, which demonstrates that relocation of the central gateway is feasible without compromising its historic integrity. No revisions to the Draft SEIR are warranted.

Response O3-5

IV. Failure to Identify Hazard Park as a Historic Resource in the Vicinity of the Project Site.

The Project's Impact Area (the area of potential direct and indirect impacts) is shown on the map in the Draft SEIR, Appendix E.2: Historical Resources Technical Report, page 4. Taking into consideration the Project Site's existing, heavily developed setting and the nature and scale of the Project in relation to surrounding development, the Impact Area was defined as encompassing a one-block radius around the Project Site. Hazard Park, which was identified as a potential historical resource through the Adelante Eastside Redevelopment Area Historic Resources Survey (PCR Services Corporation, 2008),[5] is located outside the Impact Area and is

[5] Hazard Park was assigned the California Historical Resource Status Code 5S3 ("Appears to be individually eligible for local listing or designation through survey evaluation"). It is not officially designated under federal, state, or

separated from the Project Site by development including high rise buildings on the USC Keck School of Medicine campus to the west and the Bravo Medical Magnet School to the south, as well as a significant change in grade towards Cornwell Street to the southwest. Given its distance from the Project Site and the surrounding development and grade changes that obstruct views of the Project Site from the park, the Proposed Project does not have the potential to impact the historic integrity or significance of Hazard Park. Additionally, as discussed on page 3.4-75 of the Draft SEIR, the Draft SEIR conservatively concluded that the Proposed Project, due to speculative nature of future project designs, would result in significant and unavoidable cumulative impacts on historical resources even with the implementation of Mitigation Measures CUL-1a through CUL-1c and application of Project Design Features. Thus, further analysis of impacts to the park is not included in the Draft SEIR. No revisions to the Draft SEIR are warranted.

Response O3-6

The County acknowledges the Los Angeles Conservancy's strong support of the adaptive reuse of Los Angeles County General Hospital for housing. All comments provided by the Los Angeles Conservancy in this letter are responded to above, and were appropriate, revisions have been made in the Final SEIR (see Chapter 3, *Revisions to the Draft SEIR*). This comment does not identify deficiencies within the Draft SEIR. No revisions to the Draft SEIR are warranted.

local registration criteria. PCR Services Corporation, "Intensive Historic Resources Survey: Adelante Eastside Redevelopment Area, Los Angeles, CA," prepared for the City of Los Angeles, Community Redevelopment Agency (2008), Appendix B.

2.3.3 Verbal Comments

On June 11, 2026, the County hosted a noticed virtual public information meeting from 6:00 p.m. to 7:30 p.m. to receive public comments on the Draft SEIR. During the meeting, the County provided an overview of the Proposed Project, the contents of the Draft SEIR, and the CEQA process. The Zoom meeting was presented simultaneously in English and Spanish. Following the presentation, attendees interested in providing verbal comments to the County were given a 2-minute time limit. Attendees could also provide written comments in the "chat" feature of the meeting.

The following verbal comments are transcribed from the June 11, 2026, public information meeting (see Appendix A for full transcript of the verbal comments). Minor edits have been made for grammar, punctuation, and readability where appropriate; however, the substance and intent of each comment have not been altered.

Several verbal comments received during the public information were about the ability to provide comments during the 45-day public review process and about the level of community outreach during the public review process. The County has reviewed and considered each comment and a single "Topical Response" has been prepared to address the common themes raised about the public review and community outreach process. The individual comments are reproduced below as part of the administrative record. Comments regarding project-specific or environmental issues are addressed in separate responses or by cross-reference to the applicable response elsewhere in this Final SEIR. The individuals' comments and the County's responses thereto will be included in the Final Subsequent Environmental Impact Report (SEIR) considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

Responses to individual comments are identified by the corresponding verbal comment number for ease of reference.

Topical Response 1: Public Review Process and Community Outreach

Outreach for CEQA Process

The Proposed Project provided public notice of the Draft SEIR in accordance with the requirements of CEQA and State CEQA Guidelines Section 15087. State CEQA Guidelines Section 15087 requires the following: notice be mailed to the last known name and address of all organizations and individuals who have previously requested notice in writing, and that notice also be given by at least one of the following procedures: 1) publication by the public agency in a newspaper of general circulation in the area affected by the proposed project; 2) posting of notice by the public agency on and off site in an area where the project is to be located; and/or 3) direct mailing to the owners and occupants of property contiguous to the parcel or parcels

which the project is located. As described below, the County met the requirements for notification and public review periods pursuant to CEQA.

- A Notice of Availability (NOA) of the Draft SEIR and public information meeting was circulated for a 45-day public review beginning May 15, 2026 through June 29, 2026.
- The County mailed English and Spanish versions of the NOA via certified mail to the last known name and address of those who previously requested notice in writing.
- The County posted the NOA on the Project Site within the Forecourt information kiosk and Fitness Trail information kiosk.
- Electronic copies of the NOA, Draft SEIR and appendices were made available at six libraries within the community: 1) City Terrace Library, 2) Chinatown Branch Library, 3) El Sereno Branch Library, 4) Lincoln Heights Branch Library, 5) Anthony Quinn Library, and 6) Malabar Branch Library.
- The Draft SEIR and appendices were published on the County's website[6] on May 15, 2026.
- The County indicated the availability of the Draft SEIR and the NOA via the County's social media accounts.
- The NOA was filed with the County of Los Angeles Clerk-Recorder.
- The NOA, Draft SEIR, and appendices were published to the Governor's Office of Climate and Land Use Innovation State Clearinghouse CEQAnet website.

The County provided the required public notice pursuant to CEQA and made the Draft SEIR available for review during the identified public review period, thereby providing interested agencies, organizations, and members of the public with an opportunity to review the document and submit comments.

The County conducted a virtual public information meeting, during the 45-day public review period for the Draft SEIR on June 11, 2026. The Zoom meeting was transmitted in both English and Spanish. Comments regarding the level of participation at the public information meeting and the effectiveness of the County's outreach efforts does not demonstrate that the environmental review process failed to comply with CEQA or identify a deficiency in the Draft SEIR's environmental analysis.

Additional Outreach for Master Plan

[6] https://opportunity.lacounty.gov/general-hospital

In addition to the public outreach and notification that was conducted pursuant to the CEQA process, additional extensive public engagement and outreach for the Proposed Project outside the CEQA process was undertaken by the Centennial Partners team, partners to the County in developing the Los Angeles County General Hospital Campus Master Plan (Master Plan). An email blast announcing the NOA for the Draft SEIR and Master Plan was provided to approximately 1,375 individuals via an email distribution list that was maintained and expanded over the years by the Centennial Partners team. Additionally, engagement was carried out by the Centennial Partners team in collaboration with a network of community stakeholders, which included community-based organizations, healthcare workers, labor groups, educational partners, and neighborhood leaders, as well as individuals who interact with the Project Site on a daily basis. A summary of the outreach events is listed below and also described in the Master Plan.

- 24 pop-up outreach events
- 26 forum presentations
- 102 small group meetings
- 16 Community Advisory Committee meetings
- 3 community at-large meetings
- 35 townhalls

Community engagement has taken place regularly throughout the Master Plan development process and has not been limited to key milestones. Engagement was carried out by the Centennial Partners team, in collaboration with a network of stakeholders, which included community-based organizations, healthcare workers, labor groups, educational partners, and neighborhood leaders, as well as individuals who interact with the Project Site on a daily basis. Outreach was conducted in multiple languages to engage with different audiences throughout east Los Angeles. The Centennial Partners team also maintains an active on-site presence, that includes a working office on the Project Site, which allows for regular interaction with those who use the Project Site daily.

A Community Advisory Committee (CAC) was established to review and provide input into the development of the Master Plan and included representatives from a range of local stakeholder groups. The CAC provides a forum for reviewing Master Plan materials, sharing feedback, and helping shape how information is communicated. Additionally, a Health Innovation Community Partnership (HICP) was established and facilitated engagement of healthcare providers, institutions, and community-serving organizations connected to the Project Site.

Several events were also held on the Project Site that provided opportunities for the larger community to interact with the Project Site. This includes distribution of salvaged bicycles from the General Hospital Building through two community giveaways, prioritizing families served by

the Wellness Center and neighborhood youth. It also includes multiple organized public tours of the General Hospital Building that were co-led by staff from the Los Angeles Conservancy.

The Centennial Partners team participates in ongoing collaboration with community partners including organizations such as The Wellness Center, Alma Family Services, and Eastside LEADS Coalition. The Centennial Partners team proposes continued communication, public updates, and future workshops to ensure that community voices remain integrated as the Project Site evolves overtime. Additionally, continued coordination across County departments will also ensure that future development will support existing Project Site users.

In summary, the Centennial Partners team and the County have engaged in public outreach and notification efforts that meet the requirements of CEQA, and have provided the public with meaningful opportunities to comment on the Proposed Project's potential environmental effects. Comments that recommend that additional community outreach or public engagement efforts should have been conducted reflect a preference regarding the public participation process but do not identify a deficiency in the Draft SEIR's environmental analysis or demonstrate that the environmental review process failed to comply with applicable CEQA requirements.

The County has considered comments regarding the need for enhanced public outreach and public participation. These comments and recommendations do not identify deficiencies in the environmental analysis presented in the Draft SEIR or demonstrate noncompliance with CEQA's public review requirements. No revisions to the Draft SIER are warranted to respond to this comment.

V1. Kristie Hernandez

Comment V1-1

Hi, good evening. Thank you so much for the opportunity to provide public comment.

I think for me one thing I always like to highlight is the fact that we need some more -- some more community outreach about what is taking place and what is being proposed at this occasion. This is a very large scale project and I don't think that local residents understand the gravity of how this will impact our local community.

This is bringing a lot of change, whether we're talking about foot traffic, transportation, street traffic, infrastructure, and so forth and I want to make sure that outreach is being done beyond your 200 feet radius of the project to only the areas, businesses, residents that you believe will be directly impacted. Because I think what we forget is others in the area will be impacted if you're driving through this occasion to get to and from your home, work, errands,

appointments. So I really want to make sure and underscore that there needs to be more outreach.

I know that it's located in the City of Los Angeles, but you also have unincorporated East Los Angeles right over the freeway overpass there. So if and when you have -- I also encourage in-person meetings and the fact that we received an e-mail to notify us of this public hearing one day before is unacceptable. We need to make sure that these communications are going out sooner so folks can actually accommodate and plan accordingly. I know considering work schedules, I had to jump on a little bit later but I want to make sure all these things are taken into consideration. I know it's one thing to be consultants and make sure this runs smoothly but take into consideration the local community and make sure you have interpretation. Thank you.

Response V1-1

The commenter's concerns regarding public outreach are addressed in Topical Response 1.

Comment V1-2

This is Kristie, K-R-I-S-T-I-E Hernandez. I'd like to ensure this healthy village have a community advisory committee that's made up of residents in the community. I know you've listed Boyle Heights and centennial and East L.A. So there's those part of that advisory so we're understanding the dynamics of how this proposed developments will impact. There are requests as a result. This is a landmark for many of us. We have fond memories and we want to capture the essence of this building and what it means to our community. On that note when you talk about the infrastructure and what you all are doing to make sure it is safe, I also want to make sure we are building infrastructure that will accommodate an influx of building, housing. You've mentioned businesses, workforce, childcare, so we recently saw the oil spill that took place in unincorporated East L.A. We want to ensure proper processes are in place to avoid environmental process.

In addition to that I want to advocate for parking. I know that there are certain state bills that tell us we don't have to provide parking with development and I'm strongly opposed to that. We have local jurisdiction that allow us especially if there's businesses and other staff and employees that are going to be going to this facility for the wrap around services to the intended occupants. I want to underscore community outreach. I'm advocating for an extension to 90 days to ensure you all are going out to the community and folks are providing input and make sure funding is appropriately used because we've seen misuse of funding for this type of development. Thank you.

Response V1-2

The commenter recommends that a CAC be established to provide ongoing community input during implementation of the Proposed Project. The commenter's concerns regarding a CAC are addressed in Topical Response 1.

The County acknowledges the commenter's broad concern related to the Proposed Project's impacts on the environment. The Draft SEIR evaluates the Proposed Project's potential environmental impacts across the applicable CEQA resource areas, including transportation, utilities and service systems, public services, hazards and hazardous materials, and other relevant topics. Where potentially significant impacts were identified, mitigation measures have been incorporated to reduce impacts, where feasible. No specific comments regarding the content of the analysis were provided in the Draft SEIR.

The Draft SEIR identifies the parking facilities proposed as part of the Proposed Project within Chapter 2, *Project Description*, of the SEIR. The adequacy of parking is generally considered a planning and design issue rather than a physical environmental impact under CEQA unless substantial evidence demonstrates that parking conditions would result in significant physical environmental effects.

Funding sources, allocation of project funds, and fiscal oversight are administrative and financial matters that are separate from the environmental review conducted pursuant to CEQA

The comment does not identify a deficiency in the environmental analysis presented in the Draft SEIR or provide substantial evidence demonstrating that revisions to the Draft SEIR are warranted. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

V2. Pamela Gustia

Comment V2-1

Hi, everyone. Good afternoon. My name is Pamela G, P-A-M-E-L-A A-G-U-S-T-I-A. I'm with the East Side Leads Coalition, and we've been part of this process since 2017.

My comment is not new. I've actually mentioned this to Krystin before. I mentioned it also even before the community started discussions around the community benefit agreement framework.

And it's that these public comment periods are really aggressive, really short. 45 days from May 15th, my understanding is today's meeting is the first meeting since the SEIR was released since May 15th that has been held publicly. My recommendation is this public comment is extended

to 30 days. I mentioned this in supervisorial district one. It's not a new comment. We want it to be held true. My second recommendation is that this presentation be taken to the public.

Yesterday, our coalition held a three-hour town hall in collaboration with councilmember from L.A. District 13. And three hours was just right. That's the amount it takes in my opinion to hold a robust conversation. Second, I want a clarification on the minimum residential units.

We have seen public documents hold 600 units then 800 units. I saw today over 3,000 units. So can somebody please clarify what is the minimum and what is the maximum range? 600 units to 3200 units is a very big jump. In my history I've only seen 600 or 800 been considered. That's a pretty gargantuan change. Thank you.

Response V2-1

The commenter's concern regarding the enforceability of the anticipated Community Benefits Agreement (CBA) is acknowledged. As described in Chapter 2, *Project Description*, of the Draft SEIR, the CBA is identified as an anticipated action associated with Proposed Project implementation. The terms, implementation, and enforcement of the CBA would be established through the separate agreement and County approval process.

As identified in Table 2-1, *Proposed Project Land Uses*, of the Draft SEIR, the Proposed Project would include up to 3,200 housing units. The Draft SEIR analyzes a maximum buildout scenario of the proposed Master Plan for purposes of analyzing environmental impacts under CEQA. Chapter 2, *Project Description,* of the Draft SEIR, does not establish a minimum number of residential units that must be constructed. Actual development may occur in phases and could result in fewer residential units than the maximum analyzed in the Draft SEIR, provided development remains within the parameters of the Proposed Project.

The commenter's concerns regarding the public review process are addressed in Topical Response 1.

Because the Proposed Project establishes a maximum development program rather than requiring a specific amount of development, the environmental analysis evaluates the maximum reasonably foreseeable buildout that could occur under the Proposed Project.

Accordingly, the Draft SEIR evaluates the Proposed Project based on its maximum development intensity to ensure that potential environmental impacts are conservatively analyzed. The comment does not identify a deficiency in the environmental analysis presented in the Draft SEIR or provide substantial evidence demonstrating that revisions to the Draft SEIR are warranted. No further response is required and no revisions to the Draft SEIR are warranted to respond to this comment.

V3. Cassidy Bennett

Comment V3-1

My name is Cassidy Bennett, C-A-S-S-I-D-Y B-E-N-N-E-T-T. I am an attorney with public counsel. We are also part of the east side leaves coalition and I've been part of this process for a really long time. And yeah. I would like to second Pam's comment regarding the comment period.

Especially given that the document is over a thousand pages long. That's a really -- a lot of information to get through for anybody. I think it's a lot of information for me to get through as a lawyer and as Pam said to be able to share it with the community. As the first commenter shared as well, that's so critical we need to make sure that everyone is understanding all the information in this environmental impact report, all the work you've done to understand the best option for their community moving forward.

So I would like to second the request for an increased comment period. Thank you.

Response V3-1

The commenter's concerns regarding the public review process are addressed in Topical Response 1.

V4. Martha Castro

Comment V4-1

Hi. Great. My name is Martha Castro. I'm a long time resident of East Los Angeles.

I want to third the comment. We need an extension and more public input. This is going to greatly impact the east side. It seems that we're getting a lot of housing built on this side without any public comment being taken into consideration. And I would like to see a little more input from us on this side. If you can delay it and extend the impact and have in-person conversations with the residents of East Los Angeles, not just Boyle Heights.

We're on the other side of the bridge and this is going to impact us as well. Thank you.

Response V4-1

The commenter's concerns regarding the public review process are addressed in Topical Response 1.

V5. Elias Naranjo

Comment V5-1

E-L-I-A-S. I want to also echo what everybody else is saying. I think the Master Plan is lengthy and I think it can be a lot to ingest for community.

And yeah, I think -- I feel like we still haven't reached a lot of community members to input and weigh in on everything that's happening. So I would like to see further engagement on the developer's part doing that work as well. And yeah. I do think we need to extend the public comment period because I do think it's not enough time for everybody to weigh in on this. So yeah. Thank you.

Response V5-1

The commenter's concerns regarding the public review process and public outreach are addressed in Topical Response 1.

V6. Maria Patino-Gutierrez

Comment V6-1

Hi, my name is Maria, and I'm a resident of East L.A. I'm calling to request that you extend the public comment period from 45 days to 90 days. The document was published on May 15th and this is the first time we hear about it. We ask for an in-person meeting. The document is over a thousand pages and we're concerned about the impact that the units of housing will have.

Please involve the community in your next steps. Thank you.

Response V6-1

The commenter's concerns regarding the public review process are addressed in Topical Response 1.

V7. Jose Fernandez

Comment V7-1

My name is Jose Fernandez, J-O-S-E F-E-R-N-A-N-D-E-Z. Well, I'm a 35-year resident of Boyle Heights. So pretty adjacent to the General Hospital over here. And yeah. I barely heard about this new information coming out with the EIR.

I have previous experience reviewing these documents and they are very long and take a very long time to break down for community residents.

So I'm here to ask that you please extend the public comment period because we need to include more residents in the process. And we want to make sure we get as much public participation as possible.

The General Hospital was such a huge redevelopment project that is going to require an even larger participation. It's a regional hub for the area and for the entire county. And we want to make sure we mitigate any impacts on the community and that all the services that are going to be provided in the new plan and other future redevelopments need to be able to provide opportunities for community members.

So again, I'm here to ask that we extend the review period because it's such a long document and we want to make sure we include as many people as possible in multiple languages and multiple capacities. Thank you.

Response V7-1

The County acknowledges the commenter’s concern related to the Proposed Project’s environmental impacts. Please see Response V1-1.

The commenter's concerns regarding the public review process are addressed in Topical Response 1.

2.3.4 Public Meeting Written Comment

The following comment is transcribed from the June 11, 2026, public information meeting. Minor edits have been made for grammar, punctuation, and readability where appropriate; however, the substance and intent of each comment have not been altered. The chat log from the June 11, 2026 public information meeting is provided in Appendix B to this Final Subsequent Environmental Impact Report (SEIR).

PM1. Cindy Palvarado, June 11, 2026

Comment PM1

My name is Cindy and I am a resident of the east side. Today I learned about this meeting about the Subsequent EIR. This document is over 1,000 pages! We need more time to look thru it. I stand with the ask that the public comment be extended beyond 45 days. Also, we need to have an in person meeting so that non-English speakers and other folks can participate to understand the environmental impacts of the general hospital redevelopment project.

Response PM1-1

Your comments and the County's responses thereto will be included in the Final SEIR considered by the Los Angeles County Board of Supervisors prior to consideration of approval of the Proposed Project.

The commenter's concerns regarding the public review process are addressed in Topical Response 1: Public Review Process and Community Outreach. In addition, the County provided translated public notices and Spanish interpretation during the virtual public information meeting to facilitate participation by Spanish-speaking community members. No further response is required and no revisions to the SEIR are warranted to respond to this comment.

This page intentionally left blank.

3. REVISIONS TO THE DRAFT SEIR

3.1 INTRODUCTION

This section contains revisions to the Draft Subsequent Environmental Impact Report (SEIR) in response to comments from agencies, organizations, and the public, as well as staff-directed changes which are incorporated into the Final SEIR. These text revisions include typographical corrections, insignificant modifications, and amplifications and clarifications of the Draft SEIR. For each revision, the Draft SEIR page and location on the page where the revision applies are identified, followed by the textual, tabular, or graphical revision.

Double underlined text represents language that has been added to the SEIR; text with ~~strikethrough~~ represents language that has been deleted from the Draft SEIR. None of the revisions to the Draft SEIR constitute significant new information, as defined in California Environmental Quality Act (CEQA) Guidelines Section 15088.5 and restated below.

- A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
- The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. *(Mountain Lion Coalition v. Fish and Game Com.* (1989) 214 Cal.App.3d 1043)

The revisions presented do not deprive the public a meaningful opportunity to comment upon substantial adverse environmental effects of the proposed project or feasible way to mitigate or avoid such an effect that the proposed project's proponents have declined to implement; therefore, the Draft SEIR does not need to be recirculated. They represent minor clarifications and revisions, and reflect revisions to mitigation measures in response to public agency comments on the Draft SEIR that are intended to further reduce previously identified significant environmental effects.

3.2 DRAFT SEIR REVISIONS

The following table presents revisions to Table ES-2, *Summary of Significant Environmental Impacts and Mitigation Measures*, of the Draft SEIR. Parts of Table ES-2 from the Draft SEIR that are not revised are not shown.

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
AIR QUALITY			
Significance Criterion b: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard? The Proposed Project's construction activities have the potential to result in a cumulatively considerable net increase in criteria pollutants. (**Impact AIR-1**) The Proposed Project's operational activities have the potential to result in a cumulatively considerable net increase in criteria pollutants. (**Impact AIR-2**)	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure AIR-1a:** To reduce volatile organic compounds (VOC) emissions during construction, the Project Applicant(s)/Contractor(s) ~~(or its contractors)~~ shall use paints with a VOC content that meets the South Coast Air Quality Management District Super Compliant architectural coatings standard of less than 10 grams per liter (g/L) for coating building architectural surfaces during construction. This measure shall be noted on all site and construction plans. **Mitigation Measure AIR-1b:** To reduce nitrogen oxide (NO_X) emissions during construction, the Project Applicant(s)/Contractor(s) ~~(or its contractors)~~ shall implement the following measures during construction: ▪ Use construction equipment rated by the United States Environmental Protection Agency (USEPA) as having Tier 4 Final or higher exhaust emission limits for offroad equipment with engines 25 horsepower or higher. If Tier 4 Final equipment is not readily available, the contractor may apply other technologies available for construction equipment such that it would achieve a comparable reduction in NO_X and PM emissions comparable to that of Tier 4 construction equipment. Where alternatives to USEPA Tier 4 are utilized, the contractor shall be required to show evidence to the Project Applicant(s) that these alternative technologies would achieve comparable emissions reductions.	Less Than Significant (construction) Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Certifications or alternative reduction strategies shall be required prior to receiving a construction permit. ▪ Maintain a list of all operating equipment in use on the construction site during construction for verification by the County ~~of Los Angeles Building and Safety Department~~. The construction equipment list shall state the makes, models, Equipment Identification Numbers, Engine Family Numbers, and number of construction equipment on-site. ▪ Haul and delivery truck idling times shall be minimized by shutting equipment off when not in use or reducing maximum idling time to less than three (3) minutes (beyond that required by 13 California Code of Resources [CCR] Chapter 10, Section 2485). Clear signage shall be provided for construction workers and construction vehicles at all access points. ▪ All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper conditions prior to operation. ▪ A traffic control plan shall be prepared and provided to the County. ▪ A carpool program for construction workers, including incentivizing carpooling as well providing bus service for crew members shall be implemented. ▪ Truck deliveries shall be consolidated when possible. ▪ The combined vehicle miles traveled per day for offsite haul truck trips associated with demolition debris and earthen material export/import hauling operations shall not exceed 8,930 miles per	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		day (equivalent to 180 one-way truck haul trips at 49.61 miles per one-way trip, which is the average distance to nearby serving landfills). The construction contractor(s) overseeing hauling operations shall log the number of daily haul truck loads and the one-way haul trip distance for each truck haul load of either demolition debris or earthen material for days in which truck hauling of these materials occurs. ▪ The individual requirements under this mitigation measure shall be noted on all site and construction plans. **Operation** Implement Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d. **Mitigation Measure AIR-2:** Future private tenants/business entities (i.e., non-County of Los Angeles owned or operated businesses) for new development projects that own their own truck fleets for daily business operations shall only operate trucks that are either zero-emission (Z/E) and/or meet the California Air Resources Board NO_X emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr) for Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the truck requirements under this mitigation measure shall be included in all leasing agreements.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement that any owned Class 2b through Class 8 vehicles with a GWVR over 8,500 pounds used for daily business operations shall be either Z/E and/or meet the NO_X emissions standard of 0.02 g/bhp-hr. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase agreement) to the County to verify, to the County's satisfaction, that any owned vehicle subject to the requirements under this mitigation measure comply.	
Significance Criterion c: Would the project expose sensitive receptors to substantial pollutant concentrations? The Proposed Project's construction activities have the potential to generate emissions that would exceed applicable thresholds. (**Impact AIR-3**)	Potentially Significant (construction and operation)	**Construction** Implement Mitigation Measure AIR-1b. **Operation** **Mitigation:** Implement Mitigation Measure AIR-2 **Mitigation Measure AIR-4a:** ~~Future developer/facility owners~~ Project Applicant(s)/Contractor(s) for new development projects that would use off-road equipment (e.g., forklifts and yard trucks) in daily business operations shall only utilize electric-powered off-road equipment. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written	Less Than Significant (construction) Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
The Proposed Project's warehouse and light industrial uses have the potential to generate on-site emissions that would exceed applicable thresholds (**Impact AIR-4**) The Proposed Project's warehousing and light industrial uses would generate operational TAC emissions from non-permitted sources that would exceed South Coast AQMD localized significance thresholds. (**Impact AIR-5**)		verification to the County prior to issuance of Business License. In addition, the limitation to use only electric-powered off-road equipment shall be included in all leasing agreements. Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only electric-powered equipment for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the County to verify, to the County's satisfaction, that any off-road equipment utilized will be electric-powered. **Mitigation Measure AIR-4b:** ~~Future developer/facility owners~~ Project Applicant(s)/Contractor(s) for new development projects that would use transport refrigeration units (TRUs) in daily business operations use only electric standby and/or hybrid electric TRUs (E/S TRUs). All E/S TRUs shall comply with the California Air Resources Board's "Alternative Technology" requirements under Section 2477(e)(1)(A)(3) of the California Code of Regulations, Title 13, Article 8, Chapter 9, Division 3. The project developer/facility owner shall disclose this requirement to all tenants/business entities prior to the	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		signing of any lease agreement. In addition, the limitation to use only E/S TRUs shall be included in all leasing agreements. Prior to issuance of a Business License for a new tenant/business entity, the ~~project developer/facility owners~~ Project Applicant(s)/Contractor(s) and tenant/business entity shall provide a signed document (verification document) to the Los Angeles County Department of Regional Planning noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only E/S TRUs for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the Los Angeles County Department of Regional Planning to verify, to the County's satisfaction, that any TRUs utilized will be E/S TRUs. **Mitigation Measure AIR-4c:** To reduce idling emissions from transport trucks, ~~future project developer/facility owners~~ Project Applicant(s)/Contractor(s) for new warehousing or general industrial development projects place signage at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations (e.g., Rule 2485). At minimum, each sign shall include: 1) instructions for truck drivers to shut off engines when not in use; 2) instructions for drivers of diesel trucks to restrict nonessential idling to no more than two consecutive minutes (compared to five minutes currently allowed under Rule	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		2485); and 3) telephone numbers of the building facilities manager and CARB to report violations. All signage shall be made of weatherproof materials. All site and architectural plans submitted to the County shall note the locations of these signs. ~~Prior to issuance of the Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify the installation of these signs.~~ **Mitigation Measure AIR-4d:** All truck/dock bays for new proposed facilities that accommodate cold storage shall be electrified to facilitate plug-in capability and support use of electric standby and/or hybrid electric transport refrigeration units. All site and architectural plans submitted to the Los Angeles County Building & Safety Division shall note all the truck/dock bays designated for electrification. Prior to the issuance of a Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify electrification of the designated truck/dock bays.	
Significance Criterion d: Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people? The Proposed Project's construction activities would result in short-term construction related odors that would cease upon the drying or hardening of	Less Than Significant (construction) Potentially Significant (operation)	**Mitigation Measure AIR-6:** Prior to discretionary approval by the County of Los Angeles, if it is determined that a development project has the potential to emit nuisance odors, an odor management plan shall be prepared by the Project Applicant(s)/Contractor(s) and submitted to the Los Angeles County Department of Regional Planning for review and approval. Facilities that have the potential to generate nuisance odors include, but are not limited to:	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
odor-producing materials. Impacts would be less than significant. The Proposed Project's industrial land uses have the potential to generate an odor nuance. (**Impact AIR-6**)		▪ Wastewater treatment plants ▪ Composting, green waste, or recycling facilities ▪ Fiberglass manufacturing facilities ▪ Painting/coating operations ▪ Large-capacity coffee roasters ▪ Food-processing facilities The odor management plan shall demonstrate compliance with the South Coast Air Quality Management District's Rule 402 for nuisance odors and be submitted to the County. The Odor Management Plan shall identify the best available control technologies for toxics (T-BACTs) that will be utilized to reduce potential odors to acceptable levels, including appropriate enforcement mechanisms. T-BACTs may include but are not limited to scrubbers (i.e., air pollution control devices) at the industrial facility. T-BACTs identified in the odor management plan shall be incorporated into the project's design and on-site plan(s).	
BIOLOGICAL RESOURCES			
Significance Criterion d: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or	Potentially Significant (construction)	**Mitigation Measure BIO-2: Mitigation for Impacts to Nesting Birds.** Construction activities shall avoid the nesting season for birds to the extent feasible, or conduct preconstruction nesting bird surveys if construction activities are carried out during the nesting season. To ensure compliance with the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC), the Project Applicant(s), or through the general contractor(s), shall conduct all vegetation	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
impede the use of native wildlife nursery sites? Construction activities associated with the Proposed Project would have the potential to affect nesting birds. **(Impact BIO-2)** The Proposed Project's operational uses are not anticipated to not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.		removal during the non-breeding season, between September 1 and January 31, or implement the following: If the removal of vegetation, demolition of buildings, or noise-generating construction activities are scheduled between February 1 and August 31, the County or Project Applicant/~~C~~contractor shall retain a qualified biologist (i.e., experienced with conducting nesting bird surveys) who shall conduct a focused nesting bird survey prior to the start of vegetation removal, building demolition, or noise-generating construction activities within any potential nesting habitat (all vegetation, buildings, eaves on buildings, etc.). The size of the nesting bird survey area shall be determined by a qualified biologist at the time of the survey and include the entire limits of disturbance. It may also include a buffer area if deemed necessary by the qualified biologist. The preconstruction nesting bird surveys shall be conducted no more than seven days prior to initiation of vegetation removal, building demolition activities, or noise-generating construction activities. If no active nests are detected during these surveys, no restrictions on Project activities are necessary. If active nests are found, a qualified biologist shall identify and flag an appropriate buffer around the nest, and no construction activities shall occur within the buffer until the qualified biologist has determined that young have fledged or the nest is no longer active. The specific buffer width shall be determined by a qualified biologist at the time of discovery and vary according to the bird species, site conditions, and the type of work activities to be conducted.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		The survey results shall be submitted to the County ~~of Los Angeles Department of Public Works~~ for review and approval of the recommended nest buffer areas, if any, prior to commencement of any vegetation removal, building demolition, or noise-generating construction activities on the Project Site.	
Significance Criterion e: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? Construction and operation of the Proposed Project could result in encroachment into the root protection zones or removal of protected coast live oak trees. Operation of facilities under the Proposed Project, including routine maintenance and pruning of vegetation and trees, has the potential to impact oak trees that are protected under the County's Oak Tree Ordinance. **(Impact BIO-3)**	Potentially Significant (construction and Operation)	**Construction** **Mitigation Measure BIO-3:** Mitigation for Impacts to Protected Trees. Prior to removal, relocation, or maintenance of protected oak trees, a qualified arborist shall inventory and evaluate the health of protected oak trees on the Project Site and evaluate the potential for impacts. If the arborist determines that the proposed activity would cut, destroy, remove, relocate, inflict damage, or encroach into a protection zone of a protected oak tree, the Project Applicant/Contractor shall submit an application for approval to the Los Angeles County Department of Regional Planning and obtain approval prior to impacting a protected oak tree. The Project Applicant(s)/Contractor(s) shall be required to implement the conditions of approval, including planting and care of replacement trees and protections for non-impacted oak trees. When planting replacement trees is required, replacement trees shall be in the ratio of two trees planted for each tree impacted. Replacement trees shall be indigenous oak species and shall be at least 15-gallon size and measure at least one inch in diameter one foot above the base. Replacement trees shall be properly cared for and maintained for two years and replaced if they die within that period. **Operation** Implement Mitigation Measure BIO-3.	Less Than Significant (construction and Operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
CULTURAL RESOURCES			
Significance Criterion a: Would the project cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5? During construction, the Proposed Project has the potential to impact adjacent resources through new construction outside the Los Angeles General Hospital–Acute Unit Historic District boundary. New implementing construction projects may impact adjacent historical resources if they are incompatible with the scale, massing, height, or style of adjacent resources; if they result in diminished integrity of adjacent resources (specifically, setting and/or feeling); or if they result in vibration impacts to adjacent resources. **(Impact CUL-1)**	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Program for Adjacent New Construction** If a new construction project is proposed for a site within 50 feet of an eligible or designated historical resource, then the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1a (Secretary Standards Compliance) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the project is adjacent to the resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the new construction is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the new construction is found to be adjacent to the identified resource, the Architectural Historian/Historic Architect shall assess the project, focusing on the application of Standards No. 9 and 10, both of which relate to adjacent new construction. If the Architectural Historian concludes that the new construction project meets the Standards, then the project is presumed to not have an impact on historical resources. During implementation of the project, the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1b (Project Review During Design and Construction) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications	Significant and Unavoidable (construction) Less Than Significant (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Operation of the Proposed Project at the Project Site is not anticipated to result in a substantial adverse change in the significance of historic resources. The Proposed Project would help to maintain the historical significance of the General Hospital Building through routine maintenance.		Standards to review milestone drawings and generally be available to the design team, as needed. If the proximity of new construction to historical resources is such that vibration during construction may cause them physical damage, as defined through Mitigation Measure NOI-4, the Project Applicant(s)/Contractor(s) shall also apply Mitigation Measure CUL-1c (Protection During Construction) and engage a qualified Historic Architect and Structural Engineer to prepare a Conditions Assessment Report and Construction Monitoring Plan. **Mitigation Measure CUL-1a:** Secretary Standards Compliance. For all instances in which a project is implementing activities under the Proposed Project within 50 feet of an eligible or designated historical resource identified in this Draft SEIR, the Project Applicant shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the future implementing project activity is adjacent to the identified historical resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the future implementing project activity is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the future implementing project activity is determined to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall conduct an assessment	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		of whether the proposed treatment of the historical resource complies with the Secretary of the Interior's Standards for Rehabilitation ("the Rehabilitation Standards"). If the future implementing project activity is found to not be in compliance with the Rehabilitation Standards, then the Architectural Historian/Historic Architect shall provide recommendations for how to modify the design, siting, scale, massing, or architectural treatment of the future implementing development projects to the extent feasible to bring it into compliance, or as close to compliance as feasible, which shall be integrated into the design of the Proposed Project. The professional shall prepare a memorandum or equivalent level of documentation conveying the findings of the assessment, which shall be provided to the County. **Mitigation Measure CUL-1b:** Project Review During Design and Construction. For instances in which a future project involves adjacency to a historical resource (as determined under Mitigation Measure CUL-1a), the Project Applicant(s)/Contractor(s) shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawing sets and generally be available to the design team during design and construction. The Architectural Historian/Historic Architect shall review Design Development (DD) and Construction Documentation (CD) drawing sets at 50% and 100% completion and provide a brief memo regarding ongoing project compliance with the Standards. Project review during construction shall occur quarterly and reported in memo format, which shall be provided to the County.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Mitigation Measure CUL-1c: Protection During Construction. Prior to the commencement of construction activities within proximity to, as defined in Mitigation Measure NOI-4, a historical resource, a Conditions Assessment Report will be completed by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to identify baseline conditions (cracks, deterioration, etc.). The report will be provided to the County. As part of this process, a Structural Engineer shall be consulted to determine whether any shoring or protection should be installed prior to commencement of construction activities. In addition, the Project Applicant(s)/Contractor(s) shall engage a Civil Engineer to prepare an Adjacent Building Construction Monitoring Plan ("Monitoring Plan"). The Monitoring Plan shall establish survey monuments and document and record the positions of adjacent buildings, structures, sidewalks, utilities, facades, and surface features to form a baseline for determining settlement or deformation. The Monitoring Plan shall include the following provisions: (1) shored excavation and adjacent buildings, structures, sidewalks, utilities, facades, and cracks shall be visually inspected at a minimum of one time per month; (2) survey monuments shall be measured at critical stages of excavation, shoring, dewatering, and construction but should not occur less frequently than once every thirty days; (3) monitoring reports shall be prepared by an appropriate technical professional California Professional Land Surveyor documenting the movement monitoring results and distributed to all appropriate parties, including the shoring engineer. The County shall be provided	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		all documentation and be notified if movement exceeds predetermined thresholds and calculated amounts as required.	
Significance Criterion b: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5? Although the Project Site is located within an urbanized and disturbed area of the City, there is a potential for previously undiscovered archaeological resources to be present beneath the Project Site. **(Impact CUL-2)** Operation of the Proposed Project at the Project Site would not result in activities that would disturb native soils.	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure CUL-2:** Prior to any demolition, grading, or excavation related to the construction of facilities or improvements under the Proposed Project, a qualified archaeologist shall be retained by the Project Applicant(s)/Contractor(s) to determine which areas shall require cultural resources monitoring during initial ground disturbance. The location of construction activities that are likely to encounter subsurface sediments with archaeological sensitivity shall be determined by the qualified archaeologist upon review of project excavation and grading plans. If determined necessary by the qualified archaeologist, monitoring by a qualified archaeologist shall be conducted during all initial ground disturbing activities (e.g. grading, removal of foundations, utility trenching, installation of shoring/piles, etc.) within the Project Site, from ground surface level to bedrock. If, during cultural resources monitoring, the archaeologist determines that the sediments being excavated have been previously disturbed and are unlikely to contain significant cultural materials, the archaeologist shall request that monitoring be reduced or eliminated. Spot-check monitoring shall occur during all construction, on a schedule determined by the project archaeologist. If buried cultural resources such as trash deposits, building foundations, privy pits, flaked or ground stone, or human remains are	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		inadvertently discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find and the area shall be secured to prevent disturbance. The County will be notified immediately. A qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to evaluate the significance of the find and recommend appropriate treatment measures. If the discovered materials are determined to be significant cultural resources, the archaeologist shall develop and implement an appropriate treatment plan, which may include avoidance, preservation in place, capping with fill material, or data recovery through excavation and documentation. The Treatment Plan shall be provided to the County. Work in the vicinity of the discovery, as determined by the qualified archaeologist, shall not resume until the archaeologist has determined that appropriate measures have been implemented. Treatment measures for items that are not associated with human remains typically include development of avoidance strategies, capping with fill material, or mitigation of impacts through data recovery programs such as excavation or detailed documentation. If human remains are encountered, work shall halt in accordance with California Health and Safety Code Section 7050.5 and the County of Los Angeles Medical Examiner (Medical Examiner) shall be notified immediately. If the Medical Examiner determines that the remains are Native American, the Medical Examiner shall notify the Native	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		American Heritage Commission (NAHC) within 24 hours, and the NAHC shall designate a Most Likely Descendant (MLD). The MLD shall be provided the opportunity to make recommendations regarding the treatment and disposition of the remains in accordance with Public Resources Code Section 5097.98.	
GEOLOGY AND SOILS			
Significance Criterion f: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature? The Proposed Project's construction and demolition activities have the potential to encounter paleontological resources beneath fill soils. **(Impact GEO-4)**	Potentially Significant (construction) No Impact (operation)	**Mitigation Measure GEO-4:** Prior to any excavation related to the construction of facilities or improvements proposed under the master plan, a qualified vertebrate paleontologist with a graduate degree in paleontology, geology, or a closely related earth science discipline, and more than 10 years of experience shall be retained by the Project Applicant(s)/Contractor(s) or construction contractor. Final excavation depths, locations, and construction methods shall be determined during subsequent project-level design. Accordingly, the qualified paleontologist shall review project-specific excavation and grading plans prior to construction and identify areas where monitoring is required based on the depth and extent of excavation into paleontologically sensitive geologic units (e.g., older alluvium or Puente Formation). Monitoring shall be implemented by the qualified paleontologist during ground disturbance in those identified areas. Very shallow surficial excavations (i.e., less than 5 feet in depth) within areas of previous disturbance or areas of Quaternary younger alluvial deposits shall be monitored by the qualified paleontologist to ensure that underlying sensitive units (i.e., Quaternary older alluvium) are not adversely affected. Areas consisting of artificial fill materials shall not require monitoring.	Less Than Significant (construction) No Impact (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		If future excavations take place in Quaternary older alluvial deposits or within Fernando or Puente Formation bedrock, such excavations shall be monitored on a full-time basis by a qualified paleontological monitor and under the supervision of the qualified paleontologist. The paleontological resource monitoring shall include inspection of exposed rock units during active excavations within the geologically sensitive sediments. Monitoring may be reduced if some of the potentially fossiliferous units described herein are, upon exposure and examination by qualified paleontological personnel, determined to have a low potential for containing fossil resources. The paleontological monitor shall be equipped to salvage fossils as they are unearthed to avoid construction delays and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontological monitor shall have authority to temporarily divert grading away from exposed fossils to recover the fossil specimens professionally and efficiently and collect associated data. All efforts to avoid delays in project schedules shall be made. To prevent construction delays, paleontological monitors shall be equipped with the necessary tools for the rapid removal of fossils and retrieval of associated data. This equipment shall include handheld global positioning system receivers, digital cameras, and cell phones as well as a tool kit with specimen containers, matrix sampling bags,	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		field labels, field tools (awls, hammers, chisels, shovels, etc.), and plaster kits. At each fossil locality, field data forms shall be used to record pertinent geologic data, stratigraphic sections shall be measured, and appropriate sediment samples shall be collected and submitted for analysis. Fossils collected, if any, shall be transported to a paleontological laboratory for processing where they shall be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility that meets federal and State curation standards and is approved in writing by the County of Los Angeles. Following analysis, a Report of Findings with an appended itemized inventory of specimens shall be prepared by the qualified paleontologist within a reasonable timeframe from the completion of recovery. The report and inventory, when submitted to the County along with confirmation of the curation of recovered specimens into an established, accredited museum repository, shall signify completion of the program to mitigate impacts on paleontological resources.	
GREENHOUSE GAS EMISSIONS			
Significance Criterion a: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a	Potentially Significant (construction and operation)	**Construction and Operation** **Mitigation Measure GHG-1a:** For development projects that include parking (e.g., private garages, surface parking lot, etc.), the Project Applicant(s)/Contractor(s) shall implement the following provisions of	Significant and Unavoidable (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
significant impact on the environment? Implementation of the Proposed Project would result in emissions that would exceed the South Coast Air Quality Management District bright-line greenhouse gas significance threshold. (**Impact GHG-1**)		the California Green Building Standards Code (CALGreen) as mandatory and not voluntary and shall list and identify them on all prepared building and site plans. The Project Applicant(s) shall submit these building and site plans that note the applicable measures to the County ~~of Los Angeles Building and Safety Department~~ prior to the issuance of construction permits. ▪ **Residential Structures with Three or Fewer Stories.** For residential land uses with three or fewer stories, the ~~project developer(s)~~ Project Applicant(s)/Contractor(s) shall: o Design and build condominium/townhouses dwellings that have an attached private garage to have a dedicated electric circuit to support electric vehicle charging, as outlined in the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.1. o Design and build residential buildings to, at a minimum, meet the Tier 2 electric vehicle parking standards of the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.2.1. ▪ **Nonresidential Structures and Residential Structures with Four or More Stories.** For nonresidential land uses and residential land uses that are four or more stories, the Project Applicant/Contractor(s)~~developer(s)~~ shall:	

		○ All parking areas shall be designed to provide parking for low-emitting, fuel-efficient, and carpool/van vehicles. At minimum, the number of preferential parking spaces shall equal the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.1.2. ○ Parking areas shall be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations shall comply with the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.3.3 or Section A5.106.5.3.4. **Mitigation Measure GHG-1b:** Each ~~applicant~~ Project Applicant/Contractor shall demonstrate a minimum 10 percent reduction in energy consumption below energy baselines. For the General Hospital, ASHRAE Standard 90.1-2010 shall be the energy baseline. For all other new construction and major renovation, the 2025 version of Title 24, Part 6 shall be the energy baseline. "New construction" in this context shall mean "ground up" development of a structure that has never been occupied. "Major renovation" in this context shall include additions to or redevelopment of existing structures resulting in an increase of over fifty (50) percent of the existing floor area. An overall energy reduction of 10 percent shall be demonstrated on an aggregate basis across the Project Site, allowing for some buildings to perform better than others. Compliance shall be demonstrated via: ▪ A technical memorandum (where energy reductions might be below 10% for individual buildings); or ▪ Title 24 compliance forms submitted at the time of permit (where energy reductions are above 10%); or ▪ An energy modeling report (for the General Hospital).	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		The technical memorandum shall be based on a project site-level energy calculation and reference Title 24 compliance forms where completed and available, and submitted to the County prior to issuance of each building permit. The 10 percent reduction in energy consumption may be achieved through a combination of Project Site-wide renewable energy generation, energy distribution systems, electrification, and/or building design features. The Project Site area energy calculations shall be based on new developments pursuant to the project. The Project Site-level energy calculations shall be updated as needed throughout phased development to reflect actual design progress. Where performance of an individual building or phase is below the 10 percent requirement, it will address anticipated performance in future phases to achieve the aggregate 10 percent reduction. Should the final development phase proposal show that the Project Site-wide 10 percent reduction in energy consumption was not achieved, the final phase development proposal shall include additional measures to ensure the Project Site-wide 10 percent reduction in energy consumption from the electrical grid be achieved. The "final development phase" is the phase that would complete the full buildout of the Project Site within the anticipated 25-year development horizon. If such phase is not realized within the 25-year development horizon, then the Proposed Project shall demonstrate the Project Site-wide 10 percent reduction no later than December 31st, 2050 through the implementation of additional measures. These additional measures may include but are not limited to photovoltaic arrays, appliance or mechanical system upgrades to new	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		or existing buildings, or lighting upgrades on new or existing structures. Any such additional measures shall be quantified for energy consumption reduction performance and submitted to the County for approval prior to the issuance of construction permits for the final phase proposal. **Mitigation Measure GHG-1c:** For nonresidential development projects, prior to issuance of the certificate of occupancy, the ~~property owner~~ Project Applicant(s)/Contractor(s) shall provide documentation to the County ~~of Los Angeles Building and Safety Department~~ demonstrating enrollment in a 100 percent carbon-free electricity energy plan, such as the City of Los Angeles Department of Water and Power's Green Power for Green LA program, for Proposed Project building(s) if such plan is available. If a 100 percent carbon-free electricity plan is not available, the Project Applicant(s)/Contractor(s) ~~project developer(s)/County~~ shall enroll in an energy plan with the next highest carbon-free electricity until a 100 percent carbon-free electricity energy plan becomes available. Measures to achieve 100 percent carbon-free electricity use may include, but are not limited to, plans for 100 percent renewable electricity. If such carbon-free electricity energy plans are waitlisted, the Project Applicant(s)/Contractor(s) may enroll in an available energy plan in the meantime, but shall sign up for the waiting list until such time a carbon-free electricity energy plan is available.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		In addition to the topic-specific mitigation measures identified above, the Proposed Project would also implement the following mitigation measure: **Mitigation:** Implement Mitigation Measure AIR-2 and TRA-3d.	
HAZARDS AND HAZARDOUS MATERIALS			
Significance Criterion a: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? Construction and phased demolition of existing buildings and structures would involve the routine handling, transport, and disposal of hazardous materials. Investigations across the Project Site have confirmed the presence of ACMs, LBPs, petroleum hydrocarbons, VOCs, methane, undocumented fill containing demolition debris, and an idle oil well, as well as limited occurrences of low-level radioactive waste associated with	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure HAZ-1a**: In order to minimize exposure, prior to demolition activities, asbestos-containing materials and lead-based paint surveys and evaluations shall be conducted in buildings that are to be demolished or renovated. Hazardous building materials surveys have been conducted for many Project Site structures; however, because demolition would occur in phases and certain materials are concealed within wall assemblies, mechanical systems, and other building components that cannot be fully accessed until demolition preparation activities occur, final comprehensive pre-demolition surveys consistent with South Coast Air Quality Management District (AQMD) Rule 1403 shall be completed immediately prior to demolition of each structure. Abatement measures shall be implemented in accordance with the recommendations of these evaluations. Asbestos surveys shall be conducted in accordance with South Coast AQMD Rule 1403, which specifies that all surveys are to be carried out by a Cal/OSHA-certified asbestos consultant and will follow established survey protocols, notification, and work practice requirements. Lead-based paint surveys shall be carried out by a California Department of Public Health (CDPH)–certified inspector/assessor. If necessary, a lead abatement plan would be	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
former medical and laboratory activities. **(Impact HAZ-1).** Operational hazardous materials use would include medical and laboratory supplies, cleaning agents, maintenance products, fuels, and small quantities of commercial and household products. Biomedical and medical waste generated by hospital functions would continue to be produced during long-term operation and must be managed as part of ongoing campus activities. **(Impact HAZ-2)**		prepared by the CDPH-certified project monitor or supervisor and be implemented during demolition and renovation activities. Demolition activities would be performed by CDPH-certified workers. **Mitigation Measure HAZ-1b:** Prior to start of construction, construction activities that involve subsurface disturbance within areas of the Project Site where residual petroleum hydrocarbons and volatile organic compounds (VOCs) in groundwater have been identified or are reasonably expected to be present, including areas downgradient of the former leaking underground storage tank (LUST) location at 1200 North State Street shall account for residual petroleum hydrocarbons and VOCs in groundwater that remain following regulatory closure of the former leaking underground storage tank case. A qualified environmental professional shall evaluate the potential for vapor encroachment conditions (VEC) and specify appropriate management measures, which may include removal and disposal of contaminated soil, groundwater management, vapor mitigation, or other remedial actions, consistent with regulatory requirements and recommendations of the Phase II ESA. The management measures shall be implemented during soil disturbing activities. **Mitigation Measure HAZ-1c:** Prior to construction, the Project Applicant(s)/Contractor(s) shall conduct additional confirmatory subsurface investigations in areas of known or suspected concern identified in the completed Phase II Subsurface Investigation and Methane Survey, including former and suspected underground	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		storage tank locations, both those abandoned in place and those without verified removal documentation, as well as former boiler and powerhouse areas. Because prior investigations were limited to accessible areas and did not include full site-wide excavation or investigation beneath existing structures, utilities, and active facilities, the extent of residual contamination cannot be fully characterized until demolition and site access occur. Therefore, additional confirmatory investigation shall be completed prior to grading in each affected area to fully delineate any residual contamination. These investigations shall evaluate whether residual contamination remains that could affect redevelopment. If additional residual contamination is found, a qualified geologist or industrial hygienist shall recommend appropriate remedial actions, which may include removal, disposal, or remediation of affected soils or structures, consistent with regulatory requirements. These remedial actions shall be implemented during construction. **Operation** **Mitigation Measure HAZ-2:** Prior to the issuance of building permits for any new residential or commercial structure on portions of the Project Site where volatile organic compounds (VOCs) in soil vapor have been documented above applicable screening levels, the Project Applicant(s)/Contractor(s) shall prepare and implement a vapor intrusion mitigation plan. The plan shall include site-specific engineering controls, such as passive or active sub-slab depressurization systems, vapor barriers, or equivalent measures designed to prevent intrusion of VOCs into occupied indoor spaces.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Because final building footprints, foundation designs, and finished grades have not yet been determined, a structure-specific vapor mitigation system cannot be finalized at this time. Therefore, the vapor intrusion mitigation plan shall be prepared for each applicable structure once final design plans are available and prior to permit issuance. The vapor intrusion mitigation plan shall be prepared by a qualified environmental professional in consultation with the ~~Los Angeles Department of Building and Safety (LADBS) as the permitting authority, and, as applicable,~~ Los Angeles County Department of Public Works~~,~~ and the Los Angeles Regional Water Quality Control Board (RWQCB). Design features shall comply with City of Los Angeles Methane Zone requirements, CalEPA guidance, and RWQCB performance standards for VOC mitigation. Implementation of the plan, including installation of all required engineering controls, shall be verified through inspections and post-installation testing prior to occupancy. ~~LADBS,~~The County in coordination with the RWQCB, shall review and approve the plan, confirm proper installation, and enforce compliance as part of the standard building permit and inspection process.	
HYDROLOGY AND WATER QUALITY			
Significance Criterion a: Would the project violate any water quality standards or waste discharge requirements or	Potentially Significant (construction and operation)	**Construction** Implement Mitigation Measure HAZ-2.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
otherwise substantially degrade surface or groundwater quality? Certain soils on the Project Site are contaminated and contain volatile organic compounds (VOCs) in soil vapor above screening levels, petroleum hydrocarbons in shallow soils, and methane in mapped Methane Zones, all of which would be encountered during grading and excavation. **(Impact HYD-1).** There is potential that future implementing projects would result in leaching of nutrients from growing media, allowing phosphorus to enter the stormwater runoff. **(Impact HYD-2)**		**Operation** **Mitigation Measure HYD-2:** During the initial design of each future project, the Project Applicant(s)/Contractor(s) shall prepare project-specific Stormwater Mitigation Plans (SUSMP) for review and approval by the Los Angeles County Department of Public Works (LACDPW). Low-impact development (LID) features included in project-specific SUSMPs shall be designed to minimize the leaching of nutrients from growing media. LID features shall avoid the use of growing media, mulch, and compost containing animal products, which may leach nutrients. Design modifications may include incorporation of an internal storage zone with an elevated underdrain and a carbon food source for denitrifying bacteria to create anaerobic conditions and subsequent denitrification. During the initial design of each future implementing project, the Project Applicant/Contractor shall also prepare project-specific Operation and Maintenance (O&M) Plans for proposed LID features and on-site landscaping for review and approval by the ~~Los Angeles County Department of Public Works (~~LACDPW~~)~~. The O&M plans shall be revised as needed as development plans and proposed LID features are revised. The project specific O&M Plans shall consider impacts on water quality due to the leaching of phosphorous. O&M practices shall include integrated pest management and organic maintenance methods, including those for hand weeding. The use of fertilizers, pesticides, herbicides, and products containing animal manure or animal products shall be avoided.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Prior to construction of future development projects on the Project Site, the Project Applicant(s)/Contractor(s) shall prepare and submit final building and landscape design plans to LACDPW demonstrating that all landscape-based LID features are designed to improve water quality and minimize the leaching of nutrients from growing media.	
Significance Criterion b: Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin? Due to dewatering procedures for the Proposed Project, there is potential for the groundwater level to be impacted on the Project Site. Water use would increase during Project operation because of the increase in the number of persons who would use the Project Site and the increase in landscape maintenance. **(Impact HYD-3)**	Potentially Significant (construction and operation)	**Construction and Operation** **Mitigation Measure HYD-3a:** Prior to and during construction involving deep excavation that could encounter groundwater or dewatering, monitoring wells shall be installed by the Project Applicant(s)/Contractor(s) during construction within and around the perimeter of each structure to monitor the groundwater level and evaluate the performance of the dewatering system. Before starting dewatering operations, a baseline conditions survey conducted by a licensed geotechnical or structural engineer retained by the Project Applicant(s)/Contractor(s) shall be made of all adjacent foundations and structures to assess the impact of deep excavation dewatering on adjacent structures. All signs of existing distress shall be recorded. The baseline survey shall be submitted to the County and retained for reference during construction monitoring. **Mitigation Measure HYD-3b:** During project design, the Project Applicant(s)/Contractor(s) shall retain a qualified civil or water resources engineer to prepare a Recycled and Alternative Water Supply Feasibility Study evaluating the technical and economic feasibility of using non-potable water sources for landscape irrigation. The study shall identify feasible sources, projected supply volumes, system design concepts, and implementation costs.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Based on the results of the feasibility study, future projects shall incorporate all technically and economically feasible non-potable supply systems into the final landscape irrigation supply. Irrigation water demands greater than existing irrigation demands shall be met by alternative supply sources to the maximum extent technically feasible. The use of alternative water supply sources for irrigation shall be maximized to reduce the use of potable water for irrigation and to approximate existing irrigation demands. Alternative water supply sources include, but are not limited to, reclaimed water, gray water, harvested rainwater (stormwater), and air-conditioning condensate (although not specifically mentioned in the master plan, this could represent a significant source of clean irrigation water). The County shall review and approve the Feasibility Study and irrigation design prior to permit issuance.	
NOISE			
Significance Criterion a: Would the project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? The Proposed Project's construction-related pile driving	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure NOI-1: Reduce Construction Noise to the Extent Possible.** If construction activities associated with the Proposed Project have the potential to exceed the County's construction noise thresholds at nearby on- and off-site sensitive receptors, including during pile driving or other high noise construction activities, the Project Applicant(s)/Contractor(s) shall implement the following noise reduction measures during construction: ▪ To the extent feasible, construction activities shall occur between the hours of 7:00 am to 7:00 pm on Monday through Friday and 8:00 am to 6:00 pm on Saturdays, consistent with Section 12.08.520 of the County of Los Angeles Code of Ordinances.	Significant and Unavoidable (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
activities would exceed applicable noise level standards. (**Impact NOI-1**) The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to traffic. (**Impact NOI-2**) The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to warehouse uses, clean tech/~~advanced~~light industrial, mechanical equipment, and outdoor events. (**Impact NOI-3**)		Construction activities shall not occur at any time on Sundays or legal holidays. Construction personnel shall not be permitted on the job site, and material or equipment deliveries and collections should not be permitted outside of these hours. If construction activities must occur outside of the allowable hours, the Project Applicant(s)/Contractor(s) shall follow necessary procedures to obtain an appropriate variance in accordance with Section 12.08.580 of the County of Los Angeles Code of Ordinances prior to conducting such activities. Construction activities occurring outside the allowable hours shall comply with all conditions of the approved variance. ▪ To the fullest extent practicable, the quietest available type of construction equipment shall be used. Newer equipment is generally quieter than older equipment. The use of electric powered equipment is typically quieter than diesel or gasoline powered equipment, and hydraulic powered equipment is typically quieter than pneumatic power. ▪ Where feasible, impact pile driving shall be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles. ▪ All construction equipment shall be properly maintained. Poor maintenance of equipment typically causes excessive noise levels. ▪ All construction equipment, stationary and mobile, shall be equipped with properly operating and maintained mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features that meet or exceed original factory specification and are properly maintained and functioning	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		during construction activities. Mobile or fixed "package" equipment (e.g., arc welders, air compressors) shall be equipped with shrouds and noise control features that are readily available for that type of equipment. ▪ All noisy equipment shall be operated only when necessary, and should be switched off when not in use. ▪ The use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. To the extent feasible, temporary barriers shall be employed around the project site and/or around noisy construction equipment, specifically pile driving equipment. For barriers to be effective they shall break the line-of site between the equipment and any noise-sensitive receiver. These barriers may be constructed as follows: o From commercially available acoustical panels lined with sound absorbing material (the sound absorptive faces of the panels should face the construction equipment). o From common construction materials such as plywood and lined with sound absorptive material (the sound absorptive material should face the construction equipment). o From acoustical blankets hung over or from a supporting frame. The blankets shall provide a minimum sound transmission class (STC) rating of 28 and a minimum noise reduction coefficient (NRC) of 0.80 and shall be firmly secured to the framework with the sound absorptive side of the blankets oriented towards the construction equipment. The blankets shall be overlapped by at least 6" at seams and taped so that no gaps exist. The largest blankets available shall be	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier. **Operation** **Mitigation Measure NOI-3a: Design Project Facilities to Ensure All Mechanical Equipment Complies with County Noise Standards.** During the architectural and engineering design phase of each new facility (building, central plant, parking structure, etc.) that could introduce new mechanical equipment to the Project Site, and prior to the issuance of any building permits for the facility, the Project Applicant(s)/Contractor(s) shall retain an acoustical consultant to evaluate the design and provide recommendations, as necessary, to ensure that the mechanical equipment complies with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: changes in equipment locations, upgrades to central plant buildings, rooftop parapet walls, acoustical louvers or screens, or intake and exhaust silencers. **Mitigation Measure NOI-3b: Design and Manage Outdoor Use Areas to Ensure Organized Outdoor Events Comply with County Noise Standards.** Prior to the issuance of any building permits for outdoor use areas that are anticipated to host organized events such as outdoor markets, farmers markets, summer concerts and health marches, etc. the Project Applicant(s)/Contractor shall retain an acoustical consultant to evaluate the design (event layout, sound	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		system design, etc.) and operational event details (crowd sizes, times of operation, etc.) to ensure that such events will comply with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: controls on crowd sizes and event times, and limits on sound system power levels.	
Significance Criterion b: Would the project generate excessive groundborne vibration or groundborne noise levels? The Proposed Project's construction-related pile driving activities would exceed applicable vibration standards. (**Impact NOI-4**) The Project Project's operational vibration levels are not anticipated to exceed applicable vibration standards.	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure NOI-4: Reduce Construction-Generated Groundborne Vibration to the Extent Possible.** The Project Applicant(s)/Contractor(s) shall implement the following vibration reduction measures during construction: ▪ Through coordination with the County w~~W~~here possible, impact pile driving should be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles. ▪ Distance requirements for eligible or listed historical structures (as defined in Chapter 3.4, Cultural Resources of this Draft SEIR): o Pile driving shall not be operated within 135 feet, vibratory rollers within 36 feet, or other heavy equipment (e.g., bulldozer) within 20 feet. ▪ Distance requirements for non-engineered and masonry buildings: o Pile driving shall not be operated within 100 feet, vibratory rollers within 25 feet, or other heavy equipment (e.g., bulldozer) within 15 feet.	Significant and Unavoidable (construction) Less Than Significant (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
TRANSPORTATION			
Significance Criterion a: Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities? The Proposed Project's construction activities have the potential to conflict with applicable program, plan, ordinance, or policies addressing the circulation system. (**Impact TRA-1**) The Proposed Project's operation would not conflict with a program, plan, ordinance, or policy addressing the circulation system. Impacts would be less than significant.	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure TRA-1:** The Project Applicant(s)/Contractor(s) shall develop and implement a Worksite Traffic Control Plan for any aspect of construction that would result in road closures, sidewalk closures, bicycle facility closures, removal of parking, or similar traffic disruptions. The Worksite Traffic Control Plan shall be prepared as part of the project design package according to California Manual on Uniform Traffic Control Devices (CA-MUTCD) requirements, and may include, but not be limited to, the following elements; ▪ Provide a roadway layout that shows the locations of construction activity and surrounding roadways to be used as detour routes, including special signage. ▪ Establish detour routes in coordination with the City of Los Angeles to minimize disturbances to local roadway conditions. ▪ Maintain access to existing residences at all times. ▪ Work with City of Los Angeles Department of Transportation, Los Angeles Sherriff's Department, Los Angeles County Fire Department, and Los Angeles Police Department, to coordinate all construction-related plans and minimize disturbances to local emergency management services (EMS) providers ensure that alternative evacuation and emergency routes are designed to maintain response times during construction. ▪ Provide adequate off-street parking areas at designated staging areas for construction-related vehicles. ▪ Work with transit providers to maintain access and circulation routes to existing stops during construction phases and identify	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		appropriate detours to provide rerouting during construction while minimizing service disruptions. ▪ Work with the City of Los Angeles to maintain continuity and operations of existing pedestrian and bicycle facilities during construction.	
Significance Criterion c: Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)? The Proposed Project's construction activities have the potential to result in transportation hazards. Impacts would be potentially significant. (**Impact TRA-2**) The Proposed Project's operational traffic has the potential to result in transportation hazards related to queuing at off-ramps. (**Impact TRA-3**)	Potentially Significant (construction and operation)	**Construction** Implement Mitigation Measure TRA-1. **Operation** ~~Prior to the, start of construction for the first development phase of~~ Due to the programmatic nature of a 25-year buildout of the Proposed Project, and the multiple agency authorizations required to implement the conceptual measures herein: For all future developments as part of the Proposed Project, the Project Applicant(s)/Contractor(s) shall consult with County and relevant appropriate agencies to develop ~~timing~~ mechanisms as to when the conceptual improvements identified in Mitigation Measures TRA-3(a)-(e) are implemented based on phased buildout of the Proposed Project. The following three-step process shall be followed to determine whether a development project could result in Impact TRA-3. Step 1: Determine whether cumulative land use, including the development, would exceed 15 percent of Proposed Project buildout for any single land use category in the table below.	Less Than Significant (construction) Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

<table>
<tr><th>Environmental Impact</th><th>Level of Significance without Mitigation</th><th>Mitigation Measures</th><th>Level of Significance with Mitigation</th></tr>
<tr><td></td><td></td><td>

If No: No further analysis is required, and no physical improvements are necessary.
If Yes: Proceed to Step 2.

Step 2: If a Proposed Project would result in any single Proposed Land Use exceeding 15 percent, prepare a trip generation and Transportation Demand Management (TDM) analysis.

Step 3: If the cumulative trips, after applying TDM strategies, would exceed the inbound or outbound trips associated with 15 percent of Proposed Project buildout, prepare a detailed off-ramp queuing analysis. The results of the off ramp queuing analysis will determine whether the development's trips, combined with cumulative trips, would result in a queuing impact at any of the identified off-ramp locations.

Mitigation Measure TRA-3a: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 southbound off-ramp to Mission Road.

▪ Re-stripe the off-ramp lane configuration from:
o Left turn lane, shared through-left lane, and a right lane; to
o two left turn lanes and one shared through-right turn lane.
▪ Optimize signal timing along the Mission Road coordinated corridor, including cycle length, offset, and phase splits.
▪ Apply the Caltrans' Intersection Safety Operational Assessment (ISOAP) methodology as appropriate to design and implement intersection improvements.

		▪ Coordinate with Caltrans to evaluate expanding ramp storage using concrete/landscaped area in-between existing off-ramp and freeway mainline, and implement as determined by the appropriate implementing agencies. **Mitigation Measure TRA-3b:** The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to State Street. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, right turn lane; to o shared left-right turn lane and a right turn lane. ▪ Optimize signal timing along the State Street coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements. ▪ Coordinate with Caltrans to evaluate expanding ramp storage using landscaped slope area in-between existing off-ramp and freeway connector (north side of off-ramp), and implement as determined by the appropriate implementing agencies. **Mitigation Measure TRA-3c:** The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to Soto Street. ▪ Re-stripe the off-ramp lane configuration from:	

		o Left turn lane, shared through-left turn lane, and two right turn lanes; to o two left turn lanes, one through lane, and one right turn lane. ▪ Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements ▪ Coordinate with Caltrans to evaluate striped shoulder area along north side of existing off-ramp, and implement as determined by the appropriate implementing agencies. **Mitigation Measure TRA-3d:** The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 northbound off-ramp to Cesar Chavez Avenue. ▪ Optimize signal timing along the Cesar Chavez Avenue coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements **Mitigation Measure TRA-3e:** A ~~comprehensive~~ TDM program shall be implemented as part of ~~the Proposed~~ individual development ~~P~~project's mitigation program aimed at reducing vehicular trips to the Project Site, which may mitigate Project-induced freeway off-ramp queuing hazards. Project Applicant(s)/Contractor(s) will incorporate TDM strategies and estimate their effectiveness. TDM strategies that the Proposed Project could implement to result in a quantitative reduction in vehicular trips include, but are not limited to, to the following:	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		▪ Trip Reduction Strategies o Implement Commute Trip Reduction Program (Voluntary for Mandatory) o Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) o Implement Commute Trip Reduction Marketing o Provide Ridesharing Program o Implement Subsidized or Discounted Transit Program - All Trips o Provide End-of-Trip Bicycle Facilities o Provide Employer-Sponsored Vanpool ▪ Parking Strategies o Price workplace parking o Implement Employee Parking Cash-Out o Limit Residential Parking Supply o Unbundle Residential Parking Costs from Property Cost ▪ School o Coordinate with Los Angeles Unified School District (LAUSD) to establish a School Bus Program o Active Modes of Transportation for Youth	
TRIBAL CULTURAL RESOURCES			
Significance Criterion a: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c)	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure TCR-1a: Native American Monitoring of Ground-Disturbing Activities in Native Soils** a) The Project Applicant(s) shall invite a Native American Monitor from the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) prior to the commencement of any ground-disturbing activities. "Ground-disturbing activities" shall include, but are not limited to,	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe? Ground-disturbing activities have the potential to disturb native subsurface deposits possessing traditional or cultural significance to Native American or other descendant communities. **(Impact TCR-1)** Routine operations and maintenance activities are not expected to extend into native or previously undisturbed soils where tribal cultural resources could occur.		grading, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching, for each implementing phase of the Proposed Project at all Project locations (i.e., both on-site and any off-site locations that are included in the Project description/definition and/or required in connection with the Project, such as public improvement work). b) The Project Applicant(s) shall make reasonable efforts to execute a Tribal Monitoring Agreement with the Native American Monitor prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence any ground-disturbing activity. c) The Native American Monitor shall work with the Project Applicant's qualified archaeologist during qualifying ground-disturbing activities to identify potential Native American Tribal Cultural Resources (TCRs) and communicate concerns regarding TCRs to the Project Applicant(s). The Native American Monitor will complete daily monitoring logs that will provide: description(s) and location(s) of the relevant ground-disturbing activity(ies), the type(s) of construction activity(ies), information and/or materials related to TCRs; and any other facts, conditions, materials, or discoveries of significance to the Tribe. Daily monitoring logs will identify and describe any discovered TCRs. Copies of daily monitoring logs will be provided to the Project Applicant(s) and the County at the end of all Project-related ground-disturbing activities. Daily monitoring logs will be kept confidential with the Project records. d) On-site tribal monitoring shall conclude upon either of the following, whichever occurs first: (1) written notification to the Tribe from a designated point of contact for the Project Applicant(s) that all	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		ground-disturbing activities and phases of Project implementation that may involve ground-disturbing activities are complete; or (2) written notification to the Project Applicant(s) from the Tribe that no future planned construction activity and/or development/construction phase of the Project has the potential to impact TCRs. **Mitigation Measure TCR-1b: Unanticipated Discovery of Tribal Cultural Resource (Non-Funerary)** a) In accordance with section 21074, subdivisions (a)(1)(A)-(B) of the Public Resources Code (PRC), a Tribal Cultural Resources (TCR) is a site, feature, place, cultural landscape, sacred place or object, which is of cultural value to the Tribe and either: (1) on or eligible for the California Historic Register or other local historic register or (2) the County of Los Angeles, as the lead agency for the Project, at its discretion, chooses to treat the resource as a TCR. b) Upon discovery of any TCR or potential TCR, all construction activities within a radius deemed appropriate by the qualified archaeologist shall cease and shall not resume until the discovered TCR has been fully assessed by the Native American Monitor and/or qualified archaeologist. If the assessment finds the resource to be a TCR, treatment measures and final disposition will be determined in consultation with the Tribe.	
		Mitigation Measure TCR-1c: Unanticipated Discovery of Native American Human Remains and/or Associated Grave Goods a) Native American human remains are defined in section 5097.98, subdivision (d)(1) of the Public Resources Code (PRC) as an	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		inhumation or cremation in any state of decomposition or skeletal completeness. Funerary objects, also called associated grave goods in section 5097.98 of the PRC, shall be treated alike per section 5097.98, subdivisions (d)(1) and (2) of the PRC. b) If Native American human remains and/or grave goods are discovered or recognized on the Project Site, then section 5097.9 of the PRC as well as Health and Safety Code Section 7050.5 shall be followed. c) Any discovery of Native American human remains and/or grave goods shall be kept confidential to prevent further disturbance.	
UTILTIES AND SERVICE SYSTEMS			
Significance Criterion c: Would the project result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments? Based on the estimated flows, the sewer conveyance system would be appropriately sized to accommodate the total flow for the Proposed Project; however, further detail gauging and	Potentially Significant (construction and operation)	**Construction and Operation** **Mitigation Measure USS-2:** Prior to issuance of a building permit for ~~any future development~~ a Project Applicant/Contractor under the Proposed Project that could result in an increase in wastewater generation, the Project Applicant(s)/Contractor(s) shall coordinate with the City of Los Angeles Bureau of Sanitation to conduct further detailed gauging and evaluation to identify a specific sewer connection point with sufficient capacity. If the public sewer has insufficient capacity, then the County shall be required to build a sewer line to a point in the sewer system with sufficient capacity.	Significant and Unavoidable (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
evaluation may be needed as part of the permit process for individual projects to identify suitable sewer connection points and ensure adequate line capacity. A final approval for sewer capacity and connection permit shall be made at that time. If there is insufficient capacity in the local sewer lines that would serve an individual future project, then the impact would be considered to be significant. Therefore, impacts would be potentially significant. **(Impact USS-2)**			

Revisions to Text in the Draft SEIR

CHAPTER ES, EXECUTIVE SUMMARY

ES.5.3 Alternative C: Reduced Density Medical Campus Alternative, Page ES-12

No residential, general office, retail, patient and care giver lodging, education, or clean tech/~~advanced~~ light industrial uses would be developed within the General Hospital Building.

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures, Noise, Page ES-76

The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to warehouse uses, clean tech/~~advanced~~ light industrial, mechanical equipment, and outdoor events. (**Impact NOI-3**)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures, Tribal Cultural Resources, Page ES-94

Significance Criterion ~~a~~b: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

CHAPTER 2, PROJECT DESCRIPTION

2.4.2 Proposed Project Land Uses, Project Design Features: General Hospital-Acute Unit District and Building, Page 2-23 has been modified in response to comments from the Los Angeles Conservancy

PDF-1. All work within the Los Angeles General Hospital – Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to ensure continued conformance with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Additionally, the County is pursuing federal historic preservation tax incentives for the Acute Unit's proposed rehabilitation work, which requires rigorous review by the National Park Service (NPS) and California Office of Historic Preservation (OHP) for compliance with the Rehabilitation Standards.

2.4.2 Proposed Project Land Uses, Project Design Features: Support Services Site, Page 2-26 has been modified in response to comments from the Los Angeles Conservancy

PDF-5. An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

2.4.3 Circulation and Access, Page 2-28 has been modified in response to comments from South Coast AQMD.

- **Vehicular Wayfinding:** The Proposed Project would include internal vehicular wayfinding signage, as appropriate, to direct passenger vehicles, service vehicles, and delivery vehicles to designated access points, loading areas, and circulation routes within the Project Site. Any signage located within the public right-of-way outside the Project Site would be subject to approval and jurisdiction of the applicable roadway agency.

2.4.6 Use and Development Standards, Height and Views, Page 2-13 has been modified for clarity.

Height for new buildings would be regulated based on both the building's height relative to the General Hospital Building (19 stories) and key views to the General Hospital Building from on-site locations and surrounding roadways. No structure or projections outside the Historic District, as shown in Figure 3.4-1, *Map of Historical Resources on the Project Site*, shall exceed 30 feet below ~~physical building projections would exceed~~ the highest elevation point of the roof structure or parapet wall of the existing General Hospital Building (approximately 240 feet from ground level).

To maintain sightlines, wayfinding, and a circulation corridor that recognizes the visual prominence of the General Hospital Building and its importance as the heart of a new urban village, a central corridor ~~spine~~ of open space that would be a minimum of ~~20~~ 30 feet in width

would run east to west within the Project Site from the center of the General Hospital Building's main entrance through the axis framed by the Forecourt buildings, between the footprints of new development, and continuing to the center of the Project Site.

Additionally, two view corridors of the General Hospital Building would be protected on the Project Site. View Corridor 1 is located along the proposed central corridor and within this corridor, a protected view corridor of uniform 300-foot horizontal width would be maintained from the General Hospital Building primary entrance to the terminus point located 900 feet along the proposed central corridor. View Corridor 2 is located at the intersection of Zonal Avenue and State Street and within this corridor, a protected view corridor of uniform 30-foot horizontal width would be maintained, preserving unobstructed view of the General Hospital Building's uppermost four stories.

CHAPTER 3.1, AESTHETICS

3.1.4, Project Impact Analysis, Threshold a, Operation, Page 3.1-20

Under Proposed Project conditions, two view corridors would be maintained and would protect views of the General Hospital Building. No new building, structure, or portion would intrude into a protected view corridor, which would be defined as a continuous vertical plane extending from the ground plane at each designated viewpoint along the centerline along the Community Corridor to the façade of the General Hospital Building~~, running from each designated viewport to the General Hospital Building façade~~.

CHAPTER 3.2, AIR QUALITY

3.2.1 Regulatory Framework, Pages 3.2-15 and 3.2-16 have been modified in response to comments from South Coast AQMD.

South Coast AQMD Rules and Regulations

All projects are subject to South Coast AQMD rules and regulations in effect at the time of activity, including:

- **Rule 201, Permit to Construct.** This rule requires written authorization from South Coast AQMD must be obtained prior to the installation of permitted stationary equipment that may either generate or reduce air contaminants.
- **Rule 203, Permit to Operate.** This rule requires written authorization from South Coast AQMD must be obtained prior to the operation of permitted stationary equipment that may either generate or reduce air contaminants.
- **Rule 401, Visible Emissions.** This rule is intended to prevent the discharge of pollutant emissions from an emissions source that results in visible emissions. Specifically, the rule

prohibits the discharge of any air contaminant into the atmosphere by a person from any single source of emission for a period or periods aggregating more than three minutes in any one hour that is as dark as or darker than designated No. 1 on the Ringelmann Chart, as published by the US Bureau of Mines.

- **Rule 402, Nuisance.** This rule is intended to prevent the discharge of pollutant emissions from an emissions source that results in a public nuisance. Specifically, this rule prohibits any person from discharging quantities of air contaminants or other material from any source such that it would result in an injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public. Additionally, the discharge of air contaminants would also be prohibited where it would endanger the comfort, repose, health, or safety of any number of persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property. This rule does not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.
- **Rule 403, Fugitive Dust.** This rule is intended to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (human-made) fugitive dust sources by requiring actions to prevent, reduce, or mitigate fugitive dust emissions. Rule 403 applies to any activity or human-made condition capable of generating fugitive dust and requires best available control measures to be applied to earth-moving and grading activities.
- **Rule 445, Wood Burning Devices.** In general, the rule prohibits new developments from installing wood-burning devices. This rule is intended to reduce the emission of particulate matter from such devices and applies to manufacturers and sellers of wood-burning devices, commercial sellers of firewood, and property owners and tenants that operate a wood-burning device.
- **Rule 1110.2, Emissions from Gaseous and Liquid Fueled Engines.** This rule serves to reduce NO_X, VOC, and CO emissions from stationary and portable engines greater than 50 brake horsepower (bhp) and establishes testing and monitoring requirements for the covered engines.
- **Rule 1113, Architectural Coatings.** This rule serves to limit the VOC content of architectural coatings used on projects in the South Coast AQMD. Any person who supplies, sells, offers for sale, or manufactures any architectural coating for use on projects in the South Coast AQMD must comply with the current VOC standards in this rule.
- **Rule 1166, Volatile Organic Compound Emissions from Decontaminated Soil.** Under this rule, an excavation plan is required, and excavation operations are required to be monitored for VOC concentrations.
- **Rule 1403, Asbestos Emissions from Demolition/Renovation Activities.** The purpose of this rule is to specify work practice requirements to limit asbestos emissions from building

demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials (ACM). The requirements for demolition and renovation activities include asbestos surveying, notification, ACM removal procedures and time schedules, ACM handling and clean-up procedures, and storage, disposal, and landfilling requirements for asbestos-containing waste materials. All operators are required to maintain records, including waste shipment records, and are required to use appropriate warning labels, signs, and markings.

- **Rule 1466, Control of Particulate Emissions from Soils with Toxic Air Contaminants,** to minimize the amount of off-site fugitive dust emissions containing TACs by reducing particulate emissions in the ambient air as a result of earthmoving activities, including excavating, grading, handling, treating, stockpiling, transferring, and removing soil that contains applicable TACs. Components of the fugitive dust control plan are required to include the following measures: fencing that is a minimum of six feet tall and at least as tall as the height of the tallest stockpile, with a windscreen with a porosity of 50 ± 5 percent; monitoring; notification; signage; and recordkeeping.
- **Rule 1470, Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines.** The purpose of this rule generally establishes operating requirements and emissions standards is to reduce diesel particulate matter emissions from diesel-fueled stationary equipment with engines greater than 50 bhp.

3.2.4 Project Impact Analysis, Mitigation Measure AIR-1, Pages 3.2-34 and 3.2-44, has been modified for clarity.

Mitigation Measure AIR-1a: To reduce volatile organic compounds (VOC) emissions during construction, the Project Applicant(s)/Contractor(s) ~~(or its contractors)~~ shall use paints with a VOC content that meets the South Coast Air Quality Management District Super Compliant architectural coatings standard of less than 10 grams per liter (g/L) for coating building architectural surfaces during construction. This measure shall be noted on all site and construction plans.

Mitigation Measure AIR-1b: To reduce nitrogen oxide (NO_X) emissions during construction, the Project Applicant(s)/Contractor(s) ~~(or its contractors)~~ shall implement the following measures during construction:

- Use construction equipment rated by the United States Environmental Protection Agency (USEPA) as having Tier 4 Final or higher exhaust emission limits for offroad equipment with engines 25 horsepower or higher. If Tier 4 Final equipment is not readily available, the contractor may apply other technologies available for construction equipment such that it would achieve a comparable reduction in NO_X and PM emissions comparable to that of Tier

4 construction equipment. Where alternatives to USEPA Tier 4 are utilized, the contractor shall be required to show evidence to the Project Applicant(s) that these alternative technologies would achieve comparable emissions reductions. Certifications or alternative reduction strategies shall be required prior to receiving a construction permit.

- Maintain a list of all operating equipment in use on the construction site during construction for verification by the County ~~of Los Angeles Building and Safety Department~~. The construction equipment list shall state the makes, models, Equipment Identification Numbers, Engine Family Numbers, and number of construction equipment on-site.
- Haul and delivery truck idling times shall be minimized by shutting equipment off when not in use or reducing maximum idling time to less than three (3) minutes (beyond that required by 13 California Code of Resources [CCR] Chapter 10, Section 2485). Clear signage shall be provided for construction workers and construction vehicles at all access points.
- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper conditions prior to operation.
- A traffic control plan shall be prepared and provided to the County.
- A carpool program for construction workers, including incentivizing carpooling as well providing bus service for crew members shall be implemented.
- Truck deliveries shall be consolidated when possible.
- The combined vehicle miles traveled per day for offsite haul truck trips associated with demolition debris and earthen material export/import hauling operations shall not exceed 8,930 miles per day (equivalent to 180 one-way truck haul trips at 49.61 miles per one-way trip, which is the average distance to nearby serving landfills). The construction contractor(s) overseeing hauling operations shall log the number of daily haul truck loads and the one-way haul trip distance for each truck haul load of either demolition debris or earthen material for days in which truck hauling of these materials occurs.

- The individual requirements under this mitigation measure shall be noted on all site and construction plans.

3.2.4 Project Impact Analysis, Mitigation Measure AIR-2 has been added on page 3.2-47 in response to comments from South Coast AQMD.

Impact AIR-2: Implementation of the Proposed Project would generate operation emissions that exceed the South Coast AQMD regional significance thresholds.

Mitigation: Implement Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d.

Mitigation Measure AIR-2: Future private tenants/business entities (i.e., non-County of Los Angeles owned or operated businesses) for new development projects that own their own truck fleets for daily business operations shall only operate trucks that are either zero-emission (Z/E) and/or meet the California Air Resources Board NO_X emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr) for Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the truck requirements under this mitigation measure shall be included in all leasing agreements.

Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement that any owned Class 2b through Class 8 vehicles with a GWVR over 8,500 pounds used for daily business operations shall be either Z/E and/or meet the NOX emissions standard of 0.02 g/bhp-hr. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase agreement) to the County to verify, to the County's satisfaction, that any owned vehicle subject to the requirements under this mitigation measure comply.

3.2.4 Project Impact Analysis, Page 3.2-48 has been modified in response to comments from South Coast AQMD.

Significance with Mitigation: Significant and unavoidable. Buildout of the Proposed Project would generate long-term criteria air pollutant emissions that would exceed South Coast AQMD's regional significance thresholds and cumulatively contribute to the nonattainment designations of the SoCAB. Implementation of Mitigation Measures AIR-2, GHG-1a through GHG-1c and Mitigation Measure TRA-3d would contribute to reducing mobile-source, area-source, and energy sector criteria air pollutant emissions to the extent feasible. However, due to the magnitude of emissions generated by the land uses that would be accommodated by the Proposed Project, long-term criteria air pollutant emissions generated from the Proposed Project could still exceed the South Coast AQMD's regional significance thresholds. Therefore, Impact AIR-2 would remain **significant and unavoidabl*e***.

3.2.4 Project Impact Analysis, Mitigation Measure AIR-2 has been applied and Mitigation Measure AIR-4d has been added to Impact AIR-4, Pages 3.2-55 and 3.2-56, in response to comments from South Coast AQMD. Mitigation Measure AIR-4, Page 3.2-55 and 3.2-56, has been modified for clarity.

Impact AIR-4: Warehousing and light industrial uses accommodated under the Proposed Project would generate onsite operational criteria air pollutant emissions from non-permitted sources that exceed the South Coast AQMD localized significance thresholds.

Mitigation: Implement Mitigation Measure AIR-2.

Mitigation Measure AIR-4a: ~~Future developer/facility owners~~ Project Applicant(s)/Contractor(s) for new development projects that would use off-road equipment (e.g., forklifts and yard trucks) in daily business operations shall only utilize electric-powered off-road equipment. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the limitation to use only electric-powered off-road equipment shall be included in all leasing agreements.

Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only electric-powered equipment for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition,

if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the County to verify, to the County's satisfaction, that any off-road equipment utilized will be electric-powered.

Mitigation Measure AIR-4b: ~~Future developer/facility owners~~ Project Applicant(s)/Contractor(s) for new development projects that would use transport refrigeration units (TRUs) in daily business operations use only electric standby and/or hybrid electric TRUs (E/S TRUs). All E/S TRUs shall comply with the California Air Resources Board's "Alternative Technology" requirements under Section 2477(e)(1)(A)(3) of the California Code of Regulations, Title 13, Article 8, Chapter 9, Division 3. The project developer/facility owner shall disclose this requirement to all tenants/business entities prior to the signing of any lease agreement. In addition, the limitation to use only E/S TRUs shall be included in all leasing agreements.

Prior to issuance of a Business License for a new tenant/business entity, the ~~project developer/facility owners~~ Project Applicant(s)/Contractor(s) and tenant/business entity shall provide a signed document (verification document) to the Los Angeles County Department of Regional Planning noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only E/S TRUs for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the Los Angeles County Department of Regional Planning to verify, to the County's satisfaction, that any TRUs utilized will be E/S TRUs.

Mitigation Measure AIR-4c: To reduce idling emissions from transport trucks, ~~future project developer/facility owners~~ Project Applicant(s)/Contractor(s) for new warehousing or general industrial development projects place signage at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations (e.g., Rule 2485). At minimum, each sign shall include: 1) instructions for truck drivers to shut off engines when not in use; 2) instructions for drivers of diesel trucks to restrict nonessential idling to no more than two consecutive minutes (compared to five minutes currently allowed under Rule 2485); and 3) telephone numbers of the building facilities manager and CARB to report violations. All signage shall be made of weatherproof materials. All site and architectural plans submitted to the County shall note the locations of these signs. ~~Prior to issuance of~~

~~the Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify the installation of these signs.~~

Mitigation Measure AIR-4d: All truck/dock bays for new proposed facilities that accommodate cold storage shall be electrified to facilitate plug-in capability and support use of electric standby and/or hybrid electric transport refrigeration units. All site and architectural plans submitted to the Los Angeles County Building & Safety Division shall note all the truck/dock bays designated for electrification. Prior to the issuance of a Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify electrification of the designated truck/dock bays.

3.2.4 Project Impact Analysis, Page 3.2-56 has been modified in response to comments from South Coast AQMD.

Significance with Mitigation: Significant and unavoidable. Implementation of Mitigation Measures AIR-2 and AIR-4a through AIR-~~4c~~4d would minimize localized onsite operation-related criteria air pollutant emissions. However, because no specific warehousing or industrial development project is currently proposed and the specific operations of such facilities (e.g., number of heavy-duty truck trips, location of facility, etc.) are unknown, the associated emissions, and concentrations levels cannot be determined or modeled. Thus, while implementation of mitigation would reduce emissions, future warehousing and industrial land uses could still exceed the South Coast AQMD LSTs. Therefore, Impact AIR-4 would remain **significant and unavoidable**.

3.2.4 Project Impact Analysis, Mitigation Measures AIR-2 and AIR-4d have been applied to Impact AIR-5 on page 3.2-57 in response to comments from South Coast AQMD.

Impact AIR-5: Warehousing and light industrial uses accommodated under the Proposed Project would generate onsite operational TAC emissions from non-permitted sources that exceed the South Coast AQMD localized significance thresholds.

Mitigation: Implement Mitigation Measures AIR-2 and AIR-4a through AIR-~~4c~~4d.

Page 3.2-58 has been modified in response to comments from South Coast AQMD.

Significance with Mitigation: Significant and unavoidable. Implementation of Mitigation Measures AIR-2 and AIR-4a through AIR-~~4c~~4d would minimize localized onsite operation-related TAC emissions. However, because no specific warehousing or industrial development project is currently proposed and the specific operations of such facilities (e.g., number of heavy-duty truck trips, location of facility, etc.) are unknown, the associated emissions, and health risk levels cannot be determined or modeled. Thus, while implementation of mitigation would

reduce emissions, future warehousing and industrial land uses could still exceed the South Coast AQMD health risk thresholds. Therefore, Impact AIR-5 would remain **significant and unavoidable**.

