Potential increases in transit person trips generated by the Project were estimated using Section B.8.4 and Appendix B-4 of the 2010 CMP, which provides a methodology for estimating the number of transit trips expected to result from a proposed project based on the projected number of vehicle trips. This methodology assumes an average vehicle occupancy (AVO) factor of 1.4 in order to estimate the number of person trips to and from a project site and provides the type of use (commercial, residential, etc.) and the proximity to transit services. The CMP guidelines estimate that approximately 3.5 percent of total Project person trips may use public transit to travel to and from the Project Site based on the type of use of the Project.

4. Existing Intersection Conditions

Table IV.K-3 on page IV.K-17 summarizes the V/C ratios and corresponding LOS results for the study intersections during the analyzed weekday and weekend periods previously described. As shown therein, five of the eight analyzed intersections are currently operating at LOS D or better during one or more of the analyzed periods. The remaining three intersections are currently operating at LOS E or LOS F during at least one of the five analyzed periods:

1. Cahuenga Boulevard West & Barham Boulevard
2. Cahuenga Boulevard East & Barham Boulevard
5. Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp

5. Future (2020) Intersection Conditions

Table IV.K-4 on page IV.K-19 summarizes the Future (Year 2020) Conditions V/C ratios and corresponding LOS results for the study intersections during the analyzed periods. As shown therein, four of the eight study intersections are projected to operate at

Table IV.K-3

LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods:

1. Cahuenga Boulevard West & Barham Boulevard
2. Cahuenga Boulevard East & Barham Boulevard
5. Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp
6. US-101 Northbound Off-Ramp & North Cahuenga Boulevard

As compared to Existing Conditions, traffic conditions at Intersection No. 6 are projected to worsen under Future Conditions. In addition, Intersection Nos. 1, 2, and 5, which are operating at LOS E or LOS F under Existing Conditions, are projected to operate at LOS E or LOS F during additional peak periods or worsen from LOS E to LOS F during some peak periods.

6. Environmental Impacts

a. Thresholds of Significance

(1) CEQA Guidelines

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to transportation/traffic would be significant if the Project would:

Table IV.K-4
Future (Year 2020) Conditions Intersection Level of Service

No	Intersection	Peak Hour	Future

Source: Gibson Transportation Consulting, Inc., 2014.

- Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit;

- Conflict with an applicable congestion management program including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways;

- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks;

- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);

- Result in inadequate emergency access; or

- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

Appendix G of the CEQA Guidelines does not include a sample threshold of significance for parking impacts. The prior checklist question regarding inadequate parking capacity was deleted in 2010 pursuant to a number of amendments to the CEQA Guidelines that went into effect on March 18, 2010. However, given the importance of this

issue on the Project Site and within the City , an analysis of parking capacity is provided herein.

As discussed in the Initial Study prepared for the Project, provided in Appendix A of this Draft EIR, the Project Site is not located within the vicinity of a public or private airport or planning boundary of any airport land use plan. In addition, no high-rise structures are proposed as part of the Project which would increase or change air traffic patterns or increase levels of risk with respect to air traffic. Therefore, no significant impacts with regard to air traffic patterns would occur. Further, implementation of the Project would continue the existing theatre uses within the Project Site and provide for recreational opportunities and, as such, would not include incompatible land uses. Additionally, the Project would not create sharp curves or dangerous intersections. Thus, impacts with regard to traffic hazards would be less than significant. As such, no further analysis of these issues is necessary.

(2) Congestion Management Program

The CMP guidelines state that a CMP freeway analysis be conducted if 150 or more trips attributable to the proposed development are added to a mainline freeway monitoring location in either direction during the weekday morning or afternoon commuter peak hours.

The CMP guidelines also state that a CMP arterial monitoring station analysis be conducted if 50 or more peak hour project trips are added to a CMP arterial monitoring station during the weekday morning or afternoon commuter peak hours.

A significant project-related CMP impact would occur if the CMP facility is projected to operate at LOS F (V/C > 1.00) and if the project traffic causes an incremental change in the V/C ratio of 0.02 or greater. A proposed development would not be considered to have a regionally significant impact, regardless of the increase in V/C ratio, if the analyzed facility is projected to operate at LOS E or better after the addition of project traffic.

b. Project Design Features

Project Design Feature K-1: Construction Management Plan

The Ford Theatre Foundation shall prepare a construction traffic management plan, including haul routes and staging plans, as necessary and satisfactory to the County. The construction traffic management plan would be based on the nature and timing of the specific construction activities and shall include the following elements as appropriate:

- Prohibition of construction worker parking and other construction-related vehicles on adjacent residential streets.
- Provisions to prohibit construction equipment or material deliveries within the public right-of-way.
- Provisions for temporary traffic control during all construction activities adjacent to public rights-of-way to improve traffic flow on public roadways (e.g., flag persons).
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets.
- Provisions of safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers, as appropriate.
- Provisions to accommodate the equipment storage and truck staging on-site.
- Scheduling of construction-related deliveries, haul trips, etc., so as to occur outside of the commuter peak hours to the extent feasible.
- Obtaining the required permits for truck haul routes from the City prior to issuance of any permit for the Project.

Project Design Feature K-2: The Ford Theatre's shall stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 p.m. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons.

Project Design Feature K-3: Parking and Traffic Management Plan

The Ford Theatre Foundation shall prepare a Parking and Traffic Management Plan including parking and traffic management measures and transportation demand management strategies. The Parking and Traffic Management Plan could include, but not be limited to, the following:

- Provide directions and location maps with the parking options available for visitors in web postings, real time mobile applications, marketing, notification and media materials, etc.
- Post directions and maps showing truck routes for deliveries, construction vehicles, and other trucks.
- Encourage alternate travel options (, transit and shuttle service) for visitors in event-related marketing/media information.

- Manage the use of all parking spaces in the on-site parking garages to maximize parking efficiency and avoid underutilization of parking spaces.
- Identify locations for bus drop-off/pick-up and staging.
- Provide valet assist parking in at least one parking garage to maximize parking circulation and capacity where possible during large events.
- Require employees and staff to park within designated areas.
- Implement Transportation Demand Management strategies for employees to reduce trips during the congested periods and travel via other modes beside driving alone (e.g., carpooling, flexible or alternative work schedules, transit incentives, parking incentives for carpools and vanpools, etc.)
- Provide bicycle amenities (bicycle racks, lockers, etc.).

c. Analysis of Project Impacts

(1) Traffic

(a) Construction

Construction activities would include demolition of some existing uses, grading and excavation, construction of new structures and related infrastructure, and building and landscaping finishes. As described in Section II, Project Description, of this Draft EIR, the Project would be implanted in several phases and may be completed as early as 2020. To provide a worst-case analysis, the Project is assumed to be constructed in a single phase.

The Project construction would comply with County Code requirements, which prohibits noise-generating construction activities between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays if such noise would create a noise disturbance across a residential or commercial real-property line.

(i) Construction Workers

Construction worker traffic is determined based on the number of construction workers employed during various construction phases as well as the travel mode and travel time of workers. As part of the Project, it is anticipated that most, if not all, of the construction worker trips would occur outside of typical commuter peak periods since the hours of construction typically require workers to be on-site before the weekday morning commuter peak period and depart before or after the afternoon commuter peak period (i.e.,

arrive at a site prior to 7:00 A.M. and depart before 4:00 P.M. or after 6:00 P.M.). The number of construction workers on-site would vary based on the phase of construction (e.g., demolition, grading, building construction, etc.) and is estimated to range between approximately 10 and 100 workers on-site daily. Accounting for some level of carpooling among the construction workers (average vehicle ridership of 1.135 persons per vehicle), the number of construction worker trips during the construction phase requiring the largest number of workers (e.g., 100 construction workers during building construction) would generate approximately 176 trips (88 inbound/88 outbound). As previously stated, these trips would occur outside of the peak traffic periods.

(ii) Haul Trucks and Equipment/Material Delivery Trucks

The Project's combined excavation, demolition, and other construction activities are expected to generate approximately 107,094 cubic yards of material that would be exported off-site. Assuming 12-14 cubic yard trucks are used to export the material, the Project would generate approximately 64 haul truck trips per day (32 inbound/32 outbound) during construction.

With regard to construction material delivery trucks, it is estimated that an average of between less than 10 and 30 delivery trucks could access the Project Site on a daily basis depending on the construction phase. The construction phase requiring the largest number of deliveries (e.g., 30 delivery trucks during building construction) would generate approximately 30 daily delivery truck trips (15 inbound/15 outbound).

(iii) Truck Routes

Based on the proximity of the Hollywood Freeway to the Project Site, it is anticipated that haul trucks and delivery trucks would access the Project Site traveling northbound on Cahuenga Boulevard East from the Hollywood Freeway (US-101) and would exit the Project Site onto Cahuenga Boulevard East and travel northbound on Cahuenga Boulevard East to the Hollywood Freeway.

(iv) Potential Construction Traffic Impacts

As described above, during the most intense construction phase, it is anticipated that construction activities would generate approximately 176 daily construction worker trips. In addition, based on a passenger car equivalency factor of 2.0, the 64 haul truck trips per day and the 30 daily delivery truck trips would be equivalent to 188 passenger car trips per day. Therefore, Project construction could generate a total of approximately 364 trips per day based on the construction phase. However, as discussed above, given the typical construction hours the Project would comply with, the majority of these trips would occur during off-peak hours. As such, Project construction would not be expected to

result in a significant impact at any of the analyzed intersections. In addition, the Project would include implementation of a Construction Management Plan to minimize the amount and effect of construction traffic. As outlined above in Project Design Feature K-1, the Construction Management Plan would prohibit construction workers, haul trucks and delivery trucks from parking, staging, or queuing along the surrounding residential streets.

(b) Operation

(i) Project Trip Generation

As previously described, the number of trips expected to be generated by the Project was estimated based on specific information provided by the Ford Theatre Foundation and County staff with regard to the anticipated unique operational characteristics of the Ford Theatres (i.e., attendance levels; anticipated visitor arrival and departure patterns during weekdays and weekends; events, educational, and other programming; employees, etc.). In addition, the number of trips expected to be generated by the typical land use components of the Project (e.g., restaurant use) was estimated using rates published in the *Trip Generation, 9th Edition* by ITE. Trip generation for the office uses is based on the number of existing and proposed employees and conservatively assumes an average vehicle ridership of 1.0 per employee vehicle. Table IV.K-5 on page IV.K-26 provides a summary of the existing and anticipated trip-generation estimates for the Project during the analyzed periods described previously.

As shown in Table IV.K-5, the Project is anticipated to generate the following estimated net new trips during the corresponding analysis periods:

- Weekday 7:00 A.M. to 10:00 A.M.: 35 trips (34 inbound/1 outbound)
- Weekday 4:00 P.M. to 6:00 P.M.: 60 trips (17 inbound/43 outbound)
- Weekday 6:00 P.M. to 9:00 P.M.: 18 trips (13 inbound/5 outbound)
- Saturday 11:00 A.M. to 1:00 P.M.: 92 trips (78 inbound/14 outbound)
- Saturday 6:00 P.M. to 9:00 P.M.: 92 trips (79 inbound/13 outbound)

(ii) Trip Distribution and Traffic Assignment

The second and third components of the travel demand analysis includes an estimation of the geographical distribution of origins and destinations for the trips generated by the Project (trip distribution) and the assignment of these trips to the study area roadway system (traffic assignment). As stated above, the geographic distribution of trips generated by the Project is dependent on characteristics of the street system serving the Project Site,

[a] *Ford Theatre traffic volumes during the Weekday P.M. Peak Hour include staff (e.g., employees, setup crews, production managers, etc.) trips associated with operations of the theatres (Amphitheatre, 299-seat theatre, & multi-purpose flex space).*

[b] *Weekday Evening Event Peak Hour reflects the Project Design Feature staggering of event start times between Amphitheatre and 299-seat theatre. Thus, a total of 1,299 seats is included for analysis, representing full occupancy of Amphitheatre and multi-purpose flex space (1,200 + 99 seats).*

[c] *The restaurant uses will primarily support the Ford Theatres, but will be open to the public. Thus, an internal capture credit was applied to account for patrons also attending an event at the Ford Theatres.*

[d] *Transit reduction to account for patrons and employees that may use transit, based on the improved Transit Plaza and continued presence of a shuttle to/from the Universal City/Studio City Metro Red Line Station.*

[e] *Based on information provided by Ford Theatre as part of the Project a total of 85 employees will be on-site, including 50 Ford Theatre employees (8:00 A.M. to 5:00 P.M.) and 35 Parks & Recreation employees that arrive and depart outside of the commuter peak periods (arrive by 6:00 A.M., depart before 4:00 P.M.). It should be noted that the employee numbers are overly conservative, as they do not account for the existing 140 LA Phil employees that will be replaced by other County employees relocated onsite with the Project.*

Source: Gibson Transportation Consulting, Inc., 2014.

the level of accessibility of routes to and from the Project Site, and the locations of nearby residential, entertainment and employment centers. Based on the observed distribution of traffic in the vicinity of the Project Site, Project traffic was assigned to the surrounding streets as follows: approximately 50 percent of the total Project traffic was assigned to the north of the Project Site; approximately 50 percent of the total Project traffic was assigned to the south of the Project Site; and approximately 60 percent of the Project traffic was assigned to/from the US-101 and the Project Site.

(iii) Existing with Project Intersection Conditions

The Existing with Project analysis assumes the Project is constructed, to full buildout, and added to existing traffic conditions. The Existing with Project analysis does not include ambient traffic growth, related project traffic growth, future roadway and infrastructure improvements, or mitigation. Existing with Project intersection operating conditions during the analyzed periods are shown in Table IV.K-6 on page IV.K-28.

As provided therein, five of the eight intersections are projected to operate at LOS D or better during the analyzed periods. The remaining three intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these three intersections are the same intersections currently operating at LOS E or F under Existing Conditions, as previously identified above (Intersection Nos. 1, 2, and 5). Asshown in Table IV.K-6, the addition of Project traffic to the study intersections would not exceed applicable significance thresholds. Therefore, the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Existing with Project Conditions.

(iv) Future (Year 2020) with Project Intersection Conditions

The Future (Year 2020) with Project analysis assumes the Project is constructed, to full buildout, in year 2020 and added to future baseline conditions, which, as previously described, comprises baseline traffic and ambient and related project traffic growth, but does not include any mitigation. Future (Year 2020) with Project intersection operating conditions during the analyzed hours are shown in Table IV.K-7 on page IV.K-30. As shown therein, four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods under Future (Year 2020) with Project Conditions. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these four intersections are the same intersections projected to operate at LOS E or F under Future Conditions (without the Project), as previously identified (Intersection Nos. 1, 2, 5, and 6). As summarized in Table IV.K-7, similar to the Existing with Project Conditions scenario above, Project traffic would contribute a small increase in the V/C ratios at most study intersections. Therefore, the

Table IV.K-6

Source: Gibson Transportation Consulting, Inc., 2014.

Project would not result in a significant impact at any of the study intersections during the analyzed periods under Future with Project Conditions.

(2) Congestion Management Program

(a) CMP Freeway Analysis

As stated above, the geographic distribution of trips generated by the Project is dependent on characteristics of the street system serving the Project Site, the level of accessibility of routes to and from the Project Site, and the locations of nearby residential, entertainment and employment centers. Based on the observed distribution of traffic in the vicinity of the Project Site, approximately 60 percent of the Project traffic was assigned to/from the US-101 and the Project Site. According to the trip generation estimates shown above in Table IV.K-5 on page IV.K-26, the Project is expected to generate approximately 35 net new trips in the weekday A.M. peak hour, approximately 60 net new trips in the weekday P.M. peak hour, approximately 18 net new trips in the weekday evening peak hour, approximately 92 net new trips in the Saturday midday peak hour, and approximately 92 net new trips in the Saturday evening peak hour. As detailed in the Project trip distribution patterns illustrated in Figures 10A, 10B, and 10C of the Traffic Study provided as Appendix L of this Draft EIR, the Project would add fewer than 150 trips in either direction during the weekday morning and afternoon peak hours. Therefore, no CMP impact would occur and no additional analysis of freeway segments is required per the CMP criteria.

(b) CMP Arterial Monitoring Stations

As previously described, the CMP arterial monitoring stations closest to the Project Site include Santa Monica Boulevard & Highland Avenue and Cahuenga Boulevard & Lankershim Boulevard. Based on the Project trip generation and trip distribution patterns illustrated in Figures 10A, 10B, and 10C of the Traffic Study included as Appendix L of this Draft EIR, the Project is estimated to add fewer than five trips to each of the arterial monitoring stations during the morning and afternoon peak hours. Therefore, the Project would not add more than 50 vehicle trips during the morning and afternoon peak hours at CMP arterial monitoring stations. Therefore, the Project's CMP arterial impacts are considered to be less than significant, and no further analysis is required.

(c) CMP Transit Analysis

(i) Construction

Project construction would not require the relocation or removal of the existing Metro transit stop adjacent to the Project Site or other transit stops in the vicinity of the Project Site. As such, Project development would not result in significant impacts on transit access.

(ii) Operation

According to the trip generation estimates shown above in Table IV.K-5 on page IV.K-26, the Project is expected to generate approximately 35 net new trips during weekday morning peak hour and 60 trips during weekday afternoon peak hour. Per

the methodology presented in the CMP, applying the average vehicle ridership factor of 1.4 to the estimated net new vehicle trips results in an estimated increase of approximately 49 new person trips during the weekday morning peak hour and 84 new person trips during the afternoon peak hour. The CMP provides that, of the total net person trips of a project that is not primarily residential or commercial, 3.5 percent of the total person trips attributable to the Project be assigned astransit riders. Following this approach, the Project would generate an estimated increase in transit riders of approximately three net new transit trips in the weekday morning peak hour and two net new transit trips in the weekday afternoon peak hour. As detailed above, the study area is served by numerous established transit routes, including the Metro Red Line, two Metro bus lines, and one LADOT bus line. Distribution of the Project transit trips to the transit routes available in the area would result in less than one new transit user for each transit line during the peak hours. Consequently, the total available capacity of the transit lines within the study area during the morning and afternoon peak hours is anticipated to more than accommodate the limited net additional trips during the morning and afternoon peak periods. Therefore, Project impacts on existing or future transit services in the study area would be less than significant.

(3) Access and Circulation

(a) Emergency Access

(i) Construction

Construction activities for the Project would be concentrated within the Project Site with limited off-site activities for implementation of any necessary utility improvements. As outlined above in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls, including provisions to prohibit construction equipment or material deliveries within the public right-of-way and the use of flag persons to improve traffic flow. Implementation of such provisions would ensure adequate emergency access to residences adjacent to the Project Site. In addition, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, access to the Project Site would continue to be available during construction of the Project. Thus, any potential emergency access impacts from Project-related construction would be less than significant.

(ii) Operation

As described in Section II, Project Description, of this Draft EIR, upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. Specifically,

to facilitate access and circulation within the proposed Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The existing circular driveway at the upper gate would also be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access. In addition, the Project would incorporate specific emergency access recommendations provided by the County Fire Department and the City of Los Angeles Fire Department as set forth in Project Design Feature J.1-2 included in Section IV.J.1, Public Services—Fire Protection, of this Draft EIR. In addition, as discussed above, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Notwithstanding, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and LAFD. Therefore, the Project would not result in inadequate emergency access and impacts would be less than significant.

(b) Bicycle and Pedestrian Access

(i) Construction

Construction of the Project would primarily be contained within the boundaries of the Project Site and would not affect the adjacent street system. In addition, as outlined above in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls and address any temporary lane or sidewalk closures, if necessary. Thus, any potential access impacts from Project-related construction would be less than significant.

(ii) Operation

Existing pedestrian facilities would remain with implementation of the Project. As such, pedestrian access to the Project Site would continue to be available from the sidewalks currently provided along Cahuenga Boulevard East. In addition, as part of the Project, on-site pedestrian circulation would be improved by accommodating parking within two new parking structures and providing designated pedestrian pathways to and from the parking structures and the on-site uses, thereby eliminating the pedestrian-vehicular conflicts associated with a stacked parking configuration. With the implementation of the Transit Center and modifications to the driveways described above, the Project would also improve access and circulation for vehicles and shuttles.

As previously described, bicycle lanes in the study area currently exist on North Cahuenga Boulevard between Odin Avenue and Yucca Street. In addition, there are two streets designated as bicycle routes: Odin Avenue between Highland Avenue and North Cahuenga Boulevard and Wilcox Avenue south of North Cahuenga Boulevard. As these facilities do not cross the access locations to the Project Site, the Project would not affect existing designated bicycle lanes and routes in the study area. Notwithstanding, the existing sidewalks, access driveways, and lane configurations would be maintained with the Project. In addition, the Project would include bicycle amenities (e.g., bicycle parking and bicycle-friendly amenities) located throughout the Project Site.

In summary, the Project would not decrease the performance or safety of the existing circulation system and no significant impacts with regard to pedestrian and bicycle facilities are expected to result due to the design or placement of Project access points.

(4) Parking

(a) Construction

During construction of the Project, parking for employees and construction workers would be provided on-site. In addition, the Construction Management Plan outlined above in Project Design Feature K-1, would address and manage on-site parking for employees and construction workers within the Project Site. Therefore, Project construction would not result in a significant impact with regard to the availability of parking.

(b) Operation

The parking demands of the Project would fluctuate depending on the activities, programs, and events held; time of the year (e.g., holidays); day of the week (weekdays and weekends); and time of the day. Therefore, an assessment of parking demand was conducted for several potential scenarios, including on a non-event day and during event days with varying attendance levels. The peak parking demand for the Project during the peak parking demand scenarios analyzed was estimated based on a combination of the Project's unique operational characteristics, including attendance levels, anticipated visitor arrival and departure patterns, empirical data from existing operations, industry-wide parking demand rates, average vehicle ridership rates, mode split (e.g., arriving by transit, walk, bicycle, etc.), internal capture (e.g., between the restaurant and the theatre uses), and employee data. A detailed summary of the parking demand for different operational scenarios is provided in Table 10 through Table 13 of the Traffic Study included in Appendix L of this DEIR. A summary of the parking demand scenarios analyzed and the results of the parking demand analysis is as follows:

- Non-event—This scenario assumes only office employees (e.g., Ford Theatre Foundation, Los Angeles County Arts Commission, Parks and Recreation staff), restaurant patrons, restaurant employees, and hikers would be on-site. It is also assumed that all restaurant patrons would be on-site simultaneously. During a non-event day, a peak parking demand of 291 spaces would be required.

- Event (attendance up to 1,100 patrons)—This scenario assumes an attendance level of up to 1,100 patrons in a combination of the theatres, along with the associated employees and restaurant use. During an event day with up to 1,100 patrons, a peak parking demand of 427 spaces would be required.

- Event (attendance of 1,101 to 1,300 patrons)—This scenario assumes an attendance level of 1,101 to 1,300 patrons in a combination of the theatres, along with the associated employees and restaurant use. During an event day with an attendance level of 1,101 to 1,300 patrons, a peak parking demand of 484 spaces would be required.

- Event (attendance of 1,301 to 1,598 patrons)—This scenario assumes an attendance level of 1,301 to 1,598 patrons, representing a sold out condition within all theatres, along with the associated employees and restaurant use. During an event day with an attendance level of 1,301 to 1,598 patrons, a peak parking demand of 568 spaces would be required.

As part of the Project, parking is proposed within two new parking structures, which are proposed to provide a total of 500 parking spaces (250 parking spaces in each structure). Parking within the parking structures could be expanded by approximately 75 spaces with the use of attendant assisted parking for a total of 575 parking spaces provided on-site. Additional parking at the Universal City/Studio City Metro Red Line Station would also continue to be available to accommodate the parking needs of the Project. Further, as outlined above in Project Design Feature K-3, the Project would include implementation of a Parking and Traffic Management Plan to address the varying parking needs of the Project. As summarized in Table 14 of the Traffic Study included as Appendix L of this Draft EIR, the peak parking demand for the different operation conditions would be accommodated based on the number of parking spaces to be provided and with implementation of the strategies set forth in the Parking and Traffic Management Plan, including a combination of existing on-site parking facilities, operational measures to increase parking supply such as attendant-assisted parking, employee parking management, and continued use of the parking spaces and shuttle from the Universal City/Studio City Metro Red Line Station for employees and patrons. Therefore, a sufficient number of parking spaces would be available to serve the estimated peak parking demand during a non-event day and during the analyzed event day scenarios, and Project impacts with regard to parking would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site and enhance

circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

(5) Summary of Impact Analysis

As provided by the analysis presented above, the Project would not result in significant impacts with regard to the local or regional transportation system, including intersections, highways, transit, and pedestrian and bicycle facilities. As such, the Project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, or conflict with an applicable congestion management program. In addition, the Project would not result in inadequate emergency access. Therefore, as demonstrated in the analysis above, impacts with regard to these topics would be less than significant.

(6) Consistency with Regulatory Framework

As analyzed above, the Project would not result in significant impacts to public transit, bicycle, or pedestrian facilities and therefore would not decrease the performance or safety of such facilities. In addition, with implementation of the Project, the County would continue to promote several modes of transportation including walking, biking, or public transportation. Therefore, the Project would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities and such impacts would be less than significant.

7. Cumulative Impacts

a. Traffic

(1) Construction

As shown in Figure III-1 in Section III, Environmental Setting, of this Draft EIR, the related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, are not located in close proximity to the Project Site and may or may not be developed within the same construction schedule as the Project. In addition, as all of the related projects are located within the jurisdiction of LADOT, per standard City practice, the construction of large development projects would occur in accordance with project-specific construction management plans, as is the case with the Project. As the construction management plans are reviewed and approved by LADOT, it is anticipated that through this process, LADOT would coordinate construction activities among the related projects that would have the potential to result in cumulative intersection impacts. In addition, as analyzed above, the Project would not result in significant impacts at any of the

intersections within the study area during construction. Further, implementation of the Construction Management Plan, as outlined above in Project Design Feature K-1, would manage construction-related traffic in the study area. Thus, given the distance of the Project Site to the related Projects and the construction management plans that would be in place for the Project and the related projects, the Project's contribution to cumulative construction-related traffic impacts would not be cumulatively considerable and cumulative impacts would be less than significant.

(2) Operation

Implementation of the Project in conjunction with the related projects identified in Section III, Environmental Setting, of this Draft EIR, and projected regional growth would increase the amount of traffic in the study area. As described above in the Approach and Methodology subsection, the analysis of Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS. As detailed above in Table IV.K-4 on page IV.K-19, cumulative conditions (Future (Year 2020) Conditions) demonstrate four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. As shown in Table IV.K-7 on page IV.K-30, the Project would not contribute to any significant impacts to these intersections and the Project's contribution to cumulative impacts would not be cumulatively considerable. As such, cumulative impacts would be less than significant.

b. Congestion Management Program

As described above, the Project would not add more than 50 vehicle trips during the A.M. and P.M. peak hours at the CMP arterial monitoring stations nearest to the Project Site. In addition, the Project would add less than 150 trips along the nearest freeway segment serving the Project Site in either direction during either peak hour. Further, the Project would not result in significant impacts to public transit. Thus, no CMP impact would occur under the Project and, as a result, the Project's contribution to cumulative impacts would not be cumulatively considerable. Thus, the Project's cumulative impacts would be less than significant.

c. Access and Circulation

(1) Emergency Access

Project implementation in addition to some of the related projects and regional growth (depending on proximity to the Project Site) would contribute to an increase in the amount of traffic around the Project area. As described above, the analysis of the Future

(Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS in the study area. This analysis concluded that the Project would result in less-than-significant impacts to study intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Therefore, the Project's cumulative impacts would not be cumulatively considerable. In addition, as with the Project, it is anticipated that related projects would continue to consult with the applicable Police and Fire departments regarding emergency access requirements and implement specific emergency access requirements. Additionally, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Therefore, the Project's cumulative impacts to emergency would be less than significant.

(2) Bicycle and Pedestrian Access

As provided above, Project impacts to bicycle and pedestrian access would be less than significant. Based on the proximity of the Project Site to the related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, development of the Project in conjunction with the related projects would not be expected to impact any existing shared bicycle and pedestrian facilities. Additionally, as with the Project, the applicants of the related projects would be required to design and construct their projects in conformance with applicable standards regarding sight distance, sidewalks, crosswalks, and pedestrian movement controls. Therefore, cumulative impacts would be less than significant.

d. Parking

The parking demand associated with the Project would not contribute to the cumulative demand for parking in the vicinity of the Project Site as a result of development of the Project and related projects. Specifically, as shown in Figure III-1 in Section III, Environmental Setting, of this Draft EIR, the related projects are sufficiently separated from the Project Site such that they would not share parking supplies. Additionally, because the Project would increase the number of parking spaces within the Project Site and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets. Therefore, cumulative parking impacts would be less than significant.

8. Mitigation Measures

The Project would result in less than significant impacts to traffic, access, and parking. No mitigation measures would be required.

9. Conclusion

a. Traffic

The Project would not result in significant impacts during Project construction or operation along the analyzed intersections under Existing with Project Conditions or Future (Year 2020) with Project Conditions.

b. Congestion Management Plan

No significant impacts to CMP arterial monitoring stations or freeway segments would occur. In addition, the Project's transit impacts would be less than significant.

c. Access and Circulation

Project access impacts as well as impacts related to pedestrian/bicycle facilities would be less than significant.

d. Parking

Project impacts related to parking would be less than significant.

IV. Environmental Impact Analysis

L.1 Utilities and Service Systems—Water

1. Introduction

This section analyzes the Project's potential impacts on water supply and water infrastructure. The analysis describes regional water supplies and the existing water infrastructure system serving the Project Site, estimates the water demand associated with the Project, and assesses whether there is sufficient water supply and infrastructure capacity to meet that demand. This analysis is based, in part, on the *Water System and Supply Study* prepared for the Project by Mollenhauer (March 2014) included as Appendix M of this Draft EIR.

2. Environmental Setting

a. Regulatory Framework

(1) State

(a) California Urban Water Management Plan Act

The California Urban Water Management Planning Act (California Water Code, Sections 10610–10656) addresses several State policies regarding water conservation and the development of water management plans to ensure the efficient use of available water supplies. The California Urban Water Management Planning Act also requires water suppliers to develop water management plans every five years to identify short-term and long-term demand management measures to meet growing water demands during normal, single-dry, and multiple-dry years. Specifically, municipal water suppliers that serve more than 3,000 customers or provide more than 3,000 acre-feet per year of water must adopt an Urban Water Management Plan.

(b) California Code of Regulations

Title 24, Part 5 of the California Code of Regulations (CCR), establishes the California Plumbing Code (last updated in 2013) which became effective January 1, 2014. The California Plumbing Code sets forth efficiency standards (i.e., maximum flow rates) for all new federally regulated plumbing fittings and fixtures, including showerheads and lavatory faucets. Accordingly, the maximum flow rate for showerheads is 2.0 gallons per

minute (gpm) at 80 pounds per square inch (psi). The maximum flow rate for lavatory faucets is 1.5 gpm at 60 psi. In addition, all water closets (i.e., flush toilets) are limited to 1.6 gallons per flush and urinals are limited to 0.5 gallon per flush. Further, Section 1605.3(h) establishes State efficiency standards for non-federally regulated plumbing fittings, including commercial pre-rinse spray valves.[1]

(2) Regional and County

(a) Metropolitan Water District of Southern California

Based on the water supply planning requirements imposed on its member agencies and ultimate customers, the Metropolitan Water District of Southern California (MWD) has adopted a series of official reports on the state of its water supplies. These plans are summarized below. As described, MWD has developed plans intended to provide solutions that, when combined with the rest of its supply portfolio, will ensure a reliable long-term water supply for its member agencies.

(i) MWD's 2010 Regional Urban Water Management Plan

MWD's 2010 Regional Urban Water Management Plan addresses the future of MWD's water supplies and demand through the year 2035.[2] Based on the 2010 Regional Urban Water Management Plan, MWD has plans for supply implementation and continued development of a diversified resource mix including programs in the Colorado River Aqueduct, State Water Project, Central Valley transfers, local resource projects, and in-region storage that enables the region to meet its water supply needs. In addition, MWD has comprehensive plans for stages of actions it would undertake to address up to 50 percent reduction in its water supplies. MWD has also developed an Emergency Storage Requirement to mitigate against potential interruption in water supplies resulting from catastrophic occurrences within the Southern California region as well as working with the State to implement a comprehensive improvement plan to address catastrophic occurrences that could occur outside of the Southern California region.

(ii) MWD's Integrated Resources Plan

MWD first adopted its Integrated Resources Plan in 1996. The Integrated Resources Plan is updated every five years. The most recent Integrated Resources Plan,

---

[1] *California Building Standards Commission, 2013 California Plumbing Code, Appendix L, Section 402, www.iapmo.org/Pages/2013CaliforniaPlumbingCode.aspx, accessed March 12, 2014.*

[2] *Metropolitan Water District of Southern California, The Regional Urban Water Management Plan, November 2010, www.mwdh2o.com/mwdh2o/pages/yourwater/RUWMP/RUWMP_2010.pdf, accessed March 27, 2014.*

which was adopted in 2010, demonstrates how MWD plans to develop its water resource supply portfolio out to the year 2035, including planning for hydrologic, regulatory, and other types of uncertainties.[3] Under the strategy of the 2010 Integrated Resources Plan Update, MWD will continue to develop programs to meet its reliability within its traditional core supplies, collaborate with member agencies to develop a buffer to address uncertainty, and pursue foundational actions to address other future supply vulnerabilities and uncertainties. Overall, the strategies presented in the 2010 Integrated Resources Plan Update are projected to meet the future water supply needs of Southern California, and identify the "low-regret" actions that MWD can take in order to swiftly respond to the uncertainties that exist with all water resource programs.

(iii) MWD's Water Surplus and Drought Management Plan

In 1999, MWD incorporated the water shortage contingency analysis that is required as part of any urban water management plan into a separate, more detailed plan, called the Water Surplus and Drought Management Plan. The overall objective of the Water Surplus and Drought Management Plan is to ensure that shortage allocation of MWD's imported water supplies is not required.[4] This plan provides policy guidance to manage MWD's supplies and achieve the goals laid out in the agency's Integrated Resources Plan. The Water Surplus and Drought Management Plan separates resource actions into two major categories: Surplus Actions and Shortage Actions. The Water Surplus and Drought Management Plan considers the region to be in surplus only after MWD has met all demands for water, including replenishment deliveries. The Surplus Actions store surplus water, first inside then outside of the region. The Shortage Actions of the Water Surplus and Drought Management Plan are separated into three subcategories: Shortage, Severe Shortage, and Extreme Shortage. Each category has associated actions that could be taken as a part of the response to prevailing shortage conditions. Conservation and water efficiency programs are part of MWD's resource management strategy through all categories.

(iv) MWD's Water Supply Allocation Plan

While the Water Surplus and Drought Management Plan included a set of general actions and considerations for MWD staff to address during shortage conditions, it did not include a detailed water supply allocation plan or implementation approach. Therefore,

---

[3] *Metropolitan Water District of Southern California, Integrated Water Resources Plan: Report No. 1373, 2010 Update, www.mwdh2o.com/mwdh2o/pages/yourwater/irp/IRP2010Report.pdf, accessed April 4, 2014.*

[4] *Metropolitan Water District of Southern California, Water Surplus and Drought Management Plan: Report No. 1150, August 1999, www.mwdh2o.com/mwdh2o/pages/yourwater/WSDM_Report1150.pdf, accessed April, 4, 2014.*

MWD adopted a water supply plan called the *Water Supply Allocation Plan* in February 2008. This plan includes a formula for determining reductions of water deliveries to member agencies during extreme water shortages in MWD's service area conditions (i.e., drought conditions or unforeseen cuts in water supplies).

(v) MWD's Five Year Supply Plan

In April 2008, MWD staff began working with MWD's member agencies on a *Five Year Supply Plan* (Supply Plan) to identify specific resource and conservation actions over the next five years to manage water deliveries under continued drought conditions and court ordered restrictions. The Supply Plan focuses on the following six categories of resource options to improve MWD's reliability over the next five years: water conservation, Colorado River transactions, Near Term Delta Actions, State Water Project transactions, groundwater recovery, and local resources.

(b) County of Los Angeles

In August 2008, the County Board of Supervisors adopted a Resolution declaring a countywide water supply and conservation alert, which: (a) urged the County residents, businesses, local water purveyors, and cities to intensify water conservation efforts to achieve an overall reduction in water demand of 15 to 20 percent; (b) directed all County departments to evaluate water usage and immediately implement conservation measures to reduce consumption by a target amount of 10 percent by December 31, 2008, and report back to the Board of Supervisors with recommended measures to reduce consumption by an additional 10 percent; (c) urged local water purveyors and cities to accelerate and intensify public outreach campaigns; (d) urged cities to update and adopt water wasting ordinances and prepare for enforcement of the ordinances, if necessary; and (e) encouraged County residents to follow 10 easy tips to reduce their water consumption.[5] In response to this directive, the County Board of Supervisors readopted such provisions in the Los Angeles County Code, imposing water conservation requirements for the Los Angeles County area, such as prohibiting the wash down of driveways and sidewalks, limiting the hours and duration of watering any lawn or landscaping, and prohibiting water runoff into adjoining streets.[6] In addition, the Los Angeles County Code includes

[5] *Resolution of the Board of Supervisors of the County of Los Angeles, California, Declaring a Countywide Water Supply and Conservation Alert, adopted August 5, 2008.*

[6] *Los Angeles County Code, Title 11, Chapter 11.38 Water and Sewers, Part 4 Water Conservation Requirements for the Unincorporated Los Angeles County Area, previously terminated on January 1, 1993 and readopted on October 7, 2008.*

regulations for designing, installing, and maintaining water-efficient landscapes in new projects.[7]

In November 2008, the County Board adopted a Green Building Program, in part, to improve the design and construction techniques that would promote water conservation. The Green Building Standards Ordinance[8] is a component of the Green Building Program, and requires the installation of smart irrigation controllers and high-efficiency toilets. In addition, the Drought-Tolerant Landscaping Ordinance[9] provides additional standards for the design and installation of landscaping using drought-tolerant plants that require minimal use of water and limitations on turf areas. The Low Impact Development Ordinance[10] encourages the preservation of watersheds, drainage paths, water supplies, and natural resources through compliance with additional development standards identified in the Low Impact Development Standards Manual and Green Building and Sustainability Guidelines for the County of Los Angeles. If a conflict exists between provisions of the Green Building Program and other ordinances, statutes, regulations, or requirements, the County requires the stricter provision to apply.[11]

(3) Local

(a) LADWP's 2010 Urban Water Management Plan

The Los Angeles Department of Water and Power's (LADWP) 2010 Urban Water Management Plan, adopted by the Board of Water and Power Commissioners in May 2011, details LADWP's efforts to promote the efficient use and management of its water resources and provides the basic policy principles that guide LADWP's decision-making process to secure a sustainable water supply for the City of Los Angeles in the next 25 years. LADWP's 2010 Urban Water Management Plan projects a 15 percent lower water demand trend than what was projected in the 2005 Urban Water Management Plan and lays out a detailed plan to develop a sustainable water supply portfolio that includes the increase of local water supplies and water conservation from the current 12 percent to 43 percent by 2035. Based on LADWP's 2010 Urban Water Management Plan, the focus on local supplies would increase flexibility and overall water supply reliability.

(b) LADWP's Securing L.A.'s Water Supply

The City of Los Angeles is faced with various ongoing challenges in securing its future water supplies due to among other things droughts, environmental restrictions, and climate change. In response to these uncertainties, the City prepared and released a Water Supply Action Plan entitled *Securing L.A.'s Water Supply* dated May 17, 2008.[12] The plan serves as a template for creating sustainable sources of water for the future of the City to reduce dependence on imported supplies. The plan also takes into account the realities of climate change and the concerns of drought and dry weather. The plan outlines short-term conservation strategies as well as long-term conservation and recycling measures. Short-term conservation strategies include enforcing prohibited uses of water, expanding the prohibited uses of water, extending outreach efforts, and encouraging regional conservation measures. Long-term conservation and recycling measures include increasing water conservation through reduction of outdoor water use and technology, maximizing water recycling, enhancing stormwater capture, accelerating clean-up of the San Fernando groundwater basin, and expanding groundwater storage.

b. Existing Conditions

(1) Water Supply

LADWP is responsible for providing water to properties within the City of Los Angeles limits, including the Project Site, and ensuring that the water quality meets applicable California health standards for drinking water. Water is supplied to the City from four primary sources: the Los Angeles Aqueducts, local groundwater, MWD, and recycled water. As shown in Table IV.L.1-1 on page IV.L.1-7, in 2011, the LADWP had an available water supply of 539,282 acre-feet, of which approximately 66 percent was from the Los Angeles Aqueducts, approximately 9 percent from local groundwater, approximately 23 percent from the MWD, and approximately 1.4 percent from recycled water. These water sources are described in further detail below.

(a) Los Angeles Aqueducts

Snowmelt runoff from the Eastern Sierra Nevada Mountains is collected and conveyed to the City via the Los Angeles Aqueducts. The Los Angeles Aqueducts' supplies come primarily from snowmelt and secondarily from groundwater pumping, and can fluctuate yearly due to the varying hydrological conditions.

Table IV.L.1-1
Los Angeles Department of Water and Power 2002–2011 Water Supply

Year	Los Angeles Aqueducts	Local Groundwater	MWD	Recycled Water	Transfer, Spread, Spills, and Storage[a]	Total
2002	179,237	85,153	401,303	1,944	-1,405	**669,042**
2003	251,340	86,341	317,774	1,759	2,528	**654,687**
2004	203,190	75,696	392,603	1,774	-2,958	**676,221**
2005	376,394	57,623	185,002	1,401	3,140	**617,280**
2006	380,235	67,299	189,975	3,893	-1,336	**642,738**
2007	127,392	88,041	438,344	3,595	1,044	**656,327**
2008	148,407	64,604	430,959	7,048	1,664	**649,354**
2009	137,261	66,998	357,005	7,570	3,052	**565,782**
2010	251,126	68,346	208,264	6,900	-938	**535,574**
2011	357,752	48,772	124,913	7,692	-153	**539,282**

Units are in acre-feet.

[a] *A negative number does not represent a loss. Rather, the negative number indicates the amount of water that has been taken or stored into the reservoir system. A positive number indicates spills from the reservoir system.*

Source: Los Angeles Department of Water and Power, 2012.

The City holds water rights in the Eastern Sierra Nevada where the Los Angeles Aqueducts' water supplies originate. These supplies originate from both streams and from groundwater. As indicated in Table IV.L.1-1, approximately 357,752 acre-feet of LADWP's water supplies were from the Los Angeles Aqueduct in 2011. Average deliveries from the Los Angeles Aqueduct system from 2002 through 2011 were approximately 241,233 acre-feet of water annually. Based on modeling results, LADWP projects that the average annual long-term Los Angeles Aqueducts delivery over the next 25 years is expected to be approximately 254,000 acre-feet per year and gradually decline to 244,000 acre-feet per year due to climate change impacts.[13] In addition, in the last decade, environmental considerations have required that the City reallocate approximately one-half of the Los Angeles Aqueducts water supply to environmental mitigation and enhancement projects.

[13] *Los Angeles Department of Water and Power, 2010 Urban Water Management Plan.*

(b) Groundwater

LADWP traditionally extracts groundwater from wellfields throughout the Owens Valley and local groundwater basins. Groundwater from the Owens Valley is currently accounted for in the Los Angeles Aqueduct discussion and data above. LADWP has water rights in the San Fernando and Sylmar Basins as well as two other local groundwater basins, the Central and West Coast Basins. The San Fernando, Sylmar, and Central Basins are subject to court judgments. Accordingly, pumping in the San Fernando and Sylmar Basins must be reported to the court-appointed Upper Los Angeles River Area Watermaster and pumping in the Central Basin is reported to the California Department of Water Resources, which acts as Watermaster.

LADWP has accumulated nearly 486,759 acre-feet of stored water credits in the San Fernando Basin as of October 2011.[14] This water can be withdrawn from the basin during normal and dry years or in an emergency, in addition to LADWP's approximately 87,000 acre-foot annual entitlement in the basin. LADWP currently has an annual entitlement of 3,405 acre-feet from the Sylmar Basin. In addition, LADWP's annual entitlement to the Central Basin is 15,000 acre-feet.

As shown in Table IV.L.1-2 on page IV.L.1-9, from the 2010–2011 water year (October through September), the LADWP extracted 43,951 acre-feet from the San Fernando Basin, 963 acre-feet from the Sylmar Basin, and 4,536 acre-feet from the Central Basin.[15] LADWP plans to continue production from its groundwater basins in the coming years to offset reductions in imported water supplies. Extraction from the basins will, however, be limited by water quality and overdraft protection. Both LADWP and the California Department of Water Resources have programs in place to monitor wells to prevent overdrafting. LADWP's groundwater pumping practice is based on a "safe yield" operation. The objective, over a period of years, is to extract an amount of groundwater equal to the native and imported water that recharges the basin.

(c) Metropolitan Water District of Southern California

MWD imports a portion of its water supplies from Northern California through the State Water Project's California Aqueduct and from the Colorado River through MWD's own Colorado River Aqueduct. As one of the 26 member agencies of MWD, LADWP purchases water from MWD to supplement LADWP water supplies from the Los Angeles Aqueducts and local groundwater. As of June 30, 2010, LADWP had a preferential right to

purchase 20.51 percent of MWD's total water supply.[16] As indicated in Table IV.L.1-1 on page IV.L.1-7, in 2011, LADWP received approximately 124,913 acre-feet of water from MWD. LADWP will continue to rely on MWD to meet its current and future supplemental water needs. Summaries of MWD's individual supplies, along with the challenges facing each supply and specific actions that MWD is taking to meet each of the challenges facing its water supplies, are presented below.

(i) The Colorado River

The Colorado River was MWD's original source of water upon MWD's establishment in 1928. MWD has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior (Section 5 of the Federal Boulder Canyon Project Act). California is apportioned the use of 4.4 million acre-feet of water from the Colorado River each year plus one-half of any surplus that may be available for use collectively in Arizona, California, and Nevada. Since 2003, due to increased Colorado River water use by Arizona and Nevada and droughts in the Colorado River Basin, MWD's net diversions of Colorado River water have been limited to a low of nearly 633,000 acre-feet in 2006 and a high of approximately 1,105,232 acre-feet in 2009. Average annual net deliveries for 2003 through 2010 were approximately 849,500 acre-feet, with annual volumes dependent on availability of unused higher priority agricultural water and increasing transfer of conserved water. There are various agreements and guidelines that affect the management of Colorado River water supplies, and MWD has taken steps to augment its share of Colorado River water supplies by entering into agreements with other agencies that have rights to use such water. Challenges facing MWD's Colorado River

[16] *Los Angeles Department of Water and Power, 2012.*

supply include risk of future droughts in the Colorado River Basin, pending litigation, and environmental considerations. Federal and state environmental laws protecting fish species and other wildlife species also have the potential to affect Colorado River operations.

(ii) State Water Project

The State Water Project is a water storage and delivery system of reservoirs, aqueducts, power plants, and pumping plants. The main purpose of the State Water Project is to divert and store surplus water during wet periods and distribute it to areas throughout the State. MWD is one of the 29 agencies that have long-term contracts for water service from the Department of Water Resources, and is the largest agency in terms of the number of people it serves (almost 19 million), the share of the State Water Project that it has contracted to receive (approximately 46 percent), and the percentage of total annual payments made to the Department of Water Resources by agencies with state water contracts (approximately 58 percent in 2011). MWD's State Water Contract is set to expire in 2035 and MWD presently intends to exercise an option to continue service to at least 2052.[17]

The availability of State Water Project water supply is analyzed by the Department of Water Resources in terms of "Table A" and Article 21 water deliveries.[18] Table A deliveries represent the schedule of the maximum amount of water that water contractors to the Department of Water Resources may receive annually from the State Water Project. Table A deliveries are not guarantees of annual delivery amounts but are used to allocate individual contractors' portion of the delivery amounts available. Article 21 deliveries refer to Table A deliveries with additional water supplies received only under specified conditions. The State Water Project, under a 100 percent allocation, provides MWD with 1,911,500 acre-feet of water. For calendar year 2014, the Department of Water Resources' initial allocation estimate to State Water Project contractors was set at 5 percent of contracted amounts. On January 31, 2014, the Department of Water Resources announced that its 2014 State Water Project allocation would be decreased from 5 percent to 0 percent of total contracted water deliveries to the State Water Project contractors.[19] The allocation reflects the recent precipitation conditions, existing storage in

---

[17] *Los Angeles Department of Water and Power, 2012.*

[18] *All water contracts signed in the 1960s included an estimate of the date that State Water Project water would first be delivered and a schedule of the amount of water the contractor could expect to be delivered annually. That amount of water, known as the contractor's annual Table A amount, was designed to increase gradually until the designated maximum for that State Water Project contractor was reached.*

[19] *Department of Water Resources. California State Water Project, Notice to State Water Project Contractors Number 12-09, www.dwr.water.ca.gov/swpao/deliveries.cfm, accessed April 10, 2014.*

State Water Project conservation reservoirs, and State Water Project operational constraints.

The listing of several fish species as threatened or endangered under the federal and/or California Endangered Species Acts have impacted State Water Project operations and limited the flexibility of the State Water Project. Other issues, such as the decline of some fisheries in the Bay-Delta and surrounding regions and certain operational actions in the Bay-Delta, may also substantially reduce MWD's water supply from the Bay-Delta. The State Water Project operational requirements may be further modified under new biological opinions for listed species under the federal Endangered Species Act or by the California Department of Fish and Game's issuance of incidental take authorizations under the California Endangered Species Act. To address the environmental concerns within the Delta, several programs have been proposed and/or recently completed. These programs include the CALFED Bay-Delta Program, the Delta Vision Process, and the Bay-Delta Conservation Plan. To improve water supply reliability for the entire Southern California region, MWD has also been pursuing voluntary water transfer and exchange programs with State, federal, public and private water districts and individuals.

(d) Water Conservation and Recycling

Water conservation and recycling will play an increasing role in meeting future water demands. LADWP has implemented water conservation and recycling programs with efforts underway to further promote and increase the level of these programs. LADWP is committed to supplying a higher percentage of the City's water demand through water conservation and recycling. In addition, the City's *Securing L.A.'s Water Supply* Plan serves as a template for creating sustainable sources of water for the future of the City to reduce dependence on imported supplies. The premise of the plan is for the City to meet all new demand for water due to projected population growth through a combination of water conservation and water recycling. More recently, LADWP's 2010 Urban Water Management Plan details the City's efforts to promote the efficient use and management of its water resources and provides the basic policy principles that guide LADWP's decision-making process to secure a sustainable water supply for the City of Los Angeles in the next 25 years. LADWP's 2010 Urban Water Management Plan projects a 15 percent lower water demand trend than what was projected in the 2005 Urban Water Management Plan and lays out a detailed plan to develop a sustainable water supply portfolio that includes the increase of local water supplies and water conservation from the current 12 percent to 43 percent by 2035.

(e) Precipitation Conditions

According to the Department of Water Resources, with rainfall precipitation far below normal during the winter season, California's 2014 water year has been one of the driest

years in decades and follows two consecutive dry years throughout the State.[20,21] In response to the drought conditions, California Governor Edmund G. Brown Jr. declared a State of Emergency on January 17, 2014 and directed State officials to take all necessary actions to prepare for water shortages. On January 31, 2014, the Department of Water Resources announced several actions to address water shortages, including reducing the anticipated allocation of water to customers of the State Water Project as described above, notifying long-time water rights holders in the Sacramento Valley that their water rights may be reduced to 50 percent, and asking the State Water Resources Control Board to adjust requirements that hinder conservation of currently stored water.[22] In addition, the Department of Water Resources expects to install temporary rock barriers across several Delta channels in order to protect water quality in the Delta and preserve water supplies stored in upstream reservoirs. A Drought Operations Plan and Operational Forecast, prepared by several agencies, was also released on April 8, 2014 that outlines proposed actions and a range of coordinated operations of the Central Valley Project and the State Water Project from April 1, 2014 through November 15, 2014. The purposes of this plan are to operate the Central Valley Project and the State Water Project to provide for, at a minimum, essential human health and safety needs; control saltwater intrusion in the Sacramento-San Joaquin Delta; preserve enough cold water in Shasta Lake and other reservoirs to maintain cool temperatures in the Sacramento River for Chinook salmon (these water supplies may be needed to provide critical needs in 2015 if conditions remain dry); and maintain minimum protections for endangered species.

(f) Global Warming and Climate Change

Climate change has also been a factor for California's water supply. Potential impacts of climate change on California's water resources include increases in temperature that could result in drought, stressed cold-water species in rivers, and increased demand for irrigation; changes in precipitation patterns that could lead to floods, lowered groundwater table, a reduction in snowpack, and decreased hydroelectric power; and changes in sea levels that could increase pressure on Delta levees.[23] Based on ongoing environmental and policy planning efforts, MWD has demonstrated a commitment to addressing climate change by evaluating the vulnerability of its water systems to global warming impacts and has developed appropriate response strategies and management tools that account for the impacts of climate change on future water supplies.

[23] *State of California, Department of Water Resources, Managing an Uncertain Future, October 2008.*

(2) Water Demand

LADWP's 2010 Urban Water Management Plan provides water supply and demand projections in five-year increments to 2035, based on projected population estimates provided by the Southern California Association of Governments. Table IV.L.1-3 on page IV.L.1-14 shows the projected water demand from the year 2015 through 2035 for the City of Los Angeles.

As shown in Table IV.L.1-3, in 2035 during average year hydrological conditions, the City's water demand is forecasted to be approximately 710,800 acre-feet per year. Use of the current demand per capita within this demand forecast provides a conservative estimate of projected future water demand to ensure that water supplies are available to meet projected demands. LADWP's 2010 Urban Water Management Plan anticipates adequate water supplies would be available to the service areas under normal, single-dry, and multi-dry year conditions through 2035.[24]

Based on water demand factors from the 2010 California Plumbing Code and sewage generation factors established by the City of Los Angeles Bureau of Sanitation, which also serve to estimate water consumption, the existing average daily domestic water demand associated with the existing uses at the Project Site is approximately 6,529 gpd, as provided in Table IV.L.1-4 on page IV.L.1-15.

(3) Water Infrastructure

Domestic and fire water service to the Project Site is provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. Based on a Service Advisory Report coordinated between LADWP and the County Fire Department, included in Appendix K of this Draft EIR, the water main has a fire flow of 1,750 gpm at a residual pressure of 72 psi. The Project Site is served by two existing public fire hydrants located along the public sidewalk of Cahuenga Boulevard, west of the Project Site. Currently, the Project Site does not have a dedicated separate fire service meter, supply line, or on-site fire hydrants.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to water supply and water infrastructure would be significant if the Project would:

- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which would cause significant environmental effects; or

- Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed.

c. Project Design Features

The following Project Design Features would be implemented as part of the Project:

Project Design Feature L.1-1: The Project shall install new on-site water connections, where necessary, to distribute water within the Project Site.

Table IV.L.1-4
Existing Project Site Water Demand

Use	Unit	Average Daily Consumption Rate (gpd/unit)	Average Daily Water Demand (gpd)
Amphitheatre	1,196 seats	5 gpd/seat[a]	5,980
[Inside] the Ford	87 seats	5 gpd/seat[a]	435
Box office	365 sf	50 gpd/1000 sf[b]	18
Concessions Area	320 sf	300 gpd/1000 sf[b]	96
Total			**6,529**

[a] *Generation Factors are based on the 2010 California Plumbing Code.*

[b] *Water demand was calculated using the City of Los Angeles Department of Public Works sewage generation factors, which also serve to estimate water consumption.*

Source: Mollenhauer; Matrix Environmental, 2014.

Project Design Feature L.1-2: The Project shall implement water conservation features, including, but not limited to: high-efficiency toilets and urinals, auto lavatory faucets, use of "tankless" or "on demand" water heaters, drought-tolerant planting, minimal irrigation system, use of permeable surfaces, weather-based irrigation controller with rain shutoff, use of a separate water meter (or sub meter), flow sensor, and master valve shutoff for irrigated landscape areas.

d. Analysis of Project Impacts

(1) Construction

Construction activities for the Project would result in a temporary increase in water demand. Demand for water would be associated with soil compaction and earthwork, dust control, mixing and placement of concrete, equipment and site cleanup, irrigation for plant and landscaping establishment, water line testing and flushing, and other short-term related activities. These activities would occur incrementally throughout construction of the Project (from the start of construction to Project buildout) and would be temporary in nature. The amount of water used during construction would vary depending on the conditions of soils, weather, size of the construction site, and site-specific operations. It is estimated that a total of approximately 650,000 to 800,000 gallons of water could be used throughout construction of the Project. It is noted however that this increase in water demand associated with Project construction would be temporary in nature and would occur intermittently throughout construction as needed. In addition, as concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met

by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years.

The Project would require construction of new, on-site water distribution lines to serve the proposed uses. Construction impacts associated with the installation of water distribution lines are expected to be confined to trenching in order to place the lines below surface. As discussed in Section IV.J.1, Public Services—Fire Protection, of this Draft EIR, to accommodate the required fire flow for the Project, two new connections would be provided to the existing 8-inch high pressure water main in Cahuenga Boulevard East. Vehicular and pedestrian access within the Project Site and immediately surrounding the Project Site could be affected by construction activities associated with upgrading the existing water main. However, as discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. As part of the Construction Management Plan, provisions for temporary traffic control (e.g., flag persons) would be provided during all construction activities adjacent to public rights-of-way to improve traffic flows. In addition, prior to ground disturbance, Project contractors would coordinate with LADWP to identify the locations and depth of all lines. LADWP would also be notified in advance of proposed ground disturbance activities to avoid water lines and disruption of water service.

Based on the above, sufficient water supplies would be available to accommodate Project construction activities and, while the Project would require the construction of upgraded infrastructure facilities, the construction of such infrastructure improvements would not cause significant environmental effects. As such, construction-related impacts to water supply and infrastructure would be less than significant.

(2) Operation

(a) Water Supply

The analysis of the Project's impacts relative to water supply is based on a calculation of the Project's water demand by applying water demand rates contained in the 2010 California Plumbing Code to the proposed uses, as provided in Table IV.L.1-5 on page IV.L.1-17. As shown therein, it is estimated that the Project would have an average daily domestic water demand of approximately 17,470 gpd. When accounting for the existing total Project Site water demand of approximately 6,529 gpd, the Project would result in a net increase in average daily water demand of approximately 10,941 gpd. However, as noted in the Water System and Supply Study included in

Table IV.L.1-5
Proposed Project Site Water Consumption

Use	Unit	Average Daily Consumption Rate[a] (gpd unit)	Average Daily Water Demand (gpd)
Amphitheatre	1,196 seats	5 gpd/seat	5,980
New Theatre	299 seats	5 gpd/seat	1,495
Flex Space	99 seats	5 gpd/ person	495
Restaurant-employees	13 employees	20 gpd/employee	260
Restaurant-meals	500 meals	12 gpd/ meal	6,000
Office and Amenities-visitors	66 people	5 gpd/person	330
Office and Amenities-employees	120 employees	20 gpd/employee	2,400
Maintenance Area	27 employees	20 gpd/employee	540
Project Site Total Water Demand at Project Buildout			**17,470**
Existing Project Site Total Water Demand			**(6,529)**
Net Increase in Water Demand			**10,941**
Net Increase in Water Demand with Reduced Flow Fixtures			**5,471[b]**

[a] *Water consumption estimates based on 2010 California Plumbing Code*

[b] *This accounts for a 50-percent reduction due to high efficiency flow fixtures that have been developed since the 2010 Plumbing Code consumption factors were established.*

Source: Mollenhauer, Water System and Supply Study, 2014.

Appendix M of this Draft EIR, since development of the water demand rates from the California Plumbing Code used to calculate the Project's water demand, most water fixtures, including those that would be implemented as part of the Project, now have reduced flow rates by 50 percent. Therefore, when accounting for typical flow rates of existing water fixtures, the water demand of the Project is estimated to be approximately 5,471 gpd or approximately 6.13 acre-feet per year (assuming constant water use throughout the year).

It is noted that the Project's estimated water demand is likely conservative as it does not account for additional water conservation features that would be implemented by the Project, including those required by the County as part of the County's Green Building Program. These water saving features, which could include updated landscaping and modern irrigation, would reduce the Project's net increase in water demand accordingly.

Based on LADWP's 2010 Urban Water Management Plan water demand projections through 2035, as shown in Table IV.L.1-3 on page IV.L.1-14, the water demand for the City in 2020 (Project buildout) during average year hydrological conditions is expected to reach

approximately 652,000 acre-feet. During a single-dry year, water demand is estimated to reach approximately 691,100 acre-feet and during a multiple-dry year period, water demand is forecasted to reach approximately 665,100 acre-feet. As concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years (i.e., 2020). The Project's estimated net increase in water demand of approximately 6.13 acre-feet per year would comprise approximately 0.0009 percent of the water demand for the City in 2020 during an average year, single-dry year, and multiple-dry year period. Therefore, the Project would be well within the available and projected water supplies for normal, single-dry, and multiple-dry years through the year 2035 and, as such, LADWP would be able to meet the water demand for the Project as well as existing and planned water demands of its future service area.

It should be noted that the water demand projections in LADWP's 2010 Urban Water Management Plan are based on demographic growth projections in the 2008 Regional Transportation Plan prepared by the Southern California Association of Governments. Since preparation of the 2010 Urban Water Management Plan, new growth forecasts have become available in the 2012 Regional Transportation Plan/Sustainable Communities Strategy. According to the Southern California Association of Governments, the 2012 growth forecast is lower than the 2008 growth forecast in terms of current (2010) estimates and future (2035) projections.[25] Therefore, the 2010 Urban Water Management Plan is based on a more conservative overall growth scenario.

Based on the above, the estimated water demand for the Project would not exceed the available supplies projected by LADWP. Thus, LADWP would be able to meet the water demand of the Project, as well as the existing and planned future water demands of its service area. Therefore, the Project's operation-related impacts on water supply would be less than significant.

(b) Water Infrastructure

Water service to the Project Site would continue to be supplied by LADWP for domestic and fire protection uses. While domestic water demand is typically the main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity.

---

[25] *Southern California Association of Governments, Regional Transportation Plan 2012-2035 and Sustainable Communities Strategy, Growth Forecast Appendix, pgs. 10 and 16, adopted April 2012.*

As provided in Appendix K of this Draft EIR, with implementation of an approved automatic fire sprinkler system within all of the buildings proposed, as set forth in Project Design Feature J.1-3 included in Section IV.J.1, Public Services—Fire Projection, of this Draft EIR, the required fire flow would be 4,000 gpm at a pressure of 20 psi. Based on pressure flow reports obtained from LADWP, the existing 8-inch LADWP water main in Cahuenga Boulevard East provides a flow of approximately 1,750 gpm at a residual pressure of 72 psi. As previously described, to accommodate the required fire flow of 4,000 gpm, the Project would include two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East. The Project would also include the installation of four private fire hydrants on-site and provide booster for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project would also provide new, on-site water distribution lines to serve the proposed uses.

With implementation of the proposed water infrastructure improvements described above, the Project would not exceed the available capacity within the distribution infrastructure that would serve the Project Site. Therefore, the Project would not result in operation-related impacts to water infrastructure and impacts would be less than significant.

4. Cumulative Impacts

The Project, related projects, and growth forecasted in the City through 2020 (i.e., the Project buildout year), would cumulatively increase the demand for water, thus potentially resulting in cumulative impacts on water supplies and water infrastructure. Cumulative growth in the greater Project area through 2020 includes specific known development projects, as described in Section III, Environmental Setting, of this Draft EIR, as well as general ambient growth projected to occur.

a. Water Supply

The geographic context for the cumulative impact analysis on water supply is the LADWP service area. As discussed above, LADWP, as a public water service provider, is required to prepare and periodically update an Urban Water Management Plan to plan and provide for water supplies to serve existing and projected demands. The 2010 Urban Water Management Plan prepared by LADWP accounts for existing development within the City, as well as projected growth through the year 2035 based on demographic growth projections in the Southern California Association of Governments' 2008 Regional

Transportation Plan.[26] Additionally, under the provisions of Senate Bill 610, LADWP is required to prepare a comprehensive water supply assessment for every new development "project" (as defined by Section 10912 of the Water Code) within its service area that reaches certain thresholds. The types of projects that are subject to the requirements of SB 610 tend to be larger projects that may or may not have been included within the growth projections of the 2010 Urban Water Management Plan. The water supply assessment for such projects would evaluate the quality and reliability of existing and projected water supplies, as well as alternative sources of water supply and measures to secure alternative sources if needed. In addition, Senate Bill 221 requires that for residential subdivisions with 500 units or more that are in non-urban areas, written verification from the service provider (e.g., LADWP) be submitted indicating sufficient water supply is available to serve the proposed subdivision, or the local agency shall make a specified finding that sufficient water supplies are or will be available prior to completion of the project. Continued efforts by LADWP to secure the reliability of water supplies in the future, combined with project-specific requirements to conduct analyses to ensure the availability of sufficient water supply to meet demand are expected to continue through 2020 (the Project's buildout year) and beyond.

As previously stated, based on LADWP's 2010 Urban Water Management Plan water demand projections through 2035, as shown in Table IV.L.1-3 on page IV.L.1-14, and the service area reliability assessment conducted by the LADWP in its 2010 Urban Water Management Plan, LADWP determined that it would be able to reliably provide water to its customers through the year 2035. As such, LADWP would be able to meet the water demand for the Project and the related projects.

Compliance of the Project with regulatory requirements that promote water conservation such as the County's Green Building Program, as well as Assembly Bill 32 which is discussed in detail in Section IV.C, Greenhouse Gas Emissions, of this Draft EIR, would also assist in assuring that adequate water supply is available on a cumulative basis.

Based on the above, it is anticipated that LADWP would be able to supply the demands of the Project, the related projects, and future growth through 2020 and beyond. Therefore, cumulative impacts on water supply would be less than significant.

---

[26] *As discussed above, since preparation of the 2010 Urban Water Management Plan, new growth forecasts have become available in the 2012 Regional Transportation Plan/Sustainable Communities Strategy. According to the Southern California Association of Governments, the 2012 growth forecast is lower than the 2008 growth forecast in terms of current (2010) estimates and future (2035) projections. Therefore, the 2010 Urban Water Management Plan is based on a more conservative overall growth scenario.*

b. Water Infrastructure

The geographic context for the cumulative impact analysis on water infrastructure is the vicinity of the Project Site. Development of the Project and future new development in the vicinity of the Project Site would cumulatively increase demands on the existing water infrastructure system. However, new development projects would be subject to LADWP review (or applicable jurisdiction) to assure that the existing public utility facilities would be adequate to meet the domestic and fire water demands of each project, and individual projects would be subject to LADWP requirements regarding infrastructure improvements needed to meet respective water demands, flow and pressure requirements, etc. Furthermore, LADWP, Los Angeles Department of Public Works, and the Los Angeles Fire Department would conduct ongoing evaluations to ensure facilities are adequate. Therefore, cumulative impacts on the water infrastructure system would be less than significant.

5. Mitigation Measures

As the Project would have a less than significant impact on water supply and water infrastructure during construction and operation, mitigation measures are not required.

6. Conclusion

Project-level and cumulative impacts on water supply and water infrastructure would be less than significant.

IV. Environmental Impact Analysis

L.2 Utilities and Service Systems—Energy and Energy Conservation

1. Introduction

This section analyzes the Project's potential impacts on electricity and natural gas. The analysis estimates the electricity and natural gas demand generated by the Project and evaluates whether the current and planned electrical and natural gas supplies and distribution systems are adequate to meet the Project's forecasted energy consumption. The analysis is based on the electrical loads (Electricity Memorandum) provided by Lucci & Associates, Inc., in May 2014 and the gas demand estimates (Natural Gas Memorandum) provided by The Sullivan Partnership, Inc., in May 2014, both of which are provided in Appendix N of this Draft EIR.

2. Environmental Setting

a. Regulatory Framework

(1) State

(a) Senate Bill 1389

Senate Bill 1389 (Public Resources Code Sections 25300–25323) requires the development of an integrated plan for electricity, natural gas, and transportation fuels. The California Energy Commission must adopt and transmit to the Governor and Legislature an Integrated Energy Policy Report every two years. The most recently completed report, the 2013 Integrated Energy Policy Report, addresses the state's "loading order," reduction of demand response, renewable energy, electricity system, progress toward its 2050 greenhouse gas reduction goals, natural gas supplies, and the transportation sector's contribution toward the state's greenhouse gas emissions.[1]

[1] *California Energy Commission, 2013 Integrated Energy Policy Report, pp. 1-3, www.energy.ca.gov/2013publications/CEC-100-2013-001/CEC-100-2013-001-CMF.pdf, accessed May 14, 2014.*

(b) Assembly Bill 32

Assembly Bill 32 (Health and Safety Code Sections 38500–38599), also known as the California Global Warming Solutions Act of 2006, commits the State to achieving the following: year 2000 greenhouse gas emission levels by 2010 and year 1990 levels by 2020. To achieve these goals, Assembly Bill 32 tasked the California Public Utilities Commission and California Energy Commission with providing information, analysis, and recommendations to the California Air Resources Board on ways to reduce greenhouse gas emissions in the electricity and natural gas utility sectors.

(c) California Energy Commission

The California Energy Commission (CEC) was created as the state's principal energy planning organization in 1974.[2] As discussed below, Title 24, Part 6, of the California Code of Regulations contains the CEC's 2013 Building Energy Efficiency Standards for Residential and Nonresidential Buildings.

(d) California Energy Code

The 2013 California Energy Code, which is Part 6, Title 24, California Code of Regulations, contains the CEC's 2013 Building Energy Efficiency Standards for Residential and Nonresidential Buildings and will go into effect on July 1, 2014.[3] Until July 1, 2014, the 2010 California Energy Code, Part 6 is the effective code. The 2013 Building Energy Efficiency Standards focus on several key areas to improve the energy efficiency of newly constructed buildings and additions and alterations to existing buildings, and include requirements that will enable both demand reductions during critical peak periods and future solar electric and thermal system installations.[4]

(e) California Green Building Standards Code

The California Green Building Standards Code, which is Part 11, Title 24, of the California Code of Regulations, is commonly referred to as the CALGreen Code. The 2013 CALGreen Code went into effect on January 1, 2014 and the affected energy provisions of

[3] *California Building Standards Commission, Building Standards Information Bulletin 13-07, dated December 18, 2013, www.energy.ca.gov/title24/2013standards/documents/2013-12-23_BSC-BULLETIN-13-07.pdf, accessed May 14, 2014.*

[4] *CEC, 2013 Building Energy Efficiency Standards for Residential and Nonresidential Buildings, May 2012, www.energy.ca.gov/2012publications/CEC-400-2012-004/CEC-400-2012-004-CMF-REV2.pdf, accessed May 14, 2014.*

the CALGreen Code will go into effect on July 1, 2014.[5] The 2013 CALGreen Code includes mandatory measures for non-residential development related to site development; water use; weather resistance and moisture management; construction waste reduction, disposal, and recycling; building maintenance and operation; pollutant control; indoor air quality; environmental comfort; and outdoor air quality.[6]

(f) California Environmental Quality Act

In accordance with CEQA and Appendix F, Energy Conservation, of the CEQA Guidelines, in order to assure that energy implications are considered in project decisions, EIR's are required to include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. Appendix F of the CEQA Guidelines provides a list of energy-related items that may be included throughout the various chapters of an EIR, including potential mitigation measures. In addition, while not described as significance thresholds for determining the significance of impacts related to energy, Appendix F provides the following items that may be considered in the energy analysis:

- The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project's life cycle including construction, operation, maintenance, and/or removal. If appropriate, the energy intensiveness of materials may be discussed;
- The effects of the project on local and regional energy supplies and on requirements for additional capacity;
- The effects of the project on peak and base period demands for electricity and other forms of energy;
- The degree to which the project complies with existing energy standards;
- The effects of the project on energy resources; or
- The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

(2) Local

(a) County of Los Angeles General Plan

As discussed in more detail in Section IV.H, Land Use and Planning, of this Draft EIR, the County of Los Angeles General Plan directs future growth and development in the County's unincorporated areas and establishes goals, policies, and objectives that pertain to the entire County. The current General Plan, adopted in 1980, includes a Conservation and Open Space Element that sets policy regarding energy resources. The General Plan policy consistency analysis provided in Section IV.H, Land Use and Planning, of this Draft EIR indicates the Project would be consistent with relevant General Plan polices related to energy.

(b) County Green Building Standards

Title 31 of the County Code, known as the Green Building Standards Code, adopts by reference the 2013 California Green Building Standards Code (CALGreen Code), which is designed to improve public health, safety, and general welfare by utilizing design and construction methods that reduce the negative environmental impact of development and encourage sustainable construction practices.

b. Existing Conditions

(1) Electricity

(a) Regional Conditions

Electricity, a consumptive utility, is a man-made resource. The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into energy. The delivery of electricity involves a number of system components, including substations and transformers that lower transmission line power (voltage) to a level appropriate for on-site distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid. Conveyance of electricity through transmission lines is typically responsive to market demands.

Energy capacity, or electrical power, is generally measured in watts (W) while energy use is measured in watt-hours (Wh). On a utility scale, a generator's capacity is typically rated in megawatts (MW), which is one million watts, while energy usage is measured in megawatt-hours (MWh) or gigawatt-hours (GWh), which is one billion watt-hours.

The average annual electricity demand growth in California from 2012 to 2024 is expected to range from 0.88 to 1.82 percent, while peak annual electricity demand growth is expected to range from 0.97 to 1.92 percent.[7]

The Project Site is located within the service area of the City of Los Angeles Department of Water and Power (LADWP). The Los Angeles Department of Water and Power provides electrical service throughout the City of Los Angeles (City) and many areas of the Owens Valley, serving approximately four million people within a service area of approximately 465 square miles, excluding the Owens Valley. Electrical service provided by the LADWP is divided into two planning districts: Valley and Metropolitan. The Valley Planning District includes the LADWP service area north of Mulholland Drive, and the Metropolitan Planning District includes the LADWP service area south of Mulholland Drive. The Project Site is located within LADWP's Metropolitan Planning District.

LADWP generates power from a variety of energy sources including coal, natural gas, large hydroelectric, nuclear, and renewable sources (which include small hydroelectric, solar, wind, geothermal, biomass, and waste sources). LADWP has a net dependable generation capacity greater than 7,327 MW.[8] During the 2013 fiscal year ending June 30, the most recent period for which data is available, LADWP delivered a total of approximately 23.5 million MWh of electricity to its customers.[9]

While LADWP customers represent approximately 10 percent of all the electricity consumed in California, approximately 25 percent of California's total transmission capacity is owned by LADWP. Electricity from LADWP's power generation sources is delivered to customers over a transmission system including approximately 20,000 miles of alternating current (AC) and direct current (DC) transmission and distribution circuits operating at voltages ranging from 120 volts to 500 kilovolts (kV) which are used to deliver electricity from generating plants to customers. The LADWP transmission and distribution system supplies power to the Project Site from as many as 25 different sources.[10]

---

(b) Local Conditions

LADWP currently supplies electrical power to the Project Site from overhead service lines located throughout the Project Site.

(c) Project Site Conditions

The existing estimated peak electrical consumption at the Project Site is approximately 220 KW during a one year period.[11]

(2) Natural Gas

(a) Regional Conditions

Natural gas is a combustible mixture of simple hydrocarbon compounds (primarily methane) that is used as fuel source. Natural gas provides almost one-third of the State's total energy requirements and is used in electricity generation, space heating, cooking, water heating, industrial processes, and as a transportation fuel. Natural gas is measured in terms of cubic feet (cf).

By 2020, more installed renewable generation is projected to both decrease the need for natural gas in the power generation sector and to result in a one percent decrease in natural gas demand for power generation between 2011 and 2025.[12]

Natural gas to the Project area is provided by the Southern California Gas Company (SoCalGas). SoCalGas is the principal distributor of natural gas in Southern California, serving residential, commercial, and industrial markets. SoCalGas serves approximately 20.9 million customers in more than 500 communities encompassing approximately 20,000 square miles throughout Central and Southern California, from the City of Visalia to the Mexican border.[13] SoCalGas receives gas supplies from several sedimentary basins in the western United States and Canada, including supply basins located in New Mexico (San Juan Basin), West Texas (Permian Basin), the Rocky Mountains, and Western Canada, as well as local California supplies.[14] Natural gas for SoCalGas is delivered to the region

through interstate pipelines. Gas supply available to SoCalGas from all sources was approximately 2,834 million cubic feet per day in 2012 (the most recent year for which data are available).[15] SoCalGas' total natural gas deliveries in 2012 were approximately 1,888 million cubic feet per day.[16]

(b) Local Conditions

SoCalGas natural gas service lines currently do not connect to the Project Site.

(c) Project Site Conditions

Existing natural gas usage within the Project Site is limited to the former motel building. Existing natural gas usage within the former motel building is unknown.

3. Environmental Impacts

a. Methodology

The Project's future electricity demand was estimated by Lucci & Associates, Inc., and the Project's future natural gas demand was estimated by The Sullivan Partnership, Inc. The Project's estimated energy demands were then analyzed relative to LADWP's and SoCalGas' existing and planned energy supplies in 2020 (i.e., the Project buildout year) to determine if these two energy utility companies would be able to meet the Project's energy demands. LADWP and SoCalGas were consulted to determine if adequate off-site infrastructure would exist to accommodate the Project's energy demand.

b. Thresholds of Significance

Appendix G of the CEQA Guidelines provides a set of screening questions that address impacts with regard to several environmental topics. Appendix G does not contain specific thresholds to identify when a significant energy-use impact would occur. As discussed above, Appendix F of the CEQA Guidelines states that the potentially significant energy implications of a project should be considered in an EIR and provides direction as to the type of information, analysis, and mitigation measures that may be considered in evaluating a project. However, Appendix F of the CEQA Guidelines does not provide set significance thresholds regarding energy.

---

[15] *California Gas and Electric Utilities, 2013 California Gas Report Supplement, July 2013, p. 16, www.socalgas.com/regulatory/documents/cgr/2013-cgr.pdf, accessed May 14, 2014.*

[16] *California Gas and Electric Utilities, 2013 California Gas Report Supplement, July 2013, p. 29, www.socalgas.com/regulatory/documents/cgr/2013-cgr.pdf, accessed May 14, 2014.*

For purposes of this EIR, the Project would result in a significant impact with regard to energy if the Project would:

- Result in an increase in demand for electricity or natural gas that exceeds available supply or distribution infrastructure capabilities; or
- Cause wasteful, inefficient, and unnecessary consumption of energy during construction, operation, and/or maintenance.

c. Project Design Features

As discussed in Section II, Project Description, of this Draft EIR, as part of the Project, green building design and construction practices capable of achieving Leadership in Energy and Environmental Design (LEED™) certification would be implemented in compliance with the County's Green Building Ordinance. Accordingly, the Project would incorporate the County's Green Building Standards, including compliance with the California Energy Code. Design features that could be implemented would include, but not be limited to, light colored or "cool" roofs, efficient lighting and lighting control systems, energy-efficient heating and cooling systems and controls. No other specific project design features beyond the project improvements discussed in Section II, Project Description, of this Draft EIR are proposed with regard to energy.

d. Analysis of Project Impacts

(1) Energy Demand

(a) Construction

(i) Electricity

During construction of the Project, electricity would be consumed to construct the new buildings and facilities. This electricity would be supplied from existing electrical systems within the Project Site. Electricity consumption during Project construction would vary throughout Project construction based on the construction activity (i.e., grading, building construction, etc.). However, the electricity consumption that would occur due to Project construction activities would be offset by the reduction in electricity consumption resulting from the demolition of existing uses. Furthermore, such electricity demand would be temporary in nature.

Additionally, as discussed in Section II, Project Description of this Draft EIR, electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles that would be installed along Cahuenga Boulevard East. In

addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. Vehicular and pedestrian access within the Project Site and immediately surrounding the Project Site could be affected by construction activities associated with implementation of electrical service improvements. However, as discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. As part of the Construction Management Plan, provisions for temporary traffic control (e.g., flag persons) would be provided during all construction activities adjacent to public rights-of-way to maintain and improve traffic flows.

Overall, demolition and construction activities would require limited electricity consumption and would not be expected to have any adverse impact on available electricity supplies and infrastructure. Therefore, construction-related impacts to electricity supply and infrastructure would be less than significant.

(ii) Natural Gas

Construction of the Project, including new buildings and facilities, typically would not involve the consumption of natural gas. Natural gas would not be supplied to support Project construction activities, thus there would be no demand generated by construction. The Project would, however, involve installation of new natural gas connections to serve the Project Site. Since the Project is located in an area already served by existing natural gas infrastructure, the Project would likely not require extensive infrastructure improvements to serve the Project Site. Construction impacts associated with the installation of natural gas connections are expected to be confined to trenching in order to place the lines below surface. Vehicular and pedestrian access within the Project Site and immediately surrounding the Project Site could be affected by such construction activities. However, previously discussed, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. As part of the Construction Management Plan, provisions for temporary traffic control (e.g., flag persons) would be provided during all construction activities adjacent to public rights-of-way to maintain and improve traffic flows. In addition, prior to ground disturbance, Project contractors would notify and coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service. Therefore, construction-related impacts to natural gas supply and infrastructure would be less than significant.

(b) Operation

(i) Electricity

Project operations would increase the existing demand for electricity. Based on the electricity demand estimates provided by Lucci & Associates, Inc., included as Appendix N of this Draft EIR, the Project's peak electricity demand would be approximately 2,105 KW of electricity per year. When accounting for the existing electricity usage of the former motel building, which would be removed as part of the Project, the Project's net peak electricity demand would be reduced to 2,065 KW per year. The estimated electrical consumption is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features, as noted above. LADWP forecasts that in the 2020-2021 fiscal year, the annual electricity sold within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW.[17] The Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Therefore, it is anticipated that LADWP's existing and planned electricity capacity and electricity supplies would be sufficient to support the Project's demand. In addition, LADWP has indicated that electric service to meet the Project is available and would be provided in accordance with LADWP's Rules and Regulations. While the availability of electricity is dependent upon adequate generating capacity and fuel supplies, the estimated power requirement for the Project is part of the total load growth forecast for the City and has been taken into account in the planned growth of the City's power system.[18] Thus, operational impacts associated with the Project's consumption of electricity would be less than significant.

(ii) Natural Gas

Operation of the Project would result in an increase in the consumption of natural gas for the heating of spaces and water, and cooking at the proposed restaurant. Based on the natural gas demand estimates provided by The Sullivan Partnership, Inc., included as Appendix N of this Draft EIR, the Project's natural gas demand is estimated to be approximately 8,500 cubic feet per hour. This estimated natural gas demand is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features, as noted above. In addition, as existing natural gas usage associated with the former motel building is unknown, the Project's

[17] *LADWP, 2013 Power Integrated Resource Plan, Appendix A, Table A-1, www.ladwp.com/ladwp/faces/wcnav_externalId/a-p-doc?_adf.ctrl-state=jkg1wnzfo_4&_afrLoop=641547117678742, accessed May 14, 2014.*

[18] *Written correspondence dated December 13, 2013 from the City of Los Angeles Department of Water and Power, Darrell A. Miller (refer to Appendix N).*

estimated natural gas demand does not account for existing natural gas usage within the former motel building, which would be removed as part of the Project.

The California Energy Commission analyzes energy usage throughout the state and publishes a staff demand forecast every few years, the most recent of which covers the 2012–2024 period. The California Energy Commission estimates natural gas consumption within SoCalGas' planning area could increase to 7,263 million Therms in 2020 (Project buildout year).[19] Based on the Project's estimated yearly natural gas consumption of 496,400 Therms per year,[20] the Project would account for approximately 0.007 percent of the forecast for the 2020 natural gas consumption throughout SoCalGas' planning area. Given the limited percentage of total demand represented by the Project, SoCalGas' planned demand forecasts likely account for Project development. In addition, SoCalGas has indicated that natural gas facilities are available in the area of the Project Site.[21] Further, the Project would incorporate design features to address applicable energy regulations and requirements. Specifically, as described above, green building design and construction practices capable of achieving LEED™ certification would be implemented as part of the Project in compliance with the County's Green Building Ordinance. As such, operational impacts associated with the consumption of natural gas would be less than significant.

(2) Energy Conservation

As described above, green building design and construction practices capable of achieving Leadership in Energy and Environmental Design (LEED™) certification would be implemented as part of the Project in compliance with the County's Green Building Ordinance. Accordingly, the Project would incorporate the County's Green Building Standards, including compliance with the California Energy Code. Design features that could be implemented would include, but not be limited to, light colored or "cool" roofs, efficient lighting and lighting control systems, energy-efficient heating and cooling systems and controls. In addition, as discussed in Section IV.L.1, Utilities and Service Systems—

---

[19] *The California Energy Commission's forecast includes three scenarios: a high energy demand case, a low energy demand case, and a mid energy demand case. The consumption forecast for the preliminary low energy demand case is used in this calculation to provide a conservative analysis. California Energy Commission, Draft Staff Report, California Energy Demand 2014–2024 Preliminary Forecast, May 2013, p. 55, www.energy.ca.gov/2013publications/CEC-200-2013-004/CEC-200-2013-004-SD-V1.pdf, accessed May 14, 2014. Note that this is a draft report that has not yet been finalized.*

[20] *The Project's estimated demand of 8,500 cubic feet per hour was converted to Therms (85 Therms), multiplied by 16 hours per day (assuming all Project components operate 16 hours per day), and multiplied by 365 days per year.*

[21] *Written correspondence dated December 31, 2013 from the Southern California Gas Company, Zakee Singleton (refer to Appendix N).*

Water, the Project would incorporate a variety of water conservation features that would also promote energy conservation. Further, as part of the Project, the County would continue to promote the use of alternative modes of transportation by providing shuttles to and from the Universal City/Studio City Metro Red Line Station, thereby reducing energy usage associated with additional Project vehicles. Overall, the Project would be designed and constructed in accordance with state and local green building standards that would serve to reduce the energy demand of the Project. Additionally, based on the above, the Project's energy demand would be within the existing and planned electricity and natural gas capacities of LADWP and SoCalGas, respectively. Therefore, development of the Project would not cause wasteful, inefficient, and unnecessary consumption of energy and would be consistent with the intent of Appendix F of the CEQA Guidelines.

4. Cumulative Impacts

The geographic context for the cumulative impact analysis on electricity is the service area of LADWP, and geographic context for the cumulative impact analysis on natural gas is the service area of SoCalGas. The Project in conjunction with forecasted 2020 growth in these energy utility companies' service areas would cumulatively increase the consumption of energy, thus potentially resulting in cumulative impacts on electricity and natural gas.

a. Electricity

The Project in conjunction with forecasted 2020 growth in LADWP's service area would increase electricity consumption and thus, would cumulatively increase the need for additional electricity supplies and infrastructure capacity. As previously analyzed, LADWP forecasts that in the 2020-2021 fiscal year, electricity consumption within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW. Future cumulative growth expected during this period within LADWP's service area is accounted for in this forecast. As discussed above, Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Based on this small percentage, the Project's contribution to the cumulative electricity demand would not be substantial. In addition, based on the types of uses proposed by the related projects listed in Section III, Environmental Setting, of this Draft EIR, it is anticipated that the related projects would similarly comprise a limited percentage of the forecasted total electricity demand within LADWP's service area in 2020. Further, as future electrical demands factor cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, within LADWP's service area. Although the Project, related projects, and other future development would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a

relatively small scale and would be consistent with regional and local growth expectations for LADWP's service area. Additionally, like the Project, related projects would be expected to incorporate energy conservation features, comply with applicable regulations including the City's and County's Green Building Ordinance, and incorporate mitigation measures, as necessary. Accordingly, the Project's contribution to cumulative impacts related to electricity consumption and energy conservation would be less than significant.

Electricity infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by LADWP are ongoing. It is expected that LADWP would continue to expand delivery capacity as needed to meet demand increases within its service area. Development projects, inclusive of the related projects, within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as necessary. As such, cumulative impacts with respect to electricity infrastructure would be less than significant.

b. Natural Gas

Buildout of the Project, related projects, and other future development projects in SoCalGas' service area is expected to increase natural gas consumption and thus cumulatively increase the need for additional natural gas supplies and infrastructure capacity. The California Energy Commission estimates natural gas consumption within SoCalGas' planning area will increase to 7,263 million Therms in 2020 (Project buildout year). Future 2020 cumulative growth within SoCalGas' service area is accounted for in this forecast. As previously indicated, the Project's annual natural gas usage would represent approximately 0.007 percent of the forecasted total consumption in 2020. It is anticipated that given the type of developments proposed by the related projects listed in Section III, Environmental Setting, of this Draft EIR, the related projects would similarly comprise a limited percentage of the forecasted total consumption within SoCalGas' service area in 2020. Further, as future natural gas demands factor cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, in SoCalGas' service area. Although related projects would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for SoCalGas' service area. Furthermore, like the Project, the related projects and any other future development would be expected to incorporate energy conservation features, comply with applicable regulations including the County's Green Building Ordinance, and incorporate mitigation measures, as necessary, to address natural gas demands. Accordingly, the Project's contribution to cumulative impacts related to natural gas and energy conservation would be less than significant.

Natural gas infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SoCalGas occur as needed. It is expected that SoCalGas' would continue to expand delivery capacity if necessary to meet demand increases within its service area. Development projects within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as appropriate. As such, cumulative impacts with respect to natural gas infrastructure would be less than significant.

5. Mitigation Measures

As discussed above, the Project's impacts on energy would be less than significant. As such, no mitigation measures would be required.

6. Conclusion

As indicated above, the Project's impacts on energy would be less than significant.

V. Alternatives

V. Alternatives

1. Introduction

The identification and analysis of alternatives to a project is a fundamental aspect of the environmental review process under CEQA. Specifically, Public Resources Code Section 21002.1(a) establishes the need to address alternatives in an EIR by stating that in addition to determining a project's significant environmental impacts and indicating potential means of mitigating or avoiding those impacts, "the purpose of an environmental impact report is… to identify alternatives to the project."

Direction regarding the consideration and discussion of project alternatives in an EIR is provided in CEQA Guidelines Section 15126.6, in part, as follows:

> An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. An EIR is not required to consider alternatives which are infeasible.

The CEQA Guidelines emphasize that the selection of project alternatives be based primarily on the ability to avoid or substantially lessen significant impacts relative to the proposed project, "even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly." The CEQA Guidelines further direct that the range of alternatives be guided by a "rule of reason," such that only those alternatives necessary to permit a reasoned choice are addressed. In selecting project alternatives for analysis, potential alternatives must be feasible. CEQA Guidelines Section 15126.6(f)(1) states that:

> Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations,

> jurisdictional boundaries…, and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site….

Beyond these factors, CEQA Guidelines Section 15126.6(e) requires the analysis of a "no project" alternative and CEQA Guidelines Section 15126.6(f) requires an evaluation of alternative location(s) for the project, if feasible. Based on the alternatives analysis, an environmentally superior alternative is to be designated. If the environmentally superior alternative is the No Project Alternative, then the EIR shall identify an environmentally superior alternative among the other alternatives.

2. Overview of Alternatives to the Project

The intent of the alternatives analysis is to reduce the significant impacts of a project. As evaluated in Section IV, Environmental Impact Analysis, of this Draft EIR, implementation of the Project would not result in significant impacts to any of the environmental issues evaluated in this Draft EIR which could not be reduced with compliance with regulatory requirements and the implementation of project design features and mitigation measures. Accordingly, the identification of alternatives to the Project was based, in part, on comments received during the Notice of Preparation scoping and public consultation period and the objectives established for the Project (listed in Section II, Project Description, of this Draft EIR). The following alternatives to the Project are evaluated in this section:

- Alternative 1: No Project/No Build
- Alternative 2: Reduced Project
- Alternative 3: Simultaneous Event Schedules

Each of these alternatives is described and evaluated below.

3. Alternatives Considered and Rejected

As set forth in CEQA Guidelines Section 15126.6(c), an EIR should identify any alternatives that were considered for analysis but rejected as infeasible and briefly explain the reasons for their rejection. According to the CEQA Guidelines, among the factors that may be used to eliminate an alternative from detailed consideration is the alternative's failure to meet most of the basic project objectives, the alternative's infeasibility, or the alternative's inability to avoid significant environmental impacts. Alternatives to the Project that have been considered and rejected as infeasible include:

- **Alternative Site:** To meet the Project's underlying purpose to enhance on-site programs, expand opportunities for diverse County residents to come together, and ensure the future of the existing Amphitheatre as an active and relevant historic resource, the County has identified improvements that are needed to transform the existing Ford Theatres into a multi-use cultural and recreational destination while addressing existing critical program needs of the regional arts ecosystem. Accordingly, the objectives of the Project are closely tied to the concept of improving existing conditions on the Project Site by creating a cohesive and integrated multi-use cultural and recreational destination with enhanced and new technologically advanced performing arts facilities with supporting uses and creating recreational opportunities.

  As described in Section II, Project Description, of this Draft EIR, the Project Site is currently developed with an Amphitheatre and already operates as a performing arts venue. In addition, the 32-acre Project Site is also already a designated County regional park, which is comprised primarily of undeveloped open space. As such, the development of the proposed improvements within the existing Project Site would be consistent with and would complement and enhance the existing setting and uses within the Project Site. Therefore, given the Project Site's unique location and the unavailability of large expanses of land such as the Project Site within Los Angeles County, it is not reasonable to assume that a property of the same size and character that is developed with a large theatre would be available for the County to acquire. In addition, since the County owns the existing property, the County currently does not incur any land costs. Furthermore, since one of the key objectives of the Project is to provide an on-site natural progression of appropriately-sized rehearsal and performing arts spaces which can be used at the same time, development of the Project on an alternative site could also require construction of a large theatre similar to the existing on-site Amphitheatre in addition to the Project components so that a natural progression of theatre spaces are all provided in one location. As such, development of the Project on an alternative site would likely result in greater impacts compared to the Project. Additionally, one of the key components of the underlying purpose of the Project is to ensure the future of the existing on-site Amphitheatre as an active and relevant historic resource. As the proposed Amphitheatre rehabilitation improvements are limited to the Project Site, development of the Project on an alternative site would not achieve the underlying purpose or the basic Project objectives related to enhancing the existing Project Site and preserving the historic integrity of the existing Amphitheatre.

  Based on the above, an alternative site is not considered feasible as it would fail to achieve the underlying purpose of the Project and the basic Project objectives. In addition, development at an alternative site likely would not reduce any of the Project's already less than significant impacts. Further, it is not expected that the County can reasonably acquire, control, or have access to an alternative site within Los Angeles that would provide for the uses contemplated for the Project.

Thus, in accordance with Section 15126.6(f) of the State CEQA Guidelines, this alternative was rejected from further consideration.

- **Improved Parking Only:** This Alternative assumes the existing facilities would be maintained and the two existing surface parking areas along Cahuenga Boulevard East would be replaced by two parking structures providing a combined 500 spaces. This Alternative was suggested during the Notice of Preparation scoping and public consultation period.

  While this Alternative would reduce some of the Project's already less than significant impacts, similar to the No Project/No Build Alternative analyzed below, this Alternative would be expected to result in greater impacts with regard to surface water quality and groundwater quality. Specifically, this Alternative would not implement the Project's Best Management Practices, such as catch basins and planter drains, which would result in an improvement in surface water quality runoff from the Project Site as the Project Site currently does not have BMPs in place for the treatment of stormwater runoff from the existing impervious surfaces. Therefore, while significant impacts to surface water quality would not occur under this Alternative, impacts would be greater than those of the Project. In addition, without the development of any of the performing arts facilities, offices, restaurant, hiking trail, and other supporting uses, this Alternative would not realize the underlying purpose of the Project to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource. Similarly, this Alternative would not support the objectives of the Project regarding rehabilitation of the Amphitheatre and artist and patron enhancements. Therefore, an alternative that only implements the parking proposed as part of the Project is not considered feasible as it would fail to achieve the underlying purpose and basic Project objectives. Thus, in accordance with Section 15126.6(f) of the State CEQA Guidelines, this alternative was rejected from further consideration.

4. Analysis Format

In accordance with CEQA Guidelines Section 15126.6(c) and Section 15126.6(d), each alternative is evaluated in sufficient detail to determine whether the overall environmental impacts would be less, similar, or greater than the corresponding impacts of the Project. Furthermore, each alternative is evaluated to determine whether the Project objectives identified in Section II, Project Description, of this Draft EIR would be mostly attained by the alternative. The evaluation of each of the alternatives follows the process described below:

a. The net environmental impacts of the alternative after implementation of reasonable mitigation measures are determined for each environmental issue area analyzed in this Draft EIR.

b. Post-mitigation significant and non-significant environmental impacts of the alternative and the Project are compared for each environmental issue area as follows:

   - Less: Where the net impact of the alternative would be clearly less adverse or more beneficial than the impact of the Project, the comparative impact is said to be "less."

   - Greater: Where the alternative's net impact would be clearly more adverse or less beneficial than the impact of the Project, the comparative impact is said to be "greater."

   - Similar: Where the impacts of the alternative and the Project would be roughly equivalent, the comparative impact is said to be "similar."

c. The comparative analysis of the impacts is followed by a general discussion of whether the underlying purpose and most of the basic Project objectives would be attained by the alternative.

Table V-1 on page V-6 provides a summary matrix that compares the impacts associated with the Project with the impacts of each of the analyzed alternatives. As provided in Table V-1, an alternative may result in "no impact," where implementation of the proposed improvements would not result in a change in the physical conditions within the area that would create an impact with regards to the environmental topic analyzed. Impacts may also be considered "less than significant," where implementation of the proposed improvements would result in a change in the physical conditions within the area that would be below the thresholds of significance and not create an adverse effect.

Table V-1
Comparison of Impacts Associated with the Project and Impacts of the Alternatives

Environmental Issue	Project Impact	Alternative 1: No Project/No Build	Alternative 2: Reduced Project/ No 299-Seat Theatre	Alternative 3: Simultaneous Event Schedules

VI. Alternatives

A. Alternative 1: No Project/No Build

1. Description of the Alternative

In accordance with the CEQA Guidelines, the No Project Alternative for a development project on an identifiable property consists of the circumstance under which a proposed project does not proceed. Section 15126.6(e)(3)(B) of the CEQA Guidelines states: "In certain instances, the No Project Alternative means 'no build' wherein the existing environmental setting is maintained. However, where failure to proceed with the project will not result in the preservation of existing environmental conditions, the analysis should identify the practical result of the project's non-approval and not create and analyze a set of artificial assumptions that would be required to preserve the existing physical environment." Accordingly, for purposes of this analysis, Alternative 1, the No Project/No Build Alternative assumes the Project would not be approved, and the existing environment would be maintained, with the exception of the previously approved Amphitheatre improvements and other on-going routine interior and exterior maintenance improvements. Specifically, as described in Section II, Project Description, of this Draft EIR, in September 2013, the County prepared and approved a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the restoration and rehabilitation of portions of the existing Amphitheatre. The previously approved Amphitheatre improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. The previously approved Amphitheatre improvements will occur internal to the Project Site, within the boundaries of the existing Amphitheatre. This Alternative would not result in any changes to the existing operations at the Ford Theatres. The site plan under this Alternative would resemble existing conditions, as illustrated in Figure II-2 in Section II, Project Description of this Draft EIR.

2. Environmental Impact Analysis

a. Aesthetics, Views, Light, and Glare

(1) Aesthetics

Alternative 1 would not include development of any of the components proposed as part of the Project. In addition, implementation of the previously approved Amphitheatre

improvements would occur internal to the Project Site. Other routine maintenance activities would also be limited. As such, there would be no potential for construction activities that would temporarily alter the visual appearance of the Project Site. Therefore, no visual quality impacts associated with construction would occur, and aesthetics impacts under Alternative 1 would be reduced in comparison to the less than significant impacts of the Project.

Similarly, as Alternative 1 would not alter the existing uses on the Project Site, introduce new buildings on the Project Site, or change the appearance of the Project Site, no operational impacts related to aesthetics would occur under Alternative 1. Accordingly, the aesthetics impacts of Alternative 1 would be reduced in comparison to the less than significant impacts of the Project.

(2) Views

As no development would occur under Alternative 1, existing views of or across the Project Site would not be altered and no on-site visual resources would be affected. Therefore, Alternative 1 would have no potential to obstruct an existing, publicly available, recognized view resource. No impacts related to views would occur under the No Project/No Build Alternative, and impacts would be reduced in comparison to the less than significant impacts of the Project.

(3) Light and Glare

Alternative 1 would not result in the construction of any new development on-site. In addition, based on the limited nature of the previously approved Amphitheatre improvements as well as other routine maintenance activities, this Alternative would not introduce substantial light sources associated with construction equipment or construction-related equipment and materials with the potential to cause substantial glare. No construction-related impacts with regard to light and glare would occur under Alternative 1, and such impacts would be reduced compared to the less than significant impacts of the Project.

The No Project/No Build Alternative would not alter the existing uses on the Project Site, or introduce any new sources of light or glare. Therefore, Alternative 1 would not change the existing lighting environment on the Project Site. No operation-related light and glare impacts would occur under this Alternative and such impacts would be reduced in comparison to the less than significant impacts of the Project.

b. Air Quality

(1) Construction

The No Project/No Build Alternative would not include any new development proposed as part of the Project. In addition, given the nature of the previously approved Amphitheatre improvements and other limited routine maintenance activities, such activities would not generate substantial air pollutant emissions. As such, construction-related regional and localized air quality impacts under this Alternative would not occur, and such impacts would be reduced compared to the Project's less than significant impacts.

Similarly, Alternative 1 would not result in diesel particulate emissions that could generate toxic air contaminants (TACs) or produce odors associated with construction activities. Therefore, no impacts associated with the release of TACs and odors during construction would occur under this Alternative, and such impacts would be less than the less than significant impacts of the Project.

(2) Operation

Alternative 1 would not result in any operational emissions related to vehicular traffic or the consumption of electricity and natural gas beyond those currently generated by existing uses on-site. Therefore, this Alternative would have no operational air quality impacts, and impacts would be reduced compared to the less than significant regional and localized impacts of the Project.

As set forth in Section IV.B, Air Quality, of this Draft EIR, the primary sources of potential air toxics associated with Project operations would include diesel particulate matter from delivery trucks and to a lesser extent, facility operations. As the No Project/No Building Alternative would not result in new development or increased operations on-site, no new operational diesel particulate matter emissions would occur. Therefore, no operational impacts associated with TACs would occur under the Alternative 1, and such impacts would be reduced compared to the Project.

As no development would occur under the No Project/No Build Alternative, no operational odor impacts would occur, and such impacts would be reduced compared to the less than significant impacts of the Project.

c. Greenhouse Gas Emissions

Since there would be no new permanent development or operations on-site, no new greenhouse gas (GHG) emissions would occur. As such, no new impacts associated with

global climate change would occur, and impacts would be less than the less than significant impacts of the Project

d. Biological Resources

As previously described, Alternative 1 would not include development of any of the components proposed as part of the Project. In addition, implementation of the previously approved Amphitheatre improvements would occur internal to the Project Site, within the boundaries of the existing Amphitheatre. Other routine maintenance activities would also be limited to the existing structures and landscaping. As such, Alternative 1 would not disturb areas within the Project Site where potential biological resources and sensitive habitats may exist. In addition, as set forth in the Notice of Exemption for the previously approved Amphitheatre improvements, trees to be removed based on their health, root structure, and impact to the stabilization of the hillside facing the Amphitheatre stage would be replaced with new landscaping, including new trees and shrubs. Therefore, none of the plant communities, plant species, wildlife species, and oak trees that exist within the Project Site would be affected under Alternative 1. As such, no significant impacts to biological resources would occur under Alternative 1, and such impacts would be less than those of the Project's, which would be less than significant with implementation of mitigation measures.

e. Cultural Resources

(1) Historic Resources

The No Project/No Build Alternative would not involve construction activities with the potential to affect the character-defining features of the historic Amphitheatre. In addition, as set forth in the Notice of Exemption prepared and approved by the County for the rehabilitation of portions of the existing Amphitheatre, the proposed improvements intended to address long deferred maintenance and needed repairs would be consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties because the proposed improvements would preserve and be consistent with the historic use and character of the property. Therefore, no significant impacts to historic resources would result under Alternative 1, and impacts would be less than those of the Project, which would be less than significant with mitigation.

(2) Archaeological and Paleontological Resources

No substantial grading or other earthwork activities would occur under Alternative 1. Thus, there would be no potential for this Alternative to uncover subsurface archaeological and paleontological resources. No impacts to archaeological and paleontological

resources would result under the No Project/No Build Alternative, and impacts would be less than those of the Project, which would be less than significant with mitigation.

f. Geology and Soils

The Project Site is located within the seismically active region of Southern California; thus, as with the Project, Alternative 1 would be exposed to certain site-specific geologic hazards. However, as the No Project/No Build Alternative would not introduce new development on-site, the potential for impacts related to soil erosion during construction activities would not occur. In addition, this Alternative would not introduce new activities or increase the level of human activity within the Project Site. Therefore, the No Project/No Build Alternative would not expose additional people and structures to potential adverse effects associated with geologic hazards. No impacts related to geology and soils would occur under Alternative 1, and impacts would be less than those of the Project, which would be less than significant with mitigation.

g. Hydrology, Surface Water Quality, and Groundwater

(1) Hydrology

Under Alternative 1, no new development would occur and existing development would remain. In addition, the previously approved Amphitheatre improvements and other routine maintenance activities would occur within the boundaries of the existing development. Therefore, this Alternative would not alter the amount of pervious surfaces on the Project Site, and no modifications to the existing drainage patterns of the Project Site would occur. Further, as with the Project, this Alternative would include the proposed drainage improvements as part of the previously approved Amphitheatre improvements and would not result in an increase in the volume of runoff generated from the Project Site. Therefore, no impacts to hydrology would occur under Alternative 1, and impacts would be less than the less than significant impacts of the Project.

(2) Surface Water Quality

As no new development would occur under Alternative 1, no new pollutants from stormwater runoff would be introduced into the stormwater system. However, this Alternative would not implement the Project's Best Management Practices (BMPs), such as catch basins and planter drains, which would result in an improvement in surface water quality runoff from the Project Site as the Project Site currently does not have BMPs in place for the treatment of stormwater runoff from the existing impervious surfaces. Therefore, while significant impacts to surface water quality would not occur under this Alternative, impacts would be greater than those of the Project.

(3) Groundwater

Under Alternative 1 no new development would occur, and the Project Site would remain in its existing condition. Therefore, potential changes to groundwater levels that could affect groundwater hydrology from conversion of impervious to pervious surfaces would not occur. No impacts to groundwater hydrology would occur under Alternative 1 and impacts would be reduced compared to the less than significant impacts of the Project.

With regard to groundwater quality, since no new development would occur under Alternative 1, no new pollutants from stormwater runoff would be introduced into the groundwater via infiltration from available landscape areas. However, as Alternative 1 would not implement the Project's BMPs, groundwater quality would not be improved as under the Project. Therefore, impacts to groundwater quality under Alternative 1 would be greater than the Project, although still less than significant.

h. Land Use and Planning

Under the No Project/No Build Alternative, there would be no changes to the existing land uses on-site. The existing theatre and support uses would continue to operate, and, as with the Project, the existing site land use and zoning designations would remain. In addition, no land use approvals or permits would be required. Therefore, Alternative 1 would not result in any inconsistencies with existing land use plans and policies that govern the Project Site. No impacts associated with consistency with land use regulations and plans would occur and, impacts would be less than the less than significant impacts of the Project.

i. Noise

(1) Construction

The No Project/No Build Alternative would not include any new development proposed as part of the Project. On-site construction activities would be limited to the previously approved Amphitheatre improvements and other limited routine maintenance activities that would generate limited noise and vibration within the Project Site. Thus, no impacts with regard to construction noise and vibration would occur under the No Project/No Build Alternative. Such impacts would be less than those of the Project.

(2) Operation

With regard to operation, the No Project/No Build Alternative would not introduce new on-site noise sources and would not result in an increase in off-site auto traffic. As such, no new or increased sources of noise within the Project vicinity would occur as a

result of this Alternative. Therefore, no impact with respect to operational noise would occur under Alternative 1, and impacts would be less than those of the Project.

j. Public Services

(1) Fire Protection

Alternative 1 would not involve any new development or otherwise result in changes to existing site operations. Therefore, this Alternative would not increase the level of activity on the Project Site or increase the service population for the City of Los Angeles Fire Department (LAFD) stations that serve the Project Site. No impacts to fire protection services would occur, and impacts would be less than the less than significant impacts of the Project.

(2) Police Protection

Alternative 1 would not involve any new development or otherwise result in changes to existing site operations. Therefore, this Alternative would not increase the daytime service population on-site or have the potential to increase calls for police protection services from the Los Angeles Sheriff's Department (LASD) and the City of Los Angeles Police Department (LAPD). No impacts to police protection services would occur, and impacts would be less than the less than significant impacts of the Project.

k. Traffic, Access, and Parking

Under Alternative 1, all transportation conditions would remain the same as current conditions. As construction activities under Alternative 1 would be limited to maintenance activities there would be no significant construction traffic impacts with this Alternative. In addition, as there would be no new development, there would be no additional trips generated by this Alternative, and no difference in overall transportation conditions from current conditions. Thus, there would be no impacts regarding traffic, access, and parking under Alternative 1, and impacts would be less than those of the Project.

l. Utilities and Service Systems

(1) Water

Alternative 1 would not involve construction activities which would generate a substantial short-term demand for water. As such, no construction-related impact to water supply and infrastructure would occur under the No Project/No Build Alternative, and impacts would be reduced compared to the less than significant impacts of the Project.

No changes to existing land uses or site operations would occur under Alternative 1. Therefore, no increase in the Project Site's long-term water demand would occur. No operational impacts to water supply and water infrastructure would occur, and impacts would be less than the less than significant impacts of the Project.

(2) Energy

The No Project/No Build Alternative would not involve construction activities which would generate a substantial short-term demand for electricity. In addition, construction activities would not involve the consumption of natural gas. As such, no construction-related impacts to energy would occur, and such impacts would be less than the less than significant impacts of the Project.

No changes to existing land uses or site operations would occur under Alternative 1. Therefore, no increase in energy consumption from the Project Site would occur. No operational impacts to energy would occur, and impacts would be less than the less than significant impacts of the Project.

3. Comparison of Impacts

As analyzed above, impacts to aesthetics, views, light, and glare; air quality; greenhouse gas emissions; biological resources; historical, archaeological, and paleontological resources; geology and soils; hydrology, surface water quality during construction, groundwater hydrology and groundwater quality during construction; land use and planning; noise; fire and police protection; traffic, access, and parking; and water and energy would be reduced as compared to the Project. However, impacts with regard to surface water quality and groundwater quality during operation would be greater than the Project.

4. Relationship of the Alternative to Project Objectives

No new development would be introduced on the Project Site under Alternative 1, and the existing uses on the Project Site would continue to operate as they do currently. However, as with the Project, this Alternative would include implementation of the previously approved Amphitheatre improvements. The previously approved Amphitheatre improvements would include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. Implementation of these improvements would address long deferred maintenance and needed repairs, mitigation of water infiltration, provision of slope stabilization, and improvements to the theatrical infrastructure

and performer amenities. As such, Alternative 1 would meet the Project's objective to preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County. In addition, as the previously approved Amphitheatre improvements would occur within the boundaries of the existing Amphitheatre, Alternative 1 would also meet the Project objective to provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site. While this Alternative would include theatrical systems infrastructure improvements as part of the previously approved Amphitheatre improvements, Alternative 1 would not provide for the additional Amphitheatre rehabilitation improvements proposed as part of the Project. Therefore, this Alternative would not meet the following objective to the same extent as the Project: provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination.

Additionally, as Alternative 1 would not include the development of any new facilities, this Alternative would not meet the Project's objectives regarding additional artist and patron enhancements. Specifically, without the development of the 299-seat theatre and the Flex Space proposed under the Project, this Alternative would not meet the objective to support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences. Similarly, Alternative 1 would not achieve the Project objective to repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County. Furthermore, since Alternative 1 would not include the development of new plaza areas or the proposed restaurant and structured parking, this Alternative would not support the following Project objectives: enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress; and further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

Alternative 1 would also not develop a Transit Center or include pedestrian and vehicular circulation improvements and, as such, would not achieve the objective to create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures. In addition, as this Alternative does not propose a hiking trail, Alternative 1 would not meet the Project objective to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views or surrounding iconic landmarks from a formal trail within the park boundary. Further, since this Alternative would not include the installation of an enhanced sound wall, Alternative 1 would also not support the objective to mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre. Additionally, without development of the Ford Terrace, Alternative 1 would not provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre. Lastly, Alternative 1 would not construct any of the proposed offices and, as such, would not support the objective to provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community.

Overall, Alternative 1, the No Project/No Build Alternative, would not meet most of the Project objectives, nor would it meet the Project's underlying purpose to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource.

VI. Alternatives

B. Alternative 2: Reduced Project Alternative

1. Description of the Alternative

The Reduced Project Alternative would develop the Project Site similar to the Project and would include the same components as the Project as follows: rehabilitation of certain portions of the existing Amphitheatre, the Ford Terrace, the Ford Plaza, the Transit Center, and a 0.75-mile hiking trail. However, the Reduced Project Alternative would not include development of the 299-seat theatre within the Ford Plaza. In addition, under this Alternative, the 99-seat Flex Space proposed within the Transit Center would be relocated to the area of the 299-seat theatre as proposed by the Project. With the relocation of the Flex Space from the Transit Center to the Ford Plaza under this Alternative, the footprint of the Transit Center would be reduced but would continue to feature a designated area for bus and valet drop-off, a three-level parking structure, and a maintenance facility. All other components and features of the Project as described in Section II, Project Description, of this Draft EIR would be maintained under the Reduced Project Alternative. Further, under Alternative 2, building heights and architectural features would be similar to the building heights and architectural features of the Project.

Overall, implementation of this Alternative would result in approximately 39,550 net new square feet compared to the Project's approximately 47,550 net new square feet of development. As such, this Alternative would reduce the proposed net new development by approximately 8,000 square feet or approximately 17 percent. Additionally, this Alternative would provide for 12 net new seats within the Project Site in comparison to the Project's 311 net new seats. In addition, while this Alternative would not provide the 299-seat theatre, the number of annual events and attendees would increase but would be reduced when compared to the Project.

2. Environmental Impact Analysis

a. Aesthetics, Views, Light, and Glare

(1) Aesthetics

Similar to the Project, the Reduced Project Alternative would temporarily alter the visual appearance of the Project Site due to the removal of existing buildings, surface

parking areas, and landscaping. Other construction activities, such as site preparation and grading, the staging of construction equipment and materials, and the construction of new structures would also temporarily alter the visual quality of the Project Site. As this Alternative would not include development of the 299-seat theatre, the overall amount of building construction and associated construction activities would be reduced compared to the Project. As with the Project, development of the Reduced Project Alternative would not cause the loss of unique visual resources or prominent existing features that contribute positively to the existing visual character and quality of the Project Site. Impacts to aesthetics during construction would be less than significant and less than the Project's less than significant impacts.

As with the Project, the Reduced Project Alternative would alter the existing visual character of the Project Site due to the rehabilitation of certain portions of the Amphitheatre and the development of the Ford Terrace, the Ford Plaza, the Transit Center, and a 0.75-mile hiking trail. As described above, these Project components would be developed similar to the Project, except that the 299-seat theatre would not be included within the Ford Plaza and the Flex Space proposed within the Transit Center would be relocated to the Ford Plaza within the area proposed for the 299-seat theatre. The development of a reduced Transit Center and the removal of the 299-seat theatre would reduce the building area and massing within the Project Site compared to the Project. In addition, as building heights proposed under this Alternative would be similar to the Project, the buildings proposed under this Alternative would be similarly compatible with the surrounding area. Further, as with the Project, this Alternative would incorporate architectural design features such as variations in building planes to reduce massing and introduce new landscaping to enhance the existing site and provide visual relief. Other Project features, including signage and lighting would be implemented similar to the Project and would not degrade the existing visual character of the area. Additionally, as with the Project, proposed structures would be designed to complement the existing historic character of the Ford Theatres and be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings. In summary, impacts to aesthetics under the Reduced Project Alternative would be less than significant and less than the less than significant impacts of the Project.

(2) Views

As described in Section IV.A, Aesthetics, Views, Light, and Glare, of this Draft EIR, valued visual resources within the Project Site include the hillsides surrounding the existing developed areas of the Project Site as well as the historic portions of the Amphitheatre, which are generally only visible from areas within the Project Site. As with the Project, development of this Alternative would visually fill-in existing surface parking areas fronting Cahuenga Boulevard East with new development. While this Alternative would not

construct the 299-seat theatre within the Ford Plaza, the Flex Space proposed as part of the Transit Center would be relocated within the area proposed for the 299-seat theatre. Therefore, as the 299-seat theatre and the Flex Space would occupy generally the same building footprint, no substantial visual changes are anticipated within the Ford Plaza from removal of the 299-seat theatre. Similarly, as the Flex Space under the Project has been designed as an extension of the north parking structure such that these two structures visually appear as one building, the relocation of the Flex Space to the Ford Plaza would also not result in substantial view changes within the Transit Center. Therefore, similar to the Project, given the topography of the Project Site and the location of existing development within a canyon setting, the natural hillsides would remain a prominent feature from public vantages. In addition, this Alternative would implement similar architectural features as the Project, including light-colored materials, and perimeter landscaping, which would serve to soften the visual effect on views along Cahuenga Boulevard East. Other Project features, including the relocation of the existing cell towers and the potential installation of electrical poles, would be implemented similar to the Project and would have similar effects on views. Overall, like the Project, with implementation of this Alternative, public views of the Project Site would continue to feature a semi-urban environment with a background of rolling hills, pockets of trees, and landscaping. Therefore, as with the Project, view impacts would be less than significant. Such impacts would be similar to those of the Project.

(3) Light and Glare

(a) Construction

As with the Project, substantial lighting is not anticipated during construction within the Project Site as most construction activities would occur during daylight hours. In addition, similar to the Project, to the extent construction activities during winter includes artificial light sources, such use would be temporary and would cease upon completion of construction activities. The Reduced Project Alternative would also implement the same project design feature related to construction lighting, which would provide that construction lighting be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary. Therefore, like the Project, light impacts associated with construction would be less than significant under this Alternative. However, such impacts would be reduced compared to the Project due to the reduced construction activities.

Similar to the Project, any glare generated during construction of this Alternative would be highly transitory and short-term given the movement of construction equipment and materials within each area of the Project Site. In addition, large surfaces that are usually required to generate substantial glare are typically not an element of construction activities. Therefore, as with the Project, no significant impact related to construction glare would occur under this Alternative. As the amount of development proposed under this Alternative would be reduced compared to the Project, thereby reducing the potential for

glare from construction equipment and materials, such impacts would be less than those of the Project.

(b) Operation

Similar to the Project, the Reduced Project Alternative would increase light levels within the Project Site and the surrounding area through the introduction of new light sources, including accent lighting to highlight architectural features, landscape elements, and the Project's signage; light boxes on the north parking structure, the restaurant, and the proposed sound wall to illuminate the façades; exterior lighting to provide clear identification of circulation, gathering spaces, parking facilities and for security purposes; and new theatrical lighting within the Amphitheatre. However, this Alternative would not introduce any additional lighting from the 299-seat theatre proposed by the Project. Therefore, the number of new lighting sources would be reduced as compared to the Project. Overall, as with the Project, the Reduced Project Alternative would not significantly increase nighttime lighting levels in the area and impacts with regard to lighting would be less than significant. However, such impacts would be less compared to the Project due the reduced development under this Alternative.

This Alternative would be anticipated to use the same building materials as the Project, including plaster, concrete, metal panels, fritted glass, and cement board. This Alternative would also implement the same project design feature as the Project regarding the use of non-reflective windows, glass, and metal or use of standard low-reflective or non-reflective glazing. The replacement of existing surface parking areas with structured parking similar to the Project would also reduce the potential for daytime glare from windows of parked vehicles. Thus, as with the Project, impacts related to glare under Alternative 2 would be less than significant. However, such impacts would be reduced compared to the Project due to the reduced development under this Alternative.

b. Air Quality

(1) Construction

(a) Regional and Localized Air Quality Impacts

As with the Project, construction of this Alternative would generate pollutant emissions through the use of heavy-duty construction equipment and through haul truck and construction worker trips. The overall amount of site preparation and building construction would be less under this Alternative compared to the Project due to the decrease in square footage to be developed under this Alternative. Therefore, pollutant emissions from construction activities would be less on a daily basis, as the intensity and not the duration of these activities would decrease compared to the Project. Thus, overall

construction emissions generated by this Alternative would be less than those of the Project over the construction period. Similarly, impacts during maximum conditions, those used for measuring significance, would be less than those of the Project. As such, similar to the Project, regional and localized emissions would be less than significant. However, such impacts would be less than those of the Project.

(b) Toxic Air Contaminants

With respect to construction air toxics, diesel particulate emissions associated with heavy equipment operations during grading and excavation activities represent the greatest potential for TAC emissions. As noted above, the construction emissions generated by this Alternative would be less than those of the Project over the construction period and thus would result in reduced diesel particulate emissions. In addition, as with the Project, there would be no residual emissions after construction and corresponding individual cancer risk. Therefore, like the Project, construction-related air toxic emission impacts of this Alternative would be less than significant and less than those of the Project.

