I. Executive Summary

I. Final EIR Executive Summary

1. Introduction

In accordance with California Environmental Quality Act (CEQA) Guidelines Sections 15088, 15089, and 15132, the County of Los Angeles, as Lead Agency, has prepared this Final Environmental Impact Report (Final EIR) for the Ford Theatres Project (Project).

As described in Sections 15089 and 15132 of the CEQA Guidelines, a lead agency must prepare a Final EIR before approving a project. The purpose of a Final EIR is to provide an opportunity for the lead agency to respond to comments made by the public and agencies regarding a project's Draft EIR. Pursuant to CEQA Guidelines Section 15132, this Final EIR includes a revised summary, corrections and additions to the Draft EIR, a list of persons, organizations, and agencies that provided comments on the Draft EIR, and responses to comments received regarding the Draft EIR.

This Final EIR constitutes the second part of the EIR for the Project and is intended to be a companion to the Draft EIR. The Draft EIR for the Project, circulated for public review and comment from June 23, 2014, through August 8, 2014, constitutes the first part of the EIR and is incorporated by reference and bound separately. (Refer to Volumes I through IV of the Draft EIR). This Final EIR is organized into four main sections as follows:

Section I. Executive Summary—This section provides an overview of the Project and its potential impacts. Also included in this section are areas of controversy and issues to be resolved, an overview of the public review process that was completed for the Project, and a summary of the alternatives to the Project.

Section II. Clarifications and Additions to the Draft EIR—This section provides a list of revisions that have been made to the Draft EIR for the Project, based on comments received from the public and agencies, and other items requiring updating and/or clarification.

Section III. Responses to Comments—This section presents a matrix of the parties that commented on the Draft EIR and the issues that they raised. This matrix is

followed by verbatim numbered copies of the comments followed by numbered responses to each of the written comments on environmental issues made regarding the Draft EIR for the Project for the convenience of the reader. Copies of the full original comment letters also are provided in Appendix FEIR-A of this Final EIR.

2. Project Purpose and Objectives

Section 15124(b) of the California Environmental Quality Act (CEQA) Guidelines states that the project description shall contain "a statement of the objectives sought by the proposed project." Section 15124(b) of the CEQA Guidelines further states that "the statement of objectives should include the underlying purpose of the project." The underlying purpose of the Project is to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource. The Project's specific objectives are as follows:

Historic Rehabilitation of the Amphitheatre

- Preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County.

- Provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination.

Additional Artist and Patron Site Enhancements

- Support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences.

- Repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

- Enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress.

- Further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

- Create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures.

- Enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views of surrounding iconic landmarks from a formal trail within the park boundary.

- Mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre.

- Provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre.

- Provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community.

- Provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

3. Description of the Project

a. Overview of the Proposed Development

The Ford Theatres Project is proposed to enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users. The Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and plaza deck featuring a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, an event space, and a maintenance facility; and (5) a 0.75-mile hiking trail.

(1) Amphitheatre Rehabilitation Improvements

Within the Amphitheatre, the Project would replace the existing approximately 860-square-foot projection booth and control room located to the rear and above the Amphitheatre seating with a new 800-square-foot projection booth and control room. Existing lighting positions along the back of the Amphitheatre would also be removed and replaced with an upgraded lighting platform that would be integrated within a new sound wall proposed along the rear of the Amphitheatre. The proposed sound wall could measure up to 48 feet in height. In addition, a retractable shade structure would provide cover for the Amphitheatre during day time performances.

(2) Ford Terrace

North of the Amphitheatre, the existing circular driveway and disabled parking adjacent to the secondary entrance would be modified to accommodate a dedicated artist performance entry and provide for a two-story office and concessions building and an approximately 3,750-square-foot plaza, collectively referred to as the Ford Terrace. The two-story building would include approximately 2,500 square feet of office space in one level above an approximately 2,500-square-foot concessions area at the first level. To the west of the two-story building would be a raised plaza deck that would serve pre- and post performance concessions, private receptions, and intermission concessions. Beneath the plaza, the modified driveway would form a service level referred to as the Service Court providing a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup, as well as fire department access. An

approximately 1,570-square-foot workshop to support performances would also be provided within the Service Court adjacent to the loading dock. To provide for these improvements, the Project would require removal of the existing two-story approximately 320-square-foot concessions building located adjacent to the secondary entrance. Disabled parking currently located adjacent to the secondary entrance would be accommodated within the parking structures proposed as part of the Project.

In addition, the existing approximately 1,895-square-foot, 87-seat [Inside] the Ford located at the lower level of the Amphitheatre and the associated lighting, stage, and theatrical amenities would be repurposed as a self-serve food marketplace area and provide space for storage. New ADA-accessible restrooms would also be provided at the lower level.

(3) Ford Plaza

West of the Amphitheatre, generally within the existing south surface parking area, the Project proposes the Ford Plaza. The Ford Plaza would include a three-level parking structure, which would provide approximately 250 parking spaces. A plaza deck providing approximately 45,000 square feet of outdoor plaza areas would be created above the parking structure. As part of the Ford Plaza, the existing 365-square-foot box-office would be repurposed as a museum/gallery for the Ford Theatres and just west of the existing box office an approximately 560-square-foot box office would be constructed. In addition, a three-story building providing approximately 17,600 square feet of office uses and approximately 1,200 square feet of shops/visitor amenities would be located adjacent to the new box office. At the southern boundary of the Ford Plaza, an approximately 1,000-square-foot conference room would be built to support the adjacent office space. Adjacent to the conference room would be an outdoor area that could accommodate small informal performances, musical entertainment, and/or overflow/support monitors to view events occurring within the indoor venues. North of these uses within the Ford Plaza would be an approximately 3,900-square-foot, 150-seat restaurant that would include a 1,300-square-foot kitchen/bar and a 2,600-square-foot indoor seating area. An approximately 1,000-square-foot outdoor seating area would also be included. East of the restaurant, an indoor performance venue comprised of approximately 8,000 square feet and including 299 seats would be provided. This facility would feature acoustic treatments, a proscenium stage and full theatrical lighting and rigging that would be able to accommodate multi-disciplinary performances. Backstage spaces within the new venue would include performer restrooms, dressing rooms, and a prep area for special events.

(4) Transit Center

A Transit Center consisting of a bus/van loading and unloading zone, a three-level parking structure referred to as the north parking structure, a rehearsal and event space referred to as the Flex Space, and a maintenance area would be constructed along the northwestern extent of the Project Site. Specifically, upon entering the Ford Theatres from the existing primary access at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, the Transit Center would provide a staging area for buses to load and unload. From this area, vehicles would also be directed south to the parking structure within the Ford Plaza or north to the three-level parking structure proposed within the Transit Center. The north parking structure would provide approximately 250 parking spaces.

Approximately 8,300-square-foot Flex Space would be constructed at the lowest level of the parking structure. The Flex Space would provide approximately 99 retractable seats and would include full theatrical lighting, performer restrooms, dressing rooms, and a prep area for special events. A plaza area referred to as the Transit Plaza would also be located below the parking structure. At the upper deck of the parking structure, an approximately 6,300-square-foot maintenance area consisting of office, storage, garage, and yard areas would be provided. To provide for these improvements, the Project would require removal of the existing two-story approximately 10,500-square-foot former motel building currently used as office space for Ford Theatre Foundation, Los Angeles County Arts Commission, and Philharmonic staff.

(5) Hiking Trail

The Project would also include a 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The trail would be approximately four feet in width and would feature natural-type fencing as well as “sutter wall” style retaining walls, where required or necessary, and cut-in granite steps where areas of steep terrain are proposed. Hand-railing may also be provided at the steps. The trail alignment may utilize portions of existing user-established informal trails. The hours of operation for use of the trail would observe standard park hours of sunrise to sunset.

Overall, implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

b. Project Design

The proposed improvements would be designed to complement the existing historic character of the Ford Theatres. The Project is designed to be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings (1995) Weekes and Grimmer. The new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. The Project is also designed to minimize building footprints and remain primarily within the developed areas of the Project Site. Specifically, upon buildout of the Project, approximately 4.3 acres of the 32-acre Project Site would comprise developed area, an increase of 0.8 acre. The remaining approximately 27.7 acres would comprise undeveloped open space.

In addition, to reduce the massing, the new buildings and parking structures in particular would be integrated into the existing topography of the Project Site. Building heights would range from approximately 15 feet to 67.5 feet in height as measured from adjacent grade with elevations ranging from 515 feet to 610 feet above sea level. Materials, such as wood, brick, stucco, metal panels, concrete and glass are anticipated to be used in the construction of the buildings. The new buildings and infrastructure would also be designed to be environmentally sustainable and to achieve certification under the U.S. Green Building Council's Leadership in Energy Efficiency and Design (LEED®) or equivalent green building standards. In addition, the Project would be designed to meet the County's green building requirements.

c. Access and Parking

Access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some on-site configuration and circulation modifications. In addition, to facilitate access and circulation within the Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The northernmost driveway, which is currently used primarily for egress at the end of events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from the north parking structure. The proposed driveway between the northernmost driveway and the main entrance would provide right-turn only egress from the Transit Center and the parking structure. The driveway at Pilgrimage Bridge and Cahuenga Boulevard East, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. The southern driveways would also be maintained in their existing locations with the southernmost driveway providing ingress to the south parking structure and the other

driveway providing egress. At the driveway providing egress from the south parking structure, the Project proposes a new signal to allow for safer left turns from the driveway to Cahuenga Boulevard East. Ingress and egress to the south parking structure would also be provided from the main entrance.

Within the Project Site, access to the Amphitheatre would continue to be provided at the existing main entrance. In addition, new pedestrian pathways would be provided for access to the new areas. As described above, the existing circular driveway at the secondary entrance would be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance, such as trash and recycling pickup, as well as fire department access. The Project would also include bicycle amenities.

Upon buildout of the Project, parking would be provided within two new three-level parking structures that would generally be located within the existing north and south surface parking areas that would be removed as part of the Project. Upon completion, the Project would provide a total of approximately 500 parking spaces within two parking structures and a net increase of approximately 120 to 150 parking spaces, including additional ADA parking spaces. Parking would also continue to be available at the Universal City/Studio City Metro Red Line Station. A shuttle would continue to be provided to and from the Ford Theatres during evening events. In addition, use of the Ford Theatres parking facilities by the Hollywood Bowl may continue.

d. Landscaping

A variety of native and drought tolerant plant material would be used to enhance and complement the existing plant material on the hillside. In addition, mature native trees would be planted and enhanced with complementary native vegetation. To screen off-site views of the south parking structure, the proposed landscape would berm up to cover the exposed areas of the parking structure, thereby bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. In addition, along the proposed trail, landscape improvements may include habitat restoration and enhanced plantings.

Implementation of the Project would require the removal of approximately 146 trees, including cypress, pine, palm, eucalyptus, ficus, sycamore, oak, and olive trees. This number includes the trees proposed to be removed as part of the approved Amphitheatre improvements. The Project would also relocate approximately 20 trees throughout the Project Site. As part of the Project, trees to be removed would be replaced on a minimum 1:1 basis.

e. Lighting and Signage

The Project would feature illuminated building façades on the north parking structure, the new theatre, the restaurant, and the proposed sound wall. In addition, the Project would include exterior lighting along vehicular and pedestrian pathways and at the upper level of the north parking structure for security and wayfinding purposes. Accent lighting to highlight architectural features, landscape elements, and the Project's signage would also be incorporated. Lighting throughout the plaza areas would also be provided. The Project would also include new theatrical lighting within the Amphitheatre. Light fixture control devices could be implemented, as necessary, to minimize glare.

Project signage would include various identity signs including a central identity sign. The identity signs may include the existing Ford Theatres sign along Cahuenga Boulevard East, which would be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance. In addition, a large sign identifying the Ford Theatres would be placed along the proposed sound wall. This sign is anticipated to be illuminated. The proposed sound wall and sign would replace the existing wall and sign along the top of the Amphitheatre wall. Monitors that would be used for a variety of purposes such as publicizing events, promoting the available food services, assisting in wayfinding, and for broadcasting sold-out events may also be provided in the plaza areas and other public spaces throughout the Project Site.

The Project would also include interpretive signage along the proposed hiking trail and throughout the Project Site to provide information about the history of the Ford Theatres, Ford programs and local flora and fauna. Lastly, wayfinding signs would be located throughout the Project Site, including at parking structure entrances and elevators.

f. Utilities

The Project would provide a generator east of the office and concessions building within the Ford Terrace and north of the building would be a service yard and transformers. An approximately 2,200-square-foot central utility plant is also proposed east of the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, the Project could provide a decentralized air-cooling system. Additional transformers would be installed within the Ford Plaza adjacent to the 299-seat theatre, at the central utility plant, at the north entrance of the north parking structure, and near the south trailhead termination. Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles along Cahuenga Boulevard East. These electrical poles could

measure up to 65 feet in height. In addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. Other utility improvements proposed as part of the Project would include new natural gas service, sewer and water connections, and drainage improvements. The Project would also integrate and relocate the existing cell towers and associated structures to allow construction of the Transit Center.

g. Fire Protection and Security Features

As the Project Site is located in a Very High Fire Hazard Severity Zone, a fuel modification plan would be required to minimize the risk of wildfires. The fuel modification plan for the Project would set forth buffer zones around the proposed structures. The fuel modification plan would also specify requirements pertaining to landscape irrigation, thinning and removal of brush and dead plant materials, removal of non-native plant species, and maintenance of the buffer zones. A preliminary fuel modification plan has been prepared by the Project in consultation with the Los Angeles County Fire Department, and is included in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR. A final fuel modification plan would be submitted to the Los Angeles County Fire Department for approval prior to the issuance of Project construction permits.

The Project would also include an upgraded fire system, including the installation of on-site fire hydrants and new water connections. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project's design would also incorporate security features to provide for the safety of on-site employees and visitors. These features would include high-definition surveillance cameras, and signage along the hiking trail. Entryways, lobbies, and parking areas would also be well illuminated and designed to eliminate areas of concealment.

h. Project Construction and Scheduling

The Project could be implemented in several phases to provide flexibility to continue operating the Ford Theatres during construction. Construction of the Project may be completed as early as 2020. In the event construction of the Project occurs as one phase, or in consolidated phases, the Ford Theatres would be expected to close and no events would be held until buildout of the Project or completion of the phase(s) under construction. It is estimated that the Project would require approximately 107,094 cubic yards of export. Based on the proximity of the Hollywood Freeway to the Project Site, it is anticipated that haul trucks and delivery trucks would access the Project Site traveling northbound on Cahuenga Boulevard East from the Hollywood Freeway (US-101) and would exit the Project Site onto Cahuenga Boulevard East and travel northbound on Cahuenga Boulevard East to the Hollywood Freeway.

As part of the Project, a Construction Management Plan would be implemented during construction to manage construction traffic and ensure that adequate and safe access and parking remains available during construction activities. Construction worker parking and construction staging would be accommodated on-site. Construction activities would comply with Section 12.08.440 of the Los Angeles County Code, which prohibits noise-generating construction activities between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays in the absence of certain emergencies.

3. Necessary Approvals

Discretionary approvals from the County of Los Angeles Board of Supervisors will be necessary for the Ford Theatre Foundation to implement the Project.

4. Public Review Process

In accordance with CEQA, the environmental review process for the Project commenced with solicitation of comments from identified responsible and trustee agencies, and also included early consultation with the public on the scope of the Draft EIR, through a Notice of Preparation (NOP) process. The County Department of Parks and Recreation prepared an Initial Study and circulated an NOP for public comment to the State Clearinghouse, Office of Planning and Research, responsible agencies, and other interested parties on February 7, 2014, for a 30-day review period. In addition, a public scoping meeting was conducted on February 18, 2014, at the Project Site. The public scoping meeting provided the public with the opportunity to receive information regarding the Project and to provide input regarding issues to be addressed in the Draft EIR. The Initial Study, NOP, and NOP comment letters are included in Appendix A of the Draft EIR.

Consistent with the requirements of Sections 15087 and 15105 of the CEQA Guidelines, the Draft EIR was submitted to the State Clearinghouse, Office of Planning and Research, and was circulated for a 45-day public review and comment period beginning on June 23, 2014, and ending on August 8, 2014. In addition, a public meeting was held on July 14, 2014. The public meeting provided an overview of the findings of the Draft EIR and provided the public an opportunity to submit comments regarding the Draft EIR. Following the Draft EIR public comment period, this Final EIR has been prepared that includes responses to the environmental comments raised regarding the Draft EIR.

5. Areas of Controversy/Issues to be Resolved

Potential areas of controversy and issues to be resolved by the County's decision-makers may include those environmental issue areas where the potential for significant

impacts has been identified. As evaluated in the Draft EIR and summarized below, with the incorporation of project design features and mitigation measures, the Project would not result in significant and unavoidable impacts with regard to the environmental topics presented in the Draft EIR. Based on the NOP comment letters provided in Appendix A, issues known to be of concern in the community included, but were not limited to traffic, noise, and wildfire risk. Refer to Appendix A of the Draft EIR for copies of the NOP comment letters.

Based on the comment letters received regarding the Draft EIR, which are included in Appendix FEIR-A of this Final EIR, issues known to be of concern include, but are not limited to, traffic, historic resources, and wildfire risk. As shown in Table III-1, Matrix of Comments Received in Response to the Draft EIR, provided in Section III, Responses to Comments, of this Final EIR, comments were also provided regarding other environmental topics addressed in the Draft EIR. Copies of the comment letters submitted regarding the Draft EIR are included in Appendix FEIR-A of this Final EIR.

6. Summary of Alternatives

The Draft EIR for the Project examined three alternatives to the Project in detail, which include: No Project/No Build; Reduced Project; and Simultaneous Event Schedules. A general description of these Alternatives is provided below. The Draft EIR also identified two alternatives that were considered for analysis but rejected as infeasible. These alternatives included an Alternative Site and an Improved Parking Only Alternative, which was suggested during the NOP Process. The Alternative Site Alternative considered the development of the Project in a different location and the Improved Parking Only Alternative considered the development of only the parking improvements proposed as part of the Project wherein the two existing surface parking lots would be replaced with new parking structures for 500 cars. These two alternatives were rejected in the Draft EIR for failing to meet most of the Project objectives. Refer to Section V, Alternatives, of the Draft EIR for a more detailed description of the alternatives considered and rejected as well as a description of the alternatives evaluated in detail and a comparative analysis of the impacts of these alternatives with those of the Project.

Alternative 1: No Project/No Build Alternative

Alternative 1, the No Project/No Build Alternative assumes the Project would not be approved and the existing environment would be maintained, with the exception of the previously approved Amphitheatre improvements and other on-going routine interior and exterior maintenance improvements. The previously approved Amphitheatre improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and

mechanical and electrical systems upgrades. The previously approved Amphitheatre improvements will occur internal to the Project Site, within the boundaries of the existing Amphitheatre. This Alternative would not result in any changes to the existing operations at the Ford Theatres. The site plan under this Alternative would resemble existing conditions, as illustrated in Figure II-2 in Section II, Project Description of the Draft EIR.

Alternative 2: Reduced Project Alternative

The Reduced Project Alternative would develop the Project Site similar to the Project and would include the same components as the Project as follows: rehabilitation of certain portions of the existing Amphitheatre, the Ford Terrace, the Ford Plaza, the Transit Center, and a 0.75-mile hiking trail. However, the Reduced Project Alternative would not include development of the 299-seat theatre within the Ford Plaza. In addition, under this Alternative, the 99-seat Flex Space proposed within the Transit Center would be relocated to the area of the 299-seat theatre as proposed by the Project. With the relocation of the Flex Space from the Transit Center to the Ford Plaza under this Alternative, the footprint of the Transit Center would be reduced but would continue to feature a designated area for bus and valet drop-off, a three-level parking structure, and a maintenance facility. All other components and features of the Project as described in Section II, Project Description, of the Draft EIR would be maintained under the Reduced Project Alternative. Further, under Alternative 2, building heights and architectural features would be similar to the building heights and architectural features of the Project.

Overall, implementation of this Alternative would result in approximately 39,550 net new square feet compared to the Project's approximately 47,550 net new square feet of development. As such, this Alternative would reduce the proposed net new development by approximately 8,000 square feet or approximately 17 percent. Additionally, this Alternative would provide for 12 net new seats within the Project Site in comparison to the Project's 311 net new seats. In addition, while this Alternative would not provide the 299-seat theatre, the number of annual events and attendees would increase but would be reduced when compared to the Project.

Alternative 3: Simultaneous Event Schedules Alternative

The Simultaneous Event Schedules Alternative would include the development of the same components as the Project but with long term flexibility in the scheduling of events within the Amphitheatre and proposed 299-seat theatre. Specifically, under Alternative 3, events held in the Amphitheatre, the 299-seat theatre, and the Flex Space would be able to have simultaneous events with concurrent start times whereas under the Project, events held in the Amphitheatre and the 299-seat theatre would have staggered

start times of at least 45 minutes after 6:00 P.M. on weekday evenings to avoid potentially significant traffic impacts.

As with the Project, Alternative 3 would comprise the following: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, 99-seat Flex Space, and maintenance facility; and (5) a 0.75-mile hiking trail. These components would be developed within the Project Site in the same manner as proposed under the Project described in Section II, Project Description, of the Draft EIR. The estimated increases in annual events and attendance projected to occur under the Project would also remain under this Alternative.

7. Summary of Environmental Impacts and Mitigation Measures

Table FEIR I-1 on page I-15 provides a summary of the environmental impacts of the Project. As summarized therein, implementation of the Project would not result in significant impacts to any of the environmental issues evaluated in the Draft EIR which could not be reduced with compliance with regulatory requirements and the implementation of project design features and mitigation measures.

Table FEIR I-1
Summary of Impacts Under the Project

Environmental Issue	Project Impact
A. AESTHETICS, VIEWS, LIGHT, AND GLARE	
Aesthetics	Less Than Significant
Views	Less Than Significant
Light	Less Than Significant
Glare	Less Than Significant
B. AIR QUALITY	
Construction–Regional Emissions	Less Than Significant
Construction–Localized Emissions	Less Than Significant
Operational–Regional Emissions	Less than Significant
Operational–Localized Emissions	Less than Significant
Toxic Air Contaminants	Less than Significant
Odors	Less than Significant
C. GREENHOUSE GAS EMISSIONS	Less than Significant
D. BIOLOGICAL RESOURCES	Less Than Significant with Mitigation
E. CULTURAL RESOURCES	
Historic Resources	Less Than Significant with Mitigation
Archaeological Resources	Less Than Significant with Mitigation
Paleontological Resources	Less Than Significant with Mitigation
F. GEOLOGY AND SOILS	Less Than Significant with Mitigation
G. HYDROLOGY, SURFACE WATER QUALITY, AND GROUNDWATER	
Surface Water Hydrology	Less Than Significant
Surface Water Quality	Less Than Significant
Groundwater	Less Than Significant
H. LAND USE AND PLANNING	Less Than Significant
I. NOISE	
Construction Noise	Less Than Significant
Construction Vibration	Less Than Significant
Operational Noise	Less Than Significant
J.1. PUBLIC SERVICES–FIRE PROTECTION	Less Than Significant
J.2. PUBLIC SERVICES–POLICE PROTECTION	Less Than Significant
K. TRAFFIC, ACCESS, AND PARKING	
Traffic	Less Than Significant
Congestion Management Program	Less Than Significant

Table FEIR I-1 (Continued)
Summary of Impacts Under the Project

Environmental Issue	Project Impact
Access and Circulation	Less Than Significant
Parking	Less Than Significant
L.1. UTILITIES AND SERVICE SYSTEMS—WATER	Less Than Significant
L.2. UTILITIES AND SERVICE SYSTEMS—ENERGY AND ENERGY CONSERVATION	Less Than Significant

A. Aesthetics, Views, Light, and Glare

a. Analysis of Project Impacts

(1) Aesthetics

(a) Construction Impacts

The removal of on-site structures, surface parking areas, and landscaping would not cause the loss of unique visual resources (i.e., the surrounding hillsides and historic Amphitheatre) or prominent existing features that contribute positively to the existing visual character and quality of the Project Site. As such, the Project's construction activities would not substantially degrade the existing visual character of the Project Site or the surrounding area. Therefore, aesthetics impacts associated with construction would be less than significant.

(b) Operational Impacts

The Project would provide new performing arts and support facilities that would be consistent with and build on the existing uses on the Project Site and in the surrounding community. Implementation of the Project would result in the removal of the existing former motel building currently used as office space; the projection booth and control room, which is not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; the concessions building, which is also not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; and surface parking areas and landscaping. As illustrated in the conceptual site plans provided in Section II, Project Description, of the Draft EIR, the Project would develop new structures and landscaping that would be primarily confined to areas of the Project Site that have already been developed.

While the presence of new development would invariably alter the aesthetic character of the Project Site, the Project would employ a cohesive site design in part by ensuring architectural compatibility and integration with the surrounding environment. The Project would also rehabilitate the existing historic Amphitheatre and would not result in the removal or alteration of existing features that contribute positively to the visual character of the Project Site and surrounding area. Overall, the new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. Similarly, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. As such, the Project would not substantially degrade the existing visual character or quality of the Project Site or surrounding area. Impacts related to aesthetics would be less than significant.

(2) Views

Overall, while Project implementation would modify existing public views along Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway, the proposed structures would not dominate the viewshed along Cahuenga Boulevard. Rather, the Project has been intentionally designed to limit the building footprint within areas already developed so as to preserve the natural setting of the Project Site. Accordingly, public views of the Project Site would continue to feature a semi-urban environment with a background of rolling hills, pockets of trees, and landscaping. Thus, the Project would not have a substantial adverse effect on a scenic vista, and view impacts would be less than significant.

(3) Light

(a) Construction Impacts

Substantial lighting is not anticipated during construction within the Project Site as most construction activities would occur during daylight hours. However, the Project may include lighting for construction activities occurring in the early evening during the winter season. Outdoor lighting sources such as floodlights, spot lights, and/or headlights associated with construction equipment and hauling trucks would typically accompany construction activities during this period. To the extent evening construction includes artificial light sources, such use would be temporary and would cease upon completion of proposed Project construction. Further, construction-related illumination would be used for safety and security purposes only. Additionally, as set forth in Project Design Feature A-1, construction lighting would be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary. Construction lighting, while potentially bright, would be highly focused on the particular area undergoing work. Therefore, given

that the majority of construction activities for the Project would be primarily confined to areas of the Project Site that have already been developed, which are separated from residential uses to the north, east, and south by open space and intervening topography, the surrounding uses would not be anticipated to be substantially affected by construction lighting. Thus, light impacts associated with proposed construction activities would be less than significant.

(b) Operational Impacts

Based on visual simulations provided in Section IV.A, Aesthetics, Views, Light, and Glare, of the Draft EIR, lighting associated with the proposed light boxes would be the most distinguishable light source as viewed from Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway. However, as illustrated, the light boxes would not feature so prominently such that the light boxes would emanate light that would be inconsistent with the existing light sources in the vicinity of the Project Site. In addition, there are no residential properties or other sensitive uses immediately surrounding the Project Site, and any light emanating from the proposed Project lighting would be directed within the Project Site. Further, lighting associated with the proposed theatrical lighting would be consistent with the existing lighting within the Amphitheatre. Also, in accordance with Project Design Feature A-2, Project lighting, where applicable, would incorporate shielding and aiming to prevent glare and light spill and the upward emition of light and Project lighting would not exceed 2 foot-candles outside of the Project Site boundary. Therefore, due to the types of proposed lighting and measures employed to minimize light pollution, the Project would not create a new source of substantial light that would adversely affect day or nighttime views in the area. Thus, impacts related to Project lighting would be less than significant.

(4) Glare

(a) Construction Impacts

Daytime glare could potentially accompany construction activities if reflective construction materials were positioned in highly visible locations where the reflection of sunlight could occur. However, any glare would be highly transitory and short-term, given the movement of construction equipment and materials within the construction area and the temporary nature of construction activities within each area of the Project Site. In addition, large, flat surfaces that are usually required to generate substantial glare are not typically an element of construction activities. Furthermore, the potential for nighttime glare associated with construction is unlikely as most construction activities would occur during the day, and any construction activities occurring in the early evening during the winter season would be limited and temporary. As such, the Project would not result in a significant impact related to construction glare.

(b) Operational Impacts

Building materials for the Project would likely include plaster, concrete, metal panels, fritted glass, and cement board. In accordance with Project Design Feature A-3, exterior windows, glass, and metal used on building surfaces would be non-reflective or treated with a standard low-reflective or non-reflective glazing. As such, sunlight reflected from the surfaces of proposed structures would not be expected to generate substantial daylight glare. The replacement of existing surface parking areas with structured parking would also reduce the potential for daytime glare from windows of parked vehicles. Overall, the Project would not create a new source of substantial glare which would adversely affect day or nighttime views. Therefore, glare impacts would be less than significant.

b. Cumulative Impacts

(1) Aesthetics

None of the related projects are located sufficiently close to the Project Site to enter the same field of view as the Project. Specifically, the nearest related project (Related Project No. 22) to the Project Site is located approximately 0.8 mile southwest of the Project Site. Therefore, given its location and distance from the Project Site and intervening development, Related Project No. 22 would not be within the same field of view as the Project. Notwithstanding, similar to the Project, future developments would be expected to occur in accordance with adopted plans, regulations, and guidelines such as height limits, density, and setback requirements, and would be reviewed by the County or City to ensure consistency with adopted guidelines and standards that relate to aesthetics. Further, many of the related projects in the area represent infill development that is not expected to be out of scale or character with the existing visual environment, as ensured through the County's and the City's environmental review processes. Therefore, cumulative impacts relative to aesthetics would be less than significant.

(2) Views

Based on the distance of the related projects and intervening development, none of the related projects would affect views along Cahuenga Boulevard in the area of the Project Site or block views of the hillsides surrounding the Project Site. As such, future development in the Project area would not be expected to cumulatively obstruct public views of valued visual resources within and in the immediate vicinity of the Project Site and cumulative impacts relative to views would be less than significant.

(3) Light

Development of the Project, as well as the other related projects in the area, would introduce new or expanded sources of artificial light. Consequently, ambient light levels in the Hollywood area may increase overall. However, given the proximity of the related projects to the Project Site, the additional artificial light sources introduced by these projects would not significantly alter the existing lighting environment that currently exists in the immediate Project area. In addition, each of the related projects would be required to comply with regulatory requirements which address light spill and brightness. As a result, cumulative impacts relative to light would be less than significant.

(4) Glare

With regard to glare, only related development immediately adjacent to Project structures would have the potential to create glare that could collectively pose impacts affecting a given off-site use, property, or activity. Due to the distance of the related projects from the Project Site, it is unlikely that glare could have a combined effect from a particular vantage point. In addition, it is anticipated that the related projects in the vicinity of the Project Site would be subject to discretionary review to ensure that building materials to be used would not create significant sources of glare. Further, since the Project's glare impacts would be less than significant, the Project would not contribute to any cumulative increase in glare in combination with the related projects. As such, cumulative glare impacts would be less than significant.

c. Project Design Features

Project Design Feature A-1: During construction, lighting shall be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary.

Project Design Feature A-2: Project lighting shall incorporate shielding and aiming to prevent glare, light spill, and the upward emition of light and shall not exceed 2 foot-candles outside of the Project Site boundary.

Project Design Feature A-3: Exterior windows, glass, and metal used on building surfaces shall be non-reflective or treated with a standard low-reflective or non-reflective glazing.

d. Mitigation Measures

With the implementation of project design features, impacts related to aesthetics, views, light, and glare would be less than significant. No mitigation measures would be necessary.

e. Conclusion

Project-level and cumulative impacts related to aesthetics, views, light, and glare would be less than significant.

B. Air Quality

a. Analysis of Project Impacts

(1) Construction Impacts

(a) Regional Construction Impacts

Construction of the Project has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and construction activities. Mobile source emissions, primarily NO_X, would result from the use of construction equipment such as dozers, loaders, and cranes. During the finishing phase of a building, paving operations and the application of architectural coatings (e.g., paints) and other building materials would potentially release VOCs. The Project's maximum regional emissions associated with construction would not exceed any of the daily significance thresholds set forth by the South Coast Air Quality Management District (SCAQMD). Therefore, regional emissions during construction of the Project would result in a less than significant air quality impact.

(b) Localized Construction Impacts

Maximum localized construction emissions for off-site sensitive receptors would not exceed any of the SCAQMD-recommended localized screening thresholds. Therefore, localized emissions during construction of the Project would result in a less than significant air quality impact.

(c) Toxic Air Contaminants

The greatest potential for toxic air contaminant (TAC) emissions during construction would be from diesel particulate emissions associated with heavy equipment operations during grading and excavation activities. Because the construction schedule estimates that the phases which require the most heavy-duty diesel vehicle usage, such as site grading/ excavation, would last for a short duration (e.g., approximately six months), construction of the Project would not result in a substantial, long-term (i.e., 70-year) source of TAC emissions. In addition, there would be no residual emissions or corresponding individual

cancer risk after construction. As such, Project-related TAC impacts during construction would be less than significant.

(d) Odors

During construction of the Project, activities associated with the operation of diesel-powered construction equipment, asphalt paving operations, and the application of architectural coatings and solvents may produce perceptible odors. The Project would comply with applicable regulatory requirements regarding construction activities and odors. With compliance with applicable rules and regulations, impacts associated with objectionable odors during Project construction would be less than significant.

(2) Operational Impacts

(a) Regional Operational Impacts

Regional emissions resulting from operation of the Project would not exceed any of the SCAQMD's daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

An analysis of daily operational emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The analysis shows that the net overall operational emissions associated with the Project under existing conditions (2014) would be higher than the estimated emissions at Project build-out (2020). This increase is exclusively a function of the change in default CalEEMod emission factors from 2020 to 2014 (i.e., vehicular fleet mix is cleaner in subsequent years as a result of cleaner newer vehicles). As with the Project buildout (2020) analysis year, the Project (2014) analysis would not exceed any of the established SCAQMD daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

(b) Localized Operational Impacts

Operation of the Project would not introduce any major new sources of air pollution within the Project Site. As such, on-site operational emissions would not exceed any of the localized significance thresholds.

An analysis of daily operational on-site emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The analysis shows that the net overall operational on-site emissions associated with the Project under existing conditions (2014) would be similar to the estimated emissions during Project build-out (2020). As with the Project build-out (2020) analysis year, on-site operational emissions

under existing conditions would not exceed any of the localized significance thresholds. Therefore, localized impacts from on-site emission sources would be less than significant.

In addition, the Project would not cause any new or exacerbate any existing CO hotspots, and, as a result, impacts related to localized mobile-source CO emissions would be less than significant.

(c) Toxic Air Contaminants

The primary sources of potential air toxics associated with Project operations include diesel particulate matter from delivery trucks (e.g., truck traffic on local streets and idling on adjacent streets). Although there would be an increase in the total Project Site square footage and presumably a slight increase in the number of delivery trucks, compliance with applicable rules and regulations would substantially limit potential emissions from deliveries. As such, the Project would not be considered a substantial source of diesel particulate matter and potential air toxic contaminant impacts would be less than significant.

Typical sources of acutely and chronically hazardous TACs include industrial manufacturing processes (e.g., chrome plating, electrical manufacturing, petroleum refinery). The Project would not include these types of potential industrial manufacturing process sources. As such, the Project would not release substantial amounts of TACs, and no significant impact on human health would occur.

(d) Odors

The Project does not include any uses identified by the SCAQMD as being associated with odors. However, the Project does include a restaurant which would have the potential to emit odors through cooking and charbroilers. The Project would minimize the release of odors from the proposed restaurant with odor reducing equipment as necessary. Garbage collection areas for the Project would also be covered and situated away from the property line and sensitive uses. Good housekeeping practices would be sufficient to prevent objectionable odors from garbage collection areas. Therefore, potential odor impacts would be less than significant.

(3) SCAQMD CEQA Air Quality Handbook Policy Analysis

The determination of AQMP consistency is primarily based on the long-term influence of the Project on air quality in the Air Basin. Project development would not have a significant short-term or long-term impact on the region's ability to meet State and federal air quality standards. Also, the Project would be consistent with the goals and policies of the AQMP for the control of fugitive dust. The Project's long-term influence would also be

consistent with the goals and policies of the AQMP. Therefore, the Project is considered consistent with the SCAQMD's AQMP.

b. Cumulative Impacts

(1) Construction Impacts

According to the SCAQMD, individual construction projects that exceed the SCAQMD's recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the Air Basin is in non-attainment. Construction-related daily emissions at the Project Site would not exceed any of the SCAQMD's regional or localized significance thresholds. Thus, the Project's contribution to cumulative construction-related regional emissions would not be cumulatively considerable and therefore would be less than significant. Construction of the Project also would have a less than significant impact with regard to localized emissions. Therefore, the Project's contribution to cumulative air quality impacts due to localized emissions would also not be cumulatively considerable and therefore would be less than significant.

Similar to the Project, the greatest potential for TAC emissions at each related project would generally involve diesel particulate emissions associated with heavy equipment operations during demolition and grading/excavation activities. Construction activities at each related project would not result in a long-term (i.e., 70-year) substantial source of TAC emissions. Additionally, the SCAQMD CEQA guidance does not require a health risk assessment for short-term construction emissions. It is therefore not meaningful to evaluate long-term cancer impacts from construction activities which occur over relatively short durations. As such, cumulative toxic emission impacts during construction would be less than significant.

Also similar to the Project, via mandatory compliance with SCAQMD Rules, it is anticipated that construction activities or materials used in the construction of the related projects would not create objectionable odors. Thus, odor impacts from the related projects are anticipated to be less than significant individually, as well as cumulatively in conjunction with the Project.

(2) Operational Impacts

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. Operational emissions from the Project would not exceed any of

the SCAQMD's regional or localized significance thresholds during Project build-out (2020) or under existing conditions (2014). Therefore, the emissions of non-attainment pollutants and precursors generated by Project operation would not be cumulatively considerable.

With respect to TAC emissions, neither the Project nor any of the related projects (which are largely residential, retail/commercial, and office uses), would represent a substantial source of TAC emissions, which are typically associated with large-scale industrial, manufacturing, and transportation hub facilities. As such, cumulative TAC emissions during long-term operations would be less than significant. In addition, the Project would not result in any substantial sources of TACs that have been identified by the California Air Resources Board's Land Use Guidelines, and thus, would not contribute to a cumulatively considerable impact.

With respect to potential odor impacts, neither the Project nor any of the related projects (which are primarily residential, retail, and office uses) have a high potential to generate odor impacts. Thus, potential odor impacts from related projects are anticipated to be less than significant. The Project would not result in odor impacts, and, thus, would not contribute to a cumulative odor impact.

c. Project Design Features

No specific project design features are proposed with regard to air quality.

d. Mitigation Measures

Project-level and cumulative impacts with regard to air quality would be less than significant. Therefore, no mitigation measures are required.

e. Conclusion

Project-level and cumulative impacts with regard to air quality would be less than significant.

C. Greenhouse Gas Emissions

a. Analysis of Project Impacts

Construction emissions are typically associated with demolition, site preparation, excavation, grading, and construction-related equipment and vehicular activity. Construction of the Project is estimated to generate a total of 1,442 metric tons of CO_2e.

As recommended by the SCAQMD, the total GHG construction emissions were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the Project's annual GHG emissions inventory.

The GHG emissions for the Project taking into consideration implementation of project design features included throughout the Draft EIR, the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates demonstrates that the Project has incorporated sustainability design features to reduce vehicle miles traveled and the Project's potential impact with respect to GHG emissions. The Project's GHG emissions reduction of 16.4 percent compared to the "business as usual" (BAU) scenario constitutes an equivalent or larger break from BAU than has been determined by CARB to be necessary to meet AB 32's goals (i.e., 16-percent reduction). Therefore, the Project would not have a significant impact on the environment due to its GHG emissions. In addition, the Project would be consistent with CARB's *Climate Change Scoping Plan* for the implementation of AB 32 and would comply with the County of Los Angeles Green Building Standards. Therefore, the Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

b. Cumulative Impacts

Although the Project is expected to emit GHGs, the emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. A project's GHG emissions typically would be very small in comparison to state or global GHG emissions and, consequently, they would, in isolation, have no significant direct impact on climate change. Overall, implementation of project design features included throughout the Draft EIR, compliance with the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates would contribute to GHG reductions. These reductions represent a reduction from BAU and support State goals for GHG emissions reduction. As such, the Project would support State goals for GHG emissions reduction and be consistent with AB 32. The Project also would comply with the County of Los Angeles Green Building Standards, which emphasizes improving energy conservation and energy efficiency, increasing renewable energy generation, and changing transportation and land use patterns to reduce auto dependence. The related projects would also be anticipated to comply with many of the same emissions reduction goals and objectives as the Project. In the absence of adopted standards and established significance thresholds, and given the Project's consistency with

State, regional, and local GHG emission reduction goals and objectives, the Project's impacts are concluded to be less than significant and not cumulatively considerable.

c. Project Design Features

No specific project design features beyond the Project improvements discussed in Section II, Project Description, of the Draft EIR are proposed with regard to greenhouse gas emissions.

d. Mitigation Measures

The Project would comply with applicable regulatory requirements, including the provisions set forth in the 2013 CALGreen Code that have been incorporated into the County of Los Angeles Green Building Standards Code. Impacts related to climate change would be less than significant, and no mitigation measures are required.

e. Conclusion

Impacts with regards to GHG emissions would be less than significant.

D. Biological Resources

a. Analysis of Project Impacts

(1) Potential Vegetation Community Impacts

No special-status plant communities are located in the Biological Study Area (BSA). Native plant communities that occur in the study area include chaparral scrub, which is common in undeveloped areas of southern California. As this native plant community is not listed as a special-status plant community, potential impacts to existing plant communities associated with the Project would be less than significant and no mitigation measures are required.

(2) Potential Regulatory Status Plant Species Impacts

The Project would include rehabilitation of portions of the existing Amphitheatre and development of new structures, including improvements to the exterior landscape and development of a hiking trail. Construction along the proposed hiking trail and within the existing landscaped areas would require vegetation removal. In addition, on a yearly basis, vegetation would be thinned up to 200 feet from all new structures in an effort to reduce fire risk in the area. Such activities could directly or indirectly impact identified special-status

plant species that occur within the BSA. With implementation of Mitigation Measures D-1 and D-2, potentially significant impacts to special-status plant species associated with the Project would be reduced to a less than significant level.

(3) Potential Regulatory Status Wildlife Species Impacts

(a) Construction

(i) Regulatory Status Bird Species

The coastal California gnatcatcher is identified as a species of concern by the California Department of Fish and Wildlife and would have the potential to occur in the BSA as the chaparral and sage scrub communities located in the BSA are suitable habitats for the coastal California gnatcatcher. While the potential for the coastal California gnatcatcher to occur in the BSA during construction is considered low, absence cannot be confirmed without additional surveys. As such, the Project could result in potentially significant direct impacts to the coastal California gnatcatcher. In addition, as this species is non-migratory, construction activities could result in indirect impacts on coastal California gnatcatcher species through noise disturbance and vegetation removal if they were to be in the BSA during construction. Annual vegetation thinning required out to 200 feet from all new structures would also reduce habitat for coastal California gnatcatcher. Implementation of Mitigation Measure D-3 would reduce potential impacts to a less than significant level.

Migratory birds and raptors also have the potential to occur in the BSA given the large areas of trees, vegetation, and buildings that could create the potential for migratory birds and raptors to nest. Construction activities could result in impacts on nesting birds through noise disturbance and vegetation removal if they were in the BSA during construction. Implementation of Mitigation Measure D-4 would reduce potentially significant impacts to migratory birds to a less than significant level.

(ii) Regulatory Status Small Mammal Species

The BSA includes undisturbed habitat that could be impacted as a result of construction activities. Sensitive wildlife species with the potential to occur within this habitat includes the coast horned lizard *(Phrynosoma blainvillii)* and the San Diego desert woodrat *(Neotoma lepida intermedia)*, both of which are considered species of concern by CDFW. Construction activities, including noise disturbance and vegetation removal could impact these species if they are present within the BSA during Project construction. With implementation of Mitigation Measure D-5, potential impacts to wildlife species would be reduced to a less than significant level.

(iii) Regulatory Status Bat Species

Four bat species have been identified with the potential to occur within the BSA. All species are identified as species of concern by the California Department of Fish and Wildlife with the exception of the hoary bat, which has a state rank of "S4." The BSA includes large trees, vegetation, and buildings that could provide roosting habitats for bats. Construction activities would result in noise disturbance and vegetation removal that could impact the bats if they are present during construction. Implementation of Mitigation Measures D-6 and D-7 would reduce potential impacts to bats to a less than significant level.

(b) Operation

Implementation of the Project would increase lighting, noise, and human activity within the Project Site, which could potentially deter wildlife occurring within the BSA from the area and reduce their ability to forage. In addition, the development of the proposed hiking trail would increase the risk for wildlife-human interactions within the Project Site. Furthermore, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path and reduce further disturbance of the hillside may prevent wildlife access to foraging areas and reduce their ability to move through the area. With implementation of Mitigation Measures D-8 through D-10, potential impacts to wildlife species during operation of the Project would be reduced to a less than significant level.

(4) Oak Tree Impacts

During the tree survey conducted for the Project, one coast live oak was identified for removal as part of the previously approved Amphitheatre improvements and four coast live oak trees have been identified for potential relocation. The oak tree previously contemplated for removal as part of the approved Amphitheatre improvements measured 4 inches in trunk diameter at 4.5 feet above mean natural grade. The remaining oak trees proposed to be relocated within the Project Site measured 8, 10, 12, and 14 inches in trunk diameter at 4.5 feet above mean natural grade. In accordance with the Los Angeles County Oak Tree Ordinance, a permit would be required for the removal or relocation of oak trees measuring 8 inches in trunk diameter or greater. As such, a permit would be required for the relocation of the four oak trees. As these trees are proposed to be relocated within the Project Site, the Project would not result in the permanent loss of protected trees and potential impacts to oak trees would be less than significant. Mitigation Measure D-11, provided below, would ensure the relocation of the oak trees is consistent with the Los Angeles County Oak Tree Ordinance. Mitigation Measure D-11 further outlines the procedures to be followed should the oak trees be protected in place.

(5) Regional Connectivity/Wildlife Movement

There are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Notwithstanding, development of the Project would occur primarily within the already developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. As such, the Project would not be expected to result in an increased barrier to local wildlife movement. In addition, the proposed trail alignment would generally follow the alignment of existing user-created trails, which potential wildlife in the area would already be accustomed to. Furthermore, while implementation of the proposed hiking trail would increase human activity in the hillside areas, wildlife movement typically occurs during nighttime when access to the hiking trail would not be permitted. Additionally, in accordance with Mitigation Measure D-9 provided below, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, the Project is not anticipated to negatively impact wildlife movement within the open space areas of the Project Site and the open space areas to the north and east of the Project Site. Impacts with regard to wildlife movement would be less than significant and no mitigation measures would be required.

(6) Fire Hazard Areas

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist within the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. Fires within the Project Site could result in potential impacts on existing vegetation communities, special status species, and wildlife if a fire were to spread beyond the developed areas of the Project. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, impacts with respect to wildfire risk would be less than significant.

b. Cumulative Impacts

The related projects include mostly infill developments that contain limited native vegetation or suitable habitats for wildlife species. Due to their generally developed/ disturbed nature and lack of native vegetation and habitats, the related project sites do not contribute to the long-term sustainability of natural communities and, therefore, would not have a significant impact on biological resources on a cumulative basis In addition, as with the Project, any potential impacts to biological resources resulting from development of the related projects would likely be subject to mitigation as part of the environmental review process, thereby avoiding or minimizing potential impacts to biological resources. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts to biological resources.

As previously discussed, the Project would not have a significant adverse effect on any designated regional wildlife movement corridors as there are no regional wildlife movement corridors within or adjacent to the Project Site. Based on the location of the related projects within highly urbanized areas and the proximity of the related projects to large expanses of open space, the related project sites do not provide the type of environment that would attract wildlife to those sites or use those sites to reach nearby open space areas where such wildlife are known to exist. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts with regards to wildlife movement.

c. Project Design Features

No specific project design features are proposed with regard to biological resources.

d. Mitigation Measures

Special-Status Plant Species

Mitigation Measure D-1: Prior to construction, a qualified botanist shall conduct rare plant surveys throughout the Project area. In the event special status species are found during surveys, avoidance measures shall be implemented based on the recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented, in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Surveys shall be conducted during the appropriate blooming period to the extent feasible. If surveys cannot be conducted within the appropriate blooming period, or if the presence for any species

cannot be ruled out for any other reason, avoidance measures shall be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Mitigation Measure D-2: If it is determined that special status plants would be directly impacted as a result of the Project, an on- or off-site restoration plan shall be prepared by a qualified botanist, in coordination with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

The restoration plan shall be implemented prior to the completion of the Project. The plan shall include the following: receiver locations; number of plants to be replanted and the methods of replanting; maintenance and monitoring requirements; and measures necessary for the establishment of self-sustaining populations in suitable open space areas to ensure the long-term survivability of the species in the vicinity.

Annual monitoring for at least five (5) years shall be required to ensure no-net-loss of acres of habitat for the species. The acreage ratio of lost special-status plant species habitat to habitat replaced shall be coordinated with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable, but shall be no less than 1:1.

Coastal California Gnatcatcher

Mitigation Measure D-3: Within a year prior to construction, protocol level surveys for the coastal California gnatcatcher shall be conducted within 300 feet of suitable habitat by a qualified biologist/ornithologist according to the United States Fish and Wildlife Service survey guidelines. The surveys shall include, at a minimum, a thorough examination of all suitable habitat within the Project area and vicinity for the coastal California gnatcatcher or its sign. The final survey methodology shall be determined in coordination with the United States Fish and Wildlife Service. A summary report shall be prepared upon completion of these activities and submitted to the United States Fish and Wildlife Service.

If, following protocol level surveys, no gnatcatchers are detected, but construction is delayed more than one year, additional surveys may be required, at the discretion of the United States Fish and Wildlife Service, to ensure that no gnatcatchers have moved into the area. If evidence of the coastal California gnatcatcher is found within the Project area during surveys, consultation with the United States Fish

and Wildlife Service shall be conducted, and any requirements of the regulatory agencies regarding protection of the species shall be implemented.

Migratory Birds and Raptors

Mitigation Measure D-4: The following measures shall be implemented during construction to minimize impacts on nesting birds and raptors:

a. Construction in areas that include trees, vegetation, or buildings that may provide nesting habitats for bird and raptors shall be reduced to the maximum extent feasible.

b. Trimming and removal of vegetation and trees shall be minimized and performed outside of the nesting season (February 15 to September 15) to the extent feasible.

c. In the event trimming or removal of vegetation and trees must be conducted during the nesting season, nesting bird surveys shall be completed by a qualified biologist no more than 48 hours prior to trimming or clearing activities to determine if nesting birds are within the affected vegetation. Nesting bird surveys shall be repeated if trimming or removal activities are suspended for five days or more.

d. In the event construction is scheduled during bird nesting season, nesting bird surveys shall be completed no more than 48 hours prior to construction to determine if nesting birds, raptors, or active nests are in or within 500 feet of the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more.

e. In the event nesting birds or raptors are found in the construction area, appropriate buffers (typically 300 feet for songbirds and up to 500 feet for raptors) shall be implemented, in coordination with the California Department of Fish and Wildlife, to ensure that nesting birds and active nests are not harmed. Buffers shall include fencing or other barriers around the nests to prevent any access to these areas and shall remain in place until birds have fledged and/or is no longer active, as determined through coordination with the California Department of Fish and Wildlife.

Special-Status and General Wildlife Species

Mitigation Measure D-5: A qualified biologist shall complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more. If any wildlife species are identified, appropriate

measures shall be developed and implemented to avoid impacts on these wildlife species, in consultation with resource agencies as applicable.

Bats

Mitigation Measure D-6: To the extent feasible, tree and building removal shall be scheduled during the non-breeding and active season for bats (typically October and November). Prior to construction, surveys shall be conducted by a qualified bat specialist to identify the presence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in cavities in the area, either in trees or in structures, shall be safely evicted under the direction of a bat specialist and under consultation with the California Department of Fish and Wildlife.

Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the California Department of Fish and Wildlife shall be installed and maintained to prevent bats from roosting in these cavities prior to and during construction. A summary report shall be prepared upon completion of these activities and submitted to the California Department of Fish and Wildlife.

Pre-construction bat surveys shall be conducted by a qualified bat specialist no more than seven (7) days prior to the removal of any trees within the Project area to confirm that exclusionary measures have been successful and there are not bats within the construction area. If no roosting bats are detected, no further surveys are required provided the tree removal is conducted within seven (7) days. If removal is delayed more than seven (7) days, additional surveys shall be conducted no more than seven (7) days prior to tree removal to ensure that no bats have moved into the area.

Mitigation Measure D-7: Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in the Project area. In the event a maternal colony of bats is found in the construction area, the California Department of Fish and Wildlife shall be consulted, and no work shall be conducted within 100 feet of the roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the California Department of Fish and Wildlife. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No clearing and grubbing shall be authorized adjacent to the site. Combustion equipment, such as generators, pumps, and vehicles, shall not to be parked nor operated under or adjacent to the roosting site. Construction personnel shall not enter into areas beneath the colony, especially during the evening exodus.

General Wildlife Species

Mitigation Measure D-8: Amphitheatre lighting shall be designed to focus downward on the developed areas of the Project area and minimize light spillover onto adjacent open space areas.

Mitigation Measure D-9: Fencing associated with the proposed hiking trail shall be designed to be low in height with openings between posts and rails to allow the movement of wildlife to pass over or through the fence.

Mitigation Measure D-10: Trash receptacles that are not accessible to wildlife shall be used along the proposed hiking trail and within open areas of the Project Site to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. Signage shall also be place along the trail to encourage hikers to stay within the designated trail boundary.

Oak Trees

Mitigation Measure D-11: The following measures shall be implemented to minimize impacts on oak trees:

a. Oak trees measuring 8 inches or more in diameter at 4.5 feet above mean natural grade shall be protected in place unless specifically permitted by the County of Los Angeles through the Los Angeles County Tree Ordinance.

b. Prior to construction, protection fencing shall be installed outside of the drip line of an oak tree to be protected in place during construction to minimize damage from equipment storage, debris dumping, parking, etc. within oak tree protected zones.

c. Oak trees that are relocated shall be done so in a manner consistent with the Los Angeles County Oak Tree Ordinance.

e. Conclusion

(1) Vegetation Communities

No special-status plant communities are located in the study area and impacts to vegetation communities would be less than significant.

(2) Regulatory Status Plant Species

Implementation of Mitigation Measures D-1 and D-2 would reduce potentially significant impacts to special status plants to less than significant levels.

(3) Regulatory Status Wildlife Species

(a) Regulatory Status Bird Species

Implementation of Mitigation Measures D-3 and D-4 would reduce potentially significant impacts to special status bird species to less than significant levels.