3.2.4 Project Impact Analysis, Mitigation Measure AIR-6, Page 3.2-62, has been modified for clarity.

> **Mitigation Measure AIR-6:** Prior to discretionary approval by the County of Los Angeles, if it is determined that a development project has the potential to emit nuisance odors, an odor management plan shall be prepared by the Project Applicant(s)/Contractor(s) and submitted to the Los Angeles County Department of Regional Planning for review and approval. Facilities that have the potential to generate nuisance odors include, but are not limited to:
>
> - Wastewater treatment plants
> - Composting, green waste, or recycling facilities
> - Fiberglass manufacturing facilities
> - Painting/coating operations
> - Large-capacity coffee roasters
> - Food-processing facilities
>
> The odor management plan shall demonstrate compliance with the South Coast Air Quality Management District's Rule 402 for nuisance odors and be submitted to the County. The Odor Management Plan shall identify the best available control technologies for toxics (T-BACTs) that will be utilized to reduce potential odors to acceptable levels, including appropriate enforcement mechanisms. T-BACTs may include but are not limited to scrubbers (i.e., air pollution control devices) at the industrial facility. T-BACTs identified in the odor management plan shall be incorporated into the project's design and on-site plan(s).

3.2.4 Project Impact Analysis, Mitigation Measures AIR-2 and AIR-4d have been applied to Impact AIR-8, Page 3.2-65 in response to comments from South Coast AQMD.

Impact AIR-8: The Proposed Project's operation-related activities have the potential to result in cumulative air quality impacts related to criteria pollutant emissions during operation.

> **Mitigation:** Implement Mitigation Measure AIR-2, Mitigation Measures AIR-4a through ~~4c~~4d, Mitigation Measures GHG-1a through GHG-1c, and Mitigation Measure TRA-3d.

CHAPTER 3.3, BIOLOGICAL RESOURCES

3.3.4 Project Impact Analysis, Mitigation Measure BIO-2, Page 3.3-22, has been modified for clarity.

Mitigation Measure BIO-2: Mitigation for Impacts to Nesting Birds. Construction activities shall avoid the nesting season for birds to the extent feasible, or conduct preconstruction nesting bird surveys if construction activities are carried out during the nesting season. To ensure compliance with the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC), the Project Applicant(s), or through the general contractor(s), shall conduct all vegetation removal during the non-breeding season, between September 1 and January 31, or implement the following:

If the removal of vegetation, demolition of buildings, or noise-generating construction activities are scheduled between February 1 and August 31, the County or Project Applicant/C~~c~~ontractor shall retain a qualified biologist (i.e., experienced with conducting nesting bird surveys) who shall conduct a focused nesting bird survey prior to the start of vegetation removal, building demolition, or noise-generating construction activities within any potential nesting habitat (all vegetation, buildings, eaves on buildings, etc.). The size of the nesting bird survey area shall be determined by a qualified biologist at the time of the survey and include the entire limits of disturbance. It may also include a buffer area if deemed necessary by the qualified biologist. The preconstruction nesting bird surveys shall be conducted no more than seven days prior to initiation of vegetation removal, building demolition activities, or noise-generating construction activities. If no active nests are detected during these surveys, no restrictions on Project activities are necessary.

If active nests are found, a qualified biologist shall identify and flag an appropriate buffer around the nest, and no construction activities shall occur within the buffer until the qualified biologist has determined that young have fledged or the nest is no longer active. The specific buffer width shall be determined by a qualified biologist at the time of discovery and vary according to the bird species, site conditions, and the type of work activities to be conducted.

The survey results shall be submitted to the County ~~of Los Angeles Department of Public Works~~ for review and approval of the recommended nest buffer areas, if any, prior to commencement of any vegetation removal, building demolition, or noise-generating construction activities on the Project Site.

3.3.4 Project Impact Analysis, Mitigation Measure BIO-3, Page 3.3-24, has been modified for clarity.

Mitigation Measure BIO-3: Mitigation for Impacts to Protected Trees. Prior to removal, relocation, or maintenance of protected oak trees, a qualified arborist shall inventory and evaluate the health of protected oak trees on the Project Site and evaluate the potential for impacts. If the arborist determines that the proposed activity would cut, destroy, remove, relocate, inflict damage, or encroach into a protection zone of a protected oak tree, the Project Applicant/Contractor shall submit an application for approval to the Los Angeles County Department of Regional Planning and obtain approval prior to impacting a protected oak tree. The Project Applicant(s)/Contractor(s) shall be required to implement the conditions of approval, including planting and care of replacement trees and protections for non-impacted oak trees. When planting replacement trees is required, replacement trees shall be in the ratio of two trees planted for each tree impacted. Replacement trees shall be indigenous oak species and shall be at least 15-gallon size and measure at least one inch in diameter one foot above the base. Replacement trees shall be properly cared for and maintained for two years and replaced if they die within that period.

CHAPTER 3.4, CULTURAL RESOURCES

3.4.3, Standards for Analysis, Project Design Features: General Hospital-Acute Unit District and Building, Page 3.4-59 has been modified in response to comments from the Los Angeles Conservancy.

PDF-1. All work within the Los Angeles General Hospital – Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to ensure continued conformance with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Additionally, the County is pursuing federal historic preservation tax incentives for the Acute Unit's proposed rehabilitation work, which requires rigorous review by the National Park Service (NPS) and California Office of Historic Preservation (OHP) for compliance with the Rehabilitation Standards.

3.4.3, Standards for Analysis, Project Design Features: Support Services Site, Page 3.4-62 has been modified in response to comments from the Los Angeles Conservancy.

PDF-5. An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

3.4.4 Project Impact Analysis, Mitigation Measure CUL-1, Pages 3.4-67 through 3.4-69, has been modified for clarity.

Mitigation Program for Adjacent New Construction

If a new construction project is proposed for a site within 50 feet of an eligible or designated historical resource, then the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1a (Secretary Standards Compliance) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the project is adjacent to the resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the new construction is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the new construction is found to be adjacent to the identified resource, the Architectural Historian/Historic Architect shall assess the project, focusing on the application of Standards No. 9 and 10, both of which relate to adjacent new construction.

If the Architectural Historian concludes that the new construction project meets the Standards, then the project is presumed to not have an impact on historical resources. During implementation of the project, the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1b (Project Review During Design and Construction) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawings and generally be available to the design team, as needed.

If the proximity of new construction to historical resources is such that vibration during construction may cause them physical damage, as defined through Mitigation Measure NOI-4, the Project Applicant(s)/Contractor(s) shall also apply Mitigation Measure CUL-1c (Protection During Construction) and engage a qualified Historic Architect and Structural Engineer to prepare a Conditions Assessment Report and Construction Monitoring Plan.

Mitigation Measure CUL-1b: Project Review During Design and Construction. For instances in which a future project involves adjacency to a historical resource (as determined under Mitigation Measure CUL-1a), the Project Applicant(s)/Contractor(s) shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawing sets and generally be available to the design team during design and construction. The Architectural Historian/Historic Architect shall review Design Development (DD) and Construction Documentation (CD) drawing sets at 50% and 100% completion and provide a brief memo regarding ongoing project compliance with the Standards. Project review during construction shall occur quarterly and reported in memo format, which shall be provided to the County.

Mitigation Measure CUL-1c: Protection During Construction. Prior to the commencement of construction activities within proximity to, as defined in Mitigation Measure NOI-4, a historical resource, a Conditions Assessment Report will be completed by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to identify baseline conditions (cracks, deterioration, etc.). The report will be provided to the County. As part of this process, a Structural Engineer shall be consulted to determine whether any shoring or protection should be installed prior to commencement of construction activities.

In addition, the Project Applicant(s)/Contractor(s) shall engage a Civil Engineer to prepare an Adjacent Building Construction Monitoring Plan ("Monitoring Plan"). The Monitoring Plan shall establish survey monuments and document and record the positions of adjacent buildings, structures, sidewalks, utilities, facades, and surface features to form a baseline for determining settlement or deformation. The Monitoring Plan shall include the following provisions: (1) shored excavation and adjacent buildings, structures, sidewalks, utilities, facades, and cracks shall be visually inspected at a minimum of one time per month; (2) survey monuments shall be measured at critical stages of excavation, shoring, dewatering, and construction but should not occur less frequently than once every thirty days; (3) monitoring reports shall be prepared by an appropriate technical professional California Professional Land Surveyor documenting the movement monitoring results and distributed to all appropriate parties, including

the shoring engineer. The County shall be provided all documentation and be notified if movement exceeds predetermined thresholds and calculated amounts as required.

3.4.4 Project Impact Analysis, Mitigation Measure CUL-2, Page 3.4-72 and 3.4-73, has been modified for clarity.

Mitigation Measure CUL-2: Prior to any demolition, grading, or excavation related to the construction of facilities or improvements under the Proposed Project, a qualified archaeologist shall be retained by the Project Applicant(s)/Contractor(s) to determine which areas shall require cultural resources monitoring during initial ground disturbance. The location of construction activities that are likely to encounter subsurface sediments with archaeological sensitivity shall be determined by the qualified archaeologist upon review of project excavation and grading plans.

If determined necessary by the qualified archaeologist, monitoring by a qualified archaeologist shall be conducted during all initial ground disturbing activities (e.g. grading, removal of foundations, utility trenching, installation of shoring/piles, etc.) within the Project Site, from ground surface level to bedrock.

If, during cultural resources monitoring, the archaeologist determines that the sediments being excavated have been previously disturbed and are unlikely to contain significant cultural materials, the archaeologist shall request that monitoring be reduced or eliminated. Spot-check monitoring shall occur during all construction, on a schedule determined by the project archaeologist.

If buried cultural resources such as trash deposits, building foundations, privy pits, flaked or ground stone, or human remains are inadvertently discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find and the area shall be secured to prevent disturbance. The County will be notified immediately. A qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to evaluate the significance of the find and recommend appropriate treatment measures.

If the discovered materials are determined to be significant cultural resources, the archaeologist shall develop and implement an appropriate treatment plan, which may include avoidance, preservation in place, capping with fill material, or data recovery through excavation and documentation. The Treatment Plan shall be provided to the County. Work in the vicinity of the discovery, as determined by the qualified archaeologist, shall not resume until the archaeologist has determined that appropriate measures have been implemented. Treatment measures for items that are not associated with human remains typically include development of avoidance strategies,

capping with fill material, or mitigation of impacts through data recovery programs such as excavation or detailed documentation.

If human remains are encountered, work shall halt in accordance with California Health and Safety Code Section 7050.5 and the County of Los Angeles Medical Examiner (Medical Examiner) shall be notified immediately. If the Medical Examiner determines that the remains are Native American, the Medical Examiner shall notify the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall designate a Most Likely Descendant (MLD). The MLD shall be provided the opportunity to make recommendations regarding the treatment and disposition of the remains in accordance with Public Resources Code Section 5097.98.

CHAPTER 3.6, GEOLOGY AND SOILS

3.6.4 Project Impact Analysis, Mitigation Measure GEO-4, Page 3.6-67 and 3.6-68, has been modified for clarity.

Mitigation Measure GEO-4: Prior to any excavation related to the construction of facilities or improvements proposed under the master plan, a qualified vertebrate paleontologist with a graduate degree in paleontology, geology, or a closely related earth science discipline, and more than 10 years of experience shall be retained by the Project Applicant(s)/Contractor(s) or construction contractor. Final excavation depths, locations, and construction methods shall be determined during subsequent project-level design. Accordingly, the qualified paleontologist shall review project-specific excavation and grading plans prior to construction and identify areas where monitoring is required based on the depth and extent of excavation into paleontologically sensitive geologic units (e.g., older alluvium or Puente Formation). Monitoring shall be implemented by the qualified paleontologist during ground disturbance in those identified areas.

Very shallow surficial excavations (i.e., less than 5 feet in depth) within areas of previous disturbance or areas of Quaternary younger alluvial deposits shall be monitored by the qualified paleontologist to ensure that underlying sensitive units (i.e., Quaternary older alluvium) are not adversely affected. Areas consisting of artificial fill materials shall not require monitoring.

If future excavations take place in Quaternary older alluvial deposits or within Fernando or Puente Formation bedrock, such excavations shall be monitored on a full-time basis by a qualified paleontological monitor and under the supervision of the qualified paleontologist. The paleontological resource monitoring shall include inspection of exposed rock units during active excavations within the geologically sensitive sediments.

Monitoring may be reduced if some of the potentially fossiliferous units described herein are, upon exposure and examination by qualified paleontological personnel, determined to have a low potential for containing fossil resources.

The paleontological monitor shall be equipped to salvage fossils as they are unearthed to avoid construction delays and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontological monitor shall have authority to temporarily divert grading away from exposed fossils to recover the fossil specimens professionally and efficiently and collect associated data. All efforts to avoid delays in project schedules shall be made.

To prevent construction delays, paleontological monitors shall be equipped with the necessary tools for the rapid removal of fossils and retrieval of associated data. This equipment shall include handheld global positioning system receivers, digital cameras, and cell phones as well as a tool kit with specimen containers, matrix sampling bags, field labels, field tools (awls, hammers, chisels, shovels, etc.), and plaster kits.

At each fossil locality, field data forms shall be used to record pertinent geologic data, stratigraphic sections shall be measured, and appropriate sediment samples shall be collected and submitted for analysis. Fossils collected, if any, shall be transported to a paleontological laboratory for processing where they shall be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility that meets federal and State curation standards and is approved in writing by the County of Los Angeles.

Following analysis, a Report of Findings with an appended itemized inventory of specimens shall be prepared by the qualified paleontologist within a reasonable timeframe from the completion of recovery. The report and inventory, when submitted to the County along with confirmation of the curation of recovered specimens into an established, accredited museum repository, shall signify completion of the program to mitigate impacts on paleontological resources.

3.6.5 Cumulative Impact Analysis, Page 3.6-54, has been revised for clarity.

Impact GEO-7: The Proposed Project, together with past, present, and reasonably foreseeable projects, could be located on ~~unstable soils~~ expansive and corrosive soils.

CHAPTER 3.7, GREENHOUSE GAS EMISSIONS

3.7.4 Project Impact Analysis, Mitigation Measure GHG-1, Page 3.7-33 through Page 3.7-36, has been modified for clarity.

Mitigation Measure GHG-1a: For development projects that include parking (e.g., private garages, surface parking lot, etc.), the Project Applicant(s)/Contractor(s) shall

implement the following provisions of the California Green Building Standards Code (CALGreen) as mandatory and not voluntary and shall list and identify them on all prepared building and site plans. The Project Applicant(s) shall submit these building and site plans that note the applicable measures to the County ~~of Los Angeles Building and Safety Department~~ prior to the issuance of construction permits.

- **Residential Structures with Three or Fewer Stories.** For residential land uses with three or fewer stories, the ~~project developer(s)~~ Project Applicant(s)/Contractor(s) shall:
  - Design and build condominium/townhouses dwellings that have an attached private garage to have a dedicated electric circuit to support electric vehicle charging, as outlined in the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.1.
  - Design and build residential buildings to, at a minimum, meet the Tier 2 electric vehicle parking standards of the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.2.1.
- **Nonresidential Structures and Residential Structures with Four or More Stories.** For nonresidential land uses and residential land uses that are four or more stories, the Project Applicant/Contractor(s)~~developer(s)~~ shall:
  - All parking areas shall be designed to provide parking for low-emitting, fuel-efficient, and carpool/van vehicles. At minimum, the number of preferential parking spaces shall equal the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.1.2.
  - Parking areas shall be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations shall comply with the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.3.3 or Section A5.106.5.3.4.

Mitigation Measure GHG-1b: Each ~~applicant~~ Project Applicant/Contractor shall demonstrate a minimum 10 percent reduction in energy consumption below energy baselines. For the General Hospital, ASHRAE Standard 90.1-2010 shall be the energy baseline. For all other new construction and major renovation, the 2025 version of Title

24, Part 6 shall be the energy baseline. “New construction” in this context shall mean “ground up” development of a structure that has never been occupied. “Major renovation” in this context shall include additions to or redevelopment of existing structures resulting in an increase of over fifty (50) percent of the existing floor area. An overall energy reduction of 10 percent shall be demonstrated on an aggregate basis across the Project Site, allowing for some buildings to perform better than others. Compliance shall be demonstrated via:

- A technical memorandum (where energy reductions might be below 10% for individual buildings); or
- Title 24 compliance forms submitted at the time of permit (where energy reductions are above 10%); or
- An energy modeling report (for the General Hospital).

The technical memorandum shall be based on a project site-level energy calculation and reference Title 24 compliance forms where completed and available, and submitted to the County prior to issuance of each building permit. The 10 percent reduction in energy consumption may be achieved through a combination of Project Site-wide renewable energy generation, energy distribution systems, electrification, and/or building design features. The Project Site area energy calculations shall be based on new developments pursuant to the project. The Project Site-level energy calculations shall be updated as needed throughout phased development to reflect actual design progress. Where performance of an individual building or phase is below the 10 percent requirement, it will address anticipated performance in future phases to achieve the aggregate 10 percent reduction.

Should the final development phase proposal show that the Project Site-wide 10 percent reduction in energy consumption was not achieved, the final phase development proposal shall include additional measures to ensure the Project Site-wide 10 percent reduction in energy consumption from the electrical grid be achieved. The "final development phase" is the phase that would complete the full buildout of the Project Site within the anticipated 25-year development horizon. If such phase is not realized within the 25-year development horizon, then the Proposed Project shall demonstrate the Project Site-wide 10 percent reduction no later than December 31st, 2050 through the implementation of additional measures. These additional measures may include but are not limited to photovoltaic arrays, appliance or mechanical system upgrades to new or existing buildings, or lighting upgrades on new or existing structures. Any such additional measures shall be quantified for energy consumption reduction

performance and submitted to the County for approval prior to the issuance of construction permits for the final phase proposal.

Mitigation Measure GHG-1c: For nonresidential development projects, prior to issuance of the certificate of occupancy, the ~~property owner~~ Project Applicant(s)/Contractor(s) shall provide documentation to the County ~~of Los Angeles Building and Safety Department~~ demonstrating enrollment in a 100 percent carbon-free electricity energy plan, such as the City of Los Angeles Department of Water and Power's Green Power for Green LA program, for Proposed Project building(s) if such plan is available. If a 100 percent carbon-free electricity plan is not available, the Project Applicant(s)/Contractor(s) ~~project developer(s)/County~~ shall enroll in an energy plan with the next highest carbon-free electricity until a 100 percent carbon-free electricity energy plan becomes available. Measures to achieve 100 percent carbon-free electricity use may include, but are not limited to, plans for 100 percent renewable electricity. If such carbon-free electricity energy plans are waitlisted, the Project Applicant(s)/Contractor(s) may enroll in an available energy plan in the meantime, but shall sign up for the waiting list until such time a carbon-free electricity energy plan is available.

3.7.4 Project Impact Analysis, Mitigation Measure AIR-2 has been applied to Impact GHG-1 on page 3.7-36 in response to comments from South Coast AQMD.

In addition to the topic-specific mitigation measures identified above, the Proposed Project would also implement the following mitigation measures:

Mitigation: Implement Mitigation Measures AIR-2 and TRA-3d.

3.7.4 Project Impact Analysis, Page 3.7-36 has been modified in response to comments from South Coast AQMD.

Significance with Mitigation: Significant and unavoidable. Implementation of Mitigation Measures GHG-1a through GHG-1c and Mitigation Measures AIR-2 and TRA-3d could reduce GHG emissions impacts associated with future individual development activities under the Proposed Project to a less than significant level. Mitigation Measure TRA-3d would require the implementation of a Transportation Demand Management program to reduce vehicular trips to the Project Site. However, because the specifics of the potential future development projects accommodated under the Proposed Project are unknown, it is uncertain whether all future development activities would be shown to generate GHG emissions below the South Coast AQMD bright-line threshold of 3,000 $MTCO_2e$/yr even with the identified reduction measures implemented. Additionally, while implementation of mitigation would contribute to minimizing

overall Project-related GHG emissions, it is anticipated that the Proposed Project would still exceed the South Coast AQMD bright-line threshold of 3,000 $MTCO_2e$/yr due to the magnitude of development accommodated under the Proposed Project. Therefore, Impact GHG-1 would remain **significant and unavoidable**.

3.7.5 Cumulative Impact Analysis, Mitigation Measures AIR-2 has been applied to Impact GHG-2 on page 3.7-68 in response to comments from South Coast AQMD.

In addition to the topic-specific mitigation measures identified above, the Proposed Project would also implement the following mitigation measures:

> **Mitigation:** Implement Mitigation Measure AIR-2, Mitigation Measures GHG-1a through GHG-1c, and Mitigation Measure TRA-3d.

3.7.5 Cumulative Impact Analysis, Page 3.7-68 has been modified in response to comments from South Coast AQMD.

Significance with Mitigation: Implementation of Mitigation Measures GHG-1a through GHG-1c and Mitigation Measures AIR-2 and TRA-3d would contribute to minimizing Project-related GHG emissions to the extent feasible. However, due to the magnitude of emissions generated by the land uses that would be accommodated by the Proposed Project, long-term GHG emissions generated from the Proposed Project could still exceed the South Coast AQMD bright-line threshold of 3,000 $MTCO_2e$/yr. Therefore, Impact GHG-2 would remain **significant and unavoidable**.

CHATPER 3.8, HAZARDS AND HAZARDOUS MATERIALS

3.8.4 Project Impact Analysis, Mitigation Measure HAZ-1, Page 3.8-36, has been modified for clarity.

> **Mitigation Measure HAZ-1c:** Prior to construction, the Project Applicant(s)/Contractor(s) shall conduct additional confirmatory subsurface investigations in areas of known or suspected concern identified in the completed Phase II Subsurface Investigation and Methane Survey, including former and suspected underground storage tank locations, both those abandoned in place and those without verified removal documentation, as well as former boiler and powerhouse areas. Because prior investigations were limited to accessible areas and did not include full site-wide excavation or investigation beneath existing structures, utilities, and active facilities, the extent of residual contamination cannot be fully characterized until demolition and site access occur. Therefore, additional confirmatory investigation shall be completed prior to grading in each

affected area to fully delineate any residual contamination. These investigations shall evaluate whether residual contamination remains that could affect redevelopment. If additional residual contamination is found, a qualified geologist or industrial hygienist shall recommend appropriate remedial actions, which may include removal, disposal, or remediation of affected soils or structures, consistent with regulatory requirements. These remedial actions shall be implemented during construction.

3.8.4 Project Impact Analysis, Mitigation Measure HAZ-2, Page 3.8-39, has been modified for clarity.

Mitigation Measure HAZ-2: Prior to the issuance of building permits for any new residential or commercial structure on portions of the Project Site where volatile organic compounds (VOCs) in soil vapor have been documented above applicable screening levels, the Project Applicant(s)/Contractor(s) shall prepare and implement a vapor intrusion mitigation plan. The plan shall include site-specific engineering controls, such as passive or active sub-slab depressurization systems, vapor barriers, or equivalent measures designed to prevent intrusion of VOCs into occupied indoor spaces.

Because final building footprints, foundation designs, and finished grades have not yet been determined, a structure-specific vapor mitigation system cannot be finalized at this time. Therefore, the vapor intrusion mitigation plan shall be prepared for each applicable structure once final design plans are available and prior to permit issuance.

The vapor intrusion mitigation plan shall be prepared by a qualified environmental professional in consultation with the ~~Los Angeles Department of Building and Safety (LADBS) as the permitting authority, and, as applicable,~~ Los Angeles County Department of Public Works~~,~~ and the Los Angeles Regional Water Quality Control Board (RWQCB). Design features shall comply with City of Los Angeles Methane Zone requirements, CalEPA guidance, and RWQCB performance standards for VOC mitigation.

Implementation of the plan, including installation of all required engineering controls, shall be verified through inspections and post-installation testing prior to occupancy. ~~LADBS,~~ The County in coordination with the RWQCB, shall review and approve the plan, confirm proper installation, and enforce compliance as part of the standard building permit and inspection process.

CHATPER 3.9, HYDROLOGY AND WATER QUALITY

3.9.4 Project Impact Analysis, Mitigation Measure HYD-2, Page 3.9-22, has been modified for clarity.

Mitigation Measure HYD-2: During the initial design of each future project, the Project Applicant(s)/Contractor(s) shall prepare project-specific Stormwater Mitigation Plans (SUSMP) for review and approval by the Los Angeles County Department of Public Works (LACDPW). Low-impact development (LID) features included in project-specific SUSMPs shall be designed to minimize the leaching of nutrients from growing media. LID features shall avoid the use of growing media, mulch, and compost containing animal products, which may leach nutrients. Design modifications may include incorporation of an internal storage zone with an elevated underdrain and a carbon food source for denitrifying bacteria to create anaerobic conditions and subsequent denitrification.

During the initial design of each future implementing project, the Project Applicant/Contractor shall also prepare project-specific Operation and Maintenance (O&M) Plans for proposed LID features and on-site landscaping for review and approval by the ~~Los Angeles County Department of Public Works (~~LACDPW~~)~~. The O&M plans shall be revised as needed as development plans and proposed LID features are revised. The project specific O&M Plans shall consider impacts on water quality due to the leaching of phosphorous. O&M practices shall include integrated pest management and organic maintenance methods, including those for hand weeding. The use of fertilizers, pesticides, herbicides, and products containing animal manure or animal products shall be avoided.

Prior to construction of future development projects on the Project Site, the Project Applicant(s)/Contractor(s) shall prepare and submit final building and landscape design plans to LACDPW demonstrating that all landscape-based LID features are designed to improve water quality and minimize the leaching of nutrients from growing media.

3.9.4 Project Impact Analysis, Mitigation Measure HYD-3, Pages 3.9-24 and 3.9-25, has been modified for clarity.

Mitigation Measure HYD-3a: Prior to and during construction involving deep excavation that could encounter groundwater or dewatering, monitoring wells shall be installed by the Project Applicant(s)/Contractor(s) during construction within and around the perimeter of each structure to monitor the groundwater level and evaluate the performance of the dewatering system. Before starting dewatering operations, a baseline conditions survey conducted by a licensed geotechnical or structural engineer retained by the Project Applicant(s)/Contractor(s) shall be made of all adjacent foundations and structures to assess the impact of deep excavation dewatering on adjacent structures. All signs of existing distress shall be recorded. The baseline survey

shall be submitted to the County and retained for reference during construction monitoring.

Mitigation Measure HYDE-3b: During project design, the Project Applicant(s)/Contractor(s) shall retain a qualified civil or water resources engineer to prepare a Recycled and Alternative Water Supply Feasibility Study evaluating the technical and economic feasibility of using non-potable water sources for landscape irrigation. The study shall identify feasible sources, projected supply volumes, system design concepts, and implementation costs.

Based on the results of the feasibility study, future projects shall incorporate all technically and economically feasible non-potable supply systems into the final landscape irrigation supply. Irrigation water demands greater than existing irrigation demands shall be met by alternative supply sources to the maximum extent technically feasible. The use of alternative water supply sources for irrigation shall be maximized to reduce the use of potable water for irrigation and to approximate existing irrigation demands. Alternative water supply sources include, but are not limited to, reclaimed water, gray water, harvested rainwater (stormwater), and air-conditioning condensate (although not specifically mentioned in the master plan, this could represent a significant source of clean irrigation water).

The County shall review and approve the Feasibility Study and irrigation design prior to permit issuance.

CHAPTER 3.11, NOISE

3.11.4 Project Impact Analysis, Mitigation Measure NOI-1, Pages 3.11-45 and 3.11-46, has been modified for clarity.

Mitigation Measure NOI-1: Reduce Construction Noise to the Extent Possible. If construction activities associated with the Proposed Project have the potential to exceed the County's construction noise thresholds at nearby on- and off-site sensitive receptors, including during pile driving or other high noise construction activities, the Project Applicant(s)/Contractor(s) shall implement the following noise reduction measures during construction:

- To the extent feasible, construction activities shall occur between the hours of 7:00 am to 7:00 pm on Monday through Friday and 8:00 am to 6:00 pm on Saturdays, consistent with Section 12.08.520 of the County of Los Angeles Code of Ordinances. Construction activities shall not occur at any time on

Sundays or legal holidays. Construction personnel shall not be permitted on the job site, and material or equipment deliveries and collections should not be permitted outside of these hours. If construction activities must occur outside of the allowable hours, the Project Applicant(s)/Contractor(s) shall follow necessary procedures to obtain an appropriate variance in accordance with Section 12.08.580 of the County of Los Angeles Code of Ordinances prior to conducting such activities. Construction activities occurring outside the allowable hours shall comply with all conditions of the approved variance.

- To the fullest extent practicable, the quietest available type of construction equipment shall be used. Newer equipment is generally quieter than older equipment. The use of electric powered equipment is typically quieter than diesel or gasoline powered equipment, and hydraulic powered equipment is typically quieter than pneumatic power.
- Where feasible, impact pile driving shall be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles.
- All construction equipment shall be properly maintained. Poor maintenance of equipment typically causes excessive noise levels.
- All construction equipment, stationary and mobile, shall be equipped with properly operating and maintained mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features that meet or exceed original factory specification and are properly maintained and functioning during construction activities. Mobile or fixed "package" equipment (e.g., arc welders, air compressors) shall be equipped with shrouds and noise control features that are readily available for that type of equipment.
- All noisy equipment shall be operated only when necessary, and should be switched off when not in use.
- The use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. To the extent feasible, temporary barriers shall be employed around the project site and/or around noisy construction equipment, specifically pile driving equipment. For barriers to be effective they shall break the line-of site between the

equipment and any noise-sensitive receiver. These barriers may be constructed as follows:

- From commercially available acoustical panels lined with sound absorbing material (the sound absorptive faces of the panels should face the construction equipment).
- From common construction materials such as plywood and lined with sound absorptive material (the sound absorptive material should face the construction equipment).
- From acoustical blankets hung over or from a supporting frame. The blankets shall provide a minimum sound transmission class (STC) rating of 28 and a minimum noise reduction coefficient (NRC) of 0.80 and shall be firmly secured to the framework with the sound absorptive side of the blankets oriented towards the construction equipment. The blankets shall be overlapped by at least 6" at seams and taped so that no gaps exist. The largest blankets available shall be used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier.

3.11.4 Project Impact Analysis, Mitigation Measure NOI-3, Page 3.11-56, has been modified for clarity.

Mitigation Measure NOI-3a: Design Project Facilities to Ensure All Mechanical Equipment Complies with County Noise Standards. During the architectural and engineering design phase of each new facility (building, central plant, parking structure, etc.) that could introduce new mechanical equipment to the Project Site, and prior to the issuance of any building permits for the facility, the Project Applicant(s)/Contractor(s) shall retain an acoustical consultant to evaluate the design and provide recommendations, as necessary, to ensure that the mechanical equipment complies with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: changes in equipment locations, upgrades to central plant buildings, rooftop parapet walls, acoustical louvers or screens, or intake and exhaust silencers.

Mitigation Measure NOI-3b: Design and Manage Outdoor Use Areas to Ensure Organized Outdoor Events Comply with County Noise Standards. Prior to the issuance of any building permits for outdoor use areas that are anticipated to host organized

events such as outdoor markets, farmers markets, summer concerts and health marches, etc. the Project Applicant(s)/Contractor shall retain an acoustical consultant to evaluate the design (event layout, sound system design, etc.) and operational event details (crowd sizes, times of operation, etc.) to ensure that such events will comply with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: controls on crowd sizes and event times, and limits on sound system power levels.

3.11.4 Project Impact Analysis, Mitigation Measure NOI-4, Page 3.11-61 and Page 3.11-62, has been modified for clarity.

Mitigation Measure NOI-4: Reduce Construction-Generated Groundborne Vibration to the Extent Possible. The Project Applicant(s)/Contractor(s) shall implement the following vibration reduction measures during construction:

- Through coordination with the County w~~W~~here possible, impact pile driving should be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles.
- Distance requirements for eligible or listed historical structures (as defined in Chapter 3.4, Cultural Resources of this Draft SEIR):
  - Pile driving shall not be operated within 135 feet, vibratory rollers within 36 feet, or other heavy equipment (e.g., bulldozer) within 20 feet.
- Distance requirements for non-engineered and masonry buildings:
  - Pile driving shall not be operated within 100 feet, vibratory rollers within 25 feet, or other heavy equipment (e.g., bulldozer) within 15 feet.

CHAPTER 3.15, TRANSPORTATION

3.15.1, Regulatory Framework, Local, City of Los Angeles Vision Zero Action Plan, page 3.15-6 has been modified in response to comments from LADOT

The Vision Zero Los Angeles program, implemented by City of Los Angeles Department of Transportation (LADOT), represents a Citywide effort that initially sets out to eliminate traffic deaths in the City. To achieve Vision Zero, LADOT has identified a network of streets, called the High Injury Network (HIN), which has a higher incidence of severe and fatal collisions. The HIN, which was last updated in 2024, represents eight percent of the City's street miles but accounts for approximately ~~sixty~~60 percent of all fatalities and serious injury collisions.

3.15.2, Existing Conditions, Roadways Adjacent to the Proposed Project, page 3.15-6 has been modified for clarification

3.15.~~1~~2 Existing Conditions

3.15.2, Existing Conditions, Roadways Adjacent to the Proposed Project, page 3.15-7 has been modified in response to comments from LADOT

- **Zonal Avenue** operates in the east-west direction and is designated as Avenue III. It represents a partial segment of the northern boundary of the Project Site. It provides one lane of travel in both directions with occasional left and right turn pockets. There are also Class II bike lanes in both directions between North Mission Road and North State Street. Metered street parking is permitted in designated segments along the corridor.

3.15.4, Project Impact Analysis, Threshold Question C, Tables 3.15-6, *AM Peak Hour Queues – "2050 Base" versus "2050 with Project & Operational Improvements" Comparison*, page 3.15-30, and Table 3.15-8, *PM Peak Hour Queues – "2050 Base" versus "2050 with Project & Operational Improvements,"* page 3.15-32 have been modified in response to comments from Caltrans and LADOT

Table 3.15-6 AM Peak Hour Queues – "2050 Base" versus "2050 with Project & Operational Improvements" Comparison

	2050 Queue (ft)				2050 Base & 2050 with project Comparison			
Off-Ramp	Storage Length[1]	Base	With Project & Operational Improvements	Queue Increase (ft) Δ	Queue Increase (veh)[2]	2050 w/ Project Exceeds Storage?	Mainline Speed (mph)[3]	Potential Safety Issue?
I-5 SB Off to Mission Rd.	~~1,360~~ 1,610	1,005	1,715†	710	25+	Yes	41-47	Yes
I-10 EB Off to State St.	1,565	400	-	-	-	-	-[4]	-
I-10 WB Off to State St.	~~880~~ 980	450	1,450†	1,000	25+	Yes	40-47	Yes
I-5 NB Off to C. Chavez. Ave.	950	600	950	350	14	Yes	16-50	Yes
I-10 EB Off to Soto St.	2,170	795	-	-	-	-	-	-
I-10 WB Off to Soto St.	~~2,320~~ 2,570	2,815†	2,575†	-240	-10	Yes	42-55	No[5]

Source: Fehr & Peers, 2026. Notes:

1 Storage Length is the sum of all lane-feet from the terminal intersection stop bar to the gore point.

2 Queues longer than 25 vehicles are shown as "25+". At excessive queue lengths, drivers would likely take alternative routes or alter travel behavior.

3 Range of 15-minute interval average speeds throughout peak hour on the directly upstream freeway segment (mainline or connector).

4 No queueing issue identified in 2050 with Project; thus speed differential study is not necessary.

5 "No" conclusion is based on comparison of comparison of statically calculated 95th percentile queue length to ramp storage. At volume to capacity (V/C) ratios over 1.0, queues lengths are theoretically undefined and could exceed listed length. Microsimulation analysis would be required to more accurately capture queue lengths and identify ramp spillback.

† Volume to capacity (V/C) ratio exceeds 1.0, queue lengths are technically undefined. Calculated values are shown for relative comparison purposes.

Δ Compared to 2050 Base scenario

Δ Compared to 2050 Base scenario

3.15.4 Project Impact Analysis, Mitigation Measure TRA-1, Pages 3.15-18 and 3.15-19, has been modified for clarity.

Mitigation Measure TRA-1: The Project Applicant(s)/Contractor(s) shall develop and implement a Worksite Traffic Control Plan for any aspect of construction that would result in road closures, sidewalk closures, bicycle facility closures, removal of parking, or similar traffic disruptions. The Worksite Traffic Control Plan shall be prepared as part of the project design package according to California Manual on Uniform Traffic Control Devices (CA-MUTCD) requirements, and may include, but not be limited to, the following elements;

- Provide a roadway layout that shows the locations of construction activity and surrounding roadways to be used as detour routes, including special signage.
- Establish detour routes in coordination with the City of Los Angeles to minimize disturbances to local roadway conditions.
- Maintain access to existing residences at all times.
- Work with City of Los Angeles Department of Transportation, Los Angeles Sherriff's Department, Los Angeles County Fire Department, and Los Angeles Police Department, to coordinate all construction-related plans and minimize disturbances to local emergency management services (EMS) providers ensure that alternative evacuation and emergency routes are designed to maintain response times during construction.
- Provide adequate off-street parking areas at designated staging areas for construction-related vehicles.
- Work with transit providers to maintain access and circulation routes to existing stops during construction phases and identify appropriate detours to provide rerouting during construction while minimizing service disruptions.
- Work with the City of Los Angeles to maintain continuity and operations of existing pedestrian and bicycle facilities during construction.

3.15.4 Project Impact Analysis, Mitigation Measure TRA-3, Pages 3.15-33 through 3.15-35 have been modified in response to comments from Caltrans and LADOT

Due to the programmatic nature of a 25-year buildout of the Proposed Project, and the multiple agency authorizations required to implement the measures herein: ~~Prior start of construction for the first development phase of~~

For all future developments as part of the Proposed Project, the Project Applicant(s)/Contractor(s) shall consult with County, and relevant appropriate agencies develop ~~timing~~ mechanisms as to when the conceptual improvements identified in Mitigation Measure TRA-3(a)-(e) are implemented based on phased buildout of the Proposed Project. The following three-step process shall be followed to determine whether a development project could result in Impact TRA-3.

Step 1: Determine whether cumulative land use, including the development, would exceed 15 percent of any single Proposed Land Use category in the table below.

- If No: No further analysis is required, and no physical improvements are necessary.
- If Yes: Proceed to Step 2

Step 2: If a Proposed Project would result in any single Proposed Land Use exceeding 15 percent, prepare a trip generation and Transportation Demand Management (TDM) analysis.

Step 3: If the cumulative trips, after applying TDM strategies, would exceed the inbound or outbound trips associated with 15 percent of Proposed Project buildout, prepare a detailed off-ramp queuing analysis. The results of the off ramp queuing analysis will determine whether the development's trips, combined with cumulative trips, would result in a queuing impact at the identified off-ramp location.

Proposed Land Use	**Units/Counts**	**Square Footage**
Residential	3,200 housing units	2,300,000
General Office	--	400,000
Medical Office	--	735,300
Retail	--	320,000
Patient and Caregiver Lodging	200 rooms	80,000
Community Facilities	--	350,000
Education	--	110,000
Warehouse	--	160,000
Clean Tech/ Light Industrial	--	200,000
Hospital	450 beds	400,000
Parking	8,588 spaces	3,005,678
Total	**3,200 du 450 hospital beds**	**8,060,978 square feet of new development**

Proposed Land Use	Units/Counts	Square Footage
	200 rooms 8,588 parking spaces	

Mitigation Measure TRA-3a: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 southbound off-ramp to Mission Road.

- Re-stripe the off-ramp lane configuration from:
  - Left turn lane, shared through-left lane, and a right lane; to
  - two left turn lanes and one shared through-right turn lane.
- Optimize signal timing along the Mission Road coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' Intersection Safety Operational Assessment (ISOAP) methodology as appropriate to design and implement intersection improvements.
- Coordinate with Caltrans to evaluate expanding ramp storage using concrete/landscaped area in-between existing off-ramp and freeway mainline, and implement as determined by the appropriate implementing agencies.

Mitigation Measure TRA-3b: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to State Street.

- Re-stripe the off-ramp lane configuration from:
  - Left turn lane, right turn lane; to
  - shared left-right turn lane and a right turn lane.
- Optimize signal timing along the State Street coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements.

- Coordinate with Caltrans to evaluate expanding ramp storage using landscaped slope area in-between existing off-ramp and freeway connector (north side of off-ramp), and implement as determined by the appropriate implementing agencies.

Mitigation Measure TRA-3c: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to Soto Street.

- Re-stripe the off-ramp lane configuration from:
  - Left turn lane, shared through-left turn lane, and two right turn lanes; to
  - two left turn lanes, one through lane, and one right turn lane.
- Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements
- Coordinate with Caltrans to evaluate striped shoulder area along north side of existing off-ramp, and implement as determined by the appropriate implementing agencies.

Mitigation Measure TRA-3d: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 northbound off-ramp to Cesar Chavez Avenue.

- Optimize signal timing along the Cesar Chavez Avenue coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements

Mitigation Measure TRA-3e: A comprehensive TDM program shall be implemented as part of ~~the Proposed~~ individual development ~~P~~project's ~~mitigation program~~ aimed at reducing vehicular trips to the Project Site, which may mitigate Project-induced freeway off-ramp queuing hazards. Project Applicant(s)/Contractor(s) will incorporate TDM strategies and estimate their effectiveness. TDM strategies that the Proposed Project could implement to result in a quantitative reduction in vehicular trips include, but are not limited to, to the following:

- Trip Reduction Strategies
  - Implement Commute Trip Reduction Program (Voluntary for Mandatory)
  - Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)
  - Implement Commute Trip Reduction Marketing
  - Provide Ridesharing Program
  - Implement Subsidized or Discounted Transit Program - All Trips
  - Provide End-of-Trip Bicycle Facilities
  - Provide Employer-Sponsored Vanpool
- Parking Strategies
  - Price workplace parking
  - Implement Employee Parking Cash-Out
  - Limit Residential Parking Supply
  - Unbundle Residential Parking Costs from Property Cost
- School
  - Coordinate with Los Angeles Unified School District (LAUSD) to establish a School Bus Program
  - Active Modes of Transportation for Youth

CHAPTER 3.16, TRIBAL CULTURAL RESOURCES

3.16.4 Project Impact Analysis, Mitigation Measure TCR-1, Page 3.16-15 through 3.16-17, has been modified for clarity.

Mitigation Measure TCR-1b: Unanticipated Discovery of Tribal Cultural Resource (Non-Funerary)

a) In accordance with section 21074, subdivisions (a)(1)(A)-(B) of the Public Resources Code (PRC), a Tribal Cultural Resources (TCR) is a site, feature, place, cultural landscape, sacred place or object, which is of cultural value to the Tribe and either: (1) on or eligible for the California Historic Register or other local historic register or (2) the County of Los

Angeles, as the lead agency for the Project, at its discretion, chooses to treat the resource as a TCR.

b) Upon discovery of any TCR or potential TCR, all construction activities within a radius deemed appropriate by the qualified archaeologist shall cease and shall not resume until the discovered TCR has been fully assessed by the Native American Monitor and/or qualified archaeologist. If the assessment finds the resource to be a TCR, treatment measures and final disposition will be determined in consultation with the Tribe.

Mitigation Measure TCR-1c: Unanticipated Discovery of Native American Human Remains and/or Associated Grave Goods

a) Native American human remains are defined in section 5097.98, subdivision (d)(1) of the Public Resources Code (PRC) as an inhumation or cremation in any state of decomposition or skeletal completeness. Funerary objects, also called associated grave goods in section 5097.98 of the PRC, shall be treated alike per section 5097.98, subdivisions (d)(1) and (2) of the PRC.

b) If Native American human remains and/or grave goods are discovered or recognized on the Project Site, then section 5097.9 of the PRC as well as Health and Safety Code Section 7050.5 shall be followed.

c) Any discovery of Native American human remains and/or grave goods shall be kept confidential to prevent further disturbance.

CHAPTER 3.17, UTILITIES AND SERVICES SYSTEMS

3.17.4 Project Impact Analysis, Mitigation Measure USS-2, Page 3.17-44, has been modified for clarity.

Mitigation Measure USS-2: Prior to issuance of a building permit for ~~any future development~~a Project Applicant/Contractor under the Proposed Project that could result in an increase in wastewater generation, the Project Applicant(s)/Contractor(s) shall coordinate with the City of Los Angeles Bureau of Sanitation to conduct further detailed gauging and evaluation to identify a specific sewer connection point with sufficient capacity. If the public sewer has insufficient capacity, then the County shall be required to build a sewer line to a point in the sewer system with sufficient capacity.

CHAPTER 4, ALTERNATIVES

4.3.1, No Project/No Redevelopment Alternative, Page 4-9

The No Project/No Redevelopment Alternative would involve continued operation of the Project Site as currently developed but would not allow development pursuant to existing entitlements and approvals (namely the 2014 Master Plan). ~~The 2014 Master Plan was approved by the County and is not subject to any known legal constraints that would preclude its implementation. Therefore, development consistent with the 2014 Master Plan could occur in lieu of the Proposed Project.~~ Routine maintenance and updates to existing buildings would continue to occur; however, no redevelopment pursuant to the approved 2014 Master Plan would occur. No demolition of existing structures would occur, and the critical seismic upgrades to support the ~~and~~ adaptive reuse of the General Hospital Building, as further detailed under the Proposed Project, would not be implemented through a public-private partnership or any other means. No new environmental impacts would occur with this alternative due to the lack of future development, and this alternative would be inconsistent with the prior approvals the County has issued for the Project Site. Because this alternative would not allow implementation of the Proposed Project or redevelopment of the Campus consistent with the previously approved 2014 Master Plan framework, it would not achieve several key objectives of the Proposed Project, including objectives related to modernization of Campus facilities, adaptive reuse of existing structure, implementation of a coordinated long-term planning framework for the Campus, and accommodating future growth in employment, housing, and supporting uses. Additionally, although the Project Site is located within the incorporated City of Los Angeles, the Project Site is owned by the County and the County has elected to show consistency with the County of Los Angeles General Plan 2035, this alternative would be inconsistent with the County of Los Angeles General Plan 2035 objectives. Specifically, this alternative would not meet the County's goal of accommodating new housing and jobs in anticipation of population growth in the County and the region. Moreover, this alternative would not help the City or County meet its Regional Housing Needs Assessment goals because no new residential uses would be developed within the County. Additionally, without implementation of redevelopment activities that include rehabilitation, stabilization, or replacement of aging structures, certain historic resources could continue to deteriorate over time due to age, deferred maintenance, and ongoing operational wear. Continued deterioration of historic resources may result in the gradual loss of historic integrity, which could represent an adverse outcome for cultural resources. Therefore, the County finds that the No Project/No Redevelopment ~~Business as Usual~~ Alternative is not feasible.

APPENDIX E.2, LOS ANGELES COUNTY GENERAL HOSPITAL HISTORICAL RESOURCES TECHNICAL REPORT

2.2, Project Design Features Page 10 and 12 have been modified in response to comments from the Los Angeles Conservancy.

PDF 1. Ongoing Project Review and Input by Historic Architect

All work within the Los Angeles General Hospital – Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to ensure continued conformance with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Additionally, the County is pursuing federal historic preservation tax incentives for the Acute Unit's proposed rehabilitation work, which requires rigorous review by the National Park Service (NPS) and California Office of Historic Preservation (OHP) for compliance with the Rehabilitation Standards.

PDF 5. Interpretation

An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

APPENDIX J, PLANS, PROGRAMS, ORDINANCES, POLICES REVIEW

Plans, Programs, Ordinances, Policies Review has been modified in response to comments from LADOT.

Goal, Objective, Program, or Policy	Consistency	Conflict?
Policy 10-1.1: Maintain Levels of Service for streets and not to exceed LOS "D" for avenues, collector streets, and local streets; not to exceed LOS "E" on	As a result of SB 743, intersection delay (LOS) is no longer a criterion used to assess transportation impacts under CEQA. The Community Plans LOS Policy is a non-CEQA	No

Goal, Objective, Program, or Policy	Consistency	Conflict?
Boulevards or in the community's major business districts	local policy and the discretionary approval rests with the City of Los Angeles.	

3.3 REVISIONS TO THE MASTER PLAN

Following public circulation of the Draft SEIR and Los Angeles County General Hospital Campus Master Plan (Master Plan), the Master Plan was updated to clarify certain procedures and definitions and to incorporate additional refinements. The revisions do not constitute major changes to the Proposed Project as described and analyzed in the SEIR, and are summarized below.

- Technical references to exhibits;
- Clarify approval procedures, timelines and approving agencies;
- Clarify the permit or review requirements and additional regulations for several uses, including community gardens, libraries, schools, patient and caregiver lodging, residential dwelling units, hospitals, medical and dental offices, outpatient surgical facilities, battery energy storage systems, data centers, light manufacturing, warehousing and accessory uses;
- Define the regulations for accessory storage uses;
- Update affordability requirements;
- Refine development standards for height, by making height limits more restrictive;
- Align requirements for the preservation, rehabilitation, and appropriate treatment of historic resources with the modifications made in response to public comment on the DSEIR;
- Clarify definitions for several terms, including accessory storage, Additional County Review (ACR), clarification of ambiguous language, minor or technical correction, public or private utility service center, specially regulated materials, and substantially similar in character, intensity, and impact

These revisions are consistent with the project description and development assumptions evaluated in the Draft SEIR and do not expand the scope of the proposed Master Plan or introduce new development, uses, or activities beyond those analyzed in the Draft SEIR. The revisions do not result in any new significant environmental effects or a substantial increase in the severity of previously identified significant effects and do not otherwise meet the criteria

requiring recirculation of the Draft SEIR pursuant to State CEQA Guidelines Section 15088.5. Accordingly, the revisions do not change the environmental analysis or conclusions presented in the Draft SEIR.

APPENDIX A:
Public Information Meeting Transcript

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

>> Hi, everyone. We're just waiting on some more folks before we get started. Thanks for signing in.

We're going to give it one more minute before we get started so folks can join the meeting.

All right. I'm going to get started. Can the team here just let me know if you guys can hear me okay?

>> Yup. I can hear you.

>> Okay.

>> We can hear you.

>> Wonderful. All right. Good evening, everyone. Thank you so much for joining us tonight for this virtual informational meeting where we will be sharing information on the draft, subsequent environmental impact report for the Los Angeles County General Hospital Campus Master Plan.

I'm in the L.A. County Department of Economic Opportunity. Before we jump in, I want to talk about the next slide.

I'll pass it over to Lucy to talk through the directions.

>> Thank you very much, Krystin. Good evening. I'm going to make an announcement in Spanish but before I do, I want to let everyone know for this particular meeting every single person needs to choose a language. If you speak Spanish, you choose Spanish. If you speak English, you need

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

to choose English. Okay? I'm going to make that announcement now in Spanish but this is for everyone.

(Speaking Spanish).

Thank you, Krystin.

>> All right. Thank you. Looks like the interpretation is on. If everyone wants to select their language.

Okay. Let's get started.

Oh, before we get started, the meeting is being recorded and will be available on the project website afterward along with a copy of the presentation. So you can listen to the meeting and review the document as well.

Let's go to the next slide. I'll get into some introductions. Again, my name is Krystin Hence, assistant director of capital development, in the lead agency for this SEIR. And for the Master Plan.

I'm so pleased to be here with the rest of this team and I want to introduce some of the folks working on this project.

I'll start with the right side of the screen.

Centennial Partners. And those with PlaceWorks who prepared analysis on behalf of the county.

Allyson Dong, from Terry Hayes Associates. And first on the list, last of intros is Supervisor Solis. And Guadalupe Duran-Medina who is going to say a few words before we jump in the details.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

Guadalupe, I'll pass it to you.

>> Good evening, everyone. My name is Guadalupe Duran-Medina. I serve as planning deputy to county board chair and first district supervisor Hilda Solis. We're happy to continue advancing and to be in this key milestone. The draft subsequent EIR for the campus master plan.

On behalf of chair Solis, we thank all joining us this evening. Since 2017, Chair Solis has been working with surrounding communities through adaptive reuse of the hospital building and development of west campus. This is a critical opportunity to advance many of the community's highest priorities. We look forward to hearing everyone's feedback tonight. And with that I thank you and I turn it back to Krystin.

>> Thank you so much, Guadalupe. We are also excited for this next step in this monumental project. And with that I'll dive in.

Go to the next slide. I'll give you a quick overview of what we're here to talk about today.

We have a 25-minute presentation tonight. The reason why we're here and diving into the project overview. Explanation of the California Environmental Quality Act process and the overview of the analysis conducted as part of the draft Subsequent Environmental Impact Report. From there we'll share more about immediate next steps and then we'll open the virtual floor for public comment.

We can go to the next step or next slide, please.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

So why are we here?

The purpose of this meeting is to, one, notify the public that the county has prepared a draft SEIR for the L.A. County General Hospital Campus Master Plan project.

And two, to provide stakeholders, agencies, and the public with an opportunity to provide comments on the draft SEIR content and analysis. And I want to reiterate this meeting is one opportunity to provide public comment and at the end we'll share some of the other means by which folks can share comment both through snail mail, e-mail, and other conversations that we have.

So going to the next slide.

Obviously, you've been notified since you're here tonight. So we'll jump into the project overview, which will I give you a little bit more background on the site, the analysis, and information you'll need to prepare your comments and questions.

So the General Hospital is a 1.2 million square foot 19 story art deco building that has really highlighted the L.A. skyline since it opened in 1934. The building was in operation until the Northridge earthquake and remained largely vacant ever since minus uses in some of the lower floors of the building.

If you go to the next slide.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

Various planning efforts and exercises have taken place over the last decade or so and gained significant momentum and around 2019, when the county initiated a community engagement steering committee to identify key community priorities and future uses for the campus.

These priorities informed the development of an RFP, which was released in 2023 seeking development partners for a public private partnership to redevelop the campus.

In that process, the county selected Centennial Partners. And in 2025, CP as we call them, began feasibility analysis, investigation, and planning efforts to re-envision and re-imagine the campus. So here we are today.

And wanting to dive in on what we mean by campus and site before we get into the analysis.

So if you go to the next page, you'll see what we know as sort of the main core of the campus, which is the area and center hatched in black and white. This site is located right in the middle of many important neighborhoods and iconic destinations. About a 15-minute drive from Dodger Stadium and Downtown L.A. and just a few minute drive to Lincoln heights, Boyle Heights. And surrounded by residential and industrial and county public uses on all sides.

If you go to the next slide, it's zoomed in and there's a core super block, which you saw clearly in the previous diagram as well as several

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

ancillary sites outside of that area in the northwest portion and south of the main campus that are currently used for various county support services.

On the next slide, we'll start to get a little bit finer tuned and what you see is the outline of the project site that was evaluated for the SEIR and that is about 81.9-acre site that was evaluated fully for the potential environmental impacts of a redevelopment. And within that, you'll see the pink area shaded in, which is the Master Plan area. That's about a 30.8-acre portion of the larger 81.9-acre SEIR project site. And that is the portion of the site slated for redevelopment through the private public partnership.

Surrounding that, which is the areas in gray, so within the site boundary are county uses that are intended to remain in operation. And the SEIR analyzes both the new developments to come online, potential new development, as well as continued operation of the existing uses on campus.

If we go to the next slide.

We're going to dive into the project objectives and what it is that the campus and its future vision can bring to the community and to the region.

So when we think about redeveloping this campus, we're looking to meet the current and future healthcare needs of the Los Angeles County -- of Los Angeles County and the region at large. And we're doing that through the healthy community framework that incorporates economic, community, learning, wellness, ecology as pillars. Project objectives, we're looking to redevelop in a manner that advances whole person health, preserve and

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

reuse the historic General Hospital building. Making sure it continues to thrive going forward.

And then maximize new housing on the campus.

If we go to the next slide.

So we're looking to promote economic and workforce development opportunities and the new functions slated to come online. Provide community serving institutional, educational, commercial, and community facilities, as well as public facing uses that all and the region and access.

Develop a multi-modal circulation that enhances connectivity and improves access to the adjacent neighborhoods.

And then creating a cohesive and campus wide landscape and open space. So the places between buildings that folks can gather and convene and enjoy being outside.

And the next slide.

Sorry. I'm seeing some notes. Can everyone still hear me?

>> We can still hear you.

>> Okay. Great.

And lastly, on our objectives we're looking to replace and modernize aging utilities and infrastructure and promote environmental sustainability for all that takes place on the campus and develop resilient infrastructure that can serve this campus and the site for another century plus to come. Provide systems to the community and the site.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

And so some of the characteristics that we are evaluating and looking to enhance through this process. Come through the proliferation of three hubs. What you see is a conceptual campus programming in the SEIR that really provides an illustrative depiction of where future uses can be located. How they tie together, and what they might bring to the campus.

Those three hubs are centered around commerce, centered around the historic hub which is really right around that General Hospital building and preserving that. And then medical hub, centered around the current L.A. General Medical Center that functions as the largest medical center.

Adaptive reuse of the General Hospital. So pursuing historic designation and supporting the redevelopment and preservation of the associated ancillary buildings. And improvements to the infrastructure as we talked about. Infrastructure, utility, circulation, transportation, all to find ways that people can traverse the site in the safest and most effective way possible and ensure the site is connected to the surrounding community and that the people from the surrounding community and region can access and enjoy the site.

On the next slide, little further into the characteristics.

Again, this is all about connectivity. So connecting the site to the surrounding areas. Offsite improvements that need to occur within the City of Los Angeles in order to support that connective tissue.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

We talked about maintaining the height limits so no building is taller than the highest point of General Hospital.

We start to look at detailed site development plans, building configurations and architectural designs prepared during future project level approval. Getting down to a specific building or facility, ensuring that the architectural design and configuration is consistent with the overall plan.

And future improvements to the general historic district to be consistent with SOI standards.

The image on the right shows a maximum buildout scenario. What is the maximum possible envelope of uses and density that can be developed on the site and analyzes the impacts of that maximum scenario. And you'll be able to look at the Master Plan on the website and released alongside the SEIR. How it might take shape and options and buildout potentials so you see what a real-life scenario might be fitting in this envelope analyzed for environmental impact.

Lastly, the Master Plan as described will take place over a 25-year period and occur in phases.

So we'll talk through these but these are the high level proposed land uses. Residential, office, retail, healthcare facilities, education, warehousing and clean tech, and continued hospital operation and parking on the campus. In total, projecting again that maximum buildout of 8 million -- just over 8 million square foot of new development. I'll keep reiterating.

That's a maximum envelope of what could take place while the Master Plan shows the developments that have been evaluated in concert with the community.

And the next slide.

I will pass it over to Allyson Dong, who's going to talk through the CEQA process overall and actual analysis conducted through the SEIR.

>> Great. Thank you, Krystin.

All right. So these next few slides I will present. It will be overview the CEQA process and the draft SEIR prepared for the proposed project.

So the purpose of the draft SEIR and the process is identifying disclose, reduce impacts. The draft SEIR also identifies ways to avoid and reduce impacts by identifying feasible mission measures.

With this information, the SEIR will then inform the decision makers about potential environmental impacts prior to project approval.

This slide here, you'll see a chart with three different colors. Three different processes that come together with the CEQA EIR process. We have the public scoping process. Project started in September 2025 with release of the notice of preparation for the project.

This notified the general public and stakeholders that subsequent EIR was to be prepared for the project. The project had a 58-day scoping period that ended in November 2025. And during this time, a meeting was also held.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

Then you'll see here in the middle in green, this is where we are now. The county prepared the draft SEIR for the project and notice of availability was released on May 15th of this year.

And with that we have a 45-day public review and comment period on the draft SEIR that ends on Monday, June 29th. Here we are you see in the red today. We're here in the public meeting for the county to receive public comments on the draft SEIR.

And also, want to emphasize as Krystin has. Today is not the only day to provide comments. Interested parties and public stakeholders can submit comments via e-mail, through regular mail, from now through Monday, June 29th.

Once completion of the 45-day period in SEIR process, the county will prepare a response to the comments received on the draft SEIR environmental analysis. And this will be included in the final SEIR.

So this CEQA environmental document is a draft Subsequent Environmental Impact Report. This is a SEIR to the original 2014 L.A. County Master Plan certified in 2014.

This draft evaluates this draft SEIR evaluates the proposed Master Plan, so the proposed project as Krystin was mentioning earlier.

A draft SEIR was prepared through 2014 Master Plan because of substantial changes required major revisions. So this included identification

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

of new or more environmental impacts, revised project mitigation measures that need to be considered before adoption.

The draft SEIR again relies on incorporation by reference. The analyses, findings, conclusions. And with the approval of this project, new action will replace the 2014 Master Plan project.

In addition to this EIR that builds off prior efforts, this SEIR is also a program level EIR. So program EIR is an EIR related in rules, regulations, and plans that govern a program. The program EIR provides exhaustive iterations, focuses on cumulative impacts. Also considers future proposed projects will be reviewed for CEQA requirements.

So the next few slides will focus on the environmental analysis presented in the draft SEIR.

So this side here are the environmental topics that are analyzed in the draft SEIR. You'll see two resources italicized here in the agriculture forestry resources.

So these two topics are discussed in the other CEQA considerations chapter of the draft SEIR.

These other topics here have full sections. Aesthetics, air quality, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and panning, mineral resources.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

So CEQA significance determinations. Formal conclusions about the project's potential to cause impacts to the physical environment. So these include no impact, which is the project for that environmental topic would result in no impact.

We have less than significant impacts, which are impacts that do not exceed threshold levels and no mission levels are needed.

Less than significant with mitigation measure. And significant and unavoidable impacts, impacts not able to be reduced below threshold.

You can see on the right side a quick snippet of what mitigations are. Mitigations are specific and enforceable actions that are required to avoid, minimize, compensate for environmental impacts.

Next slides focus on environmental impacts with mitigation measures and impacts even with implementation and mitigation measures.

And again, I want to emphasize that impacts discussed here have feasible mitigation measures -- result in a less than significant impact with the implementation of the mitigation measures.

First, air quality. Less than significant impacts with mitigation for construction impacts really to accumulative.

It would also have the potential to generate emissions that would exceed applicable thresholds and again, with mitigation, these will be less than significant.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

Air quality will have operational impacts related to industrial land uses that will have the potential to generate odor nuisance.

Biological resources, include construction impacts that have potential impact to roosting special status bats and nesting birds in addition to construction and operational impacts really to oak trees.

Cultural resources impacts that are less significant with mitigation are construction impacts related to previously undiscovered archaeological resources.

Next slide we'll identify the less than significant impacts with mitigation for geology and hazards. Construction impacts would result in less than significant impacts. For construction impacts really to encountering paleontological resources. And impacts less than significant as related to seismic ground shaking, lick faction, seismic settlement.

Construction impacts. Routine handling, transport and disposal of hazardous materials. Temporary impairment or interference with emergency response access.

And then we have also less than significant impacts with mitigation. Operational impacts.

Next we'll touch into hydrology, land use, and public services.

Hydrology, potential of encountering VOCs, volatile organic compounds. And potential for phosphorous leaching. Erosion and situation in the project site and increased water use.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

Land use impacts would be related to less than significant impacts would be related to operational impacts. Connective -- conflicting with plans, policies, and regulations related to cultural resources.

And public services. Less than significant impacts as it related to temporary lane closures that can impair or obstruct emergency vehicle movements.

Then we have here less than significant impacts as it related to recreation, transportation, tribal cultural resources.

With recreation, less than significant impacts. Noise and air quality impacts to nearby sensitive receptors. And operational impacts as it relates to ambient noise levels connected to organized outdoor events in open spaces.

Transportation. Relate to construction impacts with the potential to result in transportation hazards and also conflicts with applicable programs, plans, ordinances and policies that address the circulation system.

Then we also have lastly the tribal cultural resources. The project would have a less than significant impact with mitigation as is relates to disturbing native subsurface deposits.

Next, we'll look at significant and unavoidable impacts. These are impacts significant or unavoidable even with implementation and feasible mitigation measures.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

So significant and unavoidable impacts. Again, we want to also remind you this is on a program level for the project, for the entire Master Plan.

So significant and unavoidable impacts would be related to air quality and operational impacts as it relates to cumulatively considerable net increase in criteria pollutants. Those would be VOCs and nitric oxide.

Impacts relates to generation of on-site emissions that would exceed applicable thresholds.

And air pollutants that can contribute to human health, industrial uses that would exceed applicable thresholds.

Also with mitigation as it relates to cultural resources, adjacent to historical resources.

Then we move onto greenhouse gas emissions. Significant and unavoidable impacts related to construction and operational impacts as those emissions could exceed the SoCal air quality measuring district significance threshold.

Construction as related to pile driving activities that would exceed noise levels and vibration standards.

And operational impacts related to the increase in permanent noise increases related to traffic, warehouse uses, clean tech, light industrial, mechanical equipment and other outdoor activities.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

And last slide here for significant and unavoidable. For transportation and utilities and system services.

So significant and unavoidable impacts and transportation would occur during operational impacts. This would be in relation to transportation hazards. Freeway off-ramps. Includes off-ramp queueing on the southbound off-ramp to mission road, I-5 to Cesar Chavez, I-10.

Utilities and system services significant and unavoidable impacts as related to construction and operational impacts. As related to insufficient capacity and local sewer lines for future projects and also operational impacts as it relates to operational water supplies and water demand. And water supply impacts for projects constructed after 2045.

So the next slide summarizes the alternatives considered in the draft SEIR. So CEQA requires an EIR address a range of reasonable alternatives that would meet the basic objectives of the project and avoid or lessen significant impacts to the project.

So we have three alternatives at the draft SEIR. Evaluate it. No project 2014 Master Plan development. And this no project alternative represents continuation of previously approved 2014 Master Plan, which was analyzed in 2014 Master Plan EIR.

Second alternative is General Hospital adaptive reuse alternative. So this alternative would include the seismic retrofit and adaptive reuse of the General Hospital building in immediately adjacent areas within the historic

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

district only. And would also include demolition of non-historic buildings and features around the area immediately north of the General Hospital building.

No additional development would occur on the raining portion sides and the remaining would remain in the existing condition.

Final alternative. Reduced density medical campus alternative. And this alternative would allow for the demolition of previously approved buildings and structures approved for demolition under the 2014 Master Plan. Buildings and structures proposed for demolition under the proposed project and redevelopment of the project site.

So next steps we'll dive into the next steps after the 45-day commenting period.

So the -- as you see here, we are here in the red here. Today we are in the draft SEIR public review process. And within the 45-day public review period for the draft SEIR, which again ends on Monday, June 29th. The county is accepting comments on the environmental analysis contained in the draft SEIR and its technical reports. And today will be an opportunity for the public to share comments on the draft SEIR. Again, I want to emphasize today is not the only day to provide comments. You can provide comments again through e-mail, regular mail, up through Monday, June 29th.

Following that, you have here the prepared final SEIR. The county will respond to the public comments received during the public review period and will prepare a final SEIR and response to comments will be contained.

And public hearings. Anticipated in October 2026. Public hearings with the L.A. County board of supervisors will then be held to review and consider approval of the project and SEIR. From there, the county board of supervisors will consider comments received as part of the project approval process.

And then from here, I will pass it back to Krystin to discuss about the public comments and document availability.

>> Thank you, Allyson. That includes the core of the presentation. We'll open up for public comment. If you go to the next slide, just want to share -- reiterate this is not the last time for public comment. So you'll be able to continue to review the document, the full SEIR digital copy is available on DEO's website.

You can also find a hard copy at the Los Angeles County wellness center as well as several of their libraries.

And if you go to the next slide.

The comment period is open. Started on May 15th and will end on June 29th, 2026. You can submit comments verbally today. But we really encourage you to submit your comments in writing to ensure we fully capture and track all of those by e-mail as well. If you do verbally or have additional comments beyond tonight.

GeneralHospital@opportunity.LACounty.gov. You can also send me mail to the office. DEO's office at 510 South Vermont Avenue, 11th floor, Los Angeles, California 90020.

Comments are due by June 29th, 5:00 p.m.

We'll open up verbal comments tonight. You're able to raise your hand using the raise hand function on the bottom of your Zoom link. Comments will be taken in the order hands are raised. If you don't mind stating and spelling your name before you begin at which point a two-minute timer will begin to share your comments. This will not be a Q&A process. We'll take comments and note them as part of the review process. And you can share written comments in the chat, which we can take and hear as well.

So I will open it up to anyone who would like to ask a question. Again, feel free to raise your hand.

>> Hi, everyone. My name is Emily. I'm helping moderate the public comment session. Just wanted to note currently we don't have any hands raised.

Oh, looks like we just had one pop up.

All right. So we have one hand raised now. Kristie, you're going to be our speaker. I'm going to go ahead and allow you to speak. If you can go ahead and state and spell your name for the record and begin your comment.

Kristie, it looks like you unmuted yourself. We're not hearing anything currently.

>> Hello. Can you hear me now?

>> Yes.

>> Hi. Good evening. Thank you so much for the opportunity to provide public comment.

I think for me one thing I always like to highlight is the fact that we need some more -- some more community outreach about what is taking place and what is being proposed at this occasion. This is a very large scale project. And I don't think that vocal residents understand the gravity of how this will impact our local community.

This is bringing a lot of change, whether we're talking about foot traffic, transportation, street traffic, infrastructure, and so forth. And I want to make sure that outreach is being done beyond your 200 feet radius of the project to only the areas, businesses, residents that you believe will be directly impacted. Because I think what we forget is others in the area will be impacted if you're driving through this occasion to get to and from your home, work, errands, appointments. So I really want to make sure and underscore that there needs to be more outreach.

I know that it's located in the City of Los Angeles, but you also have unincorporated East Los Angeles right over the freeway overpass there. So if and when you have -- I also encourage in-person meetings. And the fact

that we received an e-mail to notify us of this public hearing one day before is unacceptable. We need to make sure that these communications are going out sooner so folks can actually accommodate and plan accordingly. I know considering work schedules, I had to jump on a little bit later but I want to make sure all these things are taken into consideration. I know it's one thing to be consultants and make sure this runs smoothly but take into consideration the local community and make sure you have interpretation. Thank you.

>> All right. Thank you for your comment.

We have another hand raised. Pamela, I'm going to go ahead and allow you to speak. If you want to go ahead and unmute yourself and state and spell your name for the record and begin your comment.

>> Awesome. Can you hear me now?

>> Yes, we can hear you.

>> Okay. Hi, everyone. Good afternoon. My name is Pamela G, P-A-M-E-L-A A-G-U-S-T-I-A. I'm with the East Side Leads Coalition, and we've been part of this process since 2017.

My comment is not new. I've actually mentioned this to Krystin before. I mentioned it also even before the community started discussions around the community benefit agreement framework.

And it's that these public comment periods are really aggressive, really short. 45 days from May 15th, my understanding is today's meeting is the

first meeting since the SEIR was released since May 15th that has been held publicly. My recommendation is this public comment is extended to 30 days. I mentioned this in supervisorial district one. It's not a new comment. We want it to be held true. My second recommendation is that this presentation be taken to the public.

Yesterday, our coalition held a three-hour town hall in collaboration with councilmember from L.A. District 13. And three hours was just right. That's the amount it takes in my opinion to hold a robust conversation. Second, I want a clarification on the minimum residential units.

We have seen public documents hold 600 units then 800 units. I saw today over 3,000 units. So can somebody please clarify what is the minimum and what is the maximum range? 600 units to 3200 units is a very big jump. In my history I've only seen 600 or 800 been considered. That's a pretty gargantuan change. Thank you.

>> Thank you, Pamela.

Currently, we don't have any hands raised.

But we will be on until 7:30 accepting public comments. So if you would like -- oh, looks like we have Cassidy has raised their hand. I'll go ahead and allow you to speak. If you can state and spell your name for the record and then begin your comment.

>> Thank you. Hi, Emily. My name is Cassidy Bennett, C-A-S-S-I-D-Y B-E-N-N-E-T-T.

I am an attorney with public counsel. We are also part of the east side leaves coalition and I've been part of this process for a really long time. And yeah. I would like to second Pam's comment regarding the comment period.

Especially given that the document is over a thousand pages long. That's a really -- a lot of information to get through for anybody. I think it's a lot of information for me to get through as a lawyer and as Pam said to be able to share it with the community. As the first commenter shared as well, that's so critical we need to make sure that everyone is understanding all the information in this environmental impact report, all the work you've done to understand the best option for their community moving forward.

So I would like to second the request for an increased comment period. Thank you.

>> Thanks for your comment.

We have another hand raised. M Castro. I'm going to allow you to speak. If you can state and spell your name for the record.

Doesn't look like you've hit unmute yet. There's a mute -- there you go.

>> Okay. Hi. Great. My name is Martha Castro. I'm a long time resident of East Los Angeles.

I want to third the comment. We need an extension and more public input. This is going to greatly impact the east side. It seems that we're getting a lot of housing built on this side without any public comment being

taken into consideration. And I would like to see a little more input from us on this side. If you can delay it and extend the impact and have in-person conversations with the residents of East Los Angeles, not just Boyle Heights.

We're on the other side of the bridge and this is going to impact us as well. Thank you.

>> Thanks for your comment. Doesn't look like we have anyone else currently with their hand raised.

As a reminder, if you'd like to provide verbal comment, please hit the raise hand button on your tool bar. You're welcome to submit written comments in the chat.

Okay. We have another hand raised now.

If you want to go ahead and unmute yourself and state and spell your name for the record.

>> Yes. E-L-I-A-S. I want to also echo what everybody else is saying. I think the Master Plan is lengthy and I think it can be a lot to ingest for community.

And yeah, I think -- I feel like we still haven't reached a lot of community members to input and weigh in on everything that's happening. So I would like to see further engagement on the developer's part doing that work as well.

And yeah. I do think we need to extend the public comment period because I do think it's not enough time for everybody to weigh in on this. So yeah. Thank you.

>> Thank you.

All right. We don't currently have any hands raised. I did want to just give a reminder for those on the phone, you can dial star nine to raise your hand to provide your comment.

And then you would dial star six to unmute.

Like I mentioned, doesn't look like we have any other hands raised at the moment.

But we will be here until 7:30 accepting comments.

Hi, everyone. We still don't have any hands raised. If you would like to provide a public verbal comment, you can raise your hand by clicking the button on the tool bar. If you'd like to provide a written comment, you can enter that into the chat.

All right. We have one hand raised now. Maria, I'm going to go ahead and allow you to unmute yourself. Please state and spell your name for the record and provide your comment.

>> Hi, my name is Maria, and I'm a resident of East L.A. I'm calling to request that you extend the public comment period from 45 days to 90 days. The document was published on May 15th and this is the first time we hear about it. We ask for an in-person meeting. The document is over a

thousand pages and we're concerned about the impact that the units of housing will have.

Please involve the community in your next steps. Thank you.

>> Thanks for your comment.

We don't currently have any other hands raised.

But like I mentioned, we'll be staying on until 7:30. So if you'd like to provide a comment, please raise your hand.

Hey, everyone. We still don't have any hands currently raised. As a reminder, we'll be in the meeting until 7:30. If you'd like to speak, please do go ahead and raise your hand.

Hello. We still do not have any hands raised currently. We will be accepting comments until the end of the meeting at 7:30. If you'd like to provide a comment, please raise your hand or enter them in writing in the chat.

If you'd like to submit a comment following the conclusion of this meeting, you can submit written comments via e-mail or postal mail.

Hello. I see we now have a hand raised. Jose, I'm going to allow you to unmute yourself. If you can state and spell your name for the record and then provide your comment.

I see you've unmuted but I can't hear anything just yet.

>> Can you hear me?

>> Yes.

DISCLAIMER: This is NOT a certified or verbatim transcript, but rather represents only the context of the class or meeting, subject to the inherent limitations of realtime captioning. The primary focus of realtime captioning is general communication access and as such this document is not suitable, acceptable, nor is it intended for use in any type of legal proceeding.

>> Beautiful.

So can I start?

>> Yeah. If you can state and spell your name and then provide your comment please.

We're not hearing anything currently if you're speaking.

>> Okay. How about now?

>> Yes.

>> Okay. My name is Jose Fernandez, J-O-S-E F-E-R-N-A-N-D-E-Z.

Were you able to capture that?

>> Yes. Thank you. You can go ahead and provide your comment.

>> Sure. Yeah. Well, I'm a 35-year resident of Boyle Heights. So pretty adjacent to the General Hospital over here. And yeah. I barely heard about this new information coming out with the EIR.

I have previous experience reviewing these documents and they are very long and take a very long time to break down for community residents.

So I'm here to ask that you please extend the public comment period because we need to include more residents in the process. And we want to make sure we get as much public participation as possible.

The General Hospital was such a huge redevelopment project that is going to require an even larger participation. It's a regional hub for the area and for the entire county. And we want to make sure we mitigate any impacts on the community and that all the services that are going to be

provided in the new plan and other future redevelopments need to be able to provide opportunities for community members.

So again, I'm here to ask that we extend the review period because it's such a long document and we want to make sure we include as many people as possible in multiple languages and multiple capacities. Thank you.

>> Thanks for your comment.

Just a reminder, we're allowing everyone to speak once. And you're not permitted to exceed your time to another person. If you do have additional comments, please do submit them through the chat feature. Or in writing any time during the 45-day draft SEIR public review period, which ends on Monday, June 29th.

Looks like we have a hand raised now. Cindy, I'm going to allow you to unmute yourself. If you can go ahead and state and spell your name for the record and provide your comment.

Cindy, looks like you unmuted yourself for a second and it muted again. You may need to hit the unmute button again.

So Cindy -- looks like you unmuted. Do you want to say something, Cindy?

We're not hearing anything currently.

Looks like Cindy is having some technical difficulties.

It does look like you were able to unmute a few times but looks like you're muted currently. So you would need to go to the tool bar at the bottom and hit unmute again for us to be able to hear you.

>> Kristie, I saw your hand raised. We were going back to your question after Cindy. We can unmute you as well.

>> All right, Cindy, looks like you submitted a comment in writing.

So I don't know if you're still interested in providing a verbal comment. If so, please do raise your hand again. For right now, we're going to go to -- we're going to go to Kristie and then Cindy, we can try coming back to you.

>> And just before we do that, I just want to note and remind everyone if you join after there is live interpretation of this meeting. You can select your language using the "more" button and selecting "Spanish".

>> Thanks, Krystin.

Kristie, I did hit for you to be -- to allow you to speak.

>> Thank you. Can you hear me?

>> Yes.

>> Thank you again. This is Kristie, K-R-I-S-T-I-E Hernandez. I'd like to ensure this healthy village have a community advisory committee that's made up of residents in the community. I know you've listed Boyle Heights and centennial and East L.A. So there's those part of that advisory so we're understanding the dynamics of how this proposed developments

will impact. There are requests as a result. This is a landmark for many of us. We have fond memories and we want to capture the essence of this building and what it means to our community. On that note when you talk about the infrastructure and what you all are doing to make sure it is safe, I also want to make sure we are building infrastructure that will accommodate an influx of building, housing. You've mentioned businesses, workforce, childcare, so we recently saw the oil spill that took place in unincorporated East L.A. We want to ensure proper processes are in place to avoid environmental process.

In addition to that I want to advocate for parking. I know that there are certain state bills that tell us we don't have to provide parking with development and I'm strongly opposed to that. We have local jurisdiction that allow us especially if there's businesses and other staff and employees that are going to be going to this facility for the wrap around services to the intended occupants. I want to underscore community outreach. I'm advocating for an extension to 90 days to ensure you all are going out to the community and folks are providing input and make sure funding is appropriately used because we've seen misuse of funding for this type of development. Thank you.

>> Thank you.

So I'm going to go ahead and go back to Cindy and see if you want to go ahead. I see your hand still raised. I'm going to allow you to unmute

yourself if you want to try again and are still interested in providing a verbal comment in addition to your written comment.

I see a message. Cindy said she was speaking but we just couldn't hear her.

Sorry about that, Cindy. I don't know if you want to try again. Right now it looks like you are muted.

So you would need to click unmute for us to be able to hear you in the tool bar at the bottom. There is a mute, unmute button. You need to click that to actually come off of mute.

We're unmuted but we still can't hear you unfortunately.

We saw you lower your hand, Cindy. Sorry we couldn't hear you.

I don't see any other hands are raised at the moment.

And we'll be on for just a minute or two more if anyone does want to raise their hand and provide a comment.

>> Thank you, everyone. It's 7:30. We're going to close the meeting. Thank you to all who attended and provided comments. The comment period is open until June 29th and you can submit via e-mail as shown on the screen and via mail. We appreciate your time and look forward to continuing conversation and dialogue around this project. Thank you.

[END -- 7:31 p.m.]

APPENDIX B:
Public Information Meeting Chat Log

18:13:15 From Fireflies.ai Notetaker Giovann to Hosts and panelists:
Fireflies invited Fireflies.ai here to record & take notes. If you do not consent to being recorded, please notify the meeting host, and they will remove Fireflies from the meeting. View Security & Privacy info: https://t.ly/5tNCS
By continuing, you agree to https://fireflies.ai/privacy
18:16:18 From Abby Stone to Everyone:
If you're joining late: please click 'Interpretation' at the bottom of your Zoom window and select your preferred language. // Si se incorpora más tarde, por favor haga clic en «Interpretación» en la parte inferior de la ventana de Zoom y seleccione su idioma preferido.
18:31:26 From Abby Stone to Everyone:
If you're joining late: please click 'Interpretation' at the bottom of your Zoom window and select your preferred language. // Si se incorpora más tarde, por favor haga clic en «Interpretación» en la parte inferior de la ventana de Zoom y seleccione su idioma preferido.
18:42:55 From Abby Stone to Everyone:
If you're joining late: please click 'Interpretation' at the bottom of your Zoom window and select your preferred language. // Si se incorpora más tarde, por favor haga clic en «Interpretación» en la parte inferior de la ventana de Zoom y seleccione su idioma preferido.
18:55:45 From Kristie Hernandez to Hosts and panelists:
When is the next public meeting to provide community members with an update on this project? And will there be another public hearing scheduled in the near future?
18:57:20 From Abby Stone to Everyone:
Thank you, your comment has been received.
19:21:17 From Kristie Hernandez to Hosts and panelists:
This is a public meeting with no other speakers. We should be allowed to speak again.
19:22:05 From Cindy to Hosts and panelists:
My name is Cindy . And I am a resident of the east side. Today I learned about this meeting about the The Subsequent EIR. This document is over 1000 pages! We need more time to look thru it. I stand with the ask that the public comment be extended beyond 45 days. Also, we need to have an in person meeting so that non-english speakers and other folks can participate to understand the environmental impacts of the general hospital redevelopment project.
19:22:08 From Kristie Hernandez to Hosts and panelists:
Thank you, Krystin.
19:22:59 From Abby Stone to Cindy, Hosts and panelists:
Thank you, your comment has been received.
19:23:30 From Cindy to Hosts and panelists:
Sorry I was speaking but you couldn’t hear me.
19:25:36 From Abby Stone to Everyone:
If you're joining late: please click 'Interpretation' at the bottom of your Zoom window and select your preferred language. / Si se incorpora más tarde, por favor haga clic en «Interpretación» en la parte inferior de la ventana de Zoom y seleccione su idioma preferido.
19:26:12 From Cindy to Hosts and panelists:
You still can’t hear me
19:31:19 From Kristie Hernandez to Hosts and panelists:

Thank you

Notes and comments:

TRANSIT PRIORITY TIMING

EMERGENCY VEHICLE PREEMPTION AT INTERSECTION (RR1)

1. AT THE BEGINNING OF PREEMPTION, IF PHASE IS DISPLAYING "WALK" IT WILL GO TO PEDESTRIAN CLEARANCE. OTHERWISE, PHASE RECEIVING A GREEN INDICATION WILL GO TO YELLOW CLEARANCE IMMEDIATELY. HOWEVER, IF PHASE 2 SIGNALS ARE GREEN THEY WILL REMAIN GREEN.
2. THIRTY (30) SECONDS OF GREEN EMERGENCY VEHICLE CLEARANCE FOR PHASE 2. PEDESTRIAN SIGNALS REMAIN SOLID "DON'T WALK". ALL OTHER VEHICULAR SIGNALS SHOW SOLID RED.
3. AT THE END OF PREEMPTION, PHASE 2 GOES TO YELLOW CLEARANCE. PEDESTRIAN SIGNALS SHOW SOLID "DON'T WALK" AND OTHER PHASES REMAIN RED.
4. SIGNALS RETURN TO NORMAL OPERATION WITH GREEN INDICATIONS FOR PHASE 4.

EMERGENCY VEHICLE PREEMPTION FLASHING BEACON AT DRIVEWAY (RR1)

1. SOFT LOGIC EQUATIONS 1 & 2.
2. FLASHING BEACONS CONNECT TO THE MIDDLE OF PHASE 4 & PHASE 6 PED LOADSWITCH.
3. AT THE BEGINNING OF EMERGENCY VEHICLE PREEMPTION, BEACONS GO FROM DARK TO ALTERNATELY FLASHING YELLOW.
4. FORTY-FIVE (45) SECONDS ALTERNATE FLASHING YELLOW FOR THE BEACONS.
5. AT THE END OF PREEMPTION, BEACONS GO DARK.

* DISTRICT NOTE: GARVEY-CESAR CHAVEZ TPS (PROJECT NO. 75060)

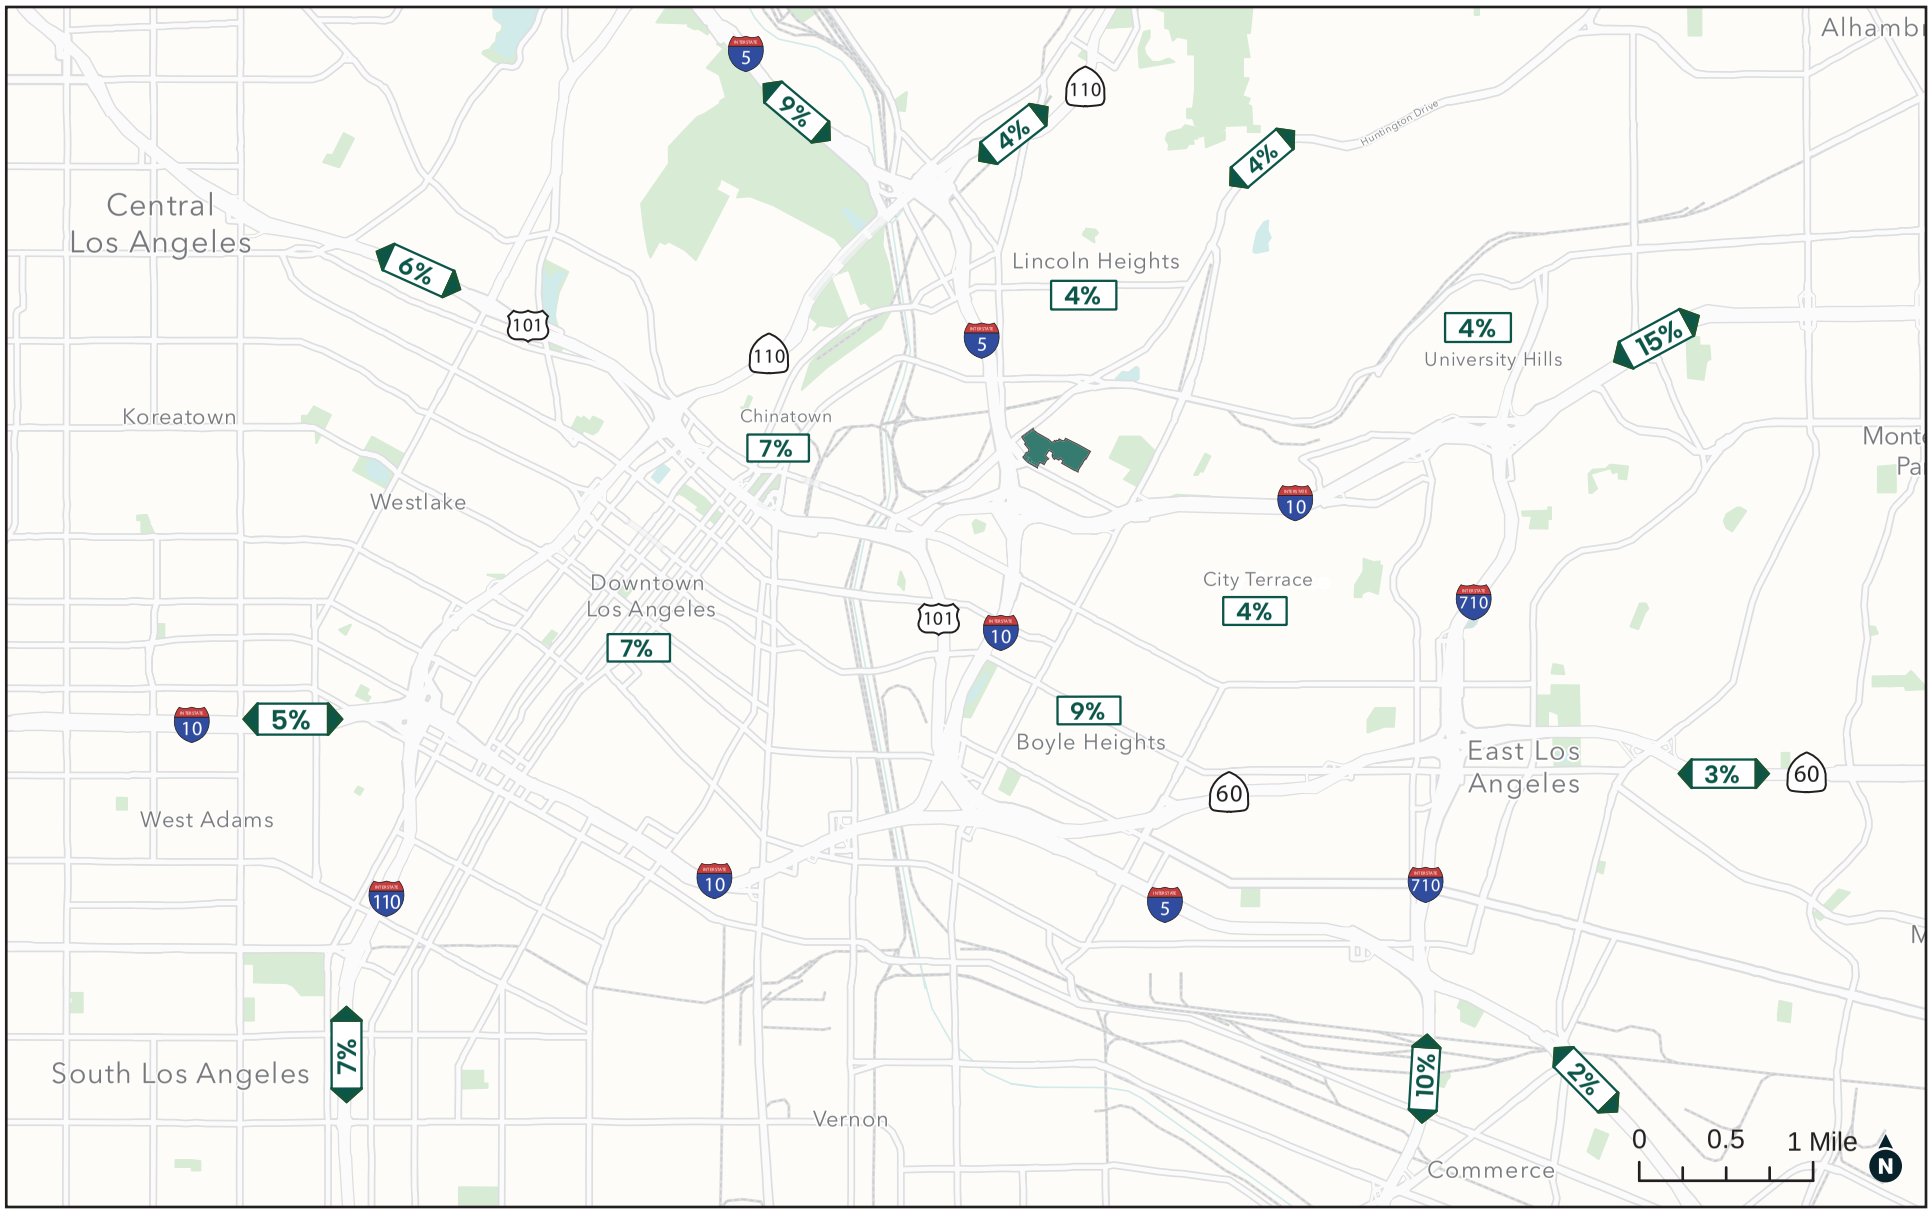
Source: Fehr & Peers, 2025

Notes:

[a] KSF = thousand square feet, DU = dwelling units

[b] Institute of Transportation Engineers (ITE) 12th Generation



[c] Internal capture of 7% was calculated using Fehr & Peers' mixed-use trip generation (MXD) tool, developed in coordination with the United States EPA;
Walk/bike/transit trip credit of 15% applied to account for the percentage of Project trips that would occur by walking, biking, or transit (LADOT TAG-defined maximum based on Project location)
Pass-by trip adjustment of 30% applied to the retail, mid-point between the 10% and 50% reductions defined in the TAG (Attachment J of TAG), as the Project would include a combination of all such uses.