(c) Odors

As with the Project, this Alternative would have the potential to produce odors during construction associated with the operation of construction equipment, the application of asphalt, the application of architectural coatings and other interior and exterior finishes, and roofing. However, like the Project, any odors produced during construction of this Alternative would dissipate away from the construction area and would be quickly diluted. Thus, as with the Project, impacts associated with objectionable odors during construction would be less than significant. However, such impacts would be reduced under this Alternative compared to the Project due to the reduction in construction emissions.

(2) Operation

(a) Regional and Localized Air Quality Impacts

Based on the reduction in square footage, the number of daily trips generated by this Alternative would be reduced compared to the Project. As vehicular emissions are dependent on the number of trips, vehicular sources would have a similar decrease in pollutant emissions compared to the Project. With the reduction in overall square footage, both area sources and stationary sources would also generate a similar reduction in pollutant emissions. As the overall square footage and vehicular trips associated with this Alternative would decrease in comparison to the Project, regional operational emissions under this Alternative would be less than those of the Project, and like the Project would be less than significant.

As described in Section IV.B, Air Quality, of this Draft EIR, localized operational impacts are determined by the peak hour intersection traffic volumes. Therefore, the decrease in operational trips during the peak hours associated with this Alternative would contribute to a proportionate decrease in localized emissions of carbon monoxide. Since the localized CO hotspot analysis for the Project did not result in any significant localized CO impacts and as traffic volumes would decrease with this Alternative, similar to the Project, localized impacts would be less than significant under this Alternative. However, such impacts would be less than those of the Project.

(b) Toxic Air Contaminants

As set forth in Section IV.B, Air Quality, of this Draft EIR, the primary sources of potential air toxics associated with Project operations would include diesel particulate matter from delivery trucks and to a lesser extent, natural gas equipment. With the reduction in daily trips and square footage, this Alternative would reduce the Project's operational diesel particulate matter emissions associated with increased truck deliveries. Thus, similar to the Project, this Alternative would result in a less-than-significant air quality impact associated with air toxics. However, such impacts would be reduced compared to the Project.

(c) Odors

As with the Project, this Alternative would not include any uses identified by the SCAQMD as being associated with odors. Therefore, similar to the Project, potential odor impacts would be less than significant under this Alternative and would be less than those of the Project due to the reduction in building square footage.

c. Greenhouse Gas Emissions

As with the Project, this Alternative would incorporate numerous project design features to reduce GHG emissions and would be designed to target the criteria for LEED Certification designation. With consideration of this Alternative's design features to reduce cumulative GHG, this Alternative would emit fewer GHG than the Project due to its reduction in daily trips relative to the Project. By incorporating energy and vehicle trip reducing features such as designing, constructing, and operating the Project to target LEED certification, this Alternative would be similar to the Project and would result in a reduction in GHG emissions from "business-as-usual" consistent with the goals of the State of California and County of Los Angeles, and is considered less than significant. Such impacts would be less than those of the Project.

d. Biological Resources

While the Reduced Project Alternative would not include development of the 299-seat theatre, this Alternative would disturb the same general Project Site area at-grade. As such, the Project's potential impacts with regard to plant communities, plant species, wildlife species, wildlife movement, and oak trees would also occur under the Reduced Project Alternative. To reduce potential impacts to biological resources, this Alternative would also implement the same mitigation measures proposed by the Project. Therefore, as with the Project, potential impacts to biological resources under this Alternative would be less than significant with mitigation. Such impacts would be similar to those of the Project.

e. Cultural Resources

(1) Historic Resources

While the Reduced Project Alternative would not include development of the 299-seat theatre, this Alternative would disturb the same general Project Site area at-grade and would include removal of the same structures proposed under the Project. Therefore, as with the Project, the rehabilitation of portions of the Amphitheatre and development of the Ford Terrace, Ford Plaza, Transit Center, and the hiking trail would not be anticipated to result in a substantial adverse change in the significance of the Ford Theatres as a historic resource. Notwithstanding, similar to the Project, given the fluid nature of architectural designs until the approval of final design plans, impacts with regards to historic resources could be potentially significant. The Reduced Project Alternative would implement the same mitigation measure as the Project to ensure the design is consistent with the Secretary of the Interior Standards. Therefore, impacts to historic resources under Alternative 2 would be less than significant with mitigation and similar to the Project.

(2) Archaeological and Paleontological Resources

While the Reduced Project Alternative would not include development of the 299-seat theatre, this Alternative would disturb the same general Project Site area at-grade. Therefore, this Alternative would result in a similar volume of excavated soil and a similar maximum depth of excavation. As such, the potential for the Reduced Project Alternative to uncover subsurface archaeological and paleontological resources would be similar to that of the Project. In the event archaeological and paleontological resources are encountered, this Alternative would be subject to the same mitigation and regulatory requirements as the Project to ensure that the resources are properly recovered and evaluated. Therefore, impacts relative to archaeological and paleontological resources under the Reduced Project Alternative would be similar to those of the Project, which would be less than significant with mitigation.

f. Geology and Soils

The Project Site is located within the seismically active region of Southern California; thus, as with the Project, Alternative 2 would be exposed to certain site-specific geologic hazards (e.g., ground shaking). In addition, as this Alternative would be developed within the same site as the Project and disturb the same general area as the Project, the Reduced Project Alternative would be exposed to the same potential hazards associated with liquefaction and lateral spreading, landslides and slope stability, and corrosive soils. As with the Project, the Reduced Project Alternative would be designed and constructed to conform to the current seismic design provisions of the California Building Code and the Los Angeles County Building Code. This Alternative would also implement the same mitigation measures as the Project to address potential impacts from liquefaction and lateral spreading and landslides and slope stability. Therefore, as with the Project, impacts due to strong seismic ground shaking, liquefaction and lateral spreading, and landslides and slope stability would be less than significant with mitigation. Like the Project, with compliance with California Building Code and County Building Code requirements, impacts with regard to corrosive soils would be less than significant. While the Reduced Project Alternative would disturb the same general areas as the Project, with elimination of the 299-seat theatre proposed under the Project, this Alternative would not introduce new activities or increase the level of human activity within the Project Site to the same extent as the Project. Therefore, the Reduced Project Alternative would expose fewer people and structures to potential geologic hazards within the Project Site. Therefore, impacts with regard to seismic ground shaking, liquefaction and lateral spreading, landslides and slope stability, and corrosive soils would be reduced compared to those of the Project.

The Reduced Project Alternative would involve similar grading and other earth-moving activities during construction, which could result in erosion. With compliance with regulatory requirements and implementation of appropriate BMPs like the Project, potential erosion impacts would be less than significant. Such impacts would be similar to those of the Project.

g. Hydrology, Surface Water Quality, and Groundwater

(1) Hydrology

Construction of the Reduced Project Alternative would require the removal of existing buildings, paving, and landscaping within the Project Site as well as earthwork activities (i.e., grading, excavation) to a similar extent as the Project. Therefore, as with the Project, construction activities under this Alternative would have the potential to temporarily alter existing drainage patterns and flows by exposing the underlying soils and making the Project Site temporarily more permeable. This potential would be similar to that of the Project since the construction area to be disturbed under this Alternative would resemble

that of the Project. Similar to the Project, during construction of the Reduced Project Alternative, runoff would be properly controlled through the implementation of a Storm Water Pollution Prevention Plan (SWPPP) and appropriate BMPs. Therefore, construction-related impacts on surface water hydrology under the Reduced Project Alternative would be less than significant, and such impacts would be similar to those of the Project.

Upon buildout, it is estimated that the Reduced Project Alternative would result in a similar net increase in the amount of impervious surfaces on-site as compared to the Project due to the similar area that would be developed. Like the Project, this Alternative would also implement the County's Low Impact Development (LID) requirements to manage post-construction stormwater runoff. Therefore, impacts to surface water hydrology during operation would be less than significant under Alternative 2 and similar to the less than significant impacts of the Project.

(2) Surface Water Quality

As with the Project, during construction of the Reduced Project Alternative, exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, construction activities such as earth moving, maintenance/operation of construction equipment, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. On-site watering activities to reduce airborne dust could also contribute to pollutant loading in runoff. The degree to which new pollutants could be introduced to the site during construction would be reduced compared to the Project given the reduction in construction activities. In addition, like the Project, the Reduced Project Alternative would include a site-specific SWPPP that would specify BMPs and erosion control measures to be used during construction to minimize pollution in runoff. Therefore, as with the Project, construction-related impacts on surface water quality would be less than significant and such impacts would be less than those of the Project.

Similar to the Project, during operation of the Reduced Project Alternative, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. The degree to which additional pollutants could be introduced to the Project Site during operation would be reduced compared to the Project due to the reduction in the uses that would be developed. In addition, implementation of County LID requirements, inclusive of stormwater BMPs similar to those of the Project to address water quality in stormwater runoff such as catch basins and planter drains would further reduce and treat potential pollutants in stormwater runoff. Thus, operational impacts on surface water quality would be less than significant, and would be less than the less than significant impacts of the Project.

(3) Groundwater

With regard to groundwater hydrology, the Reduced Project Alternative would require a similar volume of excavated soil and a similar maximum depth of excavation compared with the Project. In addition, the Reduced Project Alternative would result in a similar net increase in the amount of impervious surfaces on-site as compared to the Project. Therefore, as with the Project, development of this Alternative is not expected to encounter groundwater beneath the Project Site, which would require temporary or permanent dewatering operations. Therefore, impacts to groundwater hydrology during construction and operation of Alternative 2 would be less than significant and similar to the less than significant impacts of the Project.

Regarding groundwater quality, hazardous materials, such as fuels, paints, solvents, and concrete additives could be used during on-site grading and building construction, and would therefore require proper management and, in some cases, disposal. The management of any resultant hazardous wastes could increase the opportunity for hazardous materials releases into groundwater. As with the Project, the Reduced Project Alternative would comply with all applicable federal, state, and local requirements concerning the handling, storage, and disposal of hazardous waste, which would reduce the potential for construction activities to release contaminants into groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. Additionally, similar to construction, any surface handling of hazardous materials during operation would involve small quantities and would be handled and stored in accordance with manufacturers' specifications and applicable regulations, thereby resulting in a negligible potential impact to groundwater quality. Therefore, as with the Project, impacts with respect to groundwater water quality would be less than significant under Alternative 2. However, such impacts would be less than those of the Project due to the reduction in construction activities and overall development.

h. Land Use and Planning

Land use consistency impacts under the Reduced Project Alternative would be generally similar to those of the Project due to similarities in the development proposals. As such, the Reduced Project Alternative would be consistent with SCAG's regional plans, the County General Plan, and the County Code to the same extent as the Project. Therefore, impacts related to land use consistency would be less than significant and similar to the less than significant impacts of the Project.

i. Noise

(1) Construction

Under this Alternative, the overall amount of site preparation and building construction would be less compared to the Project due to the decrease in square footage to be developed. Therefore, noise and vibration impacts at sensitive receptors would be less on a daily basis, as the intensity and not the duration of these activities would decrease compared to the Project. Similar to the Project, construction of this Alternative would result in less than significant construction noise and vibration impacts. Construction-related noise and vibration impacts would be reduced when compared with the Project.

(2) Operation

This Alternative would include on-site noise sources that would produce noise levels that would be generally similar to those that would occur under the Project, except for additional noise sources associated with the 299-seat theatre. In addition, this Alternative would reduce the number of trips during a peak day in comparison to the Project. Furthermore, the Reduced Project Alternative would implement the same project design features as the Project, as applicable. Thus, as with the Project, noise impacts under this Alternative would be less than significant. However, such impacts would be reduced as compared to the Project.

j. Public Services

(1) Fire Protection

The types of construction activities required for the Reduced Project Alternative would be similar to the Project, although the extent of construction activities would be reduced. Accordingly, while construction-related traffic on adjacent streets which could temporarily interfere with local and on-site emergency response would be similar to the Project on a peak day, such traffic would be reduced throughout the entire duration of the construction period as compared to the Project. In addition, as with the Project, construction traffic management plans would be implemented to ensure that adequate emergency access is maintained to the Project Site and neighboring uses at all times. Further, similar to the Project, construction activities would comply with applicable codes and ordinances relating to fire safety practices. As such, construction impacts on fire protection and emergency medical services would be less than significant under this Alternative, and less than the less than significant impacts of the Project.

Like the Project, the Reduced Project Alternative does not include the development of any new residential uses and, as such, would not increase the permanent residential

population within the service area of Fire Station No. 76. In addition, while this Alternative would generate an increase in the on-site population associated with the additional seats and events to be provided within the Flex Space as well as the proposed hiking trail, the Reduced Project Alternative would involve a reduced floor area and reduced on-site population in comparison to the Project from removal of the 299-seat theatre. Notwithstanding, similar to the Project, compliance with applicable regulatory requirements under this Alternative would ensure that adequate fire prevention features would be provided that would reduce the demand for firefighting services. Similarly, while the additional traffic generated by this Alternative could potentially affect emergency response, the additional traffic would be reduced relative to the Project and would not substantially impact response times or emergency vehicle access, particularly given significant traffic impacts would not occur. Further, as this Alternative would implement the same onsite fire water system improvements as the Project, the Reduced Project Alternative would also meet the fire flow requirements set forth by the County Fire Department and LAFD. Given the Project Site's location in a Very High Fire Hazard Severity Zone, Alternative 2 would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone, similar to the Project. Overall, impacts to fire protection and emergency medical services from Alternative 2 would be less than significant and less as compared to the Project.

(2) Police Protection

As previously described, the types of construction activities required for Alternative 2 would be similar to the Project, although the extent of construction activities would be reduced due to the reduction in development under this Alternative. Therefore, construction-related traffic that could temporarily interfere with local and on-site emergency response would be reduced throughout the entire duration of the construction period as compared to the Project. In addition, as with the Project, construction traffic management plans would be implemented to ensure that adequate emergency access is maintained to the Project Site and neighboring uses at all times. Furthermore, the Reduced Project Alternative would implement the same project design features as the Project regarding the implementation of security measures during construction. Therefore, as with the Project, construction-related impacts to police protection services would be less than significant. However, such impacts would be less than under the Project due to the reduced development.

Similar to the Project, Alternative 2 would not include the development of any residential uses and, as such, would not increase the permanent residential population within the service area of the Parks Bureau South Zone or the Hollywood Community Police Station. In addition, while this Alternative would generate an increase in the on-site population associated with the additional seats and events to be provided within the Flex Space as well as the proposed hiking trail, the Reduced Project Alternative would involve a

reduced floor area and reduced on-site population in comparison to the Project from removal of the 299-seat theatre. Alternative 2 would also implement the same project design features which would serve to reduce the potential for criminal activities and assist law enforcement efforts. Furthermore, while the additional traffic generated by this Alternative could potentially cause delays in law enforcement response times, the additional traffic would be reduced relative to the Project and would not substantially impact response times or emergency vehicle access, particularly given significant traffic impacts would not occur. Therefore, impacts related to police protection services would be less than significant under Alternative 2 and less than the less than significant impacts of the Project.

k. Traffic, Access, and Parking

(1) Construction

As with the Project, construction of the Reduced Project Alternative would generate additional trips from heavy-duty construction equipment, haul trucks, and construction worker trips. However, the overall amount of building construction would be reduced as compared to the Project. Thus, the number of construction-related trips (workers and trucks) would be reduced as compared to the Project. In addition, as with the Project, this Alternative would include implementation of a Construction Management Plan to manage construction-related traffic. The Reduced Project Alternative would also not require the relocation or removal of transit stops in the vicinity of the Project Site or impede emergency, bicycle, and pedestrian access. Additionally, as with the Project, parking for construction workers and employees would be provided on-site. Overall, construction-related traffic, access, and parking impacts under the Reduced Project Alternative would be less than significant, and less than those of the Project.

(2) Operation

As the Reduced Project Alternative would not include the 299-seat theatre, the frequency of events and associated traffic would be reduced under this Alternative in comparison to the Project. It is noted however that during the weekday morning commuter peak period between 7:00 A.M. to 10:00 A.M. and the weekday evening peak period between 6:00 P.M. to 9:00 P.M., the Reduced Project Alternative would generate a similar amount of traffic as the number of employees commuting during the weekday morning peak period would be the same as under the Project and since the Project would stagger start times for events held in the Amphitheatre and the 299-seat theatre during the weekday evening peak period. The amount of traffic generated during the remaining peak times (weekday afternoon, Saturday midday, and Saturday evening) would be reduced compared to the Project. Therefore, overall operational impacts with regard to traffic, access, and parking would be reduced compared to the Project but would remain less than significant.

I. Utilities and Service Systems

(1) Water

Like the Project, construction activities associated with the Reduced Project Alternative would generate a short-term demand for water. This demand would be reduced compared to the Project due to the reduction in construction activities. Therefore, as with the Project, impacts on water supply and infrastructure associated with short-term construction activities would be less than significant and less than those of the Project.

As with the Project, operation of Alternative 2 would generate an increased demand for water relative to existing conditions. Based on the reduction in total development and population associated with events within the 299-seat theatre, water demand for this Alternative would be less than that of the Project. In addition, Alternative 2 would implement the same water conservation measures as the Project. Therefore, like the Project, this Alternative's estimated net water demand would be within LADWP's available and projected water supplies for normal, single-dry, and multi-dry years through the year 2035. The Reduced Project Alternative would also include implementation of the same water infrastructure improvements as the Project. Therefore, impacts to water supply and infrastructure under Alternative 2 would be less than significant and less than the less than significant impacts of the Project.

(2) Energy

Like the Project, construction activities associated with Alternative 2 would generate a short-term demand for electricity to operate construction equipment and light construction activities, if necessary. However, given the reduced level of construction, the demand for electricity would be reduced compared to the Project. The Reduced Project Alternative would implement the same infrastructure improvements as the Project to supply electricity to the proposed uses. As the construction of new buildings and infrastructure typically does not involve the consumption of natural gas, no natural gas would be consumed during construction of this Alternative, similar to the Project. Overall, impacts on energy supply and infrastructure associated with short-term construction activities would be less than significant and less than those of the Project, which would also be less than significant.

As with the Project, operation of Alternative 2 would generate an increased demand in electricity and natural gas relative to existing conditions. However, this demand would be reduced compared to the Project given the elimination of the 299-seat theatre and associated events and visitors. Therefore, as with the Project, impacts on energy supply and infrastructure would be less than significant. Such impacts would be less than those of the Project.

3. Comparison of Impacts

As evaluated above, the Reduced Project Alternative would reduce the Project's impacts with regard to aesthetics, light, and glare; air quality; greenhouse gas emission; surface water quality and groundwater quality; noise; public services; traffic, access, and parking; and utilities and service systems. However, as with the Project, such impacts would remain less than significant when compared to the applicable significance thresholds. Impacts associated with views; biological resources; cultural resources; geology and soils; surface water hydrology and groundwater hydrology; and land use and planning would be similar to those of the Project.

4. Relationship of the Alternative to Project Objectives

With implementation of the previously approved Amphitheatre improvements as well as the Amphitheatre rehabilitation improvements proposed as part of the Project, the Reduced Project Alternative would meet the Project's objective to preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County. Similarly, this Alternative would support the objective to provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination. Furthermore, since the Reduced Project would include the development of new plaza areas, the proposed restaurant, and structured parking, this Alternative would realize the following Project objectives: enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress; and further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

The Reduced Project Alternative would also develop a Transit Center and include pedestrian and vehicular circulation improvements and, as such, would achieve the objective to create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures. In addition, as this Alternative would include a hiking trail, Alternative 2 would meet the Project objective to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive

recreational opportunities, and encouraging visitors to experience the natural landscape and views or surrounding iconic landmarks from a formal trail within the park boundary. Further, since the Reduced Project Alternative would include the installation of an enhanced sound wall, Alternative 2 would also support the objective to mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre. Additionally, with development of the Ford Terrace, the Reduced Project Alternative would provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre. Alternative 2 would further include development of the proposed offices and, as such, would support the objective to provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community. The Reduced Project Alternative would also disturb the same general area as the Project and, as such, Alternative 2 would meet the Project objective to provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

However, without the development of the 299-seat theatre proposed under the Project, the Reduced Project Alternative would not fully meet the objective to support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences. Similarly, the Reduced Project Alternative would only partially meet the Project objective to repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

Overall, Alternative 2, the Reduced Project Alternative, would meet most of the Project objectives and would partially meet the remaining objectives. However, without providing a key component of the Project, the Reduced Project Alternative would not achieve the Project's underlying purpose to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource.

VI. Alternatives

C. Alternative 3: Simultaneous Event Schedules

1. Description of the Alternative

The Simultaneous Event Schedules Alternative would include the development of the same components as the Project but with long term flexibility in the scheduling of events within the Amphitheatre and proposed 299-seat theatre. Specifically, under Alternative 3, events held in the Amphitheatre, the 299-seat theatre, and the Flex Space would be able to have simultaneous events with concurrent start times whereas under the Project, events held in the Amphitheatre and the 299-seat theatre would have staggered start times of at least 45 minutes after 6:00 P.M. on weekday evenings to reduce traffic impacts. As with the Project, Alternative 3 would comprise the following: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, 99-seat Flex Space, and maintenance facility; and (5) a 0.75-mile hiking trail. These components would be developed within the Project Site in the same manner as proposed under the Project described in Section II, Project Description, of this Draft EIR. The estimated increases in annual events and attendance projected to occur under the Project would also remain under this Alternative.

2. Environmental Impact Analysis

a. Aesthetics, Views, Light, and Glare

(1) Aesthetics

During construction of Alternative 3, the visual appearance of the Project Site would be altered due to the removal of existing buildings, surface parking areas, and landscaping. Other construction activities, including site preparation and grading, the staging of construction equipment and materials, and the construction of foundations, new structures, and outdoor open space areas would also alter the visual quality of the Project Site. As the overall amount of building construction and associated construction activities would be

similar to the Project, temporary visual quality impacts during construction would be similar to the Project. Therefore, as with the Project, impacts to aesthetics during construction would be less than significant. Such impacts would be similar to those of the Project.

As described above, this Alternative would develop the same components as the Project. These components would be developed within the Project Site in the same manner as proposed under the Project. Therefore, as with the Project, development of Alternative 3 would not substantially degrade the existing visual character or quality of the Project Site or surrounding area. Therefore, like the Project, impacts related to aesthetics would be less than significant. Such impacts would be similar as compared to the Project.

(2) Views

As Alternative 3 would implement the same components as the Project and in the same manner as the Project, view changes under Alternative 3 would be similar to those of the Project. As such, while Alternative 3 would modify existing public views along Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway, the proposed structures would not dominate the viewshed along Cahuenga Boulevard and public views of the Project Site would continue to feature a semi-urban environment with a background of rolling hills, pockets of trees, and landscaping. Therefore, impacts with regard to views under Alternative 3 would be less than significant and similar to those of the Project.

(3) Light and Glare

(a) Construction

As previously described, Alternative 3 would include the same type of uses as the Project and would be developed in a similar manner to the Project. Therefore, like the Project, substantial lighting is not anticipated during construction within the Project Site as most construction activities would occur during daylight hours. In addition, should lighting be required during construction activities occurring in the winter, such use would be temporary and would cease upon completion of construction. Further, Alternative 3 would implement the same project design feature related to construction lighting, which would provide that construction lighting be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary. Therefore, like the Project, light impacts associated with construction would be less than significant under this Alternative, and such impacts would be similar to those of the Project.

As with the Project, any glare generated during construction of this Alternative would be highly transitory and short-term given the movement of construction equipment and materials within each area of the Project Site. In addition, large surfaces that are usually required to generate substantial glare are typically not an element of construction activities.

Therefore, as with the Project, no significant impact related to construction glare would occur under Alternative 3. As this Alternative would involve the same amount of development as the Project, such impacts would be similar to those of the Project.

(b) Operation

As Alternative 3 would develop the Project Site similar to the Project, this Alternative would also increase light levels within the Project Site and the surrounding area through the introduction of new light sources, including accent lighting to highlight architectural features, landscape elements, and the Project's signage; light boxes on the north parking structure, the new theatre, the restaurant, and the proposed sound wall to illuminate the façades; exterior lighting to provide clear identification of circulation, gathering spaces, parking facilities and for security purposes; and new theatrical lighting within the Amphitheatre. This Alternative would also include implementation of the same project design feature as the Project regarding shielding and aiming to prevent glare and light spill and the upward emition of light. Overall, as with the Project, Alternative 3 would not create a new source of substantial glare which would adversely affect day or nighttime views in the area and impacts with regard to lighting would be less than significant. Such impacts would be similar to those of the Project.

Additionally, like the Project, building materials for this Alternative would be anticipated to include plaster, concrete, metal panels, fritted glass, and cement board. This Alternative would also implement the same project design feature as the Project regarding use of non-reflective exterior windows, glass, and metal and use of a standard low-reflective or non-reflective glazing. The replacement of existing surface parking areas with structured parking similar to the Project would also reduce the potential for daytime glare from windows of parked vehicles. Thus, as with the Project, impacts related to glare under Alternative 3 would be less than significant and such impacts would be similar to those of the Project.

b. Air Quality

(1) Construction

(a) Regional and Localized Air Quality Impacts

As with the Project, construction of this Alternative would generate pollutant emissions through the use of heavy-duty construction equipment and through haul truck and construction worker trips. This Alternative would include the development of the same components as the Project. Therefore, pollutant emissions from construction activities would be the same on a daily basis, as the intensity and the duration of these activities would be the same compared to the Project. Thus, overall construction emissions

generated by this Alternative would be the same as those of the Project over the construction period. Similarly, impacts during maximum conditions, those used for measuring significance, would be the same as those of the Project. As such, like the Project, regional and localized emissions would be less than significant and impacts would be similar to those of the Project.

(b) Toxic Air Contaminants

With respect to construction air toxics, diesel particulate emissions associated with heavy equipment operations during grading and excavation activities represent the greatest potential for TAC emissions. As noted above, the construction emissions generated by this Alternative would be the same as those of the Project over the construction period and thus would result in the same amount of diesel particulate emissions. In addition, as with the Project, there would be no residual emissions after construction and corresponding individual cancer risk. Therefore, like the Project, construction-related air toxic emission impacts of this Alternative would be less than significant and similar to those of the Project.

(c) Odors

As with the Project, this Alternative would have the potential to produce odors during construction associated with the operation of construction equipment, the application of asphalt, the application of architectural coatings and other interior and exterior finishes, and roofing. However, like the Project, any odors produced during construction of this Alternative would dissipate away from the construction area and would be quickly diluted. Thus, as with the Project, impacts associated with objectionable odors during construction would be less than significant and such impacts would be the same under this Alternative compared to the Project.

(2) Operation

(a) Regional and Localized Air Quality Impacts

The simultaneous start times between the Amphitheatre and the 299-seat theatre proposed under this Alternative would not result in a change in the number of daily trips or the estimated increases in annual events and attendance projected to occur under the Project. As vehicular emissions are dependent on the number of daily trips, vehicular sources would result in the same daily pollutant emissions compared to the Project. This Alternative would include the development of the same components as the Project, thus both area sources and stationary sources would result in the same amount of pollutant emissions. As the square footage and daily vehicular trips associated with this Alternative would not change in comparison to the Project, regional operational emissions under this

Alternative would be similar to those of the Project, and like the Project would be less than significant.

As described in Section IV.B, Air Quality, of this Draft EIR, localized operational impacts are determined by the peak hour intersection traffic volumes. As the operational trips during the peak hours associated with this Alternative would not change compared to the Project, localized emissions of carbon monoxide would also remain the same. Since the localized CO hotspot analysis for the Project did not result in any significant localized CO impacts and as traffic volumes would not increase with this Alternative, like the Project, localized impacts would be less than significant under this Alternative and such impacts would be similar to those of the Project.

(b) Toxic Air Contaminants

As set forth in Section IV.B, Air Quality, of this Draft EIR, the primary sources of potential air toxics associated with Project operations would include diesel particulate matter from delivery trucks and to a lesser extent, natural gas equipment. With the same daily trips and square footage, this Alternative would result in the same operational diesel particulate matter emissions associated with increased truck deliveries as the Project. Thus, similar to the Project, this Alternative would result in a less-than-significant air quality impact associated with air toxics and such impacts would be the same compared to the Project.

(c) Odors

As with the Project, this Alternative would not include any uses identified by the SCAQMD as being associated with odors. Therefore, like the Project, potential odor impacts would be less than significant under this Alternative and would be similar to those of the Project.

c. Greenhouse Gas Emissions

As with the Project, this Alternative would incorporate numerous project design features to reduce GHG emissions and would be designed to target the criteria for LEED Certification designation. With consideration of this Alternative's design features to reduce cumulative GHG, this Alternative would emit the same GHG emissions as the Project since this Alternative would not result in a change in the number of daily trips or the estimated increases in annual events and attendance. In addition, this Alternative would have the same project components and thus GHG emissions from energy, water, and solid waste would remain the same. By incorporating energy and vehicle trip reducing features such as designing, constructing, and operating the Alternative to target LEED certification, as with the Project, this Alternative would result in a reduction in GHG emissions from

"business-as-usual" consistent with the goals of the State of California and County of Los Angeles and is considered less than significant. Such impacts would be similar to those of the Project.

d. Biological Resources

As this Alternative would disturb the same area as the Project Site, the Project's potential impacts with regard to plant communities, plant species, wildlife species, wildlife movement, and oak trees would also occur under Alternative 3. To reduce potential impacts to biological resources, this Alternative would implement the same mitigation measures proposed by the Project. Therefore, as with the Project, potential impacts to biological resources under this Alternative would be less than significant with mitigation. Such impacts would be similar to those of the Project.

e. Cultural Resources

(1) Historic Resources

Alternative 3 would disturb the same area as the Project and would include removal of the same structures proposed under the Project. Therefore, as construction activities under this Alternative would be the same as those of the Project, Alternative 3 would not be anticipated to result in a substantial adverse change in the significance of the Ford Theatres as a historic resource. Notwithstanding, similar to the Project, given the fluid nature of architectural designs until the approval of final design plans, impacts with regards to historic resources could be potentially significant. Alternative 3 would implement the same mitigation measure as the Project to ensure the design is consistent with the Secretary of the Interior Standards. Therefore, impacts to historic resources under Alternative 3 would be less than significant with mitigation and similar to the Project's impacts, which would also be less than significant with mitigation.

(2) Archaeological and Paleontological Resources

As previously described, construction activities under this Alternative would be similar to the Project. Therefore, Alternative 3 would result in a similar volume of excavated soil and a similar maximum depth of excavation. As such, the potential for Alternative 3 to uncover subsurface archaeological and paleontological resources would be similar to that of the Project. In the event archaeological and paleontological resources are encountered, this Alternative would be subject to the same mitigation and regulatory requirements as the Project to ensure that the resources are properly recovered and evaluated. As such, impacts relative to archaeological and paleontological resources under Alternative 3 would be similar to those of the Project, which would be less than significant with mitigation.

f. Geology and Soils

The Project Site is located within the seismically active region of Southern California; thus, as with the Project, Alternative 3 would be exposed to certain site-specific geologic hazards (e.g., ground shaking). In addition, as this Alternative would be developed within the same site as the Project and disturb the same general area as the Project, Alternative 3 would be exposed to the same potential hazards associated with liquefaction and lateral spreading, landslides and slope stability, and corrosive soils. As with the Project, this Alternative would be designed and constructed to conform to the current seismic design provisions of the California Building Code and the Los Angeles County Building Code. This Alternative would also implement the same mitigation measures as the Project to address potential impacts from liquefaction and lateral spreading and landslides and slope stability. Therefore, as with the Project, impacts due to strong seismic ground shaking, liquefaction and lateral spreading, and landslides and slope stability would be less than significant with mitigation. Such impacts would be similar to those of the Project. Similarly, with compliance with California Building Code and County Building Code requirements, impacts with regard to corrosive soils would be less than significant, and similar to the Project.

Alternative 3 would involve similar grading and other earth-moving activities during construction, which could result in erosion. With compliance with regulatory requirements and implementation of appropriate BMPs like the Project, potential erosion impacts would be less than significant. Such impacts would be similar to those of the Project.

g. Hydrology, Surface Water Quality, and Groundwater

(1) Hydrology

Construction of Alternative 3 would require onsite demolition, grading, and excavation activities to a similar extent as the Project. Therefore, as with the Project, construction activities under this Alternative would have the potential to temporarily alter existing drainage patterns and flows by exposing the underlying soils and making the Project Site temporarily more permeable. This potential would be similar to that of the Project since building footprints under this Alternative would resemble those of the Project. Similar to the Project, during construction of Alternative 3, runoff would be properly controlled through the implementation of a SWPPP and appropriate BMPs comparable to those proposed as part of the Project. Therefore, construction-related impacts on surface water hydrology under Alternative 3 would be less than significant, and such impacts would be similar to those of the Project.

Additionally, upon buildout, it is estimated that Alternative 3 would result in a similar net increase in the amount of impervious surfaces on-site as compared to the Project due

to the similar building footprints. Like the Project, this Alternative would also implement the County's LID requirements to manage post-construction stormwater runoff, which would reduce the volume of water leaving the Project Site compared to existing conditions. Therefore, impacts to surface water hydrology during operation would be less than significant under Alternative 3 and similar to the less than significant impacts of the Project.

(2) Surface Water Quality

As with the Project, during construction of Alternative 3, exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, construction activities such as earth moving, maintenance/operation of construction equipment, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. On-site watering activities to reduce airborne dust could also contribute to pollutant loading in runoff. The degree to which new pollutants could be introduced to the site during construction would be substantially similar to that of the Project given the similar amount of construction activities. In addition, like the Project, the Alternative 3 would include a site-specific SWPPP that would specify BMPs and erosion control measures to be used during construction to minimize pollution in runoff. Therefore, as with the Project, construction-related impacts on surface water quality would be less than significant and such impacts would be similar to those of the Project.

Similarly, during operation of Alternative 3, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. The degree to which additional pollutants could be introduced to the Project Site during operation would be substantially similar to that of the Project due to the same uses and amount of development that would be provided. In addition, implementation of the County's LID requirements, inclusive of stormwater BMPs similar to those of the Project to address water quality in stormwater runoff such as catch basins and planter drains, would reduce and treat potential pollutants in stormwater runoff. Thus, operational impacts on surface water quality under this Alternative would be less than significant, and would be similar to the less than significant impacts of the Project.

(3) Groundwater

With regard to groundwater hydrology, Alternative 3 would require a similar volume of excavated soil and a similar maximum depth of excavation compared with the Project. In addition, Alternative 3 would result in a similar net increase in the amount of impervious surfaces on-site as compared to the Project due to the similar building footprints. Therefore, as with the Project, development of this Alternative is not expected to encounter groundwater beneath the Project Site, which would require temporary or permanent dewatering operations. Therefore, impacts to groundwater hydrology during construction

and operation of Alternative 3 would be less than significant and similar to the less than significant impacts of the Project.

Regarding groundwater quality, hazardous materials, such as fuels, paints, solvents, and concrete additives could be used during on-site grading and building construction, and would therefore require proper management and, in some cases, disposal. The management of any resultant hazardous wastes could increase the opportunity for hazardous materials releases into groundwater. As with the Project, the Alternative 3 would comply with all applicable federal, State, and local requirements concerning the handling, storage and disposal of hazardous waste, which would reduce the potential for construction activities to release contaminants into groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. Additionally, similar to construction, any surface handling of hazardous materials during operation would involve small quantities and would be handled and stored in accordance with manufacturers' specifications and applicable regulations, thereby resulting in a negligible potential impact to groundwater quality. Therefore, as with the Project, impacts with respect to groundwater water quality would be less than significant under Alternative 3 and such impacts would be similar to the less than significant impacts of the Project.

h. Land Use and Planning

Land use consistency impacts under Alternative 3 would be similar to those of the Project due to similarities in the development proposals. As such, Alternative 3 would be consistent with SCAG's regional plans, the County General Plan, and the County Code to the same extent as the Project. Therefore, impacts related to land use consistency would be less than significant and similar to the less than significant impacts of the Project.

i. Noise

(1) Construction

This Alternative would include the development of the same components as the Project. Therefore, noise and vibration impacts at sensitive receptors would be the same as the intensity and the duration of these activities would be the same compared to the Project. As with the Project, construction of this Alternative would result in less than significant construction noise and vibration impacts, and such impacts would be similar to those of the Project.

(2) Operation

As with the Project, this Alternative would include on-site noise sources that would produce noise levels that would be similar to those that would occur under the Project. As analyzed in Section IV.I, Noise, of this Draft EIR, these on-site noise sources would result in less than significant impacts with implementation of the project design features. Thus, with implementation of the same project design features to be implemented under the Project, noise impacts associated with these on-site noise sources under this Alternative would also be less than significant. Additionally, the simultaneous theatre use under this Alternative would not result in a change to the number of daily trips or the estimated increases in annual events and attendance projected to occur under the Project. As vehicular noise is dependent on the number of daily trips, vehicular noise would result in the same noise level compared to the Project. Overall, operational noise impacts under the Simultaneous Event Schedules Alternative would be less than significant and similar to the Project.

j. Public Services

(1) Fire Protection

The types of construction activities required for Alternative 3 would be similar to the Project due to the similar types and amounts of new development. Accordingly, construction-related traffic which could temporarily interfere with local and on-site emergency response would be similar to the Project. As with the Project, construction traffic management plans would be implemented to ensure that adequate emergency access is maintained to the Project Site and neighboring uses at all times. In addition, similar to the Project, construction would comply with applicable codes and ordinances relating to fire safety practices. As such, construction impacts on fire protection and emergency medical services would be less than significant under this Alternative, and similar to the less than significant impacts of the Project.

Like the Project, Alternative 3 does not include the development of any new residential uses and, as such, would not increase the permanent residential population within the service area of Fire Station No. 76. As this Alternative would develop the same type and amount of uses as the Project, Alternative 3 would generate an increase in the population at the Project Site that would be similar to that of the Project. As with the Project, compliance with applicable regulatory requirements under this Alternative would ensure that adequate fire prevention features would be provided that would reduce the demand for firefighting services. Similarly, while the additional traffic generated by this Alternative could potentially affect emergency response, the additional traffic, which would be similar to the Project, would not substantially impact response times or emergency vehicle access. Further, with implementation of the same onsite fire water system

improvements as the Project, Alternative 3 would also meet the fire flow requirements set forth by the County Fire Department and LAFD. Given the Project Site's location in a Very High Fire Hazard Severity Zone, Alternative 3 would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone, similar to the Project. Overall, impacts to fire protection and emergency medical services from development of Alternative 3 would be less than significant and similar to the less than significant impacts of the Project.

(2) Police Protection

The types of construction activities required for Alternative 3 would be similar to the Project due to the similar types and amounts of new development. Therefore, construction-related traffic that could temporarily interfere with local and on-site emergency response would be similar to the Project. As with the Project, construction traffic management plans would be implemented under Alternative 3 to ensure that adequate emergency access is maintained to the Project Site and neighboring uses at all times. In addition, the Alternative 3 would implement the same project design features as the Project regarding the implementation of security measures during construction. Therefore, as with the Project, construction-related impacts to police protection services would be less than significant and similar to those of the Project.

Like the Project, Alternative 3 would not include the development of any residential uses and, as such, would not increase the permanent residential population within the service area of the Parks Bureau South Zone or the Hollywood Community Police Station. As this Alternative would develop the same type and amount of uses as the Project, Alternative 3 would generate an increase in the population at the Project Site that would be similar to that of the Project. Alternative 3 would implement the same project design features as the Project, which would serve to reduce the potential for criminal activities and assist law enforcement efforts. Furthermore, while additional traffic generated by the Project could potentially cause delays in law enforcement response times, the additional traffic would not substantially impact emergency vehicle access or response times. Therefore, impacts related to police protection services would be less than significant under Alternative 3 and similar to the less than significant impacts of the Project.

k. Traffic, Access, and Parking

(1) Construction

As with the Project, construction Alternative 3 would generate additional trips from heavy-duty construction equipment, haul trucks, and construction worker trips. As the overall amount of building demolition, excavation, and building construction would be the

same as the Project, the number of construction-related trips during these phases would be the same as the Project. In addition, as with the Project, this Alternative would implement a Construction Management Plan to manage construction-related traffic. Similar to the Project, the Simultaneous Event Schedules Alternative would also not require the relocation or removal of transit stops in the vicinity of the Project Site or impede emergency, bicycle, and pedestrian access. Additionally, as with the Project, parking for construction workers and employees would be provided on-site. Overall, construction-related traffic, access, and parking impacts under the Simultaneous Event Schedules Alternative would be less than significant, and similar to those of the Project.

(2) Operation

As discussed above, the Simultaneous Event Schedules Alternative would develop the same types and amount of uses as the Project. In addition, the estimated increases in annual events and attendance projected to occur under the Project would also remain under this Alternative. However, under the Simultaneous Event Schedules Alternative, events held in the Amphitheatre, the 299-seat theatre, and the Flex Space would be able to have simultaneous events with concurrent start times whereas under the Project, events held in the Amphitheatre and the 299-seat theatre would have staggered start times on weekday evenings. Therefore, while this Alternative would generate the same amount of overall traffic and transit trips as the Project, as well as the same demand for parking, the trips generated by this Alternative during the evening peak period between 6:00 P.M. to 9:00 P.M., would be greater than the Project. Accordingly, the traffic impacts to study intersections during this peak period would be greater than the Project. Specifically, the Simultaneous Event Schedules Alternative would result in one significant traffic impact during the weekday evening peak period at Intersection No. 6: US-101 Northbound Off-ramp & Cahuenga Boulevard North. Therefore, impacts with respect to intersection level of service would be significant and unavoidable under the Simultaneous Event Schedules Alternative and such impacts would be greater compared to the Project. Impacts regarding congestion management program facilities, access and circulation, and parking would be less than significant and similar to the Project.

I. Utilities and Service Systems

(1) Water

Like the Project, construction activities associated with Alternative 3 would generate a short-term demand for water. This demand would be similar to the Project due to the similar amount of construction activities and grading and dust control that would be required. Therefore, as with the Project, impacts on water supply and infrastructure associated with short-term construction activities would be less than significant under Alternative 3. Such impacts would be similar to those of the Project.

As with the Project, operation of Alternative 3 would generate an increased demand for water relative to existing conditions. As Alternative 3 would construct the same types and amounts of new uses as the Project, this Alternative would result in the same increase in water demand as the Project. Alternative 3 would also implement the same water conservation measures as the Project. Therefore, like the Project, this Alternative's estimated net water demand would be within LADWP's available and projected water supplies for normal, single-dry, and multi-dry years through the year 2035. Additionally, Alternative 3 would include implementation of the same water infrastructure improvements as the Project. Therefore, impacts to water supply and infrastructure under Alternative 3 would be less than significant and similar to the less than significant impacts of the Project.

(2) Energy

Like the Project, construction activities associated with Alternative 3 would generate a short-term demand for electricity. This demand would be similar to the Project due to the similar amount of construction activities that would be required. Alternative 3 would also implement the same infrastructure improvements as the Project to supply electricity to the proposed uses. As the construction of new buildings and infrastructure typically does not involve the consumption of natural gas, no natural gas would be consumed during construction of this Alternative, similar to the Project. Overall, impacts on energy supply and infrastructure associated with short-term construction activities would be less than significant under Alternative 3 and similar to the less than significant impacts of the Project.

As with the Project, operation of Alternative 3 would generate an increased demand in electricity and natural gas relative to existing conditions. As Alternative 3 would construct the same types and amounts of new uses as the Project, this Alternative would result in the same increase in energy consumption as the Project. Therefore, similar to the Project, impacts on energy supply and infrastructure under Alternative 3 would also be less than significant. Such impacts would be similar to those of the Project.

3. Comparison of Impacts

As analyzed above, the impacts of Alternative 3 would be similar to the Project for all environmental issues except traffic. Specifically, impacts associated with aesthetics, views, light, and glare; air quality; greenhouse gas emissions; biological resources; cultural resources; geology and soils; hydrology, surface water quality, and groundwater; land use and planning; noise; public services; and utilities and service systems would be similar under this Alternative when compared with the Project. However, as Alternative 3 would provide for simultaneous events with concurrent start times within the Amphitheatre and the proposed 299-seat theatre, which would create significant impacts to traffic, impacts

regarding intersection levels of service would be greater under this Alternative as compared to the Project.

4. Relationship of the Alternative to Project Objectives

The types and amounts of uses proposed under Alternative 3 would be the same as under the Project. As such, this Alternative would meet the Project's underlying purpose to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource. This Alternative would also achieve the Project objectives that support this underlying purpose.

Specifically, with implementation of the previously approved Amphitheatre improvements as well as the Amphitheatre rehabilitation improvements proposed as part of the Project, Alternative 3 would meet the Project's objective to preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County. Similarly, this Alternative would support the objective to provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination. Additionally, as Alternative 3 would include the development of the proposed facilities, this Alternative would meet the objective to support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences. Similarly, Alternative 3 would achieve the Project objective to repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

Furthermore, since Alternative 3 would include the development of new plaza areas, the proposed restaurant, and structured parking, this Alternative would support the following Project objectives: enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress; and further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

Alternative 3 would also develop a Transit Center and include pedestrian and vehicular circulation improvements and, as such, would achieve the objective to create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures. In addition, as this Alternative would include a hiking trail, Alternative 3 would meet the Project objective to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views or surrounding iconic landmarks from a formal trail within the park boundary. Further, since Alternative 3 would include the installation of an enhanced sound wall, this Alternative would also support the objective to mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre. Additionally, with development of the Ford Terrace, the Alternative 3 would provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre. Alternative 3 would further include development of the proposed offices and, as such, would support the objective to provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community. This Alternative would also disturb the same general area as the Project and, as such, Alternative 3 would meet the Project objective to provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

VI. Alternatives

D. Environmentally Superior Alternative

Section 15126.6(e)(2) of the CEQA Guidelines indicates that an analysis of alternatives to a project shall identify an Environmentally Superior Alternative among the alternatives evaluated in an EIR. The CEQA Guidelines also state that should it be determined that the No Project Alternative is the Environmentally Superior Alternative, the EIR shall identify another Environmentally Superior Alternative among the remaining alternatives.

A comparative summary of the environmental impacts anticipated under each alternative with the environmental impacts associated with the Project is provided in Table V-1 on page V-6. A more detailed description of the potential impacts associated with each alternative is provided above. Pursuant to Section 15126.6(c) of the CEQA Guidelines, the analysis below addresses the ability of the alternatives to "avoid or substantially lessen one or more of the significant effects" of the Project.

As previously stated, implementation of the Project would not result in significant and unavoidable impacts with regard to the environmental issues evaluated in this Draft EIR. Notwithstanding, of the alternatives analyzed in this Draft EIR, Alternative 1, the No Project/No Build Alternative is considered the Environmentally Superior Alternative as it would reduce most of the less than significant impacts occurring under the Project. However, Alternative 1 would result in greater (but less than significant) impacts to surface water quality and groundwater quality. In addition, as indicated above, this Alternative would not meet most of the objectives established for the Project.

In accordance with the CEQA Guidelines requirement to identify an Environmentally Superior Alternative other than the No Project Alternative, a comparative evaluation of the remaining alternatives indicates that Alternative 2, the Reduced Project Alternative, would be the Environmentally Superior Alternative. As summarized in Table V-1, this Alternative would reduce more of the Project impacts compared to Alternative 3. However, as described above, without the development of the proposed 299-seat theatre, this Alternative would not meet the underlying purpose of the Project. Additionally, as with the Alternatives evaluated herein, the Project also would not result in significant and unavoidable impacts with regard to the environmental issues evaluated in this Draft EIR.

VI. Other CEQA Considerations

VI. Other CEQA Considerations

1. Significant Unavoidable Impacts

Section 15126.2(b) of the CEQA Guidelines requires that an EIR describe any significant impacts which cannot be avoided, including those effects that can be mitigated but not reduced to a less than significant level.

As evaluated in Section IV, Environmental Impact Analysis, of this Draft EIR, implementation of the Project would not result in significant impacts to any of the environmental issues evaluated in this Draft EIR which could not be reduced with compliance with regulatory requirements or the implementation of specific project design features and/or mitigation measures. Therefore, the Project would not result in significant unavoidable impacts.

2. Significant Irreversible Environmental Changes

In accordance with Section 15126.2(c) of the CEQA Guidelines, an EIR is required to evaluate significant irreversible environmental changes that would be caused by implementation of a project. As stated in CEQA Guidelines Section 15126.2(c):

> Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

During construction and operation, the Project would necessarily consume non-renewable resources and resources that are effectively non-renewable due to their long regeneration time. The Project would require a commitment of non-renewable and renewable resources that would include: (1) building materials; (2) water; and (3) energy

resources. The Project's use of these resources is discussed below in addition to a discussion regarding potential environmental hazards.

a. Building Materials

During construction, the Project would consume non-renewable resources that would include the following building materials: certain types of lumber and other forest products; aggregate materials used in concrete and asphalt, such as sand, gravel and stone; metals, such as steel, copper, and lead; and petrochemical construction materials, such as plastics. In accordance with the County's Green Building Ordinance, during construction of the Project, a minimum of 65 percent of the non-hazardous construction and demolition debris would be recycled and/or salvaged for reuse. Thus, the consumption of non-renewable building materials, such as lumber, aggregate materials, and plastics, would be reduced. In addition, as described in Section II, Project Description, of this Draft EIR, existing waste reduction and recycling practices would continue and would be enhanced with implementation of the Project.

b. Water

Water, which is a limited, slowly renewable resource, also would be consumed during Project construction. Project consumption of water during construction and operation of the Project is addressed in Section IV.L.1, Utilities and Service Systems—Water, of this Draft EIR. As evaluated therein, given the temporary nature of construction activities, demolition and construction activities would require minimal water demand and are not anticipated to have any adverse impact on available water supplies and infrastructure. In addition, the Project's operational water demand would be within the projected water supplies for normal, single-dry, and multiple-dry years, and the City of Los Angeles Department of Water and Power (LADWP) would be able to meet the water demand for the Project in addition to the existing and planned water demands of its future service area. Furthermore, pursuant to Project Design Feature L.1-2, the Project would implement a variety of water conservation features including, but not limited to, high-efficiency plumbing fixtures, the use of water efficiency landscaping, and native/adapted/drought-tolerant plants. Thus, as evaluated in Section IV.L.1, Utilities and Service Systems—Water, of this Draft EIR, while Project operation would result in the irreversible consumption of water, the Project would not result in a significant impact related to water supply or infrastructure.

c. Energy Resources

Fossil fuels, such as diesel, gasoline, and oil, would be consumed to power construction vehicles and equipment and for the generation of electricity. As evaluated in

Section IV.L.2, Utilities and Service Systems—Energy, of this Draft EIR, electricity consumption during Project construction would vary based on the construction activity (i.e., grading, building construction, etc.). Given the nature of construction activities, the consumption of fossil fuels for energy use would occur on a temporary basis. In addition, any electricity consumption that would occur due to Project construction activities would be somewhat offset by the reduction in electricity consumption resulting from the demolition of some of the existing uses within the Project Site.

Fossil fuels for electricity, natural gas, and transportation would also be consumed during operation of the Project. As non-renewable fossil fuels would represent the primary energy source during Project operations, the existing finite supplies of these resources would be incrementally reduced. The consumption of non-renewable fossil fuels for energy use is analyzed in Section V.L.2, Utilities and Service Systems—Energy, of this Draft EIR. As analyzed therein, the Project's estimated increase in electricity and natural gas demand would be within the anticipated service capabilities of LADWP and the Southern California Gas Company, respectively. The Project would also comply with Title 24 of the California Code of Regulations, which sets forth the Building Energy Efficiency Standards to limit the amount of energy consumed by the Project. Furthermore, the Project would be designed and constructed to achieve the equivalent of LEED™ certification, at minimum, and would comply with the County's Green Building ordinance, which would also service to minimize the amount of energy consumed by the Project. Therefore, energy would not be used in a wasteful manner and long-term impacts associated with the consumption of fossil fuels would not be significant.

d. Environmental Hazards

The potential for hazards and hazardous materials within the Project Site was evaluated as part of the Initial Study prepared for the Project included as Appendix A of this Draft EIR. As provided therein, construction of the Project would involve the temporary use of typical, although potentially hazardous materials, including vehicle fuels, oils, transmission fluids, paints, adhesives, cleaning solvents, surface coatings, and other acidic or alkaline solutions that would require special handling, transport, and disposal. In addition, operation of the Project would involve the routine use and handling of potentially hazardous materials typical of those used for a multi-use cultural and recreational center, including cleaning solvents for custodial maintenance of the buildings, and pesticides for landscaping. However, all potentially hazardous materials would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations. Any associated risk would be reduced to a less than significant level through compliance with these standards and regulations. Similarly, demolition activities would comply with regulatory requirements to ensure asbestos, lead-based paints, and polychlorinated biphenyls are not released into the environment.

Overall, the analysis concluded that there are no known recognized environmental conditions on-site that have the potential to result in significant hazards impacts. In addition, compliance with regulations and standards would serve to protect against a significant and irreversible environmental change that could result from the accidental release of hazardous materials.

e. Conclusion

Based on the above, Project construction and operation would require the irretrievable commitment of slowly renewable, and non-renewable resources, which would limit the availability of these resources and the Project Site for future generations or for other uses. However, the consumption of such resources would not be considered substantial and would be consistent with regional and local growth forecasts and development goals for the area. The loss of such resources would not be highly accelerated when compared to existing conditions and such resources would not be used in a wasteful manner. Therefore, although irreversible environmental changes would result from the Project, such changes are concluded to be less than significant.

3. Growth-Inducing Impacts

Section 15126.2(d) of the CEQA Guidelines requires that growth-inducing impacts of a project be considered in a Draft EIR. Growth-inducing impacts are characteristics of a project that could directly or indirectly foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment. According to the CEQA Guidelines, such projects include those that would remove obstacles to population growth (e.g., a major expansion of a waste water treatment plant that, for example, may allow for more construction in service areas). In addition, as set forth in the CEQA Guidelines, increases in the population may tax existing community service facilities, thus requiring construction of new facilities that could cause significant environmental effects. The CEQA Guidelines also require a discussion of the characteristics of projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. Finally, the CEQA Guidelines state that it must not be assumed that growth in an area is necessarily beneficial, detrimental, or of little significance to the environment.

As discussed in the Initial Study prepared for the Project, which is provided in Appendix A of this Draft EIR, the Project would not include the development of residential uses. Therefore, the Project would not directly induce population growth within the Project area. In addition, while the Project would create temporary construction-related jobs, the work requirements of most construction projects are highly specialized such that construction workers remain at a job site only for the time in which their specific skills are

needed to complete a particular phase of the construction process. Therefore, Project-related construction workers would not be anticipated to relocate their household's place of residence as a consequence of working on the Project, and, as such, no new permanent residences in the vicinity of the Project Site would be generated during construction of the Project. Further, while the Project would increase existing County Arts Commission, County Department of Parks and Recreation, and Ford Theatre Foundation staffing within the Project Site by 85 employees, the existing 140 Los Angeles Philharmonic employees within the Project Site would be relocated off-site to other existing facilities. With the relocation of these employees, the Project would result in an overall net decrease in employees on-site. Thus, the Project would not indirectly induce population growth as a result of employment opportunities within the Project Site.

With regard to infrastructure-induced population growth, the proposed roadway improvement including the installation of a new signal at the Project Site driveway providing egress from the south parking structure is intended to improve access and allow for safer left turns from the driveway to Cahuenga Boulevard East. This improvement would not open any large undeveloped areas for new use. Utility and other infrastructure upgrades are also intended to meet Project-related demand. Specifically, any new water and wastewater connections and electrical and natural gas infrastructure have been designed to provide for the Project and would not generate substantial capacity that would induce growth. In conclusion, the Project is not expected to indirectly induce population growth through the construction of infrastructure.

4. Potential Secondary Effects

Section 15126.4(a)(1)(D) of the CEQA Guidelines requires that "if a mitigation measure would cause one or more significant effects in addition to those that would be caused by the project as proposed, the effects of the mitigation measure shall be discussed but in less detail than the significant effects of the project as proposed." With regard to this section of the CEQA Guidelines, the potential impacts that could result with the implementation of each mitigation measure included for the Project was reviewed. The following provides a discussion of the potential secondary impacts that could occur as a result of the implementation of the Project mitigation measures, listed by environmental issue area.

a. Aesthetics, Views, Light, and Glare

Impacts on aesthetics, views, light, and glare would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

b. Air Quality

Impacts on air quality would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

c. Greenhouse Gas Emissions

Impacts on greenhouse gas emissions would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

d. Biological Resources

Mitigation Measure D-1 requires that prior to construction, a qualified botanist conduct rare plant surveys throughout the Project area and outlines procedures in the event sensitive species are found. Implementation of this mitigation measure would be beneficial in reducing potential impacts to plant communities and habitats and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure D-2 prescribes the preparation of a restoration plan in the event it is determined that special status plants would be directly impacted as a result of the Project. Implementation of this mitigation measure would be beneficial in reducing potential impacts to plant communities and habitats and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure D-3 requires that protocol level surveys for the coastal California gnatcatcher be conducted within a year prior to construction and outlines the procedures to be followed in the event the coastal California gnatcatcher or its sign is detected. Implementation of this mitigation measure would be beneficial in reducing potential impacts to the coastal California gnatcatcher and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure D-4 requires that construction areas be placed to avoid nesting habitats; prescribes the appropriate schedule for activities with the potential to disturb nesting birds; sets forth specific actions in the event construction activities occur during specified timeframes; and outlines specific actions in the event nesting birds or raptors are found in the construction area. Implementation of this mitigation measure would be beneficial in reducing potential impacts to nesting birds and would ensure compliance with

applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure D-5 requires that a qualified biologist complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area and specifies procedures in the event wildlife species are identified. Implementation of this mitigation measure would be beneficial in reducing potential impacts to special-status wildlife species and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure D-6 and Mitigation Measure D-7 pertain to bats. Mitigation Measure D-6 prescribes the appropriate schedule for activities with the potential to disturb bats and requires surveys and specific actions in the event construction activities occur during specified timeframes and in the event bats are found. Mitigation Measure D-6 further prescribes measures for the safe removal of bats, if necessary. Mitigation Measure D-7 sets forth specific actions in the event a maternal colony of bats is found. Implementation of these mitigation measures would be beneficial in reducing potential impacts to bats and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of these mitigation measures.

Mitigation Measure D-8 through Mitigation Measure D-10 pertain to general wildlife species. Mitigation Measure D-8 provides that Amphitheatre lighting be designed to focus downward to minimize light spillover onto adjacent open space areas. Mitigation Measure D-9 requires that fencing associated with the proposed hiking trail be designed to be low in height with openings between posts and rails to allow the movement of wildlife. Mitigation Measure D-10 provides that trash receptacles that are not accessible to wildlife be used to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. Implementation of these mitigation measures would be beneficial in reducing potential impacts to general wildlife species. No adverse secondary impacts would result from implementation of these mitigation measures.

Mitigation Measure D-11 prescribes measures for the protection of oak trees in the Project Site. Implementation of this mitigation measure would be beneficial in reducing potential impacts to oak trees and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

e. Cultural Resources

Mitigation Measure E-1 requires that final architectural plans be reviewed and approved by a qualified professional to ensure that the Project is consistent with the Secretary of the Interior's Standards. Implementation of this mitigation measure would be beneficial in reducing potential impacts to historic resources. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure E-2 and Mitigation Measure E-3 address archaeological resources. Mitigation Measure E-2 requires that if archaeological resources are discovered, construction activities shall cease and deposits shall be treated in accordance with applicable federal, State, and local guidelines. Mitigation Measure E-3 requires that construction activities cease in the event human remains are encountered and that the County Coroner be notified. Mitigation Measure E-3 further requires the disposition of the human remains and any associated grave goods be conducted in accordance with applicable regulations. Implementation of these mitigation measures would be beneficial in reducing potential impacts to archaeological resources and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of these mitigation measures.

Mitigation Measure E-4 requires that a qualified paleontologist be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur and prescribes specific actions in the event paleontological materials are encountered. Implementation of this mitigation measure would be beneficial in reducing potential impacts to paleontological resources and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

f. Geology and Soils

Mitigation Measure F-1 requires that Project grading include a combination of ground modification and/or structural enhancements in areas subject to liquefaction. Implementation of this mitigation measure would be beneficial in reducing potential impacts regarding liquefaction and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

Mitigation Measure F-2 requires the implementation of several features, including retaining walls and flexible barriers. Implementation of this mitigation measure would be beneficial in reducing potential impacts regarding debris flows and rockfalls and would ensure compliance with applicable regulations. No adverse secondary impacts would result from implementation of this mitigation measure.

g. Hydrology, Surface Water Quality, and Groundwater

Impacts on hydrology, surface water quality, and groundwater would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

h. Land Use and Planning

Impacts on land use and planning would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

i. Noise

Mitigation Measure I-1 requires that power construction equipment, fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards) and that all equipment be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated. Mitigation Measure I-2 provides that Project construction shall not include the use of driven pile systems. Mitigation Measure I-3 requires that the contractor utilize construction equipment, such as a small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure. These mitigation measures would be beneficial in reducing potential impacts regarding construction noise and vibration. No adverse secondary impacts would result from implementation of these mitigation measures.

j. Public Services—Fire Protection

Impacts on fire protection would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

k. Public Services—Police Protection

Impacts on police protection would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

l. Traffic, Access, and Parking

Impacts on traffic, access, and parking would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

m. Utilities and Service Systems—Water

Impacts on water would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

n. Utilities and Service Systems—Energy and Energy Conservation

Impacts on energy would be less than significant and no mitigation measures are required. Therefore, no potential secondary impacts would occur.

5. Effects Not Found To Be Significant

Section 15128 of the CEQA Guidelines requires an EIR to contain a brief statement indicating reasons that various possible significant effects of a project were determined not to be significant and not discussed in detail in the EIR. An Initial Study was prepared for the Project and is included in Appendix A of this Draft EIR. The Initial Study provides a detailed discussion of the potential environmental impact areas and the reasons each environmental area is or is not analyzed further in this Draft EIR. The County determined through the Initial Study that the Project would not have the potential to cause significant impacts related to agriculture and forest resources; hazards and hazardous materials; mineral resources; population and housing; certain public services (schools, parks, libraries); recreation; and certain utilities (wastewater and solid waste). A summary of the analysis provided in Appendix A of this Draft EIR for these issue areas is provided below.

a. Agriculture and Forest Resources

The Project Site comprises a regional park that does not include any agricultural, forest, or timberland. In addition, the Project Site and surrounding area are not mapped as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. The Project Site and surrounding area are also not zoned for agricultural use or forest land and are not enrolled under a Williamson Act Contract. Therefore, no impacts to agricultural and forest resources would occur.

b. Hazards and Hazardous Materials

Construction of the Project would involve the temporary use of typical, although potentially hazardous materials, including vehicle fuels, oils, transmission fluids, paints, adhesives, cleaning solvents, surface coatings, and other acidic or alkaline solutions that would require special handling, transport, and disposal. Operation of the Project would also involve the routine use and handling of potentially hazardous materials typical of those

used for a multi-use cultural and recreational center, including cleaning solvents for custodial maintenance of the buildings, and pesticides for landscaping. However, all potentially hazardous materials would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations. Any associated risk would be reduced to a less than significant level through compliance with these standards and regulations. Similarly, demolition activities would comply with regulatory requirements to ensure asbestos, lead-based paints, and polychlorinated biphenyls are not released into the environment. Overall, the analysis concluded that there are no known recognized environmental conditions on-site that have the potential to result in significant hazards impacts. Additionally, the Project Site would not emit hazardous emissions or handle hazardous materials within 0.25-mile of a school. Further, the Project Site is not located within two miles of an airport or in the vicinity of a private airstrip which could result in a safety hazard for people residing or working in the Project area. Lastly, with implementation of a Construction Management Plan, potential impacts to emergency access during construction of the Project would be addressed. In conclusions, impacts with regard to hazards and hazardous materials would be less than significant.

c. Mineral Resources

The Project Site is a regional park that includes the existing Ford Theatres. The Project Site is not a designated mineral resource area. In addition, no mineral extraction operations currently occur on the Project Site. Furthermore, many of the areas to be developed are already developed with surface parking areas and ornamental landscaping. As such, the Project would not result in the loss of availability of a mineral resource that would be of value to the region or the state. Therefore, no impacts to mineral resources would occur.

d. Population and Housing

The Project does not propose the development of residential uses. Therefore, the Project would not directly induce population growth within the Project area. In addition, as no housing currently exists on the Project Site, the Project would not displace any existing housing or cause the displacement of any persons that would necessitate the construction of housing elsewhere. Further, while the Project would create temporary construction-related jobs, the work requirements of most construction projects are highly specialized such that construction workers remain at a job site only for the time in which their specific skills are needed to complete a particular phase of the construction process. Therefore, Project-related construction workers would not be anticipated to relocate their household's place of residence as a consequence of working on the Project, and, as such, no new permanent residences in the vicinity of the Project Site would be generated during

construction of the Project. Additionally, while the Project would increase existing County Arts Commission, County Department of Parks and Recreation, and Ford Theatre Foundation staffing within the Project Site by 85 employees. The existing 140 Los Angeles Philharmonic employees within the Project Site would relocate their offices off-site. With the relocation of these employees, the Project would result in an overall net decrease of employees on-site. Thus, the Project would not indirectly induce population growth as a result of employment opportunities within the Project Site. As such, no significant impacts with regard to population and housing would occur.

e. Public Services (Schools, Parks, and Libraries)

(1) Schools

As the Project does not propose the development of residential uses, implementation of the Project would not result in a direct increase in the number of students within the service area of the Los Angeles Unified School District. In addition, any potential impact on public school facilities resulting from the potential for the approximately 85 new employees generated by the Project to relocate to the Project area and generate a need for additional public school facilities would represent a small percentage of LAUSD's total K–12 student enrollment of 651,322 students. As such, the Project would not result in the need for new or altered school facilities. Therefore, impacts to school facilities would be less than significant.

(2) Parks

The Project Site comprises an approximately 32-acre County of Los Angeles regional park. The proposed improvements under the Project would enhance existing facilities and would increase the recreational facilities available on-site. Therefore, the Project would result in a beneficial impact on parks and recreational facilities. In addition, as the Project does not propose the development of residential uses, implementation of the Project would not result in on-site residents who would utilize nearby parks and/or recreational facilities. Therefore, no impacts with regards to parks would occur.

(3) Libraries

The Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in a direct increase in the number of residents within the service population of the Frances Howard Goldwyn–Hollywood Regional Branch Library. In addition, as Project employees would be more likely to use library facilities near their homes during non-work hours, such Project employees would generate minimal demand for library services. As such, any indirect or direct demand for

library services generated by Project employees would be negligible. Therefore, impacts with regard to library services would be less than significant.

f. Recreation

The Project would result in a beneficial impact on recreational facilities by providing improvements to an existing County regional park. In addition, it is anticipated that any recreational use by Project employees would occur on-site. Thus, the Project would not increase the use of existing off-site neighborhood and regional parks or other recreational facilities such that a substantial physical deterioration of the facility would occur or be accelerated. Therefore, no impacts with regard to recreation would occur.

g. Utilities (Wastewater and Solid Waste)

(1) Wastewater

The wastewater generated by the Project would be typical of office and restaurant uses and performance/event venues. No industrial discharge into the wastewater system would occur. As the Hyperion Treatment Plant has sufficient capacity and is in compliance with the State's wastewater treatment requirements, the Project would not exceed the wastewater treatment requirements of the Los Angeles Regional Water Quality Control Board. Therefore, impacts with regard to wastewater would be less than significant.

(2) Solid Waste

Construction of the Project would involve demolition, site grading/preparation, and building construction activities. These activities would generate construction and demolition wastes (e.g., wood, concrete, asphalt, cardboard, brick, glass, plastic, and metal) that would be recycled or collected by private waste haulers contracted by the Applicant and taken for disposal at the County's inert landfills. It is anticipated that construction of the Project would generate a total of approximately 156,700 tons of construction-related waste. The amount of construction and debris waste generated by construction of the Project would represent approximately 0.2 percent of the existing remaining disposal capacity of 64,125,859 tons for the unclassified landfill in Los Angeles County that has solid waste facility permits. Thus, the total amount of construction and demolition waste generated by the Project would represent a fraction of the remaining capacity at the unclassified landfill in Los Angeles County.

Operation of the Project would generate approximately 156.26 tons per year (0.43 tons per day) of solid waste, resulting in a net increase of approximately 74.5 tons per year (0.20 tons per day) of solid waste when compared with existing conditions. The

estimated solid waste increase generated by the Project would represent approximately 0.00007 percent of the estimated annual remaining disposal capacity and 0.001 percent of the remaining daily disposal capacity of Class III Landfills open to the Project. The waste generation factors utilized do not account for recycling or other waste diversion measures, and, as such, this estimated amount of solid waste calculated to be generated by the Project is conservative.

Based on the above, the landfills that serve the Project Site would have adequate capacity to accept the solid waste that would be generated by construction and operation of the Project. Impacts regarding landfill capacity would be less than significant.

Additionally, the Project would be consistent with the applicable regulations associated with solid waste and would promote compliance with AB 939 by providing clearly marked, source-sorted receptacles to facilitate recycling. On-site recycling would also be enhanced through a recycling program that would focus on items such as paper, cardboard, glass, aluminum, plastic, and cooking oils. Since the Project would comply with federal, State, and local statutes and regulations related to solid waste, no significant impacts would occur.

VIII. List of Preparers

VIII. List of Preparers

This section of this Draft Environmental Impact Report (EIR) identifies the lead agency for the Project and contains a list of the EIR consultant and the technical subconsultants. Résumés for the EIR consultant are included as part of this section. The résumés of the technical subconsultants are included in the respective technical appendices of this Draft EIR.

A. Lead Agency

County of Los Angeles
Department of Parks and Recreation
510 South Vermont Avenue, Room 201
Los Angeles, CA 90020

- Kathline J. King, Chief of Planning

B. Environmental Impact Report Preparation

EIR Preparation

Matrix Environmental
6701 West Center Drive, Suite 900
Los Angeles, CA 90045

- Stephanie Eyestone-Jones, President
- Laura Rodriguez, Senior Environmental Planner
- Mark Hagmann, Director of Air Quality
- Allyson Dong, Planner
- Ashley Wright, Associate Planner
- John Osako, Publications Manager

C. Technical Subconsultants

Tree Survey

Mia Lehrer + Associates
3780 Wilshire Boulevard, Suite 250
Los Angeles, CA 90010

- Benjamin Feldmann, Senior Associate
- Dawn Dyer, Associate

Biological Resources

GPA Consulting
231 California Street
El Segundo, CA 90245

- Marieka Schrader, Senior Environmental Planner

Historic Resources

GPA Consulting
231 California Street
El Segundo, CA 90245

- Teresa Grimes, Principal Architectural Historian

Geology and Soils

Leighton Consulting, Inc.
17781 Cowan
Irvine, CA 92614

- Joe Roe, Senior Project Geologist
- Carl Kim, Senior Principal Engineer

Noise

Acoustical Engineering Services, Inc.
22801 Crespi Street
Woodland Hills, CA 91364

- Amir Yazdanniyaz, Principal
- Sean Bui, Principal

Transportation and Circulation

Gibson Transportation Consulting, Inc.
523 West 6th Street, Suite 1234
Los Angeles, CA 90041

- Sarah Drobis, Principal Associate
- Richard Gibson, Associate

Water Resources and Utilities

Mollenhauer
316 West 2nd Street, Fifth Floor
Los Angeles, CA 90012

- Robert Poppe, Senior Project Manager

Glendale, CA 91203

- Mark Alcalde, President

D. Project Applicant

The Ford Theatre Foundation
2580 Cahuenga Boulevard East
Los Angeles, CA 90068

matrix environmental

STEPHANIE EYESTONE-JONES

President

Stephanie Eyestone-Jones is an urban planner with more than 20 years of experience in managing and preparing documents for the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) environmental review processes. Ms. Eyestone-Jones has been responsible for the successful completion of technically sound and legally defensible environmental documents for numerous controversial and high-profile projects throughout Southern California. During the past 20 years, she has been responsible for environmental documents for over 30 million square feet of commercial/employment space and 20,000 residential units. Ms. Eyestone-Jones is specifically known for her ability to successfully certify projects in litigious circumstances.

EDUCATION

M.A., Urban Planning, University of California, Los Angeles, California, 1992

Ms. Eyestone-Jones has effectively managed and directed large project teams and has strategically formulated and presented analyses for complex technical issues. She ensures that environmental impacts are adequately analyzed, while maintaining flexibility in the development of proposed projects. She has extensive knowledge of a wide range of environmental issues and expertise in the implementation of the CEQA process.

In conjunction with the preparation of environmental documentation, Ms. Eyestone-Jones often provides presentations at public meetings. In addition, she often provides CEQA presentations to attorneys and land use specialists at conferences.

LAURA RODRIGUEZ

Senior Environmental Planner

Laura Rodriguez has over six years of experience in the preparation of environmental compliance documentation pursuant to the California Environmental Quality Act (CEQA) and the National Environmental Protection Act (NEPA). Ms. Rodriguez has played a key role in the preparation and management of Environmental Impact Reports (EIR), Environmental Impact Statements (EIS), Initial Studies (IS), Mitigated Negative Declarations (MND), Mitigation Monitoring and Reporting Programs (MMRP), Environmental Assessments (EA), and Addenda for a variety of project types, including transportation, renewable energy, medical, commercial/retail, sports/entertainment, institutional, and mixed-use developments. Her responsibilities include coordination with subconsultants and agency staff, environmental document preparation and coordination, analytical research, document/task management, fulfilling public noticing requirements, and production and distribution. Ms Rodriguez specializes in the analysis of hydrology/water quality, geology, hazards and hazardous materials, and water supply.

MARK HAGMANN, P.E.

Director of Air Quality

Mark Hagmann has 18 years of technical and supervisory experience related to the preparation of air quality technical studies for toxic air contaminants, criteria pollutants, and greenhouse gases (GHG). He has extensive knowledge of the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) regulatory process and the rules and regulations established by the South Coast Air Quality Management District. He has prepared Air Quality Impact Assessments (AQIA) and Health Risk Assessments (HRAs) required under various state and federal environmental regulations including NEPA and CEQA, RMPP, Cal ARP, AB2588, and Proposition 65. He has also conducted GHG analyses consistent with State, regional and local guidance. Mr. Hagmann has extensive expertise with all applicable modeling tools including CalEEMod, EMFAC, AERMOD, HARP, Cal3QHC, Caline4, and EDMS. Mr. Hagmann was also selected by the SCAMQD to provide CEQA-Air Quality Specialist consulting services related to SCAQMD dispersion modeling, HRAs, and GHG analyses and GHG mitigation and monitoring plans.

Initial Study

INITIAL STUDY
FOR THE
FORD THEATRES PROJECT

County of Los Angeles
February 2014

Table of Contents

Initial Study for the Ford Theatres Project

1. Project Title:	Ford Theatres Project
2. Lead Agency:	County of Los Angeles c/o Los Angeles County Arts Commission
3. Contact Person and Address:	Joan Rupert Department of Parks and Recreation Planning Division Los Angeles County 510 South Vermont Avenue, Room 201 Los Angeles, CA 90020 E-Mail: jrupert@parks.lacounty.gov
4. Project Location:	The Ford Theatres are located at 2580 Cahuenga Boulevard East in the Hollywood Community of the City of Los Angeles in Los Angeles County, CA 90068.
5. Project Sponsor's Name and Address:	The Ford Theatres Foundation 2580 Cahuenga Boulevard East Los Angeles, CA 90068
6. General Plan Designation:	The City of Los Angeles Hollywood Community Plan designates the Project Site as a Public Facility. It is noted that while the Project Site is within the Hollywood Community Plan area of the City of Los Angeles, the land is owned by the County of Los Angeles and, as such, is not subject to City of Los Angeles General Plan.
7. Zoning:	The Project Site is zoned [Q]PF-1XL-H (Qualified Public Facility, Height District 1XL, Hillside Area) by the City of Los Angeles Municipal Code. It is noted that while the Project Site is within the City of Los Angeles, the land is owned by the County of Los Angeles and, as such, is not subject to City of Los Angeles zoning regulations.

8. Project Background and Description:

The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Ford Theatres are owned by the County of Los Angeles and operated through a three-way partnership between the County of Los Angeles Department of Parks and Recreation, the County of Los Angeles Arts Commission, and the Ford Theatre Foundation. The Project Site is currently developed with an open-air, 1,196-seat Amphitheatre with support spaces; an indoor venue located below the Amphitheatre referred to as [Inside] the Ford; a concessions building; a box office; a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission staff, and the Los Angeles Philharmonic; and surface parking areas. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register).

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Each of the proposed Project components is summarized here and set out in more detail in the Project Description included as Attachment A:

- Amphitheatre Rehabilitation and Improvements—Improvements to the Amphitheatre would include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, improved theatrical systems, infrastructure improvements and upgrades, a sound wall along the rear of the Amphitheatre to shield the Amphitheatre from traffic noise, and a retractable shade structure for the Amphitheatre.

- The Ford Terrace—The Ford Terrace would include a two-story structure with one level of office space and a lower-level concessions area and a raised plaza deck above a service level along with removal of the existing concessions building and the re-purposing of the 87-seat [Inside] the Ford as a self-serve food marketplace area and for storage.

- The Ford Plaza—The Ford Plaza, set atop a three-level parking structure, would feature a restaurant, a 299-seat theatre, a box office, a conference room, offices, visitor amenities and conversion of the existing box office to a museum/gallery for the Ford Theatres.

- The Transit Center—The Transit Center would include a designated area for bus and valet drop-off, a three-level parking structure, and a 99-seat rehearsal and event space, as well as the removal of the former motel building.

- Hiking Trail—An approximate 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively, would be constructed.

Implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site. Further, with the addition of a 299-seat theatre and the 99-seat Flex Space to be provided as part of the Project, the number of annual events provided at the Project Site is estimated to increase from 184 events to approximately 331 events and the number of annual attendees is estimated to increase from 54,640 people to approximately 93,725 people.

9. Surrounding Land Uses and Setting

The Project Site comprises an approximately 32-acre County of Los Angeles regional park located approximately 6 miles northwest of downtown Los Angeles and approximately 12 miles east of the Pacific Ocean. Primary regional access is provided by US 101 (Hollywood Freeway), which runs north-south immediately west of the Project Site. The area surrounding the Project Site includes a mix of residential uses and open space. Specifically, the Project Site is bounded by four-story, multi-family residential buildings and open space associated with the Hollywood Reservoir to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The majority of these uses are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site. The Hollywood Bowl, also a County-owned event venue, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.

10. Discretionary Approvals

Discretionary approvals from the County of Los Angeles Board of Supervisors will be necessary for the Ford Theatres Foundation to implement the Project.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☒ Aesthetics	☐ Agriculture and Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Geology and Soils
☒ Greenhouse Gas Emissions	☐ Hazards and Hazardous Materials	☒ Hydrology and Water Quality
☒ Land Use and Planning	☐ Mineral Resources	☒ Noise
☐ Population and Housing	☒ Public Services	☐ Recreation
☒ Transportation and Traffic	☒ Utilities and Service Systems	☒ Mandatory Findings of Significance

DETERMINATION (To be completed by Lead Agency)

On the basis of this initial evaluation:

I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.	
I find that, although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures described on an attached sheet have been added to the project. A MITIGATED NEGATIVE DECLARATION will be prepared.	
I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.	**X**
I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.	
I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.	

Joan Rupert

February 7, 2014
Date

ENVIRONMENTAL IMPACTS. (Explanations for all answers are required):

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
1. AESTHETICS. Would the project:				
a. Have a substantial adverse effect on a scenic vista?	☒	☐	☐	☐

Potentially Significant Impact. A scenic vista is a view of a valued visual resource. Visual resources in the vicinity of the Project Site include hillsides within and surrounding the Project Site, as well as historic buildings within the Project Site. The Project would develop several new structures within the Project Site. Several of the proposed structures would be visible within scenic vistas that are available from Cahuenga Boulevard. Therefore, the Project's potential impacts on scenic vistas will be analyzed further in an EIR.

b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒

No Impact. The Project Site contains scenic resources, such as the historic Amphitheatre and trees. However, no designated scenic highways are located in the vicinity of the Project Site.[1] As such, the Project would not damage any scenic resources within a designated State scenic highway. No impacts would occur and no mitigation measures are required. Further evaluation of this issue in an EIR is not necessary.

c. Substantially degrade the existing visual character or quality of the site and its surroundings?	☒	☐	☐	☐

Potentially Significant Impact. The Project would modify the existing visual character of the Project Site and its surroundings through the development of several new structures within the Project Site. Therefore, an analysis of the Project's potential impacts associated with visual character and quality will be provided in an EIR.

[1] *California Department of Transportation. California Scenic Highway Program, Scenic Highway Routes, www.dot.ca.gov/hq/LandArch/scenic_highways/scenic_hwy.htm, accessed August 27, 2013, and City of Los Angeles Transportation Element, June 2002.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site currently generates artificial light associated with pole lighting within the surface parking and entry areas, exterior building and plaza lighting, security lighting, and stage and production lighting. In addition, based on the materials used to construct the façades of the existing structures, sources of glare within the Project Site are limited. The Project would introduce new sources of light and glare, including architectural lighting, signage lighting, interior lighting, security and wayfinding lighting, and new building surfaces. Therefore, an analysis of the Project's potential light and glare impacts will be provided in an EIR.

With regard to potential shading impacts on shade-sensitive uses located off-site, shadow effects are dependent on several factors, including local topography, the height and bulk of proposed structural elements, the sensitivity of surrounding uses, the season, and the duration of shadow projections. Shade-sensitive uses typically include routinely useable outdoor spaces associated with residential, recreational, or institutional (e.g., schools, convalescent homes) land uses; commercial uses, such as pedestrian-oriented outdoor spaces or restaurants with outdoor eating areas; nurseries; and existing solar collectors. These uses are considered sensitive because sunlight is important to their function, physical comfort, or commerce. The Project would include the development of several structures throughout the Project Site that would range in height from approximately 15 feet to 67.5 feet, as measured from adjacent grade, with elevations ranging from 515 feet to 610 feet above sea level. Therefore, the Project would generate new shadows with varied lengths and angles, depending on the time of day and season. However, as detailed in the Project Description included in Attachment A, the uses surrounding the Project Site are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site. As such, due to the location of the new structures within the existing canyon setting, the heights of new structures and the distances between the proposed structures and surrounding uses, off-site shade-sensitive uses would not be impacted by shading from the Project. Rather, shadows from new structures would generally fall onto the Project Site and adjacent roadways. Thus, impacts associated with shading would be less than significant, and no further analysis of this topic in an EIR is necessary.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

2. AGRICULTURE AND FOREST RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:

a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒

No Impact. The Project Site comprises a regional park that does not include any agricultural land. In addition, the Project Site and surrounding area are not mapped as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency.[2] As such, the Project would not convert farmland to a non-agricultural use. No impacts would occur, and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒

No Impact. The Project Site is not zoned for agricultural use, and no agricultural zoning is present in the surrounding area. The Project Site and surrounding area are also not enrolled under a Williamson Act Contract. Therefore, the Project would not conflict with existing zoning

[2] *California Department of Conservation, Division of Land Resource Protection, Farmland Mapping and Monitoring Program, Important Farmland in California, 2010, website: www.consrv.ca.gov/DLRP/fmmp/overview/survey_area_map.htm, accessed December 17, 2013.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

for agricultural uses or a Williamson Act Contract. No impacts would occur, and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	☐	☐	☐	☒

No Impact. The Project Site is located in an urbanized area and does not include any forest or timberland. Additionally, the Project Site is not zoned for forest land and is not used as forest land. Therefore, the Project would not rezone forest land or timberland as defined by the Public Resources Code. No impacts would occur, and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

d. Result in the loss of forest land or conversion of forest land to a non-forest use?	☐	☐	☐	☒

No Impact. As stated above, the Project Site is not zoned for forest land and does not include any forest or timberland. Therefore, the Project would not result in the loss or conversion of forest land or timberland. No impacts would occur, and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

No Impact. As noted above, the Project Site does not contain any agricultural or forest uses, nor are any agricultural or forest uses located in the vicinity of the Project Site. Thus, development of the Project would not convert any farmland or forest land to non-agricultural or

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

non-forest use. No impacts would occur, and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

3. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:

a. Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site is located within the 6,700-square-mile South Coast Air Basin (Basin). Within the Basin, the South Coast Air Quality Management District (SCAQMD) is required, pursuant to the federal Clean Air Act, to reduce emissions of criteria pollutants for which the Basin is in non-attainment (i.e., ozone, particulate matter less than 10 microns in size [PM_{10}],[3] particulate matter less than 2.5 microns in size [$PM_{2.5}$], and lead[4]). As such, the Project would be subject to the SCAQMD's 2012 Air Quality Management Plan (AQMP). The AQMP contains a comprehensive list of pollution control strategies directed at reducing emissions and achieving ambient air quality standards.

Construction and operation of the Project may result in an increase in stationary and mobile source air emissions. As a result, Project development could have an adverse effect on the SCAQMD's implementation of the AQMP. Therefore, an analysis of the Project's consistency with the SCAQMD's AQMP will be provided in an EIR.

b. Violate any air quality standard or contribute to an existing or projected air quality violation?	☒	☐	☐	☐

Potentially Significant Impact. The Project would contribute to regional and localized air pollutant emissions from the Project Site during construction (short-term) and operation (long-term). Construction-related pollutants would be associated with sources such as construction worker vehicle trips, the operation of construction equipment, site grading and preparation activities, and the application of architectural coatings. During Project operation,

---

[3] *A redesignation request to Attainment for the 24-hour PM_{10} standard is pending with the United States Environmental Protection Agency.*

[4] *Partial nonattainment designation for the Los Angeles County portion of the Basin only.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

air pollutants would be emitted on a daily basis from motor vehicle travel, energy consumption, and other on-site activities. Therefore, an analysis of the Project's construction and operational air pollutant emissions will be provided in an EIR.

c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☒	☐	☐	☐

Potentially Significant Impact. As described above, Project construction and operation would emit air pollutants in the Basin, which is currently in non-attainment of federal and State air quality standards for ozone, PM_{10}, $PM_{2.5}$, and lead. Therefore, implementation of the Project could potentially contribute to air quality impacts, which could cause a cumulative impact when combined with other existing and future emissions sources in the area. Therefore, an analysis of cumulative air pollutant emissions will be provided in an EIR.

d. Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐

Potentially Significant Impact. As discussed above, the Project would contribute to regional and localized air pollutant emissions from the Project Site during construction (short-term) and operation (long-term). Some population groups, including children, the elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to air pollution than others. The SCAQMD *CEQA Air Quality Handbook* provides examples of typical sensitive receptors, which include long-term health care facilities, rehabilitation centers, convalescent centers, retirement homes, residences, schools, playgrounds, child care centers, and athletic facilities. Sensitive receptors in the Project vicinity include residential uses. Therefore, an analysis of the Project's potential to result in substantial adverse impacts to sensitive receptors will be provided in an EIR.

e. Create objectionable odors affecting a substantial number of people?	☐	☐	☒	☐

Less Than Significant Impact. No objectionable odors are anticipated as a result of either construction or operation of the Project. The Project would be constructed using conventional

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

building materials typical of construction projects of a similar type and size. Any odors that may be generated during construction would be localized and temporary in nature and would not be sufficient to affect a substantial number of people or result in a nuisance as defined by SCAQMD Rule 402.

According to the SCAQMD *CEQA Air Quality Handbook*, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. While the Project would not involve these types of uses, on-site trash receptacles used by the Project would have the potential to create odors. However, as trash receptacles would be contained, located, and maintained in a manner that promotes odor control, no substantially adverse odor impacts are anticipated. Thus, impacts with regard to odors would be less than significant, and no mitigation measures would be required. No further analysis of this issue is required.

4. BIOLOGICAL RESOURCES. Would the project:

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site comprises an approximately 32-acre County of Los Angeles regional park located adjacent to Cahuenga Boulevard East in the Hollywood Community of the City of Los Angeles. As illustrated in the Project Description included as Attachment A, the Project Site includes undeveloped natural open space. As such, development of the Project has the potential to adversely affect sensitive species that could be present within the Project Site. Therefore, this issue will be evaluated in an EIR.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site is currently developed with an Amphitheatre and support spaces, a concessions building, a box office, a former motel building, plazas, surface parking areas, and open space areas. While no riparian habitats are located within the Project Site, based on the undeveloped open space areas that comprise a portion of the Project Site, other sensitive natural communities could be present within the Project Site. As such, an analysis of this topic will be provided in an EIR.

c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒

No Impact. As described above, the Project Site is currently developed with an Amphitheatre and associated support spaces, a former motel building, plazas, surface parking areas, and open space areas. The Project Site is located within a canyon setting where there are no known federally protected waters or wetlands, as defined by Section 404 of the Clean Water Act. Therefore, the Project would have no significant impact on federally protected wetlands and no further analysis of this issue is necessary.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐

Potentially Significant Impact. As previously described, the Project Site comprises an approximately 32-acre County of Los Angeles regional park located within the Hollywood community of the City of Los Angeles. Natural habitat areas that have the potential to provide potential wildlife corridors are located on and adjacent to the Project Site. Therefore, an analysis of the Project's potential to impact wildlife movement will be provided in an EIR.

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☒	☐	☐	☐

Potentially Significant Impact. Within the Project Site, there are coast live oak trees which are subject to the Los Angeles County Oak Tree Ordinance. Implementation of the Project could require the removal and/or relocation of several oak trees within the Project Site. Therefore, in light of the Los Angeles County Oak Tree Ordinance, an analysis of this issue will be provided in an EIR.

f. Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

No Impact. According to the California Department of Fish and Wildlife California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the Project Site. Thus, the Project would not conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved habitat conservation plan. No impacts would occur, and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
5. CULTURAL RESOURCES. Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5?	☒	☐	☐	☐

Potentially Significant Impact. Section 15064.5 of the CEQA Guidelines generally defines a historic resource as a resource that is: (1) listed in, or determined to be eligible for listing in, the California Register of Historical Resources; (2) included in a local register of historical resources (pursuant to Section 5020.1(k) of the Public Resources Code); or (3) identified as significant in an historical resources survey (meeting the criteria in Section 5024.1(g) of the Public Resources Code). Additionally, any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources.

The Amphitheatre is eligible for listing in the National Register and the California Register due to its association with *The Pilgrimage Play*, which was performed within the existing Amphitheatre from 1931 to 1964. The Project would include the rehabilitation of portions of the existing Amphitheatre and the development of new structures. Therefore, further analysis of the potential for the Project to cause a substantial adverse change in the significance of a historical resource will be provided in an EIR.

b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?	☒	☐	☐	☐

Potentially Significant Impact. Section 15064.5(a)(3)(D) of the CEQA Guidelines generally defines archaeological resources as any resource that "has yielded, or may be likely to yield, information important to prehistory or history." Archaeological resources are features, such as tools, utensils, carvings, fabric, building foundations, etc., that document evidence of past

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

human endeavors and that may be historically or culturally important to a significant earlier community.

While portions of the Project Site have been subject to disturbance in the past, the Project would include improvements within existing open space areas that could have the potential to disturb existing but undiscovered archaeological resources. Therefore, further analysis of this issue will be provided in an EIR.

c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☒	☐	☐	☐

Potentially Significant Impact. Paleontological resources are the fossilized remains of organisms that have lived in a region in the geologic past and whose remains are found in the accompanying geologic strata. This type of fossil record represents the primary source of information on ancient life forms, since the majority of species that have existed on earth from this area are extinct.

As described above in response to Checklist Question 5.b, the Project would include improvements within existing open space areas that could have the potential to disturb existing but undiscovered paleontological resources. Therefore, further analysis of this issue will be provided in an EIR.

d. Disturb any human remains, including those interred outside of formal cemeteries?	☒	☐	☐	☐

Potentially Significant Impact. As previously described, while portions of the Project Site have been subject to disturbance in the past, the Project would include improvements within existing open space areas. Therefore, while not likely, there is the possibility that unknown resources could be encountered during Project construction. Thus, further analysis of this issue will be included in an EIR.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
6. GEOLOGY AND SOILS. Would the project:				
a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist–Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐

Less Than Significant Impact. Fault rupture is defined as the surface displacement that occurs along the surface of a fault during an earthquake. Based on criteria established by the California Geological Survey (CGS), faults can be classified as active, potentially active, or inactive. Active faults may be designated as Earthquake Fault Zones under the Alquist–Priolo Earthquake Fault Zoning Act, which includes standards for regulating development adjacent to active faults. These zones, which extend from 200 to 500 feet on each side of the known fault, identify areas where a potential surface fault rupture could prove hazardous for buildings used for human occupancy. Development projects located within an Alquist–Priolo Earthquake Fault Zone are required to prepare special geotechnical studies to characterize hazards from any potential surface ruptures.

The closest active fault to the Project Site is the Hollywood Fault, which is located approximately 0.4 mile south of the Project Site.[5] As such, the Project Site is not within a currently established Alquist–Priolo Earthquake Fault Zone for surface fault rupture hazards.[6] In addition, based on a review of the preliminary 2014 Earthquake Fault Zone Map for the Hollywood Quadrangle released by the California Geological Survey on January 8, 2014, the Project Site would not be within an Alquist–Priolo Earthquake Fault Zone associated with the

[5] *Preliminary Geotechnical Evaluation, John Anson Ford Theatres Master Plan, Leighton Consulting. February 7, 2013.*

[6] *Ibid.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Hollywood Fault.[7] Therefore, potential impacts would be less than significant, and no further analysis of this issue is necessary.

ii. Strong seismic ground shaking?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site is located in the seismically active Southern California region and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The closest active fault is the Hollywood Fault, which is located approximately 0.4 mile south of the Project Site. The location of the Project Site within a seismically active area in proximity to the Hollywood Fault could expose people or structures to strong seismic ground shaking. Therefore, further analysis of the Project's potential impacts associated with ground shaking will be provided in an EIR.

iii. Seismic-related ground failure, including liquefaction?	☒	☐	☐	☐

Potentially Significant Impact. Liquefaction involves a sudden loss in strength of saturated, cohesionless soils that are subject to ground vibration and results in temporary transformation of the soil to a fluid mass. If the liquefying layer is near the surface, the effects are much like that of quicksand for any structure located on it. If the layer is deeper in the subsurface, it may provide a sliding surface for the material above it. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine- to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

Based on the Seismic Hazards Maps of the State of California, the Project Site is located within a potentially liquefiable area.[8] Therefore, this issue will be analyzed further in an EIR.

---

[7] *California Department of Conservation. California Geological Survey, Earthquake Fault Zones, Hollywood Quadrangle, Preliminary Review Map, released January 8, 2014. Available at: www.consrv.ca.gov/cgs/rghm/ap/Documents/Hollywood_EZRIM.pdf.*

[8] *California Geological Survey, Regional Geologic Hazards and Mapping Program, Seismic Hazard Zones Map, Hollywood Quadrangle, March 25, 1999.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
iv. Landslides?	☒	☐	☐	☐

Potentially Significant Impact. As shown on the State of California Seismic Hazards Map for the Hollywood Quadrangle (CDMP, 1999), a portion of the site is located within an area that has been identified by the State of California as being potentially susceptible to seismically induced landslides. Therefore, an analysis of the Project's potential impacts associated with landslides will be provided in an EIR.

b. Result in substantial soil erosion or the loss of topsoil?	☒	☐	☐	☐

Potentially Significant Impact. Development of the Project would require grading, excavation to support the building foundations, and other construction activities that have the potential to disturb existing soils and expose soils to rainfall and wind, thereby potentially resulting in soil erosion. Therefore, an analysis of the Project's potential impacts associated with soil erosion or the loss of topsoil will be provided in an EIR.

c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☒	☐	☐	☐

Potentially Significant Impact. As discussed above, the Project Site could be susceptible to ground shaking. In addition, as the Project Site is located within a potentially liquefiable area, the Project Site could be subject to seismically related ground failure hazards, including liquefaction. As such, an analysis of this issue will be provided in an EIR.

d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	☒	☐	☐	☐

Potentially Significant Impact. Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated cycles of wetting and drying. Based on the undisturbed nature of portions of the Project Site, expansive soils may

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

be present. Therefore, an analysis of the Project's potential impacts associated with expansive soils will be provided in an EIR.

e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒

No Impact. The Project Site is located within a community served by existing sewer infrastructure. Therefore, wastewater generated by the Project would be accommodated via connections to the existing sewage infrastructure located in the Project area. As such, the Project would not require the use of septic tanks or alternative wastewater disposal systems. Thus, the Project would not result in impacts related to the ability of soils to support septic tanks or alternative wastewater disposal systems, and further analysis of this issue is not required.

7. GREENHOUSE GAS EMISSIONS. Would the project:

a. Generate greenhouse gas (GHGs) emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐

Potentially Significant Impact. Gases that trap heat in the atmosphere are referred to as greenhouse gases since they have effects that are analogous to the way in which a greenhouse retains heat. Greenhouse gases are emitted by both natural processes and human activities. The accumulation of greenhouse gases in the atmosphere affects the earth's temperature. The State of California has undertaken initiatives designed to address the effects of greenhouse gas emissions and to establish targets and emission reduction strategies for greenhouse gas emissions in California. Activities associated with the Project, including construction and operational activities, have the potential to generate greenhouse gas emissions. Therefore, further analysis of greenhouse gas emissions will be provided in an EIR.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
b. Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

Potentially Significant Impact. As the Project would have the potential to emit greenhouse gas emissions, an evaluation of these emissions and associated emission reduction strategies will be undertaken in an EIR to determine whether the Project conflicts with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

8. HAZARDS AND HAZARDOUS MATERIALS.

The following analysis is based, in part, on the *Phase I Environmental Site Assessment Report, John Anson Ford Theatres Master Plan, 2580 and 2630 Cahuenga Boulevard East, Hollywood District of Los Angeles, California* (Phase I ESA), prepared for the Project by Leighton Consulting, Inc. The Phase I ESA is included as Appendix IS-1 of this Initial Study.

Would the project:

a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐

Less Than Significant Impact. Construction of the Project would involve the temporary use of typical, although potentially hazardous materials, including vehicle fuels, oils, transmission fluids, paints, adhesives, cleaning solvents, surface coatings, and other acidic or alkaline solutions that would require special handling, transport, and disposal. Operation of the Project would also involve the routine use and handling of potentially hazardous materials typical of those used for a multi-use cultural and recreational center, including oil for lubrication of the projectors and the elevators, cleaning solvents for custodial maintenance of the buildings, and pesticides for landscaping. However, all potentially hazardous materials would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations. Any associated risk would be reduced to a less than significant level through compliance with these standards and regulations.

With regard to exposure of existing on-site hazards, certain portions of the existing Amphitheatre, which opened in 1931, would be rehabilitated as part of the Project. In addition,

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

the former motel building, which was constructed by at least 1953 and is currently used for Ford and Philharmonic offices, would be removed. According to the Phase I ESA, due to the age of the on-site structures, there is a potential for asbestos-containing materials (ACMs) and/or lead-based paints (LBPs) to be present on-site. However, in accordance with SCAQMD Rule 1403, Asbestos Emissions from Demolition/Renovation Activities, prior to demolition activities associated with the Project, the Applicant would conduct surveys of all buildings to verify the presence or absence of any of these materials and conduct remediation or abatement before any disturbance occurs. Any ACMs and/or LBPs would be removed by a licensed abatement contractor in accordance with all federal, State, and local regulations prior to renovation or demolition. Mandatory compliance with applicable federal and State standards and procedures would reduce risks associated with LBPs and ACMs to acceptable levels. Therefore, impacts associated with ACMs and LBPs would be less than significant.

In addition, due to the pole-mounted transformers on creosote-preserved utility poles located throughout the Project Site, there is a potential for polychlorinated biphenyls (PCBs) to be present on-site. However, as set forth in the Phase 1 ESA, evidence of releases was not observed in the vicinity of the transformers. In addition, any poles or transformers to be removed would be appropriately disposed of.

As set forth in the Phase I ESA, hazardous materials and waste observed or reported at the Project Site also include a 40-gallon, diesel, above-ground storage tank (AST), lead-acid batteries, corrosive liquids (electrolyte), and hydrogen gas associated with the cell tower control rooms; two 55-gallon oil drums associated with the elevator in the amphitheatre; two sealed plastic drums of oil stored in the projection booth for lubrication of the 35 mm projectors; a 5-gallon gas can used by the maintenance crew; and maintenance and janitorial supplies in retail packaging. Based on the Phase I ESA, there is no evidence of underground storage tanks (USTs) or ASTs being located on-site, with the exception of the previously discussed 40-gallon diesel generator observed outside the cell tower control room in the lower parking lot within a concrete berm secondary containment. In addition, according to the Phase I ESA, evidence of spills was not observed or reported.

Overall, the Phase I ESA concluded that there are no known recognized environmental conditions on-site that have the potential to result in significant hazards impacts. Therefore, impacts would be less than significant, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐

Less Than Significant Impact. The Phase I ESA included a records review (including review of previous environmental reports, selected governmental databases, and historical review). In addition, the Phase I ESA included a reconnaissance-level visit to the Project Site to identify evidence of release(s) of hazardous materials and to assess the potential for on-site releases of hazardous materials. As discussed above in Checklist Question 8.a, the Phase I ESA found no evidence of recognized environmental conditions within the Project Site. Furthermore, all potentially hazardous materials would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations. In addition, any ACMs or LBPs found during construction activities would be handled in accordance with regulatory requirements. As such, the Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Therefore, impacts would be less than significant, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒

No Impact. The Project Site is not within 0.25 mile of an existing or proposed school.[9] The nearest school to the Project Site is Valley View Elementary School located at 6921 Woodrow Wilson Drive, which is approximately 1 mile north of the Project Site. As such, the Project Site would not emit hazardous emissions or handle hazardous materials within 0.25 mile of a school. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

[9] *E-mail communication with Gwenn Godek, Contract Professional/CEQA PM with the Los Angeles Unified School District. February 3, 2014.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐

Less Than Significant Impact. California Government Code Section 65962.5 requires various State agencies to compile lists of hazardous waste disposal facilities, unauthorized releases from USTs, contaminated drinking water wells, and solid waste facilities from which there is known migration of hazardous waste and submit such information to the State on at least an annual basis. Thus, the Phase I ESA included a search of these and other selected government databases and environmental record sources. The Project Site was identified within the HAZNET database for the disposal by recycling of 1.66 tons of waste oil and mixed oil in 2005. This event was associated with a 100-year flood event that resulted in substantial flooding in the interior of the Amphitheatre building where water made contact with pneumatic oil from the elevator car.[10] Disposal of the water was performed in accordance with regulatory requirements. As such, this listing is expected to have a low potential to adversely affect the Project Site. In addition, hydrogen gas and lead-acid batteries associated with the AT&T Mobility facilities and battery electrolyte associated with the Verizon Wireless facilities were inventoried by the Los Angeles Fire Department's Hazardous Materials Division. These materials are fully enclosed within the on-site cell tower control rooms that are located on concrete pads, locked, and properly maintained by the telecommunications providers. Finally, review of the State of California Radon Survey indicated that of the 117 radon tests that have been conducted within the 90068 ZIP Code (within which the Project Site is located), 4 tests have detected radon above the EPA's action level of 4 picoCuries per liter (pCi/L). However, Los Angeles is located in EPA Radon Zone 2, which typically has radon levels between 2 pCi/L and 4 pCi/L. Thus, according to the Phase I ESA, the potential for elevated levels of natural occurring radon at the Project Site would be low. None of the addresses associated with the Project Site were listed in the other government databases or additional environmental record sources searched for in the Phase I ESA. Therefore, based on the findings of the records searches, impacts would be less than significant, and no mitigation measures would be

[10] *Personal Communication with Arthur Trowbridge, January 30, 2014.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

required. No further analysis of this issue in an EIR is required. Also refer to Checklist Question 8.a, above.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒

No Impact. The Project Site is not located within 2 miles of an airport or within an airport planning area. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

f. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒

No Impact. There are no private airstrips in the vicinity of the Project Site. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☒	☐	☐

Less Than Significant Impact with Mitigation Incorporated. Limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day, which could potentially require temporary lane closures and affect emergency access. However, in accordance with Mitigation Measure Hazards-1, below, during construction, a construction traffic management plan would be implemented to ensure that adequate and safe access remains available to the Project Site. As part of this plan, provisions for temporary traffic control would be provided during all construction activities along public rights-of-way to improve traffic flow on public roadways (e.g., flaggers). In addition, designated truck queuing, equipment staging, and construction worker parking areas would be provided. Thus, with

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

implementation of Mitigation Measure Hazards-1, potential impacts associated with emergency access during construction would be less than significant.

During operation, access and parking would continue to be implemented and monitored to ensure that emergency access is available within the Project Site and vicinity.

Based on the above, with implementation of Mitigation Measure Hazards-1, the Project would not impair the implementation of an emergency response or evacuation plan. No further analysis of this issue in an EIR is required.

Mitigation Measure Hazards-1: Prior to the start of construction, the Applicant shall prepare and implement a construction management plan to the satisfaction of the Los Angeles County Department of Public Works and in consultation with the City of Los Angeles Department of Transportation. Features of the construction management plan may include, but shall not be limited to, the following:

- Maintaining emergency access to and within the vicinity of the Project Site;
- Limiting potential lane closures to off-peak travel periods, to the extent feasible;
- Scheduling receipt of construction materials during non-peak travel periods, to the extent possible;
- Prohibiting parking by construction workers on adjacent streets and directing construction workers to park on-site or other designated parking areas; and
- Using flag persons to control traffic movement during the ingress and egress of trucks and heavy equipment from the Project Site and/or temporary lane closures.

h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☒	☐	☐	☐

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Potentially Significant Impact. Due to the Project Site's location, widely varied topography, and undeveloped open space, the Project Site could be prone to fire hazards. Therefore, further analysis of this issue will be included in an EIR.

9. HYDROLOGY AND WATER QUALITY. Would the project:

a. Violate any water quality standards or waste discharge requirements?	☒	☐	☐	☐

Potentially Significant Impact. Construction activities associated with the Project would have the potential to result in the conveyance of pollutants into municipal storm drains, particularly during precipitation events. In addition, potential changes in on-site drainage patterns resulting from Project implementation could affect the quality of storm water runoff. Therefore, further analysis of this issue will be included in an EIR.

b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☒	☐	☐	☐

Potentially Significant Impact. It is anticipated that the Project would result in an increase in the amount of on-site impermeable areas compared to existing conditions. Thus, the potential exists for existing percolation of rainwater and irrigation water into the water table to be somewhat diminished, which could affect groundwater recharge. Therefore, further analysis of this issue will be included in an EIR.

c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	☒	☐	☐	☐

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Potentially Significant Impact. The Project would involve improvements within existing surface parking areas and within portions of the Project Site that are currently undeveloped. In addition, the Project would provide for the renovation of exterior landscape areas and an approximately 0.75-mile hiking trail. As such, the Project would have the potential to alter drainage patterns within the Project Site in a manner which would result in substantial erosion or siltation. Therefore, further analysis of this issue will be included in an EIR.

d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	☒	☐	☐	☐

Potentially Significant Impact. As discussed above in Checklist Question 9.c, the Project has the potential to affect drainage patterns. Such potential changes in drainage patterns could in turn affect the rate or amount of surface water on-site. Thus, further analysis of this issue will be included in an EIR.

e. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☒	☐	☐	☐

Potentially Significant Impact. See response to Checklist Questions 9.a and 9.c, above.

f. Otherwise substantially degrade water quality?	☒	☐	☐	☐

Potentially Significant Impact. See response to Checklist Question 9.a, above.

g. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☐	☒

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

No Impact. The Project does not propose the development of residential uses. The Hollywood Reservoir to the north of the Project Site is located within a 100-year flood plain, as mapped by Federal Emergency Management Agency (FEMA), and is specifically located in FEMA's Flood Zone A.[11] However, the Project Site is not located within a 100-year flood plain, as mapped by FEMA. Specifically, the Project Site is located in FEMA's Zone X, which is defined as areas of 0.2 percent annual chance flood; areas of 1 percent annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and protected by levees from 1 percent annual chance flood. As such, the Project would not place housing within a 100-year flood plain. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

h. Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☐	☒

No Impact. As discussed above in response to Checklist Question 9.g, the Project Site is not located within a 100-year flood plain as mapped by FEMA. Thus, the Project would not place structures that would impede or redirect flood flows within a 100-year flood plain. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

i. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☒	☐	☐	☐

Potentially Significant Impact. The Hollywood Reservoir, which is held by the Mulholland Dam, is located in the Hollywood Hills approximately 0.3 mile north of the Project Site. Thus, an analysis of the potential for flooding as a result of the failure of a dam will be included in an EIR.

j. Inundation by seiche, tsunami, or mudflow?	☒	☐	☐	☐

[11] *Federal Emergency Management Agency, Flood Insurance Rate Map, Map Number 06037C1605F, January 6, 2014.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Potentially Significant Impact. A seiche is an oscillation of a body of water in an enclosed or semi-enclosed basin, such as a reservoir, harbor, lake, or storage tank. A tsunami is a great sea wave, commonly referred to as a tidal wave, produced by a significant undersea disturbance, such as tectonic displacement associated with large, shallow earthquakes. Mudflows result from the downslope movement of soil and/or rock under the influence of gravity.

The Project Site is located approximately 12 miles east of the Pacific Ocean. As such, the potential for tsunamis to occur within the Project Site is remote. No impacts would occur and no further analysis of this issue is required.

As indicated above, the Hollywood Reservoir is located approximately 0.3 mile north of the Project Site. Thus, the more localized effects associated with seiches would not be anticipated to impact the Project Site. Impacts would be less than significant, and no further analysis of this issue in an EIR is required.

With regard to the potential for mudflows, the Project Site is located within a canyon setting with substantial changes in topography occurring within the Project Site. Thus, further analysis of this issue will be included in an EIR.

10. LAND USE AND PLANNING. Would the project:

a. Physically divide an established community?	☐	☐	☐	☒

No Impact. As detailed in the Project Description included as Attachment A, the Project Site is comprised of a County regional park that includes the existing Ford Theatres. The majority of the uses surrounding the Project Site are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site. In addition, all proposed development would occur within the boundaries of the Project Site as it currently exists and would not physically alter surrounding parcels or properties. Therefore, the Project would not physically divide an established community. No impacts would occur and no mitigation measures would be required. No further evaluation of this issue is required.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☐	☐	☐

Potentially Significant Impact. As described above, the Project site is located within the City of Los Angeles, where development projects are typically guided by the Los Angeles Municipal Code (LAMC), as well as the local community plan, which is a component of the Land Use Element of the City of Los Angeles General Plan. The Project site is specifically located within the Hollywood Community Plan Area. However, the Project Site is owned and operated by the County of Los Angeles and, as such, the Project Site is not subject to the City of Los Angeles zoning and General Plan. Notwithstanding, the EIR will discuss the Project's consistency with both City and County regional planning documents, including the City of Los Angeles General Plan, as well as compliance with City consultation procedures. .

c. Conflict with any applicable habitat conservation plan or natural community conservation plan?	☐	☐	☐	☒

No Impact. According to the California Department of Fish and Wildlife California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the Project Site. Thus, the Project would not conflict with the provisions of an adopted habitat conservation plan or natural community conservation plan. No impacts would occur and no mitigation measures would be required. No further analysis of this topic in an EIR is required.

11. MINERAL RESOURCES. Would the project:

a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒

No Impact. The Project Site is a regional park that includes the existing Ford Theatres. The Project Site is not a designated mineral resource area. In addition, no mineral extraction

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

operations currently occur on the Project Site. Furthermore, many of the areas to be developed are already developed with surface parking areas and ornamental landscaping. As such, the Project would not result in the loss of availability of a mineral resource that would be of value to the region or the state. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

No Impact. See response to Checklist Question 11.a, above.

12. NOISE. Would the project result in:

a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site is located in a generally urbanized area that contains various sources of noise. The most predominate source of noise in the Project area is associated with traffic from roadways. Existing on-site noise sources include vehicle noises associated with on-site circulation and parking areas, stationary mechanical equipment, performances, and use of outdoor plazas.

During Project construction activities, the use of heavy equipment (e.g., bulldozers, backhoes, cranes, loaders, etc.) would generate noise on a short-term basis. Additionally, since the Project would introduce new outdoor areas, as well as new office and restaurant uses, to the Project Site, noise levels from on-site sources may also increase during Project operation. Furthermore, traffic attributable to the Project has the potential to increase noise levels along adjacent roadways. Therefore, further analysis of this issue will be included in an EIR.

b. Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Potentially Significant Impact. Construction of the Project could generate groundborne noise and vibration associated with site grading, clearing activities, and construction truck travel. As such, the Project would have the potential to generate and expose people to excessive groundborne vibration and noise levels during short-term construction activities. Therefore, further analysis of this issue will be included in an EIR.

c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐

Potentially Significant Impact. As discussed above in response to Checklist Question 12.a, noise from on-site sources and increased traffic levels has the potential to increase ambient noise levels above existing levels during Project operation. Therefore, further analysis of this issue will be included in an EIR.

d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐

Potentially Significant Impact. As discussed above in Checklist Questions 12.a and 12.b, Project construction activities would have the potential to temporarily or periodically increase ambient noise levels above existing levels. In addition, the introduction of new occupiable outdoor areas may also result in periodic increases in noise levels. Therefore, further analysis of this issue will be included in an EIR.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

No Impact. The Project Site is not located within 2 miles of an airport or within an airport land use plan. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

No Impact. There are no private airstrips in the vicinity of the Project Site. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

13. POPULATION AND HOUSING. Would the project:

a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐

Less Than Significant Impact. The Project does not propose the development of residential uses. Therefore, the Project would not directly induce population growth within the Project area. However, construction of the Project would create temporary construction-related jobs. Nevertheless, the work requirements of most construction projects are highly specialized such that construction workers remain at a job site only for the time in which their specific skills are needed to complete a particular phase of the construction process. Thus, Project-related construction workers would not be anticipated to relocate their household's place of residence as a consequence of working on the Project, and, therefore, no new permanent residents would be generated during construction of the Project.

With regard to operation of the Project, the Project itself would generate approximately 85 net new employees within the Project Site. It is also possible that some of these jobs would be filled by persons moving into the surrounding area, thereby generating a demand for housing. However, it is anticipated that much of this demand would be filled by then-existing vacancies in the housing market. Therefore, the potential indirect population growth associated with Project employees who may relocate their place of residence is not anticipated to be substantial. As such, the Project would not result in a notable increase in demand for new housing, and any new demand, should it occur, would be minor in the context of forecasted growth for the City of Los Angeles or the Hollywood Community. Furthermore, as the Project would be located in a generally developed area with an established network of roads and other

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

urban infrastructure, it would not require the extension of such infrastructure in a manner that would indirectly induce substantial population growth. Therefore, impacts would be less than significant, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

No Impact. As no housing currently exists on the Project Site, the Project would not displace any existing housing. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

No Impact. As no housing currently exists on the Project Site, development of the Project would not cause the displacement of any persons that would necessitate the construction of housing elsewhere. Therefore, no impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

14. PUBLIC SERVICES. Will the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

a. Fire protection?	☒	☐	☐	☐

Potentially Significant Impact. The Los Angeles Fire Department (LAFD) provides fire protection and emergency medical services for the Project Site. The closest LAFD fire station to the Project Site is Fire Station No. 76 located at 3111 Cahuenga Boulevard West in Los Angeles.[12] The Project's office, restaurant, and performance venue uses would increase the

[12] *Los Angeles Fire Department, Fire Station Locator, http://lafd.org/find-a-fire-station/275-fire-station-locator, accessed January 6, 2014.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

daytime population in the station's service area. The Project itself would generate approximately 85 new employees within the Project Site. This daytime population projected to be generated by the Project, together with the additional performance/event spaces, would contribute to an increase in the demand for fire protection and emergency medical services provided by the LAFD. In addition, due to the Project Site's location, widely varied topography, and undeveloped open space, the Project Site could be prone to fire hazards. Therefore, further analysis of this issue will be included in an EIR.

b. Police protection? ☒ ☐ ☐ ☐

Potentially Significant Impact. The Los Angeles County Sheriff Department (LACSD) provides primary police protection services for the Project Site. The closest LACSD station to the Project Site is the West Hollywood Sheriff Station located at 780 North San Vicente Boulevard in West Hollywood. In addition, the Los Angeles Police Department (LAPD) assists in the provision of emergency response to the Project site when dispatched.

The Project's office, restaurant, and increased performance/event spaces would increase the daytime population in the station's service area. The Project itself would generate approximately 85 new employees within the Project Site. This daytime population projected to be generated by the Project together with the additional performance/event spaces, would contribute to an increase in the demand for police protection services. Therefore, the EIR will provide further analysis of this issue.

c. Schools? ☐ ☐ ☒ ☐

Less Than Significant Impact. The Project Site is located within the boundaries of the Los Angeles Unified School District (LAUSD). The LAUSD is divided into seven local districts.[13] The Project Site is located in District 4.[14] As previously discussed, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in a direct increase in the number of students within the service area of the LAUSD.

---

[13] *Los Angeles Unified School District, Board of Education Districts Map, January 2010, http://notebook.lausd.net/pls/ptl/docs/PAGE/CA_LAUSD/LAUSDNET/ABOUT_US/MAPS/2009-10%20BOARD%20DISTRICTS%20ALL%20(8-5X11).PDF, accessed January 6, 2014.*

[14] *Los Angeles Unified School District, Board of Education District 4 Map, April 30, 2012, http://laschoolboard.org/sites/default/files/images/maps/2012-13BoardDistrict4Map.pdf, accessed January 6, 2014.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

In addition, any potential impact on public school facilities resulting from the potential for the approximately 85 new employees generated by the Project to relocate to the Project area and generate a need for additional public school facilities would represent a small percentage of LAUSD's total K–12 student enrollment of 651,322 students.[15] Specifically, using LAUSD's generation rate of 0.2691 student per employee, the approximately 85 new employees generated by the Project would generate approximately 23 students within LAUSD boundaries.[16] This number is conservative, as most of the employees would not be expected to relocate their residence as a result of gaining employment at the Project Site. In addition, many of the future employees may also already reside within LAUSD boundaries. As such, the Project would not result in the need for new or altered school facilities. Therefore, impacts would be less than significant, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

d. Parks?	☐	☐	☐	☒

No Impact. The Project Site comprises an approximately 32-acre County of Los Angeles regional park. The proposed improvements under the Project would enhance existing facilities and provide for new artistic programming opportunities that together would transform the existing Ford Theatres from a single-use performing arts facility to a multi-use cultural and recreational center. In addition, the Project would include an approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the Project Site. The proposed improvements would increase the recreational facilities available on-site. Therefore, the Project would result in a beneficial impact on parks and recreational facilities.

Furthermore, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in on-site residents who would utilize nearby parks and/or recreational facilities. While the Project itself would generate approximately 85 new employees within the Project Site, it is anticipated that any recreational use by these employees would occur on-site. Therefore, no impacts with regards to parks would occur and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

---

[15] *Los Angeles Unified School District. Fingertip Facts 2013-2014, http://home.lausd.net/apps/pages/index.jsp?uREC_ID=170893&type=d&pREC_ID=351680, accessed January 30, 2014.*

[16] *Los Angeles Unified School District, 2012 Developer Fee Justification Study, February 9, 2012.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
e. Other public facilities?	☐	☐	☒	☐

Less Than Significant Impact. The Project area is served by existing libraries within the Hollywood Community, including the nearby Frances Howard Goldwyn–Hollywood Regional Branch Library, located at 1623 North Ivar Avenue. As previously discussed, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in a direct increase in the number of residents within the service population of the Frances Howard Goldwyn–Hollywood Regional Branch Library. In addition, as Project employees would be more likely to use library facilities near their homes during non-work hours, such Project employees would generate minimal demand for library services. Furthermore, as discussed above in Checklist Question 13.a, some of the employees that could relocate to the Project vicinity would likely do so by moving into existing units that would have been previously occupied. As such, any indirect or direct demand for library services generated by Project employees would be negligible. Therefore, impacts would be less than significant, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

During construction and operation of the Project, roads would continue to be utilized to access the Project Site. As discussed below in Checklist Question 16.a, further analysis of the potential for the Project to result in a significant increase in the number of vehicle trips on local roadways will be included in an EIR. Any necessary improvements to local roadways associated with development of the Project will also be identified in an EIR.

15. RECREATION.

a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒

No Impact. As discussed above in Checklist Question 14.d, the Project would result in a beneficial impact on recreational facilities by providing improvements to an existing County regional park. In addition, it is anticipated that any recreational use by Project employees would occur on-site. Thus, the Project would not increase the use of existing off-site neighborhood and regional parks or other recreational facilities such that a substantial physical deterioration of the facility would occur or be accelerated. Therefore, no impacts would occur,

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site comprises an approximately 32-acre County of Los Angeles regional park. The proposed improvements under the Project would enhance existing facilities and provide for new artistic programming opportunities. In addition, the Project would include a 0.75-mile hiking trail. The physical impacts of these improvements related to agricultural resources, mineral resources, population and housing, schools, parks, libraries, wastewater, solid waste, natural gas, and electricity have been evaluated throughout this Initial Study and have been determined to be less than significant. Furthermore, the physical impacts of these improvements related to aesthetics, air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hydrology and water quality, land use and planning, noise, fire protection, police protection, transportation/circulation, and water will be further analyzed in an EIR.