(b) Regulatory Status Small Mammal Species

Implementation of Mitigation Measure D-5 would reduce potential impacts to regulatory status small mammal species to a less than significant level.

(c) Regulatory Status Bat Species

Implementation of Mitigation Measures D-6 and D-7 would reduce potential impacts to regulatory status bat species to a less than significant level.

Additionally, with implementation of Mitigation Measures D-8 through D-10, overall potential impacts to wildlife species would be reduced to a less than significant level.

(4) Oak Tree Protection

In accordance with Mitigation Measure D-11, removal or relocation of any oak trees within the Project Site would adhere to the Los Angeles County Tree Protection Ordinance. Therefore, implementation of Mitigation Measure D-11 and compliance with the Los Angeles County Tree Protection Ordinance would reduce impacts to oak trees to a less than significant level.

(5) Regional Connectivity/Wildlife Movement

There are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Furthermore, development of the Project would occur primarily within the developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. Additionally, in accordance with Mitigation Measure D-9, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, Project impacts with regard to wildlife movement would be less than significant.

In conclusion, with implementation of the mitigation measures provided above, the Project would result in less than significant impacts to biological resources.

E. Cultural Resources

a. Analysis of Project Impacts

(1) Historical Resources

(a) Potential Impacts Related to Previously Approved Amphitheatre Improvements

In September 2013, the County of Los Angeles prepared and approved a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the rehabilitation of portions of the existing Amphitheatre consistent with the Secretary of Interior Standards for the Treatment of Historic Properties. These improvements will include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. These improvements were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards. Therefore, no significant impacts with regards to historic resources would occur as a result of implementation of the previously approved Amphitheatre improvements.

(b) Potential Impacts Related to Other Improvements

Overall, impacts with regards to historic resources associated with the Project have the potential to be significant as the specific design details of the Project have not been finalized. However, with implementation of Mitigation Measure E-1, provided below, such impacts would be reduced to a less than significant level.

(2) Archaeological Resources

The results of the records search indicate there are no known archaeological sites or isolates located within a 0.5-mile radius of the Project Site or within the Project Site. While the majority of the Project would be developed within areas that have been subject to disturbance in the past, some portions of the Project would extend to previously undisturbed areas. As such, there is the possibility that archaeological resources could be discovered. With implementation of Mitigation Measures E-2 and E-3, provided below, potential impacts related to archaeological resources would be reduced to a less than significant level.

(3) Paleontological Resources

As described in the paleontological records search, excavations in the igneous rocks exposed in much of the Project Site would not uncover any recognizable fossils. However, excavations in the Topanga Formation deposits intercalated with the igneous rocks may encounter significant vertebrate fossils. Therefore, the potential exists for paleontological resources to be uncovered during construction activities and impacts associated with paleontological resources could be potentially significant. With implementation of Mitigation Measure E-4, any potential impacts related to paleontological resources would be reduced to a less than significant level.

b. Cumulative Impacts

As previously evaluated, potential impacts to historic resources associated with the Project would be less than significant with implementation of Mitigation Measure E-1. Additionally, based on the unique use and features of the Project Site as well as the area of the related projects, it is not expected that the related projects would impact historic resources of the same character (based on context, building type, evaluation, and designation) as that which is present within the Project Site. In addition, due to the distance of the related projects to the Project Site, the closest of which is approximately 0.8 mile from the Project Site (Related Project No. 22), the related projects are not anticipated to impact the historic features within the Project Site. Therefore, cumulative impacts on historic resources would be less than significant.

As discussed above, potential impacts to archaeological and paleontological resources associated with the Project would be less than significant with implementation of Mitigation Measures E-2 through E-4. With regard to potential cumulative impacts related to archaeological and paleontological resources, the related projects area is urbanized and has been disturbed and developed over time. As with the Project, in the event that archaeological and paleontological resources are uncovered, each related project would be required to comply with applicable regulatory requirements. In addition, as part of the environmental review processes for the related projects, it is expected that mitigation measures would be established as necessary to address the potential for uncovering archaeological and paleontological resources. Thus, cumulative impacts associated with archaeological and paleontological resources would be less than significant.

c. Project Design Features

No specific project design features are proposed with respect to cultural resources.

d. Mitigation Measures

Mitigation Measure E-1: To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Mitigation Measure E-2: If a unique archaeological resource is discovered during Project construction activities, work in the area shall cease and deposits shall be treated by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards or History, Architectural History, or Architecture, pursuant to 36 CFR 61 in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. In addition, if it is determined that an archaeological site is a historical resource, the provisions of Section 21084.1 of the Public Resources Code and CEQA Guidelines Section 15064.5 shall be implemented.

Mitigation Measure E-3: If human remains are encountered during construction, work in the affected area and the immediate vicinity shall be halted immediately. The construction manager at the Project Site shall be contacted, and shall notify the County Coroner. If the County Coroner determines the remains to be Native American, the archaeologist and Native American monitor shall then be contacted, if they are not on-site at the time, as well as the responsible lead agency of the discovery, who in turn shall notify the Native American Heritage Commission. Disposition of the human remains and any associated grave goods shall be in accordance with California Health and Safety Code Section 7050.5 and Public Resources Code Sections 5097.91 and 5097.98, as amended. The archaeologist and the Native American monitor, with the concurrence of the County, shall determine the area of potential impact and the timing when construction activities can resume.

Mitigation Measure E-4: A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur. The frequency of inspections shall be based on consultation with the paleontologist and shall depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If

paleontological materials are encountered, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed material to facilitate evaluation and, if necessary, salvage. The paleontologist shall assess the discovered material(s) and prepare a survey, study or report evaluating the impact. The paleontologist's survey, study or report shall contain a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Applicant shall comply with the recommendations of the evaluating paleontologist, as contained in the survey, study or report, and a copy of the paleontological survey, study or report shall be submitted to the Los Angeles County Natural History Museum and the Los Angeles County Department of Parks and Recreation. Ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the satisfaction of the paleontologist.

Mitigation Measure E-5: The Project shall include preparation of a Historic Structures Report by a historic preservation professional meeting the Secretary of the Interior's Professional Qualification Standards. The Historic Structures Report shall be prepared in compliance with National Park Service Preservation Brief No. 43: The Preparation and Use of Historic Structures Report. Pursuant to National Park Service Preservation Brief No. 43, the Historic Structures Report shall include recommendations for the treatment of the character-defining features, as well as guidance for complying with the Standards. The Historic Structures Report shall also include additional information about the history and physical features of the property. Preparation of the Historic Structures Report shall commence by the first quarter of 2015.

e. Conclusion

As evaluated above, potential impacts to the on-site historic resource would be reduced to a less than significant level with implementation of Mitigation Measures E-1. In addition, following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, the Ford Theatres would continue to be eligible for listing in the National Register and the California Register and the significance of the historic resource would not be materially impaired by the Project.

With implementation of Mitigation Measures E-2 and E-3, as set forth above, impacts to archaeological resources would be reduced to a less than significant level. With implementation of Mitigation Measure E-4, potential impacts to paleontological resources would be reduced to a less than significant level.

F. Geology and Soils

a. Analysis of Project Impacts

(1) Strong Seismic Ground Shaking

As with any new development in the State of California, Project building design and construction would be required to conform to the current seismic design provisions of the California Building Code to minimize potential seismic impacts. In addition, construction of the Project would be required to adhere to the seismic safety requirements contained in the Los Angeles County Building Code. The Project would also be required to comply with the site plan review and permitting requirements of the County of Los Angeles Department of Public Works, Building and Safety Division, including the recommendations provided in site-specific geotechnical reports subject to Building and Safety Division's review and approval, as reflected in Project Design Feature F-1 and Project Design Feature F-2, above. Compliance with regulatory requirements and implementation of project design features would ensure Project construction adheres to the seismic safety requirements contained in the State and County Building Codes and that site-specific engineering recommendations are implemented in accordance with a design-level geotechnical investigation. Therefore, the Project would not expose people or structures to potential substantial adverse effects associated with seismic ground shaking, and impacts would be less than significant.

(2) Liquefaction and Lateral Spreading

Portions of the Project Site are located within an area that has been identified by the State as being potentially susceptible to liquefaction. Given the Project Site's location within an area potentially susceptible to liquefaction, significant impacts with regard to liquefaction and lateral spreading could occur. Accordingly, Mitigation Measure F-1 is provided below to require that Project construction involve a combination of ground modification (remedial grading) and/or structural enhancements that would address potential liquefaction hazards. In addition, Project construction would adhere to the seismic safety requirements contained in the California and County Building Codes applicable to liquefaction and lateral spreading. With compliance with regulatory requirements and incorporation of the recommended structural enhancements into the design and construction of the Project, the Project would not expose people or structures to potential substantial adverse effects related to liquefaction and lateral spreading, and potential impacts would be reduced to a less than significant level.

(3) Landslides and Slope Stability

Based on the Seismic Hazard Zone Map for the Hollywood Quadrangle, a portion of the Project Site is located within an area that has been identified by the State as being susceptible to seismically-induced landslides. Based on the site-specific conditions observed as part of the geotechnical investigations, the Project Site is primarily susceptible to shallow landslide events such as debris flows and rockfalls associated with the natural slopes of the Project Site. As such, the Project could result in potentially significant impacts with regard to landslides and slope stability. The results of the stability analyses indicate the Project Site would attain sufficient stability with minor surficial grading and the incorporation of slope reinforcement measures as specified in Mitigation Measure F-2. In addition, for protection against potential future rockfalls, Mitigation Measure F-2 also includes the installation of flexible barriers. Therefore, with implementation of Mitigation Measure F-2, the Project would not expose people or structures to potential substantial adverse effects related to landslides or slope failures, and impacts would be less than significant.

(4) Erosion

Sedimentation and erosion could potentially occur as a result of exposed soils during Project construction. However, construction activities would occur in accordance with erosion control requirements, including grading and dust control measures, imposed by the County pursuant to grading permit regulations. In addition, as part of the Storm Water Pollution Prevention Plan, Best Management Practices would be implemented during construction to reduce sedimentation and erosion levels to the maximum extent possible. The Project also would comply with South Coast Air Quality Management District Rule 403, which requires the implementation of best available fugitive dust control measures during active construction periods capable of generating fugitive dust emissions. With compliance with regulatory requirements and implementation of appropriate Best Management Practices, impacts with respect to soil erosion and the loss of topsoil associated with Project construction would be less than significant.

Project operations could result in a limited degree of soil erosion from vegetated areas. However, the Project would be required to have a Low Impact Development Plan in place during the operational life of the Project in compliance with National Pollutant Discharge Elimination System permit requirements. The Low Impact Development Plan would include Best Management Practices which would reduce on-site erosion from vegetated areas within the Project Site. With compliance with these regulatory requirements, impacts with respect to sedimentation and erosion during operation would be less than significant.

(5) Corrosive Soils

Corrosion testing performed suggests the soils within the Project Site could be corrosive to concrete and ferrous metals. Corrosion testing would be performed, as required by the County Building Code, and final recommendations for concrete would be made in accordance with the latest California Building Code requirements. With compliance with all regulatory requirements and implementation of the recommendations set forth in the Geotechnical Reports as well as any subsequent recommendations, as applicable, impacts related to corrosion would be less than significant.

b. Cumulative Impacts

Cumulative growth through 2020 (inclusive of the 27 related projects) would expose a greater number of people to seismic and other secondary hazards. However, as with the Project, related projects and other future development projects in the area would be subject to established guidelines and regulations pertaining to building design and seismic safety, including those set forth in the California Building Code and Los Angeles County Building Code (or City of Los Angeles Building Code requirements, as appropriate). Therefore, with adherence to such regulations, cumulative impacts with regard to geology and soils would be less than significant.

c. Project Design Features

Project Design Feature F-1: Prior to the issuance of a grading permit(s), the Applicant shall submit to the County of Los Angeles Department of Public Works for review and approval a final design-level geotechnical investigation report that complies with all applicable State and local code requirements based on final Project designs prepared by a registered civil engineer and certified engineering geologist. The geotechnical investigation report shall include recommendations for the specific building locations and design including those pertaining to site preparation, fills and compaction, foundations, etc. The geotechnical investigation report shall be prepared to the written satisfaction of the Los Angeles Department of Public Works—Building and Safety Division.

Project Design Feature F-2: Project design and construction shall comply with all applicable current building codes and standards, including those established by the California Geological Survey's "Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication No. 117"; the Uniform Building Code as adopted by the County of Los Angeles; State and County laws, ordinances and Code requirements; and the recommendations set forth in a final geotechnical investigation(s).

d. Mitigation Measures

Mitigation Measure F-1: Project grading shall include a combination of ground modification and/or structural enhancements in areas subject to liquefaction to reduce the risk to an acceptable level (as defined by the California Geological Survey in Special Publication 117a, Chapter 2). Ground modification shall consist of the removal and replacement of undocumented fill with engineered fill. Subsequently, foundations shall be supported on conventional shallow footing systems established on engineered fill or undisturbed bedrock.

Mitigation Measure F-2: In order to minimize, capture, and manage debris flows and rockfalls, the Project shall incorporate a combination of the following measures:

- Remove and recompact loose surficial material and remove rock fall accumulations;
- Construct storm drain and catch basins in swales above proposed retaining walls to provide an outlet for rainfall runoff and to catch eroded materials. Regular maintenance of catch basins to remove eroded materials shall be performed to preserve the basin and drain functionality;
- Install retaining walls; and
- Install flexible barriers or anchored mesh net.

e. Conclusion

With compliance with all regulatory requirements and implementation of the project design features and mitigation measures described above, Project-level impacts related to geology and soils would be less than significant. In addition, cumulative impacts with regard to geology and soils would be less than significant.

G. Hydrology, Surface Water Quality, and Groundwater

a. Analysis of Project Impacts

(1) Construction Impacts

(a) Surface Water Hydrology and Water Quality

Construction of the Project would require on-site demolition, grading, and excavation activities. Such construction activities would have the potential to temporarily alter existing

drainage patterns and flows within the Project Site by exposing the underlying soils and making the Project Site temporarily more permeable. Exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, construction activities, such as earth moving, maintenance/operation of construction equipment, and handling/storage/disposal of materials, could contribute to pollutant loading in stormwater runoff. On-site watering activities to reduce airborne dust could also contribute to pollutant loading in runoff. The main pollutant of concern during construction would be sediment or soil particles that would become detached by water and wind. In accordance with the requirements of the Construction General Permit, the Project would implement a Storm Water Pollution Prevention Plan that would specify best management practices (BMPs) to be used during construction to manage runoff flows and erosion and prevent pollution. BMPs would also be provided to target pollutants of concern and be designed to reduce runoff and pollutant levels in runoff during construction. Further, implementation of BMPs, such as sandbag barriers and other sediment barriers, would serve to maintain the existing drainage flow paths and discharge points during construction.

Through compliance with all NPDES Construction General Permit requirements, including the preparation and implementation of a Storm Water Pollution Prevention Plan, implementation of BMPs, and compliance with applicable County grading regulations, construction of the Project would not violate any water quality standards; substantially alter the existing drainage pattern of the Project Site and surrounding area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site; create or contribute runoff water which would exceed the capacity of the existing stormwater drainage system or provide substantial additional sources of polluted runoff and otherwise substantially degrade water quality. In addition, Project construction would not require or result in the construction of new stormwater drainage facilities which could cause significant environmental effects. As such, impacts to surface water hydrology and water quality during construction would be less than significant.

(b) Groundwater

No water supply wells are located at the Project Site or within one mile of the Project Site that could be impacted by construction, nor would the Project include the construction of water supply wells. In addition, as noted above, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater is not expected to be encountered within the Project Site. Furthermore, groundwater was not encountered during recent on-site explorations conducted within the Project Site. Accordingly, it is not expected that groundwater would be encountered during construction that would require temporary or permanent dewatering operations. Therefore, Project development would not substantially deplete groundwater

supplies or interfere substantially with groundwater recharge. Additionally, compliance with all applicable federal, State, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater. As such, Project construction would not result in a significant impact with regard to groundwater.

(2) Operational Impacts

(a) Surface Water Hydrology

With implementation of the Project, the amount of impervious area would increase from approximately 11 percent to 13 percent. Accordingly, Project development would increase the amount of stormwater flow and volume. In addition, development of the Project would change existing drainage areas by bisecting existing tributary flows. With Project development, the total flow rate for the Project Site would increase from 119.92 cubic feet per second to 123.44 cubic feet per second and the total collected volume would increase from 381,586 cubic feet to 392,476 cubic feet. Although the runoff volume would increase as a result of an increase in impervious area, in accordance with NPDES and County requirements as set forth in Project Design Feature G-2, a Low Impact Development Plan would be prepared and implemented for the Project that would specify BMPs to promote bioretention or other functions to detain water on-site to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County Department of Public Works. Therefore, with compliance with regulatory requirements, the Project would not substantially alter the existing drainage pattern of the site or area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site, and would not create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, or require the construction of new stormwater drainage facilities. As such, operation of the Project would result in a less than significant impact on surface water hydrology.

(b) Surface Water Quality

As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. As part of the NPDES and County requirements, a Low Impact Development Plan would be prepared for the Project which would outline the stormwater treatment measures or post-construction BMPs required to control pollutants of concern associated with storm events up to the 0.75-inch precipitation level. BMPs would include source control and treatment control BMPs to remove pollutants from stormwater discharges. As the Project Site currently does

not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces, implementation of BMPs to capture and naturally filter stormwater from the Project Site would result in an improvement in surface water quality runoff from the Project Site compared to existing conditions. Therefore, with compliance with NPDES and County requirements which would require the implementation of BMPs that would serve to improve runoff from the Project Site, operation of the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality. Thus, operational impacts on surface water quality would be less than significant.

(c) Groundwater

As discussed in the Hydrology and Water Quality Report, the soils underlying the Project Site are not conducive to infiltration as they are underlain by bedrock. Notwithstanding, no water supply wells are located within the Project Site or within one mile of the Project Site and, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater does not occur within the Project Site. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination. As such, operation of the Project would not result in significant impacts to groundwater.

b. Cumulative Impacts

(1) Surface Water Hydrology and Water Quality

The Project in conjunction with the cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) through 2020 would cumulatively increase stormwater runoff flows and could possibly increase the amount of pollutants potentially resulting in cumulative impacts to surface water hydrology and water quality. However, as with the Project, cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) would be subject to NPDES and local requirements, including implementation of Storm Water Pollution Prevention Plans, Standard Urban Stormwater Mitigation Plans, and Low Impact Development Plans with appropriate BMPs to manage stormwater runoff and water quality during construction and operation. Furthermore, the local jurisdiction would review each future development project on a case-by-case basis to ensure sufficient local and regional drainage capacity is available to accommodate stormwater runoff. Therefore, with compliance with applicable laws, rules and regulations, cumulative impacts on surface water hydrology and water quality would be less than significant.

(2) Groundwater

As described above, no water supply wells, spreading grounds, or injection wells are located within a one-mile radius of the Project Site. In addition, Project development would not involve the temporary or permanent extraction of groundwater from the Project Site or otherwise use the groundwater. Furthermore, while implementation of the Project would result in an increase in impervious surface area, per County requirements, the Project would implement BMPs to capture the first flush or first 0.75-inch of rainfall for any storm event and offset the potential reduction in percolation resulting from Project development. However, development of the related projects could result in changes in impervious surface area within their respective project sites which would decrease the potential for groundwater recharge. As the related projects are located in a highly urbanized area, any reduction in groundwater recharge due to the overall net change in impervious area within the related project sites would be minimal in the context of the regional groundwater basin. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. As with the Project, the related projects would be unlikely to cause or increase groundwater contamination because compliance with existing statutes and regulations would similarly prevent the related projects from affecting or expanding any potential areas affected by contamination, or increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated. Therefore, cumulative impacts to groundwater would be less than significant.

c. Project Design Features

Project Design Feature G-1: Prior to the issuance of a grading permit, the Applicant shall provide evidence to the County of Los Angeles Department of Public Works, as appropriate, that a Notice of Intent has been filed with the State Water Resources Control Board for coverage under the Construction General Permit and a certification that a Stormwater Pollution Prevention Plan has been prepared. Such evidence would consist of a copy of the Notice of Intent stamped by the State Water Resources Control Board or Los Angeles Regional Water Quality Control Board, or a letter from either agency stating that the Notice of Intent has been filed. The Stormwater Pollution Prevention Plan would include a menu of Best Management Practices to be selected and implemented based on the phase of construction and the weather conditions to effectively manage stormwater runoff and control erosion. Best Management

Practices to be implemented as part of the Project could include, but not be limited to, the following:

- Erosion Control BMPs to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of disturbance, stabilizing disturbed areas, and protecting slopes/channels;
- Sediment Control BMPs, which are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping sediments on-site and controlling the site boundaries;
- Wind Erosion Control BMPs, which consist of applying water to prevent or minimize dust nuisance;
- Tracking Control BMPs, which consist of preventing or reducing the tracking of sediment off-site by vehicles leaving the construction area. These BMPs include street sweeping and vacuuming. The construction site would have a stabilized construction entrance to prevent off-site tracking of sediment and debris;
- Non-Stormwater Management BMPs, which are also referred to as "good housekeeping practices" involve keeping a clean, orderly construction site; and
- Waste Management and Materials Pollution Control BMPs consist of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater runoff or discharges through the proper management of construction waste.

Project Design Feature G-2: Prior to issuance of a building permit, the Applicant shall prepare and submit for review and approval a Low Impact Development Plan that would include Best Management Practices and demonstrate compliance with Low Impact Development Ordinance requirements to the Los Angeles County Department of Public Works, Building and Safety, as applicable. Specific Best Management Practices to be implemented as part of the Low Impact Development Plan for the Project to manage post-construction stormwater runoff would include, but not be limited to, the following:

- Installation of catch basins, planter drains, and building roof drain downspouts throughout the Project Site to collect roof and site runoff and direct stormwater away from structures and to potential infiltration systems.

- Installation of filter inserts to catch basins to improve the quality of stormwater runoff from the Project Site.
- Promote evapotranspiration and infiltration, and the use of native and/or drought tolerant plants
- Promote bioretention through the use of underground retention tanks and/or rainwater harvesting;
- Design material storage areas and loading docks within structures or enclosures to prevent leaks or spills of pollutants from entering the storm drain system;
- Design post-construction structural or treatment control BMPs to infiltrate stormwater runoff. Stormwater treatment facilities and systems would be designed to meet the requirements of the LID Ordinance.

d. Mitigation Measures

The Project would result in less than significant impacts to surface water hydrology, water quality, and groundwater during construction and operation. No mitigation measures would be required.

e. Conclusion

Impacts to surface water hydrology, water quality, and groundwater would be less than significant.

H. Land Use

a. Analysis of Project Impacts

(1) Consistency with Local Plans and Applicable Policies

The Project would support policies of the County's General Plan, General Goals and Policies Chapter regarding the preservation of open space areas and cultural resources, encouraging cultural and social diversity, and environmental sustainability. The Project would also support various policies of the Conservation and Open Space Element by incorporating a variety of sustainability features and maximizing the preservation of the Project Site's existing open space areas, thus maintaining the natural and scenic character of the area. With regards to the Land Use Element, the Project would support compatibility with the existing development of the Project Site and the preservation of surrounding uses and open space. The Project would further support policies of the Transportation Element by providing a new traffic signal to allow for safer left turns from the southern (egress)

driveway to Cahuenga Boulevard East; providing one new driveway between the northernmost driveway and the main entrance to facilitate access and circulation with the proposed Transit Center; and reconfiguring the northernmost driveway to provide vehicles with direct access to the proposed maintenance facility and allow egress from the north parking structure, thereby improving the flow of vehicles within and adjacent to the Project Site. The Project would also encourage use of public transit by continuing to promote parking at the Universal City/Studio City Metro Red Line Station where a shuttle would continue to be provided to and from the Ford Theatres during evening events. Additionally, with the implementation of water conservation features and the provision of necessary utility improvements, the Project would support applicable policies of the Water and Waste Management Element. The Project would also support policies of the Safety Element and would coordinate with the County and City Fire Departments and implement recommended guidelines regarding wildland fire prevention to reduce fire hazards. Overall, the Project would be generally consistent with the intent and applicable policies of the County General Plan.

While development of the Project Site is governed by the County General Plan and the Los Angeles County Code, a consistency analysis with relevant policies of the City General Plan was also conducted. As detailed in Section IV.H, Land Use, of the Draft EIR, the Project would support policies of the General Plan Framework Land Use Chapter regarding the establishment of new open space opportunities to serve the needs of existing and future residents. In addition, as off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Land Use Chapter regarding preservation of and compatibility with the scale and character of the City's residential neighborhoods. The Project would also be consistent with the relevant objectives and policies of the General Plan Framework's Urban Form and Neighborhood Design Chapter through the development and improvement of community facilities which would serve to meet the performing arts and recreational needs at a City- and County-wide level. Additionally, with the conservation of the majority of the Project Site's open space areas, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Open Space and Conservation Chapter, which guides the provision, management, and conservation of the City's public open space resources. The Project would also provide for necessary infrastructure improvements and would therefore be generally consistent with the relevant goals, objectives, and policies of the General Plan Framework's Infrastructure and Public Services Chapter. Furthermore, with the continued use of the Project Site as a public regional park and performing arts center, the Project would be consistent with the Project Site's land use designation as a public facility as set forth by the Hollywood Community Plan and Hollywood Community Plan Update. In summary, the Project would be generally consistent with relevant policies of the City General Plan.

With regard to zoning, the Los Angeles County Planning and Zoning Code regulates development of unincorporated areas of the County through land use designations and development standards regarding allowable uses, density, height, and design. As the Project Site is not located within an unincorporated area of the County, land use and zoning designations have not been established by the County for the Project Site. However, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements. The Project Site is located within the City of Los Angeles and is zoned per the City of Los Angeles Municipal Code. With implementation of the Project, the Project Site would continue to be used as a public regional park and performing arts center. As such, the Project would be consistent with the City of Los Angeles zoning of the Project Site for Public Facilities. In addition, while some of the proposed buildings and structures would exceed 30 feet in height, the Project has been intentionally designed to be compatible with the massing, size, and scale of the existing structures.

(2) Consistency with Regional Plans

As analyzed in Section IV.H, Land Use, of the Draft EIR, the Project would be generally consistent with the Southern California Association of Governments' 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, Growth Vision Report, and Regional Comprehensive Plan. Additionally, as discussed in Section IV.B, Air Quality, of the Draft EIR, Project development would not have a significant long-term impact on the region's ability to meet State and federal air quality standards. The Project would therefore be consistent with the goals and policies of the SCAQMD's Air Quality Management Plan. Further, as discussed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the Project would not conflict with the Congestion Management Program as it would not result in significant impacts to the nearby Congestion Management Program intersections or freeway monitoring locations.

(3) Conclusion Regarding Impacts Relative to Land Use Consistency

Based on the analysis provided above, the Project would be generally consistent with the adopted County and City General Plans and with relevant environmental policies in other applicable plans. As such, the Project's impacts related to land use consistency would be less than significant.

b. Cumulative Impacts

Future growth through 2020 (the Project's buildout year) as a result of related projects and general ambient growth would have the potential to alter the existing land use environment due to infill development at increased densities, conversions of vacant land to

new development, and/or conversions of land uses. However, future development projects would be subject to existing zoning and land use designations as well as environmental review by the County or City. Therefore, such future projects are not expected to fundamentally alter the existing land use relationships in the community.

The closest related project to the Project Site is Related Project No. 22, located approximately 0.8 mile southwest of the Project Site. Given its distance from the Project Site and intervening land uses, Related Project No. 22 would not combine with the Project to create any incompatibility with surrounding land uses. Additionally, as the Project would be compatible with existing surrounding land uses and would be generally consistent with applicable land use plans and policies, the Project would not contribute to significant cumulative land use compatibility or consistency impacts. The balance of the related projects would not cause cumulative land use impacts due to distance and/or existing intervening development. As such, cumulative impacts with regard to land use would be less than significant.

c. Project Design Features

No specific project design features beyond the project improvements discussed in Section II, Project Description, of the Draft EIR are proposed with regard to land use.

d. Mitigation Measures

Based on the above analysis, the Project would be generally consistent with applicable land use plans, policies, and regulations and no significant impacts with regard to land use would occur. Thus, no mitigation measures would be required.

e. Conclusion

Impacts related to land use would be less than significant.

I. Noise

a. Analysis of Project Impacts

(1) Construction Noise

(a) On-Site Construction Noise

Noise impacts from Project construction activities occurring within or adjacent to the Project Site would be a function of the noise generated by construction equipment, the

location of the equipment, the timing and duration of the noise-generating construction activities, and the relative distance to noise sensitive receptors. Construction activities would generally include demolition, grading and excavation, and building construction. Each stage of construction would involve the use of various types of construction equipment and would, therefore, have its own distinct noise characteristics. Noise from construction equipment would generate both steady-state and episodic noise that could be heard within and adjacent to the Project Site. The estimated construction noise levels at the nearest off-site receptors R1, R2, and R4 would be well below the existing daytime ambient noise levels. At receptor R3, the estimated construction-related noise levels would be consistent with the lowest measured ambient noise levels. The estimated construction-related noise levels would be below the Project significance threshold. Therefore, noise impacts associated with the Project's on-site construction activities would be less than significant.

(b) Off-Site Construction Traffic Noise

The major noise sources associated with off-site construction trucks would be associated with haul and delivery trucks. Based on an 8-hour workday and a uniform distribution of trips, there would be a maximum of 12 truck trips per hour during the peak construction period. The noise level generated by haul trucks during the peak construction period would be well below the existing daytime ambient noise level at the noise sensitive receptors along the haul routes. Therefore, noise impacts from off-site construction traffic would be less than significant.

(2) Construction Vibration

Project construction activities would generate ground-borne vibration during site demolition and excavation/grading activities when heavy construction equipment, such as large bulldozers, would be used. Vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. The estimated vibration velocity levels (from all construction equipment) would be well below the significance thresholds. Therefore, vibration impacts associated with potential building damage to off-site building structures during construction activities would be less than significant.

With regard to potential building damage to the on-site historic Amphitheatre, vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. Therefore, on-site vibration impacts associated with building damage could be significant. With implementation of Mitigation Measure I-3, which would require that construction activities in close proximity (within approximately 20 feet) of the existing Amphitheatre structure utilize smaller equipment, such as a small bulldozer and handheld

compactors, vibration levels would be reduced to less than 0.12 PPV. Therefore, with implementation of this mitigation measure, potential on-site vibration impacts with respect to building damage would be reduced to less than significant.

Relative to potential human annoyance impacts associated with the generation of on-site vibration, the estimated ground-borne vibration levels from construction equipment would be below the significance threshold for human annoyance at all off-site sensitive receptors. Therefore, on-site vibration impacts on human annoyance during construction would be less than significant.

Haul trucks during construction would generate ground-borne vibration as they travel along the Project designated haul routes. Thus, an analysis of potential vibration impacts associated with building damage and human annoyance from ground-borne vibration along the local haul route was conducted. Based on FTA data, the vibration generated by a typical truck would be approximately 63 VdB (0.006 PPV) at a distance of 50 feet from the truck. At the shortest distance between haul trucks and sensitive receptors, haul/delivery trucks would be approximately 10 feet from nearby sensitive receptors along Cahuenga Boulevard East. Vibration levels generated by the haul trucks at this distance would be 0.063 PPV, which would be well below the building damage threshold of 0.2 PPV for the residential buildings along Cahuenga Boulevard East. In addition, vibration levels generated by Project construction trucks along the haul routes would be similar to the existing truck traffic already traveling on the same roads. Therefore, potential impacts associated with vibration from delivery/haul trucks traveling along the designated haul routes would be less than significant.

(3) Operational Noise

(a) On-Site Stationary Noise Sources

(i) Mechanical Equipment

As part of the Project, new mechanical equipment would be located in various locations throughout the Project Site. Although operation of this equipment would generate noise, Project Design Feature I-1 would ensure compliance with the County's Noise Ordinance, which would limit noise from mechanical equipment from exceeding the ambient noise levels on the premises of other occupied properties. In addition, as the Project's mechanical equipment would be designed to minimize noise to on-site uses and patrons, noise levels to off-site receptors from mechanical equipment would be further reduced. Therefore, noise impacts from mechanical equipment would be less than significant.

(ii) Outdoor Areas

The Project includes two outdoor plazas at the Ford Terrace, the Transit Plaza, and Ford Plaza. In addition, the Project would include a restaurant located at the Ford Plaza that would feature an outdoor seating area with an amplified sound system. In accordance with the County's Noise Ordinance, the amplified sound system would be designed so as not to exceed a maximum noise level of 90 dBA (L_{eq}) at the restaurant outdoor seating area. Overall, the estimated noise levels from the plaza areas would not exceed the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from outdoor spaces would be less than significant.

(iii) Transportation Facilities

Sources of noise within the parking structures would primarily include car movements (i.e., engine noise), doors opening, people talking, and intermittent car alarms. The Project would also introduce a new Transit Center at the north parking structure that would include a staging area for buses to load and unload. It is anticipated that there would be up to 10 buses loading/unloading at the Transit Center at any given time. The estimated noise levels from the parking structures and the Transit Center would be below the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from the parking structures and Transit Center operations would be less than significant.

(iv) Performance Spaces

The analysis for the performance spaces accounted for audience cheering as well as an amplified sound system. As specified by Project Design Feature I-2, the proposed amplified sound system for the Amphitheatre would be designed to generate a maximum sound level of 95 dBA (L_{eq}) at as measured in "slow" response at the house mixer location. Similarly, the assumed sound levels generated by the amplified sound system inside the 299 seat theater and the 99 seat Flex Space would be approximately 95 dBA (L_{eq}). In addition, in accordance with Project Design Feature I-3, the building structure of the 299-seat theatre and the Flex Space would be designed to provide a minimum 25 dBA noise reduction. The estimated noise levels from the performance spaces would be well below the ambient noise levels at receptors R2 and R4. The estimated noise levels from the Amphitheatre amplified sound systems at receptors R1 and R3 would be approximately 0.5 dBA and 2.7 dBA higher than the existing ambient noise levels. However, the measured ambient noise levels do not include the existing Amphitheatre operation-related activities, which would result in higher ambient noise levels due to noise generated from performances within the Amphitheatre. It is further noted that the noise levels from the new 299-seat theatre and Flex Space would be contained within the building structures and are estimated to be well below the existing ambient noise levels. Therefore, the noise levels from the performance spaces including the new facilities would be similar to existing

conditions with the Amphitheatre being in operation. As such, noise impacts from the performance spaces would be less than significant.

(v) Loading Dock/Trash Collection Areas

The Project would include a new Service Court, which would include a new loading dock and trash/recycling areas. Based on measured noise levels from typical loading dock facilities, delivery trucks (while idling at the loading dock) could generate noise levels of approximately 71 dBA (L_{eq}) at a distance of 50 feet from the noise source. In addition, trash compactors would generate noise levels of approximately 66 dBA (L_{eq}) at a distance of 50 feet. The estimated noise levels from the loading dock/trash collection areas would be well below the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from loading dock/trash collection operations would be less than significant.

(b) Off-Site Traffic (Mobile Sources)

(i) Future plus Project

Future roadway noise levels were calculated along 11 off-site roadway segments in the vicinity of the Project Site. The calculated CNEL levels overestimate noise levels as they are calculated in front of the roadways and do not account for the presence of any physical sound barriers or intervening structures. The Project would result in a maximum increase of 0.2 dBA (peak-hour L_{eq} and 24-CNEL) in traffic-related noise levels along Odin Avenue during both the weekday and weekend. The estimated noise increase due to Project-related traffic would be well below the 3 dBA significance threshold. Therefore, off-site traffic noise impacts associated with future plus Project conditions would be less than significant.

(ii) Existing plus Project

An additionally analysis was conducted to determine the potential noise impacts based on the increase in noise levels due to Project-related traffic compared with the existing baseline traffic noise conditions. The maximum Project-related traffic noise increase would be 0.2 dBA CNEL along Odin Avenue. The estimated increase in off-site traffic noise levels would be below the 3-dBA CNEL significance threshold. Therefore, off-site traffic noise impacts associated with the existing plus Project traffic conditions would be less than significant.

(c) Composite Noise Level Impacts from Project Operations

In addition to considering the potential noise impacts to neighboring noise-sensitive receptors from each specific on- and off-site noise source, an evaluation of the potential

composite noise level increase (i.e., noise levels from all noise sources combined) at the analyzed sensitive receptor locations was also performed. The Project would result in an increase of 1.0 dBA at Location R3 up to 1.4 dBA at Location R1. No noise increase is anticipated at receptor Locations R2 and R4. The estimated increases in noise levels due to Project operation would be below the 3 dBA CNEL significance threshold. Therefore, composite noise level impacts due to the Project operations would be less than significant.

b. Cumulative Impacts

(1) Construction Noise and Vibration

Noise from construction of development projects is typically localized and has the potential to affect areas within 500 feet from the construction site. Thus, noise from construction activities for two projects within 1,000 feet of each other can contribute to a cumulative noise impact for receptors located midway between the two construction sites. The nearest related project is Related Project No. 22 (a hotel development at 1841 Highland Avenue), which is approximately 0.8 mile from the Project Site. Other related projects are located further from the Project Site. Due to the distance attenuation and intervening buildings between the related projects, cumulative noise impacts from construction activities would be less than significant.

Additionally, as ground-borne vibration decreases rapidly with distance, potential vibration impacts due to construction activities are generally limited to buildings/structures that are located in close proximity of the construction site (i.e., within 50 feet). As indicated above, the nearest related project is approximately 0.8 mile from the Project Site. Therefore, due to the rapid attenuation characteristics of ground-borne vibration, there is no potential for a cumulative construction impact with respect to ground-borne vibration.

(2) Operational Noise

Due to provisions set forth in the LAMC that limit stationary source noise from items such as roof-top mechanical equipment, noise levels would be less than significant at the property line for each related project. In addition, with implementation of regulatory requirements and proposed Project design features, noise impacts associated with operations within the Project Site would be less than significant. Based on the distance of the related projects from the Project Site and the noise levels associated with the Project, cumulative stationary source noise impacts associated with operation of the Project and related projects would be less than significant.

The Project and other related development in the area would produce traffic volumes (off-site mobile sources) that would generate roadway noise. Cumulative traffic

volumes during a typical weekday would result in a maximum increase of 1.9 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. During a typical weekend, the maximum cumulative traffic noise increase would be 2.5 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. At all other analyzed roadway segments, the increase in cumulative traffic noise would be lower. Thus, the cumulative traffic noise increase would be below the 3 dBA significance threshold. Therefore, cumulative noise impacts due to off-site mobile noise sources associated with the Project, future growth, and related projects would be less than significant.

c. Project Design Features

Project Design Feature I-1: Project-related outdoor mechanical equipment shall be designed to meet the County's Noise Ordinance.

Project Design Feature I-2: The design of the Project amplified sound system for the Amphitheater shall include the sound level regulator programmed to a maximum sound level of 95 dBA, as measured in "slow" response, at the house mixer locations.

Project Design Feature I-3: The building structure for the 299-seat theatre and the Flex Space shall provide a minimum 25 dBA indoor to outdoor noise reduction.

d. Mitigation Measures

(1) Construction

Mitigation Measure I-1: Power construction equipment (including combustion engines), fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards). All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated.

Mitigation Measure I-2: Project construction shall not include the use of driven pile systems.

Mitigation Measure I-3: Contractor shall utilize smaller construction equipment, such as small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure.

(2) Operation

Operation of the Project would not result in a significant impact to the off-site noise sensitive receptors. Therefore, no mitigation measures would be required.

e. Conclusion

(1) Construction

Compliance with regulatory requirements and implementation of the mitigation measures would reduce noise and vibration impacts associated with Project construction to a less than significant level. As discussed above, cumulative construction noise and vibration impacts would also be less than significant.

(2) Operation

Project-level and cumulative impacts with regard to operational noise would be less than significant.

J.1. Public Services—Fire Protection

a. Analysis of Project Impacts

(1) Construction Impacts

Project construction could temporarily increase the demand for fire protection and emergency medical services within the Project Site as construction activities could potentially expose combustible materials such as wood, plastics, sawdust, covers and coatings, to sources of ignition from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings, and lighted cigarettes. In compliance with Occupational Safety and Health Administration and Fire and Building Code requirements, construction managers and supervisory personnel would be trained in emergency response and fire safety operations, including the monitoring and management of life safety systems and facilities, and maintaining fire suppression equipment such as fire extinguishers on-site. Additionally, the Project would comply with County requirements to ensure brush clearance and other applicable measures are followed to reduce the likelihood of fire spreading through the surrounding undeveloped hillsides. Therefore, construction impacts on fire protection and emergency medical services would be less than significant.

Emergency access for City Fire Department vehicles within the Project Site and the surrounding vicinity could also be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. However, the Project would implement a Construction Management Plan during construction of the Project, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure emergency access to the Project Site and vicinity is maintained. In addition, construction worker and haul truck trips would generally occur outside the typical weekday commuter morning and afternoon peak periods. Further, emergency vehicles would utilize emergency sirens to clear a path of travel or drive in opposing traffic lanes to avoid heavy traffic. As such, impacts related to emergency access would be less than significant.

(2) Operational Impacts

(a) Facilities and Equipment

The Project does not include the development of any new residential uses and, as such, would not increase the permanent residential population within the service area of Fire Station No. 76. However, the Project would generate an increase in the daytime population at the Project Site associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. As such, the Project's increase in the population within the Project Site would increase the demand for LAFD fire protection and emergency medical services. However, as indicated by the LAFD, no changes are currently proposed within Battalion 5, which includes the fire station that services the Project Site. In addition, the Project would incorporate building design features that comply with County and City fire safety requirements, as applicable, including, but not limited to, use of fire-resistant building materials where appropriate, smoke detection and fire alarm systems, automatic sprinkler systems, and portable fire extinguishers. Further, as set forth in Project Design Feature J.1-1, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required. Implementation of a fuel modification plan would serve to provide adequate defensible space around all potentially combustible structures within a fire environment. Compliance with applicable regulatory requirements would ensure that adequate fire prevention features would be provided that would reduce the demand for firefighting services. Therefore, based on the type of development proposed and the availability of existing LAFD facilities, impacts with regard to LAFD facilities and equipment associated with the Project would be less than significant.

(b) Response Distance and Emergency Access

Section 57.507.3.3 of the Los Angeles Municipal Code sets forth a response distance for industrial and commercial uses of one mile from fire stations with an engine company and 1.5 miles from fire stations with a truck company. Fire Station No. 76 is located approximately one mile northwest of the Project Site and is equipped with one engine and one ambulance. Therefore, the Project would be located within the required emergency response distance. In addition, upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. Furthermore, the Project would incorporate specific access recommendations provided by the County Fire Department and LAFD as set forth in Project Design Feature J.1-2. Additionally, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest disaster route along Highland Avenue. The drivers of emergency vehicles also normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and LAFD. Therefore, Project-related traffic is not anticipated to impair the LAFD from responding to emergencies at the Project Site or the surrounding area. Impacts with regard to response distance and emergency access would be less than significant.

(c) Fire Flow

With implementation of a fire sprinkler system within all of the buildings proposed as set forth in Project Design Feature J.1-3, the fire flow set forth by the County Fire Department would be 4,000 gallons per minute (gpm) at a pressure of 20 psi. Domestic and fire water service is currently provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. The water main can provide approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the fire flow of 4,000 gpm, the Project would include the installation of two new connections to the existing 8-inch high-pressure water main in Cahuenga Boulevard East, or other necessary improvements to accommodate the ultimate fire flow set forth during the building permit process, as provided in Project Design Feature J.1-4. In addition, the Project would include the installation of four private fire hydrants on-site and, as set forth in Project Design Feature J.1-5, booster pumps would be required for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. As provided in Project Design Feature J.1-6, the enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. With construction of the necessary on-site fire water system improvements as coordinated with the County Fire Department, LAFD, and LADWP, the Project would meet

the fire flow requirements set forth by the County Fire Department and LAFD. Therefore, impacts regarding fire flow would be less than significant.

(d) Wildfire Risk

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist near the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, as previously described, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, implementation of the Project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. Impacts with respect to wildfire risk would be less than significant.

b. Cumulative Impacts

A number of the identified related projects and ambient growth projections fall within the service areas of Fire Station Nos. 76, 27, and 41. Several of the related projects include residential uses, which would increase the residential population of Fire Station No. 76, the "first-in" station for the Project Site, as well the secondary fire stations available to provide service to the Project Site. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population of the area and thus also increase the demand on fire services. In conjunction with the Project, this growth would cumulatively generate the need for additional fire protection services. However, similar to the Project, the related projects and all other future development projects would be subject to discretionary review by the LAFD to ensure that sufficient fire safety and hazards measures are implemented to reduce potential impacts to fire protection and emergency medical services. Furthermore, each related project would be required to comply with regulatory requirements related to fire safety, access, and fire flow.

Additionally, LAFD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, trucks and engines, ambulances, other special apparatuses, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Therefore, cumulative impacts on fire protection and emergency medical services would be less than significant.

c. Project Design Features

Project Design Feature J.1-1: A final fuel modification plan shall be prepared for the Project for review and approval by the County of Los Angeles Fire Department Fuel Modification Unit. The fuel modification plan shall include 30-foot and 200-foot buffer zones from all new structures. The 30-foot buffer zone shall provide for replanting of low-growing, irrigated drought-tolerant plant material as a means to prevent erosion and transition to the native character of the Project Site. The 200 foot buffer zone shall provide for seasonal clearing of brush and, as needed, pruning of trees to reduce the amount of potential plant material that could fuel a fire.

Project Design Feature J.1-2: Fire department access shall be provided to within 150 feet of building openings. The final design of the access driveways and internal roadways shall be coordinated with the County Fire Department and LAFD, as applicable. The proposed circular, fire department turn-around shall be a pumper truck-sized turn-around.

Project Design Feature J.1-3: The Project shall provide automatic fire sprinkler systems, approved by the County Fire Department, within all of the new buildings. With installation of fire sprinkler systems within all of the new buildings, the required fire flow shall be 4,000 gallons per minute with a residual pressure of 20 pounds per square inch, or a reduced fire flow as determined by the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

Project Design Feature J.1-4: To accommodate the required fire flow, the Project shall provide two connections to the existing 8-inch high-pressure water main in Cahuenga Boulevard East, or other necessary improvements as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

Project Design Feature J.1-5: The Project shall provide fire hydrants within the Project Site as coordinated with the County Fire Department and LAFD. Booster pumps shall be provided for all proposed fire

hydrants to meet the minimum fire flow rate and pressure requirements of the Project.

Project Design Feature J.1-6: The proposed fire system shall be a dedicated separate fire service system with no shared connections to the domestic supply lines.

d. Mitigation Measures

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant. Therefore, no mitigation measures are required.

e. Conclusion

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant.

J.2. Public Services—Police Protection

a. Analysis of Project Impacts

(1) Construction Impacts

Construction sites can be sources of nuisances and hazards, inviting theft and vandalism. When not properly secured, construction sites can contribute to a temporary increased demand for police protection services. Pursuant to Project Design Feature J.2-1, in consultation with the County of Los Angeles Sheriff's Department Parks Bureau, the Project would include the implementation of temporary security measures during construction, which could include on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction areas. In addition, equipment and building materials would be removed or secured during non-construction hours. With implementation of these measures, potential impacts associated with theft and vandalism during construction activities would be less than significant.

Emergency access for LASD and LAPD vehicles within the Project Site and the surrounding vicinity could be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. It is noted however that the construction-related traffic generated by the Project would not significantly impact LASD or LAPD response times within the Project vicinity since the drivers of police vehicles normally have

a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, most, if not all, of the construction worker and haul truck trips would occur outside the typical weekday commuter morning and afternoon peak periods, reducing the potential for traffic-related conflicts. The Project would also implement a Construction Management Plan during Project construction, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure adequate and safe access to the Project Site and vicinity is maintained. With implementation of the project design features, including the Construction Management Plan, construction of the Project would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services during Project construction would be less than significant.

(2) Operational Impacts

The Project does not include the development of any residential uses and, as such, would not increase the permanent residential population within the service area of the Parks Bureau South Zone or the Hollywood Community Police Station. However, the Project would generate a daytime population associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. The County currently operates an alarm system which is monitored by the LASD. In addition, security guards for events and overnight security shifts are currently contracted by the LASD. In consultation with LASD, these existing security and safety features would be continued and enhanced pursuant to Project Design Feature J.2-2. According to the LASD, implementation of the features set forth in Project Design Feature J.2-2 would serve to reduce the potential for criminal activities and assist law enforcement efforts. In addition, based on a preliminary review of the proposed improvements, the LAPD indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. The LAPD has also indicated that upon completion of the Project, the Applicant shall provide the LAPD Hollywood area commanding office with a diagram of each portion of the property, including access routes. Implementation of this project design feature would facilitate LAPD response. Therefore, the Project would not result in a demand for additional services that would exceed the capability of the LASD or the LAPD to serve the Project Site and impacts would be less than significant.

With respect to emergency access to the Project Site during Project operations, the analysis provided in Section IV.K, Traffic, Access, and Parking, of the Draft EIR demonstrates that Project development would result in a less than significant impact on access and local traffic conditions (i.e., nearby intersections). Therefore, the additional traffic generated by the Project would not significantly impact emergency vehicle access or response times for either the LASD or LAPD.

Based on the above, with implementation of the project design features, Project operation would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services during Project operation would be less than significant.

b. Cumulative Impacts

The geographic context for the cumulative impact analysis is the service area of the LASD's Parks Bureau South Zone and the LAPD's Hollywood Community Police Station. The Project in conjunction with identified related projects and forecasted growth through 2020 (i.e., the Project's buildout year) within these service areas would cumulatively increase the demand for police protection. All of the identified related projects fall within the service boundaries of the Hollywood Community Police Station service area. Notwithstanding, as previously described, the LASD's Parks Bureau provides law enforcement services to County facilities, including parks, lakes, golf courses, and special event venues. The related projects do not include the development of such uses. As such, the Project in combination with the related projects would not contribute to a cumulative increase in the demand for LASD Parks Bureau police protection services. Therefore, cumulative impacts on LASD Parks Bureau police protection services would be less than significant.

With regard to the LAPD, several of the related projects include residential uses, which would increase the permanent residential population within the Hollywood Community Police Station service area. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population in the area. Along with other anticipated growth through 2020, this would further increase the demand for police protection services. The Project would not develop residential units, and thus would not generate a residential population. Therefore, the Project would not contribute to a cumulative increase in the residential service population of the Hollywood Community Police Station. In addition, as previously discussed, based on a review of the Project, the LAPD has indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. Therefore, the Project's contribution to the cumulative demand for police protection services provided by the LAPD would not be cumulatively considerable. Additionally, as with the Project, each related project would be subject to the City's routine construction permitting process, which includes a review by the LAPD to ensure that sufficient security measures are implemented to reduce potential impacts to police protection services. Furthermore, the LAPD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, vehicles, and possibly station expansions or new station construction that may become

necessary to achieve the desired level of service. Through the City's regular budgeting efforts, the LAPD's resource needs would be identified and monies allocated according to the priorities at the time. Based on the above, the Project's contribution to cumulative impacts to police protection services would not be cumulatively considerable and, as such, cumulative impacts on police protection services would be less than significant.

c. Project Design Features

Project Design Feature J.2-1: During construction, the Applicant shall implement temporary security measures including, but not limited to, on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction area. Large mounds of dirt/debris/building materials and fence covers/screens shall be avoided. Equipment and building materials shall be removed or secured during non-construction hours.

Project Design Feature J.2-2: During operation, the Applicant shall implement security measures including, but not limited to:

- High-definition surveillance cameras. The cameras shall be placed along pedestrian pathways, gathering areas, and at driveways on Cahuenga Boulevard East. The camera system shall allow law enforcement agencies to view live feed remotely, shall be equipped with a hard drive capable of storing video for 15 days, and shall be capable of transferring video to disc or USB storage devices.
- Configure proposed public restrooms such that entrances are oriented towards the main event area or other high-visibility areas. The restrooms shall be secured after hours to prevent vandalism, theft, and use by transients.
- Adequate lighting and high definition surveillance cameras within the parking structures. Points of entry and egress shall be equipped with traffic control devices, and a parking lot attendant shall be employed during events.
- Signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail shall also be well-marked to prevent users from getting lost and the brush next to the trail shall be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas shall not be built along the trail.

Project Design Feature J.2-3: Upon completion of the Project, the Applicant shall provide the Los Angeles Police Department Hollywood Area commanding officer with a diagram of each portion of the property.

The diagram shall include access routes and additional information that might facilitate police response.

d. Mitigation Measures

Project-level and cumulative impacts with regard to police protection services would be less than significant. Therefore, no mitigation measures are required.

e. Conclusion

Project-level and cumulative impacts with regard to police protection services would be less than significant.

K. Traffic, Access, and Parking

a. Analysis of Project Impacts

(1) Traffic

(a) Construction Impacts

During the most intense construction phase, it is anticipated that construction activities would generate approximately 176 daily construction worker trips. In addition, based on a passenger car equivalency factor of 2.0, the 64 haul truck trips per day and the 30 daily delivery truck trips would be equivalent to 188 passenger car trips per day. Therefore, Project construction could generate a total of approximately 364 trips per day based on the construction phase. However, given the typical construction hours the Project would comply with, the majority of these trips would occur during off-peak hours. As such, Project construction would not be expected to result in a significant impact at any of the analyzed intersections. In addition, the Project would include implementation of a Construction Management Plan to minimize the amount and effect of construction traffic. As outlined in Project Design Feature K-1, the Construction Management Plan would prohibit construction workers, haul trucks and delivery trucks from parking, staging, or queuing along the surrounding residential streets.

(b) Operational Impacts

(i) Existing with Project Intersection Conditions

Based on the traffic analysis for Existing with Project Conditions, five of the eight intersections are projected to operate at LOS D or better during the analyzed periods. The remaining three intersections are projected to operate at LOS E or F during one or more of

the analyzed periods. It is noted that these three intersections are the same intersections currently operating at LOS E or F under Existing Conditions. The addition of Project traffic to the study intersections would not exceed applicable significance thresholds. Therefore, the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Existing with Project Conditions.

(ii) Future (Year 2020) with Project Intersection Conditions

Based on the traffic analysis for Future (Year 2020) with Project Conditions, four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these four intersections are the same intersections projected to operate at LOS E or F under Future Conditions (without the Project). Similar to the Existing with Project Conditions scenario, Project traffic would contribute a small increase in the V/C ratios at most study intersections. Therefore, the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Future with Project Conditions.