[d] ITE 12th Edition does not define daily rates for 936. A value to ten-times the PM peak hour rate was used.

[e] ITE 12th Edition does not define rates for auditoriums. The "movie theater" rate was used to estimate this land use, and no AM peak hour events were assumed.

[f] Trip totals by time period may differ from Exhibit A in "Draft CEQA Chapter Excerpt" by 1-4 trips (no more than 0.2% of trips) due to rounding at the detailed land use component level versus the campus area level.
The values shown in Exhibit A were utilized in the queuing analysis.

Proposed Project Trip Distribution Map

CEQA FINDINGS OF FACT
REGARDING THE FINAL SUBSEQUENT ENVIRONMENTAL IMPACT REPORT
FOR THE
LOS ANGELES COUNTY
GENERAL HOSPITAL CAMPUS MASTER PLAN PROJECT
STATE CLEARINGHOUSE NO. 2014051061

I. INTRODUCTION

The California Environmental Quality Act (CEQA) requires that a number of written findings be made by the lead agency in connection with certification of an environmental impact report (EIR) prior to approval of a project pursuant to Section 15091 and Section 15093 of the State CEQA Guidelines and Section 21081 of the California Public Resources Code (PRC). This document provides the findings required by CEQA. The potential environmental effects of the proposed Los Angeles County General Hospital Campus Master Plan Project (Proposed Project) have been analyzed in a Draft Subsequent Environmental Impact Report (Draft SEIR) (State Clearinghouse [SCH] 2014051061) dated May 2026. A Final Subsequent Environmental Impact Report (Final SEIR) has also been prepared that incorporates the Draft SEIR and contains comments received on the Draft SEIR during the public review period and public informational meeting, responses to the individual comments, revisions to the Draft SEIR including any clarifications based on the comments and the responses to the comments, and the Mitigation Monitoring and Reporting Program (MMRP) for the Proposed Project. The Final SEIR as referred to in these findings is inclusive of both the Draft SEIR and Final SEIR. This document provides the findings required by CEQA for approval of the Proposed Project.

The lead agency is responsible for the adequacy and objectivity of the EIR. The Lead Agency pursuant to State CEQA Guidelines Section 15050 is the County of Los Angeles (County). The Department of Economic Opportunity (DEO) is carrying out the SEIR process on behalf of the County. The County, as lead agency, has exercised its independent judgment and analysis in its review of the Draft SEIR and Final SEIR.

STATUTORY REQUIREMENTS FOR FINDINGS

CEQA (Public Resources Code (PRC) Section 21000, et seq.) and the State CEQA Guidelines (14 California Code of Regulations Sections 15000, et seq.) promulgated thereunder, require the environmental impacts of a project be examined before a project is approved. Specifically, regarding findings, State CEQA Guidelines Section 15091 provides:

> (a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings

for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:

1. Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the Final EIR.

2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.

3. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

(b) The findings required by subsection (a) shall be supported by substantial evidence in the record.

(c) The finding in subdivision (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives. The finding in subsection (a)(3) shall describe the specific reasons for rejecting identified mitigation measures and project alternatives.

(d) When making the findings required in subdivision (a)(1), the agency shall also adopt a program for reporting on or monitoring the changes which it has either required in the project or made a condition of approval to avoid or substantially lessen significant environmental effects. These measures must be fully enforceable through permit conditions, agreements, or other measures.

(e) The public agency shall specify the location and custodian of the documents or other material which constitute the record of the proceedings upon which its decision is based.

(f) A statement made pursuant to Section 15093 does not substitute for the findings required by this section.

The "changes or alterations" referred to in section 15091(a)(1) may include a wide variety of measures or actions as set forth in State CEQA Guidelines Section 15370, including:

(a) Avoiding the impact altogether by not taking a certain action or parts of an action.

(b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.

(c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.

(d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.

(e) Compensating for the impact by replacing or providing substitute resources or environments.

CERTIFICATION

Having received, reviewed, and considered the SEIR for the Proposed Project, as well as other information in the record of proceedings on this matter, the County, as the lead agency, adopts and certifies the following Findings of Fact (Findings). The Findings set forth the environmental and other bases for current and subsequent discretionary actions to be undertaken by the County and responsible agencies for the implementation of the Proposed Project.

In addition, the County hereby make findings pursuant to and in accordance with Section 21081 of the California Public Resources Code and State CEQA Guidelines Sections 15090 and 15091 and hereby certifies that:

(1) Changes or alterations have been required in, or incorporated into, the project which mitigate or avoid the significant environmental effect as identified in the Final EIR.

(2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.

(3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

SUBSEQUENT ENVIRONMENTAL REPORT AND DISCRETIONARY ACTIONS

The Final SEIR addresses the direct, indirect, and cumulative environmental effects associated with adoption of the Proposed Project. As a program-level SEIR, the Draft and Final SEIR evaluates a reasonable and likely maximum development that could be developed based on the

level of information that is currently available. The Draft and Final SEIR provides the environmental information necessary for the County to make a final decision on the anticipated discretionary actions related to the Proposed Project. Later activities would also be required to adhere to applicable regulations, and standards and mitigation measures identified as part of the Final SEIR and MMRP. Review of proposed future projects under the proposed Master Plan would be reviewed to determine compliance with State CEQA Guidelines Section 15168 and other applicable provisions of CEQA. Discretionary actions to be considered by the County include, but are not limited to, the following:

- Certification of the Los Angeles County General Hospital Campus Master Plan Subsequent Environmental Impact Report
- Approval and adoption of the Los Angeles County General Hospital Master Plan
- Adoption of the Mitigation Monitoring and Reporting Program for the Los Angeles County General Hospital Campus Master Plan

Additional future discretionary actions to be considered by the County could include the following:

- Approval of amendments to the Master Plan
- Approval of Ground leases and related agreement(s)
- Approval of actions related to implementation of the Master Plan or approval of future proposed projects under the Master Plan.

The County anticipates that other public agencies with potential discretionary authority related to the Proposed Project would rely on the Final SEIR as the basis for their CEQA determinations.

II. PROCEDURAL COMPLIANCE WITH CALIFORNIA ENVIRONMENTAL QUALITY ACT

The County published a Draft SEIR and commenced the public review period on May 15, 2026. A Final SEIR was completed in September 2026 in compliance with CEQA requirements. The Final SEIR has been prepared in accordance with CEQA and the State CEQA Guidelines. As authorized in State CEQA Guidelines Section 15084(d)(2), the County retained a consultant to assist with the preparation of the environmental documents, which was subject to review and direction of the County. County staff, representing the lead agency, have directed, reviewed, and modified where appropriate all material prepared by the consultant. The Final SEIR reflects the County's independent analysis and judgement. The key milestones associated with the preparation of the SEIR are summarized below. As presented below, extensive public involvement and agency notification efforts were conducted to solicit input on the scope and content of the SEIR and to solicit comments on the results of the environmental analysis presented in the Draft SEIR.

ENVIRONMENTAL REVIEW PROCESS

In conformance with CEQA, the State CEQA Guidelines, and the County of Los Angeles Environmental Document Reporting Procedures and Guidelines[1], the County conducted an extensive environmental review of the Proposed Project. The environmental review process included the following.

Scoping Process

- The County determined that a Subsequent EIR (SEIR) would be the appropriate environmental document for the Proposed Project because the Proposed Project represents a substantial change from the Los Angeles County + University of Southern California (LAC+USC) Medical Center Campus Master Plan EIR (2014 Master Plan EIR, State Clearinghouse No. 2014051061) that was certified on November 18, 2014, by the Los Angeles County Board of Supervisors, resulting in major revisions. Substantial changes occur with respect to the circumstances under which the Proposed Project will be undertaken, which required major revisions to the prior EIR. Lastly, new information of substantial importance that could not have been known at the time the prior EIR was certified would result in one or more significant effects not previously discussed and would result in an increased severity in impacts as defined in the prior EIR.
- The County issued a Notice of Preparation (NOP) and Notice of Public Scoping Meeting. The NOP was provided in both English and Spanish.
- The NOP comment period was from September 26, 2025 to October 27, 2025. Following requests from the public during the comment period, the public review period was extended to November 21, 2025.
- Pursuant to CEQA Guidelines Section 15082, copies of the NOP were available for public review at the Los Angeles County Wellness Center, City Terrace Library, Chinatown Branch Library, El Sereno Branch Library, Lincoln Heights Branch Library, Anthony Quinn Library, Malabar Branch Library, and the County of Los Angeles Department of Economic Opportunity website. The NOP was sent via certified mail to 81 recipients and via email to an distribution list of approximately 11 recipients. County DEO social media was used to publicize the CEQA process. The NOP was transmitted to the State Clearinghouse and County Clerk and was distributed to State and local agencies, Native American tribes, and/or those who previously requested such notice.
- The Centennial Partners team also distributed the NOP via email to a list of approximately 1,085 recipients that included stakeholders, individuals, groups, and agencies that have been involved in the process and/or signed up to be on an informational email list.

[1] County of Los Angeles, Environmental Document Reporting Procedures and Guidelines (1987).

- During the scoping process the County invited the public, public agencies and others to participate in a virtual public scoping meeting (Zoom webinar) on October 8, 2025. At the meeting the County provided a presentation with information about the Proposed Project known at the time and an overview of the CEQA process. All information was presented in simultaneous English and Spanish.
- A total of 10 written comments and 5 verbal comments were received during the public scoping meeting. Table 1-1, *Notice of Preparation and Scoping Meeting*, of the Draft SEIR describes the issues raised during scoping and where they are addressed in the Draft SEIR. All comments received during the scoping process are included as Appendix A to the Draft SEIR.

AB52 Tribal Consultation

In compliance with the requirements set forth in AB 52, on September 26, 2025, the County provided formal notification of the Proposed Project and sent an invitation for consultation to 12 Native American tribes (Tribe(s)). The tribes which were notified include those that are on the County's request for notification list, pursuant to PRC Section 21080.3.1, which includes tribes that have formally requested notification through the County's Department of Regional Planning, when the County, as the lead agency under CEQA, considers projects in the geographic area that is traditionally and culturally affiliated with the tribe. The County additionally contacted Native American Heritage Commission (NAHC) and received the NAHC list of tribes that are traditionally and culturally affiliated with the geographic area of the Project Site on July 25, 2025. The lists were cross-referenced and were substantially coextensive; to the extent any tribe appeared on only one of the two lists, that tribe was included in the notification to ensure full compliance with AB 52. The County extended the 30-day period for tribes to request consultation from October 27, 2025 to November 21, 2025 to coincide with the extended scoping period. The notification letters were emailed and sent via certified mail to the following:

- Band of Mission Indians
- Cahuilla Band of Indians
- Fernandeño Tataviam Band of Mission Indians
- Gabrieleño Tongva–San Gabriel Band of Mission Indians
- Gabrielino Tongva Indians of California
- Gabrielino/Tongva Nation
- Gabrielino–Tongva Tribe
- Gabrieleño Band of Mission Indians–Kizh Nation
- San Manuel Band of Mission Indians
- Santa Rosa Band of Cahuilla Indians

- Soboba Band of Luiseno Indians
- Tejon Indian Tribe

On September 30, 2025 and November 4, 2025, a response email was received from the San Manuel Band of Mission Indians stating no consultation with this tribe was requested. On October 1, 2025 and October 23, 2025, a response email was received from the Fernandeño Tataviam Band of Mission Indians stating no consultation with this tribe was requested. On November 4, 2025, the Gabrieleño Band of Mission Indians–Kizh Nation requested to consult with the County on the Proposed Project via email. The remaining eight tribes did not provide response to the County. Appendix K, *Tribal Consultation Responses*, of the Draft SEIR describes the County's tribal consultation outreach efforts.

The County began consultation via email with representatives of the Gabrieleño Band of Mission Indians–Kizh Nation on November 19, 2025. The Kizh Nation provided recommended mitigation measures tailored to the tribe's cultural protocols on January 22, 2026 via email. The County provided suggested revisions to the provided mitigation measures on March 3, 2026 via email. On March 17, 2026, the tribe provided comments on the County's proposed revisions to the mitigation measures. The County has considered all information provided by the Kizh Nation during the consultation for the Proposed Project. After acting in good faith and in consideration of the Tribe's requests and multiple rounds of emails and edits to the draft mitigation measures, the County concludes that a reasonable effort has been put forth and the County and the tribe have been unable to reach a mutual agreement regarding the mitigation measure language (PRC Section 21080.3.2[b]). An email and letter were sent via certified mail to Mr. Andrew Salas of the Gabrieleño Band of Mission Indians—Kizh Nation on May 8, 2026, concluding consultation pursuant to PRC Section 21080.3.2(b). The County considered the information and recommendations provided by the Kizh Nation and incorporated appropriate mitigation measures into the Final SEIR and MMRP to address potential impacts to TCRs. Although the County and the Kizh Nation did not reach agreement on the final mitigation measure language, the County determined that the measures included in the Final SEIR are appropriate to address the identified TCR impacts. See Chapter 3.16, *Tribal Cultural Resources*, and Appendix K, *Tribal Consultation Responses*, of the Draft SEIR for details regarding the tribal consultation process.

A comment letter was received from the Gabrielino Tongva Indians of California Tribal Council tribe on May 19, 2026 during the 45-day public comment period on the Draft SEIR. Response to this letter is included in Chapter 2, *Response to Comments*, of the Final SEIR.

Draft SEIR Process

- The County prepared a Draft SEIR and supporting technical appendices, along with the Notice of Availability (NOA) and Public Information Meeting, which were made available for a 45-day public review period beginning May 15, 2026, and ending June 29, 2026. The NOA was provided in both English and Spanish. Section 1.3, *Environmental Review Process*, of the Draft SEIR describes the issues identified for analysis in the Draft SEIR. In compliance

with Sections 15085(a) and 15087(a)(1) of the State CEQA Guidelines, the County published the NOA and Notice of Completion (NOC) of the Draft SEIR. The NOA was noticed using the same distribution as the NOP, including additional recipients that requested notification.

- The NOA and NOC were transmitted to the State Clearinghouse and County Clerk and were distributed to State and local agencies, and/or those who previously requested such notice.
- An email blast announcing the NOA and Master Plan was provided to approximately 1,375 individuals via an email distribution list that was maintained and expanded over the years by the project team.
- A virtual public information meeting (Zoom webinar) was held on June 11, 2026. The meeting included a presentation with an overview of the Proposed Project and the contents of the Draft SEIR. All information was provided in simultaneous English and Spanish. An estimated 16 members of the public participated in the informational meeting.
- A total of 20 comments were received during the public comment period. Responses are included in Chapter 2, *Response to Comments*, of the Final SEIR. The comment letters received are as follows:
  - 8 letters from public agencies
    - Gabrieleño Band of Mission Indians–Kizh Nation
    - San Gabriel Valley Council of Governments
    - Los Angeles Unified School District
    - California Department of Transportation (Caltrans)
    - South Coast Air Quality Management District (AQMD)
    - Office of the Sheriff, Los Angeles County
    - City of Los Angeles Department of Transportation (LADOT)
    - California Highway Patrol
  - 3 letters from organizations/groups
    - Alma Family Services
    - Eastside LEADS
    - Los Angeles Conservancy
  - 8 verbal comments during the public information meeting
  - 1 written comment during the public information meeting

Final SEIR Process

- The County prepared a Final SEIR, which includes an introductory chapter, comments received on the Draft SEIR and responses to those comments, and revisions made to the Draft SEIR, consistent with State CEQA Guidelines Section 15132(d). The Final SEIR includes the Draft SEIR in its entirety.

- As a result of comments received on the Draft SEIR, the County has elected to modify and/or include additional mitigation measures in the Final SEIR and MMRP. In summary, changed mitigation measures are as follows:
  - Mitigation measures were updated to provide clarity on responsible implementing party (Project Applicant(s)/Contractor(s))
  - Mitigation Measure AIR-2 and AIR-4d were added to further ensure that operational criteria pollutant, toxic air contaminants, and/or GHG emissions are reduced to the extent feasible to reduce a significant impact that was already identified in the Draft SEIR.
  - Transportation measures were updated to reflect input provided by Caltrans on the Draft SEIR regarding potential improvements to Caltrans facilities to address hazardous safety queuing impacts.
- The County prepared this Findings of Fact, a Statement of Overriding Considerations under separate cover, and a Mitigation Monitoring and Reporting Program (MMRP).
- The Final SEIR was posted to the County website and provided directly to commenting agencies on October 9, 2026, and is available online at: https://opportunity.lacounty.gov/general-hospital/.
- A public meeting which included recommendations with respect to the proposed Project and SEIR was held before County of Los Angeles Board of Supervisors, the governing body of the County, on October 20, 2026.

ADDITIONAL PUBLIC OUTREACH

In addition to the public outreach process described above that was carried forth pursuant to the State CEQA Guidelines, the County and Centennial Partners team conducted outreach throughout development of the Master Plan. The community engagement was structured through a range of engagement types. This information is described in the Master Plan and included the following:

- 24 pop-up outreach events
- 26 forum presentations
- 102 small group meetings
- 16 Community Advisory Committee meetings
- 3 community at-large meetings
- 35 town hall meetings

Community Engagement was conducted regularly throughout the Master Plan development process and has not been limited to key milestones, providing for engagement with different stakeholders. Community engagement was carried out by the County's development partner, Centennial Partners, in collaboration with a network of stakeholders, which included community-based organizations, healthcare workers, labor groups, educational partners, and

neighborhood leaders, as well as individuals who interact with the Project Site on a daily basis. Outreach was conducted in multiple languages to engage with different audiences throughout east Los Angeles. The Applicant also maintains an active on-site presence, that includes a working office on the Project Site, which allows for regular interaction with those who use the Project Site daily.

A Community Advisory Committee (CAC) was established to review and provide input into the development of the Master Plan and included representatives from a range of local stakeholder groups. The CAC provides a forum for reviewing Master Plan materials, sharing feedback, and helping shape how information is communicated. Additionally, a Health Innovation Community Partnership (HICP) was established and facilitated engagement of healthcare providers, institutions, and community-serving organizations connected to the Project Site.

Several events were also held on the Project Site, providing opportunities for the larger community to interact with the Project Site. This includes distribution of salvaged bicycles from the General Hospital Building through two community giveaways, prioritizing families served by the Wellness Center and neighborhood youth. Multiple public tours of the General Hospital Building were also organized and co-led by staff from the Los Angeles Conservancy.

The Applicant continues to collaborate with community partners including organizations such as The Wellness Center, Alma Family Services, and Eastside LEADS Coalition. The Applicant proposes continued communication, public updates, and future workshops to ensure that community voices remain integrated as the Project Site evolves overtime. Additionally, coordination across County departments will also ensure that future development will support existing Project Site users.

RECORD OF PROCEEDINGS

For purposes of CEQA and these Findings, the Record of Proceedings for the Proposed Project includes, but is not limited to, the following documents and other evidence:

- The NOP, NOA, and all other public notices issued by the County in conjunction with the Proposed Project
- The 2014 Los Angeles County + University of Southern California (LAC+USC) Medical Center Campus Master Plan EIR and related documents, including previously approved addenda to that EIR
- The Los Angeles County General Hospital Campus Master Plan
- The Draft SEIR and Final SEIR for the Proposed Project
- All written comments submitted by agencies or members of the public during the public review comment period on the Draft SEIR
- All responses to written comments submitted by agencies or members of the public during the public review comment period on the Draft SEIR

- All written and verbal public testimony presented during a noticed public hearing for the Proposed Project
- The Mitigation Monitoring and Reporting Program
- The reports and technical memoranda included or referenced in the Draft SEIR and Final SEIR
- All documents, studies, EIRs, or other materials incorporated by reference in the Draft SEIR and Final SEIR
- The Resolutions adopted by the County of Los Angeles Board of Supervisors in connection with the Proposed Project, and all documents incorporated by reference therein
- Matters of common knowledge to the County, including but not limited to federal, state, and local laws and regulations
- Any documents expressly cited in these Findings
- Any other relevant materials required to be in the record of proceedings by Public Resources Code Section 21167.6(e)

CUSTODIAN AND LOCATION OF RECORDS

The documents and other materials that constitute the administrative record for the County's actions related to the Proposed Project are at the Los Angeles County DEO's main office (510 S. Vermont Avenue, 11th Floor, Los Angeles, CA 90020). The DEO's Program Manager is the custodian of the administrative record for the Proposed Project. Copies of these documents, which constitute the record of proceedings, are available upon request at the offices of the DEO. This information is provided in compliance with Public Resources Code Section 21081.6(a)(2) and State CEQA Guidelines Section 15091(e).

PROJECT LOCATION

The Project Site encompasses approximately 81.9 acres[2] that make up the Los Angeles County General Hospital Campus (also referred to as the Campus). The Project Site consists of a main campus and four additional areas separated from the main campus by local roadways, which are referred to as the "non-contiguous areas" in the Draft SEIR. The approximately 71-acre main campus is located at 1200 State Street, on parcels of land owned by the County within the City of Los Angeles. The four non-contiguous areas of the campus are referred to as the College of Nursing and Allied Health, located directly across Mission Road; Restorative Care Village (RCV),

[2] The Project Site boundaries considered in the SEIR are the same as those described in the 2014 Master Plan EIR. The 2014 Master Plan EIR referenced varying acreage values in different chapters of the 2014 Master Plan EIR (e.g., approximately 76 acres in the Project Description Chapter [2014 Master Plan EIR page 2-1] and approximately 86 acres in the Population/Housing Chapter [2014 Master Plan EIR page 3.11-7]). For clarity and consistency, the SEIR defines the Project site as approximately 81.9 acres, inclusive of the main campus and associated non-contiguous parcels evaluated in the 2014 Master Plan EIR.

located at the northeast corner of Mission Road and Zonal Avenue; Big Blue, located at the southeast corner of Mission Road and Zonal Avenue; and Parking Structure 9, off the main campus located on the opposite side of Marengo Street. The main campus is generally bounded by Zonal Avenue, Mission Road, Marengo Street, and Chicago Street. State Street bisects the main campus. The Campus is surrounded by the Boyle Heights and Lincoln Heights neighborhoods of the City of Los Angeles, in the County of Los Angeles. The Project Site boundaries evaluated in the Draft SEIR is the same project site boundaries as in the 2014 Master Plan EIR. The Project Site is not on a hazardous waste site that is included on any list compiled pursuant to Section 65962.5 of the Government Code.

A number of buildings and features associated with the medical uses of the Campus currently occur within the Project Site. The Campus is surrounded by a mix of institutional, medical, commercial, residential, and industrial uses. The Project Site is located immediately northeast of Interstate (I) 5 (Golden State Freeway) and north of I-10 (San Bernardino Freeway). See Figure 2-2, *Project Site Boundaries,* and Figure 2-3, *Local Vicinity,* of the Draft SEIR.

PROJECT OBJECTIVES

HEALTHCARE, PUBLIC HEALTH, AND WHOLE-PERSON WELLNESS

1. To meet the current and future healthcare needs of the Los Angeles region by supporting the continued provision of essential medical services and enabling evolving models of care.
2. To redevelop the campus in a manner that advances whole-person health, including reducing housing insecurity, improving access to healthcare services, expanding access to open space, advancing transportation equity, and supporting social and economic wellbeing.

HOUSING AND ECONOMIC OPPORTUNITY

3. To preserve and adaptively reuse the historic General Hospital, maintaining architectural, cultural, and civic significance while enabling functional modernization and long-term economic viability.
4. To maximize the provision of new housing, including affordable, supportive, workforce, and other needed housing types, to address housing needs of the County and the greater Los Angeles region.
5. To promote economic and workforce development that benefits surrounding communities, including opportunities for job creation, workforce training, and local-serving commercial and institutional uses.
6. To provide community-serving, institutional, educational, commercial, community facilities, and public-facing uses that support daily needs, encourage shared use of the campus, and reinforce the campus's role as an accessible and welcoming civic place.

CIRCULATION, ACCESS, AND OPEN SPACE

7. To develop multimodal circulation that enhances connectivity within the Campus, specifically between east and west Campus, and improves access to adjacent neighborhoods, institutions, and regional transportation systems.
8. To create a cohesive, campus-wide landscape and open space framework that provides abundant, accessible public and semi-public spaces to support community activity, wellness, and social interaction.

INFRASTRUCTURE, SUSTAINABILITY, AND RESILIENCE

9. To replace and modernize aging utilities and infrastructure to support long-term campus operations.
10. To promote environmental sustainability through compact development, adaptive reuse, efficient infrastructure systems, and reduced reliance on single-occupancy vehicle travel.
11. To develop resilient infrastructure designed to withstand and recover from natural hazards while providing reliable, sustainable systems that support both project operations and serve as a community resource during emergencies.

PROJECT DESCRIPTION

The Proposed Project involves implementation of the proposed Master Plan, which would guide the long-term redevelopment of parts of the Project Site, including adaptive reuse of the General Hospital Building. The proposed Master Plan presents a conceptual, planning-level vision of the types of uses, scale, and locations of potential future development activities that could occur within a 30.8-acre portion of the approximately 81.9-acre Project Site, referred to as the “Master Plan Boundary” in the proposed Master Plan (see Section 1, Introduction, of the proposed Master Plan). The Master Plan Boundary covers that portion of Project Site that is the subject of the public-private partnership between the DEO on behalf of the County and the developer to reimagine the Campus through implementation of the Master Plan. Detailed site development plans, building configurations, and architectural designs would be prepared as future project-level approvals are proposed and would be consistent with the guiding vision of the proposed Master Plan.

The approximately 51.1 acres of the Project Site that are not subject to the proposed Master Plan would continue to be governed by the previously approved 2014 Master Plan and its associated development parameters. Certain previously approved land uses that were identified in the 2014 Master Plan that have not yet been implemented to date have been carried forth into this Draft SEIR. These uses include Community Facilities, Clean Tech/Light Industrial, Medical Office, General Office, and Hospital[3]. Because development within the areas of the

[3] The 2014 Master Plan EIR used different land use nomenclature for the proposed uses under the 2014 Master Plan. The land use titles under the 2014 Master Plan included: Wellness-Oriented Community Facilities, New

Project Site outside of the Master Plan Boundary would continue to occur pursuant to the 2014 Master Plan, this Draft SEIR evaluates potential environmental impacts associated with a conservative, maximum development scenario across the entire Project Site to ensure that a full range of potential redevelopment on the Project Site is considered.

Table 1, *Proposed Project Land Uses*, summarizes the maximum anticipated development proposed on the Project Site by land use type. The numbers in Table 1 represent the maximum amount of development that could take place on the Project Site and are used as the basis for the environmental assessment in the Final SEIR.

Table 1 Proposed Project Land Uses

Proposed Land Use	Units	Square Footage
Residential	3,200 du	2,300,000
General Office	--	400,000
Medical Office	--	735,300
Retail	--	320,000
Patient and Caregiver Lodging	200 rooms	80,000
Community Facilities	--	350,000
Education	--	110,000
Warehouse	--	160,000
Clean Tech/ Light Industrial	--	200,000
Hospital	450 beds	400,000
Parking	8,588 spaces	3,005,678
Total	**3,200 du 450 hospital beds 200 rooms 8,588 parking spaces**	**8,060,978 square feet of new development**

To support the development of the proposed new uses, the Proposed Project includes other improvements related to infrastructure, including utilities, circulation and transportation demand management strategies, parking, and open space and landscaping. In addition to onsite improvements to infrastructure, some work may occur offsite within the City of Los Angeles, such as utility connections/replacements, public right-of-way improvements, and other related

Utility Plant and Facilities, Outpatient Clinics/Laboratories/Medical Office, Professional/Administrative Office, Research and Development, Hospital Addition, Warehouse/Storage, and Residential Care Facilities. Land uses that would be carried over under the Proposed Project include: Wellness-Oriented Community Facilities (Community Facilities), New Utility Plant and Facilities (Clean Tech/Light Industrial), Outpatient Clinics/Laboratories/Medical Offices (Medical Office), Professional/Administrative Offices (General Office), Hospital, and Research and Development (Clean Tech/Light Industrial).

activities. Any future offsite improvements would be coordinated directly with and overseen by the appropriate agencies (i.e., Los Angeles Department of Water and Power, Los Angeles Sanitation Districts, City of Los Angeles Department of Transportation, City of Los Angeles Department of Public Works, Caltrans, etc.).

Detailed site development plans, building configurations, and architectural designs would be prepared at the time of future project-level approvals and would be consistent with the guiding vision of the proposed Master Plan. The Proposed Project would be developed over an estimated period of 25 years and would be implemented in phases; the actual number of units and quantities of land use types would be determined as individual project elements are implemented and could be less than the maximum envelope analyzed in the Draft SEIR. In addition, the precise distribution of land uses, square footage, and associated population among individual land use categories may vary over time in response to operational needs, provided that the overall development intensity analyzed in the Draft SEIR would not be exceeded.

Approximately 51.1 acres of the Project Site not subject to the proposed Master Plan would continue to be governed by the previously approved 2014 Master Plan and its associated development parameters. However, because development within the remainder of the Project Site would continue to occur pursuant to the 2014 Master Plan, the Draft SEIR evaluates potential environmental impacts associated with development across the entire Project Site to ensure that a full range of potential redevelopment on the Project Site is considered. See Chapter 2, *Project Description*, of the Draft EIR for the full project description.

III. ORGANIZATION AND FORMAT OF FINDINGS

The findings are divided into the following subsections:

Section IV(A); Findings on Impacts Determined to Result in No Impact or Less Than Significant Impact, presents the impacts of the Proposed Project that were determined in the Final SEIR to be less than significant without the addition of mitigation measures and presents the rationales for these determinations.

Section IV(B): Findings on Impacts Mitigated to Less Than Significant, presents significant impacts of the Proposed Project that were identified in the Final SEIR, the mitigation measures identified in the MMRP, and the rationales for the findings.

Section IV(C): Findings on Significant Unavoidable Impacts, presents significant impacts of the Proposed Project that were identified in the Final SEIR.

Section V: Alternatives to the Proposed Project, presents alternatives to the Proposed Project and evaluates them in relation to the findings set forth in State CEQA Guidelines Section 15091(a)(3), which allows a public agency to approve a project that would result in one or more

significant environmental effects if the project alternatives are found to be infeasible because of specific economic, social, or other considerations.

IV. CALIFORNIA ENVIRONMENTAL QUALITY ACT FINDINGS

Section 15091 of the State CEQA Guidelines requires that a lead agency make a finding for each significant effect resulting from implementation of the project. This section summarizes the significant environmental impacts of the Proposed Project, describes how these impacts are to be mitigated, and discusses various alternatives to the Proposed Project, which were developed in an effort to reduce the remaining significant environmental impacts.

Based on the Final SEIR discussion and analysis, the following is a summary of the environmental topics considered to have no impact, a less than significant impact, and a significant and unavoidable impact.

A. FINDINGS ON IMPACTS DETERMINED TO RESULT IN NO IMPACT OR LESS THAN SIGNIFICANT IMPACT

No Impact or Less Than Significant Impact

The County finds, based on substantial evidence in the record, that the Proposed Project will not result in significant impacts requiring mitigation with respect to the following issues. The analysis in the Draft SEIR determined that these issues would result in no impact or less than significant impacts:

- **Chapter 5.1.1, Agriculture and Forestry Resources** (Significance Criteria a-e; Cumulative Impacts [construction and operation])
- **Chapter 3.1, Aesthetics** (Significance Criteria a, b, c, and d; Cumulative Impacts [construction and operation])
- **Chapter 3.2, Air Quality** (Significance Criterion a [construction and operation])
- **Chapter 3.3, Biological Resources** (Significance Criteria a [operation], b, c, and f [construction and operation])
- **Chapter 3.4, Cultural Resources** (Significance Criterion a, b [operation], c [construction and operation])
- **Chapter 3.5, Energy** (Significance Criteria a, and b; Cumulative Impacts [construction and operation])
- **Chapter 3.6, Geology and Soils** (Significance Criteria b and e [construction and operation], and f [operation])

- **Chapter 3.7, Greenhouse Gas Emissions** (Significance Criterion b [construction and operation])
- **Chapter 3.8, Hazards and Hazardous Materials** (Significance Criteria c, d [operation], e [construction and operation], f [operation], and g [construction and operation])
- **Chapter 3.9, Hydrology and Water Quality** (Significance Criterion c [construction], d [construction and operation], and e [construction])
- **Chapter 3.10, Land Use and Planning** (Significance Criterion a [construction and operation] and b [construction])
- **Chapter 5.1.2, Mineral Resources** (Significance Criteria a and b; Cumulative Impacts [construction and operation])
- **Chapter 3.11, Noise** (Significance Criterion b [operation] and c [construction and operation])
- **Chapter 3.12, Population and Housing** (Significance Criteria a and b; Cumulative Impacts [construction and operation])
- **Chapter 3.13, Public Services** (Significance Criteria a [operation])
- **Chapter 3.14, Recreation** (Significance Criterion a [construction and operation)
- **Chapter 3.15, Transportation** (Significance Criterion a [operation], b [construction and operation], and d [operation])
- **Chapter 3.16, Tribal Cultural Resources** (Significance Criterion a [operation]; Cumulative Impacts [operation])
- **Chapter 3.17, Utilities and Service Systems** (Significance Criteria a [construction and operation], b [construction], d, and e [construction and operation]; Cumulative Impacts [construction])
- **Chapter 3.18, Wildfire** (Significance Criteria a, b, c, and d; Cumulative Impacts [construction and operation])

B. FINDINGS ON IMPACTS MITIGATED TO LESS THAN SIGNIFICANT

The County finds, based on substantial evidence in the record, that the Proposed Project will have impacts mitigated to less than significant with the corresponding feasible mitigation measures provided in the Draft SEIR, with respect to the following issues:

CHAPTER 3.2, AIR QUALITY

Environmental Impact:

The Proposed Project would have a potentially significant impact related to air quality as follows:

- **Impact AIR-1:** Implementation of the Proposed Project would generate construction emissions that have the potential to exceed the South Coast AQMD regional significance thresholds.
- **Impact AIR-3:** Implementation of the Proposed Project would generate onsite construction criteria air pollutant emissions that have the potential to exceed the South Coast AQMD localized significance thresholds.
- **Impact AIR-6:** Operation of light industrial uses accommodated under the Proposed Project could generate odors that would affect a substantial number of people.
- **Impact AIR-7:** The Proposed Project's construction activities have the potential to result in cumulative air quality impacts related to criteria pollutant emissions during construction.
- **Impact AIR-9:** The Proposed Project's operation-related activities have the potential to result in cumulative air quality impacts related to odors.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR.

Impact AIR-1

Mitigation Measure AIR-1a: To reduce volatile organic compounds (VOC) emissions during construction, the Project Applicant(s)/Contractor(s) shall use paints with a VOC content that meets the South Coast Air Quality Management District Super Compliant architectural coatings standard of less than 10 grams per liter (g/L) for coating building architectural surfaces during construction. This measure shall be noted on all site and construction plans.

Mitigation Measure AIR-1b: To reduce nitrogen oxide (NO_X) emissions during construction, the Project Applicant(s)/Contractor(s) shall implement the following measures during construction:

- Use construction equipment rated by the United States Environmental Protection Agency (USEPA) as having Tier 4 Final or higher exhaust emission limits for offroad equipment with engines 25 horsepower or higher. If Tier 4 Final equipment is not readily available, the contractor may apply other technologies available for construction equipment such that it would achieve a comparable reduction in NO_X and PM emissions comparable to that of Tier 4 construction equipment. Where alternatives to USEPA Tier 4 are utilized, the contractor shall be required to show evidence to the Project Applicant(s) that these alternative technologies would achieve comparable emissions

reductions. Certifications or alternative reduction strategies shall be required prior to receiving a construction permit.

- Maintain a list of all operating equipment in use on the construction site during construction for verification by the County. The construction equipment list shall state the makes, models, Equipment Identification Numbers, Engine Family Numbers, and number of construction equipment on-site.
- Haul and delivery truck idling times shall be minimized by shutting equipment off when not in use or reducing maximum idling time to less than three (3) minutes (beyond that required by 13 California Code of Resources [CCR] Chapter 10, Section 2485). Clear signage shall be provided for construction workers and construction vehicles at all access points.
- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper conditions prior to operation.
- A traffic control plan shall be prepared and provided to the County.
- A carpool program for construction workers, including incentivizing carpooling as well providing bus service for crew members shall be implemented.
- Truck deliveries shall be consolidated when possible.
- The combined vehicle miles traveled per day for offsite haul truck trips associated with demolition debris and earthen material export/import hauling operations shall not exceed 8,930 miles per day (equivalent to 180 one-way truck haul trips at 49.61 miles per one-way trip, which is the average distance to nearby serving landfills). The construction contractor(s) overseeing hauling operations shall log the number of daily haul truck loads and the one-way haul trip distance for each truck haul load of either demolition debris or earthen material for days in which truck hauling of these materials occurs.
- The measures under this mitigation measure shall be noted on all site and construction plans.

Impact AIR-3 **Mitigation:** Implement Mitigation Measure AIR-1b and Mitigation Measure AIR-2.

Impact AIR-6 **Mitigation Measure AIR-6:** Prior to discretionary approval by the County of Los Angeles, if it is determined that a development project has the

potential to emit nuisance odors, an odor management plan shall be prepared by the Project Applicant(s)/Contractor(s) and submitted to the Los Angeles County Department of Regional Planning for review and approval. Facilities that have the potential to generate nuisance odors include, but are not limited to:

- Wastewater treatment plants
- Composting, green waste, or recycling facilities
- Fiberglass manufacturing facilities
- Painting/coating operations Implement Mitigation Measure AIR-6.
- Large-capacity coffee roasters
- Food-processing facilities

The odor management plan shall demonstrate compliance with the South Coast Air Quality Management District's Rule 402 for nuisance odors and be submitted to the County. The Odor Management Plan shall identify the best available control technologies for toxics (T-BACTs) that will be utilized to reduce potential odors to acceptable levels, including appropriate enforcement mechanisms. T-BACTs may include but are not limited to scrubbers (i.e., air pollution control devices) at the industrial facility. T-BACTs identified in the odor management plan shall be incorporated into the project's design and on-site plan(s).

Impact AIR-7 **Mitigation:** Implement Mitigation Measures AIR-1a and 1b.

Impact AIR-9 **Mitigation:** Implement Mitigation Measure AIR-6.

CHAPTER 3.3, BIOLOGICAL RESOURCES

Environmental Impact:

The Proposed Project would have a potentially significant impact related to biological resources as follows:

- **Impact BIO-1:** During the construction phase, the Proposed Project could impact roosting special-status bats, including the pallid bat, western yellow bat, and western mastiff bat.
- **Impact BIO-2:** Construction of the Proposed Project would potentially have an adverse effect on migratory birds.
- **Impact BIO-3:** During the construction and operation phases, the Proposed Project could impact protected live oak trees on the Project Site.

- **Impact BIO-4:** During the operational phase, the Proposed Project could impact protected live oak trees on the Project Site.
- **Impact BIO-5:** During the construction phase, the Proposed Project could result in a cumulative impact on roosting special-status bats, including the pallid bat, western yellow bat, and western mastiff bat.
- **Impact BIO-6:** During the construction phase, the Proposed Project could result in a cumulative impact on migratory birds.
- **Impact BIO-7:** During the construction phase, the Proposed Project could result in a cumulative impact on protected live oak trees on the Project Site.
- **Impact BIO-8:** During the operational phase, the Proposed Project could result in a cumulative impact on protected live oak trees on the Project Site.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR.

Impact BIO-1

Mitigation Measure BIO-1: Mitigation for Impacts to Special-Status Bats. To avoid impacts on roosting bats, preconstruction surveys shall be conducted by a qualified bat biologist prior to the on-set of construction within the vicinity of vacant buildings and prior to tree removal. During surveys, biologists shall avoid unnecessary disturbance of potentially occupied roosts. Full-spectrum acoustic detectors shall be used during emergence surveys to assist in species identification. If it is determined that trees or structures in the project area are being used by bats as roost sites, the following protective measures shall be implemented:

- Disturbance of maternity roosting structures or trees (e.g., structure removal, construction equipment operation near roosts, tree trimming or removal) shall not occur during the maternity period (April 15 to September 15) to avoid impacts on reproductively active females and active maternity roosts (whether colonial or solitary). The maternity roost shall remain undisturbed from the time it is located until the following September 15 or until a qualified biologist has determined the roost is no longer active. No construction work shall occur at the roost or within a 100-foot buffer zone (or an alternative buffer zone, as determined by the biologist) until September 15.
- Exclusion devices may be installed outside of the maternity period (September 16 to April 14) to preclude bats from occupying buildings during, or prior to the on-set of construction. Exclusionary devices shall be installed only by or under the supervision of an experienced

bat biologist. Eviction of bats roosting in trees outside the maternity season shall be done in favorable weather under the supervision of a qualified bat biologist and adhering to the following two-step removal process:

- On Day 1, for trees with cavities, crevices, and exfoliating bark, and that are found to support roosting bats, Step 1 would be removal of branches and limbs with no cavities. These limbs shall be removed by hand (e.g., using chainsaws). This will create a disturbance (noise and vibration) and physically alter the tree. Bats roosting in the tree that may not have been detected during the preconstruction survey, will either abandon the roost immediately (rarely) or, after emergence, will avoid returning to the roost. For foliage roosting bats, Step 1 would be to remove adjacent, smaller, or non-habitat trees to create noise and vibration disturbance that would cause abandonment. On Day 2, under the supervision of a qualified biological monitor familiar with the life history of subject bat species, the tree may be removed.
- Qualified biologists should search all downed roost trees for dead and injured bats. The presence of dead or injured bats that are species of special concern shall be reported to the California Department of Fish and Wildlife (CDFW).

- Non-maternity roost trees should ideally be removed or trimmed in the fall between September 16 and October 31. If the removal or trimming of non-maternity roost trees cannot be timed to occur within this period, tree trimming and removal of non-maternity roost trees shall be timed to avoid periods of inclement or unseasonably cold weather to avoid impacts on bats in torpor (a period of seasonal inactivity). In all circumstances, qualified biologists shall monitor non-maternity tree removal.

Impact BIO-2

Mitigation Measure BIO-2: Mitigation for Impacts to Nesting Birds. Construction activities shall avoid the nesting season for birds to the extent feasible, or conduct preconstruction nesting bird surveys if construction activities are carried out during the nesting season. To ensure compliance with the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC), the Project Applicant(s), or through the general contractor(s), shall conduct all vegetation removal during the non-breeding season, between September 1 and January 31, or implement the following:

If the removal of vegetation, demolition of buildings, or noise-generating construction activities are scheduled between February 1 and August 31, the County or Project Applicant/Contractor shall retain a qualified biologist (i.e., experienced with conducting nesting bird surveys) who shall conduct a focused nesting bird survey prior to the start of vegetation removal, building demolition, or noise-generating construction activities within any potential nesting habitat (all vegetation, buildings, eaves on buildings, etc.). The size of the nesting bird survey area shall be determined by a qualified biologist at the time of the survey and include the entire limits of disturbance. It may also include a buffer area if deemed necessary by the qualified biologist. The preconstruction nesting bird surveys shall be conducted no more than seven days prior to initiation of vegetation removal, building demolition activities, or noise-generating construction activities. If no active nests are detected during these surveys, no restrictions on Project activities are necessary.

If active nests are found, a qualified biologist shall identify and flag an appropriate buffer around the nest, and no construction activities shall occur within the buffer until the qualified biologist has determined that young have fledged or the nest is no longer active. The specific buffer width shall be determined by a qualified biologist at the time of discovery and vary according to the bird species, site conditions, and the type of work activities to be conducted.

The survey results shall be submitted to the County for review and approval of the recommended nest buffer areas, if any, prior to commencement of any vegetation removal, building demolition, or noise-generating construction activities on the Project Site.

Impact BIO-3

Mitigation Measure BIO-3: Mitigation for Impacts to Protected Trees. Prior to removal, relocation, or maintenance of protected oak trees, a qualified arborist shall inventory and evaluate the health of protected oak trees on the Project Site and evaluate the potential for impacts. If the arborist determines that the proposed activity would cut, destroy, remove, relocate, inflict damage, or encroach into a protection zone of a protected oak tree, the Project Applicant/Contractor shall submit an application for approval to the Los Angeles County Department of Regional Planning and obtain approval prior to impacting a protected oak tree. The Project Applicant(s)/Contractor(s) shall be required to implement the conditions of the approval, including planting and care of replacement trees and protections for non-impacted oak trees. When planting replacement trees is required, replacement trees shall be in the ratio of two trees planted for each tree impacted. Replacement trees shall

be indigenous oak species and shall be at least 15-gallon size and measure at least one inch in diameter one foot above the base. Replacement trees shall be properly cared for and maintained for two years and replaced if they die within that period.

Impact BIO-4 **Mitigation:** Implement Mitigation Measure BIO-3.

Impact BIO-5 **Mitigation:** Implement Mitigation Measure BIO-1.

Impact BIO-6 **Mitigation:** Implement Mitigation Measure BIO-2.

Impact BIO-7 **Mitigation:** Implement Mitigation Measure BIO-3.

Impact BIO-8 **Mitigation:** Implement Mitigation Implement Mitigation Measure BIO-3.

CHAPTER 3.4, CULTURAL RESOURCES

Environmental Impact:

The Proposed Project would have a potentially significant impact related to cultural resources as follows:

- **Impact CUL-2:** The Proposed Project's construction activities throughout the Project Site have the potential to result in substantial adverse changes in the significance of archaeological resources.
- **Impact CUL-4:** The Proposed Project's construction activities have the potential to result in cumulative impacts on archaeological resources.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR.

Impact CUL-2 **Mitigation Measure CUL-2:** Prior to any demolition, grading, or excavation related to the construction of facilities or improvements under the Proposed Project, a qualified archaeologist shall be retained by the Project Applicant(s)/Contractor(s) to determine which areas shall require cultural resources monitoring during initial ground disturbance. The location of construction activities that are likely to encounter subsurface sediments with archaeological sensitivity shall be determined by the qualified archaeologist upon review of project excavation and grading plans.

If determined necessary by the qualified archaeologist, monitoring by a qualified archaeologist shall be conducted during all initial ground disturbing activities (e.g. grading, removal of foundations, utility trenching, installation of shoring/piles, etc.) within the Project Site, from ground surface level to bedrock.

If, during cultural resources monitoring, the archaeologist determines that the sediments being excavated have been previously disturbed and are unlikely to contain significant cultural materials, the archaeologist shall request that monitoring be reduced or eliminated. Spot-check monitoring shall occur during all construction, on a schedule determined by the project archaeologist.

If buried cultural resources such as trash deposits, building foundations, privy pits, flaked or ground stone, or human remains are inadvertently discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find and the area shall be secured to prevent disturbance. The County will be notified immediately. A qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to evaluate the significance of the find and recommend appropriate treatment measures.

If the discovered materials are determined to be significant cultural resources, the archaeologist shall develop and implement an appropriate treatment plan, which may include avoidance, preservation in place, capping with fill material, or data recovery through excavation and documentation. The Treatment Plan shall be provided to the County. Work in the vicinity of the discovery, as determined by the qualified archaeologist, shall not resume until the archaeologist has determined that appropriate measures have been implemented. Treatment measures for items that are not associated with human remains typically include development of avoidance strategies, capping with fill material, or mitigation of impacts through data recovery programs such as excavation or detailed documentation.

If human remains are encountered, work shall halt in accordance with California Health and Safety Code Section 7050.5 and the County of Los Angeles Medical Examiner (Medical Examiner) shall be notified immediately. If the Medical Examiner determines that the remains are Native American, the Medical Examiner shall notify the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall designate a Most Likely Descendant (MLD). The MLD shall be provided the opportunity to make recommendations regarding the treatment and

disposition of the remains in accordance with Public Resources Code Section 5097.98.

Impact CUL-4 **Mitigation:** Implement Mitigation Measure CUL-2.

CHAPTER 3.6, GEOLOGY AND SOILS

Environmental Impact:

The Proposed Project would have a potentially significant impact related to geology and soils as follows:

- **Impact GEO-1:** The Proposed Project could expose people or structures to potentially significant adverse effects related to surface fault rupture, strong seismic ground shaking, liquefaction, and slope stability during construction and operation.
- **Impact GEO-2:** During construction and operation, the Proposed Project could be located on unstable soils, and wet or saturated soils within excavations may cause instability.
- **Impact GEO-3:** During construction and operation, the Proposed Project could be located on expansive or corrosive soils that may create substantial risks to life or property.
- **Impact GEO-4:** Construction could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.
- **Impact GEO-5:** During construction and operation, the Proposed Project, together with past, present, and reasonably foreseeable project, would be located development within a seismically active region.
- **Impact GEO-6:** During construction and operation, the Proposed Project, together with past, present, and reasonably foreseeable projects, could be located on unstable soils.
- **Impact GEO-7:** During construction and operation, the Proposed Project, together with past, present, and reasonably foreseeable projects, could be located on expansive and corrosive soils.
- **Impact GEO-8:** During construction, the Proposed Project, together with past, present, and reasonably foreseeable projects, could destroy a unique paleontological resource or unique geologic feature.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR.

Impact GEO-1 **Mitigation Measure GEO-1:** Prior to any structural improvements to buildings or prior to any excavation related to the construction of new facilities, detailed subsurface geotechnical evaluations shall be performed

to address site-specific conditions at the locations of the planned improvements and provide detailed recommendations for design and construction. The Project Applicant(s) or its designee shall ensure that all recommendations contained in the approved geotechnical reports are incorporated into final design plans and implemented during construction. All recommendations shall be implemented.

The geotechnical evaluation(s) shall include the following measures, at a minimum, to address potential seismic ground shaking, liquefaction, and slope stability hazards. These components establish required baseline evaluation criteria. However, the licensed geotechnical engineer(s) shall identify and incorporate any additional site-specific design and construction recommendations necessary based on the results of subsurface investigations conducted for each development phase. All recommendations shall be provided to the County, be incorporated into final engineering plans, and implemented during construction. Recommendations could include but are not limited to:

- **Seismicity:** Structural elements of future improvements shall be designed to resist or accommodate appropriate site-specific ground motions and conform to the current seismic design standards.
- **Liquefaction:** An assessment of the liquefaction potential shall be made prior to detailed design and construction of project improvements. Structural design and preventative techniques, such as in situ ground modification or supporting foundations with piles at depths designed specifically for liquefaction, shall be included.

  To evaluate the potential for liquefaction, subsurface evaluation may be performed. Site-specific geotechnical evaluations that assess the liquefaction and dynamic settlement characteristics of the on-site soils shall include the drilling of exploratory borings, evaluation of groundwater depths, and laboratory testing of soils.

  Methods for construction in areas with a potential liquefaction hazard may include in situ ground modification, removal of liquefiable layers and replacement with compacted fill, or support of project improvements on piles at depths designed specifically for liquefaction. Pile foundations can be designed for a liquefaction hazard by supporting the piles on dense soil or bedrock below the liquefiable zone or employing other appropriate methods, as evaluated during the Project Site-specific evaluation. Additional recommendations to address liquefaction may include densification by installation of stone columns, vibration, deep dynamic compaction, and/or compaction grouting.

- **Slope Stability:** An assessment of slope stability shall be made prior to detailed design and construction of project improvements and design techniques, such retaining walls and drainage improvements, shall be implemented as needed. Slopes created or modified as part of the Proposed Project shall be engineered to reduce the potential for slope instability.

The geotechnical evaluation(s) shall include the following measures to address and resolve site-specific unstable soil impacts:

- **Groundwater:** Excavations for foundations in areas with shallow perched groundwater may need to be cased/shored and/or dewatered to maintain stability of the excavations and provide access for construction. All recommendations included in the preliminary geotechnical evaluations pertaining to groundwater shall be followed.

  Excavations for underground structures shall be performed with care to reduce the potential for lateral deflection of excavation sidewalls and/or shoring, which may also cause differential movement of structures located near the excavation.

  Further study, including subsurface exploration, shall be performed during the detailed design phase of future improvements to evaluate the presence of groundwater, seepage, and/or perched groundwater at the Project Site and the potential impacts on design and construction of project improvements. An assessment of the potential for shallow groundwater shall be made during the design phase of each project, and design techniques shall be developed as necessary.

- **Collapsible Soils/Settlement:** An assessment of the potential for soils that are prone to settlement shall be made prior to detailed design and construction of project improvements, and design techniques shall be developed, as appropriate, to reduce impacts related to settlement to low levels.

  During the detailed design phase of the project, surface reconnaissance and site-specific geotechnical evaluations shall be performed to assess the settlement potential of the on-site natural soils and undocumented fill. This may include detailed surface reconnaissance to evaluate site conditions, drilling of exploratory borings or test pits, and laboratory testing of soils, where appropriate, to evaluate site conditions.

  Prescribed approaches to address potential soil settlement could include either removal of the compressible/collapsible soil layers and replacement with compacted fill, surcharging to induce settlement prior to construction of improvements, allowing for a settlement

period after or during construction with new fills, or a specialized foundation design, including the use of deep foundation systems to support structures. Varieties of in situ soil improvement techniques are also available, such as dynamic compaction (heavy tamping) or compaction grouting.

The geotechnical evaluation(s) shall include the following measures to address and resolve site-specific expansive and corrosive soils hazards:

- **Expansive Soils:** Mitigation techniques to reduce expansive soil potential shall be included as necessary. Techniques shall include overexcavation and replacement with non-expansive soil, soil treatment, moisture management, and/or a specific structural design for expansive soil conditions developed during the design phase.
- **Corrosive Soils:** An assessment of the potential for corrosive soils shall be made during the detailed design phase of the project through soil testing procedures. Engineering methods shall be developed, as appropriate, to reduce impacts related to corrosive soils to low levels. Subsurface evaluation, including laboratory testing, shall be performed. Evaluation of the corrosive soil potential shall be accomplished through testing and analysis of soils at foundation design depths. The laboratory tests conducted on the soils prior to construction and improvement plan preparation shall include corrosivity tests. Review of these data by a corrosion engineer, if determined necessary in the geotechnical evaluation, shall result in corrosion protection measures that address site-specific conditions. Evaluation of the potential corrosive soils hazard shall be performed prior to detailed design and construction so that, in the event the hazard exists, engineering methods may be implemented. To avoid site-specific subsurface evaluation, corrosion protection measures may be included in the initial design for the proposed project improvements.

  Depending on site-specific conditions presented geotechnical evaluation, recommendations for corrosive soil conditions may involve the use of concrete that is resistant to sulfate exposure. Corrosion protection for metals may be needed for underground foundations or structures in areas where corrosive groundwater or soil could cause deterioration. Typical design techniques include epoxy and metallic protective coatings, the use of alternative (corrosion-resistant) materials, and selection of the appropriate type of cement and water/cement ratio.

Impact GEO-2 **Mitigation:** Implement Mitigation Measure GEO-1.

Impact GEO-3 **Mitigation:** Implement Mitigation Measure GEO-1**.**

Impact GEO-4 **Mitigation Measure GEO-4: Paleontological Resources.** Prior to any excavation related to the construction of facilities or improvements proposed under the master plan, a qualified vertebrate paleontologist with a graduate degree in paleontology, geology, or a closely related earth science discipline, and more than 10 years of experience shall be retained by the Project Applicant(s)/Contractor(s) or construction contractor. Final excavation depths, locations, and construction methods shall be determined during subsequent project-level design. Accordingly, the qualified paleontologist shall review project-specific excavation and grading plans prior to construction and identify areas where monitoring is required based on the depth and extent of excavation into paleontologically sensitive geologic units (e.g., older alluvium or Puente Formation). Monitoring shall be implemented by the qualified paleontologist during ground disturbance in those identified areas.

Very shallow surficial excavations (i.e., less than 5 feet in depth) within areas of previous disturbance or areas of Quaternary younger alluvial deposits shall be monitored by the qualified paleontologist to ensure that underlying sensitive units (i.e., Quaternary older alluvium) are not adversely affected. Areas consisting of artificial fill materials shall not require monitoring.

If future excavations take place in Quaternary older alluvial deposits or within Fernando or Puente Formation bedrock, such excavations shall be monitored on a full-time basis by a qualified paleontological monitor and under the supervision of the qualified paleontologist. The paleontological resource monitoring shall include inspection of exposed rock units during active excavations within the geologically sensitive sediments. Monitoring may be reduced if some of the potentially fossiliferous units described herein are, upon exposure and examination by qualified paleontological personnel, determined to have a low potential for containing fossil resources.

The paleontological monitor shall be equipped to salvage fossils as they are unearthed to avoid construction delays and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontological monitor shall have authority to temporarily divert grading away from exposed fossils to recover the fossil specimens professionally and efficiently and collect associated data. All efforts to avoid delays in project schedules shall be made.

To prevent construction delays, paleontological monitors shall be equipped with the necessary tools for the rapid removal of fossils and retrieval of associated data. This equipment shall include handheld global positioning system receivers, digital cameras, and cell phones as well as a tool kit with specimen containers, matrix sampling bags, field labels, field tools (awls, hammers, chisels, shovels, etc.), and plaster kits.

At each fossil locality, field data forms shall be used to record pertinent geologic data, stratigraphic sections shall be measured, and appropriate sediment samples shall be collected and submitted for analysis. Fossils collected, if any, shall be transported to a paleontological laboratory for processing where they shall be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility that meets federal and State curation standards and is approved in writing by the County of Los Angeles.

Following analysis, a Report of Findings with an appended itemized inventory of specimens shall be prepared by the qualified paleontologist within a reasonable timeframe from the completion of recovery. The report and inventory, when submitted to the County along with confirmation of the curation of recovered specimens into an established, accredited museum repository, shall signify completion of the program to mitigate impacts on paleontological resources.

Impact GEO-5 **Mitigation:** Implement Mitigation Measure GEO-1.

Impact GEO-6 **Mitigation:** Implement Mitigation Measure GEO-1.

Impact GEO-7 **Mitigation:** Implement Mitigation Measure GEO-1.

Impact GEO-8 **Mitigation:** Implement Mitigation Measure GEO-4.

CHAPTER 3.8, HAZARDS AND HAZARDOUS MATERIALS

Environmental Impact:

The Proposed Project would have a potentially significant impact related to hazards and hazardous materials as follows:

- **Impact HAZ-1:** Construction of the Proposed Project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials during demolition, construction, and long-term operation.
- **Impact HAZ-2:** Operation of the Proposed Project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials during demolition, construction, and long-term operation.

- **Impact HAZ-3:** During construction, the Proposed Project could result in reasonably foreseeable upset and accidental release of hazardous materials through hazardous materials handling, building demolition, and disturbance of contaminated soils and subsurface conditions.
- **Impact HAZ-4:** During operation, the Proposed Project could involve the continued use, storage, and handling of hazardous materials and could create a significant hazard to the public or environment through reasonably foreseeable upset and accidental release conditions during operation absent mitigation.
- **Impact HAZ-5:** The Proposed Project would have the potential to result in significant impacts during construction related to hazardous emissions and handling of hazardous materials within one-quarter mile of existing schools.
- **Impact HAZ-6:** Construction activities for the Proposed Project would be located on a site included on hazardous materials regulatory lists and could create a significant hazard to the public or environment during demolition, grading, and excavation absent mitigation.
- **Impact HAZ-7:** Construction activities for the Proposed Project could temporarily impair and/or interfere with emergency response access.
- **Impact HAZ-8:** Construction and operation of the Proposed Project, together with other past, present, and reasonably foreseeable projects in the region, could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials during demolition and construction.
- **Impact HAZ-9:** Operation of the Proposed Project, together with other past, present, and reasonably foreseeable projects in the region, could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials during long-term operation.
- **Impact HAZ-10:** During construction, the Proposed Project, together with other past, present, and reasonably foreseeable development projects could result in reasonably foreseeable upset and accidental release of hazardous materials through hazardous materials handling, building demolition, and disturbance of contaminated soils and subsurface conditions.
- **Impact HAZ-11:** During operation, the Proposed Project, together with other past, present, and reasonably foreseeable projects, could involve the continued use, storage, and handling of hazardous materials and could create a significant hazard to the public or environment through reasonably foreseeable upset and accidental release conditions during operation absent mitigation.
- **Impact HAZ-12:** The Proposed Project would have the potential to result in significant cumulative impacts during construction related to hazardous emissions and handling of hazardous materials within one-quarter mile of existing schools.
- **Impact HAZ-13:** Construction activities for the Proposed Project, together with other past, present, and reasonably foreseeable projects, would be located on a site included on

hazardous materials regulatory lists and could create a significant hazard to the public or environment during demolition, grading, and excavation absent mitigation.

- **Impact HAZ-14:** Construction activities for the Proposed Project, together with other past, present, and reasonably foreseeable projects, could temporarily impair and/or interfere with emergency response access.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR.

Impact HAZ-1

Mitigation Measure HAZ-1a: In order to minimize exposure, prior to demolition activities, asbestos-containing materials and lead-based paint surveys and evaluations shall be conducted in buildings that are to be demolished or renovated. Hazardous building materials surveys have been conducted for many Project Site structures; however, because demolition would occur in phases and certain materials are concealed within wall assemblies, mechanical systems, and other building components that cannot be fully accessed until demolition preparation activities occur, final comprehensive pre-demolition surveys consistent with South Coast Air Quality Management District (AQMD) Rule 1403 shall be completed immediately prior to demolition of each structure. Abatement measures shall be implemented in accordance with the recommendations of these evaluations. Asbestos surveys shall be conducted in accordance with South Coast AQMD Rule 1403, which specifies that all surveys are to be carried out by a Cal/OSHA-certified asbestos consultant and will follow established survey protocols, notification, and work practice requirements. Lead-based paint surveys shall be carried out by a California Department of Public Health (CDPH)–certified inspector/assessor. If necessary, a lead abatement plan would be prepared by the CDPH-certified project monitor or supervisor and be implemented during demolition and renovation activities. Demolition activities would be performed by CDPH-certified workers.

Mitigation Measure HAZ-1b: Prior to start of construction, construction activities that involve subsurface disturbance within areas of the Project Site where residual petroleum hydrocarbons and volatile organic compounds (VOCs) in groundwater have been identified or are reasonably expected to be present, including areas downgradient of the former leaking underground storage tank (LUST) location at 1200 North State Street shall account for residual petroleum hydrocarbons and VOCs in groundwater that remain following regulatory closure of the former

leaking underground storage tank case. A qualified environmental professional shall evaluate the potential for vapor encroachment conditions (VEC) and specify appropriate management measures, which may include removal and disposal of contaminated soil, groundwater management, vapor mitigation, or other remedial actions, consistent with regulatory requirements and recommendations of the Phase II ESA. The management measures shall be implemented during soil disturbing activities.

Mitigation Measure HAZ-1c: Prior to construction, the Project Applicant(s) shall conduct additional confirmatory subsurface investigations in areas of known or suspected concern identified in the completed Phase II Subsurface Investigation and Methane Survey, including former and suspected underground storage tank locations, both those abandoned in place and those without verified removal documentation, as well as former boiler and powerhouse areas. Because prior investigations were limited to accessible areas and did not include full site-wide excavation or investigation beneath existing structures, utilities, and active facilities, the extent of residual contamination cannot be fully characterized until demolition and site access occur. Therefore, additional confirmatory investigation shall be completed prior to grading in each affected area to fully delineate any residual contamination. These investigations shall evaluate whether residual contamination remains that could affect redevelopment. If additional residual contamination is found, a qualified geologist or industrial hygienist shall recommend appropriate remedial actions, which may include removal, disposal, or remediation of affected soils or structures, consistent with regulatory requirements. These remedial actions shall be implemented during construction.

Mitigation Measure HAZ-1d: The documented abandoned oil well on the southern portion of the Project Site (Santa Fe Springs Mutual Oil Syndicate Well No. 1, API No. 0403705846) shall be further evaluated by a qualified petroleum engineer or geologist prior to any ground-disturbing activities, including grading, excavation, or construction, occurring within 100 feet of the well location. The evaluation shall include confirmation of the well's current condition and abandonment status through review of regulatory records and, if necessary, field investigation field investigation to verify that the well meets current CalGEM abandonment standards.

Because existing structures, pavement, utilities, and active campus operations currently limit full access to the well location and its area of potential influence, comprehensive field verification and intrusive investigation cannot be completed at this time. The final grading limits,

excavation depths, and site access conditions will not be fully known until demolition and site clearance activities occur. Therefore, confirmation of abandonment status and any necessary subsurface investigation must occur immediately prior to grading in the affected area, once safe and unobstructed access is available.

If the evaluation determines that the well has not been properly abandoned in accordance with CalGEM standards, the well shall be plugged or otherwise remediated in compliance with Public Resources Code Sections 3208 to 3217 prior to grading in the affected area.

No grading or construction activities shall occur within the 100-foot radius (area of potential influence) of the well until CalGEM has confirmed that the well meets current abandonment standards.

Impact HAZ-2

Mitigation Measure HAZ-2: Prior to the issuance of building permits for any new residential or commercial structure on portions of the Project Site where volatile organic compounds (VOCs) in soil vapor have been documented above applicable screening levels, the Project Applicant(s)/Contractor(s) shall prepare and implement a vapor intrusion mitigation plan. The plan shall include site-specific engineering controls, such as passive or active sub-slab depressurization systems, vapor barriers, or equivalent measures designed to prevent intrusion of VOCs into occupied indoor spaces.

Because final building footprints, foundation designs, and finished grades have not yet been determined, a structure-specific vapor mitigation system cannot be finalized at this time. Therefore, the vapor intrusion mitigation plan shall be prepared for each applicable structure once final design plans are available and prior to permit issuance.

The vapor intrusion mitigation plan shall be prepared by a qualified environmental professional in consultation with the Los Angeles County Department of Public Works and the Los Angeles Regional Water Quality Control Board (RWQCB). Design features shall comply with City of Los Angeles Methane Zone requirements, CalEPA guidance, and RWQCB performance standards for VOC mitigation.

Implementation of the plan, including installation of all required engineering controls, shall be verified through inspections and post-installation testing prior to occupancy. The County, in coordination with the RWQCB, shall review and approve the plan, confirm proper installation, and enforce compliance as part of the standard building permit and inspection process.

Impact HAZ-3 **Mitigation:** Implement Mitigation Measure HAZ-1a (asbestos and lead surveys and abatement), HAZ-1b (management of residual contamination and vapor encroachment at 1200 North State Street), HAZ-1c (Phase II ESA with remediation of USTs, boilers, and powerhouse areas), HAZ-1d (evaluation and, if necessary, the abandoned oil well would be properly plugged and sealed in accordance with CalGEM standards), and HAZ-2 (vapor intrusion mitigation plan for VOCs in soil vapor at future residential and commercial structures).

Impact HAZ-4 **Mitigation:** Implement Mitigation Measure HAZ-2.

Impact HAZ-5 **Mitigation:** Implement Mitigation Measures HAZ-1a (asbestos and lead surveys and abatement prior to demolition); HAZ-1b (management of residual contamination and vapor encroachment at 1200 North State Street); HAZ-1c (subsurface investigations and remediation of USTs, boilers, and powerhouse areas); and HAZ-1d (evaluation and, if necessary, the abandoned oil well would be properly plugged and sealed in accordance with CalGEM standards).

Impact HAZ-6 **Mitigation:** Implement Mitigation Measures HAZ-1a through HAZ-1d (as described under Impact HAZ-1) and Mitigation Measure HAZ-2 (as described under Impact HAZ-2) would apply to this impact. These measures collectively address hazardous building materials, residual subsurface contamination, USTs/LUSTs, VOCs in soil vapor, methane, undocumented fill, and the idle oil well, ensuring that hazards associated with the Project Site's regulatory listings are mitigated.

Impact HAZ-7 **Mitigation:** Implement Mitigation Measures TRAF-1 and TRAF-4.

Impact HAZ-8 **Mitigation:** Implement Mitigation Measure HAZ-1a through HAZ-1d.

Impact HAZ-9 **Mitigation:** Implement Mitigation Measure HAZ-2.

Impact HAZ-10 **Mitigation:** Implement Mitigation Measures HAZ-1 through HAZ-1d and HAZ-2.

Impact HAZ-11 **Mitigation:** Implement Mitigation Measure HAZ-2.

Impact HAZ-12 **Mitigation:** Implement Mitigation Measure HAZ-1a through HAZ-1c.

Impact HAZ-13 **Mitigation:** Implement Mitigation Measures HAZ-1a through HAZ-1d and Mitigation Measure HAZ-2.

Impact HAZ-14 **Mitigation:** Implement Mitigation Measures TRAF-1 and TRAF-4.

CHAPTER 3.9, HYDROLOGY AND WATER QUALITY

Environmental Impact:

The Proposed Project would have a potentially significant impact related to hydrology and water quality as follows:

- **Impact HYD-1:** Construction of the Proposed Project could violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.
- **Impact HYD-2:** Operation of the Proposed Project could violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.
- **Impact HYD-3:** Construction and operation of the Proposed Project could substantially decrease groundwater supplies such that the Proposed Project may impede sustainable groundwater management of the basin.
- **Impact HYD-4:** Operation of the Proposed Project could result in substantial erosion or siltation on- or off-site.
- **Impact HYD-5:** Operation of the Proposed Project could violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.
- **Impact HYD-6:** Operation of the Proposed Project, together with past, present, and reasonably foreseeable projects, could violate water quality standards or discharge requirements or otherwise substantially degrade surface or groundwater quality.
- **Impact HYD-7:** Construction and operations of the Proposed Project, together with past, present, and reasonably foreseeable projects, could substantially decrease groundwater supplies such that the Proposed Project may impede sustainable groundwater management of the basin.
- **Impact HYD-8:** Operation of the Proposed Project, together with past, present, and reasonably foreseeable projects, could conflict with a water quality control plan.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR.

Impact HYD-1 **Mitigation:** Implement Mitigation Measure HAZ-2.

Impact HYD-2 **Mitigation Measure HYD-2:** During the initial design of each future project, the Project Applicant(s)/Contractor(s) shall prepare project-specific Stormwater Mitigation Plans (SUSMP) for review and approval by

the Los Angeles County Department of Public Works (LACDPW). Low-impact development (LID) features included in project-specific SUSMPs shall be designed to minimize the leaching of nutrients from growing media. LID features shall avoid the use of growing media, mulch, and compost containing animal products, which may leach nutrients. Design modifications may include incorporation of an internal storage zone with an elevated underdrain and a carbon food source for denitrifying bacteria to create anaerobic conditions and subsequent denitrification.

During the initial design of each future implementing project, the Project Applicant/Contractor shall also prepare project-specific Operation and Maintenance (O&M) Plans for proposed LID features and on-site landscaping for review and approval by the LACDPW. The O&M Plans shall be revised as needed as development plans and proposed LID features are revised. The project specific O&M Plans shall consider impacts on water quality due to the leaching of phosphorous. O&M practices shall include integrated pest management and organic maintenance methods, including those for hand weeding. The use of fertilizers, pesticides, herbicides, and products containing animal manure or animal products shall be avoided.

Prior to construction of future development projects on the Project Site, the Project Applicant(s)/Contractor(s) shall prepare and submit final building and landscape design plans to LACDPW demonstrating that all landscape-based LID features are designed to improve water quality and minimize the leaching of nutrients from growing media.

Impact HYD-3

Mitigation Measure HYD-3a: Prior to and during construction involving deep excavation that could encounter groundwater or dewatering, monitoring wells shall be installed by the Project Applicant(s)/Contractor(s) during construction within and around the perimeter of each structure to monitor the groundwater level and evaluate the performance of the dewatering system. Before starting dewatering operations, a baseline conditions survey conducted by a licensed geotechnical or structural engineer retained by the Project Applicant(s)/Contractor(s) shall be made of all adjacent foundations and structures to assess the impact of deep excavation dewatering on adjacent structures. All signs of existing distress shall be recorded. The baseline survey shall be submitted to the County and retained for reference during construction monitoring.

Mitigation Measure HYD-3b: During project design, the Project Applicant(s)/Contractor(s) shall retain a qualified civil or water resources

engineer to prepare a Recycled and Alternative Water Supply Feasibility Study evaluating the technical and economic feasibility of using non-potable water sources for landscape irrigation. The study shall identify feasible sources, projected supply volumes, system design concepts, and implementation costs.

Based on the results of the feasibility study, future projects shall incorporate all technically and economically feasible non-potable supply systems into the final landscape irrigation supply. Irrigation water demands greater than existing irrigation demands shall be met by alternative supply sources to the maximum extent technically feasible. The use of alternative water supply sources for irrigation shall be maximized to reduce the use of potable water for irrigation and to approximate existing irrigation demands. Alternative water supply sources include, but are not limited to, reclaimed water, gray water, harvested rainwater (stormwater), and air-conditioning condensate (although not specifically mentioned in the master plan, this could represent a significant source of clean irrigation water).

The County shall review and approve the Feasibility Study and irrigation design prior to permit issuance.

Impact HYD-4 **Mitigation:** Implement Mitigation Measure HYD-2.

Impact HYD-5 **Mitigation:** Implement Mitigation Measure HYD-2.

Impact HYD-6 **Mitigation:** Implement Mitigation Measure HYD-2.

Impact HYD-7 **Mitigation:** Implement Mitigation Measures HYD-3a and 3b.

Impact HYD-8 **Mitigation:** Implement Mitigation Measure HYD-2.

CHAPTER 3.10, LAND USE AND PLANNING

Environmental Impact:

The Proposed Project would have a potentially significant impact related to land use and planning as follows:

- **Impact LU-1:** Without mitigation the Proposed Project has the potential to conflict with plans, policies, and regulations adopted for the purpose of avoiding or mitigating an environmental effect, during operation.
- **Impact LU-2:** Without mitigation the Proposed Project, together with past, present, and reasonably foreseeable projects, has the potential to conflict with plans, policies, and

regulations adopted for the purpose of avoiding or mitigating an environmental effect, during operation.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR.

Impact LU-1 **Mitigation:** Implement Mitigation Measures CUL-1a through CUL-1c, Mitigation Measure CUL-2, Mitigation Measures GEO-1 through GEO-4, Mitigation Measure NOI-1, Mitigation Measures NOI-1 through NOI-4, and Mitigation Measures TRA-1 through TRA 3.

Impact LU-2 **Mitigation:** Implement Mitigation Measures CUL-1a through CUL-1c, Mitigation Measure CUL-2, Mitigation Measures GEO-1 through GEO-4, Mitigation Measure NOI-1, Mitigation Measures NOI-1 through NOI-4, and Mitigation Measures TRA-1 through TRA 3.

NOISE

Environmental Impact:

The Proposed Project would have a potentially significant impact related to noise as follows:

- **Impact NOI-3:** The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to warehouse uses, clean tech/light industrial, mechanical equipment, and outdoor events.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR.

Impact NOI-3 **Mitigation Measure NOI-3a: Design Project Facilities to Ensure All Mechanical Equipment Complies with County Noise Standards.** During the architectural and engineering design phase of each new facility (building, central plant, parking structure, etc.) that could introduce new mechanical equipment to the Project Site, and prior to the issuance of any building permits for the facility, the Project Applicant(s)/Contractor(s) shall retain an acoustical consultant to evaluate the design and provide recommendations, as necessary, to ensure that the mechanical equipment complies with Section 12.08.390 of the Los Angeles County

Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: changes in equipment locations, upgrades to central plant buildings, rooftop parapet walls, acoustical louvers or screens, or intake and exhaust silencers.

Mitigation Measure NOI-3b: Design and Manage Outdoor Use Areas to Ensure Organized Outdoor Events Comply with County Noise Standards. Prior to the issuance of any building permits for outdoor use areas that are anticipated to host organized events such as outdoor markets, farmers markets, summer concerts and health marches, etc. the Project Applicant(s)/Contractor(s) shall retain an acoustical consultant to evaluate the design (event layout, sound system design, etc.) and operational event details (crowd sizes, times of operation, etc.) to ensure that such events will comply with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: controls on crowd sizes and event times, and limits on sound system power levels.

CHAPTER 3.12, PUBLIC SERVICES

Environmental Impact:

The Proposed Project would have a potentially significant impact related to public services as follows:

- **Impact PS-1:** The Proposed Project's construction activities have the potential to result in temporary lane closures and could impair or obstruct the movement of emergency vehicles.
- **Impact PS-2:** The Proposed Project's construction activities, together with other past, present, and reasonably foreseeable projects, have the potential to result in temporary lane closures and could impair or obstruct the movement of emergency vehicles.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR.

Impact PS-1 **Mitigation:** Implement Mitigation Measure TRA-1.

Impact PS-2 **Mitigation:** Implement Mitigation Measure TRA-1.

RECREATION

Environmental Impact:

The Proposed Project would have a potentially significant impact related to recreation as follows:

- **Impact REC-2:** Operation of recreational facilities would potentially have an adverse related noise generated from organized outdoor events.
- **Impact REC-4:** The Proposed Project, together with cumulative projects, would have the potential to result in impacts on ambient noise generated from organized outdoor events during operation.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project.

Impact REC-2 **Mitigation:** Implement Mitigation Measure NOI-3b.

Impact REC-4 **Mitigation:** Implement Mitigation Measure NOI-3b.

CHAPTER 3.15, TRANSPORTATION

Environmental Impact:

The Proposed Project would have a potentially significant impact related to transportation as follows:

- **Impact TRA-1:** Construction of the Proposed Project could create potentially significant impacts to programs, plans, ordinances, or policies addressing the circulation system.
- **Impact TRA-2**: The Proposed Project's construction activities have the potential to result in transportation hazards.
- **Impact TRA-4:** Proposed Project construction activities could result in potentially significant impacts to emergency access.
- **Impact TRA-5:** Construction of the Proposed Project, together with other past, present and reasonably foreseeable projects, could create potentially significant impacts to programs, plans, ordinances, or policies addressing the circulation system during construction.
- **Impact TRA-6:** The Proposed Project's construction activities, together with past, present, and reasonably foreseeable projects, have the potential to result in transportation hazards during construction.

- **Impact TRA-8:** Proposed Project construction activities, together with past, present, and reasonably foreseeable projects, could result in potentially significant impacts to emergency access during construction.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR.

Impact TRA-1

Mitigation Measure TRA-1: The Project Applicant(s)/Contractor(s) shall develop and implement a Worksite Traffic Control Plan for any aspect of construction that would result in road closures, sidewalk closures, bicycle facility closures, removal of parking, or similar traffic disruptions. The Worksite Traffic Control Plan shall be prepared as part of the project design package according to the California Manual on Uniform Traffic Control Devices (CA-MUTCD) requirements, and may include, but not be limited to, the following elements;

- Provide a roadway layout that shows the locations of construction activity and surrounding roadways to be used as detour routes, including special signage.
- Establish detour routes in coordination with the City of Los Angeles to minimize disturbances to local roadway conditions.
- Maintain access to existing residences at all times.
- Work with City of Los Angeles Department of Transportation, Los Angeles Sherriff's Department, Los Angeles County Fire Department, and Los Angeles Police Department, to coordinate all construction-related plans and minimize disturbances to local emergency management services (EMS) providers ensure that alternative evacuation and emergency routes are designed to maintain response times during construction.
- Provide adequate off-street parking areas at designated staging areas for construction-related vehicles.
- Work with transit providers to maintain access and circulation routes to existing stops during construction phases and identify appropriate detours to provide rerouting during construction while minimizing service disruptions.

- Work with the City of Los Angeles to maintain continuity and operations of existing pedestrian and bicycle facilities during construction.

Impact TRA-2 **Mitigation**: Implement Mitigation Measure TRA-1.

Impact TRA-4 **Mitigation:** Implement Mitigation Measure TRA-1.

Impact TRA-5 **Mitigation:** Implement Mitigation Measure TRA-1.

Impact TRA-6 **Mitigation:** Implement Mitigation Measure TRA-1.

Impact TRA-8 **Mitigation:** Implement Mitigation Measure TRA-1.

CHAPTER 3.16, TRIBAL CULTURAL RESOURCES

Environmental Impact:

The Proposed Project would have a potentially significant impact related to tribal cultural resources as follows:

- **Impact TCR-1:** The Proposed Project's construction activities could inadvertently uncover subsurface tribal cultural resources and cause a substantial adverse change in the significance of a tribal cultural resource, pursuant to criteria set forth in Public Resources Code Section 5020.1(k).
- **Impact TCR-2:** The Proposed Project's construction activities could inadvertently uncover subsurface tribal cultural resources and cause a substantial cumulative adverse change in the significance of a tribal cultural resource, pursuant to criteria set forth in Public Resources Code Section 5020.1(k).

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project.

Impact TCR-1 **Mitigation Measure TCR-1a: Native American Monitoring of Ground-Disturbing Activities in Native Soils**

a) The Project Applicant(s)/Contractor(s) shall invite a Native American Monitor from the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) prior to the commencement of any ground-disturbing activities. "Ground-disturbing activities" shall include, but are not limited to, grading, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching, for each implementing phase of the Proposed Project at all Project locations (i.e., both on-site and any off-site locations that are included in the Project

description/definition and/or required in connection with the Project, such as public improvement work).

b) The Project Applicant(s)/Contractor(s) shall make reasonable efforts to execute a Tribal Monitoring Agreement with the Native American Monitor prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence any ground-disturbing activity.

c) The Native American Monitor shall work with the Project Applicant's qualified archaeologist during qualifying ground-disturbing activities to identify potential Native American Tribal Cultural Resources (TCRs) and communicate concerns regarding TCRs to the Project Applicant(s). The Native American Monitor will complete daily monitoring logs that will provide: description(s) and location(s) of the relevant ground-disturbing activity(ies), the type(s) of construction activity(ies), information and/or materials related to TCRs; and any other facts, conditions, materials, or discoveries of significance to the Tribe. Daily monitoring logs will identify and describe any discovered TCRs. Copies of daily monitoring logs will be provided to the Project Applicant(s) and the County at the end of all Project-related ground-disturbing activities. Daily monitoring logs will be kept confidential with the Project records.

d) On-site tribal monitoring shall conclude upon either of the following, whichever occurs first: (1) written notification to the Tribe from a designated point of contact for the Project Applicant(s)/Contractor(s) that all ground-disturbing activities and phases of Project implementation that may involve ground-disturbing activities are complete; or (2) written notification to the Project Applicant(s) from the Tribe that no future planned construction activity and/or development/construction phase of the Project has the potential to impact TCRs.

Mitigation Measure TCR-1b: Unanticipated Discovery of Tribal Cultural Resource (Non-Funerary)

a) In accordance with section 21074, subdivisions (a)(1)(A)-(B) of the Public Resources Code (PRC), a Tribal Cultural Resource (TCR) is a site, feature, place, cultural landscape, sacred place or object, which is of cultural value to the Tribe and either: (1) on or eligible for the California Historic Register or other local historic register or (2) the County of Los Angeles, as the lead agency for the Project, at its discretion, chooses to treat the resource as a TCR.

b) Upon discovery of any TCR or potential TCR, all construction activities within a radius deemed appropriate by the qualified archaeologist shall cease and shall not resume until the discovered TCR has been fully assessed by the Native American Monitor and/or qualified archaeologist. If the assessment finds the resource to be a TCR, treatment measures and final disposition will be determined in consultation with the Tribe.

Mitigation Measure TCR-1c: Unanticipated Discovery of Native American Human Remains and/or Associated Grave Goods

a) Native American human remains are defined in section 5097.98, subdivision (d)(1) of the Public Resources Code (PRC) as an inhumation or cremation in any state of decomposition or skeletal completeness. Funerary objects, also called associated grave goods in section 5097.98 of the PRC, shall be treated alike per section 5097.98, subdivisions (d)(1) and (2) of the PRC.

b) If Native American human remains and/or grave goods are discovered or recognized on the Project Site, then section 5097.9 of the PRC as well as Health and Safety Code Section 7050.5 shall be followed.

c) Any discovery of Native American human remains and/or grave goods shall be kept confidential to prevent further disturbance.

Impact TCR-2 **Mitigation**: Implement Mitigation Measure TCR-1a through TCR-1c.

C. FINDINGS ON SIGNIFICANT UNAVOIDABLE IMPACTS

The following summary describes unavoidable adverse environmental impacts of the Proposed Project, even with the implementation of feasible mitigation measures, or where mitigation measures were found to be infeasible. The County finds, based on substantial evidence in the record, that the proposed Project will have significant and unavoidable impacts in the following issues:

- Air Quality (Impact AIR-2, AIR-4, AIR-5, and AIR-8)
- Cultural Resources (Impact CUL-1 and CUL-3)
- Greenhouse Gas Emissions (Impacts GHG-1 and GHG-2)
- Noise (Impacts NOI-1, NOI-2, NOI-4, NOI-5, NOI-6, and NOI-7)
- Recreation (Impacts REC-1 and REC-3)
- Transportation (Impacts TRA-3 and TRA-7)
- Utilities and Service Systems (Impacts USS-1, USS-2, USS-3, and USS-4)

Findings Regarding Significant and Unavoidable Impacts

In accordance with PRC Section 21081 and State CEQA Guidelines Section 15091, the County adopts one or more of the three possible findings for each significant impact. These findings are provided below and will be used hereinafter and referenced as identified below:

- **CEQA Finding 1.** Changes or alterations have been required in, or incorporated into, the Proposed Project which avoid or substantially lessen the significant environmental effect as identified in the Final EIR (State CEQA Guidelines Section 15091[a][1].

- **CEQA Finding 2.** Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency (State CEQA Guidelines Section 15091 [a][2]).

- **CEQA Finding 3.** Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible, the mitigation measures or project alternatives identified in the Final EIR (State CEQA Guidelines Section 15091 [a][3]).

CEQA requires that the lead agency adopt mitigation measures or alternatives, where feasible, to substantially lessen or avoid significant environmental impacts that would otherwise occur. However, project modification or alternatives are not required where such changes are infeasible, as stated in State CEQA Guidelines Section 15091(a)(3). State CEQA Guidelines Section 15364 defines "feasible" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, legal, and technological factors."

For those significant impacts that cannot be mitigated to a less than significant level, a public agency, after adopting proper findings, may nevertheless approve the project if the agency first adopts a statement of overriding considerations setting forth the specific reasons why the agency found that the project's "benefits" rendered "acceptable" its "unavoidable adverse environmental effects" (State CEQA Guidelines Sections 15093 and 15043[b]; see also PRC Section 21081[b]).

The following significant environmental impacts of the Proposed Project are unavoidable and cannot be feasibly or effectively mitigated to a less than significant level. In accordance with Section 15093 of the State CEQA Guidelines, a Statement of Overriding Considerations was prepared (under separate cover) to substantiate the County's decision to accept these unavoidable substantial, adverse environmental effects because of the benefits afforded by the Proposed Project.

For each Proposed Project resource category discussed below, the following sections are provided:

- **Impact:** A specific description of the significant environmental impact(s) identified in the Draft SEIR.
- **Mitigation:** Identified feasible mitigation measures that are required as part of the Proposed Project. (If mitigation is infeasible, the reasons supporting the finding that mitigation is infeasible are discussed below under "Facts in Support of Findings.")
- **Finding:** One or more of the three specific findings set forth in State CEQA Guidelines Section 15091.
- **Facts in Support of Finding:** A summary of the reasons for the finding(s) is provided for each impact. Additional substantiation regarding the feasibility (or infeasibility) of mitigation is provided at the end of this section (which is relevant to all impacts under the given resource category).

CHAPTER 3.2, AIR QUALITY

Environmental Impact

The Proposed Project would have significant and unavoidable impacts related to air quality as follows:

- **Impact AIR-2:** Implementation of the Proposed Project would generate operation emissions that exceed the South Coast AQMD regional significance thresholds.
- **Impact AIR-4:** Warehousing and light industrial uses accommodated under the Proposed Project would generate onsite operational criteria air pollutant emissions from non-permitted sources that exceed the South Coast AQMD localized significance thresholds.
- **Impact AIR-5:** Warehousing and light industrial uses accommodated under the Proposed Project would generate onsite operational TAC emissions from non-permitted sources that exceed the South Coast AQMD localized significance thresholds.
- **Impact AIR-8:** The Proposed Project's operation-related activities have the potential to result in cumulative air quality impacts related to criteria pollutant emissions during operation.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR. As described in detail in the Final SEIR (Chapter 2, *Responses to Comments*), certain mitigation measure revisions or additions suggested by South Coast AQMD (see responses to comments A5-9 and A5-10) and LAUSD (see responses to comments A3-5 and A3-6 of the Final SEIR) were determined to be either not applicable to the Proposed Project, or infeasible.

Impact AIR-2 **Mitigation Measure AIR-2:** Future private tenants/business entities (i.e., non-County of Los Angeles owned or operated businesses) for new

development projects that own their own truck fleets for daily business operations shall only operate trucks that are either zero-emission (Z/E) and/or meet the California Air Resources Board NO_X emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr) for Class 2b through Class 8 vehicles with a gross vehicle weight rating over 8,500 pounds. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the truck requirements under this mitigation measure shall be included in all leasing agreements.

Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement that any owned Class 2b through Class 8 vehicles with a GWVR over 8,500 pounds used for daily business operations shall be either Z/E and/or meet the NOX emissions standard of 0.02 g/bhp-hr. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase agreement) to the County to verify, to the County's satisfaction, that any owned vehicle subject to the requirements under this mitigation measure comply.

In addition, implement Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d.

Impact AIR-4

Mitigation Measure AIR-4a: Project Applicant(s)/Contractor(s) for new development projects that would use off-road equipment (e.g., forklifts and yard trucks) in daily business operations shall only utilize electric-powered off-road equipment. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the limitation to use only electric-powered off-road equipment shall be included in all leasing agreements.

Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only electric-powered equipment for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and

tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the County to verify, to the County's satisfaction, that any off-road equipment utilized will be electric-powered.