16. TRANSPORTATION TRAFFIC. Would the project:

a. Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	☒	☐	☐	☐

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Potentially Significant Impact. The Project proposes development that has the potential to result in an increase in daily and peak-hour traffic within the Project vicinity. In addition, construction of the Project has the potential to affect the transportation system through the hauling of excavated materials and debris, the transport of construction equipment, the delivery of construction materials, and travel by construction workers to and from the Project Site. Therefore, further analysis of this issue will be included in an EIR.

b. Conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	☒	☐	☐	☐

Potentially Significant Impact. The Metropolitan Transportation Authority (Metro) administers the Congestion Management Program (CMP), a State-mandated program designed to address the impacts urban congestion has on local communities and the region as a whole. The CMP provides an analytical basis for the transportation decisions contained in the State Transportation Improvement Project. The CMP for Los Angeles County requires an analysis of any Project that could add 50 or more trips to any CMP intersection or more than 150 trips to a CMP mainline freeway location in either direction during either the A.M. or P.M. weekday peak hours. Implementation of the Project would generate additional vehicle trips that could potentially add more than 50 trips to a CMP roadway intersection or more than 150 trips to a CMP freeway segment. Therefore, further analysis of this issue will be included in an EIR.

c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☐	☒

No Impact. As previously described, the Project Site is not located within the vicinity of a public or private airport or planning boundary of any airport land use plan. With implementation of the Project, building heights would range from approximately 15 feet to 67.5 feet in height, as measured from adjacent grade, with elevations ranging from 515 feet to 610 feet above sea level. As such, the structures proposed by the Project would not increase or change air traffic patterns or increase levels of risk with respect to air traffic. Therefore, no

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

impacts would occur, and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

d. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐

Less Than Significant Impact. The roadways adjacent to the Project Site are part of the urban roadway network and contain no sharp curves or dangerous intersections. In addition, as shown in the Conceptual Site Plan provided in the Project Description included as Attachment A, no sharp curves or dangerous intersections would be created by the Project. Furthermore, access to the Project Site would be designed and constructed in accordance with regulatory requirements. Therefore, impacts would be less than significant and no mitigation measures would be required. No further analysis of this issue in an EIR is required.

e. Result in inadequate emergency access?	☐	☒	☐	☐

Less Than Significant Impact with Mitigation Incorporated. Limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day, which could potentially require temporary lane closures and affect emergency access. However, in accordance with Mitigation Measure Hazards-1 set forth in response to Checklist Question 8.g, above, during construction, a construction traffic management plan would be implemented to ensure that adequate and safe access remains available to the Project Site. As part of this plan, provisions for temporary traffic control would be provided during all construction activities along public rights-of-way to improve traffic flow on public roadways (e.g., flaggers). In addition, designated truck queuing, equipment staging, and construction worker parking areas would be provided. Thus, with implementation of Mitigation Measure Hazards-1, potential impacts associated with emergency access during construction would be less than significant.

During operation, access and parking would continue to be implemented and monitored to ensure that emergency access is available within the Project Site and vicinity.

Based on the above, with implementation of Mitigation Measure Hazards-1, the Project would not result in inadequate emergency access. No further analysis of this issue in an EIR is required.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
f. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	☒	☐	☐	☐

Potentially Significant Impact. The Project Site is served by a variety of transit options. The Project proposes new development that has the potential to result in an increased demand for alternative transportation modes. Therefore, further analysis of this issue will be included in an EIR.

17. UTILITIES AND SERVICE SYSTEMS. Would the project:

a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☐	☐	☒	☐

Less Than Significant Impact. Wastewater collection and treatment services within the Project vicinity are provided by the City of Los Angeles Department of Public Works (LADPW). Wastewater generated during operation of the Project would be collected and discharged into the existing sewer mains in Cahuenga Boulevard East and conveyed to the Hyperion Treatment Plant (HTP) located in El Segundo. The HTP is a part of the Hyperion Treatment System, which also includes the Tilman Water Reclamation Plant (TWRP) and the Los Angeles–Glendale Water Reclamation Plant (LAGWRP). The treatment capacity of the entire Hyperion Treatment System is approximately 550 million gallons per day (mgd) (consisting of 450 mgd at HTP, 80 mgd at TWRP, and 20 mgd at LAGWRP).[17] The HTP is designed to treat 450 mgd, with annual increases in wastewater flows limited to 5 mgd by City Ordinance No. 166,060. The HTP currently processes an average of 362 mgd and, therefore, has an available capacity of approximately 88 mgd.[18]

The discharge of effluent from the HTP into Santa Monica Bay is regulated by the HTP's NPDES Permit issued under the Clean Water Act and is required to meet the Regional Water

[17] *City of Los Angeles Department of Public Works Bureau of Sanitation, About Wastewater—Treatment Plants, www.lacity.org/san/wastewater/factsfigures.htm accessed November 15, 2013.*

[18] *City of Los Angeles Department of Public Works Bureau of Sanitation, About Wastewater—Treatment Plants, www.lacity.org/san/wastewater/factsfigures.htm, accessed November 15 2013.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Quality Control Board (RWQCB)'s requirements for a recreational beneficial use. Accordingly, the HTP's effluent to Santa Monica Bay is continually monitored to ensure that it meets or exceeds prescribed standards.

The wastewater generated by the Project would be typical of office and restaurant uses and performance/event venues. No industrial discharge into the wastewater system would occur. As the HTP has sufficient capacity and is in compliance with the State's wastewater treatment requirements, the Project would not exceed the wastewater treatment requirements of the RWQCB. Therefore, impacts would be less than significant and no mitigation measures would be required. No further evaluation of this issue in an EIR is required.

b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐

Potentially Significant Impact. Water and wastewater systems consist of two components, the source of the water supply or place of sewage treatment, and the conveyance systems (i.e., distribution lines and mains) that link the location of these facilities to an individual development site. With the increase in new building square footage and the increase in the number of events/performances within the Project Site, the Project would result in increased water demand and wastewater generation from the Project Site. With regard to water, the location, condition, and capacity of water conveyance lines will be evaluated in an EIR to determine whether adequate capacity is available to accommodate the required fire flows and domestic water demand generated by the Project.

With regard to wastewater, as described in response to Checklist Question 17.a, above, wastewater generated during operation of the Project would be collected and discharged into existing sewer mains and conveyed to the Hyperion Treatment Plant, which has an available treatment capacity of approximately 88 mgd. Wastewater from the Project currently flows through a sewer connection located along the west side of the Project Site, which connects to an existing 8-inch-diameter sewer main under Cahuenga Boulevard East that turns into a 10-inch-diameter sewer main.

Based on the Sewer Capacity Availability Request processed by the City of Los Angeles Department of Public, Bureau of Sanitation and included as Appendix IS-2 of this Initial Study,

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

the Project would generate approximately 5,452 gallons per day or approximately 0.0055 mgd of wastewater. The Project's increase in average daily wastewater flow of approximately 0.0055 mgd would represent approximately 0.006 percent of the current 88 mgd available capacity of the Hyperion Treatment Plant. Therefore, the Project-generated wastewater would be accommodated by the existing capacity of the Hyperion Treatment Plant, and a less than significant impact would occur. Thus, the Project's additional wastewater flows would not substantially or incrementally exceed the future scheduled capacity of any treatment plant.

Sewer service for the Project would be provided utilizing new or existing on-site sewer connections to the existing 8-inch/10-inch sewer main under Cahuenga Boulevard East. Project-related sanitary sewer connections and on-site infrastructure would be designed and constructed in accordance with applicable City of Los Angeles Bureau of Sanitation and California Plumbing Code standards. As noted above, a Sewer Capacity Availability Request was processed by the City of Los Angeles Bureau of Sanitation to evaluate the capability of the existing wastewater system to serve the Project's estimated wastewater flow. Based on the current approximate flow levels and design capacities in the sewer system and the Project's estimated wastewater flow, the City determined that the existing sanitary sewer line on Cahuenga Boulevard East would have an adequate capacity to accommodate the additional infrastructure demand created by the Project. No upgrades to existing sewer mains would be required.

Based on the above, the existing wastewater infrastructure would have adequate capacity to accommodate the Project's net increase in wastewater and impacts with respect to wastewater infrastructure would be less than significant. No mitigation measures would be required and no further analysis of the wastewater infrastructure in an EIR is required.

c. Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐

Potentially Significant Impact. As discussed in Checklist Questions 9.a and 9.d, above, drainage patterns and the amount of impervious surfaces on-site may be altered as a result of the Project. Therefore, the potential for the Project to require the construction of new stormwater drainage facilities will be analyzed further in an EIR.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☒	☐	☐	☐

Potentially Significant Impact. The Los Angeles Department of Water and Power (LADWP) supplies water to the Project Site. With the increase in building square footage and the increase in the number of performances/events, the Project would increase the demand for water provided by LADWP. Thus, further analysis of this issue will be provided in an EIR.

e. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐

Less Than Significant Impact. See response to Checklist Question 17.b, above. As discussed therein, the Project-generated wastewater would be accommodated by the existing capacity of the Hyperion Treatment Plant, and a less than significant impact with regard to wastewater treatment would occur. Thus, impacts with respect to wastewater treatment would be less than significant. No mitigation measures would be required and no further analysis of this issue will be provided in an EIR.

f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☐	☐	☒	☐

Less Than Significant Impact. Los Angeles County continually evaluates landfill disposal needs and capacity through preparation of the Los Angeles County Countywide Integrated Waste Management Plan (ColWMP) Annual Reports. Within each annual report, future landfill disposal needs over the next 15-year planning horizon are addressed in part by determining the available landfill capacity.[19] Based on the most recent 2012 ColWMP Annual Report, the remaining total disposal capacity for the County's Class III landfills is estimated at

[19] *Los Angeles County Countywide Integrated Waste Management Plan, 2012 Annual Report.*

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

107.61 million tons, as of December 31, 2012.[20] Additionally, in 2012, the County's Class III landfills had a total maximum daily capacity of 28,549 tons per day (tpd) and an average daily disposal of 13,255 tpd, resulting in approximately 15,294 tpd of remaining daily disposal capacity. Aggressive waste-reduction and diversion programs on a countywide level have helped reduce disposal levels at the County's landfills. Based on the 2012 CoIWMP Annual Report, the County anticipates that future disposal needs can be adequately met through 2027 through scenarios that include a combination of all or some of the following: (1) use of existing in-County Class III landfills and transformation facilities; (2) proposed expansion of in-County Class III landfill capacity through new or existing facilities; (3) use of out-of-County landfills for disposal, including waste-by-rail; (4) use of conversion technologies; (5) expansion of diversion infrastructure; and (6) maximization of waste reduction and recycling.

Construction of the Project would involve demolition, site grading/preparation, and building construction activities. These activities would generate construction and demolition wastes (e.g., wood, concrete, asphalt, cardboard, brick, glass, plastic, and metal) that would be recycled or collected by private waste haulers contracted by the Applicant and taken for disposal at the County's inert landfills. It is anticipated that construction of the Project would generate a total of approximately 156,700 tons of construction-related waste. The amount of construction and debris waste generated by construction of the Project would represent approximately 0.2 percent of the existing remaining disposal capacity of 64,125,859 tons for the unclassified landfill in Los Angeles County that has solid waste facility permits. Thus, the total amount of construction and demolition waste generated by the Project would represent a fraction of the remaining capacity at the unclassified landfill in Los Angeles County.

Based on solid waste generation factors provided by CalRecycle and its June 2006 Targeted Statewide Waste Characterization Study, operation of the Project would generate approximately 156.26 tons per year (0.43 tpd) of solid waste, resulting in a net increase of approximately 74.5 tons per year (100.20 tpd) of solid waste when compared with existing conditions.[21] The estimated solid waste increase generated by the Project would represent

---

[20] *Estimated remaining daily capacity excludes Burbank, Calabasas, San Clemente, Scholl, and Whittier Landfills which would not serve the Project Site. Puente Hills Landfill is also excluded, as it was closed on October 31, 2013.*

[21] *Waste generation factors for the Amphitheatre were based on the Integrated Waste Management Board's June 2006 Targeted Statewide Waste Characterization Study with a generation factor of 2.44 pounds per visitor per year. Waste generation factors for concessions/restaurants were based on CalRecycle Service Sector: Estimated Solid Waste Generation and Disposal Rates and used a generation factor of 1.825 pounds*

(Footnote continued on next page)

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

approximately 0.00007 percent of the estimated annual remaining disposal capacity and 0.001 percent of the remaining daily disposal capacity of Class III Landfills open to the Project. The waste generation factors utilized do not account for recycling or other waste diversion measures, and, as such, this estimated amount of solid waste calculated to be generated by the Project is conservative.

Based on the above, the landfills that serve the Project Site would have adequate capacity to accept the solid waste that would be generated by construction and operation of the Project. Impacts would be less than significant, and no mitigation measures would be required. No further evaluation of this issue is required.

g. Comply with federal, state, and local statutes and regulations related to solid waste?	☐	☐	☒	☐

Less Than Significant Impact. Solid waste management in the State is primarily guided by the California Integrated Waste Management Act of 1989 (AB 939) which emphasizes resource conservation through reduction, recycling, and reuse of solid waste. AB 939 establishes an integrated waste management hierarchy consisting of (in order of priority): (1) source reduction; (2) recycling and composting; and (3) environmentally safe transformation and land disposal.

The Project would be consistent with the applicable regulations associated with solid waste and would promote compliance with AB 939 by providing clearly marked, source-sorted receptacles to facilitate recycling. The Applicant would also enhance recycling on-site through a recycling program that would focus on items such as paper, cardboard, glass, aluminum, plastic, and cooking oils. Since the Project would comply with federal, State, and local statutes and regulations related to solid waste, no significant impacts would occur and no mitigation measures would be required. No further evaluation of this issue is required.

h. Other utilities and service systems?	☐	☐	☒	☐

per square foot per year. Waste generation for box office/museum, offices, workshop/storage, shops/visitor amenities, and central plant were based on CalRecycle Service Sector: Estimated Solid Waste Generation and Disposal Rate and used a waste generation factor of 2.19 pounds per square foot per year.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

Less Than Significant Impact. Electrical transmission to the Project Site is provided by the Los Angeles Department of Water and Power (DWP) through a network of utility poles and utility lines. In addition, natural gas service to the Project Site is provided by the Southern California Gas Company (SoCalGas). The Project would generate an increased demand for electricity and natural gas. Thus, this issue will be evaluated in an EIR.

18. MANDATORY FINDINGS OF SIGNIFICANCE.

a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐

Potentially Significant Impact. There are no bodies of water within the Project Site. Thus, the Project would not affect fish species or fish habitats. However, the Project has the potential to affect wildlife and plant species and historic resources. These potential impacts will be evaluated in an EIR.

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐

Potentially Significant Impact. The potential for cumulative impacts occurs when the independent impacts of the Project are combined with impacts from other development to result in impacts that are greater than the impacts of the Project alone. Located within the

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

vicinity of the Project Site are other current and reasonably foreseeable projects whose development, in conjunction with that of the Project, may contribute to potential cumulative impacts. Cumulative impacts for the following subject areas will be addressed in an EIR: aesthetics, air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hydrology and water quality, land use and planning, noise, public services (fire protection and police protection), transportation/traffic, and utilities and service systems (water, wastewater and stormwater).

With respect to agricultural, forest resources, and mineral resources, the Project would have no impact to these resources and, therefore, could not combine with other projects to result in cumulative impacts. In addition, the Project would not result in potential impacts associated with hazards and hazardous materials. As none of the related projects are immediately adjacent to the Project Site, cumulative impacts associated with hazards and hazardous materials would not occur.

With regard to population and housing, recreation, schools, parks, and libraries, the Project's incremental contribution to potential cumulative impacts would not be cumulatively considerable. Specifically, as discussed in the analysis above, the Project does not propose the development of residential uses and, thus, would not directly contribute to population growth within the Project Site area or an associated direct demand for parks, recreation, schools or library services.

Regarding wastewater, as discussed above in Checklist Question 17.b, the Project's increase in average daily wastewater flows would represent approximately 0.006 percent of the current 88 mgd available capacity of the Hyperion Treatment Plant. In addition, the Project's increase in average daily wastewater generation plus the future Hyperion Service Area flows of approximately 492.3 mgd would result in a total cumulative wastewater flow of approximately 494.7 mgd. Based on the existing and future capacity of the Hyperion Service Area of approximately 550 mgd, the Hyperion Service Area is expected to have adequate capacity to accommodate the cumulative wastewater flows of approximately 494.7 mgd. Therefore, cumulative impacts on the wastewater treatment systems would be less than significant. Further, as with the Project, new development projects occurring in the Project vicinity would be required to coordinate with the City of Los Angeles Bureau of Sanitation via a sewer capacity availability request to determine adequate sewer capacity. Therefore, cumulative impacts on the City's wastewater infrastructure would be less than significant.

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

With regard to solid waste, the demand for solid waste facilities would represent a small fraction of the landfill capacity available to the County of Los Angeles. In addition, as set forth in the 2012 Annual Report, the County of Los Angeles projects that adequate landfill capacity will be available to serve the County, including projected growth in the County through 2027. Thus, cumulative solid waste impacts would be less than significant. With regard to electricity and natural gas, LADWP and SoCalGas have projected that ample electricity and natural gas supplies will be available to serve anticipated future growth within the City of Los Angeles. Thus, cumulative impacts associated with electricity and natural gas would be less than significant.

c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

Potentially Significant Impact. As set forth above, the Project has the potential to result in significant impacts associated with aesthetics, air quality, biological resources, cultural resources, geology/soils, greenhouse gas emissions, hazards/hazardous materials, hydrology/ water quality (including stormwater), land use, noise, fire protection, police protection, traffic, and water. Thus, the potential direct and indirect impacts associated with these issue areas will be addressed in an EIR. As set forth above, the Project will not result in potential impacts associated with agricultural resources, forest resources, hazards, mineral resources, population and housing, recreation, schools, parks, libraries, wastewater, solid waste, electricity and natural gas. Thus, potential direct and indirect impacts associated with these issue areas would not occur and no further analysis of these issues is required.

Attachment A: Project Description

A. Introduction

The County of Los Angeles proposes improvements to the John Anson Ford Theatres (the Ford Theatres Project or Project) located at 2580 Cahuenga Boulevard East in the Hollywood Community of the City of Los Angeles (the Project Site). The Ford Theatres, one of the oldest performing arts venues in Los Angeles, are owned by the County of Los Angeles and operated through a three-way partnership between the County of Los Angeles Department of Parks and Recreation, the County of Los Angeles Arts Commission, and the Ford Theatre Foundation.

The Project includes the rehabilitation of portions of the existing 1,196-seat Amphitheatre and the development of approximately 59,230 square feet of new buildings and approximately 48,750 square feet of outdoor plaza areas, all within the current boundaries of the Ford Theatres property. These improvements, which would be developed in several phases, would include a 299-seat theatre, a multi-purpose flex space, a restaurant, office spaces, and enhanced parking facilities and visitor amenities. The Project would also provide for improved exterior landscape areas and enhanced vehicle and pedestrian circulation. An approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the Project Site is also proposed. These improvements would enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users.

B. Project Location

The Project Site comprises an approximately 32-acre County of Los Angeles regional park located approximately six miles northwest of downtown Los Angeles and approximately 12 miles east of the Pacific Ocean. As shown in Figure 1 on page 2, primary regional access is provided by US 101 (Hollywood Freeway), which runs north-south west of the Project Site. The major arterials providing regional and sub-regional access to the Project Site vicinity include Cahuenga Boulevard, Highland Avenue, and Franklin Avenue.

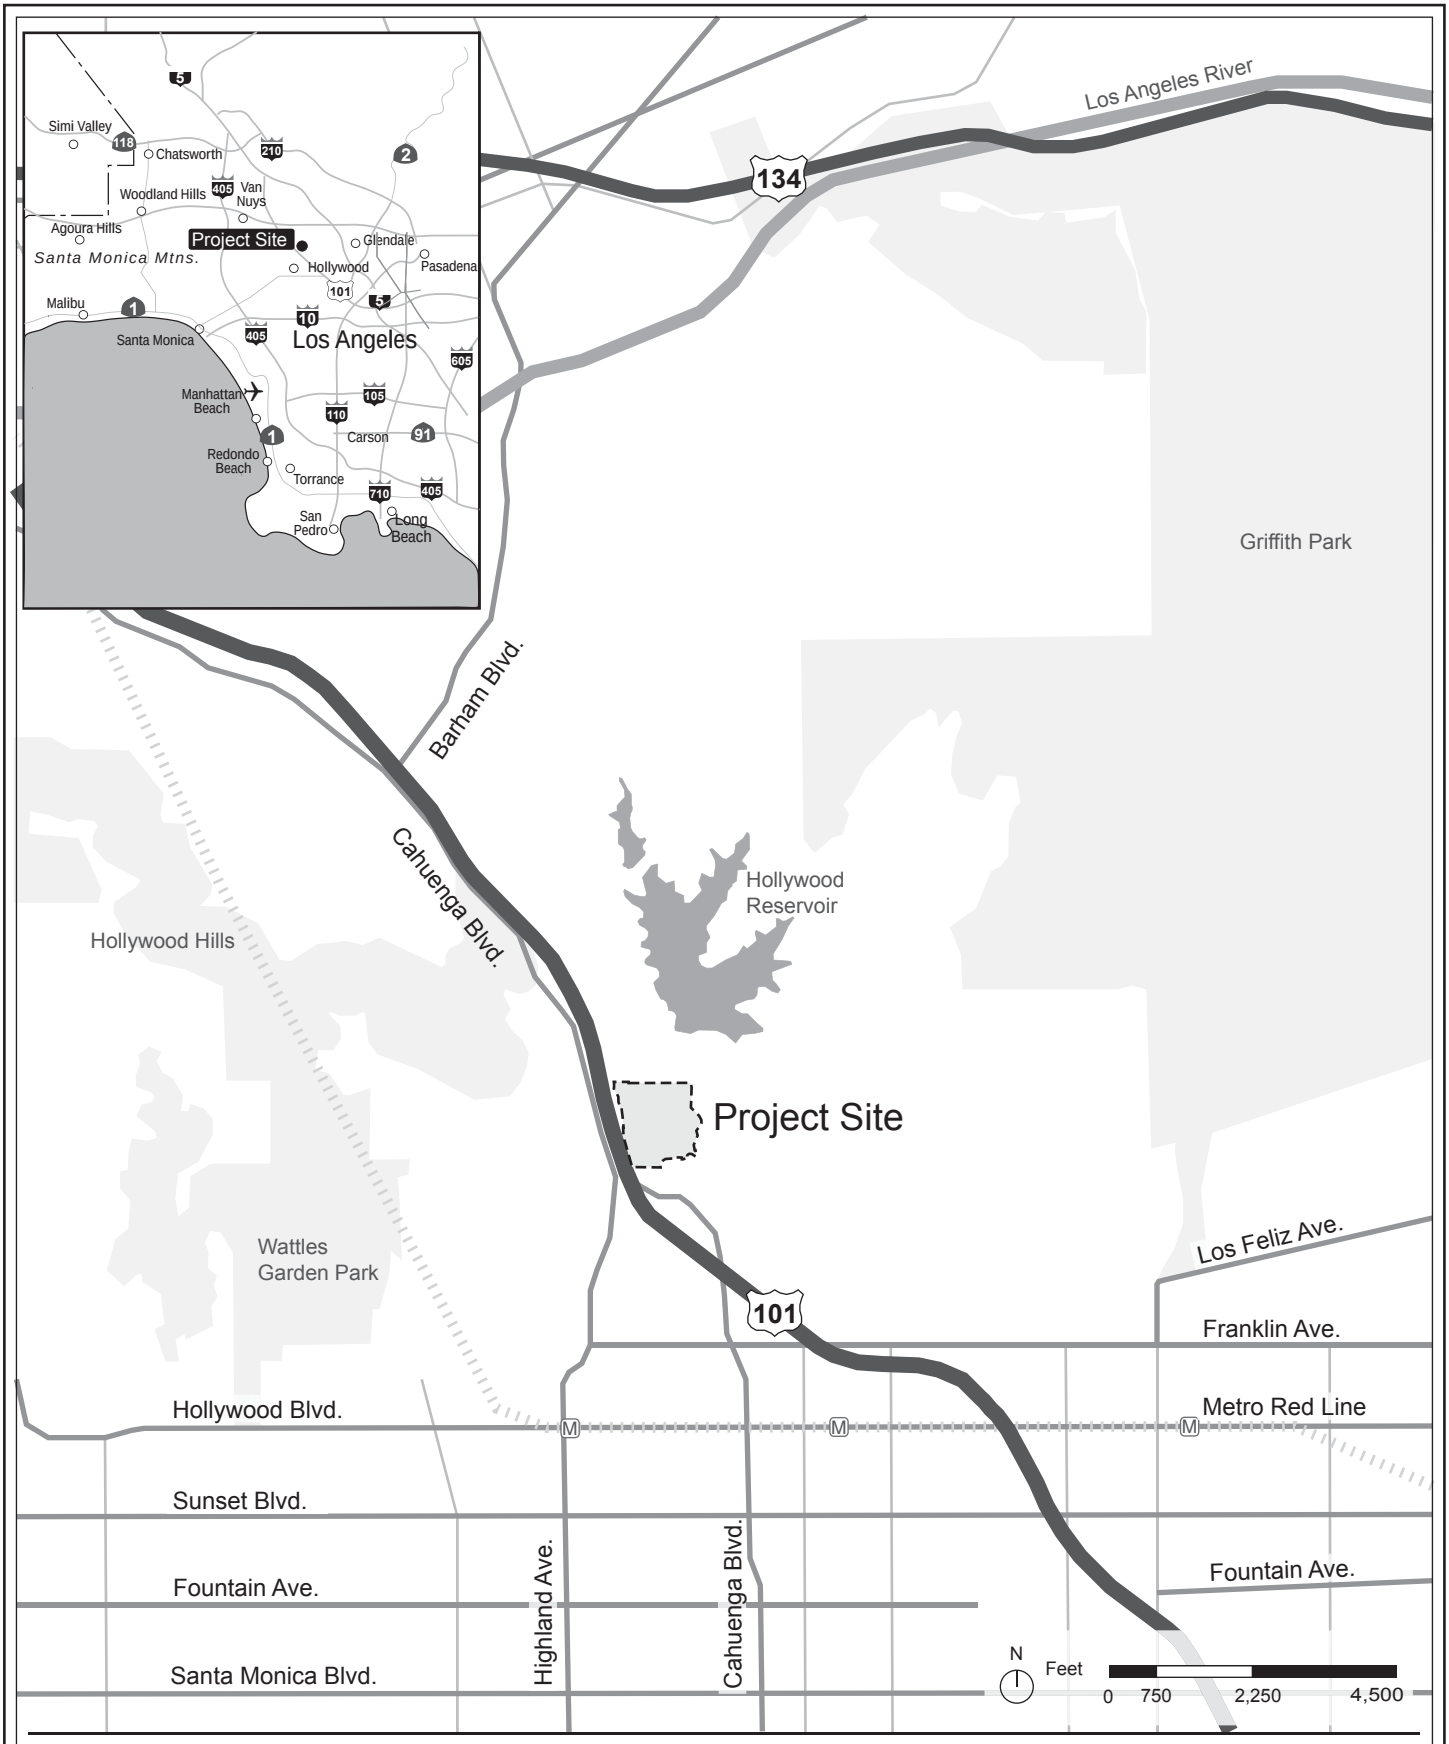

Figure 1
Regional Location Map

Source: Google Earth, 2013.

C. Background and Existing Project Site Conditions

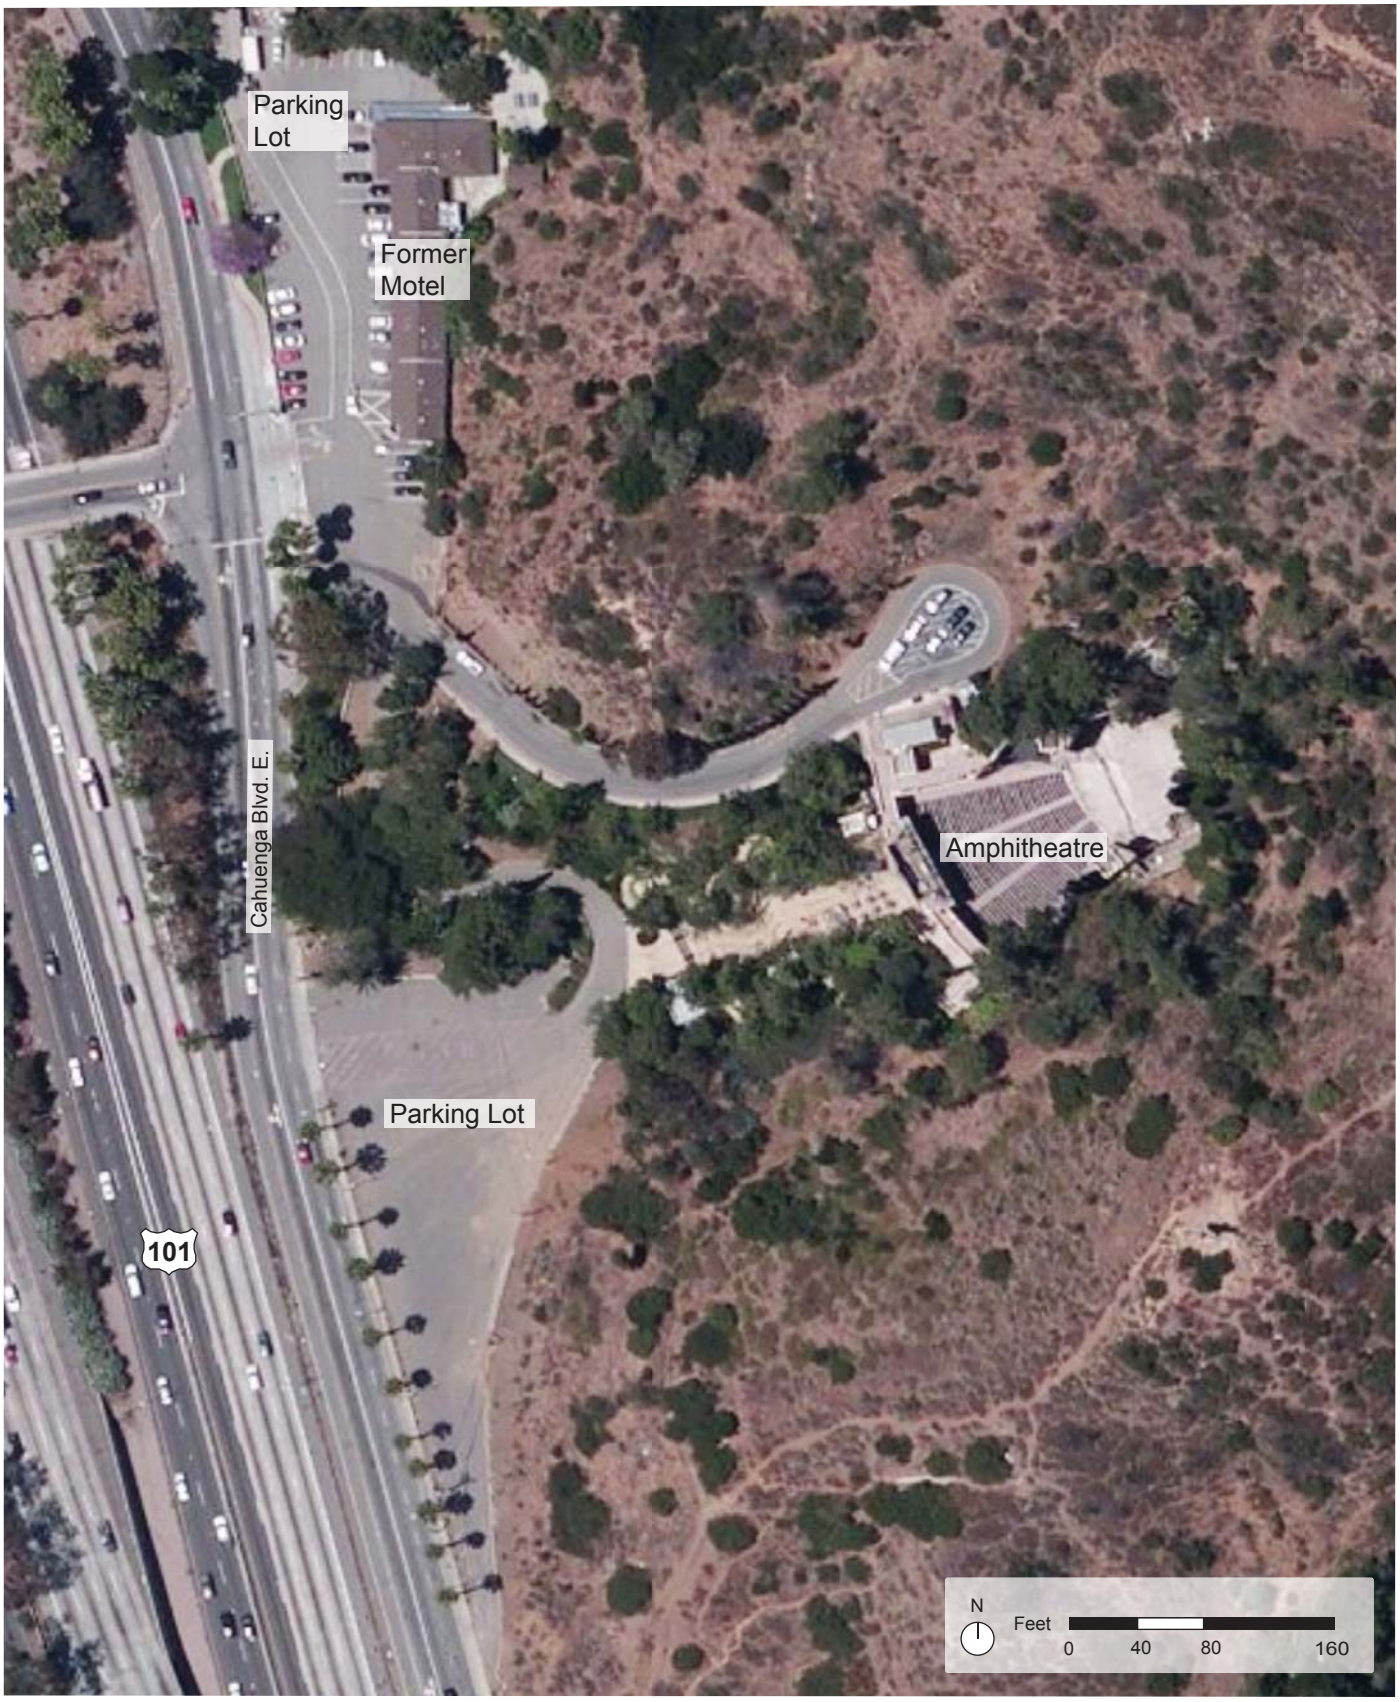
1. Background

The site of the existing Amphitheatre was originally owned by Christine Wetherhill Stevenson and Chauncey D. Clark who together provided for the construction of an outdoor amphitheatre to host Stevenson's *The Pilgrimage Play*. This play was performed in a wooden amphitheatre from 1920 to 1929, until the original structure was damaged by a brush fire in October 1929. The existing Amphitheatre, built on the same site as the original amphitheatre, was constructed of board-formed concrete, and was designed in the style of ancient Judaic architecture to resemble the gates of Jerusalem. The existing Amphitheatre opened in 1931, and in 1941, the land of the existing Amphitheatre was deeded to the County of Los Angeles. *The Pilgrimage Play* was performed at the Amphitheatre from 1931 until 1964, when a lawsuit forced its closure due to the play's religious nature. In 1976, the existing Amphitheatre, previously known as the Pilgrimage Theatre, was renamed the John Anson Ford Theatre in honor of the late Los Angeles County Supervisor's significant support of the arts. Today, the Los Angeles County Arts Commission operates the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. The Ford Theatre Foundation, in partnership with the Los Angeles County Arts Commission and the Department of Parks and Recreation, supports programs that nurture artists, arts organizations and community, providing a gateway for the people of greater Los Angeles to discover and appreciate cultures of their region and the world.

The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places.

2. Existing Project Site Conditions

As shown in the aerial photograph provided in Figure 2 on page 4, the approximately 32-acre Project Site currently includes the open-air 1,196-seat Amphitheatre with support spaces (i.e., dressing rooms, performer restrooms, green room) below; an 860-square-foot projection booth and control room located above the Amphitheatre seating; an indoor venue located below the Amphitheatre providing approximately 87 seats referred to as [Inside] the Ford; a two-story, approximately 320-square-foot concessions building; a 365-square-foot box office; a plaza referred to as Edison Plaza and a picnic area; surface parking areas; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission staff, and the Los Angeles Philharmonic.



matrix environmental

Figure 2
Existing Ford Facilties

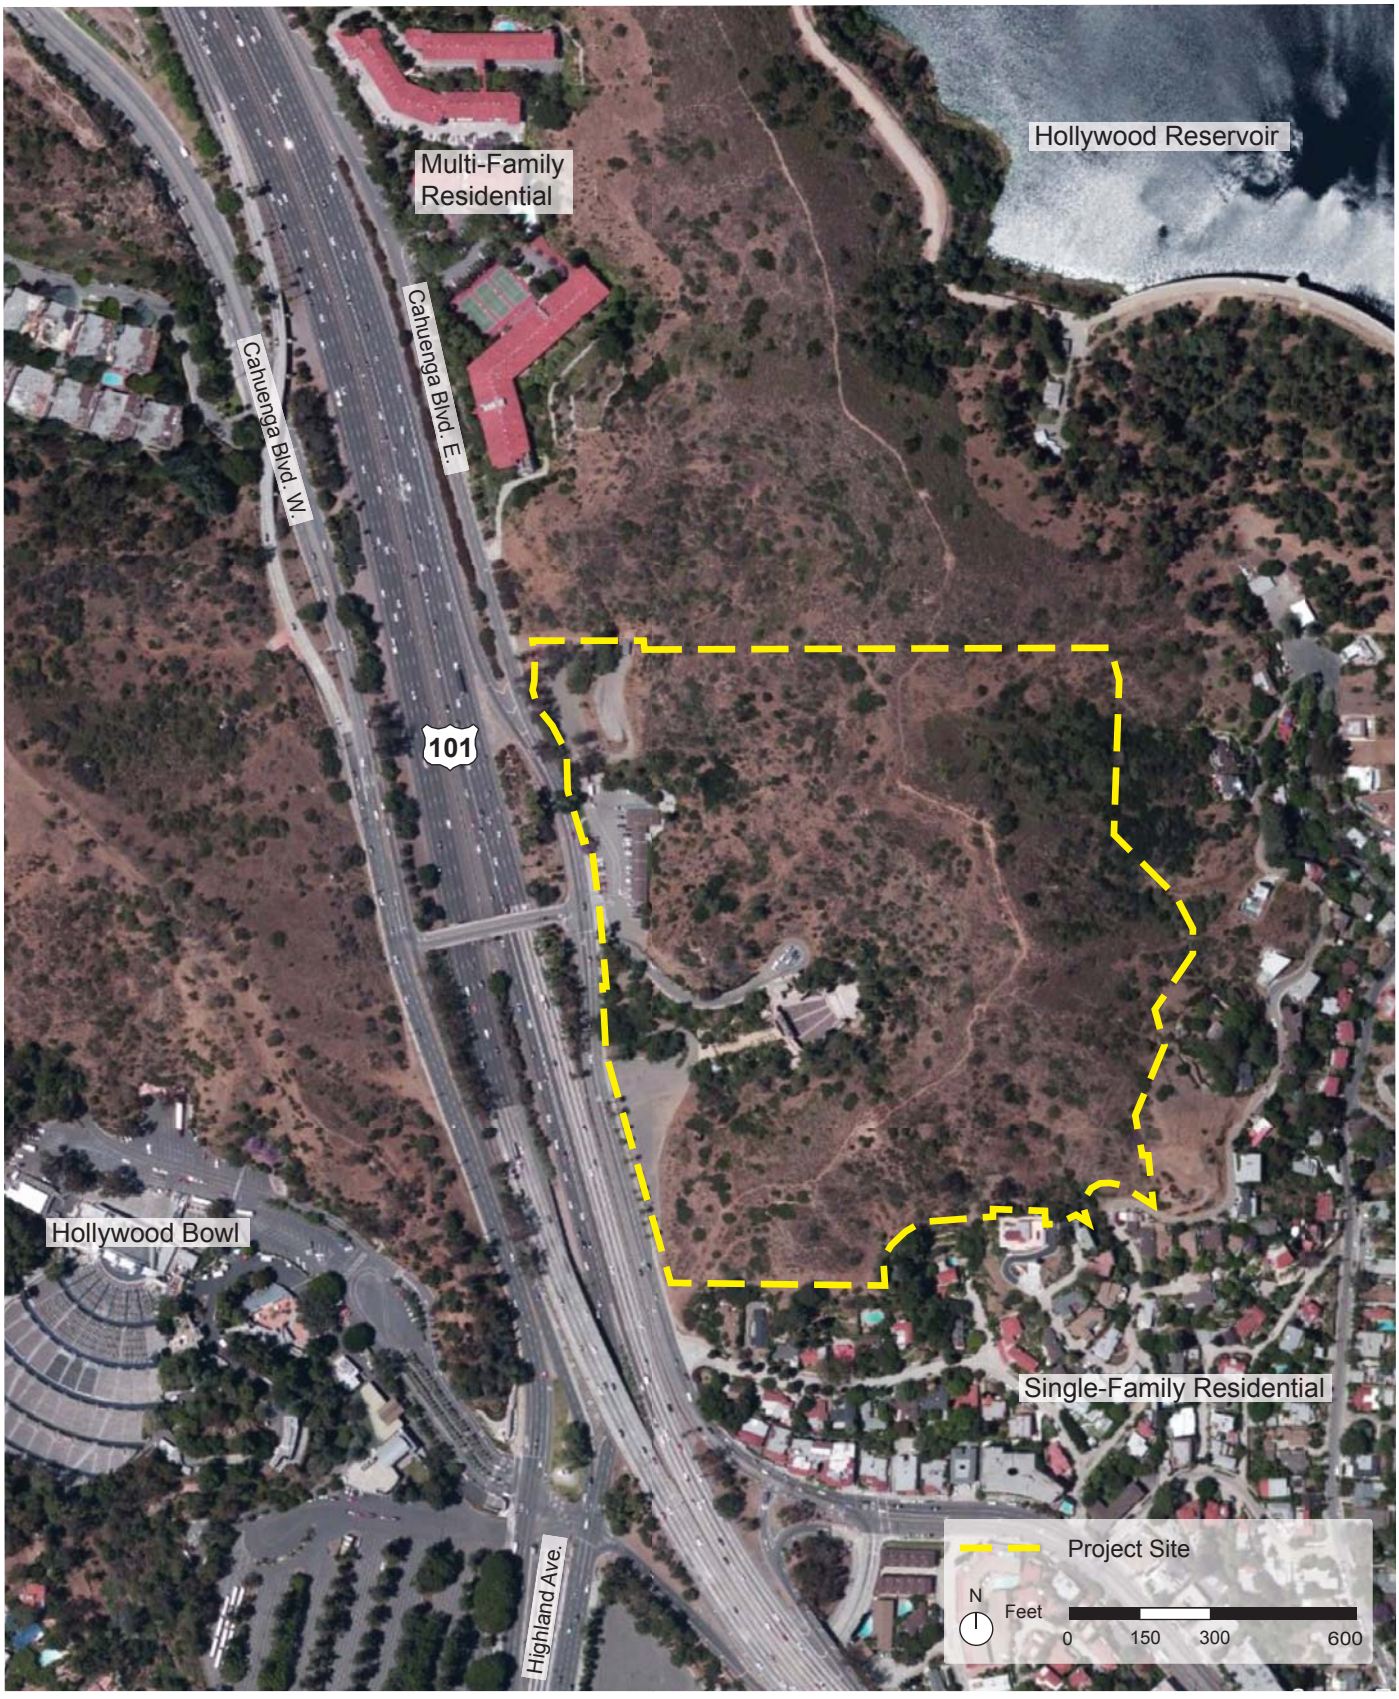
Source: Google Earth, 2013.

The Project Site also includes a cell tower and associated structures along the northwest portion of the Project Site. Other facility support spaces, such as storage and maintenance areas and restrooms, are also located throughout the Project Site. As shown further below in Table 1 on page 12, the existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The remaining areas are comprised of surface parking areas and undeveloped open space. Landscaping is provided along driveways, surface parking areas, and pedestrian pathways. Additionally, while there are no designated hiking trails within the Project Site, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails.

As shown in the aerial photograph provided in Figure 3 on 6, the Project Site is situated within the west-facing slope of a hillside where the upper elevations of the Project Site at the summit are approximately 340 feet higher than the lowest elevation along the western portion of the Project Site that is adjacent to Cahuenga Boulevard East. As such, the topography of the Project Site is widely varied from moderately sloping surface parking areas along the western portion of the Project Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions of the Project Site. Based on the varying topography of the Project Site, the buildings and structures within the Project Site similarly feature varying heights ranging from approximately 15 feet from adjacent grade (approximately 547 feet above sea level) to approximately 62 feet from adjacent grade (approximately 574 feet above sea level). With the exception of the former motel building, due to the surrounding hillsides, views of the Amphitheatre structures and support spaces are generally limited to areas along Cahuenga Boulevard East and the Hollywood Freeway.

The Project Site currently provides approximately 350 to 380 stacked parking spaces within three surface parking areas that are comprised of asphalt and dirt areas. Two surface parking lots, referred to as the north parking lot and the south parking lot, are located along Cahuenga Boulevard East, while the third surface parking lot providing disabled parking spaces is located adjacent to the upper gate. During events, parking is also available at the Universal City/Studio City Metro Red Line Station where a shuttle is provided to and from the Ford Theatres. The Hollywood Bowl also utilizes the existing parking facilities at the Ford Theatres during non-event days or during low-attendance events at the Ford Theatres.

Access to the Project Site is available via four driveways along the east side of Cahuenga Boulevard East. The northernmost driveway, located north of the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, is primarily used for egress at the end of events and is occasionally used for overflow stacked parking. The driveway at



matrix environmental

Figure 3
Aerial Photograph of the Project Site and Surrounding Vicinity

Source: Google Earth, 2013.

Pilgrimage Bridge and Cahuenga Boulevard East provides primary access to the Project Site. During events, this driveway is used for patrons entering by passenger vehicle and for shuttle access from the Universal City/Studio City Metro Red Line Station. During non-event times, this driveway serves as the main ingress and egress point for employees and vendors. The southern driveways, located south of the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, are primarily used for egress from the southern surface parking lot at the end of events. The circular driveway at the upper gate also serves as the performer entrance to the lower level Amphitheatre support spaces, shuttle and vehicular loading and unloading, trash pickup, media truck parking, and fire truck staging.

Pedestrian access to the Project Site is available from several locations along Cahuenga Boulevard East. Within the Project Site, pedestrian access to the Amphitheatre is available from pathways throughout the Project Site.

Lighting within the Project Site includes pole lighting within the surface parking and entry areas, exterior building lighting, stage and production lighting, and security lighting. Signage consists of an electronic sign identifying the Ford Theatres along Cahuenga Boulevard East, near the southern driveway, and wayfinding signage internal to the Project Site.

As provided further below in Table 2 on page 17, the Ford Theatres currently hosts approximately 184 events, including 84 events within the Amphitheatre from May through October and approximately 100 events within the [Inside] the Ford from November through April. Approximately 50,640 people attend events within the Amphitheatre during the May through October event season and approximately 4,000 people attend events within the [Inside] the Ford Theatre throughout the November through April event season for a total event season attendance of approximately 54,640 people. During the event season, the hours of operation for the Ford Theatres are from 8:00 A.M. to 11:00 P.M., Monday through Sunday.

As noted above, the Ford Theatres are operated through a three-way partnership between the County of Los Angeles Department of Parks and Recreation, the County of Los Angeles Arts Commission, and the Ford Theatre Foundation.

3. Approved Amphitheatre Improvements

In September 2013, the County of Los Angeles Chief Executive Office prepared a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the restoration and rehabilitation of portions of the existing Amphitheatre. As described in more detail below, these

improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades.

The hillside stabilization improvements will include the installation of compatible stone-clad retaining walls and drainage improvements along the rear of the stage to stabilize the existing slope and reduce runoff from the surrounding hillside. The stage reconstruction will include the removal of the existing two-level concrete Amphitheatre stage structure to allow the installation of an improved stage structure, including the placement of new and upgraded foundations that meet current code requirements; new wood stage flooring and supports; an under stage drainage system; enhanced stage support and ADA-compliant performer spaces; and new ADA-compliant restroom facilities and associated plumbing. Code-required upgrades for fire/life safety and disabled access will also be implemented. Theatrical systems infrastructure improvements include improvements to the stage pit such as new steps and traps. In addition, new energy-efficient theatrical and audio-visual infrastructure to replace existing antiquated systems, including a lighting/sound proscenium truss and lighting towers, will also be implemented. Other improvements involve the rehabilitation of portions of the stage buildings and towers including the removal of the exterior paint to provide water-resistant surfaces and to return the structures to their original color, and the installation of new roofing, windows, doors, and interior infrastructure for power, heating, and air conditioning.[1] A new addition at stage left to accommodate an audio rack room and related heating, ventilation, and air conditioning will also be provided. As part of these improvements, approximately 24 trees are anticipated to be removed based on their health, root structure, and impact to the stabilization of the adjacent hillside. Such trees will be replaced with new landscaping, including new trees and shrubs. Where feasible, some of the trees proposed to be removed may be relocated throughout the Project Site.

Implementation of these improvements will provide enhanced theatrical infrastructure and performer amenities and will address long-deferred maintenance and needed repairs, including mitigation of water infiltration and provision of slope stabilization.

D. Surrounding Uses

As shown in the aerial photograph provided in Figure 3 on page 6, the area surrounding the Project Site includes a mix of residential uses and open space. Specifically, the Project Site is bounded by 4-story multi-family residential buildings and

[1] *The removal of the exterior paint to provide water-resistant surfaces is currently underway.*

open space associated with the Hollywood Reservoir to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The majority of these uses are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site. The Hollywood Bowl is also located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.

E. Description of the Project

The Ford Theatres Project is proposed to enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users. The Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Plaza, which would include a designated area for bus and valet drop-off, a new three-level parking structure, and event space; and (5) a 0.75-mile hiking trail. Conceptual site plans illustrating the development of the Project are provided in Figure 4 and Figure 5 on pages 10 and 11. In addition, Table 1 on page 12 provides a summary of the proposed improvements. A more detailed discussion of the proposed improvements is provided below.

Within the Amphitheatre, the Project would replace the existing approximately 860-square-foot projection booth and control room located to the rear and above the Amphitheatre seating with a new 800-square-foot projection booth and control room. The existing projection booth and control room is not a character-defining feature of the Amphitheatre and includes an access stair that obstructs the primary circulation at the Amphitheatre level. The new projection booth and control room would be designed to enable the return of the walkway at the Amphitheatre level to its original condition. Existing lighting positions along the back of the Amphitheatre would also be removed and replaced with an upgraded lighting platform that would be integrated within a new sound wall proposed along the rear of the Amphitheatre. The proposed sound wall, which would measure approximately 48 feet in height, is intended to enhance performances by shielding the Amphitheatre from traffic noise from Cahuenga Boulevard and the Hollywood Freeway. In addition, a retractable shade structure would provide cover for the Amphitheatre during day time performances.

Source: Levin and Associates, December 2013.

As shown in Figure 5 on page 11, north of the Amphitheatre, the existing circular driveway and disabled parking at the upper gate would be modified to accommodate a dedicated artist performance entry and provide for a two-story office and concessions building and an approximately 3,750-square-foot plaza collectively referred to as the Ford Terrace. The two-story building would include approximately 2,500 square feet of office space in one level above an approximately 2,500-square-foot concessions area at the first level. To the west of the two-story building would be a raised plaza deck that would serve pre- and post performance concessions, private receptions, and intermission concessions. The plaza would feature landscaped raised planters with built-in benches along the perimeter and a sound wall along the eastern perimeter of the plaza. Access to the plaza would be from a staircase from the existing Amphitheatre walkway and an accessible ramp that would encircle the existing elevator tower. Beneath the plaza, the modified driveway would form a service level referred to as the Service Court providing a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup, as well as fire department access. An approximately 1,570-square-foot workshop to support performances would also be provided within the Service Court adjacent to the loading dock. To provide for these improvements, the Project would require removal of the existing two-story approximately 320-square-foot concessions building located adjacent to the upper gate. In addition, use of the existing approximately 1,895-square-foot, 87-seat [Inside] the Ford located at the lower level of the Amphitheatre and the associated lighting, stage, and theatrical amenities would be removed. This space would be repurposed as a self-serve food marketplace area and for storage. New ADA-accessible restrooms would also be provided at the lower level. In addition, disabled parking located adjacent to the upper gate would be accommodated within the parking structures proposed as part of the Project, as described further below.

West of the Amphitheatre, generally within the existing south surface parking area, the Ford Plaza would be developed and would include a three-level parking structure, referred to as the south parking structure, which would provide approximately 250 parking spaces. A plaza deck that would serve as the primary gathering space for the Ford Theatres would be created above the parking structure. The plaza deck would create approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides. As part of the Ford Plaza, the existing 365-square-foot box office located at the main entrance would be repurposed as a museum/gallery for the Ford Theatres and just west of the existing box office an approximately 560-square-foot box office would be constructed. A three-story building providing approximately 17,600 square feet of office uses and approximately 1,200 square feet of shops/visitor amenities would be located adjacent to the new box office. This three-story building would terrace south at the foothill of the plaza level. In addition, at the southern boundary of the Ford Plaza, an approximately 1,000-square-foot conference room would be built to support the adjacent office uses. Adjacent to the conference room would be an outdoor area that could accommodate small informal

performances, musical entertainment, and/or overflow/support monitors to view events occurring within the indoor venues. North of these uses within the Ford Plaza would be an approximately 3,900-square-foot, 150-seat restaurant that would include a 1,300-square-foot kitchen/bar, a 2,600-square-foot indoor seating area, and a 1,000-square-foot outdoor seating area. The restaurant would serve as the main cooking facility for the site concessions and would provide a flagship ambiance with visibility from main transportation routes. East of the restaurant, an indoor performance venue comprised of approximately 8,000 square feet and including 299 seats would be provided. This facility would feature acoustic treatments, a proscenium stage, full theatrical lighting and rigging, and multi-purpose uses. Backstage spaces within the new venue would include performer restrooms, dressing rooms, and a prep area for special events. In addition, the lobby would feature a glass curtain-wall system with pivoting doors to create an indoor/outdoor space at the edge of the Ford Plaza. This facility would expand upon and enhance the existing [Inside] the Ford programming and would eliminate both the sound control requirements of the [Inside] the Ford and the the existing functional conflicts of locating an additional performance space near the Amphitheatre.

A Transit Center consisting of a bus/van loading and unloading zone, a three-level parking structure referred to as the north parking structure, a rehearsal and event space referred to as the Flex Space, and a maintenance area would be constructed along the northwestern extent of the Project Site. Specifically, upon entering the Ford Theatres from the existing primary access at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, the Transit Center would provide a staging area for buses to load and unload. From this area, vehicles would also be directed south to the parking structure within the Ford Plaza or north to the three-level parking structure proposed within the Transit Center. The north parking structure would provide approximately 250 parking spaces. The approximately 8,300-square-foot Flex Space would be constructed at the lowest level of the parking structure. The Flex Space would provide approximately 99 retractable seats and would include full theatrical lighting, performer restrooms, dressing rooms, and a prep area for special events. A plaza area referred to as the Transit Plaza would also be located below the parking structure. The upper deck of the parking structure would extend over the Flex Space and the Transit Plaza. At the upper deck, an approximately 6,300-square-foot maintenance area consisting of office, storage, garage, and yard areas would also be provided. To provide for these improvements, the Project would require removal of the existing two-story approximately 10,500-square-foot former motel building currently used for Ford Theatre Foundation, Los Angeles County Arts Commission staff, and Philharmonic offices.

Overall, as provided in Table 1 on page 12, implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site. Additionally, as

summarized in Table 2 on page 17, with the new event spaces to be provided as part of the Project, the number of annual events is estimated to increase from 184 events to approximately 331 events and the number of annual attendees is estimated to increase from 54,640 people to approximately 93,725 people. The hours of operation at the Ford Theatres would continue to be from 8:00 A.M. to 11:00 P.M., Monday through Sunday. To accommodate the increase in programming, it is anticipated that existing staffing within the Project Site would increase from approximately 20 employees to up to 105 employees or an increase of approximately 85 employees.

As illustrated in Figure 4 on page 10, the Project would also include a 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The trail would be approximately four feet in width and would feature natural-type fencing as well as "sutter wall" style retaining walls and cut-in granite steps where areas of steep terrain are proposed. Hand-railing may also be provided at the steps. The hours of operation for use of the trail would observe standard park hours of sunrise to sunset.

1. Design

The proposed improvements would be designed to complement the existing historic character of the Ford Theatres. The Project is designed to be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings (1995) Weekes and Grimmer. The new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity by avoiding any substantial adverse change in the significance of an historic resource. The new buildings and parking structures in particular would be integrated into the existing topography of the Project Site. Building heights would range from approximately 15 feet to 67.5 feet in height as measured from adjacent grade with elevations ranging from 515 feet to 610 feet above sea level. Materials, such as wood, brick, stucco, metal panels, concrete and glass are anticipated to be used in the construction of the buildings.

The new buildings and infrastructure would also be designed to be environmentally sustainable and to achieve certification under the U.S. Green Building Council's Leadership in Energy Efficiency and Design (LEED®). The Project would also be designed to meet the County's green building requirements. Design features to reduce energy use throughout the buildings would include natural ventilation, use of daylighting controls, efficient lighting, and efficient mechanical systems and equipment through the implementation of a new central plant, transformers, and a generator. Water use would be reduced by the installation of water-efficient fixtures, equipment, and systems. Water use in irrigation

Table 2
Summary of Events and Attendance

Facility	Existing Schedule			Future Expanded Schedule		
	Number of Shows	Average Attendance per Event	Total Series Attendance	Number of Shows	Average Attendance per Event	Total Series Attendance
Amphitheatre 1,196 seats May--October						
Partner Events	40	760	30,400	40	850	34,000
Rental Events	20	700	14,000	20	800	16,000
Family Events	8	620	4,960	16	600	9,600

Rental Events	10	40	400			
Total Attendance			*4,000*			
New Theatre 299 seats September–July						
Partner Events				160	165	26,400
Rental Events				15	165	2,475
Total Attendance						*28,875*
Flex Space 99 seats July–June						
Rentals				10	75	750
Open Rehearsals and Readings				50	50	2,500
Total Attendance						*3,250*
Total Events			**184**			**331**
Total Audience			**54,640**			**93,725**

Source: Community Arts Resources, Inc., October 2012.

would also be reduced by the use of native, drought-tolerant landscape and efficient irrigation systems. In addition, local air quality would be enhanced by the reduction of VOC-containing construction materials. Construction activities would also make use of local, recycled, and renewable materials where possible and reuse construction materials

such as grading debris within the Project Site. Similarly, the use of renewable and recyclable materials during construction, and the diversion of waste materials from landfills, would reduce long-term environmental effects of the Project. The Project would also enhance on-site recycling as part of its operations.

2. Access and Parking

Access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some configuration and circulation modifications. In addition, to facilitate access and circulation within the Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection Cahuenga Boulevard East and Pilgrimage Bridge. The northernmost driveway, which is currently used primarily for egress at the end of events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from the north parking structure. The proposed driveway between the northernmost driveway and the main entrance would provide right-turn only egress from the Transit Center and the parking structure. The driveway at Pilgrimage Bridge and Cahuenga Boulevard East, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. The southern driveways would also be maintained in their existing locations with the southernmost driveway providing ingress to the south parking structure and the other driveway providing egress. At the driveway providing egress from the south parking structure, the Project proposes a new signal to allow for safer left turns from the driveway to Cahuenga Boulevard East. Ingress and egress to the south parking structure would also be provided from the main entrance. Within the Project Site, access to the Amphitheatre would continue to be provided at the main gate. In addition, new pedestrian pathways would be provided for access to the new areas. As described above, the existing circular driveway at the upper gate would be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access. The Project would also include bicycle amenities.

Upon buildout of the Project, parking would be provided within two new three-level parking structures that would generally be located within the existing north and south surface parking areas that would be removed as part of the Project. Upon completion, the Project would provide a total of approximately 500 parking spaces and a net increase of approximately 120 to 150 parking spaces, including additional ADA parking spaces. During events, parking would also continue to be available at the Universal City/Studio City Metro Red Line Station where a shuttle would continue to be provided to and from the Ford Theatres. In addition, use of the Ford Theatres parking facilities by the Hollywood Bowl may continue.

3. Landscaping

A variety of native and drought tolerant plant material would be used to enhance and complement the existing plant material on the hillside. In addition, mature native trees would be planted and enhanced with complementary native vegetation. To screen off-site views of the south parking structure, the proposed landscape would berm up to cover the exposed areas of the parking structure, thereby bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. In addition, along the proposed trail, landscape improvements may include habitat restoration and enhanced plantings.

Implementation of the Project would require the removal of approximately 143 trees, including cypress, pine, palm, eucalyptus, ficus, sycamore, and olive trees. This number includes the trees proposed to be removed as part of the approved Amphitheatre improvements described above. The Project would also relocate approximately 18 trees throughout the Project Site.

4. Lighting and Signage

The Project would feature illuminated building façades on the north parking structure, the new theatre, the restaurant, and the proposed sound wall. In addition, the Project would include exterior lighting along vehicular and pedestrian pathways and at the upper level of the north parking structure for security and wayfinding purposes. Accent lighting to highlight architectural features, landscape elements, and the Project's signage would also be incorporated. Lighting throughout the plaza areas would also be provided. The Project would also include new theatrical lighting within the Amphitheatre.

Project signage would include various identity signs including a central identity sign. The identity signs may include the existing Ford Theatres sign along Cahuenga Boulevard East, which would be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance. The Project would also include internally illuminated graphic signs along the façades of the new theatre, the north parking structure, and the restaurant. In addition, a large sign identifying the Ford Theatres would be placed along the proposed sound wall. This sign is anticipated to be illuminated. Monitors that would be used for a variety of purposes such as publicizing events, promoting the available food services, assisting in wayfinding, and for broadcasting sold-out events may also be provided in the plaza areas and other public spaces throughout the Project Site. The Project would also include interpretive signage along the proposed hiking trail and throughout the Project Site to provide information about the history of the Ford Theatres, Ford programs and local flora

and fauna. Lastly, wayfinding signs would be located throughout the Project Site, including at parking structure entrances and elevators.

5. Utilities

The Project would provide a generator east of the office and concessions building within the Ford Terrace and north of the building would be a service yard and transformers. An approximately 2,200-square-foot central utility plant is also proposed east of the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. The central utility plant would include cooling towers, chillers, a fire pump and other associated equipment. Alternatively, the Project could provide a decentralized air-cooled system. Additional transformers would be installed within the Ford Plaza adjacent to the 299-seat theatre, at the central utility plant, at the north entrance of the north parking structure, and near the south trailhead termination. Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles along Cahuenga Boulevard East. These electrical poles could measure up to 65 feet in height. In addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. Other utility improvements proposed as part of the Project would include a new fire water line, new natural gas service, and sewer and water connections and drainage improvements.

F. Project Construction and Scheduling

The Project would be implemented in several phases and may be completed as early as 2020. Construction activities would include demolition of several existing facilities, grading and excavation, and construction of new structures and related infrastructure. It is estimated that the Project would require approximately 83,774 cubic yards of export. As part of the Project, a Construction Traffic Management Plan would be implemented during construction to manage construction traffic and ensure that adequate and safe access and parking remains available during construction activities.

G. Necessary Approvals

Discretionary approvals from the County of Los Angeles Board of Supervisors will be necessary for the Ford Theatres Foundation to implement the Project.

SEWER CAPACITY AVAILABILITY REVIEW FEE (SCARF) - Frequently Asked Questions

SCAR stands for Sewer Capacity Availability Review that is performed by the Department of Public Works, Bureau of Sanitation. This review evaluates the existing sewer system to determine if there is adequate capacity to safely convey sewage from proposed development projects, proposed construction projects, proposed groundwater dewatering projects and proposed increases of sewage from existing facilities. The SCAR Fee (SCARF) recovers the cost, incurred by the City, in performing the review for any SCAR request that is expected to generate 10,000 gallons per day (gpd) of sewage.

The SCARF is based on the effort required to perform data collection and engineering analysis in completing a SCAR. A brief summary of that effort includes, but is not limited to, the following:

1. Research and trace sewer flow levels upstream and downstream of the point of connection.
2. Conduct field surveys to observe and record flow levels. Coordinate with maintenance staff to inspect sewer maintenance holes and conduct smoke and dye testing if necessary.
3. Review recent gauging data and in some cases closed circuit TV inspection (CCTV) videos.
4. Perform gauging and CCTV inspection if recent data is not available.
5. Research the project location area for other recently approved SCARs to evaluate the cumulated impact of all known SCARs on the sewer system.
6. Calculate the impact of the proposed additional sewage discharge on the existing sewer system as it will be impacted from the approved SCARs from Item 6 above. This includes tracing the cumulative impacts of all known SCARs, along with the subject SCAR, downstream to insure sufficient capacity exist throughout the system.
7. Correspond with the applicant for additional information and project and clarification as necessary.
8. Work with the applicant to find alternative sewer connection points and solutions if sufficient capacity does not exist at the desired point of connection.

Questions and Answers:

1. **When is the SCARF applied, or charged?**
   It applies to all applicants seeking a Sewer Capacity Availability Review (SCAR). SCARs are generally required for Sewer Facility Certificate applications exceeding 10,000 gpd, or request from a property owner seeking to increase their discharge thru their existing connection by 10,000 gpd or more, or any groundwater related project that discharges 10,000 gpd or more, or any proposed or future development for a project that could result in a discharge of 10,000 gpd.
2. **Why is the SCARF being charged now when it has not been in the past?**
   The City has seen a dramatic increase in the number of SCARs over 10,000 gpd in the last few years and has needed to increase its resources, i.e., staff and gauging efforts, to respond to them. The funds collected thru SCARF will help the City pay for these additional resources and will be paid by developers and property owners that receive the benefit from the SCAR effort.
3. **Where does the SCARF get paid?**
   The Department of Public Works, Bureau of Engineering (BOE) collects the fee at its public counters. Once the fee is paid then BOE prepares a SCAR request and forwards it to the BOS where it is reviewed and then returned to BOE. BOE then informs the applicant of the result. In some cases, BOS works directly with the applicant during the review of the SCAR to seek additional information and work out alternative solutions

MOLLENHAUER GROUP
316 W 2ND ST, 5TH FLOOR
LOS ANGELES, CA, 90012

Dear MOLLENHAUER GROUP,

SEWER AVAILABILITY: 2580 CAHUENGA BLVD EAST

The Bureau of Sanitation has reviewed your request of 01/07/2014 for sewer availability at **2580 CAHUENGA BLVD EAST**. Based on their analysis, it has been determined on 01/21/2014 that there is capacity available to handle the anticipated discharge from your proposed project(s) as indicated in the attached copy of the Sewer Capacity Availability Request (SCAR) .

This determination is valid for 180 days from the date shown on the Sewer Capacity Availability request (SCAR) approved by the Bureau of Sanitation.

While there is hydraulic capacity available in the local sewer system at this time, availability of sewer treatment capacity will be determined at the Bureau of Engineering Public Counter upon presentation of this letter. A Sewer Connection Permit may also be obtained at the same counter provided treatment capacity is available at the time of application.

A Sewerage Facilities Charge is due on all new buildings constructed within the City. The amount of this charge will be determined when application is made for your building permit and the Bureau of Engineering has the opportunity to review the building plans. To facilitate this determination a preliminary set of plans should be submitted to Bureau of Engineering District Office, Public Counter.

Provision for a clean out structure and/or a sewer trap satisfactory to the Department of Building and Safety may be required as part of the sewer connection permit.

Sincerely,

TONY PUEBLOS

Appendix A.2

Notice of Preparation (NOP)

NOTICE OF PREPARATION OF A

DRAFT ENVIRONMENTAL IMPACT REPORT

AND

NOTICE OF PUBLIC SCOPING MEETING

To:	All Interested Agencies, Organizations and Persons
From:	The County of Los Angeles
Subject:	Notice of Preparation of a Draft Environmental Impact Report and Public Scoping Meeting
Project Title:	The Ford Theatres Project
Project Proponent:	The Ford Theatre Foundation
Project Address:	2580 Cahuenga Boulevard East, Los Angeles, California 90068
Date of Notice:	February 7, 2014

The County of Los Angeles (County) will be the Lead Agency and will require the preparation of an Environmental Impact Report (EIR) for the Ford Theatres Project (Project) proposed by the Ford Theatre Foundation. The County requests agencies' timely comments as to the scope and content of the EIR related to the agencies' responsibilities. For all interested agencies, organizations and persons, this scoping notice allows you an early opportunity to consult on the Project before preparation of the Draft EIR. Following preparation of the Draft EIR, there will be a later separate notice of the future opportunity to comment on the analyses of the Project in the Draft EIR.

The Project description, the potential environmental effects anticipated to be studied in the EIR, and the environmental factors not potentially affected that would not be addressed in the EIR are set forth in the Initial Study and summarized here. Also included below are the date, time, and location of the Scoping Meeting that will be held in order to solicit input regarding the content of the Draft EIR. The Scoping Meeting will be in an open house format. No decisions about the Project will be made at the scoping meeting. A copy of the Initial Study prepared for the Project is not attached due to its length, but is available for public review online at http://parks.lacounty.gov/wps/portal/dpr/Newsroom/EnvironmentalDocuments/, or at http://fordtheatres.org/en/about/fordtheatresproject, and in hard copy at Los Angeles County, Department of Parks and Recreation, Planning Division, 510 South Vermont Avenue, Room 201, Los Angeles, CA 90020. Business hours are Monday–Thursday, 7:00 A.M.–5:30 P.M.

PROJECT BACKGROUND AND SUMMARY DESCRIPTION: The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Ford Theatres are owned by the County of Los Angeles and operated through a three-way partnership between the County of Los Angeles Department of Parks and Recreation, the County of Los Angeles Arts Commission, and the Ford Theatre Foundation. The Project Site is developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former

10,500-square-foot motel building currently used as staff offices. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places.

Implementation of the proposed improvements would result in approximately 47,550 net square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site, for a total of 96,300 square feet. With the addition of a 299-seat theatre and a 99-seat Flex Space, the number of annual events provided at the Project Site is also estimated to increase.

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Each of the proposed Project components is summarized here and set out in the Initial Study:

- Amphitheatre Rehabilitation and Improvements—Improvements to the Amphitheatre would include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, improved theatrical systems, infrastructure improvements and related upgrades, a sound wall along the rear of the Amphitheatre to shield the Amphitheatre from traffic noise, and a retractable shade structure for the Amphitheatre.
- The Ford Terrace—The Ford Terrace would include a two-story structure with one level of office space and a lower-level concessions area and a raised plaza deck above a service level along with removal of the existing concessions building and the re-purposing of the 87-seat [Inside] the Ford space as a self-serve food marketplace area and for storage.
- The Ford Plaza—The Ford Plaza, set atop a three-level parking structure, would feature a restaurant, a 299-seat theatre, a box office, a conference room, offices, visitor amenities and conversion of the existing box office to a museum/gallery for the Ford Theatres.
- The Transit Center—The Transit Center would include a designated area for bus and valet drop-off, a three-level parking structure, a 99-seat rehearsal and event space and removal of the former motel building.
- Hiking Trail—An approximate 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively, would be constructed.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED: Aesthetics, Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gas Emissions, Hydrology and Water Quality, Land Use and Planning, Noise, Public Services (fire and police protection), Transportation/Traffic, Utilities and Service Systems (water, electricity, and natural gas), and Mandatory Findings of Significance. These potential impacts will be addressed in the Draft EIR.

ENVIRONMENTAL FACTORS NOT POTENTIALLY AFFECTED: Based on the Initial Study, the following factors do not need to be addressed in the Draft EIR: Agriculture and Forest Resources, Hazards and Hazardous Materials, Mineral Resources, Population and Housing, Public Services (schools, parks, library services), Recreation, and Utilities and Service Systems (wastewater and solid waste).

PUBLIC SCOPING MEETING DATE AND LOCATION: A Scoping Meeting will be held on February 18, 2014, from 7:00 P.M. to 9:00 P.M. at the [Inside] the Ford Theatre within the Ford Theatres. The purpose of the Scoping Meeting is to solicit agency and other early comments regarding issues to be addressed in the Draft EIR. The Scoping Meeting will provide information regarding the Project and the anticipated scope of analyses to be contained in the Draft EIR. Written comments may be submitted at the Scoping Meeting or at any time before the end of scoping on March 11, 2014. Attendance at the Scoping Meeting is not required, and written comments on the scope of the Draft EIR by US mail or email are welcome at the County of Los Angeles, Department of Parks and Recreation address provided below.

Date:	**February 18, 2014**
Time:	**7:00 P.M.–9:00 P.M.**
Location:	**[Inside] the Ford Theatre** **2580 Cahuenga Boulevard East** **Los Angeles, CA 90068**
	Parking to be provided near the Box Office

Written comments must be submitted to the County of Los Angeles by **March 11, 2014**, to be timely scoping comments for consideration in the preparation of the Draft EIR.

Please direct your comments by e-mail or U.S. mail to:

hello mr Rupert
I am a resident of cahuenga terrace in the Hollywood dell.
I am very concerned about the ford theater .
we are already suffering severe traffic and parking problems the way it is.
I am afraid that with the addition to the ford things are going to get worst.
I am also very concerned about the trail. please make sure it is highly monitored. it is already a fire hazard due to homeless people camping there.
please listen to the neighbors concern and consider us since we live here.
thank you
regards

We have no objection to the proposed Ford Theater on-site improvements per se. It is well known that the current Transportation/Traffic situations during Hollywood Bowl and Ford Theater events have already had a highly negative impact on the ability to actually receive quality timely public emergency services such as fire (LAFD), police (LAPD) and paramedic in the local area. The Hollywood Bowl has been extending their season each year and it would not surprise us if they continue this trend and try to provide more concerts each week on a year round year basis. It does not take an "Environmental Impact Report" to understand the current traffic situation . . . It is a disaster.

The current traffic levels on the remaining area streets and freeway during Hollywood Bowl and Ford Theater events make it impossible for thousands of residents to receive emergency services for several hours during the Hollywood Bowl and Ford Theater peak traffic times. Thousands of residents are literally trapped in their homes during the Hollywood Bowl and Ford Theater peak traffic times.

Procedures to limit Hollywood Bowl and Ford Theater event related parking and traffic have been successfully implemented by the Hollywood Bowl entrance on Highland Avenue and on some of the local side streets. No meaningful attempt has been made by any City, County or State agency to limit (meter) the traffic coming off the freeway, or to limit the northbound traffic on Cahuenga or Highland leading to the Hollywood Bowl and Ford Theater events area. We do not feel that the local community can approve of any additional development of the Ford Theater, or Hollywood Bowl, without a comprehensive study and objective traffic control plan being developed by the City and State to eliminate the current and future Hollywood Bowl and Ford Theater event gridlock.

We thank you for your time . . .

County of Los Angeles

Scoping Meeting for the Environmental Impact Report Regarding the Ford Theatres Project
February 18, 2014

Written Comment Form

The purpose of the Scoping Meeting is to solicit agency and other early comments regarding issues to be addressed in the Draft Environmental Impact Report (EIR) for the Ford Theatres Project (the Project). The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Project Site is developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former 10,500-square-foot motel building currently used as staff offices. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register).

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

Comments can be submitted at the scoping meeting or sent via mail or email to the addresses below. The deadline for submitting written comments to the County is close of business day on March 11, 2014. In the space below (and on additional pages, if necessary, or in a format of your choosing), please provide any written comments you may have concerning the scope of the Draft EIR for the Project. Your comments will then be considered during preparation of the Draft EIR.

Please leave this form in the box provided or deliver via e-mail, U.S. mail or fax. Please address to Joan Rupert, County of Los Angeles, Department of Parks and Recreation, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020. Email address is jrupert@parks.lacounty.gov and fax is (213) 639-3959. If sent via U.S. mail, please add postage.

Re: **The Ford Theatres Project**
Notice of Preparation of a Draft EIR
SCH #2014021013, IGR No. 140213EA
Vic. LA/101/ PM 7.588

Dear Ms. Rupert:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the proposed Ford Theatres project. Based on the Notice of Preparation of an Environmental Impact Report (EIR), the proposed project includes rehabilitation and improvements to the existing amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and hiking trail. The Ford Plaza would include a restaurant and a 299-seat theatre, a box office, a conference room, offices, and conversion of existing box office to a museum.

As the State agency with jurisdiction over State highway transportation facilities, Caltrans is concerned with the expected increase in traffic volumes in the surrounding area, as it might exacerbate congestion on the US-101 freeway. Please evaluate potential transportation impacts to US-101 associated with this project and from future growth in the surrounding area in a Traffic Impact Analysis (TIA). Please refer traffic engineers to follow the *Caltrans Guide for the Preparation of Traffic Impacts Studies*, it is accessible online at: http://www.dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa_files/tisguide.pdf

The TIA should include evaluation of potential traffic impacts to the northbound US-101 off-ramps to Highland Avenue/Hollywood Bowl and at Cahuenga Boulevard/Hollywood Bowl. Southbound US-101 off-ramp to Highland Avenue should also be analyzed. Please include mitigation improvements if the ramp storage capacity is projected to be exceeded.

In this case, most major events at the new Ford Theatres will likely occur during weekends, but some may occur during weekdays. Consequently, both scenarios should be included in the TIA. Schedule of special events at the new Ford Theatres should be coordinated with those of at the Hollywood Bowl. Major events should not be scheduled simultaneously; otherwise, the combined scenario should also be studied and planned for. A special event traffic management plan is highly recommended to coordinate transit, vanpooling, carpooling, and other transportation options.

Listed below are elements of what Caltrans generally expects in a traffic impact study:

- Presentations of assumptions and methods used to develop trip generation, trip distribution, trip assignments, and choice of travel mode. Travel modeling should be consistent with other regional and local modeling forecasts and with travel data.

- Inclusion of all appropriate traffic volumes. Analysis should include a) traffic from the project under consideration, b) cumulative traffic from all specific approved developments in the area, c) cumulative traffic from likely not-yet-approved developments in the area, and d) traffic growth other than from the project and developments. Scenarios involving different assumptions on development and growth should be considered.

- Analysis of AM, and PM peak-hour volumes for both existing and future conditions in the affected area. Future conditions would include foreseeable development within the Hollywood Community Plan.

- Discussion of mitigation measures appropriate to alleviate anticipated traffic impacts, including a description of transportation infrastructure improvements, financial costs, funding sources and financing, sequence and scheduling considerations, implementation responsibilities, controls and monitoring.

- A plan of realistic mitigation measures under the control of the lead agency or project sponsors or specification percent shares of the costs for various mitigation actions undertaken by other agencies. Any traffic mitigation fees may be assessed proportionally with the additional traffic generated by the project. (See Caltrans' Traffic Impact Study Guide for a suggested formula).

Although the lead agency is required to comply with Los Angeles County Congestion Management Program (CMP) standards and thresholds of significance, Caltrans does not consider the Los Angeles County's CMP criteria alone to be adequate for the analysis of transportation impacts pursuant to a CEQA review. The CMP does not adequately address cumulative transportation impacts and does not analyze for safety, weaving problems, or delay. Caltrans' Guide directs preparers of traffic impact analysis to consult with the local District as early as possible to determine the appropriate requirements and criteria of significance to be used in the traffic impact analysis.

Generally, when traffic is added to already deficient highway conditions (LOS "F"), it is considered a cumulatively significant impact, as it may contribute to the extension of the congestion period and deterioration of safety.

In the spirit of mutual cooperation Caltrans staff is available to work with the project's traffic engineers to identify the parameters and the scope of work for the traffic study, as well as to determine the necessary mitigation on State Highway facilities.

If you have any questions or concerns regarding these comments and wish to schedule a meeting, please feel free to contact me at (213) 897 – 9140 or project coordinator Elmer Alvarez at (213) 897-6696 or electronically at elmer.alvarez@dot.ca.gov.

Sincerely,

DIANNA WATSON

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Ford Theaters Project in Los Angeles County (SCH # 2014021013)

Dear Ms. Rupert:

The Department of Fish and Wildlife (Department) has reviewed the above-referenced Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Ford Theaters project relative to impacts to biological resources. The NOP was submitted by Los Angeles County acting as the Lead Agency under CEQA (Guidelines § 15367). The project is located at 2580 Cahuenga Boulevard East, Los Angeles County. The approximately 32-acre project site is located within the Hollywood Hills, north-east of the Highway 101, near the Hollywood reservoir on the south-flank of the eastern Santa Monica Mountains.

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, Ford Plaza, Transit Center, and a hiking trail, within the current boundaries of the Ford Theatres site including:

- Amphitheatre Rehabilitation and Improvements—Improvements to the Amphitheatre would include; hillside stabilization, stage reconstruction, disabled access and code compliance improvements, improved theatrical systems, infrastructure improvements and upgrades, a sound wall along the rear of the Amphitheatre to shield the Amphitheatre from traffic noise, and a retractable shade structure for the Amphitheatre.

- The Ford Terrace—The Ford Terrace would include a two-story structure with one level of office space and a lower-level concessions area and a raised plaza deck above a service level along with removal of the existing concessions building and the re-purposing of the 87-seat [Inside] the Ford as a self-serve food marketplace area and for storage.

- The Ford Plaza—The Ford Plaza, set atop a three-level parking structure, would feature a restaurant, a 299-seat theatre, a box office, a conference room, offices, visitor amenities and conversion of the existing box office to a museum/gallery for the Ford Theatres.

- The Transit Center—The Transit Center would include a designated area for bus and valet drop-off, a three-level parking structure, and a 99-seat rehearsal and event space, as well as the removal of the former motel building.

- Hiking Trail—An approximate 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively, would be constructed.

The Project Site is located within a canyon surrounded by native vegetation. The majority of the site and surrounding area is undeveloped vacant land consisting of native habitats including but not limited to; shrubs, oak woodlands, and rock outcroppings.

The following statements and comments have been prepared pursuant to the California Environmental Quality Act (CEQA) under the Department's authority as Trustee Agency with jurisdiction over natural resources affected by the project (CEQA Guidelines § 15386) and pursuant to our authority as a Responsible Agency under CEQA Guidelines section 15381 over those aspects of the proposed project that come under the purview of the California Endangered Species Act (CESA), (Fish and Game Code § 2050 *et seq.*) and/or Fish and Game Code section 1600 *et seq.*

To enable the Department to adequately review and comment on the proposed project, from the standpoint of the protection of plants, fish and wildlife, we recommend the following information be included in the DEIR:

1. Proposed Alternatives. The DEIR should describe specific alternatives. To ensure that alternatives to the proposed project are fully considered and evaluated, the alternatives should avoid or otherwise minimize impacts to sensitive biological resources, including Endangered, Threatened, and Rare species as well as wildlife dispersal and reduction of fire related impacts. Specific alternative locations should be evaluated in areas with lower resource sensitivity where appropriate, and in areas that are not contiguous to natural open space. To allow the Department to evaluate the full range of alternatives we recommend the lead agency include an analysis of each Alternative in the DEIR. Furthermore, the analysis should include how each Alternative affects the significance of impacts to sensitive regional plant and animal resources.

2. Increased Barriers to Wildlife Dispersal. Creating a potential barrier to wildlife movement in the Project area will increase even further the fragmentation of high quality habitat in the Project area and further decrease the available movement corridors left available for wildlife in the Project area. The DEIR should fully evaluate the cumulative impacts of increased disturbance within this high quality habitat area immediately adjacent to the Project site (i.e., Santa Monica Mountains National Recreation Area (SMMNRA) and the Hollywood Reservoir). The DEIR should more fully evaluate how this increased barrier may impact wildlife resources.

3. Fuel Modification Zones and Fire Risk. Introducing structures into a natural area creates a new potential source of fire. An increased area of disturbance is required for compliance with fuel modification and fire zone protection, which in turn provides additional areas for invasive species to become established, and thus increases dry fuel in the area. The edge effect should be evaluated. To fully disclose the impacts to biological resources, the Department recommends the CEQA document's impact assessment includes any proposals for vegetation clearing as part of a Fuel Modification Zones and include any such impacts in the impact analysis.

4. If fuel modification will occur in drainages subject to the jurisdiction of the Department, a Streambed Alteration Agreement (SAA) pursuant to Fish and Game Code section 1602 may be required.

5. Wildlife Movement Corridor Studies. The DEIR should incorporate a thorough wildlife movement study within the project area and how the proposed development could affect this. Mule deer (*Odocoileus hemionus*), mountain lions (*Puma Concolor*), black bear (*Ursus Americanus*) and a myriad other small carnivores have the potential to utilize this area.

6. Human Influences on Previously Undisturbed Areas. The DEIR should identify if the area has been designated as an Ecological Sensitive Area or otherwise protected from general access to the public. The Project proposes the development of new trails that will join existing trails. The DEIR should evaluate impacts associated with any new trails, as well as the impact associated with increased traffic on natural resources in the area.

7. Biological Resources within the Project's Area. The DEIR should include the following information to provide a complete assessment of the flora and fauna within and adjacent to the project area, with particular emphasis upon identifying endangered, threatened, sensitive, and locally unique species and sensitive habitats.

   a. Regional Emphasis. Per CEQA Guidelines, Section 15125(c), information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis should be placed on resources that are rare or unique to the region.

   b. Rare Natural Communities. A thorough assessment of rare plants and rare natural communities, following Department's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (see: http://www.dfg.ca.gov/habcon/plant/). Please follow the nomenclature used in the Manual of California Vegetation, Second Edition, as Department protocol states this is the appropriate way to categorize and analyze impacts to rare plant communities. The ranking of Associations and Alliances is available in the above referenced manual or you may contact the Department for more information.

   c. Plant Surveys. A thorough, recent floristic-based assessment of special status plants and natural communities, following the Department's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (see http://www.dfg.ca.gov/habcon/plant/). Survey protocol asks that California Natural Diversity Data Base (CNDDB) Field Survey Forms be completed and submitted to the CNDDB to document survey results.

   d. Plant Surveys. When completing plant surveys, the entire site should be walked, and every species noted per Department protocol. Many sensitive species, including dudleya's (*Dudleya* spp.), Plummer's mariposa-lily (*Calochortus plummerae*), Palmer's grapplinghook (*Harpagonella palmeri*), among many other rare plants are very small (1 inch to 6 inches) and would be missed using transect

methodology. Please ensure all biological consultants follow the Department protocol when assessing the site for botanical resources. The Department typically does not consider biological assessments over one year old and botanical assessment over two years old as valid for the purposes of impact analysis and for the development of avoidance and mitigation measures under CEQA.

e. Sensitive Plant Species. The Department's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities*, footnote 24, states that floristic, alliance- and/or association-based mapping and vegetation impact assessments be conducted at the Project site and neighboring vicinity. The vegetation classification for the SMMNRA and environs overlaps with the project area and should be used to assist in identifying the vegetation setting and habitat conditions within the Project vicinity, as appropriate (Keeler-Wolf and Evens, 2006), found at (http://www.dfg.ca.gov/biogeodata/vegcamp/pdfs/VegMappingRpt_Santa_Monica_Mountains.pdf). The Manual of California Vegetation, second edition, should also be used to inform this mapping and assessment (Sawyer et al. 2008). Adjoining habitat areas should be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions and is necessary to develop habitat restoration goals and targets for areas subject to disturbance and remediation impacts.

f. Special Status Botanical Species. Occupied habitat for special status botanical species should be avoided and preserved in perpetuity from further development. If avoidance is not feasible, off site occupied habitat should be acquired within the area immediately adjacent to the Project site. All mitigation lands preserved on site or acquired off site should be deeded to a local land conservancy and protected in perpetuity under a conservation easement to prohibit incompatible uses on the site. Furthermore, the environmental document should be analyzing the cumulative effect of habitat loss for rare plant species, and any other rare resource as defined by CEQA, to ensure the cumulative loss is mitigated below a level of significance.

g. Biological Inventory. A current inventory of the biological resources associated with each habitat type on site and within the area of potential effect. The Department's California Natural Diversity Data Base in Sacramento should be contacted at (916) 322-2493 or www.dfg.ca.gov/biogeodata/ to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the Fish and Game Code. CNDDB should be used to generate a potential species list as a starting point, a 9 quadrangle search is recommended as to encompass a wider range of potential species that may be present in the Project area. A lack of data for a species in the immediate geographic area of the Project does not mean it does not have the potential to occur on the Project site.

h. Survey Methodologies for Sensitive Wildlife. An inventory of rare, threatened, and endangered; and other sensitive species on site and within the area of potential effect, should be included in the DEIR. Species to be addressed should include all those which meet the CEQA definition (see CEQA Guidelines, § 15380). This should include sensitive fish, wildlife, reptile, and amphibian species. Seasonal

variations in use of the project area should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with Department and the Service. Please see the following for survey methodologies recommended by the Department http://www.dfg.ca.gov/wildlife/nongame/survey_monitor.html

8. CESA-Listed Species Impacts. The DEIR should describe what methods will be employed to minimize adverse effects to CESA-listed species. In addition, any federally listed species included in any biological opinions (BOs) issued from the US Fish and Wildlife Service (Service) pursuant to the Federal Endangered Species Act, should be included in the DEIR.

9. The Department recommends the following items also be addressed In order for the project to be fully evaluated for potential impacts to CESA-listed species:

   a. California Endangered Species Act (CESA). The Department considers adverse impacts to a species protected by the CESA, for the purposes of CEQA, to be significant without mitigation. As to CESA, take of any endangered, threatened, or candidate species that results from the project is prohibited, except as authorized by State law (Fish and Game Code, §§ 2080, 2085.) Consequently, if the Project, Project construction, or any Project-related activity during the life of the Project results in take of a species designated as endangered or threatened, or a candidate for listing under CESA, the Department recommends that the project proponent seek appropriate take authorization under CESA prior to implementing the project. Appropriate authorization from the Department may include an incidental take permit or a consistency determination in certain circumstances, among other options (Fish and Game Code §§ 2080.1, 2081, subds. (b),(c)). Early consultation is encouraged, as significant modification to a project and mitigation measures may be required in order to obtain a CESA Permit. Revisions to the Fish and Game Code, effective January 1998, may require that the Department issue a separate CEQA document for the issuance of a 2081 permit unless the project CEQA document addresses all project impacts to CESA-listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of an incidental take permit. For these reasons, biological mitigation monitoring and reporting proposals should be of sufficient detail, resolution and enforceability to satisfy the requirements for a CESA Permit. The DEIR should fully address potential impacts to CESA-species.

10. Department Species of Special Concern. The DEIR should describe several Best Management Practices (BMPs) to minimize adverse effects to species that are described as Species of Special Concern (SSC). A complete list of these species may be found at http://www.dfg.ca.gov/wildlife/nongame/ssc/. To fully evaluate impacts to sensitive desert species the Department recommends the following species also be specifically addressed in the DEIR:

a. Burrowing Owls (*Athene cunicularia*). The Department recommends the Lead Agency utilize the three-tiered approach detailed in the Department's Staff Report on Burrowing Owl Mitigation (March 7, 2012 [Burrowing Owl Staff Report]) to analyze the potential for impacts to the species. The three components to evaluating species impacts are: 1) habitat assessment, 2) surveys, and 3) impact assessments. Using this methodology would result in a more robust analysis could be made to accurately identify potential impacts to the species during the CEQA process instead of deferring the analysis to consultation with the Department after and outside the CEQA process.

b. In addition, the Department recommends that a qualified biologist conduct a focused survey no more than 30 days before the onset of any ground-disturbing activities. Another survey should be conducted no sooner than 7 days prior to the start of vegetation clearing activities. If Burrowing Owls occupy the site during the non-breeding season (February1st through August 31st), a passive relocation effort may be instituted. Otherwise, the Department recommends that projects avoid occupied burrows with a minimum buffer zone consistent with the Burrowing Owl Staff Report until a Department-approved biologist verifies through non-invasive methods that either 1) the birds are not nesting; or 2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival. Failure to implement buffer zones could cause adult burrowing owls to abandon the nest, cause eggs or young to be directly impacted (crushed), and/or result in reproductive failure. The Department is available to the County for consultation to review the results of any surveys, regardless of their results, prior to ground disturbance.

11. Other Raptor Species. Raptors are protected under Section 3503.5 of the Fish and Game Code. The Department recommends completing surveys for raptor species to better inform the Project's potential impacts to the species prior to the circulation of the CEQA document. The results of the surveys may influence the mitigation measures ultimately adopted within the final CEQA document. The Department is available for consultation on raptor survey protocols and timing of the surveys to allow adequate time to adopt species specific mitigation measures as appropriate.

12. Impacts to Bats. Project work near, around, or in the Project footprint in its entirety should be fully evaluated for disturbances to bats. Also, bats commonly are found associated with snags and broken tress.

    a. Status of Bats in California. Bats are considered non-game mammals and are afforded protection by state law from take and/or harassment, (Fish and Game Code Section 4150, California Code of Regulations, Section 251.1). Several bat species are also considered SSC and meet the CEQA definition of rare, threatened or endangered species (CEQA Guidelines 15065). Again, take of SSC could require a mandatory finding of significance by the Lead Agency, (CEQA Guidelines 15065).

    b. Townsend's Big-eared Bat. On June 26, 2013 the Fish and Game Commission found that the listing of the Townsend's big-eared bat (*Corynorhinus townsendii*) as an endangered species in the State of California is warranted. Until the listing of Townsend's big-eared bat as an endangered species is published in Title 14 of the

California Code of Regulations, it is designated a candidate species. In the interim, Townsend's big-eared bat receive protection under the Fish and Game Code, and all provisions related to threatened and endangered species apply (Fish and Game Code §2085).

c. Bat Species of Concern. The DEIR should discuss impacts to western mastiff bat (*Eumops perotis californicus*), western red bat (*Lasiurus blossevillii*), California leaf-nosed bat (*Macrotus californicus*), hoary bat (*Lasiurus cinereus*), Yuma myotis (*Myotis yumanensis*), western small footed myotis (*Myotis ciliolabrum*), spotted bat (*Euderma maculatum*) and pallid bat (*Antrozous pallidus*). The Department recommends additional measures to minimize impacts and to protect these biological resources. The CEQA document should fully identify and evaluate potential impacts to any of these SSC species described as potentially occurring or where appropriate habitat is described as existing on or adjacent to the Project impact area.

d. The Department recommends surveys be conducted in any suitable habitat to determine the potential for bats to occur on site. Measures should be identified to avoid the direct loss of bats that could result from removal of trees and/or structures that may provide maternity roost habitat (e.g., in cavities or under loose bark).

13. Revegetation. Plans for restoration and revegetation should be prepared by persons with expertise in southern California ecosystems and native plant revegetation techniques. Each plan should include, at a minimum: (a) the location of the mitigation site; (b) the plant species to be used based on the impacted site, density of plantings referenced to impact site density, planting methodology; (c) a schematic depicting the mitigation area; (d) planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria (quantitative); (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; (j) reference site, and (k) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity.

14. Impact to Streams and Wetlands. The DEIR should identify the sites which have the potential to support streams under the regulatory authority of the Department. The Department has regulatory authority over activities in streams and/or lakes that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of a river or stream, or use material from a streambed. For any such activities, the project applicant (or "entity") must provide written notification to the Department pursuant to Section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, The Department determines whether a Lake and Streambed Alteration Agreement (LSA) with the applicant is required prior to conducting the proposed activities. The Department's issuance of a LSA for a project that is subject to CEQA will require CEQA compliance actions by the Department as a responsible agency. The Department as a responsible agency under CEQA may consider the Lead Agency's EIR for the project. To minimize additional requirements by the Department pursuant to Section 1600 et seq. and/or under CEQA, the document should fully identify the potential impacts to the stream or riparian resources and provide adequate

avoidance, mitigation, monitoring and reporting commitments for issuance of the LSA.

a. Episodic Streams. The Department may take jurisdiction on episodic streams, including alluvial fan streams even where flow occurs as sheet flooding. The paper recently published by Fish and Wildlife, *A Review of Steam Processes and Forms in Dryland Watersheds*, discusses the alluvial process and the significance to water resources (Vyverber, Kris. California Department of Fish and Game, *Review of Stream Processes and Forms in Dryland Watersheds*. October, 2010, California Department of Fish and Game, California Wildlife Habitat Relationships website: (http://www.dfg.ca.gov/biogeodata). The Department recommends Caltrans utilize a hydrogeomorphologist conduct to conduct a jurisdictional delineation who is familiar with assessments in dryland watersheds to complete a delineation of the creeks to be included in the DEIR. The delineation should be conducted pursuant to the Service wetland definition adopted by the Department [1]. Please note that some wetland and riparian habitats subject to The Department's authority may extend beyond the jurisdictional limits of the U.S. Army Corps of Engineers.

b. In Stream Structures. The Department recommends the current project exclude the placement of check dams, new culverts, or other flow restriction devices within Waters of the State to retain the barrier-free status of these stretches of the stream and utilize open-span bridges in lieu of culvert crossings.

15. Breeding and/or Nesting Birds. If active nest or nesting behavior is observed during pre-project biological surveys a nesting bird avoidance and minimization plan shall be established by a qualified biologist and submitted to the Department for review. The plan shall be based on, but not limited to, site lines from the nest to the work site and observations of the nesting bird's reaction to project activities. Breeding habitat/nest site fenced and/or flagged in accordance with state and federal nesting bird guidelines shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the project.[2] Continuous monitoring of the nest site by a qualified biologist shall occur during disturbance activities, and a nest observation log shall be updated once per hour during construction activities. If the monitoring biologist determines nesting activities may fail as a result of work activities, all work shall cease

---

[1] Cowardin, Lewis M., et al. 1979. Classification of Wetlands and Deepwater Habitats of the United States. U.S. Department of the Interior, Fish and Wildlife Service.

[2] NOTE: Buffer area shall increase to 300 feet for passerines and 500 feet for raptors if any endangered, threatened, or Department species of special concern are identified during protocol or pre-construction presence/absence surveys or until a nesting bird avoidance and minimization plan has been submitted by the Permittee.

within the recommended avoidance area until the biologist determines the adults and young are no longer reliant on the nest site.

16. Cumulative Impacts. The DEIR should consider the cumulative impacts of other projects within the area as a result of the implementation of the proposed project. Many currently unrealized projects could be proposed for development in this mostly natural area and piggy-back on this Project's infrastructure. There is currently no estimate for how many acres of combined potential habitat for the above mentioned species, as well as a suite of other native vertebrate and invertebrate species, will be lost as a result of the development of this project given either the known use of the general area and/or the near proximity of other currently undisturbed areas, the Department would consider potential cumulative impacts to the above mentioned species significant absent suitable mitigation.

17. Analyses of the Potential Project-Related Impacts on the Biological Resources. To provide a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, with specific measures to offset such impacts, the following should be addressed in the DEIR.

    a. A discussion of impacts associated with increased lighting, noise, human activity, changes in drainage patterns, changes in water volume, velocity, and quality, soil erosion, and /or sedimentation in streams and water courses on or near the project site, with mitigation measures proposed to alleviate such impacts should be included. Discussions regarding indirect project impacts on biological resources, including resources in nearby public lands, open space, adjacent natural habitats, riparian ecosystems, and any designated and/or proposed or existing reserve lands (*e.g.*, preserve lands associated with a Natural Community Conservation Plan). Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in adjacent areas, should be fully evaluated and provided. The latter subject should address: project-related changes to drainage patterns on and downstream of the project site; the volume, velocity, and frequency of existing and post-project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-project fate of runoff from the project site. The discussions should also address the proximity of the extraction activities to the water table, whether dewatering would be necessary, and the potential resulting impacts on the habitat, if any, supported by the groundwater.

    b. The zoning of areas for development projects or other uses that are nearby or adjacent to natural areas may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the environmental document.

    c. A cumulative effects analysis should be developed as described under CEQA Guidelines, Section 15130. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

18. Mitigation for the Project-Related Biological Impacts. The DEIR should include measures to fully avoid and otherwise protect rare natural resources from project-related impacts.

The Department considers these communities as threatened habitats having both regional and local significance.

a. The DEIR should include mitigation measures for adverse project-related impacts to sensitive plants, animals, and habitats. Mitigation measures should emphasize avoidance and reduction of project impacts. For unavoidable impacts, on-site habitat restoration or enhancement should be discussed in detail. If on-site mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, off-site mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed.

b. For proposed preservation and/or restoration, the DEIR should include measures to perpetually protect the targeted habitat values from direct and indirect negative impacts. The objective should be to offset the project-induced qualitative and quantitative losses of wildlife habitat values. Issues that should be addressed include restrictions on access, proposed land dedications, monitoring and management programs, control of illegal dumping, water pollution, increased human intrusion, etc.

c. The Department does not support the use of relocation, salvage, and/or transplantation as mitigation for impacts to rare, threatened, or endangered plant species. Studies have shown that these efforts are experimental in nature and largely unsuccessful.

Thank you for this opportunity to provide comments. Please contact Ms. Kelly Schmoker, Senior Environmental Scientist (Specialist) at Kelly.Schmoker@wildlife.ca.gov or (949) 581-1015 if you should have any questions or would like to coordinate further on the proposed project.

Sincerely,

Betty J. Courtney

Dear Ms. Rupert:

THE FORD THEATRES PROJECT – NOTICE OF PREPARATION DRAFT EIR

This is in response to your February 7, 2014 letter requesting a review of your proposed project to improve the facilities of The Ford Theatres located at 2580 Cahuenga Boulevard East, Los Angeles, CA 90068. The Bureau of Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

The Bureau of Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvements projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Existing			
Seat	3/Seat	1196 Seat	(3,588)
Concession/Restaurant	300 GPD/1000 SQ.FT	320 SQ.FT	(96)

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of your proposed project includes an existing 8-inch line on Cahuenga Blvd East. The flow from the existing 8-inch line on Cahuenga Blvd feeds into a 10-inch line on Cahuenga Blvd and then feeds into a 27-inch line on Las Palmas Ave and finally to a 45-inch line on Willoughby Ave. Figure 1 shows the details of the sewer system within the vicinity of your project. The current flows level (d/D) in the 8-inch line and the 10-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
8	Cahuenga Blvd East	*	791,080 GPD
10	Cahuenga Blvd	*	1.04 MGD
27	Las Palmas Ave.	*	4.65 MGD
45	Willoughby Ave.	24	27.15 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Treatment Plant, which has sufficient capacity for the project.

If you have any questions, please call Kwasi Berko of my staff at (323) 342-1562.

STORMWATER REQUIREMENTS

The Bureau of Sanitation, Watershed Protection Division (WPD) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

The project requires implementation of stormwater mitigation measures. These requirements are based on the Standard Urban Stormwater Mitigation Plan (SUSMP) and the recently adopted Low Impact Development (LID) requirements. The projects that are subject to SUSMP/LID are required to incorporate measures to mitigate the impact of stormwater runoff. The requirements are outlined in the guidance manual titled"*Development Best Management Practices Handbook – Part B: Planning Activities*". Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lastormwater.org. It is advised that input regarding SUSMP requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the SUSMP/LID requirements.

CONSTRUCTION REQUIREMENTS

The project is required to implement stormwater control measures during its construction phase. All projects are subject to a set of minimum control measures to lessen the impact of stormwater pollution. In addition for projects that involve construction during the rainy season that is between October 1 and April 15, a Wet Weather Erosion Control Plan is required to be prepared. Also projects that disturb more than one-acre of land are subject to the California General Construction Stormwater Permit. As part of this requirement a Notice of Intent (NOI) needs to be filed with the State of California and a Storm Water Pollution Prevention Plan (SWPPP) needs to be prepared. The SWPPP must be maintained on-site during the duration of construction.

If there are questions regarding the stormwater requirements, please call Kosta Kaporis at (213) 485-0586, or WPD's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact Daniel Hackney of the Special Project Division at (213)485-3684.

Sincerely,

Ali Poosti, Division Manager

Subject: Please don't build more theaters and restaurant on Cahuenga - FORD THEATER EXPANSION

hi there --

I would like to publicly record my dissent on allowing the Ford Theater Expansion to go through.

For those of us who live and work on the other side of the Cahuenga Pass, the traffic created by this type of expansion, paired with the Hollywood Bowl across the strew, will create a a literal roadblock to get to and from our homes and businesses. The Ford Theater side of the Pass is the only outlet for overflow traffic and the only other in and out road over the Cahuenga Pass and it is not fair to punish the thousands of people who drive that route everyday in order to be able to get past the Hollywood Bowl traffic.

As well the environmental impact would be horrendous -- that area is one of the only left in LA that affords a rich wildlife population that goes down to the Hollywood Resevoir.

I and our neighbors here in the Lake Hollywood community say NO on the Ford Theater Expansion!

Sincerely,

Meghan Cleary

Dear Ms. Rupert:

REVIEW COMMENTS
INITIAL STUDY AND NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE FORD THEATRES PROJECT

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to review and comment on the Initial Study (IS) and Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR), dated February 7, 2014, for the Ford Theatres Project (Project). The proposed Project will rehabilitate and enhance the John Anson Ford Theatres complex by demolishing certain existing buildings and structures, and constructing various new facilities on the 32-acre site.

The IS and NOP for the proposed Project were reviewed by the Department's Parks Bureau – South Zone (PB South). PB South's comments are attached hereto (see correspondence, dated March 4, 2014, from Acting Captain Erik D. Ruble).

In summary, PB South concurs with findings contained in the IS with regard to potential impacts (Project-direct and cumulative) to law enforcement services provided by the Department. PB South also recommends the integration of various features to enhance safety and crime prevention at the proposed Project site.

PB South and the Department have no further comment to submit at this time, but we reserve the right to do so when subsequent environmental documents for the proposed Project are prepared and released for public review.

Should you have any questions regarding this matter, please contact Lester Miyoshi, of my staff, at (626) 300-3012, and refer to Facilities Planning Bureau Project No. E14-008. You may also contact Mr. Miyoshi, via e-mail, at Lhmiyosh@lasd.org.

Sincerely,

JOHN L. SCOTT, SHERIFF

FACILIITES PLANNING BUREAU

SUBJECT: **REVIEW COMMENTS ON THE INITIAL STUDY AND NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE FORD THEATRES PROJECT**

Parks Bureau – South Zone (PB South) reviewed the Initial Study (IS) and Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR), dated February 7, 2014, for the Ford Theatres Project (Project). The proposed Project is located at 2580 Cahuenga Boulevard East, in the City of Los Angeles. The proposed Project will demolish certain existing on-site structures, rehabilitate and enhance the existing Ford Amphitheatre, and construct 96,300 net new square feet of associated facilities (theatres, offices, restaurant, plaza/marketplace, transit center, parking structure, and various other amenities) within the 32-acre site.

According to the IS, West Hollywood Station is the nearest LASD facility to the proposed Project site (see Section 14, Public Services, page 35). While this may be factual, Parks Bureau is the primary law enforcement service provider to the Ford Theatres.

Also, according to the IS, the proposed Project is expected to have a potentially significant impact on law enforcement service providers (see Section 14, Public Services, pages 34-35). PB South generally concurs with this assessment, because, upon completion of the proposed Project, the number of annual events held at the Project site is expected to increase from 184 to 311, and annual attendance at the Project site is expected to increase from 54,640 to 93,725 (See Section 8, Project Background and Description, pages 2-3). Local daily population will be further impacted because the proposed Project is expected to generate 85 new permanent employment opportunities at the Ford Theatres. These data represent a significant increase above current conditions, and it is reasonable to expect this growth will be accompanied by a commensurate increase in the demand for services provided by PB South. According to the IS, the DEIR will provide further analysis of this issue. With ample notice, PB South personnel can be available to discuss this matter with the Project proponent.

The IS also states other current and reasonably foreseeable projects are located within the vicinity of proposed Project, and the development of such projects, in conjunction with the proposed Project, may contribute to potential cumulative impacts to various resources and service providers, including law enforcement (see Section 18, Mandatory Findings of Significance, pages 47-48). PB South also concurs with assessment, because meeting the future needs of our service area will assuredly require the dedication of additional resources, such as, patrol deputies, other sworn deputies, support personnel, and attendant equipment (patrol vehicles, other support vehicles, communications equipment, weaponry, office furniture, computer hardware, etc.). Also, PB South's facilities are aged, undersized, and are currently operating above capacity. In order to accommodate additional staff and assets, the Station will require substantial modernization and/or expansion. Again, the DEIR will provide further analysis of this issue, and with ample notice, PB South personnel can be available to discuss this matter with the Project proponent.

Lastly, PB South prescribes to the concept of Crime Prevention Through Environmental Design (CPTED). It is our experience that, when effectively implemented, CPTED strategies can utilize the built environment to deter criminal activities and reduce the fear of crime for law-abiding citizenry. To this end, PB South provides the following input for consideration by the Project proponent during the design phase of the proposed Project:

- The proposed Project should include perimeter fencing to discourage non-patrons from entering the facility during events at the facility, thereby reducing the potential for crimes of opportunity. Perimeter fencing will also signify to patrons that they should not wander into the hills above the facility during events, and will discourage trespassing by transients during non-event hours.
- The proposed Project should be equipped with high definition surveillance cameras throughout. If cost prohibitive, such cameras should be limited to strategic locations along pedestrian pathways, gathering areas, and at driveways on Cahuenga Boulevard. The camera system should allow law enforcement agencies to view live feed remotely, should be equipped with a hard drive capable of storing video for 15 days (minimum), and should be capable of transferring video to disc or USB storage devices.
- Proposed public restrooms should be configured such that entrances are oriented towards the main event area or other high-visibility areas. The restrooms should be secured during non-event hours to prevent vandalism, theft, and use by transients who may reside in the hills above the facility.
- The proposed parking structure should be well-lit and equipped with high definition surveillance cameras. Points of entry and egress should be

equipped with traffic control devices, and a parking lot attendant should be employed during events at the facility.

- The hiking trail should be signed to advise users that it is closed at night, and that camping and smoking are strictly prohibited. The trail itself should be well-marked to prevent users from getting lost, and the brush next to the trail should be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas should not be built along the trail, because transients tend to establish campsites at such facilities. If necessary, such facilities should be provided at trail heads only, because the provision of adequate security at those locations is more feasible.
- The construction site should be protected by security personnel; surveillance cameras, adequate lighting, and perimeter fencing should be installed; large mounds of dirt/debris/building materials and fence covers/screens should be avoided because they block sightlines into and through the site by security personnel and PB South patrol deputies; to the extent possible, equipment and building materials should be removed or secured during non-construction hours.

PB South has no further comment to submit at this time, but we reserve the right to do when subsequent environmental documents for the proposed Project are prepared and made available for public review and comment.

Thank you for including the Station in the environmental review process for the proposed Project. Should you have any questions of the Station regarding this matter, please contact me or Lt. Kevin C. Hannigan at (310) 965-8659.

Subject: Cahuenga terrace parking

dear mr rupert..
Mi name is Omar Gongora, I live in cahuenga terrace and there is a big parking problem . day and night .
people from other areas just leave their cars parked in front of my house for days and weeks..
it will be very helpful if you can please approve restrictive parking in cahuenga terrace..
thank you
omar gongora

Attention: feedback / recommendations for the Ford Theatre Project EIR study.

I am located on Hillpark Drive at Highlands Owners Association. This is a 192 unit condominium complex located across the Hollywood freeway from the Ford Theatre and up from the Pilgrimage Bridge of Cahuenga West and Hillpark drive.

I am writing in response to the proposed study for the Ford Theatre project. I am sure there are concerns regarding noise and possibly exposed cuts in the hillside. These will be addressed in the EIR. This document lists areas of concerns as it relates to traffic, haul routes, emergency vehicles and services, and noise. And this letter is more focused about the increased traffic during construction and then after construction regarding the ongoing events. On the surface, the increase in traffic volume seems minimal. If each event is attended at full capacity the increase would amount to about 300 additional people. The real issue is the significant increase in traffic due to the increase in events, 184 events today growing to approximately 331 events annually. If this is one event per day, essentially, the Ford Theatre would be increasing the traffic volumes from 51 % to 93% of the days of the year. Quite simply, traffic congestion in the Pass is horrid. Adding this kind of traffic volume on streets that are already clogged must be studied. Therefore, it is critical that the EIR incorporates an honest look at the traffic issues experienced today in the Cahuenga Pass. Listed below is a breakdown of various aspects of the traffic that can include that viewpoint.

1. The study area and time period needs to be representative of the heavy usage of the streets and highways. Also referred to as "rush hour" in the morning and evening. Rush hour lasts longer than the conventional times expressed at the meeting on February 18th, 2014 at the Ford Theatre. Any traffic study (and the EIR) needs to be expanded in the Cahuenga Pass which is representative of rush hour. This is based on personal experience of traveling the pass on a daily basis over the past 22 years:
    a. Hours of rush hour:
        - AM: 7:00 am through 9:30 or 10:00 am
        - PM: 4:00 pm through 7:30 or 8:00 pm
    b. This is relevant since an assumption on the bike study concluded that "rush hour" traffic occurs from 7 to 9 am in the morning and 4 to 6 pm in the evening. This was the same understanding from the consulting firm at the February 18th meeting.
    c. EIR needs to identify options and mitigations based on the findings from the traffic study.
2. Special events that affect traffic and/or increases the typical or regular traffic flow
    a. Hollywood Bowl: typical events start at 8:00 pm with the exception of the Playboy Jazz Festival during Father's Day on Saturday and Sunday which starts at 2pm.

- This is relevant since an assumption on the bike study concluded that "rush hour" traffic is mutually exclusive from Bowl Traffic. Basically, since events start at 8:00 pm "rush hour" is over by the time Bowl Traffic starts. This is a false assumption.
- Bowl traffic starts around 4:00 or 5:00 pm so attendees can have picnic dinners before the concerts start.
- Frequently, traffic backs up from the Hollywood Bowl up Cahuenga West and flows through to Barham Blvd all the way to Burbank and cars queue up on Forest Lawn. It is routine that this route might take 30-45 minutes to travel from Forest Lawn Barham intersection to Cahuenga West and Hillpark drive.
- I am sure other routes are excessively clogged during "rush hour" in and around the Hollywood Bowl during a concert.
- There is signage on the Hollywood Freeway warning travelers of the traffic congestion on the Highland "flyover" (southbound) exit.
- Bottom line: Any traffic study needs to be performed across multiple days or weeks that include days with and without Hollywood Bowl traffic and Ford Theatre events.
- And, the EIR needs to identify mitigations / options to reduce traffic congestion when there are multiple events on a single night.

b. Hollywood Boulevard street Closures (approximately 23 days in the first 6 months of the year (see below for the 2014 schedule through June). The number of days throughout the year when the Hollywood Blvd street closure is increasing due to various activities and other major events in Hollywood like Oscars and Academy Awards.
    - The street closures have a comparable effect on traffic as the Hollywood Bowl events. Not as bad but similar (see traffic impacts under Hollywood Bowl).
    - These events may be a single night or like the Oscars and Academy Awards stretch across multiple days and as long as a week.
    - Bottom line: Any traffic study needs to be performed across multiple days or weeks that include days with and without street closures on Hollywood Blvd and with and without Ford Theatre events.
    - And, the EIR needs to identify mitigations / options to reduce traffic congestion when there are multiple events on a single night.
c. Ford Theatre event: Although the theatre is open all day it appears that the major traffic is occurring for their events starting at 8:00 pm
    - Although the Ford Theatre Shuttles many of their attendees with buses, this still causes backups on the Pilgrimage Bridge. This then causes congestion along Cahuenga East and West as these vehicles attempt to enter the facility.
    - Cahuenga East is already congested south of the Ford Theatre down to Sunset and / or Fountain.
    - Increasing the buses and traffic to the facility will further exasperate the traffic congestion.
    - Bottom line: Any traffic study needs to be performed across multiple days or weeks that include days with and without street closures on Hollywood Blvd, Hollywood Bowl, and Ford Theatre events. Meaning, all three events are occurring on a single night.

- And, the EIR needs to identify mitigations / options to reduce traffic congestion when there are multiple events on a single night.

3. CalTrans has already rated the levels of services as a D or an F for the Cahuenga Pass corridor and various intersections.
    a. This means that the congestion is so bad the amount of time it takes to travel through the intersection is extraordinarily bad. I don't know the exact time delays equated to these ratings. I can speak to the amount of delays due to the intersections I travel.
    b. Since I travel from Glendale down Forest Lawn to Barham. Make that left on Barham in to the pass and then make the left on Cahuenga West and travel along Cahuenga West to Hillpar, I can provide first hand estimates on the length of time.
        - If I arrive at the Forest Lawn and Barham intersection on an average day <u>before</u> 6pm I can travel this route in about 10-15 minutes. On a night with a Hollywood Bowl event or a Hollywood Blvd street closure it can take 20-25 minutes.
        - If I arrive at the Forest Lawn and Barham intersection on an average day after 6pm I can travel this route in about 20 -25 minutes. On a night with a Hollywood Bowl event or a Hollywood Blvd street closure it can take 45 -60 minutes.
    c. The conclusion I draw from this is that the current streets require significant modifications to handle additional traffic.
    d. Bottom line: Any traffic study needs to be performed across multiple days or weeks that include days that measures the traffic on a normal day without events and with the events listed above to better quantify the volume of traffic caused by these events. Then use this study to determine what modifications could be made to allow for more traffic and/or improve the congestion.
    e. And, the EIR needs to identify mitigations / options to reduce traffic congestion when there are multiple events on a single night.
4. Since this is a significant project it is an opportunity to trigger a larger traffic project. This could be a multi-jurisdictional project. One that involves multiple agencies and businesses in the area that wants to increase their events and, therefore, increase traffic.
    a. This would include CalTrans, the responsible agency for the Hollywood Freeway.
    b. Since Cahuenga West and East and Barham Blvd are considered State Highways identify the lead agency for these streets. This could be Cal Trans.
    c. Obviously, LA City and LA County can provide contributions to improve the streets to alleviate congestion.
    d. In the past year, there is a large push to implement bike lanes through the Cahuenga Pass. This area is critical and is considered the "backbone" to join the valley with the city. As a result, there is a vested interest in adding bike lanes. Due to the congestion we cannot afford to trade traffic lanes for bike lanes. Need to figure out a way to maintain or enhance the traffic lanes and add bike lanes. This is an opportunity to work with the Bike Czar and figure out a creative solution so we maintain traffic lanes and widen the street (and add pedestrian routes).
    e. One idea I proposed is to cantilever over the slopes above the Hollywood Freeway to widen both Cahuenga West and East. The response received was that would "cost too much money". My response to that is that it depends upon how much the projected change is wanted or needed. This could be accomplished by a multi-jurisdictional project.

Amy Cutter 6700 Hillpark Drive # 301 Los Angeles, CA 90068 C #: 818-402-4622 email: arcutter@earthlink.net

f. And, that the EIR identifies opportunities to take this multi-jurisdictional / multiple agency approach and determine options or creative mitigations to resolve the traffic congestion.

5. During the construction period, there will be 83,774 cubic yards of export. As a result, a haul route will need to be established and the project will need to deal with the added construction traffic in general and specifically related to "dump trucks" exporting dirt. This added traffic needs to consider.
    a. an alternative route than the standard conventional solution of staging the trucks on Forest Lawn Blvd in Burbank.
    b. One recommendation is a staging area somewhere south of the Ford Theatre that allows the trucks to leverage the Hollywood Freeway rather than any surface streets in the Cahuenga Pass:
        - ENTRY: allows the trucks to travel north bound on the Hollywood Freeway, exit on Cahuenga West (I believe it is called the Highland Exit) right below the Ford Theatre. Then turn left on Cahuenga East and enter the Ford Theatre.
        - UPON EXIT: turn right out of the Ford Theatre and enter directly on to the Hollywood Freeway in the north bound direction. Continue on the Hollywood Freeway to Universal Center Drive. Turn Left over the Universal Center Drive. Turn Right on Cahuenga West. Turn Right on to the Southbound on ramp to the Hollywood Freeway. (at the In and Out Burger).
        - Note: the purpose of this route is to avoid the use of Cahuenga West, East, and Barham Blvd which is already heavily congested with rush hour traffic and trucks importing or exporting dirt to other projects, and the Hollywood Bowl events, and Hollywood Blvd Closures.
        - Hours of the Haul Route: Haul route should run 10 to 3:30 pm Monday through Friday to avoid "rush hour" traffic times and conflicting with other events in the area.

6. Emergency Vehicles: to the excessive period of time of "rush hour" the Cahuenga Pass which includes Cahuenga West, Cahuenga East, Barham Blvd, and the Hollywood Freeway are severely congested. It is not uncommon for the local fire station 76 to be blocked from traveling to their destination and rendering aid. This should be studied as part of the EIR. The way the Ford Theatre project initial study document is written it indicates emergency services are not affected since they will be leveraging Mitigation Measure Hazards-1. The emphasis in the document related to this is that emergency services to and from the Ford Theatre will not be affected. The project does not take in to consideration the further reduction in service by emergency services to the neighborhood during construction and after the events start at the Ford Theatre. There is some reference that due to the fact that Mitigation Measure Hazards-1 is involved, that resolves the impacts from this project on emergency services. ON the contrary, the excessive traffic congestion does effect emergency services and will affect the level of service to the neighborhood. This project will only make the traffic worse and further degrade the services. Therefore, the EIR needs to study the impacts for emergency services to the neighborhood and identify mitigation and options.

7. Any opportunity to increase pedestrian traffic to and from the Ford Theatre should be considered. For example, today, there are no pedestrian options for people, once they travel over the Pilgrimage Bridge to cross Cahuenga East to the Ford Theatre. There is a metal barrier on one side essentially blocking or hindering pedestrian crossing over Cahuenga East. And, there is no longer a button to push to trigger the signal for a walk sign like you see in regular intersections. This should be studied and included in the plans to encourage or increase walking traffic.