(2) Congestion Management Program

(a) CMP Freeway Analysis

Based on the distribution of traffic in the vicinity of the Project Site, approximately 60 percent of the Project traffic was assigned to/from the US-101 and the Project Site. According to the trip generation estimates, the Project is expected to generate approximately 35 net new trips in the weekday A.M. peak hour, approximately 60 net new trips in the weekday P.M. peak hour, approximately 18 net new trips in the weekday evening peak hour, approximately 92 net new trips in the Saturday midday peak hour, and approximately 92 net new trips in the Saturday evening peak hour. The Project would add fewer than 150 trips in either direction during the weekday morning and afternoon peak hours. Therefore, no CMP impact would occur and no additional analysis of freeway segments is required per the CMP criteria.

(b) CMP Arterial Monitoring Stations

The CMP arterial monitoring stations closest to the Project Site are located at intersections of Santa Monica Boulevard & Highland Avenue and Cahuenga Boulevard & Lankershim Boulevard. Based on the Project trip generation and trip distribution patterns, the Project is estimated to add fewer than five trips to each of the arterial monitoring stations during the morning and afternoon peak hours. Therefore, the Project would not add more than 50 vehicle trips during the morning and afternoon peak hours at CMP

arterial monitoring stations. Therefore, the Project's CMP arterial impacts are considered to be less than significant, and no further analysis is required.

(c) CMP Transit Analysis

(i) Construction

Project construction would not require the relocation or removal of the existing Metro transit stop adjacent to the Project Site or other transit stops in the vicinity of the Project Site. As such, Project development would not result in significant impacts on transit access.

(ii) Operation

Based on Metro's CMP methodology for estimating transit trips, the Project would generate an estimated increase in transit riders of approximately three net new transit trips in the weekday morning peak hour and two net new transit trips in the weekday afternoon peak hour. The study area is served by numerous established transit routes, including the Metro Red Line, two Metro bus lines, and one LADOT bus line. Distribution of the Project transit trips to the transit routes available in the area would result in less than one new transit user for each transit line during the peak hours. Consequently, the total available capacity of the transit lines within the study area during the morning and afternoon peak hours is anticipated to more than accommodate the limited net additional trips during the morning and afternoon peak periods. Therefore, Project impacts on existing or future transit services in the study area would be less than significant.

(3) Access and Circulation

(a) Emergency Access

(i) Construction

Construction activities for the Project would be concentrated within the Project Site with limited off-site activities for implementation of any necessary utility improvements. As outlined in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls, including provisions to prohibit construction equipment or material deliveries within the public right-of-way and the use of flag persons to improve traffic flow. Implementation of such provisions would ensure adequate emergency access to residences adjacent to the Project Site. In addition, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, access to the Project Site would continue to be available during

construction of the Project. Thus, any potential emergency access impacts from Project-related construction would be less than significant.

(ii) Operation

Upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. In addition, the Project would incorporate specific emergency access recommendations provided by the County Fire Department and the City of Los Angeles Fire Department, as set forth in Project Design Feature J.1-2 included in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR. Furthermore, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Notwithstanding, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and the City of Los Angeles Fire Department. Therefore, the Project would not result in inadequate emergency access and impacts would be less than significant.

(b) Bicycle and Pedestrian Access

(i) Construction

Construction of the Project would primarily be contained within the boundaries of the Project Site and would not affect the adjacent street system. In addition, as outlined in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls and address any temporary lane or sidewalk closures, if necessary. Thus, any potential access impacts from Project-related construction would be less than significant.

(ii) Operation

Existing pedestrian facilities would remain with implementation of the Project. As such, pedestrian access to the Project Site would continue to be available from the sidewalks currently provided along Cahuenga Boulevard East. In addition, as part of the Project, on-site pedestrian circulation would be improved by accommodating parking within two new parking structures and providing designated pedestrian pathways to and from the parking structures and the on-site uses, thereby eliminating the pedestrian-vehicular conflicts associated with a stacked parking configuration. With the implementation of the

Transit Center and modifications to the driveways described above, the Project would also improve access and circulation for vehicles and shuttles.

Bicycle lanes in the study area currently exist on North Cahuenga Boulevard between Odin Avenue and Yucca Street. In addition, there are two streets designated as bicycle routes: Odin Avenue between Highland Avenue and North Cahuenga Boulevard and Wilcox Avenue south of North Cahuenga Boulevard. As these facilities do not cross the access locations to the Project Site, the Project would not affect existing designated bicycle lanes and routes in the study area. Notwithstanding, the existing sidewalks, access driveways, and lane configurations would be maintained with the Project. In addition, the Project would include bicycle amenities (e.g., bicycle parking and bicycle-friendly amenities) located throughout the Project Site.

In summary, the Project would not decrease the performance or safety of the existing circulation system and no significant impacts with regard to pedestrian and bicycle facilities are expected to result due to the design or placement of Project access points.

(4) Parking

(a) Construction

During construction of the Project, parking for employees and construction workers would be provided on-site. In addition, the Construction Management Plan outlined in Project Design Feature K-1, would address and manage on-site parking for employees and construction workers within the Project Site. Therefore, Project construction would not result in a significant impact with regard to the availability of parking.

(b) Operation

An assessment of parking demand was conducted for several potential scenarios, including on a non-event day and during event days with varying attendance levels. The peak parking demand for the Project during the scenarios analyzed was estimated based on a combination of the Project's unique operational characteristics, including attendance levels, anticipated visitor arrival and departure patterns, empirical data from existing operations, industry-wide parking demand rates, average vehicle ridership rates, mode split (e.g., arriving by transit, walk, bicycle, etc.), internal capture (e.g., between the restaurant and the theatre uses), and employee data. As part of the Project, parking is proposed within two new parking structures, which are proposed to provide a total of 500 parking spaces (250 parking spaces in each structure). Parking within the parking structures could be expanded by approximately 75 spaces with the use of attendant assisted parking for a total of 575 parking spaces provided on-site. Additional parking at the Universal City/Studio City Metro Red Line Station would also continue to be available to

accommodate the parking needs of the Project. Further, as outlined in Project Design Feature K-3, the Project would include implementation of a Parking and Traffic Management Plan to address the varying parking needs of the Project. The peak parking demands for the different operation conditions would be accommodated based on the number of parking spaces to be provided and with implementation of the strategies set forth in the Parking and Traffic Management Plan, including a combination of existing on-site parking facilities; operational measures to increase parking supply, such as attendant-assisted parking; employee parking management; and continued use of the parking spaces and shuttle from the Universal City/Studio City Metro Red Line Station for employees and patrons. Therefore, a sufficient number of parking spaces would be available to serve the estimated peak parking demand during a non-event day and during the analyzed event day scenarios, and Project impacts with regard to parking would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

(5) Summary of Impact Analysis

As provided by the analysis presented above, the Project would not result in significant impacts with regard to the local or regional transportation system, including intersections, highways, transit, and pedestrian and bicycle facilities. As such, the Project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, or conflict with an applicable congestion management program. In addition, the Project would not result in inadequate emergency access. Therefore, as demonstrated in the analysis above, impacts with regard to these topics would be less than significant.

(6) Consistency with Regulatory Framework

As analyzed above, the Project would not result in significant impacts to public transit, bicycle, or pedestrian facilities and therefore would not decrease the performance or safety of such facilities. In addition, with implementation of the Project, the County would continue to promote several modes of transportation including walking, biking, or public transportation. Therefore, the Project would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities and such impacts would be less than significant.

b. Cumulative Impacts

(1) Traffic

(a) Construction

The related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, are not located in close proximity to the Project Site and may or may not be developed within the same construction schedule as the Project. In addition, as all of the related projects are located within the jurisdiction of LADOT, per standard City practice, the construction of large development projects would occur in accordance with project-specific construction management plans, as is the case with the Project. As the construction management plans are reviewed and approved by LADOT, it is anticipated that through this process, LADOT would coordinate construction activities among the related projects that would have the potential to result in cumulative intersection impacts. In addition, as analyzed above, the Project would not result in significant impacts at any of the intersections within the study area during construction. Further, implementation of the Construction Management Plan, as outlined in Project Design Feature K-1, would manage construction-related traffic in the study area. Thus, given the distance of the Project Site to the related Projects and the construction management plans that would be in place for the Project and the related projects, the Project's contribution to cumulative construction-related traffic impacts would not be cumulatively considerable and cumulative impacts would be less than significant.

(b) Operation

Implementation of the Project in conjunction with the related projects identified in Section III, Environmental Setting, of the Draft EIR, and projected regional growth would increase the amount of traffic in the study area. The analysis of Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS. This analysis demonstrates that four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. The Project would not contribute to any significant impacts to these intersections and the Project's contribution to cumulative impacts would not be cumulatively considerable. As such, cumulative impacts would be less than significant.

(2) Congestion Management Program

The Project would not add more than 50 vehicle trips during the A.M. and P.M. peak hours at the CMP arterial monitoring stations nearest to the Project Site. In addition, the Project would add less than 150 trips along the nearest freeway segment serving the

Project Site in either direction during either peak hour. Further, the Project would not result in significant impacts to public transit. Thus, no CMP impact would occur under the Project and, as a result, the Project's contribution to cumulative impacts would not be cumulatively considerable. Thus, the Project's cumulative impacts would be less than significant.

(3) Access and Circulation

(a) Emergency Access

As described above, the analysis of the Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS in the study area. This analysis concluded that the Project would result in less than significant impacts to study intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Therefore, the Project's cumulative impacts would not be cumulative considerable. In addition, as with the Project, it is anticipated that related projects would continue to consult with the applicable Police and Fire departments regarding emergency access requirements and implement specific emergency access requirements. Additionally, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Therefore, the Project's cumulative impacts to emergency would be less than significant.

(b) Bicycle and Pedestrian Access

As provided above, Project impacts to bicycle and pedestrian access would be less than significant. Based on the proximity of the Project Site to the related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, development of the Project in conjunction with the related projects would not be expected to impact any existing shared bicycle and pedestrian facilities. Additionally, as with the Project, the applicants of the related projects would be required to design and construct their projects in conformance with applicable standards regarding sight distance, sidewalks, crosswalks, and pedestrian movement controls. Therefore, cumulative impacts would be less than significant.

(4) Parking

The parking demand associated with the Project would not contribute to the cumulative demand for parking in the vicinity of the Project Site as a result of development of the Project and related projects. Specifically, the related projects are sufficiently separated from the Project Site such that they would not share parking supplies. Therefore, cumulative parking impacts would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site

and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

c. Project Design Features

Project Design Feature K-1: Construction Management Plan

The Ford Theatre Foundation shall prepare a construction traffic management plan, including haul routes and staging plans, as necessary and satisfactory to the County. The construction traffic management plan would be based on the nature and timing of the specific construction activities and shall include the following elements as appropriate:

- Prohibition of construction worker parking and other construction-related vehicles on adjacent residential streets.
- Provisions to prohibit construction equipment or material deliveries within the public right-of-way.
- Provisions for temporary traffic control during all construction activities adjacent to public rights-of-way to improve traffic flow on public roadways (e.g., flag persons).
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets.
- Provisions of safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers, as appropriate.
- Provisions to accommodate the equipment storage and truck staging on-site.
- Scheduling of construction-related deliveries, haul trips, etc., so as to occur outside of the commuter peak hours to the extent feasible.
- Obtaining the required permits for truck haul routes from the City prior to issuance of any permit for the Project.

Project Design Feature K-2: The Ford Theatres shall stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons.

Project Design Feature K-3: Parking and Traffic Management Plan

The Ford Theatre Foundation shall prepare a Parking and Traffic Management Plan including parking and traffic management measures and transportation demand management strategies. The Parking and Traffic Management Plan could include, but not be limited to, the following:

- Provide directions and location maps with the parking options available for visitors in web postings, real-time mobile applications, marketing, notification and media materials, etc.
- Post directions and maps showing truck routes for deliveries, construction vehicles, and other trucks.
- Encourage alternate travel options (transit and shuttle service) for visitors in event-related marketing/media information.
- Manage the use of all parking spaces in the on-site parking garages to maximize parking efficiency and avoid underutilization of parking spaces.
- Identify locations for bus drop-off/pick-up and staging.
- Provide valet assist parking in at least one parking garage to maximize parking circulation and capacity where possible during large events.
- Require employees and staff to park within designated areas.
- Implement Transportation Demand Management strategies for employees to reduce trips during the congested periods and travel via other modes besides driving alone (e.g., carpooling, flexible or alternative work schedules, transit incentives, parking incentives for carpools and vanpools, etc.)
- Provide bicycle amenities (bicycle racks, lockers, etc.).

d. Mitigation Measures

The Project would result in less than significant impacts to traffic, access, and parking. No mitigation measures would be required.

e. Conclusion

(1) Traffic

The Project would not result in significant impacts during Project construction or operation along the analyzed intersections under Existing with Project Conditions or Future (Year 2020) with Project Conditions.

(2) Congestion Management Plan

No significant impacts to CMP arterial monitoring stations or freeway segments would occur. In addition, the Project's transit impacts would be less than significant.

(3) Access and Circulation

Project access impacts as well as impacts related to pedestrian/bicycle facilities would be less than significant.

(4) Parking

Project impacts related to parking would be less than significant.

L.1. Utilities and Service Systems—Water

a. Analysis of Project Impacts

(1) Construction

The amount of water used during construction would vary depending on the conditions of soils, weather, size of the construction site, and site-specific operations. It is estimated that a total of approximately 650,000 to 800,000 gallons of water could be used throughout construction of the Project. It is noted however that this increase in water demand associated with Project construction would be temporary in nature and would occur intermittently throughout construction as needed. In addition, as concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years.

The Project would require construction of new, on-site water distribution lines to serve the proposed uses. Construction impacts associated with the installation of water distribution lines are expected to be confined to trenching in order to place the lines below surface. As discussed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. In addition, prior to ground disturbance, Project contractors would coordinate with LADWP to identify the locations and depth of all lines. LADWP would also be notified in advance of proposed ground disturbance activities to avoid water lines and disruption of water service.

Based on the above, sufficient water supplies would be available to accommodate Project construction activities and, while the Project would require the construction of upgraded infrastructure facilities, the construction of such infrastructure improvements would not cause significant environmental effects. As such, construction-related impacts to water supply and infrastructure would be less than significant.

(2) Operation

(a) Water Supply

It is estimated that the Project would have an average daily domestic water demand of approximately 17,470 gallons per day (gpd). When accounting for the existing total Project Site water demand of approximately 6,529 gpd, the Project would result in a net increase in average daily water demand of approximately 10,941 gpd. However, as noted in the Water System and Supply Study included in Appendix M of the Draft EIR, since development of the water demand rates from the California Plumbing Code used to calculate the Project's water demand, most water fixtures, including those that would be implemented as part of the Project, now have reduced flow rates by 50 percent. Therefore, when accounting for typical flow rates of existing water fixtures, the water demand of the Project is estimated to be approximately 5,471 gpd or approximately 6.13 acre-feet per year (assuming constant water use throughout the year). It is noted that the Project's estimated water demand is likely conservative as it does not account for additional water conservation features that would be implemented by the Project, including those required by the County as part of the County's Green Building Program. These water saving features, which could include updated landscaping and modern irrigation, would reduce the Project's net increase in water demand accordingly.

As concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years (i.e., 2020). The Project's estimated net increase in water demand of approximately 6.13 acre-feet per year would comprise approximately 0.0009 percent of the water demand for the City in 2020 during an average year, single-dry year, and multiple-dry year period. Therefore, the Project would be well within the available and projected water supplies for normal, single-dry, and multiple-dry years through the year 2035 and, as such, LADWP would be able to meet the water demand for the Project as well as existing and planned water demands of its future service area. Therefore, the Project's operation-related impacts on water supply would be less than significant.

(b) Water Infrastructure

Water service to the Project Site would continue to be supplied by LADWP for domestic and fire protection uses. While domestic water demand is typically the main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity.

With implementation of an approved automatic fire sprinkler system within all of the buildings proposed, the required fire flow would be 4,000 gpm at a pressure of 20 psi. Based on pressure flow reports obtained from LADWP, the existing 8-inch LADWP water main in Cahuenga Boulevard East provides a flow of approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include two new connections to the existing 8-inch high-pressure water main in Cahuenga Boulevard East. The Project may include other necessary improvements to accommodate the ultimate fire flow set forth during the building permit process. The Project would also include the installation of four private fire hydrants and provide booster pumps for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project would also provide new, on-site water distribution lines to serve the proposed uses.

With implementation of the necessary water infrastructure improvements as coordinated with the County Fire Department, LAFD, and LADWP, the Project would not exceed the available capacity within the distribution infrastructure that would serve the Project Site. Therefore, the Project would not result in operation-related impacts to water infrastructure and impacts would be less than significant.

b. Cumulative Impacts

(1) Water Supply

The 2010 Urban Water Management Plan prepared by LADWP accounts for existing development within the City, as well as projected growth through the year 2035 based on demographic growth projections in the Southern California Association of Governments' 2008 Regional Transportation Plan. Additionally, under the provisions of Senate Bill 610, LADWP is required to prepare a comprehensive water supply assessment for every new development "project" (as defined by Section 10912 of the Water Code) within its service area that reaches certain thresholds. The types of projects that are subject to the requirements of SB 610 tend to be larger projects that may or may not have been included within the growth projections of the 2010 Urban Water Management Plan. The water supply assessment for such projects would evaluate the quality and reliability of existing

and projected water supplies, as well as alternative sources of water supply and measures to secure alternative sources if needed. Continued efforts by LADWP to secure the reliability of water supplies in the future, combined with project-specific requirements to conduct analyses to ensure the availability of sufficient water supply to meet demand are expected to continue through 2020 (the Project's buildout year) and beyond. Based on LADWP's 2010 Urban Water Management Plan water demand projections through 2035 and the service area reliability assessment conducted by the LADWP, LADWP determined that it would be able to reliably provide water to its customers through the year 2035. As such, LADWP would be able to meet the water demand for the Project and the related projects.

Compliance of the Project with regulatory requirements that promote water conservation such as the County's Green Building Program, as well as Assembly Bill 32 which is discussed in detail in Section IV.C, Greenhouse Gas Emissions, of the Draft EIR, would also assist in assuring that adequate water supply is available on a cumulative basis.

Based on the above, it is anticipated that LADWP would be able to supply the demands of the Project, the related projects, and future growth through 2020 and beyond. Therefore, cumulative impacts on water supply would be less than significant

(2) Water Infrastructure

The geographic context for the cumulative impact analysis on water infrastructure is the vicinity of the Project Site. Development of the Project and future new development in the vicinity of the Project Site would cumulatively increase demands on the existing water infrastructure system. However, new development projects would be subject to LADWP review (or applicable jurisdiction) to assure that the existing public utility facilities would be adequate to meet the domestic and fire water demands of each project, and individual projects would be subject to LADWP requirements regarding infrastructure improvements needed to meet respective water demands, flow and pressure requirements, etc. Furthermore, LADWP, Los Angeles Department of Public Works, and the Los Angeles Fire Department would conduct ongoing evaluations to ensure facilities are adequate. Therefore, cumulative impacts on the water infrastructure system would be less than significant.

c. Project Design Features

Project Design Feature L.1-1: The Project shall install new on-site water connections, where necessary, to distribute water within the Project Site.

Project Design Feature L.1-2: The Project shall implement water conservation features, including, but not limited to: high-efficiency toilets and urinals, auto lavatory faucets, use of "tankless" or "on demand" water heaters, drought-tolerant planting, minimal irrigation system, use of permeable surfaces, weather-based irrigation controller with rain shutoff, use of a separate water meter (or sub meter), flow sensor, and master valve shutoff for irrigated landscape areas.

d. Mitigation Measures

As the Project would have a less than significant impact on water supply and water infrastructure during construction and operation, mitigation measures are not required.

e. Conclusion

Project-level and cumulative impacts on water supply and water infrastructure would be less than significant.

L.2. Utilities and Service Systems—Energy and Energy Conservation

a. Analysis of Project Impacts

(1) Energy Demand

(a) Construction

(i) Electricity

Electricity consumption during Project construction would vary throughout Project construction based on the construction activity (i.e., grading, building construction, etc.). However, the electricity consumption that would occur due to Project construction activities would be offset by the reduction in electricity consumption resulting from the demolition of existing uses and would be temporary in nature.

Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles that would be installed along Cahuenga Boulevard East. In addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. As discussed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near

the Project Site during construction activities. Overall, demolition and construction activities would require limited electricity consumption and would not be expected to have any adverse impact on available electricity supplies and infrastructure. Therefore, construction-related impacts to electricity supply and infrastructure would be less than significant.

(ii) Natural Gas

Construction of the Project, including new buildings and facilities, typically would not involve the consumption of natural gas. Thus, there would be no demand generated by construction. The Project would, however, involve installation of new natural gas connections to serve the Project Site. Since the Project is located in an area already served by existing natural gas infrastructure, the Project would likely not require extensive infrastructure improvements to serve the Project Site. Construction impacts associated with the installation of natural gas connections are expected to be confined to trenching in order to place the lines below surface. As previously discussed, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. In addition, prior to ground disturbance, Project contractors would notify and coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service. Therefore, construction-related impacts to natural gas supply and infrastructure would be less than significant.

(b) Operation

(i) Electricity

Project operations would increase the existing demand for electricity. Based on the electricity demand estimates, the Project's peak electricity demand would be approximately 2,105 KW of electricity per year. When accounting for the existing electricity usage of the former motel building, which would be removed as part of the Project, the Project's net peak electricity demand would be reduced to 2,065 KW per year. The estimated electrical consumption is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features. LADWP forecasts that in the 2020–2021 fiscal year, the annual electricity sold within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW. The Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Therefore, it is anticipated that LADWP's existing and planned electricity capacity and electricity supplies would be sufficient to support the Project's demand. In addition, LADWP has indicated that electric service to meet the Project is available and would be provided in accordance with LADWP's Rules and Regulations. While the availability of electricity is dependent upon adequate generating

capacity and fuel supplies, the estimated power requirement for the Project is part of the total load growth forecast for the City and has been taken into account in the planned growth of the City's power system. Thus, operational impacts associated with the Project's consumption of electricity would be less than significant.

(ii) Natural Gas

Operation of the Project would result in an increase in the consumption of natural gas for the heating of spaces and water, and cooking at the proposed restaurant. Based on the natural gas demand estimates, the Project's natural gas demand is estimated to be approximately 8,500 cubic feet per hour. This estimated natural gas demand is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features. In addition, as existing natural gas usage associated with the former motel building is unknown, the Project's estimated natural gas demand does not account for existing natural gas usage within the former motel building, which would be removed as part of the Project.

Based on the Project's estimated yearly natural gas consumption of 496,400 Therms per year, the Project would account for approximately 0.007 percent of the forecast for the 2020 natural gas consumption throughout SoCalGas' planning area. Given the limited percentage of total demand represented by the Project, SoCalGas' planned demand forecasts likely account for Project development. In addition, SoCalGas has indicated that natural gas facilities are available in the area of the Project Site. Further, the Project would incorporate compliance measures to address applicable energy regulations and requirements. As such, operational impacts associated with the consumption of natural gas would be less than significant.

(2) Energy Conservation

Green building design and construction practices would be implemented as part of the Project in compliance with the County's Green Building Ordinance. Accordingly, the Project would incorporate the County's Green Building Standards, including compliance with the California Energy Code. Design features that could be implemented would include, but not be limited to, light colored or "cool" roofs, efficient lighting and lighting control systems, energy-efficient heating and cooling systems and controls. In addition, the Project would incorporate a variety of water conservation features that would also promote energy conservation. Further, as part of the Project, the County would continue to promote the use of alternative modes of transportation by providing shuttles to and from the Universal City/Studio City Metro Red Line Station, thereby reducing energy usage associated with additional Project vehicles. Overall, the Project would be designed and constructed in accordance with state and local green building standards that would serve to reduce the energy demand of the Project. Additionally, based on the above, the Project's

energy demand would be within the existing and planned electricity and natural gas capacities of LADWP and SoCalGas, respectively. Therefore, development of the Project would not cause wasteful, inefficient, and unnecessary consumption of energy and would be consistent with the intent of Appendix F of the CEQA Guidelines.

b. Cumulative Impacts

(1) Electricity

The Project in conjunction with forecasted 2020 growth in LADWP's service area would increase electricity consumption and thus, would cumulatively increase the need for additional electricity supplies and infrastructure capacity. LADWP forecasts that in the 2020–2021 fiscal year, electricity consumption within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW. Future cumulative growth expected during this period within LADWP's service area is accounted for in this forecast. As discussed above, Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Based on this small percentage, the Project's contribution to the cumulative electricity demand would not be substantial. In addition, based on the types of uses proposed by the related projects, it is anticipated that the related projects would similarly comprise a limited percentage of the forecasted total electricity demand within LADWP's service area in 2020. Further, as future electrical demand estimates factor in cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, within LADWP's service area. Although the Project, related projects, and other future development would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for LADWP's service area. Additionally, like the Project, related projects would be expected to incorporate energy conservation features, comply with applicable regulations including the City's and County's Green Building Ordinance, and incorporate mitigation measures, as necessary. Accordingly, the Project's contribution to cumulative impacts related to electricity consumption would be less than significant.

Electricity infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by LADWP are ongoing. It is expected that LADWP would continue to expand delivery capacity as needed to meet demand increases within its service area. Development projects, inclusive of the related projects, within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as necessary. As such, cumulative impacts with respect to electricity infrastructure would be less than significant.

(2) Natural Gas

Buildout of the Project, related projects, and other future development projects in SoCalGas' service area is expected to increase natural gas consumption and thus cumulatively increase the need for additional natural gas supplies and infrastructure capacity. The California Energy Commission estimates natural gas consumption within SoCalGas' planning area will increase to 7,263 million Therms in 2020 (Project buildout year). Future 2020 cumulative growth within SoCalGas' service area is accounted for in this forecast. As previously indicated, the Project's annual natural gas usage would represent approximately 0.007 percent of the forecasted total consumption in 2020. It is anticipated that given the type of developments proposed by the related projects, the related projects would similarly comprise a limited percentage of the forecasted total consumption within SoCalGas' service area in 2020. Further, as future natural gas demand estimates factor in cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, in SoCalGas' service area. Although related projects would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for SoCalGas' service area. Furthermore, like the Project, the related projects and any other future development would be expected to incorporate energy conservation features, comply with applicable regulations including the County's Green Building Ordinance, and incorporate mitigation measures, as necessary, to address natural gas demands. Accordingly, the Project's contribution to cumulative impacts related to natural gas would be less than significant.

Natural gas infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SoCalGas occur as needed. It is expected that SoCalGas' would continue to expand delivery capacity if necessary to meet demand increases within its service area. Development projects within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as appropriate. As such, cumulative impacts with respect to natural gas infrastructure would be less than significant.

c. Project Design Features

No specific project design features beyond the project improvements discussed in Section II, Project Description, of the Draft EIR are proposed with regard to energy and energy conservation.

d. Mitigation Measures

As discussed above, the Project's impacts on energy and energy conservation would be less than significant. As such, no mitigation measures would be required.

e. Conclusion

As indicated above, the Project's impacts on energy and energy conservation would be less than significant.

II. Clarifications and Additions to the Draft EIR

II. Clarifications and Additions to the Draft EIR

This section of the Final EIR provides changes to the Draft EIR that have been made to clarify, correct, or add to the environmental impact analysis for the Ford Theatres Project (the Project). Such changes are a result of public and agency comments received in response to the Draft EIR and/or new information that has become available since publication of the Draft EIR. The changes described in this section do not result in any new or increased significant environmental impacts that would result from the Project. Such changes to the Draft EIR are indicated in this section under the appropriate Draft EIR section or appendix heading. Deletions are shown with ~~strikethrough~~ and additions are shown with underline.

I. Executive Summary

Section I, Executive Summary of this Final EIR has been revised based on the Clarifications and Additions provided herein.

II. Project Description

No clarifications or additions have been made to this section of the Draft EIR.

III. Environmental Setting

No clarifications or additions have been made to this section of the Draft EIR.

IV. Environmental Impact Analysis

IV.A. Aesthetics, Views, Light, and Glare

No clarifications or additions have been made to this section of the Draft EIR.

IV.B. Air Quality

No clarifications or additions have been made to this section of the Draft EIR.

IV.C. Greenhouse Gas Emissions

No clarifications or additions have been made to this section of the Draft EIR.

IV.D. Biological Resources

No clarifications or additions have been made to this section of the Draft EIR.

IV.E. Cultural Resources

Volume 1, Section IV.E, Cultural Resources, page IV.E-27, revise Mitigation Measure E-2 as follows:

> **Mitigation Measure E-2:** If a unique archaeological resource is discovered during Project construction activities, work in the area shall cease and deposits shall be treated by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61 in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. In addition, if it is determined that an archaeological site is a historical resource, the provisions of Section 21084.1 of the Public Resources Code and CEQA Guidelines Section 15064.5 shall be implemented.

Volume 1, Section IV.E, Cultural Resources, page IV.E-28, revise Mitigation Measure E-4 as follows:

> **Mitigation Measure E-4:** A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur. The frequency of inspections shall be based on consultation with the paleontologist and shall depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If paleontological materials are

encountered, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed material to facilitate evaluation and, if necessary, salvage. The paleontologist shall assess the discovered material(s) and prepare a survey, study or report evaluating the impact. The paleontologist's survey, study or report shall contain a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Applicant shall comply with the recommendations of the evaluating paleontologist, as contained in the survey, study or report, and a copy of the paleontological survey, study or report shall be submitted to the Los Angeles County Natural History Museum and the Los Angeles County Department of Parks and Recreation. Ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the satisfaction of the paleontologist.

Additionally, at the request of Hollywood Heritage and the Los Angeles Conservancy in their comments on the Draft EIR, the Ford Theatre Foundation has agreed to provide for the preparation of a Historic Structures Report, although the Draft EIR demonstrates that there would be no significant adverse effect on cultural resources and that the Amphitheatre would remain eligible for listing in the National Register of Historic Places, with the design features and mitigation measures already incorporated in the Project. While the CEQA Guidelines provide that mitigation measures are not required for effects found to be not significant, in recognition of Hollywood Heritage's, the Los Angeles Conservancy's, and the Ford Theatre Foundation's shared interest in ensuring that the Project meets the highest possible historical preservation standards, and to facilitate tracking the implementation of the Historic Structures Report, the Ford Theatre Foundation has agreed to include preparation of an Historic Structures Report as an additional mitigation measure.

Volume 1, Section IV.E, Cultural Resources, page IV.E-28, add Mitigation Measure E-5 as follows:

Mitigation Measure E-5: The Project shall include preparation of a Historic Structures Report by a historic preservation professional meeting the Secretary of the Interior's Professional Qualification Standards. The Historic Structures Report shall be prepared in compliance with National Park Service Preservation Brief No. 43: The Preparation and Use of Historic Structures Report.

Pursuant to National Park Service Preservation Brief No. 43, the Historic Structures Report shall include recommendations for the treatment of the character-defining features, as well as guidance for complying with the Standards. The Historic Structures Report shall also include additional information about the history and physical features of the property. Preparation of the Historic Structures Report shall commence by the first quarter of 2015.

IV.F. Geology and Soils

No clarifications or additions have been made to this section of the Draft EIR.

IV.G. Hydrology, Water Quality, and Groundwater

No clarifications or additions have been made to this section of the Draft EIR.

IV.H. Land Use

No clarifications or additions have been made to this section of the Draft EIR.

IV.I. Noise

No clarifications or additions have been made to this section of the Draft EIR.

IV.J.1. Public Services—Fire Protection

Volume 1, Section IV.J.1, Public Services—Fire Protection, page IV.J.1-10, revise Project Design Feature J.1-3 as follows:

Project Design Feature J.1-3: The Project shall provide automatic fire sprinkler systems, approved by the County Fire Department, within all of the new buildings. With installation of fire sprinkler systems within all of the new buildings, the required fire flow shall be 4,000 gallons per minute with a residual pressure of 20 pounds per square inch, or a reduced fire flow as determined by the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

Volume 1, Section IV.J.1, Public Services—Fire Protection, page IV.J.1-10, revise Project Design Feature J.1-4 as follows:

> **Project Design Feature J.1-4:** To accommodate the required fire flow, the Project shall provide two connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East, or other necessary improvements as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

Volume 1, Section IV.J.1, Public Services—Fire Protection, page IV.J.1-15, revise subsection (c) Fire Flow, as follows:

As discussed in Section IV.L.1, Utilities and Service Systems—Water, of this Draft EIR, of this Draft EIR, domestic and fire water service to the Project Site would continue to be supplied by LADWP. As described in Section II, Project Description, of this Draft EIR, infrastructure improvements related to fire service would include installation of four onsite fire hydrants, illustrated in Figure IV.J.1-3 on page IV.J.1-16.

As provided in Appendix K of this Draft EIR, with implementation of a fire sprinkler system within all of the buildings proposed as set forth in Project Design Feature J.1-3, the required fire flow set forth by the County Fire Department would be 4,000 gpm at a pressure of 20 psi. This preliminary fire flow may be reduced as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

As previously described, domestic and fire water service is currently provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. The water main can provide approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include the installation of two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East, or other necessary improvements to accommodate the ultimate fire flow set forth during the building permit process, as provided in Project Design Feature J.1-4 above. In addition, the Project would include the installation of four private fire hydrants on-site and, as set forth in Project Design Feature J.1-5 above, booster pumps would be required for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. As provided in Project Design

Feature J.1-6, the enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines.

With construction of the ~~proposed~~ necessary onsite fire water system improvements as coordinated with the County Fire Department, LAFD, and LADWP, the Project would meet the fire flow requirements set forth by the County Fire Department and LAFD. Therefore, impacts regarding fire flow would be less than significant.

IV.J.2. Public Services—Police Protection

No clarifications or additions have been made to this section of the Draft EIR.

IV.K. Traffic, Access, and Parking

Volume 1, Section IV.K, Traffic, Access, and Parking, page IV.K-5, revise the fourth bullet as follows:

- Pilgrimage Bridge is an east-west roadway that connects Cahuenga Boulevard West and Cahuenga Boulevard East near the Project Site. It provides access to the Project Site with two travel lanes, one in each direction. Parking is not permitted. ~~The posted speed limit is 35 mph.~~ Speed limit signs are not posted on Pilgrimage Bridge; thus, it is assumed to be a prima-facie speed limit of 25 mph, consistent with the State of California Vehicle Code.

Volume 1, Section IV.K, Traffic, Access, and Parking, page IV.K-8, revise Section 3, Approach and Methodology, as follows:

As previously noted, while the Ford Theatres are owned and operated by the County of Los Angeles, the street system surrounding the Project Site, including the study intersections, are within the jurisdiction of the City of Los Angeles. In consultation with the County of Los Angeles Department of Public Works, it was determined that the Traffic Study for the Project be prepared in accordance with the City of Los Angeles Department of Transportation's Traffic Study Policies and Procedures (~~May 2012~~June 2013). LADOT's Traffic Study Policies and Procedures establish the guidelines for determining the appropriate traffic analysis for a project, analysis methodologies, and significance thresholds. The scope of analysis included in the Traffic Study was developed in consultation with both the LACDPW and

LADOT staff. In addition, the base assumptions and technical methodologies (i.e., trip generation, study locations, analysis methodology, etc.) were identified as part of the Traffic Study approach and were reviewed and approved by LACDPW staff.

Volume 1, Section IV.K, Traffic, Access, and Parking, page IV.K-10, replace Figure IV.K-1, Study Area and Analyzed Intersections, with Revised Figure IV.K-1 on page II-8.

Volume 1, Section IV.K, Traffic, Access, and Parking, page IV.K-25 through IV.K-27, revise subsection (ii) Trip Distribution and Traffic Assignment, as follows:

The second and third components of the travel demand analysis includes an estimation of the geographical distribution of origins and destinations for the trips generated by the Project (trip distribution) and the assignment of these trips to the study area roadway system (traffic assignment). As stated above, the geographic distribution of trips generated by the Project is dependent on characteristics of the street system serving the Project Site, the level of accessibility of routes to and from the Project Site, and the locations of nearby residential, entertainment and employment centers. Based on the observed distribution of traffic in the vicinity of the Project Site, Project traffic was assigned to the surrounding streets as follows: approximately 50 percent of the total Project traffic was assigned to/from the north of the Project Site~~;~~ and approximately 50 percent of the total Project traffic was assigned to/from the south of the Project Site~~.; and approximately~~ Approximately 60 percent of the total Project traffic was assigned to/from the US-101 and the Project Site.

IV.L.1. Utilities and Service Systems—Water

Volume 1, Section IV.L.1, Utilities and Service Systems—Water, page IV.L.1-18 through page IV.K.1-19, revise subsection (b) Water Infrastructure, as follows:

Water service to the Project Site would continue to be supplied by LADWP for domestic and fire protection uses. While domestic water demand is typically the main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity.

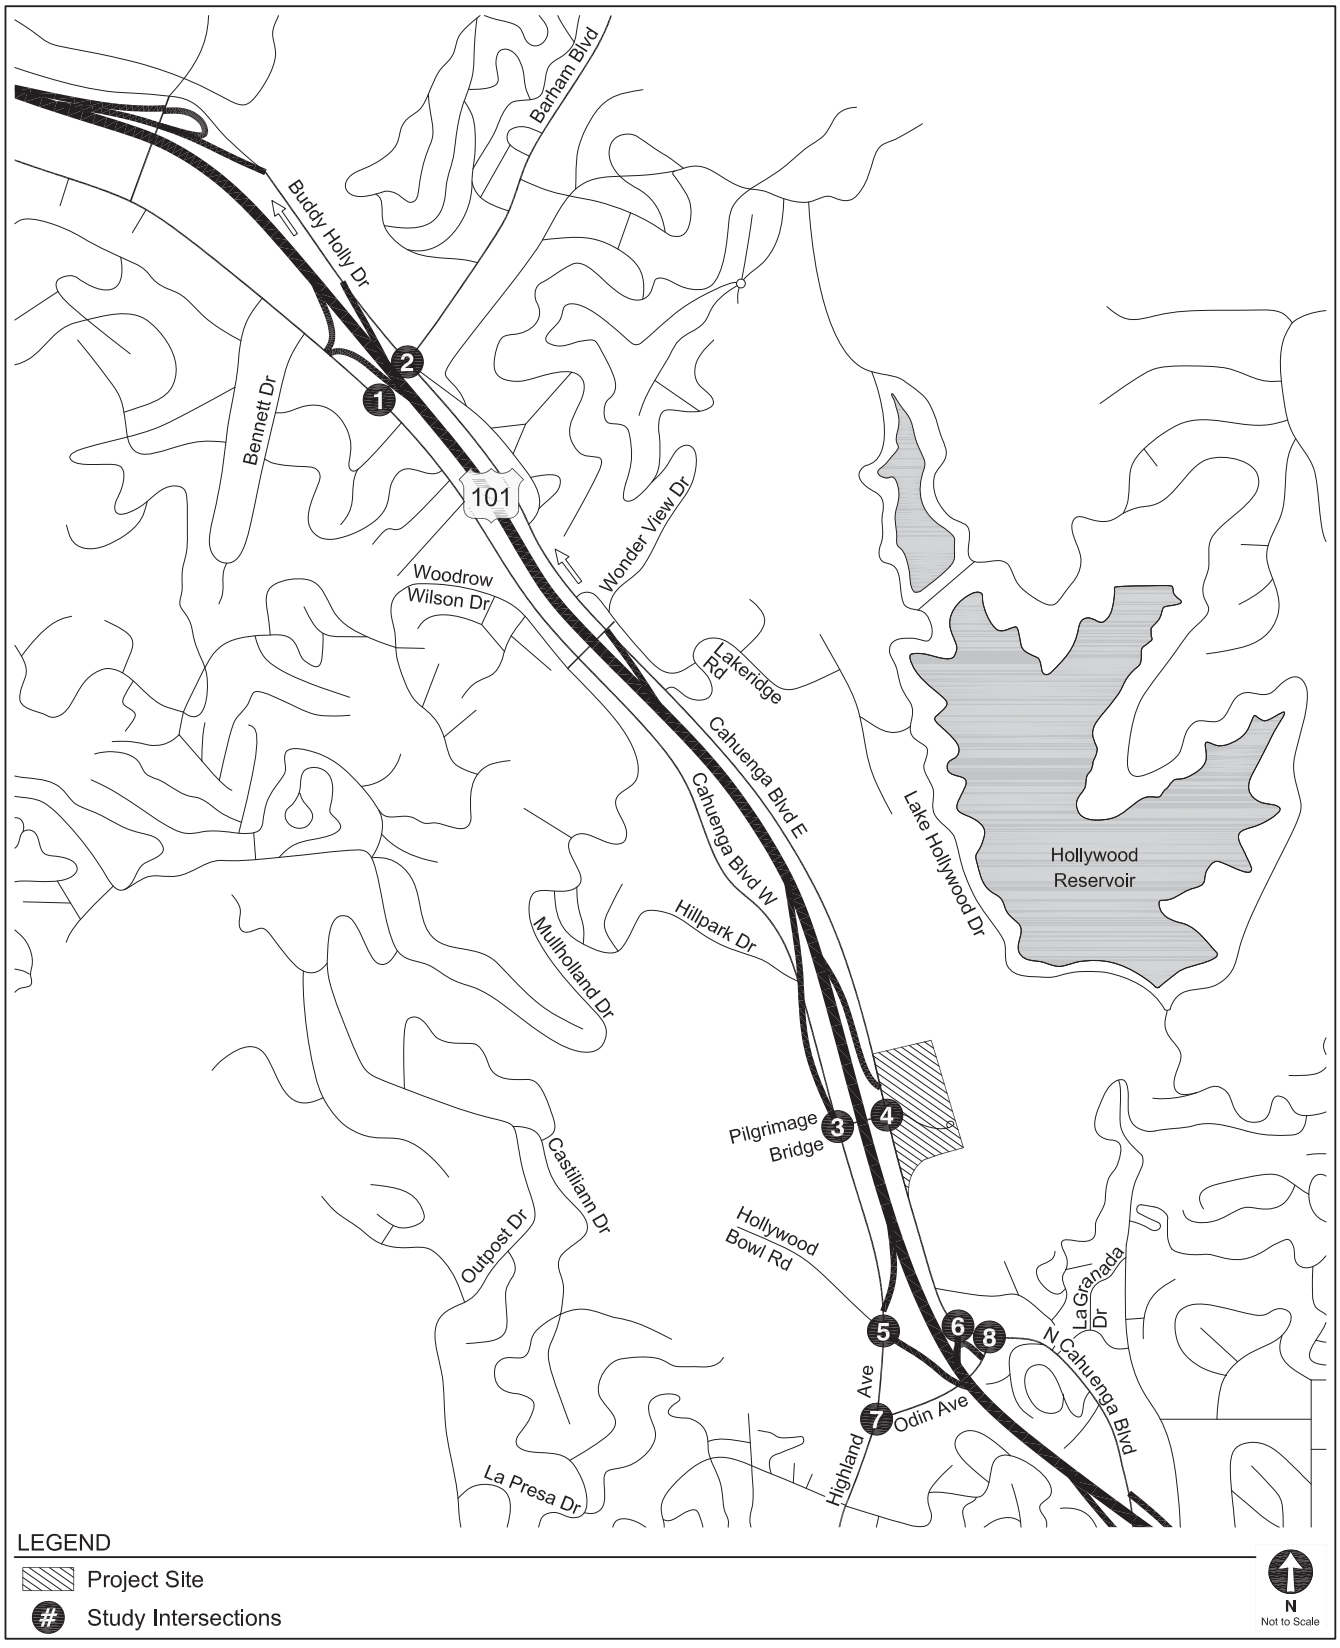

Figure IV.K-1
Study Area and Analyzed Intersections (Revised)

Source: Gibson Transportation Consulting, Inc., 2014.

As provided in Appendix K of this Draft EIR, with implementation of an approved automatic fire sprinkler system within all of the buildings proposed, as set forth in Project Design Feature J.1-3 included in Section IV.J.1, Public Services—Fire Projection, of this Draft EIR, the required fire flow would be 4,000 gpm at a pressure of 20 psi. This preliminary fire flow may be reduced as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project. Based on pressure flow reports obtained from LADWP, the existing 8-inch LADWP water main in Cahuenga Boulevard East provides a flow of approximately 1,750 gpm at a residual pressure of 72 psi. As previously described, to accommodate the required fire flow of 4,000 gpm, the Project would include two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East. The Project may include other necessary improvements to accommodate the ultimate fire flow set forth during the building permit process. The Project would also include the installation of four private fire hydrants on-site and provide booster for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project would also provide new, on-site water distribution lines to serve the proposed uses.

With implementation of the ~~proposed~~ necessary water infrastructure improvements ~~described above~~ as coordinated with the County Fire Department, LAFD, and LADWP, the Project would not exceed the available capacity within the distribution infrastructure that would serve the Project Site. Therefore, the Project would not result in operation-related impacts to water infrastructure and impacts would be less than significant.

IV.L.2. Utilities and Service Systems—Energy

No clarifications or additions have been made to this section of the Draft EIR.

V. Alternatives

No clarifications or additions have been made to this section of the Draft EIR.

VI. Other CEQA Considerations

No clarifications or additions have been made to this section of the Draft EIR.

VII. References

No clarifications or additions have been made to this section of the Draft EIR.

VIII. List of Preparers

No clarifications or additions have been made to this section of the Draft EIR.

IX. Acronyms and Abbreviations

No clarifications or additions have been made to this section of the Draft EIR.

Appendices

No clarifications or additions have been made to Appendices A through K or Appendices M through N of the Draft EIR. Specific clarifications to Appendix L, Traffic Study, of the Draft EIR are provided below. An additional appendix, Appendix P, has also been added as described further below.

Appendix L: Traffic Study

(a) General Clarification

To clarify, the tables showing existing and future with and without the Project intersection peak hour levels of service included in the main part of the Traffic Study depict the estimated intersection operating conditions for signalized intersections. The analysis for the one unsignalized intersection in the study area (Intersection No. 3, Cahuenga Boulevard East & Barham Boulevard) is provided in Appendix E of the Traffic Study.

(b) Specific Clarifications and Additions

Volume 4, Appendix L, Traffic Study, page 9, revise the first paragraph as follows:

> This chapter describes the various traffic scenarios analyzed, the methodologies used for assessing intersection ~~and street segment~~ operating conditions, and significant traffic impact criteria for the jurisdictions overseeing the analysis.

Volume 4, Appendix L, Traffic Study, page 9 through page 10, revise the first paragraph under the subsection titled Study Scope and Analysis Conditions, as follows:

The Project is in the County of Los Angeles, which requires that traffic studies follow the criteria contained in LACDPW's *Traffic Impact Analysis Report Guidelines* (Jan 1, 1997). However, since all of the study intersections are in within City of Los Angeles jurisdiction, based on direction from LACDPW staff, this traffic study follows LADOT's *Traffic Study Policies and Procedures* (~~May 2012~~June 2013), which establishes the guidelines for determining the appropriate traffic analysis for a project, analysis methodologies, significance thresholds, etc. As required by Traffic Study Policies and Procedures, the traffic analysis focused on weekday and weekend peak hours (i.e., the time periods in which congestion is at its greatest levels), which generally corresponds to the highest hour on a weekday during the morning and afternoon commuter periods and the midday peak hour on a weekend. In addition, as previously noted, analysis of the weekday and weekend evening "pre-event" peak hour was also prepared. The scope of analysis for this study was developed in consultation with LACDPW and LADOT staff. The base assumptions and technical methodologies (i.e., trip generation, study locations, analysis methodology, etc.) were identified as part of the study approach and were reviewed and approved by LACDPW staff.

Volume 4, Appendix L, Traffic Study, page 11, revise the third paragraph as follows:

The ATSAC~~)~~ system represents an advanced system in computer control of traffic signals. It was first put into operation in June 1984 in the Coliseum area of the City of Los Angeles to anticipate the expected increase in traffic due to the Summer Olympic Games, and has since been expanded to other parts of the City. The advantages of ATSAC-controlled traffic signals are substantial, including real-time adjustment of signal timing plans to reflect changing traffic conditions, identification of unusual traffic conditions caused by incidents, the ability to implement special purpose short-term signal timing changes in response to incidents, and the ability to identify signal equipment malfunctions quickly. LADOT estimates that implementation of this system improves intersection capacity by an average of 7%.

Volume 4, Appendix L, Traffic Study, page 19, revise the fourth bullet as follows:

- Pilgrimage Bridge is an east-west roadway that connects Cahuenga Boulevard West and Cahuenga Boulevard East near the Project Site. It provides access to the Project Site with two travel lanes, one in each direction. Parking is not permitted.~~ The posted speed limit is 35 mph.~~ Speed limit signs are not posted on Pilgrimage Bridge; thus, it is assumed to be a prima-facie speed

limit of 25 mph, consistent with the State of California Vehicle Code.

Volume 4, Appendix L, Traffic Study, page 23, replace Figure 2, Study Area and Analyzed Intersections, with Revised Figure 2 on page II-13.

Volume 4, Appendix L, Traffic Study, page 89, revise subsection titled Passenger Car Equivalent Trips as follows:

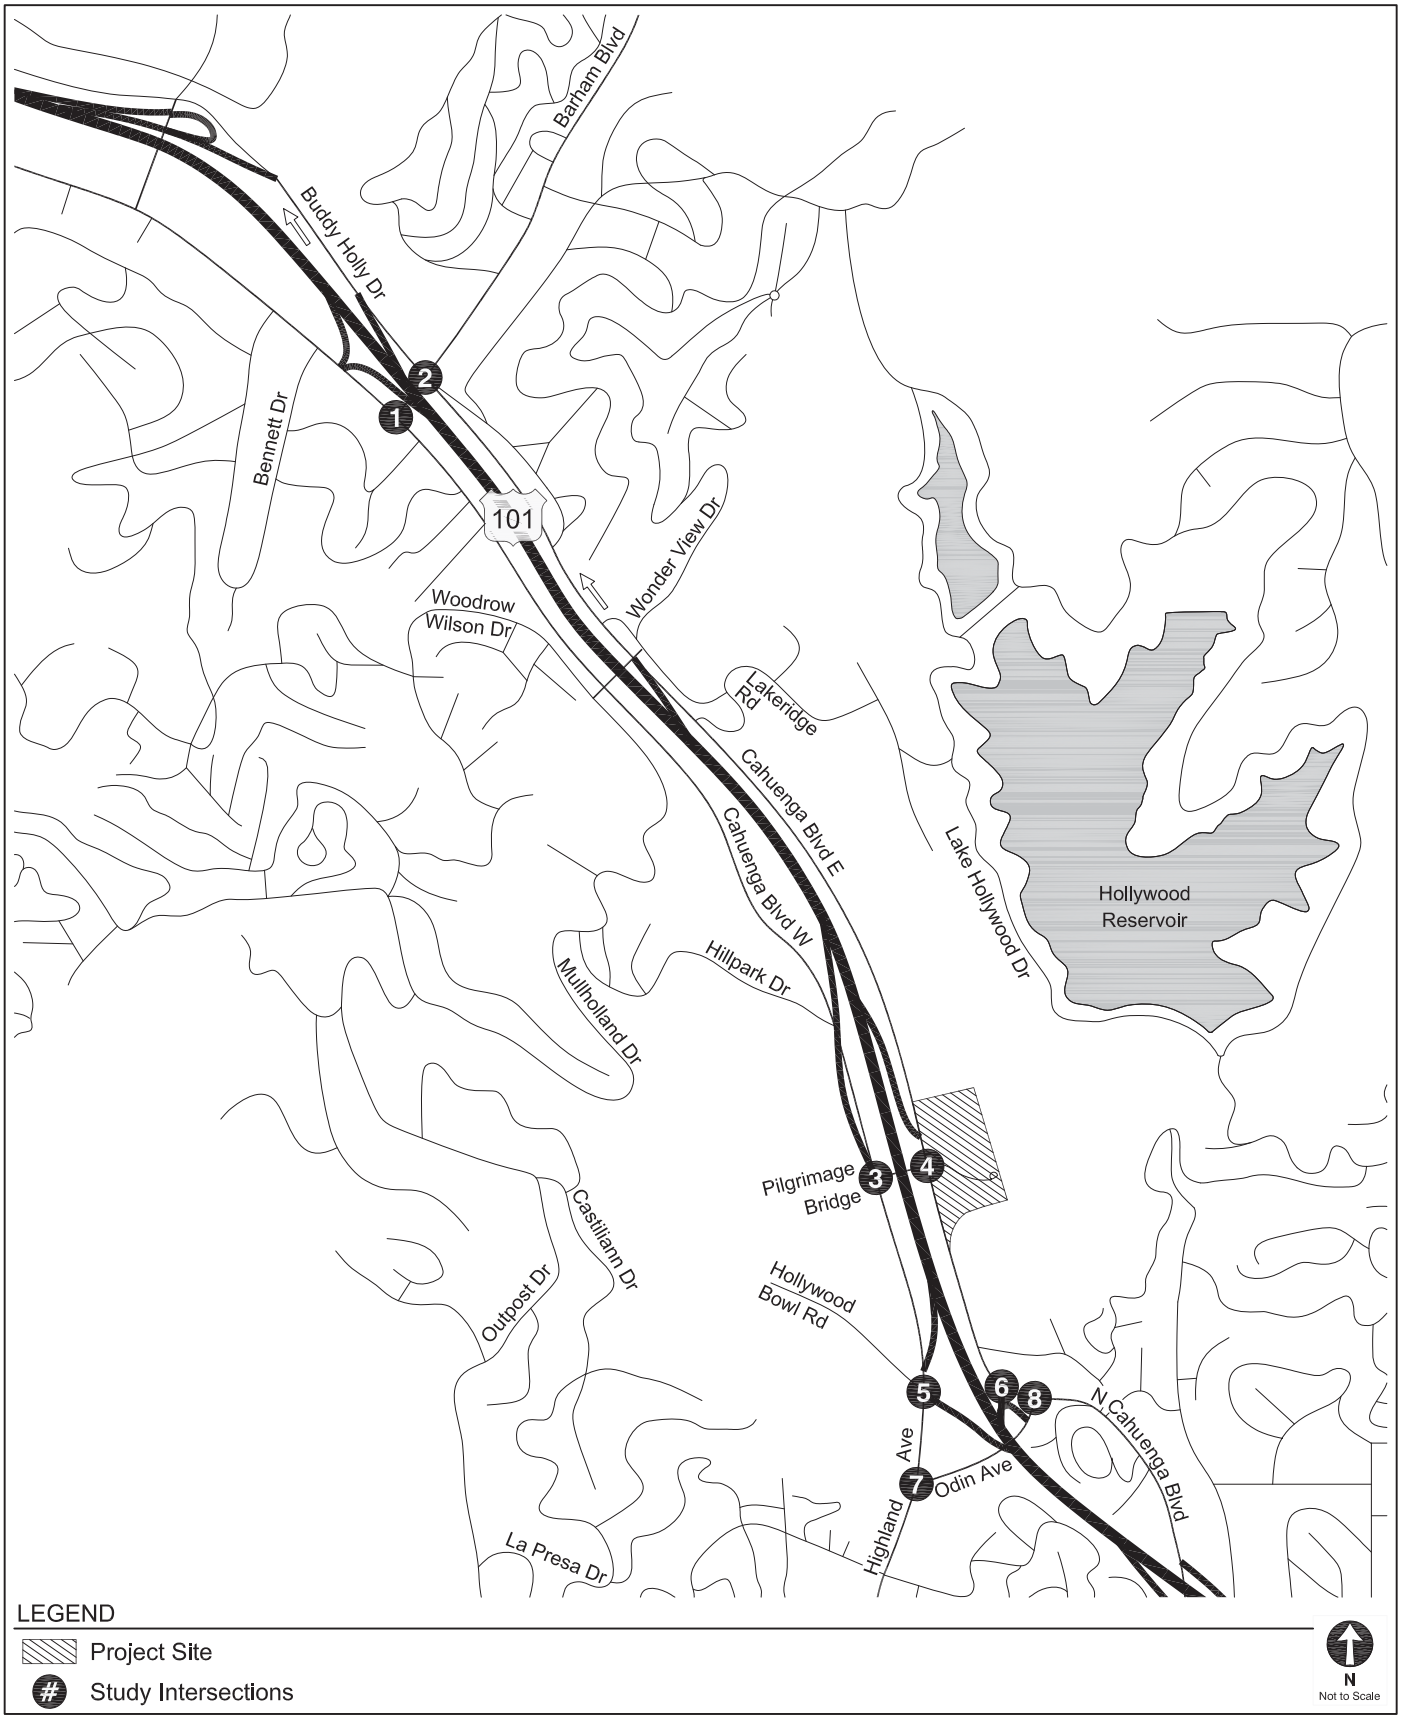
Assuming a passenger car equivalency (PCE) factor of 2.0, the 64 off-site haul trucks and 30 delivery trucks would be equivalent to ~~94~~ 188 passenger car trips per day. *Transportation Research Circular No. 212, Interim Materials on Highway Capacity* (Transportation Research Board, 1980) defines PCE for a vehicle as the number of through moving passenger cars to which it is equivalent based on the vehicle's headway and delay-creating effects. Table 8 of *Transportation Research Circular No. 212* and Exhibit 16.7 of the *2000 Highway Capacity Manual* (Transportation Research Board, 2000) suggest a PCE of 2.0 for trucks.