Mitigation Measure AIR-4b: Project Applicant(s)/Contractor(s) for new development projects that would use transport refrigeration units (TRUs) in daily business operations use only electric standby and/or hybrid electric TRUs (E/S TRUs). All E/S TRUs shall comply with the California Air Resources Board's "Alternative Technology" requirements under Section 2477(e)(1)(A)(3) of the California Code of Regulations, Title 13, Article 8, Chapter 9, Division 3. The project developer/facility owner shall disclose this requirement to all tenants/business entities prior to the signing of any lease agreement. In addition, the limitation to use only E/S TRUs shall be included in all leasing agreements.

Prior to issuance of a Business License for a new tenant/business entity, the Project Applicant(s)/Contractor(s) and tenant/business entity shall provide a signed document (verification document) to the Los Angeles County Department of Regional Planning noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only E/S TRUs for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the Los Angeles County Department of Regional Planning to verify, to the County's satisfaction, that any TRUs utilized will be E/S TRUs.

Mitigation Measure AIR-4c: To reduce idling emissions from transport trucks, Project Applicant(s)/Contractor(s) for new warehousing or general industrial development projects place signage at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations (e.g., Rule 2485). At minimum, each sign shall include: 1) instructions for truck drivers to shut off engines when not in use; 2) instructions for drivers of diesel trucks to restrict nonessential idling to no more than two consecutive minutes (compared to five minutes currently allowed under Rule 2485); and 3) telephone numbers of the building facilities manager and CARB to report violations. All signage shall be made of weatherproof materials. All site and architectural plans submitted to the County shall note the locations of these signs.

Mitigation Measure AIR-4d: All truck/dock bays for new proposed facilities that accommodate cold storage shall be electrified to facilitate plug-in capability and support use of electric standby and/or hybrid electric transport refrigeration units. All site and architectural plans submitted to the County shall note all the truck/dock bays designated for electrification. Prior to the issuance of a Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify electrification of the designated truck/dock bays.

Impact AIR-5 **Mitigation:** Implement Mitigation Measures AIR-2 and AIR-4a through AIR-4d.

Impact AIR-8 **Mitigation:** Implement Mitigation Measures AIR-2, AIR-4a through 4d, Mitigation Measures GHG-1a through GHG-1c, and Mitigation Measure TRA-3d.

Findings:

The County hereby adopts CEQA Findings 1 and 3. As described in the Statement of Overriding Considerations, the County has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact AIR-2:

- Buildout of the Proposed Project would generate long-term criteria air pollutant emissions that would exceed South Coast Air Quality Management District's (AQMD's) regional significance thresholds and cumulatively contribute to the nonattainment designations of the Southern California Air Basin (SoCAB). Implementation of Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3e, as expanded in the Final SEIR as a result of public agency comments received, would contribute to reducing mobile-source, area-source, and energy sector criteria air pollutant emissions to the extent feasible. However, due to the magnitude of emissions generated by the land uses that would be accommodated by the Proposed Project, long-term criteria air pollutant emissions generated from the Proposed Project could still exceed the South Coast AQMD's regional significance thresholds. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, Impact AIR-2 would remain significant and unavoidable.

Impact AIR-4:

- Implementation of Mitigation Measures AIR-2 and AIR-4a through AIR-4d would minimize localized onsite operation-related criteria air pollutant emissions. However, because no site-

specific warehousing or industrial development project is currently proposed and the specific operations of such facilities (e.g., number of heavy-duty truck trips, location of facility, etc.) are unknown, the associated emissions, and concentrations levels cannot be determined or modeled. Accordingly, the analysis in the Draft SEIR conservatively evaluates the maximum development potential under the proposed Master Plan to ensure that air quality impacts are not underestimated. Thus, while implementation of mitigation as revised in the Final SEIR in response to public agency comments received would reduce emissions, future warehousing and industrial land uses could still exceed the South Coast AQMD localized significance thresholds (LSTs). All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, Impact AIR-4 would remain significant and unavoidable.

Impact AIR-5:

- Implementation of Mitigation Measures AIR-4a through AIR-4d, as revised in the Final SEIR due to public agency comments received, would minimize localized onsite operation-related TAC emissions. However, because no specific warehousing or industrial development project is currently proposed and the specific operations of such facilities (e.g., number of heavy-duty truck trips, location of facility, etc.) are unknown, the associated emissions, and health risk levels cannot be determined or modeled. Accordingly, the analysis in the Draft SEIR conservatively evaluates the maximum development potential under the proposed Master Plan to ensure that air quality impacts are not underestimated. Thus, while implementation of mitigation would reduce emissions, future warehousing and industrial land uses could still exceed the South Coast AQMD health risk thresholds. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, Impact AIR-5 would remain significant and unavoidable.

Impact AIR-8:

- Implementation of Mitigation Measures AIR-2, as included in the Final SEIR due to public agency comments received, would minimize operation-related NO_x emissions. Under South Coast AQMD methodology, project-level operational impacts also represent cumulative operational impacts. The cumulative impact determination is based on the project-level significance with mitigation determination. Thus, the significance with mitigation determination accounts for all the potential reductions associated with the identified mitigation measures, as revised in the Final SEIR due to public agency comments received. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, Impact AIR-8 would remain significant and unavoidable.

CHAPTER 3.4, CULTURAL RESOURCES

Environmental Impact

The Proposed Project would have a significant and unavoidable impact related to cultural resources as follows:

- **Impact CUL-1:** The Proposed Project's new building construction has the potential to result in substantial direct adverse changes to existing historical resources to remain (the Old Administration Building, Los Angeles General Hospital–Acute Unit Building, and Los Angeles General Hospital–Acute Unit Historic District).
- **Impact CUL-3:** The Proposed Project's construction activities have the potential to result in cumulative impacts on historical resources.

Mitigation Measures:

The Proposed Project includes the following Project Design Features (PDFs) which are identified in the Final SEIR:

PDF 1

All work within the Los Angeles General Hospital–Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to conform with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Additionally, the County is pursuing federal historic preservation tax incentives for the Acute Unit's proposed rehabilitation work, which requires rigorous review by the National Park Service (NPS) and California Office of Historic Preservation (OHP) for compliance with the Rehabilitation Standards.

PDF 2

Prior to commencement of any construction activities associated with the Los Angeles General Hospital–Acute Unit Building's exterior or interior character-defining features,[4] or the Acute Unit Historic District's contributing features (Patient's and Visitor's buildings, retaining walls, gateways, State Street, Forecourt, tunnel), a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to monitor all disassembly, construction and rehabilitation activities, to ensure appropriate treatment of exterior and interior character-defining features, materials, and spaces during the construction project.

[4] Character defining features are detailed in Section 3.4.2, *Existing Conditions*, of the Draft SEIR specifically under the Evaluations of Significance discussions.

PDF 3

Prior to undergoing any demolition activities at the Los Angeles General Hospital–Acute Unit Building and any other contributing features within the Acute Unit Historic District (Patient's and Visitor's buildings, retaining walls, gateways, State Street, forecourt, tunnel), that would result in the removal of interior or exterior character-defining features (or portions thereof), Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards. HABS/HAER Level II drawings and historical narrative may follow after construction commences. To ensure public access, the Project Applicant(s) shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- **Drawings:** Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- **Photographs:** Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- **Historical Narrative:** An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

PDF 4

Prior to demolition of the Pharmacy Building and Viaduct, Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards and a qualified structural engineer with at least five years of demonstrated, related experience. HABS/HAER Level II drawings and historical narrative may follow after demolition. To ensure public access, the Project Applicant(s) shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- **Drawings:** Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing

drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.

- **Photographs:** Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- **Historical Narrative:** An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

PDF 5

An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

In addition to the PDFs, the following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR. As described in detail in the Final SEIR (Chapter 2, *Responses to Comments*), certain mitigation measure revisions or additions suggested by Los Angeles Conservancy (see response to comment O3-2,) was determined to be either not applicable to the Proposed Project, or infeasible.

Impact CUL-1 **Mitigation Program for Adjacent New Construction.** If a new construction project is proposed for a site within 50 feet of an eligible or designated historical resource, then the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1a (Secretary Standards Compliance) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the project is adjacent to the resource (taking into account the scale of the project, any physical or visual

separation, and existing baseline conditions). If the new construction is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the new construction is found to be adjacent to the identified resource, the Architectural Historian/Historic Architect shall assess the project, focusing on the application of Standards No. 9 and 10, both of which relate to adjacent new construction.

If the Architectural Historian concludes that the new construction project meets the Standards, then the project is presumed to not have an impact on historical resources. During implementation of the project, the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1b (Project Review During Design and Construction) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawings and generally be available to the design team, as needed.

If the proximity of new construction to historical resources is such that vibration during construction may cause them physical damage, as defined through Mitigation Measure NOI-4, the Project Applicant(s)/Contractor(s) shall also apply Mitigation Measure CUL-1c (Protection During Construction) and engage a qualified Historic Architect and Structural Engineer to prepare a Conditions Assessment Report and Construction Monitoring Plan.

Mitigation Measure CUL-1a: Secretary Standards Compliance. For all instances in which a project is implementing activities under the Proposed Project within 50 feet of an eligible or designated historical resource identified in this Draft SEIR, the Project Applicant shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the future implementing project activity is adjacent to the identified historical resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the future implementing project activity is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the future implementing project activity is determined to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall conduct an assessment of whether the proposed treatment of the historical resource complies with the Secretary of the

Interior's Standards for Rehabilitation ("the Rehabilitation Standards"). If the future implementing project activity is found to not be in compliance with the Rehabilitation Standards, then the Architectural Historian/Historic Architect shall provide recommendations for how to modify the design, siting, scale, massing, or architectural treatment of the future implementing development projects to the extent feasible to bring it into compliance, or as close to compliance as feasible, which shall be integrated into the design of the Proposed Project. The professional shall prepare a memorandum or equivalent level of documentation conveying the findings of the assessment, which shall be provided to the County.

Mitigation Measure CUL-1b: Project Review During Design and Construction. For instances in which a future project involves adjacency to a historical resource (as determined under Mitigation Measure CUL-1a), the Project Applicant(s)/Contractor(s) shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawing sets and generally be available to the design team during design and construction. The Architectural Historian/Historic Architect shall review Design Development (DD) and Construction Documentation (CD) drawing sets at 50% and 100% completion and provide a brief memo regarding ongoing project compliance with the Standards. Project review during construction shall occur quarterly and reported in memo format, which shall be provided to the County.

Mitigation Measure CUL-1c: Protection During Construction. Prior to the commencement of construction activities within proximity to, as defined in Mitigation Measure NOI-4, a historical resource, a Conditions Assessment Report will be completed by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to identify baseline conditions (cracks, deterioration, etc.). The report will be provided to the County. As part of this process, a Structural Engineer shall be consulted to determine whether any shoring or protection should be installed prior to commencement of construction activities.

In addition, the Project Applicant(s)/Contractor(s) shall engage a Civil Engineer to prepare an Adjacent Building Construction Monitoring Plan ("Monitoring Plan"). The Monitoring Plan shall establish survey monuments, and document and record the positions of adjacent buildings, structures, sidewalks, utilities, facades, and surface features to form a baseline for determining settlement or deformation. The Monitoring Plan shall include the following provisions: (1) shored excavation and adjacent buildings, structures, sidewalks, utilities, facades,

and cracks shall be visually inspected at a minimum of one time per month; (2) survey monuments shall be measured at critical stages of excavation, shoring, dewatering, and construction but should not occur less frequently than once every thirty days; (3) monitoring reports shall be prepared by an appropriate technical professional California Professional Land Surveyor documenting the movement monitoring results and distributed to all appropriate parties, including the shoring engineer. The County shall be provided all documentation and be notified if movement exceeds predetermined thresholds and calculated amounts as required.

Impact CUL-3 **Mitigation:** Implement Mitigation Measures CUL-1a through CUL-1c.

Findings:

The County hereby adopts CEQA Findings 1 and 3. As described in the *Statement of Overriding Considerations*, the County has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact CUL-1:

- Because project-level designs for future projects, including the extent to which future project would comply with the Secretary of Interior Standards are not known at this time, the analysis conservatively evaluates the maximum potential impacts associated with the Proposed Project. While future projects may avoid or reduce impacts through project-specific design and adherence to the Secretary of the Interior's Standards, the effectiveness of such measures cannot be determined at the programmatic level. All feasible mitigation measures were considered in the Draft and Final SEIR. Accordingly, construction impacts are considered to be significant and unavoidable.

Impact CUL-3:

- Mitigation Measures CUL-1a through CUL-1c and PDFs, implemented in various combinations and tailored on a case-by-case basis to address specific impacts, may reduce the Proposed Project's contributions to cumulative construction impacts to less than significant levels. However, given designs for future projects implementing the Proposed Project, and the extent to which they meet the Secretary of Interior Standards, are not known at this time, cumulative construction impacts are considered to be significant and unavoidable. All feasible mitigation measures were considered in the Draft and Final SEIR.

CHAPTER 3.7, GREENHOUSE GAS EMISSIONS

Environmental Impact

The Proposed Project would have a significant and unavoidable impact related to greenhouse gas emissions as follows:

- **Impact GHG-1:** Implementation of the Proposed Project would result in annual GHG emissions that exceed the South Coast AQMD bright-line GHG significance threshold.
- **Impact GHG-2:** The Proposed Project, together with cumulative projects, would substantially impact greenhouse gases.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The mitigation measures as provided include any revisions incorporated in the Final SEIR. As described in detail in the Final SEIR (Chapter 2, *Responses to Comments*), certain mitigation measure revisions or additions suggested by South Coast AQMD (see responses to comments A5-9, A5-10, and A5-11) and LAUSD (see response to comment A3-6 of the Final SEIR) were determined to be either not applicable to the Proposed Project, or infeasible.

Impact GHG-1

Mitigation Measure GHG-1a: For development projects that include parking (e.g., private garages, surface parking lot, etc.), the Project Applicant(s)/Contractor(s) shall implement the following provisions of the California Green Building Standards Code (CALGreen) as mandatory and not voluntary and shall list and identify them on all prepared building and site plans. The Project Applicant(s) shall submit these building and site plans that note the applicable measures to the County prior to the issuance of construction permits.

- **Residential Structures with Three or Fewer Stories.** For residential land uses with three or fewer stories, the Project Applicant(s)/Contractor(s) shall:
  - Design and build condominium/townhouses dwellings that have an attached private garage to have a dedicated electric circuit to support electric vehicle charging, as outlined in the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.1.
  - Design and build residential buildings to, at a minimum, meet the Tier 2 electric vehicle parking standards of the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.2.1.

- **Nonresidential Structures and Residential Structures with Four or More Stories.** For nonresidential land uses and residential land uses that are four or more stories, the Project Applicant(s)/Contractor(s) shall:
  - All parking areas shall be designed to provide parking for low-emitting, fuel-efficient, and carpool/van vehicles. At minimum, the number of preferential parking spaces shall equal the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.1.2.
  - Parking areas shall be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations shall comply with the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.3.3 or Section A5.106.5.3.4.

Mitigation Measure GHG-1b: Each Project Applicant/Contractor shall demonstrate a minimum 10 percent reduction in energy consumption below energy baselines. For the General Hospital, ASHRAE Standard 90.1-2010 shall be the energy baseline. For all other new construction and major renovation, the 2025 version of Title 24, Part 6 shall be the energy baseline. "New construction" in this context shall mean "ground up" development of a structure that has never been occupied. "Major renovation" in this context shall include additions to or redevelopment of existing structures resulting in an increase of over fifty (50) percent of the existing floor area. An overall energy reduction of 10 percent shall be demonstrated on an aggregate basis across the Project Site, allowing for some buildings to perform better than others. Compliance shall be demonstrated via:

- A technical memorandum (where energy reductions might be below 10% for individual buildings); or
- Title 24 compliance forms submitted at the time of permit (where energy reductions are above 10%); or
- An energy modeling report (for the General Hospital).

The technical memorandum shall be based on a project site-level energy calculation and reference Title 24 compliance forms where completed and available, and submitted to the County prior to issuance of each building permit. The 10 percent reduction in energy consumption may be achieved through a combination of Project Site-wide renewable energy generation, energy distribution systems, electrification, and/or building design features. The Project Site area energy calculations shall be based

on new developments pursuant to the project. The Project Site-level energy calculations shall be updated as needed throughout phased development to reflect actual design progress. Where performance of an individual building or phase is below the 10 percent requirement, it will address anticipated performance in future phases to achieve the aggregate 10 percent reduction.

Should the final development phase proposal show that the Project Site-wide 10 percent reduction in energy consumption was not achieved, the final phase development proposal shall include additional measures to ensure the Project Site-wide 10 percent reduction in energy consumption from the electrical grid be achieved. The "final development phase" is the phase that would complete the full buildout of the Project Site within the anticipated 25-year development horizon. If such phase is not realized within the 25-year development horizon, then the Proposed Project shall demonstrate the Project Site-wide 10 percent reduction no later than December 31st, 2050 through the implementation of additional measures. These additional measures may include but are not limited to photovoltaic arrays, appliance or mechanical system upgrades to new or existing buildings, or lighting upgrades on new or existing structures. Any such additional measures shall be quantified for energy consumption reduction performance and submitted to the County for approval prior to the issuance of construction permits for the final phase proposal.

Mitigation Measure GHG-1c: For nonresidential development projects, prior to issuance of the certificate of occupancy, the Project Applicant(s)/Contractor(s) shall provide documentation to the County demonstrating enrollment in a 100 percent carbon-free electricity energy plan, such as the City of Los Angeles Department of Water and Power's Green Power for Green LA program, for Proposed Project building(s) if such plan is available. If a 100 percent carbon-free electricity plan is not available, the Project Applicant(s)/Contractor(s) shall enroll in an energy plan with the next highest carbon-free electricity until a 100 percent carbon-free electricity energy plan becomes available. Measures to achieve 100 percent carbon-free electricity use may include, but are not limited to, plans for 100 percent renewable electricity. If such carbon-free electricity energy plans are waitlisted, the Project Applicant(s)/Contractor(s) may enroll in an available energy plan in the meantime, but shall sign up for the waiting list until such time a carbon-free electricity energy plan is available.

Mitigation: Implement Mitigation Measure AIR-2 and Mitigation Measure TRA-3d.

Impact GHG-2 **Mitigation:** Implement Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d.

Findings:

The County hereby adopts CEQA Findings 1 and 3. As described in the *Statement of Overriding Considerations*, the County has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact GHG-1:

- Implementation of Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d could reduce GHG emissions impacts associated with future individual development activities under the Proposed Project to a less than significant level. Mitigation Measure TRA-3d would require the implementation of a Transportation Demand Management program to reduce vehicular trips to the Project Site. However, because the specifics of the potential future development projects accommodated under the Proposed Project are not known at the programmatic level, the extent to which individual future development activities would achieve GHG emissions below the South Coast AQMD bright-line threshold of 3,000 metric tons of carbon dioxide equivalent (MTCO2e)/year even with the identified reduction measures implemented cannot be determined. Accordingly, the analysis conservatively evaluates the maximum development potential under the Proposed Project to ensure that the GHG impacts are not underestimated. While implementation of mitigation measures would contribute to minimizing overall Proposed Project-related GHG emissions, it is anticipated that the Proposed Project would still exceed the South Coast AQMD bright-line threshold of 3,000 MTCO2e/year due to the magnitude of development accommodated under the Proposed Project. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, Impact GHG-1 would remain significant and unavoidable.

Impact GHG-2:

- Implementation of Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d would contribute to minimizing Project-related GHG emissions to the extent feasible. However, due to the magnitude of emissions generated by the land uses that would be accommodated by the Proposed Project, long-term GHG emissions generated from the Proposed Project could still exceed the South Coast AQMD bright-line threshold of 3,000 MTCO2e/year. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, Impact GHG-2 would remain significant and unavoidable.

CHAPTER 3.11, NOISE

Environmental Impact

The Proposed Project would have a significant and unavoidable impact related to noise as follows:

- **Impact NOI-1:** If pile driving activities or other high noise construction activities occur, construction activities associated with phased implementation of the Proposed Project have the potential to result in temporary noise increases in excess of applicable standards.
- **Impact NOI-2:** The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to traffic.
- **Impact NOI-4:** Should pile driving be required during construction activities, such equipment would have the potential to result in groundborne vibration or noise in excess of applicable standards.
- **Impact NOI-5:** The Proposed Project's construction activities would result in cumulative impacts related to increases in ambient noise.
- **Impact NOI-6:** The Proposed Project's operational traffic would result in cumulative impacts related to increases in ambient noise.
- **Impact NOI-7:** The Proposed Project's construction activities would result in cumulative impacts related to the generation of groundborne vibration or noise in excess of applicable standards.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were made in the Final SEIR. As described in detail in the Final SEIR (Chapter 2, *Responses to Comments*), certain mitigation measure revisions or additions suggested by LAUSD (see responses to comments A3-8 and A3-9 of the Final SEIR) were determined to be either not applicable to the Proposed Project, or infeasible.

Impact NOI-1

Mitigation Measure NOI-1: Reduce Construction Noise to the Extent Possible. If construction activities associated with the Proposed Project have the potential to exceed the County's construction noise thresholds at nearby on- and off-site sensitive receptors, including during pile driving or other high noise construction activities, the Project Applicant(s)/Contractor(s) shall implement the following noise reduction measures during construction:

- To the extent feasible, construction activities shall occur between the hours of 7:00 am to 7:00 pm on Monday through Friday and 8:00 am to 6:00 pm on Saturdays, consistent with Section 12.08.520 of the

County of Los Angeles Code of Ordinances. Construction activities shall not occur at any time on Sundays or legal holidays. Construction personnel shall not be permitted on the job site, and material or equipment deliveries and collections should not be permitted outside of these hours. If construction activities must occur outside of the allowable hours, the Project Applicant(s)/Contractor(s) shall follow necessary procedures to obtain an appropriate variance in accordance with Section 12.08.580 of the County of Los Angeles Code of Ordinances prior to conducting such activities. Construction activities occurring outside the allowable hours shall comply with all conditions of the approved variance.

- To the fullest extent practicable, the quietest available type of construction equipment shall be used. Newer equipment is generally quieter than older equipment. The use of electric powered equipment is typically quieter than diesel or gasoline powered equipment, and hydraulic powered equipment is typically quieter than pneumatic power.
- Where feasible, impact pile driving shall be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles.
- All construction equipment shall be properly maintained. Poor maintenance of equipment typically causes excessive noise levels.
- All construction equipment, stationary and mobile, shall be equipped with properly operating and maintained mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features that meet or exceed original factory specification and are properly maintained and functioning during construction activities. Mobile or fixed “package” equipment (e.g., arc welders, air compressors) shall be equipped with shrouds and noise control features that are readily available for that type of equipment.
- All noisy equipment shall be operated only when necessary, and should be switched off when not in use.
- The use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. To the extent feasible, temporary barriers shall be employed around the Project Site and/or around noisy construction equipment, specifically pile driving equipment. For barriers to be effective they shall break the line-of site between the equipment and any noise-sensitive receiver. These barriers may be constructed as follows:

- From commercially available acoustical panels lined with sound absorbing material (the sound absorptive faces of the panels should face the construction equipment).
- From common construction materials such as plywood and lined with sound absorptive material (the sound absorptive material should face the construction equipment).
- From acoustical blankets hung over or from a supporting frame. The blankets shall provide a minimum sound transmission class (STC) rating of 28 and a minimum noise reduction coefficient (NRC) of 0.80 and shall be firmly secured to the framework with the sound absorptive side of the blankets oriented towards the construction equipment. The blankets shall be overlapped by at least 6" at seams and taped so that no gaps exist. The largest blankets available shall be used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier.

Impact NOI-2 No feasible mitigation available.

Impact NOI-4 **Mitigation Measure NOI-4: Reduce Construction-Generated Groundborne Vibration to the Extent Possible.** The Project Applicant(s)/Contractor(s) shall implement the following vibration reduction measures during construction:

- Through coordination with the County where possible, impact pile driving should be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles.
- Distance requirements for eligible or listed historical structures (as defined in Chapter 3.4, *Cultural Resources,* of this Draft SEIR):
  - Pile driving shall not be operated within 135 feet, vibratory rollers within 36 feet, or other heavy equipment (e.g., bulldozer) within 20 feet.
- Distance requirements for non-engineered and masonry buildings:
  - Pile driving shall not be operated within 100 feet, vibratory rollers within 25 feet, or other heavy equipment (e.g., bulldozer) within 15 feet.

Impact NOI-5 **Mitigation:** Implement Mitigation Measure NOI-1.

Impact NOI-6 **Mitigation:** Implement Mitigation Measure NOI-3a through NOI-3d.

Impact NOI-7 **Mitigation:** Implement Mitigation Measure NOI-4 and Mitigation Measure CUL-1c.

Findings:

The County hereby adopts CEQA Findings 1 and 3. As described in the *Statement of Overriding Considerations*, the County has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact NOI-1:

- Construction activities associated with the Proposed Project would generate noise levels that could exceed applicable construction noise thresholds at nearby on- and off-site sensitive receptors. While the implementation of Mitigation Measure NOI-1 would reduce construction noise levels, certain construction activities, including potential pile driving, could still result in noise levels that exceed applicable thresholds. All feasible mitigation measures were considered in the Draft and Final SEIR. Because the potential for pile driving exists and construction noise impacts cannot be reduced to a less-than-significant level with mitigation, construction noise impacts would be significant and unavoidable.

Impact NOI-2:

- Existing noise levels along the segment of Marengo Street between Lord Street and State Street already exceed the applicable exterior noise standard (approximately 70 dBA CNEL); several existing residences are located adjacent to the roadway and are projected to experience an increase of approximately 3 dBA CNEL under Proposed Project conditions. Although this increase is considered perceptible, the ambient noise environment in this corridor already exceeds 65 dBA CNEL based on observed ambient noise measurements. A range of potential traffic noise mitigation measures was considered, but all such measures were determined to be infeasible. Installation of sound walls or other barriers along Marengo Street would require use of right-of-way that is not currently available, and while residential driveways are oriented toward Lord Street and State Street rather than Marengo Street, the presence of intersecting streets at both ends of the affected segment would still constrain barrier placement, limit effectual shielding, and reduce attenuation benefit to receptors. Additionally, any barrier tall enough to provide significant noise reduction would conflict with existing utilities, sidewalks, and required visibility zones near intersections.

  No feasible mitigation measures have been identified that would substantially reduce impacts associated with a substantial increase in traffic noise levels for all roadways showing significant impacts. For these reasons, the noise reduction measures evaluated were found

to be infeasible and are not recommended for implementation. Therefore, impacts would remain significant and unavoidable.

Impact NOI-4:

- While the implementation of Mitigation Measure NOI-4 would reduce construction vibration levels, if pile driving is required, Mitigation Measure NOI-4 would not reduce construction vibration impacts to a less that significant level. In addition, as it relates to vibration impacts to historic structures, Mitigation Measure CUL-1c shall be implemented, which requires that, prior to the commencement of construction activities adjacent to a historical resource, a Conditions Assessment Report will be completed by a Historic Architect to identify baseline conditions and a Monitoring Plan, prepared by a civil engineer, to establish survey monuments and document and record the positions of adjacent buildings, structures, sidewalks, utilities, facades, and surface features to form a baseline for determining settlement or deformation.

Impact NOI-5:

- Because the Proposed Project results in a significant and unavoidable impact to construction noise, the Proposed Project's contribution to cumulative construction noise is considered cumulatively considerable. While the implementation of Mitigation Measure NOI-1 would reduce construction noise levels at the Project Site, Mitigation Measure NOI-1 would not reduce construction noise impacts to a less than significant level if pile driving is conducted. If pile driving is not conducted, Mitigation Measure NOI-1 would reduce the Proposed Project's construction noise levels to a less-than-significant impact. All feasible mitigation measures were considered in the Draft and Final SEIR. Because there is a potential for pile driving to occur during construction, cumulative construction noise impacts are considered significant and unavoidable.

Impact NOI-6:

- Because the Proposed Project results in a significant and unavoidable impact to operational noise, the Proposed Project's contribution to cumulative operational noise is considered cumulatively considerable. With the implementation of Mitigation Measures NOI-3a through NOI-3d, operational impacts associated with the Proposed Project would be reduced to less than significant levels as these mitigation measures would ensure compliance with noise standards. However, no feasible mitigation measures have been identified to reduce traffic-related noise impacts and cumulative impacts would be significant and unavoidable.

Impact NOI-7:

- Because the Proposed Project results in a significant and unavoidable impact to construction vibration, the Proposed Project's contribution to cumulative vibration impacts is considered

cumulatively considerable. While the implementation of Mitigation Measure NOI-4 would reduce construction vibration impacts to a less that significant level under typical construction methods, if pile driving is required, cumulative impacts would be reduced but remain significant and unavoidable. All feasible mitigation measures were considered in the Draft and Final SEIR. In addition, as it relates to vibration impacts to historic structures, Mitigation Measure CUL-1c shall be implemented, which would ensure no indirect structural damage would occur.

RECREATION

Environmental Impact

The Proposed Project would have a significant and unavoidable impact related to recreation as follows:

- **Impact REC-1:** Construction of recreational facilities would potentially have an adverse effect on air quality, noise, and transportation.
- **Impact REC-3:** The Proposed Project, together with cumulative projects, would have a substantial construction impact on recreational facilities related to increases in ambient noise.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR. As described in detail in the Final SEIR (Chapter 2, *Responses to Comments*), certain mitigation measure revisions or additions suggested by South Coast AQMD (see responses to comments A5-9, A5-10, and A5-11) and LAUSD (see responses to comments A3-5, A3-6, A3-8, and A3-9 of the Final SEIR) were determined to be either not applicable to the Proposed Project, or infeasible.

Impact REC-1	**Mitigation:** Implement Mitigation Measures AIR-1a through AIR-1b and NOI-1 and NOI 4.
Impact REC-3	**Mitigation:** Implement Mitigation Measures AIR-1a through AIR-1b and NOI-1 and NOI 4.

Findings:

The County hereby adopts CEQA Findings 1 and 3. As described in the *Statement of Overriding Considerations*, the County has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact REC-1:

- Mitigation measures to reduce impacts to air quality are described in Chapter 3.2, *Air Quality*, of the Draft SEIR. Mitigation measures to reduce noise impacts are described in Chapter 3.11, *Noise*, of the Draft SEIR. Mitigation measures to reduce impacts to transportation are described in Chapter 3.15, *Transportation*, of the Draft SEIR. The Proposed Project would result in significant and unavoidable construction-related effects on the environment with respect to noise, which cannot be fully mitigated, as detailed in Chapter 3.11, *Noise*, of the Draft SEIR. Mitigation measures are applied to reduce the impacts to the extent feasible.

Impact REC-3:

- The Proposed Project would result in significant and unavoidable construction-related effects on the environment with respect to noise, which cannot be fully mitigated, as detailed in Chapter 3.11, *Noise*, of the Draft SEIR. Mitigation measures are applied to reduce the impacts to the extent feasible.

CHAPTER 3.15, TRANSPORTATION

Environmental Impact

The Proposed Project would have a significant and unavoidable impact related to transportation as follows:

- **Impact TRA-3:** Operation of the Proposed Project could create potentially significant impacts to geometric hazards due to queuing at four affected off-ramp locations.
- **Impact TRA-7:** Because the Proposed Project's operational traffic impacts are significant, the Proposed Project's contribution to cumulative geometric transportation hazards is considered cumulatively considerable.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were made as a result of comments received on the Draft SEIR. As described in detail in the Final SEIR (Chapter 2, *Responses to Comments*), certain mitigation measure revisions or additions suggested by LAUSD (see response to comments A3-10 and A3-11 of the Final SEIR), Caltrans (see responses to comments A4-7, A4-), and LADOT (see responses to comments A7-12 through A4-21) were determined to be either not applicable to the Proposed Project, or infeasible.

Impact TRA-3

Due to the programmatic nature of a 25-year buildout of the Proposed Project, and the multiple agency authorizations required to implement the measures herein: For all future developments as part of the Proposed Project, the Project Applicant(s)/Contractor(s) shall consult with County and relevant appropriate agencies to develop mechanisms as to when the conceptual improvements identified in Mitigation Measures TRA-3(a)-(e) are implemented based on phased buildout of the Proposed Project. The following three-step process shall be followed to determine whether a development project could result in Impact TRA-3.

Step 1: Determine whether cumulative land use, including the development, would exceed 15 percent of any single Proposed Land Use Category in the table below.

- If No: No further analysis is required, and no physical improvements are necessary.
- If Yes: Proceed to Step 2

Step 2: If a Proposed Project would result in any single Proposed Land Use exceeding 15 percent, prepare a trip generation and Transportation Demand Management (TDM) analysis.

Step 3: If the cumulative trips, after applying TDM strategies, would exceed the inbound or outbound trips associated with 15 percent of Proposed Project buildout, prepare a detailed off-ramp queuing analysis. The results of the off ramp queuing analysis will determine whether the development's trips, combined with cumulative trips, would result in a queuing impact at the identified off-ramp location.

Proposed Land Use	Units/Counts	Square Footage
Residential	3,200 housing units	2,300,000
General Office	--	400,000
Medical Office	--	735,300
Retail	--	320,000
Patient and Caregiver Lodging	200 rooms	80,000
Community Facilities	--	350,000
Education	--	110,000
Warehouse	--	160,000
Clean Tech/ Light Industrial	--	200,000
Hospital	450 beds	400,000
Parking	8,588 spaces	3,005,678

Proposed Land Use	Units/Counts	Square Footage
Total	**3,200 du 450 hospital beds 200 rooms 8,588 parking spaces**	**8,060,978 square feet of new development**

Mitigation Measure TRA-3a: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 southbound off-ramp to Mission Road.

- Re-stripe the off-ramp lane configuration from:
  - Left turn lane, shared through-left lane, and a right lane; to
  - two left turn lanes and one shared through-right turn lane.
- Optimize signal timing along the Mission Road coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' Intersection Safety Operational Assessment (ISOAP) methodology as appropriate to design and implement intersection improvements.
- Coordinate with Caltrans to evaluate expanding ramp storage using concrete/landscaped area in-between existing off-ramp and freeway mainline, and implement as determined by the appropriate implementing agencies.

Mitigation Measure TRA-3b: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to State Street.

- Re-stripe the off-ramp lane configuration from:
  - Left turn lane, right turn lane; to
  - shared left-right turn lane and a right turn lane.
- Optimize signal timing along the State Street coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements.
- Coordinate with Caltrans to evaluate expanding ramp storage using landscaped slope area in-between existing off-ramp and freeway

connector (north side of off-ramp), and implement as determined by the appropriate implementing agencies.

Mitigation Measure TRA-3c: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to Soto Street.

- Re-stripe the off-ramp lane configuration from:
  - Left turn lane, shared through-left turn lane, and two right turn lanes; to
  - two left turn lanes, one through lane, and one right turn lane.
- Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements
- Coordinate with Caltrans and City to evaluate striped shoulder area along north side of existing off-ramp, and implement as determined by the appropriate implementing agencies.

Mitigation Measure TRA-3d: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 northbound off-ramp to Cesar Chavez Avenue.

- Optimize signal timing along the Cesar Chavez Avenue coordinated corridor, including cycle length, offset, and phase splits.
- Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements.

Mitigation Measure TRA-3e: A TDM program shall be implemented as part of the individual development of projects aimed at reducing vehicular trips to the Project Site, which may mitigate Project-induced freeway off-ramp queuing hazards. Project Applicant(s)/Contractor(s) will incorporate TDM strategies and estimate their effectiveness. TDM strategies that the Proposed Project could implement to result in a quantitative reduction in vehicular trips include, but are not limited to, to the following:

- Trip Reduction Strategies
  - Implement Commute Trip Reduction Program (Voluntary for Mandatory)

  - Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)
  - Implement Commute Trip Reduction Marketing
  - Provide Ridesharing Program
  - Implement Subsidized or Discounted Transit Program - All Trips
  - Provide End-of-Trip Bicycle Facilities
  - Provide Employer-Sponsored Vanpool
- Parking Strategies
  - Price workplace parking
  - Implement Employee Parking Cash-Out
  - Limit Residential Parking Supply
  - Unbundle Residential Parking Costs from Property Cost
- School
  - Coordinate with Los Angeles Unified School District (LAUSD) to establish a School Bus Program
  - Active Modes of Transportation for Youth

Impact TRA-7 **Mitigation:** Implement Mitigation Measures TRA-3a through TRA-3e.

Findings:

The County hereby adopts CEQA Findings 1, 2, and 3. Even with implementation of all feasible mitigation measures identified, this impact would remain significant and unavoidable. Additionally, improvements included as part of the mitigation are subject to coordination and approval with other jurisdictions (namely LADOT and Caltrans). However, as described in the *Statement of Overriding Considerations*, the County has determined that this impact is acceptable because such alterations are within the responsibility and jurisdiction of the California Department of Transportation (Caltrans) and not the agency making the finding and specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact TRA-3:

- Mitigation Measure TRA-3a through TRA-3e would reduce geometric hazards associated with freeway off-ramp queuing, but queues would still exceed available storage during at least one peak hour at each location, resulting in a significant and unavoidable impact.

Additionally, Mitigation Measure TRA-3a through TRA-3e are within the jurisdiction of Caltrans and coordination regarding timing and extent of improvements with that agency would be required.

Mitigation Measures TRA-3a through TRA-3d would reduce off-ramp queues; however, only the I-10 off-ramp to Soto Street would potentially operate within lane storage limits during both peak hours after mitigation. At the I-5 southbound off-ramp to Mission Road, the I-5 northbound off-ramp to Cesar Chavez Avenue, and the I-10 westbound off-ramp to State Street, 2050 with Project queues would still exceed available storage in the AM peak hour.

Mitigation Measures TRA-3a through TRA-3d would reduce off-ramp queueing by increasing vehicular throughput. However, those mitigation measures rely on longer signal cycles, which could increase pedestrian delay and degrade pedestrian level of service. Though the listed improvements do not add lanes, Caltrans generally recommends safety mitigation measures that do not adversely affect pedestrians or other vulnerable road users. Per the LDR Guidance, Caltrans generally recommends the following safety impact mitigation strategies:

- Transportation demand management (TDM) program(s) to reduce the project's trip generation, which may include increased transit access, commute trip reductions such as rideshare programs, shared mobility facilities (bicycle or vehicle), and increased bicycle and pedestrian infrastructure.
- Investments in existing active transportation infrastructure, or transit system amenities (or expansion) to reduce the project's trip generation.

  TDM programs can result in vehicle trip/VMT reductions due to certain types of Project Site modifications, programming, and operational changes. In turn, reductions in Proposed Project-generated vehicle trips would reduce the number of vehicles exiting the freeway to access the Project Site, reducing the effect on geometric hazards related to off-ramp queueing.

  The TDM options described herein are a list of strategies that future developments under the Proposed Project would consider for implementation. The strategies listed are described in greater detail in the California Air Pollution Control Officers Association (CAPCOA) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (CAPCOA Handbook) (2024). The CAPCOA Handbook quantifies VMT and Greenhouse Gas (GHG) reductions associated with TDM strategies, factoring in project attributes such as land use type, workforce size, and resident characteristics.

  The TDM programs described in MM TRA-3e would be implemented at a project level, as appropriate as defined in the mitigation measure. Because the specific phasing, site design, land use mix, and operational characteristics of future project under the Proposed Project are not known at the programmatic level, the VMT and trip-reduction benefits of MM TRA-3e cannot be quantified at this time with a reasonable degree of certainty. Accordingly, the analysis conservatively evaluates transportation impacts based on the maximum development scenario.

Impact TRA-7:

- Because the Proposed Project results in a significant and unavoidable impact to geometric transportation hazards, the Proposed Project's contribution to cumulative transportation hazards is considered cumulatively considerable. All feasible mitigation measures were considered in the Draft and Final SEIR. While implementation of Mitigation Measure TRA-3a through TRA-3e would reduce impacts, it would not reduce transportation hazards impacts to a less than significant level. Cumulative impacts would be significant and unavoidable.

CHAPTER 3.17, UTILITIES AND SERVICE SYSTEMS

Environmental Impact

The Proposed Project would have a significant and unavoidable impact related to utilities and service systems as follows:

- **Impact USS-1:** Operation of the Proposed Project could have a water demand that exceeds the capacity of water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.
- **Impact USS-2:** Operation of the Proposed Project could generate wastewater that exceeds the capacity at existing wastewater facilities.
- **Impact USS-3:** Operation of the Proposed Project, together with other past, present, and reasonably foreseeable projects within the LAPDW's service area, could have a water demand that exceeds the capacity of water supplies.
- **Impact USS-4:** Operation of the Proposed Project, together with other past, present, and reasonably foreseeable projects within the wastewater service area, could generate wastewater that exceeds the capacity at existing wastewater treatment facilities.

Mitigation Measures:

The following mitigation measures were included in the Draft SEIR and the Final SEIR and are applicable to the Proposed Project. The measures as provided include any revisions incorporated in the Final SEIR that were in the Final SEIR.

Impact USS-1

Mitigation Measure USS-1: As part of the site plan review for any future individual development project under the Proposed Project that is considered for construction and operation in 2045 or later, and that is also defined as a "water-demand project" in Section 15155 of the State CEQA Guidelines, the County shall request, pursuant to Section 15155, that the water provider, the City of Los Angeles Department of Water and Power (LADWP), determine whether the projected water demand associated with these project(s) was included in the most recently adopted urban water management plan. If required pursuant to Section 15155, the County shall request that LADWP prepare water supply

assessment(s) for these future projects. The County shall determine, pursuant to Section 15155, whether projected water supplies would be sufficient to satisfy the demands of the future project(s), in addition to existing and planned future uses within LADWP's service area.

Impact USS-2 **Mitigation Measure USS-2:** Prior to issuance of a building permit for a Project Applicant/Contractor under the Proposed Project that could result in an increase in wastewater generation, the Project Applicant(s)/Contractor(s) shall coordinate with the City of Los Angeles Bureau of Sanitation to conduct further detailed gauging and evaluation to identify a specific sewer connection point with sufficient capacity. If the public sewer has insufficient capacity, then the County shall be required to build a sewer line to a point in the sewer system with sufficient capacity.

Impact USS-3 **Mitigation:** Implement Mitigation Measure USS-1.

Impact USS-4 **Mitigation:** Implement Mitigation Measure USS-2.

Findings:

The County hereby adopts CEQA Findings 1 and 3. As described in the *Statement of Overriding Considerations*, the County has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the Proposed Project outweigh its significant effects on the environment.

Facts in Support of Findings:

Impact USS-1:

- Implementation of Mitigation Measure USS-1 would require the County to assess the availability of water supplies to accommodate future development with the Project Site that would be implemented beyond the year 2045. Because the Proposed Project is a long-term Master Plan, the timing and extent of future projects and the availability of water supplies beyond 22045 cannot be determined at the programmatic level. Accordingly, while Mitigation Measure USS-1 would require future evaluation of water supply availability, it cannot be confirmed at this time that sufficient water supplies would be available to serve all future development accommodated under the Proposed Project. Therefore, if it is determined that water supplies would not be sufficient to meet future water demands, impacts would remain significant and unavoidable.

Impact USS-2:

- Although the Proposed Project would implement Mitigation Measure USS-2 to reduce Project-related impacts, the need for future sewer conveyance improvements would depend on specific characteristics of future projects accommodated under the Proposed Project. Because the location, scale, timing, and funding of any required improvements cannot be determined at the programmatic level, the environmental impacts and effectiveness of such improvements cannot be evaluated with the information currently available. Because the location, scale, and timing of potential conveyance improvements have not been identified and the environmental impacts of such improvements cannot be determined with the information currently available, it cannot be concluded that wastewater impacts would be reduced to a less-than-significant level. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, the Proposed Project's impact on the capacity of existing wastewater facilities would remain significant and unavoidable.

Impact USS-3:

- Implementation of Mitigation Measure USS-1 would assess the availability of water supplies to accommodate future development that would be implemented beyond the year 2045. Because the Proposed Project is a long-term Master Plan, the timing and extent of future projects and the availability of water supplies beyond 22045 cannot be determined at the programmatic level. Accordingly, while Mitigation Measure USS-1 would require future evaluation of water supply availability, it cannot be confirmed at this time that sufficient water supplies would be available to serve all future development accommodated under the Proposed Project. Therefore, the Proposed Project's contribution to cumulative water supply impacts would be cumulatively considerable if it is determined that water supplies would not be sufficient to meet future water demands. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, impacts would remain significant and unavoidable.

Impact USS-4:

- Although the Proposed Project would implement Mitigation Measure USS-2 to reduce Project-related impacts, the need for future sewer conveyance improvements would depend on specific characteristics of future projects accommodated under the Proposed Project. Because the location, scale, timing, and funding of any required improvements cannot be determined at the programmatic level, the environmental impacts and effectiveness of such improvements cannot be evaluated with the information currently available. Because the location, scale, and timing of potential conveyance improvements have not been identified and the environmental impacts of such improvements cannot be determined with the information currently available, it cannot be concluded that cumulative wastewater impacts would be reduced to a less-than-significant level. All feasible mitigation measures were considered in the Draft and Final SEIR. Therefore, the Proposed Project's contribution to cumulative wastewater impacts would be cumulatively considerable, and cumulative impacts would remain significant and unavoidable.

V. ALTERNATIVES TO THE PROPOSED PROJECT

Alternatives Considered and Rejected During the Scoping/Project Planning Process

The following is a discussion of alternatives considered during the scoping and planning process and the reasons why they were not selected for detailed analysis in the Draft SEIR.

NO PROJECT/NO REDEVELOPMENT ALTERNATIVE

The No Project/No Redevelopment Alternative would involve continued operation of the Project Site as currently developed but would not allow development pursuant to existing entitlements and approvals (namely the 2014 Master Plan). Routine maintenance and updates to existing buildings would continue to occur; however, no redevelopment pursuant to the approved 2014 Master Plan would occur. No demolition of existing structures would occur, and the critical seismic upgrades to support the adaptive reuse of the General Hospital Building, as further detailed under the Proposed Project, would not be implemented through a public-private partnership or any other means. No new environmental impacts would occur with this alternative due to the lack of future development, and this alternative would be inconsistent with the prior approvals the County has issued for the Project Site. Because this alternative would not allow implementation of the Proposed Project or redevelopment of the Campus consistent with the previously approved 2014 Master Plan framework, it would not achieve several key objectives of the Proposed Project, including objectives related to modernization of Campus facilities, adaptive reuse of existing structure, implementation of a coordinated long-term planning framework for the Campus, and accommodating future growth in employment, housing, and supporting uses. Additionally, as the Project Site is owned by the County and the County has elected to show consistency with the County of Los Angeles General Plan 2035, this alternative would be inconsistent with the County of Los Angeles General Plan 2035 objectives. Specifically, this alternative would not meet the County's goal of accommodating new housing and jobs in anticipation of population growth in the County and the region. Moreover, this alternative would not help the City or County meet its Regional Housing Needs Assessment goals because no new residential uses would be developed within the County. Additionally, without implementation of redevelopment activities that include rehabilitation, stabilization, or replacement of aging structures, certain historic resources could continue to deteriorate over time due to age, deferred maintenance, and ongoing operational wear. Continued deterioration of historic resources may result in the gradual loss of historic integrity, which could represent an adverse outcome for cultural resources. Therefore, the County finds that the No Project/No Redevelopment Alternative is not feasible.

While the No Project/No Redevelopment Alternative would avoid many of the environmental impacts associated with redevelopment of the Campus, CEQA requires that alternatives be capable of feasibly attaining most of the basic objectives of the Proposed Project. Because this

alternative would not implement the Campus modernization or long-term planning framework contemplated by the Proposed Project, it would not feasibly attain most of the Proposed Project's fundamental objectives.

ALTERNATE SITE ALTERNATIVE

CEQA requires that the discussion of alternatives focus on alternatives to the Proposed Project or its location, which are capable of avoiding or substantially lessening any significant effects of the Proposed Project while feasibly attaining most of the project's basic objectives. The key parts of the alternative location analysis are (1) the availability of alternative locations that are of necessary size and location that are available or owned by the applicant and (2) the consistency of the selected alternative location(s) with Proposed Project objectives and County adopted plans. Further, the analysis focuses on whether any of the significant effects of the Proposed Project would be avoided or substantially lessened by developing the Proposed Project at another location. Only alternate locations that would avoid or substantially lessen any of the significant effects of the Proposed Project need be considered for inclusion in the Draft SEIR (State CEQA Guidelines, Section 15126.6[f][2][A]).

As detailed in Chapter 3, *Project Description*, of the Draft SEIR, the Project Site is owned by the County of Los Angeles and is located within the boundaries of the City of Los Angeles. The Project Site is developed with buildings and structures that support the existing Medical Center. All existing and future development plans for the Proposed Project would occur within the Project Site.

In considering the feasibility of alternate locations, the County evaluated general planning considerations such as the availability of sites of sufficient size (approximately 81.9 acres) to accommodate the Proposed Project, proximity to the existing Campus and the communities it serves, access to existing infrastructure and transit, and compatibility with surrounding land uses. Based on these considerations, no alternative sites were identified that would feasibly accommodate the Proposed Project while meeting most of its basic objectives.

The Proposed Project is intended to occur within the existing Campus and involves redevelopment and integration of multiple facilities, including existing buildings and new development that support institutional, residential, and supporting uses. As a result, implementation of the Proposed Project requires a site of sufficient size to accommodate these uses within an integrated campus environment and to allow coordination with existing facilities, infrastructure, and circulation systems. Many potential sites within the surrounding urbanized area would not provide the necessary size or configuration to support this type of integrated campus development.

In order to achieve an integrated Campus environment, the Alternate Site must be comprised of parcels or areas that are contiguous or immediately proximate to each other, of adequate size, within the City of Los Angeles, and owned by the County and capable of functioning as part of a coordinated campus. The existing Los Angeles County General Hospital Campus, consists of

multiple parcels located in proximity to one another, including parcels separated by public streets such as Marengo Street, Zonal Avenue, and Mission Road, but operate collectively as a single Campus. Any alternate location must contain enough available space for infill development and not otherwise jeopardize County operational needs and functions.

Maintaining development within the existing Campus area allows for operational coordination between facilities, shared infrastructure and utilities, and efficient circulation for patients, staff, and emergency services. Locating project components at sites outside of the immediate Campus area would reduce operational efficiency, complicate coordination of medical services and support functions, and limit the ability to utilize existing infrastructure that supports the Campus. Accordingly, alternate sites located outside the immediate Campus area would not feasibly attain most of the fundamental objectives of the Proposed Project.

An alternate site would require purchase or negotiation of long-term leases, introducing uncertainty and potential delays. The availability of a County-controlled site would increase project feasibility. Additionally, relocating the Proposed Project to a different site, particularly a site without existing medical institution, would require greater environmental disturbance and a more extensive entitlement process, and could generate land use compatibility issues. Specifically, relocating the Proposed Project to a different site could require additional land use approvals depending on the zoning and land use designations of the alternate location, particularly if the site is not currently developed or planned for large-scale institutional or medical uses. Establishing a new medical or institutional campus at an alternate location could introduce land use compatibility considerations and require additional discretionary approvals. In contrast, the Project Site is already developed as part of the Los Angeles General Hospital Campus and contains existing buildings, infrastructure, and circulation systems that support medical and institutional uses. Development within the existing Campus area allows the County to utilize this established institutional setting and existing infrastructure rather than developing a new medical complex at a different location.

Because the Proposed Project's objectives are centered on redevelopment and modernization of the existing Campus, including adaptive reuse of existing facilities and implementation of a coordinated Campus planning framework, development at an alternate location would not feasibly attain most of the fundamental objectives of the Proposed Project. Additionally, Objective 6 of the Proposed Project's objectives is intended to provide uses that do not exist at the Project Site, which include commercial, residential, and educational uses. Moreover, the Project Site is strategically located within an established urban area of the City of Los Angeles that is well served by public transit and proximate to the populations and communities the facilities are intended to serve. Because the Project Site is already developed and contains existing structures, infrastructure, and disturbance areas that support the existing operation of the Campus, redevelopment on the Project Site allows the County to build upon an established medical campus. While alternate locations could be identified within urbanized areas, such site may not provide the same existing infrastructure or operational integration as the Project Site and could require additional site assembly, redevelopment, or land use transitions to

accommodate the Proposed Project. Alternative locations may not provide comparable accessibility to transit connectivity. Additionally, this alternative would not meet the Proposed Project's objectives relating to economic development because the County-owned site is currently underutilized. Moreover, this alternative would not include the preservation or protection of historic resources on-site.

Based on the foregoing analysis, an Alternative Site is not considered to be a feasible alternative for the Proposed Project. Additionally, the Proposed Project proposes to include existing development on the Project Site because the Campus functions as an interconnected facilities, infrastructure, and circulation systems. The Proposed Project involves the redevelopment, modernization, and adaptive reuse of existing facilities, which can only occur on the existing campus. Inclusion of the existing development allows the County to plan comprehensively for the long-term operation of the Campus, including coordination of land uses, infrastructure, circulation, and supporting services. Development at an alternate site would not facilitate modernization or adaptive reuse of the existing campus facilities and would not allow implementation of the coordinated campus planning framework contemplated by the Proposed Project.

PHASED/DELAYED ALTERNATIVE

The Phased/Delayed Alternative would propose the same overall development program under the Proposed Project and within the 25-year planning horizon; however, buildout would occur more gradually, over an extended duration. This alternative would concentrate major construction activities toward the latter years of the plan and could potentially result in reduced environmental effects if future construction technologies, energy efficiency standards, or regional transportation infrastructure improvements further reduce emissions or energy demand. However, the extent and timing of such improvements are uncertain and cannot be assumed with certainty for purposes of this analysis.

Accordingly, while delayed implementation could potentially allow the Project to benefit from future technological or regulatory improvements, these potential benefits are speculative and cannot be relied upon to substantially lessen the significant environmental impacts identified for the Proposed Project.

While the Phased/Delayed Alternative could eventually achieve the same overall development program as the Proposed Project, implementation of key components would occur over a longer timeframe. As a result, this alternative would delay achievement of several important objectives of the Proposed Project, including modernization of campus facilities and adaptive reuse of the General Hospital Building. Delaying these improvements could prolong reliance on aging infrastructure and postpone the operational and planning benefits associated with the Proposed Project.

Initial phases would focus on modernization, renovation, and lower-intensity improvements that generate fewer emissions and result in reduced environmental effects in the near term.

However, this reduction would be temporary and limited to early construction phases. Under this alternative, the same overall development program would ultimately be implemented, and subsequent construction phases would generate emissions, noise, and other environmental effects similar in intensity and duration to those identified for the Proposed Project.

In addition, operational impacts at full buildout would be substantially similar to those of the Proposed Project because the total amount, intensity, and type of development would not change. As a result, while near-term construction impacts may be incrementally reduced or deferred in the near team, this alternative would not avoid or substantially lessen the Proposed Project's significant and unavoidable impacts, including air quality, cultural resources, GHG emissions, noise, recreation, and transportation, which are primarily driven by the overall scale of development and long-term operations.

Alternatives Selected for Further Analysis

The following alternatives were determined to represent a reasonable range of alternatives because they would attain most of the basic objectives of the Proposed Project and avoid or substantially lessen any of the significant effects of the project. Any other options as described above were not considered to meet the basic project objectives or reduce or substantially reduce impacts.

ALTERNATIVE A: NO PROJECT/2014 MASTER PLAN DEVELOPMENT

According to Section 15156.6(e) of the State CEQA Guidelines, a "no project" alternative shall be evaluated to allow decisionmakers to compare the impacts of approving the Proposed Project with the impacts of not approving the Proposed Project. Additionally, the no project alternative may represent the continuation of an existing land use or ongoing operation into the future. Thus, the no project alternative represents a continuation of redevelopment uses identified in the previously approved 2014 Master Plan, which was analyzed in the 2014 Master Plan EIR, subsequent addenda, and exemption.

Under the No Project/2014 Master Plan Development (Alternative A), the Proposed Project would not be implemented and the approved 2014 Master Plan would allow for continued operation and incremental modernization of the Medical Center Campus, allowing for renovation, replacement, and expansion of existing buildings and utility infrastructure as needed to support ongoing medical, administrative, and supportive functions. Alternative A would also result in an enhanced connection between the east and west portions of the Project Site. No new comprehensive redevelopment or reconfiguration of the Campus would occur beyond what is currently approved. This alternative would allow for approximately 827,801 square feet of demolition and approximately 1,157,070 square feet of new construction — including a proposed 450-bed hospital (400,000 square feet) on the Project Site—consistent with the approved 2014 Master Plan framework. No adaptive reuse of the General Hospital Building would occur.

The Project Site would, therefore, remain developed consistent with prior County approvals, and future improvements would continue to occur in response to operational needs and regulatory requirements, as determined by the County. Overall, Alternative A would result in an approximately 83 percent reduction in development buildout when compared to the Proposed Project. Alternative A would result in less demolition and less new development.

Alternative A would generally reduce short-term environmental impacts associated with construction, including aesthetics, air quality, energy, GHG, noise and vibration, population and housing, public services, recreation, transportation, and utilities and service systems because it would avoid the scale and intensity of construction and redevelopment associated with the Proposed Project. However, several operational impacts would remain when compared to the Proposed Project. Specifically, Alternative A would reduce construction impacts related to aesthetics, air quality, energy, GHG, population and housing, public services, construction noise and vibration, recreation, transportation, and utilities and service systems. Certain operational impacts related to environmental topics areas such as transportation (vehicle trips), air quality and GHG emissions (vehicle and building operations), noise (routine vehicle activity and maintenance), and utilities and energy (continued operation of aging infrastructure), would be similar to existing conditions and, therefore, similar to or slightly reduced compared to the Proposed Project.

Alternative A would reduce most of the Proposed Project's significant and unavoidable impacts; however, these impacts would not be avoided. Critically, Alternative A would increase impacts on cultural resources and would not address existing deficiencies in open space, and sustainability. Additionally, the continuation of aging infrastructure and outdated site design could exacerbate cumulative impacts over time. This alternative would not include a residential component. Thus, this alternative would not maximize the provision of new housing to address the housing needs of the county and the greater Los Angeles region. Alternative A would provide opportunities for employment to the area; however, due to the reduction in development as compared to the Proposed Project, this alternative would generate less opportunities for employment as compared to the Proposed Project. Thus, this alternative would only partially promote economic and workforce development. Overall, while Alternative A would reduce impacts, this alternative would not address existing deficiencies and would forego the long-term environmental benefits associated with comprehensive redevelopment.

Findings:

The County finds that while Alternative A would reduce short-term construction impacts and would avoid the Proposed Project's operational air quality impacts, it would not achieve the long-term environmental and operational benefits, such as co-locating jobs and housing, provided by the Proposed Project. By relying on the 2014 Master Plan and retaining the existing development pattern, the alternative does not support the County's long-term vision for a modern, integrated, health-supportive campus. Overall, Alternative A is less environmentally advantageous over the long term and would partially meet the Proposed General Hospital

objectives, but would not achieve the same level of flexibility, housing delivery, sustainability, or long-term resilience as the Proposed Project.

ALTERNATIVE B: GENERAL HOSPITAL ADAPTIVE REUSE

Under the General Hospital Adaptive Reuse Alternative (Alternative B), redevelopment within the Project Site would be limited to the adaptive reuse of the General Hospital Building and immediately adjacent areas within the Los Angeles General Hospital–Acute Building Historic District. No new construction beyond the rehabilitation, critical seismic strengthening, and interior reconfiguration of the General Hospital to support the adaptive reuse and occupation of the General Hospital Building would occur. Broader Project Site redevelopment components included in the Proposed Project, such as additional new housing, new medical or administrative facilities, open space enhancements, circulation improvements, and Project Site-wide utilities upgrades would not be implemented. This alternative focuses solely on restoring the historic General Hospital Building for continued use but does not pursue the comprehensive, multi-use redevelopment envisioned in the Proposed Project.

Alternative B would result in a mixed range of environmental effects relative to the Proposed Project. Alternative B would largely avoid the majority of construction-related impacts associated with new building development elsewhere on the Project Site. This includes reduced construction-related impacts including noise, vibration, air quality, GHG emissions, and transportation. The footprint of construction activity would be substantially smaller than under the Proposed Project. In addition, Alternative B would reduce the Proposed Project's significant and unavoidable transportation hazards impact; however, impacts would remain significant and unavoidable. This alternative would avoid the Proposed Project's potentially significant and unavoidable impacts on historic resources.

The adaptive reuse of the General Hospital Building would still require interior renovation, seismic upgrades, and building systems replacement, which would result in similar types of construction impacts as the Proposed Project but at a much smaller scale. PDFs 1 through 3 would be implemented for Alternative B to ensure compliance with the existing Standards, thereby reducing historic impacts.

While construction impacts would be reduced, Alternative B may result in greater long-term impacts related to utilities, energy efficiency, and infrastructure performance, because the remainder of the Project Site would not be modernized. Aging pipes, electrical systems, stormwater infrastructure, and circulation deficiencies would remain in place. This alternative would not achieve the long-term environmental performance improvements associated with Project Site-wide modernization under the Proposed Project.

Findings:

The County finds that Alternative B would provide benefits in preserving the historic General Hospital Building. Alternative B meets the adaptive reuse objective most effectively, and

partially advances the housing and economic development objectives of the Proposed Project. However, due to the limited geographic scope of improvements, Alternative B would not meet the majority of the Proposed Project's objectives and would not achieve the County's long-term vision for a modern, integrated health supportive campus. Overall, Alternative B would partially meet certain objectives, particularly those related to historic preservation and limited economic activation, but would not adequately meet healthcare, housing, infrastructure, and long-term planning objectives compared to the Proposed Project.

ALTERNATIVE C: REDUCED DENSITY MEDICAL CAMPUS ALTERNATIVE

The Reduced Density Medical Campus Alternative (Alternative C), would allow for the demolition of previously approved buildings and structures approved for demolition under the 2014 Master Plan, buildings and structures proposed for demolition under the Proposed Project, and redevelopment of the Project Site, over a 25-year horizon, with uses related to the medical and community-serving uses included by the Proposed Project. Alternative C would implement the Proposed Project with a focus on medical-related uses and would not include the adaptive reuse of the approximately 1.2-million-square-foot General Hospital Building. Under the Proposed Project, the General Hospital Building could accommodate a mix of residential, commercial, office, patient and caregiver lodging, and community facility uses. Under Alternative C, these uses would not occur, and the building would remain unused or be retained for future determination. No residential, general office, retail, patient and care giver lodging, education, or clean tech/advanced industrial uses would be developed under Alternative C.

Alternative C would result in a mixed range of environmental effects relative to the Proposed Project. Alternative C would reduce construction-related impacts associated with new building development elsewhere on the Project Site. This includes reduced construction noise, vibration, air quality, GHG emissions, and transportation impacts. The footprint of new construction activity would be substantially smaller than under the Proposed Project, though site-wide demolition and utility improvements would occur. In addition, Alternative C would reduce the Proposed Project's significant and unavoidable transportation hazards impact; however, this alternative may not avoid this impact.

Similar to the Proposed Project, the ultimate location and massing of potential structures in relation to existing historic buildings to remain (i.e., the Old Administration Building, Los Angeles General Hospital–Acute Building and historic district) is unknown. Mitigation Measure CUL-1 would be implemented; however, impacts are assumed to remain significant and unavoidable, similar to the Proposed Project. However, because adaptive reuse of the General

Hospital Building would not occur, impacts on historic resources have the potential to be greater.

Findings:

The County finds that Alternative C would reduce construction-related impacts compared to the Proposed Project due to the reduced scale of redevelopment. However, significant and unavoidable impacts would remain. In addition, because Alternative C would not include improvements to or adaptive reuse of the General Hospital Building, it has the potential to result in greater long-term environmental impacts associated with the continued deterioration of this historic resource. While Alternative C would reduce the severity of certain significant and unavoidable impacts associated with the Proposed Project, it would not eliminate those impacts and would not achieve key project objectives related to rehabilitation and adaptive reuse of the General Hospital Building.

ENVIRONMENTALLY SUPERIOR ALTERNATIVE

As presented above, Alternative A, Alternative B, Alternative C would reduce certain environmental impacts compared to the Proposed Project. However, the scale and nature of the reductions vary. Alternative A would reduce construction-related impacts of the Proposed Project, but impacts would remain significant and unavoidable.

The environmental inferiority of Alternative A is driven by its land use pattern. Alternative A would continue to concentrate non-residential, job-generating uses in an area with a high concentration of employment and relatively low residential density, perpetuating a job–housing imbalance. However, this alternative would avoid the Proposed Project's significant and unavoidable impacts related to transportation hazard. Improvements on the Project Site would be based on the framework identified in the 2014 Master Plan. Under Alternative A, required safety/maintenance upgrades and infrastructure upgrades necessary to support continued use of the Campus would remain. Alternative A would result in greater overall environmental disturbance than Alternative B due to infrastructure relocation and broader Campus upgrades.

Alternative B would substantially reduce construction-related impacts compared to Alternative A and the Proposed Project by limiting redevelopment to the adaptive reuse of the General Hospital and Los Angeles General Hospital–Acute Building Historic District. This alternative would avoid the extensive Project Site-wide development footprint of the Proposed Project while still providing long-term environmental and community serving benefits with rehabilitation of the historic structure. Alternative B would reduce the Proposed Project's significant and unavoidable impacts; however, these impacts would remain significant and unavoidable.

Alternative C would reduce construction-related impacts of the Proposed Project, but impacts would remain significant and unavoidable. Alternative C has the potential to result in greater long-term environmental impacts due to lack of improvements to the General Hospital Building.

Alternative C would result in greater overall environmental disturbance than Alternative A and B as this alternative would result in demolition and construction across the Project Site. Alternative C would reduce the Proposed Project's significant and unavoidable impacts; however, these impacts would remain significant and unavoidable.

Based on the comparative analysis presented in the Draft SEIR, Alternative B is identified as the Environmentally Superior Alternative. While this alternative would not meet all of the Proposed Project's objectives, with respect to providing a mix of housing, job opportunities, varied land uses, community benefits, and developing a comprehensive planning and entitlement framework, this alternative would result in fewer overall environmental impacts than Alternatives A and C. When weighing both construction and operational impacts, Alternative B presents the most balanced and environmentally advantageous outcome among the alternatives evaluated.

In accordance with State CEQA Guidelines Section 15126.6(e)(2), Alternative B is identified as the Environmentally Superior Alternative because it would:

- Reduce the magnitude of the Proposed Project's greatest impacts,
- Avoid the long-term environmental drawbacks of the No Project Alternative, and

Provide meaningful environmental and historic benefits through reuse of the existing General Hospital Building and Los Angeles General Hospital–Acute Building Historic District.

CEQA STATEMENT OF OVERRIDING CONSIDERATIONS
REGARDING THE FINAL SUBSEQUENT ENVIRONMENTAL IMPACT REPORT
FOR THE
LOS ANGELES COUNTY
GENERAL HOSPITAL CAMPUS MASTER PLAN PROJECT
STATE CLEARINGHOUSE NO. 2014051061

I. INTRODUCTION

The County of Los Angeles (County), as the Lead Agency under the California Environmental Quality Act (CEQA), has prepared this Statement of Overriding Considerations for the Los Angeles County General Hospital Campus Master Plan Project (Proposed Project). The Statement of Overriding Considerations is prepared pursuant to CEQA Guidelines Section 15093 to document the County's determination that, although the Proposed Project would result in certain significant and unavoidable environmental impacts, the specific benefits of the Proposed Project outweigh those unavoidable environmental effects.

Regarding a Statement of Overriding Considerations, State CEQA Guidelines Section 15093 provides:

> (a) CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposal [sic] project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable."
>
> (b) When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.
>
> (c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091.

The County has considered the information contained in the Final Subsequent Environmental Impact Report (Final SEIR) prepared for the Proposed Project, together with the Findings of Fact

and other relevant information in the administrative record. The County has identified the Proposed Project's significant environmental impacts and the mitigation measures that would be adopted to substantially lessen or avoid those impacts, as applicable. After considering the full record before it, the County has determined that the following impacts would remain significant and unavoidable even after implementation of feasible mitigation measures.

- Air Quality (Impact AIR-2, AIR-4, AIR-5, and AIR-8)
- Cultural Resources (Impact CUL-1 and CUL-3)
- Greenhouse Gas Emissions (Impacts GHG-1 and GHG-2)
- Noise (Impacts NOI-1, NOI-2, NOI-4, NOI-5, NOI-6, and NOI-7)
- Recreation (Impacts REC-1 and REC-3)
- Transportation (Impacts TRA-3 and TRA-7)
- Utilities and Service Systems (Impacts USS-1, USS-2, USS-3, and USS-4)

Accordingly, this Statement of Overriding Considerations identifies the specific benefits of the Project that support the County's decision to approve the Project notwithstanding the above-referenced significant and unavoidable environmental impacts. The County finds that these benefits, individually and collectively, outweigh the Project's significant and unavoidable environmental effects. This Statement of Overriding Considerations is intended to be considered together with the County's Findings of Fact, the Final EIR, and the other materials comprising the administrative record for the Project.

CERTIFICATION

Having received, reviewed, and considered the SEIR for the Proposed Project, as well as other information in the record of proceedings on this matter, the County, as the lead agency, adopts and certifies the following Statement of Overriding Considerations. The Statement of Overriding Considerations set forth the environmental and other bases for current and subsequent discretionary actions to be undertaken by the County and responsible agencies for the implementation of the Proposed Project.

II. STATEMENT OF OVERRIDING CONSIDERATIONS

Pursuant to PRC Section 21081(b) and State CEQA Guidelines section 15093(a) and (b), the County is required to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the Proposed Project. The lead or responsible agency may then approve the project and adopt a "Statement of Overriding Considerations," which states in writing the specific reasons to support the lead or responsible agency's action based on the Final EIR and other information in the record (State CEQA Guidelines section 15093 and 15096(h)). These Statement of Overriding Considerations are based on substantial evidence in the record, including but not limited to the Final EIR, public testimony, and all other materials that constitute the record of proceedings.

The County finds and determines that (1) all significant environmental effects of the Proposed Project have been substantially lessened where feasible; (2) the Proposed Project will result in certain significant adverse environmental effects that cannot be avoided or reduced to a less-than-significant level even with incorporation of all feasible mitigation measures; and (3) there are no other feasible mitigation measures or feasible Project alternatives that will further mitigate, avoid, or reduce the remaining significant environmental effects to a less-than-significant level.

The County finds that the adoption and implementation of the Los Angeles County General Hospital Campus Master Plan Project will have the following economic, social, legal, and other considerable benefits:

1. The Proposed Project would preserve and adaptively reuse the historic General Hospital Building and associated historic district, ensuring the long-term rehabilitation, maintenance, and continued productive use of one of Los Angeles County's most significant civic and healthcare landmarks.

2. The Proposed Project would facilitate the redevelopment of an underutilized County-owned campus into a mixed-use community that integrates healthcare, housing, employment, education, community facilities, and supportive services within a centrally located urban area.

3. The Proposed Project would provide up to 3,200 housing units, including affordable, supportive, workforce, and other needed housing types, helping address housing shortages within Los Angeles County and regional housing goals.

4. The Proposed Project would expand opportunities for economic development, job creation of up to approximately 7,500 new jobs, workforce training, and local-serving businesses, thereby promoting long-term economic vitality for surrounding communities.

5. The Proposed Project would reinforce the Campus as a regional center for healthcare services by allowing modernization and expansion of medical, hospital, and medical office facilities necessary to meet existing and future healthcare demands.

6. The Proposed Project would improve pedestrian, bicycle, transit, and other multimodal connections within the Campus and between surrounding neighborhoods, reducing barriers to mobility and enhancing access to regional transportation systems.

7. The Proposed Project would create a cohesive network of publicly accessible open spaces, plazas, landscaped areas, and community gathering places that promote wellness, recreation, social interaction, and neighborhood connectivity.

8. The Proposed Project would replace and modernize aging utilities and infrastructure systems, improving operational efficiency, reliability, resiliency, and long-term functionality of the Campus.

9. The Proposed Project would support long-term resilience by developing infrastructure capable of withstanding natural hazards and providing reliable services during emergencies while maintaining the Campus's role as a public resource.

10. The Proposed Project would implement a comprehensive master planning framework that provides long-term certainty regarding future development, infrastructure investment, historic preservation, land use coordination, and environmental review for redevelopment of the Campus over the planning horizon.

After balancing the specific economic, social, housing, healthcare, infrastructure, historic preservation, sustainability, and other considerable benefits of the Proposed Project, the County finds that the remaining significant and unavoidable environmental effects are acceptable due to the factors described in the Statement of Overriding Considerations above.

MITIGATION MONITORING AND REPORTING PROGRAM

The California Environmental Quality Act (CEQA) requires a Mitigation Monitoring and Reporting Program (MMRP) for projects where mitigation measures are a condition of project approval and development (Public Resources Code, Section 21081.6.). The County of Los Angeles (County) has prepared the Draft and Final Subsequent Environmental Impact Report (SEIR) to address the environmental impacts of the Los Angeles County General Hospital (LACGH) Campus Master Plan (Proposed Project) and where appropriate, recommends mitigation measures that would avoid or substantially lessen the significant environmental impacts associated with the Proposed Project. This MMRP has been developed for the Proposed Project in compliance with Public Resources Code Section 21081.6 and State CEQA Guidelines Section 15097, *Mitigation Monitoring or Reporting*. The purpose of this MMRP is to ensure the implementation of mitigation measures identified as part of the environmental review for the Proposed Project. The public agency may choose whether its program will monitor mitigation, report on mitigation, or both. This MMRP includes the following information:

- The full text of the mitigation measures;
- The party responsible for implementing the mitigation measures;
- The timing for implementation of the mitigation measures; and
- The agency responsible for monitoring the implementation.

The County of Los Angeles (County) is the designated lead agency for the MMRP. The County is responsible for implementation of the MMRP, with the Los Angeles County Department of Economic Opportunity (DEO) as the lead in coordination. The MMRP will be used by County staff responsible for ensuring compliance with mitigation measures associated with the Proposed Plan. Monitoring will consist of review of appropriate documentation, such as plans or reports prepared by the party responsible for implementation or by field observation of the mitigation measure during implementation.

For purposes of implementation of the MMRP, “Project Applicant” and “Contractor”, is defined as the County, Developer, or Developer’s Assignee.

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
AIR QUALITY			
AIR-1a: To reduce volatile organic compounds (VOC) emissions during construction, the Project Applicant(s)/Contractor(s) shall use paints with a VOC content that meets the South Coast Air Quality Management District Super Compliant architectural coatings standard of less than 10 grams per liter (g/L) for coating building architectural surfaces during construction. This measure shall be noted on all site and construction plans.	Project Applicant or Project Contractor	During construction activities	County of Los Angeles Department of Economic Opportunity
AIR-1b: To reduce nitrogen oxide (NO_X) emissions during construction, the Project Applicant(s)/Contractor(s) shall implement the following measures during construction: ▪ Use construction equipment rated by the United States Environmental Protection Agency (USEPA) as having Tier 4 Final or higher exhaust emission limits for offroad equipment with engines 25 horsepower or higher. If Tier 4 Final equipment is not readily available, the contractor may apply other technologies available for construction equipment such that it would achieve a comparable reduction in NO_X and PM emissions comparable to that of Tier 4 construction equipment. Where alternatives to USEPA Tier 4 are utilized, the contractor shall be required to show evidence to the Project Applicant(s) that these alternative technologies would achieve comparable emissions reductions. Certifications or alternative reduction strategies shall be required prior to receiving a construction permit. ▪ Maintain a list of all operating equipment in use on the construction site during construction for verification by the County. The construction equipment list shall state the makes, models, Equipment Identification Numbers, Engine Family Numbers, and number of construction equipment on-site. ▪ Haul and delivery truck idling times shall be minimized by shutting equipment off when not in use or reducing maximum idling time to	Project Applicant or Project Contractor	During construction activities	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
less than three (3) minutes (beyond that required by 13 California Code of Resources [CCR] Chapter 10, Section 2485). Clear signage shall be provided for construction workers and construction vehicles at all access points. ▪ All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper conditions prior to operation. ▪ A traffic control plan shall be prepared and provided to the County. ▪ A carpool program for construction workers, including incentivizing carpooling as well providing bus service for crew members shall be implemented. ▪ Truck deliveries shall be consolidated when possible. ▪ The combined vehicle miles traveled per day for offsite haul truck trips associated with demolition debris and earthen material export/import hauling operations shall not exceed 8,930 miles per day (equivalent to 180 one-way truck haul trips at 49.61 miles per one-way trip, which is the average distance to nearby serving landfills). The construction contractor(s) overseeing hauling operations shall log the number of daily haul truck loads and the one-way haul trip distance for each truck haul load of either demolition debris or earthen material for days in which truck hauling of these materials occurs. ▪ The individual requirements under this mitigation measure shall be noted on all site and construction plans.			
AIR-2: Future private tenants/business entities (i.e., non-County of Los Angeles owned or operated businesses) for new development projects that own their own truck fleets for daily business operations shall only operate trucks that are either zero-emission (Z/E) and/or meet the California Air Resources Board NO_X emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr) for Class 2b through Class 8 vehicles	Project Developer or Facility Owner	Prior to the issuance of business license	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
with a gross vehicle weight rating over 8,500 pounds. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of Business License. In addition, the truck requirements under this mitigation measure shall be included in all leasing agreements. Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement that any owned Class 2b through Class 8 vehicles with a GWVR over 8,500 pounds used for daily business operations shall be either Z/E and/or meet the NO_X emissions standard of 0.02 g/bhp-hr. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase agreement) to the County to verify, to the County's satisfaction, that any owned vehicle subject to the requirements under this mitigation measure comply.			
AIR-4a: Project Applicant(s)/Contractor(s) for new development projects that would use off-road equipment (e.g., forklifts and yard trucks) in daily business operations shall only utilize electric-powered off-road equipment. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of a Business License. In addition, the limitation to use only electric-powered off-road equipment shall be included in all leasing agreements.	Project Applicant or Project Contractor	Prior to issuance of a business license for a new tenant/business entity	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only electric-powered equipment for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the County to verify, to the County's satisfaction, that any off-road equipment utilized will be electric-powered.			
AIR-4b: Project Applicant(s)/Contractor(s) for new development projects that would use transport refrigeration units (TRUs) in daily business operations use only electric standby and/or hybrid electric TRUs (E/S TRUs). All E/S TRUs shall comply with the California Air Resources Board's "Alternative Technology" requirements under Section 2477(e)(1)(A)(3) of the California Code of Regulations, Title 13, Article 8, Chapter 9, Division 3. The project developer/facility owner shall disclose this requirement to all tenants/business entities prior to the signing of any lease agreement. In addition, the limitation to use only E/S TRUs shall be included in all leasing agreements. Prior to issuance of a Business License for a new tenant/business entity, the Project Applicant(s)/Contractor(s) and tenant/business entity shall provide a signed document (verification document) to the Los Angeles County Department of Regional Planning noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only E/S TRUs for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities. In addition, if applicable, the tenant/business entity shall provide	Project Applicant or Project Contractor	Prior to issuance of a business license for a new tenant/business entity	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Regional Planning

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
documentation (e.g., purchase or rental agreement) to the Los Angeles County Department of Regional Planning to verify, to the County's satisfaction, that any TRUs utilized will be E/S TRUs.			
AIR-4c: To reduce idling emissions from transport trucks, Project Applicant(s)/Contractor(s) for new warehousing or general industrial development projects place signage at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations (e.g., Rule 2485). At minimum, each sign shall include: 1) instructions for truck drivers to shut off engines when not in use; 2) instructions for drivers of diesel trucks to restrict nonessential idling to no more than two consecutive minutes (compared to five minutes currently allowed under Rule 2485); and 3) telephone numbers of the building facilities manager and CARB to report violations. All signage shall be made of weatherproof materials. All site and architectural plans submitted to the County shall note the locations of these signs.	Project Applicant or Project Contractor	At the time the plans are submitted to the County	County of Los Angeles Department of Economic Opportunity
AIR-4d: All truck/dock bays for new proposed facilities that accommodate cold storage shall be electrified to facilitate plug-in capability and support use of electric standby and/or hybrid electric transport refrigeration units. All site and architectural plans submitted to the County shall note all the truck/dock bays designated for electrification. Prior to the issuance of a Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify electrification of the designated truck/dock bays.	Project Applicant or Project Contractor	Prior to the issuance of a certificate of occupancy	County of Los Angeles Department of Economic Opportunity
AIR-6: Prior to discretionary approval by the County of Los Angeles, if it is determined that a development project has the potential to emit nuisance odors, an odor management plan shall be prepared by the Project Applicant(s)/Contractor(s) and submitted to the Los Angeles County Department of Regional Planning for review and approval. Facilities that have the potential to generate nuisance odors include, but are not limited to: ▪ Wastewater treatment plants	Project Applicant or Project Contractor	Prior to discretionary approval by the County of Los Angeles	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Regional Planning

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
▪ Composting, green waste, or recycling facilities ▪ Fiberglass manufacturing facilities ▪ Painting/coating operations ▪ Large-capacity coffee roasters ▪ Food-processing facilities The odor management plan shall demonstrate compliance with the South Coast Air Quality Management District's Rule 402 for nuisance odors and be submitted to the County. The Odor Management Plan shall identify the best available control technologies for toxics (T-BACTs) that will be utilized to reduce potential odors to acceptable levels, including appropriate enforcement mechanisms. T-BACTs may include but are not limited to scrubbers (i.e., air pollution control devices) at the industrial facility. T-BACTs identified in the odor management plan shall be incorporated into the project's design and on-site plan(s).			
BIOLOGICAL RESOURCES			
BIO-1: Mitigation for Impacts to Special-Status Bats. To avoid impacts on roosting bats, preconstruction surveys shall be conducted by a qualified bat biologist prior to the on-set of construction within the vicinity of vacant buildings and prior to tree removal. During surveys, biologists shall avoid unnecessary disturbance of potentially occupied roosts. Full-spectrum acoustic detectors shall be used during emergence surveys to assist in species identification. If it is determined that trees or structures in the project area are being used by bats as roost sites, the following protective measures shall be implemented: ▪ Disturbance of maternity roosting structures or trees (e.g., structure removal, construction equipment operation near roosts, tree trimming or removal) shall not occur during the maternity period (April 15 to September 15) to avoid impacts on reproductively active females and active maternity roosts (whether colonial or solitary). The maternity roost shall remain undisturbed from the time it is located until the following September 15 or until a qualified biologist	Project Applicant or Project Contractor and Qualified Biologist	Prior to construction activities of work within the vicinity of vacant buildings Prior to tree removal	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
has determined the roost is no longer active. No construction work shall occur at the roost or within a 100-foot buffer zone (or an alternative buffer zone, as determined by the biologist) until September 15. ▪ Exclusion devices may be installed outside of the maternity period (September 16 to April 14) to preclude bats from occupying buildings during or prior to the on-set of construction. Exclusionary devices shall be installed only by or under the supervision of an experienced bat biologist. Eviction of bats roosting in trees outside the maternity season shall be done in favorable weather under the supervision of a qualified bat biologist and adhering to the following two-step removal process: ▪ On Day 1, for trees with cavities, crevices, and exfoliating bark, and that are found to support roosting bats, Step 1 would be removal of branches and limbs with no cavities. These limbs shall be removed by hand (e.g., using chainsaws). This will create a disturbance (noise and vibration) and physically alter the tree. Bats roosting in the tree that may not have been detected during the preconstruction survey, will either abandon the roost immediately (rarely) or, after emergence, will avoid returning to the roost. For foliage roosting bats, Step 1 would be to remove adjacent, smaller, or non-habitat trees to create noise and vibration disturbance that would cause abandonment. On Day 2, under the supervision of a qualified biological monitor familiar with the life history of subject bat species, the tree may be removed. ▪ Qualified biologists should search all downed roost trees for dead and injured bats. The presence of dead or injured bats that are species of special concern shall be reported to the California Department of Fish and Wildlife (CDFW). ▪ Non-maternity roost trees should ideally be removed or trimmed in the fall between September 16 and October 31. If the removal or trimming of non-maternity roost trees cannot be timed to occur within this period, tree trimming and removal of non-maternity roost			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
trees shall be timed to avoid periods of inclement or unseasonably cold weather to avoid impacts on bats in torpor (a period of seasonal inactivity). In all circumstances, qualified biologists shall monitor non-maternity tree removal.			
BIO-2: Mitigation for Impacts to Nesting Birds. Construction activities shall avoid the nesting season for birds to the extent feasible, or conduct preconstruction nesting bird surveys if construction activities are carried out during the nesting season. To ensure compliance with the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC), the Project Applicant(s), or through the general contractor(s), shall conduct all vegetation removal during the non-breeding season, between September 1 and January 31, or implement the following: If the removal of vegetation, demolition of buildings, or noise-generating construction activities are scheduled between February 1 and August 31, the County or Project Applicant/Contractor shall retain a qualified biologist (i.e., experienced with conducting nesting bird surveys) who shall conduct a focused nesting bird survey prior to the start of vegetation removal, building demolition, or noise-generating construction activities within any potential nesting habitat (all vegetation, buildings, eaves on buildings, etc.). The size of the nesting bird survey area shall be determined by a qualified biologist at the time of the survey and include the entire limits of disturbance. It may also include a buffer area if deemed necessary by the qualified biologist. The preconstruction nesting bird surveys shall be conducted no more than seven days prior to initiation of vegetation removal, building demolition activities, or noise-generating construction activities. If no active nests are detected during these surveys, no restrictions on Project activities are necessary. If active nests are found, a qualified biologist shall identify and flag an appropriate buffer around the nest, and no construction activities shall	Project Applicant or Project Contractor and Qualified Biologist	Prior to construction activities/during construction activities	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
occur within the buffer until the qualified biologist has determined that young have fledged or the nest is no longer active. The specific buffer width shall be determined by a qualified biologist at the time of discovery and vary according to the bird species, site conditions, and the type of work activities to be conducted. The survey results shall be submitted to the County for review and approval of the recommended nest buffer areas, if any, prior to commencement of any vegetation removal, building demolition, or noise-generating construction activities on the Project Site.			
BIO-3: Mitigation for Impacts to Protected Trees. Prior to removal, relocation, or maintenance of protected oak trees, a qualified arborist shall inventory and evaluate the health of protected oak trees on the Project Site and evaluate the potential for impacts. If the arborist determines that the proposed activity would cut, destroy, remove, relocate, inflict damage, or encroach into a protection zone of a protected oak tree, the Project Applicant/Contractor shall submit an application for approval to the Los Angeles County Department of Regional Planning and obtain approval prior to impacting a protected oak tree. The Project Applicant(s)/Contractor(s) shall be required to implement the conditions of approval, including planting and care of replacement trees and protections for non-impacted oak trees. When planting replacement trees is required, replacement trees shall be in the ratio of two trees planted for each tree impacted. Replacement trees shall be indigenous oak species and shall be at least 15-gallon size and measure at least one inch in diameter one foot above the base. Replacement trees shall be properly cared for and maintained for two years and replaced if they die within that period.	Project Applicant or Project Contractor and Qualified Arborist	Prior to removal, relocation, or maintenance of protected oak trees	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Regional Planning