Amy Cutter 6700 Hillpark Drive # 301 Los Angeles, CA 90068 C #: 818-402-4622 email: arcutter@earthlink.net

8. Finally, the ambient noise level needs to be investigated as part of the EIR. We need to understand during construction and once the events start if the decibel levels will increase significantly from what they are today. At first glance, it doesn't appear that the Highland's Owners Association will be affected by noise from the Ford Theatre. However, it does need to be studied to be sure if there are any issues. In any case, the EIR needs to identify mitigations and options for such issues.

Based on my participation on February 18th and a review of the Ford Theatre Project initial study these are my comments / recommendations to help shape the EIR. Basically, things to consider based on unique aspects of the Cahuenga Pass where the Ford Theatre resides. Basically, the Ford Theatre Project wants to increase their events which in turn will increase their traffic. Since the Ford Theatre is starting out with traffic congestion that is essentially at a level D or F it may be that they cannot add any more events without addressing traffic. I would suggest the project team looks at this as an opportunity to trigger a multi-jurisdictional or multi-agency project to make significant changes in streets and/or highways that makes improvements in capacity that in turn reduces exponentially the traffic congestion.

Sincerely,

Amy Cutter

Subject: Street Closure Notice

A Note From Your Traffic Committee about Street Closures on Hollywood Blvd.

On top of this list of upcoming street closures - - the Departent of Water and Power will be replacing a water main on Sunset Blvd around the same time Hollywood Blvd. will be have lanes closed for the Oscars. Sunset going West will have only ONE LANE.

86th Annual Academy Awards – 21 Days Prior to Show

Sunday, February 9, 2014 8:00 a.m. – Saturday, March 8, 2014 8:00 a.m.

Orchid Alley, between Orange Drive and Orchid Street, will be closed.

"Robocop" Premiere

Monday, February 10, 2014 10:00 a.m. – Tuesday, February 11, 2014 12:15 a.m.

Westbound lanes of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed.

86th Annual Academy Awards – 14 Days Prior to Show

Sunday, February 16, 2014 6:00 a.m. – Tuesday, March 4, 2014 6:00 p.m.

North curb lane of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed. Additionally, the north sidewalk will be closed, allowing 8' pedestrian access, until 10:00 p.m. on March 4. The east and west curb lanes of Orange Dr., between Hollywood Blvd. and Orchid Alley, will be closed.

Amy Cutter 6700 Hillpark Drive # 301 Los Angeles, CA 90068 C #: 818-402-4622 email: arcutter@earthlink.net

86th Annual Academy Awards – 11 Days Prior to Show

Wednesday, February 19, 2014 10:00 p.m. – Tuesday, March 4, 2014 6:00 a.m.

North curb lane of Hawthorn Ave., between Highland Ave. and Orange Dr., will be closed.

86th Annual Academy Awards – 7 Days Prior to Show

Sunday, February 23, 2014 6:00 p.m. – Tuesday, March 4, 2014 6:00 a.m.

All lanes of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed. The north and south sidewalks will be closed with 8' of pedestrian access, except for the portion of the north sidewalk directly in front of the Dolby Theatre portal, which will be completely closed (pedestrian traffic will be re-routed). Additionally, the mid-block crosswalk, the south curb lane of Hawthorn Ave, between Highland Ave. and Orange Dr., and Hawthorn Alley (behind El Capitan) will be closed.

86th Annual Academy Awards – 6 Days Prior to Show

Monday, February 24, 2014 12:15 a.m. – Tuesday, March 4, 2014 6:00 a.m.

All lanes of Hawthorn Ave., between Highland Ave. and Orange Dr., will be closed.

86th Annual Academy Awards – 1 Day Prior to Show

Saturday, March 1, 2014 6:00 a.m. – Monday, March 3, 2014 6:00 a.m.

Amy Cutter 6700 Hillpark Drive # 301 Los Angeles, CA 90068 C #: 818-402-4622 email: arcutter@earthlink.net

All lanes of Orange Dr., between Hollywood Blvd. and Orchid Alley, will be closed; Orchid Street from 60 feet south of Franklin Ave. to Orchid Alley will be closed; and the north and south sidewalk of Hawthorn Ave. between Highland Ave. and Orange Dr. will be closed. Additionally, the north sidewalk of Hollywood Blvd., between Highland Ave. and Orange Dr., will be completely closed including the MTA entrance after the last regularly scheduled train on Saturday, March 1 until the first scheduled train after 6:00 a.m. on Monday, March 3.

86th Annual Academy Awards – Day of Show

Sunday, March 2, 2014 12:15 a.m. – Monday, March 3, 2014 6:00 a.m.

Orange Drive, from Hawthorn Alley to Hollywood Blvd., will be closed. The southbound 101-freeway off-ramp at Highland Ave. will be closed. Many additional closures and restrictions will be in effect. Refer to attachment for a list of all closures, beginning on 2/9/14.

"300: Rise of an Empire" Premiere

Tuesday, March 4, 2014 10:00 a.m. – 11:45 p.m.

Westbound lanes of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed.

Amy Cutter 6700 Hillpark Drive # 301 Los Angeles, CA 90068 C #: 818-402-4622 email: arcutter@earthlink.net

"Need for Speed" Premiere

Thursday, March 6, 2014 6:30 a.m. – 11:45 p.m.

All lanes of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed.

LA Marathon

Sunday, March 9, 2014 6:00 a.m. – 12 noon

Several streets in Hollywood, including parts of Hollywood Blvd., Orange Dr., and Sunset Blvd., will be closed. Towing zones will be posted up to 72 hours in advance; please follow posted restrictions. Refer to www.lamarathon.com for more information.

"The Muppets Most Wanted" Premiere

Tuesday, March 11, 2014 6:00 a.m. – 11:45 p.m.

All lanes of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed. Additionally, the south sidewalk directly in front of El Capitan Theatre will be closed from 4:00 – 10:00 p.m., with pedestrians re-routed to the nearest crosswalks.

"Captain America – The Winter Solstice" Premiere

Thursday, March 13, 2014 6:00 a.m. – 11:45 p.m.

All lanes of Hollywood Blvd., between Highland Ave. and Orange Dr., will be closed. Additionally, the south sidewalk directly in front of El Capitan Theatre will be

closed from 4:00 – 10:00 p.m. with pedestrians being re-routed to the nearest crosswalks.

Hollywood Half Marathon

Saturday, April 5, 2014 12:15 a.m. – 10:00 p.m.

All lanes of Hollywood Blvd., between Highland Ave. and LaBrea Ave., will be closed. Additionally, Vine Street from Hollywood Blvd. to Sunset Blvd. will be closed from 1:00 a.m. until 2:00 p.m.; Hollywood Blvd. between Highland Ave. and Vine St. will be closed from 4:00 – 8:00 a.m., Hollywood Blvd. between Vine St. to Hillhurst Ave. will be closed from 4:00 – 11:00 a.m., Orange Dr. between Hawthorne Ave. and Franklin Ave. will be clsoed from 4:00 – 11:00 a.m., and Sycamore Ave. between Hollywood Blvd. and Hawthorne Ave. will be closed from 4:00 – 10:00 a.m.

Los Angeles Culture Parade & Festival

Saturday, June 21, 2014 11:00 a.m. – 1:30 p.m.

All lanes of Hollywood Blvd., between Highland Ave. and Vermont Ave., will experience rolling closures for a parade moving west from Vermont Ave. Cross traffic will be allowed at intersections at certain times between parade entries.

Room 201

Los Angeles CA 90020

Dear Ms. Rupert,

Having attended the February 18th 2014 meeting I wanted to put my concerns down in writing in addition to having voiced them at the meeting. The following are my concerns as well as those of my husband and another Hollywood Heights Board member Elliot Johnson who was also in attendance.

The Designs done by Brenda Levin were beautiful and we have no comments to make about that. Our main comments have to do with Traffic, although we have concerns over what will happen during construction to the wildlife in the area.

I was very happy that when speaking to Adam Davis, Managing Director, he assured me that the open air theatre at the Ford would not follow in the Bowl's footsteps by extending their season past the summer months. We would like that to be put in writing so that this will not change in the future.

Cahuenga east is a heavily trafficked road, which at times is a one or two lane road traveling north from Odin to Barham. There is only one lane of traffic going south from the Pilgrimage Bridge to Odin. The Bridge is the only east west access into the Ford Theatre area and it is very antiquated and frequently backed up with traffic transitioning from Cahuenga West to Cahuenga East.

During construction this intersection will become more of a nightmare than it is now. The designated times for rush hour(s) cannot be applied since traffic in our area is continuous throughout the day. The light at Cahuenga and Odin backs up traffic sometimes as far south as Santa Monica Blvd, but most often to Fountain. And this is when there is NO event at the Bowl.

I would suggest a very long and hard look at how you are planning to deal with this during the construction phase. Trucks going in and out of the property will most likely cause a problem, not just to the surrounding neighborhoods but also to the general public that uses Cahuenga as a pass thru to Burbank and the Valley. The word needs to get out before construction to inform people to avoid the area and take another route. The people who live here have no choice, but you need to give choices to others, much like what was done during the 405 construction. Lots of publicity. Signs placed far enough south and north telling people to avoid the area. And no construction during Bowl season and their pre or post Bowl events.

The surrounding neighborhoods are part of a Hollywood Bowl Advisory Committee of which I am a member. This was started many years ago by then Supervisor Edelman to deal with the effects of concerts on the neighborhood and to give residents a voice. It would be productive for the Ford to create a similar committee.

During Ford Concerts we are concerned about the use of Diesel Buses which cause pollution that finds its way into our homes as buses travel our streets and idle in the parking lots while they drop off concertgoers or wait to pick them up. We would appreciate looking into a quieter less polluting form of bus.

Sincerely,

Joyce and Stanley Dyrector

Elliot Johnson

County of Los Angeles

Scoping Meeting for the Environmental Impact Report Regarding the Ford Theatres Project
February 18, 2014

Written Comment Form

The purpose of the Scoping Meeting is to solicit agency and other early comments regarding issues to be addressed in the Draft Environmental Impact Report (EIR) for the Ford Theatres Project (the Project). The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Project Site is developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former 10,500-square-foot motel building currently used as staff offices. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register).

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

Comments can be submitted at the scoping meeting or sent via mail or email to the addresses below. The deadline for submitting written comments to the County is close of business day on March 11, 2014. In the space below (and on additional pages, if necessary, or in a format of your choosing), please provide any written comments you may have concerning the scope of the Draft EIR for the Project. Your comments will then be considered during preparation of the Draft EIR.

Please leave this form in the box provided or deliver via e-mail, U.S. mail or fax. Please address to Joan Rupert, County of Los Angeles, Department of Parks and Recreation, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020. Email address is jrupert@parks.lacounty.gov and fax is (213) 639-3959. If sent via U.S. mail, please add postage.

Los Angeles, CA 90020

RE: The Ford Theaters Project EIR Scoping Comments

Dear Ms. Rupert:

The Hollywood Hills West Neighborhood Council represents stakeholders in the vicinity of the proposed Ford Theaters Project. These include approximately 45,000 residents, businesses and employees in the area, and visitors to Hollywood. We are therefore very concerned about any proposed development that would impact traffic conditions, noise and light/glare in the Cahuenga Pass.

We request that the following issues be studied in the Draft Environmental Impact Report (DEIR).

The intensification of uses at the theaters will significantly increase **traffic** to and from the site on a daily basis due to additional employees as well as on event days, the number of which will increase substantially. We request that you quantify the impacts of these increased vehicle trips on Cahuenga Boulevard East and West, Highland Avenue, Mulholland Drive, Barham Boulevard and Outpost Drive.

We are also concerned about the **cumulative effect** of all of the entertainment venues in Hollywood that result in street closures and gridlock in the Cahuenga Pass. These include all of the events at the Hollywood Bowl, premieres at the TCL Chinese Theater and the El Capitan and now additional events at the Ford Theaters. The EIR should quantify how the increase in events from 184 to 331 will contribute to the cumulative impact of street closures and traffic clogged streets, which cause motorists to seek alternate routes through our neighborhood streets. We feel that it will be a substantial contribution to this cumulative impact

We feel that the EIR should also address the following issues:

- Potential **fire danger** in the hills with so many more visitors to the site, many of whom will be first-time visitors to the area, unaware of the fire danger. The DEIR should disclose if fireworks are anticipated at the theater and if so propose mitigation to prevent them from starting brush fires
- Impacts on the physical **infrastructure** (sewer capacity, water supply, sanitary landfills, etc.) all of which will be further stretched thin by all of the additional visitors to this area which was built out in the early 1900s

- Impacts to **public safety**, including police and fire that will find it more difficult to respond to incidents in our area due to the additional traffic congestion and the need to attend to issues related to crowds at the Ford Theaters
- **Noise** impacts on nearby residences

The EIR should also address **viable alternatives**. An alternative that modernizes the facility and improves parking, but leaves it as is in terms of seating capacity and number of events, should be evaluated. It could be the environmentally superior alternative.

We look forward to receiving a copy of the Draft EIR and to the opportunity to submit comments on the Draft. This is a very important project to Los Angeles County and one that will have a lasting impact on our neighborhood. Thank you for your attention to these issues of importance to the Hollywood Hills West Neighborhood Council.

Sincerely,

Anastasia Mann
President

RE: Ford Theatres Project

Dear Ms. Rupert:

Thank you for the opportunity to comment on the proposed Ford Theatres Project at 2580 Cahuenga Boulevard East. This letter conveys recommendations from the Los Angeles County Metropolitan Transportation Authority (LACMTA) concerning issues in relation to the proposed project that are germane to our agency's statutory responsibility and our facilities and services.

Metro bus lines operate on Cahuenga Boulevard, adjacent to the proposed project. One Metro bus stop on the corner of Cahuenga Boulevard and Pilgrimage Bridge is directly adjacent to the proposed project. The following comments relate to bus operations, the existing bus stop, and the proposed Transit Center:

1. Although the project is not expected to result in any long-term impacts on transit, the developer should be aware of the bus facilities and services that are present. The existing Metro bus stop must be maintained as part of the final project.

2. During construction, the stop must be maintained or relocated consistent with the needs of Metro Bus Operations. Metro Bus Operations Control Special Events Coordinator should be contacted at 213-922-4632 regarding construction activities that may Impact Metro bus lines. (For closures that last more than six months, Metro's Stops and Zones Department will also need to be notified at 213-922-5190). Other municipal bus may also be impacted and should be included in construction outreach efforts.

3. It is also noted that the proposed project includes a new "Transit Center" for designated bus and valet drop-off and that the Theatres currently run a shuttle from the Redline Hollywood / Highland Station to the Theatre during summer months for shows. LACMTA is supportive of the thought given to transit integration and the transportation synergies that it creates. LACMTA encourages the Ford Theatres to continue to work with our agency to coordinate shuttle operations for the best service outcomes possible

4. We encourage the design of the Transit Center to accommodate Metro 40-foot, 45-foot and 60-foot buses and include the installation of bus shelters, benches and other amenities that improve the transit rider experience. Final design of the Transit Center and surrounding sidewalk areas must be Americans with Disabilities Act (ADA) compliant and

allow passengers with disabilities a clear path of travel to the bus stop from the proposed development.

Beyond impacts to Metro facilities and operations, LACMTA must also notify the applicant of state requirements. A Transportation Impact Analysis (TIA), with roadway and transit components, is required under the State of California Congestion Management Program (CMP) statute. The CMP TIA Guidelines are published in the "2010 Congestion Management Program for Los Angeles County", Appendix D (attached). The geographic area examined in the TIA must include the following, at a minimum:

1. All CMP arterial monitoring intersections, including monitored freeway on/off-ramp intersections, where the proposed project will add 50 or more trips during either the a.m. or p.m. weekday peak hour (of adjacent street traffic).

2. If CMP arterial segments are being analyzed rather than intersections, the study area must include all segments where the proposed project will add 50 or more peak hour trips (total of both directions). Within the study area, the TIA must analyze at least one segment between monitored CMP intersections.

3. Mainline freeway-monitoring locations where the project will add 150 or more trips, in either direction, during either the a.m. or p.m. weekday peak hour.

4. Caltrans must also be consulted through the NOP process to identify other specific locations to be analyzed on the state highway system.

The CMP TIA requirement also contains two separate impact studies covering roadways and transit, as outlined in Sections D.8.1 – D.9.4. If the TIA identifies no facilities for study based on the criteria above, no further traffic analysis is required. However, projects must still consider transit impacts. For all CMP TIA requirements please see the attached guidelines.

LACMTA looks forward to reviewing the Draft EIR. If you have any questions regarding this response, please contact Marie Sullivan at 213-922-5667 or by email at SullivanMa@metro.net. Please send the Draft EIR to the following address:

LACMTA Development Review
One Gateway Plaza MS 99-23-4
Los Angeles, CA 90012-2952

Sincerely,

Nick Saponara
Development Review Manager, Countywide Planning

Attachment: CMP Appendix D: Guidelines for CMP Transportation Impact Analysis

APPENDIX

D

GUIDELINES FOR CMP TRANSPORTATION IMPACT ANALYSIS

Important Notice to User: This section provides detailed travel statistics for the Los Angeles area which will be updated on an ongoing basis. Updates will be distributed to all local jurisdictions when available. In order to ensure that impact analyses reflect the best available information, lead agencies may also contact MTA at the time of study initiation. Please contact MTA staff to request the most recent release of "Baseline Travel Data for CMP TIAs."

D.1 OBJECTIVE OF GUIDELINES

The following guidelines are intended to assist local agencies in evaluating impacts of land use decisions on the Congestion Management Program (CMP) system, through preparation of a regional transportation impact analysis (TIA). The following are the basic objectives of these guidelines:

- Promote consistency in the studies conducted by different jurisdictions, while maintaining flexibility for the variety of project types which could be affected by these guidelines.
- Establish procedures which can be implemented within existing project review processes and without ongoing review by MTA.
- Provide guidelines which can be implemented immediately, with the full intention of subsequent review and possible revision.

These guidelines are based on specific requirements of the Congestion Management Program, and travel data sources available specifically for Los Angeles County. References are listed in Section D.10 which provide additional information on possible methodologies and available resources for conducting TIAs.

D.2 GENERAL PROVISIONS

Exhibit D-7 provides the model resolution that local jurisdictions adopted containing CMP TIA procedures in 1993. TIA requirements should be fulfilled within the existing environmental review process, extending local traffic impact studies to include impacts to the regional system. In order to monitor activities affected by these requirements, Notices of Preparation (NOPs) must be submitted to MTA as a responsible agency. Formal MTA approval of individual TIAs is not required.

The following sections describe CMP TIA requirements in detail. In general, the competing objectives of consistency & flexibility have been addressed by specifying standard, or minimum, requirements and requiring documentation when a TIA varies from these standards.

D.3 PROJECTS SUBJECT TO ANALYSIS

In general a CMP TIA is required for all projects required to prepare an Environmental Impact Report (EIR) based on local determination. A TIA is not required if the lead agency for the EIR finds that traffic is not a significant issue, and does not require local or regional traffic impact analysis in the EIR. Please refer to Chapter 5 for more detailed information.

CMP TIA guidelines, particularly intersection analyses, are largely geared toward analysis of projects where land use types and design details are known. Where likely land uses are not defined (such as where project descriptions are limited to zoning designation and parcel size with no information on access location), the level of detail in the TIA may be adjusted accordingly. This may apply, for example, to some redevelopment areas and citywide general plans, or community level specific plans. In such cases, where project definition is insufficient for meaningful intersection level of service analysis, CMP arterial segment analysis may substitute for intersection analysis.

D.4 STUDY AREA

The geographic area examined in the TIA must include the following, at a minimum:

- All CMP arterial monitoring intersections, including monitored freeway on- or off-ramp intersections, where the proposed project will add 50 or more trips during either the AM or PM weekday peak hours (of adjacent street traffic).
- If CMP arterial segments are being analyzed rather than intersections (see Section D.3), the study area must include all segments where the proposed project will add 50 or more peak hour trips (total of both directions). Within the study area, the TIA must analyze at least one segment between monitored CMP intersections.
- Mainline freeway monitoring locations where the project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.
- Caltrans must also be consulted through the Notice of Preparation (NOP) process to identify other specific locations to be analyzed on the state highway system.

If the TIA identifies no facilities for study based on these criteria, no further traffic analysis is required. However, projects must still consider transit impacts (Section D.8.4).

D.5 BACKGROUND TRAFFIC CONDITIONS

The following sections describe the procedures for documenting and estimating background, or non-project related traffic conditions. Note that for the purpose of a TIA, these background estimates must include traffic from all sources without regard to the exemptions specified in CMP statute (e.g., traffic generated by the provision of low and very low income housing, or trips originating outside Los Angeles County. Refer to Chapter 5, Section 5.2.3 for a complete list of exempted projects).

D.5.1 Existing Traffic Conditions. Existing traffic volumes and levels of service (LOS) on the CMP highway system within the study area must be documented. Traffic counts must

be less than one year old at the time the study is initiated, and collected in accordance with CMP highway monitoring requirements (see Appendix A). Section D.8.1 describes TIA LOS calculation requirements in greater detail. Freeway traffic volume and LOS data provided by Caltrans is also provided in Appendix A.

D.5.2 Selection of Horizon Year and Background Traffic Growth. Horizon year(s) selection is left to the lead agency, based on individual characteristics of the project being analyzed. In general, the horizon year should reflect a realistic estimate of the project completion date. For large developments phased over several years, review of intermediate milestones prior to buildout should also be considered.

At a minimum, horizon year background traffic growth estimates must use the generalized growth factors shown in Exhibit D-1. These growth factors are based on regional modeling efforts, and estimate the general effect of cumulative development and other socioeconomic changes on traffic throughout the region. Beyond this minimum, selection among the various methodologies available to estimate horizon year background traffic in greater detail is left to the lead agency. Suggested approaches include consultation with the jurisdiction in which the intersection under study is located, in order to obtain more detailed traffic estimates based on ongoing development in the vicinity.

D.6 PROPOSED PROJECT TRAFFIC GENERATION

Traffic generation estimates must conform to the procedures of the current edition of Trip Generation, by the Institute of Transportation Engineers (ITE). If an alternative methodology is used, the basis for this methodology must be fully documented.

Increases in site traffic generation may be reduced for existing land uses to be removed, if the existing use was operating during the year the traffic counts were collected. Current traffic generation should be substantiated by actual driveway counts; however, if infeasible, traffic may be estimated based on a methodology consistent with that used for the proposed use.

Regional transportation impact analysis also requires consideration of trip lengths. Total site traffic generation must therefore be divided into work and non-work-related trip purposes in order to reflect observed trip length differences. Exhibit D-2 provides factors which indicate trip purpose breakdowns for various land use types.

For lead agencies who also participate in CMP highway monitoring, it is recommended that any traffic counts on CMP facilities needed to prepare the TIA should be done in the manner outlined in Chapter 2 and Appendix A. If the TIA traffic counts are taken within one year of the deadline for submittal of CMP highway monitoring data, the local jurisdiction would save the cost of having to conduct the traffic counts twice.

D.7 TRIP DISTRIBUTION

For trip distribution by direct/manual assignment, generalized trip distribution factors are provided in Exhibit D-3, based on regional modeling efforts. These factors indicate Regional Statistical Area (RSA)-level tripmaking for work and non-work trip purposes.

(These RSAs are illustrated in Exhibit D-4.) For locations where it is difficult to determine the project site RSA, census tract/RSA correspondence tables are available from MTA.

Exhibit D-5 describes a general approach to applying the preceding factors. Project trip distribution must be consistent with these trip distribution and purpose factors; the basis for variation must be documented.

Local agency travel demand models disaggregated from the SCAG regional model are presumed to conform to this requirement, as long as the trip distribution functions are consistent with the regional distribution patterns. For retail commercial developments, alternative trip distribution factors may be appropriate based on the market area for the specific planned use. Such market area analysis must clearly identify the basis for the trip distribution pattern expected.

D.8 IMPACT ANALYSIS

CMP Transportation Impact Analyses contain two separate impact studies covering roadways and transit. Section Nos. D.8.1-D.8.3 cover required roadway analysis while Section No. D.8.4 covers the required transit impact analysis. Section Nos. D.9.1-D.9.4 define the requirement for discussion and evaluation of alternative mitigation measures.

D.8.1 Intersection Level of Service Analysis. The LA County CMP recognizes that individual jurisdictions have wide ranging experience with LOS analysis, reflecting the variety of community characteristics, traffic controls and street standards throughout the county. As a result, the CMP acknowledges the possibility that no single set of assumptions should be mandated for all TIAs within the county.

However, in order to promote consistency in the TIAs prepared by different jurisdictions, CMP TIAs must conduct intersection LOS calculations using either of the following methods:

- The Intersection Capacity Utilization (ICU) method as specified for CMP highway monitoring (see Appendix A); or
- The Critical Movement Analysis (CMA) / Circular 212 method.

Variation from the standard assumptions under either of these methods for circumstances at particular intersections must be fully documented.

TIAs using the 1985 or 1994 Highway Capacity Manual (HCM) operational analysis must provide converted volume-to-capacity based LOS values, as specified for CMP highway monitoring in Appendix A.

D.8.2 Arterial Segment Analysis. For TIAs involving arterial segment analysis, volume-to-capacity ratios must be calculated for each segment and LOS values assigned using the V/C-LOS equivalency specified for arterial intersections. A capacity of 800 vehicles per hour per through traffic lane must be used, unless localized conditions necessitate alternative values to approximate current intersection congestion levels.

D.8.3 Freeway Segment (Mainline) Analysis. For the purpose of CMP TIAs, a simplified analysis of freeway impacts is required. This analysis consists of a demand-to-capacity calculation for the affected segments, and is indicated in Exhibit D-6.

D.8.4 Transit Impact Review. CMP transit analysis requirements are met by completing and incorporating into an EIR the following transit impact analysis:

- ❑ Evidence that affected transit operators received the Notice of Preparation.
- ❑ A summary of existing transit services in the project area. Include local fixed-route services within a ¼ mile radius of the project; express bus routes within a 2 mile radius of the project, and; rail service within a 2 mile radius of the project.
- ❑ Information on trip generation and mode assignment for both AM and PM peak hour periods as well as for daily periods. Trips assigned to transit will also need to be calculated for the same peak hour and daily periods. Peak hours are defined as 7:30-8:30 AM and 4:30-5:30 PM. Both "peak hour" and "daily" refer to average weekdays, unless special seasonal variations are expected. If expected, seasonal variations should be described.
- ❑ Documentation of the assumption and analyses that were used to determine the number and percent of trips assigned to transit. Trips assigned to transit may be calculated along the following guidelines:
  - ➢ Multiply the total trips generated by 1.4 to convert vehicle trips to person trips;
  - ➢ For each time period, multiply the result by one of the following factors:

    3.5% of Total Person Trips Generated for most cases, except:

    10% primarily Residential within 1/4 mile of a CMP transit center
    15% primarily Commercial within 1/4 mile of a CMP transit center
    7% primarily Residential within 1/4 mile of a CMP multi-modal transportation center
    9% primarily Commercial within 1/4 mile of a CMP multi-modal transportation center
    5% primarily Residential within 1/4 mile of a CMP transit corridor
    7% primarily Commercial within 1/4 mile of a CMP transit corridor
    0% if no fixed route transit services operate within one mile of the project

  To determine whether a project is primarily residential or commercial in nature, please refer to the CMP land use categories listed and defined in Appendix E, *Guidelines for New Development Activity Tracking and Self Certification*. For projects that are only partially within the above one-quarter mile radius, the base rate (3.5% of total trips generated) should be applied to all of the project buildings that touch the radius perimeter.

- ❑ Information on facilities and/or programs that will be incorporated in the development plan that will encourage public transit use. Include not only the jurisdiction's TDM Ordinance measures, but other project specific measures.

- Analysis of expected project impacts on current and future transit services and proposed project mitigation measures, and;
- Selection of final mitigation measures remains at the discretion of the local jurisdiction/lead agency. Once a mitigation program is selected, the jurisdiction self-monitors implementation through the existing mitigation monitoring requirements of CEQA.

D.9 IDENTIFICATION AND EVALUATION OF MITIGATION

D.9.1 Criteria for Determining a Significant Impact. For purposes of the CMP, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$); if the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$). The lead agency may apply a more stringent criteria if desired.

D.9.2 Identification of Mitigation. Once the project has been determined to cause a significant impact, the lead agency must investigate measures which will mitigate the impact of the project. Mitigation measures proposed must clearly indicate the following:

- Cost estimates, indicating the fair share costs to mitigate the impact of the proposed project. If the improvement from a proposed mitigation measure will exceed the impact of the project, the TIA must indicate the proportion of total mitigation costs which is attributable to the project. This fulfills the statutory requirement to exclude the costs of mitigating inter-regional trips.
- Implementation responsibilities. Where the agency responsible for implementing mitigation is not the lead agency, the TIA must document consultation with the implementing agency regarding project impacts, mitigation feasibility and responsibility.

Final selection of mitigation measures remains at the discretion of the lead agency. The TIA must, however, provide a summary of impacts and mitigation measures. Once a mitigation program is selected, the jurisdiction self-monitors implementation through the mitigation monitoring requirements contained in CEQA.

D.9.3 Project Contribution to Planned Regional Improvements. If the TIA concludes that project impacts will be mitigated by anticipated regional transportation improvements, such as rail transit or high occupancy vehicle facilities, the TIA must document:

- Any project contribution to the improvement, and
- The means by which trips generated at the site will access the regional facility.

D.9.4 Transportation Demand Management (TDM). If the TIA concludes or assumes that project impacts will be reduced through the implementation of TDM measures, the TIA must document specific actions to be implemented by the project which substantiate these conclusions.

RE: The Ford Theatres Project, 2580 Cahuenga Boulevard East

Dear Ms. Rupert:

On behalf of the Los Angeles Conservancy, thank you for the opportunity to comment on the Notice of Preparation (NOP) of an environmental impact report for the Ford Theatres Project.

We submit the following comments to ensure that the proposed project, and particularly the Amphitheatre Rehabilitation and Improvements component, will not adversely impact the John Anson Ford Theatre's continued eligibility for listing in the National Register of Historic Places. We also want to ensure the project meets the Secretary of the Interior's Standards and will be compatible with the historic structure. If significant impacts are anticipated, preservation alternatives must be evaluated and adequate mitigation measures proposed as part of the ongoing environmental review process.

The existing amphitheatre opened in 1931, replacing a wooden structure from 1920, as a venue to host Christine Wetherhill Stevenson's *The Pilgrimage Play* which was produced on the site from 1920 through 1964. The amphitheatre structure, which features crenelated parapets, was constructed of board-formed concrete and designed in a style evoking ancient Judaic architecture. In 1994 the Ford Theatres property was evaluated as a potential historic resource and determined eligible for listing in the National Register of Historic Places.

The Draft EIR should evaluate the architectural and historical significance of the historic amphitheatre structure, including the identification of character-defining features of both the structure and elements associated with it. It should assess

whether proposed modifications, including stage reconstruction and the addition of a retractable shade structure, might impact the venue's continued eligibility for listing in the National Register. As currently proposed in the NOP, the project calls for the "installation of compatible stone-clad retaining walls and drainage improvements along the rear of the stage." This description leaves uncertainty as to whether the existing stone retaining walls will be retained or replaced, or be rebuilt in a manner that meets the Secretary of the Interior's Standards for the Treatment of Historic Properties.

The Draft EIR should also evaluate the aesthetic impact of proposed new construction at the Ford Theatres property to ensure that new structures are designed in a manner that is both compatible and appropriate in scale and massing to protect the integrity of the historic amphitheatre structure.

About the Los Angeles Conservancy:
The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 6,500 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please feel free to contact me at (213) 430-4203 or afine@laconservancy.org should you have any questions.

Sincerely,

Adrian Scott Fine
Director of Advocacy

Subject: The Ford Theatres Project

Thank you for the opportunity to review the Notice of Preparation of a Draft EIR for the Ford Theatres Project. Please work with the City of Los Angeles Department of Transportation (LADOT) to coordinate the preparation of the transportation section of the Draft EIR. Since the city of Los Angeles' transportation system encompasses the project, it is important that this coordination take place to ensure that appropriate analyses are prepared and corresponding transportation mitigations (if needed) are evaluated.

Looking forward to working with you on this project!

Sincerely,

Tomas Carranza, PE
Senior Transportation Engineer

Joan Rupert, Planner
Department of Parks and Recreation
Planning Division
510 South Vermont Avenue, Room 201
Los Angeles, CA 90020

Dear Ms. Rupert:

PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT, "THE FORD THEATRES PROJECT," IT INCLUDES REHABILITATION AND IMPROVEMENTS OF THE EXISTING AMPHITHEATRE AND DEVELOPEMNT OF THE FORD TERRACE, PLAZA, TRANSIT CENTER AND HIKING TRAIL, 2580 CAHUENGA BOULEVARD EAST, LOS ANGELES (FFER #201400030)

The Preparation of a Draft Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department. The following are their comments:

PLANNING DIVISION:

1. The project site is located within the City of Los Angeles, which is not a part of the emergency response area of the Los Angeles County Fire Department (also known as the Consolidated Fire Protection District of Los Angeles County). Therefore, this project does not appear to have any impact on the emergency responsibilities of this Department.

LAND DEVELOPMENT UNIT:

1. The development of this project must comply with all applicable Fire Department code and ordinance requirements for construction, access, water mains, fire flows and fire hydrants.

2. The Fire Prevention Division, Land Development Unit, has no comments regarding this project at this time. Additional comments and requirements will be addressed when the Draft EIR is prepared and circulated.

3. Should any questions arise, please contact Juan Padilla of the County of Los Angeles Fire Department, Land Development Unit, at (323) 890-4243 or at Juan.Padilla@fire.lacounty.gov.

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

1. The statutory responsibilities of the County of Los Angeles Fire Department, Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones or Fire Zone 4, archeological and cultural resources, and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed in the Draft Environmental Impact Report.

HEALTH HAZARDOUS MATERIALS DIVISION:

1. The Health Hazardous Materials Division has no objection to the proposed project.

If you have any additional questions, please contact this office at (323) 890-4330.

Very truly yours,

Frank Vidales

Los Angeles, CA 90068

RE: SCH#2014021013 CEQA Notice of Notice of Preparation (NOP); draft Environmental Impact Report (DEIR) for **The Ford Theatres Project;"** located in the City of Los Angeles; Los Angeles County, California

Dear Ms. Rupert

The Native American Heritage Commission (NAHC) has reviewed the above-referenced environmental document.

The California Environmental Quality Act (CEQA) states that any project which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA guidelines 15064.5(b).. To adequately comply with this provision and mitigate project-related impacts on archaeological resources, the Commission recommends the following actions be required:

Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, pursuant to California Environmental Quality Act (CEQA) §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities. Also, California Public Resources Code Section 21083.2 require documentation and analysis of archaeological items that meet the standard in Section 15064.5 (a)(b)(f).

If there is federal jurisdiction of this project due to funding or regulatory provisions; then the following may apply: the National Environmental Policy Act (NEPA 42 U.S.C 4321-43351) and Section 106 of the National Historic Preservation Act (16 U.S.C 470 *et seq.*) and 36 CFR Part 800.14(b) require consultation with culturally affiliated Native American tribes to determine if the proposed project may have an adverse impact on cultural resources

We suggest that this (additional archaeological activity) be coordinated with the NAHC, if possible. The final report containing site forms, site

significance, and mitigation measurers should be submitted immediately to the planning department. Any information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure pursuant to California Government Code Section 6254.10.

A list of appropriate Native American Contacts for consultation concerning the project site has been provided and is attached to this letter to determine if the proposed active might impinge on any cultural resources.

California Government Code Section 65040.12(e) defines "environmental justice" to provide "fair treatment of People…with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations and policies." (The California Code is consistent with the Federal Executive Order 12898 regarding 'environmental justice.' Also, applicable to state agencies is Executive Order B-10-11 requires consultation with Native American tribes their elected officials and other representatives of tribal governments to provide meaningful input into the development of legislation, regulations, rules, and policies on matters that may affect tribal communities.

Lead agencies should consider first, avoidance for sacred and/or historical sites, pursuant to CEQA Guidelines 15370(a). Then if the project goes ahead then, lead agencies include in their mitigation and monitoring plan provisions for the analysis and disposition of recovered artifacts, pursuant to California Public Resources Code Section 21083.2 in consultation with culturally affiliated Native Americans.

Lead agencies should include provisions for discovery of Native American human remains in their mitigation plan. Health and Safety Code §7050.5, CEQA §15064.5(e), and Public Resources Code §5097.98 mandates the process to be followed in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery.

Sincerely,

Dave Singleton
Program Analyst

RE: The Ford Theaters Project EIR Scoping Comments

Dear Ms. Rupert:

The Outpost Homeowners Association represents the 475 homes in Outpost Canyon in the area between the Hollywood Bowl and Runyon Canyon Park. Our neighborhood streets are frequently utilized by drivers connecting between the Hollywood area and San Fernando Valley as they seek to avoid congestion in the Cahuenga Pass. We are therefore very concerned about any proposed development that would impact traffic conditions in the Cahuenga Pass.

The proposed Ford Theaters Project represents an important cultural enhancement for Los Angeles County. The wide range of events that the project will facilitate will enrich the community.

Our concerns relate to the magnitude of change that will result from the County's proposed redevelopment of the John Anson Ford Theater. According to the Initial Study/Environmental Assessment, the number of events at the theaters will increase from an average of 184 today, to 331 in the future, an 80% increase. The annual attendance at the theaters will increase from 54,640 to 93,725, a 72% increase. Parking capacity will increase form 350 parking spaces to 500, and the number of employees on site will increase from 20 to 105.

The intensification of uses at the theaters will significantly increase traffic to and from the site on a daily basis due to additional employees as well as on event days, the number of which will increase substantially. We request that you quantify the impacts of these increased vehicle trips on Cahuenga Boulevard East and West, Highland Avenue, Mulholland Drive and Outpost Drive. Outpost Drive was recently reclassified by the City of Los Angeles as a Local Street, downgraded from a Collector, reflecting the City's policy directive to maintain Outpost as a low-volume, neighborhood street. If traffic is added to Outpost Drive by the proposed project, a contribution of funds toward the Outpost Neighborhood Traffic Management Plan would be an appropriate mitigation measure.

We are also concerned about the cumulative effect of all of the entertainment venues in Hollywood that result in street closures and gridlock in the Cahuenga Pass. These include all of the events at the Hollywood Bowl (In addition to the Philharmonic season, the Bowl season has been expanded to include many rental events as early as April and as late as October), the TCL Chinese Theater, the El Capitan and now the Ford Theaters. The EIR should quantify how the increase in events from 184 to 331 will contribute to the cumulative impact of street closures and traffic clogged streets, which cause motorists to seek alternate routes through our

neighborhood streets. We feel that it will be a substantial contribution to this cumulative impact. When is enough, enough!?

We feel that the EIR should also address the following issues:

- Potential fire danger in the hills with so many more visitors to the site, many of whom will be first-time visitors to the area, unaware of the fire danger
- Impacts on the physical infrastructure (sewer capacity, water supply, sanitary landfills, etc.) all of which will be further stretched thin by all of the additional visitors to this area which was built out in the early 1900s
- Impacts to public safety, including police and fire that will find it more difficult to respond to incidents in our area due to the additional traffic congestion and the need to attend to issues related to crowds at the Ford Theaters

The EIR should also address viable alternatives. The John Anson Ford Theater has survived for many years with the single, outdoor theater. An alternative that modernizes the facility and improves parking, but leaves it as is in terms of seating capacity and number of events, should be evaluated. It would likely be the environmentally superior alternative.

We look forward to receiving a copy of the Draft EIR and to the opportunity to submit comments on the Draft. This is a very important project to Los Angeles County and one that will have a lasting impact on our neighborhood. Thank you for your attention to these issues of importance to the Outpost Homeowners Association.

Sincerely,

Outpost HOA
Michael P. Meyer, President

Dear Ford Theatres Stakeholders,

In preparation for drafting the Environmental Impact Report (EIR) for the **Ford Theatres Project**, you are invited to a Public Scoping Meeting. The purpose of the meeting is to solicit input regarding the content of the Draft EIR.

Please read the **Notice of Preparation**, in which the Ford Theatres Project Initial Study is summarized. The Ford Theatres Project Initial Study sets forth the Project description, the potential environmental effects anticipated to be studied in the EIR and the environmental factors not potentially affected that would not be addressed in the EIR. Links to the study and its appendices may be found on this **web page**.

The Public Scoping meeting will take place from 7:00 p.m. to 9:00 p.m. on Tuesday, February 18, 2014 at the address below:

Ford Theatres
[Inside] the Ford
2580 Cahuenga Blvd. East
Hollywood, CA 90068

Please read the **Notice of Preparation** for full details.

Should you have any questions or concerns, please feel free to contact us at 323-856-5793.

Thank you,
Ford Theatres

County of Los Angeles

Scoping Meeting for the Environmental Impact Report Regarding the Ford Theatres Project
February 18, 2014

Written Comment Form

The purpose of the Scoping Meeting is to solicit agency and other early comments regarding issues to be addressed in the Draft Environmental Impact Report (EIR) for the Ford Theatres Project (the Project). The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Project Site is developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former 10,500-square-foot motel building currently used as staff offices. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register).

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

Comments can be submitted at the scoping meeting or sent via mail or email to the addresses below. The deadline for submitting written comments to the County is close of business day on March 11, 2014. In the space below (and on additional pages, if necessary, or in a format of your choosing), please provide any written comments you may have concerning the scope of the Draft EIR for the Project. Your comments will then be considered during preparation of the Draft EIR.

Please leave this form in the box provided or deliver via e-mail, U.S. mail or fax. Please address to Joan Rupert, County of Los Angeles, Department of Parks and Recreation, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020. Email address is jrupert@parks.lacounty.gov and fax is (213) 639-3959. If sent via U.S. mail, please add postage.

Notice of Preparation of a CEQA Document for the
The Ford Theatres Project

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. The SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the draft CEQA document. Please send the SCAQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to the SCAQMD. Please forward a copy of the Draft EIR directly to SCAQMD at the address in our letterhead. **In addition, please send with the draft EIR all appendices or technical documents related to the air quality and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files. These include original emission calculation spreadsheets and modeling files (not Adobe PDF files). Without all files and supporting air quality documentation, the SCAQMD will be unable to complete its review of the air quality analysis in a timely manner. Any delays in providing all supporting air quality documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. More recent guidance developed since this Handbook was published is also available on SCAQMD's website here: www.aqmd.gov/ceqa/hdbk.html. SCAQMD staff also recommends that the lead agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis.

The SCAQMD has also developed both regional and localized significance thresholds. The SCAQMD staff requests that the lead agency quantify criteria pollutant emissions and compare the results to the recommended regional significance thresholds found here: http://www.aqmd.gov/ceqa/handbook/signthres.pdf. In addition to analyzing regional air quality impacts, the SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional

significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the lead agency perform a localized analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/ceqa/handbook/LST/LST.html.

In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/ceqa/handbook/mobile_toxic/mobile_toxic.html. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses (such as placing homes near freeways) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Perspective*, which can be found at the following internet address: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process.

Mitigation Measures

In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate these impacts. Pursuant to state CEQA Guidelines §15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying possible mitigation measures for the project, including:

- Chapter 11 of the SCAQMD *CEQA Air Quality Handbook*
- SCAQMD's CEQA web pages at: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf.
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions
- Other measures to reduce air quality impacts from land use projects can be found in the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. This document can be found at the following internet address: http://www.aqmd.gov/prdas/aqguide/aqguide.html.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available via the SCAQMD's webpage (http://www.aqmd.gov).

The SCAQMD staff is available to work with the Lead Agency to ensure that project emissions are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at imacmillan@aqmd.gov or call me at (909) 396-3244.

Sincerely,

Ian MacMillan

Scoping Meeting for the Environmental Impact Report Regarding the Ford Theatres Project February 18, 2014

Written Comment Form

The purpose of the Scoping Meeting is to solicit agency and other early comments regarding issues to be addressed in the Draft Environmental Impact Report (EIR) for the Ford Theatres Project (the Project). The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Project Site is developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former 10,500-square-foot motel building currently used as staff offices. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register).

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

Comments can be submitted at the scoping meeting or sent via mail or email to the addresses below. The deadline for submitting written comments to the County is close of business day on March 11, 2014. In the space below (and on additional pages, if necessary, or in a format of your choosing), please provide any written comments you may have concerning the scope of the Draft EIR for the Project. Your comments will then be considered during preparation of the Draft EIR.

Please leave this form in the box provided or deliver via e-mail, U.S. mail or fax. Please address to Joan Rupert, County of Los Angeles, Department of Parks and Recreation, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020. Email address is jrupert@parks.lacounty.gov and fax is (213) 639-3959. If sent via U.S. mail, please add postage.

Notice of Preparation

February 7, 2014

To: Reviewing Agencies

Re: The Ford Theatres Project
SCH# 2014021013

Attached for your review and comment is the Notice of Preparation (NOP) for the The Ford Theatres Project draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Joan Rupert
Los Angeles County
510 South Vermont Avenue, Rm 201
Los Angeles, CA 90020

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

County of Los Angeles

Scoping Meeting for the Environmental Impact Report Regarding the Ford Theatres Project
February 18, 2014

Written Comment Form

The purpose of the Scoping Meeting is to solicit agency and other early comments regarding issues to be addressed in the Draft Environmental Impact Report (EIR) for the Ford Theatres Project (the Project). The approximately 32-acre Project Site includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles. The Project Site is developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former 10,500-square-foot motel building currently used as staff offices. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register).

The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. The proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. Implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

Comments can be submitted at the scoping meeting or sent via mail or email to the addresses below. The deadline for submitting written comments to the County is close of business day on March 11, 2014. In the space below (and on additional pages, if necessary, or in a format of your choosing), please provide any written comments you may have concerning the scope of the Draft EIR for the Project. Your comments will then be considered during preparation of the Draft EIR.

Please leave this form in the box provided or deliver via e-mail, U.S. mail or fax. Please address to Joan Rupert, County of Los Angeles, Department of Parks and Recreation, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020. Email address is jrupert@parks.lacounty.gov and fax is (213) 639-3959. If sent via U.S. mail, please add postage.

PLEASE — NO FENCING !!

1. FENCING AROUND PROPERTY. — OUR HOME PROPERTY BORDERS ON THE PARK PROPERTY. WE WISH NO FENCE BE PUT UP - TO PRESERVE AN OPEN SEAMLESS FLOW AND VIEW FROM CITY TO PARK. OUR PROPERTY SLOPE IS AGRESSIVELY STEEP, CREATING A NATURAL BARRIER FOR TRESPASSING.
2. TRAILS - WE WORRY ORGANIZED HIKING TRAILS WILL INCREASE THE HOMELESS ENCAMPMENTS AND FIRE DANGER IN THE HILLS AROUND THE FORD PROPERTY.

NOTE: ALTHOUGH THESE TWO CONCERNS MAY SEEM CONTRADICTORY, THEY ARE NOT. TRAILS INCREASE FOOT TRAFFIC - A FENCE ALONG OUR PROPERTY WOULD BE AN EYESORE AND MEANS TO HOLD ON TO AND CLIMB UP OUR HILL — FIRE SAFETY — PROPERTY SAFETY -

Re: The Ford Theatres Project - Notice of Preparation Comments

Dear Ms. Rupert:

This firm represents Mr. Nima Tehrany, the owner of the residence at 2323 Lorenzo Drive in the City of Los Angeles. The Ford Theatres Project site (the "Site") directly abuts our client's residence, so the proposed Project has the potential to significantly impact our client and his family. In particular, the Project's approximately 0.75-mile ridgeline trail would provide access to our client's property and exacerbate a nuisance currently existing on the Site (discussed below) which has prevented Mr. Tehrany from moving his family into their new home.

While our client has numerous concerns about the Project and we intend to provide a detailed comment letter on the Draft Environmental Impact Report ("DEIR") if necessary, Mr. Tehrany's primary concern at this point has to do with how the Site interacts with his property. The Site is literally a few feet from our client's residence – not just Mr. Tehrany's property, ***but the actual home itself*** (i.e., the home does not have a back yard – just a County-owned hillside slope behind it that is part of the John Anson Ford Amphitheatre Park). (See Exhibit A.) This is a significant problem because this County-owned hillside directly above Mr. Tehrany's home has a well-documented drug problem and is frequented by transients, many of whom have set up sleeping bags, mattresses, and other living accommodations just above his property.[1] Unfortunately, so narrow is the gap between the County's property and our client's home that there is no reasonable place in which Mr. Tehrany could erect a fence on his property to protect

[1] The John Anson Ford Amphitheatre Park, and surrounding hillsides, play a prominent role in a *National Geographic* documentary about drug use in Hollywood. In one episode, for example, the hills above our client's residence are featured, with County law enforcement discussing the dangers that transient drug use and other criminal activity create on surrounding residences. Please see the following video 37 minutes in (for approximately five minutes): http://www.tubeplus.me/player/2109542/Drugs,_Inc./season_3/episode_7/Hollywood_High/.

his family's privacy, and most importantly, to provide a reasonable level of safety. As a result, Mr. Tehrany has had a squatter set up residence in his home and people coming down from the hillside to wash themselves in his garden. At night, the safety of his home is especially compromised as numerous strangers arrive from elsewhere in Hollywood to congregate and do drugs.

When Mr. Tehrany was in escrow to purchase the house, his communications with County staff led him to believe that the County would allow him to install a fence on a small portion of the Ford Theatres property to prevent the above impacts. (See Exhibit B.) Instead, shortly ***after he purchased the home***, Mr. Tehrany received a letter informing him that he would not be able to build the requested fence and that the County instead had fixed its own existing chain link fence. (See Exhibit C.) Within a week that chain link fence was destroyed by transients who wanted to access Mr. Tehrany's property. Adding insult to injury, the County then released the Notice of Preparation for the Project, which would add hiking trails near Mr. Tehrany's residence and thereby further facilitate access to his residence.

While our client would like to support the proposed Project, in the absence of reasonable accommodations by the County to allow Mr. Tehrany to protect his home, he is left with little choice but to vigorously oppose the Project. The Los Angeles County Department of Parks and Recreation, which owns and operates the John Anson Ford Amphitheatre Park, has a legal obligation to prevent the existing nuisance and public safety issue on our client's property. Because the County is now embarking on the proposed Project, the California Environmental Quality Act ("CEQA") provides an additional avenue, in addition to basic nuisance law, by which the above impacts must be addressed.

Accordingly, we respectfully request that the DEIR include an analysis of the transient problem currently existing on the Site and how the proposed new hiking trail and planned access points will further exacerbate impacts on our client's home and other sensitive receptors in the area. This analysis should include daytime and nighttime surveys of existing baseline conditions in the slopes above Mr. Tehrany's residence and analysis in the following topical areas:

(1) **Public Services** – the hiking trail's increased access to the hillsides in this area will exacerbate the transient problem. How will the trail's significant impacts on police and fire services be reduced to a level less than significant in light of the above;

(2) **Aesthetics** – the County has allowed the slope above our client's property to be strewn with trash and homeless encampments. This will no doubt increase with the greater access to be facilitated by the Project. What mitigation will the County impose to reduce these impacts to a level less than significant; and

(3) **Noise** – the number of people who will come to the slopes above our client's home is only bound to increase as a result of the Project. How will the County reduce significant noise impacts on our client's home (and other sensitive receptors) from the influx of additional people at night and what mitigation will the County impose to reduce these impacts to a level less than significant.

While we hope that the DEIR will address and fully analyze the above issues, it is our expectation that the County will address the significant nuisance issues on its property now, rather than through the imposition of CEQA mitigation measures. Obviously, the sooner the above impacts are addressed, the more likely the above concerns will be rendered moot for purposes of CEQA analysis. Our client would like to reach a win-win solution with the County that would allow him to support the Project. This should not be difficult.

Thank you for the opportunity to comment on the Notice of Preparation. Should you have any questions, please do not hesitate to contact me.

Very truly yours,

Victor De la Cruz

Replacement Fence Proposal

Nima Tehrany <nimatehrany@gmail.com>
To: jepark@parks.lacounty.gov

Thu, Jan 10, 2013 at 6:43 PM

Good Afternoon Mr. Park,

First and foremost, I want to thank you sincerely for taking the time out of your busy schedule to meet with me 2323 Lorenzo Drive yesterday. Pursuant to our conversation yesterday, I would like to replace the current chain link fence with a secure anti-scale wrought iron fence to provide some real security for my family in our new home. As you were able to perceive yesterday, the hill directly behind the property is frequented by transients, many of whom have set up sleeping bags, mattresses and other transient living accommodations. This property is about a 100 yards away from the large Hollywood Cross that can be seen from both the 101 Highway and Cahuenga Blvd. As recently exposed on National Geographic's documentary show Drugs, Inc., episode Hollywood High, this particular hillside has a huge drug user transient population loitering it as the hill is so easily accessible directly from Cahuenga Blvd by the 101 Highway, just down the hill from the property. Just as recent as last month, we had a squatter in the house for a few days. Moreover, items of clothing are often found in the back of the property, next to a water hose, where many transients use the water to wash themselves on the property.

Due this huge safety concern for my family, I am proposing to replace the current chain linked fence with a more secure wrought iron anti-scaling fence, such as the one pictured in the attachment. The current fence and the new fence that I proposing to replace it with are located on the County's property. I will incur the cost of the new wrought iron fence. I will place a keyed security door in the gate and provide your office with a copy of the key to the door so that you can access the property at will. I have attached a copy of plat mat that was used by the previous owner when he was contemplating purchasing the land from the County. I have circled the location of the current chain link fence in the north portion of the survey. The wrought iron fence will replace the current chain link fence from the western cliff to the eastern cliff. The fence will measure roughly 160 linear feet and will be 8 feet high. Due to the natural bottleneck effect created by the two steep cliffs at both ends, this is the optimal location for the placement of the fence to provide the adequate security for our home.

In summary, the proposed fence will only replace the existing fence that has been in place for a very long time. The current chain link fence has no door, making access for the County difficult. The new replacement fence will provide greater ease of access to the property by the County as it will have a secure keyed door and a copy of the key will be provided to the County. I will incur the cost for the replacement wrought iron fence. Most importantly, our family can feel secure in our home.

I thank you in advance for both your time and consideration. I can

always be reached directly at (310) 617-6462.

Sincerely,
Nima M. Tehrany

Mr. Tehrany,

This is to confirm receipt of your fence proposal. As I indicated during my visit to your property I will share your proposal with our operational staff that is responsible for the Ford Theater property. Based on their review and response to your proposal I will get back to you within ten days. Feel free to contact me at any time.

Mr. Tehrany,

You should submit for plan review to Guillermo Najar who is copied on this message. The submittal should include specifications for the fence including footing depth, gauge of fencing material, gate width etc. Once the plan is approved James Barber and his staff will prepare a permit for the installation.

Good afternoon Mr. Tehran,

I will be your main contact for preparing the license agreement allowing access to County premises for the purpose of installing the wrought iron fence bordering the subject properties. For your convenience and information I have attached the County's fillable form/application for the license agreement. It generally takes 4-6 weeks to process a license. I understand for Jim Park you will be closing escrow soon. What is your time frame? Do you have a contractor and start date yet? I will need certificates of insurance from the contractor. In addition to obtaining required permits as the Licensee, you will be responsible for ensuring the contractor is properly insured and has the proper contractor's license. The contractor must provide proof of insurance. The certificates of insurance consist of general liability with additional insured endorsement, auto liability, workers comp and waiver of subrogation. The contractor's additional insured insurance must cover the County for completed operations with respect to bodily injury and property damage.

Please email the completed application to my attention. I look forward to working with you and answering any additional questions.

Diane Thorne | County of Los Angeles Department of Parks and Recreation | Land Acquisition and Development

510 So. Vermont Avenue | Los Angeles, CA 90020

Tel: 213.351.5128 | Fax: 213.639.3959 | Email: dthorne@parks.lacounty.gov | The office is closed on Fridays

Hi Diane,

Thank you for your prompt follow-up. I should hopefully be closing on the property next week. I have a contractor who is both licensed and insured. I will forward you all his license and insurance information as soon as I collect it from him. We can start the fence installation as soon as we receive the license from the County permitting us to instal it. For clarification, does the application that you attached apply if the fence is under 6 feet tall or does it only come into play if we are putting a fence that is over 6 feet requiring a permit? Also for clarification, how is the 6 feet measured if the top of the fence is curved down? Do we measure from the ground to the highest point of the fence or do we measure the actual material of the fence, including the part that is curved down at the top? I hope my question makes sense.

Sincerely,
Nima M. Tehrany

The License from Department of Parks and Recreation's Planning Division only allows for right of entry onto County premises. All other permits concerning construction of proposed fencing are obtained from Department of Public Works. Your questions regarding the proper measurement of the fencing would be answered by the Department of Public Works or the agency providing the permit for construction of your proposed fence.

Hi Diane,

Thank you so much for taking the time to meet with me and my contractor in person today on such short notice to go over the license application. I truly appreciate all of your input. Pursuant to your request this afternoon, the APN # for the subject property at 2323 Lorenzo Dr. is 5577-027-037. I will begin working on the application with my contractor today and will get it back to you as soon as possible. Should you have any questions or concerns at any time please do not hesitate to contact me directly at (310) 617-6462.

Sincerely,
Nima M. Tehrany

To: Nima Tehrany <nimatehrany@gmail.com>
Cc: Hayden Sohm <hsohm@parks.lacounty.gov>, "Kathline J. King" <KKing@parks.lacounty.gov>, Jim Park <jepark@parks.lacounty.gov>, Guillermo Najar <gnajar@parks.lacounty.gov>, James Barber <jbarber@parks.lacounty.gov>, Kimel Conway <kconway@parks.lacounty.gov>

Nima,

Thank you for coming by the office to discuss the application requirements and the scope of the work for the proposed fencing installation. Please have your contractor submit the total cost of project along with pictures and specification of the fence to be installed. As a recap, I will require detailed information describing number of posts and distance between each post, depth of each post, length of fence to be installed, an aerial showing ingress/egress routes and area of existing fence and proposed fencing. Also please indicate number of locking gates to be installed and number of keys to be given to County for access and maintenance operations.

Per our telephone call this afternoon, our Director does not have authority to accept donated improvements >$10K per the County Fiscal Manual. A Board Letter authorizing our Director to accept the improvement on behalf of the County for improvements >$10K would be required. With escrow closing as soon as February 19 and in the interest of saving time, the cost of the fencing should be no more than $10K.

Regards,

Diane Thorne | County of Los Angeles Department of Parks and Recreation | Land Acquisition and Development

B. DOCUMENTS NEEDED

Copies must be provided to us via e-mail (preferred), mail, fax, or in-person delivery

1. Exhibits

Provide maps / drawings showing <u>all</u> areas where work will occur, including paths for ingress/egress.

2. Ownership / Use Rights Documents

Provide <u>all</u> documents showing ownership / use rights of licensee / permittee.

Examples:
- Deeds
- Easements
- Other relevant licenses / permits

3. Insurance

<u>Important:</u>

- Insurance categories and amounts are those typically required but may vary depending upon nature of activities for which a license / permit is being sought.
- Submittal of Insurance certificates is <u>required prior to</u> the Department executing the license / permit.
- Sample License / Permit Agreement, Additional Insured Endorsement, and Certificate of Insurance are provided below. Carefully review sample Certificate of Insurance to ensure requirements are met. ***Process will be delayed until requirements are met.***
- Licensee / permittee shall require all of its subcontractors to maintain insurance specified in this license / permit.

Requirements:

a. General Insurance
   i. Self-Insurance (Contingent upon County approval)
   - OR -
   ii. Certificate of Insurance
      1. Coverage Requirements
         i. $2 Million – General Aggregate
         ii. $2 Million – Products/ Completed Operations Aggregate
         iii. $1 Million – Personal and Advertising Injury
         iv. $1 Million – Each Occurance
         v. $1 Million – Automobile Liability
         vi. $1 Million – Workers Comp, Each accident
         vii. $1 Million – Workers Comp, Disease (Policy limit)
         viii. $1 Million – Workers Comp, Disease (Each employee)

<u>WORKERS COMP</u>
MUST submit the following:
1. ACORD 25-S form
<u>OR</u>
2. State Compensation Insurance Fund form
(Samples included below)

<u>CERTIFICATE OF INSURANCE</u>
MUST submit the following:
1. ACORD 25-S form
<u>AND</u>
2. Additional Insured Endorsement
CG 20 10 11 85 form
(Samples included below)

b. Unique Insurance Coverage (<u>may</u> also be required, depending on situation)
   i. Sexual Misconduct Liability Coverage
   ii. Professional Liability / Errors and Omissions
   iii. Property Coverage
   iv. Crime Coverage
   v. Miscellaneous Coverage, such as Pollution Liability, Installation floater.

(Continue Below)

C. SCOPE OF WORK

(Detailed and complete information will help expedite processing)

1. State purpose of work
   Remove and dispose of existing failing chain link fence and replace with a durable wrought iron fence with a locking gate door for ease of access by the County. Copy of key for the gate door will be provided to the County. Existing chain link fence will be removed and disposed of.
2. Describe sequence of work from first to last day
   Day 1 - Remove and dispose of existing fence
   Day 2-4 - Install 18 inch deep concrete footings every 10 feet for fence posts (160 foot fence will require 16 footings and fence posts)
   Day 5 - Deliver and install custom built to measure wrought iron fence.
3. List types of vehicles involved
   N/A - No vehicles will be used at the site. Wrought iron fence will be built off site and delivered for installation. All deliveries and removal will be made through the back of subject property located at 2323 Lorenzo Dr.. New fence will be 6 feet tall, 160 feet wide with 18-inch deep footings every 10 feet for the fence posts.
4. List additional equipment involved
   N/A - No equipment will be required as wrought iron fence is being built off site and delivered for installation.
5. Describe method of securing premises / staging area
   N/A - the fence being replaced is on a hillside behind subject property and not accessible to the public.
6. Describe proposed method of remediation / restoration of premises
   N/A - Replacing existing fence will not cause any damage to the hillside.
7. List desired dates and duration of work in days
   (Weekend work and work on County holidays will not be permitted)
   Five (5) working days will be required, preferably Monday-Friday.
8. List desired hours of work
   8am to 5pm

Save

D. ADDITIONAL

(Detailed and complete information will help expedite processing)

Please describe / explain:

1. Method of cleaning premises
   Remove existing chain link fence and dispose.

2. Measures to avoid potential damage to trees, shrubs, turf, landscape
   New wrought iron fence will replace existing chain link fence, minimizing any potential damage.

3. Measures to avoid potential damage to utilities (power, gas, sprinkler heads, etc)
   N/A - no utilities on the hillside near the site of the fence being replaced.

4. Measures to avoid potential conflict with facility operations / events
   Will contact County 48 hours prior to commencement of work to clear any potential conflicts for the benefit of the County.

5. Safety issues / precautions
   Prudent use and care will be taken in both the removal and disposition of the existing chain link fence and the installation of the new wrought iron fence.

6. Public benefit - how will community benefit
   1.) Prevent loitering and transient living on County property, 2.) Provide security for the subject property and 3.) Provide accessibility to the County for maintenance operations and access through one locking gate. Current chain link fence does not allow for access. Two copies of key for the locking gate will be provided to the County.

To Complete:

1. Save this form to your computer.
2. Review this form and all required documents.
   Make sure information is complete and meets all requirements.
   Incomplete information will delay processing.
3. E-mail this form and required documents.
4. Contact the Department to confirm receipt of documents.

JOB: [Park Name] License #_____ S
MANAI [Park Street Address]
[Park City], CA [Park Zip]

This is to certify that we have issued a valid Workers' Compensation insurance policy in a form approved by the California Insurance Commissioner to the employer named below for the policy period indicated.

This policy is not subject to cancellation by the Fund except upon 30 days advance written notice to the employer.

We will also give you 30 days advance notice should this policy be cancelled prior to its normal expiration.

This certificate of insurance is not an insurance policy and does not amend, extend or alter the coverage afforded by the policy listed herein. Notwithstanding any requirement, term or condition of any contract or other document with respect to which this certificate of insurance may be issued or to which it may pertain, the insurance afforded by the policy described herein is subject to all the terms, exclusions, and conditions, of such policy.

AUTHORIZED REPRESENTATIVE PRESIDENT

EMPLOYER'S LIABILITY LIMIT INCLUDING DEFENSE COSTS: $1,000,000 PER OCCURRENCE.

ENDORSEMENT #2065 ENTITLED CERTIFICATE HOLDERS' NOTICE EFFECTIVE IS ATTACHED TO AND FORMS A PART OF THIS POLICY.

State Compensation Insurance Fund will list only <u>one</u> insurance category listed in the license agreement; other insurance certificates, such as the previous form above, will show all <u>three</u> insurance categories listed in the license agreement.

This endorsement modifies insurance provided under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART.

SCHEDULE

SEE SAMPLE LICENSE (Attached)
7.a., 7.b.

Name of Organization
County of Los Angeles and its Agents.
RE: [Park Name] License # _____ [Park Address, City, State, Zip]

(If no entry appears above, the information required to complete this endorsement will be shown in the Declarations as applicable to this endorsement.)

WHO IS AN INSURED (Section II) is amended to include as an insured the person or organization shown in the Schedule, but only with respect to liability arising out of "your work" for that insured by or for you.

Modifications to ISO form CG 20 10 11 85:

1. The insured scheduled above includes the Insured's officers, officials, employees and volunteers, except that coverage shall not extend to any indemnity coverage for the active negligence of the additional insured in any case where an agreement to indemnify the additional insured would be invalid under subdivision (b) of section 2782 of the Civil Code.

2. This insurance shall be primary as respects the insured shown in the schedule above, or if excess, shall stand in an unbroken chain of coverage excess of the Named Insured's scheduled underlying primary coverage. In either event, any other insurance maintained by the Insured scheduled above shall be in excess of this insurance and shall not be called upon to contribute with it.

3. The insurance coverage shall not be assigned, reduced, amended, cancelled, terminated, or not renewed by either party except after thirty (30) days written notice by certified mail, return receipt requested, to City.

1. **PREMISES:** Licensee, its employees, contractors and agents, after execution of this license by the Director of the Los Angeles County Department of Parks and Recreation ("Director"), is hereby granted permission to enter [Park Name] ("the Park"), located at [Street Number Street Name, City, California Zip Code].

   A. Licensee hereby acknowledges the title of Licensor and/or any other public agencies having jurisdiction there over, in and to the Premises, and covenants and agrees never to assail, contest or resist said title.

   B. Equipment, tools, materials and vehicles are not allowed to remain on the Premises overnight.

2. **LICENSED USE:** New construction, repair and replacement of cement pads for picnic areas, sidewalks and paths of travel, parking areas, trash container pads, curb & gutters, boat ramps and areas agreed to upon by all parties. The labor and materials will be provided at no expense to Licensor except when otherwise pre-arranged. Items that may be provided by the Licensor may consist of labor, cement and miscellaneous materials for the completion of an approved project.

Licensee shall exercise the permission herein given in such a manner as to minimize interference with the full use and enjoyment of said Premises by Licensor.

3. **TERM:** The term of this License commences when the License is signed by the Director and runs thereafter for a period not to exceed 2 years ending when Licensee obtains Licensor's final approval and acceptance of the Project. .

4. **CONSIDERATION:** Consideration is the public benefit derived from Licensee's improvements to the Park at no cost to Licensor with exception of cement and miscellaneous materials provided by Licensor.

5. **NOTICES:**

A. Whenever provision is made for giving written notice, such notice shall be deemed to have been received if it was sent by mail and e-mailed to: Mr. Larry Hensley at lhensley@parks.lacounty.gov and [Name of Licensee Contact at [email address] and addressed as follows:

To Licensor:
County of Los Angeles Department of Parks and Recreation
Attention: Larry Hensley, Chief of Planning
510 South Vermont Avenue, Room 201
Los Angeles, CA 90020-1975

To Licensee:
Organization's Name
Attention:
Street Number and Name
City, California [zip code]

or such other place in California as may hereinafter be designated in writing respectively by Licensor or Licensee.

6. **INDEMNIFICATION:** Licensee shall indemnify, defend and hold harmless County, its Special Districts, elected and appointed officers, employees, and agents from and against any and all liability, including but not limited to demands, claims, actions, fees, costs and expenses (including attorney and expert witness fees), arising from or connected with Licensee's acts and/or omissions arising from and/or relating to this License. The terms of this paragraph survive the termination of this License.

7. **GENERAL INSURANCE PROVISIONS:** Without limiting Licensee's indemnification of Licensor, and in the performance of this License and until all of its obligations pursuant to this License have been met, Licensee shall provide and maintain at its own expense insurance coverage satisfying the requirements specified in this Section, "General Insurance Provisions" and the "Insurance Coverage Requirements – Types and Limits" Section of this License. These minimum insurance coverage terms, types and limits (the "Required Insurance") also are in addition to and separate from any other contractual obligation imposed upon Licensee pursuant to this License. The Licensor in no way warrants that the Required Insurance is sufficient to protect the Licensee for liabilities which may arise from or relate to this License.

a. **Evidence of Coverage and Notice to Licensor**: Certificate(s) of insurance coverage (Certificate) satisfactory to Licensor, and a copy of an Additional Insured endorsement confirming County and its Agents (defined below) has been given Insured status under the Licensee's General Liability policy, shall be delivered to Licensor at the address shown below and provided prior to commencing services under this License.

i. Renewal Certificates shall be provided to Licensor not less than 10 days prior to Licensee's policy expiration dates. Licensor reserves the right to obtain complete, certified copies of any required Licensee and/or Sub-Contractor insurance policies at any time.

ii. Certificates shall identify all Required Insurance coverage types and limits specified herein, reference this License by name and number, and be signed by an authorized representative of the insurer(s). The Insured party named on the Certificate shall match Licensee's name. Certificates shall provide the full name of each insurer providing coverage, its NAIC (National Association of Insurance Commissioners) identification number, its financial rating, the amounts of any policy deductibles or self-insured retentions exceeding fifty thousand ($50,000.00) dollars, and list any Licensor required endorsement forms.

iii. Neither the Licensor's failure to obtain, nor the Licensor's receipt of, or failure to object to a non-complying insurance certificate or endorsement, or any other insurance documentation or information provided by the Licensee, its insurance broker(s) and/or insurer(s), shall be construed as a waiver of any of the Required Insurance provisions.

Certificates and copies of any required endorsements shall be sent to:

County of Los Angeles Department of Parks and Recreation
Attention: Larry Hensley, Chief of Planning
510 South Vermont Avenue, Room 201
Los Angeles, California 90020

iv. Licensee also shall promptly report to Licensor any injury or property damage accident or incident, including any injury to a Licensee employee occurring on County property, and any loss, disappearance, destruction, misuse, or theft of County property, monies or securities entrusted to Licensee. Licensee also shall promptly notify Licensor of any third party claim or suit filed against Licensee or any of its Sub-Contractors which arises

from or relates to this License, and could result in the filing of a claim or lawsuit against Licensee and/or Licensor.

b. **Additional Insured Status and Scope of Coverage**. The County of Los Angeles, its Special Districts, Elected Officials, Officers, Agents, Employees and Volunteers (collectively County and its Agents) shall be provided additional insured status under Licensee's General Liability policy with respect to liability arising out of Licensee's ongoing and completed operations performed on behalf of the Licensor. County and its Agents additional insured status shall apply with respect to liability and defense of suits arising out of the Licensee's acts or omissions, whether such liability is attributable to the Licensee or to the Licensor. The full policy limits and scope of protection also shall apply to the Licensor and its Agents as an additional insured, even if they exceed the Licensor's minimum Required Insurance specifications herein. Use of an automatic additional insured endorsement form is acceptable providing it satisfies the Required Insurance provisions herein.

c. **Cancellation of Insurance**. Except in the case of cancellation for non-payment of premium, Licensee's insurance policies shall provide, and Certificates shall specify, that Licensor shall receive not less than (30) days advance written notice by mail of any cancellation of the Required Insurance. Ten (10) days prior notice may be given to Licensor in event of cancellation for non-payment of premium.

d. **Failure to Maintain Coverage**. Licensee's failure to maintain or to provide evidence that it maintains insurance coverage acceptable to Licensor, shall constitute a material breach of this License upon which Licensor may immediately terminate and/or suspend this License. Licensor, at its sole discretion, may obtain damages from Licensee resulting from said breach.

e. **Insurer Financial Ratings**. Coverage shall be placed with insurers acceptable to the County with A.M. Best ratings of not less than A:VII unless otherwise approved by Licensor.

f. **Licensee's Insurance Shall Be Primary**. Licensee's insurance policies, with respect to any claims related to this License, shall be primary with respect to all other sources of coverage available to Licensee. Any Licensor maintained insurance or self-insurance coverage shall be in excess of and not contribute to any Licensee coverage.

g. **Waivers of Subrogation.** To the fullest extent permitted by law, Licensee hereby waives its and its insurer(s)' rights of recovery against Licensor under all the Required Insurance for any loss

arising from or related to this License. Licensee shall require its insurers to execute any waiver of subrogation endorsements which may be necessary to affect such waiver.

h. **Sub-Contractor Insurance Coverage Requirements.** Licensee shall include all Sub-contractors as insureds under Licensee's own policies or shall provide Licensor with each Sub-Contractor's separate evidence of insurance coverage. Licensee shall be responsible for verifying each Sub-Contractor complies with the Required Insurance provisions herein and shall require that each Sub-Contractor name the Licensor and Licensee as additional insureds on the Sub-Contractor's General Liability policy. Licensee shall obtain Licensor's prior review and approval of any Sub-Contractor request for modification of the Required Insurance.

i. **Deductibles and Self-Insured Retentions (SIRs).** Identify any deductibles or self-insured retentions (deductible/retentions) exceeding $25,000. Deductibles/retentions exceeding $25,000 will require the prior approval of the County Auditor-Controller. The Licensee may request approval to use a deductible/retention of more than $25,000 by submitting the current audited financial statements for review by the County Auditor-Controller which demonstrate, at the sole discretion of the County Auditor-Controller, that the Licensee has the ability to pay the higher deductible/retention. The Licensor retains the right to require the Licensee to reduce or eliminate deductibles/retentions as they apply to the Licensor, or, require Licensee to provide a bond guaranteeing payment of all such retained losses and costs attributable to the Licensee's retention, or, withhold payment to Licensee in the amount of all or any deductibles/retentions as the Licensor deem appropriate Licensee's policies shall not obligate the Licensor to pay any portion of any Licensee deductible or SIR.

j. **Claims Made Coverage.** If any part of the Required Insurance is written on claims made basis, any policy retroactive date shall precede the effective date of this License. Licensee understands and agrees it shall maintain such coverage for a period of not less than three (3) years following License expiration, termination or cancellation.

k. **Application of Excess Liability Coverage.** Licensee may use a combination of primary and excess insurance policies which provide coverage as broad as ("follow form" over) the underlying primary policies to satisfy the Required Insurance provisions.

l. **Separation of Insureds.** All liability policies shall provide cross-liability coverage as would be afforded by the standard ISO

(Insurance Services Office, Inc.) separation of insureds provision with no insured versus insured exclusions or limitations.

m. **Alternative Risk Financing Programs.** The Licensor reserves the right to review, and then approve, Licensee use of self-insurance, risk retention groups, risk purchasing groups, pooling arrangements and captive insurance to satisfy the Required Insurance provisions. The County and its Agents shall be designated as an Additional Covered Party under any approved program.

n. **Licensor Review and Approval of Insurance Requirements.** The Licensor reserves the right to review and adjust the Required Insurance provisions conditioned upon Licensor's determination of changes in risk exposures.

8. **INSURANCE COVERAGE REQUIREMENTS – TYPES AND LIMITS**

a. **Commercial General Liability** insurance (providing scope of coverage equivalent to ISO policy form CG 00 01), naming County and its Agents as an additional insured, with limits of not less than the following:

General Aggregate:	$ 2 million
Products/Completed Operations Aggregate:	$ 1 million
Personal and Advertising Injury	$ 1 million
Each Occurrence:	$ 1 million

b. **Automobile Liability** insurance (providing scope of coverage equivalent to ISO policy form CA 00 01) with a limits of not less than $1 million for bodily injury and property damage, in combined or equivalent split limits, for each single accident. Insurance shall cover liability arising out of Licensee's use of autos pursuant to this License, including owned, leased, hired, and/or non-owned autos, as each may be applicable.

c. **Workers Compensation and Employers' Liability** insurance or qualified self-insurance satisfying statutory requirements, which includes Employers' Liability coverage with limits of not less than $1 million per accident. If Licensee will provide leased employees, or, is an employee leasing or temporary staffing firm or a professional employer organization (PEO), coverage also shall include an Alternate Employer Endorsement (providing scope of coverage equivalent to ISO policy form WC 00 03 01 A) naming the County as the Alternate Employer, and the endorsement form shall be modified to provide that Licensor will receive not less than thirty (30) days advance written notice of cancellation of this coverage provision. If applicable to Licensee's operations, coverage also shall be arranged to satisfy the requirements of any federal workers

or workmen's compensation law or any federal occupational disease law.

9. **OPERATIONAL RESPONSBILITIES: Licensee shall:**

a. Comply with and abide by all applicable rules, regulations and reasonable directions of Licensor; designate and provide Licensor with the name(s) and phone contact number(s) of Licensee's responsible representative(s) who shall be on the Premises during the hours Licensee is conducting supervised apprentice training activities in accordance with written specifications submitted by Licensor pursuant to this License.

b. Licensor's representative, [Name], [Title], [Agency's Name], (xxx) xxx-xxxx phone, (xxx) xxx-xxxx cell shall provide specifications and detailed scope of work, inspect Licensee's work and reasonably determine whether or not it was completed in accordance with Licensor's specifications. In addition, the quality and workmanship must meet minimum industry standards. At the completion of each project, the Department, through the [Agency's Name] shall issue a Notice of Project Acceptance. If the improvements are unacceptable, within fifteen (15) County business days after inspection of the specific project, Licensor shall provide Licensee with a list of items that need to be corrected, or issuance of said notice will be delayed until all Project items are corrected.

c. Licensee is permitted access to the Premises from 7:00 a.m. to 6:00 p.m. weekdays, except when Licensee's permitted use conflicts with scheduled Park events or activities.

Contact [Park Superintendent's Name], [Name of Park] Superintendent, forty-eight (48) hours prior to Licensee's initial access to Premises and immediately in emergencies: phone number (xxx) xxx-xxxx, cell (xxx) xxx-xxxx, fax (xxx) xxx-xxxx, and e-mail address [_____@parks.lacounty.gov]. [Name of Licensee's emergency contact], [Title] is Licensee's emergency contact who can be reached at (xxx) xxx-xxxx by phone, and (xxx) xxx-xxxx, by cell phone.

d. At or before the time proof of insurance is submitted, provide Licensor with the names, license numbers, business addresses, and phone numbers of any and all of Licensee's contractors who will be entering the Premises.

e. Take the following precautions prior to commencing permitted activities: contact Underground Service Alert (USA) to locate utilities in or near the Premises; review park irrigation/utility plans; walk the Premises and Licensee's access route with Park

personnel to flag irrigation/utility lines, sprinkler heads, valve boxes, etc. Notwithstanding said precautions, Licensee agrees to repair or replace any pipelines, sprinkler heads, valve boxes, etc. damaged during the course of exercising the permission herein given.

f. Maintain the Premises and surrounding area in a safe and sound condition. Licensee shall ensure staging area is secured by existing chain link fence and locked gates.

g. Provide all safety and security signs, barricades, pedestrian and traffic cones, lights and other related safety features to prevent vehicular accidents, personal injury, and property damage due to Licensee's activities.

h. Assume the risks and bear all costs of damage or destruction, and loss due to theft, burglary or vandalism to any and all of Licensee's equipment, materials, tools, and vehicles owned hired, leased, or used by Licensee for this License, except to the extent that such damage or destruction and loss result from the negligence or willful misconduct of Licensor.

i. Repair or replace, to the satisfaction of Licensor, any and all of Licensor property lost, damaged, or destroyed as a result of Licensee's use of the Premises and activities. Should Licensee fail to promptly make repairs or replacements to Licensor's satisfaction, Licensor may have these repairs made at Licensee's sole cost and expense.

11. **INDEPENDENT STATUS:** This License is by and between Licensor and Licensee. It is not intended and shall not be construed to create the relationship of agent, servant, employee, partnership, joint venture or association as between Licensor and Licensee. Licensee understands and agrees to bear the sole responsibility and liability for furnishing Workers' Compensation benefits to any person for injuries arising from or connected with services performed on behalf of Licensee pursuant to this License.

12. **EMPLOYEES:** All references to the "Licensee" herein are deemed to include the employees, agents, contractors, apprentices and anyone else required under written contract with Licensee to access the Premises.

13. **LIMITATIONS:** It is expressly understood that in licensing the right to use said Premises, no estate or interest in real property is being conveyed to Licensee, and that the right to use is only a nonexclusive, revocable and unassignable permission to use the Premises in accordance with the terms and conditions of this License.

14. **AMENDMENTS:** The terms of this License may be amended by the Director upon mutual agreement of Licensor and Licensee with either party

giving the other prior written notice explaining why the amendment is being requested.

15. **ASSIGNMENT:** This License is personal to Licensee, and any attempt to assign or transfer same in whole or part without Licensor's prior written consent shall immediately terminate all of Licensee's rights hereunder.

16. **AUTHORITY TO STOP:** In the event that an authorized representative of Licensor finds that Licensee's activities on the Premises unnecessarily endanger the health or safety of persons on or near said Premises, the representative may require that this License immediately be suspended until said endangering activities cease, or until such action is taken to eliminate or prevent the endangerment.

17. **DEFAULT:** This License may be immediately revoked by Licensor in the event of any failure or refusal on the part of Licensee to keep or perform any of the terms or conditions herein. Notice of revocation shall be given as provided by Section 5 of this License. Failure by Licensor to revoke this License for noncompliance of the terms or conditions by Licensee shall not constitute a waiver of the terms or conditions.

18. **TERMINATION:** This License may be terminated at anytime without cause for any reason or no reason at all at the option of Licensor by giving 5 days' notice of termination.

19. **RESTORATION OF PREMISES:** Upon any termination of this License, Licensee shall surrender the Premises in a neat and clean condition. Licensee shall complete restoration of the licensed area to its original condition or better prior to termination of this License. Restoration of the Premises shall include, but not be limited to, removal of all of Licensee's equipment, vehicles, trailers, containers, signs, litter, and debris. Licensee shall remove all improvements unless otherwise instructed in writing by Licensor. Licensor shall conduct an inspection of the Premises to determine if restoration has been completed by Licensee. If Licensor determines that restoration has not been completed upon expiration or termination of this License, Licensor may restore said Premises entirely at the reasonable expense of Licensee.

20. **ALTERATIONS AND IMPROVEMENTS:** Licensee has examined the Premises and knows the condition thereof. Licensee accepts the Premises in the present state and condition and waives any and all demand upon the County for alteration, repair, or improvement thereof. All betterments to the Premises shall become the property of County upon the termination of this License.

21. **COUNTY LOBBYIST ORDINANCE:** Licensee is aware of the requirements of Chapter 2.160 of the Los Angeles County Code with respect to County Lobbyists as such are defined in Section 2.160.010 of said code, and certifies full compliance therewith. Failure to fully comply shall constitute a material breach upon which Licensor may terminate or suspend this License.

22. **TRANSFER OF TITLE/PARK CLOSURE:** In the event Licensor transfers title of the Park and the licensed Premises to a newly-formed or existing governmental agency, this License shall be terminated on the date of said transfer to such agency, unless that agency agrees to assume this License. Licensor agrees to use its best efforts to obtain said assignment in the event Licensor transfers title of the Park to a newly-formed or existing governmental agency. In the event Licensor closes the Park this License shall terminate upon the effective date of such closure. Licensor shall provide written notice to Licensee immediately upon any consideration by the Licensor of the possibility of transferring or closing the Park. Licensor shall provide Licensee with as much prior written notice of any such transfer or closure of the Park as reasonably possible before the effective date of any such transfer or closure.

Identification of Property Boundary and Fence Lines; Request for Stamped Survey

Diane Thorne <dthorne@parks.lacounty.gov> Tue, Feb 12, 2013 at 11:32 AM
To: Nima Tehrany <nimatehrany@gmail.com>
Cc: James Barber <jbarber@parks.lacounty.gov>, Guillermo Najar <gnajar@parks.lacounty.gov>, Natasha Robinson <NRobinson@parks.lacounty.gov>

Nima,

Attached is the "Plat of Proposed Acquisition" by Buck showing the survey of proposed fence line in 2006; and the County Assessor's map showing your property (2323 Lorenzo Drive) in green and Lot 45 in pink.

1) Identify your current property boundary, and please confirm if lot 45 highlighted in pink is part of your property on the County Assessor's Map.

2) Identify existing fence line on County Assessor's Map.

3) Identify proposed fence line on County Assessor's Map.

The Department is requesting a current stamped survey showing property boundaries and new fence line. Based on the 2006 survey (Plat Map) and 2013 Assessor Map (attached) it appears that the property lines have changed over the years.

C

COUNTY OF LOS ANGELES
DEPARTMENT OF PARKS AND RECREATION
"Parks Make Life Better!"
Russ Guiney, Director John Wicker, Chief Deputy Director

March 26, 2013

Mr. Nima M. Tehrany
2323 Lorenzo Drive
Los Angeles, California 90068

Dear Mr. Tehrany:

JOHN ANSON FORD AMPHITHEATRE
REQUEST TO REPLACE COUNTY FENCE

In February 2013 you contacted Jim Park with the Planning Division of Los Angeles County Department of Parks and Recreation while you were in escrow for the purchase of the property located at 2323 Lorenzo Drive, Los Angeles, California 90068. You requested permission to replace approximately 160 feet of the County's chain link fence located within approximately 12 feet of the John Anson Ford Amphitheatre property line.

The Department does not issue licenses to the public for the purpose of replacing fencing on County property. However, our Department's Regional Facilities Agency was notified of the fencing issue at John Anson Ford Amphitheatre and the fence was repaired on March 20, 2013.

Thank you for your request.

Sincerely,

Kathline King

Kathline King
Chief of Planning
Planning Division

EMBRACING THE RISE

Ben Feldmann, a Senior Associate with ML+A, is both landscape architect and urban designer who emphasizes the integration of sustainable methodologies, contextual adaptation, and systems thinking. He brings over 12 years of experience working on projects throughout California and the U.S. as well as abroad including Asia, Central America and Europe. Furthering the aim for resilient communities and urban regeneration, Ben seeks out solutions that greatly enhance living environments, evoking ecological synergies between built, social and natural realms. His design approach looks to provide innovative solutions that build upon the unique qualities to the site's context, climate and character.

PROFESSIONAL EXPERIENCE

2010-Present	Mia Lehrer + Associates, Senior Associate
2008-2010	Perkins + Will, Senior Urban Designer
2006-2010	BVF Designs, Independent Consultant
2006-2007	Institute of Urban and Regional Development, University of California Berkeley, Consultant
2004-2005	Centro de Diseño Arquitectura y Construcción, Tegucigalpa, (CEDAC) Honduras, Instructor
2000-2004	Hellmuth, Obata+Kassabaum, Inc. (HOK), Associate

ACADEMIC EXPERIENCE

2011	Coordinator, XED Course, *Landscape Urbanism: Recalibrating the Megalopolis,* University of Southern California
2010	Guest Juror, Landscape Architecture Department, University of Southern California
2007-2010	Guest Juror and Visiting Lecturer, College of Environmental Design, University of CA, Berkeley

RELEVANT PROJECT EXPERIENCE
Cidade da Copa, Schematic Design – Recife, Brazil
Confluence Park – Los Angeles, CA
John Anson Ford Amphitheater – Los Angeles, CA
North Atwater Multi-Modal Crossing – LA River, Los Angeles, CA
Nuevo Sur Mixed Use Development, Urban Plan and Site Design – Monterrey, Mexico
Piggyback Yard Conceptual Master Plan – Los Angeles, CA
Rio 2016 Olympic Park Master Plan Competition – Sao Paulo, Brazil
Santa Monica Civic Auditorium Master Plan – Santa Monica, CA
Tiete River Conceptual Study – Sao Paulo, Brazil
Union Station Master Plan – Los Angeles, CA
Wilshire Boulevard Temple Camps & Conference Center, Ventura County Line Master Plan – Los Angeles, CA

Draft EIR

Appendix C
Air Quality Worksheets
June 2014

Appendix C

- Calculation of SCAQMD LSTs
- Air Quality Construction CalEEMod Output File
- Air Quality Operation CalEEMod Model Outputs
    - Project (2020)
    - No Project (2020)
    - Project (2014)
    - No Project (2014)

Ford Theaters Project
Draft EIR

June 2014

- Calculation of SCAQMD LSTs

Step 1. Determine Allowable Increase using 98th percentile NO2 and Max NO2 data

Central Los Angeles NO2 Monitoring Data

SRA	Station	AQMD Design Value 98th					Threshold (ppb)	Allowable Increase (ppb)
		2010-2012	2009	2010	2011	2012		
Central Los Angeles County	Downtown LA	68.8	75	71	67	69	100	31

SRA	Station	Design Value	Max Hourly, ppb				Threshold (ppb)	Allowable Increase (ppb)
		2006-2008	2009	2010	2011	2012		
Central Los Angeles County	Downtown LA	122	115	89	110	77	180	58

Max Hourly vs. 98th Percentile Ratio (Allowable Increase)	54

Step 2. Use ratio in Step 1 to determine LST lookup value. Extrapolate Interpolate LST look-up value for project area

LST Threshold (SRA 1, 100 meter receptor)

Project Size (acres)	NO2 (lbs day)	98th Percentile NO2 (lbs day)	CO (lbs day)	PM10 (lbs day)	PM2.5 (lbs day)
5	165	89	3030	69	18

Ford Theaters Project
Draft EIR

June 2014

- Air Quality Construction CalEEMod Output File

Ford Theatre Construction (Peak Construction)

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	21.23	1000sqft	0.49	21,230.00	0
Enclosed Parking Structure	150.00	Space	1.35	60,000.00	0
Arena	16.30	1000sqft	5.24	16,300.00	0

Ford Theater Future Project Condition-Event Day (2020-Operation)

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	35.95	1000sqft	0.83	35,945.00	0
Enclosed Parking with Elevator	700.00	Space	6.30	280,000.00	0
City Park	1.00	Acre	1.00	0.00	0
Fast Food Restaurant w/o Drive Thru	6.40	1000sqft	0.15	6,400.00	0
Movie Theater (No Matinee)	1,598.00	Seat	0.83	37,646.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	11			**Operational Year**	2020
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	840	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments □ Non-Default Data

Project Characteristics - Correction factor applied to CO2 intensity factor to represent 2020 conditions.

Land Use - Site Specific

Vehicle Trips - Site Specific

Energy Use - Ampitheater conservatively assumed to be a movie theater.

LIST OF FIGURES

LIST OF TABLES

1.0 INTRODUCTION

This report presents the findings of a general biological resource assessment for the Ford Theatres Project (project). The purpose of this assessment is to describe the existing biological resources in the Biological Study Area (BSA) and assess the potential impacts associated with implementation of the project, as required by the California Environmental Quality Act (CEQA). This report incorporates the findings of a literature review and field surveys conducted by GPA biologists Sheri Mayta and Jennifer Morrison on December 11 and December 16, 2013.

1.1 Project Description

The County of Los Angeles (County) proposes improvements to the Ford Theatres located at 2580 Cahuenga Boulevard East in the Hollywood Community of the City of Los Angeles (Los Angeles) (see **Figure 1** and **Figure 2**). The project is located within a 32-acre County regional park located approximately six miles northwest of downtown Los Angeles and approximately 12 miles east of the Pacific Ocean. The Ford Theatres, one of the oldest performing arts venues in Los Angeles, are operated through a three-way partnership between the County's Department of Parks and Recreation, the County's Arts Commission, and the Ford Theatre Foundation.

The project includes the rehabilitation of portions of the existing 1,196-seat amphitheatre and the development of approximately 59,230 square feet of new buildings and approximately 48,750 square feet of outdoor plaza areas (see **Figure 3**). These improvements, which would be developed in several phases, would include a 299-seat theatre, a multi-purpose flex space, restaurant, office spaces, and enhanced parking facilities and visitor amenities. The project would also provide for improved exterior landscape areas and enhanced vehicle and pedestrian circulation. An approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the project is proposed.

These improvements would enhance existing facilities and provide for new artistic programming opportunities that together would transform the existing Ford Theatres from a performing arts facility open primarily on weekends, to a multi-use cultural and recreational center open daily for a wide variety of users.

2.0 REGULATORY SETTING

Certain ecological communities, plants, and animal species may be designated as "sensitive" or "protected" based on their low abundance, risk of extinction, restricted distribution, and/or unique habitat requirements. Generally, if a plant or animal species or ecological community has one or more of the above characteristics, it will receive a sensitive or protected status from state or federal resource agencies if, after an appropriate status review, the involved resource agency concludes that protection for the species or ecological community is warranted.

FIGURE 3. CONCEPTUAL SITE PLAN FULL BUILD OUT
Ford Theatres Project

N

After a species or ecological community receives protected status, it is essential that any action undertaken by, funded by, or approved by a state or federal agency does not adversely affect the sensitive/protected species, or their habitats. State and federal laws and regulations have therefore been created to ensure projects do not affect listed species and their habitats.

The following discussion provides a summary of state, federal, and local laws and regulations that pertain to sensitive or protected species and their habitats within or near the BSA.

2.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) requires federal agencies to ensure that actions they engage in, permit, or fund do not jeopardize the continued existence of federally listed endangered or threatened species, or result in the destruction or adverse modification of designated critical habitat for these species. Section 10 of the FESA allows for the "incidental take" of federally listed endangered or threatened species by non-federal agencies through the issuance of an incidental take permit. In order to obtain an incidental take permit, a Habitat Conservation Plan must be submitted to the appropriate federal agency, specifying the impacts that would result from the project, and how these impacts would be minimized or mitigated. According to the California Department of Fish and Wildlife (CDFW) California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the BSA.

Because there is suitable habitat for the federally-listed California coastal gnatcatcher (*Polioptila californica californica*), additional surveys are required to determine if this species is within the BSA. If gnatcatchers are found within the BSA, and if project activities could result in adverse impacts on this species, then Section 10 consultation with the U.S. Fish and Wildlife Service (USFWS) and a Habitat Conservation Plan may be required. According to the CDFW California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the BSA.

2.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (50 CFR Part 10 and Part 21), and the California Fish and Game Code (Sections 3503, 3513, and 3800), protect migratory birds, their occupied nests, and their eggs from disturbance or destruction. "Migratory birds" include all nongame, wild birds found in the U.S., except for the house sparrow (*Passer domesticus*), European starling (*Sturnus vulgaris*), and rock pigeon (*Columba livia*). Because there is suitable foraging and nesting habitat in the BSA, there is potential for migratory birds to be in the BSA; therefore, compliance with the MBTA is required.

2.3 California Environmental Quality Act

Section 15380 of the CEQA Guidelines requires that species of special concern be included in an analysis of project impacts. California Species of Special Concern ("special" animals and plants) include special-status species and all state and federal protected and candidate species, Bureau of Land Management, and U.S. Forest Service sensitive species. Species considered declining or rare by the California Native Plant Society (CNPS) or National Audubon Society, and a selection of species which are considered to be

under population stress but are not formally proposed for listing, are also included under species of special concern.

2.4 California Endangered Species Act

State-listed species and those petitioned for listing by the CDFW are fully protected under the California Endangered Species Act (CESA). Under Section 2080.1 of the California Fish and Game Code, if a species is both federally and state listed, a consistency determination agreeing with the protections outlined in the FESA permits is required if a project would impact a listed species. Under Section 2081, if a species is state-listed only, consultation with CDFW is required in order to obtain an incidental take permit if the project could result in take of a state-listed species. If no take would result, concurrence with the CDFW is required. Because no species listed by the state as threated or endangered are expected to be in the project area during construction, no consultation with the CDFW for impacts on state-listed threatened or endangered species is required.

2.5 Natural Community Conservation Planning Act of 2003

The Natural Community Conservation Planning (NCCP) program was developed under California's Natural Community Conservation Planning Act of 1991 (superceded by NCCP Act of 2003), and is a cooperative effort to protect habitats and species that have begun to decline. The primary objective of the program is to conserve natural communities while accommodating compatible land use. A local agency works with landowners and environmental organizations, with guidance from CDFW and USFWS, to develop a natural community conservation plan.

2.6 Los Angeles County General Plan

The Conservation/Open Space Element of the Los Angeles County General Plan includes the Significant Ecological Area (SEA) Program. SEAs support valuable habitat for rare, threatened, or endangered species, and are important for the conservation of biological diversity in the county. The objective of the SEA Program is to preserve the genetic and physical diversity of the county by designing biological resource areas that are self-sustaining. The program intends to ensure that privately held lands within the SEAs retain the right of reasonable use, while avoiding activities and development projects that are incompatible with the long-term survival of the SEAs. The Griffith Park SEA is approximately 0.50 mile north of the BSA; however, there are no SEAs in the BSA.

2.7 Los Angeles County Oak Tree Ordinance

The Los Angeles County Oak Tree Ordinance was established to recognize oak trees as significant, historical, aesthetic, and ecological resources. Under the Los Angeles County Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any oak tree (*Quercus* sp.) eight inches or more in diameter at four and one-half feet above mean natural grade. For oaks with multiple trunks, this includes a combined diameter of 12 inches or more for the two largest trunks. Five oak trees were identified during tree surveys measuring four, eight, 10, 12, and 14 inches at four and one-half feet above mean natural grade.

3.0 METHODS OF STUDY

3.1 Delineation of the Biological Study Area

The BSA is defined as the area that could be impacted by the project, either temporarily or permanently, and includes areas that could be indirectly affected by noise or other disturbances. The BSA includes the three primary theatre improvement areas and the proposed trail alignment, and encompasses approximately 18.2 acres of land (see **Figure 4)**. Area A (amphitheatre) includes the amphitheatre and adjacent vegetated hillside; Area B (Ford Theatres) includes the indoor theatre, office, conference room, stacked parking lot, Friends of the Ford Theatres parking lot, ticketing booths, and surrounding vegetation; and Area C (transit plaza) includes the parking lot, office buildings, flex space, and surrounding vegetation (see **Figure 3**). The trail area consists of the proposed trail alignment corridor and includes a 15-foot buffer on either side of the trail.

3.2 Literature Review

Relevant literature on the biological resources documented near the BSA was reviewed, including the California Natural Diversity Database (CNDDB), managed and updated periodically by the CDFW (see **Attachment A**). A database query was run for the Hollywood, Inglewood, Venice, Beverly Hills, Pasadena, Van Nuys, Burbank, Los Angeles, and South Gate 7.5-minute U.S. Geological Survey (USGS) quadrangles from the CNDDB Rarefind 5 online database. A review of the USFWS official species list of species designated as threatened or endangered under the FESA that have potential to be in the BSA was also completed. The CDFW Biogeographic Information and Observation System Habitat Connectivity Viewer was reviewed to determine habitat connectivity in the BSA.

3.3 Field Investigation

The BSA was surveyed on December 11 and December 16, 2013 by GPA biologists Sheri Mayta and Jennifer Morrison. All vegetation communities within the BSA were visually surveyed on foot, and all plant and wildlife species within the BSA were inventoried to the extent feasible to verify the presence or absence of protected species (see **Attachment A**).

Based on the results of the initial surveys, there is suitable habitat for coastal California gnatcatcher in the BSA, and protocol-level surveys would need to be conducted following USFWS protocol to determine presence or absence of this species in the BSA prior to construction. Additional botanical surveys would also need to be completed during the appropriate blooming periods (May – June) for several rare plant species, including slender mariposa-lily (*Calochortus clavatus* var. *gracilis*), plummer's mariposa-lily (*Calochortus plummerae*), Parry's spineflower (*Chorizanthe parryi* var. *parryi*), Mesa horkelia (*Horkelia cuneata* var. *puberula*), Palmer's grapplinghook (*Harpagonella palmeri*), and Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*) in order to rule out the potential for special-status plant species in the BSA.

CONSULTING GPA

FIGURE 4. BSA MAP
Ford Theatres Project

N

4.0 EXISTING CONDITIONS

4.1 Plant Communities

The BSA is located in the Hollywood Hills, and the primary plant communities include chaparral, ruderal, and landscaped areas (see **Figure 5**). The chaparral communities are on the hillside to the east of the office buildings and theatre. Ornamental and ruderal plant communities border the parking lot of the office building complex. Non-native ornamental species have also been planted south and east of the theatre to provide an aesthetically pleasing backdrop to the theatre stage and at the entrance to the parking lots and ticketing booth of the theatre.

4.1.1 Chaparral

The hillside surrounding the theatre and office buildings in Areas A and C, and the proposed trail alignment, are vegetated with native chaparral species. The dominant species are laural sumac (*Malosma laurina*), California buckwheat (*Eriogonum fasiculatum*), and black sage (*Salvia mellifera*). Co-dominant species include California brickelbush (*Brickellia californica*) and non-native annual grasses. A complete list of plant species observed in the BSA is included in **Attachment B** and photographs of the project area are provided in **Attachment C**.

4.1.2 Ornamental

The terraces at the foot of the hillside in Area A, and at the entrance to the parking lots and theatre ticketing booth in Areas B and C, are planted with non-native ornamental plant species. The most common species observed include juniper (*Juniperus chinensis*), Mexican fan palm (*Washingtonia robusta*), and lantana (*Lantana* sp.) There is an overstory of pine species (*Pinus* sp.), which were likely planted in the BSA. Five oak trees were identified during tree surveys measuring four, eight, 10, 12, and 14 inches at four and one-half feet above mean natural grade.

4.2 Wildlife Populations

Wildlife species observed during the biological field surveys include black phoebe (*Sayornis nigricans*), California towhee (*Melozone crissalis*), yellow-rumped warbler (*Setophaga coronata*), Anna's hummingbird (*Calypte anna*), American crow (*Corvus brachyrhynchos*), red-tailed hawk (*Buteo jamaicensis*), turkey vulture (*Cathartes aura*), western scrub jay (*Aphelocoma californica*), woodpecker (*Picoides* sp.), kingbird (*Tyrannus* sp.), and western fence lizard (*Sceloporus occidentalis*). Based on personal communication with an on-site theatre production manager, mule deer (*Odocoileus hemionus*), bobcats (*Lynx rufus*), and coyotes (*Canis latrans*) are also known to forage in the BSA, and an individual mountain lion (*Puma concolor*) is known to frequent the Griffith Park area. Deer and coyote scat were observed in the hills above the theatre during surveys.

FIGURE 5. BIOLOGICAL RESOURCES MAP
Ford Theatres Project

N

4.3 Regional Connectivity/Wildlife Movement Corridor Assessment

According to the CDFW Biogeographic Information and Observation System Habitat Connectivity Viewer, the BSA is within an undisturbed habitat block that includes native plant and wildlife species; therefore, the area may be used for local wildlife movement. However, the BSA is not designated as a regional wildlife linkage area in the County of Los Angeles General Plan. Griffith Park, approximately 0.5 mile north of the BSA, is designated as a SEA and would likely be used for regional wildlife movement in the area.

The BSA is in the Hollywood Hills and is bordered by Cahuenga Boulevard and U.S. 101 to the west, residential development to the south, open land to the east and north, and the Hollywood Reservoir to the northeast. The project area is situated directly adjacent to Cahuenga Boulevard and U.S. 101, which presents a physical barrier to wildlife movement to or from the areas west of the BSA; therefore, wildlife movement would likely be limited to local movement within the adjacent open space to the north, south, and east of the project area.

5.0 SENSITIVE RESOURCES WITH THE POTENTIAL TO BE IN THE BSA

The following discussion describes the sensitive plant and wildlife species with potential to be within the BSA based on their geographical range. These species have been afforded special status and/or protection by federal, state, or local resource conservation agencies and organizations because of the species' limited or declining population size or limited distribution. Also discussed are habitats that are of relatively limited distribution or of particular value to wildlife. Determinations on whether sensitive resources could potentially be in the BSA are based on: (1) a record reported in the CNDDB and/or (2) the presence of suitable habitat.

5.1 Special-Status Plant Communities

No special-status plant communities are located in the BSA. Native plant communities in the BSA include chaparral scrub, common in undeveloped areas of southern California.

5.2 Special-Status Plant Species

Table 1 describes the special-status plant species that have been documented in the geographic area, their habitat requirements, and the potential for them to be in the BSA.

Table 1: Special-Status Plant Species with the Potential to be in the BSA Based on Geographical Range

Common and Scientific Names	Status/Rank			General Habitat Requirements	Presence/ Absence	Potential to be in the BSA
	Federal USFWS	State CDFW	CNPS			
Arenaria paludicola Marsh sandwort	FE	SE	1B.1	Perennial herb found in swamps and freshwater marsh areas along the Pacific Coast. Blooming period: May to	A	There are no swamps or freshwater marshes in the BSA; therefore, there is

				August Elevation: 10-558 feet		no potential for this species to be in the BSA.
Astragalus brauntonii Braunton's milk-vetch	FE	--	1B.1	Perennial herb associated with fire dependent chaparral habitat and is often found growing in disturbed areas, along fire roads or in areas with low competition. Requires gravelly clay soils. Blooming period: January - August Elevation: 13 - 2,100 feet	A	There are no gravelly clay soils in the BSA; therefore, there is no potential for this species to be in the BSA.
Astragalus pycnostachyus var. *lanosissimus* Ventura Marsh milk-vetch	FE	SE	1B.1	Herbaceous perennial that is associated with dune or coastal shrub vegetation. Blooming period: June to October Elevation: 3-115 feet	A	There is no dune or coastal shrub habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
Astragalus tener var. *titi* Coastal dunes milk-vetch	FE	SE	1B.1	Annual herb found in moist depressions on clay soils or coastal dunes or grasslands. Blooming period: March - May Elevation: 3 -164 feet	A	There are no clay soils or coastal dunes or grasslands in the BSA; therefore, there is no potential for this species to be in the BSA.
Atriplex parishii Parish's brittlescale	--	--	1B.1	Annual herb found in playas and vernal pools in alkaline or clay soils. Blooming period: June - October Elevation: 82 -6,234 feet	A	There are no playas or vernal pools in the BSA; therefore, there is no potential for this species to be in the BSA.
Atriplex serenana var. *davidsonii* Davidson's saltscale	--	--	1B.2	Annual herb found in alkaline flats in association with coastal bluff scrub and coastal scrub. Blooming period: April to October Elevation: 32 – 656 feet	A	There is no coastal bluff scrub or coastal scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Berberis nevinii Nevin's barberry	FE	SE	1B.1	Evergreen shrub found on sandy soils, along gravelly wash margins, or coarse soils on steep generally	A	There are no sandy soils or gravelly wash margins in the BSA; therefore, there is no potential

				north-facing slopes. Blooming period: March - June Elevation: 900-2,707 feet		for this species to be in the BSA.
California macrophylla Round-leaved filaree	--	--	1B.1	Annual herb found in valley grassland and foothill woodland in clay soils. Blooming period: March - May Elevation: 50-3,937 feet	A	There is no valley grassland or foothill woodland in the BSA; therefore, there is no potential for this species to be in the BSA.
Calochortus clavatus var. *gracilis* Slender mariposa-lily	--	--	1B.2	Perennial herb found in foothill canyons, chaparral and coastal scrub. Blooming period: March - June Elevation: 1,050 – 3,281 feet	Potential	There is chaparral habitat in the BSA, and there is potential for this species to be in the BSA. Additional surveys during the blooming season are required to confirm presence or absence.
Calochortus plummerae Plummer's mariposa-lily	--	--	4.2	Perennial herb found in chaparral, foothill woodland, yellow pine forest, coastal sage scrub and valley grassland. Blooming period: May - July Elevation: 328 – 5,577 feet	Potential	There is chaparral habitat in the BSA, and there is potential for this species to be in the BSA. Additional surveys during the blooming season are required to confirm presence or absence.
Calystegia sepium ssp. *binghamiae* Santa Barbara morning-glory	--	--	1B.1	Perennial herb found in coastal marshes and wetland-riparian areas. Blooming period: April - May Elevation: zero – 66 feet	A	There are no coastal marshes or wetland-riparian areas in the BSA; therefore, there is no potential for this species to be in the BSA.
Centromadia parryi ssp. *australis* Southern tarplant	--	--	1B.1	Annual herb found in seasonally moist grasslands and lowlands near the coast. Blooming period: May - November Elevation: zero – 1,394	A	There are no seasonally moist grasslands or lowlands in the BSA; therefore, there is no potential for this species to be in the

				feet		BSA.
Chaenactis glabriuscula var. *orcuttiana* Orcutt's pincushion	--	--	1B.1	Annual herb found in coastal dunes and coastal bluff scrub in Southern California. Blooming period: January - August Elevation: zero -328 feet	A	There are no coastal dunes or coastal bluff scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Chenopodium littoreum Coastal goosefoot	--	--	1B.2	Annual herb found in coastal dunes. Blooming period: April - August Elevation: 32- 98 feet	A	There are no coastal dunes in the BSA; therefore, there is no potential for this species to be in the BSA.
Chloropyron maritimum ssp. maritimum Salt marsh bird's-beak	FE	SE	1B.2	Hemiparasite annual herb found in coastal dunes and salt marsh habitat. Blooming period: May - October Elevation: zero – 98 feet	A	There are no coastal dunes or salt marsh habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
Chorizanthe parryi var. *fernandina* San Fernando Valley spineflower	FC	SE	1B.1	Annual herb associated with coastal sage scrub and valley and foothill grassland. Blooming period: April - July Elevation: 492 – 4,003 feet	A	There is no coastal sage scrub or valley and foothill grassland habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
Chorizanthe parryi var. parryi Parry's spineflower	--	--	1B.1	Annual herb found in chaparral and coastal sage scrub communities. Blooming period: April - June Elevation: 902 – 4,003 feet	Potential	There is chaparral habitat in the BSA and there is potential for this species to be in the BSA. Additional surveys during the blooming season are required to confirm presence or absence.
Dithyrea maritima Beach spectaclepod	--	ST	1B.1	Perennial herb found in coastal dunes and coastal scrub in sandy soils. Blooming period: March - May	A	There are no coastal dunes or coastal scrub in the BSA; therefore, there is no potential for this species to be in the

				Elevation: 10 -164 feet		BSA.
Dodecahema leptoceras Slender-horned spineflower	FE	SE	1B.1	Annual herb found in chaparral and coastal sage scrub in sandy, alluvial fan soils. Blooming period: April - June Elevation: 656 – 2,493 feet	A	There are no coastal sage scrub or alluvial fan soils in the BSA; therefore, there is no potential for this species to be in the BSA.
Dudleya multicaulis Many-stemmed dudleya	--	--	1B.2	Perennial herb found in chaparral, valley grassland, and coastal sage scrub in clay soils. Blooming period: April - July Elevation: 49 – 2,592 feet	A	There is no valley grassland, coastal sage scrub, or clay soils in the BSA; therefore, there is no potential for this species to be in the BSA.
Harpagonella palmeri Palmer's grapplinghook	--	--	4.2	Annual herb found in chaparral, coastal scrub, and valley and foothill grassland. Blooming period: March – May Elevation: 66 – 3,133 feet	Potential	There is chaparral habitat in the BSA; therefore, there is potential for this species to be in the BSA. Additional surveys during the blooming season are required to confirm presence or absence.
Helianthus nuttallii ssp. parishii Los Angeles sunflower	--	--	1A	Perennial herb found in freshwater and salt marshes. Blooming period: August - October Elevation: 32-5,495 feet	A	There are no freshwater or salt marshes in the BSA; therefore, there is no potential for this species to be in the BSA.
Horkelia cuneata var. puberula Mesa horkelia	--	--	1B.1	Perennial herb found in cismontane woodland, chaparral, and coastal sage scrub in sandy or gravelly soils. Blooming period: February - September Elevation: 230 – 2,657 feet	Potential	There is chaparral habitat in the BSA; therefore, there is potential for this species to be in the BSA. Additional surveys during the blooming season are required to confirm presence or absence.

Lasthenia glabrata ssp. *coulteri* Coulter's goldfields	--	--	1B.1	Annual herb found in salt marshes, playas and vernal pools and associated with alkali sinks. Blooming period: February - June Elevation: 3 – 4,003 feet	A	There are no salt marshes, playas, or vernal pools in the BSA; therefore, there is no potential for this species to be in the BSA.
Lepidium virginicum var. *robinsonii* Robinson's pepper-grass	--	--	4.3	Annual herb found in chaparral and coastal scrub habitats. Blooming period: January – July Elevation: 3 – 2,904 feet	Potential	There is chaparral habitat in the BSA; therefore, there is potential for this species to be in the BSA. Additional surveys during the blooming season are required to confirm presence or absence.
Malacothamnus davidsonii Davidson's bush-mallow	--	--	1B.2	Perennial shrub found in riparian habitat in chaparral, northern coastal scrub and coastal sage scrub communities. Blooming period: June - January Elevation: 607 – 2,805 feet	A	There is no riparian habitat or coastal scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Nama stenocarpum Mud nama	--	--	2B.2	Found in riparian habitat along lake-margins and stream banks. Blooming period: January - July Elevation: 16 – 1,640 feet	A	There is no riparian habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
Nasturtium gambelii Gambel's water cress	FE	ST	1B.1	Perennial herb found in undisturbed freshwater habitats and marshes and swamps. Blooming period: April - October Elevation: 16 – 1,083 feet	A	There are no undisturbed freshwater habitats or marshes in the BSA; therefore, there is no potential for this species to be in the BSA.
Navarretia fossalis Spreading navarretia	FT	--	1B.1	Annual herb found in freshwater-marsh and vernal-pool habitats. Blooming period: April - June Elevation: 98 – 2,149 feet	A	There are no freshwater marshes or vernal pool habitats in the BSA; therefore, there is no potential for this species to be in the

						BSA.
Navarretia prostrata Prostrate vernal pool navarretia	--	--	1B.1	Annual herb found in coastal scrub, valley and foothill grasslands and vernal-pool habitat. Blooming period: April - July Elevation: 49 – 3,970 feet	A	There is no coastal scrub, valley and foothill grassland, or vernal pool habitats in the BSA; therefore, there is no potential for this species to be in the BSA.
Orcuttia californica California Orcutt grass	FE	SE	1B.1	Annual herb found in valley grassland and vernal-pools. Blooming period: April - August Elevation: 49 – 2,165 feet	A	There is no valley grassland or vernal pools in the BSA; therefore, there is no potential for this species to be in the BSA.
Phacelia stellaris Brand's star phacelia	FC	--	1B.1	Annual herb found in coastal dunes and is associated with coastal sage scrub. Blooming period: March - June Elevation: 3 -1,312 feet	A	There are no coastal dunes or coastal sage scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Potentilla multijuga Ballona cinquefoil	--	--	1A	Perennial herb found in meadows and associated with coastal sage scrub. Blooming period: June - August Elevation: zero – 7 feet	A	There are no meadows or coastal sage scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Pseudo-gnaphalium leucocephalum White-rabbit tobacco	--	--	2B.2	Perennial herb found on sandy or gravelly slopes, stream bottoms and is associated with riparian vegetation. Blooming period: July - December Elevation: zero - 6,890 feet	A	There are no sandy or gravelly slopes or riparian vegetation in the BSA; therefore, there is no potential for this species to be in the BSA.
Ribes divaricatum var. *parishii* Parish's gooseberry	--	--	1A	Perennial shrub found in riparian woodland and associated with coastal sage scrub. Blooming period: February - April Elevation: 213 – 984 feet	A	There are no riparian woodlands or coastal sage scrub in the BSA; therefore, there is no potential for this species to be in the BSA.

Sidalcea neomexicana Salt Spring checkerbloom	--	--	2B.2	Perennial herb found in playas, in chaparral, coastal scrub, and alkali sink communities. Usually found in wetlands. Blooming period: March - June Elevation: 49 – 5,020 feet	A	There is no playa habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
Symphyotrichum defoliatum San Bernardino aster	--	--	1B.2	Perennial herb found in woodland, coastal scrub, marshes and swamps, grassland and meadow habitat and in disturbed areas. Blooming period: July - November Elevation: 7 – 6,693 feet	A	There is no woodland, coastal scrub, marsh, swamp, or grassland and meadow habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
Symphyotrichum greatae Greata's aster	--	--	1B.3	Perennial herb found in damp areas in chaparral canyons. Blooming period: June-October Elevation: 984 - 6,594 feet	A	There are no damp areas in chaparral canyons in the BSA; therefore, there is no potential for this species to be in the BSA.

Federal Status USFWS Listing	**State Status CDFW Listing**	**CNPS Listing**
FE= Listed as endangered under the FESA	SE= Listed as endangered under the CESA	1A= Plant species that are presumed extinct in California
FT= Listed as threatened under the FESA	ST= Listed as threatened under the CESA	1B= Plant species that are rare, threatened, or endangered in California and elsewhere
FC= Candidate for listing (threatened or endangered) under the FESA	CSC= Species of Concern as identified by CDFW	2= Plant species that are rare, threatened, or endangered in California, but are more common elsewhere
		4 = Plants of limited distribution

5.3 Special-Status Wildlife Species

Table 2 describes the special-status wildlife species that have been documented in the geographic area, their habitat requirements, and the potential for them to be in the BSA.

Table 2: Special-Status Wildlife Species with the Potential to be in the BSA Based on Geographical Range

Common and Scientific Names	Status/Ranking		General Habitat Requirements	Presence/ Absence	Potential to be in the BSA
	Federal USFWS	State CDFW			
Invertebrates					
Brennania belkini Belkin's dune tabanid fly	--	S1S2	Found in coastal sand dunes of Southern California.	A	There are no coastal sand dunes in the BSA; therefore, there is no potential for this species to be in the BSA.
Carolella busckana Busck's gallmoth	--	SH	Found in coastal scrub dunes.	A	There are no coastal scrub dunes in the BSA; therefore, there is no potential for this species to be in the BSA.
Cicindela hirticollis gravida Sandy beach tiger beetle	--	CSC	Found along rivers, large lakes and seashores in areas of soft sandy substrates.	A	There are no soft sandy substrates in the BSA; therefore, there is no potential for this species to be in the BSA.
Cicindela senilis frosti Senile tiger beetle	--	S1	Found in coastal salt marshes and tidal mud flats as well as interior alkali mud flats.	A	There are no coastal salt marshes or tidal mud flats in the BSA; therefore, there is no potential for this species to be in the BSA.
Coelus globosus Globose dune beetle	--	S1	Found in coastal dunes, tunneling through sand underneath dune vegetation.	A	There are no coastal dunes in the BSA; therefore, there is no potential for this species to be in the BSA.
Danaus plexippus Monarch butterfly	--	S3	Adult monarchs require milkweed for breeding and as a food source for larvae. Monarchs roost in eucalyptus, Monterey pines, and Monterey cypresses in California.	A	There is no milkweed in the BSA; therefore, there is no potential for this species to be in the BSA.
Eucosma hennei Henne's eucosman moth	--	S1	Found in El Segundo sand dunes.	A	There are no sand dunes in the BSA; therefore, there is no potential for this species to be in the BSA.