Volume 4, Appendix L, Traffic Study, page 89, revise subsection titled Potential Impacts of Construction Traffic as follows:

As described above, Project construction at its most intense phases is expected to generate approximately 176 daily worker trips and ~~94~~ 188 PCE daily truck trips, which account for off-site hauling and deliveries, most of which are anticipated to occur during off-peak hours. Because a majority of construction traffic would occur during off-peak hours, Project construction is not expected to cause a significant traffic impact at any of the analyzed intersections. In order to minimize the effect of construction-related traffic on the surrounding street system, all construction workers, haul trucks and delivery trucks would be prohibited from parking, staging, or queuing along the adjacent public streets. With implementation of a Construction Management Plan, construction traffic impacts at study intersections would be less than significant.

Volume 4, Appendix L, Traffic Study, References Chapter, revise the following reference:

Traffic Study Policies and Procedures, Los Angeles Department of Transportation, ~~May 2012~~June 2013.



STUDY AREA AND ANALYZED LOCATIONS (REVISED)

FIGURE 2

Volume 4, add new Appendix P, Project Architects Résumés, as provided on pages II-15 and II-16.

Professional History

1980-Present/Architect
President of Levin & Associates, Inc., an urban design and architecture firm with emphasis in large scale renovation and adaptive re-use of historic buildings and the design of new educational, cultural, multi-family housing buildings.

Selected Projects include:
Urban Revitalization: The Oviatt, Fine Arts, and Bradbury Buildings, Wiltern Theater, Grand Central Square, Chapman Market, Hall of Justice, Pasadena Streetscapes

Arts & Culture: UC Santa Barbara Art Museum, Huntington Library, John Anson Ford Theatres, Autry National Center, Southwest Museum, Santa Monica Civic Auditorium, Barnsdall Art Park

Education: Oakwood School, Occidental, Scripps, Pitzer and Whittier Colleges, Ballona Discovery Center

Civic and Social: Dodger Stadium Renovation, Wilshire Boulevard Temple, Hercules Campus at Playa Vista, Griffith Observatory, Los Angeles City Hall, National Center for the Preservation of Democracy, Downtown Women's Center

Awards

2014 *Wilshire Boulevard Temple:*
Los Angeles Conservancy - President's Award
California Preservation Foundation Design Award

2010 AIA/LA Gold Medal Presidential Award

2008 USC Parkinson Spirit of Urbanism Award
AIA Honor Award - Griffith Observatory

2007 *Griffith Observatory:*
National Trust for Historic Preservation
California Preservation Foundation
Los Angeles Conservancy - Preservation Award

2004 AIACC Historic Preservation Achievement Award

2003 LA Chamber of Commerce – Distinguished Achievement Award

2002 Los Angeles Conservancy – Preservation Award

Andrea Rawlings, AIA

Architectural Registration

State of California 1992

Experience

Ms. Rawlings' dedication to the architectural profession is illustrated by her participation on numerous boards and commissions. She is a Project Manager with critical thinking skills and engages in thoughtful design solutions. Her communication skills enable her to effectively lead a project team and assure Client goals and expectations are met. Her responsibilities include project/client criteria conformance, project documentation, and project constructibility. Ms. Rawlings' past experience includes community based assignments for numerous public sector clients.

III. Responses to Comments

III. Responses to Comments

A. Introduction

CEQA Guidelines Section 15088(a) states that "The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments." In accordance with these requirements, this section of the Final EIR provides responses to each of the written comments received during the comment period for the Draft EIR.

Section III.B, Matrix of Comments Received in Response to the Draft EIR, includes a table that provides a graphic summary of the environmental issues raised by each commenter in response to the Draft EIR. In addition, Section III.C, Comment Letters, provides a copy of each comment letter and written responses to each of the environmental issues raised in the comment letters on the Draft EIR. Copies of the full original comment letters are also provided in Appendix FEIR-A of this Final EIR. All comments and responses would be provided to the County Board of Supervisors, the decision makers on this Project, for their consideration prior to any action on Project recommendations.

III. Responses to Comments

C. Comment Letters

Comment Letter No. 1

Scott Morgan
Director
State Clearinghouse and Planning Unit
Governor's Office of Planning and Research
State of California
P.O. Box 3044
Sacramento, CA 95812-3044

Comment No. 1-1

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. The review period closed on August 6, 2014, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Document Details Report
State Clearinghouse Data Base

SCH# 2014021013
Project Title The Ford Theatres Project
Lead Agency Los Angeles County

Type EIR Draft EIR

Description The Project includes rehabilitation and improvements to the existing Amphitheatre and development of the Ford Terrace, the Ford Plaza, the Transit Center and a hiking trail, all within the current boundaries of the Ford Theatres site. Implementation of the Project would result in approximately 47,550 net new sf of new facilities and approximately 48,750 net new sf of outdoor plaza areas within the Project Site.

Response to Comment No. 1-1

This comment acknowledges the receipt of the Draft EIR by the State of California Governor's Office of Planning and Research, State Clearinghouse and Planning Unit, and compliance with State Clearinghouse review requirements for draft environmental documents, in accordance with CEQA.

Comment Letter No. 2

Ali Poosti
Division Manager
Wastewater Engineering Services Division
Bureau of Sanitation
City of Los Angeles
2714 Media Center Dr.
Los Angeles, CA 90065-1733

Comment No. 2-1

This is in response to your June 23, 2014 letter requesting a review of your proposed project to improve the facilities of The Ford Theatres located at 2580 Cahuenga Boulevard East, Los Angeles, CA 90068. The Bureau of Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

The Bureau of Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvements projects needed to provide future capacity as the City grows and develops.

Response to Comment No. 2-1

This introductory comment describes the role of the City of Los Angeles Bureau of Sanitation, Wastewater Engineering Services Division. This comment does not raise a specific environmental issue. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. 2-2

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Existing			
Seat	3/Seat	1196 Seat	(3,588)
Concession/Restaurant	300 GPD/1000 SQ.FT	320 SQ.FT	(96)
Box Office/Museum	120 GPD/1000 SQ.FT	365 SQ.FT	(44)
Offices	120 GPD/1000 SQ.FT	10,500 SQ FT	(1,260)
Work Shop/Storage	30 GPD/1000 SQ FT	2,650 SQ FT	(80)
Proposed			
Amphitheatre: Seat	3/Seat	1196 Seat	3,588
The Ford Terrace: Lobby & Control Room	50 GPD/1000 SQ.FT	1,700 SQ.FT	85
The Ford Plaza: Seat	3/Seat	299 Seat	897

Box Office	120 GPD/1000 SQ FT	560 SQ FT	67
Conference Room	120 GPD/1000 SQ FT	1,000 SQ FT	120
Visitor Amenities	50 GPD/1000 SQ FT	1,200 SQ FT	60
The Transit Center: Seat	3/Seat	99 Seat	297
Total			**5,159**

Response to Comment No. 2-2

This comment provides the projected wastewater discharge for the Project based on the City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table. The table shows that the Project would generate approximately 5,159 gallons per day (gpd) of wastewater.

As analyzed on page 42 of the Initial Study for the Ford Theatres Project (included as Appendix A.1 of the Draft EIR), based on the Sewer Capacity Availability Request processed by the City of Los Angeles Department of Public Works, Bureau of Sanitation,

the Project was estimated to generate approximately 5,452 gpd (0.0055 mgd) of wastewater. Therefore, the Initial Study analyzed a more conservative estimate that indicates a greater increase in wastewater generation as compared to the above wastewater generation table.

Comment No. 2-3

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of your proposed project includes an existing 8-inch line on Cahuenga Blvd East. The flow from the existing 8-inch line on Cahuenga Blvd feeds into a 10-inch line on Cahuenga Blvd and then into a 21-inch line on Las Palmas Ave and finally to a 45-inch line on Willoughby Ave. Figure 1 shows the details of the sewer system within the vicinity of your project.

Response to Comment No. 2-3

This comment provides a description of the sewer infrastructure in the vicinity of the Project Site. The description of the existing sewer infrastructure in the vicinity of the Project Site provided in this comment is generally consistent with the description of the existing sewer infrastructure in the vicinity of the Project Site provided on page 42 of the Initial Study for the Ford Theatres Project (included as Appendix A.1 of the Draft EIR). Specifically, as set forth in the Initial Study: "Wastewater from the Project currently flows through a sewer connection located along the west side of the Project Site, which connects to an existing 8-inch-diameter sewer main under Cahuenga Boulevard East that turns into a 10-inch-diameter sewer main." In addition, as described on page 43 of the Initial Study: "Sewer service for the Project would be provided utilizing new or existing on-site sewer connections to the existing 8-inch/10-inch sewer main under Cahuenga Boulevard East."

Comment No. 2-4

The current flow level (d/D) in the 8-inch line cannot be determined at this time without additional gauging.

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
8	Cahuenga Blvd East	*	791,080 GPD
10	Cahuenga Blvd	32	1.03 MGD
21	Las Palmas Ave.	12	7.26 MGD
45	Willoughby Ave.	24	27.15 MGD

*No gauging available

Response to Comment No. 2-4

This comment provides a description of the approximate current flow levels and the design capacities within portions of the sewer infrastructure in the vicinity of the Project Site. As discussed on page 43 of the Initial Study for the Ford Theatres Project (included as Appendix A.1 of the Draft EIR), based on the Sewer Capacity Availability Request provided in Appendix IS-2 of the Initial Study, the City determined that the existing sanitary sewer line on Cahuenga Boulevard East would have adequate capacity to accommodate the additional infrastructure demand created by the Project.

Comment No. 2-5

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Treatment Plant, which has sufficient capacity for the project.

If you have any questions, please call Kwasi Berko of my staff at (323) 342-1562.

Response to Comment No. 2-5

The statement in the comment that "the sewer system might be able to accommodate the total flow for your proposed project" is consistent with the conclusions provided on page 43 of the Initial Study for the Ford Theatres Project (included as Appendix A.1 of the Draft EIR), which was based on the Sewer Capacity Availability Request provided by the City of Los Angeles Department of Public Works, Bureau of Sanitation, included in Appendix IS-2 of the Initial Study. The Project would comply with all required permitting procedures, including the final approval of the sewer capacity and connection permit, outlined in the comment. In addition, the statement in the comment that the Hyperion Treatment Plant "has sufficient capacity for the project" is consistent with the conclusions provided on page 43 of the Initial Study.

Comment No. 2-6

STORMWATER REQUIREMENTS

The Bureau of Sanitation, Watershed Protection Division (WPD) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

The project requires implementation of stormwater mitigation measures. These requirements are based on the Standard Urban Stormwater Mitigation Plan (SUSMP) and the recently adopted Low Impact Development (LID) requirements. The projects that are subject to SUSMP/LID are required to incorporate measures to mitigate the impact of stormwater runoff. The requirements are outlined in the guidance manual titled "*Development Best Management Practices Handbook—Part B: Planning Activities*". Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lastormwater.org. It is advised that input regarding SUSMP requirements be received in the early phases of the project from WPD's plan-checking staff.

Response to Comment No. 2-6

This comment describes the role of the City of Los Angeles Bureau of Sanitation, Water Protection Division. This comment also describes post-construction mitigation requirements that may be applicable to the Project, including the preparation of a Standard Urban Stormwater Mitigation Plan and the Low Impact Development Ordinance. As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater of the Draft EIR, the Project would result in a less than significant impact with respect to hydrology, water quality and groundwater. As such, no mitigation measures would be required. It is further noted that while the Project Site is within the City of Los Angeles and would be served by the existing City infrastructure in the vicinity of the Project Site, the Ford Theatres are owned and operated by the County of Los Angeles. Accordingly, development of the Project Site is governed by the Los Angeles County Code, which sets forth stormwater requirements. As set forth on page IV.G-5 of Section IV.G, Hydrology, Water Quality, and Groundwater, of the Draft EIR, in communication with the County of Los Angeles Department of Public Works, the previous Standard Urban Stormwater Mitigation Plan requirements have been superseded by the County's Low Impact Development requirements.

The Project would comply with all applicable stormwater regulatory requirements during operation of the Project. Specifically, as discussed on page IV.G-25 in Section IV.G, Hydrology, Water Quality, and Groundwater, of the Draft EIR, in accordance with National Pollutant Discharge Elimination System (NPDES) and County requirements as set forth in Project Design Feature G-2, a Low Impact Development Plan would be prepared and implemented for the Project that would specify Best Management Practices (BMPs) to promote bioretention or other functions to detain water onsite to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County Department of Public Works.

Comment No. 2-7

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the SUSMP/LID requirements.

Response to Comment No. 2-7

While the Project Site is within the City of Los Angeles and would be served by the existing City infrastructure in the vicinity of the Project Site, the Ford Theatres are owned and operated by the County of Los Angeles. Accordingly, development of the Project Site is governed by the Los Angeles County Code, which sets forth stormwater requirements. However, as illustrated in Figure II-4 in Section II, Project Description, of the Draft EIR, the Project would include landscape improvements along the Cahuenga Boulevard East frontage. In addition, a landscaped berm would be provided along Cahuenga Boulevard East to cover the exposed areas of the parking structure. Furthermore, as set forth on page IV.G-25 of Section IV.G, Hydrology, Water Quality, and Groundwater, of the Draft EIR, as part of the NPDES and County requirements, a Low Impact Development Plan would be prepared for the Project which would outline the stormwater treatment measures or post-construction BMPs required to control pollutants of concern associated with storm events up to the 0.75-inch precipitation level. BMPs would include source control and treatment control BMPs to remove pollutants from stormwater discharges. As the Project Site currently does not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces, implementation of BMPs to capture and naturally filter stormwater from the Project Site would result in an improvement in surface water quality runoff from the Project Site compared to existing conditions.

Comment No. 2-8

CONSTRUCTION REQUIREMENTS

The project is required to implement stormwater control measures during its construction phase. All projects are subject to a set of minimum control measures to lessen the impact

of stormwater pollution. In addition for projects that involve construction during the rainy season that is between October 1 and April 15, a Wet Weather Erosion Control Plan is required to be prepared. Also projects that disturb more than one-acre of land are subject to the California General Construction Stormwater Permit. As part of this requirement a Notice of Intent (NOI) needs to be filed with the State of California and a Storm Water Pollution Prevention Plan (SWPPP) needs to be prepared. The SWPPP must be maintained on-site during the duration of construction.

If there are questions regarding the stormwater requirements, please call Kosta Kaporis at (213) 485-0586, or WPD's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

Response to Comment No. 2-8

The Project would comply with all applicable stormwater regulatory requirements during construction of the Project. As discussed on page IV.G-22 of Section IV.G, Hydrology, Water Quality, and Groundwater, of the Draft EIR, as the construction site would be greater than one acre, Project construction activities would be regulated per the NPDES Construction General Permit. In accordance with the requirements of the Construction General Permit, the Project would implement a Stormwater Pollution Prevention Plan (SWPPP) that would specify BMPs to be used during construction to manage runoff flows and erosion and prevent pollution. In addition, construction activities would be scheduled to minimize the amount of time soil is exposed to further control erosion and stormwater runoff. BMPs would also be provided to target pollutants of concern and be designed to reduce runoff and pollutant levels in runoff during construction. Further, implementation of BMPs such as sandbag barriers and other sediment barriers would serve to maintain the existing drainage flow paths and discharge points during construction.

Comment No. 2-9

SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact Daniel Hackney of the Special Project Division at (213)485-3684.

E
S

0 660 1,320 1,980 2,640 Feet

Response to Comment No. 2-9

While the Project Site is within the City of Los Angeles and would be served by the existing City infrastructure in the vicinity of the Project Site, the Ford Theatres are owned and operated by the County of Los Angeles. Accordingly, development of the Project Site is governed by the Los Angeles County Code, which sets forth solid waste disposal and recycling requirements. The Project would comply with all applicable solid resource requirements during construction and operation of the Project, as set forth in the County's Green Building Program. In addition, as discussed on page 46 of the Initial Study for the Ford Theatres Project (included as Appendix A.1 of the Draft EIR) the Project would be consistent with the applicable regulations associated with solid waste and would promote compliance with the California Integrated Waste Management Act of 1989 by providing clearly marked, source-sorted receptacles to facilitate recycling. The Ford Theatres would also enhance recycling on-site through a recycling program that would focus on items such as paper, cardboard, glass, aluminum, plastic, and cooking oils.

Comment Letter No. 3

Frank Vidales
Chief
Forestry Division Prevention Services Bureau
County of Los Angeles Fire Department
1320 N. Eastern Ave.
Los Angeles, CA 90063-3294

Comment No. 3-1

The Completion/Draft Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department. The following are their comments:

Response to Comment No. 3-1

This introductory comment notes the Draft EIR has been reviewed by the County Fire Department. As discussed on page IV.J.1-12 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, in order to adequately identify and assess the full range of the Project's potential impacts on fire protection services, early consultation with the County Fire Department and City of Los Angeles Fire Department was conducted. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. 3-2

PLANNING DIVISION:

1. The subject property is entirely within the City of Los Angeles, which is not a part of the emergency response area of the Los Angeles County Fire Department (also known as the Consolidated Fire Protection District of Los Angeles County). Therefore, this project does not appear to have any impact on the emergency responsibilities of this Department.

Response to Comment No. 3-2

This comment summarizes the responsibility of the County Fire Department regarding the Project Site and is consistent with the Draft EIR. Specifically, as discussed on page IV.J.1-1 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, while the Ford Theatres are owned and operated by the County of Los Angeles, the Project Site is located within the City of Los Angeles. Accordingly, the Project would be built in accordance with the County of Los Angeles Fire Department requirements and emergency fire protection

and medical services for the Project Site would be provided by the City of Los Angeles Fire Department. As discussed on page IV.J.1-12 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, in order to adequately identify and assess the full range of the Project's potential impacts on fire protection services, early consultation with the County Fire Department and City of Los Angeles Fire Department was conducted.

Comment No. 3-3

LAND DEVELOPMENT UNIT:

1. The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows and fire hydrants.

Response to Comment No. 3-3

As discussed on page IV.J.1-1 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, the Project would be built in accordance with the County of Los Angeles Fire Department requirements. In addition, as described on page IV.J.1-10, the Project would incorporate building design features that comply with County fire safety requirements, including preparation of a fuel modification plan; adequate fire access; automatic fire sprinkler systems; infrastructure improvements to accommodate the required fire flow; and installation of new fire hydrants.

Comment No. 3-4

2. This property is located within the area described as Very High Fire Hazard Severity Zone (VHFHSZ). All applicable fire code and ordinance requirements for brush clearance and fuel modification plans, must be met.

Response to Comment No. 3-4

This comment is consistent with the description in the Draft EIR regarding the Project Site's location in a Very High Fire Hazard Severity Zone. As discussed on page IV.J.1-15 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, as set forth in Project Design Feature J.1-1, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel

Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system.

Comment No. 3-5

3. Every building constructed shall be accessible to Fire Department apparatus by way of access roadways, with an all-weather surface of not less than 26 feet in width. Additional width maybe required if the lowest level of the buildings constructed exceed 30 feet from the Fire Department apparatus access roadway. The roadway shall be extended to within 150 feet of all portions of the exterior walls when measured by an unobstructed route around the exterior of the building.

4. The maximum allowable grade shall not exceed 15% except where topography makes it impractical to keep within such grade. In such cases, an absolute maximum of 20% will be allowed for up to 150 feet in distance. The average maximum allowed grade, including topographical difficulties, shall be no more than 17%. Grade breaks shall not exceed 10% in ten feet.

5. Turning radii shall not be less than 32 feet. This measurement shall be determined at the centerline of the road. A Fire Department approved turning area shall be provided for all driveways exceeding 150 feet in-length.

Response to Comment No. 3-5

This comment describes the County of Los Angeles Fire Department requirements regarding roadway access, allowable grade, and turning radii. As discussed on page IV.J.1-1 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, the Project would be built in accordance with the County of Los Angeles Fire Department requirements. In addition, the Project would incorporate specific access recommendations provided by the County Fire Department. Specifically, as provided in Project Design Feature J.1-2, fire department access shall be provided to within 150 feet of building openings. The final design of the access driveways and internal roadways shall be coordinated with the County Fire Department and City of Los Angeles Fire Department, as applicable. The proposed circular, fire department turn-around shall be a pumper truck-sized turn-around.

Comment No. 3-6

6. The development may require fire flows up to 5,000 gallons per minute at 20 pounds per square inch residual pressure for up to a five-hour duration. Final fire flows will be based on the total square footage of the buildings, the types of construction used, and if the building is equipped with an approved automatic fire sprinkler system.

7. Fire hydrant spacing shall be 300 feet and shall meet the following requirements:

    a) No portion of lot frontage shall be more than 200 feet via vehicular access from a public fire hydrant.

    b) No portion of a building shall exceed 400 feet via vehicular access from a properly spaced public fire hydrant.

    c) Additional hydrants will be required if hydrant spacing exceeds specified distances.

8. Fire sprinkler systems are required in some residential and most commercial occupancies. Automatic fire sprinklers shall be in compliance with applicable Fire and Building Code requirements along with any applicable departmental regulations.

Response to Comment No. 3-6

As discussed on page IV.J.1-12 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, in order to adequately identify and assess the full range of the Project's potential impacts on fire protection services, early consultation with the County Fire Department and City of Los Angeles Fire Department was conducted. As set forth in Project Design Feature J.1-3, the Project shall provide automatic fire sprinkler systems, approved by the County Fire Department, within all of the new buildings. With installation of fire sprinkler systems within all of the new buildings, the required fire flow shall be 4,000 gallons per minute with a residual pressure of 20 pounds per square inch, or a reduced fire flow as determined by the County Fire Department, City of Los Angeles Fire Department, and City of Los Angeles Department of Water and Power during the building permit process for the Project. In addition, as provided in Project Design Feature J.1-5, the Project shall provide fire hydrants within the Project Site as coordinated with the County Fire Department and City of Los Angeles Fire Department. Booster pumps shall be provided for all proposed fire hydrants to meet the minimum fire flow rate and pressure requirements of the Project. The preliminary locations of the proposed fire hydrants are illustrated in Figure IV.J.1-3 on page IV.J-16 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR. Final hydrant spacing would be coordinated with the County Fire Department.

Comment No. 3-7

9. Specific fire and life safety requirements for the construction phase will be addressed at the building fire plan check. There may be additional requirements during this time.

10. Should any questions arise, please contact the County of Los Angeles Fire Department, Land Development Unit Inspector, Juan Padilla, at (323) 890-4243 or at Juan.Padilla@fire.lacounty.gov.

Response to Comment No. 3-7

The Project would be built in accordance with County of Los Angeles Fire Department requirements and would incorporate specific features to address fire and life safety requirements during construction as deemed necessary by the County of Los Angeles Fire Department during the building fire plan check process.

As specified in this comment, the identified individual would be contacted with questions regarding the Project's fire and life safety requirements.

Comment No. 3-8

FORESTRY DIVISION OTHER ENVIRONMENTAL CONCERNS:

1. The statutory responsibilities of the County of Los Angeles Fire Department, Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones, archeological and cultural resources, and the County Oak Tree Ordinance.

Response to Comment No. 3-8

This comment describes the statutory responsibilities of the County of Los Angeles Fire Department, Forestry Division. Specific comments from the County of Los Angeles Fire Department, Forestry Division regarding the Project are provided and responded to below.

Comment No. 3-9

2. Under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured at 4½ feet above mean natural grade. An Oak Tree Permit is required for this project. Specific questions regarding oak tree permit requirements should be directed to the Los Angeles County Department of Regional Planning at (213) 974-6411.

Response to Comment No. 3-9

Consistent with this comment, page IV.D-18 of Section IV.D, Biological Resources, of the Draft EIR, specifies that in accordance with the Los Angeles County Oak Tree Ordinance, the Project would require a permit for the relocation of four oak trees measuring 8, 10, 12, and 14 inches in trunk diameter. In addition, Mitigation Measure D-11 is provided in the Draft EIR to ensure the relocation of the oak trees is consistent with the Los Angeles County Oak Tree Ordinance. As specified in this comment, the Los Angeles County Department of Regional Planning would be contacted with questions regarding oak tree permit requirements.

Comment No. 3-10

3. This property is located in an area described by the Forester and Fire Warden as being in a Fire Hazard Severity Zone. The development of this project must comply with all Fire Hazard severity Zone code and ordinance requirements for fuel modification. Specific questions regarding fuel modification requirements should be directed to the Fuel Modification Office at (626) 969-2375.

Response to Comment No. 3-10

This comment is consistent with the description in the Draft EIR regarding the Project Site's location in a Very High Fire Hazard Severity Zone. As discussed on page IV.J.1-15 of Section IV.J.1. Public Services—Fire Protection, of the Draft EIR, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, as set forth in Project Design Feature J.1-1, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. As specified in this comment, the Fuel Modification Office would be contacted with questions regarding the Project's fuel modification requirements.

Comment No. 3-11

HEALTH HAZARDOUS MATERIALS DIVISION:

1. The Health Hazardous Materials Division has no objection to the proposed project.

If you have any additional questions, please contact this office at (323) 890-4330.

Response to Comment No. 3-11

This comment states the Health Hazardous Materials Division has no objection to the Project. This comment will be provided to the decision makers prior to consideration of Project approval. As specified in this comment, the Health Hazardous Materials Division would be contacted at the number provided with questions concerning the Division's requirements.

Comment Letter No. 4

Tom LaBonge
Councilmember, 4th District
City Hall, Room 480
Los Angeles, CA 90012

Comment No. 4-1

Counsel Member LaBonge wants to submit a support letter for the EIR for the Ford Theater; however, the City of Los Angeles IT systems are down and we don't have availability to do it at this time.

Response to Comment No. 4-1

This comment consists of a brief email submitted by the office of Councilmember Tom LaBonge indicating that Councilmember Tom LaBonge wished to submit a letter in support of the Project but would be delayed because City of Los Angeles IT systems were down. County staff indicated that they would expect a letter. Councilmember Tom LaBonge subsequently submitted a letter in support of the Project as detailed in the following Comment No. 4-2.

Comment No. 4-2

Thank you for the opportunity to review the Draft EIR for the Ford Theatres Project. It is with great pleasure that I write this letter in support of the proposed rehabilitation of the existing Ford Amphitheatre and the development of the Ford Terrance, the Ford Plaza, the Transit Center and a hiking trail all within the current boundaries of the Ford Theatres site.

The Ford Theatre is one of the oldest performing arts venues in Los Angeles and each year the Ford partners with L.A. County–based arts organizations to present an eclectic season of culturally diverse music, dance, theatre, film and family events to serve the public.

I am excited about the proposed natural hiking trail that will be accessible from both the public and theater users alike. The hillside trail will be able to provide optimal views of our most famous landmarks in the City such as the iconic Hollywood Sign, the Griffith Park Observatory, Capitol Records as well as spectacular view of Hollywood.

The addition of the Transit Center which will provide a much needed designated area for bus and valet drop-off as well as a three-level parking structure to mitigate the traffic impacts during Ford's scheduled season.

This project has my strong support and I thank you for your consideration of these comments. If you have any questions regarding this letter or any other matter, please do not hesitate to phone me at (213) 485-3337.

Response to Comment No. 4-2

Thank you for your comment. We appreciate that the City of Los Angeles councilmember for the area expresses strong support for the Project and particularly that you note the benefits of the proposed trail and its vantage points for viewing Hollywood and some of the City's most iconic landmarks, as well as the benefits of the proposed new parking lots and transit center.

Please note that Hollywood Heritage also has commented on this Project in support of the new formal interior park trail and has offered to collaborate on possible viewing locations on the trail to take advantage of views of notable landmarks along the proposed trail. The County has accepted this offer of collaboration. See Response to Comment No. 6-9 for the specific comment from Hollywood Heritage. This comment will be provided to the decision makers prior to consideration of Project approval.

Comment Letter No. 5

Krista Michaels
Acting President
Cahuenga Pass Property Owners Assn.
P.O. Box 1655
Hollywood, CA 90078-1655

Comment No. 5-1

The Cahuenga Pass Property Owners Association represents the community in the Cahuenga Pass between Mulholland Drive to the south, the 101 Freeway to the east and Lankershim Boulevard to the north. On behalf of this community, I wish to express our support for the Ford Theatres Project as described in the Draft EIR, providing the below-noted traffic mitigation is included in the project.

Response to Comment No. 5-1

This introductory comment describes the boundaries of the Cahuenga Pass Property Owners Association and notes the Association's support with the implementation of a recommended traffic mitigation measure as detailed in the comment below. The general boundaries of the Cahuenga Pass Property Owners Association with Mulholland Drive to the south and the Hollywood Freeway to the east are shown in Figure IV.K-1 of the Draft EIR.

Comment No. 5-2

Currently our community and those of the Hollywood Knolls and Manor have no safe way to walk to the Ford Theatre. Since we wish to enjoy your theatre without having to get into our cars and experience the increased traffic and parking issues, we propose that the current sidewalk along Cahuenga Boulevard East from the Ford Theatre to the Cahuenga Hills Tennis Condominiums be extended to Lakeridge Road. The distance of the proposed extension is less than two tenths of a mile.

Thank you for your consideration of this requested traffic mitigation.

Response to Comment No. 5-2

As evaluated in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the Project would not result in significant impacts regarding traffic, access, and parking. As such, no mitigation measures are required. However, as the surrounding streets and pedestrian facilities are within the jurisdiction of the City of Los Angeles, the suggested

extension of the existing sidewalk from the Cahuenga Hills Tennis Condominiums to Lakeridge Road will be forwarded to City of Los Angeles Councilmember Tom LaBonge's office with an invitation to discuss sidewalk improvements in the area of the Ford Theatres with the Ford Theatre Foundation.

Comment Letter No. 6

Bryan Cooper
President
Hollywood Heritage, Inc.
P.O. Box 2586
Hollywood, CA 90078-2586

Comment No. 6-1

The Board of Directors of Hollywood Heritage, its Preservation Issues Committee and its members, thank you for the opportunity to review and comment on The Ford Theatres Project, and the accompanying Draft Environmental Impact Report (DEIR). This is a very important project to the cultural and historic community in the Cahuenga Pass, and we look forward to working with the Ford and the Hollywood Bowl to develop the Pass as an historic and cultural destination. The vision for the Ford project speaks to that common goal. Hollywood Heritage would like to participate in a working coalition to further refine the concepts in the Master Plan.

For three decades Hollywood Heritage has been an advocate of the preservation and protection of Hollywood's historic resources. We support the goal of preserving what is most significant in Hollywood, while encouraging responsible new and infill development. Our organization has nominated many of the current Historic Cultural Monuments, listed the Hollywood Boulevard Commercial and Entertainment District in the National Register of Historic Places at the national level of significance, provided technical assistance to developers and owners of significant properties, and participated in numerous public policy discussions involving historic resources. These efforts have resulted in the rehabilitation of significant landmarks, landscapes, institutions and districts in Hollywood.

The Ford/Pilgrimage Theater property is one of the most important historic and cultural venues in the region. The Ford is a very rare type of resource and one with special significance to Southern California. It has been evaluated as a potential historic resource since 1994 and its status and character-defining spaces, materials, and features confirmed in GPA's latest research and determined eligible for listing in the National Register of Historic Places.

Hollywood Heritage has reviewed The Ford Theatres Project Draft Environmental Impact Report (State Clearinghouse no. 2014021013) and the John Anson Ford Theatre County of Los Angeles Historic Resource Report (GPA 2013/2014 Improvements). In addition, Hollywood Heritage received a presentation from the Ford Theatres Project representatives on Wednesday June 25, 2014.

Response to Comment No. 6-1

This introductory comment notes the Draft EIR has been reviewed by the Hollywood Heritage and provides a description of Hollywood Heritage and its role to advocate the preservation and protection of Hollywood's historic resources. Thank you for participating in the scoping and public comment process on this Project. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. 6-2

The organization also reviewed the categorical exemption of 2013 which authorized limited improvements to the Amphitheatre, including hillside stabilization, stage reconstruction, disabled access and code compliant improvements, upgrade to theatrical, mechanical and electrical systems. Compatible stone-clad retaining walls and drainage improvements at the rear of the stage stabilized the existing slope in this area. The existing two level concrete stage was removed, and new flooring added. Rehabilitation of portions of the stage buildings and towers included the return of the original color scheme. New doors and windows were installed. These activities addressed long-deferred maintenance and needed repairs and improved the theatrical infrastructure and performer amenities. Based on the findings of the Historic Resource Report of September 2013, this work was consistent with the Secretary of the Interior's Standards and did not impair the significance of the historic property.

Review of this material, discussion at the June 25 meeting, and discussions with the Los Angeles Conservancy have led to an understanding of the direction of the Master Plan project. The division of the scope of work developed for the categorical exemption and the phases of the Master Plan remain somewhat unclear. Work on the Amphitheatre in its entirety must meet the Secretary of the Interior's Standards to ensure that historic materials are not impacted unnecessarily. Further definition should be provided in the Final EIR and its mitigation measures.

Response to Comment No. 6-2

This comment acknowledges that Hollywood Heritage reviewed the CEQA Class 31 (Historic Resource Restoration/Rehabilitation) Notice of Exemption prepared and approved by the County of Los Angeles in September 2013 to address limited improvements to the Amphitheatre addressing long deferred maintenance and repairs and the Amphitheatre infrastructure. It is noted that implementation of these improvements is underway and these improvements have not been fully implemented. As described on page II-8 of Section II, Project Description, of the Draft EIR, the improvements proposed and approved as part of the Notice of Exemption focus on the restoration and rehabilitation of portions of the existing Amphitheatre in accordance with CEQA Guidelines Section 15331, Historical

Resource Restoration/Rehabilitation (Class 31) as supported by an historic resources report dated September 5, 2013. Separate from the Amphitheatre improvements proposed as part of the Notice of Exemption, the Project proposes the following further improvements within the Amphitheatre: replacing the existing projection booth and control room, which is not a character-defining feature of the Amphitheatre; replacing the existing lighting positions along the back of the Amphitheatre; and installation of a sound wall and shade structure. The Project, as described in the Draft EIR, also includes the Ford Terrace, the Ford Plaza, the Transit Center, and a hiking trail. As noted on page II-19 of the Draft EIR, the Project was derived from a previous Master Plan process and includes some of the same components envisioned in the Master Plan, with modifications. Please also refer to Response to Comment No. 6-12 for additional details on the approach of the project design team and the analysis of the proposed replacement sound wall and shade screen.

As summarized on page IV.E-22 of Section IV.E, Cultural Resources, of the Draft EIR, the improvements approved as part of the Notice of Exemption were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards.

As discussed on page IV.E-28 of the Draft EIR, implementation of Mitigation Measures E-1 would ensure that the proposed Project design also complies with the Secretary of Interior's Standards. The CEQA Guidelines provide that generally a project which follows the applicable Secretary of Interior Standards shall be considered as mitigated to a less than significant impact on the historic resource. The Project analysis concludes that following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, the Ford Theatres would continue to be eligible for listing in the National Register and the California Register and the significance of the historic resource would not be materially impaired by the Project, as evaluated in the Draft EIR and supporting Historic Resource Report for the Project dated May 14, 2014, and included as Appendix F of the Draft EIR.

The information in the Draft EIR describes the Project with an appropriate level of detail for CEQA analysis.

Comment No. 6-3

CEQA guidelines define a project as having a significant environmental impact when the project causes a substantial adverse change in the significance of a historical resource as defined by the California Environmental Quality Act (CEQA), Section 15064. The City of Los Angeles CEQA Thresholds Guide (2006, p. D.3-3) maintains that a project would have a significant impact on historic resources if the project results in a substantial adverse

change in the significance of a historic resource by construction that reduces the integrity or significance of important resources on the site or in the vicinity via alteration of the resource's immediate surroundings. The Ford has indicated its willingness to create a project which does not cause substantial adverse change.

Response to Comment No. 6-3

Thank you for acknowledging that the Ford Theatre Foundation through its design process and CEQA analysis has demonstrated a willingness to avoid adverse impacts on the historic resource. This comment correctly summarizes the CEQA Guidelines and the City of Los Angeles CEQA Thresholds Guide. The State CEQA Guidelines provide the thresholds of significance applicable to this Project. As discussed on page IV.E-28 of the Draft EIR, implementation of Mitigation Measures E-1 would ensure that the proposed Project design complies with the Secretary of Interior's Standards. The CEQA Guidelines provide that generally a project which follows the applicable Secretary of Interior Standards shall be considered as mitigated to a less than significant impact on the historic resource. The Project analysis concludes that following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, the Ford Theatres would continue to be eligible for listing in the National Register and the California Register and the significance of the historic resource would not be materially impaired by the Project, as evaluated in the Draft EIR and supporting Historic Resource Report for the Project dated May 14, 2014, and included as Appendix F of the Draft EIR.

Comment No. 6-4

DESCRIPTION OF THE PROJECT

The Master Plan Project Site is approximately 32 acres, and includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles and one of its most historic. The Project Site is currently developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former motel building currently used as staff offices. The Master Plan proposes improvements that would result in approximately 47,550 net square feet of new facilities (parking structures, flex space, a 299 seat theatre) and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site, for a total of 96,300 new square feet.

As outlined in the DEIR, the Project includes rehabilitation of portions of the existing Amphitheatre and development of areas termed the "Ford Terrace", the "Ford Plaza", the "Transit Center" and a hiking trail, all within the current boundaries of the Ford Theatres site. The five major areas are summarized as follows:

- Amphitheatre Rehabilitation and Improvements: hillside stabilization, stage reconstruction, disabled access and code compliance improvements, improved theatrical systems, infrastructure improvements and related upgrades, a sound wall along the rear of the Amphitheatre, and a retractable shade structure for the Amphitheatre.

- The Ford Terrace: a two-story structure with one level of office space and a lower-level concessions area and a raised plaza deck above a service level. This part of the Plan contemplates removal of the existing concessions building and the re-purposing of the 87-seat [Inside] the Ford space as a self-serve food marketplace area and for storage.

- The Ford Plaza: A plaza deck atop a three level parking structure to feature a restaurant, a 299-seat theatre, a box office, a conference room, office, and visitor amenities. This aspect of the Plan includes conversion of the existing box office to a museum/gallery.

- The Transit Center: a designated area for bus and valet drop-off, and the construction of a three-level parking structure and a 99-seat event space. The aspect of the Plan includes removal of a former motel building.

- Hiking Trail: An approximate 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza.

Response to Comment No. 6-4

This comment summarizes the various components of the Project as described in the Draft EIR. Hillside stabilization and stage reconstruction are part of the previously approved Amphitheatre improvements set forth in the September 2013 Notice of Exemption. As noted on page II-19 of the Draft EIR, the Project was derived from a previous Master Plan process and includes some of the same components envisioned in the Master Plan, with modifications.

Comment No. 6-5

GENERAL COMMENTS

For clarity, the DEIR should include a graphic or description of the work performed under the 2013 Categorical Exemption and those proposed under the Master Plan. A project of this nature is complex, and impacts from individual actions can have a cumulative effect on the integrity of the resource.

Response to Comment No. 6-5

Section II, Project Description, of the Draft EIR included a subsection titled "Approved Amphitheatre Improvements" on page II-8. The proposed improvements under the Notice of Exemption are described under that subsection. Specifically, as described on page II-8 of the Draft EIR, the restoration and rehabilitation of portions of the existing Amphitheatre will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. The hillside stabilization improvements will include the installation of compatible stone-clad retaining walls and drainage improvements along the rear of the stage to stabilize the existing slope and reduce runoff from the surrounding hillside. The stage reconstruction will include the removal of the existing two-level concrete Amphitheatre stage structure to allow the installation of an improved stage structure, including the placement of new and upgraded foundations that meet current code requirements; new wood stage flooring and supports; an under stage drainage system; enhanced stage support and ADA-compliant performer spaces; and new ADA-compliant restroom facilities and associated plumbing. Code-required upgrades for fire/life safety and disabled access will also be implemented. Theatrical systems infrastructure improvements include improvements to the stage pit such as new steps and traps. In addition, new energy-efficient theatrical and audio-visual infrastructure to replace existing antiquated systems, including a lighting/sound proscenium truss and lighting towers, will also be implemented. Other improvements involve the rehabilitation of portions of the stage buildings and towers, including the removal of the exterior paint to provide water-resistant surfaces and to return the structures to their original color, and the installation of new roofing, windows, doors, and interior infrastructure for power, heating, and air conditioning. A new addition at stage left to accommodate an audio rack room and related heating, ventilation, and air conditioning will also be provided. As part of these improvements, approximately 24 trees are anticipated to be removed based on their health, root structure, and impact to the stabilization of the adjacent hillside. Such trees will be replaced with new landscaping, including new trees and shrubs. Where feasible, some of the trees proposed to be removed may be relocated throughout the Project Site.

Page II-12 of the Draft EIR includes a subsection titled "Description of the Project" where the Project components are described.

As summarized on page IV.E-22 of Section IV.E, Cultural Resources, of the Draft EIR, the improvements approved as part of the Notice of Exemption were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards. As discussed on page IV.E-28 of the Draft EIR, implementation of Mitigation Measures E-1 would ensure that the Project design complies with the Secretary of Interior's Standards. The CEQA Guidelines provide that generally a project which follows the applicable Secretary of Interior Standards

shall be considered as mitigated to a less than significant impact on the historic resource. The Project analysis concludes that following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, as the previously approved improvements under the Class 31 Notice of Exemption and the Project would be developed consistent with the Secretary of Interior's Standards, planned development within the Ford Theatres would not have a cumulative effect on the integrity of the Amphitheatre.

Comment No. 6-6

The DEIR should also clarify the historic boundaries of the property and should include information about the Christine Stevenson Memorial Cross, originally a component of the historic Pilgrimage venue.

Response to Comment No. 6-6

Information on the cross, which is no longer a part of the Project Site, was included in the Draft EIR but is enhanced here as requested. Based on a review of historical records, the Project Site did not originally include the former motel property but did include the Christine Stevenson Memorial Cross. However, the cross is no longer owned by the County of Los Angeles and is not a part of the Project Site. As described on page IV.E-10 of Section IV.E, Cultural Resources, of the Draft EIR, a cross was erected on the hill above the Amphitheatre in 1923, in honor of Christine Stevenson, author of the Pilgrimage Play. The cross was originally constructed of stone and was lit only on Easter when the Pilgrimage Play was performed. In 1965 (after the period of significance for the property), the cross was damaged by fire and was replaced with a new cross, constructed from steel and Plexiglass. Hollywood Heritage purchased the site with the cross at the request of the County in 1980. Subsequently, the cross fell due to a windstorm and was replaced in 1985. In 1993, High Adventure Ministries constructed the existing cross, which is taller than the previous cross and comprised of different materials from the original cross. Specifically, the original cross was approximately 17 feet tall and currently stands at a height of approximately 33 feet tall. The cross is not part of the Project Site and would not be disturbed by the Project. The additional information provided herein regarding the cross does not constitute significant new information under CEQA and would not change the analyses and conclusions provided in the Draft EIR.

Comment No. 6-7

More discussion is necessary of the historic site design as a whole. This very important aspect of the property is currently discussed only as the "setting" for the amphitheatre. The site's design is a character-defining feature: the amphitheatre nestled in a ravine, using a natural planted hillside as the stage backdrop (characteristic of Greek amphitheatres) but

surprisingly oriented into the upslope rather than a long view orientation. The long central axial promenade up to the amphitheatre is character-defining, and has already been compromised by more modern additions. Historic plant materials, native stone retaining walls, controlled views, and dark surroundings contribute to this naturalistic design style so evocative of its era.

Response to Comment No. 6-7

As discussed on page IV.E-15 of Section IV.E, Cultural Resources, of the Draft EIR, to be eligible for listing in the National Register, properties must retain their physical integrity from the period in which they gained significance. Setting (the physical environment of the historic property) is one of the seven recognized factors of integrity. The Amphitheatre retains its integrity of location, materials, workmanship, feeling, and association. In addition, while its integrity of setting and design has been diminished by changes that post-date the period of significance, they are still sufficient to retain eligibility for register listing. Specifically, as evaluated on pages IV.E-15 through IV.E-16 of the Draft EIR, the vast majority of the 32-acre Project Site has not been improved and the surrounding hillsides continue to be covered with native and non-native trees, shrubs, and grasses that blend into the neighboring landscape. While surface parking lots and driveways have been enlarged, paved, and repaved, they are concentrated on the west side of the Project Site and are visually disconnected from the Amphitheatre. However, the entryway to the Amphitheatre from the south parking lot, constructed in 2000, does represent the most significant change to the setting since 1964. Whereas historic photographs depict a long, wide, nearly straight flight of steps to the front of the Amphitheatre, the new winding paths and landscaping create a more organized and formal approach that did not exist historically. Therefore, the overall integrity of setting is low.

As discussed on page IV.E-9 of Section IV.E, Cultural Resources, of the Draft EIR, Christine Wetherill Stevenson believed the rugged beauty of the Cahuenga Pass would provide a dramatic outdoor setting for the *Pilgrimage Play*. Taking advantage of the box canyon, the stage was set against a natural backdrop of chaparral and cypress growing up the hillside. This natural landscape provided the backdrop for the stage, and continued to be an important view from the seating area when the Amphitheatre was reconstructed in 1931. Since that time, however, non-native trees, including pine, ficus, palm, eucalyptus, and cypress, have been planted in the area immediately behind the stage and on both sides of the seating area. As described on page II-22 of the Draft EIR, a variety of native and drought-tolerant plant material would be used to enhance and complement the existing plant material on the hillside. In addition, mature native trees would be planted and enhanced with complementary native vegetation. As such, the landscape plan for the Project calls for the selective replacement of non-native trees with native trees and the reinforcement of the natural landscape with a variety of native and drought-tolerant plants, thereby returning the existing setting of the Amphitheatre closer to its historical setting.

Additionally, historic photographs, such as the photograph included in the cover of the Historic Resource Report provided in Appendix F of the Draft EIR, illustrate that the property was not formally landscaped with the exception of the promenade that linked the parking lots to the main entrance of the amphitheater building. This promenade was lined with stones and led to a set of concrete steps. None of these features remain. As such, the current setting is not a character-defining feature as no evidence of the original historic design exists and is no longer compromised by non-native and non-natural features. In addition, the promenade is now an asphalt driveway in which dirt and debris from the canyon walls have fallen towards the driveway over the years, substantially narrowing it. The existing plaza (Edison Plaza), winding stairs, pocket picnic areas, gates, fence, and plant materials were designed by Katherine Spitz Associates in 2000. Therefore, they are not merely an alteration of an original feature, but an entirely new feature that does not contribute to the historic character of the property.

Please also refer to Response to Comment No. 6-17 below, where it is explained that additional information on the historic site design would be provided in a Historic Structures Report to be prepared for the Ford Theatres.

Comment No. 6-8

The DEIR should describe in more detail what changes are going to be made in the appearance of the landscape and geography. Some hill areas closest to Cahuenga East appear to be leveled. This appears to be a major landscape change as there are currently three drives, one for parking, one for delivery and one to the county offices. The architectural illustration shows a rather flat, even plane, which indicates reshaping the land.

Response to Comment No. 6-8

As described on page II-21 of Section II, Project Description, of the Draft EIR, the Project would be designed to minimize building footprints and remain primarily within the developed areas of the Project Site. Specifically, implementation of the Project would further develop portions of the existing 3.5 acres of developed area within the Project Site and would extend onto approximately 0.8 acre of undeveloped area. Upon buildout of the Project, approximately 4.3 acres of the 32-acre Project Site would comprise developed area. The remaining approximately 27.7 acres would comprise undeveloped open space. In addition, to reduce the massing, the new buildings and parking structures in particular would be integrated into the existing topography of the Project Site. For example, as shown in conceptual renderings of the proposed facilities as viewed from off-site illustrated in Figure IV.A-3 and Figure IV.A-4 on pages on pages IV.A-17 through IV.A-18 of Section IV.A, Aesthetics, Views, Light, and Glare, of the Draft EIR, new development would be confined primarily to areas of the Project Site that are already developed and the new structures would be integrated into the existing canyon setting of the Project Site that

physically separates on-site buildings from off-site areas. As shown specifically in Figure IV.A-3, the south parking structure would be built into the existing topography of the Project Site and would include landscaping throughout its perimeter along Cahuenga Boulevard East that would berm up to cover the exposed areas of the parking structure, thereby screening the parking structure and bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. Similarly, the proposed three-story office building would terrace south at the foothill of the Ford Plaza level into the hillside, which would serve to effectively integrate the building into the Project Site.

Regarding existing driveways, as described on page II-22 of the Draft EIR, access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some on-site configuration and circulation modifications. In addition, to facilitate access and circulation within the Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The northernmost driveway, which is currently used primarily for egress at the end of events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from the north parking structure. The proposed driveway between the northernmost driveway and the main entrance would provide right-turn only egress from the Transit Center and the parking structure. The driveway at Pilgrimage Bridge and Cahuenga Boulevard East, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. The southern driveways would also be maintained in their existing locations.

Comment No. 6-9

Hollywood Heritage supports the proposal of a hiking trail that encompasses the property. We would like to contribute our historic knowledge to this feature of the Project. The hiking trail should stop at key viewing points to help people locate important places in Hollywood.

Response to Comment No. 6-9

Thank you for your comment expressing support for the proposed hiking trail. The Los Angeles County Department of Parks and Recreation and the Ford Theatre Foundation would welcome Hollywood Heritage's participation in this component of the Project. Appendix E of the report prepared during the master planning process for the Ford Theatres entitled, *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park*, included as Appendix O of the Draft EIR identifies views that may be available from the proposed trail in Appendix E.

Comment No. 6-10

In addition to collaborating on the hiking trail, Hollywood Heritage would like to work with the Ford on the proposed development of the Museum. Hollywood Heritage has a good deal of Pilgrimage Theatre memorabilia which was donated by the Ford.

Response to Comment No. 6-10

This comment expresses collaboration with the Ford Theatre on the redevelopment of the existing box office to a museum. The Los Angeles County Department of Parks and Recreation would welcome Hollywood Heritage's participation in this component of the Project.

Comment No. 6-11

EVALUATION OF THE RESOURCE

Hollywood Heritage commends the project team for a thorough discussion of the historic significance and character-defining features of the property and concurs that the property is currently eligible for the National Register of Historic Resources. However, instead of a primary concentration on a few buildings, Hollywood Heritage feels that the appropriate framework for evaluation of the property as a whole is as a cultural landscape, defined by the National Park Service as is a "geographic area, including both cultural and natural resources…, associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values."

There are four general types of cultural landscapes, not mutually exclusive: historic sites, historic designed landscapes, historic vernacular landscapes, and ethnographic landscapes." The Ford property would be considered a "Vernacular Landscape", which is defined as "a landscape that evolved through use by the people whose activities or occupancy shaped that landscape. Through social or cultural attitudes of an individual, family or a community, the landscape reflects the physical, biological, and cultural character of those everyday lives." Both the natural and built environment of the property should be considered when examining the Ford as a cultural landscape.

Response to Comment No. 6-11

This comment notes Hollywood Heritage concurs with the evaluation provided in Section IV.E, Cultural Resources, of the Draft EIR and the supporting Historic Resource Report included as Appendix F of the Draft EIR, which concludes that the Ford Theatres is currently eligible for the National Register of Historic Resources.

As it pertains to the comment regarding the framework for evaluation of the property as a cultural landscape, describing the Ford Theatres as a cultural landscape is not determinative for the purpose of a CEQA analysis of potential Project impacts. Specifically, based on Appendix G of the CEQA Guidelines, Project impacts with regard to historic resources would be significant if the Project would cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5 of the CEQA Guidelines. As such, the central issue for CEQA is whether or not the property is a historic resource, and if so, whether or not it would be impacted by the Project. The Ford Theatres is a historic resource subject to CEQA as it was formally determined eligible for listing in the National Register of Historic Places in 1994. In addition, properties that are formally determined eligible for listing in the National Register are automatically included in the California Register. The National Register recognizes the following categories of properties: buildings, structures, objects, sites, and districts. The determination of eligibility report categorized the property as a building.

The aim of the historic resource analysis was to update the previous evaluation to determine if the changes to the property since 1994 affected its integrity, and therefore its continued eligibility as a historic resource. The conclusion was that the Ford Theatres is eligible under Criterion A as one of the oldest performing arts sites in Los Angeles still in use, and eligible under Criterion C as one of only five outdoor theatres in Los Angeles remaining from the early 20th century. The historic resource analysis documented the alterations to the property since it was originally constructed, and concluded that it retains sufficient integrity to convey its significance.

With regard to Project impacts, the CEQA Guidelines state that "the significance of a historic resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that convey its significance and that justify its inclusion in or eligibility for inclusion in the California Register, local register, or its identification in a historic resources survey." (CEQA Guidelines Section 15064.5(b)(2).) The threshold for analyzing potential impacts on historic resources is the same for all types of historic resources, including buildings, structures, objects, sites, districts, and landscapes. The Historic Resource Report concluded that after mitigation, the Project would have a less than significant impact on the historic resource, the Ford Theatres, because it would continue to be eligible for listing in the National Register and California Register.