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
CULTURAL RESOURCES (SEE ALSO ATTACHMENT 1 – HISTORICAL RESOURCES PROJECT DESIGN FEATURES)			
Mitigation Program for Adjacent New Construction If a new construction project is proposed for a site within 50 feet of an eligible or designated historical resource, then the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1a (Secretary Standards Compliance) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the project is adjacent to the resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the new construction is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the new construction is found to be adjacent to the identified resource, the Architectural Historian/Historic Architect shall assess the project, focusing on the application of Standards No. 9 and 10, both of which relate to adjacent new construction. If the Architectural Historian concludes that the new construction project meets the Standards, then the project is presumed to not have an impact on historical resources. During implementation of the project, the Project Applicant(s)/Contractor(s) shall apply Mitigation Measure CUL-1b (Project Review During Design and Construction) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawings and generally be available to the design team, as needed. If the proximity of new construction to historical resources is such that vibration during construction may cause them physical damage, as defined through Mitigation Measure NOI-4, the Project Applicant(s)/Contractor(s) shall also apply Mitigation Measure CUL-1c (Protection During Construction) and engage a qualified Historic	Project Applicant or Project Contractor and Qualified Architectural Historian	Prior to construction activities within 50 feet of an identified historical resource	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
Architect and Structural Engineer to prepare a Conditions Assessment Report and Construction Monitoring Plan.			
CUL-1a: Secretary Standards Compliance. For all instances in which a project is implementing activities under the Proposed Project within 50 feet of an eligible or designated historical resource identified in this Draft SEIR, the Project Applicant shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the future implementing project activity is adjacent to the identified historical resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the future implementing project activity is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the future implementing project activity is determined to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall conduct an assessment of whether the proposed treatment of the historical resource complies with the Secretary of the Interior's Standards for Rehabilitation ("the Rehabilitation Standards"). If the future implementing project activity is found to not be in compliance with the Rehabilitation Standards, then the Architectural Historian/Historic Architect shall provide recommendations for how to modify the design, siting, scale, massing, or architectural treatment of the future implementing development projects to the extent feasible to bring it into compliance, or as close to compliance as feasible, which shall be integrated into the design of the Proposed Project. The professional shall prepare a memorandum or equivalent level of documentation conveying the findings of the assessment, which shall be provided to the County.	Project Applicant or Project Contractor and Qualified Architectural Historian	Prior to construction activities within 50 feet of an identified historical resource	County of Los Angeles Department of Economic Opportunity
CUL-1b: Project Review During Design and Construction. For instances in which a future project involves adjacency to a historical resource (as determined under Mitigation Measure CUL-1a), the Project	Project Applicant or Project Contractor and	During project design and construction	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
Applicant(s)/Contractor(s) shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawing sets and generally be available to the design team during design and construction. The Architectural Historian/Historic Architect shall review Design Development (DD) and Construction Documentation (CD) drawing sets at 50% and 100% completion and provide a brief memo regarding ongoing project compliance with the Standards. Project review during construction shall occur quarterly and reported in memo format, which shall be provided to the County.	Qualified Architectural Historian	activities adjacent to a historical resource	
CUL-1c: Protection During Construction. Prior to the commencement of construction activities within proximity to, as defined in Mitigation Measure NOI-4, a historical resource, a Conditions Assessment Report will be completed by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to identify baseline conditions (cracks, deterioration, etc.). The report will be provided to the County. As part of this process, a Structural Engineer shall be consulted to determine whether any shoring or protection should be installed prior to commencement of construction activities. In addition, the Project Applicant(s)/Contractor(s) shall engage a Civil Engineer to prepare an Adjacent Building Construction Monitoring Plan ("Monitoring Plan"). The Monitoring Plan shall establish survey monuments and document and record the positions of adjacent buildings, structures, sidewalks, utilities, facades, and surface features to form a baseline for determining settlement or deformation. The Monitoring Plan shall include the following provisions: (1) shored excavation and adjacent buildings, structures, sidewalks, utilities, facades, and cracks shall be visually inspected at a minimum of one time per month; (2) survey monuments shall be measured at critical stages of excavation, shoring, dewatering, and construction but should not occur less frequently than once every thirty days; (3) monitoring reports shall	Project Applicant/Contractor/ Qualified Historic Architect	Prior to construction activities within proximity to a historical resource	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
be prepared by an appropriate technical professional California Professional Land Surveyor documenting the movement monitoring results and distributed to all appropriate parties, including the shoring engineer. The County shall be provided all documentation and be notified if movement exceeds predetermined thresholds and calculated amounts as required.			
CUL-2: Prior to any demolition, grading, or excavation related to the construction of facilities or improvements under the Proposed Project, a qualified archaeologist shall be retained by the Project Applicant(s)/Contractor(s) to determine which areas shall require cultural resources monitoring during initial ground disturbance. The location of construction activities that are likely to encounter subsurface sediments with archaeological sensitivity shall be determined by the qualified archaeologist upon review of project excavation and grading plans. If determined necessary by the qualified archaeologist, monitoring by a qualified archaeologist shall be conducted during all initial ground disturbing activities (e.g. grading, removal of foundations, utility trenching, installation of shoring/piles, etc.) within the Project Site, from ground surface level to bedrock. If, during cultural resources monitoring, the archaeologist determines that the sediments being excavated have been previously disturbed and are unlikely to contain significant cultural materials, the archaeologist shall request that monitoring be reduced or eliminated. Spot-check monitoring shall occur during all construction, on a schedule determined by the project archaeologist. If buried cultural resources such as trash deposits, building foundations, privy pits, flaked or ground stone, or human remains are inadvertently discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find and the area shall be secured to	Project Applicant or Project Contractor and Qualified Archaeologist	Prior to demolition, grading, or excavation activities	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
prevent disturbance. The County will be notified immediately. A qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to evaluate the significance of the find and recommend appropriate treatment measures. If the discovered materials are determined to be significant cultural resources, the archaeologist shall develop and implement an appropriate treatment plan, which may include avoidance, preservation in place, capping with fill material, or data recovery through excavation and documentation. The Treatment Plan shall be provided to the County. Work in the vicinity of the discovery, as determined by the qualified archaeologist, shall not resume until the archaeologist has determined that appropriate measures have been implemented. Treatment measures for items that are not associated with human remains typically include development of avoidance strategies, capping with fill material, or mitigation of impacts through data recovery programs such as excavation or detailed documentation. If human remains are encountered, work shall halt in accordance with California Health and Safety Code Section 7050.5 and the County of Los Angeles Medical Examiner (Medical Examiner) shall be notified immediately. If the Medical Examiner determines that the remains are Native American, the Medical Examiner shall notify the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall designate a Most Likely Descendant (MLD). The MLD shall be provided the opportunity to make recommendations regarding the treatment and disposition of the remains in accordance with Public Resources Code Section 5097.98.			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
GEOLOGY AND SOILS			
GEO-1: Prior to any structural improvements to buildings or prior to any excavation related to the construction of new facilities, detailed subsurface geotechnical evaluations shall be performed to address site-specific conditions at the locations of the planned improvements and provide detailed recommendations for design and construction. The Project Applicant(s) or its designee shall ensure that all recommendations contained in the approved geotechnical reports are incorporated into final design plans and implemented during construction. All recommendations shall be implemented. The geotechnical evaluation(s) shall include the following measures, at a minimum, to address potential seismic ground shaking, liquefaction, and slope stability hazards. These components establish required baseline evaluation criteria. However, the licensed geotechnical engineer(s) shall identify and incorporate any additional site-specific design and construction recommendations necessary based on the results of subsurface investigations conducted for each development phase. All recommendations shall be provided to the County, be incorporated into final engineering plans, and implemented during construction. Recommendations could include but are not limited to: ▪ **Seismicity:** Structural elements of future improvements shall be designed to resist or accommodate appropriate site-specific ground motions and conform to the current seismic design standards. ▪ **Liquefaction:** An assessment of the liquefaction potential shall be made prior to detailed design and construction of project improvements. Structural design and preventative techniques, such as in situ ground modification or supporting foundations with piles at depths designed specifically for liquefaction, shall be included. To evaluate the potential for liquefaction, subsurface evaluation may be performed. Site-specific geotechnical evaluations that assess the liquefaction and dynamic settlement characteristics of the on-site	Project Applicant or Project Contractor	Prior to structural improvements to buildings Prior to excavation activities related to new facilities	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Building & Safety Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
soils shall include the drilling of exploratory borings, evaluation of groundwater depths, and laboratory testing of soils. Methods for construction in areas with a potential liquefaction hazard may include in situ ground modification, removal of liquefiable layers and replacement with compacted fill, or support of project improvements on piles at depths designed specifically for liquefaction. Pile foundations can be designed for a liquefaction hazard by supporting the piles on dense soil or bedrock below the liquefiable zone or employing other appropriate methods, as evaluated during the Project Site-specific evaluation. Additional recommendations to address liquefaction may include densification by installation of stone columns, vibration, deep dynamic compaction, and/or compaction grouting. ▪ **Slope Stability:** An assessment of slope stability shall be made prior to detailed design and construction of project improvements and design techniques, such retaining walls and drainage improvements, shall be implemented as needed. Slopes created or modified as part of the Proposed Project shall be engineered to reduce the potential for slope instability. The geotechnical evaluation(s) shall include the following measures to address and resolve site-specific unstable soil impacts: ▪ **Groundwater:** Excavations for foundations in areas with shallow perched groundwater may need to be cased/shored and/or dewatered to maintain stability of the excavations and provide access for construction. All recommendations included in the preliminary geotechnical evaluations pertaining to groundwater shall be followed. Excavations for underground structures shall be performed with care to reduce the potential for lateral deflection of excavation sidewalls			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
and/or shoring, which may also cause differential movement of structures located near the excavation. Further study, including subsurface exploration, shall be performed during the detailed design phase of future improvements to evaluate the presence of groundwater, seepage, and/or perched groundwater at the Project Site and the potential impacts on design and construction of project improvements. An assessment of the potential for shallow groundwater shall be made during the design phase of each project, and design techniques shall be developed as necessary. ▪ **Collapsible Soils/Settlement:** An assessment of the potential for soils that are prone to settlement shall be made prior to detailed design and construction of project improvements, and design techniques shall be developed, as appropriate, to reduce impacts related to settlement to low levels. During the detailed design phase of the project, surface reconnaissance and site-specific geotechnical evaluations shall be performed to assess the settlement potential of the on-site natural soils and undocumented fill. This may include detailed surface reconnaissance to evaluate site conditions, drilling of exploratory borings or test pits, and laboratory testing of soils, where appropriate, to evaluate site conditions. Prescribed approaches to address potential soil settlement could include either removal of the compressible/collapsible soil layers and replacement with compacted fill, surcharging to induce settlement prior to construction of improvements, allowing for a settlement period after or during construction with new fills, or a specialized foundation design, including the use of deep foundation systems to support structures. Varieties of in situ soil improvement techniques are also available, such as dynamic compaction (heavy tamping) or compaction grouting.			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
The geotechnical evaluation(s) shall include the following measures to address and resolve site-specific expansive and corrosive soils hazards: ▪ **Expansive Soils:** Mitigation techniques to reduce expansive soil potential shall be included as necessary. Techniques shall include over excavation and replacement with non-expansive soil, soil treatment, moisture management, and/or a specific structural design for expansive soil conditions developed during the design phase. ▪ **Corrosive Soils:** An assessment of the potential for corrosive soils shall be made during the detailed design phase of the project through soil testing procedures. Engineering methods shall be developed, as appropriate, to reduce impacts related to corrosive soils to low levels. Subsurface evaluation, including laboratory testing, shall be performed. Evaluation of the corrosive soil potential shall be accomplished through testing and analysis of soils at foundation design depths. The laboratory tests conducted on the soils prior to construction and improvement plan preparation shall include corrosivity tests. Review of these data by a corrosion engineer, if determined necessary in the geotechnical evaluation, shall result in corrosion protection measures that address site-specific conditions. Evaluation of the potential corrosive soils hazard shall be performed prior to detailed design and construction so that, in the event the hazard exists, design techniques may be implemented. To avoid site-specific subsurface evaluation, corrosion protection measures may be included in the initial design for the proposed project improvements. Depending on site-specific conditions presented geotechnical evaluation, recommendations for corrosive soil conditions may involve the use of concrete that is resistant to sulfate exposure. Corrosion protection for metals may be needed for underground foundations or structures in areas where corrosive groundwater or soil could cause deterioration. Typical design techniques include			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
epoxy and metallic protective coatings, the use of alternative (corrosion-resistant) materials, and selection of the appropriate type of cement and water/cement ratio.			
GEO-4: Paleontological Resources: Prior to any excavation related to the construction of facilities or improvements proposed under the master plan, a qualified vertebrate paleontologist with a graduate degree in paleontology, geology, or a closely related earth science discipline, and more than 10 years of experience shall be retained by the Project Applicant(s)/Contractor(s) or construction contractor. Final excavation depths, locations, and construction methods shall be determined during subsequent project-level design. Accordingly, the qualified paleontologist shall review project-specific excavation and grading plans prior to construction and identify areas where monitoring is required based on the depth and extent of excavation into paleontologically sensitive geologic units (e.g., older alluvium or Puente Formation). Monitoring shall be implemented by the qualified paleontologist during ground disturbance in those identified areas. Very shallow surficial excavations (i.e., less than 5 feet in depth) within areas of previous disturbance or areas of Quaternary younger alluvial deposits shall be monitored by the qualified paleontologist to ensure that underlying sensitive units (i.e., Quaternary older alluvium) are not adversely affected. Areas consisting of artificial fill materials shall not require monitoring. If future excavations take place in Quaternary older alluvial deposits or within Fernando or Puente Formation bedrock, such excavations shall be monitored on a full-time basis by a qualified paleontological monitor and under the supervision of the qualified paleontologist. The paleontological resource monitoring shall include inspection of exposed rock units during active excavations within the geologically sensitive sediments. Monitoring may be reduced if some of the potentially fossiliferous units	Project Applicant or Project Contractor and Qualified Vertebrate Paleontologist	Prior to excavation related to construction or improvements	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
described herein are, upon exposure and examination by qualified paleontological personnel, determined to have a low potential for containing fossil resources. The paleontological monitor shall be equipped to salvage fossils as they are unearthed to avoid construction delays and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontological monitor shall have authority to temporarily divert grading away from exposed fossils to recover the fossil specimens professionally and efficiently and collect associated data. All efforts to avoid delays in project schedules shall be made. To prevent construction delays, paleontological monitors shall be equipped with the necessary tools for the rapid removal of fossils and retrieval of associated data. This equipment shall include handheld global positioning system receivers, digital cameras, and cell phones as well as a tool kit with specimen containers, matrix sampling bags, field labels, field tools (awls, hammers, chisels, shovels, etc.), and plaster kits. At each fossil locality, field data forms shall be used to record pertinent geologic data, stratigraphic sections shall be measured, and appropriate sediment samples shall be collected and submitted for analysis. Fossils collected, if any, shall be transported to a paleontological laboratory for processing where they shall be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility that meets federal and State curation standards and is approved in writing by the County of Los Angeles. Following analysis, a Report of Findings with an appended itemized inventory of specimens shall be prepared by the qualified paleontologist within a reasonable timeframe from the completion of recovery. The			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
report and inventory, when submitted to the County along with confirmation of the curation of recovered specimens into an established, accredited museum repository, shall signify completion of the program to mitigate impacts on paleontological resources.			
GREENHOUSE GAS EMISSIONS			
GHG-1a: For development projects that include parking (e.g., private garages, surface parking lot, etc.), the Project Applicant(s)/Contractor(s) shall implement the following provisions of the California Green Building Standards Code (CALGreen) as mandatory and not voluntary and shall list and identify them on all prepared building and site plans. The Project Applicant(s) shall submit these building and site plans that note the applicable measures to the County prior to the issuance of construction permits. ▪ **Residential Structures with Three or Fewer Stories.** For residential land uses with three or fewer stories, the Project Applicant(s)/Contractor(s) shall: o Design and build condominium/townhouses dwellings that have an attached private garage to have a dedicated electric circuit to support electric vehicle charging, as outlined in the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.1. o Design and build residential buildings to, at a minimum, meet the Tier 2 electric vehicle parking standards of the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.2.1. ▪ **Nonresidential Structures and Residential Structures with Four or More Stories.** For nonresidential land uses and residential land uses that are four or more stories, the Project Applicant(s)/Contractor(s) shall:	Project Applicant or Project Contractor	Prior to issuance of construction permits	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
o All parking areas shall be designed to provide parking for low-emitting, fuel-efficient, and carpool/van vehicles. At minimum, the number of preferential parking spaces shall equal the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.1.2. o Parking areas shall be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations shall comply with the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.3.3 or Section A5.106.5.3.4.			
GHG-1b: Each Project Applicant/Contractor shall demonstrate a minimum 10 percent reduction in energy consumption below energy baseline. For the General Hospital, ASHRAE Standard 90.1-2010 shall be the energy baseline. For all other new construction and major renovation, the 2025 version of Title 24, Part 6 shall be the energy baseline. "New construction" in this context shall mean "ground up" development of a structure that has never been occupied. "Major renovation" in this context shall include additions to or redevelopment of existing structures resulting in an increase of over fifty (50) percent of the existing floor area. An overall energy reduction of 10 percent shall be demonstrated on an aggregate basis across the Project Site, allowing for some buildings to perform better than others. Compliance shall be demonstrated via: ▪ A technical memorandum (where energy reductions might be below 10% for individual buildings); or ▪ Title 24 compliance forms submitted at the time of permit (where energy reductions are above 10%); or ▪ An energy modeling report (for the General Hospital).	Project Applicant or Project Contractor	Prior to issuance of each building permit Prior to the issuance of construction permits for the final phase proposal	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Building & Safety Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
The technical memorandum shall be based on a project site-level energy calculation and reference Title 24 compliance forms where completed and available, and submitted to the County prior to issuance of each building permit. The 10 percent reduction in energy consumption may be achieved through a combination of Project Site-wide renewable energy generation, energy distribution systems, electrification, and/or building design features. The Project Site area energy calculations shall be based on new developments pursuant to the project. The Project Site-level energy calculations shall be updated as needed throughout phased development to reflect actual design progress. Where performance of an individual building or phase is below the 10 percent requirement, it will address anticipated performance in future phases to achieve the aggregate 10 percent reduction. Should the final development phase proposal show that the Project Site-wide 10 percent reduction in energy consumption was not achieved, the final phase development proposal shall include additional measures to ensure the Project Site-wide 10 percent reduction in energy consumption from the electrical grid be achieved. The "final development phase" is the phase that would complete the full buildout of the Project Site within the anticipated 25-year development horizon. If such phase is not realized within the 25-year development horizon, then the Proposed Project shall demonstrate the Project Site-wide 10 percent reduction no later than December 31st, 2050 through the implementation of additional measures. These additional measures may include but are not limited to photovoltaic arrays, appliance or mechanical system upgrades to new or existing buildings, or lighting upgrades on new or existing structures. Any such additional measures shall be quantified for energy consumption reduction performance and submitted to the County for approval prior to the issuance of construction permits for the final phase proposal.			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
GHG-1c: For nonresidential development projects, prior to issuance of the certificate of occupancy, the Project Applicant(s)/Contractor(s) shall provide documentation to the County demonstrating enrollment in a 100 percent carbon-free electricity energy plan, such as the City of Los Angeles Department of Water and Power's Green Power for Green LA program, for Proposed Project building(s) if such plan is available. If a 100 percent carbon-free electricity plan is not available, the Project Applicant(s)/Contractor(s) shall enroll in an energy plan with the next highest carbon-free electricity until a 100 percent carbon-free electricity energy plan becomes available. Measures to achieve 100 percent carbon-free electricity use may include, but are not limited to, plans for 100 percent renewable electricity. If such carbon-free electricity energy plans are waitlisted, the Project Applicant(s)/Contractor(s) may enroll in an available energy plan in the meantime, but shall sign up for the waiting list until such time a carbon-free electricity energy plan is available.	Project Applicant or Project Contractor	Prior to issuance of the certificate of occupancy	County of Los Angeles Department of Economic Opportunity
HAZARDS AND HAZARDOUS MATERIALS			
HAZ-1a: In order to minimize exposure, prior to demolition activities, asbestos-containing materials and lead-based paint surveys and evaluations shall be conducted in buildings that are to be demolished or renovated. Hazardous building materials surveys have been conducted for many Project Site structures; however, because demolition would occur in phases and certain materials are concealed within wall assemblies, mechanical systems, and other building components that cannot be fully accessed until demolition preparation activities occur, final comprehensive pre-demolition surveys consistent with South Coast Air Quality Management District (AQMD) Rule 1403 shall be completed immediately prior to demolition of each structure. Abatement measures shall be implemented in accordance with the recommendations of these evaluations. Asbestos surveys shall be conducted in accordance with South Coast AQMD Rule 1403, which specifies that all surveys are to be carried out by a Cal/OSHA-certified asbestos consultant and will follow established survey protocols, notification, and work practice	Project Applicant or Project Contractor	Prior to demolition activities	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
requirements. Lead-based paint surveys shall be carried out by a California Department of Public Health (CDPH)–certified inspector/assessor. If necessary, a lead abatement plan would be prepared by the CDPH-certified project monitor or supervisor and be implemented during demolition and renovation activities. Demolition activities would be performed by CDPH-certified workers.			
HAZ-1b: Prior to start of construction, construction activities that involve subsurface disturbance within areas of the Project Site where residual petroleum hydrocarbons and volatile organic compounds (VOCs) in groundwater have been identified or are reasonably expected to be present, including areas downgradient of the former leaking underground storage tank (LUST) location at 1200 North State Street shall account for residual petroleum hydrocarbons and VOCs in groundwater that remain following regulatory closure of the former leaking underground storage tank case. A qualified environmental professional shall evaluate the potential for vapor encroachment conditions (VEC) and specify appropriate management measures, which may include removal and disposal of contaminated soil, groundwater management, vapor mitigation, or other remedial actions, consistent with regulatory requirements and recommendations of the Phase II ESA. The management measures shall be implemented during soil disturbing activities.	Project Applicant or Project Contractor	Prior to construction activities that involve subsurface disturbance where residual petroleum hydrocarbons and VOCs	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Environmental Programs Division
HAZ-1c: Prior to construction, the Project Applicant(s)/Contractor(s) shall conduct additional confirmatory subsurface investigations in areas of known or suspected concern identified in the completed Phase II Subsurface Investigation and Methane Survey, including former and suspected underground storage tank locations, both those abandoned in place and those without verified removal documentation, as well as former boiler and powerhouse areas. Because prior investigations were limited to accessible areas and did not include full site-wide excavation or investigation beneath existing structures, utilities, and active facilities, the extent of residual contamination cannot be fully characterized until	Project Applicant or Project Contractor	Prior to construction activities Prior to grading in affected areas	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Environmental Programs Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
demolition and site access occur. Therefore, additional confirmatory investigation shall be completed prior to grading in each affected area to fully delineate any residual contamination. These investigations shall evaluate whether residual contamination remains that could affect redevelopment. If additional residual contamination is found, a qualified geologist or industrial hygienist shall recommend appropriate remedial actions, which may include removal, disposal, or remediation of affected soils or structures, consistent with regulatory requirements. These remedial actions shall be implemented during construction.			
HAZ-1d: The documented abandoned oil well on the southern portion of the Project Site (Santa Fe Springs Mutual Oil Syndicate Well No. 1, API No. 0403705846) shall be further evaluated by a qualified petroleum engineer or geologist prior to any ground-disturbing activities, including grading, excavation, or construction, occurring within 100 feet of the well location. The evaluation shall include confirmation of the well's current condition and abandonment status through review of regulatory records and, if necessary, field investigation field investigation to verify that the well meets current CalGEM abandonment standards. Because existing structures, pavement, utilities, and active campus operations currently limit full access to the well location and its area of potential influence, comprehensive field verification and intrusive investigation cannot be completed at this time. The final grading limits, excavation depths, and site access conditions will not be fully known until demolition and site clearance activities occur. Therefore, confirmation of abandonment status and any necessary subsurface investigation must occur immediately prior to grading in the affected area, once safe and unobstructed access is available. If the evaluation determines that the well has not been properly abandoned in accordance with CalGEM standards, the well shall be	Project Applicant or Project Contractor and Qualified Petroleum Engineer/Qualified Geologist	Prior to any ground disturbing activities within 100 feet of a well location	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Environmental Programs Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
plugged or otherwise remediated in compliance with Public Resources Code Sections 3208 to 3217 prior to grading in the affected area. No grading or construction activities shall occur within the 100-foot radius (area of potential influence) of the well until CalGEM has confirmed that the well meets current abandonment standards.			
HAZ-2: Prior to the issuance of building permits for any new residential or commercial structure on portions of the Project Site where volatile organic compounds (VOCs) in soil vapor have been documented above applicable screening levels, the Project Applicant(s)/Contractor(s) shall prepare and implement a vapor intrusion mitigation plan. The plan shall include site-specific engineering controls, such as passive or active sub-slab depressurization systems, vapor barriers, or equivalent measures designed to prevent intrusion of VOCs into occupied indoor spaces. Because final building footprints, foundation designs, and finished grades have not yet been determined, a structure-specific vapor mitigation system cannot be finalized at this time. Therefore, the vapor intrusion mitigation plan shall be prepared for each applicable structure once final design plans are available and prior to permit issuance. The vapor intrusion mitigation plan shall be prepared by a qualified environmental professional in consultation with the Los Angeles County Department of Public Works and the Los Angeles Regional Water Quality Control Board (RWQCB). Design features shall comply with City of Los Angeles Methane Zone requirements, CalEPA guidance, and RWQCB performance standards for VOC mitigation. Implementation of the plan, including installation of all required engineering controls, shall be verified through inspections and post-installation testing prior to occupancy. The County, in coordination with	Project Applicant or Project Contractor	Prior to issuance of building permits for any new residential or commercial structure Prior to occupancy	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Environmental Programs Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
the RWQCB, shall review and approve the plan, confirm proper installation, and enforce compliance as part of the standard building permit and inspection process.			
HYDROLOGY AND WATER QUALITY			
HYD-2: During the initial design of each future project, the Project Applicant(s)/Contractor(s) shall prepare project-specific Stormwater Mitigation Plans (SUSMP) for review and approval by the Los Angeles County Department of Public Works (LACDPW). Low-impact development (LID) features included in project-specific SUSMPs shall be designed to minimize the leaching of nutrients from growing media. LID features shall avoid the use of growing media, mulch, and compost containing animal products, which may leach nutrients. Design modifications may include incorporation of an internal storage zone with an elevated underdrain and a carbon food source for denitrifying bacteria to create anaerobic conditions and subsequent denitrification. During the initial design of each future implementing project, the Project Applicant/Contractor shall also prepare project-specific Operation and Maintenance (O&M) Plans for proposed LID features and on-site landscaping for review and approval by the LACDPW. The O&M plans shall be revised as needed as development plans and proposed LID features are revised. The project specific O&M Plans shall consider impacts on water quality due to the leaching of phosphorous. O&M practices shall include integrated pest management and organic maintenance methods, including those for hand weeding. The use of fertilizers, pesticides, herbicides, and products containing animal manure or animal products shall be avoided. Prior to construction of future development projects on the Project Site, the Project Applicant(s)/Contractor(s) shall prepare and submit final building and landscape design plans to LACDPW demonstrating that all	Project Applicant or Project Contractor	During initial design of each implementing project Prior to construction o future development projects	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Building & Safety Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
landscape-based LID features are designed to improve water quality and minimize the leaching of nutrients from growing media.			
HYD-3a: Prior to and during construction involving deep excavation that could encounter groundwater or dewatering, monitoring wells shall be installed by the Project Applicant(s)/Contractor(s) during construction within and around the perimeter of each structure to monitor the groundwater level and evaluate the performance of the dewatering system. Before starting dewatering operations, a baseline conditions survey conducted by a licensed geotechnical or structural engineer retained by the Project Applicant(s)/Contractor(s) shall be made of all adjacent foundations and structures to assess the impact of deep excavation dewatering on adjacent structures. All signs of existing distress shall be recorded. The baseline survey shall be submitted to the County and retained for reference during construction monitoring.	Project Applicant or Project Contractor and Licensed Geotechnical or Structural Engineer	Prior to and during construction involving deep excavation Before dewatering operations	County of Los Angeles Department of Economic Opportunity
HYD-3b: During project design, the Project Applicant(s)/Contractor(s) shall retain a qualified civil or water resources engineer to prepare a Recycled and Alternative Water Supply Feasibility Study evaluating the technical and economic feasibility of using non-potable water sources for landscape irrigation. The study shall identify feasible sources, projected supply volumes, system design concepts, and implementation costs. Based on the results of the feasibility study, future projects shall incorporate all technically and economically feasible non-potable supply systems into the final landscape irrigation supply. Irrigation water demands greater than existing irrigation demands shall be met by alternative supply sources to the maximum extent technically feasible. The use of alternative water supply sources for irrigation shall be maximized to reduce the use of potable water for irrigation and to approximate existing irrigation demands. Alternative water supply sources include, but are not limited to, reclaimed water, gray water, harvested rainwater (stormwater), and air-conditioning condensate (although not specifically mentioned in the master plan, this could represent a significant source of clean irrigation water).The County shall	Project Applicant or Project Contractor and Qualified Civil or Water Resources Engineer	During project design	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works Building & Safety Division, Land Development Division

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
review and approve the Feasibility Study and irrigation design prior to permit issuance.			
NOISE			
NOI-1: Reduce Construction Noise to the Extent Possible. If construction activities associated with the Proposed Project have the potential to exceed the County's construction noise thresholds at nearby on- and off-site sensitive receptors, including during pile driving or other high noise construction activities, the Project Applicant(s)/Contractor(s) shall implement the following noise reduction measures during construction: ▪ To the extent feasible, construction activities shall occur between the hours of 7:00 am to 7:00 pm on Monday through Friday and 8:00 am to 6:00 pm on Saturdays, consistent with Section 12.08.520 of the County of Los Angeles Code of Ordinances. Construction activities shall not occur at any time on Sundays or legal holidays. Construction personnel shall not be permitted on the job site, and material or equipment deliveries and collections should not be permitted outside of these hours. If construction activities must occur outside of the allowable hours, the Project Applicant(s)/Contractor(s) shall follow necessary procedures to obtain an appropriate variance in accordance with Section 12.08.580 of the County of Los Angeles Code of Ordinances prior to conducting such activities. Construction activities occurring outside the allowable hours shall comply with all conditions of the approved variance. ▪ To the fullest extent practicable, the quietest available type of construction equipment shall be used. Newer equipment is generally quieter than older equipment. The use of electric powered equipment is typically quieter than diesel or gasoline powered equipment, and hydraulic powered equipment is typically quieter than pneumatic power.	Project Applicant and Project Contractor	During construction activities	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
▪ Where feasible, impact pile driving shall be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles. ▪ All construction equipment shall be properly maintained. Poor maintenance of equipment typically causes excessive noise levels. ▪ All construction equipment, stationary and mobile, shall be equipped with properly operating and maintained mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features that meet or exceed original factory specification and are properly maintained and functioning during construction activities. Mobile or fixed "package" equipment (e.g., arc welders, air compressors) shall be equipped with shrouds and noise control features that are readily available for that type of equipment. ▪ All noisy equipment shall be operated only when necessary, and should be switched off when not in use. ▪ The use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. To the extent feasible, temporary barriers shall be employed around the project site and/or around noisy construction equipment, specifically pile driving equipment. For barriers to be effective they shall break the line-of site between the equipment and any noise-sensitive receiver. These barriers may be constructed as follows: o From commercially available acoustical panels lined with sound absorbing material (the sound absorptive faces of the panels should face the construction equipment). o From common construction materials such as plywood and lined with sound absorptive material (the sound absorptive material should face the construction equipment). o From acoustical blankets hung over or from a supporting frame. The blankets shall provide a minimum sound transmission class (STC) rating of 28 and a minimum noise reduction coefficient			

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
(NRC) of 0.80 and shall be firmly secured to the framework with the sound absorptive side of the blankets oriented towards the construction equipment. The blankets shall be overlapped by at least 6" at seams and taped so that no gaps exist. The largest blankets available shall be used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier.			
NOI-3a: Design Project Facilities to Ensure All Mechanical Equipment Complies with County Noise Standards. During the architectural and engineering design phase of each new facility (building, central plant, parking structure, etc.) that could introduce new mechanical equipment to the Project Site, and prior to the issuance of any building permits for the facility, the Project Applicant(s)/Contractor(s) shall retain an acoustical consultant to evaluate the design and provide recommendations, as necessary, to ensure that the mechanical equipment complies with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: changes in equipment locations, upgrades to central plant buildings, rooftop parapet walls, acoustical louvers or screens, or intake and exhaust silencers.	Project Applicant or Project Contractor	During the project architectural and engineering design Prior to issuance of building permits	County of Los Angeles Department of Economic Opportunity
NOI-3b: Design and Manage Outdoor Use Areas to Ensure Organized Outdoor Events Comply with County Noise Standards. Prior to the issuance of any building permits for outdoor use areas that are anticipated to host organized events such as outdoor markets, farmers markets, summer concerts and health marches, etc. the Project Applicant(s)/Contractor(s) shall retain an acoustical consultant to evaluate the design (event layout, sound system design, etc.) and operational event details (crowd sizes, times of operation, etc.) to ensure that such events will comply with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such	Project Applicant or Project Contractor and Acoustical Consultant	Prior to issuance of building permits	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
recommendations may include, but are not limited to: controls on crowd sizes and event times, and limits on sound system power levels.			
NOI-4: Reduce Construction-Generated Groundborne Vibration to the Extent Possible. The Project Applicant(s)/Contractor(s) shall implement the following vibration reduction measures during construction: ▪ Through coordination with the County where possible, impact pile driving should be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles. ▪ Distance requirements for eligible or listed historical structures (as defined in Chapter 3.4, Cultural Resources of this Draft SEIR): o Pile driving shall not be operated within 135 feet, vibratory rollers within 36 feet, or other heavy equipment (e.g., bulldozer) within 20 feet. ▪ Distance requirements for non-engineered and masonry buildings: o Pile driving shall not be operated within 100 feet, vibratory rollers within 25 feet, or other heavy equipment (e.g., bulldozer) within 15 feet.	Project Applicant or Project Contractor	During construction activities	County of Los Angeles Department of Economic Opportunity
TRANSPORTATION (SEE ALSO ATTACHMENT 2 – TRANSPORTATION MITIGATION FLOWCHART)			
TRA-1: The Project Applicant(s)/Contractor(s) shall develop and implement a Worksite Traffic Control Plan for any aspect of construction that would result in road closures, sidewalk closures, bicycle facility closures, removal of parking, or similar traffic disruptions. The Worksite Traffic Control Plan shall be prepared as part of the project design package according to California Manual on Uniform Traffic Control Devices (CA-MUTCD) requirements, and may include, but not be limited to, the following elements; ▪ Provide a roadway layout that shows the locations of construction activity and surrounding roadways to be used as detour routes, including special signage. ▪ Establish detour routes in coordination with the City of Los Angeles to minimize disturbances to local roadway conditions.	Project Applicant or Project Contractor	During project design	County of Los Angeles Department of Economic Opportunity City of Los Angeles Department of Transportation

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
▪ Maintain access to existing residences at all times. ▪ Work with City of Los Angeles Department of Transportation, Los Angeles Sherriff's Department, Los Angeles County Fire Department, and Los Angeles Police Department, to coordinate all construction-related plans and minimize disturbances to local emergency management services (EMS) providers ensure that alternative evacuation and emergency routes are designed to maintain response times during construction. ▪ Provide adequate off-street parking areas at designated staging areas for construction-related vehicles. ▪ Work with transit providers to maintain access and circulation routes to existing stops during construction phases and identify appropriate detours to provide rerouting during construction while minimizing service disruptions. ▪ Work with the City of Los Angeles to maintain continuity and operations of existing pedestrian and bicycle facilities during construction.			
TRA-3: Due to the programmatic nature of a 25-year buildout of the Proposed Project, and the multiple agency authorizations required to implement the measures herein: For all future developments as part of the Proposed Project, the Project Applicant(s)/Contractor(s) shall consult with County and relevant appropriate agencies to develop mechanisms as to when the conceptual improvements identified in Mitigation Measures TRA-3(a)-(e) are implemented based on phased buildout of the Proposed Project. The following three-step process shall be followed to determine whether a development project could result in Impact TRA-3. Step 1: Determine whether cumulative land use, including the development, would exceed 15 percent of any single Proposed Land Use Category in the table below.	Project Applicant or Project Contractor	Prior to start of construction for the first development phase	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works

<table>
<tr><th>Mitigation Measures</th><th>Party Responsible for Implementation</th><th>Implementation Timing</th><th>Agency Responsible for Monitoring</th></tr>
<tr><td>

- If No: No further analysis is required, and no physical improvements are necessary.
- If Yes: Proceed to Step 2

Step 2: If a Proposed Project would result in any single Proposed Land Use exceeding 15 percent, prepare a trip generation and Transportation Demand Management (TDM) analysis.

Step 3: If the cumulative trips, after applying TDM strategies, would exceed the inbound or outbound trips associated with 15 percent of Proposed Project buildout, prepare a detailed off-ramp queuing analysis. The results of the off ramp queuing analysis will determine whether the development's trips, combined with cumulative trips, would result in a queuing impact at the identified off-ramp location.

Total — **3,200 du; 450 hospital beds; 200 rooms; 8,588 parking spaces; 8,060,978 square feet of new development** **TRA-3a:** The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 southbound off-ramp to Mission Road. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, shared through-left lane, and a right lane; to o two left turn lanes and one shared through-right turn lane. ▪ Optimize signal timing along the Mission Road coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' Intersection Safety Operational Assessment (ISOAP) methodology as appropriate to design and implement intersection improvements. ▪ Coordinate with Caltrans to evaluate expanding ramp storage using concrete/landscaped area in-between existing off-ramp and freeway mainline, and implement as determined by the appropriate implementing agencies.			
TRA-3b: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to State Street. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, right turn lane; to o shared left-right turn lane and a right turn lane. ▪ Optimize signal timing along the State Street coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements.	Project Applicant or Project Contractor	During project construction	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
▪ Coordinate with Caltrans to evaluate expanding ramp storage using landscaped slope area in-between existing off-ramp and freeway connector (north side of off-ramp), and implement as determined by the appropriate implementing agencies.			
TRA-3c: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to Soto Street. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, shared through-left turn lane, and two right turn lanes; to o two left turn lanes, one through lane, and one right turn lane. ▪ Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements. ▪ Coordinate with Caltrans and City to evaluate striped shoulder area along north side of existing off-ramp, and implement as determined by the appropriate implementing agencies.	Project Applicant or Project Contractor	During project construction	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works
TRA-3d: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 northbound off-ramp to Cesar Chavez Avenue. ▪ Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits. Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements.	Project Applicant or Project Contractor	During project construction	County of Los Angeles Department of Economic Opportunity County of Los Angeles Department of Public Works
TRA-3e: A TDM program shall be implemented as part of the individual development projects aimed at reducing vehicular trips to the Project Site, which may mitigate Project-induced freeway off-ramp queuing hazards. Project Applicant(s)/Contractor(s) will incorporate TDM strategies and estimate their effectiveness. TDM strategies that the	Project Applicant or Project Contractor	During project design	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
Proposed Project could implement to result in a quantitative reduction in vehicular trips include, but are not limited to, the following: ▪ Trip Reduction Strategies o Implement Commute Trip Reduction Program (Voluntary for Mandatory) o Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) o Implement Commute Trip Reduction Marketing o Provide Ridesharing Program o Implement Subsidized or Discounted Transit Program - All Trips o Provide End-of-Trip Bicycle Facilities o Provide Employer-Sponsored Vanpool ▪ Parking Strategies o Price workplace parking o Implement Employee Parking Cash-Out o Limit Residential Parking Supply o Unbundle Residential Parking Costs from Property Cost ▪ School o Coordinate with Los Angeles Unified School District (LAUSD) to establish a School Bus Program o Active Modes of Transportation for Youth			County of Los Angeles Department of Public Works
TRIBAL CULTURAL RESOURCES			
TCR-1a: Native American Monitoring of Ground-Disturbing Activities in Native Soils a) The Project Applicant(s)/Contractor(s) shall invite a Native American Monitor from the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) prior to the commencement of any ground-disturbing activities. "Ground-disturbing activities" shall include, but are not limited to, grading, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching, for	Project Applicant or Project Contractor and Native American Monitor	Prior to commencement of any ground-disturbing activities Prior to issuance of any permit to	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
each implementing phase of the Proposed Project at all Project locations (i.e., both on-site and any off-site locations that are included in the Project description/definition and/or required in connection with the Project, such as public improvement work). b) The Project Applicant(s)/Contractor(s) shall make reasonable efforts to execute a Tribal Monitoring Agreement with the Native American Monitor prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence any ground-disturbing activity. c) The Native American Monitor shall work with the Project Applicant's qualified archaeologist during qualifying ground-disturbing activities to identify potential Native American Tribal Cultural Resources (TCRs) and communicate concerns regarding TCRs to the Project Applicant(s). The Native American Monitor will complete daily monitoring logs that will provide: description(s) and location(s) of the relevant ground-disturbing activity(ies), the type(s) of construction activity(ies), information and/or materials related to TCRs; and any other facts, conditions, materials, or discoveries of significance to the Tribe. Daily monitoring logs will identify and describe any discovered TCRs. Copies of daily monitoring logs will be provided to the Project Applicant(s) and the County at the end of all Project-related ground-disturbing activities. Daily monitoring logs will be kept confidential with the Project records. d) On-site tribal monitoring shall conclude upon either of the following, whichever occurs first: (1) written notification to the Tribe from a designated point of contact for the Project Applicant(s)/Contractor(s) that all ground-disturbing activities and phases of Project implementation that may involve ground-disturbing activities are complete; or (2) written notification to the Project Applicant(s) from the Tribe that no future planned construction activity and/or development/construction phase of the Project has the potential to impact TCRs.		commence ground-disturbing activities During ground-disturbing activities	

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
TCR-1b: Unanticipated Discovery of Tribal Cultural Resource (Non-Funerary) a) In accordance with section 21074, subdivisions (a)(1)(A)-(B) of the Public Resources Code (PRC), a Tribal Cultural Resources (TCR) is a site, feature, place, cultural landscape, sacred place or object, which is of cultural value to the Tribe and either: (1) on or eligible for the California Historic Register or other local historic register or (2) the County of Los Angeles, as the lead agency for the Project, at its discretion, chooses to treat the resource as a TCR. b) Upon discovery of any TCR or potential TCR, all construction activities within a radius deemed appropriate by the qualified archaeologist shall cease and shall not resume until the discovered TCR has been fully assessed by the Native American Monitor and/or qualified archaeologist. If the assessment finds the resource to be a TCR, treatment measures and final disposition will be determined in consultation with the Tribe.	Project Applicant or Project Contractor and Qualified Archaeologist	Upon discovery of any TCR or potential TCR	County of Los Angeles Department of Economic Opportunity
TCR-1c: Unanticipated Discovery of Native American Human Remains and/or Associated Grave Goods a) Native American human remains are defined in section 5097.98, subdivision (d)(1) of the Public Resources Code (PRC) as an inhumation or cremation in any state of decomposition or skeletal completeness. Funerary objects, also called associated grave goods in section 5097.98 of the PRC, shall be treated alike per section 5097.98, subdivisions (d)(1) and (2) of the PRC. b) If Native American human remains and/or grave goods are discovered or recognized on the Project Site, then section 5097.9 of the PRC as well as Health and Safety Code Section 7050.5 shall be followed. c) Any discovery of Native American human remains and/or grave goods shall be kept confidential to prevent further disturbance.	Project Applicant or Project Contractor	Upon discovery of Native American human remains and/or funerary objects	County of Los Angeles Department of Economic Opportunity

Mitigation Measures	Party Responsible for Implementation	Implementation Timing	Agency Responsible for Monitoring
UTILITIES AND SERVICE SYSTEMS			
USS-1: As part of the site plan review for any future individual development project under the Proposed Project that is considered for construction and operation in 2045 or later, and that is also defined as a "water-demand project" in Section 15155 of the State CEQA Guidelines, the County shall request, pursuant to Section 15155, that the water provider, the City of Los Angeles Department of Water and Power (LADWP), determine whether the projected water demand associated with these project(s) was included in the most recently adopted urban water management plan. If required pursuant to Section 15155, the County shall request that LADWP prepare water supply assessment(s) for these future projects. The County shall determine, pursuant to Section 15155, whether projected water supplies would be sufficient to satisfy the demands of the future project(s), in addition to existing and planned future uses within LADPW's service area.	Project Applicant or Project Contractor and County of Los Angeles Department of Economic Opportunity	During site plan review	County of Los Angeles Department of Economic Opportunity
USS-2: Prior to issuance of a building permit for a Project Applicant/Contractor under the Proposed Project that could result in an increase in wastewater generation, the Project Applicant(s)/Contractor(s) shall coordinate with the City of Los Angeles Bureau of Sanitation to conduct further detailed gauging and evaluation to identify a specific sewer connection point with sufficient capacity. If the public sewer has insufficient capacity, then the County shall be required to build a sewer line to a point in the sewer system with sufficient capacity.	Project Applicant or Project Contractor	Prior to issuance of building permits for future development that could increase wastewater generation	County of Los Angeles Department of Economic Opportunity

ATTACHMENT 1
Project Design Features

Project Design Features (PDF): General Hospital – Acute Unit District and Building

PDF-1. All work within the Los Angeles General Hospital – Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to ensure continued conformance with the Rehabilitation Standards and National Park Service guidance, as well as to ensure that historically significant views of and within the historic district are maintained. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Additionally, the County is pursuing federal historic preservation tax incentives for the Acute Unit's proposed rehabilitation work, which requires rigorous review by the National Park Service (NPS) and California Office of Historic Preservation (OHP) for compliance with the Rehabilitation Standards.

PDF-2. Prior to commencement of any construction activities associated with the Los Angeles General Hospital – Acute Unit Building's exterior or interior character-defining features, or the Acute Unit Historic District's contributing features (Patient's and Visitor's buildings, retaining walls, gateways, State Street, Forecourt, tunnel), a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to monitor all disassembly construction and rehabilitation activities, to ensure appropriate treatment of exterior and interior character-defining features, materials, and spaces during the construction project.

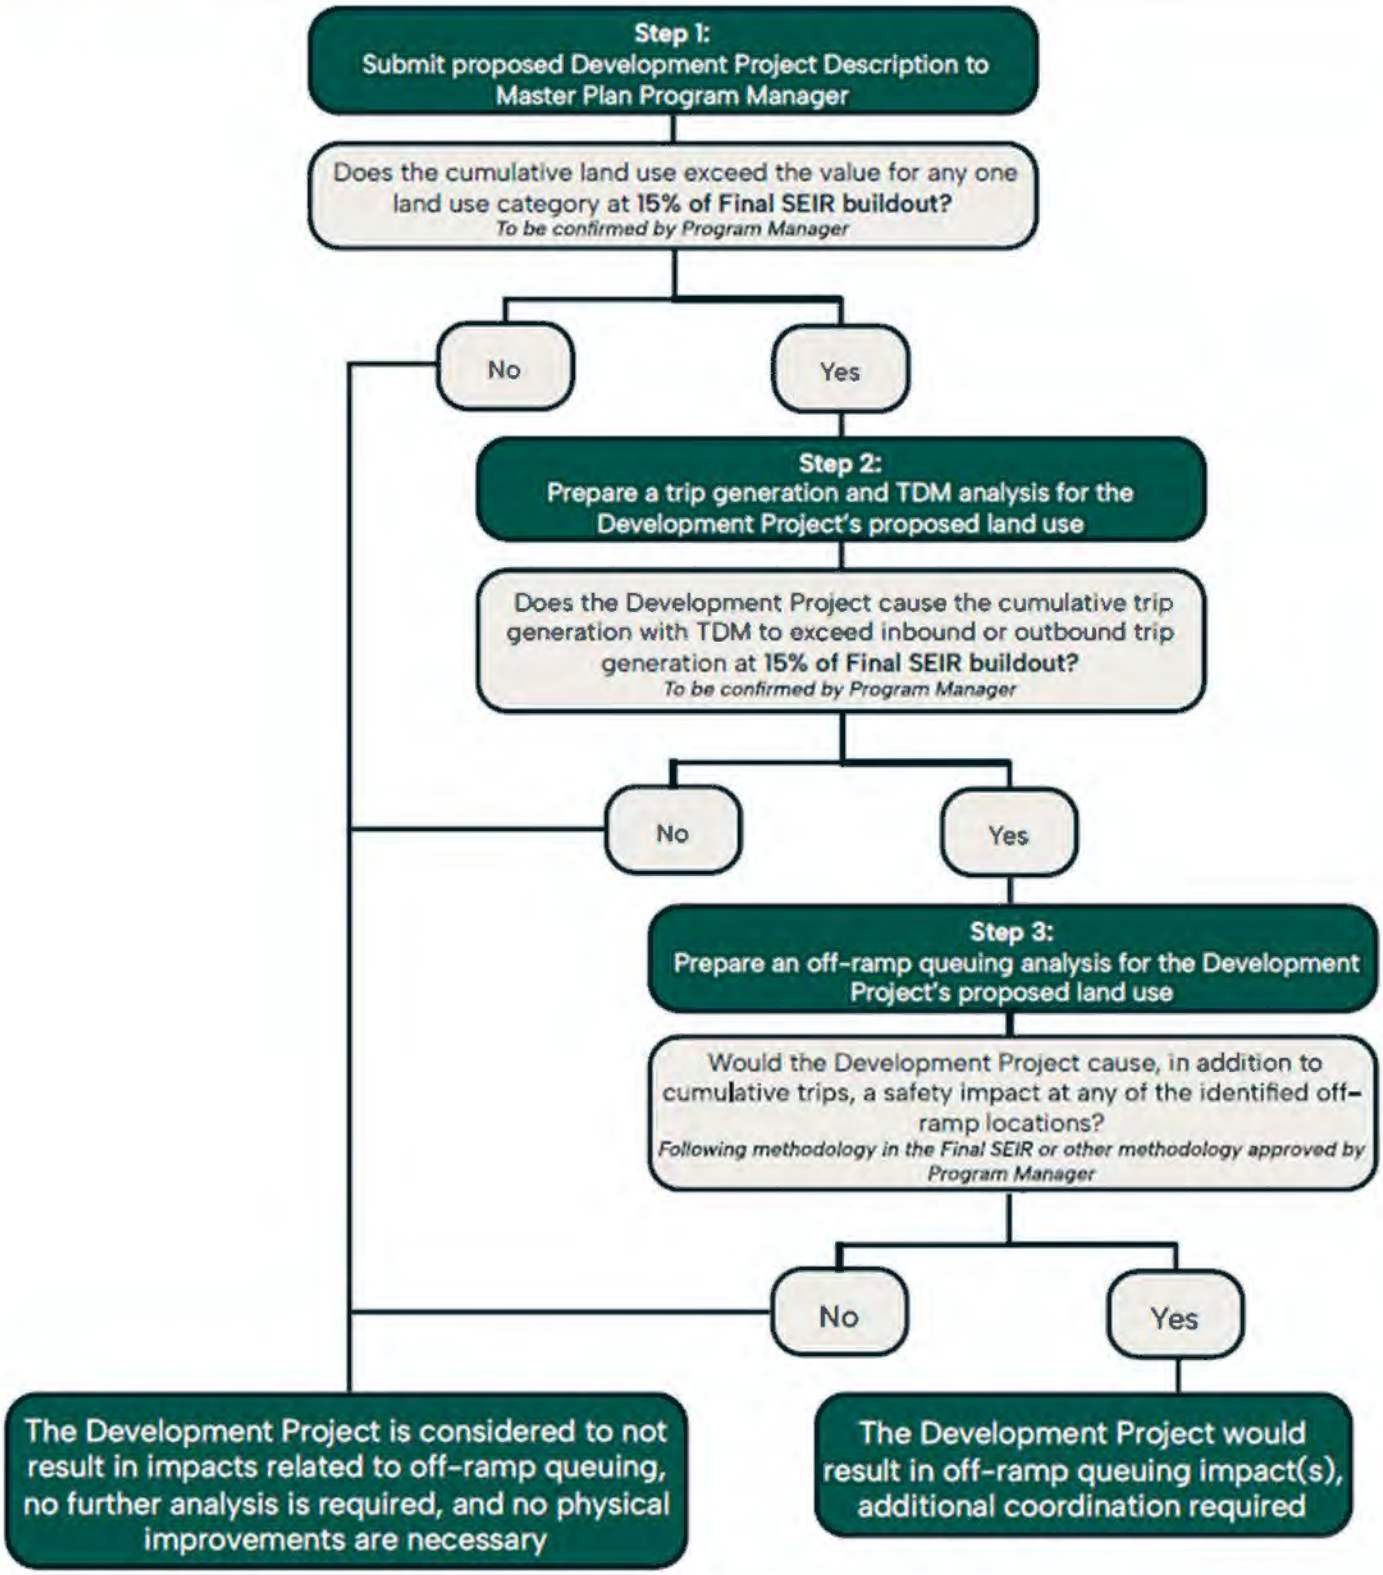
PDF-3. Prior to undergoing any demolition at the Los Angeles General Hospital – Acute Unit Building and any other contributing features within the Acute Unit Historic District (Patient's and Visitor's buildings, retaining walls, gateways, State Street, forecourt, tunnel), that would result in the removal of interior or exterior character-defining features (or portions thereof), Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards. HABS/HAER Level II drawings and historical narrative may follow after construction commences. To ensure public access, the Project Applicant(s) shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- **Drawings:** Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- **Photographs:** Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be

hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.

- **Historical Narrative**: An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

Project Design Features: Support Services Site



PDF-4. Prior to demolition of the Pharmacy Building and Viaduct, Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards and a qualified structural engineer with at least five years of demonstrated, related experience. HABS/HAER Level II drawings and historical narrative may follow after demolition. To ensure public access, the Project Applicant(s) shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- **Drawings**: Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- **Photographs**: Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- **Historical Narrative**: An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

PDF-5. An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, a publicly accessible viewing platform, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

EXECUTIVE SUMMARY

ES.1 INTRODUCTION

This document is a Draft Subsequent Environmental Impact Report (SEIR) to the Los Angeles County + University of Southern California (LAC+USC) Medical Center Campus Master Plan EIR (2014 Master Plan EIR, State Clearinghouse No. 2014051061) that was certified on November 18, 2014, by the Los Angeles County Board of Supervisors (Board) as the governing body of the County of Los Angeles (County). This Draft SEIR addresses the environmental effects associated with the implementation of the proposed Los Angeles County General Hospital Campus Master Plan (Proposed Project). As the owner of the Project Site and the public agency involved in development of the Master Plan, the County of Los Angeles is the lead agency for the Proposed Project. The California Environmental Quality Act (CEQA) requires that public agencies consider the environmental consequences before acting on projects over which they have discretionary approval authority.

ES.2 ENVIRONMENTAL PROCEDURES

This Draft SEIR has been prepared pursuant to CEQA and the State CEQA Guidelines to assess the environmental effects associated with implementation of the Proposed Project as well as anticipated future discretionary actions and approvals. CEQA establishes six main objectives for an EIR:

1. Disclose to decision makers and the public the significant environmental effects of proposed activities.
2. Identify ways to avoid or reduce environmental damage.
3. Prevent environmental damage by requiring implementation of feasible alternatives or mitigation measures.
4. Disclose to the public reasons for agency approval of projects with significant environmental effects.
5. Foster interagency coordination in the review of projects.
6. Enhance public participation in the planning process.

An EIR is the most comprehensive form of environmental documentation identified in CEQA ; it is intended to provide an objective, factually supported analysis, and full disclosure of the

environmental consequences of a proposed project with the potential to result in significant, adverse environmental impacts.

An EIR is one of various decision-making tools used by a lead agency to consider the merits and disadvantages of a project that is subject to its discretionary authority. Before approving a proposed project, the lead agency must consider the information in the EIR, determine whether the EIR was prepared in accordance with CEQA and the State CEQA Guidelines, determine that it reflects the independent judgment of the lead agency, adopt findings concerning the project's significant environmental impacts and alternatives, and adopt a statement of overriding considerations if significant impacts cannot be avoided.

ES.2.1 Type and Purpose of this Draft SEIR

As described in the State CEQA Guidelines, different types of EIRs are used for varying situations and intended uses. The Board certified the 2014 Master Plan EIR and approved the 2014 Master Plan on November 18, 2014. The 2014 Master Plan EIR evaluated the environmental effects associated with implementation of the 2014 Master Plan and identified mitigation measures to avoid or substantially lessen significant impacts where feasible, specific to the project envisioned at that time. The 2014 Master Plan EIR evaluated demolition of some existing structures and buildings on the Project Site, and development of new uses. Under the 2014 Master Plan, including the subsequent addenda, full buildout could result in a total of approximately 1,227,412 square feet of development throughout the Project Site.

The Proposed Project under consideration represents a new Master Plan that would guide redevelopment on parts of the Project Site. The Proposed Project represents a substantial change from the project considered in the 2014 Master Plan EIR and related County approvals. Therefore, pursuant to State CEQA Guidelines Section 15162, Subsequent EIRs and Negative Declarations, the County has determined that a Subsequent EIR is the appropriate level of CEQA review.

This Draft SEIR evaluates the potential environmental effects resulting from implementation of the Proposed Project, and to the extent feasible, identifies feasible mitigation measures necessary to avoid or substantially lessen significant environmental impacts associated with the Proposed Project. This Draft SEIR relies on and incorporates by reference the analysis, findings, and conclusions of the 2014 Master Plan EIR, subsequent addenda, and exemption (collectively referred to as "2014 Master Plan EIR") to the extent that the prior analysis remains relevant and applicable. The 2014 Master Plan EIR continues to provide the foundation for the environmental review of the Proposed Project and the analysis contained in this Draft SEIR builds upon that prior work rather than repeating it in its entirety.

This Draft SEIR has been prepared in accordance with State CEQA Guidelines Section 15162, Subsequent EIRs and Negative Declarations. State CEQA Guidelines Section 15162(a) and 15162(b) state that:

- **Section 15162(a):** When an EIR has been certified or a negative declaration adopted for a project, no SEIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:
  - Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
  - Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
  - New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:
    - The project will have one or more significant effects not discussed in the previous EIR or negative declaration;
    - Significant effects previously examined will be substantially more severe than shown in the previous EIR;
    - Mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
    - Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.
- **Section 15162(b):** If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration, the lead agency shall prepare a subsequent EIR if required under subdivision (a). Otherwise the lead agency shall determine whether to prepare a subsequent negative declaration, an addendum, or no further documentation.

This Draft SEIR also fulfills the requirements for a Program EIR. Program EIRs are typically more conceptual than Project EIRs, with a broader, or "programmatic," discussion of impacts, alternatives, and mitigation measures. According to Section 15168 of the State CEQA

Guidelines, a Program EIR may be prepared for a series of actions that can be characterized as one large project. Use of a program EIR gives the lead agency an opportunity to consider broad policy alternatives and program-wide mitigation measures, at an early time when the agency has greater flexibility to address project-specific and cumulative environmental impacts on a comprehensive scale.

Agencies prepare Program EIRs for programs or a series of related actions that are linked geographically; logical parts of a chain of contemplated events, rules, regulations, or plans that govern the conduct of a continuing program; or individual activities carried out under the same authority and having generally similar environmental effects that can be mitigated in similar ways.

Once a program EIR has been prepared, subsequent activities within the program must be evaluated to determine whether additional CEQA documentation are necessary. However, if the agency finds, after analysis under State CEQA Guidelines Section 15162, that no subsequent EIR would be required for a subsequent activity under the Program, a subsequent activity may be determined to be within the Program EIR's scope, and the public agency may determine that additional environmental documents are not required (State CEQA Guidelines sec. 15168[c]). When a lead agency relies on a program EIR for a subsequent activity, it must incorporate appliable mitigation measures and alternatives from the program EIR into the subsequent activities (State CEQA Guidelines sec. 15168[c][3]). If a subsequent activity would have effects outside the scope of the program EIR, the lead agency must prepare a new Initial Study leading to a Negative Declaration, Mitigated Negative Declaration, or an EIR. Even in this case, the program EIR still serves a valuable purpose as the first-tier environmental analysis. The State CEQA Guidelines encourage the use of Program EIRs, citing five advantages:

- Provide a more exhaustive consideration of impacts and alternatives than would be practical in an individual EIR;
- Focus on cumulative impacts that might be slighted in a case-by-case analysis;
- Avoid continual reconsideration of recurring policy issues;
- Consider broad policy alternatives and programmatic mitigation measures at an early stage when the agency has greater flexibility to deal with them;
- Reduce paperwork by encouraging the reuse of data (through tiering) (State CEQA Guidelines sec. 15168[h]).

As a program-level SEIR, this Draft SEIR evaluates a reasonable and likely maximum development that could be developed based on the level of information that is currently available. Later activities would also be required to adhere to applicable regulations, and standards and mitigation measures identified as part of this Draft SEIR. Review of proposed future projects under the proposed Master Plan would comply with State CEQA Guidelines Section 15168 and other applicable provisions of CEQA.

ES.2.2 Draft SEIR Organization

Executive Summary. Summarizes the background and description of the Proposed Project, the format of this Draft SEIR, alternatives to the Proposed Project, any areas of controversy or issues to be resolved, and identification of each potential significant environmental effect with proposed mitigation measures.

Chapter 1: Introduction. Describes the purpose of this Draft SEIR, background on the Proposed Project, the environmental review process, and the use of incorporation by reference.

Chapter 2: Project Description. Provides a detailed description of the Proposed Project, including its objectives, its area and location, approvals anticipated to be required as part of the Proposed Project, necessary environmental clearances, and the intended uses of this Draft SEIR.

Chapter 3: Environmental Analysis. Each environmental topic is analyzed in a separate section that discusses: the applicable regulatory framework; existing conditions; the standards for analysis (i.e., significance criteria used to determine if a significant impact would occur); the methodology to identify and evaluate the potential impacts of the Proposed Project; a summary of impact conclusion from the 2014 Master Plan EIR; the potential adverse environmental effects of the Proposed Project; the level of impact significance with and without mitigation; the potential cumulative impacts of the Proposed Project and other existing, approved, and Proposed Projects in the area; and a comparison of the conclusions presented in this Draft SEIR for the Proposed Project as compared to the County's prior findings from the 2014 Master Plan EIR.

Chapter 4: Alternatives to the Proposed Project. Describes feasible alternatives to the Proposed Project and provides a comparative impact analysis. Alternatives considered but rejected and the environmentally superior alternative are identified.

Chapter 5: Other CEQA Considerations. Provides a discussion of effects found not to be significant, significant and unavoidable impacts, significant irreversible changes to the environment, growth-inducing effects, and mandatory findings of significance.

Chapter 6: Report Preparers and Organizations Consulted. Includes a list of people and organizations that prepared or were contacted during the preparation of this Draft SEIR.

Appendices. The appendices for this document are listed in the table of contents of this Draft SEIR.

ES.3 PROJECT LOCATION

The Project Site (also referred to as Campus in this Draft SEIR) encompasses approximately 81.9 acres that make up the Los Angeles General Medical Center Campus (Campus) located at and

around 1200 State Street, on parcels of land owned by the County of Los Angeles, in the City of Los Angeles. The Project Site consists of a main campus and four additional areas separated from the main campus by local roadways, which are referred to as the "non-contiguous areas" in this Draft SEIR. The 70.5-acre main campus is generally bounded by Zonal Avenue, Mission Road, Marengo Street, and Chicago Street. State Street bisects the main campus. While this Project Site is defined in order to identify potential environmental impacts for all areas in which future activities associated with the Proposed Project could occur, it is not intended to indicate that all parts of the Project Site would be redeveloped (i.e., the existing Medical Center, the newly constructed RCV facilities). The Campus is surrounded by the Boyle Heights and Lincoln Heights neighborhoods of the City of Los Angeles, in the County of Los Angeles. The Project Site evaluated in this Draft SEIR is the same project site as in the 2014 Master Plan EIR.

A number of buildings and features associated with the medical uses of the Campus are located within the Project Site. The Campus is surrounded by a mix of institutional, medical, commercial, residential, and industrial uses. The Keck School of Medicine of USC campus and other institutional and medical uses are located on the opposite side of Zonal Avenue. Residences are located on the opposite side of Cummings Street and Chicago Street. Commercial uses are located on the opposite side of Marengo Street and residential uses are located further south on the opposite side of Marengo Street. Industrial uses are located south of Alhambra Avenue.

The Project Site is located immediately northeast of Interstate (I) 5 (Golden State Freeway) and north of I-10 (San Bernardino Freeway). The Project Site's location within the City of Los Angeles enables accessibility from multiple communities via I-5 and I-10 as well as regional transit connections, further reinforcing its role as a regional hub for medical services. The Project Site is recognized as a regionally significant facility, central to the provision of health and community services across the County of Los Angeles.

ES.4 SUMMARY OF THE PROPOSED PROJECT

The Proposed Project involves implementation of the proposed Master Plan, which would guide the long-term redevelopment of parts of the Project Site, including adaptive reuse of the General Hospital Building. The proposed Master Plan presents a conceptual, planning-level vision of the types of uses, scale, and locations of potential future development activities that could occur within a 30.8-acre portion of the approximately 81.9-acre Project Site, referred to as the "Master Plan Boundary" in the proposed Master Plan (see Section 1, Introduction, of the proposed Master Plan). The Master Plan Boundary covers that portion of Project Site that is the subject of the public-private partnership between the Los Angeles County Department of Economic Opportunity (DEO) on behalf of the County and the developer to reimagine the Campus through implementation of the Master Plan. Detailed site development plans, building

configurations, and architectural designs would be prepared as future project-level approvals are proposed and would be consistent with the guiding vision of the proposed Master Plan.

The approximately 51.1 acres of the Project Site that are not subject to the proposed Master Plan would continue to be governed by the previously approved 2014 Master Plan and its associated development parameters. Certain previously approved land uses that were identified in the 2014 Master Plan that have not yet been implemented to date have been carried forth into this Draft SEIR. These uses include Community Facilities, Clean Tech/Light Industrial, Medical Office, General Office, and Hospital[1]. Because development within the areas of the Project Site outside of the Master Plan Boundary would continue to occur pursuant to the 2014 Master Plan, this Draft SEIR evaluates potential environmental impacts associated with a conservative, maximum development scenario across the entire Project Site to ensure that a full range of potential redevelopment on the Project Site is considered.

Table ES-1, *Proposed Project Land Uses*, summarizes the maximum anticipated development proposed on the Project Site by land use type. The numbers in Table ES-1 represent the maximum amount of development that could take place on the Project Site and are used as the basis for the environmental assessment in this Draft SEIR.

Table ES-1 Proposed Project Land Uses

Proposed Land Use	Units/Count	Square Footage
Residential	3,200 housing units	2,300,000
General Office	--	400,000
Medical Office	--	735,300
Retail	--	320,000
Patient and Caregiver Lodging	200 rooms	80,000
Community Facilities	--	350,000
Education	--	110,000
Warehouse	--	160,000
Clean Tech/ Light Industrial	--	200,000
Hospital	450 beds	400,000
Parking	8,588 spaces	3,005,678

[1] The 2014 Master Plan EIR used different land use nomenclature for the proposed uses under the 2014 Master Plan. The land use titles under the 2014 Master Plan included: Wellness-Oriented Community Facilities, New Utility Plant and Facilities, Outpatient Clinics/Laboratories/Medical Office, Professional/Administrative Office, Research and Development, Hospital Addition, Warehouse/Storage, and Residential Care Facilities. Land uses that would be carried over under the Proposed Project include: Wellness-Oriented Community Facilities (Community Facilities), New Utility Plant and Facilities (Clean Tech/Light Industrial), Outpatient Clinics/Laboratories/Medical Offices (Medical Office), Professional/Administrative Offices (General Office), Hospital, and Research and Development (Clean Tech/Light Industrial).

Table ES-1 Proposed Project Land Uses

Proposed Land Use	Units/Count	Square Footage
Total	**3,200 housing units 450 hospital beds 200 rooms 8,588 parking spaces**	**8,060,978 square feet of new development**

Additionally, the Proposed Project involves the seismic retrofit, selective demolition, and major improvements to facilitate adaptive reuse of the existing 1.2 million square foot General Hospital Building (known as the Los Angeles County General Hospital–Acute Unit Building, or General Hospital Building in this Draft SEIR) and area surrounding the building, known as the Los Angeles General Hospital–Acute Unit Historic District, which are historical resources pursuant to CEQA. All activities within the General Hospital Building and larger General Hospital–Acute Unit Historic District would be achieved in strict accordance with the Secretary of the Interior's Standards (Standards) for the Treatment of Historic Properties and proposed Project Design Features (PDFs).

The proposed Master Plan would organize the main campus around three hubs connected by pedestrian-oriented corridors. The three hubs include the Commerce Hub, the Historic Hub, and the Medical Hub; each hub would have a distinct mix of uses that would reflect its role on the main campus, while the corridors would ensure connectivity across the main campus.

Height for new buildings would be regulated based on both the building's height relative to the General Hospital Building (19 stories) and key views to the General Hospital Building from on-site locations and surrounding roadways. No structure or physical building projections would exceed the highest elevation point of the roof structure of the existing General Hospital Building (approximately 240 feet from ground level). To maintain sightlines, wayfinding, and a circulation corridor that recognizes the visual prominence of the General Hospital Building and its importance as the heart of a new urban village, a central spine of open space that would be a minimum of 20 feet in width would run east to west within the Project Site from the center of the General Hospital Building's main entrance through the axis framed by the Forecourt buildings, between the footprints of new development, and continuing to the center of the Project Site.

To support the development of the proposed new uses, the Proposed Project includes other related improvements related to infrastructure, including utilities, circulation and transportation demand management strategies, parking, and open space and landscaping. In addition to on-site improvements to infrastructure, some work may occur off-site within the City of Los Angeles, such as utility connections/replacements, public right-of-way improvements, and other related activities.

Detailed site development plans, building configurations, and architectural designs would be prepared at the time that future project-level approvals are considered and would be consistent with the guiding vision of the proposed Master Plan. The Proposed Project would be developed over an estimated period of 25 years and would be implemented in phases; the actual number of units and quantities of land use types would be determined as individual project elements are implemented and could be less than the maximum envelope analyzed in this Draft SEIR. In addition, the precise distribution of land uses, square footage, and associated population among individual land use categories may vary over time in response to operational needs, provided that the overall development intensity analyzed in this Draft SEIR would not be exceeded.

ES.5 SUMMARY OF PROJECT ALTERNATIVES

State CEQA Guidelines Section 15126.6(a) requires that an EIR must address "a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives." Project objectives focus on expanding healthcare services, advancing whole-person health, preserving and adaptively reusing the historic General Hospital, increasing housing and economic opportunities, enhancing community-serving uses, improving circulation and open space, modernizing infrastructure, and promoting long-term sustainability and resilience. The alternatives in this Draft SEIR were based, in part, on their potential to reduce or eliminate the impacts determined to be potentially significant for implementation of the Proposed Project (see Table ES-1, *Summary of Significant Environmental Impacts and Mitigation Measures*). Project alternatives are assessed in further detail in Chapter 4, *Alternatives to the Proposed Project*. As demonstrated in that analysis, while the alternatives provide varying degrees of environmental benefit, each of the alternatives do not meet all of the project objectives.

ES.5.1 Alternative A: No Project/2014 Master Plan Development

According to Section 15156.6(e) of the State CEQA Guidelines, a "no project" alternative shall be evaluated to allow decisionmakers to compare the impacts of approving the Proposed Project with the impacts of not approving the Proposed Project. Additionally, the no project alternative may represent the continuation of an existing land use or ongoing operation into the future. Thus, the no project alternative represents a continuation of the previously approved 2014 Master Plan, which was analyzed in the 2014 Master Plan EIR. Under the No Project/2014 Master Plan Development (Alternative A), the Proposed Project would not be implemented and the approved 2014 Master Plan would allow for continued operation and incremental modernization of the Medical Center Campus, allowing for renovation, replacement, and

expansion of existing buildings as needed to support ongoing medical, administrative, and supportive functions. No new comprehensive redevelopment or reconfiguration of the Campus would occur beyond what is currently approved. This alternative would allow for approximately 827,801 square feet of demolition and approximately 1,157,070 square feet of new construction —including a proposed 450-bed hospital (400,000 square feet) on the Project Site—consistent with the approved 2014 Master Plan framework. No adaptive reuse of the General Hospital Building would occur.

The Project Site would, therefore, remain developed consistent with prior County approvals, and future improvements would continue to occur in response to operational needs and regulatory requirements, as determined by the County. Overall, Alternative A would result in an approximately 83 percent[2] reduction in development buildout when compared to the Proposed Project. Alternative A would result in less demolition and less new development.

Alternative A would generally reduce short-term construction-related environmental impacts such as aesthetics, air quality, noise, energy use, greenhouse gas emissions, transportation, recreation, public services, and utilities compared to the Proposed Project. However, it would not eliminate impacts entirely, as many operational impacts would remain similar to existing conditions or only slightly reduced. Alternative A would avoid the scale of redevelopment benefits but would not address key existing deficiencies, including insufficient housing, limited open space, outdated infrastructure, and reduced sustainability and resilience features. It would also increase or maintain impacts on cultural resources and could contribute to cumulative impacts over time due to continued reliance on aging systems and outdated site design. Overall, Alternative A is less environmentally advantageous over the long term and would partially meet the Proposed General Hospital objectives, but would not achieve the same level of flexibility, housing delivery, sustainability, or long-term resilience as the Proposed Project.

ES.5.2 Alternative B: General Hospital Adaptive Reuse

The General Hospital Adaptive Reuse Alternative (Alternative B) would result in the seismic retrofit and adaptive reuse of the General Hospital Building and immediately adjacent areas within the Los Angeles General Hospital–Acute Building Historic District only. This includes the visitor and patient buildings in the Forecourt. As with the Proposed Project, under this alternative, selective demolition would occur within the General Hospital Building and approximately 1.2 million square feet of new uses would be developed in the General Hospital Building. Additionally, as part of the adaptive reuse of the General Hospital Building, this alternative would include the demolition of non-historic buildings and features around the General Hospital Building and area immediately north of the General Hospital Building (mini

[2] ([6,833,578 – 1,157,070]/6,833,578) x 100 = ~83%

warehouse building, barracks D and G, and trailers). No additional development would occur on the remaining portions of the Project Site. The remaining portions of the Project Site would otherwise generally remain in its existing condition, except for required safety/maintenance upgrades and infrastructure upgrades necessary to support continued use of the Campus operations, which could include some off-site improvements. Demolition of additional buildings outside of the General Hospital Building and Los Angeles General Hospital–Acute Building historic district would not occur under this alternative. Under this alternative, utility infrastructure would connect to the existing infrastructure network.

This alternative would implement the proposed programming for the General Hospital Building including up to 90,000 square feet of office space, leasable commercial areas, and event/dining space, as well as up to 615 residential units, within the General Hospital Building. The remaining portions of the Project Site would not be redeveloped and would remain in its existing condition, apart from required safety and maintenance upgrades to support the continued use of the Campus. As with the Proposed Project, all activities within the General Hospital Building and larger General Hospital–Acute Unit Historic District would be achieved in strict accordance with the Secretary of Interior Standards. This alternative would require different seismic requirements as compared to the Proposed Project due to the modified programming.

Alternative B would substantially reduce construction-related impacts compared to the Proposed Project, including impacts related to noise, air quality, greenhouse gas emissions, transportation, and vibration, due to the significantly smaller development footprint. It would also avoid potentially significant and unavoidable impacts on historic resources while implementing design features to ensure compliance with historic preservation standards. However, because redevelopment would be localized, the remainder of the Project Site would remain largely unchanged, resulting in continued reliance on aging utilities, infrastructure, and circulation systems. Due to the limited geographic scope of improvements, Alternative B would not meet the majority of the Proposed Project's objectives and would not achieve the County's long-term vision for a modern, integrated health supportive campus. Overall, Alternative B would partially meet certain objectives, particularly those related to historic preservation and limited economic activation, but would not adequately meet healthcare, housing, infrastructure, and long-term planning objectives compared to the Proposed Project.

ES.5.3 Alternative C: Reduced Density Medical Campus Alternative

The Reduced Density Medical Campus Alternative (Alternative C), would allow for the demolition of previously approved buildings and structures approved for demolition under the 2014 Master Plan, buildings and structures proposed for demolition under the Proposed Project, and redevelopment of the Project Site, over a 25-year horizon, with uses related to the medical and community-serving uses included by the Proposed Project.

Alternative C would implement the Proposed Project with a focus on medical-related uses and would not include the adaptive reuse of the approximately 1.2-million-square-foot General Hospital Building. No residential, general office, retail, patient and care giver lodging, education, or clean tech/advanced industrial uses would be developed within the General Hospital Building. Alternative C would be limited to uses including 735,300 square feet of medical office, 400,000 square feet of hospital (450 beds), 160,000 square feet of County-support warehouse uses, and parking would be provided, which are the same square footages proposed for these uses under the Proposed Project (see Chapter 2, *Project Description*). Overall, approximately 1,295,300 square feet of new uses would be introduced on the Project Site. All development that would occur on the Project Site would be new construction, and no adaptive reuse of the General Hospital Building would occur. Demolition as previously evaluated in the 2014 Master Plan EIR would be implemented, as well as demolition of additional buildings as identified in this Draft SEIR (Viaduct, Pharmacy Building, trailers, and crypts). Similar to the Proposed Project, Campus-wide infrastructure and utility improvements necessary to implement the new uses would also occur. Like the Proposed Project, in addition to on-site improvements to infrastructure, some work may occur off-site within the City of Los Angeles, such as utility connections/replacements, public right-of-way improvements, and other related activities. Compared to the Proposed Project, Alternative C would result in a reduced overall development intensity, fewer new buildings, and a more limited mix of land uses.

Alternative C would reduce construction-related environmental impacts such as noise, air quality, greenhouse gas emissions, vibration, and transportation impacts due to a smaller development footprint, although site-wide demolition and utility upgrades would still occur. It would also reduce the Proposed Project's transportation hazards impact, though it may not fully avoid it. However, because adaptive reuse of the General Hospital Building would not occur, impacts on historic resources could be greater, and mitigation measures would not necessarily reduce those impacts to less-than-significant levels. While Alternative C would maintain essential healthcare operations and allow for phased medical modernization, it would not include housing, commercial, or community-serving uses, and would therefore not achieve the broader planning, sustainability, or economic development goals of the Proposed Project. Aging infrastructure and limited redevelopment outside medical functions would also reduce long-term improvements in sustainability, resilience, and campus-wide integration.

ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Based on the comparative analysis presented in Chapter 4, *Alternatives to the Proposed Project* of the Draft SEIR, Alternative B is identified as the Environmentally Superior Alternative. While this alternative would not meet all of the Proposed Project's objectives, with respect to providing a mix of housing, job opportunities, varied land uses, community benefits, and developing a comprehensive planning and entitlement framework, this alternative would result in fewer overall environmental impacts than Alternatives A and C. When weighing both

construction and operational impacts, Alternative B presents the most balanced and environmentally advantageous outcome among the alternatives evaluated.

In accordance with State CEQA Guidelines Section 15126.6(e)(2), Alternative B is identified as the Environmentally Superior Alternative because it would:

- Reduce the magnitude of the Proposed Project's greatest impacts,
- Avoid the long-term environmental drawbacks of the No Project Alternative, and
- Provide meaningful environmental and historic benefits through reuse of the existing General Hospital Building and Los Angeles General Hospital–Acute Building Historic District.

ES.6 AREAS OF CONTROVERSY

In accordance with Section 15123(b)(2) of the State CEQA Guidelines, the EIR summary must identify areas of controversy known to the lead agency, including issues raised by agencies and the public. Prior to preparation of the Draft SEIR, the County issued a Notice of Preparation (NOP) on September 26, 2025. The CEQA-mandated scoping period for this Draft SEIR was between September 26 and November 21, 2025, during which interested agencies and the public could submit comments about the potential environmental impacts of the Proposed Project. During this time, the County received comment letters from State and local agencies as well as the general public. Appendix A, *Notice of Preparation and Scoping Comments*, of this Draft SEIR contains the NOP as well as the comments received by County in response to the NOP. The comments received during the NOP public review period and public scoping meeting are presented in Table 1-1, *Summary of Scoping Comments Received*.

Concerns raised in letters submitted to the County in response to the NOP include the following list. Though the concerns applicable to the CEQA process are addressed in this Draft SEIR, this list is not necessarily exhaustive; rather, it attempts to capture concerns that are likely to generate the greatest interest based on the input received during the scoping process.

- Bus service and transit-oriented development
- Impacts on traffic congestion
- Impacts on public services
- Impacts on noise
- Pedestrian and bicycle connectivity
- Impacts on nearby schools regarding air quality, hazards, noise, traffic, and pedestrian safety
- Impacts on population growth
- Impacts on emergency services
- Preservation of the medical library within the General Hospital Building

Section 15123(b)(3) of the State CEQA Guidelines requires that the Executive Summary also identify issues to be resolved. As lead agency, the County will consider whether this Draft SEIR satisfies the required findings for certification, including findings pertaining to the potential project alternatives and whether or how to mitigate significant impacts.

ES.7 SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Table ES-2, *Summary of Significant Environmental Impacts and Mitigation Measures*, summarizes the conclusions of the environmental analysis in this Draft SEIR. Impacts are identified as significant, less than significant, or no impact, and mitigation measures are identified for all significant impacts. The level of significance after imposing the mitigation measures is also presented. A complete list of mitigation measures from the 2014 Master Plan EIR, along with proposed revisions is included in Appendix B, *Comparison of Adopted 2014 Master Plan EIR Mitigation Measures and Proposed 2026 SEIR Mitigation Measures*.