Euphilotes battoides allyni El Segundo blue butterfly	FE	S1	Endemic to coastal sand dunes associated with coast buckwheat.	A	There are no sand dunes or coast buckwheat in the BSA; therefore, there is no potential for this species to be in the BSA.
Onychobaris langei Lange's El Segundo Dune weevil	--	S1	Found in El Segundo sand dunes in dune scrub plant communities.	A	There are no sand dunes in the BSA; therefore, there is no potential for this species to be in the BSA.
Panoquina errans Wandering skipper	--	S1	Found along the coast and inhabits ocean bluffs, and open areas near the ocean.	A	There are no ocean bluffs in the BSA; therefore, there is no potential for this species to be in the BSA.
Socalchemmis gertschi Gertsch's socalchemmis spider	--	S1	Found in sage scrub, chaparral, oak woodland, coniferous forest, and rocky habitats in non-arid climates.	Potential	There is sage scrub and chaparral in the BSA, and potential for this species to be in the BSA.
Trigonoscuta dorothea dorothea Dorthy's El Segundo Dune weevil	--	S1	Found along coastal southern California in dune scrub plant communities.	A	There are no dune scrub plant communities in the BSA; therefore, there is no potential for this species to be in the BSA.
Amphibians					
Emys marmorata Western pond turtle	--	CSC	Found in slow moving rivers, streams, lakes ponds, wetlands, reservoirs, and brackish estuarine waters. Prefer areas that provide logs, algae or vegetation for cover, and boulders for basking.	A	There are no logs, vegetation, or boulders in the river portion of the BSA, and the channel is concrete-lined. There is no potential for this species to be in the BSA.
Rana muscosa Sierra Madre yellow-legged frog	FE	CSC	Found in rocky, cool streams in mountainous areas from elevations of 7,513 ft. to 1,214 feet.	A	There are no rocky streams in the BSA; therefore, there is no potential for this species to be in the BSA.
Taricha torosa Coast range newt	--	CSC	Found in chaparral, oak woodland, and grasslands. In the terrestrial phase they can be found in rock crevices, under plant debris in	A	There is no aquatic habitat in the BSA; therefore, there is no potential for this species to be in the BSA.

			moist to dry habitats. In the aquatic phase they inhabit ponds, reservoirs, lakes and slow moving streams.		
Reptiles					
Anniella pulchra pulchra Silvery legless lizard	--	CSC	Found in moist loose soils with plant cover and can be found in chaparral, desert scrub, and near streams with sycamores, cottonwoods, or oaks.	A	There are no moist soils or streams in the BSA; therefore, there is no potential for this species to be in the BSA.
Aspidoscelis tigris stejnegeri Coastal whiptail	--	S2S3	Found in chaparral, woodland, and riparian habitats in open, dry areas.	Potential	There is chaparral habitat in the BSA; therefore, there is potential for this species to be in the BSA.
Phrynosoma blainvillii Coast horned lizard	--	CSC	Found in grasslands, coniferous forests, woodlands, and chaparral in areas of loose soil and low vegetation. Can be found at sea level to 8,000 feet elevations.	Potential	There is chaparral habitat in the BSA and there is potential for this species to be in the BSA.
Birds					
STRIGIFORMES (owls)					
Athene cunicularia Burrowing owl	--	CSC	Found in open areas with low ground cover (less than six inches tall) and inhabit underground burrows that have been dug out by ground squirrels. Prefer areas with few to no trees.	A	There are no open areas or ground squirrel burrows in the BSA, and ground cover is taller than six inches. In addition, there are many large trees that are habitat for predators; therefore, there is no potential for this species to be in the BSA.
ACCIPITRIFORMES (hawks, eagles, vultures)					
Buteo swainsoni Swainson's hawk	--	ST	Found in prairie and grassland habitats and forage in open areas. Adjusted to agricultural settings.	A	There are no grasslands, prairies, or agricultural fields in the BSA; therefore, there is no potential for this species to be in the BSA.
CHARADRIIFORMES (shorebirds)					
Charadrius alexandrinus nivosus Western snowy	--	ST	Found in coastal beaches, sand spits, beaches at creek and river mouths, and salt pans at lagoons	A	There are no coastal beaches or sand spits in the BSA; therefore, there is no potential for this species to

plover			and estuaries.		be in the BSA.
Sternula antillarum browni California least tern	FE	SE	Found on beaches, mudflats, and sand dunes near shallow estuaries and lagoons.	A	There are no beaches, mudflats, or sand dunes in the BSA; therefore, there is no potential for this species to be in the BSA.
PASSERIFORMES (perching birds)					
Empidonax traillii extimus Southwestern willow flycatcher	FE	SE	Found in riparian habitats along rivers, streams, or other wetlands with vegetation for nesting and foraging.	A	There are no riparian habitats in the BSA; therefore, is no potential for this species to be in the BSA.
Passerculus sandwichensis beldingi Belding's savannah sparrow	--	SE	Found in coastal salt marshes in areas of dense pickleweed.	A	There are no coastal salt marshes in the BSA; therefore, there is no potential for this species to be in the BSA.
Polioptila californica californica Coastal California gnatcatcher	FT	CSC	Found in chaparral, grassland, and riparian areas near sage scrub. Requires variable amounts of semi-open sage scrub dominated by California sagebrush on shallow slope gradients.	Potential	There is chaparral and sage scrub habitat in the BSA and there is potential for this species to be in the BSA. Protocol-level surveys would be required to confirm presence or absence.
Riparia riparia Bank swallow	--	ST	Found in low areas along rivers, streams, ocean coasts, or reservoirs. Build nests in vertical banks or bluffs.	A	There are no rivers, streams, or ocean coasts in the BSA; therefore, there is no potential for this species to be in the BSA.
Vireo bellii pusillus Least Bell's vireo	FE	SE	Found in dense, willow dominated riparian habitat with lush understory vegetation.	A	There is no riparian habitat in the BSA; therefore, there is no potential for this species to be in the BSA.
FALCONIFORMES (hawks, falcons)					
Falco peregrinus anatum American peregrine falcon	FD	--	Found in coastal areas, plains, grasslands, forests and deserts in open or partially wooded areas. Tend to inhabit areas next to large bodies of water where prey is more available.	A	There are no plains, grasslands, forests, or deserts in the BSA; therefore, there is no potential for this species to be in the BSA.

GRUIFORMES (rails)					
Laterallus jamaicensis coturniculus California black rail	--	ST	Found in tidal wetlands or marshes in areas where there is mud or vegetation.	A	There are no tidal wetlands or marshes in the BSA; therefore, there is no potential for this species to be in the BSA.
PELECANIFORMES (pelicans)					
Pelecanus occidentalis californicus California brown pelican	FD	--	Found in marine areas near piers and jetties with offshore rocks and islands important for nesting. Forage in estuarine and inshore waters.	A	There are no marine areas or jetties in the BSA; therefore, there is no potential for this species to be in the BSA.
Mammals					
Antrozous pallidus Pallid bat	--	CSC	Found in rocky, mountainous areas near water or open, sparsely vegetated grasslands. Roosts in attics, rock cracks, buildings, and caves.	Potential	There are buildings in the BSA that may provide roosting habitat; therefore, there is potential for this species to be in the BSA.
Eumops perotis californicus Western mastiff bat	--	CSC	Cliff dwelling species that generally roost under rock slabs or crevices in large boulders or buildings. Foraging habitat includes dry desert washes, flood plains, chaparral, oak woodland, grassland, and agricultural areas.	Potential	There are buildings in the BSA that may provide roosting habitat and chaparral communities for foraging; therefore, there is potential for this species to be in the BSA.
Lasionycteris noctivagans Silver-haired bat	--	S3S4	Generally roost in trees, but have occasionally been found in rock crevices, under wood piles, under foundations, and in buildings, mines and caves. Forages in open meadows, above the canopy, and in the riparian zone along waterways.	A	There are no open meadows, riparian habitat, or waterways, in the BSA; therefore, there is no potential for this species to be in the BSA.

Lasiurus cinereus Hoary bat	--	S4	Primarily roost in the foliage of coniferous and deciduous trees but have also been observed in caves, beneath rock ledges, and in buildings.	Potential	There are trees and vegetation that could provide roosting habitat in the BSA; therefore, there is the potential for this species to be in the BSA.
Lasiurus xanthinus Western yellow bat	--	CSC	Found in desert regions in southern California. Usually roost in trees and often forage in open grassy areas and scrub, and riparian habitats.	A	The BSA is not in a desert region; therefore, there is no potential for this species to be in the BSA.
Microtus californicus stephensi South coast marsh vole	--	CSC	Found in wetland communities and associated grasslands in the coastal zone.	A	There are no wetland communities in the BSA; therefore, there is no potential for this species to be in the BSA.
Neotoma lepida intermedia San Diego desert woodrat	--	CSC	Found in high desert areas, chaparral, sagebrush flats, pinyon-juniper pine, and Joshua trees.	Potential	There is chaparral habitat in the BSA; therefore, there is potential for this species to be in the BSA.
Nyctinomops fermorosaccus Pocketed free-tailed bat	--	CSC	Generally roosts in crevices of cliffs, high rocky outcrops, and slopes, but may also be found roosting in buildings, caves, and under roof tiles. Forages in desert shrub and pine-oak forests.	Potential	There are buildings in the BSA that may provide roosting habitat; therefore, there is potential for this species to be in the BSA.
Nyctinomops macrotis Big free-tailed bat	--	CSC	Found in arid, rocky habitats, and been found in desert shrub, woodlands and evergreen forests. Mainly roosts in crevices of cliffs, but has also been documented in buildings, caves and tree cavities.	Potential	There are buildings in the BSA that may provide roosting habitat; therefore, there is potential for this species to be in the BSA.
Onychomys torridus Ramona Southern grasshopper	--	CSC	Found in low to moderate shrub cover and nest in abandoned burrows. Feeds on scorpions and other arthropods.	A	There are no burrows or scorpions in the BSA; therefore, there is no potential for this species to be in the BSA.

mouse					
Perognathus longimembris brevinasus Los Angeles pocket mouse	--	CSC	Found in lower elevation grassland, alluvial sage scrub and coastal sage scrub.	A	There is no grassland, alluvial sage scrub, or coastal sage scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Perognathus longimembris pacificus Pacific pocket mouse	FE	CSC	Found coastal strand and dunes, coastal sage scrub and alluvial plains in areas of fine grain and sandy substrates.	A	There are no sand dunes or coastal sage scrub in the BSA; therefore, there is no potential for this species to be in the BSA.
Sorex ornatus salicornicus Southern California saltmarsh shrew	--	CSC	Found in coastal salt marshes in areas where there is dense vegetative ground cover.	A	There are no coastal salt marshes in the BSA; therefore, there is no potential for this species to be in the BSA.
Taxidea taxus American badger	--	CSC	Found in open, arid habitats of grasslands, savannas, mountain meadows, and desert scrub.	A	There are no grasslands, savannas, or mountain meadows in the BSA; therefore, there is no potential for this species to be in the BSA.

Federal Status USFWS Listing	**State Status CDFW Listing**	**State Rank**
FE= Listed as endangered under the FESA	SE= Listed as endangered under the CESA	S1 = less than 1,000 individuals or less than 2,000 acres
FT= Listed as threatened under the FESA	ST= Listed as threatened under the CESA	S2 =1,000 -3,000 individuals or 2,000 – 10,000 acres
FD = Delisted in accordance with the FESA	CSC= Species of Concern as identified by CDFW	S3 = 3,000 – 10,000 individuals or 10,000 – 50,000 acres
		S4 = Secure within California. There is some threat or narrow habitat
		SH = All California sites are historical

5.4 Oak Tree and Plant Protection Management

There are coast live oak trees in the BSA that are subject to the Los Angeles County Tree Protection Ordinance. A permit is required to cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any tree of the oak tree genus of the size specifications listed in the Los Angeles Country Tree Protection Ordinance. Five oak trees were identified during tree surveys measuring four, eight, 10, 12, and 14 inches at four and one-half feet above mean natural grade.

6.0 PROJECT IMPACTS

6.1 Special-Status Plant Species

There is undisturbed chaparral habitat in the BSA, and there is potential for special-status plant species, including slender mariposa-lily, Plummer's mariposa-lily, Parry's spineflower, mesa horkelia, Palmer's grapplinghook, and Robinson's pepper grass, to be in the BSA during construction. The project would require some vegetation removal to construct the hiking trail and complete planned renovations within the existing landscaped areas. In addition, vegetation would be thinned up to 200 feet from all new structures yearly, as an effort to reduce fire risk in the area. Vegetation removal could directly or indirectly impact special-status plant species if they are in the BSA during construction or maintenance activities.

Portions of the chaparral plant communities would be disturbed during construction of the additional hiking trails and retaining walls. Vegetation thinning could result in impacts on special-status plants, if they are in the BSA, and existing habitat. There are four oak trees measuring eight inches or more in diameter at four and one-half feet above mean natural grade that would be relocated as part of the project; therefore, a permit would be required under the Los Angeles County Oak Tree Ordinance. Although the project could impact special-status plant species, vegetation removal would be minimized to the extent feasible. With implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on special-status plants would be less than significant.

6.2 Special-Status Wildlife Species

There is undisturbed habitat in the BSA and there is potential for special-status wildlife species, including the coast horned lizard (*Phrynosoma blainvillii*) and the San Diego desert woodrat (*Neotoma lepida intermedia)* (both California species of concern), to be in the BSA during construction. Project activities, including noise disturbance and vegetation removal, could impact these species if they are in the BSA during construction. However, with implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on special-status wildlife species would be less than significant.

The development of additional trails and rehabilitation of the amphitheatre would increase lighting, noise, and human activity in the project area. The increase in lighting, noise, and human activity could result in impacts on wildlife if it were to deter them from the area and reduce their ability to forage. In addition, the development of additional trails would increase the risk for wildlife-human interactions within the project area. However, with the implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on wildlife related to increased human activity would be less than significant.

Construction of proposed new trails would make the existing trails more accessible, which could result in increased foot traffic in the area and increased potential for erosion. Erosion could in turn impact wildlife habitat. Fencing would be installed along the lower trail alignments to keep people on the designated walking paths and reduce further disturbance of the hillside. The fencing could impact wildlife if it were to prevent access to foraging areas and reduce their ability to move through the area.

However, with implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts related to erosion and fencing would be less than significant.

The existing chaparral community contains elements of sage scrub (i.e. California sagebrush (*Artemisia Californica)* and black sage) habitat that is suitable habitat for coastal California gnatcatcher. According to the CNDDB, the most recent recording of this species was documented approximately six miles to the northwest of the BSA in 1991, and the potential for coastal California gnatcatcher to be in the BSA during construction is considered low; however, absence cannot be confirmed without additional surveys.

This species is non-migratory, and construction activities could result in impacts on coastal California gnatcatcher through noise disturbance and vegetation removal if they are in the BSA during construction. Annual vegetation thinning would be required out to 200 feet from all new structures, which would reduce habitat for coastal California gnatcatcher if they are in the BSA. However, with implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on the coastal California gnatcatcher would be less than significant.

There are large areas of trees, vegetation, and buildings in the BSA, and there is potential for migratory birds and raptors to nest within these areas. Construction activities could result in impacts on nesting birds through noise disturbance and vegetation removal if they were in the BSA during construction. However, with implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on nesting birds and raptors would be less than significant.

There are large trees, vegetation, and buildings in the BSA that could provide roosting habitat for bats. Construction activities could result in impacts on bats through noise disturbance and vegetation removal if they are in the BSA during construction. However, with implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on bats would be less than significant.

6.3 Wildlife Movement Corridor

The proposed improvements to the theatre complex would be limited to the areas within and immediately adjacent to the existing theatre or other areas that have been previously developed, and would not be expected to result in an increased barrier to wildlife movement. The project would also include the construction of trail alignments along the hillside, and fencing would be installed along the lower trails to keep people on the designated trail. The fencing could present a barrier to wildlife movement in the area. The project would also increase human activity in the hillside areas along proposed trails; however, the majority wildlife movement through the area would likely be at night when hikers would not be using the trails.

The theatre would have nighttime performances; however, human activity during these times would be contained within the amphitheatre and parking areas and patrons would not be expected to access the hillside trails. Nighttime lighting in the theatre and theatre complex could potentially impact wildlife in the area, if lighting were to spill over into adjacent open space areas; however, the theatre is an existing use, the project area is located adjacent to existing roadways and other development, and the BSA is not

designated as a wildlife movement corridor. With the implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts on wildlife movement would be less than significant.

6.4 Jurisdictional Wetlands, Waters, and Streambeds

A jurisdictional delineation was not completed as part of this general biological resource assessment. A review of the USFWS' National Wetlands Inventory indicated that there are riverine wetlands within the BSA, north of the theatre. This area was studied during the biological field survey and was determined to be a cement drainage slough with tarps and sandbags stacked on either side of the drainage to prevent erosion. The drainage does not contain wetland vegetation or connect to other waterways, and is not considered jurisdictional. No other jurisdictional features were identified in the BSA.

The construction of new structures and paving would result in a minor increase in impervious surface area in the BSA, and could result in some additional storm water runoff. However, this runoff would not flow into any receiving waters, and storm drains would be designed to accommodate anticipated flows. Vegetation removal and landscaping associated with the project could result in sedimentation and impact water quality in the non-jurisdictional drainage. However, with the implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts related to site runoff would be less than significant.

6.5 Fuel Modification and Fire Risk

The project includes the construction of new structures that could result in additional fire risk. Fires in the project area could result in impacts on existing vegetation communities if they were to spread beyond the developed theatre complex, and could potentially affect special status species and wildlife in the area. Although the new structures would present a slight risk, the project area has already been developed and construction of new structures is minimal. In addition, vegetation would be thinned up to 200 feet from all new structures yearly, as an effort to reduce fire risk in the area. With the implementation of avoidance, minimization, and mitigation measures listed in Section 7.0, impacts related to fire risk would be less than significant.

7.0 AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES

7.1 Special-Status Plant Species

- Prior to construction, a qualified botanist would conduct rare plant surveys throughout the BSA. In the event that special status species are found during surveys, avoidance measures would be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation would be developed and implemented, in consultation with the USFWS and/or the CDFW as appropriate.

  Surveys would be conducted during the appropriate blooming period to the extent feasible. If surveys cannot be conducted within the appropriate blooming period, or if presence for any species cannot be ruled out for any other reason, avoidance measures would be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation would be developed and implemented, in consultation with the USFWS and/or the CDFW as appropriate.

- If it is determined that special status plants would be impacted as a result of the project, an on- or off-site restoration plan would be prepared by a qualified botanist, in coordination with the USFWS and/or the CDFW as appropriate.

  The restoration plan would be implemented prior to the completion of the project. The plan would include the following: receiver locations; number of plants to be replanted and the methods of replanting; maintenance and monitoring requirements; and measures necessary for the establishment of self-sustaining populations in suitable open space areas to ensure the long-term survivability of the species in the vicinity.

  Annual monitoring for at least five years would be required to ensure no-net-loss of acres of habitat for the species. The acreage ratio of lost special-status plant species habitat to habitat replaced would be coordinated with the USFWS and/or the CDFW, as appropriate, but would be no less than 1:1.

7.2 Oak Trees

- Oak trees measuring eight inches or more in diameter at four and one-half feet above mean natural grade would be protected in place unless specifically permitted by the County.
- Protective fencing would be installed outside of the drip line of any oak tree to be protected in place during construction to minimize damage from equipment storage, debris dumping, parking, etc. within oak tree protected zones.
- Oak trees that are relocated would be done so in a manner consistent with the Los Angeles County Oak Tree Ordinance.

7.3 Vegetation Communities

- During construction of the recreational trails and retaining walls, vegetation removal would be minimized to the extent feasible to reduce impacts on vegetation communities.
- Appropriate erosion control measures, such as timely re-vegetation of the disturbed areas, would be implemented to control erosion on the hillside areas during trail construction.
- Following construction, areas of native vegetation communities temporarily impacted would be restored. Plans for on- or off-site re-vegetation and/or restoration would be prepared by a qualified botanist with expertise in southern California ecosystems and native re-vegetation techniques. The plan would be approved by appropriate regulatory agencies prior to issuance of a grading permit or start of construction, whichever comes first. Annual monitoring for at least five years would also be required to ensure the long-term success of the re-vegetation. In addition, native plants would be incorporated into the theatre complex and parking landscape design where feasible.
- Where feasible, native chaparral shrub species would be planted along the edges of the trails to create a natural barrier and encourage hikers to stay within the trail boundaries.

7.4 General Wildlife Species

- Fencing required along the lower trails would be designed to be lower fencing with openings between the posts and rails that allow movement of wildlife to pass over or through the fence.
- Amphitheatre lighting would be designed to focus downward on developed areas of the complex and minimize and spillover lighting into adjacent open space areas.
- Trash receptacles that are not accessible to wildlife would be used along the trails and within open areas of the theatre complex to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. In addition, signage would be placed along the trails to encourage hikers to stay within the designated trail boundaries.
- A qualified biologist would complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area. Surveys would be repeated if construction activities are suspended for five days or more. If any wildlife species are identified, appropriate measures would be developed and implemented to avoid impacts on these wildlife species, in consultation with appropriate resource agencies as applicable.

7.5 Coastal California Gnatcatcher

- Within a year prior to construction, protocol level surveys for the coastal California gnatcatcher would be conducted within 300 feet of suitable habitat by a qualified biologist/ornithologist according to the USFWS survey guidelines. The surveys would include, at a minimum, a thorough examination of all suitable habitat within the project area and vicinity for the coastal California gnatcatcher or its sign. The final survey methodology would be determined in coordination with the USFWS. A summary report would be prepared upon completion of these activities and submitted to the USFWS.
- If, following protocol level surveys, no gnatcatcher are detected, but construction is delayed more than one year, additional surveys may be required, at the discretion of the USFWS, to ensure that no gnatcatchers have moved into the area. If evidence of the coastal California gnatcatcher is found within the BSA during surveys, consultation with the USFWS would be conducted, and any regulatory requirements regarding protection of the species would be implemented.

7.6 Migratory Birds and Raptors

- The following measures would be implemented during construction to minimize impacts on nesting birds and raptors:

  a) Construction in areas that include trees, vegetation, or buildings that may provide nesting habitats for bird and raptors would be reduced to the maximum extent feasible.

  b) Trimming and removal of vegetation and trees would be minimized and performed outside of the nesting season (February 15 to September 15) to the extent feasible.

c) In the event that trimming or removal of vegetation and trees must be conducted during the nesting season, nesting bird surveys would be completed by a qualified biologist no more than 48 hours prior to trimming or clearing activities to determine if nesting birds are within the affected vegetation. Nesting bird surveys would be repeated if trimming or removal activities are suspended for five days or more.

d) In the event construction is scheduled during bird nesting season, nesting bird surveys would be completed no more than 48 hours prior to construction to determine if nesting birds, raptors, or active nests are in or within 500 feet of the construction area. Surveys would be repeated if construction activities are suspended for five days or more.

e) In the event nesting birds or raptors are found in the construction area, appropriate buffers (typically 300 feet for songbirds and up to 500 feet for raptors) would be implemented, in coordination with the CDFW, to ensure that nesting birds and active nests are not harmed. Buffers would include fencing or other barriers around the nests to prevent any access to these areas and would remain in place until birds have fledged and/or the nest is no longer active, as determined through coordination with the CDFW.

7.7 Bats

- To the extent feasible, tree and building removal would be scheduled during the non-breeding and active season for bats (typically October and November). Prior to construction, surveys would be conducted by a qualified bat specialist to identify the presence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in cavities in the area, either in trees or in structures, would be safely evicted under the direction of a bat specialist and under consultation with the CDFW.

  Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the CDFW would be installed and maintained to prevent bats from roosting in these cavities prior to and during construction. A summary report would be prepared upon completion of these activities and submitted to the CDFW.

  Pre-construction bat surveys would be conducted by a qualified bat specialist no more than seven days prior to the removal of any trees within the BSA to confirm that exclusionary measures have been successful and there are not bats within the construction area. If no roosting bats are detected, no further surveys are required provided the tree removal is conducted within seven days. If removal is delayed more than seven days, additional surveys would be conducted no more than seven days prior to tree removal to ensure that no bats have moved into the area.

- Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in the BSA. In the event that a maternal colony of bats is found in the construction area, the CDFW would be consulted, and no work would be conducted within 100 feet of the roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the CDFW. The site would be designated as a sensitive area and protected as such until the bats have left the site. No clearing and grubbing would be authorized adjacent to the site. Combustion

equipment, such as generators, pumps, and vehicles, would not to be parked nor operated under or adjacent to the roosting site. Construction personnel would not enter into areas beneath the colony, especially during the evening exodus.

7.7 Non-jurisdictional Drainages

- Appropriate best management practices (BMP), such as sandbags or silt fencing, would be implemented during vegetation removal and landscaping adjacent to on-site drainages and storm drains to reduce dirt and dust from entering these drainages.
- Areas where vegetation removal and/or grading is conducted would be stabilized with appropriate erosion control measures.

7.8 Fuel Modification and Fire Risk

- All new structures would have a 30-foot buffer where low-growing, irrigated drought tolerant plant material would be planted to prevent erosion and transition to the native character of the project area.
- All new structures would have a 200-foot buffer where brush would be seasonally thinned, outside of the bird-nesting season, through weed whipping or brush removal. Pruning of trees, including removing low branches and dead branches, would be conducted as needed, to reduce the amount of potential plant fuel.

8.0 CUMULATIVE IMPACTS

Cumulative impacts are impacts on biological resources that result from combined past, present, and foreseeable impacts of the project and other projects near the project area. To evaluate cumulative impacts, project impacts were analyzed in combination with impacts resulting from nearby or "related" projects (see **Table 3**).

Table 3: Related Projects Used for Cumulative Impacts Discussion

Address	Land Use/Size
6200 West Hollywood Boulevard	Apartment (952 dwelling units (du)), Retail (190,000 square feet (sf)

Source: Gibson Transportation Consulting, Inc.; Los Angeles Department of Transportation, 2014.

The majority of the project area has been previously developed and a large portion of the vegetation that would be impacted is ornamental landscaping. The theatre complex improvements would be limited to a relatively small area and would not encroach substantially into the hillside. With implementation of proposed mitigation measures, the project would not result in significant impacts on chaparral communities within the region. The related projects in the area are on land that has previously been developed and contains limited vegetation communities. Therefore, the project, in combination

with related projects, would not be expected to result in cumulatively considerable impacts on the vegetation communities within the region.

The project would not result in significant impacts on designated regional wildlife movement corridors, and with implementation of proposed mitigation measures would retain existing habitat linkages for wildlife using areas within and around the project area. In addition, the project would not result in significant impacts on special-status plant or wildlife species or impacts on jurisdictional waters. Based on the location of the related projects within highly urbanized areas and the proximity of the related projects to large expanses of open space, the related project areas do not provide the type of environment that would attract wildlife to those sites or use those sites to reach nearby open space areas where such wildlife are known to exist. Therefore, the project, in combination with the related projects, would not result in cumulatively considerable impacts on biological resources.

The related projects include mainly infill projects on areas that have been previously developed and contain limited habitat for wildlife species. Therefore, the related projects would not likely result in significant impacts on biological resources, and would not contribute substantially to cumulative impacts on special-status plant species, special-status wildlife species, wildlife movement corridors, or jurisdictional wetlands, waters, and streambeds. In addition, potential impacts on biological resources resulting from the related projects would likely be subject to mitigation as part of the environmental review process, thereby avoiding or minimizing any potential impacts on biological resources. Therefore, the project, in combination with the related projects, would not result in cumulatively considerable impacts on biological resources.

9.0 CONCLUSIONS

There is abundant vegetation in the hills surrounding the theatre complex, and there is the potential for nesting birds, bats, and other special-status species to be in the BSA during construction. The project has the potential to impact these species; however, with the implementation of appropriate avoidance, minimization, and mitigation measures listed above, impacts would be reduced to a less than significant level.

ATTACHMENT B

SPECIES OBSERVED DURING BIOLOGICAL SURVEYS

Species Observed in the BSA during Biological Surveys (GPA Consulting)
December 11, 2013 and December 16, 2013

Wildlife Species

1. Black phoebe (*Sayornis nigricans*)
2. California towhee (*Melozone crissalis*)
3. Anna's hummingbird (*Calypte anna*)
4. Yellow-rumped warbler (*Setophaga coronata*)
5. American crow (*Corvus brachyrhynchos*)
6. Red-tailed hawk (*Buteo jamaicensis*)
7. Turkey vulture (*Cathartes aura*)
8. Western scrub jay (*Aphelocoma californica*)
9. Woodpecker (*Picoides* sp.)
10. Kingbird (*Tyrannus sp.*)
11. Western fence lizard (*Sceloporus occidentalis*)

Plant Species

1. Chamise (*Adenostoma fasciculatum*)
2. American century plant (*Agave Americana*)
3. Century plant (*Agave tubulata*)
4. Thoroughwort (*Ageratina adenophora*)
5. Strawberry tree (*Arbutus unedo*)
6. California sagebrush (*Artemisia californica*)
7. Wild oats (*Avena* sp.)
8. California brickellia (*Brickellia californica*)
9. Ripgut brome (*Bromus diandrus*)
10. Madrid brome (*Bromus madritensis*)
11. Ceanothus (*Ceanothus sp.*)
12. Carob tree (*Ceratonia siliqua*)
13. Soap plant (*Chlorogalum pomeridianum*)
14. Tangerine (*Citrus tangerina*)
15. Jade plant (*Crassula ovata*)
16. Pride of Madera (*Echium candicans*)
17. Bush sunflower (*Encelia californica*)
18. Thickleaf yerbasanta (*Eriodictyon crassifolium*)
19. Buckwheat (*Eriogonum fasciculatum*)
20. Gum tree (*Eucalyptus* sp.)
21. Fig (*Ficus* sp.)
22. Ivy (*Hedera* sp.)
23. Summer mustard (*Hirschfeldia incana*)
24. Jacaranda (*Jacaranda mimosifolia*)
25. Juniper (*Juniperus chinensis*)
26. Common lantana (*Lantana camara*)
27. Purple lantana (*Lantana montevidensis*)

28. Western larch (*Larix occidentalis*)
29. Japanese privet (*Ligustrum japonicum*)
30. Honeysuckle (*Lonicera sp.*)
31. Southern magnolia (*Magnolia grandiflora*)
32. Laurel sumac (*Malosma laurina*)
33. Wild cucumber (*Marah sp.*)
34. Monkey flower (*Mimulus aurantiacus*)
35. Oleander (*Nerium oleander*)
36. Tree tobacco (*Nicotiana glauca*)
37. Olive (*Olea europaea*)
38. Prickly pear (*Opuntia littoralis*)
39. Fountaingrass (*Pennisetum setaceum*)
40. Phacelia (*Phacelia* sp.)
41. Date palm (*Phoenix dactylifera*)
42. Pine (*Pinus sp.*)
43. Smilo grass (*Piptatherum miliaceum*)
44. Lemonwood (*Pittosporum eugenioides*)
45. Sycamore (*Platanus racemosa*)
46. Blue plumbago (*Plumbago auriculata*)
47. Cherry (*Prunus sp.*)
48. Lemonade berry (*Rhus integrifolia*)
49. Sugar bush (*Rhus ovata*)
50. Castor bean (*Ricinus communis*)
51. Rosemary (*Rosmarinus officinalis*)
52. Russian thistle (*Salsola tragus*)
53. Black sage (*Salvia mellifera*)
54. Blue chalk sticks (*Senecio mandraliscae*)
55. Woodmint (*Stachys bullata*)
56. Small wirelettuce (*Stephanomeria exigua*)
57. Bird of paradise (*Strelitzia reginae*)
58. Champagne grape (*Vitis vinifera*)
59. Grass (*Vulpia* sp.)
60. Mexican fan palm (*Washingtonia robusta*)
61. Yucca (*Yucca sp.*)
62. *Calochortus* sp.

Tree species Observed in the BSA during Tree Surveys (Levin & Associates)
July 29, 2013 and January 17, 2014

1. Aleppo pine (*Pinus halepensis*)
2. Italian cypress (*Cupressus sempervirens*)
3. Carob (*Ceratonia siliqua*)
4. Mexican fan palm (*Washingtonia robusta*)
5. Olive (*Olea europaea*)

6. Coast live oak (*Quercus agrifolia*)
7. Canary Island Pine (*Pinus canariensis*)
8. Deodar cedar (*Cedrus deodara*)
9. Privet (*Ligustrum sinense*)
10. Strawberry tree (*Arbutus* x *marina*)
11. Red gum (*Eucalyptus camaldulensis*)
12. Benjamin's fig (*Ficus benjamina*)
13. Brazilian pepper (*Schinus terebinthifolius*)
14. Broadleaf yellowwood (*Podocarpus latifolius*)
15. Yucca (*Yucca* spp.)
16. Citrus tree (*Citrus* spp.)
17. Jacaranda tree (*Jacaranda mimosifolia*)
18. Stone pine (*Pinus pinea*)
19. California sycamore (*Platanus racemosa*)
20. Sweet gum (*Liquidambar styraciflua)*
21. Canary Island date palm (*Phoenix canariensis*)

ATTACHMENT D

PREPARER RESUMES

MARIEKA SCHRADER

Educational Background:

- B.A., Environmental Studies, University of California, Santa Cruz, 1999

Professional Experience:

- GPA Consulting, Senior Environmental Planner/Senior Biologist, 2008-Present
- PMC, Associate Environmental Planner and Project Manager, 2004-2008
- Caltrans Department of Transportation (District 7), Environmental Planner, 2000-2004

Summary of Experience: Marieka Schrader, a Senior Biologist and Environmental Planner at GPA, has been managing the environmental process for projects since 2000. At GPA, Ms. Schrader manages the biology group. She also conducts a variety of technical analyses, prepares environmental documents and permit applications, performs quality-control reviews, and conducts public outreach efforts and construction monitoring. Her expertise includes environmental compliance pursuant to the National Environmental Policy Act (NEPA), California Environmental Quality Act (CEQA), Section 106 of the National Historic Preservation Act (Section 106), Section 4(f) of the US Department of Transportation Act (Section 4(f)), the federal and state Endangered Species Acts (ESA), Clean Water Act (CWA), and other environmental laws.

Ms. Schrader manages completion of the environmental process for projects from initiation through final design, permitting, and construction. She has worked with a number of federal, state, and local lead agencies throughout California, including the Federal Transit Administration (FTA), Federal Highway Administration (FHWA), US Department of Housing and Urban Development (HUD), the California Department of Transportation (Caltrans), and the Los Angeles County Metropolitan Transportation Authority (Metro). Ms. Schrader previously worked as a project manager at PMC, where she managed the environmental process for a number of capital improvement projects in California. Ms. Schrader also worked at Caltrans (District 7), where she managed the environmental process for multiple highway projects.

Relevant Training:

2013 Bat Capture Techniques, Bat Conservation and Management Workshop

2013 Fifty Plant Families in the Field: Introduction to Keying, Friends of the Jepson Herbarium Workshop

2013 Mastering the Second Edition of the Jepson Manual, Friends of the Jepson Herbarium Workshop

2012 Western Pond Turtle Workshop, Elkhorn Slough National Estuarine Research Reserve Coastal Training Program

2012 Wetland Delineation Training, San Francisco State University Romberg Tiburon Center

Relevant Project Experience:

2014 **Santa Claus Lane Bike Path, City of Carpinteria.** The Santa Barbara County Association of Governments, in coordination with Caltrans, proposes to construct a bike lane along U.S. 101 in the City of Carpinteria, CA. Ms. Schrader is preparing portions of the Jurisdictional Delineation and Natural Environmental Study for the project and performing quality control reviews for the CEQA/NEPA documentation.

2014 **Cottonwood Creek Bridge Replacement, Tulare County.** The County of Tulare, in coordination with Caltrans, proposes to replace the existing bridge on Avenue 364 over Cottonwood Creek in Tulare County, CA. Ms. Schrader is preparing the Minimal Impact Natural Environmental Study for the project and performing quality control reviews for the CEQA/NEPA documentation.

2014 **Southern California Adventure Resort, San Bernardino County.** Urban Bike Territory, in coordination with the County of San Bernardino and the US Forest Service, proposes to construct a new mountain biking

resort near Wrightwood, CA. Ms. Schrader is managing preparation of the Biological Resources Assessment and Section 7 consultation, and is assisting with preparation the Wetland Delineation for the project. She is also performing quality control reviews for the CEQA/NEPA documentation.

2014 **Ford Theatres, Los Angeles County.** Ford Theatres proposes to expand an existing outdoor theatre complex in Los Angeles County, CA. Ms. Schrader is preparing portions of the Biological Resource Assessment for the project.

2014 **M&G Street Bridge Repairs, City of Merced.** The County of Merced, in coordination with Caltrans, proposes to repair the M Street and G Street Bridges in the City of Merced, CA. Ms. Schrader performed biological surveys for the project, and is performing quality control reviews for the CEQA/NEPA documentation.

2014 **Kibby Road Bridge Rehabilitation and Widening, Merced County.** The County of Merced, in coordination with Caltrans, proposes to rehabilitate and widen the Kibby Road Bridge over Bear Creek in Merced County, CA. Ms. Schrader is managing preparation of the Natural Environmental Study, Section 7 consultation, and Wetland Delineation for the project. She is also performing quality control reviews for the CEQA/NEPA documentation.

2014 **Moraga Road Bridge Rehabilitation and Widening, Merced County.** The County of Merced, in coordination with Caltrans, proposes to rehabilitate and widen the Moraga Road Bridge over Outside Canal in Merced County, CA. Ms. Schrader is managing preparation of the Minimal Impact Natural Environmental Study and Section 7 consultation for the project. She is also performing quality control reviews for the CEQA/NEPA documentation.

2014 **Magnolia Street Bridge, City of Huntington Beach.** The City of Huntington Beach, in coordination with Caltrans, proposes to repair and rehabilitate Magnolia Street Bridge. Ms. Schrader is managing the Essential Fish Habitat consultation, Section 7 consultation, regulatory permitting, and agency consultation for the project, pursuant to City and Caltrans requirements.

2014 **Admiralty Drive Bridge, City of Huntington Beach.** The City of Huntington Beach, in coordination with Caltrans, proposes to repair and rehabilitate the Admiralty Drive Bridge. Ms. Schrader is managing the Natural Environmental Study, Essential Fish Habitat consultation, and regulatory permitting for the project, pursuant to City and Caltrans requirements. She is also performing quality control reviews for the CEQA/NEPA documentation.

2014 **Humboldt Drive Bridge, City of Huntington Beach.** The City of Huntington Beach, in coordination with Caltrans, proposes to repair and rehabilitate the Humboldt Drive Bridge. Ms. Schrader is managing the biology studies (Natural Environmental Study), Essential Fish Habitat consultation, and regulatory permitting for the project, pursuant to City and Caltrans requirements. She is also performing quality control reviews for the CEQA/NEPA documentation.

2014 **Riverside Drive Bridge Replacement, City of Los Angeles.** The City of Los Angeles, in coordination with Caltrans, proposes to rehabilitate and widen the Riverside Drive Bridge. Ms. Schrader prepared the Visual Impact Assessment, and managed preparation of the technical studies and CEQA/NEPA documentation, pursuant to City and Caltrans requirements. She is currently managing the regulatory permitting process, including CWA 404 and 401 permits and Streambed Alteration Agreement.

2014 **Lost Canyon Road Bridge, City of Santa Clarita.** The City of Santa Clarita, in coordination with Caltrans, proposes to widen the Lost Canyon Road Bridge. Ms. Schrader is managing preparation of the technical analysis, CEQA/NEPA documentation, and regulatory permitting for the project, pursuant to City and Caltrans requirements.

2014 **Firestone Boulevard Bridge Widening, City of Norwalk.** The City of Norwalk is widening the Firestone Boulevard Bridge to improve traffic circulation. Ms. Schrader managed the regulatory permitting process and NEPA revalidation for the project.

2014 **Higuera Street Bridge Replacement, City of Culver City.** The City of Culver City, in cooperation with Caltrans, proposes to replace the Higuera Street Bridge over Ballona Creek. Ms. Schrader is managing preparation of the Natural Environmental Study for the project, pursuant to City and Caltrans requirements. She is also performing quality control reviews for the CEQA/NEPA documentation.

2014 **Santa Rosa Road Widening, City of Camarillo.** The City of Camarillo, in coordination with Caltrans, proposes to widen a portion of Santa Rosa Road from two to four lanes. Ms. Schrader managed preparation of the technical analysis and CEQA/NEPA documentation process, pursuant to City and Caltrans requirements, and is managing the mitigation monitoring phase.

2014 **Lake Road Shoulder Widening, Merced County.** The County of Merced, in coordination with Caltrans, proposes to widen shoulders along a portion of Lake Road in Merced County, CA. Ms. Schrader is performing quality control reviews for the CEQA/NEPA documentation.

2013 **Sepulveda Boulevard Bridge, City of Manhattan Beach.** The City of Manhattan Beach, in coordination with Caltrans, proposes to widen Sepulveda Boulevard Bridge over a recreational trail. Ms. Schrader is managing preparation of the Natural Environmental Study (Minimal Impacts) report and the Visual Issues Memorandum for the project, pursuant to City and Caltrans requirements. She is also performing quality control reviews for the CEQA/NEPA documentation.

2013 **East San Fernando Valley Transit Corridor, City of Los Angeles**. Metro, in coordination with the City of Los Angeles, is proposing either a bus route or light rail route to improve transit circulation. Ms. Schrader is preparing the visual and aesthetic impacts reports, pursuant to Metro and FTA requirements. She is also performing quality control reviews for the CEQA/NEPA documentation.

2013 **Oakdale Road Bridge Replacement, Merced County.** The County of Merced replaced the Oakdale Road Bridge over Merced River. Ms. Schrader managed the mitigation monitoring for restoration work completed following construction, pursuant to agency requirements.

2013 **Lewis Road Landscaping Project, City of Camarillo.** The City of Camarillo proposes to landscape portions of Lewis Road and install a monument sign. Ms. Schrader managed preparation of the Natural Environmental Study (Minimal Impacts) for the project.

2013 **Agoura Road Widening, City of Agoura Hills.** The City of Agoura Hills proposes to widen portions of Agoura Road from two to four lanes. Ms. Schrader managed preparation of the technical analysis and CEQA documentation, and is managing the regulatory permitting process.

2013 **Rice Avenue/East Channel Islands Boulevard Intersection Improvements, County of Ventura.** The County of Ventura proposes to widen the existing intersection to provide additional turn lanes and improve traffic circulation. Ms. Schrader prepared portions of the CEQA documentation for the project, including the biology section, pursuant to County requirements.

2013 **Placentia Metrolink Station, City of Placentia.** The City of Placentia is proposing to construct a new Metrolink station. Ms. Schrader is managing preparation of technical analysis, the CEQA Addendum, and NEPA Environmental Assessment, pursuant to City and FTA requirements.

2012 **Calleguas Creek Bike Trail – Phase III, City of Camarillo.** The City of Camarillo is proposing to construct the third phase of a bike trail along Calleguas Creek. Ms. Schrader prepared the Minimal Impact Natural Environmental Study, pursuant to City and Caltrans requirements.

2012 **Rice Avenue/East Wooley Road Intersection Improvements, County of Ventura.** The County of Ventura proposes to widen the existing intersection to provide additional turn lanes and improve traffic circulation. Ms. Schrader prepared portions of the CEQA documentation, including the biology section, pursuant to County requirements.

2011 **North Spring Street Viaduct Widening and Rehabilitation, City of Los Angeles.** The City of Los Angeles, in coordination with Caltrans, proposes to widen and rehabilitate the North Spring Street. Ms. Schrader

managed preparation of technical updates prepared the revised Final CEQA/NEPA documentation, pursuant to City and Caltrans requirements.

2011 **Sepulveda Boulevard Widening, City of Culver City.** Ms. Schrader prepared an Initial Study Checklist and revised the checklist to reflect recent changes to the project, which includes widening Sepulveda Boulevard between Playa Street/Jefferson Boulevard and Green Valley Circle to eliminate an existing bottleneck.

2011 **US 101 HOV Widening, Ventura and Santa Barbara Counties.** Caltrans is constructing HOV lanes along a 6-mile segment of US 101. Ms. Schrader prepared portions of the NEPA/CEQA documentation and coastal permit applications for the City of Carpinteria, Ventura County, and Santa Barbara County, and conducted peer reviews of technical analysis completed.

2011 **Geer Road Bridge, Stanislaus County.** Stanislaus County, in coordination with the Caltrans District 10, proposed to seismically retrofit the Geer Road Bridge over the Tuolumne River. Ms. Schrader completed the Water Quality Assessment for the project.

2010 **US 101/Palo Comado Canyon Road Interchange, City of Agoura Hills.** The City of Agoura Hills, in coordination with Caltrans, proposes to widen the US Highway 101/Palo Comado Canyon Road Overcrossing. Ms. Schrader prepared portions of the CEQA/NEPA documentation, including the growth and cumulative impacts analyses for the project, pursuant to City and Caltrans requirements.

2010 **High Speed Rail – Fresno to Bakersfield, California High-Speed Rail Authority.** The Authority is proposing to develop a high-speed rail system coordinating with the state's existing transportation network, which includes intercity rail and bus lines, regional commuter rail lines, urban rail and bus transit lines, highways, and airports. Ms. Schrader worked on preparing and reviewing sections of the EIR/EIS for the Fresno to Bakersfield segment of the project, including the traffic and transportation section.

2010 **I-110 HOT Lanes, City of Los Angeles**. Caltrans proposes to convert existing HOV lanes to HOT lanes on Interstate 110. Ms. Schrader prepared portions of the CIA for the project and assisted in the preparation of the public outreach summary report for the project, pursuant to Caltrans requirements.

2009 **Calleguas Creek Bike Trail – Phase II, City of Camarillo.** Ms. Schrader worked on the CEQA Addendum, assisted with the project Natural Environmental Study, and prepared the environmental permit applications required for construction of the project, which included construction of a bike trail along Calleguas Creek.

2009 **Old Creek Road Bridge Replacement, County of Ventura.** Ms. Schrader prepared the visual impact analysis and helped coordinate Section 7 consultation for the project, which included constructing a new bridge over San Antonio Creek to replace an existing low-water crossing.

2009 **Camarillo Drain Widening, City of Camarillo.** Ms. Schrader assisted with the preparation of the permit closeout reports for the project, which included repairing and widening the Camarillo Hills Drain, damaged during a storm.

2009 **Carpenter Road Bridge, City of Modesto.** Ms. Schrader prepared the Water Quality Report and the 1602 Streambed Alteration Notification Package for the project, which included retrofitting and widening the Carpenter Road Bridge over the Tuolumne River.

2008 **Yuba City CIP Manager, City of Yuba City.** Ms. Schrader was contracted by the City of Yuba City to perform contract staff work, as well as oversee environmental clearance for projects under design as part of the City's Capital Improvement Program. Between October 2005 and December 2006, Ms. Schrader was responsible for coordinating with City engineers and managing the environmental process for a number of CIP projects within the City.

2008 **Morning Drive/SR-178 Interchange, City of Bakersfield**. Ms. Schrader coordinated the technical analysis, CEQA/NEPA documentation, and coordinated with the Thomas Roads Improvements Program

requirements and Caltrans for the project, which included constructing a new interchange at the existing Morning Drive/State Route 178 Intersection.

2008 **I-5/Oasis Road Interchange, City of Redding.** Ms. Schrader coordinated preparation of the Preliminary Environmental Assessment Report and technical analysis during initiation of the project, which included replacing the existing Interstate 5/Oasis Road Interchange.

2008 **Grant Line Road/State Route 99 Interchange Reconstruction, City of Elk Grove.** Ms. Schrader oversaw completion of the project wetland delineation and Biological Assessment pursuant to Section 7 of the federal ESA, and managed the environmental permitting process for the project, which included reconstructing and expanding the existing Grant Line Road/State Route 99 Interchange.

2008 **Grant Line Road Widening, City of Elk Grove.** Ms. Schrader coordinated preparation of the technical analysis, CEQA documentation, and mitigation monitoring plan for the project, which included widening Grant Line Road from the State Route 99/Grant Line Road Interchange to Bradshaw Road.

2008 **Franklin Boulevard/Elk Grove Boulevard Intersection Improvements, City of Elk Grove.** Ms. Schrader oversaw revision of the technical analysis, preparation of the revised CEQA document, and managed the environmental permitting process for the project, which included improving the Franklin Boulevard/Elk Grove Boulevard Intersection.

2008 **Elk Grove Rail Stop, City of Elk Grove.** Ms. Schrader coordinated technical analysis and CEQA documentation for the project, which included constructing a new Amtrak rail stop.

2008 **Fire Station No. 4 Relocation, City of Yuba City.** Ms. Schrader coordinated preparation of the technical analysis and the draft CEQA document for the project, which included constructing a new fire station to replace an existing fire station (Station No. 4).

2008 **Rancho Cordova Parkway Interchange, City of Rancho Cordova.** Ms. Schrader coordinated the Preliminary Environmental Assessment Report, public scoping meeting, Notice of Preparation, technical analysis, and agency coordination for the project, which included constructing a new interchange over US Highway 50 between Sunrise Boulevard and Hazel Avenue.

2007 **ADA Sidewalk and Curb Improvements, City of Yuba City.** Ms. Schrader managed technical analysis and CEQA/NEPA documentation (pursuant to HUD regulations) for the project, which included constructing sidewalk and curb improvements at several locations in Yuba City.

2007 **Gauche Park Renovation, City of Yuba City.** Ms. Schrader managed preparation of an addendum to the CEQA document and oversaw implementation of mitigation requirements during final design and PS&E for the project, which included renovating Gauche Park.

2007 **State Route 104 Improvements, City of Ione.** Ms. Schrader obtained the Caltrans encroachment permit for environmental field surveys and conducted ongoing coordination for review and approval of the CEQA documentation to secure a construction encroachment permit for the project, which included constructing a new intersection with State Route 104.

2007 **Bridge Street Reconstruction, City of Yuba City.** Ms. Schrader coordinated the technical analysis, CEQA and NEPA documentation, and coordinated with Caltrans, FHWA, and the State Historic Preservation Officer for review and approval of the NEPA documents through Caltrans' Local Assistance Department for the project, which included reconstructing a portion of Bridge Street between Plumas Street and Boyd Avenue.

2007 **Plumas Street Improvements, City of Yuba City.** Ms. Schrader coordinated the preparation of technical analysis and draft CEQA document, circulated the CEQA document for public review, and coordinated with Caltrans as part of the encroachment permit process for the project, which included improvement to the existing Plumas Street corridor between Colusa Avenue (State Route 20) and Bridge Street.

2005 **Winters Railroad Trestle Improvements, City of Winters.** Ms. Schrader coordinated technical analysis, prepared the CEQA documentation and mitigation monitoring plan, prepared permit applications, and coordinated the environmental process for the project, which included rehabilitating a historical railroad trestle bridge for bicycle and pedestrian use.

2004 **SR-99/Eaton Road Interchange Improvements, City of Chico.** Ms. Schrader coordinated technical analysis, CEQA/NEPA documentation, coordination with Caltrans, and environmental permitting for the project, which included improvement to the State Route 99/Eaton Road Interchange.

2004 **SR-70/Delleker Road Shopping Center and Intersection Improvements, Plumas County.** Ms. Schrader coordinated technical analysis and prepared the CEQA documentation and a mitigation monitoring plan for the project, which included constructing a new shopping center at the corner of State Route 70 and Delleker Road.

2004 **Tick Canyon Scour Mitigation, Los Angeles County.** Ms. Schrader managed the CEQA and permitting processes and prepared the CEQA documentation for the project, which included construction of a check dam to minimize scour damage to the State Route 14 Bridge over Tick Canyon Wash.

2004 **I-5/Hasley Canyon Road Interchange Reconstruction, City of Santa Clarita**. As an Environmental Planner for Caltrans District 7, Ms. Schrader provided consultant review and oversight of the environmental process for this project, which included reconstructing the Interstate 5/Hasley Canyon Interchange.

2004 **SR-126/Commerce Center Drive Interchange, Los Angeles County.** As an Environmental Planner for Caltrans District 7, Ms. Schrader provided consultant review and oversight of the environmental process for the project, which included a new grade-separated interchange at the State Route 126/Commerce Center Drive Intersection.

2002 **Santa Clara River Bridge Replacement, City of Santa Clarita**. Ms. Schrader managed the environmental permitting process and construction mitigation monitoring for this project, which included replacing the Interstate 5 Bridge over Santa Clara River.

2000 **I-5/Valencia Boulevard Interchange Reconstruction, City of Santa Clarita.** Ms. Schrader managed the construction mitigation monitoring for this project, which included improvements to the Interstate 5/Valencia Boulevard Interchange.

SHERI MAYTA

Educational Background:

- GIS Certificate, Ventura Community College, CA, 2007
- B.S., Ecology and Evolution, University of California, Santa Barbara, 2004
- Equine Studies, Southern Seminary College, Buena Vista, VA, 1989-1991

Professional Experience:

- GPA Consulting, Associate Biologist, 2012-Present
- Senior Restoration Ecologist, Coastal Restoration Consultants Inc., 2007-2012
- Restoration Project Coordinator/GIS Specialist, Ojai Valley Land Conservancy, 2004-2008
- Scientific Aide/Rare Plant Specialist California Department of Fish and Game, 2006-2008

Summary of Experience: Sheri Mayta is an associate biologist at GPA. Over the past several years she has worked on a diverse array of projects involving protected plant and animal species. Ms. Mayta has extensive experience supervising and coordinating upland, riparian and wetland habitat restoration projects, including restoration projects along Santa Barbara and Ventura County rivers and streams. At GPA, Ms. Mayta conducts construction monitoring, mitigation site monitoring, data analyses, biological and botanical surveys, threatened and endangered species surveys, GIS mapping and analyses, vegetation classification, assists in wetland delineations and prepares environmental reports. Having worked with protected species in both the public and private sector over the past 8 years, Ms. Mayta's wide ranging survey experience enables her to provide the capability to carry out both habitat and detailed botanical surveys throughout central and southern California.

Supplemental Experience:

- Ms. Mayta has also managed all aspects of native plant restoration, including seed collection, propagation, restoration projects, and has managed field crews implementing native plant restoration projects.
- Ms. Mayta has an extensive knowledge of plant taxonomy and plant community ecology and classification, and plant identification. She has extensive experience conducting botanical surveys and is trained in rare plant survey protocols. She has monitored and maintained experimental populations of the endangered Ventura marsh milkvetch.
- Ms. Mayta has also been trained in vegetation classification and monitoring of plant communities and GIS mapping using the latest GIS-based software.
- In addition to her botanical experience, Ms. Mayta has extensive experience conducting bird surveys, including breeding and nesting surveys in southern and eastern portions of California. Ms. Mayta is trained in protocol-level surveys for southwestern willow flycatcher. Ms. Mayta has also assisted with identification and surveys of protected wildlife species, including least Bell's vireo, and California red-legged frog.

Relevant Project Experience:

2014 **Bridge Replacement over Cottonwood Creek, County of Tulare.** The County of Tulare proposes to replace the existing bridge on Avenue 364 over Cottonwood Creek. Ms. Mayta performed botanical and biological surveys and inventoried all resources observed. Ms. Mayta also produced maps and figures for the project using GIS software.

2014 **SR-126 Barrier Improvement Project, County of Ventura.** Caltrans proposes to construct a median barrier and improvements to State Route 126 between Hallock Drive in Santa Paula and E Street in Fillmore. Ms. Mayta gathered and analyzed data and produced constraints level maps and figures for a Community Impact Assessment technical study using GIS software.

2014 **M and G Street Bridge Repair, County of Merced.** The County of Merced proposes to repair M Street Bridge and G Street Bridge over Bear Creek. Ms. Mayta performed botanical and biological surveys and inventoried all resources observed. Ms. Mayta also produced maps and figures for the project using GIS software.

2014 **Lake Road Shoulder Widening, County of Merced.** The County of Merced is proposing to widen the paved shoulders of a segment of road between Yosemite Avenue and E. Bellvue Road. Ms. Mayta assisted in the wetland delineation, performed botanical and biological surveys and inventoried all resources observed. Ms. Mayta also produced maps and figures for the project using GIS software.

2014 **Santa Claus Lane Class I Bike Path, County of Santa Barbara.** The Santa Barbara County Association of Governments (SBCAG) is proposing to construct a bike path between Santa Claus Lane and Carpinteria Avenue. Ms. Mayta assisted with the wetland delineation, gathered data, and produced maps and figures for a constraints analysis in order to identify areas of sensitivity for use in project design.

2014 **Winton Way and Gertrude Avenue Signal.** The County of Merced proposes to install a new traffic signal at the intersection of Winton and Gertrude Avenue, near the community of Winton. Ms. Mayta produced figures and maps for the Preliminary Environmental Study using GIS software.

2014 **Mission Oaks Boulevard Bridge Repair.** The City of Camarillo Public Works Department proposes to repair one footing of the Mission Oaks Boulevard Bridge over Calleugas Creek. Ms. Mayta completed the California Fish and Wildlife Streambed Alteration Agreement and the Regional Water Quality Control Board Section 401 Water Quality Certification for the project.

2013 **Ford Theatres Project, County of Los Angeles.** Ms. Mayta performed biological and botanical surveys and inventoried all resources observed to support the CEQA analysis. She also produced figures and maps for the project using GIS software.

2013 **Merced County Sidewalks In-fill Project.** The County of Merced proposes to construct sidewalk segments to fill-in gaps and provide contiguous sidewalk access through the project areas. The proposed sidewalk in-fill locations are within the communities of Winton, Delhi, Dos Palos, Hilmar, Le Grand and Planada. Ms. Mayta produced figures and maps for the Preliminary Environmental Study using GIS software.

2013 **Bear Creek Bridge Replacement, County of Merced.** The County of Merced proposes to replace the Bear Creek bridge structure. Ms. Mayta performed botanical and biological surveys throughout the project site as well as assisting with the wetland delineation. Ms. Mayta also produced figures and maps for the project using GIS software.

2013 **Moraga Road Bridge Replacement, County of Merced.** The county of Merced proposes to replace the Moraga Road bridge structure over Outside Canal. Ms. Mayta performed botanical and biological surveys throughout the project site as well as assisting with the wetland delineation. Ms. Mayta also produced maps and figures for the project using GIS software.

2013 **Oakdale Bridge Project, County of Merced.** The County of Merced replaced the Oakdale Road Bridge over Merced River. Ms. Mayta conducted vegetation monitoring of the mitigation site to measure the current condition of the plantings based on the success criteria in the mitigation plan. Ms. Mayta also produced maps and figures for the project using GIS software.

2013 **Southern California Adventure Resort.** Conducted botanical and biological surveys, inventoried all resources observed and produced a botanical survey report. Ms. Mayta also collected and analyzed data using ArcGIS to produce cartographic products for the client.

2012 **Agoura Road Widening Project – Agoura Hills.** The City of Agoura Hills is proposing to widen Agoura Road from two lanes to four. The project was recently expanded beyond the limits of the original ESL. Ms. Mayta conducted a biological survey and inventory of botanical resources for the additional ESL areas.

2012 **SR-150 Santa Paula Creek Bank Stabilization and Fish Passage Project – Santa Paula.** Caltrans conducted a large-scale bank stabilization and fish passage project adjacent to SR-150 near the city of Santa Paula.

Ms. Mayta conducted construction and permit compliance monitoring until project completion in 2012. In addition to construction monitoring, Ms. Mayta conducted regular biological surveys for nesting birds and assisted in fish capture and relocation.

2012 **Calleguas Park Restoration Plan – Camarillo.** California State University Channel Islands (CSUCI) is currently in the process of producing a master plan for the park in cooperation with the National Park Service. Ms. Mayta assisted with preliminary vegetation surveys and habitat assessment using the California Rapid Assessment Method (CRAM). She also conducted data analysis using GIS software to produce wetland delineation and vegetation maps for the restoration plan.

2012 **Toland Road Landfill Off-site Mitigation Project – Ventura County.** Coastal Restoration Consultants (CRC) was hired to prepare and implement a restoration plan for 1.65 acres along the Santa Clara River between the cities of Santa Paula and Saticoy for The Nature Conservancy. As part of the mitigation and monitoring plan for the project, Ms. Mayta assisted with pre-project monitoring, photo monitoring and annual vegetation monitoring.

2012 **Piru Creek Clean-out Offsite Mitigation Project – Santa Paula**. A restoration plan was generated and implemented to mitigate the impacts of sediment removal on the banks of Piru Creek at the SR 126 bridge. Ms. Mayta performed pre-project, annual vegetation surveys and data analysis for the project including generating annual mitigation monitoring reports for CDFG. She also assisted with the wetland delineation for the site.

2010 **Santa Cruz Island Experimental Coastal Sage Scrub Restoration Project – Santa Cruz Island.** The Nature Conservancy contracted CRC to implement an experimental design to determine the feasibility of large-scale restoration on the island. Ms. Mayta was involved with seed collection, plant propagation and installation. She also assisted with conducting monthly qualitative vegetation monitoring over a two year period as well as assisting in the planning and implementation of additional experiments. Ms. Mayta also assisted with ant surveys to determine the population size of Argentine ants on the island.

2012 **Hedrick Ranch Nature Area Restoration – Santa Paula.** The California State Coastal Conservancy purchased this property as part of the Santa Clara River Parkway initiative and granted it to the Friends of the Santa Clara River (FSCR) to manage and restore over time. Ms. Mayta assisted in the collection of seed, propagation and installation of plants on site. She also conducted annual vegetation monitoring, bird surveys and Least Bell's Vireo nesting surveys.

2010 **Ojai Meadow Preserve Restoration Project- Ojai.** The Ojai Valley Land Conservancy contracted Coastal Restoration Consultants to prepare and implement a restoration plan for approximately 20 acres of their 57-acre parcel. Ms. Mayta supervised staff and managed daily operations for the project. She also assisted in conducting bi-annual vegetation monitoring and bird surveys. Ms. Mayta also conducted construction monitoring for the grading phase of the project.

2008 **Ventura marsh milkvetch – Ventura and Santa Barbara County.** CDFG in collaboration with Rancho Santa Ana Botanic Garden, Santa Barbara Botanic Garden and USFWS implemented a strategy for introducing experimental introductions of the endangered Ventura marsh milkvetch into the coastal areas of Ventura and Santa Barbara Counties. Ms. Mayta was responsible for collecting field data on a weekly basis, performing frequent biological surveys of the site and conducting annual monitoring of the plant populations.

JENNIFER MORRISON

Educational Background:

- B.S., Marine Biology, California State University, Long Beach, 2008

Professional Experience:

- GPA Consulting, Associate Biologist, 2011
- National Marine Fisheries Service; Protected Resources Division, Southwest Region, Contracting Biologist, 2008-2011

Summary of Experience: Jennifer Morrison is an Associate Biologist at GPA. At GPA, Ms. Morrison prepares environmental documents, Section 404, Section 401, and Section 1602 permit applications, assists with technical analyses, and performs biological surveys and construction monitoring. Her experience includes working with local and state agencies, including Caltrans and several counties and cities in Southern California. Prior to working for GPA, Ms. Morrison was a contracting biologist for the National Marine Fisheries Service and assisted with Endangered Species Act listing decisions and critical habitat designations for endangered species, including green sturgeon and black abalone.

Relevant Training/Certifications:

2013 Certified *Caulerpa taxifolia* surveyor under the *Caulerpa* Control Protocol

2013 Completed training session on the biology, ecology, and habitat management of the Western Burrowing Owl (*Athene cunicularia hypugea*) through the Elkhorn Slough Coastal Training Program

Relevant Project Experience:

2014 **Firestone Boulevard Bridge over San Gabriel River Project, City of Norwalk.** The City of Norwalk is replacing the Firestone Boulevard Bridge over the San Gabriel River. Ms. Morrison performs weekly surveys of the project area for nesting birds and conducts monthly construction monitoring.

2014 **Ford Theatres Project, County of Los Angeles.** The County of Los Angeles proposes improvements to the Ford Theatres in the Hollywood Community of the City of Los Angeles. Ms. Morrison conducted a biological survey of the project area and is preparing the Biological Resources Assessment for the project.

2013 **Oakdale Road Bridge Replacement Project, Merced County.** The County of Merced replaced the Oakdale Road Bridge over Merced River. Ms. Morrison surveyed the project area and determined the percent vegetation cover and plant species composition of the restoration areas using transects. She also assisted in preparation of the Annual Monitoring Report.

2013 **Kibby Road Bridge over Bear Creek Bridge Replacement Project. Merced County.** Merced County proposes to replace the Bear Creek Bridge structure located on Kibby Road approximately 0.5 miles east of the City of Merced. Ms. Morrison assisted with the NES for this project.

2013 **Moraga Road over Outside Canal. Merced County.** Merced County proposes to replace the Moraga Road Bridge structure over Outside Canal, located approximately one mile north of State Route 33 and 1.3 miles east of the I-5 in Merced. Ms. Morrison assisted with the NES for this project.

2013 **Avenue 364 Bridge over Cottonwood Creek. County of Tulare.** Tulare County proposes to replace the existing bridge on Avenue 364 over Cottonwood Creek just west of State Route (SR) 245 and south of SR-201. Ms. Morrison assisted with the NES for this project.

2013 **Higuera Street Bridge Improvement Project. City of Culver City.** The City of Culver City proposes to replace and widen the existing Higuera Street Bridge over Ballona Creek. Ms. Morrison prepared the NES(MI) and Visual Impact Memorandum for the project.

2013 **Sepulveda Boulevard Bridge Widening Project. City of Manhattan Beach.** The City of Manhattan Beach proposes to widen the Sepulveda Boulevard Bridge from 33rd Street to Rosecrans Avenue in Manhattan Beach. Ms. Morrison prepared the NES(MI) and Visual Impact Memorandum for the project.

2013 **Admiralty Drive Bridge over Queen Elizabeth Passage. City of Huntington Beach.** The City of Huntington Beach is proposing to repair and rehabilitate the Admiralty Drive Bridge over Queen Elizabeth Passage in Huntington Harbor. Ms. Morrison prepared the NES and permit applications for the project.

2013 **Humboldt Drive Bridge over Short Channel. City of Huntington Beach.** The City of Huntington Beach is proposing to repair and rehabilitate the Humboldt Drive Bridge over Short Channel Passage in Huntington Harbor. Ms. Morrison prepared the NES and permit applications for the project.

2013 **Lost Canyon Road Bridge Widening. City of Santa Clarita.** The City of Santa Clarita is widening the Lost Canyon Road Bridge over Sand Canyon Wash. Ms. Morrison prepared the NES, IS-MND and environmental permits for the project.

2012-13 **Riverside Drive Bridge Widening Project, City of Los Angeles**. The City of Los Angeles is widening the Riverside Drive Bridge over the Los Angeles River. Ms. Morrison prepared the NES and permits for the project and assisted with the wetland delineations.

2012 **Calleguas Creek Bike Trail – Phase IV – City of Camarillo.** The City of Camarillo is designing the fourth phase of the Calleguas Creek bike trail. Ms. Morrison prepared a biological technical memo for this project.

2012 **Avenue 26 Bridge Seismic Retrofit. City of Los Angeles.** Conducted biological fieldwork and research, coordinated with regulatory agencies, and prepared the NES(MI).

2012 **Los Osos Valley Road (LOVR)/U.S. 101 Interchange Improvements Plan Check. City of San Luis Obispo.** Reviewed the plans and specifications to ensure that all biological mitigation measures included in the environmental documents were incorporated into the PS&E package.

2012 **Santa Rosa Road Widening – City of Camarillo.** The City of Camarillo, in coordination with Caltrans, proposed to widen a portion of Santa Rosa Road from 2 to 4 lanes. Ms. Morrison assisted in completion of the Community Impacts Technical Memorandum.

2012 **US 101 HOV Widening, Ventura and Santa Barbara Counties.** Caltrans is constructing HOV lanes along a 6-mile segment of US 101. Ms. Morrison conducted preconstruction surveys and construction monitoring, and will continue monitoring until 2013.

2012 **Agoura Road Widening – City of Agoura Hills.** The City of Agoura Hills proposes to widen Agoura Road from 2 to 4 lanes to improve its current conditions and to enhance bicycle and pedestrian safety and accessibility. Ms. Morrison completed the supplemental biological resources evaluation.

2012 **Calleguas Creek Bike Trail – Phase II, City of Camarillo.** The City of Camarillo is constructing the second phase of a bike trail along Calleguas Creek. Ms. Morrison conducted preconstruction surveys and construction monitoring for permit compliance.

2012 **Calleguas Creek Bike Trail – Phase III, City of Camarillo.** The City of Camarillo is designing the third phase of a bike trail along Calleguas Creek. Ms. Morrison assisted with the Preliminary Environmental Study.

2012 **Yorba Linda Historic Resources Element, City of Yorba Linda.** GPA is assisting the city to develop a Historic Preservation Element. This will require an Initial Study/Negative Declaration (IS/ND) to comply with CEQA. Ms. Morrison assisted with the IS/ND.

2011 **East San Fernando Boulevard Corridor, City of Los Angeles**. The Los Angeles County Metropolitan Transportation Authority, with the City of Los Angeles, is conducting an Alternatives Analysis, EIR/EIS, and related engineering for the project to improve transit circulation. Ms. Morrison assisted in the research for the community impacts analysis.

2011 **Fletcher Drive Bridge Seismic Retrofit – City of Los Angeles.** The City of Los Angeles is currently retrofitting the Fletcher Drive Bridge over the Los Angeles River to meet Caltrans' updated seismic standards. Ms. Morrison conducted swallow and bat preconstruction surveys.

2011 **Lewis Road Landscaping, Wall, and Monument Project – City of Camarillo.** The City of Camarillo planned to improve the appearance of Lewis Road by installing landscaping, a high wall to screen view of adjacent industrial properties, and a monument sign. Ms. Morrison assisted in the preparation of the PES form.

2011 **Rice Avenue/E. Channel Islands Boulevard Intersection Improvements – County of Ventura.** The County of Ventura proposed to widen the existing intersection in order to improve its operations. Ms. Morrison assisted in onsite biological surveys and the completion of the Biological Memorandum for the project.

2011 **Rice Avenue/E. Wooley Road Intersection Improvements – County of Ventura.** The County of Ventura proposed to widen the existing intersection in order to improve operations of the intersection to an acceptable level of service. Ms. Morrison assisted in onsite biological surveys and the completion of the Biological Memorandum for the project.

2011 **Springville Road Interchange Project – City of Camarillo.** The City of Camarillo is currently building the new Springville Interchange over U.S. Highway 101 between Central and Las Posas Avenues. As part of the Mitigation and Monitoring Plan for the project, Ms. Morrison performed biological surveys of the site, checked site conditions to ensure compliance with regulatory permits, and completed Biological Monitoring Reports for the project.

2011 **Old Creek Road Crossing Improvement Project – County of Ventura.** The County of Ventura, with support from Caltrans and CDFG, replaced a low-water crossing with a multi-span bridge to provide safe year-round vehicular crossing over San Antonio Creek and to aid in steelhead restoration. After project completion, Ms. Morrison performed onsite surveys of revegetation areas and drafted the mitigation-monitoring year-end reports for the project. Ms. Morrison will continue to monitor the success rate of the mitigation planting for a total of five years.

2011 **Higuera Street Bridge Replacement – Culver City, CA.** Culver City with cooperation with Caltrans proposes to replace the existing Higuera Street Bridge over Ballona Creek. The project is needed to meet current seismic and geometric standards for California. Ms. Morrison performed onsite biological surveys and is completing the Natural Environmental Study for the project. She also prepared the Preliminary Environmental Study.

2011 **SR-150 Santa Paula Creek Rock Weir Fishway Project – Santa Paula.** Caltrans constructed a large-scale bank stabilization and fish passage project on Santa Paula Creek adjacent to State Route 150 near the City of Santa Paula. Ms. Morrison assisted in conducting species surveys and mitigation monitoring during construction to ensure compliance with regulatory agency permits. Ms. Morrison continued conducting species surveys and construction monitoring until project completion, and assisted in the capture and relocation of aquatic species out of the project site.

2010 **National Marine Fisheries Service – Long Beach.** Ms. Morrison assisted with compiling current research and drafting biological reports for black abalone and green sturgeon to support ESA section 4 listing decisions and critical habitat designations. Duties also included reviewing and summarizing the public comments that were received based on the ESA documents. Ms. Morrison also edited marine mammal stranding reports for accuracy and input the data into the National Marine Mammal Stranding database.

2008 **National Marine Fisheries Service – Long Beach.** Ms. Morrison assisted with ESA section 4 listing decisions and critical habitat designations for black abalone and green sturgeon, and input marine

mammal stranding data into the National Marine Mammal Stranding database. Duties also included conducting literature searches and developing EndNote libraries for sea turtles, marine mammals and other marine species.

2006 **White Sea Bass Project – Santa Catalina Island.** Ms. Morrison assisted with fish surveys on board the Yellowfin vessel. Duties included retrieving fish and invertebrates from gill nets, identifying and taking standard measurements of organisms, and recording species data.

TABLE OF CONTENTS

EXECUTIVE SUMMARY

This report presents the results of a historic resource report prepared for the Ford Theatres Project. Nestled in the Hollywood Hills at the junction of Cahuenga and Highland Avenues, the John Anson Ford Theatres (Ford Theatres) is owned by the County of Los Angeles and operated through a three-way partnership between the County of Los Angeles Department of Parks and Recreation, the County of Los Angeles Arts Commission, and the Ford Theatre Foundation. The 32-acre property sits on the east side of the Cahuenga Pass and currently provides two entertainment venues: the 1,200-seat Ford Amphitheatre and the 87-seat theatre space, known as Inside the Ford.

The County of Los Angeles proposes improvements to the Ford Theatres (Project). The Project includes the rehabilitation of portions of the existing amphitheatre and the development of approximately 59,030 square feet of new buildings and approximately 48,750 square feet of outdoor plaza areas. These improvements would include a 299-seat theatre, a multi-purpose flex space, a restaurant, office spaces, and enhanced parking facilities and visitor amenities. The Project would also provide for the renovation of exterior landscape areas and enhanced vehicle and pedestrian circulation. An approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the Project Site is also proposed. These improvements would enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users.

The Ford Theatres property was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places (National Register). Properties that have been determined eligible for listing in the National Register are automatically included in the California Register of Historical Resources (California Register). Properties that are listed in the California Register are considered to be historic resources subject to the California Environmental Quality Act (CEQA).

As the evaluation was 20 years old, GPA determined that the property should be re-evaluated to account for the changes that had been made to the property in the intervening years. After conducting additional research and field inspections, it was concluded that the Ford Theatres is eligible for listing in the National Register under Criterion A as one of the oldest performing arts sites in Los Angeles still in use, and eligible under Criterion C as one of only five outdoor theatres in Los Angeles remaining from the early 20th century. GPA documented the alterations to the property since it was originally constructed, and concluded that it retains sufficient integrity to convey its significance. GPA also identified the character-defining features of the property.

As the property is a historic resource subject to the CEQA, GPA analyzed the potential impacts the Project may have on the Ford Theatres. GPA concluded that the impact of the new construction could be mitigated by the application of the Secretary of the Interior's Standards. The Project would negatively affect the property's integrity of setting and feeling. Nevertheless, the integrity as a whole would be sufficient to convey its significance. The Ford Theatres would continue to be eligible for listing in the California Register.

1. INTRODUCTION

1.1 Purpose and Qualifications

The purpose of this report is to identify and evaluate historic resources that may be affected by the implementation of the Ford Theatres Project (Project); to assess any potential impacts the Project may have on identified historic resources; and to recommend mitigation measures, as appropriate. This report was prepared to facilitate the environmental compliance of the Project under the provisions of the California Environmental Quality Act (CEQA).

The Project includes the rehabilitation of portions of the existing amphitheatre and the development of approximately 59,030 square feet of new buildings and approximately 48,750 square feet of outdoor plaza areas. These improvements, which would be developed in several phases, would include a 299-seat theatre, a multi-purpose flex space, a restaurant, office spaces, and enhanced parking facilities and visitor amenities. The Project would also provide for the renovation of exterior landscape areas and enhanced vehicle and pedestrian circulation. An approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the Project Site is also proposed. These improvements would enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users.

This report includes a description of the regulatory framework for the evaluation of historic resources, a description of the environmental setting including a brief history of the John Anson Ford Theatres and the context in which it was evaluated, an analysis of potential impacts that the Project may have on identified historic resources, and recommended mitigation measures for any potential adverse impacts to those resources.

Teresa Grimes, Principal Architectural Historian at GPA Consulting, was responsible for the preparation of this report. Ms. Grimes fulfills the qualifications for historic preservation professionals outlined in Title 36 of the Code of Federal Regulations, Part 61. Her resume is available upon request.

1.2 Methodology

In preparing this report, the following tasks were performed:

1. Researched the Ford Theatres to determine whether or not it is currently listed as a landmark at the national, state, or local levels and whether or not it has been previously evaluated as a historic resource. The research revealed that the amphitheatre was evaluated in 1994 and determined eligible for listing in the National Register of Historic Places. This evaluation corresponds with a California Register Status Code of 2S2. A copy of the state historic resource inventory form is attached as Appendix A. Properties that have been determined eligible for listing in the National Register of Historic Places are automatically included in the California Register of Historical Resources. For more information about these programs see Section II of this report. As the property was evaluated 20 years ago, it was re-evaluated to account for the changes that have been made to the property since the original evaluation.

2. Conducted a field inspection of the Project Site and surrounding area to determine the scope of the study. The study area was identified as the Project Site itself.

3. The post-war motel building that is located north of the vehicular entrance to the Project Site from the Pilgrimage Bridge was not identified as a potential historic resource for lack of integrity. The 1954 aerial photograph of the property illustrates that it is merely a remnant of a large motel complex that originally included two other buildings of equal size. Alterations to the existing building include the replacement of doors, windows on the first story, and possibly the exterior cladding. Due to the alterations, it has no genuine potential to qualify as a historic resource and was not targeted for further research or evaluation.

4. Conducted a subsequent field inspection to analyze the physical integrity of the property and to identify and photograph the character-defining features of the Ford Theatres.

5. Researched the property to establish the general history and context through Internet sources and local libraries including a review of relevant databases, books, and articles. The history of the property at www.fordamphitheatre.org was the starting point for the research. The Ford Theatres staff also provided information about the physical changes that have taken place since the 1990s.

6. Reviewed and analyzed ordinances, statutes, regulations, bulletins, and technical materials relating to federal, state, and local historic preservation designations, and assessment processes and programs to establish the significance, integrity, period of significance, and character-defining features of the property.

7. Analyzed the Project description and plans for potential impacts and developed mitigation measures.

2. REGULATORY FRAMEWORK

Generally, a lead agency must consider a property a historic resource under the CEQA if it is eligible for listing in the California Register. The California Register is modeled after the National Register. Furthermore, a property is presumed to be historically significant if it is listed in a local register of historic resources or has been identified as historically significant in a historic resources survey (provided certain criteria and requirements are satisfied) unless a preponderance of evidence demonstrates that the property is not historically or culturally significant.[1] The National and California Register designation programs are discussed below.

2.1 National Register of Historic Places

The National Register is "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[2]

[1] Public Resources Code Section 5024.1 and 14 CCR Section 4850.
[2] Title 36 Code of Federal Regulations Part 60.2.

Criteria

To be eligible for listing in the National Register, a property must be at least 50 years of age (unless the property is of "exceptional importance") and possess significance in American history and culture, architecture, or archaeology. A property of potential significance must meet one or more of the following four established criteria: [3]

A. Associated with events that have made a significant contribution to the broad patterns of our history; or

B. Associated with the lives of persons significant in our past; or

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Yield, or may be likely to yield, information important in prehistory or history.

Physical Integrity

According to *National Register Bulletin #15*, "to be eligible for listing in the National Register, a property must not only be shown to be significant under National Register criteria, but it also must have integrity." Integrity is defined in *National Register Bulletin #15* as "the ability of a property to convey its significance."[4] Within the concept of integrity, the National Register recognizes the following seven aspects or qualities that in various combinations define integrity: feeling, association, workmanship, location, design, setting, and materials.

Context

To be eligible for listing in the National Register, a property must also be significant within a historic context. *National Register Bulletin #15* states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning...is made clear."[5] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

2.2 California Register of Historical Resources

In 1992, Governor Wilson signed Assembly Bill 2881 into law establishing the California Register. The California Register is an authoritative guide used by state and local agencies, private groups, and citizens to identify historic resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse impacts.[6]

The California Register consists of properties that are listed automatically as well as those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

[3] Title 36 Code of Federal Regulations Part 60.4.
[4] *National Register Bulletin #15*, pp. 44-45.
[5] Ibid., p. 7.
[6] Public Resources Code Section 5024.1 (a).

- California properties listed in the National Register and those formally Determined Eligible for the National Register;
- State Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (SOHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.[7]

The criteria for eligibility of listing in the California Register are based upon National Register criteria, but are identified as 1-4 instead of A-D. To be eligible for listing in the California Register, a property generally must be at least 50 years of age and must possess significance at the local, state, or national level, under one or more of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California, or national history; or
3. It embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important in the prehistory or history of the local area, California, or the nation.

Historic resources eligible for listing in the California Register may include buildings, sites, structures, objects, and historic districts. Resources less than 50 years of age may be eligible if it can be demonstrated that sufficient time has passed to understand its historical importance. While the enabling legislation for the California Register is less rigorous with regard to the issue of integrity, there is the expectation that properties reflect their appearance during their period of significance.[8]

The California Register may also include properties identified during historic resource surveys. However, the survey must meet all of the following criteria:[9]

1. The survey has been or will be included in the State Historic Resources Inventory;
2. The survey and the survey documentation were prepared in accordance with office [OHP] procedures and requirements;
3. The resource is evaluated and determined by the office [OHP] to have a significance rating of Category 1 to 5 on a DPR Form 523; and
4. If the survey is five or more years old at the time of its nomination for inclusion in the California Register, the survey is updated to identify historical resources which

[7] Public Resources Code Section 5024.1 (d).
[8] Public Resources Code Section 4852.
[9] Public Resources Code Section 5024.1.

have become eligible or ineligible due to changed circumstances or further documentation and those which have been demolished or altered in a manner that substantially diminishes the significance of the resource.

OHP Survey Methodology

The evaluation instructions and classification system proscribed by the SOHP in its *Instructions for Recording Historical Resources* provide a three-digit evaluation code for use in classifying potential historic resources. In 2003, the codes were revised to address the California Register. The first digit indicates the general category of evaluation. The second digit is a letter code to indicate whether the resource is separately eligible (S), eligible as part of a district (D), or both (B). The third digit is a number, which is coded to describe some of the circumstances or conditions of the evaluation. The general evaluation categories are as follows:

1. Listed in the National Register or the California Register.
2. Determined eligible for listing in the National Register or the California Register.
3. Appears eligible for listing in the National Register or the California Register through survey evaluation.
4. Appears eligible for listing in the National Register or the California Register through other evaluation.
5. Recognized as historically significant by local government.
6. Not eligible for listing or designation as specified.
7. Not evaluated or needs re-evaluation.

3. ENVIRONMENTAL SETTING

3.1 Historical Background

Nestled in the Hollywood Hills at the junction of Cahuenga and Highland Avenues, the Ford Theatres is owned and operated by the County of Los Angeles and located in a county regional park. The 32-acre property sits on the east side of the Cahuenga Pass and provides two entertainment venues: the 1,200-seat Ford Amphitheatre and the 87-seat theatre space, known as Inside the Ford.

The amphitheatre was built in 1920 as the site of the Pilgrimage Play, a 12-part Passion Play depicting the life and death of Jesus Christ. Hence the original name for the venue was the Pilgrimage Theatre. The author, Christine Wetherill Stevenson, believed the rugged beauty of the Cahuenga Pass would provide a dramatic outdoor setting for the play. Wetherill Stevenson was born and raised in Philadelphia where she helped found the Philadelphia Art Alliance. Together with Mrs. Chauncey D. Clark and other investors, she purchased the land on which the Hollywood Bowl now sits for the purposes of building a theatre. The other investors didn't like the idea of being limited to religious productions, so they bought out Wetherill Stevenson, and she purchased the land across the street. A wood amphitheatre was built on the site with the help of volunteers. Taking advantage of the box canyon, the stage was set against a natural backdrop

of chaparral and cypress growing up the hillside. The original design and layout for the amphitheatre was apparently prepared by architect Bernard Maybeck.

H. Ellis Reed was hired to produce and direct the play, which was performed by local actors every summer from 1920 to 1929. The play was performed nightly, except Sundays, for approximately eight weeks. A cast of more than 100 was selected at the beginning of each summer, although the same actors performed a few roles for several seasons. While attending Hollywood High School, Fay Wray appeared in the play. Other actors who graced the Pilgrimage Theatre included Gale Gordon, Peggy Converse, Rachel Ames, and Addison Richards. Wetherill Stevenson did not live to see the theatre become a cultural institution. She died suddenly in 1922, just two years after the play opened. An electrically illuminated cross was erected on the hill above the amphitheatre and dedicated in her honor in 1923.[10] After Wetherill Stevenson's death, *Los Angeles Times* owner Harry Chandler acquired the property and performance rights to the play from her estate.

Originally, patrons arrived to the amphitheatre mostly by streetcar. By 1924, more and more patrons arrived by automobile. So driveways and parts of the grounds were regraveled and resurfaced. Schools, churches, civic organizations, and other groups often purchased large blocks of tickets and made annual excursions to see the play together. The venue became even more accessible by automobile and bus when the Hollywood Parkway opened in 1940.[11] Parking areas were also expanded at this time.[12]

A brush fire in 1929 destroyed the original wood structure. The present amphitheatre was built on the same site and opened in 1931. The orientation of the seating area and location of the stage generally remained the same, and some of the original stone was incorporated into the new structure at house right. The amphitheatre is constructed of board-formed poured-in-place concrete and supposedly designed in the style of ancient Judaic architecture to resemble the gates of Jerusalem.[13]

The architect of the amphitheatre, William Lee Woollett was born in Albany, New York and came from a long line of architects. Following in his father's footsteps William Lee Woollett studied architecture at MIT and after working for the Boston firm Femur and Page, he returned to Albany in 1896 to set up his own practice. In 1905, he was joined briefly by John W. Woollett, one of his brothers, who was also an architect. After the fire and earthquake in San Francisco, William Lee went out to investigate the prospects of starting an office there in 1909. He stayed in California and later gained considerable recognition for his State Armories in San Francisco and Los Angeles, numerous schools, office buildings, theatres, and houses. William Lee Woollett's son, William Woollett, and grandson Joseph L. continue to practice in California.

The Pilgrimage Play was not performed in 1938 season so that the internationally renowned theatre director Max Reinhardt could stage *Faust*. The art director Nicolai Remisoff altered the stage for the production. "He retained the former center stage, sliced off the canyon walls, and built on either side a stage at right angles to the old one."[14] The classic Goethe drama was one of three theatre events organized by Reinhardt that year. From 1902 and 1933, Reinhardt directed various theatres in Berlin. In 1920, he helped organize the Salzberg Festival in Austria.

[11] The Parkway is now part of the Hollywood Freeway.
[12] No Author, "Travel to Outdoor Stage Entertainments Simplified," *Los Angeles Times*, July 7, 1940, p. A1.
[13] This statement is often made about the design of the theatre, but is pure speculation.
[14] No Author, "Cast of 150 Rehearses Daily for Presentation of 'Faust'," *Los Angeles Times*, August 1, 1938, p. A1.

After Austria was invaded by Germany in 1938, he immigrated to the United States. He was invited by the California Festival Association to organize the Salzberg-in-Hollywood. Previously, the association hired Reinhardt to stage plays in the Hollywood Bowl in 1932 and 1936. Although the three plays staged by Reinhardt were praised by critics and audiences, the annual festival that was envisioned did not come to fruition.

Production of the Pilgrimage Play resumed in 1939 and continued to be performed until 1964, interrupted only by World War II, when the structure was converted to dormitories for servicemen.[15] In 1941, the land was deed to the County of Los Angeles. The Pilgrimage Play continued to be presented until a lawsuit in 1964 forced its closure because of its religious nature. Opponents argued that expending public funds on a religious play violated the principle of the separation of church and state.

The County continued to use the amphitheatre for a variety of concerts and performances, but public attendance dwindled. The structure gradually deteriorated until the late County Supervisor John Anson Ford obtained funding for capital improvements, several decades ago. The Pilgrimage Theatre was then renamed in his honor. It was used intermittently for Shakespearean plays, jazz concerts, and dance performances until former County Supervisor Ed Edelman revived the venue with the creation of the Ford Amphitheatre Season (originally called "Summer Nights at the Ford") in 1993.

The indoor theatre space at the Ford was rented by numerous groups, most notably the Mark Taper Forum, who made it the home of their second stage "Taper Too" from 1972 to 1997. In 1998, the space was extensively renovated and renamed Inside the Ford. Improvements were also made to the stage, backstage and public areas of the Ford. An additional $1.6 million was spent between 1999 and 2000 to make the facility ADA (Americans with Disabilities Act) complaint. These improvements included an elevator for the three-level structure, the construction of the new entryway, and Edison Plaza.

3.2 Architectural Description

The 32-acre site is irregular in shape and located in the Hollywood Hills on the east side of the Cahuenga Pass. It consists of natural and man-made features, the largest of which is the 1,200-seat amphitheatre. The landscape is diverse. It includes native and non-native trees, grasses, and shrubs. The terrain consists of rolling foothills, some quite steep. Surface parking lots are located off Cahuenga Boulevard on the western edge of the site. Newer pre-cast concrete blocks and older broken concrete pieces are used to form retaining walls along parking lots and driveways. Near the vehicular entrance to the site from the Pilgrimage Bridge is a post-war motel building that is used as office space by the Ford Theatre Foundation, Los Angeles County Arts Commission staff, and Los Angeles Philharmonic. A service road leads from the former motel building to the north side of the amphitheatre ending in a cul-de-sac. This road is lined with Italian cypress (Cuppressus semperviren) trees on the north and a sidewalk and low iron fence on the south. The cul-de-sac includes handicapped parking spaces and a loading zone.

Besides the amphitheatre there are two small buildings on the site: the concession building and the box office. The concession building was originally designed as the box office. It is located near the cul-de-sac of the service road on the north side of the amphitheatre. It is a two-story building with a flat roof and stucco exterior. A shade structure is located on the north and west elevations where patrons place and receive orders from windows. Second story windows are covered by security bars. The box office was originally designed as the caretaker's cottage. It is located at the entrance courtyard on the west side of the site. It is also a one-story building with a flat roof and stucco exterior. The building has two levels, which is reflected in the stepped massing. The ticket window is located on the north elevation and is covered by an awning.

The entryway to the amphitheatre is from the south parking lot. It was constructed in 2000 and consists of winding paths that create a gradual climb from the box office, a waterfall, various species of trees and plants, and pocket picnic areas. At the top of the entryway is Edison Plaza. The amphitheatre generally has an east-west orientation and is situated in a box canyon. The seating area is on the west, while the stage and back stage area is to the east. The main entrance is centered and recessed at the base of the outside wall. It is flanked by convex and concave concrete walls with different surface textures. These different surface textures are found throughout the structure. In some cases the boards used to form the concrete walls were laid vertically and in other cases they were laid horizontally. The mixture of the concrete is also inconsistent. It some cases it has a heavy aggregate and in other cases a fine one. Above the main entrance is a pointed arched parapet. The pointed arched doorway on the inside wall of the main entrance has been closed. The door next to the main entrance leads to the entry of the Inside the Ford theatre. Storage and dressing rooms are also located on this lower level.

Grand staircases are located on each side of the main entrance. The one on the south marches up the outer wall, while the one on the north is situated between the inner and outer walls.

The north staircase bifurcates to lead to the concessions building and the amphitheatre lobby at Door A, while the south staircase leads to the amphitheatre lobby at Door D. The back inside wall of the seating area is broken by four, heavy, double wood paneled doors decorated with a recessed grill pattern. These doors are situated in rectangular openings and lead to the seating aisles. On the upper level is a stucco clad addition housing the projection room and lighting booth. Also attached is a tall corrugated metal parapet wall running along the top of the amphitheatre wall. The wall was added to reduce the sound from Cahuenga Boulevard and the Hollywood Freeway. These two major additions have not altered the original structure, but merely rest on top of the walls. The amphitheatre seating consists of individual metal theatre type chairs and is not original.

The north and south walls of the seating area are stepped downward towards the stage. The stage has upper and lower levels and is flanked by two elaborate two-story towers with crenellated parapets. These towers were added in 1945, the same time the stage was enlarged.[16] Rustic stonework forms the foundation for the stage and the walls at the rear of the stage. The stone appears to be local, and the various colors, shapes, and size suggest that the walls were constructed and repaired over time. The hillside with stone retaining walls encloses the amphitheatre on the east. The stone on the south side of the seating area may have been recycled from the 1920 structure.

4. EVALUATION OF ELIGIBILITY

4.1 National Register of Historic Places

Criterion A

To be eligible for the National Register under Criterion A, a resource must have a direct association with events that have made a significant contribution to the broad patterns of our history. The Ford Theatres is eligible for listing in the National Register under Criterion A at the local level in the context of the cultural history of Los Angeles. It is significant as one of the oldest performing arts sites in Los Angeles still in use. The other performing arts venues in Los Angeles include: Trinity Auditorium (1913) which is no longer used for the performing arts; the Hollywood Bowl (1920) which has been rebuilt several times; and the Greek Theater (1930) which is still in use. In addition to these major theatres and amphitheatres there are a number of smaller venues in Los Angeles. Many were owned by theatre circuits that operated nationally or regionally including the Orpheum, Pantages, and Belasco. The Los Angeles County Music Center was built between 1964 and 1967 and represents an endeavor to create a modern civic auditorium that began in the 1930s.

The Ford Theatres, like other theatres in Los Angeles, represents the personal vision of an individual on a quest to bring the performing arts to Los Angeles. Christine Wetherill Stevenson, a wealth Quaker from Philadelphia, sought to promote open-air dramas focusing on the lives of great religious leaders. As the founder of the Theater Arts Alliance in 1918, she spearheaded the search for a natural setting to build an amphitheatre to produce the plays. She and Mrs. Chauncy Clarke first purchased 65 acres that became the site of the Hollywood Bowl.[17] After parting ways with the Theater Arts Alliance, she purchased a 29-acre site across from the Bowl and had constructed a wood amphitheatre. She hired director H. Ellis Reed to produce the drama of the *Life of Christ*, having written the play herself. The play opened in 1920 and was

[16] No Author, "Pilgrimage Theatre Work to Be Rushed," *Los Angeles Times*, February 28, 1945, p. 2.
[17] The number of acres varies slightly depending on the source.

performed every summer until 1964, with only brief interruptions. Although Wetherill Stevenson died in 1922, the amphitheatre she created lived on. Since the 1960s the amphitheatre has featured more diverse programming to appeal to a more diverse audience. The period of significance for this context would be 1931 when the new amphitheatre was constructed through 1964 when the Pilgrimage Play ceased production.

Criterion B

To be eligible for listing in the National Register under Criterion B, a property must be associated with the lives of persons significant in our past. Many persons have worked, performed, and attended the Ford Theatres since it was constructed. Visiting a building, whatever its use would not be considered an important connection. The amphitheatre would not be considered eligible under Criterion B because a historically significant actor, musician, or artist performed there; seeing that it is highly unlikely that the amphitheatre would be reflective of the person's body of work. However, it is the cumulative contribution these individuals made to the performing arts that support the eligibility of the amphitheatre under Criterion A. There are two individuals with a close association with the amphitheatre: Christine Wetherill Stevenson and John Anson Ford. The amphitheatre would not be considered significant for its association with Wetherill Stevenson because she died in 1922, just two years after the opening. As such, she did not play a part in the design or construction of the existing amphitheatre, although the play she wrote was performed there for decades. While John Anson Ford was instrumental in revitalizing the amphitheatre, his efforts took place too recently to be considered historically significant. Therefore, the Ford Theatres is ineligible for listing in the National Register under Criterion B.

Criterion C

To be eligible for listing under Criterion C, a property must embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction. The Ford Theatres was constructed of board-formed poured-in-place concrete, which was a popular method of construction during the Great Depression. Therefore, the amphitheatre would not be significant for its method of construction because it was neither innovative nor unique. As one of only five outdoor theatres in Los Angeles remaining from the early 20th century, the Ford Theatres is significant as a type. The outdoor theatre movement that took place during the early part of the 20th century resulted in the construction of a number of amphitheatres. Some were constructed in parks by municipal governments, while others were constructed on college campuses.

The Hollywood Bowl and Greek Theater are substantially different from the Ford Theatres in terms of the architecture. The Hollywood Bowl was primarily designed for musical performances and features a shell, which has been reconstructed. The design of the Greek Theater was a fairly literal interpretation of an ancient Grecian amphitheatre, which has been somewhat lost by later alterations. The remaining amphitheatres in Greater Los Angeles are in Eagle Rock, Claremont, and Pasadena. Myron Hunt designed all three. Constructed in 1920, the Brookside Theater in Pasadena is very small, nestled on a hillside in a public park, and includes no permanent buildings. The Hillside Theater at Occidental College in the community of Eagle Rock was constructed in 1924. Although the auditorium and orchestra remain, the skene (backstage) and proscenium were demolished and reconstructed in a late modern style. The outdoor theatre at Pomona College in Claremont was designed in 1912. It has been restored and renamed the Fred Sontag Greek Theater.

The Ford Theatres embodies the distinguishing characteristics of a type – an early 20th century amphitheatre - in its overall plan, sequencing of spaces, concrete walls and support system, monumental main entrance and staircases, minimal ornamentation, open-air seating, and stage area that blends into the canyon. The amphitheatre is also significant for its association with the architect William Lee Woollett. Woollett was known for his flamboyant approach to ornament and rather liberal view of architectural historicism. Perhaps his best-known extant work is his collaboration with Albert C. Martin on the Million Dollar Theater (1918). This was actually the first building he designed after moving to Los Angeles from San Francisco. He also designed interior murals for the Paramount Theater (1920), prepared plans for the Santa Monica Pier Amusement Company to reflect Pompeian architecture, and designed a theatre in Venice. A talented artist as well, Woollett's non-architectural works included murals, set designs, and sculptures. He often wrote articles about architecture and urban planning in trade magazines and professional journals. Active in civic affairs, he was appointed to the Municipal Arts Commission in 1933 and helped draft the Cultural Heritage Ordinance in 1962. The Ordinance established the Cultural Heritage Commission, and Woollett became the founding president. Woollett was a prolific and accomplished architect who is considered a master for the quality of his work and for his contributions to the profession. The Ford Theatres represents one of his larger and more prominent commissions. The corbelled arches and crenellated parapets prominently displayed reflect a free and largely speculative interpretation of the architecture of the Holy Land.

Criterion D

Criterion D was not considered in this report, as it generally applies to archeological resources. At any rate, there is no reason to believe that the Ford Theatres has yielded, or will yield information important to the prehistory or history of the local area, California, or nation.

Integrity

To be eligible for listing in the National Register, properties must retain their physical integrity from the period in which they gained significance. In the case of architecturally significant properties, the period of significance is normally the date of construction. For historically significant properties, the period of significance is usually measured by the length of the associations. As such, the period of significance for the Ford Theatres is 1931 to 1964; the year the building was constructed through the period when the Pilgrimage Play was still performed. While some factors of integrity are more important than others depending on the property, a majority of the seven recognized factors should be retained. The amphitheatre retains its integrity of location, materials, workmanship, feeling, and association. Its integrity of setting and design has been diminished by changes that post-date the period of significance; however, they are still adequate. Overall, the amphitheatre retains sufficient integrity to convey its significance. Following is a point-by-point analysis:

- *Location – The place where the historic property was constructed or the place where the historic event occurred.*

The Ford Theatres has not been moved. Therefore, its integrity of location has been retained.

- *Setting – The physical environment of the historic property.*

While the broad setting of the Ford Theatres remains substantially unaltered, the immediate setting has changed noticeably. The vast majority of the 32-acre site has not been improved.

The surrounding hillsides continue to be covered with native and non-native trees, shrubs, and grasses that blend into the neighboring landscape. Surface parking lots and driveways have been enlarged, paved, and repaved; however, they are concentrated on the west side of the site and are visually disconnected from the amphitheatre. The entryway to the amphitheatre from the south parking lot was constructed in 2000. It represents the most significant change to the setting since 1964. Historic photographs (please see the cover photograph) depict a long, wide, nearly straight flight of steps to the front of the amphitheatre. The new winding paths and landscaping create a more organized and formal approach that did not exist historically. Therefore, the overall integrity of setting is low.

- *Materials – The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.*

Most of the changes to the amphitheatre since 1964 have involved the addition, not the removal of, materials. The original poured-in-place concrete walls and support system and wood doors and screens are still present. Some wood doors have been replaced; however, the new doors are identical to the old. Since the key materials remain, the integrity of materials has been retained.

- *Design – The combination of elements that create the form, plan, space, structure, and style of a property.*

A number of alterations to the amphitheatre since 1964 have muddled the design. These include the new entryway and elevator in the front and the sound walls along the upper level and sides of the seating area. However, the 1931 fabric remains remarkably distinguishable from these later additions because it is characterized by the poured-in-place concrete walls and support system that remain evident throughout the stage house and seating area. Furthermore the reoccurring design motifs, supposedly based upon the architecture of the Holy Land, including the heavy wood doors and screens, pointed arched openings, and religious symbols are still present and visible. Therefore, the integrity of design is fair.

- *Workmanship – The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.*

The techniques used in the construction of the building are in full display. The boards and different types of concrete used in the construction of the building can be seen in the textures and patterns on the walls. The hand-chiseled wood doors and screens reveal the workmanship of the carpenters who created them. However, it must be noted that the doors are mostly reproductions. While the original design and material has been preserved, the workmanship from the period no longer remains. However as a whole, the integrity of workmanship in the amphitheatre is sufficient.

- *Feeling – A property's expression of the aesthetic or historic sense of a particular period of time.*

This aspect of integrity is the most difficult to assess because it depends on individual perceptions. It results from the presence of physical features that, taken together, convey the property's historic character. Therefore, the Ford Theatres retains its integrity of feeling, because it still evokes the sense of an outdoor theatre constructed during the 1930s.

- *Association – The direct link between an important event or person and a historic property.*

The Ford Theatres is not eligible under Criterion B, but is eligible under Criterion A. The building is associated with a pattern of events, the history of the performing arts in Los Angeles. The key features from the period of significance remain including the poured-in-place concrete structure and support system, basic plan of the building, seating area, and stage. Therefore, the amphitheatre retains its integrity of association.

4.2 California Register of Historical Resources

The California Register was modeled on the National Register. The criteria for eligibility for listing in the California Register are virtually the same as the National Register. Therefore, the Ford Theatres is eligible for listing in the California Register for the same reasons noted above.

4.3 Character-Defining Features

Character-defining features are the architectural components that contribute to a building's sense of time and place. Preservation Brief #17: Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving Their Character notes:

> A complete understanding of any property may require documentary research about its style, construction, function, its furnishings or contents; knowledge about the original builder, owners, and later occupants; and knowledge about the evolutionary history of the building. Even though buildings may be of historic, rather than architectural significance, it is their tangible elements that embody its significance for association with specific events or persons and it is those tangible elements both on the exterior and interior that should be preserved.[18]

The character-defining features of buildings can be generally grouped into three categories: the overall visual character of a building, the exterior materials and craftsmanship, and the interior spaces, features, and finishes. The relative importance of character-defining features depends on the level of craftsmanship, visibility, and integrity. In addition, some character-defining features are more important than others in conveying the significance of the building.

The Ford Theatres is significant in the cultural history of Los Angeles, specifically the performing arts, at the local level. It also exemplifies the outdoor theatre movement as an excellent example of an early 20th century amphitheatre. The period of significance of the property is 1931 to 1964; the year the amphitheatre was constructed through the period when the Pilgrimage Play was still performed. The features in Table I (see Appendix B) are described as either "primary" or "secondary" character-defining features. Primary character-defining features are considered the most important elements contributing to the significance of the property, while secondary features are considered less important.

5. PROJECT IMPACTS

5.1 Determining the Significance of Impacts on Historical Resources

In enacting the California Register, the Legislature amended CEQA to clarify which properties are significant, as well as which project impacts are considered to be significantly adverse.

[18] *National Register Preservation Brief #17,* p. 1.

> A project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.[19]
>
> A substantial adverse change means demolition, destruction, relocation, or alteration of the resource such that the significance of a historical resource is materially impaired.[20]

The CEQA Guidelines include a slightly different definition of substantial adverse change:

> Substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource is materially impaired.[21]

The Guidelines go on to state that the significance of a historic resource is materially impaired when a project:

> Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources.[22]

Thus, a project would have an impact on a historic resource if it reduced its integrity to the point that it would no longer be able to convey its significance, and therefore the historic resource would no longer be eligible for inclusion in the California Register of Historical Resources.

5.2 Secretary of the Interior's Standards

The Secretary of the Interior's Standards for Rehabilitation (Standards) are codified at 36 Code of Federal Regulations (CFR) Section 67.7. The Standards are designed to ensure that rehabilitation does not materially impair the significance of a historic resource. Thus, the Standards are usually relevant in assessing whether there is a substantial adverse change under CEQA. The CEQA Guidelines state:

> Generally, a project that follows the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings* (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historic resource.[23]

The definition of "rehabilitation" assumes that at least some repair or alteration of the historic building will be needed in order to provide for an efficient contemporary use; however, these repairs and alterations must not damage or destroy materials, features, or finishes that are important in defining the building's historic character.

The Standards are as follows:

[19] Public Resource Code Section 21084.1.
[20] Public Resource Code Section 5020.1(q).
[21] 14 CCR Section 15064.5(b)(1).
[22] 14 CCR Section 15064.5(b)(2).
[23] 14 CCR Section 15064.5(b)(3).

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.

2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.

3. Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other buildings, will not be undertaken.

4. Changes to a property that have acquired historic significance in their own right will be retained and preserved.

5. Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.

6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.

7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

8. Significant archeological resources affected by a project will be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.

9. New additions, exterior alterations, or related new construction will not destroy historic materials that characterize the property. The new work shall be differentiated from the old and will be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.

10. New additions and adjacent or related new construction will be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

The Standards are not intended to be prescriptive, but instead provide general guidance. They are intended to be flexible and adaptable to specific project conditions to balance continuity and change, while retaining materials and features to the maximum extent feasible. Their interpretation requires exercising professional judgment and balancing the various opportunities and constraints of any given project. Not every Standard necessarily applies to every aspect of a project, nor is it necessary to comply with every Standard to achieve compliance. For a project to comply with the Standards, it must achieve a balance of continuity and change.

5.3 Analysis of Project Impacts

The Ford Theatres Project proposes to enhance the existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users. The Project is

comprised of the following components: historic amphitheatre, Ford Terrace, Ford Plaza, Transit Center/Flex Space, and hiking trail. For a complete description of the Project, please refer to the Draft Environmental Impact Report. Each of these components is analyzed separately below for its potential impact on the historic resource.

While compliance with the Standards results in a less than significant impact on historic resources under CEQA, noncompliance does not necessarily equal the material impairment of historic resources. Historic resources can continue to retain sufficient integrity to convey their significance, even if they are altered in a manner that does not comply with the Standards. Thus, the analysis of project impacts was based on whether the Project complies with the Standards and whether the Project would affect the integrity of the Ford Theatres and therefore its eligibility for inclusion in the California Register.

Amphitheatre

Improvements Underway

In September 2013, the County of Los Angeles Chief Executive Office prepared a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the rehabilitation of portions of the existing amphitheatre. As described in more detail below, these improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. These improvements were analyzed independently for compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards.

The hillside stabilization improvements will include the installation of compatible stone-clad retaining walls and drainage improvements along the rear of the stage to stabilize the existing slope and reduce runoff from the surrounding hillside. The stage reconstruction will include the removal of the existing two-level concrete amphitheatre stage structure to allow the installation of an improved stage structure, including the placement of new and upgraded foundations that meet current code requirements; new wood stage flooring and supports; an under stage drainage system; enhanced stage support and ADA-compliant performer spaces; and new ADA-compliant restroom facilities and associated plumbing. Code-required upgrades for fire/life safety and disabled access will also be implemented. Theatrical systems infrastructure improvements include improvements to the stage pit such as new steps and traps. In addition, new energy-efficient theatrical and audio-visual infrastructure to replace existing antiquated systems, including a projection screen, lighting/sound proscenium truss, and lighting towers will also be implemented. Other improvements involve the rehabilitation of portions of the stage buildings and towers including the removal of the exterior paint to provide water-resistant surfaces and to return the structures to their original color, and the installation of new roofing, windows, doors, and interior infrastructure for power, heating, and air conditioning. A new addition at stage left to accommodate an audio rack room and related heating, ventilation, and air conditioning will also be provided. As part of these improvements, 24 trees are anticipated to be removed based on their health, root structure, and impact to the stabilization of the adjacent hillside. Such trees will be replaced with new landscaping, including new trees and shrubs.

Proposed Improvements

Within the amphitheatre, the Project would replace the existing approximately 860-square-foot projection booth and control room located to the rear and above the seating area with a new 800-square-foot projection booth and control room. Existing lighting positions along the back of the amphitheatre would also be removed and replaced with an upgraded lighting platform that would be integrated within a new sound wall. In addition, a retractable shade structure would provide cover for the amphitheatre during day time performances.

These improvements appear to comply with the relevant Standards. Per the Standards, these improvements are consistent with the historic use of the amphitheatre (Standard #1) and do not involve the removal of any primary character-defining features (Standard #5). The existing projection room and control room, as well as the sound wall are not character-defining features.

The proposed projection booth and control room as well as the sound wall would be an improvement on these existing, non-original additions. Inside the seating area, these features would be visible but behind the audience during performances. Covered in sound absorbent panels, they would present a fairly plain and neutral backdrop for the historic architecture. Outside the seating area, there would be a screen of semi-transparent panels that would have a lighter feel than the existing corrugated metal. Furthermore, these features would be clearly differentiated from the original concrete structure (Standard #9) and could be removed in the future without negatively impacting the original concrete structure (Standard #10).

These improvements would not negatively affect the integrity of the Ford Theatres. The existing projection booth and control room as well as the sound wall have already diminished the integrity of design. (Please see the analysis of integrity on pages 16 to 18.) As stated above, the replacement of these features is an improvement on the existing condition. They would also enable the return of the walkway at the amphitheater level to its original condition. This walkway is now obstructed by an access stair that would be removed. Nonetheless, given the fluid nature of the architectural design until the approval of final plans, mitigation measures for this component of the Project are required to ensure compliance with the Standards.

Ford Terrace

North of the amphitheatre, the existing handicap parking at the upper gate would be relocated, and that area would be modified to accommodate a new dedicated artist performance entry and provide for a a two-story office and concessions building and an approximately 3,750-square-foot plaza collectively referred to as the Ford Terrace. The two-story building would include approximately 2,500 square feet of office space in one level above an approximately 2,500-square-foot concessions area at the first level. To the west of the new two-story building would be a raised plaza deck that would serve pre- and post performance concessions, private receptions, and intermission concessions. The plaza would feature landscaped raised planters with built-in benches along the perimeter and a new sound wall along the eastern perimeter of the plaza. Access to the new plaza would be from a new staircase from the existing amphitheatre walkway and a new accessible ramp that would encircle the existing elevator tower. Beneath the plaza, the modified driveway would form a service level referred to as the Service Court providing a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup, as well as fire department access. An approximately 1,570-square-foot workshop to support performances would also be provided within the Service Court adjacent to the loading dock. To provide for these improvements, the Project would require removal of the existing concession building. In

addition, use of the existing Inside the Ford theatre space would be removed. This space would be repurposed as a self-serve food marketplace area and for storage. New ADA-accessible restrooms would also be provided at the lower level.

It appears that these improvements would have a minimal visual impact on the amphitheatre from within the seating area. The north wall of the amphitheater separates the seating area from the existing loading zone, which is not a character-defining feature. The design of the Ford Terrace is a particularly sensitive matter given its proximity to the historic amphitheater. It would be similar to the design of the other components of the Project, which are intended to form a cohesive whole. As this component of the Project primarily involves new construction, the most applicable Standards are #9 and #10. Given the fluid nature of the architectural design until the approval of final plans, it is also difficult to ascertain the compatibility between the new construction and the historic resource. Therefore mitigation measures for this component of the Project are required to ensure compliance with the Standards.

These improvements would affect the integrity of setting. The concession building is a secondary character-defining feature. Although it was constructed during the period of significance, it has been altered. The removal of this building would not in and of itself constitute an impact on the historic resource, because it does not have any significance separate and apart from the amphitheatre. As stated on pages 16 to 18, the integrity of setting is already low because of the changes that have occurred since 1964. The integrity of setting would be further diminished with the removal of the concession building and the construction of these improvements.

Inside the Ford theatre is not a character-defining feature, because it post-dates the period of significance and was extensively renovated in 1998. Therefore, reusing this space would comply with the Standards and would not negatively affect the integrity of the Ford Theatres because it would not involve the alteration or removal of any character-defining features.

Ford Plaza

West of the amphitheatre, generally within the existing south parking lot, the Ford Plaza would be developed and would include a new three-level parking structure, referred to as the south parking structure. A plaza deck that would serve as the primary gathering space for the Ford Theatres would be created above the parking structure. As part of the Ford Plaza, the existing 365-square-foot box office would be repurposed as a museum/gallery for the Ford Theatres and just west of the existing box office a new approximately 560-square-foot box office would be constructed. A three-story building providing approximately 17,600 square feet of office uses and approximately 1,200 square feet of shops/visitor amenities would be located adjacent to the new box office. This three-story building would terrace south at the foothill of the plaza level. In addition, at the southern boundary of the Ford Plaza, an approximately 1,000-square-foot conference room would be built to support the adjacent office uses. Adjacent to the conference room would be an outdoor area that could accommodate small informal performances, musical entertainment, and/or overflow/support monitors to view events occurring within the indoor venues. North of these uses within the Ford Plaza would be an approximately 3,900-square-foot, 150-seat restaurant that would include a 1,300-square-foot kitchen/bar, a 2,600-square-foot indoor seating area, and a 1,000-square-foot outdoor seating area. The restaurant would serve as the main cooking facility for the site concessions. East of the restaurant, a new indoor performance venue comprised of approximately 8,000 square feet and including 299 seats would be provided.

There are no character-defining features in this portion of the property that are related to the historic significance of the Ford Theatres, other than the box office which is discussed below. While these improvements are situated on the western edge of the Project Site, the amphitheatre would be visible in the distance. Therefore, this area of the property is somewhat more sensitive than the location of the Transit Center/Flex Space, which is discussed below. The integrity of the setting of the Ford Theatres is already low because of the changes that have occurred since 1964, specifically the existing Edison Plaza, stairs, and picnic areas constructed in 2000. These improvements created a more organized and formal approach to the amphitheatre than existed historically. (Please see the analysis of integrity on pages 16 to 18.)

While a very large portion of the 32-acre site would remain unimproved parkland, from the perspective of theatre patrons, the amphitheatre would no longer feel like an independent cultural venue nestled in the Hollywood Hills. Rather the amphitheatre would be one part of a larger cultural and recreational center. The Ford Plaza would represent a significant increase in the utilization of the property. Therefore it would further diminish the integrity of setting and would compromise the integrity of feeling of the Ford Theatres.

As this component of the Project primarily involves new construction, the only applicable Standards are #9 and #10. The design of the Ford Plaza is similar to the design of the other components of the Project, which are intended to form a cohesive whole. The buildings are situated on either side of a plaza, which is essentially a continuation of the existing stairs. This is a smart organizational device because it funnels the view toward the amphitheatre. Rather than constructing one large building, the uses are divided into a series of smaller buildings that would be constructed of concrete, wood, metal panels, and glass. They appear to comply with Standard #9 in that they would not destroy any historic materials, are clearly distinguishable as new, and are appropriately scaled to the site. The buildings comply with Standard #10 because they could be removed in the future without negatively impacting the historic resource. Nonetheless, given the fluid nature of the architectural design until the approval of final plans, it is difficult to ascertain the compatibility between the new and old. Therefore mitigation measures for this component of the Project are required to ensure compliance with the Standards.

The box office is a secondary character-defining feature. Although it is an original element of the amphitheatre, it has been altered. Therefore, only the height, shape, massing, flat roof, and stucco exterior are considered character-defining - not the interior or box office windows on the north elevation. There are no specific plans for how this building would be repurposed as a museum/gallery. However, any impacts these alterations would have on the box office could be reduced to a less than significant level by compliance with the Standards. Therefore mitigation measures are required.

Transit Center/Flex Space

A Transit Center consisting of a bus/van loading and unloading zone, a three-level parking structure referred to as the north parking structure, a new rehearsal and event space referred to as the Flex Space, and a maintenance area would be constructed along the northwestern extent of the property. The approximately 8,300-square-foot Flex Space would be constructed at the lowest level of the parking structure. A plaza area referred to as the Transit Plaza would also be located below the parking structure. The upper deck of the parking structure would extend over the Flex Space and the Transit Plaza. At the upper deck, an approximately 6,300-square-foot maintenance area consisting of office, storage, garage, and yard areas would also be

provided. To provide for these improvements, the Project would require removal of the former motel building.

These improvements appear to comply with the Standards. The north parking lot and former motel building are not character-defining features. The former motel building was not designed or constructed as part of the Ford Theatres. As this component of the Project involves new construction, the only applicable Standards are #9 and #10. Because of the distance between the proposed Transit Center/Flex Space and the historic amphitheatre, the requirement for compatibility between the new and old and the concept of reversibility rooted in these two Standards is not paramount. The design of the Transit Center/Flex Space is similar to the design of the other components of the Project, which are intended to form a cohesive whole. Much of the new square footage would be below ground. The parking structure would be constructed of concrete and the buildings on top would feature the extensive use of glass.

These improvements would not negatively affect the integrity of the Ford Theatres. This area of the property is the ideal location for new construction because of its proximity to Cahuenga Boulevard and the Pilgrimage Bridge, the relatively flat topography, the historic condition has already been altered, and the fact that it is visually disconnected from the historic amphitheatre. The integrity of the setting of the Ford Theatres is already low because of the changes that have occurred since 1964. The remaining aspects of integrity are not relevant because there are no character-defining features in this portion of the property that are related to the historic significance of the Ford Theatres (Please see the analysis of integrity on pages 16 to 18.) As this component of the Project would have a less than significant impact on the Ford Theatres, no mitigation measures are recommended or required.

Hiking Trail

The Project would also include a 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The trail would be approximately four feet in width and would feature natural-type fencing as well as "sutter wall" style retaining walls and cut-in granite steps where areas of steep terrain. Hand-railing may also be provided at the steps.

This component of the Project would have no impact on the historic resource. In this case, none of the Standards are applicable because there are no character-defining features in this portion of the property that are related to the historic significance of the Ford Theatres. The trail would not be visually intrusive or reduce the integrity of the Ford Theatres. Therefore, no mitigation measures are recommended or required.

5.4 Mitigation Measures

CEQA requires the Lead Agency to examine and impose mitigation measures that would avoid or minimize any impacts or potential impacts to historic resources.

Amphitheatre

Under the Project, the existing amphitheatre would be altered by the replacement of the non-original projection booth and control room as well as the sound wall. It appears that there will be no substantial adverse change in the significance of the Ford Theatres as a historic resource by this component of the Project. Nonetheless, given the fluid nature of architectural design until

the approval of final plans, the following mitigation measures for implementing the Project are recommended:

> **Project Plan Review.** To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Ford Terrace

Under the Project, the existing amphitheatre would be altered by the removal of the concession building and the construction of a dedicated artist entrance, two-story office and concessions building, and other spaces designed to support theatre operations. It appears that there will be no substantial adverse change in the significance of the Ford Theatres as a historic resource by this component of the Project. Nonetheless, given the fluid nature of architectural design until the approval of final plans, the following mitigation measures for implementing the Project are recommended:

> **Project Plan Review.** To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Ford Plaza

Under the Project, a parking structure, plaza, and a variety of new uses would be added west of the amphitheatre including a new box office, visitor amenities, restaurant, conference room, and indoor performance venue. It appears that there will be no substantial adverse change in the significance of the Ford Theatres as a historic resource by this component of the Project. Nonetheless, given the fluid nature of architectural design until the approval of final plans, the following mitigation measures for implementing the Project are recommended:

> **Project Plan Review.** To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Transit Center/Flex Space

Mitigation measures regarding the Transit Center/Flex Space are not required since the improvements would not significantly impact the historic or architectural significance of the Ford Theatres.

Hiking Trail

Mitigation measures regarding the hiking trail are not required since the improvements would not significantly impact the historic or architectural significance of the Ford Theatres.

5.5 Conclusions

Under CEQA, implementation of the mitigation measures proposed would reduce all impacts on the historic resource to a less than significant level. The property's integrity of setting was low and integrity of design was fair when the building was re-evaluated for the purposes of this report. The Project would reduce the integrity of the property further. As a result of so much new construction on the property, especially the Ford Terrace and Ford Plaza, which are proximate to the amphitheater, the integrity of the setting and feeling would be diminished. Nevertheless, the integrity as a whole would be sufficient to convey its historical significance. The Ford Theatres would continue to be eligible for listing in the California Register. Therefore the significance of the historic resource will not be materially impaired by the Project

TABLE I – Character-Defining Features

Type	Feature	Description	Photographs
Not	Parking Lots, South	The south parking lots are not character-defining features because the date they were constructed cannot be verified, they are utilitarian in design, and they are visually disconnected from the theatre.	
Not	Parking Lots, North	The north parking lots are not character-defining features because the date they were constructed cannot be verified, they are utilitarian in design, and they are visually disconnected from the amphitheatre.	

Type	Feature	Description	Photographs
Not	Pole Sign	The pole sign in the south parking lot is not a character-defining feature because it was constructed after the period of significance.	
Not	Driveway between the north and south parking lots	The driveways are not character-defining features because the date they were constructed cannot be verified, they are utilitarian in design, and they are visually disconnected from the amphitheatre.	

Type	Feature	Description	Photographs
Not	Driveway to loading area	The driveways are not character-defining features because the date they were constructed cannot be verified, they are utilitarian in design, and they are visually disconnected from the amphitheatre.	
Not	Motel/Office Building	The former motel in the north parking lot is now used as an office building. It is not a character-defining feature because it was not designed or constructed as part of the theatre complex.	

Type	Feature	Description	Photographs
Not	Entrance Gate	The entrance gate to the Edison Plaza is not a character-defining feature because it was constructed after the period of significance.	
Not	Edison Plaza	Edison Plaza, including the staircase, ramps, and landscaping, is not a character-defining feature because it was constructed after the period of significance.	Primary	Plan	The overall plan of the amphitheatre and the sequencing of the spaces are primary character-defining features because they are original and essential elements of the amphitheatre.	N/A

Type	Feature	Description	Photographs
Primary	Materials	The primary material found in the amphitheatre is concrete. The poured-in-place concrete construction is typical of the era. Therefore it is a primary character-defining feature. The board forms are visible throughout the building and create interesting patterns on the walls.	
Primary	Materials	The charcoal stone along the south wall of the seating area is a primary character-defining feature. It was likely salvage from the 1920 structure that was destroyed by fire, and used in the construction of the 1931 amphitheatre.	

Type	Feature	Description	Photographs
Primary	Stone	Stone was also used in the construction of the 1931 amphitheatre along the north wall of the seating area, the stairs on the stage, and the retaining walls and stairs behind the stage. The stonework was changed in 1945 when the stage towers were constructed. This stone is still present and appears to have been quarried from the site. It is a primary character-defining feature because it was added during the period of significance and is highly visible.	
Not	Materials	Hollow clay tile was used to construct the demising walls in the interior spaces. Although original, it is not a character-defining feature because the spaces in which it is found are not visible to the general public. Furthermore, it is a common material that is not used as a design element.	

Type	Feature	Description	Photographs
Primary	Staircases	The north and south staircases near the main entrance are primary character-defining features because they are original and key design elements that contribute to the monumental feeling of the amphitheatre.	