Cultural landscapes are not a new property type; rather they are geographic areas that have been modified by human design or use and are usually documented as sites or historic districts. There are four general types of cultural landscapes: designed landscapes such as gardens; sites such as battlefields; ethnographic landscapes such as Native American settlements; and vernacular landscapes such as farms. The historic

resource analysis included in the Draft EIR did not approach the property as a cultural landscape for the following reasons. Cultural landscapes are properties where the landscape itself is as important, if not more important, than the buildings or structures in the landscape. Such is not the case with the Ford Theatres where the landscape provides the setting for the building without which the property would not be significant. In addition, the vast majority of the property is comprised of native California chaparral that is not integral to its use as an amphitheater and is not accessible to visitors. Therefore, all of the unimproved open space of the Project Site has not been modified by human use or design. Furthermore, the area of the landscape that is accessible to visitors, specifically the area between the Amphitheatre and the parking lots to the west, does not retain integrity from the period of significance, has already been disturbed, and does not qualify as a historical listing.

The historic resource analysis also did not identify the Ford Theatres as a vernacular landscape because it was not shaped by human activity over a period of time. A vernacular landscape is defined by the National Park Service as follows:

> ***Historic vernacular landscape:*** *A landscape that evolved through use by the people whose activities or occupancy shaped it. Through social or cultural attitudes of an individual, a family, or a community, the landscape reflects the physical, biological, and cultural character of everyday lives. Function plays a significant role in vernacular landscapes. This can be a farm complex or a district of historic farmsteads along a river valley. Examples include rural historic districts and agricultural landscapes.*

The Amphitheatre was designed by the architect William Lee Woollett and constructed in 1931. Amphitheaters are often categorized as designed landscapes because they are consciously designed by a professional working within a recognized principal or style. However, not all amphitheaters are alike, and the Ford Theatres is different from most. Some amphitheaters contain no permanent buildings, while others contain formal stages and natural seating areas, while still others contain natural stages and formal seating areas. While there is variation within the design of amphitheaters, the Ford Theatres is unique in that it is dominated by a large and imposing building that contains a stage, seating area, restrooms, dressing rooms, etc., and two smaller ancillary buildings. Therefore, the Ford Theatres is unlike most amphitheaters that are comprised of a collection of buildings, structures, and natural and man-made features that collectively form an amphitheater.

Based on above, the historic resource analysis did not identify the property as a cultural landscape nor as a vernacular landscape. However, in the determination of the Ford Theatres eligibility for the National Register, the historical analysis of the

property considered both the natural and built environment, as specifically discussed on page IV.E-15 of the Draft EIR.

Comment No. 6-12

TREATMENT OF THE RESOURCE

All features identified by GPA as primary and secondary contributing resources are significant. Removal of any of these materials and features must be carefully considered.

The DEIR states that the proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. The project proposes to demolish one ancillary historic building and potentially more of the character-defining landscape features. The sound wall and shade structure proposed for the Amphitheatre have the potential to diminish the character of the space. Careful justification statements and design of these elements will help to clarify the impact. A more robust statement of how these aspects of the project meet the Standards and the mitigation measures proposed to achieve them is needed.

Response to Comment No. 6-12

A summary of the National Park Service guidance regarding the analysis of character-defining features is provided on page IV.E-17 of Section IV.E, Cultural Resources, of the Draft EIR. As described on page IV.E-18, the character-defining features of buildings can be generally grouped into three categories: the overall visual character of a building, the exterior materials and craftsmanship, and the interior spaces, features, and finishes. The relative importance of character-defining features depends on the level of craftsmanship, visibility, and integrity. A review of the character-defining features of the Amphitheatre is provided in Table I of the Historic Resource Report included in Appendix F of the Draft EIR. Some character-defining features are more important than others in conveying the significance of the building, which is why some features were identified as primary and others were identified as secondary. As analyzed on page IV.E-19 of the Draft EIR, the concessions building is identified as a secondary character-defining feature because although it was constructed during the period of significance, it has been altered. In addition, the concessions building is incidental to the historical and architectural significance of the property and, while the spatial relationship between the Amphitheatre and concessions building is close, the concessions building is not within an important viewshed for patrons as they approach the property and is not visible from the Amphitheatre seating area. As evaluated on page IV.E-23 of the Draft EIR, removal of the concessions building would not in and of itself constitute an impact on a historic resource because the concessions building does not have any significance separate and apart from the Amphitheatre. In addition, while the analysis acknowledges

that removal of the concessions building would further diminish the integrity of the Ford Theatres, construction of the Ford Terrace improvements would not result in a substantial adverse change in the significance of the Ford Theatres as a historic resource and it would continue to be eligible for listing in the National Register and California Register.

It is noted that the primary consideration of the design team in developing the Project was the preservation and enhancement of the historic character and integrity of the Amphitheatre. Each decision was measured against the goal of retaining the character of the resource as well as the conservation and restoration of historic materials. In each case, the respect for the sense of place and the integrity of the historic building was balanced against the needs of a modern state-of-the-art theatre operation as well as current code, fire life safety, and accessibility requirements. Among the most challenging components of the Project was the need to improve disabled access to the Amphitheatre for both the performer and the patron, and to provide direct access to the stage for load-in and load-out for theatre operations. The existing condition requires that operations share a non- compliant ramp to access the stage with performers. There is currently only a one-person dressing room accessible to the stage. In order to achieve the access and the appropriate separation of the performer and operations staff, the entire existing non-compliant fire department turn around at the ADA-accessible parking adjacent to the concessions building must be widened and lowered approximately eight feet to connect all the Project levels with an elevator for new dressing rooms that are accessible and a loading dock with direct access to the stage. In order to achieve compliant access, the existing concessions building must be demolished. In considering relocation of the concessions building from the current location it was determined that it would lose its historic context associated with the Amphitheatre and therefore greatly diminish its character-defining features. However, as described above, without the concessions building, the Amphitheater would continue to retain its eligibility for the National Register.

With regard to the proposed sound wall and shade structure, as evaluated on page IV.E-22 of the Draft EIR, the proposed Amphitheatre improvements, including the replacement of the existing projection booth and control room and existing lighting positions, and the addition of a new sound wall and retractable shade structure would be consistent with the historic use of the Amphitheatre (Standard #1) and would not involve the removal of any primary character-defining features (Standard #5). In addition, these improvements would be clearly differentiated from the original concrete structure (Standard #9) and could be removed in the future without negatively impacting the original concrete structure (Standard #10). The proposed sound wall would replace the existing plywood and metal structure that was installed to mitigate the sound from the freeway and contain the sound of performances within the Amphitheatre. It was added onto the top of the original concrete Amphitheatre walls. The Project proposes to replace this as it has been ineffective due to the materials used and the unsubstantial construction. As with the existing sound wall, the proposed sound wall would be installed onto the top of the original

concrete Amphitheatre walls, preserving the historic materials, but designed to perform acoustically as proposed. Additionally, it should be noted that in order to provide protection and audience comfort for the daytime patrons, the Ford has traditionally raised a parachute as a temporary sun shade that can be easily deployed for daytime productions to shade the audience. For rehearsals, a parachute attached to the stage truss and building towers is also used to protect performers. However the temporary installation of the parachutes is achieved in an unsafe manner–requiring the tech crew to shimmy across the truss. The Project would incorporate a system of sun shades deployed on cables which would be connected both at the proposed sound wall, the stage truss, and at vertical supports in the upstage landscape. The fabric shades would be completely mechanically retractable into housings in the sound wall, and into the stage truss. The cables would also be retractable and demountable, thus ensuring that the nighttime performances remain open to the sky with unencumbered views.

While the Historic Resource Report for the Project included as Appendix F of the Draft EIR analyzed the Project for compliance with the Secretary of the Interior's Standards, the Standards are not the determining factor in assessing impacts on historic resources under CEQA. Project impacts with regard to historic resources would be significant if the Project would cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5(b) of the CEQA Guidelines. (See also CEQA Guidelines Appendix G, Cultural Resources). Substantial adverse change in the significance of a historic resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historic resource would be materially impaired. (14 CCR Section 15064(b)(1).) As evaluated in Section IV.E, Cultural Resources, of the Draft EIR, while the removal of the concessions building and the construction of the sound wall and shade structure would alter the historic Amphitheatre, with implementation of Mitigation Measure E-1, which would ensure the Project is developed consistent with the Standards, the Amphitheatre would retain sufficient integrity to continue to convey its significance and would retain eligibility for listing in the National and State Register.

Comment No. 6-13

COMPATIBLE NEW CONSTRUCTION

Hollywood Heritage congratulates the Ford on retaining a highly qualified historic architect to guide the rehabilitation of the historic structures, a very capable historic preservation consultant to assemble the historic documentation, and a knowledgeable landscape architect to formulate an approach to the landscape which will retain the character of this historic setting. The projects begun under the Categorical Exemption in 2013 should provide a foundation for the policies and decisions that will be needed to successfully

complete the programmatic goals while retaining important character-defining features of the landscape, circulation and recreation areas, and the historic theatre complex.

Response to Comment No. 6-13

Thank you for acknowledging the applicable professional qualifications of the historic architect, historic preservation consultant, and landscape architect engaged by the Ford Theatre Foundation for this Project.

Comment No. 6-14

The new construction proposed is discussed with reference to the Secretary of the interior's Standards for building additions, not as components of an historic vernacular landscape. The site, although altered, still is a vernacular landscape with its own style, character, and significance. Care should be taken to ensure that the magnitude of new construction does not overwhelm this.

Response to Comment No. 6-14

Please also refer to the discussion in Response to Comment No. 6-11 above. As discussed therein, the property is not analyzed as an historic vernacular landscape for specific reasons, although the analysis of potential impacts would have been the same if it had been analyzed in that manner. Specifically, the property did not evolve naturally into an outdoor amphitheater. Rather, it was consciously designed and has been consciously altered since the Amphitheatre was constructed in 1931. In addition, the setting of the Amphitheatre is a combination of undeveloped open space and improved landscape areas. The vast majority of the property is undeveloped open space that is covered with plants that are commonly found in the California chaparral habitat. This landscape provides the backdrop for the stage, and is an important view from the seating area. However, non-native trees, including pine, ficus, palm, eucalyptus, and cypress, have been planted in the area immediately behind the stage and on both sides of the seating area. Improved landscape areas are also found around the former motel building, parking lots, driveways, and pedestrian pathways located between Cahuenga Boulevard and the Amphitheatre. These areas however, do not reflect a principal or style of landscape design and do not retain integrity from the period of significance for the property from 1931 to 1964. Therefore, the immediate setting of the Amphitheatre was not identified as an important character-defining feature nor was the property analyzed as a designed historic landscape.

The areas between Cahuenga Boulevard East and the Amphitheatre, including the former motel building, parking lots, driveways, and pedestrian paths do not possess qualities that contribute to the historic character of the property. Thus, they were identified as the most suitable locations for new buildings, as opposed to constructing new buildings

in the unimproved open space. Furthermore, the landscape plan for the Project calls for the selective replacement of non-native trees with native trees and the reinforcement of the natural landscape with a variety of native and drought-tolerant plants.

The Historic Resource Report for the Project included as Appendix F of the Draft EIR analyzed potential Project impacts based upon compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. The Standards address four types of treatment: preservation, rehabilitation, restoration, and reconstruction. In the case of the Project, the treatment is rehabilitation. The Guidelines for the Treatment of Cultural Landscapes were prepared by the National Park Service to illustrate the application of the four treatment options to cultural landscapes. However, the Standards for rehabilitation are the same for buildings and cultural landscapes. Therefore, the analysis of potential Project impacts would have been the same, even if the Amphitheatre was identified and analyzed as a cultural landscape.

Comment No. 6-15

IDENTIFICATION OF SURROUNDING RESOURCES

Additional information about the impacts the proposal will have on surrounding historic resources including the Pilgrimage Cross and Whitley Heights is needed.

Response to Comment No. 6-15

With respect to the cross, as discussed in Response to Comment No. 6-6 above, while the Project Site did originally include the Christine Stevenson Memorial Cross, the cross, as it exists today, is no longer owned by the County of Los Angeles and is not a part of the Project Site. The cross that was built in 1923, known as the Christine Stevenson Memorial Cross, has been reconstructed several times, most recently in 1993 and is not old enough to qualify as a historic resource. In addition, no changes are proposed to the cross as part of the Project.

Whitley Heights is a historic resource because it is listed in the National Register of Historic Places and is designated a Los Angeles Historic Preservation Overlay Zone. The northernmost portion of the historic district is approximately 0.5 mile from the entrance to the Ford Theatres. The Project has no potential to impact the status of Whitley Heights as the historic resource would not be materially altered by the Project.

Comment No. 6-16

The cross was built in 1923 as a monument to Christine Wetherill Stevenson and was part of the original Pilgrimage property. Formally the feature is referred to as the "Hollywood

Pilgrimage Memorial Monument." Hollywood Heritage purchased the Cross at the request of the County. While the Cross has been replaced, the feature should be acknowledged as part of the original property. Hollywood Heritage transferred the Cross to High Adventure Ministers. In 1993 High Adventure Ministries built the current cross standing 33 feet tall. In 1997, the Church on the Way took over the care and maintenance of the cross on the Cahuenga Pass.

Response to Comment No. 6-16

Thank you for your input on the cross. Please refer to Response to Comment No. 6-6 and Response to Comment No. 6-15 above. The Draft EIR notes the cross was part of the original fabric of the Amphitheatre. Specifically, as described on page IV.E-10 of Section IV.E, Cultural Resources, of the Draft EIR, "a cross was erected on the hill above the Amphitheatre in 1923, in honor of Christine Stevenson, author of the Pilgrimage Play."

Comment No. 6-17

RECOMMENDED MITIGATION MEASURES

Hollywood Heritage recommends that additional mitigation measures be added to the one current measure. That measure requires the participation of a qualified historic preservation professional, but does not adequately define their role or responsibilities. In order to ensure that the Master Plan will comply with the Standards and thus avoid significant impacts (the stated intent in the DEIR), Hollywood Heritage requests that the following measures be added:

Prepare a Cultural Landscape/Historic Structure Report prior to implementation of Master Plan components. Historic documentation, plans, and specifications prepared for the 2013 Categorical Exemption project should form the basis for a Cultural Landscape/ Historic Structure Report. The work performed under the Categorical Exemption should be added to the chronology of site development presented in the 2013 Historic Resource Report and in the Cultural Resource Technical Report of the DEIR.

Using these reports, prepare a Preservation Plan that will ensure that the proposed components of the Master Plan continue to meet the Secretary of the Interior's Standards and do not diminish the physical integrity and character-defining features of the resource. A complete Historic Structures Report which includes a detailed scope of work for each of the proposed component will help to ensure that all aspects of the Plan meet the Standards. The benefit of this approach is two-fold: to provide a baseline of existing conditions and character-defining features, and to ensure that implementation does not result in loss of status for the resource. Justify the approach to removal of historic stone retaining walls. Provide a treatment plan for any remaining stone walls, and explore

replacement in kind if not feasible. The Master Plan should be more informed by this historic site design. A Cultural Landscape Report will help to identify the site features which should guide future improvements. Amphitheaters are a recognized type of feature by the Cultural Landscape Foundation.

Supplement the Cultural Landscape/Historic Structures Report with a set of design guidelines which address site design and character-defining features. To ensure the continued eligibility of the site, the aesthetic impact of proposed new construction to ensure that new structures should be designed in a manner that is both compatible and appropriate in scale and massing to protect the integrity of the historic amphitheater structure.

Confer with the State Office of Historic Preservation to ensure that the Ford property will remain eligible for listing in the NR after project implementation.

Retain the historic concession stand as part of the Ford Terrace component.

Response to Comment No. 6-17

The analysis in the Draft EIR is sufficient to comply with CEQA and documents that the Project would not have a significant adverse impact on an historic resource. However, in response to the comment, the Ford Theatre Foundation has agreed to prepare an Historic Structures Report. Preparation of an Historic Structures Report would be included in the mitigation program for the Project although the Project would have no impact on the resource as defined by CEQA without this additional measure. Refer to Section II, Clarifications and Additions to the Draft EIR, of this Final EIR for this additional measure, which has been added as Mitigation Measure E-5. The Historic Structures Report would include additional information about the history and physical features of the property. As the Historic Structures Report would address the entire property, a separate Cultural Landscape Report would not be required. The Historic Structures Report would be prepared in compliance with National Park Service Preservation Brief No. 43: The Preparation and Use of Historic Structures Report. Pursuant to National Park Service Preservation Brief No. 43, the Historic Structures Report would include recommendations for the treatment of the character-defining features, as well as guidance for complying with the Standards. Therefore, a separate Preservation Plan would not be required.

The Los Angeles County Department of Parks and Recreation would determine if separate design guidelines are required after the Historic Structures Report is complete.

The State Office of Historic Preservation was notified of the Project and was provided an opportunity to comment during the Notice of Preparation and during the public

comment period for the Draft EIR. The State Office of Historic Preservation did not provide any comments regarding the Project. Furthermore, the State Office of Historic Preservation is not required to be consulted because no state-owned historic resources are affected by the Project.

Please also refer to Response to Comment No. 6-12 for a summary of the analysis on the removal of the concessions building. As evaluated on page IV.E-23 of the Draft EIR, removal of the concessions building would not in and of itself constitute an impact on a historic resource because the concessions building does not have any significance separate and apart from the Amphitheatre. In addition, while the analysis acknowledges that removal of the concessions building would further diminish the integrity of the Ford Theatres, construction of the Ford Terrace improvements would not result in a substantial adverse change in the significance of the Ford Theatres as a historic resource as it would continue to be eligible for listing in the National Register and California Register. As further discussed in Response to Comment No. 6-12, the primary consideration of the design team in developing the Project was the preservation and enhancement of the historic character and integrity of the Amphitheatre. Each decision was measured against the goal of retaining the character of the resource as well as the conservation and restoration of historic materials. In each case the respect for the sense of place and the integrity of the historic building was balanced against the needs of a modern state-of-the-art theatre operation as well as current code, fire life safety, and accessibility requirements. In order to achieve compliant access, the existing concessions building must be demolished. In considering relocation of the concessions building from its current location it was determined that it would lose its historic context associated with the Amphitheatre and therefore greatly diminish its character-defining features. However, as described above, without the concessions building, the Amphitheater would continue to retain its eligibility for the National Register.

Comment No. 6-18

CONCLUSION

Restoration of the Ford Theatres brings continued activity and life to an historic and beloved location. This is highly desired. However, the Master Plan appears to indicate a shift from an isolated, nature-based and formally organized setting to a postmodern, urbanized, and brightly lit design. While not reaching a threshold of significant adverse effect, there is likely a preferred variation in the future design which can be more consistent with the historic cultural landscape. If the Ford is more visible as a cultural resource, the entire Cahuenga Pass area will be enhanced.

The additional mitigation measures proposed above will ensure that the project will not adversely impact the John Anson Ford Theatre's continued eligibility for listing in the National Register of Historic Places and that the entire project (landscape, theatre rehabilitation, new construction) meets the Secretary of the Interior's Standards.

All proposed modifications, including stage reconstruction and the addition of a retractable shade structure, should be analyzed against the venue's continued eligibility for listing in the National Register. Existing stone retaining walls will be retained or replaced, or be rebuilt in a manner that meets the Secretary of the Interior's Standards for the Treatment of Historic Properties.

Hollywood Heritage appreciates the efforts of the Ford's management and its project team. Our organization believes in the sensitive development of the historic Cahuenga Pass area as a venue for the arts and will work diligently with the team to achieve the goals of the Ford and to preserve and protect the historic and cultural resources on the site and adjacent to it. Our archives and professional technical assistance is at your disposal. Please feel free to contact us at (323) 874-4005 should you have any questions.

Response to Comment No. 6-18

Thank you for your helpful and constructive participation in the review process on the Ford Theatres Project and your offer of access to your archives and technical assistance. We appreciate your acknowledgement of the Project team's efforts to implement the Project goals for this unique cultural venue with a sensitive design for future development.

As noted in these responses to your comments on the Project and on page II-19 of the Draft EIR, the Project was derived from a previous Master Plan process and includes some of the same components envisioned in the Master Plan, with modifications. In addition, as summarized on page IV.A-20 of Section IV.A, Aesthetics, Views, Light, and Glare, of the Draft EIR, the Project would employ a cohesive site design in part by ensuring architectural compatibility and integration with the surrounding environment. The Project would also rehabilitate the existing historic Amphitheatre and would not result in the removal or alteration of existing features that contribute positively to the visual character of the Project Site and surrounding area. Overall, the new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. Similarly, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Furthermore, as illustrated in Figure IV.A-3 on page IV.A-17 and in Figure IV.A-4 on page IV.A-18, proposed Project lighting would be of low intensity and

would be designed to be non-intrusive to adjacent uses and be integrated within the buildings and overall Project Site.

Additionally, as summarized on page IV.E-28 of the Draft EIR, potential impacts to the Amphitheatre from implementation of the Project, including the addition of a shade structure, would be reduced to a less than significant level with implementation of Mitigation Measures E-1, which would ensure that the Project design complies with the Standards. The CEQA Guidelines provide that generally a project which follows the applicable Secretary of Interior Standards shall be considered as mitigated to a less than significant impact on the historic resource. The Project analysis concludes that following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, the Ford Theatres would continue to be eligible for listing in the National Register and the California Register and the significance of the historic resource would not be materially impaired by the Project. Implementation of the recommended mitigation measure to prepare a Historic Structures Report would further reduce the Project's impacts.

As summarized on page IV.E-22 of Section IV.E, Cultural Resources, of the Draft EIR, the improvements approved as part of the Notice of Exemption, which include stage reconstruction, were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards.

Comment Letter No. 7

Adrian Scott Fine
Director of Advocacy
Los Angeles Conservancy
523 West Sixth Street, Suite 826
Los Angeles, CA 90014

Comment No. 7-1

On behalf of the Los Angeles Conservancy, thank you for the opportunity to comment on the draft environmental impact report (EIR) for the Ford Theatres Project. The Ford Theatres is significant as one of the oldest performing arts venues in Los Angeles still in use, as an example of an early twentieth century amphitheater, and for its association with architect William Lee Woollett. It was determined eligible for listing in the National Register of Historic Places in 1994 and is listed in the California Register of Historical Resources.

Response to Comment No. 7-1

This introductory comment notes review of the Draft EIR by the Los Angeles Conservancy and describes the Amphitheatre's historic status consistent with the description included in the Draft EIR. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. 7-2

The Conservancy previously submitted comments on the Notice of Preparation (NOP) in March 2014, and our comments addressed various aspects relating to the rehabilitation of the historic amphitheater. With the release of the draft EIR, we've recently learned that several of the planned improvements for the amphitheater were previously approved through a Notice of Exemption prior to the NOP's release.

Response to Comment No. 7-2

Thank you for participating in the scoping and comment opportunities on this Project. The letters submitted during the Notice of Preparation process for the Project are included in Appendix A of the Draft EIR. As discussed on page II-8 of Section II, Project Description, of the Draft EIR, in September 2013, the County of Los Angeles prepared and approved a Notice of Exemption pursuant to CEQA Guidelines Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the restoration and rehabilitation of portions of the existing Amphitheatre consistent with the Secretary of Interior Standards for the Treatment of Historic Properties.

Comment No. 7-3

We fully understand the programming needs of the Ford Theatres and recognize that the County has long served as a good steward of the historic venue. The creation of a list documenting primary and secondary character-defining features of the Ford Theatres site as part of the EIR is an important tool for understanding the significance of various features of the venue as it evolved over time. While this list provides invaluable information, it does not offer guidance for the treatment of these character-defining features in the future; the draft EIR provides generalized language specifying the application of the Secretary of the Interior's Standards for proposed work.

The Conservancy recommends that the County expand upon its stewardship of the Ford Theatres through the creation of site master plan that establishes some baseline documentation of the site and can inform and guide any future changes. Given the historical significance of the site, we strongly advise that a Historic Structure Report (HSR) be prepared for the Ford Theatres in conjunction with a Preservation Plan that can guide such areas as the implementation of recommendations for the treatment of historic materials and character-defining features.

Response to Comment No. 7-3

Thank you for your recommendation that a Historic Structures Report be prepared. Hollywood Heritage has also recommended the preparation of a Historic Structures Report and, as discussed above in the Hollywood Heritage comment letter Response to Comment No. 6-17, the Ford Theatre Foundation in consultation with the County has agreed to provide for the preparation of a Historic Structures Report as a tool to help guide treatment of recognized character defining features notwithstanding the fact that preparation of the report is not required to avoid a significant impact on the historic resource. As discussed in Response to Comment No. 6-17, preparation of a Historic Structures Report would be included in the mitigation program for the Project. Refer to Section II, Clarifications and Additions to the Draft EIR, of this Final EIR for the additional mitigation measure. The Historic Structures Report would include additional information about the history and physical features of the property. The Historic Structures Report would be prepared in compliance with National Park Service Preservation Brief No. 43: The Preparation and Use of Historic Structures Report. Pursuant to National Park Service Preservation Brief No. 43, the Historic Structures Report would include recommendations for the treatment of the character-defining features as well as guidance for complying with the Standards. Therefore, a separate Preservation Plan would not be required.

Comment No. 7-4

About the Los Angeles Conservancy:

The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 6,500 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please feel free to contact me at (213) 430-4203 or afine@laconservancy.org should you have any questions.

Response to Comment No. 7-4

This closing comment describes the Los Angeles Conservancy and provides contact information should questions arise regarding the Project.

Comment Letter No. 8

Michael P. Meyer
President
Outpost Homeowners Association
7007 Macapa Dr.
Los Angeles, CA 90068-2001

Comment No. 8-1

The Outpost Homeowners Association represents the 475 homes in Outpost Canyon in the area between the Hollywood Bowl and Runyon Canyon Park. Our neighborhood streets are frequently utilized by drivers connecting between the Hollywood area and San Fernando Valley as they seek to avoid congestion in the Cahuenga Pass. We are therefore very concerned about any proposed development that would impact traffic conditions in the Cahuenga Pass.

Response to Comment No. 8-1

This comment provides a general introduction to the comments and concerns of the Outpost Homeowners Association related to traffic impacts in the Cahuenga Pass. Specific comments regarding the Draft EIR are provided and responded to below. As described by the commenter, Outpost Canyon is located in the area between the Hollywood Bowl and Runyon Canyon Park. The Outpost Canyon roadways are shown in Figure IV.K-1 on page IV.K-10 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR. However, to provide further clarification on street locations, additional roadway name labels have been incorporated in Figure IV.K-1 included in Section II, Clarifications and Additions to the Draft EIR, of this Final EIR.

Comment No. 8-2

We provided a comment letter during your scoping comment period and feel that our issues and requested impact analyses were completely ignored. We therefore find that it would be futile to provide detailed comments on the DEIR as we expect that they will be ignored/dismissed as well. We feel that the traffic analysis in the DEIR was completely inadequate and biased in favor of the project by underestimating its potential impacts.

Response to Comment No. 8-2

Thank you for participating in both the scoping and Draft EIR comment opportunities on this EIR. It is unfortunate that you feel that your comments were ignored. The detailed traffic analysis of "worst case" conditions provided in the Draft EIR and the County's

agreement to project design features that would serve to avoid potentially significant impacts indicate that your view is unsupported and incorrect. The County and the Ford Theatre Foundation seek to be a good neighbor to the public and private land uses in the area and wish to achieve the Project goals without adverse impacts to the physical environment. We hope that a review of these responses to your comments and the information in the Draft EIR referenced will help to allay your concerns as the documents fully disclose for the public and the decision makers the analysis of the Project and the basis for concluding that this Project would cause no new significant traffic impacts.

Your comment refers to the scoping process letter dated March 7, 2014, from the Outpost Homeowners Association regarding the Ford Theatres Project EIR Scoping Comments submitted during the Notice of Preparation and included in Appendix A of the Draft EIR. The scoping comments included in the letter related to changes associated with number of events, increased attendance, traffic and parking (including study area), cumulative effect of entertainment venues in Hollywood, potential fire danger, impacts on the physical infrastructure (sewer capacity, water supply, sanitary landfills, etc.), and public safety, as well as suggested viable alternatives to be considered. Contrary to the assertion that the issues and requested analyses identified were completely ignored, the Draft EIR fully addresses impacts associated with the Project in the topic areas noted, including traffic, public services, utilities, and alternatives (refer to Section IV.K, Traffic, Access, and Parking; Section IV.J, Public Services; Section IV.L, Utilities and Service Systems; and Section V, Alternatives, of the Draft EIR).

With regard to traffic, your comment offers no basis to support the statement that the traffic analysis was completely inadequate and underestimated potential impacts. The Draft EIR and Traffic Study, included as Appendix L of the Draft EIR, provide a comprehensive analysis of the potential traffic impacts associated with the Project and includes sufficient documentation of the development of the methodology, assumptions and supporting data and information reviewed, etc., that were used, as well as the determination of baseline conditions. The approach and methodology for preparation of the traffic analysis is summarized on page IV.K-8 of the Draft EIR and further detailed in Chapter 2, Traffic Impact Analysis Methodology, of the Traffic Study. As described therein, the Traffic Study was prepared in accordance with the City of Los Angeles Department of Transportation's (LADOT's) *Traffic Study Policies and Procedures* (June 2013), which establish the guidelines for the analysis methodologies and significance thresholds. The scope of the traffic analysis was developed in consultation with the County of Los Angeles Department of Public Works (LACDPW) and LADOT staff, and in consideration of input received during the public scoping process. The base assumptions, technical methodologies, and study area were identified as part of the study approach and were reviewed and approved by LACDPW staff. As required by LADOT's *Traffic Study Policies and Procedures*, the traffic analysis focused on weekday and weekend peak hours (i.e., the time periods in which congestion is at its greatest levels), which generally corresponds to

the highest hour on a weekday during the morning and afternoon commuter periods and the midday peak hour on a weekend.

It is recognized that the Cahuenga Pass experiences high traffic volume and vehicular queuing on evenings when the Hollywood Bowl has events or is in season and therefore, an analysis of the weekday and weekend evening "pre-event" peak hour was also prepared. The relative impact of the added traffic volumes to be generated was evaluated based on an analysis of operating conditions at the study intersections, with and without the Project. In general, according to the significant impact criteria, the higher the volume-to-capacity ratio and worse level of service, the lower the amount of Project traffic that can be added before causing a significant impact. As discussed in Section IV.K, Traffic, Access and Parking, of the Draft EIR, with the implementation of project design features, particularly Project Design Feature K-2, which would require the Ford Theatres to stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons, the incremental increase in traffic generated by the Project would not create significant impacts at any of the study intersections under any of the analyzed peak hours using the significance impact criteria established by the City. Therefore, Project impacts on intersection operations were determined to be less than significant based upon substantial evidence.

Comment No. 8-3

Our concerns relate to the magnitude of change that will result from the County's proposed redevelopment of the John Anson Ford Theater. The number of annual events at the theaters will increase from an average of 184 today, to 331 in the future, an 80% increase. This will add traffic from the daily rehearsals; not just the artists/performers, but set designers, lighting technicians, sound people, etc., plus all the deliveries of food and beverage, refuse removal, etc. The annual attendance at the theaters will increase from 54,640 to 93,725, a 72% increase. Parking capacity will increase form 350 parking spaces to 500, and the number of employees on site will increase from 20 to 105. And yet the traffic analysis in the DEIR contends that there will be virtually no increase in traffic generated by the theaters.

Response to Comment No. 8-3

Refer to Table II-2, Summary of Events and Attendance, in Section II, Project Description, of the Draft EIR for details regarding the average number of events within each of the proposed venues. As summarized therein, the venues subject to the future expanded schedule are listed as the existing Amphitheatre (1,196 seats) and the proposed new small theatre (299 seats) and the new Flex Space (99 seats). While the Project would include an increase in events within these venues, it is noted that the open air

Amphitheatre would only operate from approximately May through October while the proposed enclosed 299 seat theatre and 99 seat Flex Space could operate year round with scheduled periods of down time for maintenance. As such, simultaneous events within all three venues would occur for an approximately six month period during the year. In addition, attendance at events at the Ford Theatres depends on the time of year and weather, as well as on the activities, programs and events. Accordingly, attendance fluctuates by season, day of the week, and time of day. However, to provide a conservative analysis, the traffic analysis provided in the Draft EIR focused on the Project impacts on the busiest days of the year for Project events, and the analysis showed that the Project would not create a significant traffic impact on those busy days. The average or daily traffic conditions would be expected to be lower than that analyzed in the Draft EIR and would not create any significant impacts.

To give context to the performance seating capacity of the Ford Theatres, even with two new venues proposed in the Project, the 299 seat theater and the 99 seat Flex Space, and accounting for the proposed removal of the existing 87-seat [Inside] the Ford venue, the net number of new performance seats within the Ford Theatres of 311 seats remains relatively small. Comparing the Ford Theatres and the Hollywood Bowl open air amphitheatres, the existing Ford Theatres Amphitheatre has a capacity of 1,196 seats while the Hollywood Bowl amphitheatre capacity is approximately 17,376 seats.

A summary of the Project traffic volumes, as well as the methodology, considerations and assumptions used in determining the Project's trip-generation forecast is provided in Section IV.K, Traffic, Access and Parking of the Draft EIR, with further details provided in Chapter 5, Project Trip Generation and Distribution, of the Traffic Study included as Appendix L of the Draft EIR. As discussed on pages 45 through 48 of the Traffic Study, the Project trip-generation forecast considered vehicular trips associated with the number of seats provided in the theatres, employees, event staff (e.g., security, event, public relations, artists/performers and other related staff), etc., as well as those related to the hiking trail and restaurant uses. As described on page IV.K-13 of the Draft EIR, the trip-generation forecasts associated with the Project is based on the Project's land use components, attendance figures, anticipated visitor arrival and departure patterns, events and other programming information collected through field data or provided by the Ford Theatres and County staff. Table IV.K-5 on page IV.K-26 of the Draft EIR summarizes the trip generation for the Project. As shown, the Project is anticipated to generate 35 net new trips during the weekday morning peak hour, 60 net new trips during the weekday afternoon peak hour, 18 net new trips during the weekday event peak hour, 92 net new trips during the Saturday midday event peak hour, and 92 net new trips during the Saturday evening event peak hour.

Contrary to the comment that the "EIR contends there will be virtually no traffic" from the Project, the Draft EIR analysis fully discloses the added traffic projected from the Project as provided in Table IV.K-5, Project Trip Generation, on page IV.K-26 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR. As shown in Table IV.K-6 and Table IV.K-7 of the Draft EIR, although the Project would result in an increase in traffic within the study area, the incremental increase is not large enough to be considered significant according to the significant impact criteria established by the City of Los Angeles.

Comment No. 8-4

The intensification of uses at the theaters will significantly increase traffic to and from the site on a daily basis due to additional employees as well as on event days, the number of which will increase substantially. We requested that you quantify the impacts of these increased vehicle trips on Cahuenga Boulevard East and West, Highland Avenue, Mulholland Drive and Outpost Drive. This reasonable request was ignored in favor of a much smaller study area focused only on the immediate vicinity of the project. The intersection of Cahuenga West at Mulholland/Woodrow Wilson, a key bottleneck in the Cahuenga Pass was ignored.

Response to Comment No. 8-4

The increase in traffic due to the Project was fully addressed in Section IV.K, Traffic, Access and Parking, of the Draft EIR, and the supporting Traffic Study included as Appendix L of the Draft EIR. The Traffic Study was prepared under the supervision of the County of Los Angeles in accordance with the County's guidelines, adopted policies, procedures, and standards, and provides a comprehensive analysis of the potential traffic impacts associated with the Project. The scope of the traffic analysis was developed in consultation with the County of Los Angeles Department of Public Works and City of Los Angeles Department of Transportation staff, and in consideration of input received during the public scoping process. The base assumptions, technical methodologies, and study area were identified as part of the study approach and were reviewed and approved by LACDPW staff.

The study area was developed so that the full range of potential impacts of the Project on the local and regional roadway network could be determined. In consultation with the County and City, as well as through the public scoping process, eight intersections (both signalized and unsignalized) in the area were identified for analysis. The intersections include intersections along the primary access routes to and from the Project Site which would be most directly impacted by Project traffic (e.g., Cahuenga Boulevard East and West, Highland Avenue, Odin Avenue, Barham Boulevard, etc.). The study intersection locations were selected based on the Project vehicle trip generation, the

anticipated distribution of the Project trips, existing intersection/corridor operations, and travel routes/patterns to and from the Ford Theatres. The traffic analysis study area encompassed several intersections in the vicinity of the site, including key intersections that may have existing or future operational issues and a relatively higher percentage of Project-related vehicle turning movements (e.g., along Cahuenga Boulevard East and West, Highland Avenue, Odin Avenue, Barham Boulevard, etc), as well as freeway on-off ramp intersections.

The comment includes a request for analysis of additional intersections that were not included as study intersections in the Traffic Study, including the intersection of Cahuenga Boulevard West & Woodrow Wilson Drive-Mulholland Drive, as well as intersections along Outpost Drive. This earlier request was not "ignored" as the comment suggests, but the intersections for impact analysis were selected following consultation with both City and County traffic engineers on the appropriate study methodology, which did not include these intersections. The named intersections, as well as other intersections in the area (e.g., Cahuenga Boulevard West & Hillpark Drive, Cahuenga Boulevard East & Lakeridge Road, Cahuenga Boulevard East & Lakeridge Place, etc.), were not selected for analysis as they would have relatively lower traffic volumes on the side street and minor approach to the intersection and no documented existing or projected future adverse operational issues, but most importantly, these locations are projected to accommodate little if any Project-related vehicular turning movements. Thus, these intersections would not be significantly impacted by Project traffic.

Comment No. 8-5

Outpost Drive was recently reclassified by the City of Los Angeles as a Local Street, downgraded from a Collector, reflecting the City's policy directive to maintain Outpost as a low-volume, neighborhood street. Traffic will be added to Outpost Drive by the proposed project, warranting a contribution of funds toward the Outpost Neighborhood Traffic Management Plan as an appropriate mitigation measure.

Response to Comment No. 8-5

A detailed description of the Project trip distribution is provided in Chapter 5, Project Trip Generation and Distribution of the Traffic Study included as Appendix L of the Draft EIR. The Project traffic volumes were distributed and assigned to the local street system based on the following considerations: location of residential, entertainment and employment centers; the level of accessibility of routes to and from the Project Site; existing intersection traffic volumes; the Project ingress/egress availability based on the proposed site access and circulation scheme; the location of the existing and proposed driveways; anticipated patron arrival and departure information; and existing traffic count data at the Ford Theatres driveways, etc.

The Project trip distribution is illustrated in Figure 9 and the associated project-only traffic volumes in Figures 10A, 10B, and 10C for weekday, weekday event, and Saturday peak hour conditions, of the Traffic Study. Outpost Drive is a local street located in the residential community located to the west of Cahuenga Boulevard West and the Hollywood Bowl. The Outpost Canyon roadways are shown in Figure IV.K-1 on page IV.K-10 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR. However, as previously mentioned, to provide further clarification on street locations, additional roadway name labels have been incorporated in Figure IV.K-1 included in Section II, Clarifications and Additions to the Draft EIR, of this Final EIR. Outpost Drive does not provide direct access to or from the Ford Theatres. Accordingly, it is anticipated to carry little net new traffic associated with the Project that would be generated outside of the Outpost Neighborhood itself.

The intersection levels of service during the weekday A.M. and P.M. commuter and event peak hours, as well as the Saturday midday event and evening event peak hours are shown in Table IV.K-6 of the Draft EIR for the Existing plus Project conditions and Table IV.K-7 of the Draft EIR for the Future with Project conditions. Based on the conclusions presented in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, traffic impacts were determined to be less than significant. Therefore, no mitigation measures are required. However, your comment will be provided to the decision makers prior to their consideration of Project approval.

Comment No. 8-6

We are also concerned about the cumulative effect of all of the entertainment venues in Hollywood that result in street closures and gridlock in the Cahuenga Pass. These include all of the events at the Hollywood Bowl (In addition to the Philharmonic season, the Bowl season has been expanded to include many rental events as early as April and as late as October), the TCL Chinese Theater, the El Capitan and now the Ford Theaters. The EIR failed to quantify how the increase in events from 184 to 331 will contribute to the cumulative impact of street closures and traffic clogged streets, which cause motorists to seek alternate routes through our neighborhood streets. We feel that it will be a substantial contribution to this cumulative impact. The he

Response to Comment No. 8-6

Your comment is not correct when it indicates that cumulative traffic has not been disclosed and properly addressed. The Draft EIR provides a comprehensive analysis of the cumulative traffic impacts associated with the Project, as well as discloses existing and future traffic volumes and roadway operating conditions for weekday, weekday event and weekend event peak hour conditions. The traffic analysis evaluated impacts of the Project based on actual traffic count data collected at the identified study locations, which were

conducted when local schools were in session and when both the Ford Theatres and Hollywood Bowl were holding events. In addition, Hollywood Boulevard was closed from Orange Grove Avenue to Highland Avenue.[1] See Chapter 4, Future without Project Traffic Conditions, of the Traffic Study for further discussion of the development of future cumulative traffic conditions. The forecast cumulative traffic conditions were prepared in accordance with procedures outlined in CEQA Guidelines Section 15130, which provides the following two options for developing cumulative traffic volume forecast:

> *(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or*
>
> *(B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency.*

As discussed in Chapter 4 of the Traffic Study, the forecast cumulative traffic conditions is conservative in that it overestimates impacts that would likely occur from both ambient traffic growth and traffic growth due to related projects (i.e., both the "A" and "B" options outlined in the CEQA Guidelines listed above). It is important to note that the entertainment venues outlined in the comment (Hollywood Bowl, TCL Chinese Theater, the El Capitan), including the Ford Theatres are all existing venues that schedule events throughout the year, and their traffic is reflected in the existing and future traffic volumes disclosed in the Draft EIR, as well as the intersection level of service for the analyzed conditions outlined in the Draft EIR.

The Draft EIR does acknowledge that the number of annual events at the Ford Theater would increase and therefore the nearby residents would experience an increase in traffic on the area streets on more days per year than occurs today. The Draft EIR traffic impact analysis, however, focused on the Project impacts on the busiest days of the year for Project events and the analysis demonstrated that the Project would not create any significant impacts on those busy days. Attendance levels for the Ford Theatre programs/events can vary depending on the time of year and the nature of the program/event. For example, programs may range from a small meeting to an event that

---

[1] *Communication between Gibson Transportation Consulting Inc. and City of Los Angeles Department of Public Works, Bureau of Street Services Investigation and Enforcement Division. August 2014.*

utilizes both the Amphitheatre and smaller theatres. To evaluate the worst case scenario of operations, the traffic study analysis represents an event that utilizes the maximum seating capacity of the Amphitheatre and proposed venues, and is based on traffic conditions when both the Hollywood Bowl and Ford Theatres were in season and holding events. Thus, the Traffic Study presents a worst case analysis of the potential traffic impacts associated with the Project, and documents that there would be a less than significant traffic impact from the Project.

As discussed on page IV.K-37 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the analysis of Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection level of service. As the Project's traffic impacts would be less than significant, the Project's contribution towards cumulative traffic impacts were determined to be less than significant. Therefore, no mitigation measures are required.

Comment No. 8-7

In summary; the traffic analysis has lost sight of the forest for the trees. It focuses on the small number of cars added at a limited number of intersections immediately adjacent to the Theaters and it misses the bigger picture; the cumulative impact of more events on more days, superimposed on the other events already congesting the Cahuenga Pass causing motorists to cut through our neighborhood. This project might not cause the cut through traffic to be higher on any given day, but it will cause it to be higher on many more days of the year.

We appreciate the opportunity to submit comments on the Draft EIR. We just wish that the County of Los Angeles and its consultants were more serious about honestly disclosing and mitigating the impacts of this project on the neighborhoods that surround it. This is a very important project to Los Angeles County and one that will have a lasting impact on our neighborhood. We are disappointed that these issues of importance to the Outpost Homeowners Association were not seriously addressed in the DEIR.

Response to Comment No. 8-7

As indicated in the responses to this comment letter, we hope to address your concerns that this Project's incremental contributions to traffic rise to the level of a significant impact. The full and professional analysis and disclosure in this regard in the Draft EIR indicate that this Project, as recommended, has no significant traffic impact. Responses to the comments provided in this summary comment are contained in Response to Comment Nos. 8-2 through 8-6 above. Your comments will be provided to the decision makers prior to consideration of Project approval.

Comment Letter No. 9

Jeffrey P. Brown
2285 La Granada Dr.
Los Angeles, CA 90068-2723
jeffreypbrown@gmail.com

Comment No. 9-1

We live at 2285 La Granada Drive, around the corner from the Ford and have a few questions regarding your summary memo of June 23, 2014:

Response to Comment No. 9-1

This is an introductory comment. Specific comments regarding the Draft EIR are provided and responded to below. La Granada Drive is located in the area south of the Ford Theatres. This roadway is shown in Figure IV.K-1 on page IV.K-10 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR. However, to provide further clarification on street locations, additional roadway name labels have been incorporated in Figure IV.K-1 included in Section II, Clarifications and Additions to the Draft EIR, of this Final EIR.

Comment No. 9-2

1) It is unclear from the memo if there will be one or two three-story parking structures, It/they are mentioned both in your Ford Plaza description AND your Transit Center description,

Response to Comment No. 9-2

As described on page II-22 in Section II, Project Description, of the Draft EIR, upon buildout of the Project, parking would be provided within two new three-level parking structures that would be located within the existing north and south surface parking areas. Specifically, the Ford Plaza would include a three-level parking structure, referred to as the south parking structure that would provide approximately 250 parking spaces. The Transit Center would include an additional three-level parking structure referred to as the north parking structure that would provide approximately 250 parking spaces. The Project would provide a total of 500 parking spaces within two parking structures.

Comment No. 9-3

2) Regardless of answer to the question above, how many on-site parking spaces will exist if the project is approved and built? How does that number relate to the number of patrons the site will accommodate?

Response to Comment No. 9-3

As provided in Response to Comment No. 9-2 above, the Project would include 500 parking spaces within two parking structures. As discussed on page IV.K-34 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the parking demands of the Project would fluctuate depending on the activities, programs, and events held; time of the year (e.g., holidays); day of the week (weekdays and weekends); and time of the day. Therefore, an assessment of parking demand was conducted for several potential scenarios, including on a non-event day and during event days with varying attendance levels. The peak parking demand for the Project during the peak parking demand scenarios analyzed was estimated based on a combination of the Project's unique operational characteristics, including attendance levels, anticipated visitor arrival and departure patterns, empirical data from existing operations, industry-wide parking demand rates, average vehicle ridership rates, mode split (e.g., arriving by transit, walk, bicycle, etc.), internal capture (e.g., between the restaurant and the theatre uses), and employee data.

A detailed summary of the parking demand for different operational scenarios is provided in Table 10 through Table 13 of the Traffic Study included in Appendix L of the Draft EIR. Based on that analysis, a peak parking demand of 568 spaces would be required. Each parking structure would provide approximately 250 parking spaces, for a total of approximately 500 parking spaces. Parking within the parking structures could be expanded by approximately 75 spaces with the use of attendant assisted parking for a total of 575 parking spaces provided on-site. Additional parking at the Universal City/Studio City Metro Red Line Station would also continue to be available to accommodate the parking needs of the Project. Therefore, a sufficient number of parking spaces would be available to serve the estimated peak parking demand during a non-event day and during the event day scenarios.

Comment No. 9-4

3) Will satellite parking with bus transport be part of the plan? We ask because the Transit Center would seem to accommodate "bus and valet drop-off."

Response to Comment No. 9-4

As discussed on page IV.K-34 in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, additional parking at the Universal City/Studio City Metro Red Line Station would continue to be available to accommodate the parking needs of the Project, which would include shuttle services for patrons. As described on page II-18 of Section II, Project Description, of the Draft EIR, the transit center would accommodate a bus/van loading and unloading zone.

Comment No. 9-5

4) You mention that the number of events is going to increase. Will the season also be extended so that traffic becomes a year-round challenge?

Thanks you in advance.

Response to Comment No. 9-5

As summarized in Table II-2 on page II-20 of Section II, Project Description, of the Draft EIR, events within the Amphitheatre would continue to be held only from May through October. The Amphitheatre would not be programmed on a year-round basis. Events within the proposed new 99-seat Flex Space and the proposed 299-seat theatre would be held year round with scheduled periods of down time for maintenance. As provided on page IV.K-22 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR, as part of the Project, the Ford Theatres would stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons (see Project Design Feature K-2). Implementation of this project design feature would avoid potentially significant traffic impacts from simultaneous events. In addition, as part of Project Design Feature K-3, the Project would include a Parking and Traffic Management Plan that would include traffic management measures during events such as encouraging alternate travel options in event-related marketing/media information, identifying locations for bus drop-off/pick-up and staging, and encourage carpooling. As discussed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the Project would result in a less than significant impact to traffic.

Comment Letter No. 10

Amy Cutter
6700 Hillpark Dr., Apt. 301

Comment No. 10-1

Attached is my formal response to the Ford Theatre Draft EIR due today, August 8th, 2014. I believe I have provided the level of detail, referenced sections and pages in the Draft EIR, and each place I am seeking the answer to a question or clarification. After each topic I have added an ASK and restated the question that I think needs to be answered.

I have also provided my initial letter sent in on 3/11/2014 as a reference to the original public notice.

Please review and let me know if you have any questions or comments.

Response to Comment No. 10-1

Thank you for participating in both the scoping and Draft EIR comment opportunities on this EIR. This introductory comment describes the format of the attached comment letter. Specific comments regarding the Draft EIR are provided and responded to below.

Comment letters provided during the Notice of Preparation are included in Appendix A of the Draft EIR.

Comment No. 10-2

I am located on Hillpark Drive at the Highlands Owners Association. This is a 192 unit condominium complex located next to the Hollywood freeway and northwest of the Ford Theatre and up from the Pilgrimage Bridge off of Cahuenga West and Hillpark drive. I have lived at this location since 1992. I am not a traffic expert, a city planner, nor an engineer. However, I am someone who lives in the Cahuenga Pass for the past 22 years and has experience traveling through and within the Pass on a daily basis. That makes me an expert on the traffic patterns and congestion. I start my trek to work from within the Pass and leave around 8:30 to 9:15 in the morning and return from work or errands anywhere from 5:30 usually 6pm through 7:30 pm in the evening on weekdays. Work is located in Glendale, California where the standard route is up Barham over to Forest Lawn and on to the eastbound 134 Freeway.

Response to Comment No. 10-2

This introductory comment provides background information regarding the commenter. Specific responses regarding the Draft EIR are provided and responded to below. As shown in Figure IV.K-1 on page IV.K-10 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR, Hillpark Drive and the location for the referenced condominium complex, is located west of Cahuenga Boulevard West, north of Pilgrimage Drive.

Comment No. 10-3

I am writing in response to the draft EIR for the Ford Theatre project. I am sure there are concerns regarding noise and possibly exposed cuts in the hillside never mind a host of other environmental impacts. Since I live across the canyon I am not going to speak to these topics. Rather, this document focuses almost exclusively on traffic concerns, haul routes, emergency vehicles and services, and noise. And, specifically about the increased traffic during construction and then after construction associated with the ongoing and increased number of events at the Ford Theatre. On the surface, the increase in traffic volume seems minimal. If each event is attended at full capacity the increase would amount to about 300 additional people. The real issue is the significant increase in traffic due to the increase in events, 184 events today growing to approximately 331 events annually. This is according to the original proposal document released back in early 2014. This is If this is one event per day, essentially, the Ford Theatre would be increasing the traffic volumes from 51 % to 93% of the days of the year. This is a significant impact. Later on in this letter I will be speaking to why this is a relevant point.

Response to Comment No. 10-3

Potential noise impacts of the Project are evaluated in Section IV.I, Noise, of the Draft EIR. As discussed therein, compliance with regulatory requirements and implementation of the mitigation measures provided would reduce noise and vibration impacts associated with Project construction to a less than significant level. Project impacts with regard to operational noise were also evaluated and determined to be less than significant.

With regard to development on the hillsides, as described on page II-21 of Section II, Project Description, of the Draft EIR, the Project has been designed to minimize building footprints and remain primarily within the developed areas of the Project Site. Specifically, implementation of the Project would further develop portions of the existing 3.5 acres of developed area within the Project Site and would extend onto approximately 0.8 acre of undeveloped area. Upon buildout of the Project, approximately 4.3 acres of the 32-acre Project Site would comprise developed area. The remaining approximately 27.7 acres would comprise undeveloped open space.

Potential traffic, access, and parking impacts during construction and operation of the Project are analyzed in Section IV.K, Traffic, Access and Parking, of the Draft EIR with supporting technical data and analysis provided in the Traffic Study included as Appendix L of the Draft EIR. Section IV.K, Traffic, Access and Parking, of the Draft EIR includes an analysis of the traffic related impacts of the Project during the following periods: weekday morning commuter peak period between 7:00 A.M. to 10:00 A.M.; weekday afternoon commuter peak period between 4:00 P.M. to 6:00 P.M.; weekday evening (pre-event) peak period between 6:00 P.M. to 9:00 P.M.; Saturday midday peak period between 11:00 A.M. to 1:00 P.M.; and Saturday evening (pre-event) peak period between 6:00 P.M. to 9:00 P.M.

While the Project would include an increase in events within the Ford Theatres, it is noted that the Amphitheatre, which provides the largest number of seats compared to the proposed venues, would continue to operate from approximately May through October while the other venues could operate year round with scheduled periods of down time for maintenance. As such, simultaneous events within all three venues would occur for approximately six months of the year. In addition, attendance at events at the Ford Theatres depends on the time of year and weather, as well as on the activities, programs and events. Accordingly, attendance fluctuates by season, day of the week, and time of day. However, the traffic analysis provided in the Draft EIR focused on the Project impacts on the busiest days of the year for Project events and the analysis showed that with implementation of project design features, primarily Project Design Feature K-2 which would require the Ford Theatres to stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons, the Project would not create an significant traffic impact on those busy days. Therefore, average traffic conditions would be expected to be lower than that analyzed in the Draft EIR and would not result in a significant impact on traffic.