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
AESTHETICS (*The Proposed Project meets the criteria of Public Resources Code Section 21099(d)(1), and aesthetic impacts shall not be considered significant impacts on the environment. However, the Draft SEIR includes an evaluation of aesthetics for informational purposes only, to provide a complete record of the Proposed Project's visual context, demonstrate consistency with applicable design standards and policies, and inform the public about potential visual changes related to building height, massing, and site improvements.*)			
Significance Criterion a: Would the project have a substantial adverse effect on a scenic vista?	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion b: Would the project substantially degrade the view from a scenic highway, including, but not limited to, trees, rock outcroppings, and historic buildings?	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion c: In nonurbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
applicable zoning and other regulations governing scenic quality?			
Significance Criterion d: Would the project expose people on- or off-site to substantial light or glare which would adversely affect day or nighttime views in the area?	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
AIR QUALITY			
Significance Criterion a: Would the project conflict with or obstruct implementation of the applicable air quality plan? The Proposed Project's construction activities would be required to comply with requirements to minimize short-term emissions from on-road and off-road diesel equipment and would be required to comply with applicable regulations. Impacts would be less than significant.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
The Proposed Project's operation of future development under the Proposed Project would not conflict with or obstruct the implementation of the applicable air quality plan.			
Significance Criterion b: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard? The Proposed Project's construction activities have the potential to result in a cumulatively considerable net increase in criteria pollutants. (**Impact AIR-1**) The Proposed Project's operational activities have the potential to result in a cumulatively considerable net	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure AIR-1a:** To reduce volatile organic compounds (VOC) emissions during construction, the Project Applicant(s) (or its contractors) shall use paints with a VOC content that meets the South Coast Air Quality Management District Super Compliant architectural coatings standard of less than 10 grams per liter (g/L) for coating building architectural surfaces during construction. This measure shall be noted on all site and construction plans. **Mitigation Measure AIR-1b:** To reduce nitrogen oxide (NO_X) emissions during construction, the Project Applicant (or its contractors) shall implement the following measures during construction: ▪ Use construction equipment rated by the United States Environmental Protection Agency (USEPA) as having Tier 4 Final or higher exhaust emission limits for offroad equipment with engines 25 horsepower or higher. If Tier 4 Final equipment is not readily available, the contractor may apply other technologies available for construction	Less Than Significant (construction) Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
increase in criteria pollutants. (**Impact AIR-2**)		equipment such that it would achieve a comparable reduction in NOX and PM emissions comparable to that of Tier 4 construction equipment. Where alternatives to USEPA Tier 4 are utilized, the contractor shall be required to show evidence to the Project Applicant(s) that these alternative technologies would achieve comparable emissions reductions. Certifications or alternative reduction strategies shall be required prior to receiving a construction permit. ▪ Maintain a list of all operating equipment in use on the construction site during construction for verification by the County of Los Angeles Building and Safety Department. The construction equipment list shall state the makes, models, Equipment Identification Numbers, Engine Family Numbers, and number of construction equipment on-site. ▪ Haul and delivery truck idling times shall be minimized by shutting equipment off when not in use or reducing maximum idling time to less than three (3) minutes (beyond that required by 13 California Code of Resources [CCR] Chapter 10, Section 2485). Clear signage shall be provided for construction workers and construction vehicles at all access points. ▪ All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper conditions prior to operation.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		▪ A traffic control plan shall be prepared and provided to the County. ▪ A carpool program for construction workers, including incentivizing carpooling as well providing bus service for crew members shall be implemented. ▪ Truck deliveries shall be consolidated when possible. ▪ The combined vehicle miles traveled per day for offsite haul truck trips associated with demolition debris and earthen material export/import hauling operations shall not exceed 8,930 miles per day (equivalent to 180 one-way truck haul trips at 49.61 miles per one-way trip, which is the average distance to nearby serving landfills). The construction contractor(s) overseeing hauling operations shall log the number of daily haul truck loads and the one-way haul trip distance for each truck haul load of either demolition debris or earthen material for days in which truck hauling of these materials occurs. ▪ The individual requirements under this mitigation measure shall be noted on all site and construction plans. **Operation** Implement Mitigation Measures GHG-1a through GHG-1c and Mitigation Measure TRA-3d.	
Significance Criterion c: Would the project expose sensitive	Potentially Significant	**Construction** Implement Mitigation Measure AIR-1b.	Less than Significant (construction)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
receptors to substantial pollutant concentrations? The Proposed Project's construction activities have the potential to generate emissions that would exceed applicable thresholds. (**Impact AIR-3**) The Proposed Project's warehouse and light industrial uses have the potential to generate on-site emissions that would exceed applicable thresholds (**Impact AIR-4**) The Proposed Project's warehousing and light industrial uses would generate operational TAC emissions from non-permitted sources that would exceed South Coast AQMD localized significance thresholds. (**Impact AIR-5**)	(construction and operation)	**Operation** **Mitigation Measure AIR-4a:** Future developer/facility owners for new development projects that would use off-road equipment (e.g., forklifts and yard trucks) in daily business operations shall only utilize electric-powered off-road equipment. The project developer/facility owner shall disclose this requirement to all tenants/business entities and provide written verification to the County prior to issuance of a Business License. In addition, the limitation to use only electric-powered off-road equipment shall be included in all leasing agreements. Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the County noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only electric-powered equipment for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities and retained and posted by the Business License by the facility owner onsite. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the County to verify, to the County's satisfaction, that any off-road equipment utilized will be electric-powered. **Mitigation Measure AIR-4b:** Future developer/facility owners for new development projects that would use transport refrigeration	Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		units (TRUs) in daily business operations use only electric standby and/or hybrid electric TRUs (E/S TRUs). All E/S TRUs shall comply with the California Air Resources Board's "Alternative Technology" requirements under Section 2477(e)(1)(A)(3) of the California Code of Regulations, Title 13, Article 8, Chapter 9, Division 3. The project developer/facility owner shall disclose this requirement to all tenants/business entities prior to the signing of any lease agreement. In addition, the limitation to use only E/S TRUs shall be included in all leasing agreements. Prior to issuance of a Business License for a new tenant/business entity, the project developer/facility owner and tenant/business entity shall provide a signed document (verification document) to the Los Angeles County Department of Regional Planning noting that the project development/facility owner has disclosed to the tenant/business entity the requirement to use only E/S TRUs for daily operations. This verification document shall be signed by authorized agents for the project developer/facility owner and tenant/business entities. In addition, if applicable, the tenant/business entity shall provide documentation (e.g., purchase or rental agreement) to the Los Angeles County Department of Regional Planning to verify, to the County's satisfaction, that any TRUs utilized will be E/S TRUs. **Mitigation Measure AIR-4c:** To reduce idling emissions from transport trucks, future project developer/facility owners for new warehousing or general industrial development projects place	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		signage at truck access gates, loading docks, and truck parking areas that identify applicable California Air Resources Board (CARB) anti-idling regulations (e.g., Rule 2485). At minimum, each sign shall include: 1) instructions for truck drivers to shut off engines when not in use; 2) instructions for drivers of diesel trucks to restrict nonessential idling to no more than two consecutive minutes (compared to five minutes currently allowed under Rule 2485); and 3) telephone numbers of the building facilities manager and CARB to report violations. All signage shall be made of weatherproof materials. All site and architectural plans submitted to the County shall note the locations of these signs. Prior to issuance of the Certificate of Occupancy, the Los Angeles County Building & Safety Division shall verify the installation of these signs.	
Significance Criterion d: Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people? The Proposed Project's construction activities would result in short-term construction related odors that would cease upon the drying or hardening of odor-producing materials.	Less Than Significant (construction) Potentially Significant (operation)	**Mitigation Measure AIR-6:** Prior to discretionary approval by the County of Los Angeles, if it is determined that a development project has the potential to emit nuisance odors , an odor management plan shall be prepared by the Project Applicant(s) and submitted to the Los Angeles County Department of Regional Planning for review and approval. Facilities that have the potential to generate nuisance odors include, but are not limited to: ▪ Wastewater treatment plants ▪ Composting, green waste, or recycling facilities ▪ Fiberglass manufacturing facilities ▪ Painting/coating operations ▪ Large-capacity coffee roasters	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Impacts would be less than significant. The Proposed Project's industrial land uses have the potential to generate an odor nuance. (**Impact AIR-6**)		▪ Food-processing facilities The odor management plan shall demonstrate compliance with the South Coast Air Quality Management District's Rule 402 for nuisance odors and be submitted to the County. The Odor Management Plan shall identify the best available control technologies for toxics (T-BACTs) that will be utilized to reduce potential odors to acceptable levels, including appropriate enforcement mechanisms. T-BACTs may include but are not limited to scrubbers (i.e., air pollution control devices) at the industrial facility. T-BACTs identified in the odor management plan shall be incorporated into the project's design and on site plan(s).	
BIOLOGICAL RESOURCES			
Significance Criterion a: Would the project have a substantial effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure BIO-1: Mitigation for Impacts to Special-Status Bats**. To avoid impacts on roosting bats, preconstruction surveys shall be conducted by a qualified bat biologist prior to the on-set of construction within the vicinity of vacant buildings and prior to tree removal. During surveys, biologists shall avoid unnecessary disturbance of potentially occupied roosts. Full-spectrum acoustic detectors shall be used during emergence surveys to assist in species identification. If it is determined that trees or structures in the project area are being used by bats as roost sites, the following protective measures shall be implemented: ▪ Disturbance of maternity roosting structures or trees (e.g., structure removal, construction equipment operation near	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Individual development projects and implementation activities under the Proposed Project that require removal of on-site trees or other potential roost sites would result in a potentially significant impact to roosting special-status bats. **(Impact BIO-1)** Operational activities would not have an adverse effect on special status species because implementation of the Proposed Project would not differ significantly from current operational activities.		roosts, tree trimming or removal) shall not occur during the maternity period (April 15 to September 15) to avoid impacts on reproductively active females and active maternity roosts (whether colonial or solitary). The maternity roost shall remain undisturbed from the time it is located until the following September 15 or until a qualified biologist has determined the roost is no longer active. No construction work shall occur at the roost or within a 100-foot buffer zone (or an alternative buffer zone, as determined by the biologist) until September 15. ▪ Exclusion devices may be installed outside of the maternity period (September 16 to April 14) to preclude bats from occupying buildings during or prior to the on-set of construction. Exclusionary devices shall be installed only by or under the supervision of an experienced bat biologist. Eviction of bats roosting in trees outside the maternity season shall be done in favorable weather under the supervision of a qualified bat biologist and adhering to the following two-step removal process: ▪ On Day 1, for trees with cavities, crevices, and exfoliating bark, and that are found to support roosting bats, Step 1 would be removal of branches and limbs with no cavities. These limbs shall be removed by hand (e.g., using chainsaws). This will create a disturbance (noise and vibration) and physically alter the tree. Bats roosting in the tree that may not have been detected during the preconstruction survey, will either abandon the roost	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		immediately (rarely) or, after emergence, will avoid returning to the roost. For foliage roosting bats, Step 1 would be to remove adjacent, smaller, or non-habitat trees to create noise and vibration disturbance that would cause abandonment. On Day 2, under the supervision of a qualified biological monitor familiar with the life history of subject bat species, the tree may be removed. ▪ Qualified biologists should search all downed roost trees for dead and injured bats. The presence of dead or injured bats that are species of special concern shall be reported to the California Department of Fish and Wildlife (CDFW). ▪ Non-maternity roost trees should ideally be removed or trimmed in the fall between September 16 and October 31. If the removal or trimming of non-maternity roost trees cannot be timed to occur within this period, tree trimming and removal of non-maternity roost trees shall be timed to avoid periods of inclement or unseasonably cold weather to avoid impacts on bats in torpor (a period of seasonal inactivity). In all circumstances, qualified biologists shall monitor non-maternity tree removal.	
Significance Criterion b: Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California	No Impact (construction and operation)	None	No Impact (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Department of Fish and Wildlife or U.S. Fish and Wildlife Service? No riparian habitat or federally protected surface waters, wetlands, or other aquatic resources are located within or immediately adjacent to the Project Site.			
Significance Criterion c: Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? No federally protected wetlands are within or immediately adjacent to the Project Site.	No Impact (construction and operation)	None	No Impact (construction and operation)
Significance Criterion d: Would the project interfere substantially with the movement of any native	Potentially Significant (construction)	**Mitigation Measure BIO-2: Mitigation for Impacts to Nesting Birds.** Construction activities shall avoid the nesting season for birds to the extent feasible, or conduct preconstruction nesting bird surveys if construction activities are carried out during the	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites? Construction activities associated with the Proposed Project would have the potential to affect nesting birds. **(Impact BIO-2)** The Proposed Project's operational uses are not anticipated to not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.	Less Than Significant (operation)	nesting season. To ensure compliance with the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC), the Project Applicant(s), or through the general contractor(s), shall conduct all vegetation removal during the non-breeding season, between September 1 and January 31, or implement the following: If the removal of vegetation, demolition of buildings, or noise-generating construction activities are scheduled between February 1 and August 31, the County or contractor shall retain a qualified biologist (i.e., experienced with conducting nesting bird surveys) who shall conduct a focused nesting bird survey prior to the start of vegetation removal, building demolition, or noise-generating construction activities within any potential nesting habitat (all vegetation, buildings, eaves on buildings, etc.). The size of the nesting bird survey area shall be determined by a qualified biologist at the time of the survey and include the entire limits of disturbance. It may also include a buffer area if deemed necessary by the qualified biologist. The preconstruction nesting bird surveys shall be conducted no more than seven days prior to initiation of vegetation removal, building demolition activities, or noise-generating construction activities. If no active nests are detected during these surveys, no restrictions on Project activities are necessary. If active nests are found, a qualified biologist shall identify and flag an appropriate buffer around the nest, and no construction	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		activities shall occur within the buffer until the qualified biologist has determined that young have fledged or the nest is no longer active. The specific buffer width shall be determined by a qualified biologist at the time of discovery and vary according to the bird species, site conditions, and the type of work activities to be conducted. The survey results shall be submitted to the County of Los Angeles Department of Public Works for review and approval of the recommended nest buffer areas, if any, prior to commencement of any vegetation removal, building demolition, or noise-generating construction activities on the Project Site.	
Significance Criterion e: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? Construction and operation of the Proposed Project could result in encroachment into the root protection zones or removal of protected coast live oak trees. Operation of facilities under the Proposed Project, including routine maintenance	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure BIO-3: Mitigation for Impacts to Protected Trees.** Prior to removal, relocation, or maintenance of protected oak trees, a qualified arborist shall inventory and evaluate the health of protected oak trees on the Project Site and evaluate the potential for impacts. If the arborist determines that the proposed activity would cut, destroy, remove, relocate, inflict damage, or encroach into a protection zone of a protected oak tree, the Project Applicant shall submit an application for approval to the Los Angeles County Department of Regional Planning and obtain approval prior to impacting a protected oak tree. The Project Applicant(s) shall be required to implement the conditions of approval, including planting and care of replacement trees and protections for non-impacted oak trees. When planting replacement trees is required, replacement trees	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
and pruning of vegetation and trees, has the potential to impact oak trees that are protected under the County's Oak Tree Ordinance. **(Impact BIO-3)**		shall be in the ratio of two trees planted for each tree impacted. Replacement trees shall be indigenous oak species and shall be at least 15-gallon size and measure at least one inch in diameter one foot above the base. Replacement trees shall be properly cared for and maintained for two years and replaced if they die within that period. **Operation** Implement Mitigation Measure BIO-3.	
Significance Criterion f: Would the project conflict with the provisions of an adopted Habitat Conservation Plan; Natural Community Conservation Plan; or other approved local, regional, or state habitat conservation plan? There are no adopted Habitat Conservation Plans or Natural Community Conservation Plans or similar approved plans at the State or federal level for the Project Site or adjacent areas.	No Impact (construction and operation)	None	No Impact (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
CULTURAL RESOURCES			
Significance Criterion a: Would the project cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5? During construction, the Proposed Project has the potential to impact adjacent resources through new construction outside the Los Angeles General Hospital–Acute Unit Historic District boundary. New implementing construction projects may impact adjacent historical resources if they are incompatible with the scale, massing, height, or style of adjacent resources; if they result in diminished integrity of adjacent resources (specifically, setting and/or feeling); or if they result in vibration impacts	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Program for Adjacent New Construction** If a new construction project is proposed for a site within 50 feet of an eligible or designated historical resource, then the Project Applicant(s) shall apply Mitigation Measure CUL-1a (Secretary Standards Compliance) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the project is adjacent to the resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the new construction is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the new construction is found to be adjacent to the identified resource, the Architectural Historian/Historic Architect shall assess the project, focusing on the application of Standards No. 9 and 10, both of which relate to adjacent new construction. If the Architectural Historian concludes that the new construction project meets the Standards, then the project is presumed to not have an impact on historical resources. During implementation of the project, the Project Applicant(s) shall apply Mitigation Measure CUL-1b (Project Review During Design and Construction) and engage a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional	Significant and Unavoidable (construction) Less Than Significant (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
to adjacent resources. **(Impact CUL-1)** Operation of the Proposed Project at the Project Site is not anticipated to result in a substantial adverse change in the significance of historic resources. The Proposed Project would help to maintain the historical significance of the General Hospital Building through routine maintenance.		Qualifications Standards to review milestone drawings and generally be available to the design team, as needed. If the proximity of new construction to historical resources is such that vibration during construction may cause them physical damage, as defined through Mitigation Measure NOI-4, the Project Applicant(s) shall also apply Mitigation Measure CUL-1c (Protection During Construction) and engage a qualified Historic Architect and Structural Engineer to prepare a Conditions Assessment Report and Construction Monitoring Plan. **Mitigation Measure CUL-1a:** Secretary Standards Compliance. For all instances in which a project is implementing activities under the Proposed Project within 50 feet of an eligible or designated historical resource identified in this Draft SEIR, the Project Applicant shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to determine whether the future implementing project activity is adjacent to the identified historical resource (taking into account the scale of the project, any physical or visual separation, and existing baseline conditions). If the future implementing project activity is determined not to be adjacent to the identified historical resource, the Architectural Historian/Historic Architect shall prepare a statement to that effect, and no further analysis shall be required. If the future implementing project activity is determined to be adjacent to the identified historical resource,	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		the Architectural Historian/Historic Architect shall conduct an assessment of whether the proposed treatment of the historical resource complies with the Secretary of the Interior's Standards for Rehabilitation ("the Rehabilitation Standards"). If the future implementing project activity is found to not be in compliance with the Rehabilitation Standards, then the Architectural Historian/Historic Architect shall provide recommendations for how to modify the design, siting, scale, massing, or architectural treatment of the future implementing development projects to the extent feasible to bring it into compliance, or as close to compliance as feasible, which shall be integrated into the design of the Proposed Project. The professional shall prepare a memorandum or equivalent level of documentation conveying the findings of the assessment, which shall be provided to the County. **Mitigation Measure CUL-1b:** Project Review During Design and Construction. For instances in which a future project involves adjacency to a historical resource (as determined under Mitigation Measure CUL-1a), the Project Applicant(s) shall engage the services of a qualified Architectural Historian or Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to review milestone drawing sets and generally be available to the design team during design and construction. The Architectural Historian/Historic Architect shall review Design Development (DD) and Construction Documentation (CD) drawing sets at 50% and 100% completion and provide a brief memo regarding ongoing project compliance	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		with the Standards. Project review during construction shall occur quarterly and reported in memo format, which shall be provided to the County. **Mitigation Measure CUL-1c:** Protection During Construction. Prior to the commencement of construction activities within proximity to, as defined in Mitigation Measure NOI-4, a historical resource, a Conditions Assessment Report will be completed by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards to identify baseline conditions (cracks, deterioration, etc.). The report will be provided to the County. As part of this process, a Structural Engineer shall be consulted to determine whether any shoring or protection should be installed prior to commencement of construction activities. In addition, the Project Applicant(s) shall engage a Civil Engineer to prepare an Adjacent Building Construction Monitoring Plan ("Monitoring Plan"). The Monitoring Plan shall establish survey monuments and document and record the positions of adjacent buildings, structures, sidewalks, utilities, facades, and surface features to form a baseline for determining settlement or deformation. The Monitoring Plan shall include the following provisions: (1) shored excavation and adjacent buildings, structures, sidewalks, utilities, facades, and cracks shall be visually inspected at a minimum of one time per month; (2) survey monuments shall be measured at critical stages of	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		excavation, shoring, dewatering, and construction but should not occur less frequently than once every thirty days; (3) monitoring reports shall be prepared by an appropriate technical professional California Professional Land Surveyor documenting the movement monitoring results and distributed to all appropriate parties, including the shoring engineer. The County shall be provided all documentation and be notified if movement exceeds predetermined thresholds and calculated amounts as required.	
Significance Criterion b: Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5? Although the Project Site is located within an urbanized and disturbed area of the City, there is a potential for previously undiscovered archaeological resources to be present beneath the Project Site. **(Impact CUL-2)**	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure CUL-2:** Prior to any demolition, grading, or excavation related to the construction of facilities or improvements under the Proposed Project, a qualified archaeologist shall be retained by the Project Applicant(s) to determine which areas shall require cultural resources monitoring during initial ground disturbance. The location of construction activities that are likely to encounter subsurface sediments with archaeological sensitivity shall be determined by the qualified archaeologist upon review of project excavation and grading plans. If determined necessary by the qualified archaeologist, monitoring by a qualified archaeologist shall be conducted during all initial ground disturbing activities (e.g. grading, removal of foundations, utility trenching, installation of shoring/piles, etc.) within the Project Site, from ground surface level to bedrock.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Operation of the Proposed Project at the Project Site would not result in activities that would disturb native soils.		If, during cultural resources monitoring, the archaeologist determines that the sediments being excavated have been previously disturbed and are unlikely to contain significant cultural materials, the archaeologist shall request that monitoring be reduced or eliminated. Spot-check monitoring shall occur during all construction, on a schedule determined by the project archaeologist. If buried cultural resources such as trash deposits, building foundations, privy pits, flaked or ground stone, or human remains are inadvertently discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find and the area shall be secured to prevent disturbance. The County will be notified immediately. A qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to evaluate the significance of the find and recommend appropriate treatment measures. If the discovered materials are determined to be significant cultural resources, the archaeologist shall develop and implement an appropriate treatment plan, which may include avoidance, preservation in place, capping with fill material, or data recovery through excavation and documentation. The Treatment Plan shall be provided to the County. Work in the vicinity of the discovery, as determined by the qualified archaeologist, shall not resume until the archaeologist has determined that appropriate measures have been implemented. Treatment measures for	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		items that are not associated with human remains typically include development of avoidance strategies, capping with fill material, or mitigation of impacts through data recovery programs such as excavation or detailed documentation. If human remains are encountered, work shall halt in accordance with California Health and Safety Code Section 7050.5 and the County of Los Angeles Medical Examiner (Medical Examiner) shall be notified immediately. If the Medical Examiner determines that the remains are Native American, the Medical Examiner shall notify the Native American Heritage Commission (NAHC) within 24 hours, and the NAHC shall designate a Most Likely Descendant (MLD). The MLD shall be provided the opportunity to make recommendations regarding the treatment and disposition of the remains in accordance with Public Resources Code Section 5097.98.	
Significance Criterion c: Would the project disturb any human remains, including those interred outside of dedicated cemeteries? Ground-disturbing activities have the potential to unearth human remains. Should human remains be uncovered during construction, those remains	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
would require proper treatment in accordance with applicable laws, including Health and Safety Code Sections 7050.5-7055 and Public Resources Code Section 5097.98 require that there be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains. Operation of the Proposed Project at the Project Site is not anticipated to affect human remains as the Proposed Project's operational activities are not anticipated to disturb native soils.			
ENERGY			
Significance Criterion a: Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
resources, during project construction or operation? The Proposed Project would result in per capita electricity, natural gas, and gasoline and diesel fuel consumption rates below the County average under both the mixed-fuel design scenario and the all-electric design scenario.			
Significance Criterion b: Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency? Construction and operation of the Proposed Project would comply with the Energy Action Plan, County of Los Angeles 2045 CAP, and the Long-Term Energy Efficiency Strategic Plan.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
GEOLOGY AND SOILS			
Significance Criterion a: Would the project subject residents [or occupants, visitors, etc.] to potential seismic-related hazards, including the risk of loss, injury, or death involving: i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault. (Refer to Division of Mines and Geology Special Publication 42.) ii) Strong seismic ground shaking. iii) Seismic-related ground failure, including liquefaction iv) Landslides. The active Upper Elysian Park blind thrust fault is	Potentially Significant (construction and operation)	**<u>Construction and Operation</u>** **Mitigation Measure GEO-1:** Prior to any structural improvements to buildings or prior to any excavation related to the construction of new facilities, detailed subsurface geotechnical evaluations shall be performed to address site-specific conditions at the locations of the planned improvements and provide detailed recommendations for design and construction. The Project Applicant(s) or its designee shall ensure that all recommendations contained in the approved geotechnical reports are incorporated into final design plans and implemented during construction. All recommendations shall be implemented. The geotechnical evaluation(s) shall include the following measures, at a minimum, to address potential seismic ground shaking, liquefaction, and slope stability hazards. These components establish required baseline evaluation criteria. However, the licensed geotechnical engineer(s) shall identify and incorporate any additional site-specific design and construction recommendations necessary based on the results of subsurface investigations conducted for each development phase. All recommendations shall be provided to the County, be incorporated into final engineering plans, and implemented during construction. Recommendations could include but are not limited to: ▪ **Seismicity:** Structural elements of future improvements shall be designed to resist or accommodate appropriate	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
approximately 0.4 mile north of the approximate center of the Project Site. Thus, lurching or cracking of the ground surface as a result of nearby seismic events is a possible and potentially significant impact. Strong seismic ground shaking represents a potentially significant impact, particularly for retained buildings that are not designed to current seismic standards. Therefore, seismic ground shaking is potentially significant. The risk of damage from liquefaction and seismic settlement could occur under the Proposed Project due to the presence of young alluvial soils and shallow groundwater in portions of the Project Site. The probability of seismically induced landslides on the Project Site is considered remote. **(Impact GEO-1)**		site-specific ground motions and conform to the current seismic design standards. ▪ **Liquefaction:** An assessment of the liquefaction potential shall be made prior to detailed design and construction of project improvements. Structural design and preventative techniques, such as in situ ground modification or supporting foundations with piles at depths designed specifically for liquefaction, shall be included. To evaluate the potential for liquefaction, subsurface evaluation may be performed. Site-specific geotechnical evaluations that assess the liquefaction and dynamic settlement characteristics of the on-site soils shall include the drilling of exploratory borings, evaluation of groundwater depths, and laboratory testing of soils. Methods for construction in areas with a potential liquefaction hazard may include in situ ground modification, removal of liquefiable layers and replacement with compacted fill, or support of project improvements on piles at depths designed specifically for liquefaction. Pile foundations can be designed for a liquefaction hazard by supporting the piles on dense soil or bedrock below the liquefiable zone or employing other appropriate methods, as evaluated during the Project Site-specific evaluation. Additional recommendations to address liquefaction may include densification by	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		installation of stone columns, vibration, deep dynamic compaction, and/or compaction grouting. ▪ **Slope Stability:** An assessment of slope stability shall be made prior to detailed design and construction of project improvements and design techniques, such retaining walls and drainage improvements, shall be implemented as needed. Slopes created or modified as part of the Proposed Project shall be engineered to reduce the potential for slope instability. The geotechnical evaluation(s) shall include the following measures to address and resolve site-specific unstable soil impacts: ▪ **Groundwater:** Excavations for foundations in areas with shallow perched groundwater may need to be cased/shored and/or dewatered to maintain stability of the excavations and provide access for construction. All recommendations included in the preliminary geotechnical evaluations pertaining to groundwater shall be followed. Excavations for underground structures shall be performed with care to reduce the potential for lateral deflection of excavation sidewalls and/or shoring, which may also cause differential movement of structures located near the excavation.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Further study, including subsurface exploration, shall be performed during the detailed design phase of future improvements to evaluate the presence of groundwater, seepage, and/or perched groundwater at the Project Site and the potential impacts on design and construction of project improvements. An assessment of the potential for shallow groundwater shall be made during the design phase of each project, and design techniques shall be developed as necessary. ▪ **Collapsible Soils/Settlement:** An assessment of the potential for soils that are prone to settlement shall be made prior to detailed design and construction of project improvements, and design techniques shall be developed, as appropriate, to reduce impacts related to settlement to low levels. During the detailed design phase of the project, surface reconnaissance and site-specific geotechnical evaluations shall be performed to assess the settlement potential of the on-site natural soils and undocumented fill. This may include detailed surface reconnaissance to evaluate site conditions, drilling of exploratory borings or test pits, and laboratory testing of soils, where appropriate, to evaluate site conditions. Prescribed approaches to address potential soil	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		settlement could include either removal of the compressible/collapsible soil layers and replacement with compacted fill, surcharging to induce settlement prior to construction of improvements, allowing for a settlement period after or during construction with new fills, or a specialized foundation design, including the use of deep foundation systems to support structures. Varieties of in situ soil improvement techniques are also available, such as dynamic compaction (heavy tamping) or compaction grouting. The geotechnical evaluation(s) shall include the following measures to address and resolve site-specific expansive and corrosive soils hazards: ▪ **Expansive Soils:** Mitigation techniques to reduce expansive soil potential shall be included as necessary. Techniques shall include over excavation and replacement with non-expansive soil, soil treatment, moisture management, and/or a specific structural design for expansive soil conditions developed during the design phase. ▪ **Corrosive Soils:** An assessment of the potential for corrosive soils shall be made during the detailed design phase of the project through soil testing procedures. Engineering methods shall be developed, as appropriate, to reduce impacts related to corrosive soils to low levels. Subsurface evaluation, including laboratory testing, shall	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		be performed. Evaluation of the corrosive soil potential shall be accomplished through testing and analysis of soils at foundation design depths. The laboratory tests conducted on the soils prior to construction and improvement plan preparation shall include corrosivity tests. Review of these data by a corrosion engineer, if determined necessary in the geotechnical evaluation, shall result in corrosion protection measures that address site-specific conditions. Evaluation of the potential corrosive soils hazard shall be performed prior to detailed design and construction so that, in the event the hazard exists, design techniques may be implemented. To avoid site-specific subsurface evaluation, corrosion protection measures may be included in the initial design for the proposed project improvements. Depending on site-specific conditions presented geotechnical evaluation, recommendations for corrosive soil conditions may involve the use of concrete that is resistant to sulfate exposure. Corrosion protection for metals may be needed for underground foundations or structures in areas where corrosive groundwater or soil could cause deterioration. Typical design techniques include epoxy and metallic protective coatings, the use of alternative (corrosion-resistant) materials, and selection of the appropriate type of cement and water/cement ratio.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion b: Would the project result in substantial soil erosion or the loss of topsoil? Required NPDES/SWPPP measures, building code compliance, and site-specific geotechnical recommendations would control construction-related erosion. Operationally, engineered drainage, LID features, and required BMPs would effectively manage runoff on the Site's steep slopes and landscaped areas.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion c: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	Potentially Significant (construction and operation)	**Construction and Operation** Implement Mitigation Measure GEO-1.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Mapped areas of subsidence were not found in the City or County of Los Angeles reference materials. Therefore, the potential for subsidence on the Project Site is relatively low. Given these conditions and the anticipated depth of excavation for proposed structures and utilities, groundwater could be encountered during construction. Therefore, groundwater impacts would be potentially significant. Given the extent of demolition, excavation, and reconstruction planned across the Project Site under the Proposed Project, these conditions could result in localized ground movement and structural distress if not addressed. **(Impact GEO-2)**			
Significance Criterion d: Would the project be located on expansive soil, as defined in	Potentially Significant	**Construction and Operation** Implement Mitigation Measure GEO-1.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Table 18-1B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property? Pockets of clay-rich alluvium and weathered Puente Formation bedrock may be present on the Project Site, and would present a low to moderate expansion risk. **(Impact GEO-3)**	(construction and operation)		
Significance Criterion e: Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater? The Proposed Project would not require the use of septic tanks or alternative wastewater disposal systems.	No Impact (construction and operation)	None	No Impact (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion f: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature? The Proposed Project's construction and demolition activities have the potential to encounter paleontological resources beneath fill soils. **(Impact GEO-4)**	Potentially Significant (construction) No Impact (operation)	**Mitigation Measure GEO-4: Paleontological Resources.** Prior to any excavation related to the construction of facilities or improvements proposed under the master plan, a qualified vertebrate paleontologist with a graduate degree in paleontology, geology, or a closely related earth science discipline, and more than 10 years of experience shall be retained by the Project Applicant(s) or construction contractor. Final excavation depths, locations, and construction methods shall be determined during subsequent project-level design. Accordingly, the qualified paleontologist shall review project-specific excavation and grading plans prior to construction and identify areas where monitoring is required based on the depth and extent of excavation into paleontologically sensitive geologic units (e.g., older alluvium or Puente Formation). Monitoring shall be implemented by the qualified paleontologist during ground disturbance in those identified areas. Very shallow surficial excavations (i.e., less than 5 feet in depth) within areas of previous disturbance or areas of Quaternary younger alluvial deposits shall be monitored by the qualified paleontologist to ensure that underlying sensitive units (i.e., Quaternary older alluvium) are not adversely affected. Areas consisting of artificial fill materials shall not require monitoring. If future excavations take place in Quaternary older alluvial deposits or within Fernando or Puente Formation bedrock, such excavations shall be monitored on a full-time basis by a qualified	Less Than Significant (construction) No Impact (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		paleontological monitor and under the supervision of the qualified paleontologist. The paleontological resource monitoring shall include inspection of exposed rock units during active excavations within the geologically sensitive sediments. Monitoring may be reduced if some of the potentially fossiliferous units described herein are, upon exposure and examination by qualified paleontological personnel, determined to have a low potential for containing fossil resources. The paleontological monitor shall be equipped to salvage fossils as they are unearthed to avoid construction delays and remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontological monitor shall have authority to temporarily divert grading away from exposed fossils to recover the fossil specimens professionally and efficiently and collect associated data. All efforts to avoid delays in project schedules shall be made. To prevent construction delays, paleontological monitors shall be equipped with the necessary tools for the rapid removal of fossils and retrieval of associated data. This equipment shall include handheld global positioning system receivers, digital cameras, and cell phones as well as a tool kit with specimen containers, matrix sampling bags, field labels, field tools (awls, hammers, chisels, shovels, etc.), and plaster kits. At each fossil locality, field data forms shall be used to record pertinent geologic data, stratigraphic sections shall be measured,	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		and appropriate sediment samples shall be collected and submitted for analysis. Fossils collected, if any, shall be transported to a paleontological laboratory for processing where they shall be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility that meets federal and State curation standards and is approved in writing by the County of Los Angeles. Following analysis, a Report of Findings with an appended itemized inventory of specimens shall be prepared by the qualified paleontologist within a reasonable timeframe from the completion of recovery. The report and inventory, when submitted to the County along with confirmation of the curation of recovered specimens into an established, accredited museum repository, shall signify completion of the program to mitigate impacts on paleontological resources.	
GREENHOUSE GAS EMISSIONS			
Significance Criterion a: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment? Implementation of the Proposed Project would result	Potentially Significant (construction and operation)	**<u>Construction and Operation</u>** **Mitigation Measure GHG-1a:** For development projects that include parking (e.g., private garages, surface parking lot, etc.), the Project Applicant(s) shall implement the following provisions of the California Green Building Standards Code (CALGreen) as mandatory and not voluntary and shall list and identify them on all prepared building and site plans. The Project Applicant shall submit these building and site plans that note the applicable	Significant and Unavoidable (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
in emissions that would exceed the South Coast Air Quality Management District bright-line greenhouse gas significance threshold. (**Impact GHG-1**)		measures to the County of Los Angeles Building and Safety Department prior to the issuance of construction permits. • **Residential Structures with Three or Fewer Stories**. For residential land uses with three or fewer stories, the project developer(s) shall: o Design and build condominium/townhouses dwellings that have an attached private garage to have a dedicated electric circuit to support electric vehicle charging, as outlined in the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.1. o Design and build residential buildings to, at a minimum, meet the Tier 2 electric vehicle parking standards of the Residential Voluntary Measures of CALGreen, Division A4.1, Planning and Design, as outlined under Section A4.106.8.2.1. • **Nonresidential Structures and Residential Structures with Four or More Stories.** For nonresidential land uses and residential land uses that are four or more stories, the applicant/developer(s) shall: o All parking areas shall be designed to provide parking for low-emitting, fuel-efficient, and carpool/van vehicles. At minimum, the number of preferential parking spaces shall equal the Tier 2	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.1.2. o Parking areas shall be designed to provide electric vehicle (EV) charging stations. At minimum, the number of EV charging stations shall comply with the Tier 2 Nonresidential Voluntary Measures of CALGreen, Division A5.1, Planning and Design, Section A5.106.5.3.3 or Section A5.106.5.3.4. **Mitigation Measure GHG-1b:** Each applicant shall demonstrate a minimum 10 percent reduction in energy consumption below energy baseline. For the General Hospital, ASHRAE Standard 90.1-2010 shall be the energy baseline. For all other new construction and major renovation, the 2025 version of Title 24, Part 6 shall be the energy baseline. "New construction" in this context shall mean "ground up" development of a structure that has never been occupied. "Major renovation" in this context shall include additions to or redevelopment of existing structures resulting in an increase of over fifty (50) percent of the existing floor area. An overall energy reduction of 10 percent shall be demonstrated on an aggregate basis across the Project Site, allowing for some buildings to perform better than others. Compliance shall be demonstrated via: • A technical memorandum (where energy reductions might be below 10% for individual buildings); or	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		• Title 24 compliance forms submitted at the time of permit (where energy reductions are above 10%); or • An energy modeling report (for the General Hospital). The technical memorandum shall be based on a project site-level energy calculation and reference Title 24 compliance forms where completed and available, and submitted to the County prior to issuance of each building permit. The 10 percent reduction in energy consumption may be achieved through a combination of Project Site-wide renewable energy generation, energy distribution systems, electrification, and/or building design features. The Project Site area energy calculations shall be based on new developments pursuant to the project. The Project Site-level energy calculations shall be updated as needed throughout phased development to reflect actual design progress. Where performance of an individual building or phase is below the 10 percent requirement, it will address anticipated performance in future phases to achieve the aggregate 10 percent reduction. Should the final development phase proposal show that the Project Site-wide 10 percent reduction in energy consumption was not achieved, the final phase development proposal shall include additional measures to ensure the Project Site-wide 10 percent reduction in energy consumption from the electrical grid be achieved. The "final development phase" is the phase that would complete the full buildout of the Project Site within the	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		anticipated 25-year development horizon. If such phase is not realized within the 25-year development horizon, then the Proposed Project shall demonstrate the Project Site-wide 10 percent reduction no later than December 31st, 2050 through the implementation of additional measures. These additional measures may include but are not limited to photovoltaic arrays, appliance or mechanical system upgrades to new or existing buildings, or lighting upgrades on new or existing structures. Any such additional measures shall be quantified for energy consumption reduction performance and submitted to the County for approval prior to the issuance of construction permits for the final phase proposal. **Mitigation Measure GHG-1c:** For nonresidential development projects, prior to issuance of the certificate of occupancy, the property owner shall provide documentation to the County of Los Angeles Building and Safety Department demonstrating enrollment in a 100 percent carbon-free electricity energy plan, such as the City of Los Angeles Department of Water and Power's Green Power for Green LA program, for Proposed Project building(s) if such plan is available. If a 100 percent carbon-free electricity plan is not available, the project developer(s)/County shall enroll in an energy plan with the next highest carbon-free electricity until a 100 percent carbon-free electricity energy plan becomes available. Measures to achieve 100 percent carbon-free electricity use may include, but are not limited to, plans for 100 percent renewable electricity. If such carbon-free electricity energy plans are waitlisted, the Project Applicant may enroll in an	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		available energy plan in the meantime, but shall sign up for the waiting list until such time a carbon-free electricity energy plan is available. Implement Mitigation Measure TRA-3d.	
Significance Criterion b: Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases? The Proposed Project would not conflict with applicable strategies and regulations to reduce greenhouse gas emissions. Impacts would be less than significant.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
HAZARDS AND HAZARDOUS MATERIALS			
Significance Criterion a: Would the project create a significant hazard to the public or the environment through the routine transport, use, or	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure HAZ-1a**: In order to minimize exposure, prior to demolition activities, asbestos-containing materials and lead-based paint surveys and evaluations shall be conducted in buildings that are to be demolished or renovated. Hazardous building materials surveys have been conducted for many Project	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
disposal of hazardous materials? Construction and phased demolition of existing buildings and structures would involve the routine handling, transport, and disposal of hazardous materials. Investigations across the Project Site have confirmed the presence of ACMs, LBPs, petroleum hydrocarbons, VOCs, methane, undocumented fill containing demolition debris, and an idle oil well, as well as limited occurrences of low-level radioactive waste associated with former medical and laboratory activities. **(Impact HAZ-1).** Operational hazardous materials use would include medical and laboratory supplies, cleaning agents, maintenance products, fuels, and small quantities of commercial and household products. Biomedical and		Site structures; however, because demolition would occur in phases and certain materials are concealed within wall assemblies, mechanical systems, and other building components that cannot be fully accessed until demolition preparation activities occur, final comprehensive pre-demolition surveys consistent with South Coast Air Quality Management District (AQMD) Rule 1403 shall be completed immediately prior to demolition of each structure. Abatement measures shall be implemented in accordance with the recommendations of these evaluations. Asbestos surveys shall be conducted in accordance with South Coast AQMD Rule 1403, which specifies that all surveys are to be carried out by a Cal/OSHA-certified asbestos consultant and will follow established survey protocols, notification, and work practice requirements. Lead-based paint surveys shall be carried out by a California Department of Public Health (CDPH)–certified inspector/assessor. If necessary, a lead abatement plan would be prepared by the CDPH-certified project monitor or supervisor and be implemented during demolition and renovation activities. Demolition activities would be performed by CDPH-certified workers. **Mitigation Measure HAZ-1b:** Prior to start of construction, construction activities that involve subsurface disturbance within areas of the Project Site where residual petroleum hydrocarbons and volatile organic compounds (VOCs) in groundwater have been identified or are reasonably expected to be present, including areas downgradient of the former leaking underground storage tank (LUST) location at 1200 North State Street shall	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
medical waste generated by hospital functions would continue to be produced during long-term operation and must be managed as part of ongoing campus activities. **(Impact HAZ-2)**		account for residual petroleum hydrocarbons and VOCs in groundwater that remain following regulatory closure of the former leaking underground storage tank case. A qualified environmental professional shall evaluate the potential for vapor encroachment conditions (VEC) and specify appropriate management measures, which may include removal and disposal of contaminated soil, groundwater management, vapor mitigation, or other remedial actions, consistent with regulatory requirements and recommendations of the Phase II ESA. The management measures shall be implemented during soil disturbing activities. **Mitigation Measure HAZ-1c:** Prior to construction, the Project Applicant(s) shall conduct additional confirmatory subsurface investigations in areas of known or suspected concern identified in the completed Phase II Subsurface Investigation and Methane Survey, including former and suspected underground storage tank locations, both those abandoned in place and those without verified removal documentation, as well as former boiler and powerhouse areas. Because prior investigations were limited to accessible areas and did not include full site-wide excavation or investigation beneath existing structures, utilities, and active facilities, the extent of residual contamination cannot be fully characterized until demolition and site access occur. Therefore, additional confirmatory investigation shall be completed prior to grading in each affected area to fully delineate any residual contamination. These investigations shall evaluate whether residual contamination remains that could affect redevelopment.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		If additional residual contamination is found, a qualified geologist or industrial hygienist shall recommend appropriate remedial actions, which may include removal, disposal, or remediation of affected soils or structures, consistent with regulatory requirements. These remedial actions shall be implemented during construction. **Mitigation Measure HAZ-1d:** The documented abandoned oil well on the southern portion of the Project Site (Santa Fe Springs Mutual Oil Syndicate Well No. 1, API No. 0403705846) shall be further evaluated by a qualified petroleum engineer or geologist prior to any ground-disturbing activities, including grading, excavation, or construction, occurring within 100 feet of the well location. The evaluation shall include confirmation of the well's current condition and abandonment status through review of regulatory records and, if necessary, field investigation field investigation to verify that the well meets current CalGEM abandonment standards. Because existing structures, pavement, utilities, and active campus operations currently limit full access to the well location and its area of potential influence, comprehensive field verification and intrusive investigation cannot be completed at this time. The final grading limits, excavation depths, and site access conditions will not be fully known until demolition and site clearance activities occur. Therefore, confirmation of abandonment status and any necessary subsurface investigation	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		must occur immediately prior to grading in the affected area, once safe and unobstructed access is available. If the evaluation determines that the well has not been properly abandoned in accordance with CalGEM standards, the well shall be plugged or otherwise remediated in compliance with Public Resources Code Sections 3208 to 3217 prior to grading in the affected area. No grading or construction activities shall occur within the 100-foot radius (area of potential influence) of the well until CalGEM has confirmed that the well meets current abandonment standards. **Operation** **Mitigation Measure HAZ-2:** Prior to the issuance of building permits for any new residential or commercial structure on portions of the Project Site where volatile organic compounds (VOCs) in soil vapor have been documented above applicable screening levels, the Project Applicant(s) shall prepare and implement a vapor intrusion mitigation plan. The plan shall include site-specific engineering controls, such as passive or active sub-slab depressurization systems, vapor barriers, or equivalent measures designed to prevent intrusion of VOCs into occupied indoor spaces.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Because final building footprints, foundation designs, and finished grades have not yet been determined, a structure-specific vapor mitigation system cannot be finalized at this time. Therefore, the vapor intrusion mitigation plan shall be prepared for each applicable structure once final design plans are available and prior to permit issuance. The vapor intrusion mitigation plan shall be prepared by a qualified environmental professional in consultation with the Los Angeles Department of Building and Safety (LADBS) as the permitting authority, and, as applicable, Los Angeles County Public Works, and the Los Angeles Regional Water Quality Control Board (RWQCB). Design features shall comply with City of Los Angeles Methane Zone requirements, CalEPA guidance, and RWQCB performance standards for VOC mitigation. Implementation of the plan, including installation of all required engineering controls, shall be verified through inspections and post-installation testing prior to occupancy. LADBS, in coordination with the RWQCB, shall review and approve the plan, confirm proper installation, and enforce compliance as part of the standard building permit and inspection process.	
Significance Criterion b: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions	Potentially Significant (construction and operation)	**Construction** Implement Mitigation Measures HAZ-1a through HAZ-1d and Mitigation Measure HAZ-2. **Operation** Implement Mitigation Measure HAZ-2.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
involving the release of hazardous materials into the environment? Construction and phased demolition would involve activities with an elevated potential for accidental release of hazardous materials, including removal and handling of ACMs and LBP from aging structures and tunnels documented to contain friable ACM and deteriorated mechanical systems. **(Impact HAZ-3)** Operation would involve the continued use, storage, and on-site transfer of hazardous materials associated with hospital and medical functions (including biomedical wastes), laboratories, maintenance activities, and other campus uses that routinely employ chemicals, solvents, fuels, and			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
related products. **(Impact HAZ-4).**			
Significance Criterion c: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substance, or waste within one-quarter mile of an existing or proposed school? The Project Site is within one-quarter mile of Francisco Bravo Medical Magnet Senior High School (0.2 mile east of the Project Site) and the East Los Angeles Occupational Center (0.1 mile southeast of the Project Site). Construction and demolition would involve activities with the potential to emit hazardous emissions or release hazardous building materials in proximity to these schools. **(Impact HAZ-5)** Operational hazardous materials use is routine, small	Potentially Significant (construction) Less Than Significant (operation)	Implement Mitigation Measures HAZ-1a through HAZ-1d.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
in scale, and subject to strict regulatory oversight, the potential for emissions or off-site releases affecting nearby schools is low.			
Significance Criterion d: Would the project be located on a site that is included on a list of hazardous materials compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment? The Project Site is included on hazardous materials regulatory lists with confirmed contamination and ongoing UST operations, the potential for exposure during construction is considered substantial. **(Impact HAZ-6)** Operational activities would not involve disturbance of known contamination or legacy fill	Potentially Significant (construction) Less Than Significant (operation)	Implement Mitigation Measures HAZ-1a through HAZ-1d and Mitigation Measure HAZ-2.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
soils. With appropriate mitigation and compliance with ongoing regulatory oversight, the potential for significant hazards during operation would be reduced to less than significant.			
Significance Criterion e: For a project within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area? The Proposed Project includes demolition of the existing emergency helipad and construction of a new helipad to support hospital emergency operations. Construction activities associated with this helipad would be limited to the Project Site and would not	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
introduce new flight operations or alter established flight paths during construction. Compliance with FAA standards would ensure that helipad demolition and reconstruction do not pose a hazard to air navigation or surrounding land uses. The Project Site is outside the influence area of any airport land use compatibility plan, and no private airstrips are located within two miles of the Project Site. Operation of the replacement helipad would continue to be regulated under FAA and LAFD requirements for emergency medical heliports, ensuring that flight operations, lighting, and airspace clearances remain consistent with applicable safety standards.			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion f: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan? Construction activities could temporarily impair and/or interfere with emergency response access in the vicinity of the Project Site because of possible temporary lane closures, detours, and construction-related traffic. This impact would be a temporary but is considered potentially significant impact. **(Impact HAZ-7)** The Proposed Project would be designed and operated to maintain sufficient emergency ingress and egress for fire and medical services, and no substantial impediments to	Potentially Significant (construction) Less Than Significant (operation)	Implement Mitigation Measures TRA-1 and TRA-4.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
emergency response or evacuation would occur.			
Significance Criterion g: Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires? The Project Site is not in a State of California Very High Fire Hazard Severity Zone (FHSZ) or in an area designated by the LACFD as subject to wildland fire risk.	No Impact (construction and operation)	None	No Impact (construction and operation)
HYDROLOGY AND WATER QUALITY			
Significance Criterion a: Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality? Certain soils on the Project Site are contaminated and contain volatile organic compounds	Potentially Significant (construction and operation)	**Construction** Implement Mitigation Measure HAZ-2. **Operation** **Mitigation Measure HYD-2:** During the initial design of each future project, the Project Applicant(s) shall prepare project-specific Stormwater Mitigation Plans (SUSMP) for review and approval by the Los Angeles County Department of Public Works (LACDPW). Low-impact development (LID) features included in project-specific SUSMPs shall be designed to minimize the	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
(VOCs) in soil vapor above screening levels, petroleum hydrocarbons in shallow soils, and methane in mapped Methane Zones, all of which would be encountered during grading and excavation. **(Impact HYD-1).** There is potential that future implementing projects would result in leaching of nutrients from growing media, allowing phosphorus to enter the stormwater runoff. **(Impact HYD-2)**		leaching of nutrients from growing media. LID features shall avoid the use of growing media, mulch, and compost containing animal products, which may leach nutrients. Design modifications may include incorporation of an internal storage zone with an elevated underdrain and a carbon food source for denitrifying bacteria to create anaerobic conditions and subsequent denitrification. During the initial design of each future implementing project, the Project Applicant shall also prepare project-specific Operation and Maintenance (O&M) Plans for proposed LID features and on-site landscaping for review and approval by the Los Angeles County Department of Public Works (LACDPW). The O&M plans shall be revised as needed as development plans and proposed LID features are revised. The project specific O&M Plans shall consider impacts on water quality due to the leaching of phosphorous. O&M practices shall include integrated pest management and organic maintenance methods, including those for hand weeding. The use of fertilizers, pesticides, herbicides, and products containing animal manure or animal products shall be avoided. Prior to construction of future development projects on the Project Site, the Project Applicant(s) shall prepare and submit final building and landscape design plans to LACDPW demonstrating that all landscape-based LID features are designed	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		to improve water quality and minimize the leaching of nutrients from growing media.	
Significance Criterion b: Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin? Due to dewatering procedures for the Proposed Project, there is potential for the groundwater level to be impacted on the Project Site. Water use would increase during Project operation because of the increase in the number of persons who would use the Project Site and the increase in landscape maintenance. **(Impact HYD-3)**	Potentially Significant (construction and operation)	**Construction and Operation** **Mitigation Measure HYD-3a:** Prior to and during construction involving deep excavation that could encounter groundwater or dewatering, monitoring wells shall be installed by the Project Applicant(s) during construction within and around the perimeter of each structure to monitor the groundwater level and evaluate the performance of the dewatering system. Before starting dewatering operations, a baseline conditions survey conducted by a licensed geotechnical or structural engineer retained by the Project Applicant(s) shall be made of all adjacent foundations and structures to assess the impact of deep excavation dewatering on adjacent structures. All signs of existing distress shall be recorded. The baseline survey shall be submitted to the County and retained for reference during construction monitoring. **Mitigation Measure HYD-3b:** During project design, the Project Applicant(s) shall retain a qualified civil or water resources engineer to prepare a Recycled and Alternative Water Supply Feasibility Study evaluating the technical and economic feasibility of using non-potable water sources for landscape irrigation. The study shall identify feasible sources, projected supply volumes, system design concepts, and implementation costs. Based on the results of the feasibility study, future projects shall incorporate all technically and economically feasible non-potable supply systems into the final landscape irrigation supply.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Irrigation water demands greater than existing irrigation demands shall be met by alternative supply sources to the maximum extent technically feasible. The use of alternative water supply sources for irrigation shall be maximized to reduce the use of potable water for irrigation and to approximate existing irrigation demands. Alternative water supply sources include, but are not limited to, reclaimed water, gray water, harvested rainwater (stormwater), and air-conditioning condensate (although not specifically mentioned in the master plan, this could represent a significant source of clean irrigation water). The County shall review and approve the Feasibility Study and irrigation design prior to permit issuance.	
Significance Criterion c: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would: i) Result in a substantial erosion or siltation on- or off-site? ii) Substantially increase the rate or amount of surface	Less Than Significant (construction) Potentially Significant (operation)	Implement Mitigation Measure HYD-2.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
runoff in a manner that would result in flooding on- or offsite? iii) Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff? iv) Impede or redirect flood flows? Adherence to the BMPs in SWPPPs and ESCPs would reduce, prevent, or minimize soil erosion from Project-related grading and construction activities. Drainage would be designed such that the Proposed Project would not result in a substantial increase in the rate or amount of surface runoff or flooding on- or off-site. All potential future development disturbing more than one acre would be required to follow the SWPPP guidelines when designing on-			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
site stormwater treatment facilities. There is potential for erosion and siltation on the Project Site. Therefore, impacts are potentially significant. Adherence to regulatory requirements would minimize the amount of stormwater runoff from the Proposed Project. With the implementation of site-specific hydrology and hydraulic studies and adherence to LACDPW's allowable discharge rates, there would not be a significant increase in stormwater runoff to the County's storm drain system. Implementation of the Proposed Project would include a storm drain system to collect, treat, and convey stormwater into the existing storm drain system in the area. **(Impact HYD-4)**			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion d: In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation? The Project Site is not in a designated flood inundation area or tsunami inundation area. The Project Site is in an area with a minimal flood hazard.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion e: Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan? The Proposed Project could leach phosphorus into stormwater runoff, which would violate water quality standards. Therefore, without a set procedure in place, this impact would be potentially significant. **(Impact HYD-5)**	Less Than Significant (construction) Potentially Significant (operation)	Implement Mitigation Measure HYD-2.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
LAND USE AND PLANNING			
Significance Criterion a: Would the project physically divide an established community? All construction activities would be conducted in close partnership with existing County and hospital uses to ensure the Campus remains accessible to the larger region. The proposed uses and redevelopment at the Project Site would be limited to the existing boundaries of the Project Site. No surrounding residential neighborhoods would be divided, and no off-site residential buildings would be displaced due to the Proposed Project.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion b: Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted	Less Than Significant (construction)	Implement Mitigation Measures CUL-1a through CUL-1c.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
for the purpose of avoiding or mitigating an environmental effect? The Proposed Project would be generally supportive of or consistent with the relevant policies and objectives in Connect SoCal 2024, LA County General Plan 2035, and the City's Northeast Los Angeles Community Plan. The Proposed Project has the potential to conflict with plans, policies, and regulations adopted for the purpose of avoiding or mitigating an environmental effect related to cultural resources. **(Impact LU-1).**	Potentially Significant (operation)		
NOISE			
Significance Criterion a: Would the project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general	Potentially Significant (construction and operation)	**Construction** **Mitigation Measure NOI-1: Reduce Construction Noise to the Extent Possible.** If construction activities associated with the Proposed Project have the potential to exceed the County's construction noise thresholds at nearby on- and off-site sensitive receptors, including during pile driving or other high noise	Significant and Unavoidable (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
plan or noise ordinance, or applicable standards of other agencies? The Proposed Project's construction-related pile driving activities would exceed applicable noise level standards. (**Impact NOI-1**) The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to traffic. (**Impact NOI-2**) The Proposed Project has the potential to result in permanent noise increases in excess of applicable standards under operational conditions related to warehouse uses, clean tech/advanced industrial, mechanical equipment, and outdoor events. (**Impact NOI-3**)		construction activities, the Project Applicant(s) shall implement the following noise reduction measures during construction: ▪ To the extent feasible, construction activities shall occur between the hours of 7:00 am to 7:00 pm on Monday through Friday and 8:00 am to 6:00 pm on Saturdays, consistent with Section 12.08.520 of the County of Los Angeles Code of Ordinances. Construction activities shall not occur at any time on Sundays or legal holidays. Construction personnel shall not be permitted on the job site, and material or equipment deliveries and collections should not be permitted outside of these hours. If construction activities must occur outside of the allowable hours, the Project Applicant(s) shall follow necessary procedures to obtain an appropriate variance in accordance with Section 12.08.580 of the County of Los Angeles Code of Ordinances prior to conducting such activities. Construction activities occurring outside the allowable hours shall comply with all conditions of the approved variance. ▪ To the fullest extent practicable, the quietest available type of construction equipment shall be used. Newer equipment is generally quieter than older equipment. The use of electric powered equipment is typically quieter than diesel or gasoline powered equipment, and hydraulic powered equipment is typically quieter than pneumatic power.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		▪ Where feasible, impact pile driving shall be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles. ▪ All construction equipment shall be properly maintained. Poor maintenance of equipment typically causes excessive noise levels. ▪ All construction equipment, stationary and mobile, shall be equipped with properly operating and maintained mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features that meet or exceed original factory specification and are properly maintained and functioning during construction activities. Mobile or fixed "package" equipment (e.g., arc welders, air compressors) shall be equipped with shrouds and noise control features that are readily available for that type of equipment. ▪ All noisy equipment shall be operated only when necessary, and should be switched off when not in use. ▪ The use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only. To the extent feasible, temporary barriers shall be employed around the project site and/or around noisy construction equipment, specifically pile driving equipment. For barriers to be effective they shall break the line-of site between the equipment and any noise-sensitive receiver. These barriers may be constructed as follows:	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		o From commercially available acoustical panels lined with sound absorbing material (the sound absorptive faces of the panels should face the construction equipment). o From common construction materials such as plywood and lined with sound absorptive material (the sound absorptive material should face the construction equipment). o From acoustical blankets hung over or from a supporting frame. The blankets shall provide a minimum sound transmission class (STC) rating of 28 and a minimum noise reduction coefficient (NRC) of 0.80 and shall be firmly secured to the framework with the sound absorptive side of the blankets oriented towards the construction equipment. The blankets shall be overlapped by at least 6" at seams and taped so that no gaps exist. The largest blankets available shall be used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier. **Operation** **Mitigation Measure NOI-3a: Design Project Facilities to Ensure All Mechanical Equipment Complies with County Noise Standards.** During the architectural and engineering design phase of each new facility (building, central plant, parking structure,	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		etc.) that could introduce new mechanical equipment to the Project Site, and prior to the issuance of any building permits for the facility, the Project Applicant(s) shall retain an acoustical consultant to evaluate the design and provide recommendations, as necessary, to ensure that the mechanical equipment complies with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: changes in equipment locations, upgrades to central plant buildings, rooftop parapet walls, acoustical louvers or screens, or intake and exhaust silencers. **Mitigation Measure NOI-3b: Design and Manage Outdoor Use Areas to Ensure Organized Outdoor Events Comply with County Noise Standards.** Prior to the issuance of any building permits for outdoor use areas that are anticipated to host organized events such as outdoor markets, farmers markets, summer concerts and health marches, etc. the Project Applicant(s) shall retain an acoustical consultant to evaluate the design (event layout, sound system design, etc.) and operational event details (crowd sizes, times of operation, etc.) to ensure that such events will comply with Section 12.08.390 of the Los Angeles County Code of Ordinances to reduce impacts to off-site receptors. Such recommendations may include, but are not limited to: controls on crowd sizes and event times, and limits on sound system power levels.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion b: Would the project generate excessive groundborne vibration or groundborne noise levels? The Proposed Project's construction-related pile driving activities would exceed applicable vibration standards. (**Impact NOI-4**) The Project Project's operational vibration levels are not anticipated to exceed applicable vibration standards.	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure NOI-4: Reduce Construction-Generated Groundborne Vibration to the Extent Possible**. The Project Applicant(s) shall implement the following vibration reduction measures during construction: ▪ Where possible, impact pile driving should be replaced with other piling techniques, such as vibratory pile driving or drilled and poured-in-place piles. ▪ Distance requirements for eligible or listed historical structures (as defined in Chapter 3.4, Cultural Resources of this Draft SEIR): o Pile driving shall not be operated within 135 feet, vibratory rollers within 36 feet, or other heavy equipment (e.g., bulldozer) within 20 feet. ▪ Distance requirements for non-engineered and masonry buildings: o Pile driving shall not be operated within 100 feet, vibratory rollers within 25 feet, or other heavy equipment (e.g., bulldozer) within 15 feet.	Significant and Unavoidable (construction) Less Than Significant (operation)
Significance Criterion c: For a project within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose	No Impact (construction) Less Than Significant (operation)	None	No Impact (construction) Less Than Significant (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
people residing or working in the project area to excessive noise levels? The Project Site is not located within two miles of a public airport or public use airport. The existing helipads at the Project Site would continue to operate the long-term average noise levels generated by helicopters are anticipated to be relatively low compared to other existing noise sources and are not anticipated to change significantly as a result of the Proposed Project. Therefore, the noise impacts associated with helipads would be less than significant.			
POPULATION AND HOUSING			
Significance Criterion a: Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
indirectly (for example, through extension of roads or other infrastructure)? The County and City have a large pool of construction labor from which to draw within commuting distance of the Project Site. Construction workers are likely to be employed on the job site only for as long as their skills are needed to complete a specific phase of the construction process. The increase in population anticipated on the Project Site represents a small percentage (approximately 2 percent) of the projected population growth for the City of Los Angeles.			
Significance Criterion b: Would the project displace substantial numbers of existing people or housing, necessitating the	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
construction of replacement housing elsewhere? There are no permanent housing units on-site; the Proposed Project would not displace existing housing.			
PUBLIC SERVICES			
Significance Criterion a: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives? The Proposed Project's construction activities have the potential to result in temporary lane closures and could impair	Potentially Significant (construction) Less Than Significant (operation)	Implement Mitigation Measure TRA-1.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
or obstruct the movement of emergency vehicles **(Impact PS-1).** The proposed increase in demand on LAPD services associated with the Proposed Project's new residents and development would be minimal and would not require the construction of new or expanded police facilities. The Proposed Project would generate middle and high school students that would attend the local schools assigned to the Project Site. The Proposed Project would include open space, residential amenities, and community benefit space, which would provide recreational opportunities for residents and could reduce demand on off-site facilities.			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
RECREATION			
Significance Criterion a: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? It is unlikely that a substantial number of construction workers would relocate to the immediate vicinity of the Project Site such that use of existing parks or recreational facilities would result in substantial physical deterioration. Due to the provision of on-site facilities, it is not expected that the projected growth in resident, visitor, and employee populations on-site would result in a significant increase in the use of existing local parks.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion b: Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment? The Proposed Project includes additional open space and recreational areas. Construction activities could result in noise and air quality impacts on nearby sensitive receptors, including local residents, hospital patrons, or possibly users of local park and recreational facilities. **(Impact REC-1)** The Proposed Project's operation of open space areas could be used for organized outdoor events, which have the potential to result in impacts on ambient noise levels. **(Impact REC-2)**	Potentially Significant (construction and operation)	**Construction** Implement Mitigation Measures AIR-1a through AIR-1b and NOI-1 and NOI-4. **Operation** Implement Mitigation Measure NOI-3b.	Significant and Unavoidable (construction) Less Than Significant (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
TRANSPORTATION			
Significance Criterion a: Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities? The Proposed Project's construction activities have the potential to conflict with applicable program, plan, ordinance, or policies addressing the circulation system. (**Impact TRA-1**) The Proposed Project's operation would not conflict with a program, plan, ordinance, or policy addressing the circulation system. Impacts would be less than significant.	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure TRA-1:** The Project Applicant(s) shall develop and implement a Worksite Traffic Control Plan for any aspect of construction that would result in road closures, sidewalk closures, bicycle facility closures, removal of parking, or similar traffic disruptions. The Worksite Traffic Control Plan shall be prepared as part of the project design package according to California Manual on Uniform Traffic Control Devices (CA-MUTCD) requirements, and may include, but not be limited to, the following elements; ▪ Provide a roadway layout that shows the locations of construction activity and surrounding roadways to be used as detour routes, including special signage. ▪ Establish detour routes in coordination with the City of Los Angeles to minimize disturbances to local roadway conditions. ▪ Maintain access to existing residences at all times. ▪ Work with City of Los Angeles Department of Transportation, Los Angeles Sherriff's Department, Los Angeles County Fire Department, and Los Angeles Police Department, to coordinate all construction-related plans and minimize disturbances to local emergency management services (EMS) providers ensure that alternative evacuation and emergency routes are designed to maintain response times during construction. ▪ Provide adequate off-street parking areas at designated staging areas for construction-related vehicles.	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		▪ Work with transit provides to maintain access and circulation routes to existing stops during construction phases and identify appropriate detours to provide rerouting during construction while minimizing service disruptions. ▪ Work with the City of Los Angeles to maintain continuity and operations of existing pedestrian and bicycle facilities during construction.	
Significance Criterion b: Would the project conflict or be inconsistent with CEQA Guidelines Section15064.3, subdivision (b)? The Proposed Project would result in a reducing in vehicle miles traveled (VMT) compared to the exiting Countywide VMT. Impacts would be less than significant.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion c: Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Potentially Significant (construction and operation)	Construction Implement Mitigation Measure TRA-1. Operation Prior to the start of construction for the first development phase of the Proposed Project, the Project Applicant(s) shall consult	Less Than Significant (construction) Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
The Proposed Project's construction activities have the potential to result in transportation hazards. Impacts would be potentially significant. (**Impact TRA-2**) The Proposed Project's operational traffic has the potential to result in transportation hazards related to queuing at off-ramps. (**Impact TRA-3**)		with County to develop timing mechanisms as to when the improvements identified in Mitigation Measure TRA-3(a)-(e) are implemented based on phased buildout of the Proposed Project. Mitigation Measure TRA-3a: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 southbound off-ramp to Mission Road. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, shared through-left lane, and a right lane; to o two left turn lanes and one shared through-right turn lane. ▪ Optimize signal timing along the Mission Road coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' Intersection Safety Operational Assessment (ISOAP) methodology as appropriate to design and implement intersection improvements. Mitigation Measure TRA-3b: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to State Street. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, right turn lane; to o shared left-right turn lane and a right turn lane. ▪ Optimize signal timing along the State Street coordinated corridor, including cycle length, offset, and phase splits.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements. Mitigation Measure TRA-3c: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-10 westbound off-ramp to Soto Street. ▪ Re-stripe the off-ramp lane configuration from: o Left turn lane, shared through-left turn lane, and two right turn lanes; to o two left turn lanes, one through lane, and one right turn lane. ▪ Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements. Mitigation Measure TRA-3d: The following traffic operations improvements shall be implemented to mitigate potentially significant impacts to off-ramp queuing at the I-5 northbound off-ramp to Cesar Chavez Avenue. ▪ Optimize signal timing along the Soto Street coordinated corridor, including cycle length, offset, and phase splits. ▪ Apply the Caltrans' ISOAP methodology as appropriate to design and implement intersection improvements.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		Mitigation Measure TRA-3e: A comprehensive TDM program shall be implemented as part of the Proposed Project's mitigation program aimed at reducing vehicular trips to the Project Site, which may mitigate Project-induced freeway off-ramp queuing hazards. TDM strategies that the Proposed Project could implement to result in a quantitative reduction in vehicular trips include, but are not limited to, the following: ▪ Trip Reduction Strategies o Implement Commute Trip Reduction Program (Voluntary for Mandatory) o Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) o Implement Commute Trip Reduction Marketing o Provide Ridesharing Program o Implement Subsidized or Discounted Transit Program - All Trips o Provide End-of-Trip Bicycle Facilities o Provide Employer-Sponsored Vanpool ▪ Parking Strategies o Price workplace parking o Implement Employee Parking Cash-Out o Limit Residential Parking Supply o Unbundle Residential Parking Costs from Property Cost ▪ School	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		o Coordinate with Los Angeles Unified School District (LAUSD) to establish a School Bus Program o Active Modes of Transportation for Youth	
Significance Criterion d: Would the project result in inadequate emergency access? The Proposed Project would have the potential to interfere with emergency access to the Project Site during construction. Impacts would be potentially Significant. (**Impact TRA-4**) The Proposed Project would not result in inadequate emergency access under operational conditions. Impacts would be less than significant.	Potentially Significant (construction) Less Than Significant (operation)	Implement Mitigation Measure TRA-1.	Less Than Significant (construction and operation)
TRIBAL CULTURAL RESOURCES			
Significance Criterion a: Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)? No known tribal cultural resources listed or eligible for listing in the National Register, California Register, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k) have been identified on the Project Site or in the immediate vicinity.			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion a: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe? Ground-disturbing activities have the potential to disturb native subsurface deposits possessing traditional or cultural significance to Native American or other descendant communities. **(Impact TCR-1)** Routine operations and maintenance activities are not expected to extend into native	Potentially Significant (construction) Less Than Significant (operation)	**Mitigation Measure TCR-1a: Native American Monitoring of Ground-Disturbing Activities in Native Soils** a) The Project Applicant(s) shall invite a Native American Monitor from the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) prior to the commencement of any ground-disturbing activities. "Ground-disturbing activities" shall include, but are not limited to, grading, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching, for each implementing phase of the Proposed Project at all Project locations (i.e., both on-site and any off-site locations that are included in the Project description/definition and/or required in connection with the Project, such as public improvement work). b) The Project Applicant(s) shall make reasonable efforts to execute a Tribal Monitoring Agreement with the Native American Monitor prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence any ground-disturbing activity. c) The Native American Monitor shall work with the Project Applicant's qualified archaeologist during qualifying ground-disturbing activities to identify potential Native American Tribal Cultural Resources (TCRs) and communicate concerns regarding TCRs to the Project Applicant(s). The Native American Monitor will complete daily monitoring logs that will provide: description(s) and location(s) of the relevant ground-disturbing activity(ies), the type(s) of construction activity(ies), information and/or materials related to TCRs; and any other facts, conditions,	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
or previously undisturbed soils where tribal cultural resources could occur.		materials, or discoveries of significance to the Tribe. Daily monitoring logs will identify and describe any discovered TCRs. Copies of daily monitoring logs will be provided to the Project Applicant(s) and the County at the end of all Project-related ground-disturbing activities. Daily monitoring logs will be kept confidential with the Project records. d) On-site tribal monitoring shall conclude upon either of the following, whichever occurs first: (1) written notification to the Tribe from a designated point of contact for the Project Applicant(s) that all ground-disturbing activities and phases of Project implementation that may involve ground-disturbing activities are complete; or (2) written notification to the Project Applicant(s) from the Tribe that no future planned construction activity and/or development/construction phase of the Project has the potential to impact TCRs. **Mitigation Measure TCR-1b: Unanticipated Discovery of Tribal Cultural Resource (Non-Funerary)** a) In accordance with section 21074, subdivisions (a)(1)(A)-(B) of the Public Resources Code (PRC), a TCR is a site, feature, place, cultural landscape, sacred place or object, which is of cultural value to the Tribe and either: (1) on or eligible for the California Historic Register or other local historic register or (2) the County of Los Angeles, as the lead agency for the Project, at its discretion, chooses to treat the resource as a TCR. b) Upon discovery of any TCR or potential TCR, all construction activities within a radius deemed appropriate by the qualified	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
		archaeologist shall cease and shall not resume until the discovered TCR has been fully assessed by the Native American Monitor and/or qualified archaeologist. If the assessment finds the resource to be a TCR, treatment measures and final disposition will be determined in consultation with the Tribe. **Mitigation Measure TCR-1c: Unanticipated Discovery of Native American Human Remains and/or Associated Grave Goods** a) Native American human remains are defined in section 5097.98, subdivision (d)(1) of the PRC as an inhumation or cremation in any state of decomposition or skeletal completeness. Funerary objects, also called associated grave goods in section 5097.98 of the PRC, shall be treated alike per section 5097.98, subdivisions (d)(1) and (2) of the PRC. b) If Native American human remains and/or grave goods are discovered or recognized on the Project Site, then section 5097.9 of the PRC as well as Health and Safety Code Section 7050.5 shall be followed. c) Any discovery of Native American human remains and/or grave goods shall be kept confidential to prevent further disturbance.	
UTILITIES AND SERVICE SYSTEMS			
Significance Criterion a: Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects? The water system for future development within the Project Site would be designed to provide on-site water demands from the existing public water collection system owned by LADWP. Once operational, the sewer system would be designed to convey on-site sewage flows within the Project Site to the existing public sewer collection system owned by LASAN, which ultimately discharges into the Hyperion Water Reclamation Plant. The Proposed Project would be required to comply with site-specific "allowable discharge rates" that limit post-project peak flow discharges compared to existing conditions, thus			

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
minimizing the potential for flooding on- or off-site. With the Central Utility Plant, the Proposed Project's electrical demand on the grid would not result in the need for new or expanded LADWP facilities. New and replacement buildings in compliance with these standards would generally have greater natural gas efficiency than existing buildings. The Project Site is currently served by telecommunication infrastructure, and increased service connections as part of the Proposed Project would be done incrementality.			
Significance Criterion b: Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	Less Than Significant (construction) Potentially Significant (operation)	**Mitigation Measure USS-1:** As part of the site plan review for any future individual development project under the Proposed Project that is considered for construction and operation in 2045 or later, and that is also defined as a "water-demand project" in Section 15155 of the State CEQA Guidelines, the County shall request, pursuant to Section 15155, that the water provider, the City of Los Angeles Department of Water and Power (LADWP), determine whether the projected water demand associated with these project(s) was included in the most recently adopted urban	Less Than Significant (construction) Significant and Unavoidable (operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
The Proposed Project assumes a phased long-term 25-year development horizon. The current 2020 UWMP projects water supplies based on population projections through 2045. The next UWMP will project water supplies through 2050. As such, it is not known whether sufficient water supplies and entitlements would exist to accommodate those projects' water demand. Therefore, water supply impacts for projects constructed after 2045 could be potentially significant. **(Impact USS-1).**		water management plan. If required pursuant to Section 15155, the County shall request that LADWP prepare water supply assessment(s) for these future projects. The County shall determine, pursuant to Section 15155, whether projected water supplies would be sufficient to satisfy the demands of the future project(s), in addition to existing and planned future uses within LADPW's service area.	
Significance Criterion c: Would the project result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition	Potentially Significant (construction and operation)	**Construction and Operation** **Mitigation Measure USS-2:** Prior to issuance of a building permit for any future development under the Proposed Project that could result in an increase in wastewater generation, the Project Applicant(s) shall coordinate with the City of Los Angeles Bureau of Sanitation to conduct further detailed gauging and evaluation to identify a specific sewer connection point with sufficient capacity. If the public sewer has insufficient capacity, then the	Significant and Unavoidable (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
to the provider's existing commitments? Based on the estimated flows, the sewer conveyance system would be appropriately sized to accommodate the total flow for the Proposed Project; however, further detail gauging and evaluation may be needed as part of the permit process for individual projects to identify suitable sewer connection points and ensure adequate line capacity. A final approval for sewer capacity and connection permit shall be made at that time. If there is insufficient capacity in the local sewer lines that would serve an individual future project, then the impact would be considered to be significant. Therefore, impacts would be potentially significant. **(Impact USS-2)**		County shall be required to build a sewer line to a point in the sewer system with sufficient capacity.	

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
Significance Criterion d: Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? The Proposed Project would divert 50 percent of all generated tonnage for recycling and reuse, pursuant to the County of Los Angeles Code of Ordinances Chapter 20.87. In addition, CALGreen requires a minimum of 65 percent of the nonhazardous construction and demolition waste to be recycled and/or salvaged. The Proposed Project's landfill waste would be less than one percent of the residual capacities for the Simi Valley Landfill & Recycling Center, the Antelope Valley Public Landfill,	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
and the Lancaster Landfill and Recycling Center. Therefore, there is sufficient capacity at the landfills for solid waste generated by the Proposed Project.			
Significance Criterion e: Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste? The Proposed Project's solid waste is adequately accommodated by landfills serving the Project Site. The County and landfills that would serve the Project Site would comply with all applicable federal, State, and local solid waste regulations, such as Division 4.4 of the CALGreen Code, AB 341, AB 1826, and the Los Angeles County Code of Ordinances Chapter 20.87.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
WILDFIRE			
Significance Criterion a: Would the project substantially impair an adopted emergency response plan or emergency evacuation plan? Compliance with local and State requirements and regulations would ensure that development of the Proposed Project would not substantially impair an adopted emergency response plan or emergency evacuation plan.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)
Significance Criterion b: Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire? Development of the Proposed Project would occur on a site	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
that is already developed and not in a very high FHSZ. Adherence to building practices, fire safety regulations, and vegetation fuel management requirements would reduce the potential for exacerbating wildfire risks.			
Significance Criterion c: Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environments? The installation of new utilities would be regulated under the CBC and CFC and is subject to fire safety review and oversight by the LAFD, which would minimize wildfire risks associated with the installation	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Environmental Impact	Level of Significance without Mitigation	Mitigation Measures	Level of Significance with Mitigation
and maintenance of infrastructure.			
Significance Criterion d: Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes? The Project Site is fully developed and is not in proximity to steep slopes or natural drainage courses, and is not located in a VHFHSZ. Therefore, impacts would be less than significant.	Less Than Significant (construction and operation)	None	Less Than Significant (construction and operation)

1. INTRODUCTION

This document is a Draft Subsequent Environmental Impact Report (SEIR) to the Los Angeles County + University of Southern California (LAC+USC) Medical Center Campus Master Plan EIR (2014 Master Plan EIR, State Clearinghouse No. 2014051061) that was certified on November 18, 2014, by the Los Angeles County Board of Supervisors (Board) as the governing body of the County of Los Angeles (County). This Draft SEIR evaluates the proposed Los Angeles County General Hospital Campus Master Plan (LA County General Hospital Campus Master Plan or Proposed Project). The Proposed Project includes implementation of the Proposed Project. The LA County General Hospital Campus Master Plan would guide future redevelopment of a portion of the County-owned property in and around the Los Angeles General Medical Center (herein referred to as the Project Site or Campus). This Draft SEIR has been prepared in accordance with Section 21166 of the Public Resources Code and State California Environmental Quality Act (CEQA) Guidelines Sections 15162 and 15164. The County of Los Angeles is the lead agency under CEQA, acting through the Department of Economic Opportunity (DEO)

1.1 BACKGROUND

The LAC+USC Medical Center (Campus or Project Site) was established in 1878, with the approximately 1.2 million square foot General Hospital Building opening in 1933. As one of the largest hospitals in the country, the Campus has continued to play an active role in the provision of health services of the County since the late-1800s. In response to evolving building and safety code requirements, the County initiated plans in 1998 to replace the historic General Hospital. A new modern facility (Los Angeles General Medical Center [Medical Center]) was completed in 2008 and now serves as the primary medical hub of the Campus. The General Hospital building has remained largely vacant, with the exception of the Wellness Center, located on the ground level, and Los Angeles County Departments of Public Works and Health Services operation and maintenance staff, located in ground and subterranean levels since 2008.

The Board approved the LAC+USC Medical Center Campus Master Plan (2014 Master Plan), certified the 2014 Master Plan EIR, and adopted a Findings of Fact and Statement of Overriding Considerations and Mitigation Monitoring and Reporting Program (MMRP) on November 18, 2014. It should be noted that the name of the Campus has since changed to the Los Angeles General Medical Center (Medical Center). The Board approved the name change during their meeting on Tuesday, May 2, 2023.

The 2014 Master Plan EIR analyzed the environmental impacts associated with buildout of the 2014 Master Plan, which included the construction of new and renovated medically related

office, retail, open space, and parking uses and demolition of existing buildings and structures on the Campus to accommodate new development over a 25-year period. The main elements of the 2014 Master Plan included the following:

- Inpatient Facilities
- Outpatient Facilities
- Medical Center Offices
- Central Utility Expansion
- Pedestrian Circulation Access
- Biotech Research and On-Campus Housing
- Parking Facilities
- Campuswide Community Open Space and Landscape Conceptual Elements

The objectives of the 2014 Master Plan, as identified in the 2014 Master Plan EIR, were to:

- Achieve a community-friendly campus.
- Promote healthy lifestyles and wellness.
- Maximize access to the medical center by the community.
- Provide opportunities for appropriate education and job training.
- Incorporate on-campus business opportunities.
- Plan for future program development.

A critical component of the 2014 Master Plan was to alleviate navigational challenges through the following actions:

- Create an “assisted grade transition” (with use of an escalator, for example) to improve accessibility between the existing courtyard of the Replacement Hospital and the upper Outpatient Department clinic building.
- Use elevators within the proposed parking structures west of State Street to provide an accessible route from Marengo Street to the Wellness Center at the General Hospital.
- Modify the slope of the hillside west of the General Hospital entry plaza and connect the proposed public-serving amenities at the base of the hill to the historic plaza with use of escalators.

Since certification of the 2014 Master Plan EIR, three addenda have been prepared to analyze refinements to the 2014 Master Plan and were certified by the County in 2017, 2023, and 2025. Additionally, an exemption was processed in 2024 for a permanent supportive housing facility on the Project Site. Under the 2014 Master Plan, including the subsequent addenda, full buildout could result in a total of approximately 1,227,412 square feet of development throughout the Project Site. References to the “2014 Master Plan EIR” in this Draft SEIR include

the 2014 Master Plan EIR, the three certified addenda, and exemption unless otherwise noted. Similarly, references in this Draft SEIR to the 2014 Master Plan include the 2014 Master Plan and any amendments, as evaluated by the subsequent addenda, unless otherwise noted. A description of the refinements evaluated under each addendum is provided below.

Restorative Care Village Phase I

The Restorative Care Village (RCV) Phase I and III Project (2017 Project) proposed three new facilities that were not proposed in the 2014 Master Plan Project or analyzed in the 2014 Master Plan EIR: 1) a 96-bed recuperative care facility, 2) a 64-bed crisis residential treatment program facility, and 3) a replacement childcare facility. The 2017 Project included two other changes to the 2014 Master Plan: 1) relocation of the proposed new central utility plant from a site south of Zonal Avenue to a site just to the southwest, and 2) a 20 percent reduction (127,000 square feet) in the 635,000 square feet of Research and Development use that was projected under the 2014 Master Plan. The Board certified the addendum for the 2017 Project on December 19, 2017. The RCV Phase I component (a total of 70,342 square feet) was competed in April 2022, and the relocation of the childcare facility was completed in January 2023.

Restorative Care Village Phase II

According to the certified addendum to 2014 Master Plan EIR for the RCV Phases IV and V Project, Phase II of the RCV consists of interior renovations to existing wards inside the main hospital tower. At the time this Draft SEIR was prepared, construction related to interior renovations to existing wards inside the main hospital tower has not yet begun.

Restorative Care Village Phase III

The RCV Phase III Project (2024 Project) proposed the development of a new permanent supportive housing building and wellness hub. The 2024 Project consisted of 294 units for low-income seniors and people experiencing homelessness and two manager's units. The 2024 Project was determined to be exempt from CEQA under Public Resources Code Section 21080.27 (Statutory Exemption). At the time this Draft SEIR was prepared, the 2024 Project was under construction.

Restorative Care Village Phases IV and V

The RCV Phases IV and V Project (2023 Project) proposed three new components on the Project Site: 1) a two-story, 33,650-square-foot mental health urgent care center and residential withdrawal management facility; 2) a four-story, 115,420-square-foot and 128-bed psychiatric subacute facility; and 3) surface parking lot with 55 spaces around the new buildings. The 2023

Project also included a reduction of 60,000 square feet of Research and Development use and a reduction of 50,000 square feet of Professional/Administrative Office use. The Board certified the 2023 Addendum December 19, 2023. At the time this Draft SEIR was prepared, construction of RCV Phases IV and V was ongoing.

Los Angeles County General Hospital & West Campus Stabilization Project

The Los Angeles County General Hospital & West Campus Stabilization Project (2025 Project) included four stabilization components. Three of the components were within the scope of the 2014 Master Plan EIR: 1) demolition of select structures on the West Campus; 2) modifications to site infrastructure, accessibility, and hazards on the West Campus; and 3) decommissioning and demolition of the West Central Plant. In addition, the 2025 Project proposed two components not evaluated in the 2014 Master Plan EIR: 1) the maintenance and seismic retrofit of the General Hospital to address its immediate structural integrity needs; and 2) the relocation of operations of the Violence Intervention Program–Community Mental Health Clinic from portions of the Project Site to the Central Juvenile Hall campus at 1605 Eastlake Avenue. The Board certified the 2025 Addendum on June 17, 2025. At the time this Draft SEIR was prepared, construction of the 2025 Project has not yet begun.

The General Hospital Stabilization component of the 2025 Project is intended to address ongoing structural safety, maintenance, and preservation needs associated with the aging historic building. These stabilization activities were approved and were necessary to reduce seismic risk and maintain the structural integrity of the buildings.

Los Angeles General Hospital Campus Master Plan (Proposed Project)

This Draft SEIR analyzes the impacts of the proposed LA County General Hospital Campus Master Plan (Proposed Project). In 2023, the County issued a request for proposals (RFP), seeking a partner in a public-private partnership to catalyze the redevelopment of the Campus with the goal of creating a mixed-use neighborhood. The County has partnered with Centennial Partners to lead the master planning effort. The Master Plan would guide future redevelopment on parts of the Campus and is the subject of this SEIR. The Proposed Project analyzed in this Draft SEIR would allow for redevelopment at the Project Site with a mixed-use community within Project Site that is interconnected with the Los Angeles General Medical Center (Medical Center), RCV, and the surrounding community. A full description of the Proposed Project is provided in Chapter 2, *Project Description*, of this Draft SEIR.

1.2 PURPOSE OF THIS SUBSEQUENT EIR

As previously stated, the Board approved the 2014 Master Plan and certified the 2014 Master Plan EIR on November 18, 2014. The 2014 Master Plan EIR evaluated the environmental effects associated with implementation of the 2014 Master Plan and identified mitigation measures to avoid or substantially lessen significant impacts where feasible, specific to the master plan envisioned at that time. This Draft SEIR relies on and incorporates by reference the analysis, findings, and conclusions of the 2014 Master Plan EIR, subsequent addenda, and exemption (collectively referred to as "2014 Master Plan EIR") to the extent that the prior analysis remains relevant and applicable. The Proposed Project under consideration and evaluated in this Draft SEIR represents a new proposed Master Plan that would govern redevelopment on parts of the Project Site, and would largely supersede the prior Master Plan that was approved by the County. The Proposed Project represents a substantial change from the project considered in the 2014 Master Plan EIR and related County approvals.

CEQA requires that all state and local governmental agencies consider the environmental consequences of projects over which they have discretionary authority before taking action on those projects. This Draft SEIR evaluates the environmental impacts of the Proposed Project in comparison to conditions existing at the time the Notice of Preparation (NOP) was circulated and determines whether the previous environmental documentation retains adequate informational value on the assessment of environmental impacts, or whether the Proposed Project would result in new or substantially different significant environmental impacts such that previously proposed mitigation measures would be eliminated or revised, or whether new mitigation measures are required. Refer to Chapter 3, *Environmental Analysis*, of this Draft SEIR for a detailed description of the existing conditions of the Project Site.

This Draft SEIR has been prepared in accordance with State CEQA Guidelines Section 15162, Subsequent EIRs and Negative Declarations. State CEQA Guidelines Section 15162(a) and 15162(b) state that:

- When an EIR has been certified or a negative declaration adopted for a project, no SEIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:
  - Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
  - Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

- New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:
  - The project will have one or more significant effects not discussed in the previous EIR or negative declaration;
  - Significant effects previously examined will be substantially more severe than shown in the previous EIR;
  - Mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
  - Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

- If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration, the lead agency shall prepare a subsequent EIR if required under subdivision (a). Otherwise, the lead agency shall determine whether to prepare a subsequent negative declaration, an addendum, or no further documentation.

Pursuant to Section 15162 of the State CEQA Guidelines, this Draft SEIR has been prepared to evaluate the environmental effects of the Proposed Project, which represents a new discretionary action and would result in a new Master Plan that would largely replace the previously approved 2014 Master Plan Project analyzed in the 2014 Master Plan EIR. This Draft SEIR relies on and incorporates by reference the analysis, findings, and conclusions of the 2014 Master Plan EIR, subsequent addenda, and exemption (collectively referred to as "2014 Master Plan EIR") to the extent that the prior analysis remains relevant and applicable. The 2014 Master Plan EIR continues to provide the foundation for the environmental review of the Proposed Project and the analysis contained in this Draft SEIR builds upon that prior work rather than repeating it in its entirety.

This is a program Draft SEIR that evaluates the environmental impacts associated with the full buildout of development under the proposed Master Plan through a 25-year (2050) planning horizon. The Draft SEIR recommends mitigation measures that are intended to mitigate the identified significant impacts associated with the buildout under the Master Plan. Some previously adopted mitigation measures from the 2014 Master Plan EIR are carried forward as part of the Proposed Project, to the extent they remain applicable and effective at reducing environmental impacts. In some cases, modifications to previously adopted measures are proposed to reflect current site conditions, specifics of the Proposed Project, or updated

regulatory requirements. Some previously adopted mitigation measures may no longer applicable, or the need for new mitigation measures is identified. Appendix B, *Comparison of Adopted 2014 Master Plan EIR Mitigation Measures and Proposed 2026 SEIR Mitigation Measures*, to this Draft SEIR, details the proposed mitigation measures associated with the Proposed Project, and documents those changes from the 2014 Master Plan EIR.

This Draft SEIR has also been prepared in accordance with the County of Los Angeles Environmental Document Reporting Procedures and Guidelines (County Guidelines), adopted by the County in November 1987. This evaluation is consistent with County Guidelines Section 705, Tiering, which states that agencies are encouraged to tier EIRs to eliminate repetition and focus the discussion at each level of environmental review. As the level of detail increases, the EIR should be limited to the effects not discussed previously. Each report should just focus on the impacts that are new or more specific to the level of planning analyzed.

The overall purpose of this Draft SEIR is to inform the lead agency, responsible agencies, decision makers, and the general public about the probable environmental effects resulting from construction and operation of the Proposed Project. Discretionary actions currently foreseeable by the County, as lead agency, are described in Section 2.6, *Intended Uses of the EIR*. This Draft SEIR addresses effects that may be significant and adverse; evaluates alternatives to the project; and identifies mitigation measures to reduce or avoid adverse effects.

This Draft SEIR for the Proposed Project is a programmatic SEIR. A program EIR is described in Section 15168 of the State CEQA Guidelines as an EIR that "may be prepared on a series of actions that can be characterized as one large project and are related either geographically, as logical parts in the chain of contemplated actions, [or] in connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program…." Because the Proposed Project consists of a proposed master plan that sets a framework for redevelopment of parts of the Campus over a period of years (estimated 25 years for the purposes of this SEIR), the County determined that a program SEIR would be the appropriate document for the Proposed Project.

As a program-level SEIR, this Draft SEIR evaluates a reasonable and likely maximum development, which was assumed for the environmental analysis, that could be developed based on the level of information that is currently available. Later activities would also be required to adhere to applicable regulations, standards, and mitigation measures identified as part of this Draft SEIR.

By completing programmatic environmental review of the full buildout, future projects may proceed with streamlined entitlement processes and subsequent environmental review pursuant to CEQA. Such tiering under CEQA is intended to eliminate some otherwise the repetitive evaluation of the same environmental issues that were adequately addressed in the first-tier environmental impact report. Review of proposed future projects under the proposed

Master Plan would comply with State CEQA Guidelines Section 15168 and other applicable provisions of CEQA.

1.3 ENVIRONMENTAL REVIEW PROCESS

1.3.1 Notice of Preparation and Scoping Period

The NOP process facilitates early agency coordination and can assist with determining the scope of the environmental issues to be addressed in the Draft SEIR. State CEQA Guidelines Section 15063 states that, if the lead agency can determine that an EIR will clearly be required for a project, an Initial Study is not required. Given the substantial amount of previous information regarding anticipated potential environmental impacts disclosed in the 2014 Master Plan EIR, the County determined that preparation of an Initial Study was not necessary, in accordance with State CEQA Guidelines Section 15063, to anticipate the scope environmental issues that would arise from the Proposed Project.

The County determined that an SEIR would be appropriate for this project based on the discussion provided above and issued a "Notice of Preparation (NOP) of a SEIR and Notice of Public Scoping Meeting" on September 25, 2025, for a 30-day comment period to conclude on October 27, 2025 (see Appendix A, *NOP and Scoping Comments Received*). As a result of public comments received during the scoping period, the County elected to extend the comment period through November 21, 2025. Comments received during the NOP's public review period, from September 26, 2025, to November 21, 2025, are in Appendix A. A public scoping meeting was noticed and held virtually via Zoom Conferencing on October 8, 2025, at 5:00 p.m. Written comments and verbal comments transcribed by a court reporter are also included in Appendix A.

Table 1-1, *Summary of Scoping Comments Received*, identifies the comments received during the NOP public review period and the comments received during the scoping meeting. Comments were reviewed and considered, and where appropriate, the Draft SEIR addresses these comments by incorporating additional analysis, clarifying project impacts, and refining mitigation measures.

Table 1-1 Summary of Scoping Comments Received

Commenting Agency/Person	Date	Comment Summary	Issue Addressed In:
Kristie Hernandez	10/08/25	▪ Questions about the Proposed Project's process for community outreach ▪ Raises concerns regarding plumbing, electrical, and water	Chapter 1, *Introduction*, Chapter 3.3, *Air Quality*, Chapter 3.15, *Transportation*, and

		infrastructure, traffic, parking, emergency vehicle access, and air quality	Chapter 3.17, *Utilities and Service Systems*
Cassidy Bennett	10/08/25	▪ Questions how the community benefits agreement will be enforced	Chapter 2, *Project Description*
Pamela Eastside	10/08/25	▪ Requests that the scoping period is extended ▪ Expresses concern about relevance of impacts discussed in the 2014 Master Plan EIR	Chapter 1*, Introduction* and Chapter 3, *Environmental Analysis* *Comment period was extended from October 27 to November 21, 2025*
Jesus Estrada-Martinez	10/08/25	▪ Expresses concern that community benefits will be limited ▪ Questions if the Master Plan can maximize potential community benefits ▪ Questions if the community is able to suggest other categories for evaluation beyond those included in the CEQA checklist	Chapter 2, *Project Description* and Chapter 3, *Environmental Analysis*
Ari Gutierrez Arambula	10/08/25	▪ Questions if the SEIR will evaluate the underground of the Campus ▪ Questions if there will be consideration of air traffic, drones, helipads, etc. ▪ Questions if there will be revenue generating activities on the Campus that can help fund the community	Chapter 2, *Project Description*, Chapter 3.6, *Geology and Soils*, and Chapter 3.15, *Transportation*
Daniel Jimenez	10/08/25	▪ No comments provided	N/A
Yolanda Durate	10/08/25	▪ Questions if there will be an opportunity to review the major revisions to the 2014 Master Plan EIR ▪ Questions if the mitigation measures identified in the 2014 Master Plan EIR have been revised	Chapter 2, *Project Description* and Chapters 3.1 through 3.18 Appendix B

Table 1-1 Summary of Scoping Comments Received

Commenting Agency/Person	Date	Comment Summary	Issue Addressed In:
		▪ Questions the extent to which the Proposed Project would impact the community benefits agreement	
Emmanuel Matamoros	10/08/25	▪ States that the University of Southern California (USC) should share some of community agreements and benefits responsibilities	Chapter 2, *Project Description*
Vivian English	10/08/25	▪ No comments provided	N/A
Alicia Godinez Rodriguez	10/08/25	▪ States that the community needs affordable housing, increased housing rates, a limit on the demolition of rent-stabilized housing, and commitment to providing benefits for the community	Chapter 2, *Project Description* and Chapter 3.12, *Population and Housing*
Andrew Leung	10/08/25	▪ Proposes that the General Hospital's 2nd floor medical library space be preserved and operation of the library be provided by the LAC Public Library System	Chapter 2, *Project Description*
Native American Heritage Commission (NAHC)	10/13/25	▪ Recommends consultation with California Native American tribes ▪ Provides a summary of AB 52, SB 18, and NAHC recommendations for conducting cultural resource assessments	Chapter 3.16, *Tribal Cultural Resources*
Benjamin Franklin Library	10/17/25	▪ States that the Benjamin Franklin Branch Library is temporarily closed and cannot be used as a location to post the NOP or SEIR	Notice of Availability (NOA) *Location removed from distribution list*
Los Angeles County Fire Department (LACFD)	10/17/25	▪ Requests that the NOP comment period be extended. ▪ Issues are not foreseen with the Project	Chapter 1*, Introduction* *Comment period was extended from October 27 to November 21, 2025*

Table 1-1 Summary of Scoping Comments Received

Commenting Agency/Person	Date	Comment Summary	Issue Addressed In:
Los Angeles Metro	10/21/25	▪ Requests that the Draft SEIR include a discussion regarding Bus Service ▪ Provides recommendations for transit-oriented development ▪ Provides a link to Metro Adjacent Development Handbook	Chapter 3.15, *Transportation*
Southern California Association of Governments (SCAG)	10/23/25	▪ Requests that the Draft SEIR include a side-by-side comparison of the SCAG goals with discussions of the consistency, non-consistency, or non-applicability of the goals and supportive analysis; provides a suggested format ▪ Recommends that the Proposed Project's CEQA lead agency review the Connect SoCal 2024 PEIR for guidance on mitigation measures	Chapter 3.7, *Greenhouse Gas Emission*, Chapter 3.11, *Land Use and Planning*, and Chapter 3.15, *Transportation*
California Department of Transportation (Caltrans)	10/23/25	▪ Suggests the Proposed Project incorporate multi-modal and complete streets transportation elements ▪ Identifies intersections that may be impacted by the proposed project ▪ Requests that the County provide Caltrans with the opportunity to review the traffic safety impact analysis ▪ Recommends that pedestrian and bicycle connectivity be clearly incorporated into the project description ▪ Suggests a multimodal conflict analysis be conducted ▪ Suggests that the Draft SEIR ensure all modes are served well by planning and development activities including reducing single occupancy vehicle trips, ensuring	Chapter 2*, Project Description,* Chapter 3.7, *Greenhouse Gas Emissions*, and Chapter 3.15, *Transportation*

Table 1-1 Summary of Scoping Comments Received

Commenting Agency/Person	Date	Comment Summary	Issue Addressed In:
		safety, reducing vehicle miles traveled, supporting accessibility, and reducing greenhouse gas emissions	
City of Los Angeles Department of Transportation (LADOT)	10/26/25	▪ Requests that the County provide the City with the opportunity to review the transportation study for the Proposed Project ▪ States that the transportation study for the Proposed Project should be prepared following the latest Transportation Assessment Guidelines August 2022	Chapter 3.15, *Transportation*
Los Angeles County Sheriff's Department (LASD)	10/28/25	▪ LASD expects that the Draft SEIR will evaluate the Proposed Project's impacts on public services, population, transportation, and noise ▪ LASD expects the SEIR to include a Construction Traffic Mitigation Plan	Chapter 3.11, *Noise*, 3.12, *Population and Housing*, Chapter 3.13, *Public Services*, and Chapter 3.15, *Transportation*
Law Office of Jordan R. Sisson on behalf of SEIU Local 721	10/28/25	▪ Requests that the NOP be recirculated and requests that an IS be circulated with the recirculated NOP ▪ States that none of the previous environmental documentation is readily available on the County's website for the Proposed Project ▪ States that the NOP needs to clarify the scope of the Program EIR and future CEQA review ▪ Provides recommendations for the inclusion of a statement of overriding considerations and alternatives to be included in the NOP to allow the public to provide comments	Chapter 1, *Introduction* and Chapter 4, *Alternatives to the Proposed Project*

Table 1-1 Summary of Scoping Comments Received

Commenting Agency/Person	Date	Comment Summary	Issue Addressed In:
Los Angeles Unified School District (LAUSD)	10/28/25	▪ Identifies one District site and one school located in the Project's study area ▪ Recommends measures and conditions designed to help reduce or eliminate potential impacts to schools ▪ Requests the EIR specifically addresses potential impacts to schools regarding Air Quality, Hazards, Noise, and Transportation/Traffic (including pedestrian safety) ▪ States that the Team must coordinate any construction activities with LAUSD	Chapter 3.3, *Air Quality*, Chapter 3.8, *Hazards and Hazardous Materials*, Chapter 3.11, *Noise*, Chapter 3.13, *Public Services*, and Chapter 3.15, *Transportation*
Los Angeles County Fire Department (LACFD)	11/7/25	▪ States that the Project Site is within the City of Los Angeles, which is not part of the emergency response area for LACFD ▪ Determined that the Proposed Project would not have any impact on the emergency responsibilities of LACFD ▪ States that specific fire and life safety requirements will be determined upon submittal of design or architectural plans to the LACFD as part of the building plan check review process prior to building permit issuance	Chapter 3.13, *Public Services*

1.3.2 Draft Subsequent EIR Public Review and Comment Period

The scope of the Draft SEIR was determined based on the comments received by the County in response to the NOP as well as the County's understanding of environmental resources and issues present on the Project Site through its preparation the 2014 Master Plan EIR. Pursuant to Sections 15126.2 and 15126.4 of the State CEQA Guidelines, the Draft SEIR should identify any

potentially significant adverse impacts and recommend mitigation that would reduce or eliminate these impacts to levels of insignificance. The information in Chapter 2, *Project Description*, establishes the basis for analyzing project-related environmental impacts.

This Draft SEIR is being circulated for public review for 45 days, from May 15, 2026, to June 29, 2026. Interested agencies, members of the public and other entities are invited to provide written comments on the Draft SEIR to the County address shown below. Upon completion of the 45-day review period, the County will review all written comments received and prepare written responses for comments that raise environmental issues pursuant to Public Resources Code section 21091(d).

The Draft SEIR is available to the general public for review at the following location: https://opportunity.lacounty.gov/how-we-help/capital-development-projects/

Comments from agencies, individuals, and others on the Draft SEIR must be submitted prior to the close of the 45-day public review period which ends on June 29, 2025, at 5:00 pm. All comments on the Draft SEIR should be sent to:

Krystin Hence, Assistant Director, Capital Development
County of Los Angeles
Department of Economic Opportunity
510 S. Vermont Avenue, 11th Floor
Los Angeles, CA 90020
Tel: (844) 777-2059
generalhospital@opportunity.lacounty.gov

The County will also host an informational public meeting during the 45-day public comment period for the Draft SEIR. The meeting will be held virtually (via Zoom) on Thursday, June 11, 2026 from 5:00 pm to 6:30 pm, and will include a presentation overview of the results of this Draft SEIR and provide an opportunity to receive verbal comments from the public.

Public agencies that submit comments during the 45-day public review period on the SEIR will receive written responses to their comments at least 10 days prior to final action on the Proposed Project. If the Board decides to certify the Final SEIR, it will make any necessary findings required by CEQA and the State CEQA Guidelines regarding the extent and nature of the impacts presented in the Final SEIR. The Final SEIR must be certified by the County Board of Supervisors on behalf of the County prior to a decision to approve the Proposed Project.

1.3.3 Preparation of the Final Subsequent EIR and Consideration of Project

Following completion of the 45-day Draft SEIR public review period, a Final SEIR will be prepared. A Final SEIR will incorporate the received comments, responses to the comments, and any changes to the Draft SEIR that result from comments. The Final SEIR will be presented to the County for certification as the environmental document for the project. Public agencies, members of the public and others who comment on the Draft SEIR will be notified of the availability of the Final SEIR and the date of the public hearing before the County.