Type	Feature	Description	Photographs
Primary	Wood Doors, Original	The original wood doors are primary character-defining features because they are original, exhibit craftsmanship from the period, and are key design elements. The original doors can be differentiated from the reproduction doors (see below) by the general wear, layers of paint, and hardware.	

Type	Feature	Description	Photographs
Secondary	Wood Doors, Reproduction	The double wood doors to the seating area and stage towers, as well as others, were reproduced. They are secondary character-defining features because they maintain the historic design, but not the historic workmanship.	

Type	Feature	Description	Photographs
Primary	Wood Screens	The wood screens are primary character-defining features because they are original, exhibit craftsmanship from the period, and are key design elements.	

Type	Feature	Description	Photographs
Primary	Seating Area	The open-air seating area is a primary character-defining feature because it is an essential element of the amphitheatre.	
Not	Seats	The seats are not character-defining features because they are not original and post-date the period of significance.	

Type	Feature	Description	Photographs
Primary	Main Stage	The main stage is a primary character-defining feature because it is an essential element of the theatre. The present size and general configuration dates from the period of significance; however, it has changed during that period. The towers added in 1945 encroached into the stage, making it slightly narrower toward the rear. At that time the stage was divided into three tiers. Sometime after 1956, the top tier was removed and additional steps were added to the bottom of the stairs that lead up the hillside. The lower tier was reconstructed.	Primary	Stage Left and Right Towers	Other aspects of the stage include the stage left and right towers that were constructed in 1945. They are primary character-defining features because they were constructed during the period of significance and are essential elements of the amphitheatre.	

Type	Feature	Description	Photographs
			
Not	Stage Lighting	The stage lighting (including the fixtures as well as the battens and other support structures) are not character-defining features because they are non-original and post-date the period of significance.	

Type	Feature	Description	Photographs
Secondary	Religious Symbols	Religious symbols including crosses in concrete relief are secondary character-defining features because they are original, but minor design elements.	

Type	Feature	Description	Photographs
Not	Light Fixtures	The iron chandeliers in the north staircase are the most prominent light fixtures in the amphitheatre. They are not character-defining features because they are non-original and post-date the period of significance.	

Type	Feature	Description	Photographs
Not	Elevator Tower	The elevator tower and related features are not character-defining features because they post-date the period of significance.	

Type	Feature	Description	Photographs
Not	Loading In/Out	The loading zone is not a character-defining feature because it is utilitarian in design and most of the materials including the screens and roll-up door post-date the period of significance.	
Not	Inside the Ford	The main space and features associated with Inside the Ford are not character-defining features because they are utilitarian in design and post-date the period of significance.	
Type	Feature	Description	Photographs
Not	Ancillary Spaces	The dressing area, storage, and other ancillary spaces below the stage are not character-defining features because they are utilitarian in design and inaccessible to the general public.	Not	Restrooms	The restrooms are not character-defining features. Although the spaces themselves are original, they have been recently altered and include no historic fabric.	

Type	Feature	Description	Photographs
Not	Concession Bar	The concession bar is not a character-defining feature. Although the space is original it includes no historic fabric.	
Not	Projection Room and Sound Booth	The projection room and sound booth is not a character-defining feature because it post-dates the period of significance.	

Type	Feature	Description	Photographs
			
Secondary	Concession Building	The concession building is a secondary character-defining feature. Although it was constructed during the period of significance, it has been altered. Therefore, only the height, shape, massing, flat roof, stucco exterior, and second story windows are considered character-defining - not the interior, service windows on the north elevation, or surrounding pergola.	

Type	Feature	Description	Photographs
Secondary	Box Office	The box office is a secondary character-defining feature. Although it is an original element of the amphitheatre, it has been altered. Therefore, only the height, shape, massing, flat roof, and stucco exterior are considered character-defining - not the interior or box office windows on the north elevation.

*7. Briefly describe the present physical appearance of the property, including condition, boundaries, related features, surroundings, and (if appropriat architectural style.

This 1,500 seat open-air amphitheatre is built in an oval-shaped plan within a natural bowl in the Hollywood Hills. The west side (back) of the theater contains a tall outer wall of poured-in-place concrete with an inner wall rising from the second story. The back inside wall of the theatre is broken by three heavy, double wood paneled doors decorated with a recessed grill pattern, accessing the seating isles. A centered, corbelled arch at the base of the outside wall is flanked by fluted convex and concave concrete surfaces broken by ornamental wood grilles on each side of the recessed entry. Above the arched entry is a pointed arched parapet. A grand stairway lead up to the main entry from the parking lot below. On the second level is a stucco clad addition attached to the main second story portion, housing a lighting and sound booth. Also attached is a tall corrugated metal parapet wall running along the top of the amphitheatre wall. These two major additions have not altered the original building, but merely rest on top of the original walls. The integrity of the original architecture remains intact.

The north and south walls of the amphitheatre are stepped downward towards the stage and are decorated with cross reliefs. The stage is flanked by two, elaborate two story towers with crenelated parapets. The corbelled arch is repeated in the doors and recessed panels. The side walls towards the rear of the stage also feature crenelated parapets. Rustic stonework forms the foundation of the stage and the walls at the rear of the stage. The natural hillside setting with stone retaining walls encloses the amphitheatre at the east side. Additional details include the heavy, Gothic-arched wooden paneled doors along the side walls. *19. Briefly discuss the property's importance within the context. Use historical and architectural analysis as appropriate. Compare with similar properties.

The Pilgrimage Theater is significant under Criterion A because of the historic role it played as an important cultural event and major tourist draw for Hollywood and Los Angeles. The "Life of Christ," also called the Pilgrimage Play, was performed every summer between 1920 and 1964 except after the first theater burned in 1929-30 and once in 1934. The Pilgrimage Theater was the personal vision of Christine Wetherill Stevenson, a wealthy Philadelphia Quaker, who sought to promote open-air dramas focusing on the lives of great religious leaders. As the founder of the Theater Arts Alliance in 1918, she spearheaded the search for a natural setting to build an amphitheater to produce the plays. She and Mrs. Chauncey Clarke first purchased 65 acres that became the site of the Hollywood Bowl. In 1920, Mrs. Stevenson purchased a smaller 29 acre site across from the Hollywood Bowl, and hired director H. Ellis Reed to produce the drama of the Life of Christ, having written the play herself. After Christine Stevenson died in 1923, Los Angeles Times owner Harry Chandler acquired the property and performance rights to the play from her estate. Los Angeles County obtained the amphitheatre during the early 1940s. In 1978 the county renamed it after John Anson Ford, a popular member of the board of supervisors who served from 1934 to 1958.

Continuation Sheet

#7 Description

The site is enhanced by landscape features on the adjacent hillsides, including a variety of trees. Adjacent and the north of the theater is a small, detached rectangular shaped flat roofed stucco-clad building that serves as a ticket office.

#19 Significance and Evaluation

The building is also eligible under Criterion C for its unique architectural style. The original design and layout of the amphitheater was apparently prepared by Bernard Maybeck between 1921 and 1922, but Maybeck's work was evidently largely destroyed in the fire of 1929. The present building was built on the same site as the earlier theater, apparently incorporating some of the original stone walls. This design was produced in 1930 by Los Angeles architect William Lee Woollett to reflect the ancient Judean architecture of Assyria and Babylon. The corbelled arches and crenelated parapets prominently displayed on the building reflect a free and largely speculative interpretation of the architecture of the Holy Land. The Gothic-arched, massive wooden paneled doors with metal straps also suggests a Medieval flavor. Religious symbols incorporated into the building, including cross and tablet motifs, relate directly to the building's intended purpose. This building is significant as an especially rare example of a period revival style of architecture which was employed only rarely, particularly relative to the huge popularity of the other period revival modes during the 1920s.

The building is also significant for its association with the architect and designer, William Lee Woollett, who was known for his flamboyant approach to ornament and rather liberal view of architectural historicism. Perhaps his best-known extant work is his collaboration with Albert C. Martin on the Million Dollar Theater (Los Angeles, 1918). He also designed interior murals for the Paramount Theater (Los Angeles, 1920), prepared plans for the Santa Monica Pier Amusement Company to reflect Pompeian architecture, and designed a theater in Venice. Woollett's non-architectural works included murals, set designs, sculptures and books. He was appointed to the Municipal Arts Commission in 1933.

The building is also associated with two important historical themes present in Southern California during the 1920s: religion and the entertainment industry. Both conventional and non-traditional forms of faith were gaining strength during this era, with the latter perhaps best typified by the theatrical evangelist, Aimee Semple McPherson. The Pilgrimage Theater represents a similar melding together of the entertainment and religious themes in a manner which perhaps would not have been possible elsewhere.

TERESA GRIMES is a Principal Architectural Historian at GPA. She has over 25 years of experience in the field of historic preservation in the private, public, and non-profit sectors. Teresa is widely recognized as an expert in the identification and evaluation of historic resources having successfully prepared dozens of landmark and historic district applications for a wide variety of property types. Her many projects have included historic context statements for Riverside, Calabasas, Glendale, and Carmel-by-the-Sea, and historic resource surveys in Riverside, Whittier, Calabasas, Pasadena, and Los Angeles. Teresa has also completed numerous environmental compliance documents involving major landmarks; examples include the Cinerama Dome, Dodger Stadium, Los Angeles Sports Arena, Beverly Hills Post Office, and Baldwin Hills Shopping Center.

RE: Cultural Archaeological Resources Records Search for the Ford Theaters Project, City of Los Angeles, California

Dear Ms. Eyestone-Jones,

As per your request received on January 14, 2104, an expedited records search was conducted for the above referenced project. The search includes a review of all recorded archaeological sites within a -mile radius of the project site as well as a review of cultural resource reports on file. In addition, the California Points of Historical Interest (SPHI), the California Historical Landmarks (SHL), the California Register of Historical Resources (CAL REG), the National Register of Historic Places (NRHP), the California State Historic Resources Inventory (HRI), and the City of Los Angeles Historic-Cultural Monuments (LAHCM) listings were reviewed for the above referenced project site. The following is a discussion of the findings.

Due to the sensitive nature of cultural resources, archaeological site locations are not released.

Hollywood, CA USGS 7.5 Quadrangle

RCHAEOLOGICAL RESOURCES:

No archaeological sites have been identified on our maps within a -mile radius of the project site. No sites are located within the project site. This does not preclude the potential for archaeological sites to be identified during project activities. No isolates have been identified within a -mile radius of the project site. No isolates are located within the project site.

HISTORIC BUILT-ENVIRONMENT RESOURCES:

Ten above-ground historic resources (19-166802, 19-167374, 19-167483, 19-169328, 19-171018, 19-173461, 19-175297, 19-187701, 19-188479, 19-190333□) have been identified on our maps within a □-mile radius of the project site. One above ground historic resources are located within the project site.
(□□Located within the project site)

ADDITIONAL CULTURAL RESOURCE LISTINGS:

The **California Historic Resources Inventory (HRI)** lists twenty-one properties that have been evaluated for historical significance within a □-mile radius of the project site **(see enclosed list)**. These are additional resources that are listed in the Historic Properties Data file and are located either within the project site or within the search radius.

The **California Point of Historical Interest (SPHI)** of the Office of Historic Preservation, Department of Parks and Recreation, lists no properties within a □-mile radius of the project site.

The **California Historical Landmarks (SHL)** of the Office of Historic Preservation, Department of Parks and Recreation, lists no properties within a □-mile radius of the project site.

The **California Register of Historical Resources (CAL REG)** lists seventeen properties within a □-mile radius of the project site **(□see enclosed list). The subject property is listed on this register.** These are properties determined to have a National Register of Historic Places Status of 1 or 2, a California Historical Landmark numbering 770 and higher, or a Point of Historical Interest listed after 1□1□1998.

The **National Register of Historic Places (NRHP)** lists three properties within a □-mile radius of the project site **(□see enclosed list)**. **The subject property is eligible for inclusion on the register, but is not on the register.**

The **City of Los Angeles Historic-Cultural Monuments (LAHCM)** lists one property within the project site **(see below)**.

No. 617 Hollywood Pilgrimage Memorial Monument
2580 Cahuenga Blvd

HISTORIC MAP REVIEW

Santa Monica, CA (1902 □ 1921) 15□USGS - indicated that in 1902, there was little to no visible development in the project site; however, there were three roads and one building within the vicinity of the project area. Two intermittent streams ran through the vicinity of the project area. The project site was located to the south of the Cahuenga Pass within the Santa Monica Mountains. Historic place names nearby included Hollywood. In 1921, there appeared to be one building within the project site. There was a significant increase in development with several more roads and buildings present within the project area. A railroad ran to the west of the project site. Only one

intermittent stream remained to the east of the project site. All other previously mentioned features remained.

PREVIOUS CULTURAL RESOURCES INVESTIGATIONS:

Twenty-nine studies (LA1101 , LA1578, LA2099, LA3496, LA3855, LA4314□, LA4384, LA4909, LA5329, LA5332, LA6471, LA7063, LA7367, LA7562, LA7565, LA7566, LA8015, LA8020, LA8115, LA8762, LA10149, LA10507, LA10620, LA11520, LA11555, LA11769□, LA11783, LA11975, LA11992) have been conducted within a □-mile radius of the project site. Of these, two are located within the project site. There are sixteen additional investigations located on the Hollywood, CA 7.5□USGS Quadrangle that are potentially within a □-mile radius of the project site. The reports are not mapped due to insufficient locational information.
(□□Located within the project site)

RECOMMENDATIONS

According to our records, the majority of the project site has not been previously studied for the presence of archaeological resources. Therefore, it is recommended that a Phase I archaeological survey be conducted prior to the approval of the proposed project plans. Furthermore, the subject property is listed on the California Register of Historical Resources; is eligible for inclusion on the National Register of Historic Resources; and contains a City of Los Angeles Historic-Cultural Monument. Recordation forms on file at this office suggest the property is NR eligible under criterion □A□and □C□ Therefore, it is also recommended that additional study be conducted by a qualified architectural historian to assess the effects of the project activities on the historical status of the property prior to the approval of the project plans. Finally, the Native American Heritage Commission should be consulted to identify if any additional traditional cultural properties or other sacred sites are known to be in the area.

The professional consultant you retain may request the records search map, archaeological site records, and bibliography from the Information Center referencing the SCCIC number listed above for a fee (per the fee schedule). For your convenience, you may find a professional consultant□at www.chrisinfo.org. Any resulting reports by the qualified consultant should be submitted to the South Central Coastal Information Center as soon as possible.
□The SCCIC does not endorse any particular consultant and makes no claims about the qualifications of any person listed. Each consultant on this list self-reports that they meet current professional standards.

If you have any questions regarding the results presented herein, please contact the office at 657.278.5395 Monday through Thursday 9:00 am to 3:30 pm.

Should you require any additional information for the above referenced project, reference the SCCIC number listed above when making inquiries. Requests made after initial invoicing will result in the preparation of a separate invoice.

Sincerely,
SCCIC

1 Properties listed in the National Register (NR) or the California Register (CR)

1D Contributor to a district or multiple resource property listed in NR by the Keeper. Listed in the CR.
1S Individual property listed in NR by the Keeper. Listed in the CR.

1CD Listed in the CR as a contributor to a district or multiple resource property by the SHRC
1CS Listed in the CR as individual property by the SHRC.
1CL Automatically listed in the California Register – Includes State Historical Landmarks 770 and above and Points of Historical Interest nominated after December 1997 and recommended for listing by the SHRC.

2 Properties determined eligible for listing in the National Register (NR) or the California Register (CR)

2B Determined eligible for NR as an individual property and as a contributor to an eligible district in a federal regulatory process. Listed in the CR.
2D Contributor to a district determined eligible for NR by the Keeper. Listed in the CR.
2D2 Contributor to a district determined eligible for NR by consensus through Section 106 process. Listed in the CR.
2D3 Contributor to a district determined eligible for NR by Part I Tax Certification. Listed in the CR.
2D4 Contributor to a district determined eligible for NR pursuant to Section 106 without review by SHPO. Listed in the CR.
2S Individual property determined eligible for NR by the Keeper. Listed in the CR.
2S2 Individual property determined eligible for NR by a consensus through Section 106 process. Listed in the CR.
2S3 Individual property determined eligible for NR by Part I Tax Certification. Listed in the CR.
2S4 Individual property determined eligible for NR pursuant to Section 106 without review by SHPO. Listed in the CR.

2CB Determined eligible for CR as an individual property and as a contributor to an eligible district by the SHRC.
2CD Contributor to a district determined eligible for listing in the CR by the SHRC.
2CS Individual property determined eligible for listing in the CR by the SHRC.

3 Appears eligible for National Register (NR) or California Register (CR) through Survey Evaluation

3B Appears eligible for NR both individually and as a contributor to a NR eligible district through survey evaluation.
3D Appears eligible for NR as a contributor to a NR eligible district through survey evaluation.
3S Appears eligible for NR as an individual property through survey evaluation.

3CB Appears eligible for CR both individually and as a contributor to a CR eligible district through a survey evaluation.
3CD Appears eligible for CR as a contributor to a CR eligible district through a survey evaluation.
3CS Appears eligible for CR as an individual property through survey evaluation.

4 Appears eligible for National Register (NR) or California Register (CR) through other evaluation

4CM Master List - State Owned Properties – PRC §5024.

5 Properties Recognized as Historically Significant by Local Government

5D1 Contributor to a district that is listed or designated locally.
5D2 Contributor to a district that is eligible for local listing or designation.
5D3 Appears to be a contributor to a district that appears eligible for local listing or designation through survey evaluation.

5S1 Individual property that is listed or designated locally.
5S2 Individual property that is eligible for local listing or designation.
5S3 Appears to be individually eligible for local listing or designation through survey evaluation.

5B Locally significant both individually (listed, eligible, or appears eligible) and as a contributor to a district that is locally listed, designated, determined eligible or appears eligible through survey evaluation.

6 Not Eligible for Listing or Designation as specified

6C Determined ineligible for or removed from California Register by SHRC.
6J Landmarks or Points of Interest found ineligible for designation by SHRC.
6L Determined ineligible for local listing or designation through local government review process; may warrant special consideration in local planning.
6T Determined ineligible for NR through Part I Tax Certification process.
6U Determined ineligible for NR pursuant to Section 106 without review by SHPO.
6W Removed from NR by the Keeper.
6X Determined ineligible for the NR by SHRC or Keeper.
6Y Determined ineligible for NR by consensus through Section 106 process – Not evaluated for CR or Local Listing.
6Z Found ineligible for NR, CR or Local designation through survey evaluation.

7 Not Evaluated for National Register (NR) or California Register (CR) or Needs Revaluation

7J Received by OHP for evaluation or action but not yet evaluated.
7K Resubmitted to OHP for action but not reevaluated.
7L State Historical Landmarks 1-769 and Points of Historical Interest designated prior to January 1998 – Needs to be reevaluated using current standards.
7M Submitted to OHP but not evaluated - referred to NPS.
7N Needs to be reevaluated (Formerly NR Status Code 4)
7N1 Needs to be reevaluated (Formerly NR SC4) – may become eligible for NR w/restoration or when meets other specific conditions.
7R Identified in Reconnaissance Level Survey: Not evaluated.
7W Submitted to OHP for action – withdrawn.

re: Paleontological resources for the proposed Ford Theatres Project, in the City of Los Angeles, Los Angeles County, project area

Dear Stephanie:

I have conducted a thorough check of our paleontology collection records for the locality and specimen data for the proposed Ford Theatres Project, in the City of Los Angeles, Los Angeles County, project area as outlined on the portion of the Hollywood topographic quadrangle map that you sent to me on 10 January 2014. We do not have any vertebrate fossil localities that lie directly within the proposed project boundaries, but we do have localities nearby from the same sedimentary deposits that occur in the proposed project area.

Much of the proposed project area has exposures of intrusive or volcanic basaltic igneous rocks that will not contain any fossils. Intercalated with the igneous rocks are exposures of the marine middle Miocene Topanga Formation [also referred to in this area as the Middle Topanga Formation]. Our closest vertebrate fossil locality in the Topanga Formation is LACM 1084, northwest of the proposed project area west of the Hollywood Freeway (Highway 101) between Bonnie Hill Drive and Ione Place. Locality LACM 1084 documents the occurrence of *Paleoparadoxia*, a member of an extinct group of peculiar marine mammals called the Desmostylia that had heavy bodies, relatively short and stout legs, and unique cylindrically cuspate cheek teeth. Desmostylian fossils are uncommon in southern California. The *Paleoparadoxia* specimen collected from locality LACM 1084 has been published in the scientific literature by E. D. Mitchell (1963. Brachyodont desmostylians from Miocene of San

Clemente Island, California. Bulletin of the Southern California Academy of Sciences, 62(4):192-201.) and R. H. Reinhart (1959. A Review of the Sirenia and Desmostylia. University of California Publications in Geological Sciences, 36(1):1-146.). Further northwest of the proposed project area we have another Topanga Formation vertebrate fossil locality, LACM 6969, that was collected during construction of the Metrorail Universal City subway station at the intersection of Lankershim Boulevard and the Hollywood Freeway (Highway 101). Locality LACM 6969 produced a fossil fish fauna containing specimens of grunion, Atherinidae, herrings, *Etringus*, *Ganolytes*, and *Sardinella*, codlets, Bregmacerotidae, bigeyes, Priacanthidae, croakers, Sciaenidae, mackerels, Scombridae, and boarfishes, Caproidae.

Excavations in the igneous rocks exposed in much of the proposed project area will not uncover any recognizable fossils. Excavations in the Topanga Formation deposits exposed intercalated with the igneous rocks, however, may well encounter significant vertebrate fossils. Any substantial excavations in the sedimentary deposits in the proposed project area, therefore, should be closely monitored to quickly and professionally collect any specimens without impeding development. Many of the specimens collected nearby from the Topanga Formation are small and would be missed in typical paleontological excavation monitoring. It is recommended that sediment samples be collected and processed to determine their small fossil potential. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod

Attention: Mr. A. Leonard Madson, Principal

Subject: Geotechnical Investigation
Off-Season Two Improvements
2580 Cahuenga Boulevard East
Hollywood District of Los Angeles, California

Reference: Leighton Consulting, Inc., 2013, Preliminary Geotechnical Evaluation John Anson Ford Theaters Master Plan 2580 Cahuenga Boulevard East Hollywood District of Los Angeles, California, Project No. 603057-001, dated February 7, 2013.

In accordance with our April 30, 2013 proposal, authorized on May 2, 2013, Leighton Consulting, Inc. (Leighton) is pleased to present this geotechnical exploration report in support of the proposed Off-Season Two Improvements planned for the John Anson Ford Amphitheater. Our scope of work for this study included research, geologic mapping, subsurface exploration, laboratory testing, engineering analysis, design team meetings, and preparation of this report.

The Off Season Two Improvements are expected to include restoration of historic features and improvements to the amphitheater stage. Planned improvements include replacement of the existing stage, below stage spaces, and upstage retaining walls.

17781 Cowan ▪ Irvine, CA 92614-6009
949.250.1421 ▪ 949.250.1114 Fax

The new basement floor levels below the stage are to be lowered and sub-surface and surface drainage elements improved, including new and replacement sanitary sewers and storm drains.

This report presents the results of our geotechnical exploration program and provides recommendations for design and construction of the proposed project.

We appreciate the opportunity to be of service to the Ford Theatre Foundation. If you have any questions or if we can be of further service, please call us at your convenience at (866) LEIGHTON, at the direct extensions listed below, or e-mail us as listed below.

Respectfully submitted,

1.0 INTRODUCTION

1.1 Authorization

In accordance with your authorization on May 2, 2013, and based on our April 30, 2013 Off-Season Two Improvements proposal, Leighton Consulting, Inc. (Leighton) has performed document review, geologic mapping, subsurface exploration, laboratory testing, and engineering analysis for the John Anson Ford Theaters Master Plan Off-Season Two Improvements. The project is located at 2580 Cahuenga Boulevard in the Hollywood District of Los Angeles, California (Figure 1).

1.2 Objective

The objective of our investigation was to identify subsurface stratigraphy (soil type and thickness, depth to bedrock) within the area of planned improvements. Access constraints prevented exploration at some locations, such as below the existing basements and at the towers adjacent to the stage. Accordingly, assumptions have been made to model the stratigraphy at unexplored locations for our analysis and will require field verification during construction.

1.3 Scope of Work

Our scope included document review, geologic mapping, subsurface exploration, laboratory testing, engineering analysis, on-site meeting with the design team, and preparation of this report. To accomplish our scope of work we provided the following services:

- *Review of Available Data*: We reviewed the schematic design draft plans, Off Season Two Improvements, sheets S-200 Lower Level Plan, S-201 Mezzanine Level Plan, S-202 Amphitheater Plan, L-500 Sections and C3.00 Utility and Drainage Plan, prepared by Levin and Associates Architects, dated April 5, 2013 and accompanying memorandum dated April 9, 2013.

- *Geologic Mapping*: We performed field mapping of the observable rock mass, rockfall debris, and surficial soil conditions around the amphitheater to document current geologic conditions and identify potential geotechnical and geologic constraints impacting the overall project site (Plate 1, Geologic Map). Location of cross sections A-A' and B-B' developed during our preliminary

evaluation in 2012 are also shown on Plate 1. Geologic data, test pit, and cross section locations (C-C', D-D' and E-E') specific to the Off-Season Two project are shown on Plate 2, Test Pit and Cross Section Location Map). Geologic cross sections are shown on Plates 3, Generalized Geologic Cross Sections A-A' and B-B', and Plate 4, generalized Geologic Cross Sections C-C', D-D' and E-E'.

- *Geophysical Survey*: We performed a geophysical refraction and surface wave velocity survey as part of our preliminary investigation conducted in 2012. For ease of reference a copy of the seismic survey report (Leighton, 2013) is included in Appendix A of this report. Locations of the refraction surveys are shown on Plate 1.

- *Geotechnical Exploration*: We excavated four test pits (TP-1 through TP-4) behind the existing terraced retaining walls to the east of the amphitheater and in the landscape area adjacent to the north tower. Due to the extremely difficult site access and heavy vegetation, we hand excavated test pits in the selected areas to obtain geologic data. Test pit logs are incorporated in the geologic sections on Plate 4. Each test pit was photographed prior to backfilling. Bulks samples were collected from the test pits and transferred to our lab for geotechnical laboratory testing. The test pits were backfilled and compacted with the excavated material. Key photos of the proposed improvements area are included in Appendix B, Test Pit Logs and Photos.

- *Laboratory Testing*: We performed geotechnical laboratory testing on bulk samples recovered during the investigation to determine compaction characteristics (ASTM D1557-12), expansion potential (ASTM D 4829), and corrosion (California Test methods CT 417 Part II, 422, and 532/647). Laboratory test results are included in Appendix C, Laboratory Data.

- *Engineering Analysis*: We performed an evaluation of the proposed project based on the field data gathered during our current and prior studies at the site.

- *Report:* Leighton prepared this report documenting the results of the geological mapping, subsurface exploration, laboratory testing, and engineering analysis and provides recommendations for design and construction of the Off-Season Two Improvements.

1.4 Project Description

The Off-Season Two Improvements include demolition and construction of new footings within the amphitheater footprint, below the concrete tower structures north and south of the stage and north tunnel, removal and replacement of basement retaining walls, drainage improvements, and slab on grade construction. New terraced retaining walls are also planned to replace the existing stone walls behind the stage in conjunction with hillside landscaping. New and replacement sanitary sewer and storm drain lines are also planned.

1.5 Study Area

As presented on Figure 1, generally, the project site is located on steep hillside terrain within a County of Los Angeles Park. The study area is bordered to the west by Cahuenga Boulevard East and U.S. Route 101 and to the east by the steep flanks of the Santa Monica Mountains. The site of the existing Ford Theatre spans for approximately 1,320 feet along the base of the hills and contains three asphalt-paved parking lots (northern lot, motel lot and southern lot) facing Cahuenga Boulevard East, a former motel building, and the existing Amphitheatre with loading area, pedestrian walkways and box office. Elevations of the sites existing improvements range from approximate elevation El. 552 feet mean sea level (msl) near the entrance to the site at Cahuenga Boulevard East to a high of El. 654 feet msl in the northern region of the Off Season Two Improvements area (Plate 1). The ridgeline east of and above the amphitheater rises to a high of elevation 944 feet msl (USGS, 1966) before descending easterly to Weid Canyon, the site of Mulholland Dam (Hollywood Reservoir).

The Off-Season Two Improvements are proposed for construction within the amphitheater footprint (Plate 2, Test Pit and Cross Section Location Map), which consists of subterranean tunnels and corridors below the stage and amphitheater seating area, two concrete towers and mezzanines north and south of the stage, terraced stone walls and planter areas behind the stage. Erosion and debris flow impacted concrete drainage swales capture hillside runoff directed toward an 18-inch-diameter reinforced concrete storm drain pipe (RCP) upslope of the terraced stone walls. Existing upslope hillside improvements above the main masonry block wall include a wooden platform and a concrete cribwall that has been damaged by rockfalls in the north area of the site including a masonry block wall upslope in a heavily vegetated area. Photos of the Off-Season Two Improvements area are located in Appendix B, Test Pit Logs and Photos.

2.0 GEOLOGIC RECONNAISSANCE AND MAPPING

We performed geologic reconnaissance and field mapping of the Off-Season Two Improvements project area supplement the data procured during literature review. The following sections provide general descriptions of the conditions expected at the areas of the Off-Season Two Improvements. The interpreted subsurface conditions are shown on Plate 4, Generalized Geologic Cross Sections C-C', D-D', and E-E'.

2.1 Lower Level

The lower levels of the basement walls and north tunnel foundation footprints underlie the amphitheater stage and seating area (Figure B-1). The approximate footprint of the lower level basement retaining wall, interior walls, and corridors leading to and from the north tunnel are indicated on Plate 2.

The eastern basement retaining wall is of masonry block construction and exhibits mineral efflorescence along the mortar joints and block faces due to seepage through the wall indicating either non-functioning or non-existent wall drains. Based on regional mapping and extrapolated field conditions exposed within test pits TP-2 and TP-3 (Figure B-2), it appears bedrock underlying the foundations consists predominately of basalt and appears to have been cut to fit the "footprint" of the foundations and retaining walls during original construction of the Theater in the 1920's. Approximately 12 to 48-inches of overexcavation behind the retaining walls appears to have been performed to allow adequate space for construction.

Backfill material behind the walls consist of a mixture of the bedrock material, predominately basalt and a silty sand mixture of basalt and sandstone rock fragments. This backfill prism also contains an abundant overgrowth of roots from the many large trees that line the hillside. Abundant oversize material, i.e. cobbles and boulders are also present within the fill prisms.

2.2 Mezzanine Level

The mezzanine levels located north and south of the stage provide access to the upper tower levels and for stage lighting (Plate 2). The mezzanine decks adjacent to the two towers are bordered by steep bedrock slopes consisting of thick accumulations of colluvium and rock talus.

Upper Level Mezzanine Deck North: The slopes bordering the northern mezzanine level are inclined at 60-65 degrees, contain large diameter trees and consist of near vertical headscarp exposures of severely weathered basalt bedrock with thick accumulations of colluvium forming on the slope (Figure B-5). The colluvial material is subject to slow creep and debris flows during heavy precipitation as evidenced by bent trees, overtopping mezzanine walls, and sandbag barriers with plastic sheeting covering the slopes in an effort to prevent further mass erosion affecting the daily operations of the Theater.

Upper Level Mezzanine Deck South: The slopes bordering the southern mezzanine level are steeply inclined to near vertical and contain exposures of basalt, sandstone and thick accumulations of colluvium and rockfall debris. The basalt in this area degrades to angular, silty-clayey sand forming the majority of the colluvial material. The sandstone in this area is very hard, well cemented and heavily jointed due to faulting and tectonic uplift. This sandstone outcrop contains near vertical, fresh exposures of sandstone rock faces with thick accumulations of rock talus (rockfall debris). These accumulations form along the base of the slope impacting the southern concrete walls (Figure B-6). A steel H-beam reportedly installed to provide structural support to the concrete wall has been damaged by the boulder sized talus rockfalls occurring along structural planes of weakness. This area is shown on Plates 1 and 2 as having high potential for continued rockfalls.

2.3 Amphitheatre Plan

The existing improvements consist of a series of stacked stone walls and concrete stairs (Figure B-2) ascending to a concrete drainage swale and masonry block wall ranging in height from 32- to 84-inches tall (Figures B-3 and B-4). The stone retaining wall foundations were constructed on basalt bedrock (Figure B-2), drainage is accomplished by a series of 1- to 4-inch-diameter weep holes located above the wall footings. Some weep holes are partially obstructed by soil and weed overgrowth and were dry at the time of our observations.

The slopes above these stone walls are inclined from 50-65 degrees and consist of exposures of severely weathered basalt bedrock with thick accumulations of colluvium forming on the slope. Surficial slumping of undocumented artificial fill and colluvium was observed at several locations. Dense vegetation consists of large trees, small shrubs and grasses. The hillside above the amphitheater area

was constructed with a concrete lined drainage swale outletting to an 18-inch-diameter downdrain and retaining wall structure (Figure B-3).

The southern limit of the concrete drainage swale is obscured from view by thick accumulations of soil and vegetation (Figure B-4). Above the drainage swale to the northeast, concrete cribbing emplaced to prevent rockfall damage from upslope outcrops has sustained damage due to rockfalls evidenced from one of the many sandstone boulders perched on the slope face (Figure B-3). An additional masonry block wall was constructed easterly of the upper drainage swale in a small canyon drainage. The slopes below this area are heavily vegetated. The condition of the masonry block wall in this area is unknown but is suspected to be impacted by sediment build up and potential rockfall (Plates 1 and 2).

3.0 GEOLOGIC CONDITIONS

3.1 Regional Geology and Tectonics

The study area for the proposed project is located on the south flank of the eastern Santa Monica Mountains, west of the Cahuenga Fault within the Transverse Ranges Geomorphic Province of California. The distinctive uplifted east-west trending features of the Transverse Ranges were formed as a result of the compressive forces between the converging Pacific and North American Plates (Yerkes, 1965). The Santa Monica Mountains in this area expose north-trending, fault bound blocks containing an assemblage of older Tertiary-age marine and non-marine sedimentary and intrusive and extrusive volcanic rocks (Figure 2, Regional Geologic Map). An east-west trending ridge, in line with the main crest of the Santa Monica Mountains, is the principal topographic feature of the area. Cahuenga Pass, a low gap in the ridge, separates this ridge from the main crest of the Santa Monica Mountains (CDMG, 1953) formed largely as a result of erosion of soft shale outcrops west of the Cahuenga fault and formation of resistant sandstone to the east.

The present physiographic setting of the project site is predominantly northwest to west-facing steep sided to near-vertical (ridge forming sandstones) terrain along the eastern side of the study area. The topographic relief across the site varies between approximately 551 feet above msl in the northwestern portion of the site to approximately 944 feet above msl along the ridgeline to the east of the existing former motel building. The topographic features are closely related to tectonic uplift, ridgeline erosion, erosion of soft shales, and intrusive-extrusive basaltic flows. Internal drainage has eroded major gullies and rills into the underlying bedrock material.

3.2 Site Specific Geology

The local geologic units encountered at the Off-Season Two Improvements project area are discussed below, in order of relative age, youngest to oldest. The surficial units observed include recent and Quaternary-age sediments that form a thin mantle over the bedrock. These surficial units include undocumented artificial fill associated with the amphitheater construction, debris flows, surficial rock failures, and colluvium. The colluvium is generally not depicted on the map due to its relatively thin nature, except where it has been recently mapped during our geologic reconnaissance (Plates 1 and 2). Bedrock belonging to the Tertiary-

age Topanga Formation and intrusive-extrusive volcanic rocks (pillow basalt) correlative to the Topanga Formation exposed throughout the project study area and mapped during our geologic investigation is depicted on Plate 1.

Artificial Fill, Undocumented (Map Unit – Afu): Artificial fill materials have been mapped in the areas behind the terraced stone walls as shown on Plate 4. The thickness of the artificial fill underlying the majority of the improvements area is unknown; however, based on our current investigation we anticipate the existing foundations to be founded on bedrock with nominal amounts of fill underlying the slab on grade construction. As encountered at the test pit locations (shown on Plate 2), fill material consists predominately of silty sand to clayey sand (SM-SC) with varying amounts of basalt and sandstone rock fragments ranging in size from small cobbles to boulders greater than 14-inches in long dimension. The fill material depths at the test pit locations ranged from less than 12-inches up to 5 feet (Plate 4).

Debris Flows and Surficial Failures: Several small (volume) debris flows and surficial failures were mapped at various locations along the slopes at the site, as indicated on Plates 1 and 2. The debris flows (gravitational slides) affecting the proposed construction area consist of thick accumulations of colluvium characterized as silty-clayey sand (SM-SC) comprised of fine to coarse grained, angular sandstone and basalt rock fragments. The material is loose, occurs predominately within the basalt formation and is prone to sliding during significant, prolonged rainfall events.

Rockfalls: Rockfalls and wedge failure events originating in the initiation zone of the sandstone outcrop have resulted in thick accumulations of talus at the toe of the slope and concrete retaining wall constructed as part of the southern mezzanine deck area (Plate 2). These events can be expected to continue and consist of individual rocks to several cubic yard volume events. The run out zone below this outcrop is very narrow and constrained by the existing concrete retaining wall. A steel H-beam installed to provide structural support to the concrete wall is bent suggesting rockmass dislodged and either bounced, slid and/or rolled down slope before coming to rest against the steel structure. The principal causal mechanism of rockfalls and wedge failures in this area is a result of the steep near vertical topography, discontinuities within the rockmass, *weathering* susceptibility and root-wedging. Seismic shaking within the region can produce rockfall events.

Colluvium (Map Unit – Qcol): Slopewash or colluvial deposits are composed of materials that have been eroded, deposited, and transported by either running water (sheetflow), and/or gravitational sliding. The colluvial material at the site consists of brown, dry, loose silty clayey sands and rock fragments mechanically derived from severely weathered Topanga Formation basalt and sandstone material.

Topanga Formation Bedrock: The sedimentary bedrock unit exposed in the hillside and test pits belongs to the Tertiary-age Topanga Formation and is further described below:

Sandstone (Map Unit – Tts): This very hard, well cemented and heavily jointed sandstone outcrop was observed primarily in the southern portion of the site occurring in fault and depositional intrusive contact with the basalt formations, as indicated on Plate 1. The sandstone unit was observed to be orange brown, hard, thin to thickly bedded, well cemented with fine to coarse grained quartz sand and fine pebble sized subangular quartz inclusions. The rockmass is well oxidized with trace amounts of pyrite that contain reddish black oxide rimming along the cubic grains. The sandstone is in fault contact with very fine grained, siliceous quartz sandstone containing dark red cherty laminations. These rock masses are severely fractured, heavily jointed with very narrow zones of rock gouge along the faults.

Sandstone (Map Symbol - Ttbs): Although not observed in the Off Season Two Improvements area, this friable sandstone was observed during our earlier investigation east of the northern parking lot, north of the former motel building, and east of the southernmost parking lot, as indicated on Plate 1. This sandstone unit was observed to be dark gray with basalt fragments and rounded manganese nodules throughout, friable or crumbly, and severely weathered and fractured. Heavy secondary mineralization and chemical alteration of the mafic minerals within the unit was also observed.

Tertiary Volcanic Rocks (Map Unit – Tvb): The Tertiary-age pillow basalt formed from flows issuing from deep linear fissures (mid-oceanic fractures) in the ocean crust, observed within the test pits, forms the majority of the bedrock material exposed in the slopes immediately above the proposed improvement area (Plate 1). This highly weathered, intrusive-extrusive igneous rock is massive, orange brown on oxidized surfaces to grayish black on less weathered surfaces. Chemical weathering and decomposition of the basalt mineralogy is severe

causing degradation of the rock mass into angular sand and gravel sized fragments thereby influencing the rock strength and elastic properties. Fresh or discolored (dark grayish black) rock is present as a discontinuous framework and as corestones. This degradation to soil causes thick accumulations of secondary clayey colluvium which are susceptible to debris flows.

3.3 Geologic Structure

Regional uplift of the Santa Monica Mountains is primarily the result of movement along the Santa Monica and Hollywood faults combined with extrusive igneous intrusions that once occurred along linear fissures in oceanic crust. The major faults in the project area most important to the structural and stratigraphic evolution of the fault bound blocks are the Cahuenga Fault Zone, the Brush Canyon fault, the Ferndell fault, the Griffith fault and the Los Angeles River fault.

Minor faults mapped in the sandstone outcrop in the southern area of the site generally strike N66°W to N76°W and dip steeply out of slope between 84° to 88° to the north correlating well to the regional trend of the local fault structure. Bedrock strikes predominately in a north-south direction dipping steeply into slope to the east between 60° to 65° (Plate 1). Contact between the sandstone bedrock and the pillow basalt exposed in the southern portion of the site were partially obscured due to dense vegetation and colluvial buildup and is therefore queried (Plate 1).

3.4 Rippability

As indicated in Section 1.3, a seismic refraction survey was completed in the southern and motel parking lots (Leighton, 2013). The seismic refraction survey was performed to predict the rippability of the material that underlies the site, which is primarily volcanic basalt and sandstone bedrock. Based on the seismic velocity profiles, jointed and fractured nature of the bedrock structure, the onsite materials within the planned excavation depths are considered rippable with conventional grading equipment.

However, due to access constraints conventional earthmoving equipment will likely not be able to access the areas of proposed improvements without significant access provided. As part of the current study, hand held electric chisels were used to excavate the basalt formation in the test pits. A depth of approximately 4 feet was obtained in Test Pit TP-1 with little difficulty.

Excavation of the material below a depth of 4 feet proved slightly difficult due to decreasing bedrock weathering with depth and equipment access constraints. The sandstone outcrop mapped in the southern portion of the site should be expected to be encountered during the planned renovations along the southern boundary. This material is hard and well cemented, pervasively fractured and jointed, and will prove moderately difficult to excavate with hand held equipment.

3.5 Groundwater

Due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the proposed project site, shallow groundwater is not expected to exist at the site. However, if prolonged seasonal precipitation occurs during the construction period, nuisance water should be expected to build up behind the eastern basement retaining wall thereby posing minor constraints on construction. Additionally, surface runoff during rainfall events should be anticipated. Should nuisance water be encountered during construction, dewatering the excavation(s) may be necessary and could be accomplished using sump pumps.

4.0 GEOLOGIC HAZARDS

Geologic hazards for the overall Theater complex include surface faulting, ground lurching, seismic shaking, landslides, liquefaction, seismically-induced settlement, lateral spreading, seismically-induced landslides, and flooding. Additional geologic hazards specifically affecting the proposed Off-Season Two Improvements Area include the potential for mass movements in the form of debris flows and rockfalls. The following sections discuss these hazards and their potential impacts at the site in more detail.

4.1 Faulting and Seismicity

In general, the primary seismic hazards for sites in the region include strong ground shaking and surface fault rupture. Our discussion of faults potentially impacting the site is prefaced with a discussion of California legislation and state policies concerning the classification and land-use criteria associated with faults. By definition of the California Geological Survey (CGS), an active fault is a fault which has had surface displacement within Holocene time (about the last 11,000 years). The state geologist has defined a potentially active fault as any fault considered to have been active during Quaternary time (last 1,800,000 years). This definition is used in delineating Earthquake Fault Zones (EFZ) as mandated by the Alquist-Priolo Earthquake Faulting Zones Act of 1972 and as most recently revised in 2007 (Hart and Bryant, 2007). The intent of this act is to ensure that urban development and habitable structures are not sited across the traces of active faults. Based on our review, the site is not located within an EFZ, (CGS, 2000).

Numerous active and potentially active faults have been mapped within the southern California region, several of which are within close proximity to the site (Figure 3 – Regional Fault Map). Per the latest California Geological Survey fault database, the major active and potentially active fault systems that could produce significant ground shaking at the site include the Hollywood and Santa Monica fault zones, and the Upper Elysian Park Thrust fault. The distance of these faults and the estimated slip rates if known are provided below:

Hollywood Fault: The active Hollywood fault is located approximately 0.7 kilometers (0.4 miles) to the south of the site. The fault is capable of producing an estimated maximum magnitude (Mw) 6.4 earthquake. The fault is truncated on the west by the north-northwest trending erosional escarpment known locally

as the West Beverly Hills Lineament (WBHL) marking the left step between the Santa Monica fault and the Hollywood fault (Dolan et al., 2000a). The WBHL creates a topographic erosional escarpment separating older alluvium on the west from younger alluvium on the east. Subsurface evidence for late Quaternary faulting is evident from several studies based upon geomorphic evidence, stratigraphic correlation between borings and fault trenching studies conducted in Hollywood (Dolan et al., 1997, 2000b). Recent faulting at Camino Palmero occurred after deposition of 9ka sediments and prior to deposition of sediments dated at 6ka making this fault active by definition by classification criteria adopted by the California Geological Survey that defines activity of faults based on dates of known rupture events. Based on sediment accumulation rates determined by radiocarbon dating, the dip separation is low but at least 0.75 mm/yr (D. Ponti in Hummon et al., 1994). Dolan et al., (1997) estimate that strike separation on the fault is greater than 0.25 mm/yr.

Santa Monica Fault Zone: The Santa Monica fault zone is located approximately 2.3 km (1.4 mi) from the site and is part of the west trending Transverse Ranges Southern Boundary fault system. The Santa Monica faults extends from Pacific Palisades through Santa Monica and into west Los Angeles were it merges with the Hollywood fault at the WBHL in Beverley Hills. The Santa Monica fault is thought to be capable of producing an estimated maximum magnitude (Mw) 6.6 earthquake. Several investigations (Dolan et al., 2000a; Hummon et al., 1992; Dolan and Sieh, 1992; and Crook and Proctor, 1992) have indicated the fault is active based on geomorphic evidence and fault trenching studies indicating the active portion of the Santa Monica fault does not extend east of the WBHL of Dolan and Sieh (1992). The fault has not been zoned, however, the fault is considered active by the State Geologist.

Upper Elysian Park Anticlinorium: The Elysian Park Anticlinorium is a southward verging anticline approximately 20 kilometers long (12.4 mi) with a curved, southward-convex axis, lying between the Hollywood fault on the northwest through the Silver Lake District to the right lateral East Montebello fault on the east in the City of San Gabriel. Uplift along the structure has produced the Elysian, Repetto and Monterey Park Hills. Deformed Quaternary deposits across the Coyote Pass Escarpment and related structures allowed Oskin et al., (2000) to estimate a late Quaternary slip rate on the blind Elysian Park reverse fault of 0.8-2.2 mm/yr. The California Geological Survey (2003) has estimated an average slip rate of 1.3mm/yr and an estimated maximum magnitude (Mw) of 6.4 for the Elysian Park Thrust fault system.

4.2 Surface Fault Rupture

Our review of available in-house literature indicates that no known active faults have been mapped across the site, and the site is not located within an Alquist-Priolo Earthquake Fault Zone (Hart and Bryant, 2007; CGS, 1986). Based on the United States Geological Survey (USGS) fault parameters database and latitude and longitude coordinates N34.1136° and W118.3355°, the closest active fault to the site is the Hollywood fault, located approximately 0.4 miles south of the site (http://geohazards.usgs.gov/cfusion/hazfaults_search). Based on the current geologic framework, the potential for surface fault rupture onsite is expected to be low.

4.3 Ground Shaking

Strong ground shaking can be expected at the site during moderate to severe earthquakes in this general region. This is common to virtually all of Southern California. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. According to the United States Geological Survey (USGS) at the time of this writing, the most recent local (within 25 kilometers of the site) earthquake was the MW 3.4 earthquake on September 7, 2012, approximately 3.4 miles to the southwest (http://earthquake.usgs.gov/earthquakes/eqarchives/epic/) believed to be attributed to movement along the San Vicente Blind thrust fault. The 2010 California Building Code (CBC) seismic coefficients are presented in the following subsections:

- *CBC Coefficients*: Based on our site reconnaissance, the project site is underlain predominantly by bedrock. The shear wave velocity in the upper 30 meters at the project site based on the recent geophysical survey performed at the site as a part of this evaluation (GeoVision, 2012) ranges between 1,880 and 2,139 feet-per-second.

  In accordance with the 2010 Edition of the CBC, this site should be classified as a Class C site. The following values may be used for the seismic design method based on the 2010 CBC:

2010 CBC Based Seismic Design Parameters (Mapped Values)

CBC Categorization/Coefficient	Design Value
Site Longitude (decimal degrees)	-118.3355 W
Site Latitude (decimal degrees)	34.1136 N
Site Class Definition	C
Seismic Design Category	D
Mapped spectral response acceleration parameter at short period, S_S	1.79
Mapped spectral response acceleration parameter at a period of 1 sec, S_1	0.60
Short Period (0.2 sec) Site Coefficient, F_a	1.0

4.4 Secondary Seismic Hazards

Liquefaction Potential: Liquefaction is the loss of soil strength or stiffness due to a buildup of pore-water pressure during severe ground shaking. Liquefaction is associated primarily with loose (low density), saturated, fine- to medium-grained, cohesionless soils. As shown on the State of California Seismic Hazard Zones Map for the Hollywood Quadrangle (CDMG, 1999), portions of the overall study area are located within an area that has been identified by the State of California as being potentially susceptible to liquefaction (see Figure 4). The Off Season Two Improvements are underlain by bedrock and are not located within a liquefiable area.

Lateral Spreading Potential: Lateral spreading is a phenomenon in which large blocks of intact, non-liquefied soil move downslope on a liquefied soil layer. Lateral spreading is often a regional event. For lateral spreading to occur, a liquefiable soil zone must be laterally continuous, unconstrained laterally in at

least one direction and free to move along sloping ground. Due to the topographic relief and the potential for liquefaction to occur, there is a potential for lateral spreading at the overall project site.

Seismically-Induced Settlement: Since the project site is underlain predominantly by bedrock, the potential for seismically-induced settlement is low.

Seismically-Induced Landslides: As shown on the State of California Seismic Hazard Zones Map for the Hollywood Quadrangle (CDMG, 1999), a portion of the project site is located within an area that has been identified by the State of California as being potentially susceptible to seismically induced landslides (see Figure 4).

Seiches, Tsunamis, Inundation Due to Large Water Storage Facilities: Seiches are large waves generated in very large enclosed bodies of water or partially enclosed arms of the sea in response to ground shaking. The only large enclosed body of water within close proximity to the site is the Hollywood Reservoir located to the northeast of the site. Based on the location and elevation of the large ridgeline between the site and the Hollywood Reservoir, the seiche risk at the site is considered negligible.

Tsunamis are waves generated in large bodies of water by fault displacement or major ground movement. The project area is predominantly at elevations higher than 500 feet above mean sea level, therefore the tsunami risk at the site is considered nil.

Earthquake-induced flooding can be caused by failure of dams or other water-retaining structures as a result of earthquake. According to the County of Los Angeles Seismic Safety Element (1990) and the City of Los Angeles Safety Element (1996), the site is not located within a potential inundation area for an earthquake induced dam failure from Hollywood Reservoir. Even though the site is not located within a potential inundation area for the Hollywood Reservoir, the dam is continually monitored by the Army Corp of Engineers (ACOE) to guard against the threat of dam failure. The possibility of dam failures during an earthquake has been addressed by the California Division of Mines and Geology in an earthquake planning scenario for a magnitude 8.3 earthquake on the San Andreas fault (Davis et al., 1982) and a magnitude 7.0 earthquake on the Newport Inglewood Fault Zone (Toppozada et al., 1988). Both reports state catastrophic failure of a dam as a result of an earthquake is highly unlikely.

Current design practices, dam review, modification or total reconstruction of existing dams are intended to ensure that all dams are capable of withstanding the maximum earthquake for the site. Therefore the potential for the site to be inundated as a result of dam failure is considered negligible.

4.5 Slope Stability

The results of the stability analyses provided in this report (Appendix D) indicate the project site will generally attain sufficient stability with minor surficial grading and slope reinforcement measures. The global factor of safety is estimated to be about 1.5 and 1.1 for static and pseudostatic conditions, respectively. Slope stability issues specific to the Off-Season Two Improvements are discussed below.

4.5.1 Debris flows

Mass movements include landslides and debris flows. Debris flow areas were encountered during our subsurface investigation at the project area, subsequent verbal conversations with Theater personnel indicate debris flows have occurred at the site (Figure B-5). The project site lies within a previously existing canyon cut down into the formational material surrounded by moderately steep natural slopes composed of massive pillow basalt and steeply dipping sandstone formations.

During our geotechnical investigation we mapped several areas that were possibly debris flow scars and/or accumulations of colluvium (Figure B-5). Areas of thick accumulation of surficial materials, predominately basalt, have the potential to develop into debris flows.

Debris flows and debris slides should be expected to occur in the heads of steep gullies, on steep slopes and along ridgelines underlain by basalt. When rainfall intensity is great enough to cause water to percolate into the colluvium at a rate which exceeds the rate at which the water can percolate into the bedrock, slope failure of colluvium will occur. The surficial stability of the natural slopes is dependent upon the thickness of weaker soils and the slope gradient. Thick accumulations of colluvial soils on steep slopes are susceptible to surficial failures, debris flows and downhill creep during periods of heavy rain. The most likely source of

debris flow potential is from the steep slopes and drainages in the northeastern and southern portion of the proposed improvements area.

Our recommendations regarding mitigation of debris flow are discussed in Section 6.0 of this report.

4.5.2 Rockfalls

Field mapping and geologic analysis of the sandstone rock outcrops exposed in the southern portion of the site indicated the presence of intersecting pairs of joint sets and conjugate fault planes. Due to local orientations of the joint sets, the presence of fractured, freshly exposed rock faces and damage to the previously referenced H-beam (Figure B-6), the potential exists for detachment and down slope translation of rock, which could impact the proposed development.

The proposed development is expected to require provisions to protect improvements and occupants from rock fall hazards. On a preliminary basis, provisions should be included in the site layout to include such devices as a rock fence located near the toe of the slopes. Other more elaborate techniques such as rock netting situated along the faces of slopes vulnerable to rock falls may also be necessary after landscaping is implemented.

4.6 Expansive Soils

Based on our geotechnical exploration at the site, the near surface soils are generally granular with localized silt and clay layers. The laboratory test result of two representative samples from Leighton test pit TP-1 and TP-4, showed low expansion index (EI) potential wetted EI =11 and EI=24, respectfully. Results of expansion index tests indicate that the onsite soils have low expansion potential.

4.7 Corrosive Soils

Corrosive soils are characterized by their ability to degrade concrete and corrode ferrous materials in contact with water or soil. In particular, concrete is susceptible to corrosion when it is in contact with soil or water that contains high concentrations of soluble sulfates which can result in chemical deterioration of the concrete. Results of laboratory testing indicate soluble sulfate contents of 73

and 175 ppm, which range from negligible to moderate sulfate exposure. Since irrigation water in Southern California is considered to have moderate sulfate attack potential (typical sulfate concentrations of 150 to 250 ppm), concrete should be designed to resist moderate sulfate exposure.

The site soils are deemed highly corrosive to ferrous metals based on minimum soil resistivity 1,200 to 2,050 ohm-cm recorded from two samples.

5.0 FINDINGS AND CONCLUSIONS

Based on our investigation, we conclude that the proposed project is feasible from a geotechnical standpoint. We did not encounter significant geotechnical constraints that cannot be mitigated by proper planning, design, and sound construction practices. The key findings of our investigation for the site are summarized below:

- The near surface materials encountered consist of undocumented fill soils and colluvium. The upper 3 to 5 feet of colluvial material are considered compressible. Undocumented fills locally contain large oversize sandstone rock fragments and concrete debris. The fill as encountered at the site is associated with past construction activities.

- The colluvium as encountered consisted predominately of angular sands and gravel sized basalt rock fragments intermixed with organic debris from hillside vegetation. The colluvium forms thick accumulations near the toe of slopes and behind the existing concrete, stone and masonry block retaining walls and within the drainage swales impeding flow. Our observations suggest the colluvium has overtopped the various retaining walls at some point if the past and will continue to do so unless mitigated and maintained. Colluvium is subject to continuous downhill creep due to gravity and rapid releases in the form of debris flows following periods of intense precipitation.

- The basalt bedrock on site has massive pillow structure, is very blocky, interlocked, and partially disturbed with multi-faceted angular blocks formed by joint sets and as a result of rapid crystallization during formation. Basalt at the site should also be expected to occur in dikes and sills in the sedimentary formations. Zeolite veining and other minerals are common.

- The sandstone outcrop in the southern portion of the Off-Season Two Improvements area contain weak planar structural features in unfavorable orientation with respect to the north facing rock slope. This area is prone to rock falls and is expected to require some provisions such as debris walls, rock fences, or rock netting to protect improvements and occupants from the hazards associated with localized rock falls and/or pop-outs. A detached boulder greater than five feet long remains perched near the top of the talus pile while smaller sized rock material up to 2 feet long provide the majority of the talus debris now resting against the southern mezzanine level concrete retaining wall.

- Based on the rock quality determined during the test pit excavations, field mapping and refraction survey (Appendix A), it is our opinion that the basalt and sandstone materials will vary from easily rippable near surface to moderately difficult using electric hand chisels below 4 feet in depth.

- Groundwater was not encountered. Nuisance water could be encountered during and after seasonal precipitation behind the eastern basement retaining wall.

- Results of laboratory testing indicate soluble sulfate contents of 73 and 175 ppm, which range from negligible to moderate sulfate exposure. Since irrigation water in Southern California is considered to have moderate sulfate attack potential (typical sulfate concentrations of 150 to 250 ppm), concrete should be designed to resist moderate sulfate exposure.

- Results of the expansion testing indicate the two representative samples from Leighton test pits TP-1 and TP-4 showed low expansion index (EI) potential when wetted EI =11 and EI=24, respectfully. Non-cohesive granular fill derived from a mixture of these materials is expected to have low expansion potential. Expansive soils not specifically encountered during this investigation may be present locally onsite.

- The existing onsite soils expected to be generated from the basalt formation appear to be suitable for re-use as fill during proposed construction provided they are free of organic material and oversize debris. However, the potential for significant erosion exists if granular fill soils are used on slope faces.

- Oversize material (cobble sized to 14 inches in long dimension) was encountered in Test Pit TP-4. Oversize material could also be generated while excavating the sandstone rocks in the southern portion of the site. Oversize material should be removed from the site or placed at a designated, pre-approved disposal area within the Theater complex.

- Several sandstone boulders lie on the slope face in the northeastern portion of the site above the existing concrete swale and below the crib wall. Damage to the crib wall was observed suggesting sandstone boulders become dislodged in the form of rockfall.

6.0 GEOTECHNICAL RECOMMENDATIONS

Extensive removals of loose slope materials will be required for the project. Many areas around the Theater currently have substantial debris flow and rock fall accumulations. These materials should be removed to unload retaining walls, re-establish proper freeboard behind walls, and reduce the potential for remobilization.

Due to the slopes surrounding the Theater complex, continued regular maintenance will be necessary, especially after periods of heavy or prolonged precipitation. Considering that significant landscaping on the slopes is already planned as part of the project, we recommend that trails and paths be established to facilitate access for maintenance crews to slope areas that currently have debris flow and rock fall accumulations because these areas will likely require regular cleanouts.

The damaged crib wall should be repaired and filled in with crushed rock to provide protection against rock falls and debris flows. The repair should include removal of the debris and rock fall/soil accumulation behind the crib wall.

For protection against future debris flows all new retaining walls should have a minimum freeboard height of 9 inches (height of wall above retained soil). Backfill behind existing walls should be lowered where possible to establish a nominal 9-inch freeboard.

For protection against future rockfalls, we recommend installation of flexible barriers at the bottom of the slope, several feet upslope of any existing retaining walls. Considering that the project site is a performance venue, we anticipate that aesthetics will be an important factor in selecting the rockfall mitigation system. The visual impact of flexible barriers, such as stainless steel cables with steel bollards or wrought iron fencing, will be easier to mitigate. The barrier should establish an effective freeboard of 4 feet. Alternatively, an anchored mesh net may be used. However, its visual impact will be more difficult to mitigate since all upslope areas with potentially loose rock fragments will require coverage.

New structural elements may be supported on spread-type shallow foundation systems established in engineered fill or undisturbed natural soils. Alternatively, deep foundations may be used. Capacities developed for new foundations may be used to evaluate existing footings and cast-in-drilled-hole (CIDH) piles.

The following geotechnical recommendations have been developed based on the exhibited engineering properties of the onsite materials and their anticipated behavior during and after construction, seismic design considerations, floor slabs, and grading.

There are existing basement walls below the stage. Shallow foundations (spread footings) for new structures should be deepened to extend below the active zone of existing basement walls, roughly a plane extending from the base of the basement wall at a 60 degree angle from horizontal, to avoid surcharging the walls. Footings may be deepened by excavating below the active zone and backfilling with concrete or with controlled low strength material (CLSM).

New basement walls planned below existing foundations within their active zones should be designed to accommodate surcharge loads. Surcharge may be modeled as half the footing bearing pressure within the wall's active zone applied horizontally.

New pile segments within the active zone of existing basement walls should be isolated from surrounding soils using Sonotubes or equivalent.

Leighton should review the grading plans, shoring plans, foundation plans, and specifications when they are available to verify that the recommendations presented in this report have been properly interpreted and incorporated.

6.1 Earthwork and Grading

All earthwork and grading should be performed in accordance with the following recommendations and Earthwork and Grading Guide Specifications presented in Appendix E.

6.1.1 Site Preparation

Prior to construction, the area of proposed new structures/foundations should be cleared of any vegetation and demolition trash and debris. These materials should be removed from the site. Any underground obstructions onsite should be removed. Efforts should be made to locate any existing utility lines to be removed or rerouted where interfering with the proposed construction. Any resulting cavities should be properly backfilled and compacted. After the site is cleared, the soils should be carefully observed for the removal of all unsuitable deposits. All undocumented fill should be excavated from proposed structure footprints.

6.1.2 General Grading Recommendations

New structures may be supported on conventional shallow footing foundation systems established on engineered fill or undisturbed bedrock.

The existing undocumented artificial fill should be removed and replaced as engineered fill. Overexcavation and recompaction should extend a minimum horizontal distance equal to the vertical distance between the proposed footing bottom and depth of overexcavation.

After completion of the overexcavation and prior to fill placement, the exposed soils/weathered bedrock should be scarified to a minimum depth of 12 inches, moisture conditioned and compacted to at least 90 percent relative compaction based on ASTM Test Method D 1557.

The onsite soils, less any deleterious material or organic matter, can be used in required fills. Cobbles larger than 6 inches in largest diameter should not be used in the fill. Any required import material should consist of relatively non-expansive soils with an Expansion Index (EI) less than 20. The imported materials should contain sufficient fines (binder material) so as to be relatively impermeable and result in a stable subgrade when compacted. All proposed import materials should be approved by the geotechnical engineer of record prior to being placed at the site.

6.1.3 Pipe Bedding

Any proposed pipe should be placed on properly placed bedding materials. Pipe bedding should extend to a depth in accordance to the pipe manufacturer's specification. The pipe bedding should extend to at least 12 inches over the top of the pipeline. The bedding material may consist of compacted free-draining sand, gravel, or crushed rock. Pipe bedding material should have a Sand Equivalent (SE) of at least 30.

6.1.4 Trench Backfill

Trench excavations above pipe bedding may be backfilled with onsite soils under the observation of the geotechnical consultant. All fill soils should be placed in loose lifts, moisture conditioned as required and compacted to a minimum of 90 percent relative compaction based on ASTM Test Method D 1557-12. Lift thickness will be dependent on the equipment used as suggested in the latest edition of the *Standard Specifications for Public Works Construction* (Greenbook). The fill soils should extend to the bottom of the aggregate base for new pavement, or to finished grade.

6.2 Shallow Foundations

New shallow spread footings may be established in engineered fill or undisturbed natural soils or bedrock.

6.2.1 Minimum Embedment and Width

Footings should have a minimum embedment of 12 inches and have a minimum width of 12 inches.

6.2.2 Bearing Value

Footings established on engineered fill or undisturbed natural soils may be designed to impose an allowable bearing pressure of 3,000 pounds per square foot (psf). A one-third increase in the bearing value for short duration loading, such as wind or seismic forces, may be used.

The ultimate bearing capacity can be taken as 9,000 psf, which does not incorporate a factor of safety. A resistance factor of 0.5 should be used for bearing capacity evaluation with factored loads. The recommended bearing value is a net value, and the weight of concrete in the footings can be taken as 150 pounds per cubic foot (pcf); the weight of soil backfill can be neglected when determining the downward loads.

6.2.3 Settlement

The estimated total settlement of the structures supported on spread footings as recommended above is less than 1 inch. The differential settlement between adjacent columns is estimated to be less than ½ inch over a horizontal distance of 30 feet.

6.2.4 Lateral Resistance

Lateral loads can be resisted by soil friction and by the passive resistance of the soils. A coefficient of friction of 0.35 can be used between the footings and the floor slab and the supporting soils. The ultimate passive resistance of undisturbed natural soils or engineered fill soils can be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot (pcf). The friction resistance and the passive resistance of the soils can be combined without reduction in determining

the total lateral resistance. A resistance factor of 1 should be used for lateral capacity evaluation with factored loads.

6.3 Deep Foundations

Cast-In-Drilled Hole (CIDH) concrete piles or micropiles may also be used to support new structural elements.

6.3.1 Cast-In-Drilled Hole (CIDH) Piles

Details of pile capacity analyses are presented in Appendix F. Design recommendations are summarized in the following subsections.

6.3.1.1 Axial Capacity of CIDH Pile

We understand that theatrical lighting towers are proposed on the hillsides surrounding the amphitheater. The capacities below may be used for design of drilled, cast-in-place concrete piles (CIDH).

Downward Capacity of CIDH Piles (kips)			
Depth of Pile Tip (feet)	**18-inch-diameter**	**24-inch-diameter**	**30-inch-diameter**
15	20	25	30
20	30	45	50
25	45	65	80

Dead-plus-live load capacities are shown. A one-third increase may be used for wind or seismic loads. A factor of safety of 3 was used for shaft friction and end bearing was neglected in determining the pile capacities.

Uplift capacities may be taken as equal to 50 percent of the downward capacities. The capacities presented are based on the strength of the soils; the strength of the pile section should be checked to verify the structural capacity of the piles.

A resistance factor of 0.5 should be used for downward and uplift capacity evaluation with factored loads.

Piles in groups may be spaced at 3 pile widths on-centers. If the piles are so spaced, no reduction in axial capacity due to group action need be considered in the design.

6.3.1.2 Lateral Capacity of CIDH Pile

Lateral loads may be resisted by the caissons and by the passive resistance of the soils. The lateral capacity of the caissons will depend on the caisson type and size, the permissible deflection, and on the degree of fixity at the top of the caisson. We have assumed piles will be installed on an effective 45 to 60 degree slope.

We have calculated lateral load, maximum moments, and depths to maximum moment for CIDH concrete piles (caissons) using the computer program LPILE by ENSOFT, Inc. We have assumed a concrete compressive strength value (f'_c) of 5,000 pounds per square inch (psi).

Lateral Capacities of 18-Inch-Diameter CIDH Pile

Pile Head Deflection (inches)	Fixity	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
¼	Free Head	14	640	6
½	Free Head	20	1,030	7
¼	Fixed Head	30	1,620	0
½	Fixed Head	44	2,610	0

Lateral Capacities of 24-Inch Diameter-CIDH Pile

Pile Head Deflection (inches)	Fixity	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
¼	Free Head	23	1,320	6
½	Free Head	33	2,110	7
¼	Fixed Head	50	3,325	0
½	Fixed Head	72	5,330	0

Lateral Capacities of 36-Inch Diameter-CIDH Pile

Pile Head Deflection (inches)	Fixity	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
¼	Free Head	35	2,290	10
½	Free Head	50	3,660	11
¼	Fixed Head	74	5,780	0
½	Fixed Head	100	8,800	0

The analyses performed uses the flexural stiffness of the caissons computed from the modulus of elasticity (*E*) and moment of inertia (*I*). The modulus of elasticity (*E*) is derived based on the concrete compressive strength and the moment of inertia (*I*) is derived based on the caisson cross-section geometry. The values of *E* and *I* are assumed constant along the entire length of the caissons.

Lateral pile capacities considering a reduced moment of inertia due to cracked concrete pile sections should be evaluated after reinforcing details become available.

A resistance factor of 1 should be used for lateral capacity evaluation with factored loads.

The capacities presented in the table above are for pile lengths equal to or greater than 20 feet. This length is measured below the pile cap. The lateral capacity and reduction in the bending moment are based in part on the assumption that any required backfill adjacent to the caisson caps and grade beams are properly compacted.

For caissons in groups spaced at least 3 pile widths on-center, no reduction in the lateral capacity need be considered for the first row of caissons. For subsequent rows in the direction parallel to loading, caissons in groups spaced closer than 8 caisson widths on-center will have a reduction in lateral capacity due to group effects. The lateral capacity of caissons in groups spaced at 3 caisson widths on-center may be assumed to be reduced by half. The reduction for other caisson spacings may be interpolated between no reduction for caissons spaced at 8 caisson widths on-center and the reduction for caissons spaced at 3 caisson widths on-center.

The passive resistance of engineered fill against caisson caps and grade beams will depend on the method of installation. The passive resistance of engineered fill may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot (pcf), up to a maximum pressure of 3,000 pounds per square foot. A one-third increase in the passive value may be used for wind or seismic loads. The lateral resistance of the caissons and the passive resistance of the soils may be combined without reduction in determining the total lateral resistance.

6.3.1.3 Settlement

Piles in groups may be spaced at 3 pile widths on-centers. If the piles are so spaced, no reduction in axial capacity due to group action need be considered in the design.

The settlement of the proposed improvements founded on caissons in the manner recommended, will be approximately ½ inch or less. Differential settlement will be approximately ¼ inch or less. The

differential settlement is anticipated to occur over a minimum span of 40 feet.

Settlement of piles, generally resulting from settlement of the supporting soils and elastic compression of piles, is expected to be on the order of ¼ inch. The settlement analysis should be evaluated when the actual structural load and pile cap configuration become available.

6.3.1.4 Construction

The drilling of the pile shafts and placement of the steel reinforcement and concrete should be done under the continuous observation of the project geotechnical engineer. Localized caving within unsupported excavations should be anticipated. Casing may be required where/if sands layers occur. Excavations for piles that are spaced at less than five diameters (center to center) should be not open simultaneously. Concrete for closely spaced piles should be placed and allowed to set for at least 24 hours before initiating the excavation for any adjacent piles. Steel reinforcement and concrete should be placed as soon as possible after approval of the drill hole. Pile excavations should not be left open overnight. Tremie pipes should be utilized when placing the concrete to prevent the concrete from falling and/or striking the walls of the borehole. Although groundwater was not encountered in our explorations, perched groundwater table may be present following periods of rainfall.

6.4 Slabs-on-Grade

Concrete slabs may be designed using a modulus of subgrade reaction of 150 pci provided the subgrade is prepared as described in Section 6.1, *Earthwork and Grading*. From a geotechnical standpoint, we recommend slab-on-grade be a minimum 5 inches thick with No. 3 rebars placed at the center of the slab at 24 inches on center in each direction. The structural engineer should design the actual thickness and reinforcement based on anticipated loading conditions. Where moisture-sensitive floor coverings or equipment is planned, the slabs should be protected by a minimum 10-mil-thick vapor barrier between the slab and subgrade.

Minor cracking of concrete after curing due to drying and shrinkage is normal and should be expected; however, concrete is often aggravated by a high water/cement ration, high concrete temperature at the time of placement, small nominal aggregate size, and rapid moisture loss due to hot, dry, and/or windy weather conditions during placement and curing. Cracking due to temperature and moisture fluctuations can also be expected. The use of low-slump concrete or low water/cement ratios can reduce the potential for shrinkage cracking. Additionally, our experience indicates that the use of reinforcement in slabs and foundations can generally reduce the potential for concrete cracking.

To reduce the potential for excessive cracking, concrete slabs-on-grade should be provided with construction or weakened plane joints at frequent intervals. Joints should be laid out to form approximately square panels.

6.5 Lateral Earth Pressures

Recommended lateral earth pressures are provided as equivalent fluid unit weights, in psf/ft. or pcf., for design of basement and retaining walls in drained conditions using onsite sandy soils as backfill. These values do not contain an appreciable factor of safety, so the structural engineer should apply the applicable factors of safety and/or load factors during design.

Lateral Earth Pressures

Condition	Equivalent Fluid Unit Weight (psf/ft)
	Level Backfill
Active	35
Seismic Increment	20
At-Rest	55
Passive	300
Coefficient of Friction	0.35

Walls that are free to rotate or deflect may be designed using active earth pressure. For the basement walls or walls that are fixed against rotation, the at-rest pressure should be used. For seismic condition, the pressure should be distributed as an inverted triangular distribution and the dynamic thrust should be applied at a height of 0.6H above the base of the wall.

Care should be taken to provide appropriate drainage so as no water is allowed to remain behind the retaining wall for any significant length of time. Retaining structures should be provided with a drainage system, as illustrated on Figure 5, *Retaining Wall Backfill and Subdrain Detail*, to prevent buildup of hydrostatic pressure behind the wall.

In addition to the recommended earth pressures, walls below grade adjacent to existing structures or streets and areas of traffic should be designed to accommodate surcharge loads. For traffic surcharge, a uniform lateral pressure of 100 pounds per square foot acting as a result of an assumed 300 pounds per square foot surcharge behind the wall due to normal traffic; the traffic surcharge load may be neglected provided a minimum of 10 foot clearance between the wall and the traffic is maintained. We will provide surcharge loading from adjacent foundations after reviewing details of the planned basement walls in relation to existing foundations.

Backfills for retaining walls should be compacted to a minimum of 90 percent relative compaction (based on ASTM Test Method D1557). During construction of retaining walls, the backcut should be made in accordance with the requirements of Cal/OSHA Construction Safety Orders. Relatively light construction equipment should be used to backfill retaining walls. We also recommend using at-rest pressures for design of walls supporting settlement-sensitive structures.

Earth pressures used in the design of the walls should be indicated on the retaining wall plans. All retaining wall designs and plans should be reviewed by the project geotechnical consultant to confirm that the appropriate soil parameters are used.

6.6 Flexible Pavement

To provide support for paving of the new transit plaza, and surface parking and driveways, the subgrade soils should be prepared as recommended in Section 6.1, *Earthwork and Grading*. The preparation of the paving area subgrade should be performed immediately prior to placement of the base course. Proper drainage of the paved areas should be provided since this will reduce moisture infiltration into the subgrade and increase the life of the paving.

6.6.1 Aggregate Base Course

The base course for hot mix asphalt (HMA) concrete paving should meet the specifications for Class 2 Aggregate Base as defined in Section 26 of the latest edition of the State of California Department of Transportation Standard and Specifications. Alternatively, the base course could meet the specifications for untreated base as defined in Section 200-2 of the latest edition of *Standard Specifications for Public Works Construction* (Greenbook). Crushed Miscellaneous Base (CMB) may be used for the base course provided the geotechnical consultant evaluates and tests it before delivery to the site.

6.6.2 Hot Mix Asphalt (HMA) Concrete

The required HMA concrete paving and base thicknesses will depend on the expected wheel loads and volume of traffic (Traffic Index or TI). Assuming that the paving subgrade will consist of engineered fill or bedrock materials with an R-value of at least 30 compacted to at least 90 percent relative compaction based on ASTM Test Method D 1557, the minimum recommended paving thicknesses are presented in the following table:

Asphalt Concrete Pavement Section for Reconstruction

Traffic Index	Hot Mix Asphalt Thickness (inches)	Aggregate Base Thickness (inches)	Total (inches)
5.0 or less	3.0	4.0	7.0
6.0	3.5	5.5	9.0
7.0	4.0	7.0	11.0
8.0	5.0	8.0	12.0
9.0	5.5	9.5	15.0

Representative samples of the actual subgrade materials should be obtained and tested for R-Value following rough grading of the pavement subgrade to confirm the pavement design sections.

6.7 Temporary Excavations

All temporary excavations, including footings, utility trenches, dry wells should be performed in accordance with project plans, specifications, and all OSHA requirements. Excavations 5 feet or deeper should be laid back or shored in accordance with OSHA requirements before personnel are allowed to enter.

No surcharge loads should be permitted within a horizontal distance equal to the height of cut or 5 feet, whichever is greater from the top of the cut, unless the cut is shored appropriately.

During construction, the soil conditions should be regularly evaluated to verify that conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Soil types will vary, but Type C soils can be expected at shallow depths and Type A soils within bedrock. Close coordination between the competent person and the geotechnical engineer should be maintained to facilitate construction while providing safe excavations.

6.8 Shoring

Shoring may be required to accommodate removal of existing basement walls and construction of new basement walls. Shoring and underpinning may also be required to prevent undermining of adjacent existing foundations. The anticipated shoring/underpinning system for the site will consist of soldier piles and lagging. Soldier piles may consist of steel H-beams set in predrilled holes and backfilled with lean-mix concrete to the ground surface.

6.8.1 Lateral Earth Pressures

For design of cantilevered shoring, where the surface of the backfill is level, it can be assumed that drained soils will exert a lateral pressure equal to that developed by a fluid with a density of 35 pounds per cubic foot (pcf).

In addition to the recommended earth pressure, the upper 10 feet of shoring adjacent to streets and driveways should be designed to resist a uniform lateral pressure 100 psf, acting as a result of an assumed 100 psf surcharge behind the shoring due to normal street traffic. If the traffic is kept back at least 10 feet from the shoring, the traffic surcharge may be

neglected. We can determine lateral surcharge pressures for specific cases, such as construction crane, concrete trucks, and other heavy construction equipment adjacent to shoring, if requested.

6.8.2 Surcharge Pressure from Adjacent Foundations

Where existing foundations are within a 1:1 plan projected upward from the bottom of the planned shoring and basement walls, a lateral surcharge load should be applied to the active earth pressure to account for the pressure imposed by the foundation. Once details of existing adjacent foundations are established, we can provide design surcharge pressures to be applied to shoring and basement walls.

6.8.3 Design of Soldier Piles

For the design of soldier piles spaced at least two diameters on centers (OC), the allowable lateral bearing value (passive value) of the soils below the level of excavation may be assumed to be 600 psf at the excavated surface, up to a maximum of 6,000 psf. To develop the full lateral value, provisions should be taken to assure firm contact between the soldier piles and the undisturbed soils. The concrete placed in the soldier pile excavations may be a lean-mix concrete. However, the concrete used in that portion of the soldier pile which is below the planned excavated level should be of sufficient strength to adequately transfer the imposed loads from the soldier pile to the surrounding soils.

The frictional resistance between the soldier piles and the retained earth may be used in resisting the downward component of the design load. The coefficient of friction between the soldier piles and the retained earth may be taken as 0.4. This value is based on the assumption that uniform full bearing will be developed between the steel soldier beam and the lean-mix concrete and between the lean-mix concrete and the retained earth. In addition, provided that the portion of the soldier piles below the excavated level is backfilled with structural concrete, the soldier piles below the excavated level may be used to resist downward loads. The frictional resistance between the concrete soldier piles and the soils below the excavated level may be taken as equal to 500 psf.

6.8.4 Lagging

Continuous lagging will be required between the soldier piles above the bedrock contact. Careful installation of the lagging will be necessary to achieve bearing against the retained earth.

The soldier piles should be designed for the full anticipated lateral pressure. However, the pressure on the lagging will be less due to arching in the soils. For clear spans up to 8 feet, we recommend that the lagging be designed for a semi-circular distribution of earth pressure where the maximum pressure is 400 psf at the midline between soldier piles, and 0 psf at the soldier piles.

Deflection: It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized, however, that some deflection will occur. To help protect adjacent existing buildings and infrastructure, the maximum allowable horizontal shoring deflection as measured at the top of the excavation is ½ inch.

If greater deflection occurs during construction, additional bracing may be necessary to minimize settlement of adjacent structures and of any utilities in the adjacent streets. To reduce the deflection of the shoring, if desired, a greater active pressure could be used in the shoring design.

Monitoring: Some means of monitoring the performance of the shoring system is recommended. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all the soldier piles. We will be pleased to discuss this further with the design consultants and the contractor when the design of the shoring system is finalized. Other methods of monitoring could include the installation of inclinometers.

6.9 Maintenance Guidelines and Erosion Control

We understand it will be the responsibility of the County of Los Angeles to maintain the slopes surrounding the theater site, including adequate planting, proper irrigation and maintenance, and repair of faulty irrigation systems. To reduce the potential for erosion and slumping of soil prisms on steep slopes, all slopes should be planted with plants that require minimal irrigation. Slope

planting should be carried out as soon as practical upon completion of the Off Season Two Improvements. Surface water runoff and standing water at the top of slopes should be avoided. Oversteepening of slopes should be avoided during landscaping activity. Maintenance of proper drainage and proper maintenance of vegetation, including regular slope irrigation, should be performed. Slope irrigation should avoid directly spraying onto the slope face. Drip system irrigation should be considered. Overwatering and consequent runoff and ground saturation should be avoided. If automatic sprinklers systems are installed, their use must be adjusted to account for rainfall conditions.

Any soil, debris or vegetation overgrowth should be removed from all terrace drains to enable runoff water to flow freely and properly. Regular maintenance and cleanup of terrace drains should be performed especially during the rainy season and immediately following prolonged seasonal events. Damage to terrace drains such as minor cracking should be promptly repaired and/or sealed prior to the start of the rainy season. Water should not be allowed to enter cracks or expansion gaps within the terrace drains where applicable.

6.10 Additional Geotechnical Services

The geotechnical recommendations presented in this report are based on subsurface conditions as interpreted from limited geologic mapping and seismic refraction surveys. Our conclusions and recommendations presented in this report should be reviewed and verified by Leighton during site construction and revised accordingly if exposed geotechnical conditions vary from our preliminary findings and interpretations. The recommendations presented in this report are only valid if Leighton verifies the site conditions during construction. Geotechnical observation and testing should be provided during the following activities:

- Grading and excavation of the site;
- Landscape excavation and grading;
- Overexcavation and compaction;
- Compaction of all fill materials;
- Shoring and underpinning system installation;

- Excavation and installation of foundations;
- After excavation of all slabs and footings and prior to placement of steel or concrete to confirm the slabs and footings are founded in firm, compacted fill;
- Utility trench backfilling and compaction; and
- When any conditions are encountered that varies significantly from the conditions described in this report.

Leighton should review the grading and foundation plans and specifications, when available, to comment on the geotechnical aspects. Our recommendations should be revised, as necessary, based on future plans and incorporated into the final design plans and specifications.

7.0 COUNTY OF LOS ANGELES BUILDING CODE SECTION 111 STATEMENT

Provided that the recommendations in this report are implemented, it is Leighton's opinion that the proposed improvements will be safe from the hazards of landslide, settlement, or slippage, and that the completed grading and proposed improvements will not adversely affect the stability of adjacent properties.

8.0 LIMITATIONS

This research report was based wholly on available published data and very limited non-invasive subsurface exploration. Such information is, therefore, incomplete. The nature of many projects is such that differing earth materials and/or geologic conditions can be present within small distances and under varying climatic conditions. Changes in subsurface conditions can and do occur over time. Therefore, findings, conclusions and recommendations presented in this feasibility report are based on the assumption that Leighton will provide design-specific geotechnical exploration and testing, and geotechnical observation and testing during construction.

This report was prepared for the sole use of the Ford Theatre Foundation and their design team, for their use in assessing the proposed Off-Season Two Improvements, in accordance with generally accepted geotechnical engineering practices at this time in the County of Los Angeles.

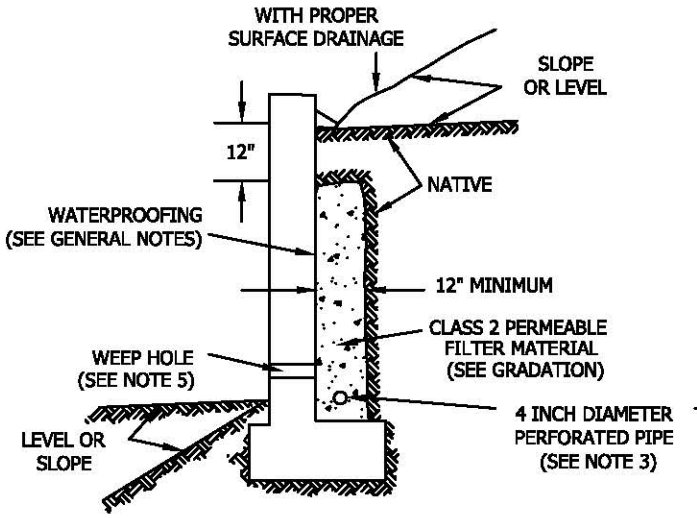
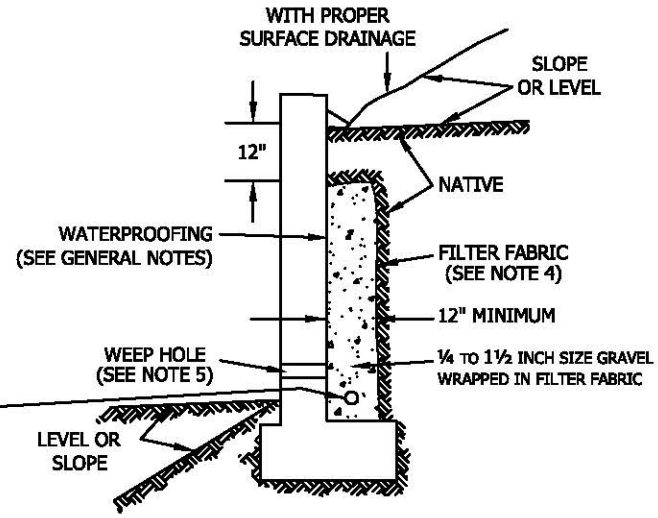
SUBDRAIN OPTIONS AND BACKFILL WHEN NATIVE MATERIAL HAS EXPANSION INDEX OF ≤50

OPTION 1: PIPE SURROUNDED WITH CLASS 2 PERMEABLE MATERIAL



OPTION 2: GRAVEL WRAPPED IN FILTER FABRIC



Class 2 Filter Permeable Material Gradation
Per Caltrans Specifications

Sieve Size	Percent Passing
1"	100
3/4"	90-100
3/8"	40-100
No. 4	25-40
No. 8	18-33
No. 30	5-15
No. 50	0-7
No. 200	0-3

GENERAL NOTES:

* Waterproofing should be provided where moisture nuisance problem through the wall is undesirable.
* Water proofing of the walls is not under purview of the geotechnical engineer
* All drains should have a gradient of 1 percent minimum
*Outlet portion of the subdrain should have a 4-inch diameter solid pipe discharged into a suitable disposal area designed by the project engineer. The subdrain pipe should be accessible for maintenance (rodding)
*Other subdrain backfill options are subject to the review by the geotechnical engineer and modification of design parameters.

Notes:
1) Sand should have a sand equivalent of 30 or greater and may be densified by water jetting.
2) 1 Cu. ft. per ft. of 1/4- to 1 1/2-inch size gravel wrapped in filter fabric
3) Pipe type should be ASTM D1527 Acrylonitrile Butadiene Styrene (ABS) SDR35 or ASTM D1785 Polyvinyl Chloride plastic (PVC), Schedule 40, Armco A2000 PVC, or approved equivalent. Pipe should be installed with perforations down. Perforations should be 3/8 inch in diameter placed at the ends of a 120-degree arc in two rows at 3-inch on center (staggered)
4) Filter fabric should be Mirafi 140NC or approved equivalent.
5) Weephole should be 3-inch minimum diameter and provided at 10-foot maximum intervals. If exposure is permitted, weepholes should be located 12 inches above finished grade. If exposure is not permitted such as for a wall adjacent to a sidewalk/curb, a pipe under the sidewalk to be discharged through the curb face or equivalent should be provided. For a basement-type wall, a proper subdrain outlet system should be provided.
6) Retaining wall plans should be reviewed and approved by the geotechnical engineer.
7) Walls over six feet in height are subject to a special review by the geotechnical engineer and modifications to the above requirements.

RETAINING WALL BACKFILL AND SUBDRAIN DETAIL FOR WALLS 6 FEET OR LESS IN HEIGHT

1 INTRODUCTION

A seismic refraction and surface wave survey was conducted at the Ford Amphitheatre in Los Angeles, California on August 30th through the 31st, 2012. The survey was conducted along two (2) arrays designated as S-1 and S-2 (Figure 1). The purpose of this investigation was to provide a shear (S) wave velocity profile to a depth of 30 meters (98.4 ft), or more, for UBC/IBC site classification and to determine depth to bedrock beneath the two (2) profiles.

Each array (S-1 and S-2) was collected using total lengths in the space available, as located by Leighton personnel. The endpoints and center of each array were recorded by **GEO*V**ision* using a submeter GPS (Table 1) and plotted on a site map (Figure 1). Array S-1 was located in the southern parking lot and had a total line length of 47 m. Array S-2 was located in the central parking lot and had a total line length of 70.5 m.

The average shear wave velocity of the upper 30 m (V_S30) is used in the NEHRP provisions and the Uniform Building Code (UBC) to separate sites into classes for earthquake engineering design (BSSC, 1994). The average shear wave velocity of the upper 100 feet (V_S100) is used in the International Building Code (IBC) for site classification. These site classes are as follows:

Class A – hard rock – $V_S30 > 1500$ m/s (UBC) or $V_S100 > 5{,}000$ ft/s (IBC)
Class B – rock – $760 < V_S30 \leq 1500$ m/s (UBC) or $2{,}500 < V_S100 \leq 5{,}000$ ft/s (IBC)
Class C – very dense soil and soft rock – $360 < V_S30 \leq 760$ m/s (UBC)
or $1{,}200 < V_S100 \leq 2{,}500$ ft/s (IBC)
Class D – stiff soil – $180 < V_S30 \leq 360$ m/s (UBC) or $600 < V_S100 \leq 1{,}200$ ft/s (IBC)
Class E – soft soil – $V_S30 < 180$ m/s (UBC) or $V_S100 < 600$ ft/s (IBC)
Class F – soils requiring site-specific evaluation

At many sites, active surface wave techniques (SASW and MASW) with the utilization of portable energy sources, such as hammers and weight drops, are sufficient to obtain a 30 m/100 ft S-wave velocity sounding. At sites with high ambient noise levels and/or very soft soils, these energy sources may not be sufficient to image to 30 m and a larger energy source, such as a bulldozer, is necessary. Alternatively, passive surface wave techniques, such as the refraction microtremor method of Louie (2001) or the array microtremor technique can be used to extend the depth of investigation at sites that have adequate noise levels.

The following sections include a discussion of equipment and field procedures, data processing, results of the geophysical survey and conclusions.

2 EQUIPMENT AND FIELD PROCEDURES

Seismic refraction and surface wave equipment used during this investigation consisted of two Geometrics Geode 24-channel signal enhancement seismographs, 4.5 Hz vertical geophones, seismic cables with 10-foot takeouts, a 3 lb hammer, a 10 lb hammer, a 20 lb sledgehammer, a vehicle mounted accelerated weight drop and an aluminum plate. The GPS system consisted of a Trimble ProXRS with OmniSTAR submeter differential corrections.

Each seismic line consisted of one spread of 48 geophones aligned in a linear array. Each spread was placed with geophones spaced 1 to 1.5 m apart for a total length of 47 to 70.5 m as outlined in Table 1. All geophone locations were measured using a 100-meter tape measure. Relative elevations along each seismic line were surveyed using a Nikon AP-7 automatic level.

Up to 31 shot point locations were occupied on each line: off-end shots, end shots and multiple interior shot points located between every fourth geophone. Site access and topography limited the placement of some of the off-end shot points and the energy source used.

A typical seismic survey field layout is shown in Appendix A. The 20 lb sledgehammer or a vehicle mounted accelerated weight drop (AWD) were used as the energy source for each shot point. The 3 lb hammer and 10 lb hammer were used for the 1 m to 1.5 m offset source locations and the shot point located at the center of the array. A Geometrics hammer switch attached to the sledgehammer, or mounted on the aluminum plate, and coupled to the Geode via a trigger extension was used to trigger the seismograph upon impact. The final seismic record at each shot point was the result of stacking 5 to 10 shots to increase the signal to noise ratio. All seismic records were stored on a laptop computer. Data files were named with the sequential line, spread and shot number and a ".dat" extension (i.e. data file 1105.dat is the seismic record from line 1, spread 1, shot 5). Data acquisition parameters, file names and leveling data were recorded on a field form, which is retained in project files.

3 METHODOLOGY

3.1 Seismic Refraction Technique

Detailed discussions of the seismic refraction method can be found in Telford et al. (1990), Dobrin and Savit (1988) and Redpath (1973).

When conducting a seismic survey, acoustic energy is input to the subsurface by an energy source such as a sledgehammer impacting a metallic plate, weight drop, vibratory source or explosive charge. The acoustic waves propagate into the subsurface at a velocity dependent upon the elastic properties of the material through which they travel. When the waves reach an interface where the density or velocity changes significantly, a portion of the energy is reflected back to the surface and the remainder is transmitted into the lower layer. Where the velocity of the lower layer is higher than that of the upper layer, a portion of the energy is also critically refracted along the interface. Critically refracted waves travel along the interface at the velocity of the lower layer and continually refract energy back to the surface. Receivers (geophones) laid out in linear array on the surface, record the incoming refracted and reflected waves. The seismic refraction method involves analysis of the travel times of the first energy to arrive at the geophones. These first arrivals are from either the direct wave (at geophones close to the source) or critically refracted waves (at geophones further from the source).

Analysis of seismic refraction data depends upon the complexity of the subsurface velocity structure. If the subsurface target is planar in nature then the slope intercept method (Telford et al., 1990) can be used to model multiple horizontal or dipping planar layers. A minimum of one end shot is required to model horizontal layers and reverse end shots are required to model dipping planar layers. If the subsurface target is undulating (i.e. bedrock valley) then layer based analysis routines such as the generalized reciprocal method (Palmer, 1980 and 1981; Lankston and Lankston, 1986 and Lankston, 1990), reciprocal method (Hawkins, 1961) also referred to as the ABC method, Hales' method (Hales, 1958), delay time method (Wyrobek, 1956 and Gardner, 1967), time-term inversion (Scheidegger and Willmore, 1959), plus-minus method (Hagedoorn, 1959) and wavefront method (Rockwell, 1967) are required to model subsurface velocity structure. These methods generally require a minimum of 5 shot points per spread (end shots, off-end shots and a center shot). If subsurface velocity structure is complex and cannot be adequately modeled using layer-based modeling techniques (i.e. complex weathering profile in bedrock, numerous lateral velocity variations), then Monte Carlo or tomographic inversion techniques (Zhang and Toksoz, 1998; Schuster and Quintus-Bosz, 1993) are required to model the seismic refraction data. These techniques require a high shot density; typically every 2 to 6 stations/geophones. Generally, these techniques cannot effectively take advantage of off-end shots to extend depth of investigation, so longer profiles are required.

Errors in seismic refraction models can be caused by velocity inversions, hidden layers or lateral velocity variations. At sites with steeply dipping or highly irregular bedrock surfaces, out of plane refractions (refractions from structures to the side of the line rather than from beneath the line) may severely complicate modeling. A velocity inversion is a geologic layer with a lower seismic velocity than an overlying layer. Critical refraction does not occur along such a layer because velocity has to increase with depth for critical refraction to occur. This type of layer, therefore, cannot be recognized or modeled and depths to underlying layers would be

overestimated. A hidden layer is a layer with a velocity increase, but of sufficiently small thickness relative to the velocities of overlying and underlying layers, that refracted arrivals do not arrive at the geophones before those from the deeper, higher velocity layer. Because the seismic refraction method generally only involves the interpretation of first arrivals, a hidden layer cannot be recognized or modeled and depths to underlying layers would be underestimated. Saturated sediments, overlying high velocity bedrock can be a hidden layer under many field conditions. However, saturated sediments generally have a much higher velocity than unsaturated sediments, typically in the 5,000 to 7,000 ft/s range, and can occasionally be interpreted as a second arrival when the layer does not give rise to a first arrival. A subsurface velocity structure that increases as a function of depth rather than as discrete layers will also cause depths to subsurface refractors to be underestimated, in a manner very similar to that of the hidden layer problem. Lateral velocity variations that are not adequately addressed in the seismic models will also lead to depth errors. Tomographic imaging techniques can often resolve the complex velocity structures associated with hidden layers, velocity gradients and lateral velocity variations. However, in the event of an abrupt increase in velocity at a geologic horizon, the velocity model generated using tomographic inversion routines will smooth the horizon with velocity being underestimated at the interface and possibly overestimated at depth.

3.2 Surface Wave Technique

A discussion of active and passive surface wave methods is provided in the technical note included as Appendix A. Active surface wave techniques include the spectral analysis of surface waves (SASW) and multi-channel array surface wave (MASW) methods. The passive surface wave technique consisted of the array microtremor method.

The basis of surface wave methods is the dispersive characteristic of Rayleigh waves when propagating in a layered medium. The phase velocity, V_R, depends primarily on the material properties (V_S, mass density, and Poisson's ratio or compression wave velocity) over a depth of approximately one wavelength. Waves of different wavelengths, λ, (or frequencies, f) sample different depths. As a result of the variance in the shear stiffness of the layers, waves with different wavelengths travel at different phase velocities; hence, dispersion. A surface wave dispersion curve, or dispersion curve for short, is the variation of V_R with λ or f.

The SASW and MASW methods are in-situ seismic methods for determining shear wave velocity (V_S) profiles (Stokoe et al., 1994; Stokoe et al., 1989; Park et al., 1999a and 1999b, Foti, 2000). Surface wave techniques are non-invasive and non-destructive, with all testing performed on the ground surface at strain levels in the soil in the elastic range (< 0.001%). SASW testing consists of collecting surface wave phase data in the field, generating the dispersion curve, and then using iterative forward or inverse modeling to calculate the shear stiffness profile. MASW testing consists of collecting multi-channel seismic data in the field and applying a wavefield transform to obtain the dispersion curve and data modeling.

A detailed description of the SASW field procedure is given in Joh, 1996. A vertical dynamic load is used to generate horizontally-propagating Rayleigh waves. The ground motions are monitored by two, or more, vertical receivers and recorded by the data acquisition system

capable of performing both time- and frequency-domain calculations. Theoretical, as well as practical considerations, such as attenuation, necessitate the use of several receiver spacings to generate the dispersion curve over the wavelength range required to evaluate the stiffness profile. To minimize phase shifts due to differences in receiver coupling and subsurface variability, the source location is reversed.

After the time-domain motions from the two receivers are converted to frequency-domain records using the Fast Fourier Transform, the cross power spectrum and coherence are calculated. The phase of the cross power spectrum, ϕ_w (f), represents the phase differences between the two receivers as the wave train propagates past them. It ranges from $-\pi$ to π in a wrapped form and must be unwrapped through an interactive process called masking. Phase jumps are specified, near-field data (wavelengths longer than three times the distance from the source to first receiver), and low-coherence data are removed. The experimental dispersion curve is calculated from the unwrapped phase angle and the distance between receivers by:

$$V_R = f * d_2/(\Delta\phi/360°),$$

Where V_R is Rayleigh wave phase velocity, f is frequency, d_2 is the distance between receivers, and $\Delta\phi$ is the phase difference in degrees.

WinSASW V1, a program developed at the University of Texas at Austin, or WinSASW V2 (Joh, 2002) is used to reduce SASW data and interpret the dispersion curve.

A detailed description of the MASW method is given by Park, 1999a and 1999b. Ground motions are recorded by 24 or more geophones spaced 1 to 2 m apart and aligned in a linear array and connected to a seismograph. A wavefield transform, such as the f-k or τ-p transform, is applied to the time history data to isolate the surface wave dispersion curve. PICKWIN95, software developed by Oyo Corporation is typically used to process the MASW data and obtain the dispersion curve.

A detailed discussion of the array microtremor method can be found in Okada, 2003. This technique uses 4 to 24 receivers aligned in a 2-dimensional array. Triangle, circle, semi-circle and "L" shaped arrays are commonly used, although any 2-dimensional arrangement of receivers can be used. Receivers typically consist of 1 to 4.5 Hz geophones. The triangle array, which consists of several embedded equilateral triangles, is often used as it provides good results with a relatively small number of geophones. With this array the outer side of the triangle should be at least equal to the desired depth of investigation. The "L" array is useful at sites located at the corner of perpendicular intersecting streets. Typically 10 to 20, 30-second noise records are acquired for analysis. The surface wave dispersion curve is estimated by calculating the spatial autocorrelation (SPAC) function for the time-history data. A first-order Bessel function is fit to the SPAC function to obtain the dispersion curve (phase velocity at each frequency). PICKWIN95, software developed by Oyo Corporation is typically used to process the array microtremor data and obtain the dispersion curve.

The active and passive surface wave techniques compliment one another as outlined below:

- SASW/MASW techniques image the shallow velocity structure which cannot be imaged by the microtremor technique and is needed for an accurate V_S30/V_S100' estimate.
- Microtremor techniques work best in noisy environments where SASW/MASW depth investigation may be limited.
- In a noisy environment the microtremor technique will usually extend the depth of an SASW/MASW sounding.
- The degree of fit in the overlapping portion of the dispersion curves from the two techniques provides a level of confidence in the results.

The dispersion curves generated from the active and passive surface wave soundings are generally combined and modeled. Typically, WinSASW V1 or V2 is used to model the data, whereby through iterative forward and/or inverse modeling, a V_S profile is found whose theoretical dispersion curve is a close fit to the field data.

The final model profile is assumed to represent actual site conditions. Several options exist for forward modeling: a formulation that takes into account only fundamental-mode Rayleigh wave motion (called the 2-D solution) and one that includes all stress waves and incorporates receiver geometry (3-D solution) (Roesset et al., 1991).

The theoretical model used to interpret the dispersion assumes horizontally layered, laterally invariant, homogeneous-isotropic material. Although these conditions are seldom strictly met at a site, the results of active and/or passive surface wave testing provide a good "global" estimate of the material properties along the array. The results may be more representative of the site than a borehole "point" estimate.

Based on our experience at other sites, the shear wave velocity models determined by surface wave testing are within 20% of the velocities that would be determined by other seismic methods (Brown, 1998). The average velocity of the upper 30 meters or 100 feet, however, is much more accurate than this, often to better than 5%, because it is less sensitive to the layering in the model.

4 DATA REDUCTION AND MODELING

4.1 Seismic Refraction Survey

Seismic refraction data were first modeled using the generalized reciprocal method (GRM), as outlined in Palmer, 1980 and 1981, Lankston and Lankston, 1986, and Lankston, 1990. GRM is a seismic-refraction interpretation method designed to accurately map undulating refractor surfaces from in-line refraction data using both forward and reverse shots. This method can accurately model refractor surfaces with dips of less than 20 degrees. The seismic refraction models developed using the GRM technique were used as starting models for the tomographic inversion discussed later in this section.

The first step in data processing consisted of picking the arrival time of the first energy received at each geophone (first arrival) for each shot point. The first arrivals on each seismic record are either a direct arrival from a compressional (P) wave traveling in the uppermost layer or a refracted arrival from a subsurface interface where there is a velocity increase. First-arrival times were selected using the automatic and manual picking routines in the software package SeisImager™ (Oyo Corporation). These first arrival times were saved in an ASCII file containing shot location, geophone locations and associated first arrival time. Errors in the first arrival times were variable with error generally increasing with distance from the shot point. First arrival picking errors probably averaged about 1 ms with error probably less than 0.5 ms at geophone locations near the shot point and up to 2 ms at distal geophone locations.

Relative elevations for each geophone location were calculated from the leveling data using a spreadsheet and converted to approximate elevations using GPS data collected at the end of each line.

Data qualities were affected by factors such as: on site activity (e.g. traffic), weak coupling of geophones and source to the asphalt surface and geologic conditions. For certain lines, data acquisition was delayed due to traffic noise and continued when traffic ceased or lessened to acceptable limits.

The seismic refraction data were processed using the GRM computer program VIEWSEIS (Viewlog Systems, Inc.). The first arrival and elevation data files were entered into the program and time-distance plots for the forward and reverse shots were generated. Forward shots are shot points where energy travels from geophone 1 to 48. Energy travels in the opposite direction for reverse shots and shots inside each spread (interior and center shots) have both forward and reverse components. The first arrival data for all the shot points were then assigned to the layer from which they were refracted. Two layers were assigned to the travel time data. These layers corresponded to sediments and bedrock/saturated sediments. The travel time data refracted from the deepest imaged layer were then phantomed (shifted in time) to line up with the travel-time data associated with the zero-offset end shot, therefore, forming a single travel-time curve for each refractor along the line. This method was employed for both forward and reverse shots. After phantoming was completed, GRM processing was conducted to generate depth and velocity models.

Seismic refraction data were then modeled using the tomographic analysis technique available in the SeisImager™ Plotrefa software package, developed by Oyo Corporation. Refraction tomography techniques are often able to resolve complex velocity structure (e.g. velocity gradients) that can be observed in bedrock weathering profiles. Layer based modeling techniques such as the GRM are not able to accurately model the velocity gradients that can be observed in weathered bedrock.

Tomographic analysis was conducted as outlined in the following steps. An initial model was generated using parameters outlined by the processor. The initial model had 20 layers with the top of the bottom layer at a depth related to the imaged depth of the model. Velocity ranges were also set to values outside of the starting model minimum and maximum. The velocity models were extended to permit the use of off-end shot points during the inversion. A minimum of 20 iterations of non-linear raypath inversion were then implemented to improve the fits of the travel time curves to near-surface sediments/rock. After each set of inversions were completed, the initial parameters were adjusted and the model run again in an iterative process. These steps were repeated until acceptable fits and RMS error were achieved. The final tomographic velocity models for the seismic line were exported as ASCII files and imported into the Geosoft Oasis montaj® v7 mapping system where the velocity model was gridded, contoured and annotated for presentation.

4.2 Surface Wave Survey

The MASW data were reduced using the software Seismic Pro Surface V6.0 developed by Geogiga using the following steps:

- Input seismic record into software.
- Enter receiver spacing, geometry and wavelength restrictions, as necessary.
- Apply wavefield transform to seismic record to convert the data to phase velocity – frequency space.
- Identify and pick dispersion curve.
- Repeat for all shot records and merge dispersion curves.
- Convert dispersion curves to WinSASW format for modeling.

The surface wave dispersion curves from the active surface wave data were used for modeling. An iterative forward modeling process was used to generate an S-wave velocity model for the sounding. During this process an initial velocity model was generated based on general characteristics of the dispersion curve. The theoretical dispersion curve was then generated using the 2-D modeling algorithm (fundamental mode Rayleigh wave dispersion module) and compared to the field dispersion curve. Adjustments were then made to the thickness and velocities of each layer and the process repeated until an acceptable fit to the field data was obtained.

Data inputs into the modeling software included layer thickness, S-wave velocity, P-wave velocity and mass density. P-wave velocity and mass density only have a very small influence (i.e. less than 10%) on the S-wave velocity model generated from a surface wave dispersion

curve. However, realistic assumptions for P-wave velocity, which is impacted by the location of the bedrock, and mass density will slightly improve the accuracy of the S-wave velocity model.

Constant mass density values of 1.7 to 2.2 g/cc were used in the profile for subsurface soils. Variation in mass density has a negligible effect on surface wave dispersion within the normal range encountered in geotechnical engineering. During data modeling, the compression wave velocity, V_P, of unsaturated soils was estimated using a Poisson's ratio, ν, of 0.30 and the relationship:

$$V_P = V_S \left[(2(1-\nu))/(1-2\nu)\right]^{0.5}$$

Depth to groundwater at this site is unknown. For modeling purposes, the water table was assumed to be greater than 30 m. The presence of water at a depth of less than 30 m would have a negligible effect on the model and V_{S30}.

5 DISCUSSION OF RESULTS

The seismic tomography models for S-1 and S-2 are presented as Figures 2 and 3, respectively. The color scheme used on the tomography images consist of blue-green, yellow-orange and red-pink representing low, intermediate and high velocities, respectively. The transition from blue to green occurs at a velocity of 800 m/s and the transition from green to yellow occurs at a velocity of 1,400 m/s. The transition from orange to red occurs at 2,200 m/s. The GRM model is not presented as it was considered redundant.

Tomographic inversion techniques will typically model a gradual increase in velocity with depth even if an abrupt velocity contact is present. Therefore, if velocity gradients are not present, tomographic inversion routines will overestimate and underestimate velocity above and below a layer contact, respectively. Velocity gradients can, however, be very common in geologic environments with alluvial deposits and weathered rock, such as the project site. In tomographic images, layer contacts are not clearly defined and thus, ranges of velocities are used to interpret possible rock conditions and competency. For the purpose of discussion, velocities of less than 500 m/s are considered to be unconsolidated sediments, velocities in the 1,000 m/s to 2,000 m/s range are interpreted as weathered rock and velocities greater than 2,500 m/s are the interpreted rock layer.

The fit of the theoretical dispersion curves to the experimental data collected and the modeled V_S profiles for S-1 and S-2 are presented in Figures 3 and 4, respectively. The resolution decreases gradually with depth because of the loss of sensitivity of the dispersion curve to changes in V_S at greater depth. The V_S profiles used to match the field data of S-1 and S-2 is provided in tabular form as Table 2 and 3.

Analysis of Rayleigh wave (MASW) data was very difficult due to higher modes (probable first higher mode) that were dominant at high frequencies. The data were modeled using an effective mode modeling approach which allowed the jump from fundamental mode to first higher mode to be modeled. The half space velocity is not well constrained; however, this has no effect on V_{S30} because the upper portion of the subsurface controls the average shear wave velocity for the profile. It is our recommendation that Love wave (MALW) techniques should be performed at this site; it has been our experience that dominant higher modes are not an issue in MALW data.

5.1 Seismic Array S-1

The seismic refraction tomography model for seismic array S-1 is presented as Figure 2. The seismic tomography model for this line shows a thicker layer of sediments on the western side of the line with a gradual decrease in thickness toward the eastern portion of the line. The interpreted unconsolidated sediments at the 500 m/s contour are approximately 1 m thick beneath the western and central portion and less than 1 m beneath the eastern portion of the line. The interpreted weathered rock unit at the 1,000 m/s contour is approximately 4 m deep beneath the western and central portion and 3 m beneath the eastern portion of the line. The interpreted rock unit at the 2,500 m/s contour is approximately 8 m deep beneath the western and central portion and 9 m beneath the eastern portion of the line. The large change in depth between the 1,000 m/s

and 2,500 m/s contours likely reflects a weathered rock zone and not an abrupt contact between the two interpreted layers.

The shear wave velocity profile for seismic array S-1 consists of about 2.75 m of soft sediments or fill material with an S-wave velocity of 190 m/s to 218 m/s. At a depth of approximately 4.75 m, S-wave velocity increases from about 285 m/s to 820 m/s. S-wave velocity increases to about 1,008 m/s at a depth of about 10 m. S-wave velocity is relatively uniform between a depth of 10 m and 30 m, ranging from about 1,008 to 1,194 m/s. Average shear wave velocity to a depth of 30 m, V_{S30}, is 652 m/s at the location of the surface wave array.

5.2 Seismic Array S-2

The seismic refraction tomography model for seismic array S-2 is presented as Figure 3. The seismic tomography model for this line shows a thicker layer of sediments on the northern side of the line with a gradual decrease in thickness toward the southern portion of the line. The interpreted unconsolidated sediments at the 500 m/s contour are less than 1 m thick beneath the southern portion and approximately 2 m beneath the central and northern portion of the line. The interpreted weathered rock unit at the 1,000 m/s contour is approximately 2 m deep beneath the southern portion and 6 m to 7 m beneath the central and northern section of the line. The interpreted rock unit at the 2,500 m/s contour is approximately 15 m deep beneath the southern portion, about 14 m deep beneath the central portion and 16 m beneath the northern portion of the line. The large change in depth between the 1,000 m/s and 2,500 m/s contours likely reflects a weathered rock zone and not an abrupt contact between the two interpreted layers.

The shear wave velocity profile for seismic array S-2 consists of about 2.5 m of soft sediments or fill material with an S-wave velocity of 147 m/s to 234 m/s. Below a depth of 5 m, S-wave velocity increases from about 385 m/s to 715 m/s at a depth of approximately 8.75 m. S-wave velocity increases to about 1,014 m/s at a depth of about 14 m. Below a depth of 20 m, S-wave velocity increases from about 1,230 m/s to 1,508 m/s at a depth of approximately 27 m. Average shear wave velocity to a depth of 30 m, V_{S30}, is 573 m/s at the location of the surface wave array.

6 CONCLUSION

A seismic refraction and surface wave survey was conducted along two (2) lines (S-1 and S-2) at Ford Amphitheatre in Los Angeles, California. The locations of the seismic lines are presented in Figure 1 and Table 1.

The seismic refraction survey was conducted to determine the depth to rock. The seismic refraction tomography models for seismic arrays S-1 and S-2 are presented as Figure 3 and 4, respectively. The interpreted weathered rock unit is approximately 4 m deep beneath the western and central portion and 3 m beneath the eastern portion of array S-1 and approximately 2 m deep beneath the southern portion and 6 to 7 m beneath the central and northern portion of the array S-2. The interpreted rock unit is approximately 8 m deep beneath the western and central portion and 9 m beneath the eastern portion of the array S-1. The interpreted rock unit beneath seismic array S-2 is approximately 15 m deep beneath the southern portion, about 14 m deep beneath the central portion and 16 m beneath the northern portion of the line.

Active surface wave measurements using MASW were made at two locations to characterize shear wave velocity of the upper 30 m, or more. The locations of the active surface wave arrays are presented in Figure 1 and Table 1. The shear wave velocity depth profiles (S-1 and S-2) determined by this method are presented as Figures 3 and 4 and in Tables 2 and 3.

V_{S30} is approximately 652 m/s beneath the surface wave array S-1. V_S30 is approximately 573 m/s beneath the surface wave array S-2. Therefore, according to the Uniform and International Building Codes, the area in the vicinity of the arrays is classified as Class C, very dense soil and soft rock.

* This geophysical investigation was conducted under the supervision of a California Professional Engineer using industry standard methods and equipment. A high degree of professionalism was maintained during all aspects of the project from the field investigation and data acquisition, through data processing interpretation and reporting. All original field data files, field notes and observations, and other pertinent information are maintained in the project files and are available for the client to review for a period of at least one year.

  A professional engineer's certification of interpreted geophysical conditions comprises a declaration of his/her professional judgment. It does not constitute a warranty or guarantee, expressed or implied, nor does it relieve any other party of its responsibility to abide by contract documents, applicable codes, standards, regulations or ordinances.

APPENDICES

SEISMIC REFRACTION METHOD

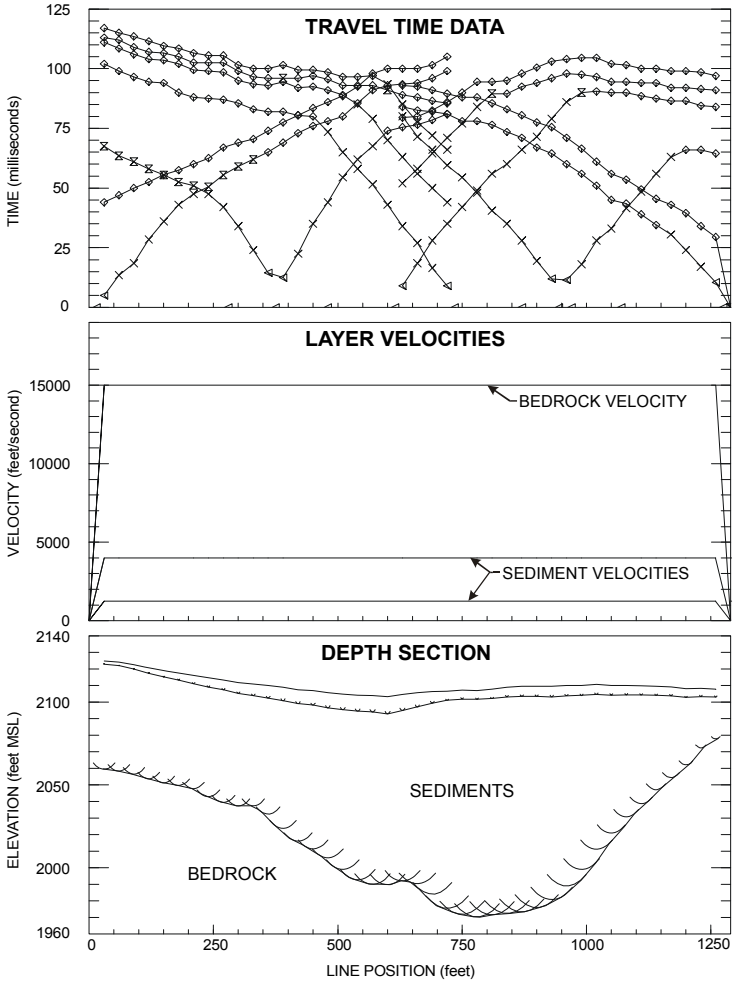
GEO*Vision* conducts high-resolution seismic refraction and seismic reflection surveys in support of a variety of engineering, environmental, and hydrogeologic investigations.

When conducting seismic surveys, acoustic energy is input to the subsurface by an energy source such as a sledgehammer impacting a metallic plate, weight drop, vibratory source, or explosive charge. The acoustic waves propagate into the subsurface at a velocity dependent upon the elastic properties of the material through which they travel. When the waves reach an interface where the density or velocity changes significantly, a portion of the energy is reflected back to the surface, and the remainder is transmitted into the lower layer. Where the velocity of the lower layer is higher than that of the upper layer, a portion of the energy is also critically refracted along the interface. Critically refracted waves travel along the interface at the velocity of the lower layer and continually refract energy back to surface. Receivers (geophones), laid out in linear array on the surface, record the incoming refracted and reflected waves. The seismic refraction method involves analysis of the travel times of the first energy to arrive at the geophones. These first arrivals are from either the direct wave (at geophones close to the source), or critically refracted waves (at geophones further from the source). The seismic reflection method involves the analysis of reflected waves, which occur later in the seismic record.

GEO*Vision* uses the seismic refraction method to:

- **Map bedrock topography**
- **Map depth to groundwater**
- **Map faults in bedrock**
- **Map faults forming groundwater barriers**
- **Characterize landslides**
- **Estimate bedrock rippability**
- **Evaluate soil and rock properties**

Seismic Refraction Survey in Mojave Desert, California using XLR8 2700 lb Accelerated Weight Drop Energy Source



Seismic Refraction Survey to Map Bedrock Topography

1124 Olympic Drive, Corona, California 92881 ph 951-549-1234 fx 951-549-1236 www.geovision.com

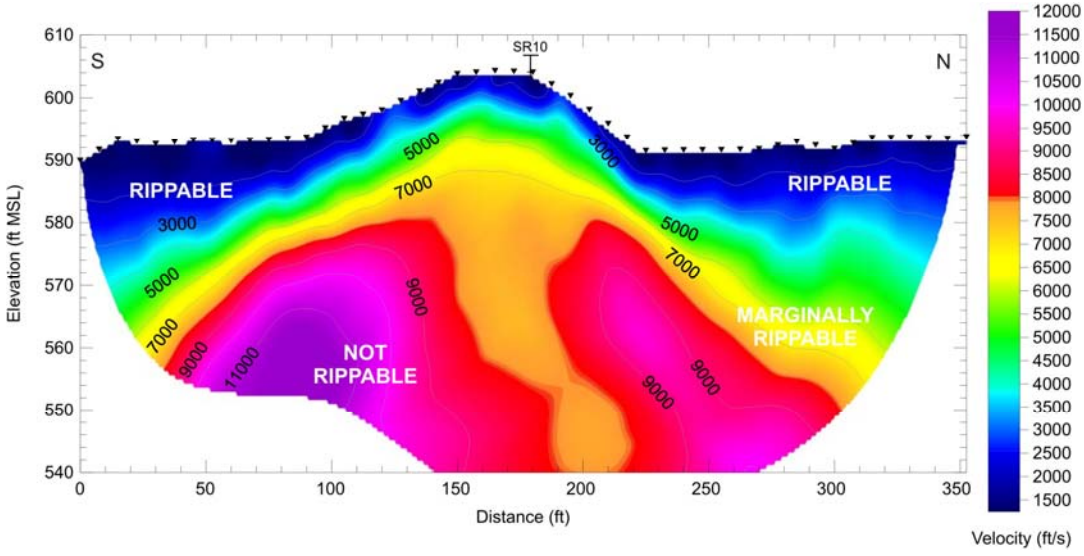
GEO*Vision* seismic refraction equipment includes:

- Multiple Geometrics Geode 24-channel seismographs
- Oyo DAS-1 seismograph with 144-channel capability
- Seismic refraction cables with 10 to 55 ft takeouts
- 4.5, 8 and 10 Hz geophones
- 40 and 100 kg accelerated weight drop energy sources
- Betsy downhole percussion firing rod
- Seismic Source and Gisco radio trigger modules
- High-voltage blaster

100 kg Accelerated Weight Drop

Geometrics Geode Seismographs

Analysis of seismic refraction data depends upon the complexity of the subsurface seismic velocity structure. If the subsurface target is planar in nature then the slope intercept method can be used to model multiple horizontal or dipping planar layers. A minimum of one end shot is required to model horizontal layers and reverse end shots are required to model dipping planar layers. If the subsurface target is undulating and exhibits an abrupt velocity increase (e.g. basement surface) then layer based analysis routines such as the generalized reciprocal method, delay time method, time-term method, plus-minus method and wavefront method are required to model subsurface velocity structure. These methods generally require a minimum of 5 to 7 shot points per spread (end shots, off end shots and a center shot). If subsurface velocity structure is complex and cannot be adequately modeled using layer-based modeling techniques (e.g., complex weathering profile in bedrock, numerous lateral velocity variations), then tomographic inversion techniques are best suited to model the seismic refraction data. These techniques require a high shot density (typically every 2 to 6 stations/ geophones).