Comment No. 10-4

In the introduction of the Traffic, Access, and Parking (section K), speaks to the desire for the City and County to improve the traffic conditions. And, I think these agencies would like to insure that pressure is placed on developments to study the existing and identify additional traffic trips made based on the construction of the proposed project. Additionally, "The Congestion Management Program (CMP) is a State-mandated program enacted by the state legislature to address the increasing concern that urban congestion is affecting the economic vitality of the State, in this case the heart of Hollywood in an around the Cahuenga Pass, and diminishing the quality of life in our community. Stated differently, a lot of Angelenos avoid the Cahuenga Pass and want nothing to do with visiting this area due to the excessive congestion, at times almost grid lock. This affects the economics in Hollywood, the Hollywood Bowl, and the Ford Theatre today and in the future after the project. Basically, locals are not visiting these venues and purchasing services because it

is too difficult to make the TRIP, affecting the economics. Further the City of Los Angeles's General Plan related to Transportation states to "…provide adequate accessibility to commerce, work opportunities, and essential services and to maintain acceptable levels of mobility for all those who live, work, travel, or move goods in the City. It seems to me the Ford Theatre, a Los Angeles County operation, needs to take the opportunity to collaborate with the other major agencies and create a multi-jurisdictional project, along with the Bike Czar, CalTrans, the City of Los Angeles, Hollywood Bowl, City of Burbank, City of Hollywood, Universal, and the other entertainment companies to identify a fundamental shift in approach to traffic in the Cahuenga Pass. More on this later.

Response to Comment No. 10-4

The comments regarding opportunities to collaborate with other jurisdictions, entertainment companies and venues regarding traffic in the Cahuenga Pass will be provided to the decision makers prior to consideration of Project approval. It is noted that the City of Los Angeles Department of Transportation was consulted during preparation of the traffic analysis for the Project.

The County and the Ford Theatre Foundation seek to be a good neighbor to the public and private land uses in the area and wish to achieve the Project goals without adverse impacts to the physical environment. We hope that a review of these responses to your comments and the information in the EIR referenced will help to allay your concerns as the documents fully disclose for the public and the decision makers the analysis of the Project and the basis for concluding that this Project would cause no new significant traffic impacts. In particular, the County has identified several project design features (Project Design Feature K-1, Construction Management Plan; Project Design Feature K-2, staggering start times of simultaneous events in the Amphitheatre and the 299-seat theatre on weekday evenings; and Project Design Feature K-3, Parking and Traffic Management Plan) to be implemented as part of the Project that would avoid potentially significant traffic impacts on the surrounding street system to the extent feasible. For example, as described on page IV.K-22 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR, as part of the Project, the Ford Theatres shall stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons (see Project Design Feature K-2). As shown in Section V, Alternatives, of the Draft EIR, Alternative 3, Simultaneous Event Schedules, which would allow events held in the Amphitheatre, the 299-seat theatre, and the Flex Space to occur simultaneously, is anticipated to result in a significant traffic impact at one study intersection. However, as demonstrated in the Project operations, with implementation of Project Design Feature K-2, the County is willing to forgo the flexibility of simultaneous event schedules in order to avoid potentially significant traffic impacts.

Comment No. 10-5

Quite simply, traffic congestion in the Cahuenga Pass is horrid. This is a subjective statement. Based on experience and observation traveling the Pass daily in the morning around 9 am and evening around 6 or 6:30 it is a level D or E based on the chart in Appendix L on page 15. For example, if I am traveling on Forest Lawn heading toward Hollywood from Burbank and make the left on to Barham, that intersection during the evening rush hour (at 6pm or later) can take an additional 10 to 15 minutes and I may be queued up and cycle through 5–7 signal light cycles. The # of cars in the queue for this light on Forest Lawn can be up to quarter mile back up. Then to travel up Barham to Barham and Cahuenga east might take an additional 10 to 15 minutes. Then to make the left on Cahuenga West might take a few more minutes and 1 additional light cycle. Traveling past Mulholland to Hillpark drive on a Hollywood Bowl night at say between 6:30 to 7:30 pm at night might take an additional 15 to 20 minutes. Again on a Hollywood Bowl night it is not uncommon for the traffic to back up from the Hollywood Bowl entrance all the way up the hill on Cahuenga West past the Pilgrimage bridge to Mulholland and at times up to Barham Blvd. This is further documented by the backup at the Highland Flyover (exit on the southbound 101 freeway to Highland Blvd that actually places you on Cahuenga West between Hillpark and the Pilgrimage Bridge. Further, the congestion is so bad and the back up from the Hollywood Bowl on to the freeway is so long, Caltrans now has a permanent light flashing, display posted of traffic congestion. You may want to check in with Caltrans if they have a record of how often or what nights this display is used. So, the contrast is during off peak hours it might take me 5–7 minutes to travel this route and on a heavily congested evening could take upwards of 45 minutes to travel this 4–5 mile stretch. This is the definition of "horrid". Adding the kind of traffic volume on streets that are already clogged appears to be studied in the Draft EIR.

Response to Comment No. 10-5

The comment expresses the opinion of the commenter regarding existing traffic congestion in the Cahuenga Pass and will be provided to the decision makers prior to consideration of Project approval. The Draft EIR and Traffic Study included as Appendix L of the Draft EIR provide a comprehensive analysis of the potential impacts associated with the Project, and includes documentation of the development of the methodology, assumptions and extensive supporting data and information reviewed, etc., that were used, as well as the determination of baseline conditions. The methodology used in the traffic analysis was reviewed and approved by the County of Los Angeles Department of Public Works. The Project is located in the County of Los Angeles, however, since all of the study intersections are within the City of Los Angeles jurisdiction, the City's analysis methodologies and significance thresholds were utilized in accordance with the City of Los Angeles Department of Transportation *Traffic Study Policies and Procedures* (June 2013). The traffic analysis focused on weekday and weekend peak hours (i.e., the time periods in

which congestion is at its greatest levels), which generally corresponds to the highest hour on a weekday during the morning and afternoon commuter periods and the midday peak hour on a weekend. It is recognized that the Cahuenga Pass experiences high traffic volume and vehicular queuing on evenings when the Hollywood Bowl has events or is in season, as well as during street closures in Hollywood. This is highlighted in both the existing and future intersection operating conditions shown in Tables 8 and 9, on pages 60 and 66 of the Traffic Study, contained in Appendix L of the Draft EIR. For example, Intersection No. 1, Cahuenga Boulevard West & Barham Boulevard and Intersection No. 2, Cahuenga Boulevard East & Barham Boulevard, which are both on the travel route described in the comment, are anticipated to operate at worse level of service, D, E, or F, during one or more of the weekday morning or afternoon commuter peak hours and/or weekday event peak hour.

The relative impact of the added traffic volumes to be generated was evaluated based on an analysis of operating conditions at the study intersection, with and without the Project. In general, according to the significant impact criteria, the higher the volume-to-capacity ratio and worse level of service, the lower the amount of Project traffic that can be added before causing a significant impact. Based on the City's sliding scale method for calculating the level of impact due to traffic generated by a Project, an impact is deemed significant if the resulting incremental increase in the volume-to-capacity ratio exceeds 0.02 while operating at level of service D or 0.01 while operating at level of service E or F. As shown in Tables 8 and 9, the maximum level of Project impact is 0.005 at any intersection operating at level of service D, E, or F. Thus, although vehicular queuing may occur along corridors in the Cahuenga Pass, the Project traffic levels at any of these individual study intersections are nowhere near the level needed to cause a significant impact. The Draft EIR concludes that the Project would not have any operational traffic impacts. As discussed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the Project would not create significant impacts at any of the study intersections under any of the analyzed peak hours using the significance impact criteria established by the City. Therefore, Project impacts on intersection operations would be less than significant.

Comment No. 10-6

The reason I state seems to be, is that the numbers that are presented in Appendix L do not seem representative of what homeowners in the Cahuenga Pass experience on a daily basis. The good news is that there was a traffic study and my comments about the timing of the traffic study were adjusted to accommodate actual traffic congestion not the definition from previous traffic study of the definition of "rush hour". The bad news is that it is unclear the exact location within the 8 intersections where the data was collected from. All pivotal intersections but which actual streets and lanes contained the sensors? The rest of the letter will speak to:

- why and where there are concerns surrounding the data
- accurately representing the true congestion
- other concerns or statements or conclusions drawn within the Draft EIR
- request for further investigation
- request answers to questions generated prompted by the data collected and the assumptions made based on this said date.

Response to Comment No. 10-6

The scope of the traffic analysis was developed in consultation with LACDPW, in coordination with adjacent jurisdictions, and in consideration of input received during the public scoping process. The Traffic Study was prepared under the supervision of LACDPW in accordance with the County's and City's guidelines (City of Los Angeles Department of Transportation's *Traffic Study Policies and Procedures*, June 2013), adopted policies, procedures, and standards. As described in the Draft EIR, although the Ford Theatres are located within and owned by the County of Los Angeles; the street system surrounding the Project Site, including the study intersections, are within the City of Los Angeles. The base assumptions, technical methodologies, and study area were reviewed and approved by LACDPW. A summary of the existing street and highway system is provided on pages IV.K-4 through IV.K-9, in Section IV.K, Traffic, Access and Parking of the Draft EIR. The study area was developed so that the full range of potential impacts of the Project on the local and regional roadway network could be determined. In accordance with CEQA, the traffic analysis evaluated impacts of the Project on the existing environment based on actual traffic count data collected at the identified study locations. A summary of the Traffic Study scope, methodology, and traffic scenarios is provided in Chapter 2, Traffic Impact Analysis Methodology, of the Traffic Study. A detailed description of the existing traffic conditions, which serves as the basis for the traffic analysis of both existing and future traffic conditions, is outlined in Chapter 3, Existing Conditions of the Traffic and Parking Impact Report.

Traffic studies focus on the time periods in which congestion is at its greatest levels, during what is known as the "peak period" of traffic, which generally corresponds to one to two-hour segments on a weekday during the morning and afternoon commuter periods and the midday period on a weekend. In addition to the weekday morning and afternoon commuter periods and weekend midday period, as the attendance and traffic volumes associated with the Ford Theatres is the highest during evening events, an analysis of both the weekday and weekend "pre-event" peak hour was also conducted. As described on page IV.K-13 of the Draft EIR, to identify the weekday morning and afternoon peak hour and weekend midday peak hour, as well as the weekday and weekend "pre-event" peak

hour for each intersection, traffic counts were taken at the study intersections during the weekday morning and afternoon commuter peak periods (7:00 A.M. to 10:00 A.M. and 4:00 P.M. to 6:00 P.M.) and during a weekend midday peak period (11:00 A.M. to 1:00 P.M.), as well as during the weekday and weekend evening pre-event peak period (6:00 P.M. to 9:00 P.M.). The traffic counts were conducted in September 2013 when local schools were in session and when both the Ford Theatres and Hollywood Bowl were holding events. In addition, Hollywood Boulevard was closed from Orange Grove Avenue to Highland Avenue.

Consistent with Section 15125(a) of the CEQA Guidelines, the traffic counts used for preparation of the Draft EIR traffic analysis represent a reasonable definition of the physical environment at the study intersections as it existed at the time the Notice of Preparation was issued.

Table 1, Level of Service Definitions for Signalized Intersections on page 15 of the Traffic Study included as Appendix L of the Draft EIR provide the generalized description of the qualitative measures used to describe traffic conditions, including level of service categories, volume-to-capacity ratios, and associated definitions. The existing weekday, weekday event, and Saturday intersection traffic volumes are illustrated in Figures 5A, 5B, and 5C, respectively, and the existing intersection level of service during the analyzed peak hours is shown in Table 3 of the Traffic Study.

Comment No. 10-7

It is critical that the Draft EIR incorporates first-hand look at the traffic issues experienced today in the Cahuenga Pass. I do question the data in light of the Level of Service defined in Appendix L page 15 and the assessments provided at the eight intersections. For Intersections 1, 2, and 5 the data presented is probably representative of the data collection period. I wonder why Intersection 3 is missing from Appendix L , Table 3, page 30. It seems unbelievable that the data collected at intersections # 3 (that is found in the traffic section IV K-17 but missing from the Appendix L) is listed as Level A, along with intersection 4, along with intersection 7.

Response to Comment No. 10-7

Please refer to Response to Comment No. 10-5 for information regarding the analysis time periods and existing traffic count data and operating conditions. We have reviewed the data referenced, and it is correct in the Draft EIR. Thank you for pointing out the benefit of clarifying the location in the document of the substantial volume of traffic analysis and data supporting the narrative in the traffic analysis. The traffic count data worksheets of the turning movement counts at the study intersections are provided within Appendix B of the Traffic Study, which is included as Appendix L of the Draft EIR. Table 3

on page 30 of the Traffic Study in Appendix L of the Draft EIR provides a summary of the Existing Conditions intersection peak hour level of service for each of the *signalized* intersections. To provide clarification on the location of data for both signalized and unsignalized intersections, the title of Table 3 will be revised to state "Table 3, Existing Conditions Signalized Intersection Peak Hour Levels of Service." Refer to Section II, Clarifications and Additions to the Draft EIR, of this Final EIR for the revised title. The analysis of the unsignalized intersection (Intersection No. 3, Cahuenga Boulevard East & Barham Boulevard) is described and documented in Appendix E of the Traffic Study, beginning on page E-1. The delay and level of service for the unsignalized intersection for the Existing Conditions is shown in Table E-1 of the Traffic Study, at page E-5, which correspond to the reported delays and level of service shown in Table IV.K-3 on page IV.K-17 of the Draft EIR.

Comment No. 10-8

For example, diving in to a little more detail to determine what is happening with the Level of Service at the Pilgrimage bridge (intersections 3 and 4), where was the data collected? Was the data collected on the bridge as the traffic approaches Cahuenga East and West or actually recorded based on the traffic on Cahuenga East and West. Meaning,

1. At intersection # 3, was the data collected across the four lanes of traffic heading southbound on Cahuenga West including the left turn lane as well as northbound or only one of the four:

   A. South bound lanes including the left turn lane

   B. Just the left turn lane

   C. The one Northbound lane

   D. heading west across the Pilgrimage bridge

      And, were the locations different if data reflected current traffic without the project, current traffic with the project, future traffic (20 years out) without the project, future traffic (20 years out) with the project?

   ASK: Please respond with the specific location (actual streets and lanes) of the data sensors and collection

2. At intersection # 4, was the data collected across the three lanes of traffic heading Northbound on Cahuenga East including the left turn lane as well as the one southbound lane, or only one of the five

   A. one South bound lane

B. the three Northbound lanes

C. just the left turn lane in the Northbound lane,

D. heading east across the Pilgrimage bridge or

E. heading east exiting the Ford Theatre project opposite the Pilgrimage bridge?

And, were the locations different if data reflected current traffic without the project, current traffic with the project, future traffic (20 years out) without the project, future traffic (20 years out) with the project?

ASK: Please respond with the specific location (actual streets and lanes) of the data sensors and collection

Response to Comment No. 10-8

The existing traffic volumes at the study intersections during the weekday, weekday event and Saturday peak hours are highlighted in Figures 5A, 5B, and 5C, of the Traffic Study included as Appendix L of the Draft EIR. As shown in the traffic count data worksheets provided in Appendix B of the Traffic Study, the traffic count data collected are manual counts of the vehicular volume by movements (i.e., left-turns, through traffic, and right-turns) for all of the intersection approaches (each roadway) and encompass the volume from every travel lane approaching the intersection. The counts are recorded at 15-minute intervals throughout the analysis period. For example, at Intersection No. 3 (Cahuenga Boulevard West & Pilgrimage Bridge), the traffic counts reflect the northbound through and right-turn movements and the southbound left and through movements on Cahuenga Boulevard West and the westbound right-turn movements on Pilgrimage Bridge. Similarly, for Intersection No. 4 (Cahuenga Boulevard East & Pilgrimage Bridge), the traffic counts reflect the northbound left and through movements on Cahuenga Boulevard East, the eastbound left, through and right-turn volume on Pilgrimage Bridge, and the westbound left, through and right-turn movements from the Ford Theatres main driveway. A summary of the existing lane configurations at the study intersections is provided in Figure 3 on page 24 of the Traffic Study. As outlined in Section IV.K, Traffic, Access, and Parking of the Draft EIR, and further described in the Traffic Study, the existing traffic count data serves as the basis for the traffic analysis of both existing and future traffic conditions and the baseline for evaluating traffic-related impacts of the Project.

Comment No. 10-9

3. What was the calculation used to determine the LOS? Meaning, was the data collected across the designated AM, PM, and weekday event time periods and then averaged? Was additional mathematical formulas applied the understated to reflect the “Delay/V/C”?

Response to Comment No. 10-9

A summary of the traffic study scope, analysis methodology, and traffic scenarios is provided in Chapter 2, Traffic Impact Analysis Methodology, of the Traffic Study. As described on pages 11 and 12 of the Traffic Study included in Appendix L of the Draft EIR, on Intersection Level of Service Methodology, the signalized intersections were evaluated using the Critical Movement Analysis methodology, which determines volume-to-capacity ratios on a critical movement basis. The overall intersection volume-to-capacity ratio is subsequently assigned a level of service value to describe intersection operations. The Critical Movement Analysis methodology was implemented using City of Los Angeles, LADOT's Calcadb Lite spreadsheet application to analyze intersection operating conditions, consistent with LADOT's *Policies and Procedures*. It is noted that the Critical Movement Analysis methodology reflects the calculated average operating conditions for individual intersections and does not in every case account for vehicular queuing along corridors, pedestrian conflicts, etc. The unsignalized intersections were analyzed using the Highway Capacity Manual methodology (Transportation Research Board, 2010) to determine the overall intersection delay. The Highway Capacity Manual methodology calculates the average delay, in seconds, of a vehicle passing through the intersection in any direction. The intersection analyses were prepared for each of the analysis conditions (weekday A.M. and P.M. peak hours, weekday event peak hour, etc.) and reported in level of service summary tables in the Traffic Study and in Section IV.K, Traffic, Access, and Parking, of the Draft EIR.

Comment No. 10-10

4. I realize the report provided the time periods of data collection went above and beyond by extending the hours of the study to reflect more accurately the heavy congestion periods in the Cahuenga Pass. (see page 13 of the Section K: Traffic, Access, and Parking. This is appreciated considering the feedback in the original response back on 3/11/14 (see attached letter).

Response to Comment No. 10-10

Thank you for acknowledging the expanded analysis time periods included in the Draft EIR and responsiveness to the commenter's March 11, 2014, letter received during the Notice of Preparation.

Comment No. 10-11

5. On page 22 of Section K, there is a reference to the construction related deliveries will be scheduled outside of commuter peak hours. There is specific reference that:

A. construction workers would arrive at the project before 7 am.

B. And leave either before 4pm or after 6pm.

Three points come to mind:

1 According to the County code requirements, construction cannot occur the hours before 7 am on weekdays. And, there is a separate requirement regarding noisy construction work. So, if the bulk of the workers arrive before 7 am will they all stand around and do quite work (when the heavy earth movement is occurring)?

2 Commuter and event congestion really starts at 5:30 and runs through 8 pm or 8:30 depending upon the event.

3 I am not sure how these arrival and departure times improve things for the roadways surrounding the project and reduce "counted requisite TRIPS".

ASK: Please respond with the specific details why these numbers were provided and how that calculates (either increases or decreases) the total number of inbound and outbound TRIPS

Response to Comment No. 10-11

Construction-related traffic is addressed in Section IV.K, Traffic, Access, and Parking of the Draft EIR and further described in Chapter 13 of the Traffic Study included as Appendix L of the Draft EIR. As described beginning on page 87 of the Traffic Study, in general the shift times for construction workers and hours of construction typically require workers to be on site before the weekday morning commuter peak period and allow them to leave before or after the afternoon commuter peak period (i.e., arrive at the site by 7:00 A.M. and depart before 4:00 P.M. or after 6:00 P.M.). For example, an eight-hour shift between 7:00 A.M. and 3:00 P.M. would travel to and from the site outside of the weekday commuter or weekend midday peak periods, when the roadway system is most heavily constrained. The trip-generation estimates associated with construction workers outlined in the Draft EIR do not reflect a reduction in trips. As the number of trips would occur during off-peak hours, Project construction is not expected to cause a significant traffic impact at the analyzed intersections during peak hours.

Comment No. 10-12

6. The TRIP generation also seems suspect or some mathematical algorithm was used that does not equate to reality for the average driver in Los Angeles. One vehicle one person. If you review the numbers provided in Section K: Traffic, Access, and Parking on page 24 I am not sure how the report arrived at:

A. 176 daily construction worker Trips (88 inbound / 88 outbound

B. 64 haul trucks (32 inbound / 32 outbound

C. 30 daily construction material delivery trucks (15 inbound / 15 outbound

I don't state the issue to the numbers based on the shear # of daily construction works, trucks hauling dirt or deliveries. I question this data as you move to the next point on the total number of inbound and outbound trips. Keep reading as I make my two points about these TRIP numbers:

1. Not sure of the hours of the truck hauls but if you do the math 107,094 cubic yards of dirt divided by 14 cubic yards per truck and there are 64 daily deliveries (32 inbound and 32 outbound), this dirt hauling would take 119.5 days (64 * 14 = 896 cubic yards per day. 107,095 / 896 = 119.5 days. If the hauling occurred 6 days out of the week, since according to the County Code, no loud construction noise on Sundays, this could take upwards of 19.9 weeks.

ASK: is this the expected timeframe and approach for the hauling of dirt?

Response to Comment No. 10-12

A full discussion of the construction traffic trip-generation estimates, methodology, assumptions, impact analyses, etc. is provided in Chapter 13, Construction Impact Analysis, of the Traffic Study included as Appendix L of the Draft EIR. As detailed therein, the estimated number of construction workers each day, depending on the phase of construction (e.g., demolition, grading, building construction, etc.) is anticipated to range between approximately 10 and 100 workers. Assuming some level of carpooling among the construction workers, an average vehicle ridership of 1.135 person per vehicle was applied, as provided in the *CEQA Air Quality Handbook* (South Coast Air Quality Management District, 1993). Thus, during the construction phase with the largest number of workers, 100 construction workers are anticipated to generate approximately 176 trips per day [100 workers ÷ 1.135 workers per vehicle × 2 (1 inbound, 1 outbound) = 176 trips per day].

Regarding the proposed truck activity, approximately 107,094 cubic yards of material is anticipated to be exported off-site during the course of the combined excavation, demolition and other construction activities for the Project. It is anticipated that 12- to 14-cubic-yard dirt trucks would be used to export the soil. Assuming approximately 720 cubic yards of export per day, a total of 64 daily haul truck trips are estimated to be generated on a worst case construction day (during excavation and demolition phases of construction). With regard to construction material delivery trucks, it is estimated that an

average of between fewer than 10 and 30 daily delivery truck trips would travel to the Project Site, depending on the construction phase.

It should be noted that the most intensive construction phase in terms of trucks generally occurs during the demolition, grading or export phases of construction, whereas the period that generates the most construction worker traffic occurs during the building finishing and site work construction activities toward the later end of the construction phasing. However, in order to provide a conservative analysis of construction traffic, the trip-generation forecast included traffic from the peak construction worker phase, as well as the peak construction truck phase. Further, for purposes of analyzing the worst case scenario associated with construction, the Project was assumed to be complete in one phase. However, it is recognized in the Draft EIR that the Project is likely to be constructed over time, as funding allows and to keep the Ford Theatres operating during some or all of the May to October event season. It is noted, however, that the County Arts Commission has announced that the Ford Amphitheatre would be closed for the summer season in 2015 and would reopen in the spring/summer of 2016 to accommodate maintenance work in the Amphitheatre associated with previously approved Amphitheatre improvements as part of the Class 31 Notice of Exemption prepared and approved in September 2013.[2]

Comment No. 10-13

2. On page 25 in Section K, Traffic, Access, and Parking, it shows five bullet points about the inbound and outbound TRIPS. It may be I am not calculating correctly but it looks like there are 221 inbound trips and only 76 outbound TRIPS. Please clarify these numbers. Not sure if there is averaging and rounding up and rounding down that skew the numbers. What it looks like is that people in vehicles arrive but they never leave? Maybe the construction workers are arriving by car and leaving by bus?

ASK: Is it possible that people in vehicles arrive to the Project Site but they never leave?

Response to Comment No. 10-13

The bullet points outlined on page IV.K-25 of the Draft EIR summarize the anticipated Project trip-generation forecast for each of the analyzed peak hours (i.e., 1-hour segment) as shown in Table IV.K-5 on page IV.K-26 of the Draft EIR. It is incorrect to combine trips for each of the analyzed peak hours, including for different days of the week (e.g., weekday and weekend) as suggested in this comment. The trip-generation forecast

[2] *Ford Theatres, About Us, News and Press Room, http://fordtheatres.org/UserFiles/File/2014%20Summer%20Workbook/2015FordSeasonRelease_FINAL.pdf; accessed September 5, 2014.*

shown in Table IV.K-5 reflects inbound and outbound trips that are anticipated to occur during that identified peak hour, and does not show the trips made during off-peak periods. The net new Project trips during each of the analysis peak hours (weekday A.M. and P.M. peak hours, weekday evening event peak hour, Saturday midday peak hour and Saturday evening peak hour) were evaluated according to the County and City's adopted policies and procedures.

Comment No. 10-14

7. The next questionable set of numbers in Section K, Traffic, Access, and Parking talks about the Trip distribution traffic assignment. In the paragraph a top of page 27 it talks about the approximate percentage of traffic that would be assigned to north of the project, south of the project, and to/from the US-101 and the Project Site. The issue is not the distribution but the percentage. Not sure how you can end up with 160 % if the traffic is split in three areas: 50 percent to the North, 50 percent to the south, and 60 percent to/from US 101 and the Project Site. One might conclude from these numbers that congestion exceeds capacity by 160 % which might reflect reality that we are living with level E and F LOS.

   ASK: Please explain further what is being attempted.

Response to Comment No. 10-14

A detailed description of the Project trip distribution is provided in Chapter 5, Project Trip Generation and Distribution of the Traffic Study included as Appendix L of the Draft EIR. The Project trip distribution is illustrated in Figure 9 and the associated Project-only traffic volumes in Figures 10A, 10B, and 10C for weekday, weekday event, and Saturday peak hour conditions, of the Traffic Study. As described on page 49 of the Traffic Study, approximately half of the traffic was assigned to/from the north and half was assigned to/from the south. Of this, approximately 60 percent of the Project-related traffic is anticipated to utilize the US-101 to/from the Project Site. The last sentence of the first paragraph on Page IV.K-27 of Section IV.K, Traffic, Access and Parking, of the Draft EIR has been revised as provided in Section II, Clarifications and Additions to the Draft EIR, of this Final EIR. Thank you for pointing out this ambiguity so that we can clarify the wording to be consistent and correctly describe the traffic distribution illustrated in Figure 9 of the Traffic Study.

Comment No. 10-15

8. In Section K, Traffic, Access, and Parking, there is a point being made surrounding CMP, Congestion Management Program indicating based on the

inbound and outbound TRIPS and the percentage of distribution that this project is no CMP impact and no additional analysis of freeway segments is required per the CMP Criteria. That assumes the TRIP calculations are correct. I contend that the TRIP numbers are questionable along with the Percentage of traffic distribution.

ASK: Please justify the numbers identified in this paragraph on page 29 and how that compares to the numbers identified on page 25, and the details covered on page 24 breaking down the specific TRIPS.

Response to Comment No. 10-15

The Congestion Management Program Analysis, including methodology and assumptions, is addressed in Section IV.K, Traffic, Access, and Parking, beginning on page IV.K-29 of the Draft EIR, and further described in Chapter 10, Congestion Management Program Analysis, of the Traffic Study. The Project traffic volumes outlined in Table IV.K-5 on page IV.K-26 (and summarized on page IV.K-25) were assigned to the study intersections and the resulting traffic volumes are provided in Figures 10A, 10B, and 10C of the Traffic Study provided as Appendix L of the Draft EIR. These volumes reflect the anticipated net new trips associated with operation of the Project.

Based on a review of the Project traffic volumes shown in these figures, the Project would add fewer than 150 trips in either direction during the weekday morning or afternoon peak hour on the US-101 Freeway. Addition of at least 150 trips is the threshold for requiring a traffic impact analysis for a Congestion Management Program mainline freeway monitoring location according to the *2010 Los Angeles County Congestion Management Program* (Metro, 2010) guidelines. The Congestion Management Program impact analysis reflects an evaluation of the potential impacts of the Project when it is in operation. The summary of trips provided on page IV.K-24 of the Draft EIR reflects the trip generation and analysis associated with construction traffic.

Comment No. 10-16

9. More importantly, I am not sure how the report can justify the low number of net new TRIPs considering the number of additional days of events. Maybe the additional seating to the project justifies the lower number of net new TRIPs. I am just not sure how this project is able to justify this low number considering the number of new events. Again, the real issue is the significant increase in traffic due to the increase in events, 184 events today growing to approximately 331 events annually. If this is one event per day, essentially, the Ford Theatre would be increasing the traffic volumes from 51 % to 93%. This low TRIPs needs to be explained or recalculated in a way to reflect these 147 added events. (see original Ford Theatre report initially released at the beginning of 2014.

ASK: Please clarify how the numbers justify the low number of TRIPS

Response to Comment No. 10-16

The Draft EIR does acknowledge that the number of annual events at the Ford Theater would increase and therefore the nearby residents would experience an increase in traffic on the area streets on more days per year than occurs today. The Draft EIR traffic impact analysis, however, demonstrates that the Project impacts on the busiest days of the year for Project events would be less than significant according to the approved methodology outlined in LADOT's *Traffic Study Policies and Procedures*, with concurrence of the County. Further, the Traffic Study analysis demonstrated that there would not be an impact that was significant even assuming the worst case evaluation of operations that utilize the maximum seating capacity of the Amphitheatre and the proposed new venues (e.g., sold-out events) and traffic conditions when both the Ford Theatres and Hollywood Bowl were holding events.

To give context to the performance seating capacity of the Ford Theatres, even with two new venues proposed as part of the Project, including the 299 seat theater and the 99-seat Flex Space, and accounting for the proposed removal of the existing 87-seat [Inside] the Ford venue, the net number of new performance seats within the Ford Theatres of 311 seats remains relatively small. Comparing the Ford Theatres and Hollywood Bowl open air amphitheatres, the existing Ford Theatres Amphitheatre has a capacity of 1,196 seats while the Hollywood Bowl amphitheatre capacity is approximately 17,376 seats.

Comment No. 10-17

10. Looks like the looks like the export of dirt shifted from 83,774 cubic yards of dirt to 107,095. Please confirm if this change in export is correct? Will the amount of cubic yards of dirt change again?

    ASK: please confirm the amount of cubic yards of dirt today and did the amount change?

Response to Comment No. 10-17

Based on preliminary estimates and Project design available during the Notice of Preparation process, it was estimated that the Project would require approximately 83,774 cubic yards of export. Since the Notice of Preparation and with further development on Project design, the initial estimate was revised to approximately 107,094 cubic yards of export as described in Section II, Project Description, of the Draft EIR.

Comment No. 10-18

11. If the Ford theatre is planning to add 147 net new events according to their own report, how can the Draft EIR actually state that the new trips adjusted for the observed distribution in the vicinity of the Project Site can actually say 35 net new trips in the weekday, approximately 18 net new trips in the weekday evenings and 92 net new events on the weekends found on page 29 of section IV.K Traffic, Access, and Parking

    ASK: These net new #s could be accurate for existing events. What are the net new #s for 147 additional events at the Ford theatre?

Response to Comment No. 10-18

A full discussion of the Project trip-generation estimates, Project traffic volumes, as well as the methodology, considerations and assumptions used in determining the Project's trip-generation forecast is provided on page IV.K-25 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR. The trip-generation estimates reflect the anticipated net new increases in traffic during the weekday and weekend event peak hours that could be generated by the Ford Theatres for any event held, not just for existing events, as referenced in the comment.

Comment No. 10-19

12. Emergency vehicles: Today with the excessive congestion along Cahuenga East and Cahuenga West, the emergency vehicles out of Station 76 often are unable to traverse these streets. There are no shoulders for the cars to move, with or without sirens. Sirens do no good if there is nowhere for the cars to move.

    ASK: Please explain how the added congestion from construction vehicles and added events are not going to impact emergency vehicle travel?

Response to Comment No. 10-19

As discussed in Section IV.J, Public Services, of the Draft EIR, emergency access for City Fire Department, Los Angeles Police Department, and Los Angeles Sheriff's Department vehicles within the Project Site and the surrounding vicinity could be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. As a result, Project construction activities could increase response times for emergency vehicles along Cahuenga Boulevard East and main connectors. However, pursuant to Project Design Feature K-1, the Project would implement a Construction Management Plan

during construction of the Project, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure emergency access to the Project Site and vicinity is maintained. As described in detail in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, features of the Construction Management Plan may include prohibition of construction worker parking on adjacent residential streets, scheduling construction activities to reduce the effect on traffic flow, and provisions to accommodate the equipment storage and truck staging on-site. In addition, construction worker and haul truck trips would generally occur outside the typical weekday commuter morning and afternoon peak periods. Further, emergency vehicles utilize emergency sirens to clear a path of travel or drive in opposing traffic lanes to avoid heavy traffic. As such, impacts related to emergency access would be less than significant.

Comment No. 10-20

13. Looks like my comments from my 3/11/14 letter were heard. There are references to improving pedestrian access. This is a good thing. And, it speaks to a reference could be considered "transportation-friendly" and "fair and equitable access to the residents" with a limited cost to the project. This could also increase customers without increasing net new TRIPs to the Ford Theatre.

    Repeating what is in my prior letter: Any opportunity to increase pedestrian traffic to and from the Ford Theatre should be considered. For example, today, there are no pedestrian options for people, once they travel over the Pilgrimage Bridge to cross Cahuenga East to the Ford Theatre. There is a metal barrier on one side essentially blocking or hindering pedestrian crossing over Cahuenga East. And, there is no longer a button to push to trigger the signal for a walk sign like you see in regular intersections.

    ASK: This should be studied and included in the plans to encourage or increase walking traffic.

Response to Comment No. 10-20

Thank you for addressing pedestrian access to the Project Site. Potential impacts regarding access and circulation are discussed on page IV.K-32 through IV.K-34 of Section IV.K, Traffic, Access, and Parking, of the Draft EIR and further described in the Traffic Study included as Appendix L of the Draft EIR. As evaluated in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, the Project would not result in significant impacts regarding traffic, access, and parking. As such, no mitigation measures are required. However, as the surrounding streets and pedestrian facilities are within the jurisdiction of the City of Los Angeles, this comment will be forwarded to City of Los Angeles Councilmember Tom LaBonge's office with an invitation to discuss sidewalk improvements in the area of the Ford Theatres with the Ford Theatre Foundation.

Comment No. 10-21

14. We need to understand during construction and once the events start if the decibel levels will increase significantly from what they are today. At first glance, it doesn't appear that the Highland's Owners Association will be affected by noise from the Ford Theatre. However, it does need to be studied to be sure if there are any issues. In any case, the EIR needs to identify mitigations and options for such issues.

    ASK: The ambient noise level needs to be investigated as part of the EIR.

Response to Comment No. 10-21

You are correct that the analysis shows that the Highland's Owners Association will not be affected by construction noise. Potential noise impacts during construction and operation of the Project are evaluated in Section IV.I, Noise, of the Draft EIR. Ambient noise levels are specifically described on page IV.I-13 through IV.I-17 of the Draft EIR. As summarized on page IV.I-53 of the Draft EIR, compliance with regulatory requirements and implementation of the mitigation measures provided would reduce noise and vibration impacts associated with Project construction to a less than significant level. In addition, Project impacts during operation would be less than significant. The following mitigation measures were identified for implementation during construction of the Project:

Mitigation Measure I-1: Power construction equipment (including combustion engines), fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards). All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated.

Mitigation Measure I-2: Project construction shall not include the use of driven pile systems.

Mitigation Measure I-3: Contractor shall utilize smaller construction equipment, such as small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure.

Additionally, the Project would include the following project design features related to Project operations:

Project Design Feature I-1: Project-related outdoor mechanical equipment shall be designed to meet the County's Noise Ordinance.

Project Design Feature I-2: The design of the project amplified sound system for the Amphitheater shall include the sound level regulator programmed to a maximum sound level of 95 dBA, as measured in "slow" response, at the house mixer locations.

Project Design Feature I-3: The building structure for the 299-seat theatre and the Flex Space shall provide a minimum 25 dBA indoor to outdoor noise reduction.

Comment No. 10-22

15. There are references that the Pilgrimage bridge has a speed limit of 35 mph on page Appendix L page 19. There is no speed limit posted on the Pilgrimage bridge.

    ASK: Can you explain how the speed on a two lane bridge could be set to 35 mph?

Response to Comment No. 10-22

There is no posted speed limit on Pilgrimage Bridge and therefore, it is assumed to be a prima-facie speed limit of 25 miles per hour, consistent with the State of California Vehicle Code. Thank you for pointing out this inconsistency so that it can be corrected in the Final EIR. This statement has been corrected as reflected in Section II, Clarifications and Additions to the Draft EIR, of this Final EIR.

Comment No. 10-23

16. There is a reference that no significant impacts occurred even when extending past the Study Area. Specifically, in Appendix L, page 16. "The Project Study Area was designed to ensure the all potentially significantly impacted intersections, prior to any mitigations, were analyzed, and the boundary of the Study Area was extended, as necessary, to confirm that there were no significant impacts at or outside the boundary of the Study Area."

    There are two points to be made about this proclamation:

    A. Due to the excessive congestion in the Cahuenga Pass, any construction, maintenance or added construction traffic like truck hauling causes severe backups and queuing at the intersections.

Response to Comment No. 10-23

Project Design Feature K-1 includes the preparation of a Construction Management Plan, which outlines the management and traffic control measures to be implemented, haul

routes and staging plans, etc., as necessary and satisfactory to the County. The construction traffic management plan would be based on the nature and timing of the specific construction activities, including scheduling construction-related deliveries, haul trips, etc., so as to occur outside of the weekday commuter peak hours to the extent feasible. With implementation of Project Design Feature K-1, impacts associated with construction traffic and parking would be less than significant.

Comment No. 10-24

B. The Study area really needs to be extended to include:

1. Cahuenga West up through the on ramp to the 101 Freeway north of Barham.

2. Barham Blvd from Cahuenga West toward Burbank down and including the Barham and Forest Lawn intersection

3. Since traffic queues up at Cahuenga East and the Pilgrimage bridge at the Ford Theatre Project traveling southbound to North Cahuenga Blvd to at least to Franklin Blvd, Hollywood Blvd, and Sunset Blvd.

Response to Comment No. 10-24

The study area was developed so that the full range of potential impacts of the Project on the local and regional roadway network could be determined. In consultation with the County and City, as well as through the public scoping process, eight intersections (both signalized and unsignalized) in the area were identified for analysis. The intersections include intersections along the primary access routes to and from the Project Site which would be most directly impacted by Project traffic (e.g., Cahuenga Boulevard East and West, Highland Avenue, Odin Avenue, Barham Boulevard, etc.). The study intersection locations were selected based on the Project vehicle trip generation, the anticipated distribution of the Project trips, existing intersection/corridor operations, and travel routes/patterns to and from the Ford Theatres. The traffic analysis study area encompasses several intersections in the vicinity of the site, including key intersections that may have existing or future operational issues, and a relatively higher percentage of Project-related vehicle turning movements (e.g., along Cahuenga Boulevard East and West, Highland Avenue, Odin Avenue, Barham Boulevard, etc), as well as freeway on-off ramp intersections.

The comment includes a request for analysis of additional intersections that were not included as study intersections in the Traffic Study, including intersections along Cahuenga Boulevard West north of Barham Boulevard, Barham Boulevard from Cahuenga Boulevard West to the City of Burbank (including Barham Boulevard & Forest Lawn Drive),

and those intersections along North Cahuenga Boulevard south of study area. These intersections were not selected for analysis because they would not serve sufficient Project traffic volumes such that a significant Project traffic impact would be identified.

According to the City's significant impact criteria, an impact is considered significant if the project results in an increase in the volume-to-capacity ratio of an intersection by 0.01 (assuming that the intersection is operating at level of service E or F). This generally correlates to a traffic volume increase of at least 16 vehicles per lane per hour in the peak direction. The roadways described in this comment are at least four lane roads. Thus, the Project would have to add at least 32 vehicles per hour in the peak direction in order to create a significant impact at these intersections beyond the study area. Figures 10A, 10B, and 10C on pages 51 through 53 of the Traffic Study show that none of the roads leading to these intersections beyond the study area are anticipated to accommodate 32 net new vehicles per lane per hour in any one direction and, therefore, the Project would not generate enough traffic in the Barham Boulevard, North Cahuenga Boulevard, Cahuenga Boulevard West or other identified corridors beyond the study area, to create a significant impact.

Further, there would be no significant impacts at any intersections located on the boundaries of the study area, and the Project traffic assignment as shown in Figures 10A, 10B, 10C, on pages 51 through 53 of the Traffic Study show that the Project would not generate sufficient traffic volumes past the study area in any direction to cause a significant intersection impact. Therefore, the study area encompassed in the Traffic Study was large enough to capture all of the potential significant impacts of the Project and additional intersections are not required to be analyzed.

Comment No. 10-25

C. Although stated differently in the report, there are multiple intersections without left turn lanes. These intersections alone when vehicles are attempting to make the left hand turn can cause severe backups affecting traffic congestion up and down the Cahuenga Pass. Backups can occur upwards of a quarter to a half a mile. Intersections include:

   1. Cahuenga West and Mulholland Blvd—northbound. Note: this intersection is south of Cahuenga West and Barham

   2. Barham Blvd and Blair Drive—heading toward Burbank just below Lake Hollywood Blvd.

ASK: Please provide clarification on:

   1. how these intersections without a left hand turn lane affect congestion

2. should the study area include one or both of these intersections

Response to Comment No. 10-25

The analysis methodology accounts for the lane geometry at the study intersections, including exclusive left-turn lanes, where provided, as shown in Figure 3 on page 24 of the Traffic Study. As shown in Figure 3, several intersections do not provide separate left-turn lanes, which was reflected in the analysis and intersection operating conditions shown in Table IV.K-6 (Existing plus Project conditions) on page IV.K-28 and Table IV.K-7 (Future plus Project conditions) on page IV.K-30 of the Draft EIR. The City's significance criteria is based on overall intersection operations as defined by the vehicle-to-capacity ratio and level of service, and not vehicular queuing along a particular corridor or intersection.

The comment includes a request for analysis of additional intersections that were not included as study intersections in the Traffic Study, including the intersections of Cahuenga Boulevard West & Woodrow Wilson Drive-Mulholland Drive and Barham Boulevard & Blair Drive. These intersections, as well as other intersections in the area (e.g., Cahuenga Boulevard West & Hillpark Drive, Cahuenga Boulevard East & Lakeridge Road, Cahuenga Boulevard East & Lakeridge Place, etc.), were not selected for analysis as they would have relatively lower traffic volumes on the side street and minor approach to the intersection and no documented existing or projected future adverse operational issues, but most importantly, these locations are projected to accommodate little, if any, Project-related vehicular turning movements. Thus, these intersections would not be significantly impacted by Project traffic.

Comment No. 10-26

17. The reason the last point is severely relevant depends upon the ultimate haul route. Although in the report in Section IV.K page 24 it states the "anticipated" haul route might be inbound "…access the Project Site traveling northbound on Cahuenga Blvd East from the Hollwyood Freeway (US-101) and [outbound] would exit the Project Site onto Cahuenga Blvd East and travel northbound on Cahuenga Blvd East to the Hollywood Freeway. The report does not indicate the full route. The point of this entry is two-fold:

    A. Depending upon the streets traveled for the haul route, for example Barham to Forest Lawn, then the recommendation in this letter is that the Study area needs to be extended to include these intersections. Especially since, Barham and Cahuenga East based on the data reported in the Draft EIR in Appendix L indicates on weekday AM is a LOS F and weekday PM is a LOS D.

B. If the plan is to proceed with the haul route as anticipated then it makes sense to extend the Study Area to include intersections of Cahuenga North in the southbound direction toward Franklin Blvd, Hollywood Blvd, and Sunset Blvd.

ASK: include these additional intersections south of the project and north and east of the project to anticipate impacts from the project both during Construction and after the Project is implemented. In either case, both parts of the Cahuenga Pass will be impacted.

Response to Comment No. 10-26

Pursuant to Project Design Feature K-1, as part of the Project, a Construction Management Plan would be implemented, including haul routes and staging plans, to the satisfaction of the County. The Construction Management Plan shall include elements such as provisions to accommodate the equipment storage and truck staging on-site, scheduling construction-related deliveries, haul trips, etc., so as to occur outside of the commuter peak hours to the extent feasible, as well as obtaining the required permits for truck haul routes prior to issuance of permits for the Project as described on page IV.K-22 of the Draft EIR. The truck haul route would comply with the approved truck routes designated within the City and County. Based on the proximity of the Hollywood Freeway to the Project Site, it is anticipated that haul trucks leaving the site (outbound) would travel northbound on Cahuenga Boulevard East to US-101 and inbound trucks would travel northbound on Cahuenga Boulevard East from US-101. The Construction Management Plan would formalize how construction would be carried out and identify specific actions that would be required to reduce effects on the surrounding community.

Further, as described on page 88 of the Traffic Study, approximately 14 truck trips per hour (seven inbound, seven outbound) are forecast to occur during the excavation and demolition periods, assuming haul truck trips would occur uniformly over a 5-hour period (e.g., 10:00 A.M. to 3:00 P.M.). The intersections identified in this comment, among others, were not selected for analysis because they would not serve sufficient haul truck traffic during the commuter peak periods such that a significant impact could occur. Based on the construction traffic analysis included in Section IV.K, Traffic, Access, and Parking, of the Draft EIR, with implementation of the Construction Management Plan, construction-related impacts would be less than significant. Thus, expansion of the study area related to construction traffic is not required.

Regarding the request to expand the study area to include intersections to the south, north, and east of the Project due to increases in traffic from Project operations, refer to Response to Comment No. 10-24 above. As discussed therein, there would be no significant impacts at any intersections located in the boundaries of the study area and the Project would not generate sufficient traffic volumes past the study area in any direction to

cause a significant intersection impact. Therefore, the study area encompassed in the Traffic Study was large enough to capture the potential significant impacts of the Project and additional intersections are not required to be analyzed.

Comment No. 10-27

18. The traffic study did take in to account midweek evening event traffic when both the Ford Theatre and the Hollywood Bowl events were occurring simultaneously. Don't know if this was a light Hollywood Bowl night or one of the heavily attended event night at the Hollywood Bowl.

    ASK: provide more details about whether the study included a Hollywood Bowl event that experienced peak or very high attendance.

Response to Comment No. 10-27

The traffic count data included in the Draft EIR was conducted on Friday, September 6 and Saturday, September 7, 2013, when both the Ford Theatres and the Hollywood Bowl held events. On those days, the Hollywood Bowl hosted the Blue Man Group, which was considered a busy, well-attended event, with attendance of approximately 14,606 on Friday evening and approximately 15,105 on Saturday evening. As noted on page II-9 of Section II, Project Description, of the Draft EIR, the Hollywood Bowl has a seating capacity of approximately 17,376. Therefore, the traffic counts included in the Project traffic analysis captured well-attended events at the Hollywood Bowl.

Comment No. 10-28

19. The traffic study does not indicate if the data collection occurred on a night when the Hollywood Blvd street closure was in effect.

    ASK: provide more data if Hollywood Blvd was closed on the day or night of the data collection.

Response to Comment No. 10-28

The City issues permits at various times throughout the year for the temporary closure of travel lanes along roadways throughout the Hollywood community, including Hollywood Boulevard, to accommodate special events (e.g., the Academy Awards, movie premieres, marathons, parades and festivals, etc.). Daily traffic counts on urban roadways, such as Hollywood Boulevard, are variable and can be highly influenced by recurring and intermittent events such as school traffic, roadway construction, as well as accidents, special events, economic trends, weather, etc. In addition to being conducted when both the Ford Theatres and Hollywood Bowl held events, the traffic counts used for the

preparation of the Draft EIR traffic analysis were conducted when street closures were in effect on Hollywood Boulevard from Orange Grove Avenue to Highland Avenue.[3]

Comment No. 10-29

The Ford Theatre Project wants to increase their events which in turn will increase their traffic. Since the Ford Theatre is starting out with traffic congestion that is essentially at a level D or F it may be that they cannot just add any more events without addressing traffic. The Draft EIR is making a claim that the new trips adjusted for the observed distribution in the vicinity of the Project Site can actually say 35 net new trip sin the weekday an peak hour, approximately 18 net new trips in the weekday evenings and 92 net new events on the weekends if the Ford theatre is planning to add 147 net new events according to their own report. Based on these numbers the Draft EIR on section IV,K page 29 Congestion Management Program requirements are met based on the # of net new trips. And, therefore since these net new #s are less than 150 trips in either direction during the weekday morning and afternoon peak hours, no CMP impact would occur and no additional analysis of freeway segments is required per the CMP criteria. Again, this is why I am asking to have a review of the TRIP #s in general and the net new TRIPS.

Response to Comment No. 10-29

A summary of the Project traffic volumes, as well as the methodology, considerations and assumptions used in determining the Project's trip-generation forecast is provided in Section IV.K, Traffic, Access and Parking of the Draft EIR, with further details provided in Chapter 5 (Project Trip Generation and Distribution) of the Traffic Study included as Appendix L of the Draft EIR. As discussed on pages 45 through 48 of the Traffic Study, the Project trip-generation forecast considered vehicular trips associated with the number of seats provided in the Amphitheatre and proposed venues, employees, event staff (e.g., security, event, public relations, artists/performers and other related staff), etc., as well as those related to the hiking trail and restaurant uses. The trip-generation forecasts associated with the Project is based on the Project's land use components, attendance figures, anticipated visitor arrival and departure patterns, events and other programming information collected through field data or provided by the Ford Theatres and County staff. Table IV.K-5 on page IV.K-26 of the Draft EIR summarizes the trip generation for the Project.

The commenter correctly summarizes the net new traffic anticipated to be generated by the Project, including 35 net new trips during the weekday morning peak hour, 60 net

[3] *Communication between Gibson Transportation Consulting Inc. and City of Los Angeles Department of Public Works, Bureau of Street Services Investigation and Enforcement Division. August 2014.*

new trips during the weekday afternoon peak hour, 18 net new trips during the weekday event peak hour, 92 net new trips during the Saturday midday event peak hour, and 92 net new trips during the Saturday evening event peak hour. The Draft EIR provides an extensive analysis of the traffic-related impacts of the anticipated net new traffic generated by the Project and concludes that traffic impacts at the study intersections would be less than significant.

As previously described, the traffic analysis includes an assessment of Congestion Management Program arterial and freeway monitoring stations that may be impacted by the Project, in accordance with the Traffic Impact Analysis guidelines referenced in the 2010 Congestion Management Program for Los Angeles County. Refer to Chapter 10, Congestion Management Program, of the Traffic Study for a summary of the Congestion Management Program traffic assessment for arterial and freeway monitoring locations, as well as transit. The Congestion Management Program is a State-mandated program that serves as the monitoring and analytical basis for transportation funding decisions in the County made through the Regional Transportation Improvement Program and State Transportation Improvement Program processes. The Congestion Management Program requires that a Traffic Impact Analysis be performed for all Congestion Management Program arterial monitoring intersections where a project would add 50 or more trips and Congestion Management Program mainline freeway monitoring locations where a project would add 150 or more trips during either the morning or afternoon weekday peak hours.

As outlined on page 71 of the Traffic Study, based on the estimated Project trip-generation forecast and the assignment of Project traffic volumes shown in Figures 10A, 10B, and 10C, there would be fewer than 150 A.M. or P.M. peak hour trips distributed to the freeways in the Project area; therefore, the Project's Congestion Management Program freeway impacts are considered to be less than significant and no further analysis is required based on the Congestion Management Program guidelines, significance criteria, and methodology. The Congestion Management Program arterial monitoring stations closest to the Project Site include the intersections of Santa Monica Boulevard & Highland Avenue (approximately one and one-half miles south of the Project Site) and Cahuenga Boulevard & Lankershim Boulevard (approximately two and one-quarter miles northwest of the Project Site). Based on the Project trip-generation forecast, there would be nominal Project trips traveling past these Congestion Management Program arterial monitoring stations during either the weekday morning and afternoon peak hours. Therefore, the Project's Congestion Management Program arterial impacts are considered to be less than significant, and no further analysis is required for these arterial monitoring stations.

As previously described, the Draft EIR does acknowledge that the number of annual events at the Ford Theater would increase and therefore the nearby residents would experience an increase in traffic on the area streets on more days per year than occurs

today. The Draft EIR traffic impact analysis showed that the Project did not create any significant impacts on those busy days.

Comment No. 10-30

Rather than declaring they are exempt from further analysis, I would suggest the project team looks at this as an opportunity to trigger a multi-jurisdictional or multi-agency project to make significant changes in streets and/or highways that make improvements in capacity that in turn reduces exponentially the traffic congestion. Stated differently, BE A LEADER!

Response to Comment No. 10-30

The comment regarding opportunities to trigger a multi-jurisdictional project to make changes in the City of Los Angeles streets to increase capacity to reduce the traffic congestion will be provided to the decision makers prior to consideration of Project approval.

Comment No. 10-31

As mentioned during the public hearing and again in my letter date 3/11/2014, this is an opportunity for a key development project to take a bold step and produce a truly innovative approach to traffic congestion and corresponding mitigations. This could be a project that uses creative solutions, collaboration amongst multiple agencies and multiple interests for the greater improvement of traffic congestion in the Cahuenga Pass. There is great interest by the bike Czar to implement bike paths in the Cahuenga Pass

A. Obviously, LA City and LA County can provide contributions to improve the streets to alleviate congestion. And, they are key stakeholder for this project.

B. In the past year, there is a large push to implement bike lanes through the Cahuenga Pass. This area is critical and is considered the “backbone” to join the valley with the city. As a result, there is a vested interest in adding bike lanes. Due to the congestion we cannot afford to trade traffic lanes for bike lanes. Need to figure out a way to maintain or enhance the traffic lanes and add bike lanes. This is an opportunity to work with the Bike Czar and the Major to figure out a creative solution so we maintain traffic lanes and widen the street (and add bike and pedestrian routes).

C. One idea proposed is to cantilever over the slopes above the Hollywood Freeway to widen both Cahuenga West and East. The response received was that would “cost too much money”. My response to that is that it depends upon how much

the projected change is wanted or needed. This could be accomplished by a multi-jurisdictional project.

D. There are other stakeholders who have a vested interest in a solution who may want to sign up to contribute to the solution. I am thinking of the City of Hollywood, City of Burbank, MTA, Hollywood Bowl (LA Philharmonic), Trizacon Complex (Hollywood and Highland), Universal Studios, Warner Brothers, and other entertainment companies just to name a few.

Response to Comment No. 10-31

Thank you for your comment regarding opportunities to improve streets and alleviate congestion, implementation of bike lanes through the Cahuenga Pass, cantilevering over the slopes of the Hollywood Freeway, and other stakeholders with interest in the community. Your comment will be provided to the decision makers prior to consideration of Project approval.

Comment No. 10-32

Seize the opportunity. This project could be held up as shining example of how projects could be run in a way to improve congestion and circulation in difficult economic times. If you pull the resources and partner with other agencies in the city and county might be ripe for solution that could provide a larger solution.