If the decision-making body of the lead agency (here, the Board) approves the Proposed Project, CEQA requires the Board adopt "findings" with respect to each significant effect identified in the EIR (Public Resources Code Section 21081; State CEQA Guidelines Section 15091). For each significant effect, CEQA requires the approving agency to make one or more of the following findings:

- Changes or alterations have been required for, or incorporated into, the project that avoid or substantially lessen the significant environmental effect, as identified in the final EIR.
- Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
- Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

In the event that the County, as the lead agency, concludes that the Proposed Project will result in significant effects that would not be substantially lessened or avoided by feasible mitigation measures and alternatives, the County must adopt a "statement of overriding considerations" (Public Resources Code Section 21081, subd. (b); State CEQA Guidelines Section 15093). Under CEQA, such statements are intended to provide a written means by which the lead agency balances the benefits of the Proposed Project with the identified significant and unavoidable environmental impacts.

Where the lead agency concludes that the economic, legal, social, technological, or other benefits outweigh the unavoidable significant environmental impacts, the lead agency may find such impacts "acceptable" and approve the project. In addition, pursuant to Section 21081.6 of the Public Resources Code, public agencies, when approving a project, must also adopt a program for monitoring or reporting the changes that were incorporated into the project or made a condition of project approval to mitigate or avoid significant effects on the environment.

As part of the certification of the 2014 Master Plan EIR, the Board adopted a Mitigation Monitoring and Reporting Program (MMRP) in compliance with 21081.6 of the California Public

Resources Code. The MMRP identified the mitigation measures adopted by the Board to avoid or substantially lessen the significant environmental effects of the 2014 Master Plan and established the procedures for monitoring, reporting, and verifying implementation of those measures. Should the County elect to certify the Draft SEIR, a new MMRP reflecting the updated measures identified in this Draft SEIR will be prepared and adopted by the County. The revised MMRP will supersede the previously adopted MMRP for purposes of monitoring and ensuring implementation of all applicable mitigation measures for the Proposed Project.

1.4 INCORPORATION BY REFERENCE

Some documents are incorporated by reference into this Draft SEIR, consistent with section 15150 of the State CEQA Guidelines, and they are available for review at the County of Los Angeles Department of Economic Opportunity Website at the following location: https://opportunity.lacounty.gov/generalhospital/

- *LAC+USC Medical Center Master Plan EIR*, County of Los Angeles, November 2014.
- *Recuperative Care and Crisis Residential Care Centers*, County of Los Angeles, November 2017.
- *Psychiatric Subacute Facility, Mental Health Urgent Care Center, Residential Withdrawal Management Facility*, County of Los Angeles, October 2023.
- *LA County General Hospital & West Campus Stabilization Project*, County of Los Angeles, June 2025.
- *LA County General Hospital Campus Master Plan*, Centennial Partners, May 2026.

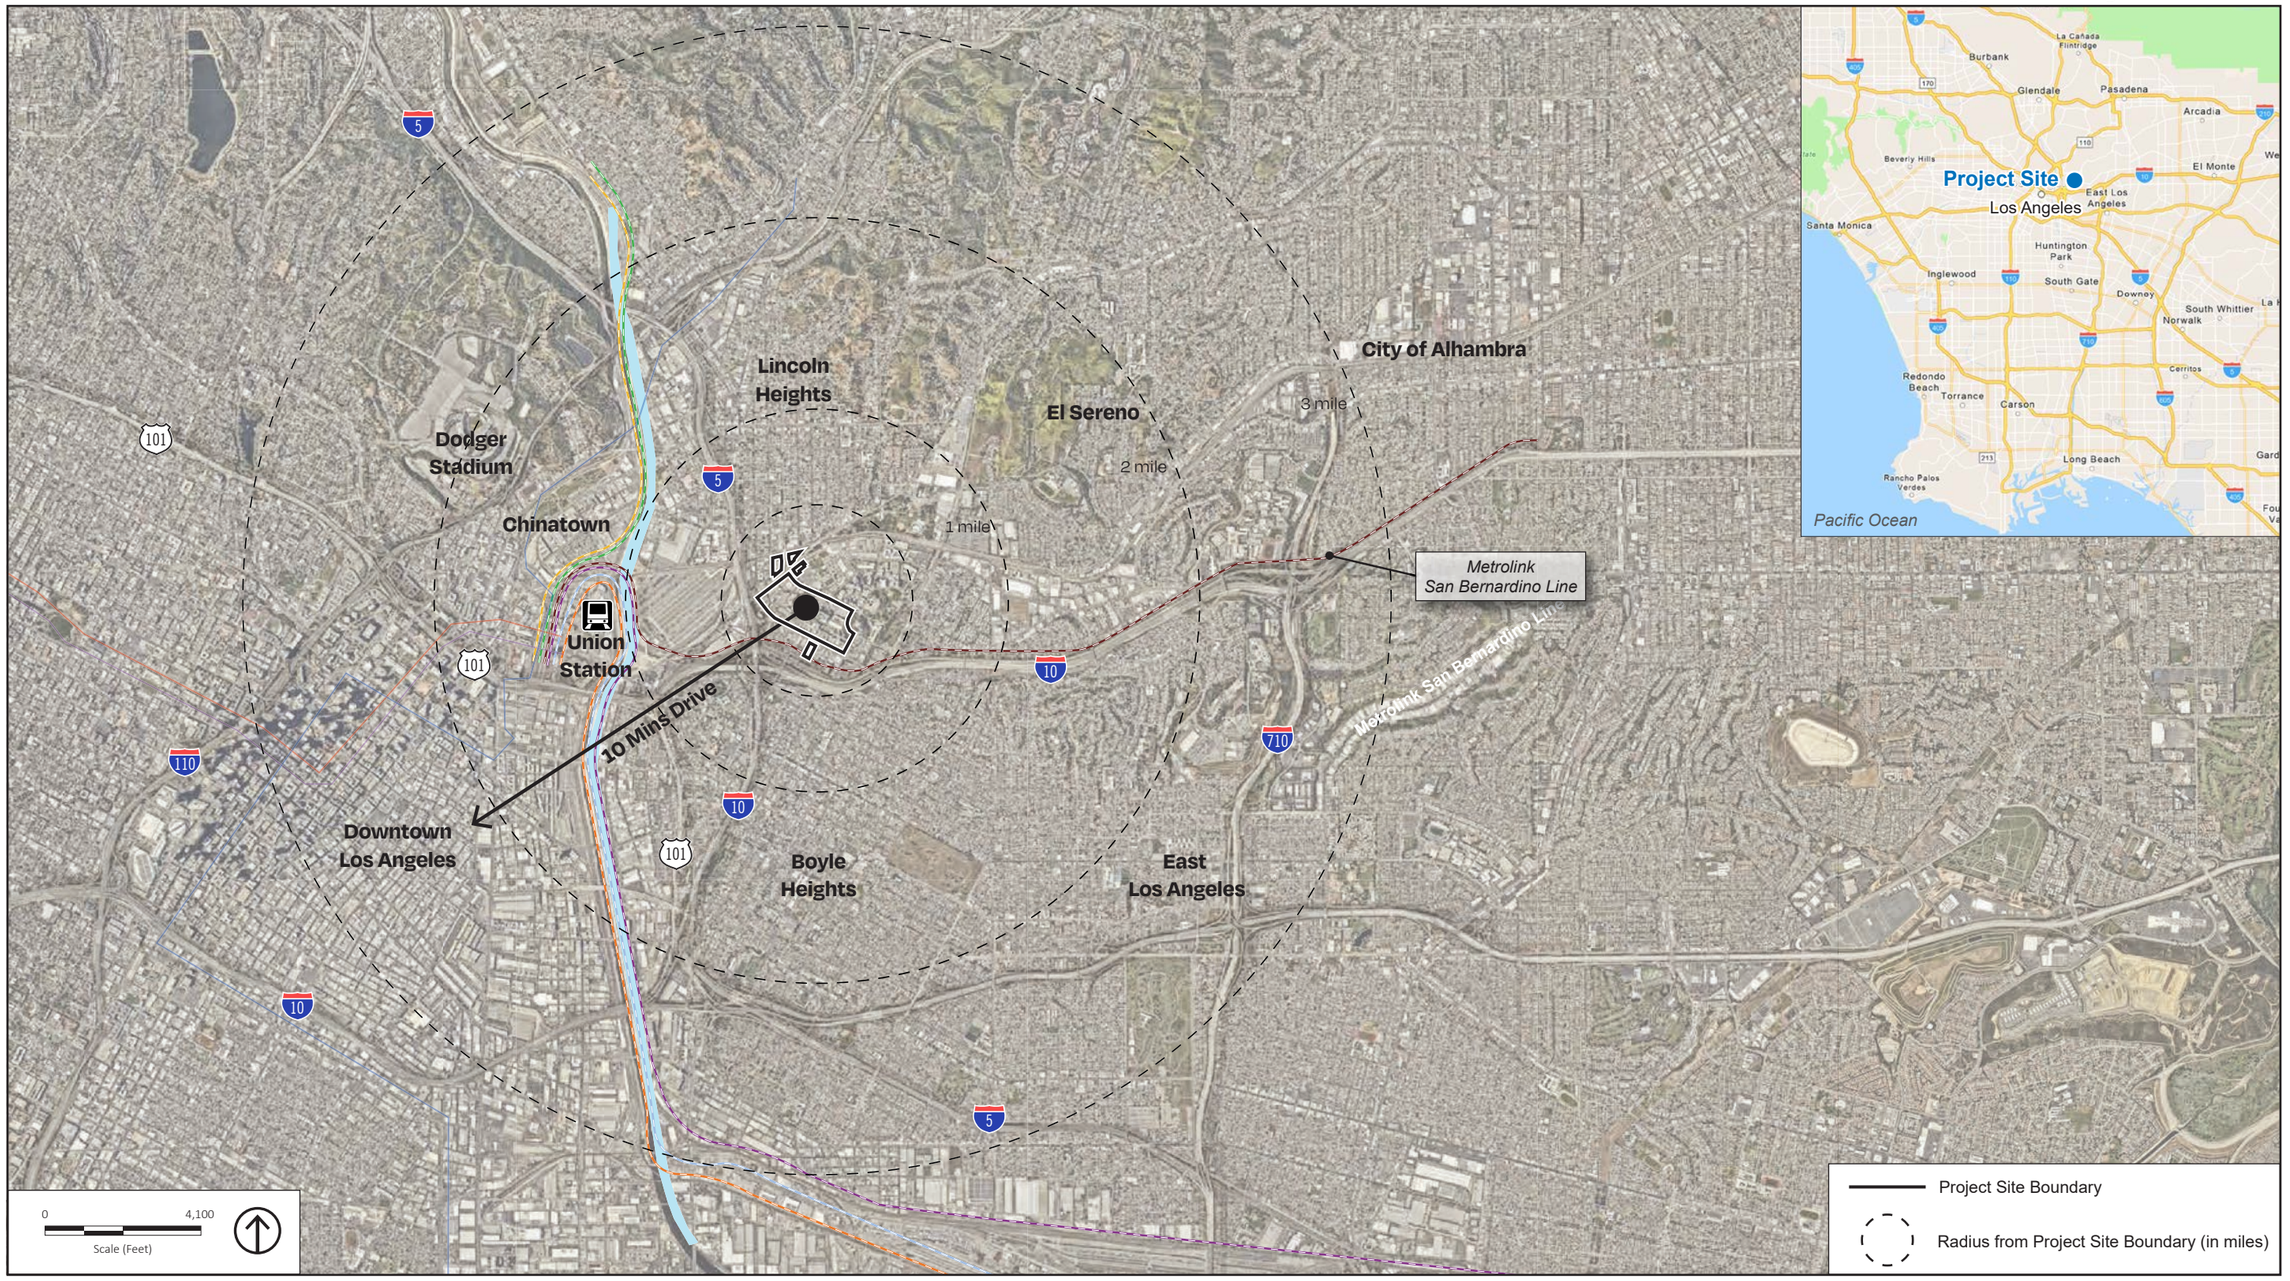
2. PROJECT DESCRIPTION

2.1 INTRODUCTION

This chapter of the Draft Subsequent Environmental Impact Report (SEIR) describes the proposed Los Angeles (LA) County General Hospital Campus Master Plan Project (Proposed Project). The lead agency pursuant to Section 15050 of the State California Environmental Quality Act (CEQA) Guidelines is the County of Los Angeles (County). The Department of Economic Opportunity (DEO) is carrying out the SEIR process on behalf of the County. The County of Los Angeles Board of Supervisors, as governing body of the County, would consider the Draft SEIR when the Proposed Project is recommended to the Board for approval. The Proposed Project includes implementation of the Los Angeles County General Hospital Campus Master Plan (proposed Master Plan), which would guide future redevelopment of parts of the County-owned Los Angeles General Medical Center Campus (Campus). This chapter describes the Proposed Project objectives, components, and construction assumptions that are used as the basis for the environmental impacts evaluation in this Draft SEIR. Existing land uses and site conditions that form the environmental baseline are described in Chapter 3, *Environmental Analysis*.

2.2 PROJECT LOCATION

The Project Site (also referred to as Campus in this Draft SEIR) is on County-owned property in the City of Los Angeles, immediately northeast of Interstate (I-) 5 (Golden State Freeway) and north of I-10 (San Bernardino Freeway). The Project Site is recognized as a regionally significant medical facility, central to the provision of health and community services across the County of Los Angeles. Figure 2-1, *Regional Location*, depicts the regional location of the Proposed Project. The Campus is surrounded by the Boyle Heights and Lincoln Heights neighborhoods of the City of Los Angeles to the south and north, respectively. The Project Site is accessible via I-5 and I-10 as well as proximate regional transit connections, including Los Angeles Union Station approximately two miles from the Project Site, further reinforcing its role as a regional hub for medical services.



As shown in Figure 2-2, *Project Site Boundaries*, the Project Site includes a main campus and four additional areas separated from the main campus by local roadways; these areas that are not part of the main campus are referred to as the "non-contiguous areas" in this Draft SEIR. The four non-contiguous areas of the campus are referred to as the College of Nursing and Allied Health, located directly across Mission Road; Restorative Care Village (RCV), located at the northeast corner of Mission Road and Zonal Avenue; Big Blue, located at the southeast corner

of Mission Road and Zonal Avenue; and Parking Structure 9, off the main campus located on the opposite side of Marengo Street. In total, the Project Site is approximately 81.9 acres.[1] The approximately 71-acre main campus is located at 1200 State Street and is generally bounded by Zonal Avenue, Mission Road, Marengo Street, and Chicago Street. State Street bisects the main campus. While this Project Site is defined in order to identify potential environmental impacts in all areas in which future activities associated with the Proposed Project could occur, it is not intended to indicate that all parts of the Project Site would be redeveloped; some areas such as the existing Medical Center and the newly constructed RCV facilities, are not proposed for redevelopment as part of the Proposed Project.

A number of buildings and features associated with the medical uses of the Campus are located within the Project Site. As shown in Figure 2-3, *Local Vicinity*, the Campus is surrounded by a mix of institutional, medical, commercial, residential, and industrial uses. The Keck School of Medicine of USC campus and other institutional and medical uses are located on the opposite side of Zonal Avenue. Residences are located on the opposite side of Cummings Street and Chicago Street. Commercial uses are located on the opposite side of Marengo Street and residential uses are located further south on the opposite side of Marengo Street. Industrial uses are located south of Alhambra Avenue. Detailed descriptions of surrounding land uses and sensitive receptors are provided in the applicable technical sections in Chapter 3.0, *Environmental Analysis*.

[1] The Project Site boundaries considered in this Draft SEIR are the same as those described in the 2014 Master Plan EIR. The 2014 Master Plan EIR referenced varying acreage values in different chapters of the 2014 Master Plan EIR (e.g., approximately 76 acres in the Project Description Chapter [2014 Master Plan EIR page 2-1] and approximately 86 acres in the Population/Housing Chapter [2014 Master Plan EIR page 3.11-7]). For clarity and consistency, this Draft SEIR defines the Project site as approximately 81.9 acres, inclusive of the main campus and associated non-contiguous parcels evaluated in the 2014 Master Plan EIR.

2.3 STATEMENT OF PROJECT OBJECTIVES

The primary purpose of the Proposed Project is to address some of the region's urgent challenges—that include, but are not limited to, housing insecurity, public health disparities, disconnection of the Project Site with the surrounding communities, and climate vulnerability—through a holistic framework rooted in health equity, synergetic infrastructure, and cultural resilience. Pursuant to State CEQA Guidelines Section 15124, the following objectives support the Proposed Project's purpose and will assist the County of Los Angeles in developing a reasonable range of alternatives to be evaluated in this SEIR. These objectives build on and are consistent with the objectives defined in the 2014 Master Plan EIR, which were as follows:

- Achieve a community-friendly campus
- Promote healthy lifestyles and wellness
- Maximize access to the Medical Center by the community
- Provide opportunities for appropriate education and job training
- Incorporate on-campus business opportunities
- Plan for future program development

2.3.1 Proposed Project Objectives

HEALTHCARE, PUBLIC HEALTH, AND WHOLE-PERSON WELLNESS

1. To meet the current and future healthcare needs of the Los Angeles region by supporting the continued provision of essential medical services and enabling evolving models of care.
2. To redevelop the campus in a manner that advances whole-person health, including reducing housing insecurity, improving access to healthcare services, expanding access to open space, advancing transportation equity, and supporting social and economic wellbeing.

HOUSING AND ECONOMIC OPPORTUNITY

3. To preserve and adaptively reuse the historic General Hospital, maintaining architectural, cultural, and civic significance while enabling functional modernization and long-term economic viability.
4. To maximize the provision of new housing, including affordable, supportive, workforce, market rate, and other needed housing types, to address housing needs of the County and the greater Los Angeles region.
5. To promote economic and workforce development that benefits surrounding communities, including opportunities for job creation, workforce training, and local-serving commercial and institutional uses.

6. To provide community-serving, institutional, educational, commercial, community facilities, and public-facing uses that support daily needs, encourage shared use of the campus, and reinforce the campus's role as an accessible and welcoming civic place.

CIRCULATION, ACCESS, AND OPEN SPACE

7. To develop multimodal circulation that enhances connectivity within the Campus, specifically privileging pedestrian connectivity between east and west Campus, and improves access to adjacent neighborhoods, institutions, and regional transportation systems.
8. To create a cohesive, campus-wide landscape and open space framework that provides abundant, accessible public and semi-public spaces to support community activity, wellness, and social interaction.

INFRASTRUCTURE, SUSTAINABILITY, AND RESILIENCE

9. To replace and modernize aging utilities and infrastructure to support long-term campus operations.
10. To promote environmental sustainability through compact development, adaptive reuse, efficient infrastructure systems, and reduced reliance on single-occupancy vehicle travel.
11. To develop resilient infrastructure designed to withstand and recover from natural hazards while providing reliable, sustainable systems that support both project operations and serve as a community resource during emergencies.

2.4 PROJECT CHARACTERISTICS

2.4.1 Project Overview

The Proposed Project involves implementation of the proposed Master Plan, which would guide the long-term redevelopment of parts of the Project Site, including adaptive reuse of the General Hospital Building. The proposed Master Plan presents a conceptual, planning-level vision of the types of uses, scale, and locations of potential future development activities that could occur within a 30.8-acre portion of the approximately 81.9-acre Project Site, referred to as the "Master Plan Boundary" in the proposed Master Plan (see Section 1, Introduction, of the proposed Master Plan). The Master Plan Boundary covers that portion of Project Site that is the subject of the public-private partnership between the DEO on behalf of the County and the developer to reimagine the Campus through implementation of the Master Plan. Detailed site development plans, building configurations, and architectural designs would be prepared as future project-level approvals are proposed and would be consistent with the guiding vision of the proposed Master Plan.

The approximately 51.1 acres of the Project Site that are not subject to the proposed Master Plan would continue to be governed by the previously approved 2014 Master Plan and its associated development parameters. Certain previously approved land uses that were identified in the 2014 Master Plan that have not yet been implemented to date have been carried forth into this Draft SEIR. These uses include Community Facilities, Clean Tech/Light Industrial, Medical Office, General Office, and Hospital[2]. Because development within the areas of the Project Site outside of the Master Plan Boundary would continue to occur pursuant to the 2014 Master Plan, this Draft SEIR evaluates potential environmental impacts associated with a conservative, maximum development scenario across the entire Project Site to ensure that a full range of potential redevelopment on the Project Site is considered.

The Proposed Project includes the following land uses, which are described in more detail in this chapter:

- Residential, including, but not limited to, affordable housing
- General and medical office space
- Commercial and retail uses
- Patient and Caregiver Lodging
- Community Facilities
- Educational uses
- Warehousing space
- Clean tech and light industrial development
- Hospital uses
- Parking
- Open space and landscaping
- Campuswide infrastructure improvements

In addition to a description of these proposed uses, a summary of the overall approach to adaptive reuse of the General Hospital Building, which is a part of the Proposed Project, is also provided.

[2] The 2014 Master Plan EIR used different land use nomenclature for the proposed uses under the 2014 Master Plan. The land use titles under the 2014 Master Plan included: Wellness-Oriented Community Facilities, New Utility Plant and Facilities, Outpatient Clinics/Laboratories/Medical Office, Professional/Administrative Office, Research and Development, Hospital Addition, Warehouse/Storage, and Residential Care Facilities. Land uses that would be carried over under the Proposed Project include: Wellness-Oriented Community Facilities (Community Facilities), New Utility Plant and Facilities (Clean Tech/Light Industrial), Outpatient Clinics/Laboratories/Medical Offices (Medical Office), Professional/Administrative Offices (General Office), Hospital, and Research and Development (Clean Tech/Light Industrial).

2.4.2 Proposed Project Land Uses

Table 2-1, *Proposed Project Land Uses*, summarizes the maximum anticipated development proposed on the Project Site by land use type. The numbers in Table 2-1 represent the maximum amount of development that could take place on the Project Site and are used as the basis for the environmental assessment in this Draft SEIR. The quantities of each land use are based on information contained in the proposed Master Plan. Future redevelopment proposed to be implemented on the Project Site, would occur in phases over an estimated 25 years; the actual number of units and quantities of land use types would be determined as individual project elements are implemented and could be less than the maximum envelope analyzed in this Draft SEIR. In addition, the precise distribution of land uses, square footage, and associated population among individual land use categories may vary over time from the figures provided in response to operational needs, and some variation is anticipated in the EIR analysis, provided that the overall development intensity analyzed in this Draft SEIR, would not be exceeded.

Table 2-1 Proposed Project Land Uses

Proposed Land Use	Units/Counts	Square Footage
Residential	3,200 housing units	2,300,000
General Office	--	400,000
Medical Office	--	735,300
Retail	--	320,000
Patient and Caregiver Lodging	200 rooms	80,000
Community Facilities	--	350,000
Education	--	110,000
Warehouse	--	160,000
Clean Tech/ Light Industrial	--	200,000
Hospital	450 beds	400,000
Parking	8,588 spaces	3,005,678
Total	**3,200 du 450 hospital beds 200 rooms 8,588 parking spaces**	**8,060,978 square feet of new development**

Figure 2-4, *Conceptual Campus Programming*, provides an illustrative depiction of where future uses could be located within the Project Site. As identified in Figure 2-5, *Conceptual Hubs and Corridors,* a description of the three conceptual hubs is as follows:

- The **Commerce Hub** would be located within the western portion of the main campus and would serve as the community-facing center of economic activity, cultural celebration, and daily life. The Commerce Hub could include mixed-uses consisting of community-oriented retail, small businesses, incubator space, and cultural uses that would support local entrepreneurship and creative expression.
- The **Historic Hub** would be centered on the Forecourt and General Hospital Building. Recreational facilities, open space, and food-oriented programs such as a kitchen and restaurant incubator or mercado food hall could be provided in the Historic Hub.
- The **Medical Hub** would be centered on the Los Angeles General Medical Center (LA General Medical Center) and would build on the Project Site's role as a center for care while expanding access to community-oriented health services. Supporting amenities could include grab-and-go food and beverage, wellness garden and respite spaces to serve patients, visitors, doctors, nurses, and staff.

A description of the three conceptual corridors is provided below:

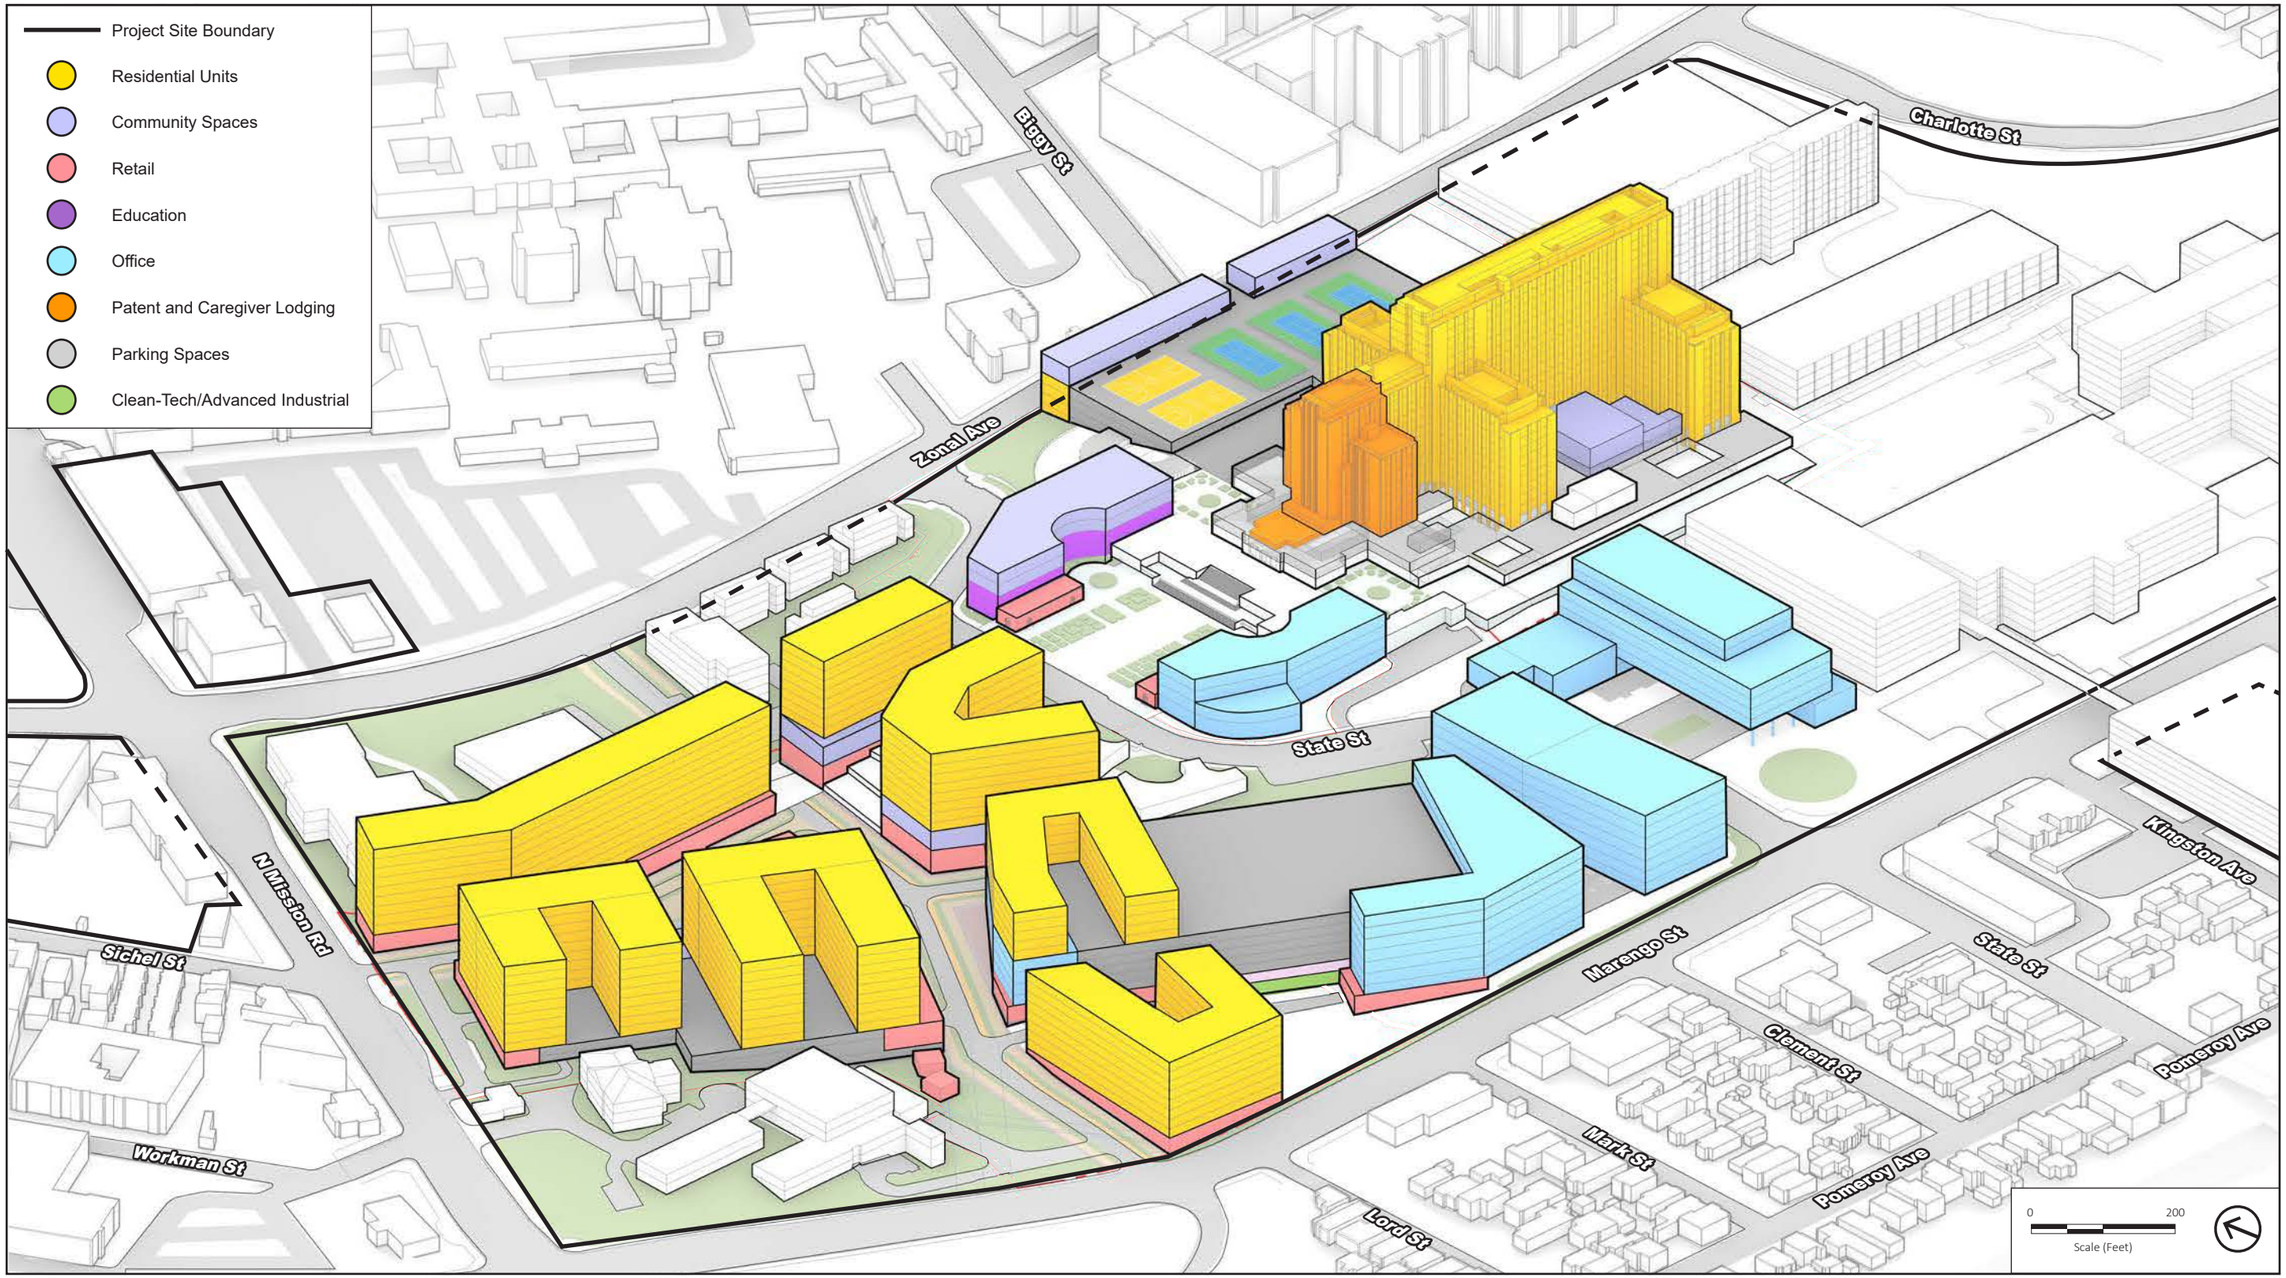
- The **Community Corridor** would form the central civic spine and would link the Commerce Hub to the Historic Hub. This corridor could support community activities including markets, events, and informal daily use.
- The **Wellness Corridor** would link the Medical Hub and the Commerce Hub. This corridor would be designed to support movement, prevention, and recovery. Additionally, this corridor would integrate active living routes, shaded seating, and wellness-oriented programming.
- The **Innovation Corridor** would connect the Medical Hub and the Historic Hub and would focus on health-related innovation, research, training, and entrepreneurship. This corridor could be lined with flexible spaces for incubators, educational programs, and supportive services. This corridor would support collaboration between institutions, community, organizations, and emerging enterprises.

Precise locations, massing, square footage, and resulting densities (population and employment) may evolve as the Proposed Project is implemented in phases. For purposes of analysis in this Draft SEIR, the development program presented in Table 2-1 represents the maximum development scenario evaluated. While the table identifies anticipated square footages and population associated with specific land uses, the allocation of square footage and uses may be distributed in different configurations across the Project Site during implementation, and within the overall development program and intensity analyzed in this Draft SEIR.

Provided below is a description of the anticipated land uses under the Proposed Project.

RESIDENTIAL

As identified in Table 2-1, up to 3,200 housing units could be developed within the Project Site. Of these units, a minimum of 25 percent would be designated as affordable. This land use category would permit multi-family housing and mixed-use developments with residential and commercial components, as well as adult residential facilities, family childcare homes, l foster family homes, group homes for children, joint live/work units, residential substance use recovery facilities, rooming and boarding houses, and small family homes for children (as defined in Los Angeles County Code of Ordinances Section 22.140.530). Unit types would vary in size and would be designed to accommodate a variety of household types and could be for rent or sale. As further described under "Summary of General Hospital Adaptive Reuse," below, the General Hospital Building, within the Los Angeles General Hospital - Acute Unit Building Historic District, is conceptually planned to be adaptively reused to accommodate up to approximately 615 housing units, representing a portion of the proposed total of up to 3,200 housing units. The remaining residential units would be in the form of new construction in various parts of the Project Site. As discussed in detail below in Section 2.4.7, *Design Guidelines*, of this chapter, no structure or projection would exceed the highest elevation point of the roof structure or parapet wall of the existing General Hospital Building, which stands at 19 stories tall or approximately 240 feet above ground level.



GENERAL OFFICE AND MEDICAL OFFICE

The Proposed Project includes development of up to 735,300 square feet of medical office use and up to 400,000 square feet of general office use within the Project Site. Medical office uses would support the larger hospital uses on the Project Site. Permitted medical offices could include dental offices and laboratories integrated with office uses. General office uses would include business or professional offices space.

COMMERCIAL/RETAIL

The Project Site would also be redeveloped with up to 320,000 square feet of commercial/retail uses. Uses permitted within this land use would include farmer's markets, general retail (e.g., grocery stores/supermarkets, foodstuffs, beverages, secondhand, and specialty goods), , banks, barber and beauty shops, bars and cocktail lounges, bicycle rentals, dry cleaning drop-off and pick-up services, movie theaters, pet grooming services, photocopying and duplicating services, photography studios, printers and publishers, repair shops, restaurants and eating establishments, tourist information, and veterinary clinics. As further described under "Summary of General Hospital Adaptive Reuse," below, the General Hospital Building would be adaptively reused to include up to 90,000 square feet of the commercial/retail space.

This page intentionally left blank.

Figure 2-5 - Conceptual Hubs and Corridors

Source: RIOS 2025.

This page intentionally left blank.

PATIENT AND CAREGIVER LODGING

The proposed patient and caregiver lodging use would provide accommodations for onsite users (as opposed to general tourism lodging). It would allow for up to 200 rooms on the Project Site, some or all of which could be located within the General Hospital Building. These rooms are intended to serve patients, families, and visiting staff of the LA General Medical Center. As further described under "Summary of General Hospital Adaptive Reuse," the General Hospital Building is conceptually planned to be adaptively reused to include up to 91,000 square feet of patient and caregiver lodging use and up to 200 rooms.

COMMUNITY FACILITIES

The Proposed Project would include up to 350,000 square feet of community facilities uses throughout the Project Site. Permitted community facilities uses would include community gardens, farming, auditoriums and event spaces, museums, adult continuing education (business, trade/extension school, and professional), health clubs, gymnasium, parks, recreational clubs, riding and hiking trails, sauna and steam baths, swimming pools, kitchens and commissary kitchens (including street vendors), and day care facilities. This use would also permit domestic violence shelters and emergency shelters.

EDUCATIONAL FACILITIES

The Proposed Project could include development of up to 110,000 square feet of educational/school uses, which could be a public or private transitional kindergarten (TK) through 12th grade.

WAREHOUSE

The Proposed Project would include up to 160,000 square feet of storage facilities/warehouse uses.

CLEAN TECH/LIGHT INDUSTRIAL

The Proposed Project would include up to 200,000 square feet of clean tech/light industrial uses. The proposed clean tech/light industrial land use would permit the following uses: clean technology and light industrial, accessory technology infrastructure uses (server and data processing functions); laboratories (research and testing); light manufacturing (artistic and artisanal goods, alcoholic beverages, cosmetic and pharmaceutical, food and drink, garment and accessory, general, and textile); and scientific research or experimental development of materials, methods or products.

HOSPITAL

Under the 2014 Master Plan Project, the County identified the potential development of up to three new inpatient towers with 150 beds each (450 beds total) in the area now occupied by the Outpatient Department (OPD) building, Interns and Residents Dorm (IRD) building, and Parking Structure 12. Those previously approved uses have not been developed and are carried forward under the Proposed Project.

PARKING

For the purposes of this analysis in this Draft SEIR, a conservative parking assumption was used consistent with the broader buildout scenario. Specifically, 3,005,678 square feet of parking uses were assumed, equivalent to approximately 8,588 parking stalls, which includes replacement parking as a result of any existing parking to be removed as part of Proposed Project. As described, this Draft SEIR assumes a conservative buildout scenario reflecting maximum allowable uses on the Project Site, and development would occur in multiple phases over an extended period. Parking would be delivered concurrently with the uses it is intended to serve, and parking demand would be evaluated on a project-by-project basis to account for changes in travel behavior, including reduced reliance on automobiles through transportation demand management measures implemented as part of this project.

The Proposed Project would include sufficient parking spaces to accommodate demand, with no parking minimums (pursuant to Assembly Bill 2097 [2022]), within the Project Site. Parking would be accommodated in structured and surface parking areas, and could include subterranean levels. Parking areas would be strategically located to accommodate the various uses at designated locations, in consideration of the three main access points into the Project Site (from Mission Road, State Street/Marengo Street, and State Street/Zonal Avenue). Centralized parking would be paired with active parking management strategies to balance parking demand across the different user groups and peak periods. Parking structures are anticipated to range from three to seven above-ground levels.

All faces of a parking structure that would be visible from a roadway would receive appropriate design treatment. Additionally, all faces of a parking structure that would be visible from public and residential areas would be screened to reduce light and glare. This would be achieved through design features such as incorporating the use of color, screening, art, green walls, or supergraphics.

SUMMARY OF GENERAL HOSPITAL ADAPTIVE REUSE

The approximately 1.2 million square foot General Hospital Building has been largely vacant since 2008. As further described in Chapter 3.4, *Cultural Resources*, the General Hospital Building (known as the Los Angeles County General Hospital - Acute Unit Building) and an area

surrounding the building, known as the Los Angeles General Hospital - Acute Unit Historic District, are historical resources pursuant to CEQA. The Proposed Project includes the adaptive reuse of the Los Angeles General Hospital – Acute Unit Building and its associated ancillary buildings and features that together comprise the Los Angeles General Hospital - Acute Unit Building Historic District to accommodate a range of uses that are included in Table 2-1.

Potential General Hospital Building Uses

While the ultimate uses and quantity of uses may change, based on early feasibility studies, it is anticipated that uses within the General Hospital Building could include residential, commercial, office uses, patient and caregiver lodging, and community facilities. Table 2-2, *Conceptual General Hospital Reuse Programming*, provides a breakdown of approximate square footage for anticipated uses within the General Hospital Building.

Table 2-2 Conceptual General Hospital Adaptive Reuse Programming

Proposed Use	Square Footage Range
Residential	400,000–500,000 (approximately 615 residential units)
Commercial/Office/Community Facilities	80,000–90,000
Patient and Caregiver Lodging	9,000–91,000 (up to 200 rooms)

The square footages presented above reflect conceptual programming for active uses and do not represent the full building area. Remaining space within the building would include retaining historic interior features, internal circulation areas, building services (e.g., mechanical equipment and utility space), and other non-programmable areas. Building amenities to support these land uses are conceptually planned to include, but not be limited to, a community garden(s), pool, barbecue and dining area(s), lounges, sports courts, community event spaces, and daycare facilities, and are anticipated to be interior to the General Hospital Building and on the roof of an accompanying proposed parking structure.

In addition to the work within the General Hospital Building, other improvements within the Los Angeles General Hospital - Acute Unit Building Historic District are proposed. Within the Forecourt area, which is the publicly accessible entrance to the General Hospital Building, improvements would be made in consideration of the larger Master Plan vision. Improvements within the historic district would be implemented in accordance with the Secretary of Interior's Standards for the Treatment of Historic Properties (Standards). The existing Forecourt features, such as landscaping and pavers that in some areas are in poor condition, could be removed and enhanced to allow for improved accessibility and safety. Subsurface infrastructure connections may be installed. Existing texture and patterns would remain and the Forecourt would remain as an outdoor space and gateway to the General Hospital Building.

Anticipated General Hospital Building Construction Activities

While the precise construction activities to be conducted would be determined through future design and engineering studies, the following discussion provides anticipated construction activities that could be anticipated within the General Hospital Building and proximate historic areas, for purposes of analysis of environmental impacts in this Draft SEIR. In addition to these construction activities, remediation and/or removal of hazardous materials would occur. This description of anticipated activities provides further refinement from that analyzed in the Los Angeles County General Hospital & West Campus Stabilization Project EIR Addendum that was approved by the County in 2025.

Rehabilitation of the General Hospital Building would undergo "soft demolition" of non-essential and non-historic elements, including outdated/deteriorating mechanical, electrical, and plumbing (MEP) systems; interior finishes, interior partitions, and other non-loadbearing components; and hazardous materials.

The General Hospital Building would be re-roofed and new mechanical equipment and outdoor patios would be added. A portion of the north elevation at the basement and 1st to 3rd floors would be demolished to accommodate the integration of a new parking garage. Along the south elevation of the 1st floor, new openings would be created at the west and east ends of a concrete retaining wall and would provide access to the lobby.

The General Hospital Building would also undergo critical seismic strengthening. New foundations would be added at the basement level, maintaining existing floor elevations. New shear walls would be added at all floors, requiring demolition and reconstruction at corridors. New reinforced concrete super walls would avoid high integrity historic spaces within the building and help limit the amount of earthquake movement that would affect exterior elevations.

In the interior of the General Hospital Building, the 1st floor and historic lobby would continue to serve as the primary entrance and circulation, with the central corridor acting as an interior street. Existing 1st floor rooms would be reconfigured and finished to prepare for future uses.

With the exception of a portion of the north elevation walls and the removal of some original interior finishes and features as described above, the vast majority of the building's character-defining features and materials enumerated would be preserved under the Proposed Project.

The Patient's and Visitor's buildings in the Forecourt area would be retained and would receive interior tenant improvements. State Street, the existing gateway at Marengo Street, and the west and east gateways at Zonal Avenue would be retained. The historic central gateway may be relocated further east along Zonal Avenue, within the Los Angeles General Hospital - Acute Unit Building Historic District. The open area comprising the Entrance Forecourt would be retained. While portions of the Forecourt paving may be reconstructed, the new paving would match the

historic gridded design. New contemporary pedestrian lighting may be added to the Forecourt area. Historic cypress and olive trees would be retained or replaced in kind, and the rest of the Forecourt would receive new landscaping.

Most extant retaining walls, particularly those along the western edge of the Los Angeles General Hospital - Acute Unit Building Historic District boundary, providing support along the promontory, would be retained, with limited sections demolished to accommodate new development.

As further discussed in Section 2.4.7, *Demolition Activities*, of this chapter, and Chapter 3.4, *Cultural Resources*, a number of non-historic buildings and features within the Los Angeles General Hospital - Acute Unit Building Historic District would be demolished to accommodate new programming within the Los Angeles General Hospital - Acute Unit Building Historic District, and new infill construction would be added. New construction would be designed to be compatible with the size, scale, massing, height, and overall design of contributing buildings, structures, and site features within the Los Angeles General Hospital - Acute Unit Building Historic District, in conformance with the Project Design Features listed below.

Project Design Features

Included as part of the Proposed Project, all work to the General Hospital Building and within the Los Angeles General Hospital - Acute Unit Building Historic District is required to comply with the Secretary of the Interior's Standards for Rehabilitation ("the Rehabilitation Standards") as part of the ongoing federal historic preservation tax credit application process for the property. A qualified Historic Architect or Architectural Historian meeting the Secretary of the Interior's Professional Qualifications Standards will continue to review the Acute Unit drawings as the design progresses to ensure that the design conforms with the Rehabilitation Standards. Key features that make up the historic elements of General Hospital Acute Unit will be retained and incorporated into the design. This includes but is not limited to:

- **Primary Corridors (all levels):** Existing walls to be demolished and reconstructed to a similar configuration. Existing terrazzo and steel wainscotting to be removed, abated, and stored for reinstallation at the reconstructed corridors.

- **Entry Lobby (1st floor, 2nd-story space):** All materials will be protected and finished in place. Through traffic in this area would be minimized during the cleanout, abatement, selective demolition, and seismic demolition phases.

- **Kitchen (1st floor, 2nd-story space):** Maintain the configuration of double-height space. There are no known materials or finishes to protect in place.

- **Library (2nd floor):** All materials, finishes, and fixtures will be protected in place. Through traffic in this area would be minimized during the cleanout, abatement, selective demolition, and seismic demolition phases.

- **Morgue (2nd floor):** All materials, finishes, and fixtures will be protected in place. Through traffic in this area would be minimized during the cleanout, abatement, selective demolition, and seismic demolition phases.

- **Surgery Theater, Operating Room No. 1 (15th-17th floors):** All materials, finishes, fixtures, and equipment will be protected in place. Through traffic in this area would be minimized during the cleanout, abatement, selective demolition, and seismic demolition phases.

- **Operating Rooms (6 total, 15th floor):** Existing demising walls would be demolished. Floor tiles will be protected in place for the incorporation into the future residential program planning.

In addition, to ensure that no impacts would occur to the identified historic resources and that all applicable standards and guidelines are followed, the following Project Design Features (PDFs) would be implemented as part of the Proposed Project.

Project Design Features: General Hospital – Acute Unit District and Building

PDF-1. All work within the Los Angeles General Hospital – Acute Unit Historic District and the treatment of all its contributing buildings, structures, and site features, as well as the rehabilitation of the Acute Unit Building and the treatment of all its exterior and interior character-defining features and materials, shall be overseen by a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards. The Historic Architect shall review all drawings and specifications at major milestones (50% and 100% Schematic Design, Design Development, and Construction Documents) to ensure continued conformance with the Rehabilitation Standards and National Park Service guidance. New construction within the Acute Unit Historic District shall adhere to Rehabilitation Standards No. 9 and 10 and the guidance related to new construction.

Additionally, the County is pursuing federal historic preservation tax incentives for the Acute Unit's proposed rehabilitation work, which requires rigorous review by the National Park Service (NPS) and California Office of Historic Preservation (OHP) for compliance with the Rehabilitation Standards.

PDF-2. Prior to commencement of any construction activities associated with the Los Angeles General Hospital – Acute Unit Building's exterior or interior character-defining features, or the Acute Unit Historic District's contributing features (Patient's and Visitor's buildings, retaining walls, gateways, State Street, Forecourt, tunnel), a Historic Architect meeting the Secretary of the Interior's Professional Qualifications Standards shall be retained to monitor all disassembly,

construction and rehabilitation activities, to ensure appropriate treatment of exterior and interior character-defining features, materials, and spaces during the construction project.

PDF-3. Prior to undergoing any demolition at the Los Angeles General Hospital – Acute Unit Building and any other contributing features within the Acute Unit Historic District (Patient's and Visitor's buildings, retaining walls, gateways, State Street, forecourt, tunnel), that would result in the removal of interior or exterior character-defining features (or portions thereof), Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards. HABS/HAER Level II drawings and historical narrative may follow after construction commences. To ensure public access, the Project Applicant(s) shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- **Drawings:** Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- **Photographs:** Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- **Historical Narrative**: An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

Project Design Features: Support Services Site

The Proposed Project also includes PDFs related to the Support Services Site, which was previously identified as an eligible historic district. While the Support Services Site was largely demolished in the late 1990s and 2000s and no longer retains sufficient integrity to convey its significance as a historic district, the site played an important role in the history and development of the hospital. The Pharmacy and Viaduct, which had been identified as contributors to the Support Services Site, are the only remaining vestiges of the Support Services Site and would be demolished under the Proposed Project. The following PDFs would document and interpret these resources and their associations with the history and development of Los Angeles County General Hospital.

PDF-4. Prior to demolition of the Pharmacy Building and Viaduct, Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level II photographic documentation shall be prepared by a qualified professional meeting the Secretary of the Interior's Professional Qualifications Standards and a qualified structural engineer with at least five years of demonstrated, related experience. HABS/HAER Level II drawings and historical narrative may follow after demolition. To ensure public access, the Project Applicant(s) shall submit documentation to the following archives/organizations: Library of Congress, HABS/HAER/HALS Collection; Los Angeles Conservancy; County of Los Angeles Library; and other entities/repositories to be identified by the Historic Architect.

- **Drawings**: Existing historic drawings of the historical resource shall be photographed with large-format negatives or photographically reproduced on Mylar. In the absence of existing drawings, full-measured existing conditions drawings of the building's floorplans and exterior elevations should be prepared.
- **Photographs**: Photo-documentation shall be prepared to HABS/HAER standards for archival photography. HABS/HAER standards require large-format black-and-white photography, with the original negatives having a minimum size of 4"x5". Digital photography, roll film, film packs, and electronic manipulation of images are not acceptable. All film prints, a minimum of 4"x5", must be hand-processed according to the manufacturer's specifications and printed on fiber base single weight paper and dried to a full gloss finish. A minimum of twelve photographs must be taken. Photographs must be identified and labeled using HABS/HAER standards.
- **Historical Narrative**: An architectural historian meeting the Secretary of the Interior's Professional Qualifications Standards shall compile historical background information relevant to the historical resource and prepare a narrative.

PDF-5. An Interpretation Plan shall be prepared and implemented for the "Support Services Site" that originally comprised the west half of the Los Angeles General Hospital main campus and that was largely demolished and redeveloped following the 1994 Northridge earthquake. Interpretation may include online (i.e. in the form of a StoryMap) or on-site display(s) of historic photographs, historic maps, or other historic materials accompanied by a narrative of the history and development of the General Hospital. A team of qualified professionals with at least five years of demonstrated, related experience shall prepare a preliminary Interpretation Plan which shall be presented at a public workshop at which members of the community and interested constituent groups will have the opportunity to provide feedback that will be considered in the development of the plan.

2.4.3 Circulation and Access

The Proposed Project could include up to seven vehicular entrances to the main campus: two via State Street, one at Marengo Street, two via Mission Road, and two via Zonal Avenue. Signalization could occur at Marengo Street and a new entrance to the Project Site. The proposed redevelopment within the main campus would be in consideration of the three primary arrival points that currently occur at the main campus: LA General Medical Center (from Marengo Street and State Street), Central Campus (from Zonal Avenue and State Street), and West Campus (from Mission Road). The three primary arrival points would form a hub centered around the major uses located at the main campus: the Medical Hug (centered on the LA General Medical Center), the Historic Hub (centered on the General Hospital Building), and new Commerce Hub (within the western portion of the main campus). As previously discussed, the three hubs would be linked through three primary corridors including the Wellness Corridor, Community Corridor, and Innovation Corridor. The Wellness Corridor would link the Commerce Hub to the Medical Hub; the Innovation Corridor would link the Medical Hub to the Historic Hub; and the Community Corridor would link the Historic Hub to the Commerce Hub.

As previously discussed, parking facilities for each hub would be appropriately sized to meet the demand of the Proposed Project and be located at centralized locations in structured or surface lots. Additional car and shuttle drop-off points would be provided at key circulation points, such as at the Forecourt and Medical Center entrance. The proposed circulation plan would emphasize multimodal access, pedestrian comfort, accessible design, and seamless internal and regional connections. Key circulation features anticipated are as follows:

- **Mobility Hub:** A Mobility Hub could be strategically located to enhance access to existing surrounding bus lines and the existing internal campus shuttle. Other multimodal features such as bicycle parking and repair stations, shade and seating areas, rideshare drop-offs, a fleet of car-share vehicles, and bus charging infrastructure, could be provided.
- **Shuttle Circulation:** Two existing Campus shuttle routes serve the Campus. The Proposed Project would expand the routes to improve circulation throughout the main campus. Shuttle stops would be aligned with key drop-offs, gateways, and destinations. A central shuttle branch is proposed along the Wellness Corridor and would permit only authorized vehicular access within the bollard-protected pedestrian zone.
- **State Street Spine:** The existing alignment of State Street through the Project Site would be maintained, and the roadway could be transformed into a central access feature to support vehicles, pedestrians, and bikes, and include Americans with Disabilities Act (ADA)-compliant pathways.
- **Central Spine:** The Central Spine would form the primary axis to connect the western portion of the main campus to the eastern portion of the main campus. The Central Spine would provide a direct and visible pedestrian pathway and would increase connectivity between the western and eastern portions of the main campus.

- **Pedestrian Network:** The Proposed Project could include a layered system of trails, ramps, elevators, stairways, and terraces to connect open spaces and key destinations in consideration of the unique topographic grade changes on the Project Site. The proposed street-level plan would be designed to encourage movement and comfort, with curb-less streets, textured pavers, shade trees, lighting, seating, and landscape amenities to define a public realm. The Proposed Project would include a pedestrian-protected road, which would prevent non-emergency vehicular traffic using motorized bollards, and could be accessed from either Zonal Avenue, Mission Road, or Marengo Street. These bollards could be removed to allow emergency vehicles to get through the area.
- **Accessible Pathways and Fitness Loop:** Site grading would use excavated fill to reduce slopes along primary streets to less than five percent. The Proposed Project could provide a connected network of fitness pathways within the main campus. Along the routes, exercise stations, pocket parks, and shaded rest areas could be provided.
- **Bicycle Path:** Bicycle circulation on the Project Site builds on the existing Class II bikeway along Mission Road, which connects to networks along the Los Angeles River and towards Downtown Los Angeles. Public bicycle parking stations would be provided at each entry point of the main campus. Within the main campus, the Proposed Project would provide dedicated bicycle lanes along the Wellness Corridor and State Street. Each proposed residential building would include secure, residential-only bicycle parking. Designated bicycle parking would be provided on Marengo Street, at the State Street entrance, and at the primary Mission Road entrance.
- **Service and Emergency Access:** The Proposed Project would include a service loop to support County of Los Angeles Department of Health Services (DHS) trams, waste transfer, loading, and deliveries with minimal public interference. Service and loading operations would be consolidated along a proposed dedicated service entry, potentially from Marengo Street. This service corridor would provide controlled access to County uses. The loading dock for the adaptive reuse of the General Hospital Building would connect to the existing basement service network at the east end of the building. Loading areas would be designed to be located away from primary pedestrian ingress and egress areas by at least 20 feet. Wherever feasible, loading areas would be located at the rear of the building. The Proposed Project's street network would be designed to provide comprehensive fire and emergency access to all buildings within the main campus while preserving the existing access lanes to facilities outside the main campus.

2.4.4 Open Space and Landscaping

The parts of the Project Site governed by the Master Plan would be developed with a balance of publicly accessible and private (residential) open space, in an amount that would correspond to a minimum of ten percent of the building footprint.

As future projects are developed, existing trees, including mature and/or protected trees, may be removed across the Project Site (see Chapter 3.3, *Biological Resources* for more information about existing onsite trees). The proposed landscape design would emphasize local biodiversity through the use of native and adaptive plant species that promote drought-resistant planting, ecosystem regeneration, and habitat integrity. The approach would be intended to strengthen ecological function and reduce irrigation demand.

PUBLICLY ACCESSIBLE OPEN SPACE

A conceptually planned network of open spaces would include the following elements.

Landscaping: Landscaping throughout the Project Site would include California native drought-tolerant lawns, shrubbery, flowers, or trees, which would be continuously maintained. Publicly accessible walkways may be developed in the landscaped areas. Landscaping may be a part of the building, such as internal atriums and ground-floor planters. New ground-floor uses facing major circulation routes would include activated, accessible frontages with public areas, shaded seating, and landscape buffers. Residential development would share public open spaces such as front porches to encourage interaction.

- **The Forecourt:** The Forecourt would remain as the civic heart for large-scale events and daily community use (markets, movie nights, performances). The Forecourt would be brought up to modern standards, and all textures, patterns, vegetation would remain. Focused replacement of trees that are in poor condition would occur.

Neighborhood Open Spaces: Courtyards, pocket parks, edible community gardens, exercise stations, pocket parks, pollinator habitats, shaded rest zones, and rooftop gardens would be located throughout the Project Site to be integrated with future development.

Public Art and Signage: Civic art would be incorporated in the Proposed Project in compliance with the County's Civic Art Policy, which requires one percent of the project cost to be dedicated to civic art. Civic art could include murals, sculptures, interactive installations, and other forms of art integrated throughout the campus. Temporary art features, such as installations on construction fencing, could also be implemented during the construction phase.

- The public realm would reinforce a cohesive district identity while supporting intuitive navigation and opportunities for local cultural expression.

- **Wayfinding:** Multilingual, ADA-compliant signage at entries, nodes, and destinations would be provided across the Project Site. Additionally, the Proposed Project would incorporate a cohesive design across the Project Site with intuitive orientation logic.

Branding: Unifying visual identity would be applied through furnishings, fixtures, lighting, signage, and paving, allowing site-wide cohesion with localized storytelling.

A Central Park could be provided through grand terraced gathering space that would be designed to connect key places within the main campus. The Central Park could be aligned with the Central Spine and extend from the Historic Hub to the Commerce Hub.

RESIDENTIAL OPEN SPACE

Private open spaces would be integrated into future residential development to include but not limited to rooftop amenities, dedicated residential fitness facilities, pool/fitness courts, coworking spaces, libraries, balconies, and recreation rooms.

2.4.5 Infrastructure Improvements

The Project Site would undergo comprehensive updates to the infrastructure network on the Project Site, in order to meet the needs of the proposed land uses. Future potential removal and upgrade of potable water lines, sewer lines, a stormwater system, electrical lines, natural gas, and steam infrastructure during future phases of construction would primarily involve grading and trenching to replace and install new infrastructure, as needed. This would include decommissioning and demolition of existing outdated and inefficient energy and water distribution/collection systems including the existing West Central Plant, consistent with assumptions in the 2014 Master Plan EIR. The West Central Plant is currently operating with significant capacity loss and unsafe infrastructure. The Proposed Project may include development of a new centralized energy distribution system (utility plant), or a broader system of electrical and natural gas infrastructure, which is included in the 200,000 square feet of clean tech/light industrial shown in Table 2-1. This could include interim infrastructure that may be needed, given the phased redevelopment of the Project Site. All new building construction would comply, at minimum, with the California Building Standards Code (California Code of Regulations, Title 24).

Similarly, new water (through coordination with City of Los Angeles Department of Water and Power [LADWP]) and wastewater (through coordination with Los Angeles Sanitation Districts [LASAN]) infrastructure would be installed to replace existing outdated infrastructure. All replacement infrastructure would connect into existing mainlines and would be sized to appropriately serve the proposed development. All future development resulting from the Proposed Project would be required to adhere to the County of Los Angeles' Low Impact Development (LID) Standards (County of Los Angeles Code of Ordinances Chapter 12.84) to maximize capture and treatment of stormwater.

The Proposed Project's sewer and non-potable water network could be designed to maximize gravity wastewater capture and could allow for wastewater treatment and reuse as development phases are advanced. The network of sewer mains could vary from 8-inch to 18-inch diameter pipe laid beneath planned street and plaza spaces. The locations and sizing of

these on-site mains could allow for future gravity sewer connections appropriate to accommodate future program needs.

The new fire water service network designed for the Proposed Project could include 10-inch diameter fire water main connections which could extend from Marengo Street and Mission Road onto the main campus and connect to the existing fire water main. Fire and potable water service could extend into the Project Site following the routes of the circulation for ease of future connection, maintenance, and installation. The potable and fire water distribution network could be phased and sized to align with future development programming assumptions. It is anticipated that the new system of distribution could coincide with proposed roadway circulation patterns to create ease of future connections and connected loops to help improve long-term infrastructure resilience. At each connection point backflow prevention could be provided in a six-inch diameter potable water connection.

In addition to on-site improvements to infrastructure, some work may occur off-site within the City of Los Angeles, such as utility connections/replacements, public right-of-way improvements, and other related activities. Any future off-site improvements would be coordinated directly with and overseen by the appropriate agencies (i.e., LADWP, LASAN, City of Los Angeles Department of Transportation, City of Los Angeles Department of Public Works, etc.).

2.4.6 Use and Development Standards

Use and development standards are included as part of the proposed Master Plan. They are intended to guide future development and individual development projects would be reviewed for consistency with these standards.

HEIGHT AND VIEWS

Height for new buildings would be regulated based on both the building's height relative to the General Hospital Building (19 stories) and key views to the General Hospital Building from on-site locations and surrounding roadways. No structure or physical building projections would exceed the highest elevation point of the roof structure of the existing General Hospital Building (approximately 240 feet from ground level).

To maintain sightlines, wayfinding, and a circulation corridor that recognizes the visual prominence of the General Hospital Building and its importance as the heart of a new urban village, a central spine of open space that would be a minimum of 20 feet in width would run east to west within the Project Site from the center of the General Hospital Building's main entrance through the axis framed by the Forecourt buildings, between the footprints of new development, and continuing to the center of the Project Site.

STEP BACKS AND TERRACING

- On steep slopes, terracing strategies would be used to reduce perceived height and accommodate grade changes.
- Buildings could be built to the sidewalk (i.e., 0-foot minimum building setbacks from sidewalks)
- Building-to-building setbacks would be provided as required by the California Building Code.
- Step backs on upper floors would not be required for any new building.
- At least 50 percent of any building's ground floor façade that would be oriented towards the Central and Wellness Corridors would be composed of active uses with windows.

PARKING STRUCTURE DESIGN

All faces of a parking structure that would be visible from a roadway would receive appropriate design treatment. Additionally, all faces of a parking structure that would be visible from public and residential areas would be screened to reduce light and glare. This would be achieved through design features such as unique style and character, incorporating the color of use, screening, art, green walls, or supergraphics.

2.4.7 Demolition Activities

The Proposed Project includes the demolition of existing buildings, structures, storage containers, modular buildings, pavement, utilities, and landscaping. Table 2-3, *Buildings and Features to Be Demolished*, lists the buildings proposed for demolition, and Figure 2-6, *Buildings and Features to Be Demolished*, identifies the locations of the structures proposed for demolition. As shown in Table 2-3, demolition of all but six (6) buildings and structures have been previously analyzed in the 2014 Master Plan EIR and the Los Angeles County General Hospital & West Campus Stabilization Project EIR Addendum approved in 2025. Buildings 1 through 22 were approved for demolition under the 2014 Master Plan EIR and reconfirmed in the 2025 Addendum to the 2014 Master Plan EIR (Stabilization Project). Buildings 13 and 14 were approved for demolition under the 2025 Addendum to the 2014 Master Plan EIR.

Demolition of buildings 23 through 28 have not been previously evaluated. In order to provide a comprehensive analysis of the Proposed Project, environmental effects associated with previously approved demolition of these buildings is included in this Draft SEIR for informational purposes only as these activities do not constitute new information, substantial changes in circumstances or substantial project changes requiring subsequent or supplemental analysis under CEQA.

Table 2-3 Buildings and Features to Be Demolished

Building Number	Building Name/Number	Square Footage
1	Shed 1 (Pharmacy Trailer) (Bldg. #503)	1,010
2	Shed 2 (Pharmacy Trailer) (Bldg. #538)	5,650
3	West Central Power Plant (Bldg. #516)	17,860
4	Chiller (Bldg. #534)	1,320
5	Barracks D Building (Bldg. #104)	2,690
6	Barracks G Building (Thrift Shop) (Bldg. # 105)	2,340
7	Trailer 1 (east)/Trailer 3 (west) (Bldg. #111)	7,000
8	Parking Structure 10 (Bldg. #410)	326,578
9	Trailer 15 (Bldg. #407)	2,740
10	Trailer 8 (Bldg. #408)	5,390
11	Trash Compactor (Bldg. #506)	2,750
12	Annex Trailers (Bldgs. #522, #523, #524, #544)	7,030
13 [a]	Mason Shop (Bldg. #529)	4,200
14 [a]	General Laboratory Building (Bldg. #302)	24,980
15	Trailer 17 (Bldg. #309)	4,550
16	Mini Warehouse Building (Supply Chain) (Bldg. #120)	22,480
17	Trailer 126 (Bldg. #112)	11,670
18	Tram Shop (Bldg. #528)	1,470
19	Tram Shop Storage and Pressure Washer Building (Bldg. #536)	370
20	Outpatient Building (Bldg. #121)	215,460
21	Interns and Residents Building (Bldg. #122)	142,448
22	Parking Structure 12 (Bldg. #124)	425,600
23 [b]	Morgue Overflow Crypts	2,500
24 [b]	Pharmacy Building (Bldg. # 502)	49,033
25 [b]	Tunnel/Viaduct (Bldg. # 604)	9,900
26 [b]	Morgue Overflow Crypts (Bldgs. #525, #526 & #531)	2,570
27 [b]	Morgue Overflow Crypt (Bldg #535)	700
28 [b]	Storage Sheds	1,100
	Total	**1,301,389**

Notes: Building 1 through 22 approved for demolition under the 2014 Master Plan EIR and reconfirmed in the 2025 EIR Addendum to the 2014 Master Plan EIR (Stabilization Project)

a Approved for demolition under the 2025 EIR Addendum to the 2014 Master Plan EIR (Stabilization Project)

b Not previously evaluated for demolition.

2.4.8 Construction Activities

For purposes of the analyses contained in this Draft SEIR, it is assumed that full buildout of land uses included in the Proposed Project would occur within an estimated 25-year period (from 2026 through 2050). Components of the Proposed Project would be developed as each phase of the Proposed Project advances, and as funding allows. It is assumed that construction activities associated with various projects could occur simultaneously, including construction to support adaptive reuse of the General Hospital Building.

Site preparation for new construction would involve grading, soil haul, utility trenching, etc. The grading strategy for the Proposed Project would be designed to closely balance the tiered grades of the existing topography, accommodate the needs of the proposed building program, and provide improved circulation and ADA access throughout the Project Site. Grading would occur throughout the Project Site with excavation depths ranging from 36 feet below ground surface to 0 feet below ground surface. Total earthwork at the Project Site would include up to approximately 182,500 cubic yards (CY) of cut and 149,900 CY of fill, with 44,000 CY of export.[3]

During demolition and construction, vehicles, equipment, and materials would be staged and stored within the Project Site. Typical construction equipment to be used could include backhoes, excavators, concrete saws, graders, dozers, scrapers, water trucks, forklifts, crane, loaders, aerial lifts, generators, welders, rollers, pavers, and air compressors. Use of a pile driver is assumed. The construction site and staging areas would be clearly marked, and construction fencing would be installed to prevent disturbance and safety hazards. Parking facilities for all construction workers would be identified prior to the demolition, grading, and construction phases, and are assumed to be internal to the Project Site.

2.4.9 Long-Term Operation and Maintenance Activities

Upon completion of each phase, long-term operation and maintenance responsibilities would be carried out to ensure the ongoing functionality of infrastructure, landscaping, open space, and public amenities. Maintenance activities would include routine inspections, repairs, replacements, landscape upkeep and replacement, and compliance with applicable stormwater and environmental regulations. Public safety, including private security and security monitoring features (e.g., cameras, security lighting, active patrols, etc.), would also be enhanced and implemented through long-term operation and maintenance.

[3] The 44,000 CY of export accounts for bulking factor and contingency.

Figure 2-6 - Buildings and Features to be Demolished

This page intentionally left blank.

2.5 COMPARISON TO THE 2014 MASTER PLAN

The 2014 Master Plan functioned as a County medical facilities-focused document that guided modernization of the operational Medical Center, with land uses centered on inpatient and outpatient medical services, hospital support functions, and other institutional healthcare activities. The 2014 Master Plan focused on improving medical service delivery, internal circulation, and the long-term functionality of the County's Medical Center. In contrast, the Proposed Project proposes a comprehensive, community-oriented vision for the Campus that extends beyond institutional healthcare uses.

The Proposed Project (new Master Plan) introduces a diversified land use program that provides for a balance of housing and jobs and includes residential development, commercial and office uses, community-serving commercial uses, educational facilities, adaptive reuse of the historic General Hospital Building, and a connected network of public open spaces. These expanded land use types and development intensities were not contemplated under the 2014 Master Plan and introduce new environmental considerations, including, but not limited to, population and housing growth, public service demands, and transportation changes.

For reference, the previously approved 2014 Master Plan EIR, as modified by subsequent addenda, evaluated approximately 1,227,412 square feet of total new development. The Proposed Project would result in approximately 6,833,566 square feet of development beyond what was identified in the 2014 Master Plan and EIR. This comparison is provided for informational purposes only; the net change in development between the 2014 Master Plan and the Proposed Project will not be used as the basis of the environmental analysis. Instead, the Draft SEIR evaluates the Proposed Project in its entirety relative to existing baseline conditions.

2.6 INTENDED USES OF THE EIR

State CEQA Guidelines Section 15124(d) requires an EIR to contain a statement briefly describing the intended uses of the EIR. This Draft SEIR evaluates potential environmental impacts associated with the implementation of the Proposed Project and provides information regarding short-term, long-term, direct, indirect, and cumulative environmental effects of the Proposed Project. This Draft SEIR also identifies feasible mitigation measures and/or alternatives that would minimize or eliminate potential significant impacts associated with the Proposed Project. Lead agencies are charged with the duty to substantially lessen or avoid significant environmental effects where feasible. Where a lead agency identifies unavoidable adverse environmental effects of a project, State CEQA Guidelines Section 15093 authorizes the agency to balance, as applicable, the economic, legal, social, technological, or other benefits of a project against its unavoidable adverse environmental effects when determining whether to approve a project. If the specific economic, legal, social, technological, or other benefits

outweigh the unavoidable adverse environmental effects, these effects may be deemed acceptable by the agency and substantiated in a statement of overriding considerations.

The County of Los Angeles is the lead agency for the Proposed Project as the owner of the Project Site and has approval authority over the Proposed Project. The County is the lead agency tasked to certify the Final SEIR and approve the new proposed Master Plan. Although the County is the lead agency for the Proposed Project, certain utility providers and off-site agencies (i.e., City of Los Angeles) for related infrastructure improvements have approval authority as responsible agencies. There are no trustee agencies (e.g., Regents of the University of California, Department of Fish and Wildlife, State Lands Commission, and Department of Parks and Recreation).

2.6.1 Responsible Agencies

State CEQA Guidelines Section 21069 defines a "responsible agency" as a public agency, other than the lead agency, that has responsibility for carrying out or approving a project. When a public agency acts as a responsible agency for a project, the responsible agency shall have more limited authority than a lead agency. The responsible agency may require changes in a project to lessen or avoid only the effects, either direct or indirect, of that part of the project which the agency will be called on to carry out (CEQA Guidelines Section 15041).

The responsible agencies for the Proposed Project are identified in Table 2-4, *Anticipated Actions Required*.

Table 2-4 Anticipated Actions Required

Lead Agency	Primary Actions
County of Los Angeles	▪ Certification of the Draft SEIR and approval of the new Master Plan and associated permitted uses and development standards. ▪ Approval of amendments to all other relevant ordinances and actions as necessary to ensure consistency of regulations and implementation of the Proposed Project. ▪ Ground lease agreement(s). ▪ Funding-related actions pertaining to approvals ▪ Approval of community benefits agreement. ▪ Grading, excavation, foundation, and other building permits. ▪ Other permits and approvals as deemed necessary to implement the Project.
Responsible Agencies	**Actions for Future Activities**
State Water Resources Control Board	▪ National Pollutant Discharge Elimination System permit
California Office of Historic Preservation	▪ Approval of official listing of resources on the National Register of Historic Places (NRHP)
City of Los Angeles Department of Water and Power	▪ Approval of utility connections and potential removal of sewer and storm lines ▪ Approval of Water Supply Assessment
City of Los Angeles Department of Transportation	▪ Approval of off-site roadway improvements
City of Los Angeles Bureau of Sanitation	▪ Solid waste on-site processing and collection
Los Angeles County Metropolitan Transportation Authority (Metro)	▪ Related approvals for Mobility Hub

2.6.2 Required Permits and Approvals

This is a program Draft SEIR that examines the environmental impacts of the Proposed Project. This Draft SEIR also addresses various actions by the County of Los Angeles to approve and implement the Proposed Project. It is the intent of this Draft SEIR to evaluate the environmental impacts of the Proposed Project, thereby enabling the County of Los Angeles, other responsible agencies, and interested parties to make informed decisions with respect to the Proposed Project. The anticipated approvals required for the Proposed Project include but are not limited to those listed in Table 2-4, *Anticipated Actions Required*.

3. ENVIRONMENTAL ANALYSIS

3.0.1 Introduction

This chapter examines the environmental setting of the Proposed Project, analyzes the effects of the Proposed Project and the significance of its impacts, and recommends mitigation measures to reduce or avoid impacts. This chapter has a separate section for each environmental topic identified below.

The Proposed Project is analyzed for potential significant impacts in accordance with Appendix F, "Energy Conservation," and Appendix G, "Environmental Checklist Form," of the California Environmental Quality Act (CEQA) Guidelines. Environmental topics and their corresponding sections and abbreviations are:

3.1	Aesthetics (AES)	3.10	Land Use and Planning (LUP)
3.2	Air Quality (AIR)	3.11	Noise (NOI)
3.3	Biological Resources (BIO)	3.12	Population and Housing (POP)
3.4	Cultural Resources (CUL)	3.13	Public Services (PUB)
3.5	Energy (ENE)	3.14	Recreation (REC)
3.6	Geology and Soils (GEO)	3.15	Transportation (TRA)
3.7	Greenhouse Gas Emissions (GHG)	3.16	Tribal Cultural Resources (TCR)
3.8	Hazards and Hazardous Materials (HAZ)	3.17	Utilities and Service Systems (USS)
3.9	Hydrology and Water Quality (HYD)	3.18	Wildfire (WIL)

In addition, the analysis considers Effects Not Found to Be Significant (Agricultural and Forestry Resources and Mineral Resources) in Chapter 5, *Other CEQA Considerations,* of this Draft SEIR. Mandatory Findings of Significance is also included in Chapter 5, *Other CEQA Considerations,* of this Draft SEIR, as required under State CEQA Guidelines Section 15065, to determine whether the Proposed Project would have any significant effects on the environment that cannot be mitigated to a less-than-significant level.

3.0.2 Organization of Environmental Analysis

To assist the reader with comparing information between environmental issues, each topical section of this chapter is organized under the same major headings.

- **Regulatory Framework** offers an overview of applicable laws, regulations, plans, and policies relevant to each environmental topic.

- **Existing Conditions** describes the existing environmental conditions, describing baseline conditions against which the impacts of the Proposed Project can be compared.
- **Standards for Analysis** refer to the quantitative or qualitative standards, performance levels, thresholds, or criteria used to evaluate whether an impact is significant. These standards are based primarily on Appendix G of the 2025 State CEQA Guidelines unless otherwise noted. This section also provides an overview of key methods, assumptions, and considerations that inform the impact analysis and provides an overview of the impact conclusions of the 2014 Master Plan EIR for comparative purposes.
- **Project Impact Analysis** provides a detailed discussion of the potential direct and indirect impacts of the Proposed Project. Mitigation measures are included as necessary. The impact discussion is organized under headings that correspond to the significance criteria in the 2025 State CEQA Guidelines. Where a significant impact is identified, an impact statement is provided to convey the specific impact, and the level of significance without and with mitigation is provided.
- **Cumulative Impact Analysis** provides an overview of the geographic setting and cumulative projects considered in the cumulative impact assessment. Significant cumulative impacts are identified, and mitigation measures are included as necessary, using the same format provided for the project impact analysis.
- **Comparison to the 2014 Master Plan EIR Impact Analysis** provides a comparison to the impact methodology and conclusions of the 2014 Master Plan EIR for informational purposes.
- **References** are provided for information sources used in the development of the discussion.

3.0.3 Levels of Significance

The level of significance is identified for each impact in this Draft SEIR. Although the criteria for determining significance are different for each topic area, the environmental analysis applies a uniform classification of the impacts based on definitions consistent with CEQA and the State CEQA Guidelines:

- **No impact.** The project would result in no adverse effect on the environment.
- **Less than significant.** The project would not exceed the established significance criteria.
- **Significant.** The project would exceed the established significance criteria. For each significant impact, the EIR identifies mitigation measures to reduce, eliminate, or avoid the adverse effect. If one or more mitigation measures would reduce the impact to a less-than-significant level successfully, this is stated in the EIR.
- **Significant and unavoidable.** The project would exceed the established significance criteria, and no feasible mitigation measures are available to reduce the impact to a less-than-significant level.

Impacts that are identified as significant or potentially significant are identified as follows after the analysis:

- **Impact (Environmental Topic Abbreviation)-#: Impact statement summary**

3.0.4 Evaluation Methodology

Under State CEQA Guidelines Section 15064, the decision as to whether an environmental effect should be considered significant is reserved to the discretion of the lead agency, based on substantial evidence in the record as a whole, including consideration of views held by members of the public. An ironclad definition of significant effect is not always possible because the significance of an activity may vary based on the setting. Pursuant to State CEQA Guidelines Section 15064(b), the analysis in this Draft SEIR is based on scientific and factual data that have been reviewed by the lead agency and represents the lead agency's independent judgment and conclusions.

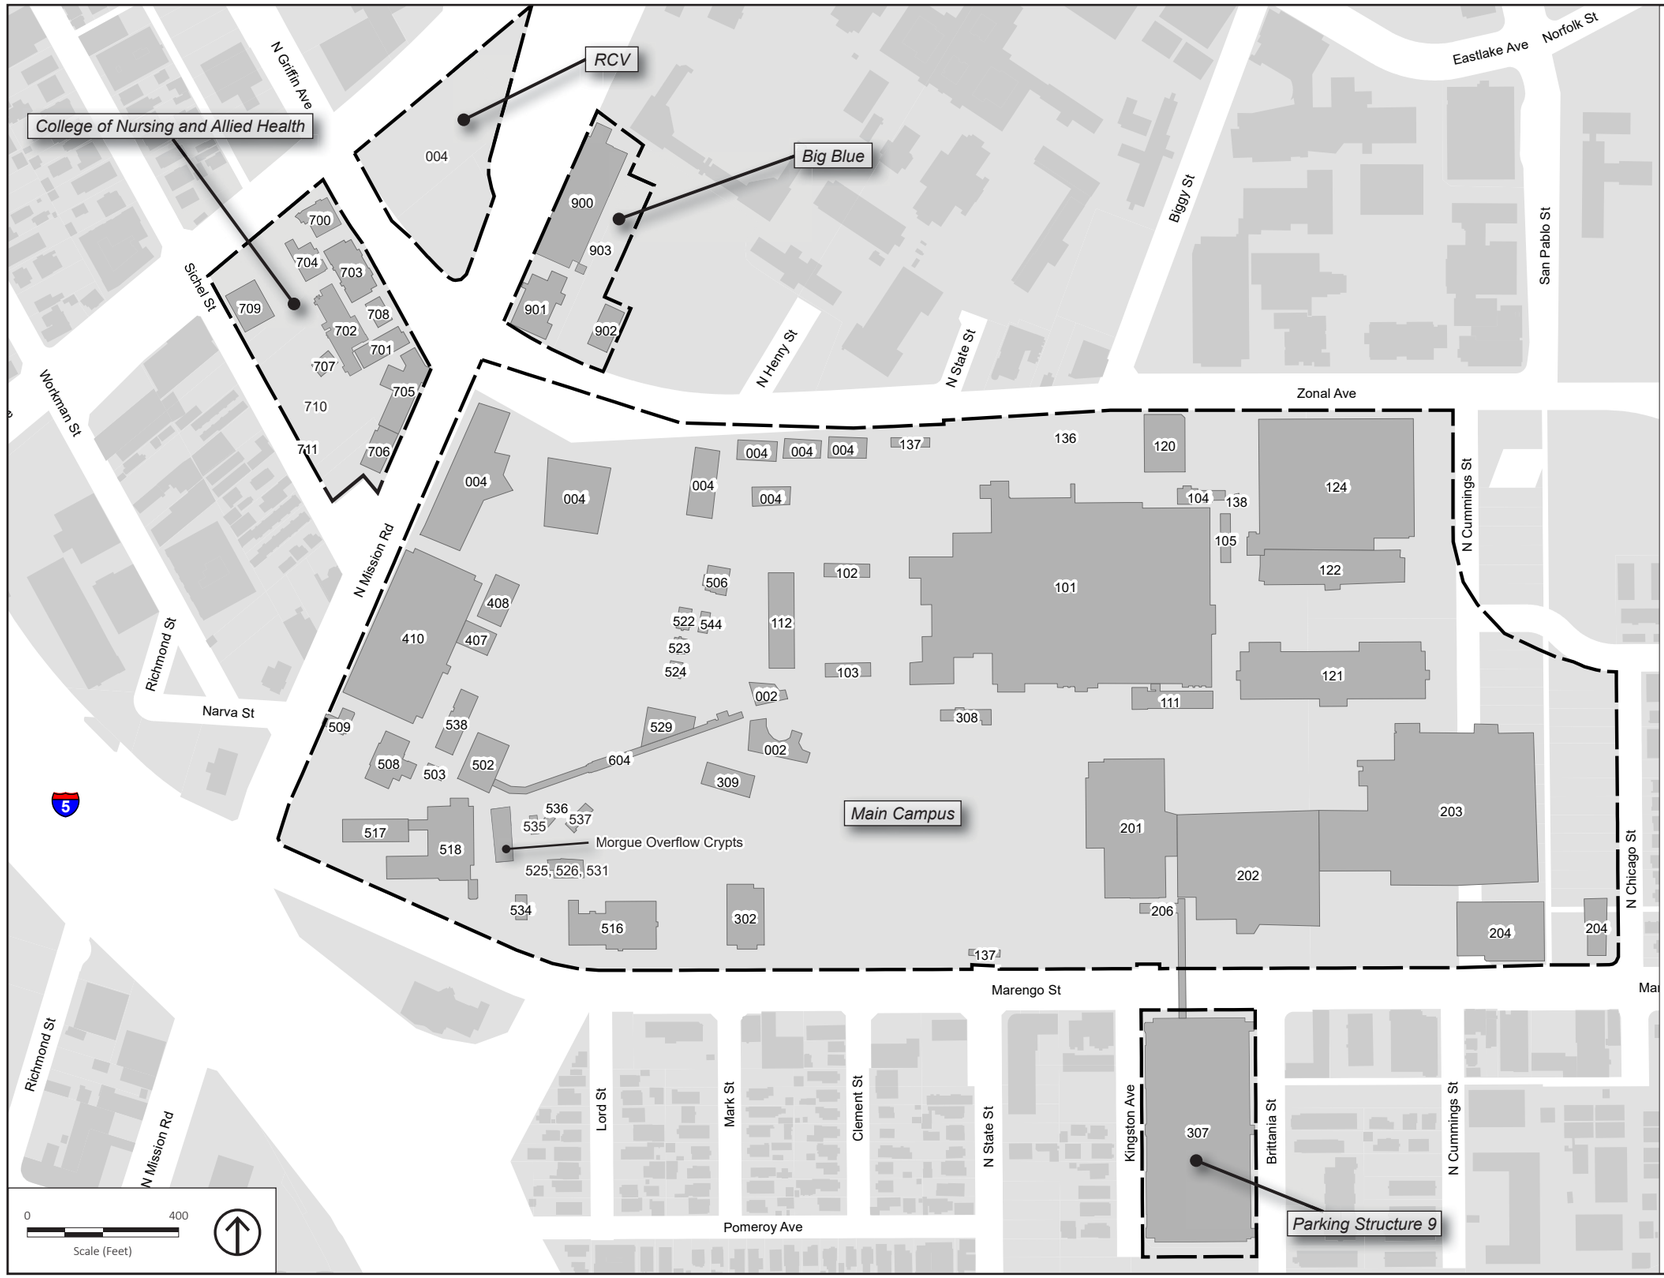
Baseline

Section 15125, Environmental Setting, of the State CEQA Guidelines requires an EIR to include a description of the physical environmental conditions of the project vicinity. These conditions typically constitute the baseline physical conditions by which the lead agency will determine whether impacts are significant. Pursuant to State CEQA Guidelines Section 15126.2, Consideration and Discussion of Significant Environmental Impacts, the environmental setting at the time the Notice of Preparation (NOP) was circulated or when the environmental review process was commenced typically constitutes baseline conditions for the environmental analysis. The NOP for this Proposed Project was circulated beginning September 26, 2025.

As a Subsequent EIR, this Draft SEIR is not required to consider a new existing conditions baseline (i.e., existing conditions at the time the Draft SEIR NOP is circulated) and may consider the previously approved Master Plan as analyzed in the 2014 Master Plan EIR as part of the "baseline" conditions for the SEIR. However, this Draft SEIR uses as the Baseline for the Proposed Project the existing setting at the time of issuance of the NOP for the Draft SEIR. In some cases, the environmental analysis in this Draft SEIR may evaluate future development and activities that were already analyzed in the 2014 Master Plan EIR. In doing so, this Draft SEIR provides a comprehensive, updated analysis of potential impacts as a result of future development on the Project Site under the Proposed Project. This approach is appropriate given that the Proposed Project provides an updated vision, development framework, and buildout projections, for the entire Project Site. Chapters 3.1 through 3.18 summarize the methodology and conclusions in the 2014 Master Plan EIR for comparative purposes against the analysis in this Draft SEIR.

The following sections summarize the existing setting for the Proposed Project. Additional details specific to each environmental topic are included throughout this Draft SEIR. This section also summarizes the existing setting as it compares to the previously approved development analyzed in the 2014 Master Plan EIR.

Main Campus



The approximately 71 acre "main campus" part of the Project Site is characterized by gently sloping to moderately sloping topography. The main campus is on a series of terraced and graded parcels. Ground elevations generally range from approximately 420 feet above mean sea level (msl) near the eastern part of the Project Site to approximately 320 feet above msl in the western part. The topography of the Project Site has been substantially modified by past grading to accommodate the Campus's existing uses, resulting in a largely developed site with limited natural features. Steeper slopes are in the north and east parts of the Project Site, and the southern and western parts are flat.

The Project Site provides bus, shuttle, and private auto access to the existing plaza at the General Hospital Building. State Street is the only street for vehicular traffic that crosses the main part of the Project Site. It also provides a drop-off area for patients and visitors when going to the Clinic Tower building.

Figure 3-1, *Campus Existing Configuration*, illustrates the locations and layouts of existing buildings on the Campus. The area east of State Street holds the majority of the active clinical (both inpatient and outpatient) services, including the Replacement Hospital (also known as the Los Angeles General Medical Center or Medical Center), West Central Plant, the Outpatient Department (OPD) building, and Clinic Tower (built in 2008). This area is the primary public-facing part of the Campus, representing the "front door" of the Campus to the community.

Also east of State Street are the Interns and Residents Dormitory building (IRD), currently used for hospital administration; several parking lots; and Parking Structure 12. However, the former General Hospital Building is the dominant building on this side of the Campus because of its height and presence on a crest within the Campus. The General Hospital Building, a historic resource eligible for listing on the National Register of Historic Places, was built in 1933 and operates as a Wellness Center on the 1st and 2nd floors and the surrounding gardens. The General Hospital was built with two administrative buildings, a gatehouse, and a utility tunnel and bridge. Several modular structures have been added at the historic entry plaza as well as north, east, and south of the General Hospital Building. See Chapter 3.4, *Cultural Resources*, for detail regarding historical development patterns and features.

This page is intentionally left blank.

Most of the area west of State Street (sometimes referred to as the west campus) is considered to be underutilized, with a large amount of undeveloped space and significant topographic grade change that limits cohesive development and activity. The area west of State Street includes the County of Los Angeles Medical Examiner's facilities, on-grade and structural parking, and several support buildings. Many of these buildings are one-story modular buildings and not fully functional; therefore, several Campus programs are currently housed in temporary buildings or trailers. The western part of the main campus also holds the various phases of the Restorative Care Village (RCV). Recuperative Care Center and Crisis Residential Treatment Facility (RCV Phase I) are in operation and the Psychiatric Subacute Facility, Mental Health Urgent Care Center, and Residential Withdrawal Management Facility (RCV Phases IV and V) are currently being completed at the southwest corner of Mission Road and Zonal Avenue.

Improvements to the County of Los Angeles Medical Examiner building are currently being completed, including the replacement of 13 of the 14 unitized cold storage facilities with a new singular efficient prefabricated crypt building within approximately the same footprint. Additional improvements include a concrete foundation system, underground utilities for the new prefabricated crypt building, and seismic retrofits to the County of Los Angeles Medical Examiner administration building and adjacent building and maintenance repairs to the County of Los Angeles Medical Examiner building and parking lot.

Non-Contiguous Parcels

Directly across Mission Road from the main campus to the northwest, is a cluster of Spanish Colonial buildings that house facilities for administration, counseling, social work, facilities support, and clinical support. This area includes the College of Nursing and Allied Health as well as parking lot 14 (collectively referred to as the "College of Nursing and Allied Health" property). Across Mission Road, at the northeast corner of Mission Road and Zonal Avenue, a permanent supporting housing project (RCV Phase III), which is currently under construction. At the southeast corner of Mission Road and Zonal Avenue is Building C of the Los Angeles General Medical Center, formerly known as the Rand Schrader Clinic; the Carpenter's Mill building, known as "Big Blue;" and parking lot 6A (collectively referred to as the "Big Blue" property). The Medical Center buildings on the main campus are connected to Parking Structure 9—which is off the main campus on the opposite side of Marengo Street—by a pedestrian bridge that crosses Marengo Street.