Seismic Refraction Survey to Map Bedrock Rippability

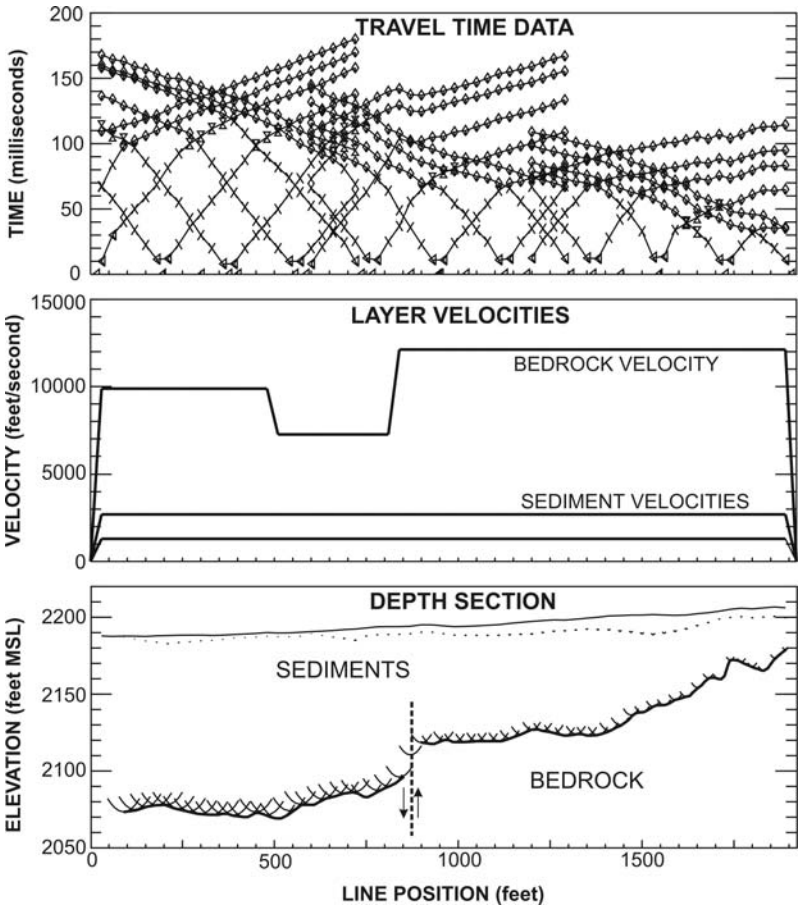
1124 Olympic Drive, Corona, California 92881 ph 951-549-1234 fx 951-549-1236 www.geovision.com

GEO*Vision* maintains several software packages to model seismic refraction data including:

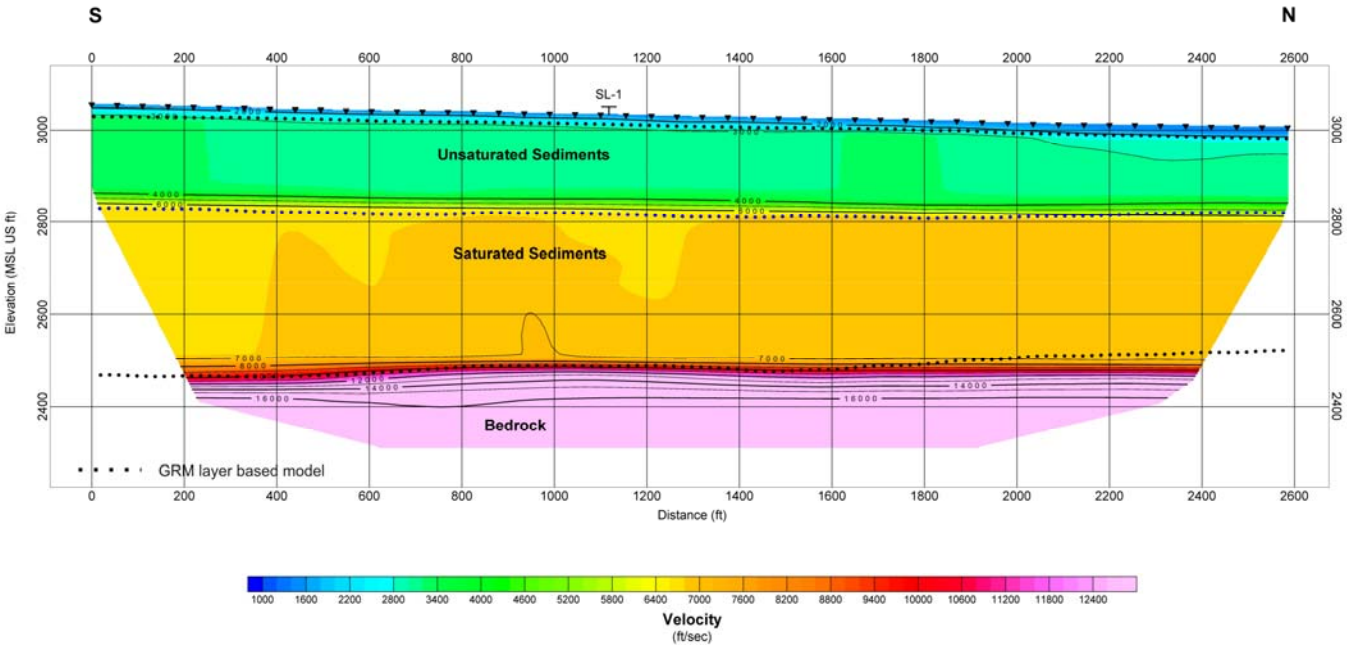
- Firstpix™ by Interpex, Ltd.
- IXrefraX by Interpex ,Ltd.
- Viewseis™ by Viewlog Systems, Ltd.
- Refract by Geogiga
- Seisimager™ by Geometrics, Inc./Oyo Corporation
- Rayfract™ by Intelligent Resources, Inc.
- SeisOpt™ Pro by Optim LLC

These software packages allow processing of seismic refraction data using the following layer based and smooth velocity model techniques:

- Generalized reciprocal method (GRM)
- Reciprocal method/delay time method
- Time-Term method
- Plus-Minus method
- Wavefront method
- Monte Carlo based inversion
- Delta t-V tomographic inversion
- Wavepath Eikonal traveltime tomographic inversion
- Nonlinear traveltime tomographic analysis



Seismic Refraction Survey to Map Bedrock Fault



Seismic Refraction Survey to Map Depth to Groundwater (200 ft deep) and Bedrock (500 to 600 ft deep) as part of a Groundwater Resources Investigation. Energy Source Consisted of XLR8 2700 lb Accelerated Weight Drop. Data modeled using Nonlinear Traveltime Tomographic Analysis with a Layer-Based Starting Model.

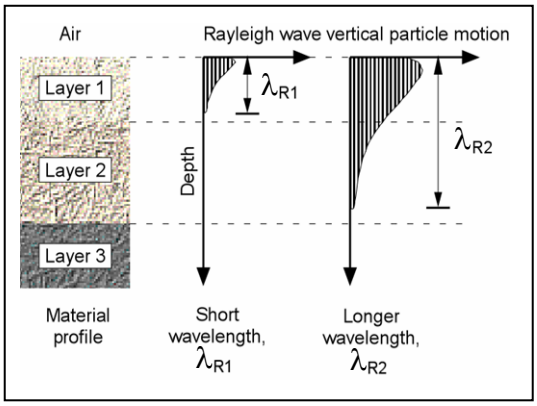
Seismic Refraction Survey to Characterize a Landslide

ACTIVE AND PASSIVE SURFACE WAVE TECHNIQUES

GEOVision geophysical services

Overview

Active and passive surface wave techniques are relatively new in-situ seismic methods for determining shear wave velocity (V_S) profiles. Testing is performed on the ground surface, allowing for less costly measurements than with traditional borehole methods. The basis of surface wave techniques is the dispersive characteristic of Rayleigh waves when traveling through a layered medium. Rayleigh wave velocity is determined by the material properties (primarily shear wave velocity, but also to a lesser degree compression wave velocity and material density) of the subsurface to a depth of approximately 1 to 2 wavelengths. As shown in the adjacent diagram, longer wavelengths penetrate deeper and their velocity is affected by the material properties at greater depth. Surface wave testing consists of measuring the surface wave dispersion curve at a site and modeling it to obtain the corresponding shear wave velocity profile.



Active Surface Wave Techniques

Active surface wave techniques measure surface waves generated by dynamic sources such as hammers, weight drops, electromechanical shakers, vibroseis and bulldozers. These techniques include the spectral analysis of surface waves (SASW) and multi-channel array surface wave (MASW) methods.

Hammer Energy Sources

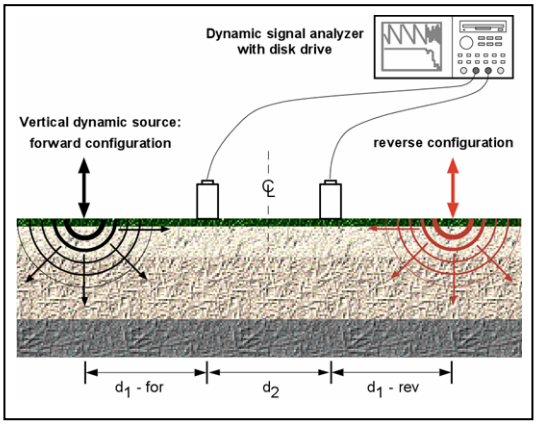
Accelerated Weight Drop

Electromechanical Shaker

Bulldozer Energy Source

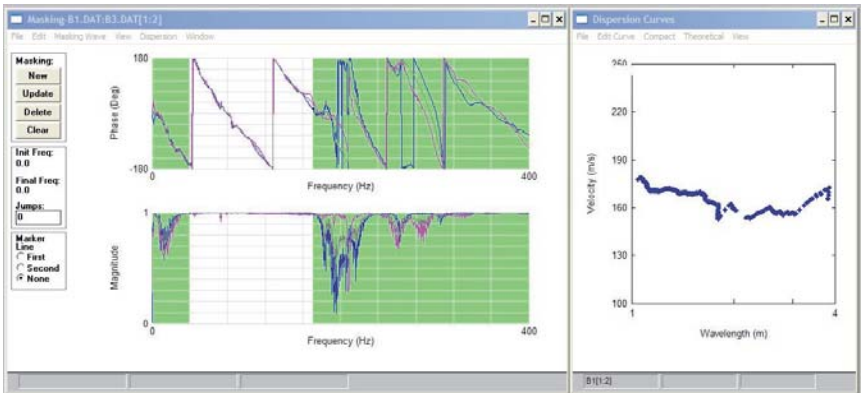
1124 Olympic Drive, Corona, California 92881 ph. 951-549-1234 fx 951-549-1236 www.geovision.com

The SASW method is optimized for conducting V_S depth soundings. A dynamic source is used to generate surface waves of different wavelengths (or frequencies) which are monitored by two or more receivers at known offsets. An expanding receiver spread and optimized source-receiver geometry are used to minimize near field effects, body wave signal and attenuation. A dynamic signal analyzer is typically used to calculate the phase and coherence of the cross spectrum of the time history data collected at a pair of receivers. During data analysis, an interactive masking process is used to discard low quality data and to unwrap the phase spectrum, as shown in the figure below. The dispersion curve (Rayleigh wave phase velocity versus frequency or alternatively wavelength) is calculated from the unwrapped phase spectrum.



SASW Setup

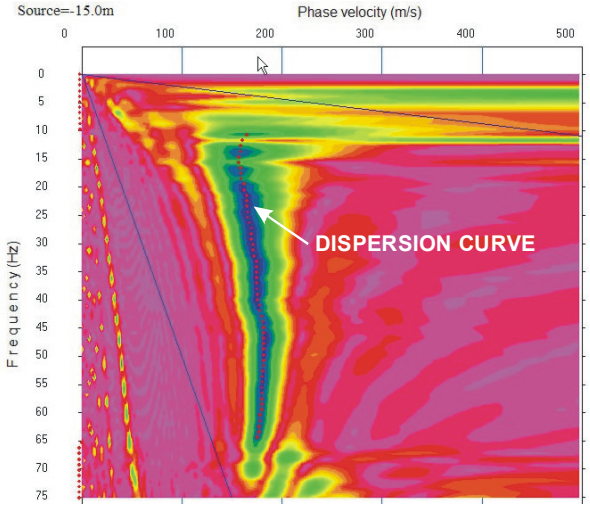
HP Dynamic Signal Analyzer



Masking of Wrapped Phase Spectrum and Resulting Dispersion Curve

The MASW field layout is similar to that of the seismic refraction technique. Twenty four, or more, geophones are laid out in a linear array with 1 to 2m spacing and connected to a multi-channel seismograph as shown below. This technique is ideally suited to 2D V_S imaging, with data collected in a roll-along manner similar to that of the seismic reflection technique. The source is offset at a predetermined distance from the near geophone usually determined by field testing. The Rayleigh wave dispersion curve is obtained by a wavefield transformation of the seismic record such as the f-k or τ-p transforms. These transforms are very effective at isolating surface wave energy from that of body waves. The dispersion curve is picked as the peak of the surface wave energy in slowness (or velocity) – frequency space as shown. One advantage of the MASW technique is that the wavefield transformation may not only identify the fundamental mode but also higher modes of surface waves. At some sites, particularly those with large velocity inversions, higher surface wave modes may contain more energy than the fundamental mode.

MASW Field Setup

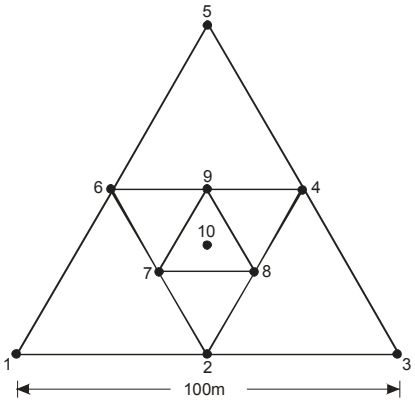


Wavefield Transform of MASW data

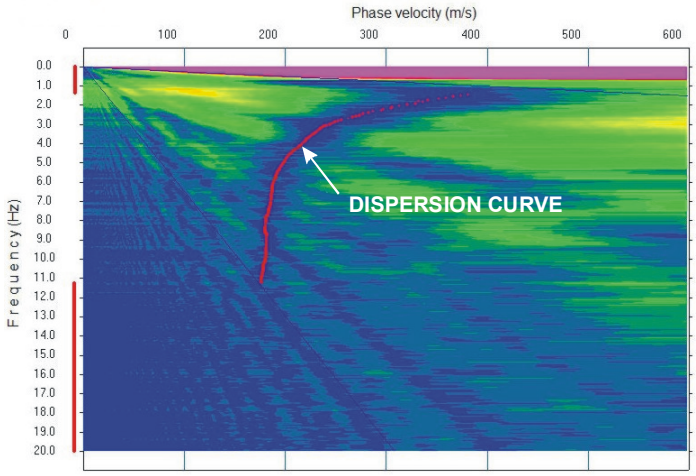
Passive Surface Wave Techniques

Passive surface wave techniques measure noise; surface waves from ocean wave activity, traffic, factories, etc. These techniques include the array microtremor and refraction microtremor (REMI) techniques.

The array microtremor technique typically uses 7 or more 4.5- or 1-Hz geophones arranged in a two-dimensional array. The most common arrays are the triangle, circle, semi-circle and "L" arrays. The triangle array, which consists of several embedded equilateral triangles, is often used as it provides good results with a relatively small number of geophones. With this array the outer side of the triangle should be at least as long as the desired depth of investigation. Typically, fifteen to twenty 30-second noise records are acquired for analysis. The spatial autocorrelation (SPAC) technique is one of several methods that can be used to estimate the Rayleigh wave dispersion curve. A first order Bessel function is fit to the SPAC function to determine the phase velocity for particular frequency. The image shown below shows the degree of fitness of the Bessel function to the SPAC function for a wide range of phase velocity and frequency. The dispersion curve, is the peak (best fit), as shown in the figure below.



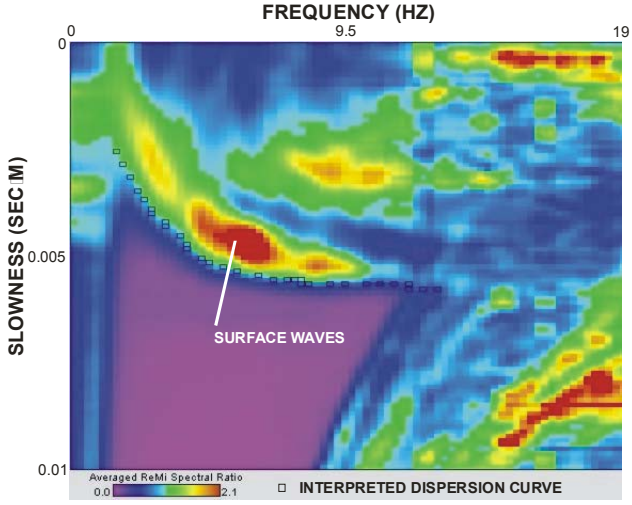
Triangle Array Geometry



Dispersion Curve from Array Microtremor Measurements

The refraction microtremor (REMI) technique uses a field layout similar to the seismic refraction method (hence its name). Twenty-four, 4.5 Hz geophones are laid out in a linear array with a spacing of 6 to 8m and fifteen to twenty 30-second noise records are acquired. A slowness-frequency (p-f) wavefield transform is used to separate Rayleigh wave energy from that of other waves. Because the noise field can originate from any direction, the wavefield transform is conducted for multiple vectors through the geophone array, all of which are summed. The dispersion curve is defined as the lower envelope of the Rayleigh wave energy in p-f space. Because the lower envelope is picked rather than the energy peak (energy traveling along the profile is slower than that approaching from an angle), this technique may be somewhat more subjective than the others, particularly at low frequencies. The SPAC technique can also be used to extract the surface wave dispersion curve from linear array microtremor data providing there are omni-directional noise sources.

Refraction Microtremor Array Layout



Wavefield Transform of REMI Data

Depth of Investigation

Active surface wave investigations typically use various sized sledge hammers to image the shear wave velocity structure to depths of up to 15m. Weight drops and electromechanical shakers can often be used to image to depths of 30m. Bulldozers and vibroseis trucks can be used to image to depths as great as 100m. Passive surface wave techniques can often image shear wave velocity structure to depths of over 100m, given sufficient noise sources and space for the receiver array. Large passive arrays, utilizing long-period seismometers with GPS clocks have been used to image shear wave velocity structure to depths of several kilometers.

Combined Active and Passive Surface Wave Testing

The combined use of active and passive techniques may offer significant advantages on many investigations. It can be very costly to mobilize large energy sources for 30m/100ft active surface wave soundings. In urban environments, the combined use of active and passive surface wave techniques can image to these depths without the need for large energy sources. We have found that dispersion curves from active and passive surface wave techniques are generally in good agreement, making the combined use of the two techniques viable. It is not recommended that passive surface wave techniques be applied alone for UBC/IBC site classification investigations. Microtremor techniques do not generally characterize near surface velocity, which may have a significant impact of the average shear wave velocity of the upper 30m or 100ft and so should always be used in conjunction with SASW or MASW. An SASW sounding to a depth of 30m requires at least a 60m linear array. If sufficient space is not available for this, it may be possible to use a 45m triangle array on the site or place a 100-200m long REMI array along an adjacent sidewalk or an "L" array at an adjacent street intersection.

Microtremor Measurements along Sidewalk

Modeling

There are several options for interpreting surface wave dispersion curves, depending on the accuracy required in the shear wave velocity profile. A simple empirical analysis can be done to estimate the average shear wave velocity profile. For greater accuracy, forward modeling of fundamental-mode Rayleigh wave dispersion as well as full stress wave propagation can be performed using several software packages. A formal inversion scheme may also be used. With many of the analytical approaches, background information on the site can be incorporated into the model and the resolution of the final profile may be quantified.

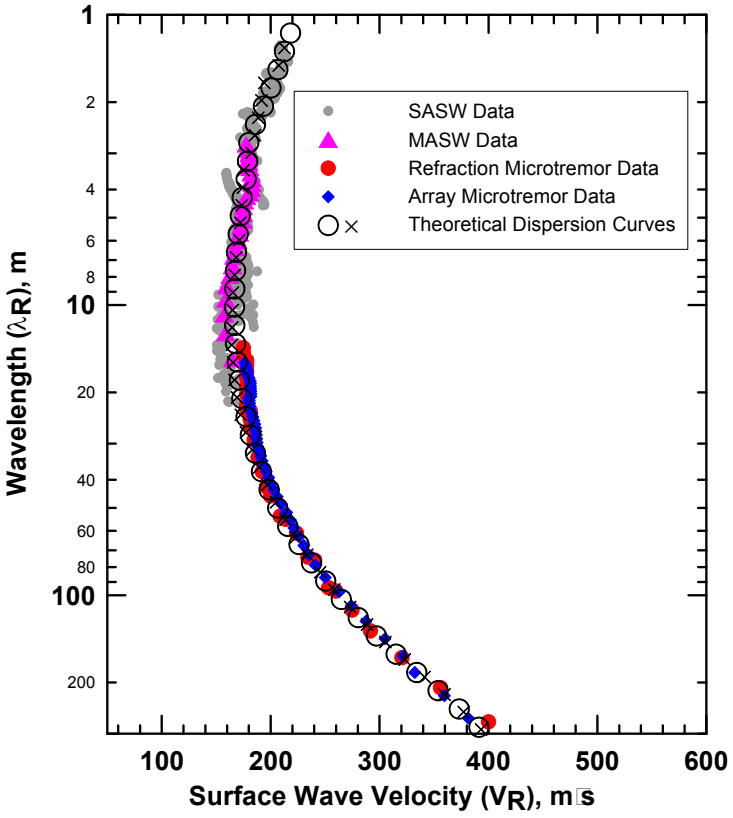
Applications

Active and passive surface wave testing can be used to obtain V_S profiles for:

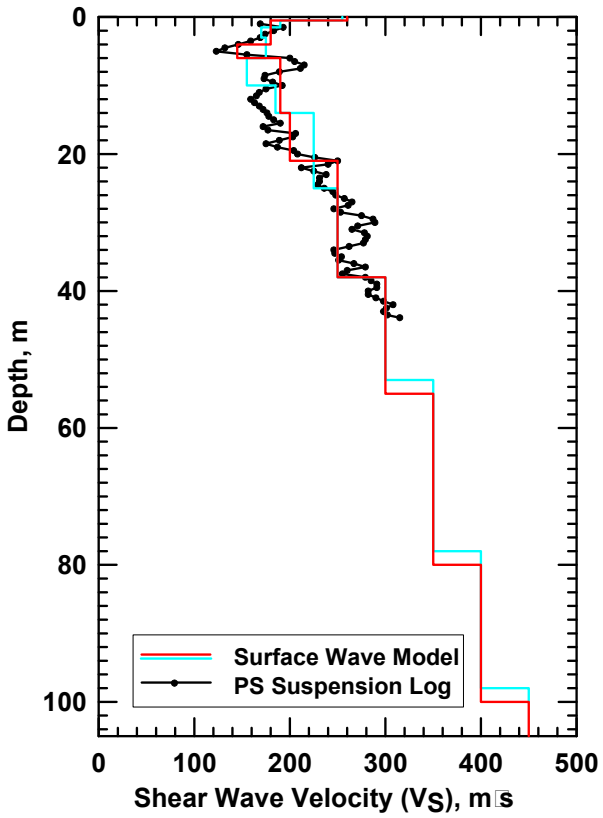
- UBC/IBC site classification for seismic design
- Earthquake site response
- Seismic microzonation
- Liquefaction analysis
- Soil compaction control
- Mapping subsurface stratigraphy
- Locating potentially weak zones in earthen embankments and levees

Case History

The figures below show the surface wave dispersion curves and alternative shear wave velocity models for a site in Los Angeles, California. All of the previous figures illustrating SASW, MASW, array and refraction microtremor techniques were from this site. The dispersion curves from all four methods are shown on the left along with the theoretical dispersion curves for alternative S-wave velocity versus depth models on the right. Conditions at this site were very poor for active surface wave techniques because of the presence of very low velocity hydraulic fill. In fact, with active surface wave techniques it was only possible to image to a depth of about 12.5m with energy sources typically capable of imaging to 30m. There is excellent agreement in the dispersion curves generated from all of the methods over the overlapping wavelength ranges. The minor differences probably result from variable velocity of the hydraulic fill within the sampling volume of the specific methods. Two Vs versus depth models were generated to illustrate the difficulty modeling the highly variable, near surface velocity structure evident in the PS log. The two surface wave models yielded similar values for the average shear-wave velocity of the upper 30m (V_S30), 201 and 202 m/s, illustrating that Vs30 is much more tightly constrained than the actual layer thicknesses and velocities in the models. V_S30 estimated from the PS log (194 m/s) is within 4% of that estimated from the two surface wave models (201 and 202 m/s). The small differences in V_S30 between the two methods may easily result from the different sampling regimes (borehole versus large area) rather than errors in either of the methods.



Field Data and Theoretical Dispersion Curve



V_S Model

In contrast to borehole measurements which are point estimates, surface wave testing is a global measurement, that is, a much larger volume of the subsurface is sampled. The resulting profile is representative of the subsurface properties averaged over distances of up to several hundred feet. Although surface wave techniques do not have the layer sensitivity or accuracy (velocity and layer thickness) of borehole techniques; the average velocity over a large depth interval (i.e. the average shear wave velocity of the upper 30m or 100ft) is very well constrained. Because surface wave methods are non-invasive and non-destructive, it is relatively easy to obtain the necessary permits for testing. At sites that are favorable for surface wave propagation, active and passive surface wave techniques allow appreciable cost and time savings.

APPENDIX E

APPENDIX E

LEIGHTON CONSULTING, INC.
EARTHWORK AND GRADING GUIDE SPECIFICATIONS

TABLE OF CONTENTS

E-1.0 GENERAL

E-1.1 Intent

These Earthwork and Grading Guide Specifications are for grading and earthwork shown on the current, approved grading plan(s) and/or indicated in the Leighton Consulting, Inc. geotechnical report(s). These Guide Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the project-specific recommendations in the geotechnical report shall supersede these Guide Specifications. Leighton Consulting, Inc. shall provide geotechnical observation and testing during earthwork and grading. Based on these observations and tests, Leighton Consulting, Inc. may provide new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

E-1.2 Role of Leighton Consulting, Inc.

Prior to commencement of earthwork and grading, Leighton Consulting, Inc. shall review the "work plan" prepared by the earthwork contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing. During earthwork and grading, Leighton Consulting, Inc. shall observe, map, and document subsurface exposures to verify geotechnical design assumptions. If observed conditions are found to be significantly different than the interpreted assumptions during the design phase, Leighton Consulting, Inc. shall inform the owner, recommend appropriate changes in design to accommodate these observed conditions, and notify the review agency where required. Subsurface areas to be geotechnically observed, mapped, elevations recorded, and/or tested include (1) natural ground after clearing to receiving fill but before fill is placed, (2) bottoms of all "remedial removal" areas, (3) all key bottoms, and (4) benches made on sloping ground to receive fill.

Leighton Consulting, Inc. shall observe moisture-conditioning and processing of the subgrade and fill materials, and perform relative compaction testing of fill to determine the attained relative compaction. Leighton Consulting, Inc. shall provide test results to the owner and the Contractor on a routine and frequent basis.

E-1.3 The Earthwork Contractor

The earthwork contractor (Contractor) shall be qualified, experienced and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Guide

Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing grading and backfilling in accordance with the current, approved plans and specifications.

For projects in excess of 10,000 cubic-yards of earthwork, the Contractor shall prepare and submit to the owner and Leighton Consulting, Inc. a work plan that indicates the sequence of earthwork grading, the number of "spreads" of work and the estimated quantities of daily earthwork contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and Leighton Consulting, Inc. of changes in work schedules and updates to the work plan at least one working day in advance of such changes so that appropriate observations and tests can be planned and accomplished. The Contractor shall not assume that Leighton Consulting, Inc. is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish earthwork and grading in accordance with the applicable grading codes and agency ordinances, these Guide Specifications, and recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of Leighton Consulting, Inc., unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, Leighton Consulting, Inc. shall reject the work and may recommend to the owner that earthwork and grading be stopped until these unsatisfactory condition(s) are rectified.

E-2.0 PREPARATION OF AREAS TO BE FILLED

E-2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies and Leighton Consulting, Inc.. Care should be taken not to encroach upon or otherwise damage native and/or historic trees designated by the Owner or appropriate agencies to remain. Pavements, flatwork or other construction should not extend under the “drip line” of designated trees to remain.

Leighton Consulting, Inc. shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 2 percent of organic materials (by dry weight: ASTM D 2974-00). No fill lift shall contain more than 5 percent of organic matter. Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area. As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed.

E-2.2 Processing

Existing ground that has been declared satisfactory for support of fill, by Leighton Consulting, Inc., shall be scarified to a minimum depth of 6 inches (15 cm). Existing ground that is not satisfactory shall be overexcavated as specified in the following Section E-2.3. Scarification shall continue until soils are broken down and free of large clay lumps or clods and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

E-2.3 Overexcavation

In addition to removals and overexcavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be overexcavated to competent ground as evaluated by Leighton Consulting, Inc. during grading. All undocumented fill soils under proposed structure footprints should be excavated

E-2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), (>20 percent grade) the ground shall be stepped or benched. The lowest bench or key shall be a minimum of 15 feet (4.5 m) wide and at least 2 feet (0.6 m) deep, into competent material as evaluated by Leighton Consulting, Inc.. Other benches shall be excavated a minimum height of 4 feet (1.2 m) into competent material or as otherwise recommended by Leighton Consulting, Inc.. Fill placed on ground sloping flatter than 5:1 (horizontal to vertical units), (<20 percent grade) shall also be benched or otherwise overexcavated to provide a flat subgrade for the fill.

E-2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by Leighton Consulting, Inc. as suitable to receive fill. The Contractor shall obtain a written acceptance (*Daily Field Report*) from Leighton Consulting, Inc. prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

E-3.0 FILL MATERIAL

E-3.1 Fill Quality

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by Leighton Consulting, Inc. prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to Leighton Consulting, Inc. or mixed with other soils to achieve satisfactory fill material.

E-3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 6 inches (15 cm), shall not be buried or placed in fill unless location, materials and placement methods are specifically accepted by Leighton Consulting, Inc.. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 feet (3 m) measured vertically from finish grade, or within 2 feet (0.61 m) of future utilities or underground construction.

E-3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of Section E-3.1, and be free of hazardous materials ("contaminants") and rock larger than 3-inches (8 cm) in largest dimension. All import soils shall have an Expansion Index (EI) of 20 or less and a sulfate content no greater than ($\leq$) 500 parts-per-million (ppm). A representative sample of a potential import source shall be given to Leighton Consulting, Inc. at least two full working days before importing begins, so that suitability of this import material can be determined and appropriate tests performed.

E-4.0 FILL PLACEMENT AND COMPACTION

E-4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill, as described in Section E-2.0, above, in near-horizontal layers not exceeding 8 inches (20 cm) in loose thickness. Leighton Consulting, Inc. may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers, and only if the building officials with the appropriate jurisdiction approve. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

E-4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture-content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM) Test Method D 1557-02^{e1}.

E-4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density as determined by ASTM Test Method D 1557-02$^{\varepsilon 1}$. For fills thicker than 15 feet (4.5 m), the portion of the fill deeper than 15 feet below proposed finish grade shall be compacted to 95 percent of the ASTM D 1557-02$^{\varepsilon 1}$ laboratory maximum density. Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

E-4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet (1 to 1.2 m) in fill elevation, or by other methods producing satisfactory results acceptable to Leighton Consulting, Inc.. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of the ASTM D 1557-02$^{\varepsilon 1}$ laboratory maximum density.

E-4.5 Compaction Testing

Field-tests for moisture content and relative compaction of the fill soils shall be performed by Leighton Consulting, Inc.. Location and frequency of tests shall be at our field representative(s) discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

E-4.6 Compaction Test Locations

Leighton Consulting, Inc. shall document the approximate elevation and horizontal coordinates of each density test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that Leighton Consulting, Inc. can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than 5 feet apart from potential test locations shall be provided.

E-5.0 EXCAVATION

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by Leighton Consulting, Inc. during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by Leighton Consulting, Inc. based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by Leighton Consulting, Inc. prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by Leighton Consulting, Inc.

E-6.0 TRENCH BACKFILLS

E-6.1 Safety

The Contractor shall follow all OSHA and Cal/OSHA requirements for safety of trench excavations. Work should be performed in accordance with Article 6 of the *California Construction Safety Orders*, 2003 Edition or more current.

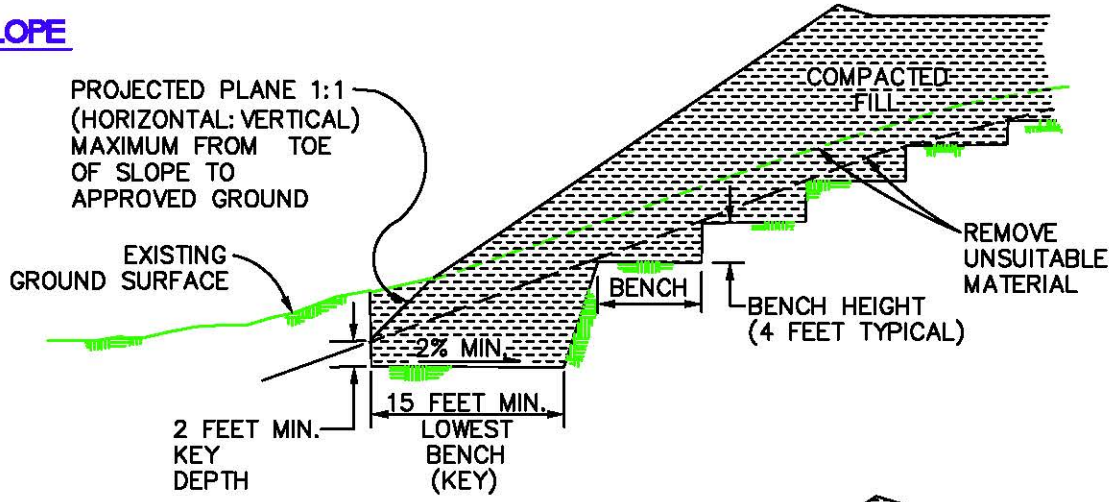
E-6.2 Bedding and Backfill

All bedding and backfill of utility trenches shall be performed in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). Bedding shall be placed to 1-foot (0.3 m) over the top of the conduit, and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of relative compaction (ASTM D 1557-02$^{\varepsilon 1}$) from 1 foot (0.3 m) above the top of the conduit to the surface. Jetting of the bedding around the conduits shall be observed by Leighton Consulting, Inc. and backfill above the pipe zone (bedding) shall be observed and tested by Leighton Consulting, Inc..

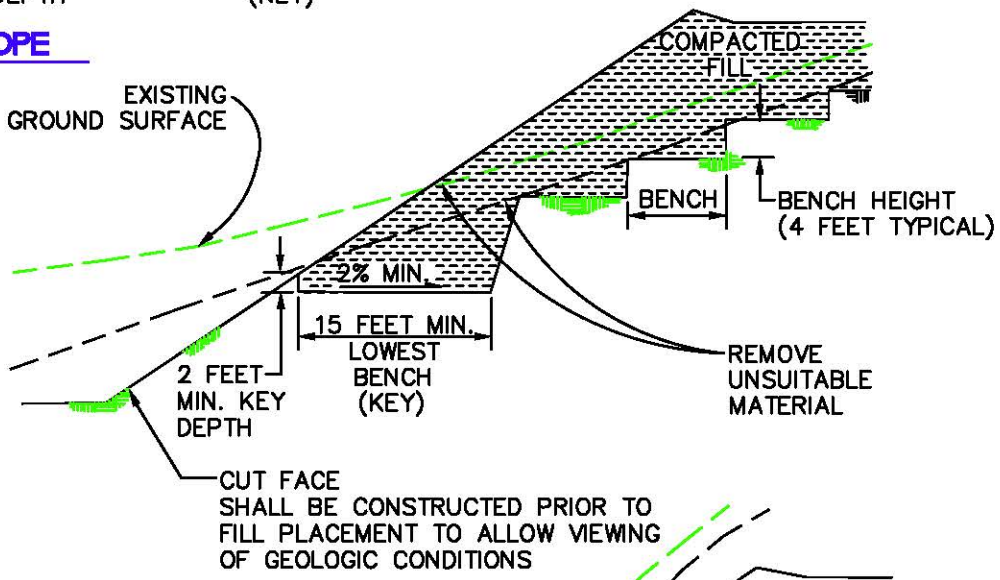
E-6.3 Lift Thickness

Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to Leighton Consulting, Inc. that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method, and only if the building officials with the appropriate jurisdiction approve.

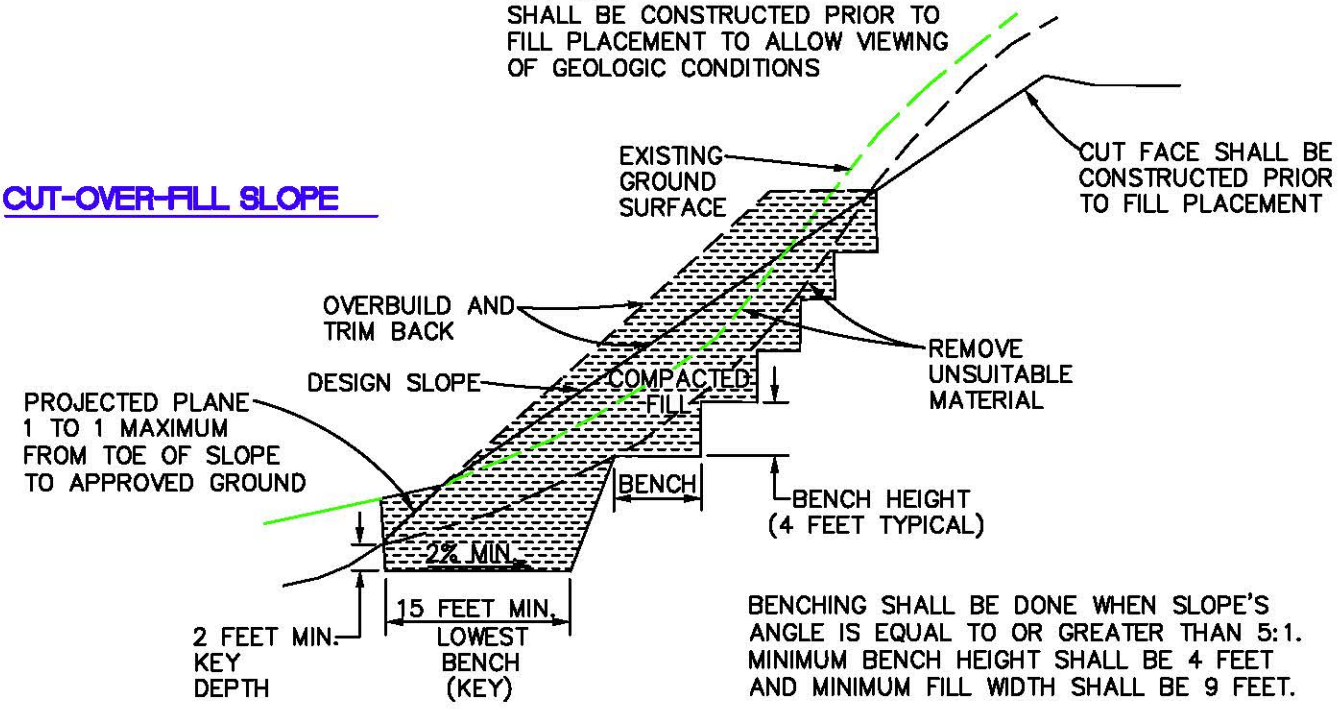
FILL SLOPE



FILL-OVER-CUT SLOPE

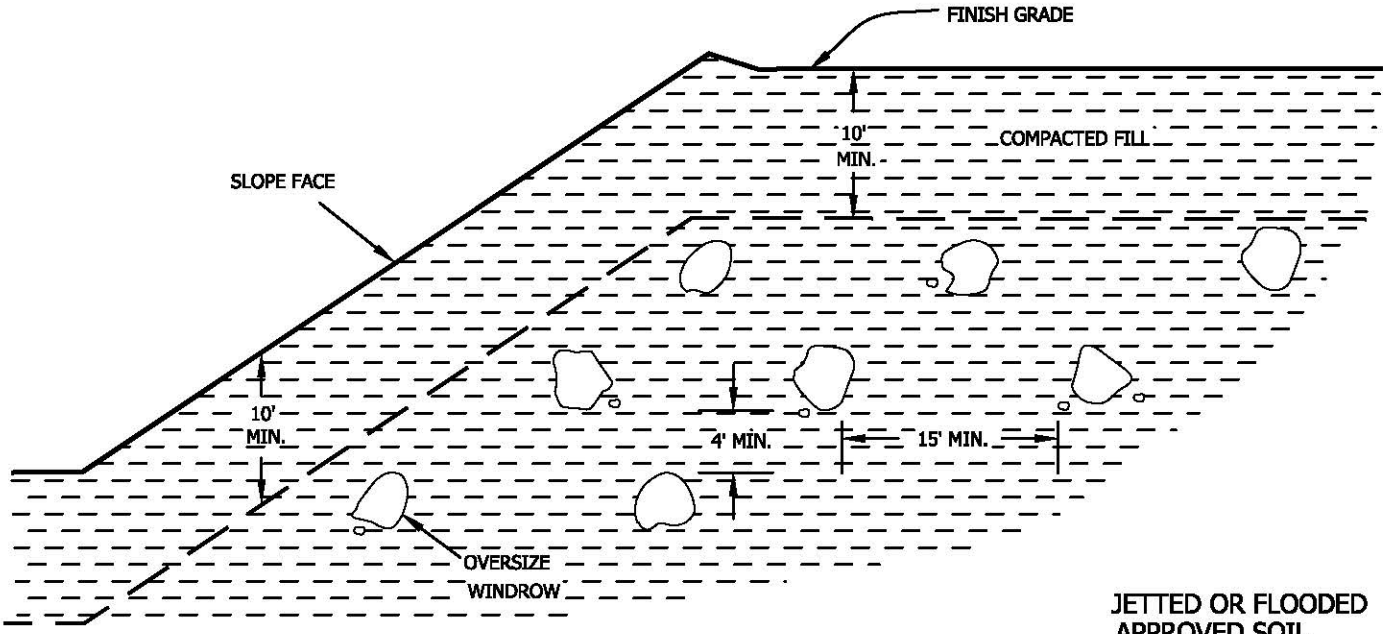


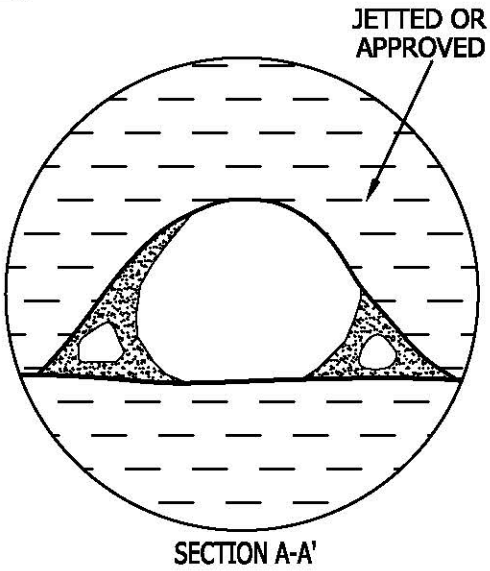
CUT-OVER-FILL SLOPE



BENCHING SHALL BE DONE WHEN SLOPE'S ANGLE IS EQUAL TO OR GREATER THAN 5:1. MINIMUM BENCH HEIGHT SHALL BE 4 FEET AND MINIMUM FILL WIDTH SHALL BE 9 FEET.

KEYING AND BENCHING	GENERAL EARTHWORK AND GRADING SPECIFICATIONS STANDARD DETAILS A	Leighton





- Oversize rock is larger than 8 inches in largest dimension.
- Backfill with approved soil jetted or flooded in place to fill all the voids.
- Do not bury rock within 10 feet of finish grade.
- Windrow of buried rock shall be parallel to the finished slope face.

SUBDRAIN ALTERNATE A

SUBDRAIN ALTERNATE B

- SUBDRAIN INSTALLATION - Subdrain collector pipe shall be installed with perforations down or, unless otherwise designated by the geotechnical consultant. Outlet pipes shall be non-perforated pipe. The subdrain pipe shall have at least 8 perforations uniformly spaced per foot. Perforation shall be 1/4" to 1/2" if drilled holes are used. All subdrain pipes shall have a gradient at least 2% towards the outlet.
- SUBDRAIN PIPE - Subdrain pipe shall be ASTM D2751, ASTM D1527 (Schedule 40) or SDR 23.5 ABS pipe or ASTM D3034 (Schedule 40) or SDR 23.5 PVC pipe.
- All outlet pipe shall be placed in a trench and, after fill is placed above it, rodded to verify integrity.

Date and Time of Analysis

Date: July 10, 2013 Time: 15:26:54

Problem Title

Ford Theater Foundation

603507-002

Ford Theater Foundation

SP

Drilled, Cast-in-Place Concrete Caissons - 18-inch Diameter

Program Options

Units Used - US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes nonlinear bending stiffness and nominal Moment
Capacity with Pile Response Computed Using Nonlinear EI

Computation Options:
- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip

- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix elements
- Output pile response for full length of pile
- Analysis assumes no soil movements acting on pile
- No p-y curves to be computed and output for user-specified depths

Solution Control Parameters:

- Number of pile increments	=	100
- Maximum number of iterations allowed	=	1000
- Deflection tolerance for convergence	=	1.0000E-05 in
- Maximum allowable deflection	=	100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total Number of Sections	=	1
Total Pile Length	=	25.00 ft
Depth of ground surface below top of pile	=	0.00 ft
Slope angle of ground surface	=	45.00 deg.

Pile dimensions used for p-y curve computations defined using 2 points.
p-y curves are computed using values of pile diameter interpolated over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	18.0000000
2	25.000000	18.0000000

Input Structural Properties:

Section No. 1:

Section Type	=	Elastic Pile
Cross-sectional Shape	=	Circular
Section Length	=	25.000 in
Top Width	=	18.000 in
Bottom Width	=	18.000 in
Top Area	=	254.469005 sq. in
Bottom Area	=	254.469005 sq. in
Moment of Inertia at Top	=	5.153E+03 in^4
Moment of Inertia at Bottom	=	5.153E+03 in^4
Elastic Modulus	=	3800000.000 lbs/in

Ground Slope and Pile Batter Angles

Ground Slope Angle	=	45.000 degrees
	=	0.785 radians
Pile Batter Angle	=	0.000 degrees
	=	0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is stiff clay without free water

Distance from top of pile to top of layer = 0.000 ft
Distance from top of pile to bottom of layer = 5.000 ft

Layer 2 is stiff clay without free water

Distance from top of pile to top of layer = 5.000 ft
Distance from top of pile to bottom of layer = 50.000 ft

(Depth of lowest layer extends 25.00 ft below pile tip)

Effective Unit Weight of Soil vs. Depth

Effective unit weight of soil with depth defined using 4 points

Point No.	Depth X ft	Eff. Unit Weight pcf
1	0.00	120.00000
2	5.00	120.00000
3	5.00	130.00000
4	50.00	130.00000

Summary of Soil Properties

Layer Num.	Soil Type (p-y Curve Criteria)	kpy pci	Rock Emass psi	Depth krm ft	Eff. Unit Wt., pcf	Cohesion Test Prop. psf	Friction Ang., deg.	qu Elas. Subgr. psi	RQD percent	Epsilon 50
1	Stiff Clay w/o Free Water	--	--	0.00	120.000	1500.000	--	--	--	0.00
				5.000	120.000	1500.000	--	--	--	0.00
2	Stiff Clay w/o Free Water	--	--	5.000	130.000	3000.000	--	--	--	0.00
				50.000	130.000	3000.000	--	--	--	0.00

Loading Type

p-y criteria for static loading was used for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 6

Load Load Condition 1 Condition 2 Axial Thrust

18 inch Dia CIDH

No.	Type				Force, lbs
1	5	y =	0.250 in	S = 0.000 in/in	0.000
2	5	y =	0.500 in	S = 0.000 in/in	0.000
3	5	y =	1.000 in	S = 0.000 in/in	0.000
4	4	y =	0.250 in	M = 0.000 in-lbs	0.000
5	4	y =	0.500 in	M = 0.000 in-lbs	0.000
6	4	y =	1.000 in	M = 0.000 in-lbs	0.000

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust values were determined from pile-head loading conditions

Number of Sections = 1

Section No. 1:

Moment-Curvature properties derived from elastic section properties

---

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 0.250000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships. The above values of total stress are computed for combined axial stress and do not equal the actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =   -0.000007027 radians
Maximum bending moment           =      -1618042. inch-lbs
Maximum shear force              =         30784. lbs
Depth of maximum bending moment  =       0.000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             16
Number of zero deflection points =              3
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 0.500000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.5000000 inches
Computed slope at pile head = -0.0000101 radians

18 inch Dia CIDH

Maximum bending moment = -2604361. inch-lbs
Maximum shear force = 44181. lbs
Depth of maximum bending moment = 0.000000 inches below pile head
Depth of maximum shear force = 0.000000 inches below pile head
Number of iterations = 18
Number of zero deflection points = 3

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 1.000000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 3:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0000145 radians
Maximum bending moment           =      -4189377. inch-lbs
Maximum shear force              =         63438. lbs
Depth of maximum bending moment  =       0.000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             20
Number of zero deflection points =              2
```

18 inch Dia CIDH

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head = 0.250000 in
Moment at pile head = 0.000 in-lbs
Axial load at pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0032300 radians
Maximum bending moment           =        638645. inch-lbs
Maximum shear force              =         14356. lbs
Depth of maximum bending moment  =     78.0000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             15
Number of zero deflection points =              4
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 5

```
Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head   =        0.500000 in
Moment at pile head       =           0.000 in-lbs
Axial load at pile head   =           0.000 lbs
```

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 5:

```
Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =     -0.0057979 radians
Maximum bending moment           =       1029268. inch-lbs
Maximum shear force              =         20468. lbs
Depth of maximum bending moment  =     87.0000000 inches below pile head
Depth of maximum shear force     =      0.000000 inches below pile head
Number of iterations             =             17
Number of zero deflection points =              3
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 6

```
Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head   =        1.000000 in
Moment at pile head       =           0.000 in-lbs
Axial load at pile head   =           0.000 lbs
```

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 6:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0104031 radians
Maximum bending moment           =       1654761. inch-lbs
Maximum shear force              =         29237. lbs
Depth of maximum bending moment  =     96.0000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             21
Number of zero deflection points =              3
```

Summary of Pile Response(s)

Definitions of Pile-Head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case	Load Type	Condition 1 V(lbs) or y(inches)	Condition 2 in-lb, rad., or in-lb/rad.	Axial Load lbs	Pile-Head Deflection inches	Maximum Moment in-lbs	Maximum Shear lbs	Pile-Head Rotation radians

Problem Title

Ford Theater Foundation

603507-002

Ford Theater Foundation

SP

Drilled, Cast-in-Place Concrete Caissons - 24-inch Diameter

Program Options

Units Used - US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes nonlinear bending stiffness and nominal Moment
Capacity with Pile Response Computed Using Nonlinear EI

Computation Options:
- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip

- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix elements
- Output pile response for full length of pile
- Analysis assumes no soil movements acting on pile
- No p-y curves to be computed and output for user-specified depths

Solution Control Parameters:

- Number of pile increments	=	100
- Maximum number of iterations allowed	=	1000
- Deflection tolerance for convergence	=	1.0000E-05 in
- Maximum allowable deflection	=	100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total Number of Sections	=	1
Total Pile Length	=	25.00 ft
Depth of ground surface below top of pile	=	0.00 ft
Slope angle of ground surface	=	45.00 deg.

Pile dimensions used for p-y curve computations defined using 2 points.
p-y curves are computed using values of pile diameter interpolated over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	24.0000000
2	25.000000	24.0000000

Input Structural Properties:

Section No. 1:

Section Type	=	Elastic Pile
Cross-sectional Shape	=	Circular
Section Length	=	25.000 in
Top Width	=	24.000 in
Bottom Width	=	24.000 in
Top Area	=	452.389342 sq. in
Bottom Area	=	452.389342 sq. in
Moment of Inertia at Top	=	1.629E+04 in^4
Moment of Inertia at Bottom	=	1.629E+04 in^4
Elastic Modulus	=	3800000.000 lbs/in

Ground Slope and Pile Batter Angles

Ground Slope Angle	=	45.000 degrees
	=	0.785 radians
Pile Batter Angle	=	0.000 degrees
	=	0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is stiff clay without free water

Distance from top of pile to top of layer = 0.000 ft
Distance from top of pile to bottom of layer = 5.000 ft

Layer 2 is stiff clay without free water

Distance from top of pile to top of layer = 5.000 ft
Distance from top of pile to bottom of layer = 50.000 ft

(Depth of lowest layer extends 25.00 ft below pile tip)

Effective Unit Weight of Soil vs. Depth

Effective unit weight of soil with depth defined using 4 points

Point No.	Depth X ft	Eff. Unit Weight pcf
1	0.00	120.00000
2	5.00	120.00000
3	5.00	130.00000
4	50.00	130.00000

Summary of Soil Properties

* This analysis makes computations of pile response using nonlinear moment-curvature relationships. The above values of total stress are computed for combined axial stress and do not equal the actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =   -0.000003684 radians
Maximum bending moment           =      -3325652. inch-lbs
Maximum shear force              =         50912. lbs
Depth of maximum bending moment  =       0.000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             16
Number of zero deflection points =              2
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 0.500000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.5000000 inches
Computed slope at pile head = -0.000005274 radians

24 inch Dia CIDH

Maximum bending moment = -5331546. inch-lbs
Maximum shear force = 72832. lbs
Depth of maximum bending moment = 0.000000 inches below pile head
Depth of maximum shear force = 0.000000 inches below pile head
Number of iterations = 18
Number of zero deflection points = 2

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 1.000000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 3:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =   -0.000007394 radians
Maximum bending moment           =      -8354772. inch-lbs
Maximum shear force              =        102050. lbs
Depth of maximum bending moment  =       0.000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             21
Number of zero deflection points =              1
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head = 0.250000 in
Moment at pile head = 0.000 in-lbs
Axial load at pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0026137 radians
Maximum bending moment           =      1316221. inch-lbs
Maximum shear force              =        23723. lbs
Depth of maximum bending moment  =     96.0000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             15
Number of zero deflection points =              2
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 5

```
Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head   =        0.500000 in
Moment at pile head       =           0.000 in-lbs
Axial load at pile head   =           0.000 lbs
```

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
The above values of total stress are computed for combined axial stress and do not equal the
actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 5:

```
Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =     -0.0046829 radians
Maximum bending moment           =       2107604. inch-lbs
Maximum shear force              =         33825. lbs
Depth of maximum bending moment  =    105.0000000 inches below pile head
Depth of maximum shear force     =      0.000000 inches below pile head
Number of iterations             =             17
Number of zero deflection points =              2
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 6

```
Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head   =        1.000000 in
Moment at pile head       =           0.000 in-lbs
Axial load at pile head   =           0.000 lbs
```

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 6:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0083864 radians
Maximum bending moment           =       3370691. inch-lbs
Maximum shear force              =         48252. lbs
Depth of maximum bending moment  =    120.0000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             21
Number of zero deflection points =              2
```

Summary of Pile Response(s)

Definitions of Pile-Head Loading Conditions:

```
Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians
```

Load Case	Load Type	Condition 1 V(lbs) or y(inches)	Condition 2 in-lb, rad., or in-lb/rad.	Axial Load lbs	Pile-Head Deflection inches	Maximum Moment in-lbs	Maximum Shear lbs	Pile-Head Rotation radians
1	5	y = 0.2500	S = 0.000	0.0000000	0.25000000	-3325652.	50912.	0.00000000

Name of input data file: 30 inch Dia CIDH.lp6d
Name of output file: 30 inch Dia CIDH.lp6o
Name of plot output file: 30 inch Dia CIDH.lp6p
Name of runtime file: 30 inch Dia CIDH.lp6r

Date and Time of Analysis

Date: July 10, 2013 Time: 15:20:49

Problem Title

Ford Theater Foundation

603507-002

Ford Theater Foundation

SP

Drilled, Cast-in-Place Concrete Caissons - 30-inch Diameter

Program Options

Units Used - US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes nonlinear bending stiffness and nominal Moment
Capacity with Pile Response Computed Using Nonlinear EI

Computation Options:
- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip

- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix elements
- Output pile response for full length of pile
- Analysis assumes no soil movements acting on pile
- No p-y curves to be computed and output for user-specified depths

Solution Control Parameters:

- Number of pile increments	=	100
- Maximum number of iterations allowed	=	1000
- Deflection tolerance for convergence	=	1.0000E-05 in
- Maximum allowable deflection	=	100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total Number of Sections	=	1
Total Pile Length	=	25.00 ft
Depth of ground surface below top of pile	=	0.00 ft
Slope angle of ground surface	=	45.00 deg.

Pile dimensions used for p-y curve computations defined using 2 points.
p-y curves are computed using values of pile diameter interpolated over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	30.0000000
2	25.000000	30.0000000

Input Structural Properties:

Section No. 1:

Section Type	=	Elastic Pile
Cross-sectional Shape	=	Circular
Section Length	=	25.000 in
Top Width	=	30.000 in
Bottom Width	=	30.000 in
Top Area	=	706.858347 sq. in
Bottom Area	=	706.858347 sq. in
Moment of Inertia at Top	=	3.976E+04 in^4
Moment of Inertia at Bottom	=	3.976E+04 in^4
Elastic Modulus	=	3800000.000 lbs/in

Ground Slope and Pile Batter Angles

Ground Slope Angle	=	45.000 degrees
	=	0.785 radians
Pile Batter Angle	=	0.000 degrees
	=	0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is stiff clay without free water

Distance from top of pile to top of layer = 0.000 ft
Distance from top of pile to bottom of layer = 5.000 ft

Layer 2 is stiff clay without free water

Distance from top of pile to top of layer = 5.000 ft
Distance from top of pile to bottom of layer = 50.000 ft

(Depth of lowest layer extends 25.00 ft below pile tip)

Effective Unit Weight of Soil vs. Depth

Effective unit weight of soil with depth defined using 4 points

Point No.	Depth X ft	Eff. Unit Weight pcf
1	0.00	120.00000
2	5.00	120.00000
3	5.00	130.00000
4	50.00	130.00000

Summary of Soil Properties

Layer Num.	Soil Type (p-y Curve Criteria)	Depth ft	Eff. Unit Wt., pcf	Cohesion Test Prop. psf	Friction Ang., deg.	qu Elas. Subgr. psi
		Epsilon 50	kpy pci	Rock Emass psi	krm Test Type	RQD percent
1	Stiff Clay w/o Free Water	0.00	120.000	1500.000	--	--
--	0.00	--	--	--	--	--
			5.000	120.000	1500.000	--
--	0.00	--	--	--	--	--
2	Stiff Clay w/o Free Water	5.000	130.000	3000.000	--	--
--	0.00	--	--	--	--	--
		50.000	130.000	3000.000	--	--
--	0.00	--	--	--	--	--

Loading Type

p-y criteria for static loading was used for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 6

Load	Load	Condition 1	Condition 2	Axial Thrust

30 inch Dia CIDH

No.	Type					Force, lbs
1	5	y =	0.250 in	S =	0.000 in/in	0.000
2	5	y =	0.500 in	S =	0.000 in/in	0.000
3	5	y =	1.000 in	S =	0.000 in/in	0.000
4	4	y =	0.250 in	M =	0.000 in-lbs	0.000
5	4	y =	0.500 in	M =	0.000 in-lbs	0.000
6	4	y =	1.000 in	M =	0.000 in-lbs	0.000

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust values were determined from pile-head loading conditions

Number of Sections = 1

Section No. 1:

Moment-Curvature properties derived from elastic section properties

---

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 0.250000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships. The above values of total stress are computed for combined axial stress and do not equal the actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =   -0.000002219 radians
Maximum bending moment           =      -5771914. inch-lbs
Maximum shear force              =         74800. lbs
Depth of maximum bending moment  =       0.000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             18
Number of zero deflection points =              1
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 2

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 0.500000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.5000000 inches
Computed slope at pile head = -0.000003019 radians

30 inch Dia CIDH

Maximum bending moment = -8800018. inch-lbs
Maximum shear force = 101732. lbs
Depth of maximum bending moment = 0.000000 inches below pile head
Depth of maximum shear force = 0.000000 inches below pile head
Number of iterations = 19
Number of zero deflection points = 1

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 3

Pile-head conditions are Displacement and Slope (BC Type 5)
Displacement of pile head = 1.000000 in
Slope of pile head = 0.000E+00 in/in
Axial load on pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 3:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =   -0.000004028 radians
Maximum bending moment           =     -13404342. inch-lbs
Maximum shear force              =        135661. lbs
Depth of maximum bending moment  =       0.000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             29
Number of zero deflection points =              1
```

30 inch Dia CIDH

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head = 0.250000 in
Moment at pile head = 0.000 in-lbs
Axial load at pile head = 0.000 lbs

Depth X inches	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb/rad.	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 4:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0022138 radians
Maximum bending moment           =      2290200. inch-lbs
Maximum shear force              =        35069. lbs
Depth of maximum bending moment  =    111.0000000 inches below pile head
Depth of maximum shear force     =       0.000000 inches below pile head
Number of iterations             =             15
Number of zero deflection points =              2
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 5

```
Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head   =        0.500000 in
Moment at pile head       =           0.000 in-lbs
Axial load at pile head   =           0.000 lbs
```

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 5:

```
Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =     -0.0039605 radians
Maximum bending moment           =       3655340. inch-lbs
Maximum shear force              =         49933. lbs
Depth of maximum bending moment  =    126.0000000 inches below pile head
Depth of maximum shear force     =      0.000000 inches below pile head
Number of iterations             =             18
Number of zero deflection points =              2
```

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 6

```
Pile-head conditions are Displacement and Moment (BC Type 4)
Deflection at pile head   =        1.000000 in
Moment at pile head       =           0.000 in-lbs
Axial load at pile head   =           0.000 lbs
```

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 6:

```
Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0069681 radians
Maximum bending moment           =      5587910. inch-lbs
Maximum shear force              =        69448. lbs
Depth of maximum bending moment  =    138.0000000 inches below pile head
Depth of maximum shear force     =      0.000000 inches below pile head
Number of iterations             =             22
Number of zero deflection points =              1
```

Summary of Pile Response(s)

Definitions of Pile-Head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case	Load Type	Condition 1 V(lbs) or y(inches)	Condition 2 in-lb, rad., or in-lb/rad.	Axial Load lbs	Pile-Head Deflection inches	Maximum Moment in-lbs	Maximum Shear lbs	Pile-Head Rotation radians

References: Leighton Consulting, Inc., 2013, Geotechnical Investigation, Off-Season Two Improvements, 2580 Cahuenga Boulevard East, Hollywood District of Los Angeles, California, Project No. 10296.001, dated September 10.

Ensoft, Inc., 2011, LPile Version 6.0.14, Computer Program for Analyzing Stress and Deformation of a Pile or Drilled Shaft Under Lateral Load.

We were requested to provide supplementary geotechnical recommendations to support the design of the project. We received memoranda dated August 16, 2013 and September 12, 2013 from Structural Focus, the project structural engineer requesting supplementary information. The subject memoranda are included herewith as Appendices A and B.

Surcharge Loading on Retaining walls and Basement Walls

Retaining wall surcharge information was requested in the August 16, 2013 memorandum. As generally stated in Leighton Consulting, Inc. (2013), shallow foundations (spread footings) for new structures should be deepened to extend below the active zone of existing basement walls, roughly a plane extending from the base of the basement wall at a 60 degree angle from horizontal, to avoid surcharging the walls. Footings may be deepened by excavating below the active zone and backfilling with concrete or with controlled low strength material (CLSM).

New basement walls planned below existing foundations within their active zones should be designed to accommodate surcharge loads. Surcharge may be modeled as half the footing bearing pressure within the wall's active zone applied horizontally.

The stacked walls shown on page A-3 of Appendix A need not be designed to accommodate surcharge loading because upslope footings are not planned within the active zones of the walls. However, the basement wall should be designed to accommodate a surcharge from the upslope stacked walls. The surcharge pressure may be modeled as an additional equivalent fluid weight of 50 pounds per square foot per square foot depth (psf/ft) of wall.

There is insufficient detail in the exhibit on page A-2 to provide more detailed surcharge information. The relative elevations and horizontal distances between walls and adjacent footings are required.

LIGHT POLE FOUNDATIONS

Drilled, cast-in-place concrete pile foundation information to support lighting fixtures was requested in the September 12, 2013 memorandum. Maximum combined design reaction loads provided in the memorandum are as follows:

Axial = 25 kips
Lateral Shear = 15 kips
Moment = 510 kip-feet

We used the computer program LPILE (Ensoft, Inc., 2011) to build and analyze our pile foundation models. Results are presented in Appendix C. We used a concrete compressive strength value (f_c') of 4 kips per square inch (ksi) and a yield stress (f_y) of 60 ksi for the steel reinforcing.

To account for the reduction in bending stiffness due to concrete cracking, a subroutine in the program LPILE that computes the bending stiffness as a function of applied bending moment and axial loading was incorporated into the analyses. We have assumed that the minimum steel reinforcing consists of 12 US Std. #9 bars with clear concrete cover thickness of 3-inches for the 36-inch-diameter piles. For 42-inch-diameter piles, we have assumed that the minimum steel reinforcing consists of 12 US Std. #10 bars with clear concrete cover thickness of 3-inches.

Results are summarized in the table below:

Pile Head Deflection (inches)	Pile Diameter (Free Head)	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
1	36 inches	15	6,500	4
½	42 inches	15	6,500	4

Adjacent walls should be designed to accommodate a lateral point load of 15 kips imposed by the pile foundation.

We appreciate the opportunity to work with you on this project. If you have any questions regarding this addendum or if we can be of further service, please call us at your convenience.

Respectfully submitted,

LEIGHTON CONSULTING, INC.

APPENDIX A

Memo

Date:	August 16, 2013	**Project No.:**	13023
Project Name:	Ford Theater ☐Off-season Two Improvements		
To:	Kaitlin Drisko, Levin ☐Associates Architects	**Via:**	Email
Cc:	Robert Stone, Levin ☐Associates Architects	**Via:**	Email
From:	Melineh Zomorrodian, Structural Focus		
Subject:	Surcharge Loading	**Pages:**	1

Memo:

In our previous memos dated April 9, 2013 and August 7, 2013, we have requested surcharge loading recommendations from the geotechnical engineer. During the geotechnical coordination meeting on August 9, 2013, we were asked to provide foundation loading to the geotechnical engineer so that they can include the surcharge loading recommendation in the final report.

1. For surcharge loading on new basement walls:
   Attached foundation plan includes dead, live, and seismic loading demands on existing building foundations.

2. Surcharge loading for new stacked site retaining walls:
   Attached section shows the stacked site retaining walls with the weight of the walls and the weight of the finishes. Please note the height of the walls vary and the elevation of the foundations vary along the length of the retaining wall.

3. Surcharge loading from new light pole piles adjacent to existing or new retaining walls:
   Loading on the light pole piles to be provided in a future memo after coordination with design team.

Memo

Date:	September 12, 2013	**Project No.:**	13023
Project Name:	Ford Theater ☐Off-season Two Improvements		
To:	Kaitlin Drisko, Levin ☐Associates Architects	**Via:**	Email
Cc:	Robert Stone, Levin ☐Associates Architects	**Via:**	Email
From:	Melineh Zomorrodian, Structural Focus		
Subject:	Reaction Loads on New Pile Foundations	**Pages:**	1

Memo:

During the geotechnical coordination meeting on August 9, 2013, we were asked to provide loading on the new pile foundations to the geotechnical engineer so that they can provide recommendations on the pile depth and size as well as the recommended surcharge loading to be used in the design and☐or analysis of the existing or new retaining walls adjacent to the new pile foundations. Loading on the light pole pile foundations is provided on the attached plan.

Problem Title

Ford Theater Foundation

603507-002

Ford Theater Foundation

SP

Drilled, Cast-in-Place Concrete Caissons - 30-inch Diameter

Program Options

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes nonlinear bending stiffness and nominal moment capacity with pile response computed using nonlinear EI

Computation Options:
- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix elements
- Output pile response for full length of pile
- Analysis assumes no soil movements acting on pile
- p-y curves computed and output for user-specified depths

Solution Control Parameters:
- Number of pile increments = 100
- Maximum number of iterations allowed = 1000
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total Number of Sections = 1

Total Pile Length = 25.00 ft

Depth of ground surface below top of pile = 0.00 ft

Slope angle of ground surface = 45.00 deg.

Pile dimensions used for p-y curve computations defined using 2 points.
p-y curves are computed using values of pile diameter interpolated over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	36.0000000
2	25.000000	36.0000000

Input Structural Properties:

Section No. 1:

Section Type = Drilled Shaft (Bored Pile)

Section Length = 25.000 ft
Section Diameter = 36.000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 45.000 degrees
= 0.785 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is stiff clay without free water

Distance from top of pile to top of layer = 0.000 ft
Distance from top of pile to bottom of layer = 5.000 ft

Layer 2 is stiff clay without free water

Distance from top of pile to top of layer = 5.000 ft
Distance from top of pile to bottom of layer = 50.000 ft

(Depth of lowest layer extends 25.00 ft below pile tip)

Effective Unit Weight of Soil vs. Depth

Effective unit weight of soil with depth defined using 4 points

Point No.	Depth X ft	Eff. Unit Weight pcf
1	0.00	120.00000
2	5.00	120.00000
3	5.00	130.00000
4	50.00	130.00000

Summary of Soil Properties

Layer Num.	Soil Type (p-y Curve Criteria)	Depth ft	Eff. Unit Wt., pcf	Cohesion psf	Friction	Test Type	qu	RQD	Epsilon 50	kpy	Test Prop.	Rock Emass	krm	Elas. Subgr.

Ang., deg.	psi	percent	pci	pci	psi
1	Stiff Clay w/o Free Water		0.00	120.000	1500.000
			0.00	120.000	1500.000
2	Stiff Clay w/o Free Water		0.00	130.000	3000.000
			0.00	130.000	3000.000

Loading Type

Cyclic loading criteria were used for computation of p-y curves for all analyses.

Number of cycles of loading = 10

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 15000.000 lbs	M = 6120000.000 in-lbs	25.000

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially

Output of p-y Curves at Specified Depths

Lateral load-transfer (p-y) curves are computed and output at 6 depths.
(Note the depths of these curves may differ from nodal point depths.),/

Depth No.	Depth Below Pile Head ft	Depth Below Ground Surface ft
1	0.000	0.000
2	5.000	5.000
3	10.000	10.000

4	15.000	15.000
5	20.000	20.000
6	25.000	25.000

Depth of ground surface below top of pile = 0.00 ft

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Sections Analyzed = 1

Section No. 1:

Dimensions and Properties of Drilled Shaft:

Length of Section	=	25.00000000 ft
Shaft Diameter	=	36.00000000 in
Concrete Cover Thickness	=	3.00000000 in
Number of Reinforcing Bars	=	12 bars
Yield Stress of Reinforcing Bars	=	60.00000000 ksi
Modulus of Elasticity of Reinforcing Bars	=	29000. ksi
Gross Area of Shaft	=	1017.87601976 sq. in.
Total Area of Reinforcing Steel	=	12.00000000 sq. in.
Area Ratio of Steel Reinforcement	=	1.18 percent

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As	=	4139.979 kips
Tensile Load for Cracking of Concrete	=	-458.502 kips
Nominal Axial Tensile Capacity	=	-720.000 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	1.12800	1.00000	14.43600	0.00000
2	1.12800	1.00000	12.50194	7.21800

12	1.12800	1.00000	12.50194	-7.21800

Concrete Properties:

Compressive Strength of Concrete	=	4.0000000 ksi
Modulus of Elasticity of Concrete	=	3604.9965326 ksi
Modulus of Rupture of Concrete	=	-0.4743416 ksi
Compression Strain at Peak Stress	=	0.0018863
Tensile Strain at Fracture of Concrete	=	-0.0001154
Maximum Coarse Aggregate Size	=	0.7500000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.025

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension
Y = stress in reinforcing steel has reached yield stress
T = tensile strain in reinforcement exceeds 0.005 when compressive strain in concrete is less than 0.003.
Z = depth of tensile zone in concrete section is less than 10 percent of section depth
Bending Stiffness (EI) = Bending Moment / Curvature
Position of neutral axis is computed from compression side of pile
Compressive stresses are positive in sign. Tensile stresses are negative in sign.

Axial Thrust Force = 0.025 kips

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	0.025	9791.891	0.00300000

Note note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether

the transverse reinforcing steel bars are spirals or tied hoops.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318-08, Section 9.3.2.2 or the value required by the design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Horizontal shear force at pile head = 15000.000 lbs
Applied moment at pile head = 6120000.000 in-lbs
Axial thrust load on pile head = 25.000 lbs

* This analysis makes computations of pile response using nonlinear moment-curvature relationships.
  The above values of total stress are computed for combined axial stress and do not equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      1.0337679 inches
Computed slope at pile head      =     -0.0127416 radians
Maximum bending moment           =      6497747. inch-lbs
Maximum shear force              =       -57341. lbs
Depth of maximum bending moment  =     48.0000000 inches below pile head
Depth of maximum shear force     =    180.0000000 inches below pile head
Number of iterations             =             55
Number of zero deflection points =              2
```

Pile-head Deflection vs. Pile Length for Load Case 1

Boundary Condition Type 1, Shear and Moment

```
Shear      =          15000. lbs
Moment     =        6120000. in-lbs
Axial Load =             25. lbs
```

Pile Length in	Pile Head Deflection in	Maximum Moment in-lbs	Maximum Shear lbs
300.000	1.0337679	6497747.	-57341.
285.000	1.0489069	6496493.	-56888.

Summary of Pile Response(s)

Definitions of Pile-Head Loading Conditions:

```
Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians
```

Load No.	Load Type	Condition 1 V(lbs) or Shear lbs	Condition 2 in-lb, rad., y(inches) or Rotation in-lb/rad.	Axial Load lbs	Pile-Head Deflection inches	Maximum Moment in-lbs	Maximum Pile-Head Shear lbs
1	1	V = 15000.	M = 6120000.	25.00000000	1.03376790	6497747.	-57341.

The analysis ended normally.

Problem Title

Ford Theater Foundation

603507-002

Ford Theater Foundation

SP

Drilled, Cast-in-Place Concrete Caissons - 30-inch Diameter

Program Options

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes nonlinear bending stiffness and nominal moment capacity with pile response computed using nonlinear EI

Computation Options:
- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix elements
- Output pile response for full length of pile
- Analysis assumes no soil movements acting on pile
- No p-y curves to be computed and output for user-specified depths

Solution Control Parameters:
- Number of pile increments = 100
- Maximum number of iterations allowed = 1000
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total Number of Sections = 1

Total Pile Length = 25.00 ft

Depth of ground surface below top of pile = 0.00 ft

Slope angle of ground surface = 45.00 deg.

Pile dimensions used for p-y curve computations defined using 2 points.
p-y curves are computed using values of pile diameter interpolated over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	42.0000000
2	25.000000	42.0000000

Input Structural Properties:

Section No. 1:

Section Type = Drilled Shaft (Bored Pile)

Section Length = 25.000 ft
Section Diameter = 42.000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 45.000 degrees
= 0.785 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is stiff clay without free water

Distance from top of pile to top of layer = 0.000 ft
Distance from top of pile to bottom of layer = 5.000 ft

Layer 2 is stiff clay without free water

Distance from top of pile to top of layer = 5.000 ft
Distance from top of pile to bottom of layer = 50.000 ft

(Depth of lowest layer extends 25.00 ft below pile tip)

Effective Unit Weight of Soil vs. Depth

Effective unit weight of soil with depth defined using 4 points

Point No.	Depth X ft	Eff. Unit Weight pcf
1	0.00	120.00000
2	5.00	120.00000
3	5.00	130.00000
4	50.00	130.00000

Summary of Soil Properties

Layer Num.	Soil Type (p-y Curve Criteria)	Depth ft	Eff. Unit Wt., pcf	Cohesion psf	Friction	Test Type	qu	RQD	Epsilon 50	kpy	Test Prop.	Rock Emass	Elas. Subgr. krm
1	Stiff Clay w/o Free Water	0.00	120.000	1500.000	--	--	--	--	0.00	--	--	--	--
		5.000	120.000	1500.000	--	--	--	--	0.00	--	--	--	--
2	Stiff Clay w/o Free Water	5.000	130.000	3000.000	--	--	--	--	0.00	--	--	--	--
		50.000	130.000	3000.000	--	--	--	--	0.00	--	--	--	--

Ang., deg.	psi	percent	pci	pci	psi
1	Stiff Clay w/o Free Water	0.00	120.000	1500.000	
		0.00	5.000	120.000	1500.000
2	Stiff Clay w/o Free Water	0.00	5.000	130.000	3000.000
		0.00	50.000	130.000	3000.000

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 15000.000 lbs	M = 6120000.000 in-lbs	25.000

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Sections Analyzed = 1

Section No. 1:

Dimensions and Properties of Drilled Shaft:

Length of Section = 25.00000000 ft

Shaft Diameter	=	42.00000000 in
Concrete Cover Thickness	=	3.00000000 in
Number of Reinforcing Bars	=	12 bars
Yield Stress of Reinforcing Bars	=	60.00000000 ksi
Modulus of Elasticity of Reinforcing Bars	=	29000. ksi
Gross Area of Shaft	=	1385.44236023 sq. in.
Total Area of Reinforcing Steel	=	15.24000000 sq. in.
Area Ratio of Steel Reinforcement	=	1.10 percent

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As	=	5573.088 kips
Tensile Load for Cracking of Concrete	=	-620.869 kips
Nominal Axial Tensile Capacity	=	-914.400 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	1.27000	1.27000	17.36500	0.00000
2	1.27000	1.27000	15.03853	8.68250
3	1.27000	1.27000	8.68250	15.03853
4	1.27000	1.27000	0.00000	17.36500
5	1.27000	1.27000	-8.68250	15.03853
6	1.27000	1.27000	-15.03853	8.68250
7	1.27000	1.27000	-17.36500	0.00000
8	1.27000	1.27000	-15.03853	-8.68250
9	1.27000	1.27000	-8.68250	-15.03853
10	1.27000	1.27000	0.00000	-17.36500
11	1.27000	1.27000	8.68250	-15.03853
12	1.27000	1.27000	15.03853	-8.68250

Concrete Properties:

Compressive Strength of Concrete	=	4.0000000 ksi
Modulus of Elasticity of Concrete	=	3604.9965326 ksi
Modulus of Rupture of Concrete	=	-0.4743416 ksi
Compression Strain at Peak Stress	=	0.0018863
Tensile Strain at Fracture of Concrete	=	-0.0001154
Maximum Coarse Aggregate Size	=	0.7500000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.025

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension
Y = stress in reinforcing steel has reached yield stress
T = tensile strain in reinforcement exceeds 0.005 when compressive strain in concrete is less than 0.003.

Z = depth of tensile zone in concrete section is less than 10 percent of section depth
Bending Stiffness (EI) = Bending Moment / Curvature
Position of neutral axis is computed from compression side of pile
Compressive stresses are positive in sign. Tensile stresses are negative in sign.

Axial Thrust Force = 0.025 kips

Bending Max Concrete Curvature Stress rad/in. ksi	Bending Max Steel Stress ksi	Bending Run Moment in-kip	Stiffness kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in	Msg

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	0.025	14850.088	0.00300000

Note note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are spirals or tied hoops.

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318-08, Section
9.3.2.2 or the value required by the design standard being followed.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Horizontal shear force at pile head = 15000.000 lbs
Applied moment at pile head = 6120000.000 in-lbs
Axial thrust load on pile head = 25.000 lbs

Depth X	Deflect. y	Bending Moment	Shear Force	Slope S	Total Stress	Bending Stiffness	Soil Res. Spr. Distrib. p
Es*h	Lat. Load						
inches	inches	in-lbs	lbs	radians	psi*	lb-in^2	lb/in
lb/inch	lb/inch

* This analysis makes computations of pile response using nonlinear moment-curvature
relationships.
  The above values of total stress are computed for combined axial stress and do not
equal the
  actual stresses in concrete and steel in the range of nonlinear bending.

Output Verification: Computed forces and moments are within specified convergence
limits.

Output Summary for Load Case No. 1:

Pile-head deflection             =      0.5070405 inches
Computed slope at pile head      =     -0.0066206 radians
Maximum bending moment           =      6482994. inch-lbs
Maximum shear force              =       -54814. lbs
Depth of maximum bending moment  =     48.0000000 inches below pile head
Depth of maximum shear force     =    180.0000000 inches below pile head
Number of iterations             =             70
Number of zero deflection points =              2

Attention: Mr. Mohammad Saeid, CCM Senior Project Manager

Subject: Addendum No. 2 to Geotechnical Exploration Report
Response to Review Comments
Off-Season Two Improvements
John Anson Ford Theaters
2580 Cahuenga Boulevard East
Hollywood District of Los Angeles, California

Leighton Consulting, Inc. (Leighton) is pleased to present this second addendum to the referenced geotechnical exploration report (Leighton, 2013b) responding to review comments from the County of Los Angeles Department of Public Works (County).

This addendum responds to comments in the Geologic Review Sheet from the Geotechnical and Materials Engineering Division (GMED), dated December 24, 2013; comments in the Soils Engineering Review Sheet from GMED, dated December 11, 2013; and Comment Nos. 46, 47, and 55 from the Building and Safety Division (Plan Check No. BL1311250035), dated December 18, 2013. Copies of the referenced review sheets are included in Appendix A. For the ease of reference, the comments are presented below in italics before our responses.

RESPONSES TO GEOLOGIC REVIEW SHEET

Comment

The geotechnical consultants provide recommendations for rockfall and debris flow protection/mitigation, none of which appear to have been incorporated into the plans submitted to this office.

The project manager and developer/owner should determine if protecting the facility from these hazards is within the scope of the proposed work, and if so, should have the consultant's recommendations incorporated into the plans. If it is determined that protecting the facility from these hazards is not within the scope of work for this project, then it must be understood by all parties that these hazards will continue to affect the facility.

Response to Comment

We understand that our recommendations for rockfall and debris hazard mitigation will be incorporated into future plans. Leighton will review the plans and document their general conformance with our recommendations.

RESPONSES TO SOILS ENGINEERING REVIEW SHEET

Comment No. 1

Provide original copies of the Leighton report dated 2/7/13 and 7/12/13 to the Soils Engineering Section for review. These reports are referenced on the submitted plans however were not provided for our review. Additional comments may arise once the requested information is provided.

Response to Comment No. 1

The requested reports along with Leighton (2013b) and Leighton (2013c) are included in the enclosed CD-ROM. The July 12, 2013 report was a draft version of Leighton (2013b).

Comment No. 2

Provide calculations and recommendations for seismic earth pressure for all retaining walls with retained heights greater than 6 feet. Per County policy, the seismic loading for retaining walls with retained heights greater than 6 feet must be derived from the peak ground acceleration at the subject site. Verify and provide calculations and recommendations as necessary.

Response to Comment No. 2

The requested recommendations are presented in Leighton (2013b). It was our understanding that the project falls under the 2010 California Building Code and 2011 County of Los Angeles Building Code. Accordingly, the recommended seismic increment of 20 pounds per cubic foot (page 31 of Leighton, 2013b) was based on 50 percent of the site ground acceleration per Section 3.5.14 of the County's 2010 Manual for Preparation of Geotechnical Reports.

Calculations are included in Appendix B. We used a friction angle of 33 degrees with a cohesion intercept of zero. See our response to Comment No. 7 below for further discussion on shear strength parameters.

Comment No. 3

Provide calculations for the surcharge loads recommended in the soils report.

Response to Comment No. 3

Surcharge loads were based on an at-rest horizontal earth pressure coefficient of 0.5. Actual surcharge pressures are anticipated to range between induced active and at-rest pressures. Accordingly, the recommended coefficient of 0.5 (half of bearing pressure) is deemed appropriately conservative.

Comment No. 4

Clarify which of the proposed retaining walls will be designed with additional surcharge load due to stacked (upslope) retaining walls. Show and identify these retaining walls on the plans and geotechnical map.

Response to Comment No. 4

The subject terraced (stacked) landscape planter and retaining walls are located behind the stage in the main amphitheater and were shown on plan view on Plate 2 of Leighton (2013b) and in cross-section on Plate 4 of Leighton (2013b), and reproduced herein as Figures 1a and 1b for ease of reference. The stacked walls are clouded and identified on Figures 1a and 1b.

As stated in Leighton (2013b), only the new basement wall immediately adjacent to the lowermost stacked wall will be designed to accommodate surcharge. The surcharge loading of 50 pounds per cubic foot was calculated based on an equivalent sloped backfill (Appendix C).

Comment No. 5

Provide a table with all the retaining walls, basement walls, and the design lateral earth pressures. Include the expected surcharge loading and seismic loading for each wall. Add the table to the plans.

Response to Comment No. 5

All walls are to be designed to accommodate the earth pressures recommended in Leighton (2013b) and surcharge pressures recommended in Leighton (2013c). Final dimensioning and tallying of retaining walls will be performed by others and reviewed by Leighton for conformance with Leighton recommendations.

Comment No. 6

Discuss and address the Soils Nail shoring system shown on the shoring plans. Provide calculations and analyses that show the proposed soil nail wall shoring system will meet the County minimum factors of safety. Specify the soil nails which will be tested. Per the submitted shoring plans, the geotechnical engineer must observe all proof and performance tests and clarify soil types. The soils engineer must discuss and verify existing soil conditions and provide recommendations and conclusions and/or provide appropriate modifications.

Response to Comment No. 6

Soil nail design calculations are included herein as Appendix D.

Five percent of the soil nails will be proof tested. In general, every 20th anchor will be proof tested in sequence. Proof testing will be performed out of sequence if necessary to obtain a relatively uniform area distribution of test anchors.

In addition, two anchors will be performance tested. We currently anticipate testing one of the top row anchors shown on Sheets ES-2 and ES-6 of shoring drawings in Appendix D.

Comment No. 7

Provide direct shear test data results which substantiate the shear strengths utilized in the Soil Nail system. Provide boring logs and the locations of soil samples of the shear tests.

Response to Comment No. 7

The shear strengths utilized in the soil nail wall design were based on parameters used for slope stability analysis in Leighton (2013a). These shear strength parameters were generally based on the group mean values listed in CDMG (1998)[1]. Pertinent pages from the reference are included in Appendix E.

Comment Nos. 8 to 10

These comments pertain to required additions to design drawings, which are being addressed by others.

Comment No. 11

The Soils Engineer of record must review the building plans and sign and stamp the plans in verification of his recommendations. Original manual signature and wet stamp are required.

[1] California Division of Mines and Geology (CDMG), 1998, State of California Seismic Hazard Zones Report, Hollywood 7.5-Minute Quadrangle, scale 1:24,000.

Response to Comment No. 11

Acknowledged. Leighton will review, sign, and stamp the final plans.

Comment No. 12

This comment pertains to submittal of revised drawings, which is being addressed by others.

Comment No. 13

Requirements of the Geology Section are attached.

Response to Comment No. 13

Acknowledged.

Comment No. 14

Include a copy of this review sheet with your response.

Response to Comment No. 14

Acknowledged. The review sheet is included in Appendix A.

RESPONSES TO BUILDING AND SAFETY REVIEW SHEET

Comment No. 46

Update the soils report references, include all reports.

Response to Comment No. 46

Acknowledged.

Comment No. 47

Have the consulting soils/geotechnical engineer review and approve the foundation plans, shoring plans and details (106.4.3).

Response to Comment No. 46

Acknowledged. Leighton will review, and upon acceptance will sign and stamp the final plans. Additional recommendations, if any, will be provided at that time.

Comment No. 55

The soils report does not contain recommendation for the soil nail and the shoring design is based on the soil nail and shotcrete. Provide recommendations for the soil nail from the soil engineer or revise the shoring design per the soils report. The shoring design is not checked at this time. Resubmit the revised shoring design or revised soils report for shoring plan check. Additional corrections may follow.

Response to Comment No. 55

Acknowledged. Shoring design had not been started at the time Leighton (2013a) and Leighton (2013b) were published. We have reviewed the shoring design in Appendix D and it is in general conformance with our recommendations. Leighton will review, sign, and stamp the final plans.

CLOSURE

Leighton appreciates the opportunity to be of continued service to the Ford Theater Foundation on this project. Should you have any questions regarding this report, or if we may be of further assistance, please contact us at your convenience. The undersigned may be reached at (213) 892-1530.

Respectfully submitted,

LEIGHTON CONSULTING, INC.

Action: Plan is not recommended for approval for reasons below.

Remarks/Conditions:

The geotechnical consultants provide recommendations for rockfall and debrisflow protection/mitigation, none of which appear to have been incorporated into the plans submitted to this office.

The project manager and developer/owner should determine if protecting the facility from these hazards is within the scope of the proposed work, and if so, should have the consultant's recommendations incorporated into the plans. If it is determined that protecting the facility from these hazards is not within the scope of work for this project, then it must be understood by all parties that these hazards will continue to affect the facility.

Building Plan Check No. 1310240093, 1311250035

Review of:
Building Plan Dated By Processing Center **11/25/13, 9/10/13**
Soils Engineering Report Dated **10/15/13**

ACTION:

Building plan is not recommended for approval.

REMARKS:

1. Provide original copies of the Leighton report dated 2/7/13 and 7/12/13 to the Soils Engineering Section for review. These reports are referenced on the submitted plans however were not provided for review. Additional comments may arise once the requested information is provided.

2. Provide calculations and recommendations for seismic earth pressure for all retaining walls and basement walls with retained height greater than 6 feet. Per County policy, the seismic loading for retaining walls with a retained height greater than 6 feet must be derived from the peak ground acceleration at the subject site. Verify and provide calculations and recommendations, as necessary.

3. Provide calculations for the surcharge loads recommended in the soils report.

4. Clarify which of the proposed retaining walls will be designed with additional surcharge load due to stacked (upslope) retaining walls. Show and identify these retaining walls on the plans and on the geotechnical map.

5. Provide a table with all of the retaining walls, basement walls, and the design lateral earth pressures. Include the expected surcharge loading and seismic loading for each wall. Add the table to the plans.

6. Discuss and address the Soils Nail shoring system shown on the Shoring Plans. Provide calculations and analyses that show the proposed soil nail wall shoring system will meet County minimum factors of safety. Specify the soil nails which will be tested. Per the submitted shoring plans, the geotechnical engineer must observe all proof and performance tests and clarify soil types. The soils engineer must discuss and verify existing soils conditions and provide recommendations and conclusions and/or provide appropriate modifications.

7. Provide direct shear test data results which substantiate the shear strengths utilized in the Soil Nail system. Provide boring logs and the locations of soil samples of the shear tests.

8. Show the following on the Building plans:
   a. Indicate all relevant soils reports by the Soils Engineer of record. The latest soils reports submitted are not shown on the plans.
   b. Existing and proposed grades.
   c. Show table of retaining walls with design earth pressures recommended by the Soils Engineer. See Remark 5 above.
   d. Provide reference to the submitted Shoring Plans.
   e. All standard notes regarding fill compaction and density testing requirements, as necessary.
   f. All recommended mitigation measures, as necessary.

9. Show the following on the Shoring Plans:
   a. Indicate the Soils Engineer of record and all relevant soils reports by the Soils Engineer of record.
   b. Provide foundation details for the Soil Nail shoring system.
   c. Specify the soil nails which will be proof and performance tested.
   d. All recommended mitigation measures, as necessary.

Your application for a permit, together with plans and specifications, has been examined and you are advised that the issuance of a permit is withheld for the reasons hereinafter set forth. The approval of plans and specifications does not permit the violation of any section of the Building Code, or other local ordinance or state law.

NOTE: Numbers in the parenthesis ( ) refer to sections of the 2011 edition of the County of Los Angeles Building Code (LACBC), Table (T), Plumbing Code (PC), Mechanical Code (MC), Electrical Code (EC), Fire Code (FC), or Building Code Manual (B.C.M.), 2005 National Design Specifications (NDS), 2008 AF&PA Special Design Provisions for Wind and Seismic (SDPWS), 2005 Minimum Design Loads for Buildings and Other Structures including Supplement No. 1 (ASCE7). For County of Los Angeles Building Code Amendments and B.C.M.s, visit www.dpw.lacounty.gov/bsd.

INSTRUCTIONS

- All corrections apply to this plan check.
- In the left-hand margin of the circled corrections, please indicate the sheet number and detail or note number on the plans where the corrections are made. Resubmit marked original plans and two corrected sets of plans, calculations and this plan review list.
- Incomplete, unclear, or faded drawings or calculations will not be accepted.
- The plan check engineer will be available for conference and telephone calls between the hours of 9 AM and 3 PM on the following days: Tue and Thurs. **Appointments are recommended**. Incorporate all comments as marked on checked set of plans and calculations and these correction sheets.

GENERAL REQUIREMENTS

APPLICATION AND PERMIT

1. A separate application and permit(s) is/are required for: (106.1)
   a. Electrical work
   b. Mechanical work
   c. Plumbing work
2. The permit application must be signed by the property owner, or licensed contractor, or authorized agent at the time the permit is to be issued:
   a. For owner-builder permits: Owners' signature must be verified by notarization or personal identification.
   b. For contractor building permits: Prior to the issuance of a building permit, the contractor shall have the following:
      i. A certificate of workers Compensation Insurance made out to the Contractors State License Board.
      ii. Notarized letter of authorization for agents.
      iii. Copy of Contractors State License or pocket ID.

REFERRALS

(issued by Ben Ling during prior meeting) ← NOT RECEIVED BY LBA

ALL AGENCY APPROVALS are required prior to permit issuance. Please see the attached agency referral sheet for details.

3. (Soil)(Foundation)(Geology) report(s) must be approved by the Geotechnical & Materials Engineering Division. Provide a copy of approved report and Department approval letter.
4. A Grading Permit may be / is required and a separate grading permit application may need to be processed. Contact Drainage & Grading Section of Building and Safety Division to determine if a grading permit is required. (Appendix J103)

   A grading permit is required for the following:
   a. All excavations exceeding 2-ft. in depth (except for footings, basements and retaining walls). Note: the placement of excess material from such excavations may require a grading permit.
   b. All fills:
      i. Intended to support structures.
      ii. That obstructs or diverts a drainage course.
      iii. One foot or more in depth placed on natural slopes steeper than 5 units horizontal to 1 unit vertical.
      iv. 3-ft. or more in depth at its deepest point and greater than 50 cubic yards.
      v. 5-ft. or more in depth at its deepest point and greater than 20 cubic yards.
   c. The grading of access roads or pads for exploratory excavations.
5. Rough grading approval is required before a building permit can be issued. (Appendix J105.7)

SUPPLEMENTAL PLAN REVIEW COMMENTS/SHEETS

6. Refer to the attached sheets for supplemental plan review comments:
   a. Solid Waste Disposal
   b. Non-residential Green Building Standards Code Review
7. Photocopy/blueprint the following on the plans: (Do NOT staple to the plans)
   a. Best Management Practice for Construction Activity (Attachment A) requirements

AREA, OCCUPANCY, AND CONSTRUCTION

8. Specify the type of construction on the Title Sheet.
9. The basic allowable building area is 8500 SF per Table 503. Justify and provide allowable building area analysis on the plan.

MEANS OF EGRESS

10. Provide required head room: 6'8" at the stairs and 7'6" at exit path.
11. Provide details for all stairway showing the following: (1009, 1012)

a. Maximum 7-in., minimum 4-in. rise and minimum 11-in. run (tread).
b. The tolerance between the largest and smallest riser height and/or tread depth shall not exceed 0.375-in. in any flight of stairs.
c. Minimum headroom over the stairs 6-ft. 8-in.
d. Minimum 44-in. clear width.
e. Provide handrails at both sides. The handrail height shall be 34-in. to 38-in. above the nosing, with 1-1/2-in. clearance to the wall, and ends returned to the wall. Open handrails shall have intermediate rails or an ornamental pattern such that a 4-in. sphere in diameter cannot pass through.
f. Handgrip portion of handrails shall not be less than 1-1/4-in. nor more than 2-in. in cross-sectional dimension having a smooth surface with no sharp corners.
g. Stairway framing, connections, bracings, and footings.
h. One-hour construction for the enclosed usable space under the stairs.

12. Provide Exit signs.
13. Exit signs shall be internally or externally illuminated. Internally illuminated exit signs shall be listed and labeled in accordance with UL 924 and shall be installed in accordance with the manufacturer's instructions and Chapter 27. Externally illuminated exits signs shall comply with the graphics and power source requirements in Sections 1011.5.1 and 1011.5.3, respectively. When the face of an exit sign is illuminated from an external source, it shall have an intensity of not less than 5-foot-candles (54 lux).(1011.2)
14. Note on the plans: "Any time a building or a portion of a building is occupied, the means of egress serving the occupied portion shall be illuminated at an intensity of not less than 1-foot-candle (11 lux) at the walking surface level." (1006)
15. The power supply for means of egress illumination shall be provided by the premise's electrical supply. In the event of power supply failure, illumination shall be automatically provided from an emergency system for the following areas: (1006.3)
    a. Aisles and unenclosed egress stairways in rooms and spaces that require two or more means of egress.
    b. Corridors, exit enclosures, and exit passageways in buildings required to have two or more exits.
    c. Exterior egress components at other than the level of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.
    d. Interior exit discharge elements, as permitted in Section 1027.1, in buildings required to have two or more exits.
    e. Exterior landings, as required by Section 1008.1.6, for exit discharge doorways in buildings required to have two or more exits.
16. The exit signs shall also be connected to an emergency electrical system which is to provide continued illumination for a duration of not less than 1-1/2 hr. in case of primary power loss. Continued illumination is to be provided from storage batteries, unit equipment, or an on-site generator and the installation of the emergency power system shall be installed in accordance with Chapter 27. (1006.3)
17. Emergency lighting facilities shall be arranged to provide initial illumination that is at least an average of 1-foot-candle (11 lux) and a minimum at any point of 0.1-foot-candle (1 lux) measured along the path of egress at floor level. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. (1006.4)
18. Egress doors or gates shall be openable from the egress side without the use of a key, special knowledge, or effort. Door handles, pulls, latches, locks, and other operating devices shall be installed 34 to 48 in. above the finished floor. Manually operated flush bolts or surface bolts are not permitted. The unlatching of any door or leaf shall not require more than one operation. (1008.1.9)
19. Plans must indicate / detail the floor or landing on each side of doors is not more than 1/2-in. lower than the threshold of the doorway. Raised thresholds and floor level changes greater than 1/4-in. at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50% slope). (1008.1.7)

FIRE DAMPERS, DUCTS AND RETURN AIR PLENUMS

20. Fire and smoke dampers to be installed at penetrations in the following locations: (716.5)
    a. fire barrier,

GENERAL REQUIREMENTS

21. Obtain architect's and engineer's stamp and signature on the plan include soils engineer.
22. Update code reference to LACBC.
23. Identify historical stairs and guardrails on the plan.
24. Submit a modification for use of non-complying ramp to Research Section, Jonathan Lam at 626-458-6352, for approval.

25. Provide 45 min door at 1 hour fire barrier.
26. Provide panic hardware at the door from an electrical room with more than 1200 A.
27. Provide 1 hour separation from each other: dressing rooms, store room and etc per 410.5.2.
28. Coordinate door number at the lower level between the door schedule and floor plan.
29. Detail guards when located along open-sided walking surfaces, mezzanines, industrial equipment platforms, stairways, ramps and landings that are located more than 30-in above the floor or grade below. (1013.1)
    a. Have a minimum height of 42-in.
    b. Have intermediate rails or an ornamental pattern such that a 4-in. diameter sphere cannot pass through. (1013.3)
    c. Shall be designed for 50-plf applied in any direction at the top and to transfer the load through the supports of the structure. (1607.7)
    d. Shall be designed for a 200 lb concentrated load applied in any direction at any point along the top.(1607.7.1)
30. Provide 42" guard at the roof hatch that located within 10 feet from the roof boundary.

Disabled Access

31. Provide a detailed program to explain how path of travel will be provided to the Public Street and accessible parking space to the theater. The program shall be approved by Research Section, Jonathan Lam at 626-458-6352 and provide the approved program on the plan.
32. Provide an accessible route from wheel chair seats to stage, dressing rooms, locker rooms and other spaces use by performers. 1104B.3.11
33. Provide applicable and enlarged accessible parking plan and passenger loading space plan with details, dimensions and notes to verify disabled access requirements.
34. Provide loading and unloading space on the passenger side for van access parking.
35. Provide applicable and enlarged plans and sections for each stairs (include scenic stairs): rise/run, stripping, handrail, handrail extension, guard, nosing, width, and dimensions.
36. Handrail extension shall be in the direction of the stair flight.
37. Handrails shall extend a minimum of 12 inches beyond the top nosing and 12 inches plus the tread width beyond the bottom nosing
38. Provide a removal base under sinks for knee clearance and reference knee clearance details.
39. Provide 28: to 34: high counter with knee clearance under the sink.
40. Provide applicable enlarged restroom plan with dimensions, details and all clear spaces marked.
41. A door is not allowed to encroach into the required clear space at the front of plumbing fixtures.
42. Provide applicable enlarged stair plan and sections
43. Comply with Emergency Standard effective August 1, 2012:
    a. Provide 16" to 18" between the centerline of the accessible water closet and the side of wall or partition.
    b. Provide 60" clear space around the water closet. A fixture is not allowed within the clear space.
    c. Provide toilet tissue dispensers at 7" to 9" in the front of the water closet measured to the center of the dispenser.
    d. Provide the spout of the drinking fountain at minimum 15" from the vertical support and Maximum 5" from the front edge of the unit, including bumpers.
    e. Provide visual characters and raised characters on the signs with fonts comply with the width of the upper case letter "O" is 60% minimum of and 110% maximum of the height of the uppercase letter "I" and stroke thickness of the uppercase letter "I" shall be maximum 15% of the height of the character.
    f. Signs with raised characters and Braille shall be located 48" minimum above the finish floor or ground surface, measured from the baseline of the lowest line of Braille and 60 inches maximum above the finish floor or ground surface, measured from the baseline of the highest line of raised characters.
    g. Provide the sign within 3" from the approach side of a door

STRUCTURAL REQUIREMENTS

44. NOTE ON THE PLANS: "The use of rolled steel sections and/or bolts manufactured outside the United States will require verification that the products comply with applicable ASTM Standards. Mill certificates will be required for all steel. Steel grades other than ASTM-A36 will require testing by an approved laboratory. All foreign bolts must be approved by County of Los Angeles Building and Safety prior to their use."
45. Note on the plans: "Compaction report shall be submitted to the Building Inspector prior to footing inspection."

46. Update the soils report references, include all the reports.
47. Have the consulting soils/geotechnical engineer review and approve the foundation plans, shoring plans and details. (106.4.3)
48. All shop welding shall be performed within a licensed fabricator by LA City of ICC.
49. The occupancy category for this building is III. Design the building with I factor of 1.25.
50. Update occupancy category and I factor on seismic design information.
51. Provide structural calculations for foundation, stairs, handrail, guard
52. Provide framing plan over the pit as shown on the calc.
53. Use 0.35 for friction per the soils report.
54. Obtain seismic load requirement for retaining wall and basement wall over 6 feet from the soils engineer.
55. The soils reports do not contain recommendation for the soil nail and the shoring design is based on the soil nail and shotcrete. Provide recommendations for soil nail from the soil engineer or revise the shoring design per the soils report. The shoring design is not checked at this time. Resubmit the revised shoring design or revised soils report for shoring plan check. Additional corrections may follow.

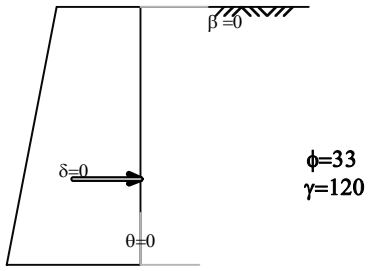
APPENDIX B

INPUT DATA

Condition:…… Horizontal Soil Layer (DE)

ϕ, Soil friction (deg)	33.0
δ, Friction angle between soil and concrete wall (deg)	0.0
β, Backfill slope angle (deg)	0.0
θ, Angle of wall slope with vertical wall	0.0
γ, Wet unit weight of the soil (pcf)	120
PeakHorizontal Acceleration	0.48
k_h, Horizontal acceleration coefficient	0.24
k_v, Vertical acceleration coefficient	0.00
$\psi = \tan^{-1}(k_h/(1-k_v))$	13.5 deg

CONFIGURATION



OUTPUT

a) At Rest condition

1. Coeff of **Earth Pressure at Rest, Ko** :…… **0.46**
   Equivalent Fluid Pressure…… 54.6 psf/ft

USE 55 psf/ft

Rankine Solution (For vertical wall only, θ = 0, assuming no wall friction, δ = 0, and upward backfill only, β = 0)

1. Coeff of **Active Earth Pressure, K_A** :…… **0.29**
   Equivalent Fluid Pressure…… 35.4 psf/ft

$$K_A^{RANKINE} = \frac{\cos\beta - \sqrt{\cos^2\beta - \cos^2\phi}}{\cos\beta + \sqrt{\cos^2\beta - \cos^2\phi}}$$

USE 35 psf/ft

2. Coeff of **Passive Earth Pressure, K_P**:…… **3.39**
   Equivalent Fluid Pressure…… 407.1 psf/ft

$$K_P^{RANKINE} = \frac{\cos\beta + \sqrt{\cos^2\beta - \cos^2\phi}}{\cos\beta - \sqrt{\cos^2\beta - \cos^2\phi}}$$

USE 400 psf/ft

3. Coeff of **Seismic - Static Active Earth Pressure, K_{AE}** :…… **0.46**
   Equivalent Fluid Pressure…… 55 psf/ft

$$K_{AE} = \frac{\cos^2(\phi-\theta-\psi)}{\cos\psi\cos^2\theta\cos(\delta+\theta+\psi)\left[1+\sqrt{\frac{\sin(\delta+\phi)\sin(\phi-\beta-\psi)}{\cos(\delta+\theta+\psi)\cos(\beta-\theta)}}\right]^2}$$

4. **Seismic Active Earth Pressure**
   Equivalent Fluid Pressure: 55 psf/ft- 35 psf/ft= 20.0 psf/ft

USE 20 psf/ft

PASSIVE AND ACTIVE PRESSURES **Ford Theater** **Hollywood, CALIFORNIA**	PROJECT NAME : JAFT PROJECT NUMBER : 10296.002 DESIGNED/CHECKED BY: sp/ck	**Figure B-1**

APPENDIX C

Ind. Surcharge on Basement Wall
(See attached Figure)

equivalent backslope $\beta \sim 40°$

$\phi = 33°$, $c = 600$ psf (CDMG, 1998)

Basement wall ~ 12' High

Calculate equivalent ϕ^*

ϕ^* incorporates cohesion

$\tau = c + \sigma \tan\phi = \sigma \tan\phi^*$

$= 600 \text{ psf} + 12 \times 120 \tan 33 = 12 \times 120 \tan\phi^*$

$\Rightarrow \phi^* = 46.8°$

considering that a portion of the active soil wedge may be in wall backfill, reduce c by FS = 2 $\Rightarrow c^* = 300$ psf

$\tan\phi^{**} = [300 \text{ psf} + 12 \times 120 \tan 33°] / 12 \times 120$

$\phi^{**} = 40.6° \sim 40°$

Project No.	10296.001
Project Name	JAFT
Engineer	CK
Date	Oct '13
Figure No.	X1

Leighton and Associates
A LEIGHTON GROUP COMPANY

Using NAVFAC 7.2-64 (Anchored)

with $\beta = 45°$, $\phi^{**} = 40°$

$K_A = 0.6 \Rightarrow 72$ pcf

Rec'd surcharge for active case

$= 72 - 35$ (rec'd active pressure for level backfill) $= 37$ pcf

Ratio of $\frac{\text{At-Rest}}{\text{Active}} = \frac{55 \text{ pcf}}{35 \text{ pcf}} = 1.57$

Rec'd surcharge for at-rest case

$= 37 \times 1.57 = 58$ pcf

Considering that actual case will be between Active & At-rest condition, use Arith. of values: $\frac{37 + 58}{2} = 47.6$

$\Rightarrow$ Rec'd surcharge = $\boxed{50 \text{ pcf}}$

Re: **JAF Amphitheatre** **JOB #13-146**
Hollywood, California

Subject: **Temporary Shoring Design Submittal**

Dear Mr. Delgadillo:

Enclosed please find the temporary shoring design submittal for the above referenced project.

Should you have any additional questions or comments regarding this matter, please advise.

Sincerely,

EARTH SUPPORT SYSTEMS, INC.

Roy P. Reed, P.E.
Project Engineer

1. THE SHORING ENGINEER IS DEFINED AS THE REGISTERED CIVIL ENGINEER WHOSE STAMP RESIDES ON THESE DRAWINGS.
2. THE GENERAL CONTRACTOR (GC) IS AS DEFINED WITHIN THE CONTRACT DOCUMENTS.
3. CONSTRUCTION SHALL CONFORM TO ALL APPLICABLE SAFETY AND CONSTRUCTION CODES.
4. THE SHORING CONTRACTOR IS DEFINED AS THE ENTITY WHICH INSTALLS THE SUPPORT SYSTEM(S) SHOWN ON AND DESCRIBED WITHIN THE CONTRACT DOCUMENTS.
5. THE DESIGN OF THE SOIL NAIL WALL IS BASED ON THE GUIDELINES SET FORTH BY THE FHWA CIRCULAR NO. 7 DESIGN & CONSTRUCTION MONITORING OF SOIL NAIL WALLS."
6. GENERAL SITE EXCAVATION SHALL BE COORDINATED WITH THE INSTALLATION OF THE SHORING SYSTEM TO ENSURE SAFE WORKING CONDITIONS AND TO PREVENT THE LOSS OF GROUND AND THE CAVING OF BANKS.
7. PILE DRIVING EQUIPMENT, DRILL EQUIPMENT & CRANES SHALL NOT BE LOCATED WITHIN TEN (10) FEET OF THE SHORING BULKHEAD UNLESS SPECIFICALLY PROVIDED FOR IN THE DESIGN AND SPECIFICALLY SHOWN IN THESE DRAWINGS.
8. ALL SHORING DATA ON THESE SHEETS ARE THE EXCLUSIVE PROPERTY EARTH SUPPORT SYSTEMS INC. AND NO PART OF THESE DRAWINGS SHALL BE COPIED AND/OR USED WITHOUT OUR WRITTEN CONSENT.
9. THE GENERAL CONTRACTOR SHALL VERIFY ALL DIMENSIONS AND CONDITIONS AT THE SITE AND REPORT ANY VARIATIONS TO THE SHORING ENGINEER.
10. THE GENERAL CONTRACTOR SHALL COORDINATE SHORING WITH DRAWINGS OF RECORD TO ENSURE PROVISIONS OF POCKETS, BLOCKOUTS, OFFSETS AND ANY OTHER ITEMS THAT MAY BE IN CONFLICT WITH OR AFFECTED BY THE SHORING SYSTEM.
11. ALL INSPECTION SERVICES, MATERIAL TESTING OR NOTIFICATIONS SHALL BE THE RESPONSIBILITY OF THE GENERAL CONTRACTOR.
12. ALL PERMITS (EXCEPT OSHA PERMIT) SHALL BE PROCURED AND PAID FOR BY THE GENERAL CONTRACTOR.
13. ALL ENCROACHMENT EASEMENTS AND PERMISSIONS SHALL BE PROCURED AND PAID FOR BY THE GENERAL CONTRACTOR.
14. ALL STRUCTURAL DETAILS OR SHAPES SHOWN ARE THOSE UTILIZED FOR DESIGN. ALTERNATE DETAILS, CONNECTIONS, SHAPES AND/OR MATERIALS MAY BE USED SUBJECT TO THE APPROVAL OF THE SHORING ENGINEER AND THE BUILDING OFFICIAL.
15. THE GENERAL CONTRACTOR SHALL PERIODICALLY MONITOR THE FACE OF SHOTCRETE AS THE INSTALLATION PROGRESSESS. THE SURVEY DATA SHALL BE REDUCED, INTERPRETED AND TRANSMITTED TO THE SHORING ENGINEER.
16. IF IN THE OPINION OF THE SHORING ENGINEER, MONITORING DATA INDICATES EXCESSIVE MOVEMENT, ALL SHORING WORK SHALL CEASE UNTIL THE SHORING ENGINEER INVESTIGATES THE SITUATION AND MAKES RECOMMENDATIONS FOR REMEDIATION OR CONTINUING. IN ADDITION, THE SURVEY DATA WILL BE USED BY THE SHORING CONTRACTOR TO MAINTAIN ALIGNMENT OF THE SHORING FACE.

PROCEDURE FOR SOIL NAILING

1. LINES AND GRADES ARE TO BE ESTABLISHED BY THE GENERAL CONTRACTOR TO ENSURE PROPER LOCATION OF SOIL NAIL ANCHORS.
2. EXCAVATED FACE SHALL BE TRIMMED UNIFORMLY TO A VERTICAL PLANE OR BATTER (SEE PLANS & SECTIONS) AT BACK FACE OF SHOTCRETE BY CONTRACTOR. START EXCAVATION AND SHOTCRETE IN LIFTS NOT TO EXCEED FIVE (5) FEET OR AS OTHERWISE AUTHORIZED BY THE SHORING ENGINEER. CONTINUE THIS EXCAVATION PROCEDURE UNTIL ANCHOR LEVELS ARE REACHED.
3. THE GENERAL CONTRACTOR SHALL GRADE SAFE WORKING AND DRILLING BENCHES NOT MORE THAN TWO (2) FEET LOWER THAN THE ANCHOR LEVEL. BENCHES SHALL HAVE LENGTHS AND WIDTHS WHICH WILL ALLOW FOR SAFE AND PRODUCTIVE MOVEMENT OF THE ANCHOR DRILLING EQUIPMENT.
4. DRILL ANCHOR HOLES TO THE DEPTHS AND DIAMETERS INDICATED OR AS OTHERWISE AUTHORIZED BY THE SHORING ENGINEER. IF CAVING OCCURS, CASING OR OTHER ALTERNATE DRILLING METHODS MAY BE USED AS AUTHORIZED BY THE SHORING ENGINEER.
5. INSERT THE ANCHOR TENDONS INTO THE DRILLED SHAFTS WHILE TAKING MEASURES TO ENSURE THAT THE TENDONS ARE CENTERED (I.E. BY THE USE OF CENTRALIZING DEVICES OR OTHER MEANS ACCEPTABLE TO THE SHORING ENGINEER) IN THE DRILLED SHAFT.
6. BACKFILL THE ANCHOR LENGTH WITH A CONCRETE GROUT MIX IDENTIFIED IN MATERIALS.
7. AFTER ANCHORS HAVE BEEN PLACED, REINFORCEMENT & SHOTCRETE SHALL BE APPLIED TO THE EXCAVATED FACE. A BEARING PLATE WILL THEN BE PLACED ON THE ANCHOR AND BOLTED DOWN WITH A BEARING NUT.
8. EXCAVATE TO NEXT DRILL BENCH LOCATION AFTER SHOTCRETE HAS CURED FOR TWO (2) DAYS MIN.
9. REPEAT STEPS 5 THROUGH 10 AS APPLICABLE FOR EACH ADDITIONAL LEVEL OF ANCHORS OR UNTIL BOTTOM OF EXCAVATION IS REACHED.

PROCEDURE FOR SOIL NAIL TESTING

1. PROOF TEST 5% OF TOTAL ANCHORS @ 150% OF ALLOWABLE PULL-OUT RESISTANCE IN ACCORDANCE WITH FHWA "GEOTECHNICAL ENGINEERING CIRCULAR No.7."
2. PERFORMANCE TEST 2 ANCHORS MINIMUM @ 150% OF ALLOWABLE PULL-OUT RESISTANCE IN ACCORDANCE WITH FHWA "GEOTECHNICAL ENGINEERING CIRCULAR No.7."
3. ALLOWABLE PULL OUT RESISTANCE FOR THIS PROJECT EQUALS: 2,827 POUNDS PER LINEAL FOOT. (12.5-PSI)
4. ALL TESTING TO BE PERFORMED UNDER THE SUPERVISION OF THE GEOTECHNICAL ENGINEER'S REPRESENTATIVE.

MATERIALS (SOIL NAIL WALL)

1. WELDING: ELECTRIC ARC USING ELECTRODES E70-XX PLACED BY QUALIFIED WELDERS.
2. MISCELLANEOUS STEEL: STEEL SHALL CONFORM TO REQUIREMENTS OF ASTM A-36 (36 KSI) OR BETTER.
3. ANCHOR TENDON: ANCHOR TENDON SHALL BE GRADE 75 ASTM A-615 THREADED BAR OR BETTER. SEE CROSS SECTIONS FOR BAR SIZES & LENGTHS.
4. ANCHOR CONCRETE/GROUT: ANCHOR PLUG FOR SOIL NAILS SHALL BE NEAT PORTLAND CEMENT WITH A MAXIMUM WATER-CEMENT RATIO OF 0.45 BY WEIGHT. IT MAY CONTAIN AN ADDITIVE TO CONTROL SHRINKAGE, SUCH AS INTRAPLAST-N BY SIKA CORP., AND SHALL HAVE SUFFICIENT STRENGTH TO INSURE LOAD TRANSFER BETWEEN THE THREADED BAR AND SOIL. AT THE SHORING CONTRACTORS OPTION, A 3000 PSI CONCRETE @ 28 DAYS COMPRESSIVE STRENGTH MAY BE UTILIZED.
5. SHOTCRETE: SHOTCRETE SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH AT 28 DAYS OF 4000 PSI.
6. REINFORCING STEEL: REINFORCING STEEL SHALL BE GRADE 60 AND CONFORM TO REQUIREMENTS OF ASTM A615.
7. WELDED WIRE FABRIC: STEEL SHALL CONFORM TO THE REQUIREMENTS OF ASTM A-185.
8. HOLLOW BARS: CTS TITAN HOLLOW BARS CONFORMING TO MANUFACTURER'S SPECIFICATIONS.

MONITORING (TEMPORARY)

1. MONITORING OF THE SURROUNDING GRADE ADJACENT TO THE SHORED EXCAVATION AND EXISTING STRUCTURES SHALL BE PERFORMED AT REGULAR INTERVALS, NOT TO EXCEED FIVE DAYS OR WITH EACH LIFT OF THE EXCAVATION (WHICHEVER IS MORE FREQUENT), TO CONFIRM THAT HORIZONTAL MONUMENTS AND SETTLEMENTS AGREE WITH THOSE ESTIMATED. (MAXIMUM ESTIMATED LATERAL MOVEMENT OR SETTLEMENT = 1.0 INCH) MONITORING MAY BE PERFORMED WEEKLY IF THE RESULTS OF PERFORMANCE MONITORING INDICATE STABLE CONDITIONS AND THE CONSTRUCTION MANAGER CONCURS THAT MONITORING FREQUENCY CAN BE REDUCED. A BASELINE SURVEY SHALL BE PERFORMED PRIOR TO THE BEGINNING OF CONSTRUCTION. SURVEY MONITORING POINTS SHALL BE PLACED AT SOIL NAIL LEVEL ONE AT APPROXIMATELY 36 FEET ON CENTER HORIZONTALLY. A SECOND SERIES OF MONITORING POINTS SHALL BE PLACED 15 FEET FROM THE FACE OF THE SHORING WALL ON THE ADJACENT GROUND.
2. THE EFFECTS OF THE PROPOSED EXCAVATION AND SHORING SYSTEM ON EXISTING IMPROVEMENTS & UTILITIES SHALL BE MONITORED IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOTECHNICAL CONSULTANT CONTAINED IN THE GEOTECHNICAL DOCUMENTS LISTED UNDER THE "GRADING & GEOTECHNICAL SPECIFICATIONS".

SUMMARY OF SPECIAL INSPECTION

1	Concrete	13.1	Verify soils conditions are substantially in conformance with the soil investigation report
2	Bolts installed in concrete	13.2	Verify that foundation excavations extend to proper depth and bearing strata
3	Concrete moment-resisting space frame	13.3	Provide soil compaction test results, depth of fill, relative density, bearing values
4	Reinforcing steel and prestressing steel	13.4	Provide soil expansion test results, expansion index, recommendations for foundations, on-grade floor slab design for each building site
5.1	All structural welding	14	Smoke control system
5.2	Weld testing ductile moment-resisting steel frame	15	Special cases (describe)
5.3	Welding reinforcing steel	16	off-site fabrication of building components
6	High-strength bolting	17	Other special inspections as required by designer (Structural Observation)
7	Structural masonry		
8	Reinforced gypsum concrete		
9	Insulating concrete fill		
10	Spray-applied fireproofing		
11	Deep foundations (piling & drilled caissons)		
12	Shotcrete		

Number	Description of Type of Inspection Required, Location, Remarks, etc.	Design Strength
1	Shotcrete. Verify design mix & strength.	4000 psi
2	Anchor Grout. Verify design mix & strength.	3000 psi
3	Verify drilled shaft length, diameter & angle for soil nails.	
4	Proof testing 5% of total anchors to 150%.	
5	Performance testing @150% (min. 2 anchors per soil type).	
6	Placement of reinf. steel & soil nails.	
7	Field Welds	E70-XX
8	Soil item 13.1	

a. The Special Inspections listed are in addition to the called inspections required by the CBC, as amended. Special Inspection is not a substitute for inspection by a City Inspector.
   1. Structural Observation does not include or waive the responsibility for the inspections required by the CBC.

b. Continuous inspection is always required during the performance of the work unless otherwise specified. When work in more than one category of work requiring special inspection is to be performed simultaneously, or the geographic location of the work is such that it cannot be continuously observed in accordance with the provisions of the CBC, it is the agent's responsibility to employ a sufficient number of inspectors to assure that all the work is inspected in accordance with those provisions.

c. The Special Inspectors must be certified by the City of San Diego to perform the type of inspection specified.

Exceptions:
1. Soils inspections by the Soils Engineer of record.
2. Smoke Control System, by the Mechanical Engineer of record.
3. When waived by the Building Official.

d. It is the responsibility of the contractor to notify the Special Inspector or inspection agency at least one working day prior to performing any work that requires special inspection.

e. Specially inspected work that is installed or covered without the approval of the City Inspector is subject to removal or exposure.

TEMPORARY SOIL NAIL DESIGN PARAMETERS

FORMATION (BORING NO.4):
Ø = 33° γ = 125 pcf.
C = 600 psf. Fa = 25 psi. (ultimate)

SOIL DESIGN PARAMETERS USED FOR SOIL NAIL WALL DESIGN ARE BASED IN THE RECOMMENDATIONS CONTAINED IN:

Temporary Shotcrete Facing Design

Facing Properties

$H := 25 \cdot ft$ = Maximum retained height

$Hs := 110 \cdot ft$ = Retained slope height

$t_f := 4 \cdot in$ = Shotcrete facing thickness

$f'_c := 4000 \cdot psi$ = Shotcrete compressive strength

$shaft := 6 \cdot in$ = Soil nail drill shaft diameter

$Sh := 6 \cdot ft$ = Horizontal nail spacing

$Sv := 5 \cdot ft$ = Vertical nail spacing

Welded Wire Reinforcement

Wire ≡ "W4.0 x W4.0"

grid ≡ 4·in = Welded wire center-to-center grid spacing

$N := 1$ = Number of welded wire reinforcement per layer

$Ast = 0.12 \cdot \frac{in^2}{ft}$ = Weld wire reinforcement area per foot width

$Ah := N \cdot Ast$ = Welded wire horizontal cross sectional area

$Av := Ah$ = Welded wire vertical cross sectional area

$Fy_{wire} := 60 \cdot ksi$ = Welded wire yield strength (ASTM A 1064)

Welded Wire

$Ah = 0.12 \cdot \frac{in^2}{ft}$
$Av = 0.12 \cdot \frac{in^2}{ft}$

Waler Bars at Nail Head (As Applicable)

bar ≡ 4 = Waler rebar size ("N/A" = Not applicable)

$Nb := 2$ = Number of waler / bearing bars

$db := diabar$ = Waler / bearing bar nominal diameter

$Ab := areabar$ = Waler / bearing bar cross sectional area

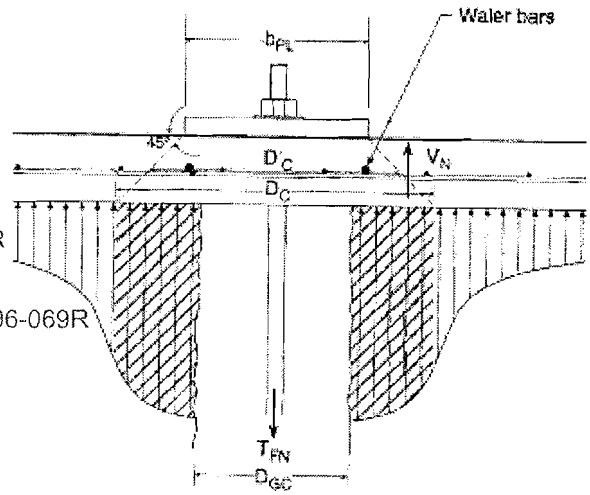
$Fy_b := 60 \cdot ksi$ = Waler / bearing bar yield strength (Grade 60)

Waler / Bearing Bars

$db = 0.5 \cdot in$
$Ab = 0.2 \cdot in^2$

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

Facing Properties (Continued)



Nail Head Assembly

Plate := "8-in x 8-in x 3/4in"

$b_p := 8 \cdot in$ = Bearing plate width - 8" min, FHWA-SA-96-069R

$t_p := 0.75 \cdot in$ = Bearing plate thickness - 0.75" min, FHWA-SA-96-069R

$Fy_p := 36 \cdot ksi$ = Bearing plate yield strength (Grade 36)

Soil Stremgth Properties

$\phi := \frac{33 \cdot deg}{1.5}$ = Internal soil friction angle (Conservative)

$\gamma := 125 \cdot pcf$ = Soil unit weight

$C := \frac{600 \cdot psf}{1.5}$ = Soil cohesion

$x := 1.4$ = Horizontal Slope Projection

$y := 1$ = Vertical Slope Projection

Internal Failure Loading

Initial Guess fail := 35·deg

Given

$$\frac{d}{dfail} Q(fail) = 0$$

$\beta := Find(fail)$

$\beta = 40.3 \cdot deg$
$Q(\beta) = 9288 \cdot plf$

Critical Failure Plane Geometry

I. Facing Flexure

SLD Strength Factors - Group IV, Temporary

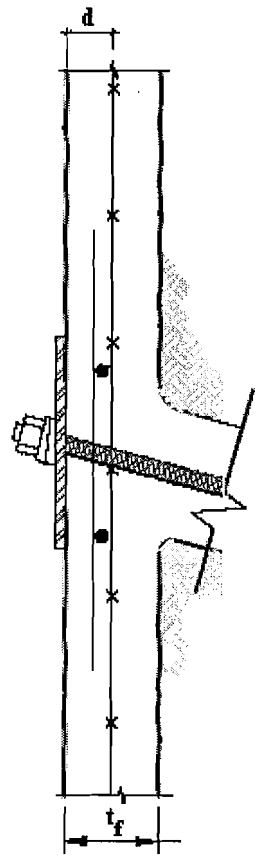
$d := \frac{t_f - dia}{2}$ = Distance to tensile negative moment reinforcement

$A_{v_j} := Av \cdot Sh + Nb \cdot Ab \cdot (j - 1)$ = Negative reinforcement area

$A_{h_j} := Ah \cdot Sv + Nb \cdot Ab$ = Positive reinforcement area

$C_F := \begin{cases} 2.0 & \text{if } t_f \le 4 \cdot in \\ 1.5 & \text{if } 4 \cdot in < t_f \le 6 \cdot in \\ 1.0 & \text{otherwise} \end{cases}$ = Flexure pressure factor
Table 4.2, p. 104 FHWA-SA-96-069R

$\alpha_F := 0.67$ = Nail head facing flexure factor
Table 4.4, p. 119 FHWA-SA-96-069R



Reinforcing depth, $d = 1.9 \cdot in$

Reinforcement Area

$A_{v_1} = 0.72 \cdot in^2$	$A_{h_1} = 1 \cdot in^2$	***Positive***
$A_{v_2} = 1.12 \cdot in^2$	$A_{h_2} = 1 \cdot in^2$	***Negative***

Horizontal Moment Capacity

$$mv_j := \frac{A_{v_j} \cdot \min(Fy_{wire}, Fy_b)}{Sh} \cdot \left(d - \frac{A_{v_j} \cdot \min(Fy_{wire}, Fy_b)}{1.7 \cdot f'_c \cdot Sh} \right)$$

= Negative moment capacity
p. 106 eqn 4.1A FHWA-SA-96-069R

$$mh_j := \frac{A_{h_j} \cdot \min(Fy_{wire}, Fy_b)}{Sv} \cdot \left(d - \frac{A_{h_j} \cdot \min(Fy_{wire}, Fy_b)}{1.7 \cdot f'_c \cdot Sv} \right)$$

= Positive moment capacity
p. 106 eqn 4.1A FHWA-SA-96-069R

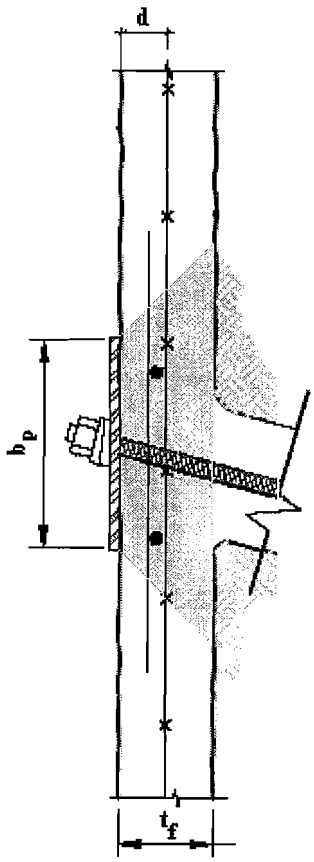
$$T_F := \min\left[\begin{bmatrix} 8C_F \cdot (mv_1 + mv_2) \cdot \left(\frac{Sh}{Sv}\right) \\ 8C_F \cdot (mh_1 + mh_2) \cdot \left(\frac{Sv}{Sh}\right) \end{bmatrix}\right]$$

= Nominal nail head flexural capacity
p. 105 eqn 4.1A FHWA-SA-96-069R

Ultimate Strength	$T_F = 46.4 \cdot kip$
Allowable Strength	$\alpha_F \cdot T_F = 31.1 \cdot kip$

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

II. Punching Shear



SLD Strength Factors - Group I, Permanent

Figure 4.9, p. 108 FHWA-SA-96-069R

$hc := t_f$ = Effective punching cone height

$Dc := b_p + 2hc$ = Effective punching cone diameter (Bottom)

$Dc' := b_p + hc$ = Critical punching cone diameter (Mid-height)

$Dgc := shaft$ = Diameter of grouted soil nail column

$Ac := \frac{\pi \cdot Dc^2}{4}$ = Area of effective punching cone

$Agc := \frac{\pi \cdot Dgc^2}{4}$ = Area of effective punching cone

$Ac = 201 \cdot in^2$	Critical cone diameter, $Dc' = 12 \cdot in$
$Agc = 28 \cdot in^2$	Grouted col. diameter, $Dgc = 6 \cdot in$

Nominal Nail Head Shear Strength

$\alpha_s := 0.67$ = Punching shear strength factor - Table 4.5, p. 121 FHWA-SA-96-069R

$C_s := 1.0$ = Punching shear pressure factor - Table 4.5, p. 121 FHWA-SA-96-069R

$V_N := 4 \cdot \sqrt{f'_c \cdot psi} \cdot \pi \cdot Dc' \cdot hc$ = Internal punching shear strength - Table 4.2, p. 107 FHWA-SA-96-069R
ACI 318-99, Eqn. 11-37

$$T_{PS} := \frac{V_N}{1 - C_s \cdot \frac{(Ac - Agc)}{Sv \cdot Sh - Agc}}$$

= Nominal nail head srength (Punching shear)
Eqn. 4.3, p. 109 FHWA-SA-96-069R

Ultimate Strength	$T_{PS} = 39.7 \cdot kip$
Allowable Strength	$\alpha_s \cdot T_{PS} = 26.6 \cdot kip$

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

GOVERNING ALLOWABLE NAIL HEAD STRENGTH

$$Tgov := \min\left(\begin{pmatrix} \alpha_F \cdot T_F \\ \alpha_s \cdot T_{PS} \end{pmatrix}\right)$$

$Tgov = 26.6 \cdot kip$	*Allowable flexural capacity governs facing strength*

Minimum Allowable Nail Head Service Load Check

$F_F := 0.50$ = Nail head survice factor p. 50 & 119 FHWA-SA-96-069R

$kc := 1.5$ = Complexity coefficient p. 50 & 119 FHWA-SA-96-069R
kc = 1 for normal configurations
kc = 2 for complex multi-layered soil configurations

$$t_F := \frac{2kc \cdot F_F \cdot Q(\beta) \cdot Sh \cdot Sv}{H}$$ = Nail head survice load eqn. 4.6 FHWA-SA-96-069R

$SLoad := if(t_F \le Tgov, "Ok", "No Good")$

$SLoad = "Ok"$

Nail Head Allowable Load	$Tgov = 26.6 \cdot kip$
Nail Head Service Load	$t_F = 16.7 \cdot kip$

Check Upper Cantilever

One-Way Service Flexure Check

$Hcant := 3.5 \cdot ft$ = Maximum height of cantilevered shotcrete

$Ps := 100 \cdot psf$ = Uniform surcharge load

$$ms := \frac{2 \cdot Q(\beta)}{H^2} \cdot \frac{Hcant^3}{6} + Ps \cdot \frac{Hcant^2}{2}$$ = Cantilevered one-way service moment

$Mall := \alpha_F \cdot mv_2$ = Allowable one-way service moment

$Flexure := if(ms \le Mall, "Ok", "No Good")$

$ms = 0.82 \cdot kip \cdot \frac{ft}{ft}$
$Mall = 1.09 \cdot kip \cdot \frac{ft}{ft}$

$Flexure = "Ok"$

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

One-Way Service Shear

$vs := \frac{2 \cdot Q(\beta)}{H^2} \cdot \frac{Hcant^2}{2} + Ps \cdot Hcant$ = Cantilevered service shear

$V_{NS} := 2 \cdot \sqrt{f'_c \cdot psi} \cdot d$ = Cantilevered one-way nominal shear
ACI 318, Eqn. 11-28

$Vall := \alpha_s \cdot V_{NS}$ = Cantilevered one-way allowable shear

$Shear := if(vs \le Vall, "Ok", "No Good")$

$vs = 0.5 \cdot klf$
$Vall = 1.9 \cdot klf$

Shear = "Ok"

Welded Wire Mesh Minimum Development & Splice Length

$\lambda := 1$ = Aggregate concrete factor - ACI 12.2.4

$Awire := Ah \cdot grid$ = Cross sectional area of welded wire grid

$l_d := 0.27 \cdot \frac{Awire \cdot in}{grid} \cdot \left(\frac{Fy_{wire}}{\sqrt{f'_c \cdot lb}} \right) \cdot \lambda$ = Welded wire fabric development length - ACI 12.8

$splice := \max\left(\begin{pmatrix} grid + 2 \cdot in \\ 1.5 \cdot l_d \\ 6 \cdot in \end{pmatrix} \right)$ = Minimum welded wire splice length
ACI 12.19.1 & 12.19.2

$l_d = 2.6 \cdot in$
$splice = 6 \cdot in$

Minimum splice, Lap 2 Sqaures

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

Facing Reinforcement Details (Continued)

Waler & Bearing Bars Minimum Development Length (As Applicable)

bar = 4 = Waler / Bearing rebar size (As applicable)

db = 0.5·in = Waler bar nominal diameter

$\alpha := 1$ = Rebar location factor - ACI 12.2.4

$\beta := 1$ = Coating factor - ACI 12.2.4

$\lambda := 1$ = Aggregate concrete factor - ACI 12.2.4

$cmin := t_f - d$ = Waler / Bearing rebar minimum cover (As applicable)

spacing := 12·in = Waler / Bearing spacing (As applicable)

ACI 7.7.1 & ACI 12.2.2

Cover := if(cmin ≥ 2·in, "Ok" , "No Good")

Space := if(spacing ≥ 2·db, "Ok" , "No Good")

Cover = "Ok"
Space = "Ok"

Minimum Waler Bar Length

$$l_d := \begin{cases} 0\cdot in & \text{if bar = "N/A"} \\ \text{otherwise} & \\ \quad \dfrac{\dfrac{Fy_b}{psi}\cdot\alpha\cdot\beta\cdot\lambda}{25\cdot\sqrt{\dfrac{f'_c}{psi}}}\cdot db & \text{if bar} \le 6 \\ \quad \dfrac{\dfrac{Fy_b}{psi}\cdot\alpha\cdot\beta\cdot\lambda}{20\cdot\sqrt{\dfrac{f'_c}{psi}}}\cdot db & \text{if bar} > 6 \end{cases}$$

= Basic development length - ACI 12.2.2

$l_d = 19\cdot in$

Use, 24" Long Waler Bars 12" o.c.

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

Theoretical Displacement

$H = 25\,ft$ = Maximum soil nail retained height

$Lnail := 25 \cdot ft$ = Average nail length of wall under consideration

$Soil\_type := "A"$ = Soil type - Use: "A" for dense granular soils / rock
"B" for medium dense granular soils
"C" for loose granular soils / clays

$C := 0.70$ = Typical nail length to wall height ratio

$$\delta := \begin{cases} 0.1\% & \text{if } Soil\_type = "A" \\ 0.2\% & \text{if } Soil\_type = "B" \\ (0.4\%) & \text{if } Soil\_type = "C" \end{cases}$$ = Peak wall displacement coefficients p. 53, 2.4.6 FHWA-SA-96-069R

$$\Delta := \frac{\delta \cdot C \cdot H^2}{Lnail}$$ = Maximum theoretical deflection

$\Delta = 0.2 \cdot in$

Facing Reinforcement Details

Minimum Reinforcement

$b := 12 \cdot in$ = Width of concrete section for analysis

Vertical Direction

$Asvmin := 0.0012 \cdot t_f \cdot b$ = Minimum vertical reinforcement area - ACI 14.3.2

$Avsteel := Av \cdot b$ = Total vertical reinforcement per foot width

$Vertical := if(Asvmin \le Avsteel, "Ok", "No Good")$

$Asvmin = 0.06 \cdot in^2$

$Avsteel = 0.12 \cdot in^2$

Vertical = "Ok"

Horizontal Direction

$Ashmin := 0.0020 \cdot t_f \cdot b$ = Minimum horizontal reinforcement area - ACI 14.3.3

$Ahsteel := Ah \cdot b + Nb \cdot Ab$ = Total horizontal reinforcement per foot width

$Horizontal := if(Ashmin \le Ahsteel, "Ok", "No Good")$

$Ashmin = 0.1 \cdot in^2$

$Ahsteel = 0.52 \cdot in^2$

Horizontal = "Ok"

SLD Strength Factors - Group IV, Temporary

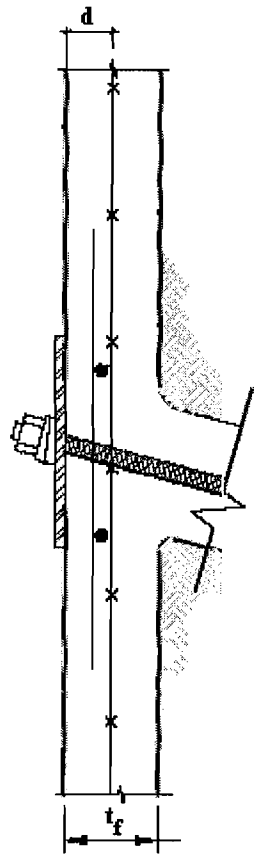
$d := \frac{t_f - dia}{2}$ = Distance to tensile negative moment reinforcement

$A_{v_j} := Av \cdot Sh + Nb \cdot Ab \cdot (j - 1)$ = Negative reinforcement area

$A_{h_j} := Ah \cdot Sv + Nb \cdot Ab$ = Positive reinforcement area

$C_F := \begin{cases} 2.0 & \text{if } t_f \le 4 \cdot in \\ 1.5 & \text{if } 4 \cdot in < t_f \le 6 \cdot in \\ 1.0 & \text{otherwise} \end{cases}$ = Flexure pressure factor
Table 4.2, p. 104 FHWA-SA-96-069R

$\alpha_F := 0.67$ = Nail head facing flexure factor
Table 4.4, p. 119 FHWA-SA-96-069R



Reinforcing depth, $d = 2.9 \cdot in$

Reinforcement Area

$A_{v_1} = 1.44 \cdot in^2$	$A_{h_1} = 1.6 \cdot in^2$	***Positive***
$A_{v_2} = 1.84 \cdot in^2$	$A_{h_2} = 1.6 \cdot in^2$	***Negative***

Horizontal Moment Capacity

$$mv_j := \frac{A_{v_j} \cdot \min(Fy_{wire}, Fy_b)}{Sh} \cdot \left(d - \frac{A_{v_j} \cdot \min(Fy_{wire}, Fy_b)}{1.7 \cdot f'_c \cdot Sh} \right)$$

= Negative moment capacity
p. 106 eqn 4.1A FHWA-SA-96-069R

$$mh_j := \frac{A_{h_j} \cdot \min(Fy_{wire}, Fy_b)}{Sv} \cdot \left(d - \frac{A_{h_j} \cdot \min(Fy_{wire}, Fy_b)}{1.7 \cdot f'_c \cdot Sv} \right)$$

= Positive moment capacity
p. 106 eqn 4.1A FHWA-SA-96-069R

$$T_F := \min\left[\begin{bmatrix} 8C_F \cdot (mv_1 + mv_2) \cdot \left(\frac{Sh}{Sv}\right) \\ 8C_F \cdot (mh_1 + mh_2) \cdot \left(\frac{Sv}{Sh}\right) \end{bmatrix}\right]$$

= Nominal nail head flexural capacity
p. 105 eqn 4.1A FHWA-SA-96-069R

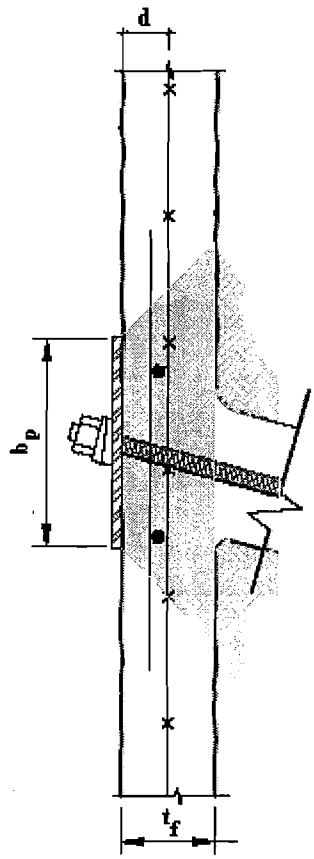
Ultimate Strength	$T_F = 84.9 \cdot kip$
Allowable Strength	$\alpha_F \cdot T_F = 56.9 \cdot kip$

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

II. Punching Shear

SLD Strength Factors - Group I, Permanent

Figure 4.9, p. 108 FHWA-SA-96-069R



$hc := t_f$ = Effective punching cone height

$Dc := b_p + 2hc$ = Effective punching cone diameter (Bottom)

$Dc' := b_p + hc$ = Critical punching cone diameter (Mid-height)

$Dgc := shaft$ = Diameter of grouted soil nail column

$Ac := \frac{\pi \cdot Dc^2}{4}$ = Area of effective punching cone

$Agc := \frac{\pi \cdot Dgc^2}{4}$ = Area of effective punching cone

$Ac = 452 \cdot in^2$	Critical cone diameter, $Dc' = 18 \cdot in$
$Agc = 28 \cdot in^2$	Grouted col. diameter, $Dgc = 6 \cdot in$

Nominal Nail Head Shear Strength

$\alpha_s := 0.67$ = Punching shear strength factor - Table 4.5, p. 121 FHWA-SA-96-069R

$C_s := 1.0$ = Punching shear pressure factor - Table 4.5, p. 121 FHWA-SA-96-069R

$V_N := 4 \cdot \sqrt{f'_c \cdot psi} \cdot \pi \cdot Dc' \cdot hc$ = Internal punching shear strength - [illegible]
ACI 318-99, Eqn. 11-37

$$T_{PS} := \frac{V_N}{1 - C_s \cdot \frac{(Ac - Agc)}{Sv \cdot Sh - Agc}}$$

= Nominal nail head srength (Punching shear)
Eqn. 4.3, p. 109 FHWA-SA-96-069R

Ultimate Strength	$T_{PS} = 95.2 \cdot kip$
Allowable Strength	$\alpha_s \cdot T_{PS} = 63.8 \cdot kip$

Earth Support Systems, Inc.
5937 Darwin Court # 105
Carlsbad, CA 92008

GOVERNING ALLOWABLE NAIL HEAD STRENGTH

$$Tgov := \min\left(\begin{pmatrix} \alpha_F \cdot T_F \\ \alpha_s \cdot T_{PS} \end{pmatrix}\right)$$

Tgov = 56.9·kip

Allowable flexural capacity governs facing strength

Minimum Allowable Nail Head Service Load Check ---> $Ps := 1500 \cdot psf$ = Uniform surcharge load

$F_F := 0.50$ = Nail head survice factor p. 50 & 119 FHWA-SA-96-069R

$kc := 1.5$ = Complexity coefficient p. 50 & 119 FHWA-SA-96-069R
kc = 1 for normal configurations
kc = 2 for complex multi-layered soil configurations

$$t_F := \frac{2kc \cdot F_F \cdot Q(\beta) \cdot Sh \cdot Sv}{H} + Ps \cdot Sh \cdot Sv$$ = Nail head survice load eqn. 4.6 FHWA-SA-96-069R

$SLoad := if(t_F \le Tgov, "Ok", "No Good")$

SLoad = "Ok"

Nail Head Allowable Load	Tgov = 56.9·kip
Nail Head Service Load	t_F = 46.3·kip

Check Upper Cantilever

One-Way Service Flexure Check

$Hcant := 3 \cdot ft$ = Maximum height of cantilevered shotcrete

$Ps := 100 \cdot psf$ = Uniform surcharge load (Footing outside 1-1 projection)

$$ms := \frac{2 \cdot Q(\beta)}{H^2} \cdot \frac{Hcant^3}{6} + Ps \cdot \frac{Hcant^2}{2}$$ = Cantilevered one-way service moment

$Mall := \alpha_F \cdot mv_2$ = Allowable one-way service moment

$Flexure := if(ms \le Mall, "Ok", "No Good")$

ms = 0.46·kip·ft/ft
Mall = 2.73·kip·ft/ft

Flexure = "Ok"

One-Way Service Shear

$vs := \frac{2 \cdot Q(\beta)}{H^2} \cdot \frac{Hcant^2}{2} + Ps \cdot Hcant$ = Cantilevered service shear

$V_{NS} := 2 \cdot \sqrt{f'_c \cdot psi} \cdot d$ = Cantilevered one-way nominal shear
ACI 318, Eqn. 11-28

$Vall := \alpha_s \cdot V_{NS}$ = Cantilevered one-way allowable shear

Shear := if(vs ≤ Vall, "Ok", "No Good")

vs = 0.3·klf
Vall = 2.9·klf

Shear = "Ok"

Welded Wire Mesh Minimum Development & Splice Length

$\lambda := 1$ = Aggregate concrete factor - ACI 12.2.4

$Awire := Ah \cdot grid$ = Cross sectional area of welded wire grid

$l_d := 0.27 \cdot \frac{Awire \cdot in}{grid} \cdot \left(\frac{Fy_{wire}}{\sqrt{f'_c \cdot lb}} \right) \cdot \lambda$ = Welded wire fabric development length - ACI 12.8

$splice := \max\left(\begin{pmatrix} grid + 2 \cdot in \\ 1.5 \cdot l_d \\ 6 \cdot in \end{pmatrix} \right)$ = Minimum welded wire splice length
ACI 12.19.1 & 12.19.2

$l_d = 5.1 \cdot in$
splice = 8·in

Minimum splice, Lap 2 Sqaures

Facing Reinforcement Details (Continued)

Waler & Bearing Bars Minimum Development Length (As Applicable)

bar = 4 = Waler / Bearing rebar size (As applicable)

db = 0.5·in = Waler bar nominal diameter

$\alpha := 1$ = Rebar location factor - ACI 12.2.4

$\beta := 1$ = Coating factor - ACI 12.2.4

$\lambda := 1$ = Aggregate concrete factor - ACI 12.2.4

$cmin := t_f - d$ = Waler / Bearing rebar minimum cover (As applicable)

spacing := 12·in = Waler / Bearing spacing (As applicable)

ACI 7.7.1 & ACI 12.2.2

Cover := if(cmin ≥ 2·in, "Ok" , "No Good")

Cover = "Ok"

Space := if(spacing ≥ 2·db, "Ok" , "No Good")

Space = "Ok"

Minimum Waler Bar Length

$$l_d := \begin{cases} 0\cdot in & \text{if bar = "N/A"} \\ \text{otherwise} & \\ \quad \begin{cases} \dfrac{\dfrac{Fy_b}{psi}\cdot\alpha\cdot\beta\cdot\lambda}{25\cdot\sqrt{\dfrac{f'_c}{psi}}}\cdot db & \text{if bar} \le 6 \\ \dfrac{\dfrac{Fy_b}{psi}\cdot\alpha\cdot\beta\cdot\lambda}{20\cdot\sqrt{\dfrac{f'_c}{psi}}}\cdot db & \text{if bar} > 6 \end{cases} & \end{cases}$$

= Basic development length - ACI 12.2.2

$l_d = 19\cdot in$

Use, 24" Long Waler Bars 12" o.c.

Theoretical Displacement

$H = 20\,ft$ = Maximum soil nail retained height

$Lnail := 20 \cdot ft$ = Average nail length of wall under consideration

$Soil\_type := "A"$ = Soil type - Use: "A" for dense granular soils / rock
"B" for medium dense granular soils
"C" for loose granular soils / clays

$C := 0.70$ = Typical nail length to wall height ratio

$$\delta := \begin{cases} 0.1\% & \text{if } Soil\_type = "A" \\ 0.2\% & \text{if } Soil\_type = "B" \\ (0.4\%) & \text{if } Soil\_type = "C" \end{cases}$$ = Peak wall displacement coefficients p. 53, 2.4.6 FHWA-SA-96-069R

$$\Delta := \frac{\delta \cdot C \cdot H^2}{Lnail}$$ = Maximum theoretical deflection

$\Delta = 0.2 \cdot in$

Facing Reinforcement Details

Minimum Reinforcement

$b := 12 \cdot in$ = Width of concrete section for analysis

Vertical Direction

$Asvmin := 0.0012 \cdot t_f \cdot b$ = Minimum vertical reinforcement area - ACI 14.3.2

$Avsteel := Av \cdot b$ = Total vertical reinforcement per foot width

$Vertical := if(Asvmin \le Avsteel, "Ok", "No Good")$

$Asvmin = 0.09 \cdot in^2$

$Avsteel = 0.24 \cdot in^2$

$Vertical = "Ok"$

Horizontal Direction

$Ashmin := 0.0020 \cdot t_f \cdot b$ = Minimum horizontal reinforcement area - ACI 14.3.3

$Ahsteel := Ah \cdot b + Nb \cdot Ab$ = Total horizontal reinforcement per foot width

$Horizontal := if(Ashmin \le Ahsteel, "Ok", "No Good")$

$Ashmin = 0.14 \cdot in^2$

$Ahsteel = 0.64 \cdot in^2$

$Horizontal = "Ok"$

John Ansen Ford Theaters - Detail 4/ES10

General Data	
File Indentifier	WALL23.GNI
Unit weight of water	62.4
Base depth for analysis	22.0
Seismic Coefficient	0.0
Minimum Base Exit Angle	-15.0
X Search limit (left)	0.002
X Search limit (right)	177.91
Number of slip circles	250
No. of slip circle exits	30

LRFD and Safety Factor Data	
Analysis Mode: (L)RFD or (S)LD (specify L or S)	S
= SLD Safety and Strength Factors (mode S only) =	
FS for Soil Cohesion	1.3

John Ansen Ford Theaters - Detail 5/ES10

General Data	
File Indentifier	WALL20B.GNI
Unit weight of water	62.4
Base depth for analysis	20.0
Seismic Coefficient	0.0
Minimum Base Exit Angle	-15.0
X Search limit (left)	0.002
X Search limit (right)	60.0
Number of slip circles	250
No. of slip circle exits	30

LRFD and Safety Factor Data	
Analysis Mode: (L)RFD or (S)LD (specify L or S)	S
= SLD Safety and Strength Factors (mode S only) =	
FS for Soil Cohesion	1.3
FS for Soil Friction	1.3
Strength Factor for Head Strength	0.67
Strength Factor for Nail Tendon Strength	0.55
Strength Factor for Nail Pullout Resistance	0.5
= LRFD Load Factors (mode L only) =	
LF for Unit Weight of Water	1
LF for Unit Weight of Soil	1.35
LF for Surcharge Loads	1.75
LF for Seismic Loads	1
= LRFD Resistance Factors (mode L only) =	
RF for Soil Cohesion	1
RF for Soil Friction Angle	0.75
RF for Head Strength	0.9
RF for Nail Pullout Resistance	0.7
RF for Nail Tendon Strength	0.9

SOIL NAIL WALL SUPPORT DESIGN
(Vertical Elements)

PARAMETERS:

$F_y := 75 \cdot ksi$ = STEEL YIELD STRENGTH

$F_b := 0.66 \cdot F_y$ = ALLOWABLE STEEL BENDING STRENGTH

$f'_c := 4000 \cdot psi$ = GROUT COMPRESSIVE STRENGTH

$E := 29000 \cdot ksi$ = STEEL MODULUS OF ELASTICITY

$x_{pile} := 3 \cdot ft$ = HORIZONTAL SPACING OF PILES

$t_{conc} := 6 \cdot in$ = MAXIMUM SOIL NAIL WALL THICKNESS

$t_{soil} := 3.0 \cdot ft$ = ASSUMED THICKNESS OF MOBILIZED SOIL MASS

$\gamma_c := 150 \cdot pcf$ = UNIT WEIGHT OF CONCRETE

$c := 0.0 \cdot psf$ = SOIL COHESION

$\gamma_s := 125 \cdot pcf$ = UNIT WEIGHT OF SOIL

$h := 25 \cdot ft - 5 \cdot ft$ = MAX. HEIGHT OF SOIL MASS ABOVE CUT

$h = 20 ft$

$R_b := x_{pile} \cdot (t_{conc} \cdot \gamma_c + t_{soil} \cdot \gamma_s) h \ldots$
$+ -c \cdot h \cdot x_{pile}$

$R_b = 27 \cdot kip$ = MAXIMUM VERTICAL SOIL LOAD

$P_s := 0 \cdot psf$ = SURCHARGE PRESSURE

$l := 5.0 \cdot ft$ = MAXIMUM UNBRACED LENGTH

$l = 5 \cdot ft$

$d_{shaft} := 6 \cdot in$ = DRILLED SHAFT DIAMETER

PILE DIMENSIONS & MATERIAL PROPERTIES

$d := \frac{11}{8}in$ = BAR DIAMETER

$A := \frac{\pi \cdot d^2}{4}$ = AREA OF BAR

$K := 0.65$ = EFFECTIVE LENGTH FACTOR

$E := 29000 \cdot ksi$ = MODULAS OF ELASTICITY OF STEEL

$\gamma_{stl} := 490 \cdot pcf$ = UNIT WEIGHT OF STEEL

STRUCTURAL PROPERTY CALCULATIONS

$r := \frac{d}{4}$ = RADIUS OF GYRATION

$r = 0.34 \cdot in$

$S_x := \frac{\pi \cdot d^3}{32}$ = SECTION MODULUS

$S_x = 0.26 \cdot in^3$

$I_x := \frac{\pi \cdot d^4}{64}$

$I_x = 0.18 \cdot in^4$ = MOMENT OF INERTIA

$A_{grout} := \frac{\pi \cdot d_{shaft}^2}{4} - A$

$A_{grout} = 26.79 \cdot in^2$ = AREA OF GROUT

CALCULATE ALLOWABLE AXIAL COMPRESSIVE STRESS:

$$C_c := \sqrt{\frac{2\cdot\pi^2\cdot E}{F_y}} \qquad C_c = 87.36$$

$$\frac{K\cdot l}{r} = 113.45$$

Attention: Mr. A. Leonard Madson, Principal

Subject: Geotechnical Investigation
Off-Season Two Improvements
2580 Cahuenga Boulevard East
Hollywood District of Los Angeles, California

Reference: Leighton Consulting, Inc., 2013, Preliminary Geotechnical Evaluation John Anson Ford Theaters Master Plan 2580 Cahuenga Boulevard East Hollywood District of Los Angeles, California, Project No. 603057-001, dated February 7, 2013.

In accordance with our April 30, 2013 proposal, authorized on May 2, 2013, Leighton Consulting, Inc. (Leighton) is pleased to present this geotechnical exploration report in support of the proposed Off-Season Two Improvements planned for the John Anson Ford Amphitheater. Our scope of work for this study included research, geologic mapping, subsurface exploration, laboratory testing, engineering analysis, design team meetings, and preparation of this report.

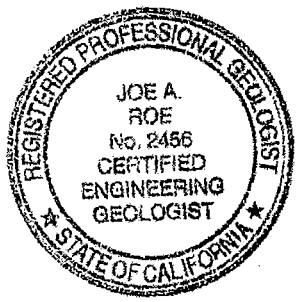
The Off Season Two Improvements are expected to include restoration of historic features and improvements to the amphitheater stage. Planned improvements include replacement of the existing stage, below stage spaces, and upstage retaining walls.

17781 Cowan ▪ Irvine, CA 92614-6009
949.250.1421 ▪ 949.250.1114 Fax

The new basement floor levels below the stage are to be lowered and sub-surface and surface drainage elements improved, including new and replacement sanitary sewers and storm drains.

This report presents the results of our geotechnical exploration program and provides recommendations for design and construction of the proposed project.

We appreciate the opportunity to be of service to the Ford Theatre Foundation. If you have any questions or if we can be of further service, please call us at your convenience at (866) LEIGHTON, at the direct extensions listed below, or e-mail us as listed below.



Respectfully submitted,

TABLE OF CONTENTS (Continued)

1.0 INTRODUCTION

1.1 Authorization

In accordance with your authorization on May 2, 2013, and based on our April 30, 2013 Off-Season Two Improvements proposal, Leighton Consulting, Inc. (Leighton) has performed document review, geologic mapping, subsurface exploration, laboratory testing, and engineering analysis for the John Anson Ford Theaters Master Plan Off-Season Two Improvements. The project is located at 2580 Cahuenga Boulevard in the Hollywood District of Los Angeles, California (Figure 1).

1.2 Objective

The objective of our investigation was to identify subsurface stratigraphy (soil type and thickness, depth to bedrock) within the area of planned improvements. Access constraints prevented exploration at some locations, such as below the existing basements and at the towers adjacent to the stage. Accordingly, assumptions have been made to model the stratigraphy at unexplored locations for our analysis and will require field verification during construction.

1.3 Scope of Work

Our scope included document review, geologic mapping, subsurface exploration, laboratory testing, engineering analysis, on-site meeting with the design team, and preparation of this report. To accomplish our scope of work we provided the following services:

- *Review of Available Data*: We reviewed the schematic design draft plans, Off Season Two Improvements, sheets S-200 Lower Level Plan, S-201 Mezzanine Level Plan, S-202 Amphitheater Plan, L-500 Sections and C3.00 Utility and Drainage Plan, prepared by Levin and Associates Architects, dated April 5, 2013 and accompanying memorandum dated April 9, 2013.

- *Geologic Mapping*: We performed field mapping of the observable rock mass, rockfall debris, and surficial soil conditions around the amphitheater to document current geologic conditions and identify potential geotechnical and geologic constraints impacting the overall project site (Plate 1, Geologic Map). Location of cross sections A-A' and B-B' developed during our preliminary

evaluation in 2012 are also shown on Plate 1. Geologic data, test pit, and cross section locations (C-C', D-D' and E-E') specific to the Off-Season Two project are shown on Plate 2, Test Pit and Cross Section Location Map). Geologic cross sections are shown on Plates 3, Generalized Geologic Cross Sections A-A' and B-B', and Plate 4, generalized Geologic Cross Sections C-C', D-D' and E-E'.

- *Geophysical Survey*: We performed a geophysical refraction and surface wave velocity survey as part of our preliminary investigation conducted in 2012. For ease of reference a copy of the seismic survey report (Leighton, 2013) is included in Appendix A of this report. Locations of the refraction surveys are shown on Plate 1.

- *Geotechnical Exploration*: We excavated four test pits (TP-1 through TP-4) behind the existing terraced retaining walls to the east of the amphitheater and in the landscape area adjacent to the north tower. Due to the extremely difficult site access and heavy vegetation, we hand excavated test pits in the selected areas to obtain geologic data. Test pit logs are incorporated in the geologic sections on Plate 4. Each test pit was photographed prior to backfilling. Bulks samples were collected from the test pits and transferred to our lab for geotechnical laboratory testing. The test pits were backfilled and compacted with the excavated material. Key photos of the proposed improvements area are included in Appendix B, Test Pit Logs and Photos.

- *Laboratory Testing*: We performed geotechnical laboratory testing on bulk samples recovered during the investigation to determine compaction characteristics (ASTM D1557-12), expansion potential (ASTM D 4829), and corrosion (California Test methods CT 417 Part II, 422, and 532/647). Laboratory test results are included in Appendix C, Laboratory Data.

- *Engineering Analysis*: We performed an evaluation of the proposed project based on the field data gathered during our current and prior studies at the site.

- *Report:* Leighton prepared this report documenting the results of the geological mapping, subsurface exploration, laboratory testing, and engineering analysis and provides recommendations for design and construction of the Off-Season Two Improvements.

1.4 Project Description

The Off-Season Two Improvements include demolition and construction of new footings within the amphitheater footprint, below the concrete tower structures north and south of the stage and north tunnel, removal and replacement of basement retaining walls, drainage improvements, and slab on grade construction. New terraced retaining walls are also planned to replace the existing stone walls behind the stage in conjunction with hillside landscaping. New and replacement sanitary sewer and storm drain lines are also planned.

1.5 Study Area

As presented on Figure 1, generally, the project site is located on steep hillside terrain within a County of Los Angeles Park. The study area is bordered to the west by Cahuenga Boulevard East and U.S. Route 101 and to the east by the steep flanks of the Santa Monica Mountains. The site of the existing Ford Theatre spans for approximately 1,320 feet along the base of the hills and contains three asphalt-paved parking lots (northern lot, motel lot and southern lot) facing Cahuenga Boulevard East, a former motel building, and the existing Amphitheatre with loading area, pedestrian walkways and box office. Elevations of the sites existing improvements range from approximate elevation El. 552 feet mean sea level (msl) near the entrance to the site at Cahuenga Boulevard East to a high of El. 654 feet msl in the northern region of the Off Season Two Improvements area (Plate 1). The ridgeline east of and above the amphitheater rises to a high of elevation 944 feet msl (USGS, 1966) before descending easterly to Weid Canyon, the site of Mulholland Dam (Hollywood Reservoir).

The Off-Season Two Improvements are proposed for construction within the amphitheater footprint (Plate 2, Test Pit and Cross Section Location Map), which consists of subterranean tunnels and corridors below the stage and amphitheater seating area, two concrete towers and mezzanines north and south of the stage, terraced stone walls and planter areas behind the stage. Erosion and debris flow impacted concrete drainage swales capture hillside runoff directed toward an 18-inch-diameter reinforced concrete storm drain pipe (RCP) upslope of the terraced stone walls. Existing upslope hillside improvements above the main masonry block wall include a wooden platform and a concrete cribwall that has been damaged by rockfalls in the north area of the site including a masonry block wall upslope in a heavily vegetated area. Photos of the Off-Season Two Improvements area are located in Appendix B, Test Pit Logs and Photos.

2.0 GEOLOGIC RECONNAISSANCE AND MAPPING

We performed geologic reconnaissance and field mapping of the Off-Season Two Improvements project area supplement the data procured during literature review. The following sections provide general descriptions of the conditions expected at the areas of the Off-Season Two Improvements. The interpreted subsurface conditions are shown on Plate 4, Generalized Geologic Cross Sections C-C', D-D', and E-E'.

2.1 Lower Level

The lower levels of the basement walls and north tunnel foundation footprints underlie the amphitheater stage and seating area (Figure B-1). The approximate footprint of the lower level basement retaining wall, interior walls, and corridors leading to and from the north tunnel are indicated on Plate 2.

The eastern basement retaining wall is of masonry block construction and exhibits mineral efflorescence along the mortar joints and block faces due to seepage through the wall indicating either non-functioning or non-existent wall drains. Based on regional mapping and extrapolated field conditions exposed within test pits TP-2 and TP-3 (Figure B-2), it appears bedrock underlying the foundations consists predominately of basalt and appears to have been cut to fit the "footprint" of the foundations and retaining walls during original construction of the Theater in the 1920's. Approximately 12 to 48-inches of overexcavation behind the retaining walls appears to have been performed to allow adequate space for construction.

Backfill material behind the walls consist of a mixture of the bedrock material, predominately basalt and a silty sand mixture of basalt and sandstone rock fragments. This backfill prism also contains an abundant overgrowth of roots from the many large trees that line the hillside. Abundant oversize material, i.e. cobbles and boulders are also present within the fill prisms.

2.2 Mezzanine Level

The mezzanine levels located north and south of the stage provide access to the upper tower levels and for stage lighting (Plate 2). The mezzanine decks adjacent to the two towers are bordered by steep bedrock slopes consisting of thick accumulations of colluvium and rock talus.

Upper Level Mezzanine Deck North: The slopes bordering the northern mezzanine level are inclined at 60-65 degrees, contain large diameter trees and consist of near vertical headscarp exposures of severely weathered basalt bedrock with thick accumulations of colluvium forming on the slope (Figure B-5). The colluvial material is subject to slow creep and debris flows during heavy precipitation as evidenced by bent trees, overtopping mezzanine walls, and sandbag barriers with plastic sheeting covering the slopes in an effort to prevent further mass erosion affecting the daily operations of the Theater.

Upper Level Mezzanine Deck South: The slopes bordering the southern mezzanine level are steeply inclined to near vertical and contain exposures of basalt, sandstone and thick accumulations of colluvium and rockfall debris. The basalt in this area degrades to angular, silty-clayey sand forming the majority of the colluvial material. The sandstone in this area is very hard, well cemented and heavily jointed due to faulting and tectonic uplift. This sandstone outcrop contains near vertical, fresh exposures of sandstone rock faces with thick accumulations of rock talus (rockfall debris). These accumulations form along the base of the slope impacting the southern concrete walls (Figure B-6). A steel H-beam reportedly installed to provide structural support to the concrete wall has been damaged by the boulder sized talus rockfalls occurring along structural planes of weakness. This area is shown on Plates 1 and 2 as having high potential for continued rockfalls.

2.3 Amphitheatre Plan

The existing improvements consist of a series of stacked stone walls and concrete stairs (Figure B-2) ascending to a concrete drainage swale and masonry block wall ranging in height from 32- to 84-inches tall (Figures B-3 and B-4). The stone retaining wall foundations were constructed on basalt bedrock (Figure B-2), drainage is accomplished by a series of 1- to 4-inch-diameter weep holes located above the wall footings. Some weep holes are partially obstructed by soil and weed overgrowth and were dry at the time of our observations.

The slopes above these stone walls are inclined from 50-65 degrees and consist of exposures of severely weathered basalt bedrock with thick accumulations of colluvium forming on the slope. Surficial slumping of undocumented artificial fill and colluvium was observed at several locations. Dense vegetation consists of large trees, small shrubs and grasses. The hillside above the amphitheater area

was constructed with a concrete lined drainage swale outletting to an 18-inch-diameter downdrain and retaining wall structure (Figure B-3).

The southern limit of the concrete drainage swale is obscured from view by thick accumulations of soil and vegetation (Figure B-4). Above the drainage swale to the northeast, concrete cribbing emplaced to prevent rockfall damage from upslope outcrops has sustained damage due to rockfalls evidenced from one of the many sandstone boulders perched on the slope face (Figure B-3). An additional masonry block wall was constructed easterly of the upper drainage swale in a small canyon drainage. The slopes below this area are heavily vegetated. The condition of the masonry block wall in this area is unknown but is suspected to be impacted by sediment build up and potential rockfall (Plates 1 and 2).

3.0 GEOLOGIC CONDITIONS

3.1 Regional Geology and Tectonics

The study area for the proposed project is located on the south flank of the eastern Santa Monica Mountains, west of the Cahuenga Fault within the Transverse Ranges Geomorphic Province of California. The distinctive uplifted east-west trending features of the Transverse Ranges were formed as a result of the compressive forces between the converging Pacific and North American Plates (Yerkes, 1965). The Santa Monica Mountains in this area expose north-trending, fault bound blocks containing an assemblage of older Tertiary-age marine and non-marine sedimentary and intrusive and extrusive volcanic rocks (Figure 2, Regional Geologic Map). An east-west trending ridge, in line with the main crest of the Santa Monica Mountains, is the principal topographic feature of the area. Cahuenga Pass, a low gap in the ridge, separates this ridge from the main crest of the Santa Monica Mountains (CDMG, 1953) formed largely as a result of erosion of soft shale outcrops west of the Cahuenga fault and formation of resistant sandstone to the east.

The present physiographic setting of the project site is predominantly northwest to west-facing steep sided to near-vertical (ridge forming sandstones) terrain along the eastern side of the study area. The topographic relief across the site varies between approximately 551 feet above msl in the northwestern portion of the site to approximately 944 feet above msl along the ridgeline to the east of the existing former motel building. The topographic features are closely related to tectonic uplift, ridgeline erosion, erosion of soft shales, and intrusive-extrusive basaltic flows. Internal drainage has eroded major gullies and rills into the underlying bedrock material.

3.2 Site Specific Geology

The local geologic units encountered at the Off-Season Two Improvements project area are discussed below, in order of relative age, youngest to oldest. The surficial units observed include recent and Quaternary-age sediments that form a thin mantle over the bedrock. These surficial units include undocumented artificial fill associated with the amphitheater construction, debris flows, surficial rock failures, and colluvium. The colluvium is generally not depicted on the map due to its relatively thin nature, except where it has been recently mapped during our geologic reconnaissance (Plates 1 and 2). Bedrock belonging to the Tertiary-

age Topanga Formation and intrusive-extrusive volcanic rocks (pillow basalt) correlative to the Topanga Formation exposed throughout the project study area and mapped during our geologic investigation is depicted on Plate 1.

Artificial Fill, Undocumented (Map Unit – Afu): Artificial fill materials have been mapped in the areas behind the terraced stone walls as shown on Plate 4. The thickness of the artificial fill underlying the majority of the improvements area is unknown; however, based on our current investigation we anticipate the existing foundations to be founded on bedrock with nominal amounts of fill underlying the slab on grade construction. As encountered at the test pit locations (shown on Plate 2), fill material consists predominately of silty sand to clayey sand (SM-SC) with varying amounts of basalt and sandstone rock fragments ranging in size from small cobbles to boulders greater than 14-inches in long dimension. The fill material depths at the test pit locations ranged from less than 12-inches up to 5 feet (Plate 4).

Debris Flows and Surficial Failures: Several small (volume) debris flows and surficial failures were mapped at various locations along the slopes at the site, as indicated on Plates 1 and 2. The debris flows (gravitational slides) affecting the proposed construction area consist of thick accumulations of colluvium characterized as silty-clayey sand (SM-SC) comprised of fine to coarse grained, angular sandstone and basalt rock fragments. The material is loose, occurs predominately within the basalt formation and is prone to sliding during significant, prolonged rainfall events.

Rockfalls: Rockfalls and wedge failure events originating in the initiation zone of the sandstone outcrop have resulted in thick accumulations of talus at the toe of the slope and concrete retaining wall constructed as part of the southern mezzanine deck area (Plate 2). These events can be expected to continue and consist of individual rocks to several cubic yard volume events. The run out zone below this outcrop is very narrow and constrained by the existing concrete retaining wall. A steel H-beam installed to provide structural support to the concrete wall is bent suggesting rockmass dislodged and either bounced, slid and/or rolled down slope before coming to rest against the steel structure. The principal causal mechanism of rockfalls and wedge failures in this area is a result of the steep near vertical topography, discontinuities within the rockmass, *weathering* susceptibility and root-wedging. Seismic shaking within the region can produce rockfall events.

Colluvium (Map Unit – Qcol): Slopewash or colluvial deposits are composed of materials that have been eroded, deposited, and transported by either running water (sheetflow), and/or gravitational sliding. The colluvial material at the site consists of brown, dry, loose silty clayey sands and rock fragments mechanically derived from severely weathered Topanga Formation basalt and sandstone material.

Topanga Formation Bedrock: The sedimentary bedrock unit exposed in the hillside and test pits belongs to the Tertiary-age Topanga Formation and is further described below:

Sandstone (Map Unit – Tts): This very hard, well cemented and heavily jointed sandstone outcrop was observed primarily in the southern portion of the site occurring in fault and depositional intrusive contact with the basalt formations, as indicated on Plate 1. The sandstone unit was observed to be orange brown, hard, thin to thickly bedded, well cemented with fine to coarse grained quartz sand and fine pebble sized subangular quartz inclusions. The rockmass is well oxidized with trace amounts of pyrite that contain reddish black oxide rimming along the cubic grains. The sandstone is in fault contact with very fine grained, siliceous quartz sandstone containing dark red cherty laminations. These rock masses are severely fractured, heavily jointed with very narrow zones of rock gouge along the faults.

Sandstone (Map Symbol - Ttbs): Although not observed in the Off Season Two Improvements area, this friable sandstone was observed during our earlier investigation east of the northern parking lot, north of the former motel building, and east of the southernmost parking lot, as indicated on Plate 1. This sandstone unit was observed to be dark gray with basalt fragments and rounded manganese nodules throughout, friable or crumbly, and severely weathered and fractured. Heavy secondary mineralization and chemical alteration of the mafic minerals within the unit was also observed.

Tertiary Volcanic Rocks (Map Unit – Tvb): The Tertiary-age pillow basalt formed from flows issuing from deep linear fissures (mid-oceanic fractures) in the ocean crust, observed within the test pits, forms the majority of the bedrock material exposed in the slopes immediately above the proposed improvement area (Plate 1). This highly weathered, intrusive-extrusive igneous rock is massive, orange brown on oxidized surfaces to grayish black on less weathered surfaces. Chemical weathering and decomposition of the basalt mineralogy is severe

causing degradation of the rock mass into angular sand and gravel sized fragments thereby influencing the rock strength and elastic properties. Fresh or discolored (dark grayish black) rock is present as a discontinuous framework and as corestones. This degradation to soil causes thick accumulations of secondary clayey colluvium which are susceptible to debris flows.

3.3 Geologic Structure

Regional uplift of the Santa Monica Mountains is primarily the result of movement along the Santa Monica and Hollywood faults combined with extrusive igneous intrusions that once occurred along linear fissures in oceanic crust. The major faults in the project area most important to the structural and stratigraphic evolution of the fault bound blocks are the Cahuenga Fault Zone, the Brush Canyon fault, the Ferndell fault, the Griffith fault and the Los Angeles River fault.

Minor faults mapped in the sandstone outcrop in the southern area of the site generally strike N66°W to N76°W and dip steeply out of slope between 84° to 88° to the north correlating well to the regional trend of the local fault structure. Bedrock strikes predominately in a north-south direction dipping steeply into slope to the east between 60° to 65° (Plate 1). Contact between the sandstone bedrock and the pillow basalt exposed in the southern portion of the site were partially obscured due to dense vegetation and colluvial buildup and is therefore queried (Plate 1).

3.4 Rippability

As indicated in Section 1.3, a seismic refraction survey was completed in the southern and motel parking lots (Leighton, 2013). The seismic refraction survey was performed to predict the rippability of the material that underlies the site, which is primarily volcanic basalt and sandstone bedrock. Based on the seismic velocity profiles, jointed and fractured nature of the bedrock structure, the onsite materials within the planned excavation depths are considered rippable with conventional grading equipment.

However, due to access constraints conventional earthmoving equipment will likely not be able to access the areas of proposed improvements without significant access provided. As part of the current study, hand held electric chisels were used to excavate the basalt formation in the test pits. A depth of approximately 4 feet was obtained in Test Pit TP-1 with little difficulty.

Excavation of the material below a depth of 4 feet proved slightly difficult due to decreasing bedrock weathering with depth and equipment access constraints. The sandstone outcrop mapped in the southern portion of the site should be expected to be encountered during the planned renovations along the southern boundary. This material is hard and well cemented, pervasively fractured and jointed, and will prove moderately difficult to excavate with hand held equipment.

3.5 Groundwater

Due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the proposed project site, shallow groundwater is not expected to exist at the site. However, if prolonged seasonal precipitation occurs during the construction period, nuisance water should be expected to build up behind the eastern basement retaining wall thereby posing minor constraints on construction. Additionally, surface runoff during rainfall events should be anticipated. Should nuisance water be encountered during construction, dewatering the excavation(s) may be necessary and could be accomplished using sump pumps.

4.0 GEOLOGIC HAZARDS

Geologic hazards for the overall Theater complex include surface faulting, ground lurching, seismic shaking, landslides, liquefaction, seismically-induced settlement, lateral spreading, seismically-induced landslides, and flooding. Additional geologic hazards specifically affecting the proposed Off-Season Two Improvements Area include the potential for mass movements in the form of debris flows and rockfalls. The following sections discuss these hazards and their potential impacts at the site in more detail.

4.1 Faulting and Seismicity

In general, the primary seismic hazards for sites in the region include strong ground shaking and surface fault rupture. Our discussion of faults potentially impacting the site is prefaced with a discussion of California legislation and state policies concerning the classification and land-use criteria associated with faults. By definition of the California Geological Survey (CGS), an active fault is a fault which has had surface displacement within Holocene time (about the last 11,000 years). The state geologist has defined a potentially active fault as any fault considered to have been active during Quaternary time (last 1,800,000 years). This definition is used in delineating Earthquake Fault Zones (EFZ) as mandated by the Alquist-Priolo Earthquake Faulting Zones Act of 1972 and as most recently revised in 2007 (Hart and Bryant, 2007). The intent of this act is to ensure that urban development and habitable structures are not sited across the traces of active faults. Based on our review, the site is not located within an EFZ, (CGS, 2000).

Numerous active and potentially active faults have been mapped within the southern California region, several of which are within close proximity to the site (Figure 3 – Regional Fault Map). Per the latest California Geological Survey fault database, the major active and potentially active fault systems that could produce significant ground shaking at the site include the Hollywood and Santa Monica fault zones, and the Upper Elysian Park Thrust fault. The distance of these faults and the estimated slip rates if known are provided below:

Hollywood Fault: The active Hollywood fault is located approximately 0.7 kilometers (0.4 miles) to the south of the site. The fault is capable of producing an estimated maximum magnitude (Mw) 6.4 earthquake. The fault is truncated on the west by the north-northwest trending erosional escarpment known locally

as the West Beverly Hills Lineament (WBHL) marking the left step between the Santa Monica fault and the Hollywood fault (Dolan et al., 2000a). The WBHL creates a topographic erosional escarpment separating older alluvium on the west from younger alluvium on the east. Subsurface evidence for late Quaternary faulting is evident from several studies based upon geomorphic evidence, stratigraphic correlation between borings and fault trenching studies conducted in Hollywood (Dolan et al., 1997, 2000b). Recent faulting at Camino Palmero occurred after deposition of 9ka sediments and prior to deposition of sediments dated at 6ka making this fault active by definition by classification criteria adopted by the California Geological Survey that defines activity of faults based on dates of known rupture events. Based on sediment accumulation rates determined by radiocarbon dating, the dip separation is low but at least 0.75 mm/yr (D. Ponti in Hummon et al., 1994). Dolan et al., (1997) estimate that strike separation on the fault is greater than 0.25 mm/yr.

Santa Monica Fault Zone: The Santa Monica fault zone is located approximately 2.3 km (1.4 mi) from the site and is part of the west trending Transverse Ranges Southern Boundary fault system. The Santa Monica faults extends from Pacific Palisades through Santa Monica and into west Los Angeles were it merges with the Hollywood fault at the WBHL in Beverley Hills. The Santa Monica fault is thought to be capable of producing an estimated maximum magnitude (Mw) 6.6 earthquake. Several investigations (Dolan et al., 2000a; Hummon et al., 1992; Dolan and Sieh, 1992; and Crook and Proctor, 1992) have indicated the fault is active based on geomorphic evidence and fault trenching studies indicating the active portion of the Santa Monica fault does not extend east of the WBHL of Dolan and Sieh (1992). The fault has not been zoned, however, the fault is considered active by the State Geologist.

Upper Elysian Park Anticlinorium: The Elysian Park Anticlinorium is a southward verging anticline approximately 20 kilometers long (12.4 mi) with a curved, southward-convex axis, lying between the Hollywood fault on the northwest through the Silver Lake District to the right lateral East Montebello fault on the east in the City of San Gabriel. Uplift along the structure has produced the Elysian, Repetto and Monterey Park Hills. Deformed Quaternary deposits across the Coyote Pass Escarpment and related structures allowed Oskin et al., (2000) to estimate a late Quaternary slip rate on the blind Elysian Park reverse fault of 0.8-2.2 mm/yr. The California Geological Survey (2003) has estimated an average slip rate of 1.3mm/yr and an estimated maximum magnitude (Mw) of 6.4 for the Elysian Park Thrust fault system.

4.2 Surface Fault Rupture

Our review of available in-house literature indicates that no known active faults have been mapped across the site, and the site is not located within an Alquist-Priolo Earthquake Fault Zone (Hart and Bryant, 2007; CGS, 1986). Based on the United States Geological Survey (USGS) fault parameters database and latitude and longitude coordinates N34.1136° and W118.3355°, the closest active fault to the site is the Hollywood fault, located approximately 0.4 miles south of the site (http://geohazards.usgs.gov/cfusion/hazfaults_search). Based on the current geologic framework, the potential for surface fault rupture onsite is expected to be low.

4.3 Ground Shaking

Strong ground shaking can be expected at the site during moderate to severe earthquakes in this general region. This is common to virtually all of Southern California. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. According to the United States Geological Survey (USGS) at the time of this writing, the most recent local (within 25 kilometers of the site) earthquake was the MW 3.4 earthquake on September 7, 2012, approximately 3.4 miles to the southwest (http://earthquake.usgs.gov/earthquakes/eqarchives/epic/) believed to be attributed to movement along the San Vicente Blind thrust fault. The 2010 California Building Code (CBC) seismic coefficients are presented in the following subsections:

- *CBC Coefficients*: Based on our site reconnaissance, the project site is underlain predominantly by bedrock. The shear wave velocity in the upper 30 meters at the project site based on the recent geophysical survey performed at the site as a part of this evaluation (GeoVision, 2012) ranges between 1,880 and 2,139 feet-per-second.

  In accordance with the 2010 Edition of the CBC, this site should be classified as a Class C site. The following values may be used for the seismic design method based on the 2010 CBC:

2010 CBC Based Seismic Design Parameters (Mapped Values)

CBC Categorization/Coefficient	Design Value
Site Longitude (decimal degrees)	-118.3355 W
Site Latitude (decimal degrees)	34.1136 N
Site Class Definition	C
Seismic Design Category	D
Mapped spectral response acceleration parameter at short period, S_S	1.79
Mapped spectral response acceleration parameter at a period of 1 sec, S_1	0.60
Short Period (0.2 sec) Site Coefficient, F_a	1.0
Long Period (1.0 sec) Site Coefficient, F_v	1.3
Adjusted spectral response acceleration parameter at short period, S_{MS}	1.79
Adjusted spectral response acceleration parameter at a period of 1 sec, S_{M1}	0.78
Design spectral response acceleration parameter at short period, S_{DS}	1.19
Design spectral response acceleration parameter at a period of 1 sec, S_{D1}	0.52

4.4 Secondary Seismic Hazards

Liquefaction Potential: Liquefaction is the loss of soil strength or stiffness due to a buildup of pore-water pressure during severe ground shaking. Liquefaction is associated primarily with loose (low density), saturated, fine- to medium-grained, cohesionless soils. As shown on the State of California Seismic Hazard Zones Map for the Hollywood Quadrangle (CDMG, 1999), portions of the overall study area are located within an area that has been identified by the State of California as being potentially susceptible to liquefaction (see Figure 4). The Off Season Two Improvements are underlain by bedrock and are not located within a liquefiable area.

Lateral Spreading Potential: Lateral spreading is a phenomenon in which large blocks of intact, non-liquefied soil move downslope on a liquefied soil layer. Lateral spreading is often a regional event. For lateral spreading to occur, a liquefiable soil zone must be laterally continuous, unconstrained laterally in at

least one direction and free to move along sloping ground. Due to the topographic relief and the potential for liquefaction to occur, there is a potential for lateral spreading at the overall project site.

Seismically-Induced Settlement: Since the project site is underlain predominantly by bedrock, the potential for seismically-induced settlement is low.

Seismically-Induced Landslides: As shown on the State of California Seismic Hazard Zones Map for the Hollywood Quadrangle (CDMG, 1999), a portion of the project site is located within an area that has been identified by the State of California as being potentially susceptible to seismically induced landslides (see Figure 4).

Seiches, Tsunamis, Inundation Due to Large Water Storage Facilities: Seiches are large waves generated in very large enclosed bodies of water or partially enclosed arms of the sea in response to ground shaking. The only large enclosed body of water within close proximity to the site is the Hollywood Reservoir located to the northeast of the site. Based on the location and elevation of the large ridgeline between the site and the Hollywood Reservoir, the seiche risk at the site is considered negligible.

Tsunamis are waves generated in large bodies of water by fault displacement or major ground movement. The project area is predominantly at elevations higher than 500 feet above mean sea level, therefore the tsunami risk at the site is considered nil.

Earthquake-induced flooding can be caused by failure of dams or other water-retaining structures as a result of earthquake. According to the County of Los Angeles Seismic Safety Element (1990) and the City of Los Angeles Safety Element (1996), the site is not located within a potential inundation area for an earthquake induced dam failure from Hollywood Reservoir. Even though the site is not located within a potential inundation area for the Hollywood Reservoir, the dam is continually monitored by the Army Corp of Engineers (ACOE) to guard against the threat of dam failure. The possibility of dam failures during an earthquake has been addressed by the California Division of Mines and Geology in an earthquake planning scenario for a magnitude 8.3 earthquake on the San Andreas fault (Davis et al., 1982) and a magnitude 7.0 earthquake on the Newport Inglewood Fault Zone (Toppozada et al., 1988). Both reports state catastrophic failure of a dam as a result of an earthquake is highly unlikely.

Current design practices, dam review, modification or total reconstruction of existing dams are intended to ensure that all dams are capable of withstanding the maximum earthquake for the site. Therefore the potential for the site to be inundated as a result of dam failure is considered negligible.

4.5 Slope Stability

The results of the stability analyses provided in this report (Appendix D) indicate the project site will generally attain sufficient stability with minor surficial grading and slope reinforcement measures. The global factor of safety is estimated to be about 1.5 and 1.1 for static and pseudostatic conditions, respectively. Slope stability issues specific to the Off-Season Two Improvements are discussed below.

4.5.1 Debris flows

Mass movements include landslides and debris flows. Debris flow areas were encountered during our subsurface investigation at the project area, subsequent verbal conversations with Theater personnel indicate debris flows have occurred at the site (Figure B-5). The project site lies within a previously existing canyon cut down into the formational material surrounded by moderately steep natural slopes composed of massive pillow basalt and steeply dipping sandstone formations.

During our geotechnical investigation we mapped several areas that were possibly debris flow scars and/or accumulations of colluvium (Figure B-5). Areas of thick accumulation of surficial materials, predominately basalt, have the potential to develop into debris flows.

Debris flows and debris slides should be expected to occur in the heads of steep gullies, on steep slopes and along ridgelines underlain by basalt. When rainfall intensity is great enough to cause water to percolate into the colluvium at a rate which exceeds the rate at which the water can percolate into the bedrock, slope failure of colluvium will occur. The surficial stability of the natural slopes is dependent upon the thickness of weaker soils and the slope gradient. Thick accumulations of colluvial soils on steep slopes are susceptible to surficial failures, debris flows and downhill creep during periods of heavy rain. The most likely source of

debris flow potential is from the steep slopes and drainages in the northeastern and southern portion of the proposed improvements area.

Our recommendations regarding mitigation of debris flow are discussed in Section 6.0 of this report.

4.5.2 Rockfalls

Field mapping and geologic analysis of the sandstone rock outcrops exposed in the southern portion of the site indicated the presence of intersecting pairs of joint sets and conjugate fault planes. Due to local orientations of the joint sets, the presence of fractured, freshly exposed rock faces and damage to the previously referenced H-beam (Figure B-6), the potential exists for detachment and down slope translation of rock, which could impact the proposed development.

The proposed development is expected to require provisions to protect improvements and occupants from rock fall hazards. On a preliminary basis, provisions should be included in the site layout to include such devices as a rock fence located near the toe of the slopes. Other more elaborate techniques such as rock netting situated along the faces of slopes vulnerable to rock falls may also be necessary after landscaping is implemented.

4.6 Expansive Soils

Based on our geotechnical exploration at the site, the near surface soils are generally granular with localized silt and clay layers. The laboratory test result of two representative samples from Leighton test pit TP-1 and TP-4, showed low expansion index (EI) potential wetted EI =11 and EI=24, respectfully. Results of expansion index tests indicate that the onsite soils have low expansion potential.

4.7 Corrosive Soils

Corrosive soils are characterized by their ability to degrade concrete and corrode ferrous materials in contact with water or soil. In particular, concrete is susceptible to corrosion when it is in contact with soil or water that contains high concentrations of soluble sulfates which can result in chemical deterioration of the concrete. Results of laboratory testing indicate soluble sulfate contents of 73

and 175 ppm, which range from negligible to moderate sulfate exposure. Since irrigation water in Southern California is considered to have moderate sulfate attack potential (typical sulfate concentrations of 150 to 250 ppm), concrete should be designed to resist moderate sulfate exposure.

The site soils are deemed highly corrosive to ferrous metals based on minimum soil resistivity 1,200 to 2,050 ohm-cm recorded from two samples.

5.0 FINDINGS AND CONCLUSIONS

Based on our investigation, we conclude that the proposed project is feasible from a geotechnical standpoint. We did not encounter significant geotechnical constraints that cannot be mitigated by proper planning, design, and sound construction practices. The key findings of our investigation for the site are summarized below:

- The near surface materials encountered consist of undocumented fill soils and colluvium. The upper 3 to 5 feet of colluvial material are considered compressible. Undocumented fills locally contain large oversize sandstone rock fragments and concrete debris. The fill as encountered at the site is associated with past construction activities.

- The colluvium as encountered consisted predominately of angular sands and gravel sized basalt rock fragments intermixed with organic debris from hillside vegetation. The colluvium forms thick accumulations near the toe of slopes and behind the existing concrete, stone and masonry block retaining walls and within the drainage swales impeding flow. Our observations suggest the colluvium has overtopped the various retaining walls at some point if the past and will continue to do so unless mitigated and maintained. Colluvium is subject to continuous downhill creep due to gravity and rapid releases in the form of debris flows following periods of intense precipitation.

- The basalt bedrock on site has massive pillow structure, is very blocky, interlocked, and partially disturbed with multi-faceted angular blocks formed by joint sets and as a result of rapid crystallization during formation. Basalt at the site should also be expected to occur in dikes and sills in the sedimentary formations. Zeolite veining and other minerals are common.

- The sandstone outcrop in the southern portion of the Off-Season Two Improvements area contain weak planar structural features in unfavorable orientation with respect to the north facing rock slope. This area is prone to rock falls and is expected to require some provisions such as debris walls, rock fences, or rock netting to protect improvements and occupants from the hazards associated with localized rock falls and/or pop-outs. A detached boulder greater than five feet long remains perched near the top of the talus pile while smaller sized rock material up to 2 feet long provide the majority of the talus debris now resting against the southern mezzanine level concrete retaining wall.

- Based on the rock quality determined during the test pit excavations, field mapping and refraction survey (Appendix A), it is our opinion that the basalt and sandstone materials will vary from easily rippable near surface to moderately difficult using electric hand chisels below 4 feet in depth.

- Groundwater was not encountered. Nuisance water could be encountered during and after seasonal precipitation behind the eastern basement retaining wall.

- Results of laboratory testing indicate soluble sulfate contents of 73 and 175 ppm, which range from negligible to moderate sulfate exposure. Since irrigation water in Southern California is considered to have moderate sulfate attack potential (typical sulfate concentrations of 150 to 250 ppm), concrete should be designed to resist moderate sulfate exposure.

- Results of the expansion testing indicate the two representative samples from Leighton test pits TP-1 and TP-4 showed low expansion index (EI) potential when wetted EI =11 and EI=24, respectfully. Non-cohesive granular fill derived from a mixture of these materials is expected to have low expansion potential. Expansive soils not specifically encountered during this investigation may be present locally onsite.

- The existing onsite soils expected to be generated from the basalt formation appear to be suitable for re-use as fill during proposed construction provided they are free of organic material and oversize debris. However, the potential for significant erosion exists if granular fill soils are used on slope faces.

- Oversize material (cobble sized to 14 inches in long dimension) was encountered in Test Pit TP-4. Oversize material could also be generated while excavating the sandstone rocks in the southern portion of the site. Oversize material should be removed from the site or placed at a designated, pre-approved disposal area within the Theater complex.

- Several sandstone boulders lie on the slope face in the northeastern portion of the site above the existing concrete swale and below the crib wall. Damage to the crib wall was observed suggesting sandstone boulders become dislodged in the form of rockfall.

6.0 GEOTECHNICAL RECOMMENDATIONS

Extensive removals of loose slope materials will be required for the project. Many areas around the Theater currently have substantial debris flow and rock fall accumulations. These materials should be removed to unload retaining walls, re-establish proper freeboard behind walls, and reduce the potential for remobilization.

Due to the slopes surrounding the Theater complex, continued regular maintenance will be necessary, especially after periods of heavy or prolonged precipitation. Considering that significant landscaping on the slopes is already planned as part of the project, we recommend that trails and paths be established to facilitate access for maintenance crews to slope areas that currently have debris flow and rock fall accumulations because these areas will likely require regular cleanouts.

The damaged crib wall should be repaired and filled in with crushed rock to provide protection against rock falls and debris flows. The repair should include removal of the debris and rock fall/soil accumulation behind the crib wall.

For protection against future debris flows all new retaining walls should have a minimum freeboard height of 9 inches (height of wall above retained soil). Backfill behind existing walls should be lowered where possible to establish a nominal 9-inch freeboard.

For protection against future rockfalls, we recommend installation of flexible barriers at the bottom of the slope, several feet upslope of any existing retaining walls. Considering that the project site is a performance venue, we anticipate that aesthetics will be an important factor in selecting the rockfall mitigation system. The visual impact of flexible barriers, such as stainless steel cables with steel bollards or wrought iron fencing, will be easier to mitigate. The barrier should establish an effective freeboard of 4 feet. Alternatively, an anchored mesh net may be used. However, its visual impact will be more difficult to mitigate since all upslope areas with potentially loose rock fragments will require coverage.

New structural elements may be supported on spread-type shallow foundation systems established in engineered fill or undisturbed natural soils. Alternatively, deep foundations may be used. Capacities developed for new foundations may be used to evaluate existing footings and cast-in-drilled-hole (CIDH) piles.

The following geotechnical recommendations have been developed based on the exhibited engineering properties of the onsite materials and their anticipated behavior during and after construction, seismic design considerations, floor slabs, and grading.

There are existing basement walls below the stage. Shallow foundations (spread footings) for new structures should be deepened to extend below the active zone of existing basement walls, roughly a plane extending from the base of the basement wall at a 60 degree angle from horizontal, to avoid surcharging the walls. Footings may be deepened by excavating below the active zone and backfilling with concrete or with controlled low strength material (CLSM).

New basement walls planned below existing foundations within their active zones should be designed to accommodate surcharge loads. Surcharge may be modeled as half the footing bearing pressure within the wall's active zone applied horizontally.

New pile segments within the active zone of existing basement walls should be isolated from surrounding soils using Sonotubes or equivalent.

Leighton should review the grading plans, shoring plans, foundation plans, and specifications when they are available to verify that the recommendations presented in this report have been properly interpreted and incorporated.

6.1 Earthwork and Grading

All earthwork and grading should be performed in accordance with the following recommendations and Earthwork and Grading Guide Specifications presented in Appendix E.

6.1.1 Site Preparation

Prior to construction, the area of proposed new structures/foundations should be cleared of any vegetation and demolition trash and debris. These materials should be removed from the site. Any underground obstructions onsite should be removed. Efforts should be made to locate any existing utility lines to be removed or rerouted where interfering with the proposed construction. Any resulting cavities should be properly backfilled and compacted. After the site is cleared, the soils should be carefully observed for the removal of all unsuitable deposits. All undocumented fill should be excavated from proposed structure footprints.

6.1.2 General Grading Recommendations

New structures may be supported on conventional shallow footing foundation systems established on engineered fill or undisturbed bedrock.

The existing undocumented artificial fill should be removed and replaced as engineered fill. Overexcavation and recompaction should extend a minimum horizontal distance equal to the vertical distance between the proposed footing bottom and depth of overexcavation.

After completion of the overexcavation and prior to fill placement, the exposed soils/weathered bedrock should be scarified to a minimum depth of 12 inches, moisture conditioned and compacted to at least 90 percent relative compaction based on ASTM Test Method D 1557.

The onsite soils, less any deleterious material or organic matter, can be used in required fills. Cobbles larger than 6 inches in largest diameter should not be used in the fill. Any required import material should consist of relatively non-expansive soils with an Expansion Index (EI) less than 20. The imported materials should contain sufficient fines (binder material) so as to be relatively impermeable and result in a stable subgrade when compacted. All proposed import materials should be approved by the geotechnical engineer of record prior to being placed at the site.

6.1.3 Pipe Bedding

Any proposed pipe should be placed on properly placed bedding materials. Pipe bedding should extend to a depth in accordance to the pipe manufacturer's specification. The pipe bedding should extend to at least 12 inches over the top of the pipeline. The bedding material may consist of compacted free-draining sand, gravel, or crushed rock. Pipe bedding material should have a Sand Equivalent (SE) of at least 30.

6.1.4 Trench Backfill

Trench excavations above pipe bedding may be backfilled with onsite soils under the observation of the geotechnical consultant. All fill soils should be placed in loose lifts, moisture conditioned as required and compacted to a minimum of 90 percent relative compaction based on ASTM Test Method D 1557-12. Lift thickness will be dependent on the equipment used as suggested in the latest edition of the *Standard Specifications for Public Works Construction* (Greenbook). The fill soils should extend to the bottom of the aggregate base for new pavement, or to finished grade.

6.2 Shallow Foundations

New shallow spread footings may be established in engineered fill or undisturbed natural soils or bedrock.

6.2.1 Minimum Embedment and Width

Footings should have a minimum embedment of 12 inches and have a minimum width of 12 inches.

6.2.2 Bearing Value

Footings established on engineered fill or undisturbed natural soils may be designed to impose an allowable bearing pressure of 3,000 pounds per square foot (psf). A one-third increase in the bearing value for short duration loading, such as wind or seismic forces, may be used.

The ultimate bearing capacity can be taken as 9,000 psf, which does not incorporate a factor of safety. A resistance factor of 0.5 should be used for bearing capacity evaluation with factored loads. The recommended bearing value is a net value, and the weight of concrete in the footings can be taken as 150 pounds per cubic foot (pcf); the weight of soil backfill can be neglected when determining the downward loads.

6.2.3 Settlement

The estimated total settlement of the structures supported on spread footings as recommended above is less than 1 inch. The differential settlement between adjacent columns is estimated to be less than ½ inch over a horizontal distance of 30 feet.

6.2.4 Lateral Resistance

Lateral loads can be resisted by soil friction and by the passive resistance of the soils. A coefficient of friction of 0.35 can be used between the footings and the floor slab and the supporting soils. The ultimate passive resistance of undisturbed natural soils or engineered fill soils can be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot (pcf). The friction resistance and the passive resistance of the soils can be combined without reduction in determining

the total lateral resistance. A resistance factor of 1 should be used for lateral capacity evaluation with factored loads.

6.3 Deep Foundations

Cast-In-Drilled Hole (CIDH) concrete piles or micropiles may also be used to support new structural elements.

6.3.1 Cast-In-Drilled Hole (CIDH) Piles

Details of pile capacity analyses are presented in Appendix F. Design recommendations are summarized in the following subsections.

6.3.1.1 Axial Capacity of CIDH Pile

We understand that theatrical lighting towers are proposed on the hillsides surrounding the amphitheater. The capacities below may be used for design of drilled, cast-in-place concrete piles (CIDH).

Downward Capacity of CIDH Piles (kips)			
Depth of Pile Tip (feet)	**18-inch-diameter**	**24-inch-diameter**	**30-inch-diameter**
15	20	25	30
20	30	45	50
25	45	65	80

Dead-plus-live load capacities are shown. A one-third increase may be used for wind or seismic loads. A factor of safety of 3 was used for shaft friction and end bearing was neglected in determining the pile capacities.

Uplift capacities may be taken as equal to 50 percent of the downward capacities. The capacities presented are based on the strength of the soils; the strength of the pile section should be checked to verify the structural capacity of the piles.

A resistance factor of 0.5 should be used for downward and uplift capacity evaluation with factored loads.

Piles in groups may be spaced at 3 pile widths on-centers. If the piles are so spaced, no reduction in axial capacity due to group action need be considered in the design.

6.3.1.2 Lateral Capacity of CIDH Pile

Lateral loads may be resisted by the caissons and by the passive resistance of the soils. The lateral capacity of the caissons will depend on the caisson type and size, the permissible deflection, and on the degree of fixity at the top of the caisson. We have assumed piles will be installed on an effective 45 to 60 degree slope.

We have calculated lateral load, maximum moments, and depths to maximum moment for CIDH concrete piles (caissons) using the computer program LPILE by ENSOFT, Inc. We have assumed a concrete compressive strength value (f'_c) of 5,000 pounds per square inch (psi).

Lateral Capacities of 18-Inch-Diameter CIDH Pile

Pile Head Deflection (inches)	Fixity	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
¼	Free Head	14	640	6
½	Free Head	20	1,030	7
¼	Fixed Head	30	1,620	0
½	Fixed Head	44	2,610	0

Lateral Capacities of 24-Inch Diameter-CIDH Pile

Pile Head Deflection (inches)	Fixity	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
¼	Free Head	23	1,320	6
½	Free Head	33	2,110	7
¼	Fixed Head	50	3,325	0
½	Fixed Head	72	5,330	0

Lateral Capacities of 36-Inch Diameter-CIDH Pile

Pile Head Deflection (inches)	Fixity	Shear Force at Pile Top (kips)	Maximum Bending Moment (kips-in)	Depth to Maximum Moment (feet)
¼	Free Head	35	2,290	10
½	Free Head	50	3,660	11
¼	Fixed Head	74	5,780	0
½	Fixed Head	100	8,800	0

The analyses performed uses the flexural stiffness of the caissons computed from the modulus of elasticity (E) and moment of inertia (I). The modulus of elasticity (E) is derived based on the concrete compressive strength and the moment of inertia (I) is derived based on the caisson cross-section geometry. The values of E and I are assumed constant along the entire length of the caissons.

Lateral pile capacities considering a reduced moment of inertia due to cracked concrete pile sections should be evaluated after reinforcing details become available.

A resistance factor of 1 should be used for lateral capacity evaluation with factored loads.

The capacities presented in the table above are for pile lengths equal to or greater than 20 feet. This length is measured below the pile cap. The lateral capacity and reduction in the bending moment are based in part on the assumption that any required backfill adjacent to the caisson caps and grade beams are properly compacted.

For caissons in groups spaced at least 3 pile widths on-center, no reduction in the lateral capacity need be considered for the first row of caissons. For subsequent rows in the direction parallel to loading, caissons in groups spaced closer than 8 caisson widths on-center will have a reduction in lateral capacity due to group effects. The lateral capacity of caissons in groups spaced at 3 caisson widths on-center may be assumed to be reduced by half. The reduction for other caisson spacings may be interpolated between no reduction for caissons spaced at 8 caisson widths on-center and the reduction for caissons spaced at 3 caisson widths on-center.

The passive resistance of engineered fill against caisson caps and grade beams will depend on the method of installation. The passive resistance of engineered fill may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot (pcf), up to a maximum pressure of 3,000 pounds per square foot. A one-third increase in the passive value may be used for wind or seismic loads. The lateral resistance of the caissons and the passive resistance of the soils may be combined without reduction in determining the total lateral resistance.

6.3.1.3 Settlement

Piles in groups may be spaced at 3 pile widths on-centers. If the piles are so spaced, no reduction in axial capacity due to group action need be considered in the design.

The settlement of the proposed improvements founded on caissons in the manner recommended, will be approximately ½ inch or less. Differential settlement will be approximately ¼ inch or less. The

differential settlement is anticipated to occur over a minimum span of 40 feet.

Settlement of piles, generally resulting from settlement of the supporting soils and elastic compression of piles, is expected to be on the order of ¼ inch. The settlement analysis should be evaluated when the actual structural load and pile cap configuration become available.

6.3.1.4 Construction

The drilling of the pile shafts and placement of the steel reinforcement and concrete should be done under the continuous observation of the project geotechnical engineer. Localized caving within unsupported excavations should be anticipated. Casing may be required where/if sands layers occur. Excavations for piles that are spaced at less than five diameters (center to center) should be not open simultaneously. Concrete for closely spaced piles should be placed and allowed to set for at least 24 hours before initiating the excavation for any adjacent piles. Steel reinforcement and concrete should be placed as soon as possible after approval of the drill hole. Pile excavations should not be left open overnight. Tremie pipes should be utilized when placing the concrete to prevent the concrete from falling and/or striking the walls of the borehole. Although groundwater was not encountered in our explorations, perched groundwater table may be present following periods of rainfall.

6.4 Slabs-on-Grade

Concrete slabs may be designed using a modulus of subgrade reaction of 150 pci provided the subgrade is prepared as described in Section 6.1, *Earthwork and Grading*. From a geotechnical standpoint, we recommend slab-on-grade be a minimum 5 inches thick with No. 3 rebars placed at the center of the slab at 24 inches on center in each direction. The structural engineer should design the actual thickness and reinforcement based on anticipated loading conditions. Where moisture-sensitive floor coverings or equipment is planned, the slabs should be protected by a minimum 10-mil-thick vapor barrier between the slab and subgrade.

Minor cracking of concrete after curing due to drying and shrinkage is normal and should be expected; however, concrete is often aggravated by a high water/cement ration, high concrete temperature at the time of placement, small nominal aggregate size, and rapid moisture loss due to hot, dry, and/or windy weather conditions during placement and curing. Cracking due to temperature and moisture fluctuations can also be expected. The use of low-slump concrete or low water/cement ratios can reduce the potential for shrinkage cracking. Additionally, our experience indicates that the use of reinforcement in slabs and foundations can generally reduce the potential for concrete cracking.

To reduce the potential for excessive cracking, concrete slabs-on-grade should be provided with construction or weakened plane joints at frequent intervals. Joints should be laid out to form approximately square panels.

6.5 Lateral Earth Pressures

Recommended lateral earth pressures are provided as equivalent fluid unit weights, in psf/ft. or pcf., for design of basement and retaining walls in drained conditions using onsite sandy soils as backfill. These values do not contain an appreciable factor of safety, so the structural engineer should apply the applicable factors of safety and/or load factors during design.

Lateral Earth Pressures

Condition	Equivalent Fluid Unit Weight (psf/ft)
	Level Backfill
Active	35
Seismic Increment	20
At-Rest	55
Passive	300
Coefficient of Friction	0.35

Walls that are free to rotate or deflect may be designed using active earth pressure. For the basement walls or walls that are fixed against rotation, the at-rest pressure should be used. For seismic condition, the pressure should be distributed as an inverted triangular distribution and the dynamic thrust should be applied at a height of 0.6H above the base of the wall.

Care should be taken to provide appropriate drainage so as no water is allowed to remain behind the retaining wall for any significant length of time. Retaining structures should be provided with a drainage system, as illustrated on Figure 5, *Retaining Wall Backfill and Subdrain Detail*, to prevent buildup of hydrostatic pressure behind the wall.

In addition to the recommended earth pressures, walls below grade adjacent to existing structures or streets and areas of traffic should be designed to accommodate surcharge loads. For traffic surcharge, a uniform lateral pressure of 100 pounds per square foot acting as a result of an assumed 300 pounds per square foot surcharge behind the wall due to normal traffic; the traffic surcharge load may be neglected provided a minimum of 10 foot clearance between the wall and the traffic is maintained. We will provide surcharge loading from adjacent foundations after reviewing details of the planned basement walls in relation to existing foundations.

Backfills for retaining walls should be compacted to a minimum of 90 percent relative compaction (based on ASTM Test Method D1557). During construction of retaining walls, the backcut should be made in accordance with the requirements of Cal/OSHA Construction Safety Orders. Relatively light construction equipment should be used to backfill retaining walls. We also recommend using at-rest pressures for design of walls supporting settlement-sensitive structures.

Earth pressures used in the design of the walls should be indicated on the retaining wall plans. All retaining wall designs and plans should be reviewed by the project geotechnical consultant to confirm that the appropriate soil parameters are used.

6.6 Flexible Pavement

To provide support for paving of the new transit plaza, and surface parking and driveways, the subgrade soils should be prepared as recommended in Section 6.1, *Earthwork and Grading*. The preparation of the paving area subgrade should be performed immediately prior to placement of the base course. Proper drainage of the paved areas should be provided since this will reduce moisture infiltration into the subgrade and increase the life of the paving.

6.6.1 Aggregate Base Course

The base course for hot mix asphalt (HMA) concrete paving should meet the specifications for Class 2 Aggregate Base as defined in Section 26 of the latest edition of the State of California Department of Transportation Standard and Specifications. Alternatively, the base course could meet the specifications for untreated base as defined in Section 200-2 of the latest edition of *Standard Specifications for Public Works Construction* (Greenbook). Crushed Miscellaneous Base (CMB) may be used for the base course provided the geotechnical consultant evaluates and tests it before delivery to the site.

6.6.2 Hot Mix Asphalt (HMA) Concrete

The required HMA concrete paving and base thicknesses will depend on the expected wheel loads and volume of traffic (Traffic Index or TI). Assuming that the paving subgrade will consist of engineered fill or bedrock materials with an R-value of at least 30 compacted to at least 90 percent relative compaction based on ASTM Test Method D 1557, the minimum recommended paving thicknesses are presented in the following table:

Asphalt Concrete Pavement Section for Reconstruction

Traffic Index	Hot Mix Asphalt Thickness (inches)	Aggregate Base Thickness (inches)	Total (inches)
5.0 or less	3.0	4.0	7.0
6.0	3.5	5.5	9.0
7.0	4.0	7.0	11.0
8.0	5.0	8.0	12.0
9.0	5.5	9.5	15.0

Representative samples of the actual subgrade materials should be obtained and tested for R-Value following rough grading of the pavement subgrade to confirm the pavement design sections.

6.7 Temporary Excavations

All temporary excavations, including footings, utility trenches, dry wells should be performed in accordance with project plans, specifications, and all OSHA requirements. Excavations 5 feet or deeper should be laid back or shored in accordance with OSHA requirements before personnel are allowed to enter.

No surcharge loads should be permitted within a horizontal distance equal to the height of cut or 5 feet, whichever is greater from the top of the cut, unless the cut is shored appropriately.

During construction, the soil conditions should be regularly evaluated to verify that conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Soil types will vary, but Type C soils can be expected at shallow depths and Type A soils within bedrock. Close coordination between the competent person and the geotechnical engineer should be maintained to facilitate construction while providing safe excavations.

6.8 Shoring

Shoring may be required to accommodate removal of existing basement walls and construction of new basement walls. Shoring and underpinning may also be required to prevent undermining of adjacent existing foundations. The anticipated shoring/underpinning system for the site will consist of soldier piles and lagging. Soldier piles may consist of steel H-beams set in predrilled holes and backfilled with lean-mix concrete to the ground surface.

6.8.1 Lateral Earth Pressures

For design of cantilevered shoring, where the surface of the backfill is level, it can be assumed that drained soils will exert a lateral pressure equal to that developed by a fluid with a density of 35 pounds per cubic foot (pcf).

In addition to the recommended earth pressure, the upper 10 feet of shoring adjacent to streets and driveways should be designed to resist a uniform lateral pressure 100 psf, acting as a result of an assumed 100 psf surcharge behind the shoring due to normal street traffic. If the traffic is kept back at least 10 feet from the shoring, the traffic surcharge may be

neglected. We can determine lateral surcharge pressures for specific cases, such as construction crane, concrete trucks, and other heavy construction equipment adjacent to shoring, if requested.

6.8.2 Surcharge Pressure from Adjacent Foundations

Where existing foundations are within a 1:1 plan projected upward from the bottom of the planned shoring and basement walls, a lateral surcharge load should be applied to the active earth pressure to account for the pressure imposed by the foundation. Once details of existing adjacent foundations are established, we can provide design surcharge pressures to be applied to shoring and basement walls.

6.8.3 Design of Soldier Piles

For the design of soldier piles spaced at least two diameters on centers (OC), the allowable lateral bearing value (passive value) of the soils below the level of excavation may be assumed to be 600 psf at the excavated surface, up to a maximum of 6,000 psf. To develop the full lateral value, provisions should be taken to assure firm contact between the soldier piles and the undisturbed soils. The concrete placed in the soldier pile excavations may be a lean-mix concrete. However, the concrete used in that portion of the soldier pile which is below the planned excavated level should be of sufficient strength to adequately transfer the imposed loads from the soldier pile to the surrounding soils.

The frictional resistance between the soldier piles and the retained earth may be used in resisting the downward component of the design load. The coefficient of friction between the soldier piles and the retained earth may be taken as 0.4. This value is based on the assumption that uniform full bearing will be developed between the steel soldier beam and the lean-mix concrete and between the lean-mix concrete and the retained earth. In addition, provided that the portion of the soldier piles below the excavated level is backfilled with structural concrete, the soldier piles below the excavated level may be used to resist downward loads. The frictional resistance between the concrete soldier piles and the soils below the excavated level may be taken as equal to 500 psf.

6.8.4 Lagging

Continuous lagging will be required between the soldier piles above the bedrock contact. Careful installation of the lagging will be necessary to achieve bearing against the retained earth.

The soldier piles should be designed for the full anticipated lateral pressure. However, the pressure on the lagging will be less due to arching in the soils. For clear spans up to 8 feet, we recommend that the lagging be designed for a semi-circular distribution of earth pressure where the maximum pressure is 400 psf at the midline between soldier piles, and 0 psf at the soldier piles.

Deflection: It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized, however, that some deflection will occur. To help protect adjacent existing buildings and infrastructure, the maximum allowable horizontal shoring deflection as measured at the top of the excavation is ½ inch.

If greater deflection occurs during construction, additional bracing may be necessary to minimize settlement of adjacent structures and of any utilities in the adjacent streets. To reduce the deflection of the shoring, if desired, a greater active pressure could be used in the shoring design.

Monitoring: Some means of monitoring the performance of the shoring system is recommended. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all the soldier piles. We will be pleased to discuss this further with the design consultants and the contractor when the design of the shoring system is finalized. Other methods of monitoring could include the installation of inclinometers.

6.9 Maintenance Guidelines and Erosion Control

We understand it will be the responsibility of the County of Los Angeles to maintain the slopes surrounding the theater site, including adequate planting, proper irrigation and maintenance, and repair of faulty irrigation systems. To reduce the potential for erosion and slumping of soil prisms on steep slopes, all slopes should be planted with plants that require minimal irrigation. Slope

planting should be carried out as soon as practical upon completion of the Off Season Two Improvements. Surface water runoff and standing water at the top of slopes should be avoided. Oversteepening of slopes should be avoided during landscaping activity. Maintenance of proper drainage and proper maintenance of vegetation, including regular slope irrigation, should be performed. Slope irrigation should avoid directly spraying onto the slope face. Drip system irrigation should be considered. Overwatering and consequent runoff and ground saturation should be avoided. If automatic sprinklers systems are installed, their use must be adjusted to account for rainfall conditions.

Any soil, debris or vegetation overgrowth should be removed from all terrace drains to enable runoff water to flow freely and properly. Regular maintenance and cleanup of terrace drains should be performed especially during the rainy season and immediately following prolonged seasonal events. Damage to terrace drains such as minor cracking should be promptly repaired and/or sealed prior to the start of the rainy season. Water should not be allowed to enter cracks or expansion gaps within the terrace drains where applicable.

6.10 Additional Geotechnical Services

The geotechnical recommendations presented in this report are based on subsurface conditions as interpreted from limited geologic mapping and seismic refraction surveys. Our conclusions and recommendations presented in this report should be reviewed and verified by Leighton during site construction and revised accordingly if exposed geotechnical conditions vary from our preliminary findings and interpretations. The recommendations presented in this report are only valid if Leighton verifies the site conditions during construction. Geotechnical observation and testing should be provided during the following activities:

- Grading and excavation of the site;
- Landscape excavation and grading;
- Overexcavation and compaction;
- Compaction of all fill materials;
- Shoring and underpinning system installation;

- Excavation and installation of foundations;
- After excavation of all slabs and footings and prior to placement of steel or concrete to confirm the slabs and footings are founded in firm, compacted fill;
- Utility trench backfilling and compaction; and
- When any conditions are encountered that varies significantly from the conditions described in this report.

Leighton should review the grading and foundation plans and specifications, when available, to comment on the geotechnical aspects. Our recommendations should be revised, as necessary, based on future plans and incorporated into the final design plans and specifications.

7.0 COUNTY OF LOS ANGELES BUILDING CODE SECTION 111 STATEMENT

Provided that the recommendations in this report are implemented, it is Leighton's opinion that the proposed improvements will be safe from the hazards of landslide, settlement, or slippage, and that the completed grading and proposed improvements will not adversely affect the stability of adjacent properties.

8.0 LIMITATIONS

This research report was based wholly on available published data and very limited non-invasive subsurface exploration. Such information is, therefore, incomplete. The nature of many projects is such that differing earth materials and/or geologic conditions can be present within small distances and under varying climatic conditions. Changes in subsurface conditions can and do occur over time. Therefore, findings, conclusions and recommendations presented in this feasibility report are based on the assumption that Leighton will provide design-specific geotechnical exploration and testing, and geotechnical observation and testing during construction.

This report was prepared for the sole use of the Ford Theatre Foundation and their design team, for their use in assessing the proposed Off-Season Two Improvements, in accordance with generally accepted geotechnical engineering practices at this time in the County of Los Angeles.

Subject: Addendum No. 3 to Geotechnical Exploration Report
Off-Season Three and Four Improvements
John Anson Ford Theaters
2580 Cahuenga Boulevard East
Hollywood District of Los Angeles, California

In accordance with our January 6, 2014 proposal, authorized on January 13, 2014, Leighton Consulting, Inc. (Leighton) is pleased to present this third addendum to our geotechnical exploration report in support of the proposed Off-Season Three and Four Improvements. Our scope of work for this study included geologic mapping, subsurface exploration, laboratory testing, engineering analysis, and preparation of this report.

This addendum presents the results of our geotechnical exploration and field mapping program and provides recommendations for design and construction of the proposed improvements.

We appreciate the opportunity to be of service to the Ford Theatre Foundation. If you have any questions or if we can be of further service, please call us at your convenience at (866) LEIGHTON, at the direct extensions listed below, or e-mail us as listed below.

Respectfully submitted,

TABLE OF CONTENTS

ATTACHMENTS:

1.0 INTRODUCTION

1.1 Authorization

In accordance with your authorization on January 13, 2014, and based on our January 6, 2014 proposal, Leighton Consulting, Inc. (Leighton) has performed geologic mapping, subsurface exploration, laboratory testing, and engineering analysis for the proposed Off-Season Three and Four Improvements at John Anson Ford Theaters. The project is located at 2580 East Cahuenga Boulevard in the Hollywood District of Los Angeles, California (Figure 1, *Site Location Map*).

1.2 Objective

The objective of our investigation was to obtain rock quality designation (RQD) estimates of bedrock to evaluate proposed grading, which includes lowering the grade of the cul-de-sac road immediately north of the existing amphitheater by approximately 10 feet and significant hillside cuts ranging from 35 to 50 feet in height for proposed transformer and generator pads and a central plant, see Plate 1, *Revised Geologic Map*.

The transformer and generator pads, proposed on the north and east sides of the cul-de-sac, are located below a potential debris flow area emanating from the drainage swale that outlets to the cul-de-sac. The Central Plant, proposed north of the cul-de-sac entrance, is partially within a surfically mapped failure originating from within the basalt formation.

Therefore, we focused on the area surrounding the cul-de-sac entrance and hillside terrain within the planned 0.75-mile-long pedestrian trail. The main geologic considerations are the potential for debris flows emanating from the hillside swale above the area of planned transformer and generator pads and slope stability.

1.3 Scope of Work

Our scope included document review, geologic mapping, subsurface exploration, laboratory testing, engineering analysis, on-site meeting with the design team, and preparation of this report. To accomplish our scope of work we provided the following services:

- *Review of Available Data*: We reviewed the Draft Interim Site Plan Off-Season 3 and 4, Scale 1"=40', prepared by Levin and Associates Architects, dated December 9, 2013.

- *Geologic Mapping*: We performed field mapping of the observable rock mass, and surficial soil conditions in the project area. Newly collected geologic and structural data is shown on Plate 1, *Revised Geologic Map*.

- *Geotechnical Cross Sections:* We updated existing cross sections A-A' and B-B' developed during our preliminary evaluation (Leighton, 2013a) and constructed five (5) additional cross sections F-F', G-G' H-H', I-I' and J-J' to evaluate the proposed improvements with respect to interpreted subsurface conditions. Geologic cross sections are shown on Plates 2 and 3.

- *Geotechnical Exploration*: We excavated one rock core (RC-1) to a depth of 37 feet below the existing ground surface (bgs) within the cul-de-sac in the area of the planned transformer and generator pads to obtain recoverable rock cores in determination of Rock Quality Designation (RQD) for use in slope stability analysis. The RQD is a modified core recovery percentage in which unrecovered core, fragments and pieces of rock and altered rock are not counted so as to downgrade the quality designation of recovered rock. Rock coring at this location identified the soft crumbly weathered basalt bedrock to a depth of approximately 10 feet below grade. Below 10 feet the formational material becomes extremely hard, very well cemented and resistant characterized as andesitic brecciated basalt bedrock to the total depth of the core. RQD are included on the boring log in Appendix B, *Subsurface Exploration*. Rock cores were collected from the boring at approximate 2.5- and 5-foot intervals and transferred to our lab for analysis. The boring was backfilled with bentonite grout and capped with concrete to the ground surface after completion. Drill cuttings and drilling mud were disposed of on-site.

- *Laboratory Testing*: Unconfined compression testing of samples from RC-1 was performed to develop shear strength parameters for slope stability analysis. Results are shown in Appendix C, *Laboratory Testing*.

- *Engineering Analysis*: We performed an evaluation of the proposed Off-Season Three and Four improvements project based on the field data gathered during our current and prior studies at the site.

- *Report:* Leighton prepared this report documenting the results of the geological mapping, subsurface exploration and engineering analysis and provides updated recommendations where applicable for design and construction of the Off-Season Three and Four Improvements.

1.4 Project Description

The overall John Anson Ford Theaters Master Plan Project includes the following primary components: (1) preservation and rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a four-story structure with three levels of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a meeting hall, and offices and visitor amenities; (4) the Transit Plaza, which would include a designated area for bus and valet drop-off, a new three-level parking structure, and a 99-seat rehearsal and event space; and (5) a 0.75-mile hiking trail.

Leighton understands the Off-Season 3 and 4 improvements are to consist primarily of a new concessions building, loading dock and service court, pads for new transformers and generator, new Central Plant and electrical services, and a 0.75-mile-long pedestrian trail and associated appurtenances. Geotechnical information was collected to supplement previous information provided in our referenced reports (Leighton 2013a and 2013b) in order to complete the current scope of work.

1.5 Study Area

The project site (Site) is situated within a west-facing hillside slope immediately east of US 101 (Hollywood Freeway). The summit and upper ridgeline ranges from Elevation +840 to +940 feet mean sea level (msl) and are approximately 350 feet higher than the lowest elevation along the western portion of the Site adjacent to Cahuenga Boulevard East (Elevation +510 to +570 feet msl). As such, the topography of the Site is widely varied from moderately sloping surface parking areas along the western portion of the Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions.

Rock outcroppings are visible primarily along the ridgelines and as steep near-vertical cliffs. Thick surficial deposits of colluvium and weathered bedrock obscure the structural rock exposures over most of the hillside terrain except as indicated on Plate 1.

The remaining areas are comprised of surface parking and undeveloped open space. Landscaping is provided along driveways, surface parking areas, and pedestrian pathways. Additionally, while there are no designated hiking trails within the Site, there are existing user-created trails and badly distressed concrete stairs in the hills behind the Amphitheater.

2.0 GEOLOGIC RECONNAISSANCE AND MAPPING

We advanced a continuous rock core boring (RC-1) to a depth of 37 feet bgs and performed field mapping of the Off-Season Three and Four Improvements project area to supplement the data provided in our referenced reports. The interpreted subsurface conditions are shown on revised cross sections, Plate 2, sections A-A' and B-B' developed during our preliminary evaluation and new cross sections F-F', G-G' H-H', I-I' and J-J' on Plate 3. Cross Sections C-C', D-D' and E-E', developed in support of the Off-Season Two improvements, remain unaffected by acquisition the new geologic information and are included for reference on Plate 2.

2.1 Cul-de-Sac Parking Area

The circular parking area (cul-de-sac) will be lowered by approximately 10 feet below current grade to accommodate construction of a four-story Office and Concessions Building, Ford Terrace Plaza, new loading dock and staging area, Artist Workshop Building, and generator and transformer pads (See Plate 3, Cross Sections F-F' and G-G'). The approximate footprint of the proposed improvements is shown on Plate 1.

From our geologic field mapping and core boring (RC-1), it appears bedrock within the hillside above the cul-de-sac consists predominately of weathered pillow basalt in contact with steeply dipping (N9˚E,54˚SE to N20˚E,67˚SE) and severely weathered sandstone and lesser shale. Based on data recovered from the core boring, basaltic bedrock underlying the footprint of these proposed areas is expected to become extremely hard and resistant (RQD>90%) at approximately 10 feet below current grade corresponding to Elevation +592 feet msl. Basalt bedrock encountered at this depth interval consists of extremely hard, resistant and well cemented andesitic brecciated basalt and will prove difficult to excavate below weathered depths.

The swale above the proposed transformer and generator pads has been reported verbally to have been subject to enormous debris flows that cascaded down the cul-de-sac to the access drive to East Cahuenga Boulevard. Retaining walls for the transformer and generator pads will require significant freeboard (extension of wall above retained backslope) and to consider temporary surcharge imposed by wet soil debris. A storm drain catch basin will need to be constructed to allow regular rainfall runoff to be transported away for the retaining structures to prevent buildup of hydrostatic pressure behind the walls. Periodic

maintenance to prevent excessive buildup of soil debris will need to be regularly performed.

Based on the results of slope stability analysis, the required cuts for the transformer and generator pads may be accomplished without shoring. The weathered zone (upper 10 feet of excavation) will likely slough and require a 2:1 (horizontal to vertical) backslope. Retaining walls will be required to augment the stability of the cut slopes and establish the recommended freeboard. Results of slope stability analyses are shown in Appendix D, *Slope Stability Analysis*.

2.2 Central Plant and Electrical Services

A new Central Plant and Electrical Services Building (Central Plant) is proposed in an area of surficial instability, within heavily weathered pillow basalt formation (Plate 3, Cross Section H-H'). There is an existing cast-in-place concrete wall with timber lagging immediately west of the proposed Central Plant. The timber lagging is heavily distressed and rotting in place. The concrete wall is slightly terraced, and intermittently overtopped with surficial soil debris during heavy precipitation. The concrete wall has several cracks within the face and will need to be removed and replaced in order to construct the Central Plant.

Based on the results of slope stability analysis, the required cut for the Central Plant may be accomplished without shoring. The weathered zone (upper 10 feet of excavation) will likely slough and require a 2:1 (horizontal to vertical) backslope. Retaining walls will be required to augment the stability of the cut slope and establish the recommended freeboard. Results of slope stability analyses are shown in Appendix D.

2.3 Pedestrian Trail

A 0.75-mile-long pedestrian trail is proposed for construction to access the hillside areas of the theatre. Based on our geologic mapping (Plate 1), the main geotechnical considerations for this pathway are thick, loose soil accumulations; hard, resistant ridge top; and cliff-forming sandstone and shale. The existing heavily damaged and cracked concrete stairs constructed on the hillside to provide access to the cross above the amphitheater will require repair or replacement. It is anticipated that the trail will consist of lightweight pipe and batter board to account for stepped elevation differences with aluminum or wood stairs constructed in areas of cliff-forming sandstone and shale. A majority of the

pathway is expected to require relatively minor earthwork improvements such as stabilization and compaction of loose soil.

3.0 FINDINGS AND CONCLUSIONS

Based on the results of our supplemental exploration, we conclude that the proposed Off-Season Three and Four improvements project is feasible from a geotechnical standpoint. We did not encounter significant geotechnical constraints that cannot be mitigated by proper planning, design, and sound construction practices. The key findings of our supplemental investigation for the site are summarized below:

- The near surface materials encountered consist of a thin layer (less than 1-foot thick) of undocumented fill in the cul-de-sac area. Undocumented fills locally contain large oversize rock fragments and basalt debris. The fill encountered at the site is associated with past construction activities.

- The colluvium consists predominately of angular sands and gravel sized basalt rock fragments intermixed with organic debris from hillside vegetation. The colluvium forms thick accumulations in the swale above the proposed generator and transformer pads at the cul-de-sac. Verbal discussions with onsite personnel indicate the colluvium has slid down the swale as a debris flow during the winter of 2005-2006. Colluvium is subject to continuous downhill creep and subject rapid releases in the form of debris flows following periods of intense precipitation.

- The basalt bedrock in the cul-de-sac area has massive pillow structure, is very blocky, interlocked, and partially disturbed with multi-faceted angular blocks formed by joint sets and as a result of tectonic uplift during the mountain building process. Basalt in this location was observed to be weathered to a depth of approximately 10 feet below grade becoming very hard, very well cemented brecciated basalt and will prove difficult to excavate below its weathered depth. Heavy ripping should be anticipated.

- Steeply dipping sandstone and very hard shale with weak planar structural features in unfavorable orientation (N9˚E,54˚SE to N20˚E,67˚SE) to the proposed pads is expected to be encountered in the western portion of the cut for transformer and generator pads. The sandstone is of limited thickness (approximately 6-inches) at this location and embedded with the heavily fractured and weathered shale. The shale is well cemented and can be prove moderately difficult to excavate in the weathered zone. Sandstone on other areas of the site was observed to be thickly bedded and outcrops along ridge tops and in cliff forming exposures. Heavy ripping should be anticipated.

- Based on the rock quality (RQD) determined during the core boring (RC-1) excavation (Appendix B), it is our opinion that the basalt and sandstone materials will vary from easily rippable near surface to difficult below 10 feet in depth.

- Groundwater was not encountered. Nuisance water could be encountered during and after seasonal precipitation emanating from the natural drainage swale above the area of proposed transformer and generator pads.

- The required cuts for the transformer and generator pads and Central Plant may be accomplished without shoring. The weathered zone (upper 10 feet of excavation) will likely slough and require a 2:1 (horizontal to vertical) backslope. Retaining walls will be required to augment the stability of the cut slope and establish the recommended freeboard to protect against debris flows.

- The existing onsite soils are expected to be generated from the basalt formation and are not suitable for re-use as fill behind the retaining structures. Select free draining backfill material is required to prevent hydrostatic pressure from building up behind the retaining walls.

- Oversize material could be generated while excavating the sandstone rocks and brecciated basalt during excavation in the cul-de-sac area. Oversize material should be removed from the site or placed at a designated, pre-approved disposal area within the theater complex.

4.0 GEOTECHNICAL RECOMMENDATIONS

Recommendations contained in the referenced reports and addendum (Leighton 2013a, 2013b, 2013c) remain applicable to the site except were superseded by more stringent recommendations contained herein. Extensive removals and recompaction of loose slope materials will be required for the project as they have substantial debris flow potential. These materials should be removed and recompacted where applicable or removed in their entirety to reduce the potential for remobilization.

For protection against future debris flows the new retaining walls for the generator and transformer pads and the Central Plant should have a minimum freeboard height of 24 inches (height of wall above retained soil). A storm drain and catch basin should be constructed in the swale above the planned walls to provide an outlet for rainfall runoff and to catch eroded materials. Eroded materials will build up in the catch basin and regular maintenance should be performed to preserve the basin and drain functionality.

Retaining wall recommendations are presented in Leighton (2013b). The concrete pads for transformer and generator pads and the Central Plant may be established on 18-inches of engineered fill or directly on bedrock overlain by a sand leveling course of nominal thickness. From a geotechnical standpoint, we recommend that the slab-on-grade be a minimum of 5 inches thick with No. 3 rebars placed at the center of the slab at 24 inches on center in each direction. The structural engineer should design the actual thickness and reinforcement based on anticipated loading conditions.

Leighton should review the grading plans, shoring plans, foundation plans, and specifications when they are available to verify that the recommendations presented in this report have been properly interpreted and incorporated.

APPENDIX D

APPENDIX D

SLOPE STABILITY ANALYSIS

Global Stability

Slope stability analyses were performed for the cross sections shown on Plate 3. The locations of these cross sections are shown on Plate 1. The results of the analyses are presented at the rear of this appendix. The slope stability analyses were conducted using the computer program *SLIDE v6.008* (Rocscience, 2011). *SLIDE* performs stability calculations using two-dimensional (2D) limit equilibrium techniques based on vertical slice equilibrium.

Geologic Model

The geologic model used in the slope stability analyses is based on our geologic reconnaissance, results of our subsurface exploration, and review of pertinent information in the literature. In general, the slope stability models were constructed with stratigraphy identical to that shown on Plate 3.

Material Strength Parameters

The strength parameters used in our preliminary evaluation (Leighton, 2013a) were generally based on the parameters listed in the *Seismic Hazard Zone Report for the Hollywood 7.5-Minute Quadrangle, Los Angeles County, California* (CDMG, 1998). Our slope stability models for cross sections A-A' and B-B' were updated with the results of field exploration performed as part of the current study.

The Hoek-Brown failure criterion was selected as the appropriate approach to represent shear strength of the basalt (T_{vb}) rock mass at the project site. The basalt exhibited non-persistent (apparently random) jointing. Its structure varied widely form generally massive to blocky. Shearing would involve both intact rock and joints. Postulated failure planes would most likely follow step paths.

Considering that the individual blocks within the basalt rock mass are much smaller than the slope, the Hoek-Brown rock mass model provides a reasonable methodology to analyze step-path failure as an equivalent failure through a heavily-jointed isotropic rock mass. The incorporation of an appropriate Geological Strength Index (GSI) of the rock mass model provides a rational methodology to account for the impact of sheared

zones at faults. For this study, a GSI of 33 (seamy structure with fair to poor surface conditions) was conservatively assigned to the basalt. The computer program RocLab v1.031 (Rocscience, Inc., 2007) was used to develop Mohr-Coulomb parameters for slope stability analysis based on the Hoek-Brown criterion. An intact uniaxial compressive strength of 130 kips per square foot (ksf) was used based on the weakest sample tested in the laboratory. The resulting shear strength parameters are shown in Table D1 below.

Similarly, the cross-bedding strength of the Topanga formation sandstone/shale was estimated used the Hoek-Brown failure criterion. An intact uniaxial compressive strength of 130 ksf was used with a GSI of 40 (seamy structure with good to fair surface conditions). The along-bedding strengths were adopted from CDMG (1998). The resulting shear strength parameters are shown in Table C1 below.

The strength parameters for the other subsurface materials modeled in our slope stability analyses were generally consistent CDMG (1998).

Table C1: Shear Strength Parameters for Slope Stability Analysis

Material Description	Cross Bedding		Along Bedding	
	c′ (psf*)	ø′ (degrees)	c′ psf	ø′ (degrees)
Artificial Fill - A_f (Static)	255	30	Isotropic	
(Pseudostatic)				
Colluvium/Slope Wash (Static)	400	14	Isotropic	
(Pseudostatic)				
Tertiary Volcanic Rocks - T_{vb} (Static)	4,000	38	Isotropic	
(Pseudostatic)				
Topanga Formation Bedrock - T_t (Static)	5,000	40	350	28
(Pseudostatic)				

*pounds per square foot

Stability Analysis Methodology

The search techniques for circular and block slip surfaces programmed into the software was used for the analyses. The Factor of Safety (FOS) of each surface was computed using Spencer's method of slices for limit equilibrium. The above analyses were conducting for both static and pseudostatic scenarios; the pseudostatic analyses were computed using a coefficient of horizontal acceleration (k_h) of 0.15.

Results of Analyses

The results of the analyses (program output files) are included in the rear of this appendix. The results are organized by cross section and present the results of the static analyses followed by the pseudostatic analyses.

Conclusions

The results of the stability analyses provided in this report indicate the proposed grading for the project will provide sufficient stability of the proposed improvements and the surrounding hillside. With the anticipated support provided by recommended retaining structures, the factor of safety for each scenario was calculated to be over 1.5 and 1.1 for static and pseudostatic conditions, respectively.

LEGEND

Afu — ARTIFICIAL FILL-UNDOCUMENTED, CONTAINS STOCKPILED ONSITE DEBRIS SILTY SANDY GRAVEL TO GRAVELLY SAND WITH COBBLE AND BOULDER SIZED DEBRIS.

Qcol — QUATERNARY COLLUVIUM, LOOSE, CONSISTS OF LOCALLY DERIVED BEDROCK MATERIAL, UNCONSOLIDATED, SUSCEPTIBLE TO SLOPE CREEP AND RAPID EROSION. MANTLES SLOPES, WITH THICK WEDGE AT TOES OF CUT SLOPES. DEBRIS FLOW HAZARD

MIDDLE TOPANGA FORMATION AND VOLCANIC BEDROCK

Tts — LIGHT GREY TO ORANGE BROWN, HARD, THICKLY BEDDED, RESISTANT TO EROSION, MODERATELY TO WELL CEMENTED SANDSTONE WITH LOCALIZED PEBBLY LAYERS. FINE TO COARSE ANGULAR TO TRACE ROUNDED GRAINS. INCLUDES QUARTZ PEBBLE SIZED INCLUSIONS. UNIT INCLUDES VERY FINE GRAINED SANDY SILTSTONE, THINLY BEDDED AND CONTAINS DARK REDDISH BROWN, SILICEOUS CHERTY BEDS. CLIFF FORMING. SEVERELY FRACTURED, BLOCKY. ROCKFALL HAZARD ALONG CUT SLOPES. CIRCLED WHERE BURIED.

Ttbs — DARK GREY, CRUMBLY SANDSTONE WITH BASALT FRAGMENTS AND ROUNDED MANGANESE NODULES. SEVERELY WEATHERED AND FRACTURED. HEAVY SECONDARY MINERALIZATION AND CHEMICAL ALTERATION OF MAFIC MINERALS. CIRCLED WHERE BURIED.

Tvb — EXTRUSIVE BASALTIC VOLCANIC ROCKS, DARK GREY TO BLACK. VESSICULAR TO PILLOW STRUCTURE, SEVERELY WEATHERED AND FRACTURED. PERVASSIVE BLOCKY FRACTURE, MODERATE LUSTER ON WEATHERED BLOCKY FACES. DEGRADES TO SAND SIZED FRAGMENTS. HEAVY SECONDARY MINERALIZATION TO EPIDOTE. CHEMICALLY WEATHERED. FRIABLE- NEAR SURFACE, HARD AND VERY RESISTANT WITH DEPTH, CIRCLED WHERE BURIED.

GEOLOGIC CONTACT, DASHED WHERE APPROXIMATE, DOTTED WHERE CONCEALED, QUERRIED WHERE UNCERTAIN

F. . ?. — FAULT CONTACT, DASHED WHERE APPROXIMATE AND OBSERVED DOTTED WHERE CONCEALED, QUERIED WHERE UNCERTAIN.

APPROXIMATE BOUNDARIES OF CUT SLOPES

APPROXIMATE BOUNDARY OF COLLUVIUM. DEBRIS FLOWS PRIMARILY WITHIN BASALT FORMATION. ARROW DENOTES DIRECTION OF MOVEMENT. AREAS ARE SUBJECT TO ONGOING CREEP AND SEDIMENT BUILDUP BEHIND EXISTING RETAINING WALL IMPROVEMENTS.

50↓ 24W — STRIKE AND DIP OF BEDDING

21W 35 — STRIKE AND DIP OF FAULT

15W 35 — STRIKE AND DIP OF BEDROCK CONTACT

60 38W 34E — STRIKE AND DIP OF LOCALIZED SHEAR SURFACES

20W 55 — STRIKE AND DIP OF JOINTS

EXISTING RETAINING WALLS

BASALT DIKE

SURFACE CONTACT OF SANDSTONE BEDDING AND INTRUSIVE BASALT OUTCROPS

APPROXIMATE CENTERLINE OF EXISTING DRAINAGES. ARROW DENOTES DIRECTION OF SURFACE FLOW

OM 70.5M — APPROXIMATE LOCATION OF SEISMIC LINES S-1 AND S-2, SHOWN WITH LENGTH IN METERS (M) AND VELOCITY IN METERS PER SECOND (M/S). (LEIGHTON, 2013a)

J J' — LOCATION OF GEOLOGIC CROSS SECTIONS (LEIGHTON 2013a AND CURRENT STUDY)

RC-1 T.D.37.5' — LOCATION OF ROCK CORE BORING SHOWING TOTAL DEPTH (T.D.)

SCALE 0 40 80 FEET