Based on my participation on February 18th and June 23rd a review of the Ford Theatre Project Draft EIR these are my comments/recommendations and questions to continue shaping the Draft EIR. Basically, things to consider based on unique aspects of the Cahuenga Pass where the Ford Theatre resides.

Response to Comment No. 10-32

Thank you for your comment. Your comment letter will be provided to the decision makers prior to consideration of Project approval.

Comment Letter No. 11

Stephen DeCordova
2336 Lorenzo Dr.
Los Angeles, CA 90068-2726

Comment No. 11-1

I live at 2336 Lorenzo Drive, on the back side of the hill behind/around the Ford Theater stage. For years, my neighbors and I have worked to keep the county apprised of homeless encampments on the hillside above our homes. Their cooking fires are a great danger to our entire neighborhood, especially during our constant dry weather. Their unsightly, unhealthy garbage is also a problem. The Ford Theater hiking trail has been one of the primary sources of access to the hillside for these people.

Response to Comment No. 11-1

As described on page II-5 of Section II, Project Description, of the Draft EIR, there are no designated hiking trails within the Project Site. However, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails. The County continues to work with the surrounding community and the Sheriff's Department to prohibit the use of the existing unofficial trails. Please see the responses below concerning the proposed formal trail that is a part of the Project.

Comment No. 11-2

The county has responded to our information and requests with repeated sweeps removing these people from the hillside. It has been our hope that the hiking trail would be closed. Are we really going to "improve" the trail and ensure its continuance? Does the Ford Theater really need a hiking trail to justify it's existence?

I am in favor of rehabilitation of the Amphitheater and development of new facilities for the performing arts at the Ford, but I am vehemently opposed to any further development of the hiking trail. In the interest of public safety, please consider amending your plans to include shutting down the hiking trail, and fencing off all public access points to the adjacent hillside areas.

Response to Comment No. 11-2

As described on page II-19 of Section II, Project Description, of the Draft EIR, the Project proposes a 0.75-mile ridgeline hiking trail which may utilize portions of existing

user-established informal trails. As shown in Figure II-4, Overall Conceptual Site Plan, on page II-13 of the Draft EIR, the majority of the section of the proposed trail that begins at the southern trailhead off the Ford Terrace and continues uphill to the area where the cross is situated would be located downslope of the ridgeline; thus, physically separating trail users from residences. In addition, with the establishment of a formal trail, the County would observe standard park hours of operation for use of the trail of sunrise to sunset. As discussed in Section IV.J.2, Public Services—Police Protection, of the Draft EIR, as part of the Project, Project Design Feature J.2-2 would require the implementation of security measures that would deter transients from using the hiking trail such as securing the proposed public restroom, which would be located at one of the trail heads, after hours to prevent use by transients and providing signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail would also be well-marked to prevent users from getting lost and the brush next to the trail would be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas would not be provided along the trail. The entire length of the trail would be monitored for litter and violation of use twice daily, once in the morning and once before closing of the trail by Ford Theatres maintenance staff. Trail maintenance would be conducted by the Parks Trails Unit as needed.

As provided on page II-11 of Section II, Project Description, of the Draft EIR, one of the Project's key objectives is to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views of surrounding iconic landmarks from a formal trail within the park boundary. The proposed hiking trail would achieve this key objective of the Project.

This comment expressing opposition to the development of the hiking trail will be provided to the decision makers prior to consideration of Project approval.

Comment Letter No. 12

Marci Diller
2370 San Marco Dr.
Hollywood, CA 90068-2735

Comment No. 12-1

I came to the meeting with concerns over hiking trail, more people/traffic, and proper spending for renovations/improvements. I am leaving very encouraged and excited to watch Ford grow. I look forward to becoming more involved. ☺

Response to Comment No. 12-1

This introductory comment acknowledges attendance at the Public Meeting conducted during the public review period for the Draft EIR and support for the Project. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. 12-2

Concern is protecting our Hwd Hills wildlife.

Response to Comment No. 12-2

Potential Project impacts to wildlife in the surrounding hillsides are evaluated in Section IV.D, Biological Resources, of the Draft EIR. As summarized on page IV.D-26 of the Draft EIR, there are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the Biological Study Area is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Furthermore, development of the Project would occur primarily within the developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. Additionally, in accordance with Mitigation Measure D-9, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, Project impacts with regard to wildlife movement were determined to be less than significant.

Comment Letter No. 13

Joyce and Stanley Dyrector
6866 Iris Cir.
Hollywood, CA 90068-2716

Comment No. 13-1

Please address the following concerns in the EIR

The Designs done by Brenda Levin were beautiful and I have no comments to make about that. My main comments have to do with Traffic, although I have concerns over what will happen during construction to the wildlife in the area.

Response to Comment No. 13-1

This introductory comment supports the Project design by Levin and Associates and notes the main concerns regarding the Project are traffic-related. Specific comments regarding the Draft EIR are provided and responded to below.

Potential impacts to wildlife during construction are discussed in Section IV.D, Biological Resources, of the Draft EIR. As evaluated on page IV.D-16 through IV.D-17 of the Draft EIR, implementation of Mitigation Measures D-3 through D-7 would reduce potential impacts to sensitive wildlife species potentially on the site, including the coastal California gnatcatcher; migratory birds, nesting birds, and raptors; the coast horned lizard and the San Diego desert woodrat; and certain bat species to a less than significant level.

Comment No. 13-2

Cahuenga east is a heavily trafficked road which is at times is either a one or two lane road traveling north from Odin to Barham. There is only one lane of traffic going south from the Pilgrimage Bridge to Odin. The Bridge is the only east west access into the Ford Theatre area and it is very antiquated and frequently backed up with north and south bound traffic on Highland turning east to go from Cahuenga West to Cahuenga East.

During construction this intersection will become more of a nightmare than it is now. The designated times for rush hour(s) cannot be applied since our traffic begins before, during, and after so called rush hour(s). The light at Cahuenga and Odin backs up traffic all the way south, sometimes as far south as Santa Monica Blvd, but most often to Fountain. And this is when there is NO event at the Bowl.

I would suggest a very long and hard look at how you are planning to deal with this during the construction phase. Trucks going in and out of the property will most likely cause a problem, not just to the surrounding neighborhoods but to the general public who use Cahuenga as a pass thru to Burbank and the Valley. The word needs to get out before construction for people to avoid the area and take another route. The people who live here have no choice, but you need to give choices to the others, much like what was done during the 405 construction. Lot's of publicity. Signs placed far enough south and north telling people to avoid the area. And no construction during Bowl season and their pre Bowl events or post Bowl events.

Response to Comment No. 13-2

The Draft EIR addressed traffic, access and parking in Section IV.K, Traffic, Access and Parking, with supporting technical data and analysis provided in the Traffic Study included as Appendix L of the Draft EIR. As shown in Figure IV.K-1 on page IV.K-10 of the Draft EIR, the traffic study evaluated potential traffic-related impacts at intersections along the corridors referenced in the comment (i.e., Cahuenga Boulevard East, Pilgrimage Bridge, Odin Avenue, etc.). As discussed in Section IV.K, Traffic, Access and Parking, of the Draft EIR, the incremental increase in traffic generated by the Project would not create significant impacts at any of the study intersections under any of the analyzed peak hours using the significance impact criteria established by the City. Therefore, Project impacts on intersection operations were found to be less than significant.

Traffic studies focus on the time periods in which congestion is at its greatest levels, during what is known as the "peak period" of traffic, which generally corresponds to one to two-hour segments on a weekday during the morning and afternoon commuter periods and the midday period on a weekend. As the attendance and traffic volumes associated with the Ford Theatres is the highest during evening events, an analysis of both the weekday and weekend "pre-event" peak hour was conducted in addition to the weekday morning and afternoon commuter periods and weekend midday period. As described on page IV.K-13 of the Draft EIR, to identify the weekday morning and afternoon peak hour and weekend midday peak hour, as well as the weekday and weekend "pre-event" peak hour for each intersection, traffic counts were taken at the study intersections during the weekday morning and afternoon commuter peak periods (7:00 A.M. to 10:00 A.M. and 4:00 P.M. to 6:00 P.M.) and during a weekend midday peak period (11:00 A.M. to 1:00 P.M.), as well as during the weekday and weekend evening pre-event peak period (6:00 P.M. to 9:00 P.M.).

Construction-related traffic is addressed in Section IV.K, Traffic, Access, and Parking of the Draft EIR and further described in Chapter 13 of the Traffic Study. Pursuant to Project Design Feature K-1, as part of the Project, a Construction Management Plan would be prepared and implemented, which would outline the traffic control measures to be

implemented, haul routes and staging plans, etc., as necessary and satisfactory to the County. The Construction Management Plan would be based on the nature and timing of the specific construction activities, including scheduling construction-related deliveries, haul trips, etc., so as to occur outside of the weekday commuter peak hours to the extent feasible. With implementation of Project Design Feature K-1, impacts associated with construction traffic and parking would be less than significant.

Comment No. 13-3

Also the neighborhood would not be in favor of more concerts that bring more traffic into our already over congested streets.

Response to Comment No. 13-3

The increase in traffic due to the Project is addressed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR. As concluded in that analysis, implementation of the Project would not result in any significant traffic impacts in the study area during any of the analyzed peak hours. In addition, pursuant to Project Design Feature K-2, as part of the Project, the start times of events to be held in the Amphitheatre and the 299-seat theatre would be staggered on weekday evenings and, per Project Design Feature K-3, a Parking and Traffic Management Plan would be implemented to manage traffic and parking during events. These project design features have been incorporated to minimize the effect of parking and traffic on the surrounding street system. The comment describing the neighborhood's position on additional concerts with more traffic will be forwarded to the decision makers prior to consideration of Project approval.

Comment Letter No. 14

Wendy Horowitz
horowitz@lapl.org

Comment No. 14-1

I live on Cahuenga Terrace by the Ford Theater and my property sits right behind a trail that leads up to the Pilgrimage Cross. For decades, I've lived in constant fear of brushfire because homeless persons regularly use the hiking trail to set up tents and encampments where they smoke and cook and drink. I read that the Ford Theater plans to enhance the hiking trail and I want to urge you to reconsider this as it puts all of us living in the Hollywood Dell in danger.

After years of campaigning with the police and fire departments, we finally got a No Tresspassing sign, with the municipal code listed, put up in the path of the trail. Therefore, it is now officially unlawful to access that area. Why would the Ford Theater flagrantly disregard the law?

Response to Comment No. 14-1

As described on page II-5 of Section II, Project Description, of the Draft EIR, there are no designated hiking trails within the Project Site. However, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails. The County continues to work with the surrounding community and the Sheriff's Department to prohibit the use of the existing unofficial trails. It is noted that as the surrounding hillsides are public land the existing "No Trespassing" signs are not appropriate. Signs for use control such as "Do Not Go Beyond This Point" or "Over Night Camping Prohibited" and "No Camp fires or Smoking" etc. as well as hours of operation for the trail are available for public use and would replace the "No Trespassing" signs.

As described on page II-19 of Section II, Project Description, of the Draft EIR, the Project proposes a 0.75-mile ridgeline hiking trail which may utilize portions of existing user-established informal trails. As shown in Figure II-4, Overall Conceptual Site Plan, on page II-13 of the Draft EIR, the majority of the section of the proposed trail that begins at the southern trailhead off the Ford Terrace and continues uphill to the area where the cross is situated would be located downslope of the ridgeline; thus, physically separating trail users from residences. In addition, with the establishment of a formal trail, the County would observe standard park hours of operation for use of the trail of sunrise to sunset. As discussed in Section IV.J.2, Public Services—Police Protection, of the Draft EIR, as part of the Project, Project Design Feature J.2-2 would require the implementation of security

measures that would deter transients from using the hiking trail such as securing the proposed public restroom after hours to prevent use by transients and providing signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail would also be well-marked to prevent users from getting lost and the brush next to the trail would be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas would not be provided along the proposed trail. The entire length of the trail would be monitored for litter and violation of use twice daily, once in the morning and once before closing of the trail by Ford Theatres maintenance staff. Trail maintenance would be conducted by the Parks Trails Unit as needed.

Comment No. 14-2

I unfortunately am working the night shift on Monday, July 14, or I would raise my concerns at the information meeting, but I did ask my neighbors to attend, so I hope this component of the expansion plan will be explained in detail as well as safety issues realting to it.

Response to Comment No. 14-2

Thank you for your comment and these concerns have been raised. Please refer to Response to Comment No. 14-1 above, regarding the security measures to be implemented along the proposed hiking trail.

Comment No. 14-3

Please undertsand that I am happy that the Ford will get needed improvements and increased space, but there is no need to invite trouble, and frankly grave danger, with a new and improved hiking trail in a brush fire zone where homes are only yards away.

Thank you very much for your consideration,

Response to Comment No. 14-3

As discussed on page IV.J.1-15 in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, given the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan

Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system.

Comment Letter No. 15

Greg Johnson
6728 Hillpark Dr.
Los Angeles, CA 90068-2170

Comment No. 15-1

i am happy to see that there will be a nice and overdue improvement for the theater. I am a resident in the pass, at the Highlands complex across the 101 from the Ford.

Response to Comment No. 15-1

Thank you for your support for the Project. Your specific comments regarding the Draft EIR are provided and responded to below.

Comment No. 15-2

I have a great concern what the traffic will be like when this project in happening. Just a quick question. will the pilgrimage bridge be replaced or widened for the influx of new traffic that will be coming to ford.

Response to Comment No. 15-2

The Draft EIR evaluated both construction and operational traffic for the Project and concluded that with the inclusion of project design features there would be no significant impact on traffic. Potential traffic impacts during construction of the Project are discussed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR. As discussed on page IV.K-23 through IV.K-25 of the Draft EIR, the Project would be constructed in several phases and may be completed as early as 2020. To provide a worst-case analysis, the Project's traffic analysis assumed the Project would be constructed in a single phase. The Project construction would comply with County Code requirements, which prohibits noise-generating construction activities between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays if such noise would create a noise disturbance across a residential or commercial real-property line. As part of the Project, it is anticipated that most, if not all, of the construction worker trips would occur outside of typical commuter peak periods since the hours of construction typically require workers to be on-site before the weekday morning commuter peak period and depart before or after the afternoon commuter peak period (i.e., arrive at a site prior to 7:00 A.M. and depart before 4:00 P.M. or after 6:00 P.M.). Based on the proximity of the Hollywood Freeway to the Project Site, it is anticipated that haul trucks and delivery trucks would access the Project Site traveling northbound on

Cahuenga Boulevard East from the Hollywood Freeway (US-101) and would exit the Project Site onto Cahuenga Boulevard East and travel northbound on Cahuenga Boulevard East to the Hollywood Freeway. During the most intense construction phase, it is anticipated that construction activities would generate approximately 176 daily construction worker trips. In addition, based on a passenger car equivalency factor of 2.0, the 64 haul truck trips per day and the 30 daily delivery truck trips would be equivalent to 188 passenger car trips per day. Therefore, Project construction could generate a total of approximately 364 trips per day based on the construction phase. However, given the typical construction hours the Project would comply with, the majority of these trips would occur during off-peak hours. As such, Project construction would not be expected to result in a significant impact at any of the analyzed intersections. In addition, the Project would include implementation of a Construction Management Plan to minimize the amount and effect of construction traffic. As outlined in Project Design Feature K-1, the Construction Management Plan would prohibit construction workers, haul trucks and delivery trucks from parking, staging, or queuing along the surrounding residential streets.

As summarized on page IV.K-38 of the Draft EIR, the Project would result in less than significant impacts to traffic. As such, no mitigation measures are required. The Project does not propose to replace or widen the existing Pilgrimage Bridge.

Comment No. 15-3

i know the city is planning on taking away one lane of Cahuenga West traffic for a bike lane. That in itself seems rather frightening, especially during Bowl season.

Please advise and thank you,

Response to Comment No. 15-3

The existing and future bicycle facilities are addressed in Section IV.K, Traffic, Access, and Parking, of the Draft EIR and is further described in Chapter 3, Existing Conditions (page 20), and Chapter 4, Future without Project Traffic (page 34), of the Traffic Study contained in Appendix L of the Draft EIR. Any City of Los Angeles proposal to change Cahuenga Boulevard West is beyond the scope of the proposed Ford Theatres Project and would be the subject of a separate environmental review. The comment related to the City's potential removal of a travel lane on Cahuenga Boulevard West to accommodate a bike lane will be forwarded to the decision makers prior to consideration of the Project.

> On the third page of the attachment, Board meeting transcript 12-18-12, numbered page 25, Supervisor Yaroslavsky's comments are not properly identified. He is the speaker, who addresses the Chair on line 14 to the end of the page. Inadvertent or not, this error should be corrected by the Executive Office. Supervisor Yaroslavsky deserves credit for responding to CRD3's concern about how, specifically, we were spending the 17 million dollars earmarked for the Ford. {This does not include the raise for Mr. Davis and the recent $7500 gift}
>
> *YAROSLAVSKY: "The scope of the work to be implemented by the Foundation includes the repair and or replacement of performance equipment, fixtures and infrastructure, including heating, ventilation and air conditioning, utilities and fire protection systems. That is essentially the project, the first phase of the project. The CEO Board letter more than adequately addressed the scope of the work. Thank you."*
>
> Ask yourself, if your mother reported that she was spending another $17 million dollars to repair or replace 'performance equipment, fixtures and infrastructure' if the above description would be sufficient.

There is a big difference between repairing an air conditioner and installing a brand new one. Remember, the 1200 seat amphitheatre is an outdoor facility, so its safe to say the 'heating, ventilation and air con' referred to by the Supervisor is for the 87 seat [Inside] theatre.

Joel, if you could send me a copy of the master plan and all of it's phases, it would make the project go down smoother for the public. The devil is in the details and we do have to let the chips fall where they may, but arts supporters everywhere want to know what specifically is happening and what mechanism is in place for the selection of a restaurateur etc. Hopefully not more Patina group who have fallen down in quality as they've expanded.

If you don't respond appropriately by directing me to the documents online or sending them on in PDF I could widen out the reach of this inquiry. Levin must be very well-respected and could have someone in her office forward over something with Zev's permission.

Cheers.

Eric Preven
The County Resident from District 3

CRD3: "ITEM NO. 12 IS THE FORD AMPHITHEATER, WHICH I, FRANKLY, CHERISH, AND WE ARE SPENDING 10 MILLION OR ALMOST 10 MILLION ON MORE UNSPECIFIED UPGRADES. LAST YEAR WE SPENT APPROXIMATELY 6 OR 7 MILLION ON UNSPECIFIED UPGRADES. HERE'S MY TINY LITTLE RESIDENT REQUEST. COULD WE SPECIFY WHAT THOSE UPGRADES ARE? BECAUSE THEN I THINK IT WOULD BE EASIER TO FOLLOW AND ENJOY AS THESE THINGS BLOSSOM. FOR EXAMPLE, I THINK WE WERE VERY CLEAR ABOUT THE YAROSLAVSKY RESTROOM AT THE HOLLYWOOD BOWL ACROSS THE STREET. AND I JUST THINK IT'S NICE TO KNOW WHAT WE'RE FIXING UP BECAUSE IT WAS NOT IN THE DOCUMENTATION.

Wow! The below upgrade at the classic Capitol in Port Chester, only cost $2 million!!!
December 31, 2012, 2:48 pm2 Comments

Promoter Who Revamped Capitol Theater Buys It

The concert promoter who revitalized the Capitol Theater in Port Chester, N.Y., this year as a rock music hall has bought that landmark building from its previous owner. The promoter, Peter Shapiro, who is also a partner in the Brooklyn Bowl, said he paid $11.5 million for the 1,800-seat theater, closing a deal on Friday with the previous owner, Marvin Ravikoff.

Mr. Shapiro had been leasing the building, which in recent years Mr. Ravikoff rented out for only corporate events and private parties. But last summer Mr. Shapiro spent more than **$2 million refurbishing the space and installing a modern lighting and sound system** with an eye toward restoring its status as a rock-'n'-roll mecca.

Since September, when the theater reopened with a Bob Dylan concert, Mr. Shapiro has promoted more than 50 rock shows, showcasing acts including My Morning Jacket and Fiona Apple, and a well-received series of reunion shows by the Rascals. "I'm doubling down," Mr. Shapiro said. "I decided to have this theater for the rest of my life."

A version of this article appeared in print on 01/01/2013, on page C2 of the NewYork edition with the headline: Promoter Buys Capitol Theater.

WHITNEY ENGERAN CORDOVA: HI. GOOD MORNING, MR. CHAIRMAN, MEMBERS OF THE BOARD. MY NAME IS WHITNEY ENGERAN CORDOVA, I'M SENIOR DIRECTOR OF PUBLIC HEALTH FOR A.I.D.S. HEALTHCARE FOUNDATION. I'M SPEAKING TO ITEMS 25 AND 26, SOLE-SOURCE CONTRACTS FOR SERVICES. A.H.F. HAS INDICATED, A.I.D.S. HEALTHCARE FOUNDATION HAS INDICATED IN A LETTER TO DR. FIELDING DATED DECEMBER 17, 2012, OBJECTS TO SOLE-SOURCE CONTRACTS WITHOUT BIDS FOR THESE SERVICES. WE HAVE FILED A PROTEST, BELIEVE THAT THEY ARE PROCEDURALLY FLAWED AND BAD POLICY AND ASK THAT THEY BE WITHDRAWN. WE HAVE HEARD FAR TOO MANY TIMES FROM D.H.S.P. THAT DEADLINES ARE APPROACHING OR THAT THERE'S INSUFFICIENT TIME TO DO A PROPER BID. THESE EXCUSES SHOULD NOT OVERRIDE THE PUBLIC'S INTERESTS AND WE HOPE THAT THE BOARD WILL EXERCISE OVERSIGHT IN MAKING D.H.S.P. ACT MORE RESPONSIBLY AND DO THAT WHICH THEY ARE CONSTITUTED TO DO, BID AND PURCHASE SERVICES FOR THE CITIZENS OF LOS ANGELES COUNTY IN ACCORDANCE WITH THE LAW AND PRACTICES ESTABLISHED WITHOUT ABUSING IT OR YOU WITH THESE REQUESTS. THANK YOU FOR YOUR ATTENTION.

SUP. KNABE: THANK YOU, WHITNEY. WOULD THE DEPARTMENT LIKE TO RESPOND, PLEASE? MR. FIELDING OR SOMEONE FROM HIS STAFF HERE TO RESPOND?

CYNTHIA HARDING: GOOD MORNING. THIS IS CYNTHIA HARDING, DEPUTY DIRECTOR FOR THE DEPARTMENT OF PUBLIC HEALTH. AND WE UPHOLD OUR RECOMMENDATIONS TO THE BOARD TO APPROVE THESE SOLE- SOURCE CONTRACTS THAT WERE PULLED TOGETHER AND DEVELOPED. FOLLOWING ALL OF THE BOARD'S POLICIES AND QUALIFICATIONS, WE FEEL THAT THE AGENCIES WE'RE RECOMMENDING HAVE A UNIQUE SET OF QUALIFICATIONS AND EXPERTISE TO PROVIDE THE SERVICES OUTLINED IN THE SCOPES OF WORK AND THEREFORE BELIEVE THAT WE HAVE NOT VIOLATED ANYTHING IN PRESENTING THEM TO YOU FOR RECOMMENDATION TODAY.

SUP. RIDLEY-THOMAS, CHAIRMAN: ALL RIGHT. THANK YOU VERY MUCH. ANY FURTHER COMMENT ON IT? SUPERVISOR YAROSLAVSKY?

SUP. YAROSLAVSKY: WE'RE STILL IN THE MULTIPLE ITEMS, CORRECT?

SUP. RIDLEY-THOMAS, CHAIRMAN: YES. WE ARE IN MULTIPLE ITEMS. ARE WE DONE WITH?

SUP. KNABE: THIS IS REGARDS 25 AND 26.

SUP. YAROSLAVSKY: I WANT TO ADDRESS SOMETHING ON ITEM 12.

SUP. RIDLEY-THOMAS, CHAIRMAN: YES. ON THE MATTER OF SOLE-SOURCE, I THINK IT CAME UP AT THE LAST BOARD MEETING

PERTAINING TO THE DEPARTMENT OF HEALTH SERVICES. I THINK THE REQUEST WAS MADE TO GET FEEDBACK FROM THE SAID DEPARTMENT REGARDING ANY PATTERN OF SOLE SOURCING AND THE PREPONDERANCE OF SUCH. THE SAME MAY BE APPLICABLE IN THE CASE OF THE DEPARTMENT OF PUBLIC HEALTH. SO, MR. FUJIOKA WITH RESPECT TO THOSE TWO OFFICES -- MR. FUJIOKA? WITH RESPECT TO THOSE TWO OFFICES IN TERMS OF SOLE SOURCE, IT MIGHT BE USEFUL FOR A REPORT TO COME BACK TO EACH BOARD OFFICE AS TO THE PREPONDERANCE OR THE PATTERN OF SOLE SOURCING. IT WOULD BE USEFUL FOR THE BOARD TO HAVE KNOWLEDGE OF THE SAME. THAT WAS REQUESTED REGARDING D.H.S. LAST WEEK, DEPARTMENT OF PUBLIC HEALTH THIS WEEK. SO WHEN WE RETURN, IF YOU COULD GIVE AN UPDATE TO THE BOARD, IT WOULD BE USEFUL. THANK YOU VERY MUCH. SUPERVISOR YAROSLAVSKY, YOU WANTED TO RAISE AN ISSUE? MR. CHAIRMAN, I JUST WANTED TO VERY SUCCINCTLY ADDRESS THE COMMENTS THAT WERE MADE ON ITEM NO. 12. IN THE C.E.O.'S BOARD LETTER, THIS IS ON THE JOHN ANSON FORD THEATER, I'LL JUST QUOTE FROM PAGE 2. THE SCOPE OF WORK TO BE IMPLEMENTED BY THE FOUNDATION INCLUDES THE REPAIR AND/OR REPLACEMENT OF PERFORMANCE EQUIPMENT, FIXTURES AND INFRASTRUCTURE, INCLUDING HEATING, VENTILATION AND AIR CONDITIONING UTILITIES AND FIRE PROTECTION SYSTEMS. THAT IS ESSENTIALLY THE PROJECT, THE FIRST PHASE OF THIS PROJECT. THE C.E.O. BOARD LETTER MORE THAN ADEQUATELY ADDRESSED THE SCOPE OF THE WORK. THANK YOU.

Response to Comment No. 16-1

This comment transmits the referenced email and attachments of other emails of dates between December 2012 and January 2013. This introductory comment does not raise any environmental issue regarding the Draft EIR, for which public outreach during scoping and public outreach prior to the preparation of the Draft EIR occurred in February 2014, and public comment on the Draft EIR occurred June through August 2014. As requested, the attachments have been printed and included with the full text of these commentsand will be provided to the decision makers prior to consideration of Project approval.

I now have the master plan and budget documents for the dream Zev is trying to make reality.

January 26, 2013

As Open as the Genre It Celebrates

By **NATE CHINEN**

SAN FRANCISCO — Hours before the opening-night concert for the SFJazz Center here on Wednesday, Randall Kline stood on the floor of the Robert N. Miner Auditorium and briefly slipped into reverie. Onstage, a few feet away, the pianist McCoy Tyner and the vibraphonist Bobby Hutcherson were testing out acoustics and rekindling a partnership; others scurried about, giving the room an expectant hum.

“I’m sorry, you’ll have to excuse me,” said Mr. Kline, the founder and executive artistic director of SFJazz, as he took it all in, finally snapping some pictures with his phone. “We’ve been working toward this moment for so long, it almost feels surreal.”

In one sense he was referring to the history of SFJazz, a presenting organization that began as a weekend festival called Jazz in the City in 1983 and now ranks among the leaders in its field. But he was also speaking more tangibly about the center, a $64

million, 35,000-square-foot building that suggests a physical manifestation of his organization's ideals.

An approachable three-story structure in glass and concrete, the SFJazz Center is being billed as the nation's first free-standing building created for jazz. And if the careful wording of that claim suggests a hedge against comparisons with Frederick P. Rose Hall — the $128 million home of Jazz at Lincoln Center, ensconced within the Time Warner Center in Manhattan — it hardly diminishes the extraordinary scope and promise of SFJazz's achievement.

"It's an impressive building, and has a certain grandeur," said the saxophonist Joshua Redman on Wednesday. "But it also feels kind of down-to-earth, and like it's part of the neighborhood." (Mr. Redman, a former artistic director of SFJazz, happened to be warming up in the center's Joshua Redman dressing room.)

The jazz circuit in this country has always relied on a network of nightclubs, but there are far fewer now than there once were — and not just in San Francisco, which counts Yoshi's as the exception that proves the rule. For 30 years SFJazz was nomadic, using spaces like the Herbst Theater and Grace Cathedral. Mr. Kline began thinking about a dedicated home more than a decade ago, eager to solidify an identity and establish a consistent standard of production.

In 2004 he shared his vision with the Bay Area architect Mark Cavagnero. After weighing options like a partnership with the San Francisco Symphony, they set their sights on a property occupied by an auto repair shop in the emergent-chic Hayes Valley neighborhood (and just a block away from Davies Symphony Hall). Mr. Cavagnero began drawing up designs.

But the idea of a purpose-built structure wasn't necessarily an easy sell with the SFJazz board: as some members pointed out, the organization had flourished for years without it. One thing that helped Mr. Kline's cause was the focus and passion of his argument about permanence; another was a lead gift of $20 million, which he had secured from an anonymous benefactor.

One core principle for the new building, through many rounds of planning, was that it would be a community center as much as a concert hall. To that end, the glass exterior conveys a literal and conceptual transparency, while the second-floor lobby is bracketed by bars and balconies. (A pair of commissioned murals depicting jazz scenes, by the artists Sandow Birk and Elyse Pignolet, adorn the lobby walls.) The Joe Henderson Lab, a secondary 80-seat performance space that will accommodate workshops and other gatherings, sits at ground level, its goings-on visible to passers-by.

And while a street-level cafe called South at SFJazz won't open for business until next month, it will be run by Charles Phan, the influential chef and owner of the Slanted Door restaurant group. It will be open all day, serving customers who aren't SFJazz patrons, which Mr. Kline said was the point.

As for the feel of the auditorium, Mr. Cavagnero said, "I started looking at these Unitarian churches, because they're places that are about people meeting, and there is no formal power relationship; it's about everyone being equal."

He said he drew particular inspiration from Frank Lloyd Wright's Unity Temple and Louis Kahn's First Unitarian Church, adopting similar proportions for the hall. Its steeply raked seating plan offers good sightlines, and even a sense of intimacy, from just about every vantage. (One row of balcony seats, which peers down from behind the stage, is likely to become a prized perch for music students looking to get inside the action.)

Mr. Kline, whose own set of references included a range of nonsacramental spaces like the Brooklyn Lyceum and the Fat Cat in Greenwich Village, put it this way: "We wanted the focused feeling of a concert hall but the relaxed proximity of a club."

The sound in the cubelike auditorium, which was designed with input from the theater consultant Len Auerbach and the acoustician Sam Berkow, runs toward the drier end of the spectrum: generally better for jazz than the reverberant standard of a classical hall, which can drown a group in cymbal wash. Wooden slats running along the walls disperse sound while adding a low-key visual flair.

It will take a little while for sound technicians to get to know the room; during Wednesday's concert, which featured an honor roll of musicians with established ties to SFJazz, there were some inconsistencies. But the natural drum sound was a winner: Jeff Ballard came across crisply behind Mr. Redman and the tenor saxophonist Joe Lovano on "Blackwell's Message," a tune by Mr. Lovano. And there was a pristine hush in the air during a first-time duet by the pianist Chick Corea and the guitarist Bill Frisell.

Wednesday was the kickoff for an opening-week festival that also featured concerts by Mr. Tyner, Mr. Hutcherson, the SFJazz Collective and the organization's five resident artistic directors this season: Mr. Frisell, the violinist Regina Carter, the pianist Jason Moran, the alto saxophonist Miguel Zenón and the percussionist John Santos.

The programming — not just this week but throughout a 30th-anniversary season that will feature multi-night appearances by the pianist Brad Mehldau, the fado singer Ana

Moura, the tabla player Zakir Hussain and the banjoist Béla Fleck — speaks to an inherent curiosity in the SFJazz psyche, an eagerness to tease out unlikely connections. (One immediately talked-about component of Mr. Moran's residency, in May, will be an improvised collaboration with local skateboarders.)

And to the extent that the SFJazz Center has enabled that breadth of style and approach, it disarms the very comparisons it invites. Jazz at Lincoln Center, taking its cue from Wynton Marsalis, its artistic director, has always used its programming to express a firm conviction about what jazz is (and by strong implication, what it isn't — or what isn't it). Mr. Kline and his team aren't naturally inclined toward that definitive sort of mission, and it's fortunate that they don't have to be.

A permanent home is a sign of hard-fought maturity; it demands that an organization be understood on its own terms. That will increasingly be the case for SFJazz — and yet the bicoastal symmetry has its uses, at least for now.

"Jazz at Lincoln Center has been incredibly successful," said Mr. Redman, "and if SFJazz can be successful, maybe one of the legacies will be that in the foreseeable future, they won't be the only two. There'll be other venues, other buildings for jazz that can enter the discussion. I think that would be fantastic."

Do you happen to have the drawings I gave you last year? The Zev Anson Ford is back in a robust way tomorrow at item 12 tomorrow -- $76,464,000 in Cap Improve money is a lot!!!

It's way too much… and sneaky. Or maybe it's not sneaky. Is someone covering this?

Each of the last years, Zev has been squirreling away this and that…. see below. But the County Arts money… should not be poured into a place across from Hollywood bowl…
that will never quite be all that.... It's nice as is as a piece of faded glory. What is actually going on is a fancy parking lot and office structure… for the Arts Dept.

The Zev Signature series is expensive… really expensive. Tx $80, $60, $40 ?

Young Musicians Foundation: *Gamer Jams: Music Behind the Screen*
FRI Sept. 27, at 8:30PM

Pairing classical music with pop culture, **Young Musicians Foundation** offers a one-of-a-kind show as they highlight a rich but often overlooked component of the video game industry. Led by conductor **Roger Kalia**, the 65-member youth orchestra will perform the soundscapes of popular video games in *Gamer Jams: Music Behind the Screen*. Audiences will be immersed in the digital world of the ultimate pop medium through a display of live music, synchronized lighting and video projection.

Tickets: $80, $60, $40
Subscribers & Friends of the Ford: $64, $48, $32

The following bits caught my attention:

May 29, 2012 - Wendell (Adam) Davis salary supplement ($ amount unknown):
http://file.lacounty.gov/bos/supdocs/68684.pdf

July 3 2012 - $7.5 million
http://file.lacounty.gov/bos/supdocs/69569.pdf

Sept. 25, 2012 - $7,500
Supervisor Yaroslavsky
Ford Theatre Foundation in the amount of $7,500 (12-4279)

Dec 18, 2012 - $9.745 million
http://file.lacounty.gov/bc/q4_2012/cms1_187901.pdf

So I filed a PRA for Master Plan - which you now have...

Things I would like to know...

How many people attended the public input meetings (2 were held)? Was a record made of the attendees and their backgrounds? One would assume these were the most self-interested members of the public. Since public dollars will fund the County's "reinvestment" in the master plan including considerable expansion of existing facilities, one would like to see a showing of real public engagement in the process rather than just the affluent patrons and staff closest to the Ford, both of whom stand to gain the most from this massive public expenditure. How were these public meetings noticed and advertised? Where were they held? Was public transit accessible for attendees?

Have any demand studies been done of whether there is really a need for this facility expansion within the County's theatre arts community (both public and private)? Considering its out-of-the-way location and poor parking capacity, wouldn't the County get a bigger bang for its buck by investing in a facility that is more connected to existing public access and does not require a huge investment in parking structures? Is there an endowment and capital campaign planned along with this in order to demonstrate a wide and deep desire for the

public to co-invest in this master plan so this does not turn out to be a white elephant that leaves the public having to pay the long-term legacy costs for an under-utilized facility? In addition to the expensive access challenges, does it make sense to invest in more use of a facility that has such big noise issues? Rather than spend gobs of money mitigating the 101 noise issues, why not invest in another County facility that doesn't present these problems in the first place? How many days does Disney Hall sit idle and likewise for other similar arts venues in LA County?

Page 12 of the master plan is hilarious - cites a need for venues "woven into the fabric of city life." The Ford will NEVER be that without a huge outlay completely out of scale for its importance to our civic life and vitality. The Ford failed as a private facility and has limped along as a viable facility only through ongoing public subsidy. Nothing suggests a private operator would ever consider making this kind of investment absent some kind of market analysis. So why should the County?

Basically this a chance for the very affluent communities around the Ford to have their own "private" community center that will suck vitality and customers from other nearby civic areas while further worsening community isolation and class segregation. Why should someone from a fancy Hollywood Hills subdivision venture to downtown LA or even Hollywood or Studio City if they can isolate themselves in their own little "arts village" nestled in the hills just a few minutes drive from their expensive homes?

Pork/Patronage opportunities for Zev and Co.:

1) Restaurant concession
2) Likely in conjunction with (1) above, a catering/private event space concession subsidised at great public expense with huge parking facility, security and landscaping - bar mitzvahs and corporate retreats will be charged top-dollar, yet the public will be unlikely to get the premium though they will be left with the economic consequences of this activity being sucked from elsewhere
3) Museum/gallery space will likely be a valuable addition to some well-to-do donor of Zev's who needs to give their pet not-for-profit something to do

This will be a big stimulus program for all the affluent kids who can't find real jobs but are happy to be buoyed by the County's generous arts programming while public safety gets cut in Montabello.

In true Zev fashion, this presents itself as an innocuous, politically correct arts boost, but it is really a massive disguised re-distribution of precious arts funding to help an already over-served area and does nothing to help the overall arts profile in the rest of the County.
Thank you.

What should be done with funds that remain unspent?

However, in the waning years of the assessment it becomes a drafting error in which the "last" 20% never gets spent. How can this problem be solved?

How does the Department of Parks & Recreation propose to administer the wind-down of Proposition A once Proposition A funding is no longer available?

by Alisa Bellinkoff Katz, Yaroslavsky's Chief Deputy...

MOTION http://file.lacounty.gov/bos/supdocs/73922.pdf

AGN. NO. ___)
M OTION BY SUPERVISOR ZEV YAROSLAVSKY January 22, 2013
By any standard, Proposition A – the Los Angeles County Safe Neighborhood Parks Propositions of 1992 and 1996 – has been a tremendous success. Hundreds of park, recreation, beach, open space, museum, senior citizen centers, and at-risk youth facilities have been bought, built, renovated and expanded in every area of the county, providing benefits to every resident and every property owner. Almost every project proposed in the measures has been completed, and we are on track to complete the rest, at the projected cost of $859 million, within the next few years. Additionally, through its keen stewardship of the program, the Regional Park & Open Space District that was created to administer Proposition A has generated $256 million worth of "Excess Funds" that have also been made available for park and open space purposes. Each of these measures imposed an assessment for a period of 22 years. The

assessment for Proposition A of 1992 will expire after fiscal year 2014-15, and the assessment for Proposition A of 1996 will expire after fiscal year 2018-19. The Regional Park & Open Space District (RPOSD), of which this Board is the Board of Directors, should consider whether and how a new park funding measure might be

implemented to take the place of Proposition A. In addition, the RPOSD should examine issues that will arise in the next few years in connection with the impending phase-out, and take action where necessary to ensure a smooth transition to whatever may come next.

These issues include the following:

A. Each of these assessments lasts for 22 years, but each also allows for a slight change in administration after 20 years. On that date, which occurs on July 1, 2013 for the 1992 assessment, the requirement to spend 80% of the assessment for capital outlay is removed. If the Board agrees, this could allow the RPOSD to recoup its full administrative costs, which have in recent years exceeded the 5% of assessment otherwise available to it.

B. The expiration of the 80% capital outlay requirement will also allow agencies to expend a portion of Excess Funds for Maintenance & Servicing, if the Board agrees.

C. The measure allows only 80% of "available" excess to be spent every year on "Excess Funds" projects. This provision was placed in the measure to ensure that funds were handled in a fiscally conservative fashion. However, in the waning years of the assessment it becomes a drafting error in which the "last" 20% never gets spent. How can this problem be solved?

D. Of the $540 million allocated for projects under the 1992 Proposition, $535 million has been committed and $518 million has been paid out. Of the $319 million allocated for projects under the 1996 Proposition, $304 million has been committed and $282.5 million has been paid out. Of the $256.6 million

made available in "Excess Funds," almost $150 million has been allocated but only $79 million has been paid out. There is also an unspent balance of approximately $47 million in the Maintenance & Servicing fund. Should a firm deadline be established for the actual expenditure of these funds? What should be done with funds that remain unspent?

E. Some funds have been allocated to agencies and so technically have been "spent" by the RPOSD; however, the monies have not actually been used to buy or build park or open space projects. Should a firm deadline be established for the actual expenditure of these funds on projects?

F. It appears likely that all funds will not have been expended before the collection of assessments comes to an end. How does the Department of Parks & Recreation propose to administer the wind-down of Proposition A once Proposition A funding is no longer available?

These and other questions should be resolved as quickly as possible so that we can ensure an orderly and successful phase-out of Propositions A of 1992 and 1996.

I, THEREFORE, MOVE that the Board direct the Regional Park & Open Space District, in consultation the CEO, County Counsel, financial advisors and consultants as necessary, to prepare the following:

1. A report summarizing the projects completed with Proposition A funding to date;
2. An assessment of the need for capital outlay to buy and build park and open space projects during the next 10 and 20 years in Los Angeles County;
3. A legal analysis of potential mechanisms to raise the funds identified in Item 2., above;
4. A report in response to the phase-out issues identified as A. to F. in the preamble to this motion.

Subject: CRD3 -- The County's FY 11-12 Civic Art Program Report is out!!!

http://file.lacounty.gov/bc/q1_2013/cms1_190762.pdf

Don't miss the bureaucratic work of art on page one of the report... the CC list... call it a japanese neoclassical arrangement on the title Executive Officer...*Chief Executive Officer*, *Deputy Chief Executive Officer*, *Acting Senior Assistant Executive Officer*, *Senior Manager, Chief Executive Office.*

I'll riff for a moment... how about: *Acting Senior Assistant Chief Deputy Executive Officer ... in training.* lol

But nary a word about old John Anson Ford. Which I found surprising. You'd think plenty of local artists would be cooking up installations. For some reason not too much noise re: the Zev Anson Ford... (other than the 101) Sorry.

Anyway, the Civic Art report is interesting. They spend a lot of real money on art and presumably artists -- and a few (not enough) school programs. [my point about blowing through 70 million on a restaurant venue].

I do worry wince when I see a $304,000 mural for the Bob Hope Patriotic hall. Not because I don't love murals, I do, in fact. The Bob Hope Patriotic Hall restoration commenced in 2006, cost $48 million dollars...and still isn't done-- doh! I'll spare you a conniption here-

Seeing the San Angelo Multi-purpose Center among the listed projects tugged on my heart strings for the artist, Mara Lonner.
I remember July 17, 2012 when Gloria Molina for no stated reason flushed a $292,000 net-zero energy design down the proverbial toilet, along with Mara's work, I think. Maybe it will survive. I'm sure she got to keep her small check, but as you know, a successful commission can be more valuable for a local artist. It was very weird, because the architect, Michael

Lehrer, who is highly respected, told me that the project was already out to bid... That's a huge red flag -- all the community engagement stuff had already happened. Lehrer is an award winning architecture firm and the chap was geniunely flummoxed. Molina swung the axe, but nobody quite knows why. Like a movie star who won't wear the custom made dress. If I were the producer, I'd say "put it on, It's net-zero energy and it cost 300 grand!"
http://file.lacounty.gov/bos/supdocs/69869.pdf

San Angelo Multi-Purpose Center
Artist Mara Lonner worked closely with the project architect to design a 37-foot long lasercut steel artwork that reaches across the entire the south wall of the building. Three larger-than-life bronze flowers will blossom from the two dimensional panels. The back of the artwork will be coated with a florescent paint to create a halo glow, adding to the dynamic cast shadows of the patterned pieces.

Subject: CRD3 -- Take three town meetings a day and call me in the morning!!!

The cat is out of the bag, big meeting on the jails Tuesday March 19, 2013, including S-1, a preview of the nearly 1 Billion dollar plan to build a new Men's Central Jail at 11am. S-5 is at 1pm, where the Sheriff and his posse report back on his self-improvement efforts, from this year's Sheriff of the year. According to the Sheriff, there have been 1572 town meetings in the jails since October 2011. Which you may not know is nearly three a day. The Board of Supervisors has one Board meeting in the time the Sheriff has 21 Town Meetings.

Subject: CRD3 -- Get Smarter 10/4/12 -- LA County Maritime Operations

Wendy Watanabe the fearless Auditor Controller of Los Angeles County has finally slipped her report on the Sheriff's Maritime division into the mix. It's only four months late but given what we already know - it is not at all encouraging.

Turns out there are four separate Sheriff units that comprise the Sheriff's Maritime operations - three are managed, if you can call it that, by the Sheriff's Field Operations Region II division. The Special Enforcement Bureau which constitutes about a third of the fleet is run by the Homeland Security division.

THE UNITS
-Marina del Rey (MDR) w/ emphasis on county coastline near Marina and Santa Monica Bay.
-Parks Bureau patrols Castaic and Pyramid Lakes.
-Avalon Station patrols Catalina and San Clemente Islands.
-Special Enforcement Bureau (SEB) conducts specialized missions in county waterways.

ADMINISTRATIVE OVERSIGHT
It is not a surprise that according to Wendy Watanabe - who should be pictured, wearing a life-vest to highlight the absurdity of her signing off on the Get Smart Sonar vessel in June - to slip under a September 30, 2012 funding deadline, has determined, five months after setting out on this voyage, that Sheriff Baca needs to improve the tracking of maritime operations and cost.

At this time shockingly, a basic level of accountability is simply not happening... at all!!!

-None of the units track vessel usage.
-Maritime units do not always track objectives and resources for operations and activities.
-No standard or benchmarks have been established to evaluate maritime operations.

THE FLEET
The Sheriff has 30 vessels, but since he does not track vessel usage or maritime activities, Watanabe was unable to determine if this was enough. Any suggestion that this division needs beefing up is insane, to use the official term. (See Get Smart Recap)

-MDR has six vessels, but only three are available on any given day and the unit uses only two.
[This is not a riddle.]

-SEB has no information about its activities.
[Red Flag]

-AVALON station management complained that inboard gasoline engines, have a greater risk of explosion, so new boats.... See OMG -- (See Get Smart Recap)

STAFFING

MDR Station claim they do not have enough deputy boat operators to cover the maritime shifts they currently work. Often one deputy, sometimes with limited experience, as opposed to a minimum of two, operate vessels alone, creating safety risks.

Watanabe notes that without activity and staffing information it's difficult to assess what's really needed.

VESSEL ACQUISITION AND OPERATING COST

Watanabe's analysis reveals that 18 of the 30 vessels were acquired through grants or donations. Obviously there is big difference between state funding and a donor gift. Watanabe's report has no specificity. 3 vessels were purchased with county funds.

For the remaining 9 vessels the Sheriff could not produce acquisition method or cost and did not record these 9 vessels in the county's eCAPS accounting system, as required by county fiscal policy.
[Tanaka-ccounting]

For this reason the auditor, who may or may not get seasick, was unable to assess the value of these 9 vessels. The 21 registered vessels were estimated to have cost 7.1 million.

Since the Sheriff does not separately track operating costs, they are seamlessly blended into unit or patrol stations total operating costs.

Watanabe's recommendations:

Sheriff's management:

1. Improve the tracking and evaluation of maritime operations' objectives, resource usage, and activities.
2. Evaluate their current vessels to ensure they are appropriate for their unassigned usage.
3. Evaluate maritime unit staffing, and consider training additional deputies to operate vessels.
4. Evaluate the feasibility of obtaining customs officer cross-designation for boat operators in other appropriate Sheriff's units.
5. Record all vessels in eCAPS, including the acquisition method and total cost/value of acquiring and outfitting vessels for use.
6. Consider tracking maritime costs separately.
7. Evaluate the feasibility of consolidating all maritime operations into an existing single unit.

CRD3 recommendations:

Get rid of both Tanaka and Baca

Though it is tempting to wait for the Aero Bureau division audit, inform the public immediately as to yet another piece of the puzzle that points to the management change desperately needed in the Sheriff's department. If the feeling is, 'Steady As She Blows', after consuming the attached and below - including a dazzling exchange on the status of the Electronic Monitoring program, at end of GET SMART recap doc...

I would be very surprised.

Sheriff Lee Baca -- 7-27-12 CCJV Transcript -- Page 200 (11 of PDF in attached packet) -

"And what I'm saying is what's problematic here is that everyone's to blame and I'll take the blame for everyone because of my position as the Sheriff." [Line 14-17]

"I know the policy. And I know how to write policy. And so I've written several policies here that are critical to your commission. I appointed Paul Tanaka as the undersheriff because he's uniquely qualified for this position. You go through two recessions and you're losing hundreds of millions of dollars for the public service mission, you do need a C.P.A. I've had non C.P.A financial officers, they do a terrific job. But when it comes to the hard times, they don't do a terrific job. And when we ran the budget over 25 million and I told the Board of Supervisors I was going to pay back the 25 million in the next fiscal year. I'm the only department that ever ran over their budget and paid it back. **So there's a lot of things that Mr. Tanaka is able to do that he probably doesn't get enough credit for.** When it comes down to the so-called values and standards of the departments, which I have cherished and I helped write, I don't believe in talking about things in a way that confuses the deputies or confuses anybody."

"By contrast, LASD **provisions on the use of force are neither comprehensive nor easy to understand.** There is no single, comprehensive, and organized policy, and the various provisions do not reflect unified higher-level principles governing all policies related to the use of force. Use of force provisions are scattered in seemingly random chapters and subsections in the Manual, as well as in unit directives, facility memoranda and other written orders. **A deputy or supervisor would need to spend hours even to locate -- let alone read and understand -- the various provisions relating to the use of force scattered throughout thousands of pages in the Manual.** For example, the force reporting provisions follow a provision concerning the rent control laws and are located hundreds of pages after policies describing when force is appropriate."

Zev's Blog: A boatload of homeland security

January 10, 2012

Sheriff's officials are hoping to soon have a second terrorist-fighting boat patroling the waters off L.A. County.

Its crews have secured evidence from offshore pot busts. Its advanced sonar helped locate wreckage from a mid-air plane crash off the coast three years ago.

But mostly the Ocean Rescue II spends its days scanning for a threat that its crew hopes will never appear on any law enforcement blotter: the possibility that weapons of mass destruction might be smuggled into the massive **Port of Los Angeles.**

"This boat essentially provides homeland security for the entire L.A.County coast," says **Los Angeles County Sheriff**'s Lt. Jack Ewell, who has worked on the 55-foot-long, super-high-tech vessel since its deployment in the port three years ago.

Paid for with a **$2.25 million federal grant** from the Department of Homeland Security and operated by a rotating 3-man crew from the sheriff's special enforcement bureau, the Ocean Rescue II can scan ship hulls for traces of biological,

radiological, chemical and nuclear weapons and can transmit the data to onshore labs in real time. Its sonar sees threats in the murkiest waters; its remote underwater vehicle can pluck bombs from ship bottoms and retrieve evidence 3,000 feet underwater.

"It's pretty unique," says David Gutierrez, vice-president of manufacturing at Willard Marine in Anaheim, which custom-built the vessel for the Sheriff's Department. "It looks like just a standard boat with a lot of bells and whistles, but it's a very important piece of equipment at the port."

But the combination of all that technology and salt air is an ongoing issue: "You have to keep it painted, maintain the engines—to keep a boat like that working 7 days a week requires a lot of maintenance," Ewell says.

"It's like a patrol car," agrees Gutierrez. "It has to always be ready to go."

This, Ewell says, is why the sheriff **hopes to bring in a backup** with the help of a $3 million federal grant won by the department last year.

"A second boat will give us the capability to rotate vessels, or to have two boats in the water at the same time," Ewell says.

It also will add to the sheriff's already impressive counter-terrorism arsenal, which includes a radiation-detecting helicopter and a biological- and chemical-weapon-sniffing Labrador named Johnny Ringo.

At least eight of the 34 boats in the sheriff's department fleet are assigned to the Special Enforcement Bureau, which includes the Homeland Security Division where Ewell works. Another dozen—including an offshore vessel with nuclear detection capabilities—patrol out of Marina del Rey or Catalina Island.

Backing them up, of course, are maritime forces from the U.S. Coast Guard as well as port-stationed boats manned by the Long Beach police, the Port of Los Angeles police and other law enforcement agencies.

The stakes are high, Ewell explains.

"It's been estimated that an incident that shut down the port here would cost theU.S.economy $2 billion a day," he says. "Forty percent of the nation's imports come through here, and our coastal region is heavily populated. It would devastate the region if anything were to affect the port."

So far, Ewell says, the boat's daily scanning hasn't uncovered any dirty bombs. ("Believe me, you'd know it if they did.")

But it has been put to other uses. In April 2010, for instance, the sheriff's department used it to help secure **a large cache of marijuana** from an isolated cove on Catalina Island where a smuggler's boat had been stranded.

And in 2009, when two private planes **collided in mid-air** off the coast of Long Beach, Ewell says, "the boat was used for two weeks straight to recover parts of the planes, and to **find the victims**and return the remains to their families."

The second boat, if authorized next week by the Board of Supervisors, would similarly do double duty, Ewell says. Like Ocean Rescue II, it is expected to be equipped with advanced life support equipment, and to be set up for large-scale diver operations.

"We'll use it on medical emergencies, criminal investigations, plane crashes," he says. "The way budgets are these days, you have to get a lot of bang from the buck."

Posted 1/10/12 - a day that will also live in infamy!!!! Best, Target Preven, CRD3

Subject: CRD3 -- Public Request to post the John Anson Ford Master Plan on the Supplemental Agenda

Hi, Adam:
Thanks for reaching out.

We have not met, but I am familiar with your work. As you know by now, I adore the open air vibe at the John Anson Ford and I'm a bit an open government aficionado, too.

The public is going to put more than $10 million dollars in precious cap improvement money into a project next Tuesday, but do not have the full picture that you and Ms. Zucker and others presumably have, like what is the total budget? Are you aware of how much money has been approved for work at the John Anson Ford in the last few years?

-How much of that work that was previously earmarked has actually been completed?
-What is the master plan?
-How does this $10,000,000 relate to the master plan?
-What is the total cost of the project and timeline?
-How much is for the new offices & parking?

-How much is for the restaurant/gallery?

I remember when Michael Govan came down recently with Ms. Pisano, he was chastised by a cranky Supervisor who shall remain nameless, after giving a detailed presentation that I thought was quite strong, because he did not bring visual aids on the LACMA plans.