The parcel on the northeast corner of Alhambra Avenue and Griffin Avenue is used for medical archive storage. It is also the site of parking lot 13. This parcel is not part of the Proposed Project and is thus not shown on Figure 3-1. An additional parcel between Valley Boulevard, Eastlake Avenue, and Alcazar Street is used as a storage and maintenance yard. This parcel is also not included as part of the Proposed Project and is thus not shown on Figure 3-1.

Comparison to 2014 Master Plan EIR Approved Conditions

At the time this Draft SEIR was prepared, several components of the development activities analyzed in the 2014 Master Plan EIR were completed or underway on-site. Specifically, demolition of the structures at the Women's and Children's Hospital site is complete, construction of RCV Phase I is complete, and construction of Phases III, IV, and V of the RCV is underway. The structures at the Women's and Children's Hospital site were demolished in 2021. In the western part of the main campus, the RCV Phase I was completed in April 2022, and the replacement childcare facility was completed in January 2023. Construction of the permanent supportive housing is underway at the non-contiguous parcel located at the northeast corner of Mission Road and Zonal Avenue (RCV). Construction of the Residential Withdrawal Management Facility, Mental Healthy Urgent Care, and Psychiatric Subacute Facility (RCV Phases IV and V) is underway at the former Women's and Children's Hospital site. The 2025 Addendum confirmed the structures that were identified for demolition in the 2014 Master Plan and included two new buildings for demolition (see Table 2-2, *Buildings to Be Demolished*). Table 3-1, *Summary of Approved Development and Demolition Square Footage*, identifies the square footage implemented to date.

Table 3-1 Summary of Approved Development and Demolition Square Footage

	Approved New Development Square Footage	Approved Demolition Square Footage
Total Approved	1,227,412[1]	1,217,801[3]
Total Implemented to Date	70,342[2]	390,000[3]
Total Remaining	**1,157,070**	**827,801**

[1] The 2014 Master Plan proposed 1,245,000 square feet of new development; the 2017 Project proposed a reduction of 127,000 square feet of Research and Development and a new 70,342 square foot Residential Care Facility, which would result in 1,188,342 square feet of new development; the 2023 Project proposed a reduction of 50,000 square feet of Administrative Office, a new 15,770 square foot medical office (land swap with Research and Development and Office Use), 115,420 square foot hospital addition (land swap with Research and Development and Office), and 17,880 square foot Residential Care Facility, which would result in 1,227,412 square feet of new development.

[2] Total square footage from implementation of Phase I of the Recuperative Care Village (RCV). Phases IV and V of the RCV are under construction.

[3] The 2014 Master Plan proposed the demolition of 1,092,763 square feet; the 2025 Project included additional buildings that increase the demolition square footage to 1,217,801 square feet.

[4] Total square footage from the demolition at the former Women's and Children's Hospital site (2014 Master Plan EIR component).

This demolition and new development were previously evaluated in the 2014 Master Plan EIR. However, to evaluate the Proposed Project and provide a comprehensive analysis of potential environmental effects resulting from implementation of the Proposed Project, this Draft SEIR

provides an updated evaluation of demolition of previously analyzed buildings, as well as the additional buildings that would be demolished under the Proposed Project.

Regulatory Setting

As the County of Los Angeles is the owner of the Project Site, the Proposed Project is not subject to the City of Los Angeles' planning and zoning ordinances. The Proposed Project remains subject to applicable federal and State laws, regulations, and policies. The Master Plan would guide the long-term phased redevelopment of parts of the Project Site, including adaptive reuse of the General Hospital Building. For coordination purposes, the County may consider aspects of local policies and regulations for the communities surrounding the Project Site when it is appropriate and feasible, although the County is not bound by those policies and regulations. Therefore, the City of Los Angeles' (City's) plans, policies, and regulations are provided for informational purposes only. Chapters 3.1 through 3.18 identify the policies and regulations of the City of Los Angeles that the County may consider when evaluating future development and activities that implement the Proposed Project.

Potential Effects of the Project on the Environment

The California Supreme Court concluded in *California Building Industry Association vs. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369 that "CEQA generally does not require an analysis of how existing environmental conditions will impact a project's future users or residents." The *CBIA vs. BAAQMD* ruling provided for several exceptions to the general rule where an analysis of the project on the environment is warranted:

1. If the project would exacerbate existing environmental hazards (such as exposing hazardous waste that is currently buried).
2. If the project qualifies for certain specified exemptions (certain housing projects and transportation priority projects pursuant to Public Resources Code (PRC) Sections 21159.21 (f),(h); 21159.22 (a),(b)(3); 21159.23 (a)(2)(A); 21159.24 (a)(1),(3); or 21155.1 (a)(4),(6).
3. If the project is exposed to potential noise and safety impacts on projects due to proximity to an airport (pursuant to PRC sec. 21096).
4. School projects require specific assessment of certain environmental hazards (pursuant to PRC sec. 21151.8).

Therefore, the evaluation of the significance of project impacts under CEQA focuses on the potential impacts of the Proposed Project on the environment, including whether the Proposed Project may exacerbate any existing environmental hazards. Existing environmental hazards identified in the Northeast Los Angeles Community Plan area include, but are not limited to, seismic hazards, geological hazards, and wildfire hazards. Therefore, while the effects of these

hazards on the Proposed Project are generally not subject to CEQA review following the *CBIA vs. BAAQMD* case, a discussion of the project's potential to exacerbate these hazardous conditions is provided in Section 3.6, *Geology and Soils*, and Section 3.18, *Wildfire*, of this Draft SEIR.

3.0.5 Cumulative Impacts

A cumulative impact is created by the combination of the project evaluated in the EIR with other reasonably foreseeable projects causing related impacts. State CEQA Guidelines Section 15130 requires an EIR to discuss cumulative impacts of a project when the project's incremental effect is "cumulatively considerable." Cumulative effects could occur when future development under the project is combined with development in the surrounding area or, in some instances, in the entire region.

Pursuant to State CEQA Guidelines Section 15130(a)(3), where a cumulative impact is significant when compared to baseline conditions, the analysis must address whether the project's contribution to the significant cumulative impact is "considerable." If the contribution of the project is considerable, then the EIR must identify potentially feasible measures that could avoid or reduce the magnitude of the project's contribution to a less-than-considerable level. If the project's contribution is not considerable, it is considered less than significant, and no mitigation for the project's contribution is required.

State CEQA Guidelines Section 15130(b)(1) states that the information used in the analysis of cumulative impacts should come from one or two sources:

A. A list of past, present, and probable future projects producing related cumulative impacts, including, if necessary, those projects outside the control of the agency; or

B. A summary of projections contained in an adopted local, regional, or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

The cumulative impact analyses in this Draft SEIR use a combination of methods A and B. The cumulative discussions in Chapters 3.1 through 3.18 explain the geographic scope of the area affected by each cumulative effect (e.g., immediate project vicinity, county, watershed, air basin), which depends on the environmental topic being analyzed. For example, in assessing macroscale air quality impacts, all development in the air basin contributes to regional

emissions of criteria pollutants, and basin-wide projections of emissions are the best tool for determining the cumulative impact. In assessing aesthetic impacts, however, only development in the local area of change would contribute to a cumulative visual effect because the area of change is only visible near the local area.

Cumulative projects within approximately one mile of the Project Site are described in Table 3-2, *List of Cumulative Projects*, and shown on Figure 3-2, *Cumulative Projects*. The approximate one-mile radius represents a reasonable distance within which similar projects or activities could contribute to overlapping environmental effects. However, the cumulative geographic study areas for each environmental topic can vary and are defined within each chapter of this Draft SEIR. Development within the Project Site (i.e., the recently completed RCV Phase I, ongoing improvements to structures on the Project Site, and ongoing construction of Phases II, III, IV, and V) is considered part of the environmental baseline.

Table 3-2 List of Cumulative Projects

Number	Project Name	Location	Project Proponent	Status	Distance to Project Site	Description of Project
1.	The 2839 Prewett Project	2824–2839 N. Prewett Street	Phillip Wilson, Dennis Holmes, and Stanislav Troy	Seeking City Approvals	Approximately 1.0 mile	The project proposes to develop the 9,536-square-foot (0.22-acre) vacant lot with a new, two-story, 3,938-square-foot, single-family dwelling with an attached, two-car garage and an attached, 800-square-foot accessory dwelling unit with separate entry. The project would include two additional uncovered parking spaces at the rear yard; 2,913 square feet of landscaping, including low impact development stormwater infiltration planters; a 482-square-foot pool, and two retaining walls measuring up to six feet in height. The project would require 777 cubic yards of cut and 132 cubic yards of fill for a total of 909 cubic yards of grading. No imported material would be required, and 645 cubic yards would be exported for disposal at an inert waste landfill.
2.	3880 Mission Project	3880 N Mission Road	Related Fund Management and Newland Capital Group	Seeking City Approvals	Approximately 1.0 mile	The project would involve the import of 344,000 cubic yards of soil to partially fill in a single-level subterranean parking level and basement areas associated with existing warehouse, logistics, light industrial, and office buildings (the remainder of the fill will come from on-

Table 3-2 List of Cumulative Projects

Number	Project Name	Location	Project Proponent	Status	Distance to Project Site	Description of Project
						site sources). Any prior or subsequent development on the site is not a part of this project.
3.	Boyle Heights Community Plan Update	4,271 acres bounded by I-10 and Marengo Street to the north, Union Pacific Railway Lines to the south, Indiana Street to east, and Los Angeles River to the west	Los Angeles Department of City Planning	Adopted	Immediately southwest	This cumulative project presents a long-range planning effort. No specific development projects are included in it. The proposed plan includes amending both the text of the Boyle Heights Community Plan and the General Plan Land Use Map of the Boyle Heights Community Plan. The proposed plan would also adopt several zoning ordinances to implement the updates to the community plan, including adding new zoning districts and other zoning provisions to Chapter 1A of the New Zoning Code, as well as rezoning all parcels in the plan area to regulate specific uses and apply objective development standards (including height of structures, Floor Area Ratios [FAR], site configuration) using the New Zoning Code. Additional zoning ordinances include a Community Plan Implementation Overlay (CPIO) District, amendments to the River Improvement

Table 3-2 List of Cumulative Projects

Number	Project Name	Location	Project Proponent	Status	Distance to Project Site	Description of Project
						Overlay (RIO) District and the Clean Up Green Up (CUGU) Overlay, and an amendment to the Adelante Eastside Redevelopment Plan, and related amendments to the General Plan, including the Framework Element and Mobility Plan necessary to implement the proposed plan.
4.	Estrella Azul	2201 E. 1st Street	A Community of Friends	Planning and Design	Approximately 1.0 mile	Four-story structure featuring 80 units and supportive services
5.	2330 E 3rd Street	2330 E 3rd Street	Terra Capital, LLC	Planning and Design	Approximately 1.1 miles	Four-story structure featuring 53 units
6.	443 S Soto Street	443 S Soto Street	East LA Community Corporation	Approved	Approximately 1.2 miles	140-unit affordable housing complex
7.	USC Discovery and Translation Hub	1590 North Eastlake Avenue; 1425-1501 North San Pablo Street; 1540-1580 East Alcazar Street	University of Southern California	Approved	Approximately 0.25 mile	Seven-story, nearly 144-foot-tall building featuring over 200,000 square feet of research space, including both wet and dry labs
8.	Chavez Garden	2518-2536 East Cesar E. Chavez Avenue	Los Angeles Housing Department	Planning and Design	Approximately 0.70 mile	110-unit affordable housing complex

Table 3-2 List of Cumulative Projects

Number	Project Name	Location	Project Proponent	Status	Distance to Project Site	Description of Project
9.	2115-2125 East Cesar Chavez Avenue	2115-2125 East Cesar Chavez Avenue	Cesar Chavez 888, LLC	Under Review	Approximately 0.60 mile	Six-story mixed-use structure with 50 units
10.	Medical Examiner Crypt Expansion	1104 North Mission Road	County of Los Angeles Public Works	Approved	On-Site	The Medical Examiner Crypt Expansion Project will replace 13 of 14 existing cold storage facilities at the Medical Examiner Headquarters (1104 N. Mission Road) with a new 4,700 square foot prefabricated crypt building, along with a new concrete foundation and underground utilities. The structure will be located within approximately the same footprint as the existing temporary crypts, which is in the parking lot on the east side of building 1104A. The Board of Supervisors approved the project on August 5, 2025, and delegated authority to Public Works to advertise and award the construction contract via competitive low bid. The project was found categorically exempt from CEQA under Guidelines Sections 15302(b)/(c) and 15303(e), with a Notice of Exemption filed with the County Clerk on August 14, 2025. The project is currently in plan check, with construction

Table 3-2 List of Cumulative Projects

Number	Project Name	Location	Project Proponent	Status	Distance to Project Site	Description of Project
						scheduled to begin in Summer 2026 with target completion at the end of 2026.
11.	Medical Examiner Seismic Retrofit	1104 North Mission Road	County of Los Angeles Department of Public Works	Planning and Design	On-Site	The project consists of seismic retrofits to the Medical Examiner administration building (1102) and the adjacent 1104A building, managed by the Department of Public Works. All work is planned to be completed from the exterior of both buildings to maintain uninterrupted ME operations throughout construction.
12.	Medical Examiner Deferred Maintenance Repair Project	1104 North Mission Road	County of Los Angeles Department of Public Works	Approved	On-Site	This project consists of deferred maintenance repairs (HVAC and electrical) to Medical Examiner building 1104A building and to an adjacent parking lot. The parking lot component is currently in design, with design expected to be completed in September 2026. Construction is expected to begin in November 2026 and be completed in August 2027 (two phases, nine months total). The HVAC and electrical repairs are undergoing a Value Engineering (VE) study to establish prioritized scope within the available budget; VE is expected to be completed in August 2026. This project was approved by the Board of Supervisors via a Facility Reinvestment Program Board

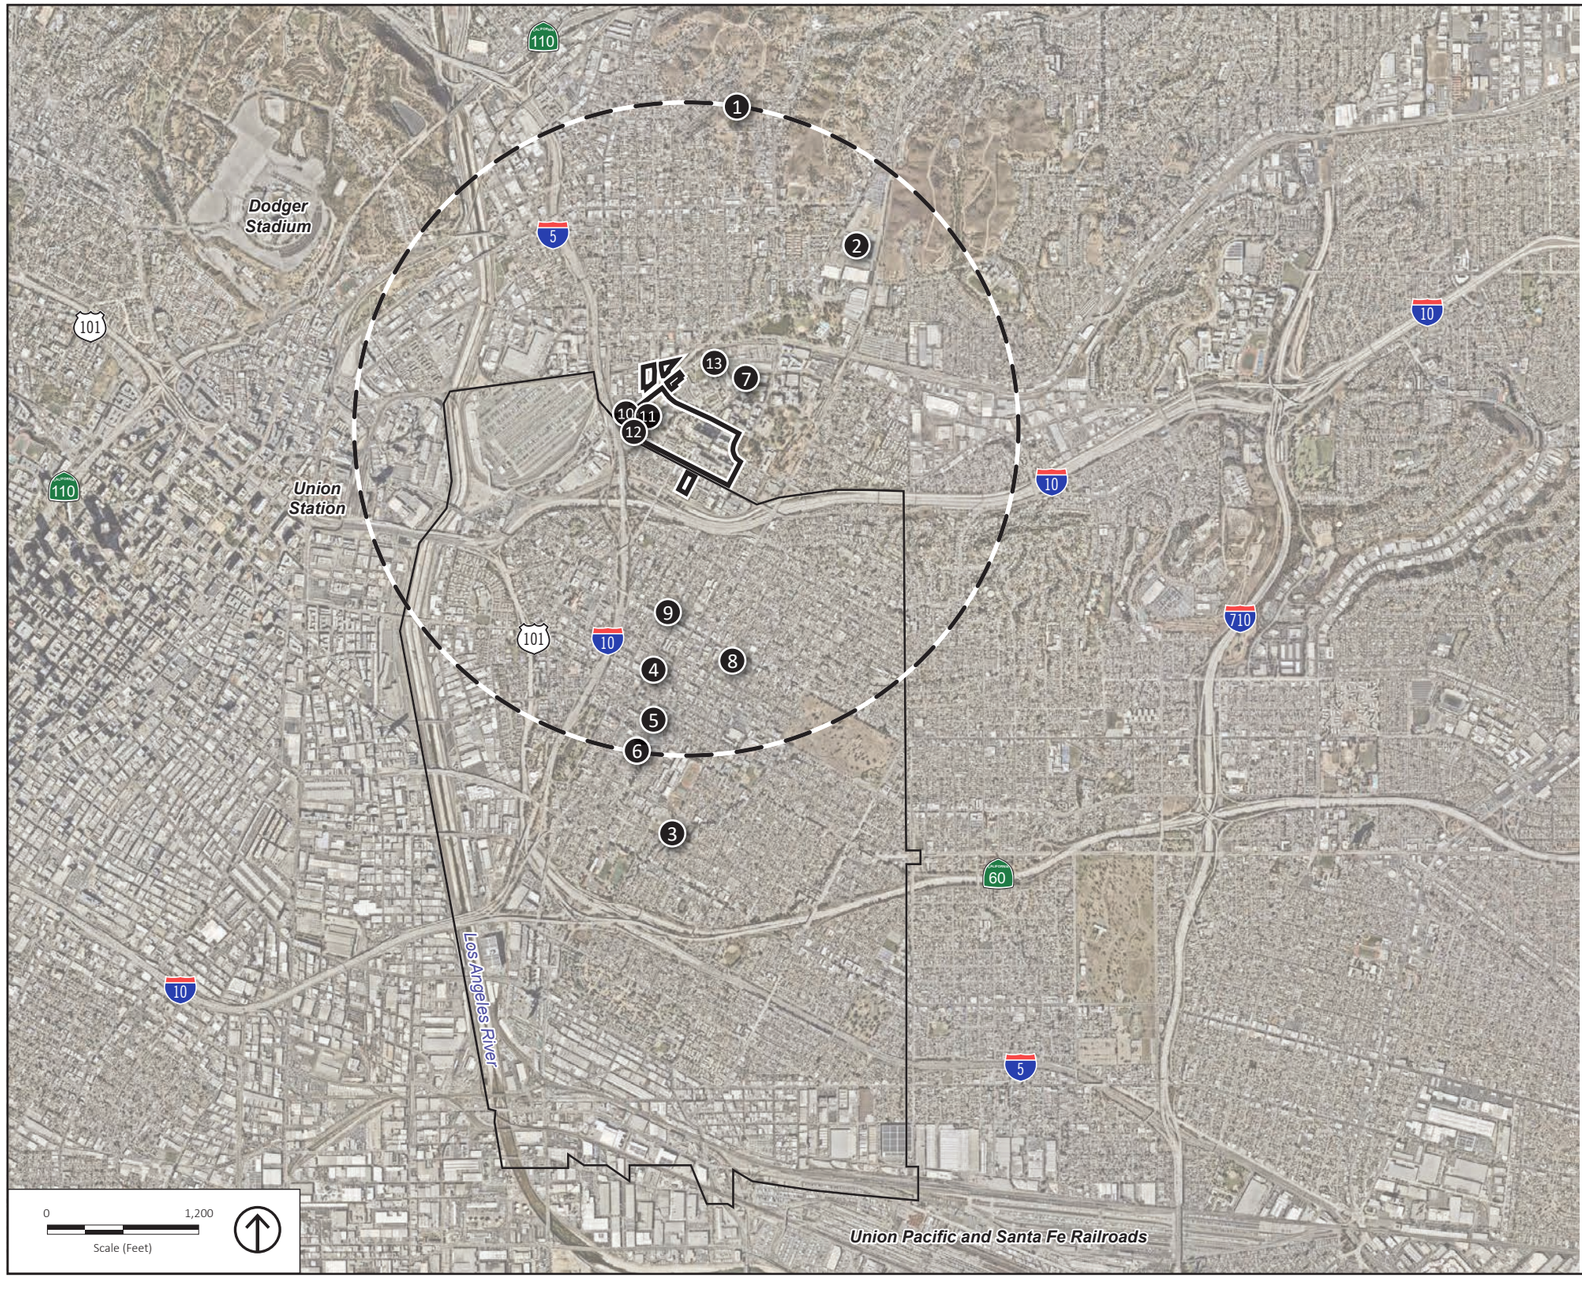

Table 3-2 List of Cumulative Projects

Number	Project Name	Location	Project Proponent	Status	Distance to Project Site	Description of Project
						letter dated May 28, 2019. The project has been determined to be categorically exempt from CEQA.
13.	RCV Surface Parking Lot	1605 Eastlake Avenue	County of Los Angeles Department of Public Works	Planning and Design	Approximately 0.23 mile	The surface parking lot will require the demolition of three existing structures at the site. The lot will serve exclusively as support infrastructure for RCV Phases IV and V.

3.1 AESTHETICS

This chapter of the Draft SEIR discusses the potential impacts related to aesthetics from the implementation of the Proposed Project. As discussed in Section 3.1.5, of this chapter, the Proposed Project meets the criteria of Public Resources Code Section 21099(d)(1), and aesthetic impacts shall not be considered significant impacts on the environment. However, the Draft SEIR includes an evaluation of aesthetics for informational purposes only, to provide a complete record of the Proposed Project's visual context (including shade and shadow), demonstrate consistency with applicable design standards and policies, and inform the public about potential visual changes related to building height, massing, and site improvements. This chapter also describes the Project Site's visual setting and identifies applicable regulatory requirements.

During the Notice of Preparation (NOP) public review period, which was from September 26, 2025, to November 21, 2025, no comments were received regarding aesthetic impacts associated with the Proposed Project. A CEQA scoping meeting was conducted on October 8, 2025, where no comments regarding these issues were received. The NOP and all scoping comment letters are included as Appendix A, *Notice of Preparation and Scoping Comments*, of this document and are presented in Table 1-1, *Summary of Scoping Comments Received*.

3.1.1 Regulatory Framework

As County of Los Angeles is the owner of the Project Site and the public agency involved in development of the proposed Master Plan, the County of Los Angeles is the lead agency for the Proposed Project. Therefore, the Proposed Project is not subject to the City of Los Angeles' planning and zoning ordinances. The County remains subject to applicable federal and State laws, regulations, and policies. For coordination purposes, the County may consider aspects of local policies and regulations for the communities surrounding the Project Site when it is appropriate and feasible, although the County is not bound by those policies and regulations. Therefore, the City's local planning regulations are provided for informational purposes only.

FEDERAL

National Scenic Byways Program

The National Scenic Byways Program is part of the United States (U.S.) Department of Transportation, Federal Highway Administration. Established in Title 23, Section 162 of the United States Code under the Intermodal Surface Transportation Efficiency Act of 1991 and reauthorized and expanded significantly in 1998 under Transportation Equity Act (TEA)-21 and again under Safe Accountable Flexible Efficient Transportation Equity Act-A Legacy for Users (SAFETEA-LU) in 2005, the program is a grass-roots collaborative effort established to help recognize, preserve and enhance selected roads throughout the United States (Caltrans 2026a).

On September 22, 2019, the Reviving America's Scenic Byways Act of 2019 was signed by the President and became Public Law 116-57. This law requires the U.S. Secretary of Transportation to solicit nominations for certain roads to be designated under the National Scenic Byways Program as National Scenic Byways or All-American Roads based on their archaeological, cultural, historic, natural, recreational, and scenic qualities (Caltrans 2026a).

The Consolidated Appropriations Act, 2021 (Public Law 116-260), enacted on December 27, 2020, appropriated $16 million for the National Scenic Byways Program under section 162 of title 23, United States Code. The explanatory statement accompanying the Consolidated Appropriations Act, 2021 stated that Federal Highway Administration (FHWA) should make new designations under the scenic byways program, as required by the Reviving America's Scenic Byways Act of 2019 (Public Law 116-57), prior to issuing a notice of funding opportunity (NOFO) for the scenic byways program. FHWA announced the 2021 Designations to America's Byways on February 16, 2021 (Caltrans 2026a).

STATE

California Scenic Highway Program

The California Department of Transportation (Caltrans) established and implemented the California Scenic Highway Program to protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment (Streets and Highways Code Section 260 et seq.).

Caltrans defines a State Scenic Highway as any freeway, highway, road, and other public right-of-way that “traverses an area of outstanding scenic quality, containing striking views, flora, geology, and other unique natural attributes.” Once a highway has been designated a State scenic highway, or a scenic corridor, special consideration must be made whenever a project proposes to develop the surrounding area (Caltrans 2026b).

California Building Code

The California Building Code (CBC), Part 2 of Title 24 in the California Code of Regulations (CCR), is based on the International Building Code. The CBC includes standards for outdoor lighting that are intended to improve energy efficiency, and to reduce light pollution and glare by regulating light power and brightness, shielding, and sensor controls.

LOCAL

As the County of Los Angeles is the owner of the Project Site, the Proposed Project is not subject to the City of Los Angeles’ planning and zoning ordinances. The County remains subject to applicable federal and State laws, regulations, and policies. For coordination purposes, the County may consider aspects of local policies and regulations for the communities surrounding

the Project Site when it is appropriate and feasible, although the County is not bound by those policies and regulations. Therefore, the City's local planning regulations are provided for informational purposes only.

County of Los Angeles Building Code

The most current version of the County of Los Angeles Building Code (Title 26 of the Los Angeles County Code) is the county's locally amended adoption of the 2022 California Building Code (part of Title 24 of the California Building Standards Code), establishing minimum standards for the design, construction, alteration, repair, and maintenance of buildings and structures to protect health, safety, and welfare throughout the unincorporated areas and participating cities (County of Los Angeles 2023).

County of Los Angeles General Plan 2035

The Conservation and Natural Resources Element of the County of Los Angeles General Plan 2035 (LA County General Plan 2035) (County of Los Angeles 2015) provides goals and policies relevant to aesthetic resources. Applicable policies from the Conservation and Natural Resources Element include the following.

Goal C/NR 13: Protected visual and scenic resources.

- **Policy C/NR 13.1.** Protect scenic resources through land use regulations that mitigate development impacts.
- **Policy C/NR 13.3.** Reduce light trespass, light pollution and other threats to scenic resources.
- **Policy C/NR 13.4.** Encourage developments to be designed to create a consistent visual relationship with the natural terrain and vegetation.
- **Policy C/NR 13.5.** Encourage required grading to be compatible with the existing terrain.

County of Los Angeles Code of Ordinances

Title 22 of the Los Angeles Code of Ordinances establishes land use, development, and design standards that guide the aesthetic character of development within unincorporated Los Angeles County. Although the Project Site is located within the jurisdictional boundaries of the City of Los Angeles, it is owned and operated by the County of Los Angeles. Accordingly, select provisions of Title 22 are referenced for informational and comparative purposes to provide context regarding commonly applied County design and aesthetic standards. Title 22 includes regulations governing building form, height, setbacks, landscaping, and signage, as well as design provisions within Community Standards Districts (CSDs) and other special zones intended to preserve or enhance local visual character. The ordinance also implements the County's "Public Art in Private Development" program, which promotes integration of public art and high-quality design in new development. Compliance with applicable provisions of Title 22

ensures that County-reviewed projects maintain a visually compatible and cohesive built environment consistent with the County's planning and design objectives (County of Los Angeles 2025).

City of Los Angeles General Plan

The City of Los Angeles General Plan (General Plan) is composed of elements covering various aspects of the urban environment. The City's General Plan has 11 citywide elements and 34 Community Plans that make up the Land Use Element. The Project Site is in the Northeast Los Angeles Community Plan area; the Northeast Los Angeles Community Plan is discussed below. The Framework Element is the General Plan's organizing element and connects all the elements. The Urban Form and Neighborhood Design chapter of the Framework Element provides goals addressing urban design (City of Los Angeles 1995). The following are applicable goals, objectives, and policies from the Framework Element related to aesthetics.

Goal 5A: A livable city for existing and future residents and one that is attractive to future investment. A City of interconnected, diverse neighborhoods that builds on the strengths of those neighborhoods and functions at both the neighborhood and citywide scales.

- **Policy 5.2.2.** Encourage the development of centers, districts, and selected corridor/boulevard nodes such that the land uses, scale, and built form allowed and/or encouraged within these areas allow them to function as centers and support transit use. Additionally, develop these areas so that they are compatible with surrounding neighborhoods.

- **Objective 5.5:** Enhance the livability of all neighborhoods by upgrading the quality of development and improving the quality of the public realm.

The applicable goal from the Open Space Element of the General Plan (City of Los Angeles 1973) include:

Goal: To conserve unique natural features, scenic areas, cultural and appropriate historical monuments for the benefit and enjoyment of the public.

The applicable policy from the Conservation Element of the General Plan (City of Los Angeles 2001) include:

- **Policy.** Continue to encourage and/or require property owners to develop their properties in a manner that will, to the greatest extent practical, retain significant existing land forms (e.g., ridge lines, bluffs, unique geologic features) and unique scenic features (historic, ocean, mountains, unique natural features) and/or make possible public view or other access to unique features or scenic views.

Northeast Los Angeles Community Plan

The Northeast Los Angeles Community Plan area encompasses the hills and valleys east of the Los Angeles River and north of the Boyle Heights Community Plan area in the City. The 15,000-acre area, with roughly 250,000 inhabitants in a diverse collection of communities and neighborhoods, serves as a transition area between the downtown center of the City of Los Angeles and the neighboring cities of Glendale, Pasadena, South Pasadena, and Alhambra to the north and east. The general purpose of the Northeast Los Angeles Community Plan is to preserve and enhance the character of the Community Plan area by strengthening the viability and identity of its neighborhoods and communities and improving the quality of life for all its residents. Applicable policies from the Northwest Los Angeles Community Plan (City of Los Angeles 1999) include:

- **Policy 1-3.2.** Consider factors, such as neighborhood character and aesthetics, identity; compatibility of land uses; impacts on livability, services, public facilities, and traffic levels, when changes in residential densities are proposed.
- **Policy 14-2.1.** Encourage the preservation, maintenance, enhancement and adaptive reuse of existing buildings in commercial areas through the restoration of original facades and the design of new construction which complements the old in a harmonious fashion, enhancing the historic pattern.

City of Los Angeles Municipal Code

The Los Angeles Municipal Code (LAMC) sets forth regulations and standards regarding the allowable type, density, height, and design of new development projects. In particular, Chapter 1 of the LAMC, General Provisions and Zoning, provides development standards for the various zoning districts in the City of Los Angeles. The LAMC also sets forth the following specific regulations regarding lighting:

- Chapter 1, Article 2, Section 12.21 General Provisions, paragraph A, Section 5, Part (k), restricts light spill onto adjacent properties and provides minimum luminance levels for safety within and around parking facilities.
- Chapter 4, Section 93.0117, Outdoor Lighting Affecting Residential Property, establishes requirements for outdoor lighting affecting residential properties by limiting light trespass, requiring fixtures to be shielded and directed downward, and sets an illumination threshold of two foot-candles at residential property lines.

As part of the LAMC, the City of Los Angeles Planning and Zoning Code includes standards for different land uses and identifies which land uses are allowed in various zoning districts. The Project Site has a City of Los Angeles zoning designation of Public Facilities, Height District 1 (PF-1) (ZIMAS 2026). The PF zoning district allows public health facilities, including clinics and

hospitals. PF-1 zoning does not have restrictions regarding the heights of buildings or any specific front-, side-, or rear-yard setbacks (LAMC Section 12.04.09).

City of Los Angeles Walkability Checklist

The 2008 Walkability Checklist for Entitlement Review was developed by the City Planning Department's Urban Design Studio to encourage city planning staff, project proponents, and community stakeholders to pursue high quality urban design that provides enhanced pedestrian movement, access, comfort, and safety, both in the public right-of-way and on private properties. It specifies urban design guidelines that are generally applicable to all projects requiring discretionary approval by the City for new construction. The Walkability Checklist consists of objectives, goals, and implementation strategies regarding various design elements that are intended to improve the pedestrian environment, protect neighborhood character, and promote high quality urban form.

Such topics as sidewalks, crosswalks/street crossings, on-street parking, utilities, building orientation, off-street parking and driveways, on-site landscaping, building façades, building signage, and lighting are addressed and should be considered in the design of a project (City of Los Angeles 2008).

3.1.2 Existing Conditions

As shown on Figure 3-1, *Campus Existing Configuration*, and *Figure 3.1-1, Aerial Photographs of the General Hospital Building*, the entirety of the Project Site is developed with buildings and structures that make up and support the Los Angeles General Medical Center. Specifically, the Project Site includes medical and office uses, parking facilities, and maintenance facilities to support the continued operation of these critical community-serving uses.

LANDFORMS, LANDSCAPE, AND TOPOGRAPHIC CHARACTER

The Project Site occupies a range of flat to rolling and hilly terrain, with steep slopes that visually separate the east and west parts of the Project Site. The landscape and open spaces on the Project Site consist largely of a fragmented collection of underutilized areas framed by the existing building layout and natural topography. The majority of the Project Site is comprised of built structures and paved areas. Landscaped areas are limited in size, isolated, and generally not designed as integrated or continuous open space. The use of inconsistent landscaping, non-native plantings, and dispersed amenities contribute to a lack of cohesion. Open spaces that provide more expansive views of the Project Site are at the historic General Hospital forecourt and adjacent terrace areas. In high-traffic areas, including the drop-off zones at the clinical tower, inpatient tower, and outpatient courtyard, vehicular circulation is the primary influence on the areas' visual character due to concrete sidewalks, paved parking lots, driveways, and access roads.

SCENIC VISTAS AND VISUAL RESOURCES WITHIN A SCENIC HIGHWAY

A scenic vista is a public view from a location that is publicly accessible or composite views along a public roadway or trail. Scenic vistas often refer to views of natural lands but may also be compositions of natural and developed areas, or entirely of developed areas, such as a scenic vista of a rural town and surrounding agricultural lands or a city's skyline. As used herein, a "scenic vista" is defined as a publicly accessible view of a broad, expansive landscape or other unique unusual features (i.e., scenic resources) that has been deemed significant or valuable by the community. The unique unusual features must make up an important or dominant portion of the viewshed.

Scenic vistas are often associated with designated scenic overlooks or other elevated vista points. The area surrounding the Project Site occupies a range of flat to rolling and hilly terrain; the terrain ranges from approximately 320 feet above mean sea level (msl) in the west to approximately 440 feet above msl in the northeast where the Project Site borders Cornwell Street. The Project Site contains a 40-foot grade difference between the elevated General Hospital Building area and the lower western portion of the main campus. Due to this topographic variation, views of portions of the Project Site are available from a number of vantage points in the nearby Boyle Heights neighborhood. Similarly, from higher elevations and upper stories of taller buildings on the Project Site, informal (i.e., not officially designated) off-site views are possible. The 2014 Master Plan EIR did not identify any recognized scenic vistas within the Project viewshed, nor do any local planning documents.

Scenic resources are generally considered to include public places recognized for their scenic quality or deserving protection from adverse visual change or visual impacts to users enjoying their visual quality. They are designated or otherwise recognized by a public authority (federal, state, or local) or visual quality experts for their scenic qualities. While there is no comprehensive list of specific features that automatically qualify as scenic resources, certain characteristics can be identified which contribute to the determination of a scenic resource. This includes but is not limited to historic buildings, landmark or distinctive trees, or unique rock formations (Caltrans 2026c). The historic General Hospital Building is the dominant visible feature on the Campus and is a defining visual landmark that features an Art Deco façade and stands at 19 stories. The General Hospital Building can be seen from many locations in Los Angeles, from Elysian Park, downtown Los Angeles, and at certain locations from all local traversing freeways. Additionally, the Old Administration Building, Pharmacy Building, and the Tunnel/Viaduct are some of the oldest elements of the Campus and have a distinct visual appearance, though are smaller in scale than the General Hospital Building and visible only from the immediate vicinity. While the General Hospital and Old Administration buildings (both considered historic resources pursuant to CEQA as described in detail in Chapter 3.4, *Cultural Resources*) are not formally recognized as scenic resources in local planning documents, for purposes of this Draft SEIR, they are considered scenic resources.

There are several key viewsheds within and near the Project Site. The Marengo Boulevard entry at State Street establishes the primary procession into the Campus and frames the approach to the Forecourt, reinforcing the General Hospital Building's stature and civic presence. The view centrally from Mission Street, near the proposed Commerce Plaza, aligns with the monumental historic axis and central spine, offering a clear reading of the General Hospital Building's symmetry and heart of the Campus. From the Zonal Avenue entry, views of the stepped façade convey the scale and layered composition of the General Hospital Building as it rises above the surrounding terrain.

East- and west-facing views across the landscape from the edge of the Project Site typically end at the horizon line where the terrain meets the skyline, or are blocked by existing trees and buildings. Informal views of portions of the Downtown Los Angeles skyline are visible facing west and southwest from the edge of the Project Site along Marengo Street at State Street and particularly in areas of higher elevation, or from elevated stories in the General Hospital Building. Direct north-facing views within the center of the Project Site, or from its southern borders, are largely framed or blocked by Campus medical buildings, the office towers of the University of Southern California Health Sciences Campus (USC HSC), and trees. The northwest-facing views include the taller forms of the Elysian Hills, with the San Gabriel Mountains ridgelines in the distance to the north. These views are not considered scenic vistas as they are distant, intermittently visible through urban development, and are not part of a designated scenic corridor or a continuous panoramic view. Hillside colors include gray-green chaparral and woodland, seasonal grassland that shifts from bright green to tan in summer and fall, and the more consistently green evergreen trees and irrigated landscaping associated with foothill residences. The Northeast Los Angeles Community Plan identifies Mount Washington, the San Gabriel Mountains, and the Eagle Rock as views that are major attributes to the community (City of Los Angeles 1999). However, these attributes do not make up a dominant portion of the viewshed as views of these attributes are heavily obstructed from the Project Site and surrounding area due to intervening development. Therefore, no recognized scenic vistas are identified within the viewshed of the Project Site; informal and intermittent views of the General Hospital Building, downtown skyline, and local foothills and mountain ridgelines are available from the surrounding public viewsheds.

State Scenic Highways are recognized under the California Streets and Highways Code. The California Department of Transportation (Caltrans) administers the California Scenic Highway Program, intended to protect and enhance California's natural scenic beauty, as well as safeguard the social and economic values provided by the State's highways (Caltrans 2025). The nearest officially designated State Scenic highway to the Project Site is State Route (SR)- 2 located approximately 12 miles northeast (Caltrans 2026d). The Project Site is not within a viewshed of a State Scenic Highway. It should be noted that a portion of the SR-110 freeway (Arroyo Seco Historic Parkway Scenic Byway), between US-101 and E Colorado Boulevard in the City of Pasadena, is identified by Caltrans as an official Federal Byway (Caltrans 2025) but is not a designated State Scenic Highway. A Federal Byway, such as the Arroyo Seco Historic Parkway

Scenic Byway, is federally designated for its intrinsic qualities, but this designation does not automatically make it a California State Scenic Highway, which requires a separate state-level designation and local corridor protection (FHWA 2025). The Arroyo Seco Historic Parkway Scenic Byway is approximately 1.46 miles northwest of the Project Site. Due to the distance, topography, and intervening development, only the top portions of the General Hospital Building are visible from a limited segment of the southbound lanes of the Arroyo Seco Historic Parkway Scenic Byway. The Arroyo Seco Historic Parkway Scenic Byway is not visible from the Project Site.

SCENIC CHARACTER AND QUALITY

Surrounding Area

The Project Site is located in an urbanized and densely developed area of the City of Los Angeles. As shown in Figure 2-3, *Local Vicinity*, the Campus is surrounded by variety of uses, including public uses, residential, commercial, industrial, medical, and institutional uses. The surrounding area is transected by two major freeways: Interstate (I-) 5 to the west and I-10 to the south. The I-10 has a partially below-grade (depressed) configuration and is not visible from the Project Site, whereas I-5, has an elevated configuration at Marengo Street/Mission Road as it nears the interchange with I-10 farther south, and is visible from the Project Site.

The character of physical development in the vicinity of the Project Site is shaped by the proximity of the Los Angeles River, topographic variation, and transportation infrastructure. Three closely adjoining railroad alignments are present in the surrounding area's visual setting: the Union Pacific Railroad (UPRR) to the north along Valley Boulevard (adjacent to the Project Site to the north and the Burlington Northern Santa Fe (BNSF) line, which follows the I-10 on the north side in an east-west direction (approximately 1,500 feet away). The Los Angeles River is about 0.7 miles west of the Project Site, flanked on both sides by industrial development and railroad uses. The low-lying areas of Boyle Heights, collectively known as "The Flats," adjacent to the river contain flat terrain with a dense concentration of light and heavy industrial buildings, warehouses, and transportation-related infrastructure. Industrial uses extend eastward from the river to Mission Road, which functions as a visual boundary along the western portion of the Project Site for heavy industrial operations such as auto wrecking yards, truck yards, factories, metal plating facilities, and automotive repair shops in the adjacent flatlands bordering the river. Non-cohesive streetscape features and low-rise, utilitarian buildings of stucco or brick construction dominate the major streets adjoining the Project Site.

Project Site

Within the Project Site, development spans a wide range of periods, from the early twentieth century to more recent construction from the 1970s onward. Details about the historical significance of the Project Site and its features can be found in Chapter 3.4, *Cultural Resources*. The General Hospital Building was originally completed in 1933 and contains 19 above-grade

levels of former medical uses and 1.2 million square feet of developed space. The building is eligible for listing on the National Register of Historic Places (NRHP), and the County is currently undertaking the process to formally list the building on the NRHP. The General Hospital Building is listed on the California Register of Historical Resources (CRHR) and is included in the Built Environment Resource Directory (BERD) for Los Angeles County.

With the exception of the distinctive visually unified landscape, hardscape, and architectural elements designed in conjunction with the General Hospital Building during the 1930s, design treatments, as measured by the choice of architectural style, building form/siting, and the design of parking areas, vary widely; they appear to be typical of regional-scale medical facilities found across the Southern California region and are not distinctive and/or unique to the Campus setting in the community. By contrast, the General Hospital Building and related landscape, hardscape, and architectural features (concrete terrace walls, gate posts, perimeter walls, wrought iron, entry guard stations, ornamental trees, shrubbery, and grass turf areas) have a highly unified, visually distinctive, and vivid design character. Due to its massing, scale, height, and location atop high terrain, the General Hospital Building is one of the community's primary visual landmarks (see Figure 3.1-1, *Aerial Photographs of the General Hospital Building*) —one that can be readily seen in many north- and northeast-facing views from the east, south, and southwest.

The County Medical Examiner's facilities, on-grade and structural parking, and large open areas with a number of support buildings are visible within the western portion of the main campus. Many of the buildings within the western portion of the main campus are one-story modular buildings and in poor physical condition that do not contribute to visual quality of the main campus or effectively support operation. Some buildings are not fully functional; therefore, several Campus programs are currently being housed in temporary buildings or trailers. Outdoor storage areas for equipment and construction staging areas (for the Restorative Care Village [RCV] currently in construction) are also present. These elements of the western portion of the campus are at a lower elevation than and downslope of General Hospital Building, and are not generally visible from areas off of the Project Site. Overall, the visual setting of the main campus is marked by abrupt changes in design character and in uses.

There is a sharp visual divide between Campus built features, landscape components, and the surrounding neighborhood design element. Mission Road features a mix of light industrial uses (such as automotive repair and manufacturing), gas stations, and medical offices associated with the Campus, resulting in a varied design character. Zonal Avenue forms the northern boundary of the main campus and separates the main campus from the USC Health Sciences Campus (HSC). Compared to Mission Road and Marengo Street, Zonal Avenue has a quieter character, shaped by its rolling topography, mature parkway trees, and a mix of hospital and non-healthcare-related uses that are more uniform in their design character and structural design. The main campus boundary along Zonal Avenue is clearly defined by parking structures, topography, perimeter walls and fencing, and landscaped features.

Sensitive Viewer Groups

Individuals within the viewshed of the Project Site include thousands of residents who reside in both single-family and low-rise multi-family residential buildings of varying densities on the streets adjoining the Project Site south of Marengo Street and east of Chicago Street, commuting motorists, pedestrians, and campus staff and visitors. These viewer sub-groups and their relative sensitivity is described below:

- **Residents** who reside in residences on streets adjoining the Project Site, employees, clients, students, and visitors at the Project Site, adjacent USC University Hospital, and other neighborhood businesses experience a moderate to high level of sensitivity to changes in the visual setting due to their prolonged time on the Project Site or immediate vicinity.
- **Commuters** on the adjoining I-5 and I-10 freeways and local streets that offer fleeting views of the taller buildings on the Project Site experience a low level of sensitivity to changes in the visual setting due to the fleeting duration of visibility and highly urbanized surrounding conditions.
- **Students** traveling to and from Francisco Bravo Medical Magnet High School (located approximately 650 feet east of the Project Site) experience a low to moderate level of sensitivity to changes in the visual setting given proximity to the Project Site (repeated visible exposure) and varied modes of travel.
- **Bicyclists** along the bike route that borders a portion of the Project Site on Griffin Avenue experience a moderate to high level of sensitivity to changes in the visual setting because they are presumed to choose bicycle routes based, in part, on aesthetic considerations and because of the more prolonged duration of visibility.

LIGHT/GLARE AND SHADE/SHADOW

“Light” refers to artificial light sources associated with the built environment, including streetlights, building lights, parking lot lights, security lights, and other sources. These light sources can contribute to “light pollution,” which can impair views of the night sky and create other environmental impacts. Poorly shielded or otherwise misdirected light sources can also result in “light spill,” which refers to the unwanted transmission of light onto adjacent areas that may affect sensitive receptors, such as residential properties or wildlife habitat.

“Glare” is created by lights that are particularly bright or poorly shielded as well as surfaces that reflect sunlight or artificial light, creating glare. Sources of glare may include reflective building materials, exterior lighting at commercial buildings and other structures (e.g., porch lights, landscape lighting, security lighting), vehicle headlights, and street lighting. Existing on-site sources of glare may include reflective building materials, exterior lighting, and vehicle headlights.

The Project Site is fully developed with buildings and structures, including current construction activities, that compose and support the Medical Center. Existing on-site sources of artificial light include light emanating from building interiors and outdoor buildings, security, sidewalk, and parking lot lights. Decorative uplighting illuminates the exterior of the General Hospital Building nightly. The existing lighting and glare conditions on the Project Site do not expose nearby sensitive receptors to excessive light or glare as the Project Site is within a highly urbanized area of the City of Los Angeles and is surrounded by numerous sources of artificial light and glare. Existing off-site lighting sources include street lighting, vehicular lighting, and exterior lighting on existing commercial, industrial, and residential uses. The nearest light and glare sensitive receptors are the residences south of the Project Site, across Marengo Street.

Observed effects of extended periods of shade and shadow are dependent on the height and type of features that may cast shadows, seasonal changes (equinoxes), the time of day, and the type of receptors. Shade/shadow is currently associated with existing development on the Project Site. While increased shade is often considered a positive feature in areas of prolonged heat, groups considered sensitive to extended periods of shade/shadow include routinely useable outdoor spaces associated with residential or institutional land uses; commercial uses, such as pedestrian-oriented outdoor areas or restaurants with outdoor eating areas; nurseries; existing solar collectors; and recreational areas, such as parks. There are no shade/shadow sensitive receptors on or in the immediate vicinity of the Project Site.

3.1.3 Standards for Analysis

SIGNIFICANCE CRITERIA

Appendix G, "Environmental Checklist Form," of the California Environmental Quality Act (CEQA) Guidelines, Section I, states that, "except as provided in Public Resources Code Section 21099," the proposed project would result in a significant aesthetic impact if it would:

a) Have a substantial adverse effect on a scenic vista.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) In an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.

d) Expose people on- or off-site to substantial light or glare, which would adversely affect day or nighttime views in the area, or result in substantial shadow impacts on shadow-sensitive land uses.

METHODOLOGY

In 2013, the State of California enacted Senate Bill 743 (SB 743), which made several changes to CEQA for projects located in areas served by transit. Specifically, Public Resources Code Section 21099(d)(1) provides that “aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment.” Projects meeting these criteria, as defined below, are not considered to have a "significant impact" on the environment:

- Public Resources Code Section 21099 defines a “transit priority area” as an area within one-half mile of a major transit stop that is “existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program adopted pursuant to Section 450.216 or 450.322 of Title 23 of the Code of Federal Regulations.”
- Public Resources Code Section 21064.3 defines “major transit stop” as “a site containing an existing rail or bus rapid transit station, a ferry terminal served by bus or rail transit, or the intersection of two or more major bus routes with a frequency of service interval of 20 minutes or less during the morning and afternoon peak commute periods.”
- Public Resources Code Section 21099 defines an infill site as a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses.
- Public Resources Code Section 21099 defines an “employment center project” as “a project located on property zoned for commercial uses with a floor area ratio [FAR] of no less than 0.75 and that is located in a TPA.

The Project Site is located within a one-half mile radius of the Los Angeles General Medical Center station for the Metro J Line (910/950). The Metro J Line qualifies as a high-quality transit corridor (HQTC), as it provides service intervals no longer than 15 minutes during peak commute hours, and is noted as an HQTC in SCAG's "High-Quality Transit Corridors Interactive Map” (Metro 2024, SCAG 2025). Additionally, the Project is located within two types of Priority Development Areas (PDAs) as defined in the 2024 SCAG RTP/SCS: Transit Priority Areas (TPAs) and Livable Corridors (LCs). PDAs are defined in the 2024 RTP/SCS as areas within the SCAG region where future growth can be located to help the region reach RTP/SCS goals. Therefore, the Project Site is located within a defined TPA and is within one-half mile of a major transit stop.

The Project Site is in an entirely developed and urbanized part of Los Angeles and has been developed with uses for decades. It is surrounded entirely by urban uses. Therefore, the Project Site is considered an infill site.

The Proposed Project would allow for the development of over 8 million square feet of new development with a variety of land use types, including residential uses as well as employment-serving uses (i.e., office, commercial/retail, patient and caregiver lodging, warehouse, clean tech/advanced industrial, and hospital uses) with an overall FAR greater than 0.75. Therefore, the Proposed Project is considered to be a mixed-use residential project and employment center project.

The Proposed Project meets the criteria of Public Resources Code Section 21099(d)(1) since it is a mixed-use residential and employment center project on an infill site within a transit priority area. Therefore, aesthetic impacts shall not be considered significant impacts on the environment. However, the Draft SEIR includes an evaluation of aesthetics for informational purposes only, to provide a complete record of the Proposed Project's visual context, to demonstrate consistency with applicable design standards and policies, and to informs the public about potential visual changes related to building height, massing, and site improvements.

The analysis of aesthetic impacts in this section is based on a review of existing site conditions; surrounding land uses; and identification of sensitive viewer groups in relation to changes that could result from development resulting from implementation of the Proposed Project The evaluation is consistent with CEQA and the State CEQA Guidelines and applicable County policies and is informed by industry standards for visual impact assessment, including considerations of viewer sensitivity, changes in visual quality, and compatibility with existing land uses. Impacts are assessed using established significance thresholds to determine whether the Proposed Project would substantially degrade the existing visual environment or affect scenic resources. The Project Site is in an urbanized area characterized by existing buildings, paved streets, and supporting infrastructure. Given this context, the urban standard is applied for evaluating aesthetics under CEQA and, therefore, consistency with applicable zoning and regulations governing scenic quality is described, for informational purposes.

The analysis evaluates the Proposed Project's potential to result in aesthetics impacts by examining the anticipated visual contrast between future development accommodated under the Proposed Project and the existing visual character of the Project Site and surrounding area. Although the Proposed Project does not include site-specific architectural plans, it establishes development standards and permitted uses that would govern future buildout of the Project Site. Accordingly, this analysis is based on reasonable assumptions derived from these standards including maximum allowable building heights, densities, floor area ratios, and development intensities. This is done in relation to sensitive receptor viewer groups who would be exposed to potential changes. While the ultimate location and scale of future developments would evolve over time, this evaluation is in consideration of the viewer groups who may experience such change. It is important to note that visual change does not constitute a significant impact under CEQA, rather, the change must result in a substantial adverse effect, substantial damage, or

substantial degradation in the existing qualities of the visual environment for the impact to be considered significant.

This approach ensures that the environmental analysis conservatively evaluates the full buildout envelope of the Proposed Project, such that future development facilitated by the Proposed Project would not result in impacts beyond those disclosed herein. Visual impacts are assessed by examining the anticipated contrast between the maximum buildout scenario and the existing visual character of the Project Site and surrounding area, with particular emphasis on building height, massing, bulk, and site intensity, which are the primary determinants of visual character at the plan level.

The methodology is consistent with State CEQA Guidelines Section 15146 and 15168, which allows environmental analysis at a programmatic level where site-specific details are not yet available, provided that the analysis evaluates the maximum reasonably foreseeable development scenario. The analysis, therefore, provides a comprehensive evaluation of aesthetic impacts associated with implementation of the Proposed Project.

The term *viewshed* is used throughout this aesthetics analysis. A viewshed comprises all the surface areas visible from an observer's viewpoint. The limits of a viewshed are defined as the visual limits of the views from the Project Site. It also includes the locations of viewers likely to experience the changes brought about by the Proposed Project. In a densely developed urban setting, viewsheds are typically constrained by topography, clusters of mature trees, and building placements. Due to the difficulty of discerning smaller scale design features in an urban setting, a half-mile limit is frequently an appropriate viewshed boundary marker; whereas viewshed boundaries are set at greater distances when significant large-scaled visual resources are present or are being proposed (e.g., tall buildings; local mountains; large tree clusters or geological formations) because, depending on the vantage point, such elements can often be seen across distances of several miles.

Viewer sensitivity is defined both as the viewer's concern for scenic quality and the viewer's response to change in the visual resources that make up the view. The sensitivity of viewers in their perception of visual quality, as well as their sensitivity to changes in visual quality, varies based on familiarity with the view, sense of ownership of the view, and the nature of one's activity while receiving the view.

OVERVIEW OF 2014 MASTER PLAN EIR IMPACT ANALYSIS

As a Subsequent EIR, this Draft SEIR will provide a comprehensive update of the 2014 Master Plan EIR upon County certification and will be the first-tier environmental document for future projects and activities on the Campus. This section provides an overview of the impact conclusions in the 2014 Master Plan EIR for comparative purposes with the analysis of the

Proposed Project contained in Section 3.1.4, *Project Impact Analysis*, and 3.1.5, *Cumulative Impact Analysis*.

The 2014 Master Plan EIR concluded that the 2014 Master Plan (and subsequent projects analyzed through addenda to the 2014 Master Plan EIR) would not result in significant aesthetic impacts related to scenic vistas, visual character, or light and glare. The demolition of the Women's and Children's Hospital was previously identified as a significant impact on scenic resources, but because the building was demolished in 2021, this impact is not relevant to the Proposed Project. Table 3.1-1, *Summary of the 2014 Master Plan EIR Aesthetics Impact Conclusions*, provides an overview of previous aesthetic impact conclusions for the Campus.

Table 3.1-1 Summary of the 2014 Master Plan EIR Aesthetic Impact Conclusions

Significance Criteria[1]	Significance before Mitigation	Mitigation Measure[2]	Significance after Mitigation
AES-1: Would the project have a substantial adverse effect on scenic vistas?	No Impact (construction) Less Than Significant (operation)	MM-AES-1	No Impact (construction) Less Than Significant (operation)
AES-2: Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	Significant (construction) No Impact (operation)	MM-CR-2	Significant and Unavoidable (construction) No Impact (operation)
AES-3: Would the project substantially degrade the existing visual character or quality of the site and its surroundings?	Less Than significant (construction and operation)	None	Less Than Significant (construction and operation)
AES-4: Would the project create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?	No Impact (construction) Less Than Significant (operation)	None	No Impact (construction) Less Than Significant (operation)

Source: County of Los Angeles 2014

1. Significance criteria in this table are those used in the 2014 Master Plan EIR. The analysis in this SEIR uses current significance criteria, which are sometimes different.
2. See Appendix B, *Comparison of Adopted 2014 Master Plan EIR Mitigation Measures and Proposed 2026 SEIR Mitigation Measures*, for a complete list of mitigation measures from in the 2014 Master Plan EIR, along with proposed revisions.

3.1.4 Project Impact Analysis

As previously described, Public Resources Code 21099 applies to the Proposed Project as a mixed-use residential and employment center project on an infill site within a TPA. Therefore, the Proposed Project is exempt from a determination of significant aesthetic impacts. This discussion is provided for information purposes only and not for determining whether the Proposed Project would result in significant impacts to the environment.

a) Would the project have a substantial adverse effect on a scenic vista?

CONSTRUCTION

The Project Site viewshed does not contain any recognized scenic vistas. Informal and intermittent views of the General Hospital Building, downtown skyline, local foothills, and mountain ridgelines are available from the surrounding public viewsheds. Construction activities, which are of temporary duration and have been occurring on the northwest part of the Campus for several years, would include the presence of construction vehicles, cranes, and barricading as well as extensive grading, excavation, hauling, soil stockpiling, and new landscape installation. Construction equipment would be staged within the boundaries of the Campus; the specific staging locations would be determined by the construction contractor(s) in consultation with the County. Staging for construction efforts on the main campus would be at a lower grade and largely not visible to off-site viewers.

On-site viewers, including patients, visitors, and employees, may experience temporary changes in visual conditions during construction; however, these effects would be short-term and typical of ongoing previously approved redevelopment on the urbanized Project Site. Although views from some locations on the Project Site may be obstructed by construction of new buildings, these views are informal (e.g., ordinary views that can be acquired from hundreds of vantages throughout the viewshed and do not merit official recognition), and no views of designated or recognized scenic vistas would be obstructed as none are available within the Project Site viewshed. Thus, impacts on a scenic vista during construction would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

OPERATION

As discussed above under Existing Conditions, no designated scenic vistas have been identified within the Project Site viewshed, and no recognized scenic vistas were identified within the community. While the General Hospital Building is a scenic resource and is visible from locations throughout the surrounding area due to its visible scale and prominence, it is located within a highly developed and urbanized part of Los Angeles and does not make up a dominant portion of the viewshed. Therefore, it does not constitute a clearly defined scenic vista.

As noted above, informal views of scenic vistas from some locations on and around the Project Site may be obstructed by new buildings; however, no designated scenic vistas or views would be obstructed or affected. The Proposed Project would facilitate development of new buildings, increased landscaping, and overall comprehensive integration of land uses on the east and west parts of the Project Site. The Proposed Project would allow for greater levels of development intensity and site activation than currently exist on the main campus. However, the height of any future development would not exceed that of the existing General Hospital Building (19 stories above grade) and key views to the General Hospital Building from on-site locations and surrounding roadways would be maintained to ensure no obstruction of views of the General Hospital Building.

The Proposed Project would implement podium massing, which is designed to maintain the flexibility of form and use of upper-level development. At grade, architecture and massing would respond to the intensity and diversity of public activity. The Master Plan would not impose fixed height limits across the Project Site; building height and massing would be responsive to the General Hospital Building, specifically new development in proximity to the General Hospital Building. As identified in the proposed Master Plan, new development in proximity to the Forecourt would be limited to approximately four to five stories to avoid visual interference with the façade of the Forecourt and the General Hospital Building. Development within the western portion of the main campus would be designed to retain views to the upper portion of the General Hospital Building.

Under Proposed Project conditions, two view corridors would be maintained and would protect views of the General Hospital Building. No new building, structure, or portion would intrude into a protected view corridor, which would be defined as a continuous vertical plane, running from each designated viewport to the General Hospital Building façade. One of the two view corridors would be established to maintain sightlines, wayfinding, and a circulation corridor that recognizes the visual prominence of the General Hospital Building and its importance as the heart of a new urban village; this central spine of open space would run east to west within the Project Site from the center of the General Hospital Building's main entrance through the axis framed by the forecourt buildings, between the footprints of new development, and continuing to the center of the Project Site. The second view corridor would be maintained from the intersection of Zonal Avenue and State Street to the General Hospital Building and would preserve unobstructed views of the General Hospital Building's uppermost four stories.

New street trees and new open spaces would also be added in areas that are now paved and occupied by infrastructure, storage areas, and underutilized buildings. Overall, future development under the Proposed Project would visually connect the west and east parts of the Project Site that are currently visually disjointed. The Proposed Project includes the adaptive reuse of the General Hospital Building to house a mix of uses; however, all changes to this building would be done in compliance with the Secretary of the Interior's Standards to preserve the building's historic defining features (see Chapter 3.4, *Cultural Resources*, for more

information), and the building would remain in a similar visible fashion as its current conditions. Further, only informal views of the General Hospital Building are available from the surrounding public viewsheds, and those would remain with implementation of the Proposed Project. Thus, **less-than-significant impacts** on a scenic vista would occur as a result of the operation of the Proposed Project.

Significance without Mitigation: Less than significant. No mitigation is necessary.

b) Would the project substantially degrade the view from a scenic highway, including, but not limited to, trees, rock outcroppings, and historic buildings?

No designated scenic highways, corridors, or parkways have been identified within or near the Project Site. The nearest officially designated State Scenic Highway is SR-2 located approximately 12 miles northeast of the Project Site. As previously discussed, a portion of the SR-110 (Arroyo Seco Historic Parkway Scenic Byway) between US-101 and E Colorado Boulevard in Pasadena is identified by Caltrans as an official Federal Byway (Caltrans 2025b). The SR-110 is 1.46 miles northwest of the Project Site. Due to distance, topography, and intervening development, the majority of Project Site is not visible from the SR-110; only distant fleeting views of portions of the upper levels of the General Hospital Building are visible.

CONSTRUCTION

Construction of the Proposed Project would involve demolition of existing structures, grading, and building construction, which would require the use of heavy equipment (e.g., excavators, cranes, haul trucks), staging areas, and temporary construction fencing. These activities would temporarily alter view within and around the Project Site.

The Project Site is fully developed and in an urbanized area of the City of Los Angeles. No rock outcroppings exist within or around the Project Site. The Project Site is not visible from a designated State Scenic Highway and only distant and fleeting views of portions of the upper levels of the General Hospital Building are visible from SR-110.

The 2014 Master Plan EIR identified several scenic resources within the boundaries of the Campus, including the General Hospital Building and the Women's and Children's Hospital. It should be noted that the Women's and Children's Hospital buildings were demolished in 2021 pursuant to the 2014 Master Plan EIR; the 2014 Master Plan EIR determined that the demolition of the Women's and Children's Hospital would result in significant and unavoidable scenic resources impacts. Because the buildings associated with the Women's and Children's Hospital were demolished in 2021 and the site on which the former Women's and Children's Hospital was located is currently under construction as part of the Restorative Care Village (RCV), this previous impact is not applicable to the Proposed Project. The Project Site is not within a viewshed of a State Scenic Highway, and the Proposed Project would not degrade the views

from the SR-110; thus, impacts on scenic resources within a scenic highway corridor from construction would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

OPERATION

As previously discussed, the Proposed Project includes the demolition of existing structures, including two structures that were not previously identified for demolition under the 2014 Master Plan EIR. These structures include the Pharmacy Building and Tunnel/Viaduct. As further discussed in Chapter 3.4, *Cultural Resources*, of this Draft SEIR, these structures are not eligible for historic designation, are not visible from a scenic highway, and are not considered scenic resources. Additionally, the Tunnel/Viaduct and Pharmacy Building are not visible from the SR-110. Therefore, the Proposed Project would not substantially degrade the view from the scenic byway.

The Project Site contains native trees, specifically the southern California black walnut tree. Construction could potentially affect these trees; however, these trees do not represent a regionally or locally significant population, and are not visible from the SR-110 (see Chapter 3.3, *Biological Resources*). Any construction activities would alter localized tree cover but would not substantially change the overall visual character of the Project Site, given the increase in landscaped areas that is proposed.

The Proposed Project would include the adaptive reuse of the General Hospital Building and surrounding areas within the Los Angeles General Hospital-Acute Unit Building Historic District; however, all changes to this feature would be done in compliance with the Secretary of the Interior's Standards to preserve historic-defining features, and the building would remain visible from the Federal Byway as under existing conditions. The proposed Master Plan would establish view corridors to preserve and uplift the historic monumentality of the General Hospital Building. Additionally, the massing strategy was designed to respond to the Project Site's unique site topography, adjacency to existing medical uses on the Campus, and historic preservation goals related to the General Hospital (see Chapter 2, *Project Description*). New development near the forecourt would remain limited to four or five stories to preserve human scale and avoid competition with the historic façade of the General Hospital Building. Development on the West Campus would respect regional views by remaining below the upper portion of the General Hospital Building, ensuring that new development reinforces, rather than overwhelm, the building. Through careful massing, setbacks, and placement, the Proposed Project would protect historic viewsheds of the General Hospital Building. The Project Site is not within a corridor of a State Scenic Highway. Given that only distant fleeting views of portions of the upper levels of the General Hospital Building are visible and that the majority of Project Site is not visible from the SR-110 freeway, the Proposed Project would not degrade the views from

the Arroyo Seco Historic Parkway Scenic Byway. Thus, impacts on scenic resources within a scenic highway corridor from operation would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

c) In nonurbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

The Project Site is in the City of Los Angeles, an urbanized area, defined by the U.S. Census Bureau as a "densely developed territory, and encompass[es] residential, commercial, and other nonresidential urban land uses… [with] at least 2,000 housing units or at least 5,000 people" (U.S. Census Bureau 2020). As described in the 2014 Master Plan EIR, the visual setting of the Campus and surrounding area is characterized by low to high visual quality, providing a flexible urban design context for new development features. As the Project Site is owned and operated by the County, the property is not subject the City of Los Angeles' land use and zoning regulations. Additionally, the Proposed Project includes Use and Development Standards that would establish land use standards applicable to all future implementing projects under the Master Plan to ensure compatibility with the existing and planned character of the surrounding area. Thus, future development under the Master Plan would maintain and enhance the visual character and scenic quality on-site (see Chapter 2, *Project Description*).

CONSTRUCTION

Proposed Project construction activities would occur over 25 years within an existing urbanized area that has undergone extensive development, including recent and ongoing construction associated with the RCV, and where a highly varied range of architectural styles and land uses are in close proximity. Temporary construction features such as equipment, fencing, staging areas, cranes, and earthwork would be typical of urban construction and would not permanently alter visual character or obstruct identified scenic resources.

The Project Site is owned and operated by the County of Los Angeles and the County has elected to apply its own planning and zoning laws; therefore, the County's planning and development framework, including applicable LA County General Plan 2035 and campus planning policies related to design and visual character, governs project implementation. Construction activities would be temporary in nature and would occur in accordance with applicable County requirements governing construction staging, site maintenance, and safety, which are intended to minimize visual disorder during active construction. Because construction-related visual changes would not represent a permanent alteration of visual

character, would be consistent with the existing urban character, and would not conflict with applicable County policies or other regulations governing scenic quality, impacts would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

OPERATION

Although the Project Site is located within an urbanized area of the City of Los Angeles, the Project Site is owned and operated by the County. Therefore, as previously identified, the Proposed Project is not subject to the City of Los Angeles' planning and zoning ordinances. Nevertheless, State CEQA Guidelines Appendix G checklist question c addresses whether a project would conflict with applicable zoning and other regulations governing scenic quality. Accordingly, this Draft SEIR provides a discussion of consistency with relevant goals, policies, and objectives related to scenic quality in Table 3.1-2, *Proposed Project's Potential to Conflict with Applicable Scenic Quality Policies and Objectives*, for informational purposes.

Table 3.1-2 Proposed Project's Potential to Conflict with Applicable Scenic Quality General Plan Goals, Policies, and Objectives

Goal/Policy/Objective	Potential to Conflict
County of Los Angeles General Plan	
Conservation and Natural Resources Element	
Goal C/NR 13: Protected visual and scenic resources.	**No Conflict.** The Project Site includes the General Hospital Building and Forecourt (a contributor), which is a scenic resource. The Proposed Project would result in the adaptive reuse of the General Hospital Building and Forecourt. The Proposed Project would retain the historic architectural features of the General Hospital Building, which would remain an important and historic focal point on the Project Site (see Chapter 2, *Project Description,* Section 2.4.2, *Proposed Project Land Uses*).
Policy C/NR 13.1. Protect scenic resources through land use regulations that mitigate development impacts.	**No Conflict.** The Project Site includes the General Hospital Building and Forecourt (a contributor), which is a scenic resource. The Proposed Project would result in the adaptive reuse of the General Hospital Building and forecourt. The Proposed Project would retain the historic architectural features of the General Hospital Building, which would remain an important and historic focal point on the Project Site (see Chapter 2, *Project Description,* Section 2.4.2, *Proposed Project Land Uses*). The Proposed Project would not conflict with this policy because the Proposed Project would implement a massing strategy to respond to the unique site topography, and historic preservation

Table 3.1-2 Proposed Project's Potential to Conflict with Applicable Scenic Quality General Plan Goals, Policies, and Objectives

Goal/Policy/Objective	Potential to Conflict
	goals as it relates to the General Hospital Building. As discuss under impact discussion (a), the Master Plan would maintain two view corridors to protect views to the General Hospital Building. Additionally, the Proposed Project would not interfere with the County's ability to protect scenic resources through land use regulations. Therefore, the Proposed Project would not conflict with this policy.
Policy C/NR 13.3. Reduce light trespass, light pollution and other threats to scenic resources.	**No Conflict.** The Proposed Project would introduce new light sources consistent with the existing urban environment, and proposed outdoor lighting would be designed to minimize spillover and glare through the use of shielding, downward-directed fixtures, and other design features.
Policy C/NR 13.4. Encourage developments to be designed to create a consistent visual relationship with the natural terrain and vegetation.	**No Conflict.** The Project Site is in an urbanized area of the City of Los Angeles. The Proposed Project's land uses were developed with the surrounding land uses and community context in mind. The Proposed Project would allow new development with more intensity and height, but would generally be consistent and compatible with the visual relationship within and surrounding the Project Site through site planning, building massing, and design features that reflect surrounding development patterns and provide appropriate visual transitions to adjacent uses. Height for new buildings would be regulated based on both the building's height relative to the General Hospital Building and key views to the General Hospital Building from on-site locations and surrounding roadways. Landscaping throughout the Project Site would include California native drought-tolerant lawn, shrubbery, flowers, or trees, compatible with natural vegetation. On steep slopes, terracing strategies would be used to reduce perceived height and accommodate grade changes.
Policy C/NR 13.5. Encourage required grading to be compatible with the existing terrain.	**No Conflict.** The Project Site does not contain prominent natural landforms or varied topography. On steep slopes, terracing strategies would be used to reduce perceived height and accommodate grade changes. Grading associated with the Proposed Project would be compatible with existing site conditions and would not alter or conflict with the surrounding terrain.
City of Los Angeles General Plan	
Framework Element	
Policy 5.2.2. Encourage the development of centers,	**No Conflict.** The Proposed Project emphasizes multimodal access, accessible design, and seamless internal and regional connections,

Table 3.1-2 Proposed Project's Potential to Conflict with Applicable Scenic Quality General Plan Goals, Policies, and Objectives

Goal/Policy/Objective	Potential to Conflict
districts, and selected corridor/boulevard nodes such that the land uses, scale, and built form allowed and/or encouraged within these areas allow them to function as centers and support transit use. Additionally, develop these areas so that they are compatible with surrounding neighborhoods.	including the development of a mobility hub and a system of trails, ramps, stairways, and terraces that integrates with existing pedestrian routes (see Chapter 2, *Project Description,* Section 2.4.3, *Circulation and Access*). The Proposed Project's land uses were developed with the surrounding land uses and community context in mind. Although the Proposed Project would allow development at greater intensity and height than existing conditions, the proposed Master Plan would include development standards that would preclude structures or projections outside the Historic Zone for the General Hospital Building from exceeding the highest elevation point of the roof structure or parapet wall of the historic General Hospital Building.
Goal 5A: A livable city for existing and future residents and one that is attractive to future investment. A City of interconnected, diverse neighborhoods that builds on the strengths of those neighborhoods and functions at both the neighborhood and citywide scales.	**No Conflict.** The Proposed Project would add up to 3,200 housing units, 320,000 square feet of retail, and 350,000 square feet of community facilities that would contribute to the facilitation of a livable city. The Proposed Project emphasizes multimodal access, accessible design, and seamless internal and regional connections, including the development of a mobility hub and a system of trails, ramps, stairways, and terraces that integrates with existing pedestrian routes to interconnect surrounding neighborhoods (see Chapter 2, *Project Description,* Section 2.4.3, *Circulation and Access*).
Objective 5.5. Enhance the livability of all neighborhoods by upgrading the quality of development and improving the quality of the public realm.	**No Conflict.** Implementation of the Proposed Project would enhance the Project Site and improve aesthetic quality and livability in the surrounding area through the addition of new buildings, open spaces, and site utilities that contribute to a more organized and visually appealing site. The Proposed Project emphasizes multimodal access, accessible design, and seamless internal and regional connections, including the development of a mobility hub and a system of trails, ramps, stairways, and terraces that integrates with existing pedestrian routes (see Chapter 2, *Project Description,* Section 2.4.3, *Circulation and Access*). The organization of open space and podium elements would establish a cohesive and continuous common ground that would function independently from the development above. Podium massing would be designed to shape and support a network of public spaces. Proposed community facilities would enhance public amenities in the area that support social interaction, contributing to a more functional and livable environment for on-site residents and the surrounding community. Additionally, landscape, shade structures and planted

Table 3.1-2 Proposed Project's Potential to Conflict with Applicable Scenic Quality General Plan Goals, Policies, and Objectives

Goal/Policy/Objective	Potential to Conflict
	areas would be integrated throughout the podium to enhance comfort and microclimate.
Open Space Element	
Goal: To conserve unique natural features, scenic areas, cultural and appropriate historical monuments for the benefit and enjoyment of the public.	**No Conflict.** The Proposed Project would include the adaptive reuse of the General Hospital and would preserve the character-defining and historic features of the building. The Proposed Project would establish view corridors to preserve the historic monumentality of the building. Additionally, a massing strategy was designed to respond to the unique site topography, adjacencies to existing medical uses on the Campus, and historic preservation goals as it relates to the General Hospital. Height for new buildings would be regulated based on both the building's height relative to the General Hospital Building and key views to the General Hospital Building from on-site locations and surrounding roadways (see Chapter 2, *Project Description,* Section 2.4.6, *Development Standards*).
Conservation Element	
Objective. Protect important natural habitats and scenic sites outside the city which are owned by the city or are impacted by city facilities.	**No Conflict.** The Project Site is entirely developed and is in an urbanized area of the City. No natural habitats or scenic sites are in the vicinity of the Project Site and would not be affected by the Proposed Project.
Policy. Continue to encourage and/or require property owners to develop their properties in a manner that will, to the greatest extent practical, retain significant existing land forms (e.g., ridge lines, bluffs, unique geologic features) and unique scenic features (historic, ocean, mountains, unique natural features) and/or make possible public view or other access to unique features or scenic views.	**No Conflict.** The Project Site is entirely developed and is located within an urbanized area of the City. No natural habitats or unique geologic features are on or in the vicinity of the Project Site. No recognized scenic vistas were identified within the Project viewshed; only informal views of the General Hospital, downtown skyline, and local foothills and mountain ridgelines are available from the surrounding public viewsheds. The Proposed Project would preserve the character-defining and historic features of the General Hospital Building. Height for new buildings would be regulated based on both the building's height relative to the General Hospital Building and key views to the General Hospital Building from on-site locations and surrounding roadways. Development standards of the Proposed Project would ensure that sightlines would be maintained.
City of Los Angeles Northeast Community Plan	
Policy 1-3.2. Consider factors, such as neighborhood character and aesthetics, identity;	**No Conflict.** The Proposed Project would add a maximum of 3,200 dwelling units. The Project Site is in an urbanized area characterized by existing buildings, paved streets, and supporting infrastructure.

Table 3.1-2 Proposed Project's Potential to Conflict with Applicable Scenic Quality General Plan Goals, Policies, and Objectives

Goal/Policy/Objective	Potential to Conflict
compatibility of land uses; impacts on livability, services, public facilities, and traffic levels, when changes in residential densities are proposed.	The visual setting of the Campus and surrounding area is characterized by low to high visual quality, providing a flexible urban design context for new development features. Project construction would occur in a flexible, fully urbanized setting that has seen extensive development and where a highly varied range of architectural styles and land uses are in close proximity. The Proposed Project's land uses were developed with the surrounding land uses and community context in mind. New development under the Proposed Project would be designed to remain flexible, consistent, and compatible with the visual relationship within and surrounding the Project Site. The proposed Master Plan would include development standards that would preclude structures or projections outside the Historic Zone for the General Hospital Building from exceeding the highest elevation point of the roof structure or parapet wall of the historic General Hospital Building. New development in proximity to the forecourt would be limited to approximately four to five stories to retain views to the forecourt and General Hospital Building.
Policy 14-2.1. Encourage the preservation, maintenance, enhancement and adaptive reuse of existing buildings in commercial areas through the restoration of original facades and the design of new construction which complements the old in a harmonious fashion, enhancing the historic pattern.	**No Conflict.** The Proposed Project incorporates adaptive reuse strategies where feasible while addressing the aging utilities and infrastructure within the Campus. See also discussion of Policy C/NR 13.1.

Source: City of Los Angeles 1973, 1999, 2001; County of Los Angeles 2025.

As shown in Table 3.1-2, the Proposed Project would be consistent with the relevant goals, policies and objectives in City of Los Angeles General Plan, County of Los Angeles General Plan, and Northeast Los Angeles Community Plan. In addition, because the Proposed Project is within a transit priority area, pursuant to Public Resources Code Section 21099(d)(1), aesthetic impacts of a mixed-use residential project on an infill site within a transit priority area shall not be considered significant impacts on the environment. Therefore, there would be **less than significant impacts** related to conflicts with zoning or other regulations governing scenic quality.

Significance without Mitigation: Less than significant. No mitigation is necessary.

d) Would the project expose people on- or off-site to substantial light or glare which would adversely affect day or nighttime views in the area, or result in substantial shadow impacts on shadow-sensitive land uses?

CONSTRUCTION

Construction activities are expected to primarily occur during allowable construction hours of 7:00 am to 7:00 pm on Monday through Saturday, consistent with LA County Code of Ordinances Section 12.08.440. If, during development of the final construction schedules for phased activities under the Proposed Project, it is deemed necessary to work outside the permitted hours, the Project Applicant would follow necessary procedures to obtain an appropriate variance in accordance with Section 12.08.580 of the County of Los Angeles Code of Ordinances. Therefore, construction activities are unlikely to substantially alter ambient light levels or result in significant spillover light impacts on surrounding land uses, as construction would primarily occur during daylight hours. The Project Site is in a fully urbanized setting with numerous existing sources of light and glare. These sources of light and glare include existing Campus health services buildings and existing buildings along adjoining streets, streetlights, vehicular headlights, and reflective surfaces associated with nearby buildings and paved areas. There is little potential for construction activities to produce substantial glare because construction is temporary and typically involves non-reflective or matte-finished equipment and materials that are not designed to reflect sunlight. Any temporary lighting used for safety or security would be limited in duration, low-intensity, and directed downward in accordance with standard construction practices, thereby minimizing light spill or glare onto adjacent uses or public rights-of-way. In addition, although no shade-sensitive viewing groups are currently present within the Project Site or its immediate off-site perimeter, there is no potential for construction equipment and activities (e.g., cranes) to cast substantial shadow/shade. Shade/shadows that may be cast during construction would result from temporary equipment that is typically not fixed/stationary and would not result in substantial changes. Construction activities resulting from the Proposed Project, when considered in addition to existing sources of light and glare in the urban environment, would be negligible; and **less-than-significant** project construction impacts related to light, glare, shade, and shadow would occur.

Significance without Mitigation: Less than significant. No mitigation is necessary.

OPERATION

Existing on-site sources of artificial light include light emanating from building interiors and outdoor building, security, sidewalk, and parking lot lights. Existing off-site lighting sources include street lighting, vehicular lighting, and exterior lighting on existing commercial, industrial, and residential uses. Existing sources of glare include reflective building materials such as glass windows and façades, vehicle headlights, and reflective surfaces associated with paved

roadways, parking areas, and commercial storefronts. The nearest light and glare sensitive receptors are the residences south of the Project Site, across Marengo Street.

The Proposed Project would result in new buildings and structures on-site. The Proposed Project would introduce development intensities and types to the Project Site that exceed assumptions in the 2014 Master Plan EIR; however, the type of development that are being proposed would not be new to the area given the developed urban context. Lighting associated with the proposed residential, commercial, medical, office, retail, warehouse, parking, and open space uses would be consistent with those emanating from similar uses that currently exist on-site or in the immediate vicinity of the Project Site (see Chapter 3.10, *Land Use and Planning*). Lighting from new development on the Project Site would be consistent with the existing urban environment and would generally conform to lighting and glare regulations, including but not limited to the regulations listed above in Section 3.1.1, *Regulatory Framework*.

The proposed outdoor lighting would be designed to minimize spillover lighting and glare through the use of shielding, downward-directed fixtures, and other design features. Some of the design elements for light control and reduced spillover lighting for the proposed outdoor lighting include limiting the mounting height and steep aiming angles, various lighting modes, visors and shielding, reflective housing around the luminaires, limiting the number of luminaires, and appropriate light levels based on location of the lights. The proposed light poles would incorporate all these elements, and each element can be arranged individually to control and minimize any potential spillover lighting impacts. Additionally, there are existing outdoor street light poles in the surrounding area.

Regarding shade and shadow effects, any new shadowing would primarily occur during lower sun-angle periods and the extent and duration of shadows would depend on the final design of individual developments. Given the existing development context, the presence of existing tall structures, and the lack of sensitive receptors that would be directly affected (routinely useable outdoor spaces associated with residential or institutional land uses; pedestrian-oriented outdoor areas or restaurants with outdoor eating areas; nurseries; solar collectors; or recreational areas), the Proposed Project is not anticipated to result in adverse effects related to shade and shadow. Due to the separation between proposed building areas and nearby residential uses, projected shadows extending to the east and south would dissipate before reaching off-site properties or would occur only briefly during early morning or late afternoon hours when sunlight availability is already reduced. The surrounding residential uses are separated from the primary building envelopes by existing Project Site development, roadways, and setbacks, which limit the extent to which Proposed Project-generated shadows could reach residential areas. Any incremental shading that may occur would be consistent with shadow patterns typical of an urban campus environment.

Therefore, the Proposed Project would not result in substantial sources of light, glare, shade, or shadows given the surrounding existing conditions in a highly developed urban environment, and impacts are **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

3.1.5 Cumulative Impact Analysis

The cumulative geographic study area used to assess potential cumulative aesthetics impacts is limited to locations that have clear sightlines to the Project Site. The cumulative geographic study area boundaries extend to 0.5 miles from the main campus perimeter. This cumulative study area was selected as it encompasses the area from which the Proposed Project and nearby cumulative projects would be visible and where their combined visual effects could reasonably occur. The cumulative projects that are within 0.5 miles of the main campus perimeter include the Boyle Heights Community Plan update (Cumulative Project 3), USC Discovery and Translation Hub (Cumulative Project 7), Medical Examiner Crypt Expansion (Cumulative Project 10), Medical Examiner Seismic Retrofit (Cumulative Project 11), Medical Examiner Deferred Maintenance Repair Project (Cumulative Project 12), and RCV Surface Parking Lot (Cumulative Project 13).

The full list of 13 cumulative projects is provided in Chapter 3, *Environmental Analysis*, and illustrated on Figure 3-2, *Cumulative Projects*, of this Draft SEIR.

Would the project have a cumulative effect related to aesthetics?

SCENIC VISTAS

Construction

Cumulative impacts would occur if the Proposed Project, together with past, present, and reasonably foreseeable future projects, result in temporary construction activities that have a substantial adverse effect on scenic vistas. No designated scenic vistas have been identified within the 0.5-mile cumulative geographic study area. Construction of these projects, in combination with the Proposed Project, could result in temporary visual obstructions, such as cranes, scaffolding, and construction equipment, which may intermittently affect views across the cumulative geographic study area. However, these effects would be short-term, localized, and reversible, and would not result in permanent obstruction of scenic vistas. The Proposed Project's construction activities would occur on a rolling and phased basis, and any view disruptions would cease upon completion of construction. The Proposed Project's contribution to cumulative impacts would not be cumulatively considerable because it would not result in the permanent loss or substantial degradation of scenic vistas, and temporary construction-

related obstructions would not combine with other projects to create a substantial adverse visual condition. Accordingly, cumulative impacts related to scenic vistas during construction would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

Operation

The Proposed Project and the cumulative projects are located within an urbanized environment characterized by built structures and limited long-range scenic views. New cumulative development would occur on previously disturbed or developed parcels. Cumulative impacts would occur if the Proposed Project, together with other past, present, and reasonably foreseeable projects in the cumulative geographic study area, substantially create an adverse effect on a scenic vista. As previously noted, no recognized scenic vistas were identified within the Project Site viewshed; only informal views of the General Hospital Building, downtown skyline, and local foothills and mountain ridgelines are available from the surrounding public viewsheds. Ordinary views within the viewshed, which do not capture the above-referenced visual resources, are generally of moderately low to moderate visual quality, and would be mostly preserved. The proposed Master Plan would include development standards that would preclude structures or projections outside the Historic Zone for the General Hospital Building from exceeding the highest elevation point of the roof structure or parapet wall of the historic General Hospital Building. Additionally, new development near the Forecourt would be limited to approximately four to five stories to preserve human scale and avoid competing with the historic façade of the General Hospital Building. A central spine of open space would run east to west within the Project Site to maintain sightlines and a view corridor at the intersection of Zonal Avenue and State Street would be maintained to preserve views to the General Hospital Building. In addition, the Proposed Project would implement a massing strategy to respond to the Project Site's unique topography.

Cumulative impacts would occur if the Proposed Project, together with other past, present, and reasonably foreseeable projects in the cumulative geographic study area, result in a substantial adverse effect on a scenic vista. The projects identified in Chapter 3 that are within the geographical study area include Cumulative Projects 3, 7, 10, 11, 12, and 13. As a land use plan, Cumulative Project 3 could potentially introduce increased density, scale, and height than what currently exists in the surrounding area. Cumulative Project 7 would include the development of a seven-story structure; Cumulative Projects 10, 11, and 12, would include a crypt expansion and seismic retrofit and maintenance improvements to the Medical Examiner Building, which is located on-site; and Cumulative Project 13 would include the development of a surface parking lot. No recognized scenic vistas were identified within the Proposed Project viewshed, and as the cumulative related projects are within 0.5 miles of the Project Site and are located in densely developed urban settings, the viewsheds of the cumulative related project would be similarly constrained by topography and building placements. In addition, the cumulative

projects would be required to comply with applicable zoning regulations regarding massing and size to reduce any potential impacts related to the obstruction of a scenic vista. Because no recognized scenic vistas are identified within cumulative geographic study area viewshed, and cumulative development would occur within a highly urbanized environment characterized by existing buildings and limited scenic resources, cumulative impacts to scenic vistas would not be significant. The Proposed Project would not contribute to cumulative impacts on scenic vistas because no recognized scenic vistas are present within the Project Site and cumulative geographic study area viewshed. In addition, development under the Proposed Project includes development standards to ensure that future development facilitated by the Proposed Project would not significantly nor negatively affect scenic vistas, nor result in effects that are potentially cumulatively significant. Therefore, the Proposed Project's contribution would not be cumulatively considerable, and cumulative impacts to scenic vistas would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

VIEWS FROM A SCENIC HIGHWAY

Construction

Cumulative impacts would occur if the Proposed Project, together with past, present, and reasonably foreseeable future projects, result in substantial degradation to scenic resources within a State scenic highway during construction. No officially designated State scenic highways are located within the cumulative geographic study area viewshed. The Project Site is not visible from the Arroyo Seco Historic Parkway Scenic Byway, a designated federal scenic byway. Only portions of the upper levels of the General Hospital Building are visible from the Arroyo Seco Historic Parkway Scenic Byway. Therefore, construction activities associated with the Proposed Project, including the presence of construction equipment, stating areas, and temporary lighting, would not be visible from a State scenic highway and would not affect scenic resources or views from such roadways.

Similarly, while cumulative projects in the surrounding area may involve construction activities, the absence of visibility between the Project Site and a State scenic highway precludes the potential for combined visual effects on scenic highway views. Additionally, the 05.-mile cumulative study area is not within the viewshed of any State scenic highway. Accordingly, the Proposed Project would not result in an impact and would not contribute to a cumulatively considerable impacts related to scenic resources within a State scenic highway. Therefore, **no cumulative impacts** would occur.

Significance without Mitigation: No impact. No mitigation is necessary.

Operation

The cumulative geographic study area is located in a highly urbanized portion of the City of Los Angeles, where cumulative growth is generally limited to infill redevelopment. As previously noted, no designated scenic highways, corridors, or parkways have been identified within the Project viewshed. The Arroyo Seco Historic Parkway Scenic Byway is identified by Caltrans as an official Federal Byway and is 1.46 miles northwest of the Project Site. Due to distance, topography, and intervening development, only portions of the upper levels of the General Hospital Building are visible from the southbound lanes of the SR-110 freeway. No rock outcroppings exist within the cumulative project viewshed, which is heavily urbanized. Trees within the cumulative project viewshed consist of ornamental street trees associated with existing development. These trees contribute to the localized streetscape character, but they do not constitute a scenic resource at the scale of a highway viewshed. The Proposed Project would not require removal of mature, visually prominent tree stands that could otherwise be considered scenic resources and would not introduce substantial changes to tree patterns visible from the Arroyo Seco Historic Parkway Scenic Byway. Cumulative projects would occur on dispersed sites with the existing tree canopy consisting primarily of ornamental street trees within developed areas. These trees contribute to localized streetscape character rather than broader scenic views, and any potential tree removal with cumulative projects would be limited in scope and dispersed, avoiding any meaningful change to views from the scenic byway. To the extent that the Proposed Project or cumulative projects add new landscaping, this would likely include ornamental and shade trees consistent with existing urban conditions, which would not alter or diminish scenic views from the byway. While the cumulative project in the geographic study area would introduce additional development, such changes would occur within a setting already dominated by buildings, streets, and infrastructure, and are unlikely to alter the scenic qualities of the Arroyo Seco Historic Parkway Scenic Byway or any other designated scenic highways. Because the identified cumulative projects are unlikely to alter the scenic qualities of the Arroyo Seco Historic Parkway Scenic Byway or any other designated scenic highway due to distance topography, and intervening development, cumulative impacts related to scenic highway views would not be significant. Accordingly, the Proposed Project's contribution would not be cumulatively considerable. Impacts would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.

SCENIC QUALITY

Construction

Cumulative impacts would occur if the Proposed Project, together with past, present, and reasonably foreseeable future projects, result in conflicts with regulations related to scenic quality during construction.

While multiple projects could be under construction concurrently, these activities would be temporary, phased, and geographically dispersed, and would not result in a sustained or permanent change to the visual character of the area. The visual environment would be restored upon completion of construction activities. The Proposed Project's contribution would not be cumulatively considerable because construction-related visual changes are inherently temporary and reversible, and would not combine with other projects to result in a substantial adverse effect on visual character or quality. Therefore, cumulative impacts would be **less than significant**.

Significance without Mitigation: Less than significant. No mitigation is necessary.