On the John Anson Ford project the pubic has seen nothing, as far as I know. The master plan and related studies have never been posted or made public. Is that right?

I only know that those materials exist because I attended a board meeting and asked about it. The third district public affairs maven directed me to do a public records act request, which, reluctantly, and at my expense, I did. But, as Supervisor Yaroslavsky, once told me, "you are only one resident from District 3."

He's right.

As a preservationist, I have my own opinion, but what about everybody else?

It seemed to me that there were only two lightly attended workshops some years ago, and I remember wondering if those who attended the workshops were individuals close to the project? Were they? Did the department of regional planning do a mailer? I am pleased that you intend to have more meetings because in no way was the outreach on this robust and the public has a big appetite for outreach details… it's zeitgeisty.

It is essential, therefore, that the master plan and the studies and the renovation program be posted for several weeks so that people can understand and then fully embrace what is happening… or perhaps raise issues or concerns.

Adam, I assume that you and Laura take seriously the obligation and responsibility to make plans for exciting public works PUBLIC before approval.

I'll copy Alisa B. Katz, Zev's Chief of staff, and ask her if this is the last chance that the public has to understand the project before the money is committed, but regardless of her response, because Ms. Katz is understandably busy, please post a reasonable roadmap tomorrow on the supplemental agenda -- sometimes referred to [in anger] as the Green sheet!!

Laura attended this Tuesday's meeting, so she knows what I mean.

I want you to know that everybody adores the arts community downtown, in fact, Supervisor Knabe was specifically identified as an Arts Champion! [Disclosure: it was from a nice chap who he was honoring with scroll, but it's actually true -- all the supervisors are -- Knabe's been funding Opera for educators for years!]

Anyway, the takeaway from the standing room only meeting was that capital improvement money needs to be distributed where it is most needed, and the supervisors need to be prepared to go to the mat to explain the priorities to their many and varied constituents. Next Tuesday...

Kindly confirm receipt.

Response to Comment No. 22-1

This comment transmits the referenced emails. Some statements in the emails provided raise specific issues regarding the planning process that resulted in the project description for this Project while other comments do not. Responses to those specific comments raised regarding planning for the Project are provided below. This comment will be provided to the decision makers prior to consideration of Project approval.

With respect to the email dated January 30, 2014, as noted on page II-19 of Section II, Project Description, of the Draft EIR, the Project was derived from a previous Master Plan process and includes some of the same components envisioned in the Master Plan, with modifications. The Project is not being developed as a Master Plan. As described on page II-12 of the Draft EIR, the Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and plaza deck featuring a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, an event space, and a maintenance facility; and (5) a 0.75-mile hiking trail. As discussed on page II-25 of the Draft EIR, the Project could be implemented in several phases to provide flexibility to continue operating the Ford Theatres while scheduling off-season construction. Construction of the Project may be completed as early as 2020.

In accordance with CEQA, the environmental review process for the Project commenced with solicitation of comments from identified responsible and trustee agencies, as well as interested parties on the scope of the Draft EIR, through a Notice of Preparation process. The County Department of Parks and Recreation prepared an Initial Study and circulated a Notice of Preparation for public comment to the State Clearinghouse, Office of Planning and Research, responsible agencies, and other interested parties on February 7, 2014, for a 30-day review period. In addition, a public scoping meeting was conducted on February 18, 2014. The public scoping meeting provided the public with the opportunity to receive information regarding the Project and to provide input regarding issues to be addressed in the Draft EIR. The Initial Study, Notice of Preparation, and Notice of Preparation comment letters are included in Appendix A of the Draft EIR.

Consistent with the requirements of Sections 15087 and 15105 of the CEQA Guidelines, the Draft EIR was submitted to the State Clearinghouse, Office of Planning and Research, and was circulated for a 45-day public review and comment period beginning on June 23, 2014, and ending on August 8, 2014. In addition, a public meeting was held on July 14, 2014. The public meeting provided an overview of the findings of the Draft EIR

and provided the public an opportunity to submit comments regarding the Draft EIR. Following the Draft EIR public comment period, this Final EIR has been prepared that includes responses to the comments raised regarding the Draft EIR.

> "Thank you, Sir. Item 12 today was delayed. And apparently we do need a Vin Scully down here, as Supervisor Yaroslavsky intimated last week, or a couple weeks ago. Item 12 was some capital improvement projects. And the reason why it was contentious is because of the different district offices were getting theirs and one getting the other, one getting this and that. Supervisor Yaroslavsky got a $10 million John Anson Ford delivery. But unfortunately that money was one in a series of deliveries of money. And

Laura Zucker, who is the head of the LA County arts, has agreed to post the plan, the master plan for the John Anson Ford redo that's coming up down the road. And then we'll all get a chance to look at it before next week. I appreciate that and look forward to scrutinizing it the way we would in any community, like Mark Ridley-Thomas's or Mayor Antonovich's or Gloria Molina's or or yours, Sir. Like with county golf. Thank you."

Subject: CRD3 -- 5of6 -- Community Development Commission to accept up to $10,000,000 in First 5 LA funds --

Authorize the Community Development Commission to accept up to $10,000,000 in First 5 LA funds into Fiscal Year 2013-14 approved budget http://file.lacounty.gov/bos/supdocs/79953.pdf

"This is a First 5 matter. We're essentially accepting these dollars for the purposes of our moving forward with the implementation of services to youth and their families. This adds to the $25 million that was adopted last year. And we are taking advantage of the good work of the community development commission for this purpose."
Mark Ridley-Thomas

Does that mean that the Antelope Valley's growth in homelessness and reduction of capacity would be considered? And if so, how would that be?
Mike Antonovich

"Given the motion and the timeline that's before us, time is an urgent matter. The First 5 board has an expectation that this N.O.F.A. be out by the end of october."
Sean Rogan

"Dr. Southard, yesterday at the blue ribbon commission, the issue came up with the department of children and family services, the department of public health, health services and l.A.S.H.A. That they have trouble getting the mental health information from our departments of mental health on homeless

families and other families in distress. Why can't a portion of the grant funds be used to create a system to ensure communication among departments and agencies to provide those services to the homeless families?"
Mike Antonovich

"If there are obstacles that are related to financing of systems to assist the provision of that information, mental health department would be eager to find resources to do that."
Marv Southard

"Next week would be too late?"
Mike Antonovich

"It would mean it would be two weeks. That's the problem."
Mark Ridley-Thomas

"We were told that the department of mental health was not sharing that information. So if we could have a report back from the C.E.O. On that precise issue."
Mike Antonovich

"Certainly, Supervisors."
Marv Southard

"Through sequestration and budget cuts, H.U.D. Is messaging that our jurisdiction should anticipate about an 8 percent-- 5 to 8 percent cut in homeless service dollars. So here in Los Angeles and the Los Angeles continuum of care, we have about a $7 million potential reduction in funding that can come in and serve programs that are already operating."
Mike Arnold

"I have a question. It claims that it's all for subsidies. Is there any administrative costs that C.D.C. Is taking from it?"
Gloria Molina

"Yes. 8 percent."
Mike Arnold

"8 percent of how much?"
Gloria Molina

"Half of what it was before."
Mark Ridley-Thomas

"I'm sorry."
Gloria Molina

"Half of what it was before. "
Mark Ridley-Thomas

"Half of what it was before? They shouldn't get any. So how much is that out of this amount?"
Gloria Molina

"$800,000 for the $10 million. "
Sean Rogan

"It was 15 before, correct? And fully justified as such. On the 25 [million] it was 15 [percent], was it not?
Mark Ridley-Thomas

"I don't know what the exact number is so I don't want to be misquoted."
Sean Rogan

"But you know i'm somewhere in the region. And you argued as hard as you could to make sure that the administrative fee was such that you could do the best job that the agency could do. And the fact of the

matter is what's fair is fair. And we are now moving with roughly 8 percent. And we will get every ounce of our money's worth because we've turned to this agency because they consistently have done what we think is a reputable job. And we thank you. And 5 percent sounds better. Anything more for now? Supervisor?"
Mark Ridley-Thomas

"He wanted 15 percent from you, too? "
Zev Yaroslavsky

"Yeah, he did."
Mark Ridley-Thomas

"Son of a gun."
Zev Yaroslavsky

"It's really shameful. They already do this work. And I just can't believe they'd take any administrative money into it. It's children's money."
Gloria Molina

"All right. Thanks very much."
Mark Ridley-Thomas

"All right. Mr. Chairman, I just want to say that I think Sean and his department have done a really good job on administering this program. The program you're about to embark under, the one we did last year, they came in with a gun to your head with no time left to do it. You administered it. You got the money out. You got the contracts signed. The money is getting out the door really, from my point of view in record time. Somebody was going to have to pay for it. We were going to have to pay somebody to do it. If we didn't pay C.D.C., we would have to pay the consultant to do it. This is a better deal and they know what they're doing. So I just wanted to say that, leaving all joking aside, that Sean has delivered and that's pretty good."
Zev Yaroslavsky

"Thank you very much, Supervisor Yaroslavsky. Any further comment on the matter?"
Mark Ridley-Thomas

"Yes, I think I have to. This wasn't a criticism of Sean and his work. He does great work. I just think it should have been a straight up subsidy that First 5 could have done instead of relaying it here.
Gloria Molina

"All right. Thanks very much. The item is before us. Are there any objections to moving forward With the item as amended?"
Mark Ridley-Thomas

"Yes. I'd like to abstain as it's a new term around here."
Gloria Molina

"A term of art."
Mark Ridley-Thomas

"Not new."
Zev Yaroslavsky

"New and improved."
Mark Ridley-Thomas

"It hasn't been new since Ridley-Thomas got here. [Laughter]."
Zev Yaroslavsky

"Well, I'm glad to know that I've made a contribution. Thank you so much."
Mark Ridley-Thomas

CRD3: The Community Development Commission was found in June to have serious INTERNAL CONTROL issues
after KCET ran a piece on Knabe "Family Ties" and in particular, a toxic Enterprise Rental Car procurement. www.socalconnected.org - search for "family ties"
Also, in July 2012, $87.3 million from First 5 LA was transferred to the county's health and mental health departments to fight childhood obesity, provide Ins. coverage for children and substance abuse treatment for parents. Sheila Shima of CEO said the money would be held in a... *special county fund* in order to streamline administrative processes. Molina may have had it right, a classic "rip-off."

http://egpnews.com/2012/08/supervisor-calls-87-3m-in-funding-for-children's-programs-a-'rip-off'/

Subject: CRD3 -- Community Development Commission -- LACK OF INTERNAL CONTROL

http://file.lacounty.gov/bos/supdocs/77626.pdf

This item buried late last week, and not scheduled before the board, is a great example of why the auditor is practically useless. It was only a couple weeks ago that Watanabe was lauded for securing $742,000,000 in CRA money by investing $1,000,0000 in overtime, yet it appears that the CDC is apparently underspending it's budget by almost $100 million annually. Worse, this was/is during one of the hardest economic periods in years. Arggh. That's like 20% of the money earmarked, but not invested...in the community. See attached page 18 for the reasons. For CRD3, it makes no sense and quite frankly, doesn't cut it.

As always, with run-of-the-mill county bungling, all of the following problems are merely relics from a bygone era (2010)...."relax, we've already improved everything." Like the jails, and the DCFS. A brand new procurement team leader, identified as a lawyer, has been brought in to remedy the appalling mismanagement. It better not be Mike Gennaco. The former procurement officer has apparently left.

-CDC supervision of overtime has been lax at best.

-CDC Management has kept no written justifications for Sole Source purchasing.

The auditor also found that the CDC staff did not always follow the commission's contracting procedures. Those procedures are being completely rewritten by July 1, 2013, yet we have not heard back from Ellen Sandt or Mr. Yaroslavsky about the countywide initiative to improve this category.

Apparently, evaluators did not always sign conflict of interest statements and evaluator comments did not always adequately support the assigned scores. Dates for approvals were left off documents so it was hard to tell the sequence of approval.

In one 1.2 million dollar contract, [most of this stuff was 2010, so why it took three years is baffling] CDC did not document their method for selecting a shortlist vendor, or indicate how vendors would be selected. Nor did CDC have any written procedures for selecting proposers from a list of qualified vendors. Important to remmeber that the Board of supervisors is the overseeing board for this group, personally. They could install folks who would pay attention, but that would involve relinquishing control.

Auditor found invoices where CDC paid higher rates than specified in the contract and one instance where CDC did not take an available discount.

CDC staff have not been "signing conflict of interest statements before evaluating proposals" as is required.

Bottom line, "contract solicitation outreach efforts" are bad to extra bad. For the six solicitations reviewed, CDC staff did not document when the solicitation notices were mailed to vendors and the auditor could not determine if the notices were timely or, in many cases, who they were sent to. PFFFFT.

Anyone remember ...Enterprise rent a car ... an Englander Knabe & Allen client have benefited from these lax protocols. (see below)

CDC must ensure that proposal scores are adequately supported. The Auditor found numerous instances where comments did not support the assigned scores. Two of five (40%) of the five evaluations reviewed were not scored in accordance with CDC procedures.

Now, CDC has some new procedures that will be unveiled July 1, 2013.

Let's ALL look the new procedures over together to be sure they are clean and simple. And the public wants
the report back to Mike D. Antonovich, on what actions have been taken in connection with the Enterprise rental car imbroglio.

Find the link below for the report back from the Auditor-Controller that we've all been waiting for following last year's KCET piece on Knabe "Family Ties" and in particular, the toxic Enterprise Rental Car procurement. www.socalconnected.org - search for "family ties"

http://file.lacounty.gov/bc/q1_2013/cms1_189487.pdf

The report by the Auditor Controller confirms key findings "by the media" and concludes that "Community Development Commission's (CDC) outreach was substantially inadequate given the many competitors in the retail vehicle leasing industry in Southern California" but the investigators found "no evidence showing familiar business relationships between the three enterprise employees and four CDC employees involved with the solicitation."

CRD3: This type of investigation ought to be conducted by law enforcement not The Office of County Investigations (OCI). Time and time again this group provides an unwanted cushion for even the most hard to stomach actions and or omissions that may constitute serious criminal misconduct. Watanabe who is an auditor appointed by the Board will admit that such wrongdoing is for the District Attorney, Attorney General or Federal investigators to determine.

On January 15, 2013, prior to publishing this report back that had been called for urgently by Supervisor Antonovich, OCI "met with CDC management." The CDC expressed general agreement with the findings and recommendations. They will respond in 30 days.

CRD3: This explicitly subverts the protocol the public expects - which is a thorough dragging out into the light of day. A credible independent investigation by law enforcement is needed without further delay.

Matt Knabe (Lobbyist for Enterprise) and Don Knabe (Voting member of Community Development Commission)
The Board of Supervisors currently serves as the Commissioners of the CDC setting policy for the agency. In Fiscal Year 2012-2013 the agency has a budget of $485 million and a total staff size of 551. Over 74 percent of the CDC's funding comes from the U.S. Department of Housing and Urban Development (HUD).

Matt Knabe told investigators that he was unaware of the CDC's vehicle leasing and fleet services solicitation until the proposed contract with Enterprise appeared on the board's agenda for March 6, 2012 -- http://file.lacounty.gov/bos/supdocs/66779.pdf ;
Mr. Matt Knabe told the auditor controller that "no one from his firm (EKA) had any contact with Don Knabe about the solicitation." The investigators found no evidence to support any attempts to influence the award of this fleet services contract" worth nearly 2 million dollars.

CRD3: That's nice, but the public is not willing to take Matt Knabe at his word alone. Too many issues have arisen, and the notion of he himself conducting an investigation among his employees is insufficient to restore confidence. Matt Knabe attended the Board meeting on March 6 and or March 13, 2012 presumably to help Santos Kreimann and his client, Modern Parking Inc., to secure a deal to manage more than 10,000 parking spaces for County Beaches and Harbors, over spectacular objection. This matter was also addressed in the Socal Connected piece. Modern Parking Inc. has subsequently stopped lobbying with EKA and the lobbying firm has added Standard Parking as its new Parking client. Though this practice may be common it begs numerous questions as to who, specifically, is controlling the awarding of county contracts. [EKA recently dumped Come Land Maintenance and picked up Diamond Contract Services in the janitorial sector -- worthy of careful scrutiny.]

Mr. Kreimann completed his ethics training on December 3, 2012, after years of serving as Director of Beaches and Harbors without AB1234 ethics training, as is required. A critical part of Mr. Kreimann's job in that role is to meet behind closed-doors with Marina del Rey developers, some of whom may now be experiencing investigation by the District Attorney regarding various Assessor-related malfeasances. For the last nine months Mr. Kreimann has played a key role in the Assessor's office as, CEO Bill Fujioka's 'exceptional manager'. He has allegedly been sorting through cases to determine which may require further review by the DA's Public Integrity Division. This type of sifting should obviously not be done by the man who worked closely with numerous Marina del Rey developers. The public takes exception with that 'exceptional' arrangement.

Executive Director, Sean Rogan
Investigators interviewed the CDC's Executive Director, Sean Rogan, who stated that he was "100% confident that there was absolutely no influence in regards to the Supervisor's son." He added that, "There certainly wasn't any political influence or lobby pressure."

CRD3: How Mr. Rogan knows that, is of great interest. He must mean he felt no pressure of any kind himself. Also of interest for the public is how in the world such a boldly, toxic-on-its-face, solicitation containing the following passage could pass muster for the county board of supervisors...?

"Enterprise was the only company that responded to the request. Based on Enterprise being the only respondent, Commission staff has concluded that Enterprise is the only vendor in the area available to provide the needed services."
[...the area is Southern California!]

Mr. Rogan claims a contract analyst came to him in December 2012 saying he failed to act appropriately and correct outreach details, because he/she was simply too embarrassed. The CDC represented to the board that they had sent an email to 50 firms in the fleet rental business. In fact they only sent the Request for Information (RFI) to 16, but the document attached to the CDC's email did not clearly inform potential vendors what content was expected and an exhibit that was to accompany the RFI and list the vehicles to be acquired was not included with the email.

Only 10 of the 16 firms were actually in the business of automobile fleet rental. But these ten firms stated that they had no recollection of receiving an email solicitation. Four firms told investigators that they would have been interested in bidding, had they received the RFI.

The CDC failed to contact over 60 entities in the business of fleet rental. They received just one bid. *CRD3: Pffft.*

The CDC violated its own policy of not advertising for procurements over $10,000 on their website and the county's website.

"Substantially inadequate outreach" is a gross understatement.

CRD3 conclusion: The Enterprise deal was rigged. If it walks like a duck and quacks like a duck it is a duck. There is no way that this happened by chance. This was a rigged bid. We don't yet know by whom, but the OCI report merely confirms that nobody wants to confess to any crimes at this time. That is of course expected. This matter requires the attention of credible independent investigators - other than Mr. Kreimann - who are experienced at enforcing bid-rigging and collusion laws. The un-named 'contract analyst' who may be scapegoated here, needs to be protected by civil rights organizations and applicable whistleblower rules and guidelines.

A full wide investigation is long overdue.

Thank you for your interest in county government.

Eric Preven
The County Resident from District 3
818-762-7719
818-645-2616 mobile

From March 6, 2012 -
1-D. Recommendation: Approve and authorize the Executive Director to negotiate, execute, and if necessary, terminate a five-year contract with Enterprise Fleet Management using up to a total of $1,750,000 in Commission and Housing Authority program funds for all five years

On motion of Supervisor Ridley-Thomas, seconded by **Supervisor Knabe**, this item was approved.

CRD3 notes:
-- no RFP cuz nobody was interested in providing cars to county ???

On December 20, 2011, a RFI was issued to determine the feasibility of utilizing leased vehicles with a full maintenance service program for the Community Development Commission.

This letter recommends approval of a five-year lease contract with Enterprise Fleet Management

(Enterprise) to **provide 61 new** leased vehicles and a full maintenance service program for those vehicles as well as a maintenance program for **17 existing vehicles** being retained by the Commission. **The vehicles will be used by Commission and Housing Authority staff.**

78 company cars -- for 650 employees -- w/ maint agreement ???

On March 9, 2010, the Board approved a similar agreement with Enterprise for the lease of five vehicles to be used for the **Section 8 inspectors** in Lancaster as a pilot program. This program has proven successful, and when implemented agency-wide, will significantly reduce fleet costs. In Fiscal Year 2011-2012, the total fleet annual budget was over **$880,000**, with the average vehicle age of approximately 8 years with over 76,000 miles. The move to Enterprise will replace the aged existing fleet with new models and reduce the size of the fleet pool by allowing staff to rent additional vehicles from Enterprise daily as needed. The estimated fleet budget in future years will be approximately $580,000, which includes approximately $350,000 per year for the Enterprise contract, plus fuel, miscellaneous maintenance costs and administrative expenses. This represents an estimated savings of approximately $300,000 per year.

The Commission issued a Request for Information (RFI) for the purpose of seeking information regarding leased vehicles with full maintenance service programs. Enterprise was the only company that responded to the request. **Based on Enterprise being the only respondent, Commission staff has concluded that Enterprise is the only vendor in the area available to provide the needed services.**

> Subject: CRD3 -- John Anson Ford Scoping meeting…. & Request for Radius map
>
> Very odd but pleasant enough meeting in the small Ford theatre… numerous concerns from locals re: traffic congestion etc.
> Architect Brenda Levin was there… who Zev celebrates (on her website) because she brings a sense of 'common ownership and civic pride' and Zucker & Davis were there too. I was disappointed that there was no model, no presentation form Laura or Adam… or Levin explaining… or introducing [Insert Eli Broad-type] who is going to take us home on this!!!! It was a format… best described as follow the sketchy posters and county spinners will answer your questions…
>
> There was a fire retardant blanket that the county team would occasionally inflate to smother a hot questioner. hehe. I jest, but I delivered my message about transparency.
>
> They made it seem like… oh, we have no idea, the EIR has to come back, then we'll have a better idea… As you know, the EIR is a safe zone - that gives any agency official an excuse to throw their hands up in the air…dunno! "Need to wait for the EIR!"
>
> And the funding, they claimed, not approved. I said, what about the 20+ million that has been earmarked over the last couple years… including the $10 million, last week. Brenda Levin reminded me that the overall budget was over $100,000,000 million … I had thought $75,000,000… you corrected me to $60,000,000…
>
> The current work, going on now, according to Levin, who made it seem like she's supervising is a very expensive painting of the two old towers. (Argh) Caught my attention, that the new wooden stage (outdoor) won't be installed until next 2015 off season… she said the new seats were nice. The 299 theatre seems to be…a tool for managing director Davis to be able to provide a year round house to accommodate some demand…he did not elaborate.
>
> And oddly he complained to me that folks won't come to Ford because they don't like stacked parking and the restaurant isn't good. Another chap said Crumbles who currently have the conession, cater to the

crowd… in a cool artsy local way… for a swedish performance they do swedish meatballs…for a mexican folkloric… tamales, for a korean dance… kimchee.

so I don't understand. I told Maria Chong-Castillo, Zev's deputy, we should call the new restaurant, Zev's or maybe Maria's? She winced...

I asked about the increase from 79 or so perfs a season to over 300… this caught the attention of a neighborhood council rep who was there. He left early, when he saw there was no there, there.

The presentation about what is happening was almost non-existent, beyond those photos we've seen. I don't think I saw anything new… a lot of weird EIR talk… from county consultants who, one had the feeling just came from,
the visioning process in marina del rey…

There was one persistent theme…

A number of folks asked about city approvals and the response was always the same…" this is county jurisdiction. "

But someone pressed… but the Mulholland view council… (tk) do you need their approval?

See Zev.

I was reminded that I asked for a PDF copy of the December 12, 2012 "Right of Entry Permit" for the John Anson Ford.
I'll keep you posted. {pardon the informality… I'm running.}

Response to Comment No. 25-1

This comment transmits the referenced emails. Some statements in the emails provided raise specific issues regarding the scoping meeting for the Project.. This comment will be provided to the decision makers prior to consideration of Project approval.

With regard to the Scoping Meeting, as described on page 1 of the Notice of Preparation distributed on February 7, 2014, the Scoping Meeting was held to solicit input regarding the content of the Draft EIR and "will be in an open house format." Because the purpose of scoping and early public consultation on a Draft EIR is to solicit information from agencies and the public about environmental issues to be addressed in a Draft EIR, it is an early stage of the process. This may explain what the comment characterizes as responses that defer answers to the later Draft EIR. The scoping topic most raised was traffic congestion, as noted in the comment.

The comment expresses the opinion that there should have been a project model and more visual aids at the scoping meeting and that funding information should have been available. The comment also mentions hearing about various proposed elements of the Project that were described, including the proposed small theatre, restaurant and new parking lots to avoid the current stacked parking and a proposed increase in the number of performances.

As provided in Comment Letter No. 26, below, the requested information regarding the radius map and Notice of Preparation distribution used in the scoping process was provided to Mr. Eric Preven at his request on February 28, 2014.

Re: Request for Radius Map and Outreach Information

Dear Mr. Preven:

This is in response to your Public Records Act request made on February 18, 2014 for a copy of a radius map and a description of the mailing outreach regarding the radius map.

We have completed our search and have determined that there is 1 page of document responsive to your request. A copy of the radius is enclosed.

With respect to outreach information, there are as follows:

Agency List: 113 - 105 Fed Express, 7 certified mails, 1 in person filing at County Clerk.

Fed Ex: 104 addresses

State Clearinghouse Package: 1 address (shipped Fed Ex)

Certified Mail (PO Boxes): 7 addresses

County Clerk: Filed the notice in person

Owners List: 756 - mailed by mailing house, regular mail

Occupants List: 389 - mailed by mailing house, regular mail

Total number of stakeholders who received the email blast from the Arts Commission: 451

If you have any questions, please contact me at (213) 974-2163.

Very truly yours,

Response to Comment No. 26-1

The commenter received the records in response to his request for public records for the Project scoping outreach mailings and radius list for owner/occupant mailings on February 28, 2014. That letter is attached to his comment, which then summarizes the distribution during the Notice of Preparation process and indicates his disappointment with the length of the "yearlong" EIR process.

This comment will be provided to the decision makers prior to consideration of Project approval.

>
> 2.
>
> Bumps, but not actual pay increases, for the Zev Anson Ford gang.
>
> Attached is the budget for Arts Commission (and Animal Control for benchmarking) -- I just wanted to understand the 'increase in staff' and 'size and scope' of the arts edu programming-- but the arts commish budget doesn't track any budgeted positions like other county depts. This must have to do with the Foundation running things. But, has the staff increased substantially?
>
> I think so. Can you ask Joel to send over an accurate staff list with salaries.
>
> In the recent past I barked about an unidentified supplement being generously provided to Zucker and Davis -- nothing wrong with generous supplements, but they ought to be disclosed. This is a PRA 6250 et seq. to see all previous, current and planned, salary supplements for Laura Zucker and Adam Davis dba

Wendell*, including any other compensation packages, to ensure that we are benchmarking with the field, and not lagging.

Arts development is so important and it is absolutely critical that we not lose this team and thus I request a delay pending a full review of the ARTS commission budget in advance of the upcoming budget hearing in June.

During the April/May campaign, 3rd district candidates suggested that we were not spending enough $ on art... and not equitably enough.

Let's get a report, to be clear.

I propose an Special Item (S-1) on all of the great Art stuff we have been admirably doing... inclusive of the challenges, that the commission may have encountered. I think it should be a co-presentation between the CEO's Brence Culp, who has roots in the 3rd district and knowledge about the great work that is being done, supplementally, including a variety of AECOM upgrades. We should also have Brenda Levin, Zev's favorite architect pontificate briefly about the ongoing EIR... and master plan budget. We've payed her a lot it would be good to hear her wax poetic about the great plan.

Eric Preven
The County Resident from District 3

67-C Recommendation to adjust the salary range for two (2) non-represented classifications in the department of the Executive Office of the Board of Supervisors. The justification for this request is to recognize the expanding role of the Arts Commission since its original allocation, most notably in the size and scope of the arts education programs as well as a notable increase in the size of the staff under the Director.

"Specifically, we are recommending a salary range increase for the position of Executive Director, Arts Commission from salary range R12 to R15."

"The projected budgeted annual cost for the salary changes is estimated to total $36,721"

"Please note, we are recommending changes in the salary range designations, not actual pay increases for the current incumbent."

Monthly....

R15 = Approx. $13,208.42

Item #8807
$10,631.85 EXEC DIRECTOR,ARTS COMMISSION N23 R12

Item #8808
$10,631.85 EXEC DIRECTOR,ARTS COMMISSION(UC) N23 R12

67-C. Chief Executive Officer's recommendation: Approve the introduction of an ordinance amending County Code, Title 6 - Salaries, to adjust the salary range for the Executive Director, Arts Commission, and the Executive Director, Arts Commission (Unclassified), in the Executive Office of the Board of Supervisors to recognize the expanding role of the Arts Commission since its original allocation. (Relates to Agenda No. 67-D) (14-2762)

2. 67-D. Ordinance for introduction amending County Code, Title 6 - Salaries by changing the salaries of two non-represented employee classifications for the Executive Director, Arts Commission, and the Executive Director, Arts Commission (Unclassified), in the Executive Office of the Board of Supervisors. INTRODUCE, WAIVE READING, AND PLACE ON THE AGENDA FOR ADOPTION (Relates to Agenda No. 67-C) (14-2765)

Mission Statement

The Department of Animal Care and Control, operating under State law and County ordinance, provides for public safety in the community through the removal and impoundment of domestic animals and livestock in the unincorporated areas of the County and contract cities. Central to the core mission of the Department is enforcement of applicable animal control laws, medical care and sheltering of impounded animals, recovery and redemption of lost animals with their owners, adoption and placement of available animals, investigation of animal cruelty and dangerous animal complaints, rabies vaccinations, and licensing of dogs and cats. The Department also provides for public education programs, spay and neuter surgeries and evacuation of animals during local and regional emergencies. The Department operates six animal shelters which have veterinary medical clinics as part of their operations. Department costs are partially offset by revenue from pet licenses, income from contract cities, and fees collected for various activities in the shelters.

2014-15 Budget Message

The 2014-15 Recommended Budget reflects an overall increase in NCC of $1.0 million primarily due to Board-approved increases in salaries and employee benefits, funding for 10.0 positions for the Antelope Valley Communication Center, 3.0 positions for the Major Case Unit, one-time funding for the replacement of the Voice Recorder System, and aging vehicles. These increases are partially offset by the deletion of one-time funding for safety equipment, vehicles, and a video surveillance system.

Critical/Strategic Planning Initiatives

The Department of Animal Care and Control will continue to enhance revenue and develop more efficient processes for the delivery of its services. The primary efforts will be the implementation of the Antelope Valley Communication Center to streamline response to service calls from constituents in the Antelope Valley and offset the workload from the existing communication center, and augmentation of staff in the department's Major Case Unit. The Department is contemplating an enterprise solution for mobile connectivity to provide field staff and service vehicles access to data and updates through real time connectivity to the department's network and shelter management system.

This endeavor will significantly enhance the efficiency of the officers in the field by providing mobile access to licensing information, and report writing in the field. The deployment of video surveillance continues to be a high priority for the department, ensuring the safety of our employees, the public, and animals in our care; and provides a secure environment, improves workforce accountability, and discourages theft and other inappropriate conduct. The department has been finalizing its 2020 plan. This is a five year plan for fiscal years 2015-16 through 2019-20 that focuses on two key areas of need: facilities improvement and replacement; and staffing requirements. In the interim, the refurbishment of aged kennel buildings and other animal housing facilities continues to be a primary focus of the department's facility management strategy.

Changes From 2013-14 Budget

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
2013-14 Final Adopted Budget	**38,018,000**	**0**	**14,659,000**	**23,359,000**	**371.0**
New/Expanded Programs					
1. Antelope Valley (AV) Communication Center: Reflects an increase in salaries and employee benefits and services and supplies to fund 6.0 Intermediate Typist Clerks, 1.0 Supervising Typist Clerk, 2.0 Animal Control Officer I, and 1.0 Animal Control Officer II positions at the new AV Communication Center.	706,000	--	--	706,000	10.0
2. Major Case Unit: Reflects funding for 3.0 additional Animal Control Officer II positions to conduct criminal investigations.	242,000	--	--	242,000	3.0
Other Changes					
1. Salaries and Employee Benefits: Primarily reflects Board-approved increases in salaries and health insurance subsidies.	589,000	--	--	589,000	--
2. Retirement: Reflects an increase primarily due to prior-year losses in Los Angeles County Employees Retirement Association's investment portfolio and revised investment return assumptions.	259,000	--	--	259,000	--
3. Countywide Cost Allocation Adjustment: Reflects an adjustment in rent charges to comply with Federal Office of Management and Budget claiming guidelines (2CFR Section 225).	132,000	--	--	132,000	--
4. One-Time Funding: Reflects the deletion of one-time funding for safety equipment, vehicles, video surveillance and a public address system.	(1,275,000)	--	--	(1,275,000)	--
5. Reclassification: Reflects the reclassification of a Warehouse Worker II to Procurement Assistant II position.	--	--	--	--	--
6. Voice Recorder System: Reflects one-time funding for the replacement of the Voice Recorder System.	150,000	--	--	150,000	--

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
7. Ongoing Funding: Reflects the transfer of ongoing funding to the Provisional Financing Uses budget unit.	(68,000)	--	--	(68,000)	--
8. Vehicle Replacement: Reflects one-time funding for the replacement of five aging vehicles.	250,000	--	--	250,000	--
9. Unavoidable Costs: Reflects changes in worker's compensation costs due to anticipated benefit increases and escalating medical cost trends and an increase in retiree health premiums, fully offset by a reduction in unemployment insurance costs and services and supplies.	--	--	--	--	--
Total Changes	**985,000**	**0**	**0**	**985,000**	**13.0**
2014-15 Recommended Budget	**39,003,000**	**0**	**14,659,000**	**24,344,000**	**384.0**

Unmet Needs

The Department's unmet needs request include funding for volunteer and medical programs. Additionally, the Department is requesting funding for replacement of asphalt in the perimeter of the kennel buildings and parking lots at all of the department's care centers, replacement of kennels at the Carson, Baldwin Park, Lancaster and Downey care centers, a mobile connectivity solution for field access to the department's network and shelter management system, implementation of a CCTV system at the Downey Care Center, and implementation of countywide dead animal removal services.

Less Administration	--	--	--	--	--
Net Program Costs	3,947,000	--	3,947,000	--	50.0

Authority: Mandated program - California Food and Agricultural Code Sections 30801-05, 30952, 31105-08, 31252, 31254, and 32252-53 and Los Angeles County Code Section 10.20.030.

The Licensing program is responsible for the maintenance of new license information and processing of annual renewal notices to animal owners in the unincorporated areas of the County and contract cities.

The Canvassing program performs neighborhood animal license enforcement at residences and other locations in the unincorporated areas of the County and contract cities. Department representatives collect past due licenses, verify rabies vaccination compliance, and perform annual inspections of businesses that care for, sell, or house animals.

3. Field Services (Includes Call Center)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	11,912,000	--	5,106,000	6,806,000	146.0
Less Administration	--	--	--	--	--
Net Program Costs	11,912,000	--	5,106,000	6,806,000	146.0

Authority: Mandated program - California Food and Agriculture Code Sections 30501, 31101, 31105, and 31602 and California Penal Code Section 597.

Responds to calls in the unincorporated areas of the County and contract cities for the capture and removal of dangerous and aggressive, stray, and unwanted dogs, cats, and other non-wildlife animals. Provides direct customer services including the removal of dead animals from the public and acceptance of relinquished animals. Assists other public service agencies in providing emergency services during natural or man-made disasters.

4. Medical Services (Shelter and Clinic)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	5,356,000	--	969,000	4,387,000	31.0
Less Administration	--	--	--	--	--
Net Program Costs	5,356,000	--	969,000	4,387,000	31.0

Authority: Mandated program - California Food and Agricultural Code Sections 30501, 30503, 31101, 31105, 31602, and 31751.3.

Provides general medical services to stray, relinquished, and abandoned animals brought in from the field by Animal Control officers and the public. Medical Services provides examinations, vaccinations, deworming, treatment, surgical repair, and surgical sterilization consistent with the Spay and Neuter Program, and services provided by private veterinarians.

5. Special Enforcement (Includes Spay and Neuter Program, Major Case, and Critical Case Processing Unit)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	2,075,000	--	--	2,075,000	25.0
Less Administration	--	--	--	--	--
Net Program Costs	2,075,000	--	--	2,075,000	25.0

Authority: Spay and Neuter Program: Mandated program - California Food and Agricultural Code Sections 30503 and 31751.3. Major Case Unit: Mandated program - California Food and Agricultural Code Sections 31645 and 31646; California Penal Code Sections 399.5, 597, and 599aa; and Los Angeles County Code Sections 10.20.280, 10.28.020, 10.28.270, and 10.40.010.

The Spay and Neuter Program supports the mandated spaying or neutering of all shelter dogs or cats prior to adoption and the County's mandated program in the unincorporated communities of the County.

The Major Case Unit responds to calls or requests, investigates, and prosecutes incidents of animal cruelty or dangerous animals.

The Critical Case Processing Unit conducts administrative hearings to determine whether offending dogs are potentially dangerous or vicious, and to investigate and process potentially dangerous and vicious dog cases.

6. Administration

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	6,362,000	--	--	6,362,000	33.0
Less Administration	--	--	--	--	--
Net Program Costs	6,362,000	--	--	6,362,000	33.0

Authority: Non-mandated, discretionary program.

Administration provides the support required for the ongoing operations of the Department. This includes the executive office, budget and fiscal services, contract development and monitoring, human resources, fleet management, and information technology.

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos

FUND	FUNCTION	ACTIVITY
GENERAL FUND	RECREATION & CULTURAL SERVICES	CULTURAL SERVICES

Mission Statement

To foster excellence, diversity, vitality, understanding, and accessibility of the arts in the County. The Arts Commission provides leadership in cultural services for the County, including information and resources for the community, artists, educators, arts organizations, and municipalities.

2014-15 Budget Message

The 2014-15 Recommended Budget reflects a net increase of $99,000 primarily due to restoring funding for the Organizational Grant, unavoidable cost increases, and Board-approved increases in salaries and employee benefits, partially offset by the deletion of one-time funding for the Organizational Grant program and Ford Theatre programs.

Critical/Strategic Planning Initiatives

- Continue a multi-year initiative to implement the Board-adopted *Arts for All* strategic plan to make the arts core in K-12 for 1.7 million students in the County by developing ongoing systems for data collection that will inform *Arts for All* planning processes, as well as provide evidence of changes in arts education offerings in the region over time.
- Institute a number of new systems to improve grants and professional development programs, including the development of new guidelines for the FY 2015-16 Organizational Grant Program.
- Continue implementation of the Master Plan for the current and future facilities of the John Anson Ford Theatres focusing on upgrades to the theatre itself, including amphitheatre stage reconstruction, new retaining walls and landscaping on the hillside, and tenant improvements consisting of additional dressing rooms, a new green room, and Americans with Disabilities Act improvements.
- Implement, through the Los Angeles County Open Spaces District grant funds, a new Civic Art Graffiti Abatement Project which will create innovative arts based projects.

Changes From 2013-14 Budget

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
2013-14 Final Adopted Budget	**10,813,000**	**669,000**	**1,446,000**	**8,698,000**	**0.0**
Other Changes					
1. Salaries and Employee Benefits: Primarily reflects Board-approved increases in salaries and health insurance subsidies.	146,000	12,000	--	134,000	--
2. Retirement: Reflects an increase primarily due to prior-year losses in Los Angeles County Employees Retirement Association's investment portfolio and revised investment return assumptions.	63,000	6,000	--	57,000	--
3. One-Time funding: Reflects the deletion of one-time funding provided for the Organizational Grant ($200,000), Jazzed and Motivated ($6,000), and Signature Series at the Ford ($375,000).	(581,000)	--	--	(581,000)	--
4. Organizational Grant: Reflects an increase in funding ($400,000) to fully restore the program to $4,518,000 as well as funding to cover the licensing fees for the California Cultural Data Project ($36,000).	436,000	--	--	436,000	--
5. Civic Art: Reflects one-time funding for Art Asset Management and Inventory ($240,000), and project management ($95,000).	335,000	335,000	--	--	--
6. Unavoidable Costs: Reflects funding for unavoidable production cost increases for the Holiday Celebration ($21,000), and minimum wage increases for the Arts Internship program ($14,000) and temporary staff at the Ford Theatre ($18,000).	53,000	--	--	53,000	--
7. Ministerial Adjustments: Reflects appropriation and revenue adjustments for the Arts Education and Civic Art programs based on anticipated revenue changes.	(105,000)	--	(105,000)	--	--
Total Changes	**347,000**	**353,000**	**(105,000)**	**99,000**	**0.0**
2014-15 Recommended Budget	**11,160,000**	**1,022,000**	**1,341,000**	**8,797,000**	**0.0**

Unmet Needs

The Arts Commission's critical unmet needs include additional funding and positions for the Administration, Civic Art, John Anson Ford Theatre and Organizational Grant program as well as full restoration of the Free Concerts program.

Departmental Program Summary

1. Organizational Grants and Professional Development

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	4,922,000	--	16,000	4,906,000	--
Less Administration	--	--	--	--	--
Net Program Costs	4,922,000	--	16,000	4,906,000	--

Authority: Non-mandated, discretionary program.

The program provides financial support, technical assistance, and professional development services to 370 non-profit arts organizations annually. Programs assist and strengthen non-profit organizations and municipal programs to provide arts services to enrich the lives of County residents. All applications undergo a rigorous peer panel review and scoring process to determine the quality of proposed projects and services, which are then approved by the Board. Grantees are provided additional opportunities, which include in-depth leadership training for executive, artistic, and managing directors; workshops on advancement and capacity building topics such as human resources, marketing, board development, and fundraising; grant application workshops; and scholarships for arts administrators to take courses at the Center for Non-profit Management and Long Beach Non-profit Partnership, and to attend local conferences.

2. Arts Internships

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	695,000	--	45,000	650,000	--
Less Administration	--	--	--	--	--
Net Program Costs	695,000	--	45,000	650,000	--

Authority: Non-mandated, discretionary program.

The program provides approximately 125 paid 10-week summer internships for undergraduate college students at 105 performing and literary arts non-profits and municipal arts agencies. In addition, interns participate in an arts summit. This program develops future arts leaders to serve in staff positions, as board members, and volunteers in organizations that provide cultural services to County residents. The program works in partnership with the Getty Foundation, which supports internships in visual arts organizations.

3. Arts Education

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	1,407,000	--	900,000	507,000	--
Less Administration	--	--	--	--	--
Net Program Costs	1,407,000	--	900,000	507,000	--

Authority: Non-mandated, discretionary program.

The Arts Commission provides leadership for the 2002 Board-adopted *Arts for All*, a countywide collaboration working to create vibrant classrooms, schools, communities, and economies through the inclusion of the arts as core curriculum for each of our 1.6 million public K-12 students. Key strategies include: 1) assisting school districts in planning and implementing arts education; 2) building capacity of both teachers and community artists to deliver high-quality arts instruction; 3) publishing online directories of arts education programs for students and educators; and 4) collecting, analyzing, and sharing data to track progress and inform strategy.

4. Community Programs - John Anson Ford Theatres

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	1,196,000	--	48,000	1,148,000	--
Less Administration	--	--	--	--	--
Net Program Costs	1,196,000	--	48,000	1,148,000	--

Authority: Non-mandated, discretionary program.

Operates and programs the John Anson Ford Theatres and supports its flagship program, the Ford Amphitheatre Summer Partnership Program, which provides resources to County resident arts organizations and assists them to successfully present performances in its historic 1,200 seat amphitheatre. This appropriation does not reflect earned income, which is deposited in the Ford Theatre Special Development Fund, and contributed income, which is in the budget of the Ford Theatre Foundation, the non-profit fundraising arm of the Ford.

5. Community Programs – Holiday Celebration

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	949,000	--	332,000	617,000	--
Less Administration	--	--	--	--	--
Net Program Costs	949,000	--	332,000	617,000	--

Authority: Non-mandated, discretionary program.

The County Holiday Celebration, which celebrated its 54th year in 2013, is a three-hour music and dance production held every December 24th at the Music Center's Dorothy Chandler Pavilion. The show is free to the public and honors the diverse cultures and holiday traditions that are celebrated in the many communities of the County. The Holiday Celebration is broadcast live on KCET and streamed on the Internet and is watched by an estimated one million local viewers. The program is also aired on the Armed Forces Network, bringing the show to United States service men and women living on military bases around the world.

6. Community Programs – Free Concerts in Public Sites

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	30,000	--	--	30,000	--
Less Administration	--	--	--	--	--
Net Program Costs	30,000	--	--	30,000	--

Authority: Non-mandated, discretionary program.

Free Concerts in Public Sites includes concerts and participatory workshops that are free to the public. Events include concerts at non-profit, municipal, and County sites which apply for funding from the Board to support musician fees, and interactive music and dance workshops designed to engage communities in the performing arts by encouraging direct participation in diverse art forms.

7. Civic Art

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	1,022,000	1,022,000	--	--	--
Less Administration	--	--	--	--	--
Net Program Costs	1,022,000	1,022,000	--	--	--

Authority: Non-mandated, discretionary program.

The program provides leadership in the development of high quality civic spaces by integrating the work of artists into the planning, design, and construction of County infrastructure and facilities. The program encourages innovative approaches to civic art and provides access to artistic experiences of the highest caliber to residents and visitors of the County. It also provides educational resources and ensures stewardship to foster broad public access to artwork owned by the County. The program has developed and maintains the records and inventory for County-owned civic artwork.

8. Administration

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	939,000	--	--	939,000	--
Less Administration	--	--	--	--	--
Net Program Costs	939,000	--	--	939,000	--

Authority: Non-mandated, discretionary program.

The administrative unit, which is made up of five staff positions, oversees the Arts Commission's strategic planning, budgeting, private sector fundraising, human resources, information technology (IT), marketing and communications, and provides support for the 15 Arts Commissioners appointed by the Board. This appropriation also includes general administrative and IT supplies.

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Net Program Costs	11,160,000	1,022,000	1,341,000	8,797,000	0.0

Response to Comment No. 27-1

This comment transmits the referenced email and attachments. This comment does not raise an environmental issue regarding the Draft EIR. This comment will be provided to the decision makers prior to consideration of Project approval.

Comment Letter No. 28

A Sandoval
wh16mmgal@aol.com

Comment No. 28-1

I live on Cahuenga Terrace, which is next door to the John Anson Ford Theater and my neighbors have told me about the plans to renovate the compound, add new structures, increase capacity and improve upon the hiking trail. This concerns me deeply because that hiking trail has attracted homeless encampments for decades and we who live in this neighborhood are under constant threat from wild fires that result from carelessness from these individuals. I am worried that making the hiking trail easier to access is only going to lure more smokers, campers, etc. who, homeless or not, could easily start a fire along the trail and destroy homes in its wake.

Response to Comment No. 28-1

As described on page II-5 of Section II, Project Description, of the Draft EIR, there are no designated hiking trails within the Project Site. However, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails. The County continues to work with the surrounding community and the Sheriff's Department to prohibit the use of the existing unofficial trails. As described on page II-19 of Section II, Project Description, of the Draft EIR, the Project proposes a 0.75-mile ridgeline hiking trail which may utilize portions of existing user-established informal trails. As shown in Figure II-4, Overall Conceptual Site Plan, on page II-13 of the Draft EIR, the majority of the section of the proposed trail that begins at the southern trailhead off the Ford Terrace and continues uphill to the area where the cross is situated would be located downslope of the ridgeline; thus, physically separating trail users from residences. With the establishment of a formal trail, the County would observe standard park hours of operation for use of the trail of sunrise to sunset.

Additionally, as discussed in Section IV.J.2, Public Services—Police Protection, of the Draft EIR, as part of the Project, Project Design Feature J.2-2 would require the implementation of security measures that would deter transients from using the hiking trail such as securing a proposed public restroom after hours to prevent use by transients and providing signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail would also be well-marked to prevent users from getting lost and the brush next to the trail would be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas would not be built along the trail. In addition, as discussed on

page IV.J.1-15 in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, given the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. The entire length of the trail would be monitored for litter and violation of use twice daily, once in the morning and once before closing of the trail by Ford Theatres maintenance staff. Trail maintenance would be conducted by the Parks Trails Unit as necessary.

The Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system.

Comment No. 28-2

There is already a No Tresspassing sign posted along the trail; are you or the Ford people planning to get it removed somehow?

Response to Comment No. 28-2

As discussed on page II-5 of Section II, Project Description, of the Draft EIR, there are no designated hiking trails within the Project Site. However, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails. It is noted that as the surrounding hillsides are public land the existing "No Trespassing" signs are not appropriate. Signs for use control such as "Do Not Go Beyond This Point" or "Over Night Camping Prohibited" and "No Camp fires or Smoking" etc. as well as hours of operation for the trail are available for public use and would replace the "No Trespassing" signs. As described in Response to Comment No. 28-1, with the establishment of a formal trail, the County would observe standard park hours of operation for use of the trail of sunrise to sunset. In addition, signage would be provided along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited.

Comment No. 28-3

I intend to discuss this with the local fire department to see if this is something we can forestall until proper safety measures are in place. I also understand that there was a meeting about it last week and I was unable to attend; perhaps you or someone from your

office could make a statement explaining how the trail will be maintained, monitored, etc. so the neighborhood can rest a little easier.

Response to Comment No. 28-3

Please refer to Response to Comment No. 28-1 regarding the security measures that would be implemented along the proposed hiking trail and the Project's compliance with City and County requirements for construction, access, water mains, fire hydrants, fire flows, and brush clearance in a Very High Fire Hazard Severity Zone. Also refer to Response to Comment No. 28-1 for a discussion of the proposed maintenance schedule for the hiking trail.

Comment No. 28-4

I am all for the expansion of the Ford Theater as I enjoy it and attend shows there often, however fire danger is another thing entirely and with the drought and dry hot weather coming our way, encouraging hikers to the area is just not wise. I hope you will see my point and pass this along to the people involved.

Response to Comment No. 28-4

Please refer to Response to Comment No. 28-1 regarding the Project's compliance with City and County requirements for construction, access, water mains, fire hydrants, fire flows, and brush clearance in a Very High Fire Hazard Severity Zone.

Subject: The Ford Theatres Project
SCH#: 2014021013

Dear Kathline King:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. The review period closed on August 6, 2014, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Dear Ms. King:

THE FORD THEATRES PROJECT – NOTICE OF COMPLETION AND AVAILABILITY OF DRAFT EIR

This is in response to your June 23, 2014 letter requesting a review of your proposed project to improve the facilities of The Ford Theatres located at 2580 Cahuenga Boulevard East, Los Angeles, CA 90068. The Bureau of Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

The Bureau of Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvements projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Existing			
Seat	3/Seat	1196 Seat	(3,588)
Concession/Restaurant	300 GPD/1000 SQ.FT	320 SQ.FT	(96)
Box Office/Museum	120 GPD/1000 SQ.FT	365 SQ.FT	(44)
Offices	120 GPD/1000 SQ.FT	10,500 SQ FT	(1,260)
Work Shop/Storage	30 GPD/1000 SQ FT	2,650 SQ FT	(80)

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of your proposed project includes an existing 8-inch line on Cahuenga Blvd East. The flow from the existing 8-inch line on Cahuenga Blvd feeds into a 10-inch line on Cahuenga Blvd and then into a 21-inch line on Las Palmas Ave and finally to a 45-inch line on Willoughby Ave. Figure 1 shows the details of the sewer system within the vicinity of your project. The current flow level (d/D) in the 8-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
8	Cahuenga Blvd East	*	791,080 GPD
10	Cahuenga Blvd	32	1.03 MGD
21	Las Palmas Ave.	12	7.26 MGD
45	Willoughby Ave.	24	27.15 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Treatment Plant, which has sufficient capacity for the project.

If you have any questions, please call Kwasi Berko of my staff at (323) 342-1562.

STORMWATER REQUIREMENTS

The Bureau of Sanitation, Watershed Protection Division (WPD) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

The project requires implementation of stormwater mitigation measures. These requirements are based on the Standard Urban Stormwater Mitigation Plan (SUSMP) and the recently adopted Low Impact Development (LID) requirements. The projects that are subject to SUSMP/LID are required to incorporate measures to mitigate the impact of stormwater runoff. The requirements are outlined in the guidance manual titled"*Development Best Management Practices Handbook – Part B: Planning Activities*". Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lastormwater.org. It is advised that input regarding SUSMP requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the SUSMP/LID requirements.

CONSTRUCTION REQUIREMENTS

The project is required to implement stormwater control measures during its construction phase. All projects are subject to a set of minimum control measures to lessen the impact of stormwater pollution. In addition for projects that involve construction during the rainy season that is between October 1 and April 15, a Wet Weather Erosion Control Plan is required to be prepared. Also projects that disturb more than one-acre of land are subject to the California General Construction Stormwater Permit. As part of this requirement a Notice of Intent (NOI) needs to be filed with the State of California and a Storm Water Pollution Prevention Plan (SWPPP) needs to be prepared. The SWPPP must be maintained on-site during the duration of construction.

If there are questions regarding the stormwater requirements, please call Kosta Kaporis at (213) 485-0586, or WPD's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact Daniel Hackney of the Special Project Division at (213)485-3684.

Sincerely,

Ali Poosti, Division Manager
Wastewater Engineering Services Division

FIRE DEPARTMENT

1320 NORTH EASTERN AVENUE
LOS ANGELES, CALIFORNIA 90063-3294

DARYL L. OSBY
FIRE CHIEF
FORESTER & FIRE WARDEN

July 17, 2014

Kathline J. King, Chief
Department of Parks and Recreation
Planning Section
510 South Vermont Avenue, Room 201
Los Angeles, CA 90020

Dear Kathline J. King:

COMPLETION/DRAFT ENVIRONMENTAL IMPACT REPORT, "THE FORD THEATRES PROJECT," THE REHABILITATION OF PORTIONS OF THE EXISTING AMPHITHEATRE AND DEVELOPMENT OF THE FORD TERRACE, THE FORD PLAZA, THE TRANSIT CENTER AND A HIKING TRAIL, 2580 CAHUENGA BOULEVARD EAST, LOS ANGELES CITY (FFER #201400107)

The Completion/Draft Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department. The following are their comments:

PLANNING DIVISION:

1. The subject property is entirely within the City of Los Angeles, which is not a part of the emergency response area of the Los Angeles County Fire Department (also known as the Consolidated Fire Protection District of Los Angeles County). Therefore, this project does not appear to have any impact on the emergency responsibilities of this Department.

LAND DEVELOPMENT UNIT:

1. The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows and fire hydrants.

2. This property is located within the area described as Very High Fire Hazard Severity Zone (VHFHSZ). All applicable fire code and ordinance requirements for brush clearance and fuel modification plans, must be met.

3. Every building constructed shall be accessible to Fire Department apparatus by way of access roadways, with an all-weather surface of not less than 26 feet in width. Additional width maybe required if the lowest level of the buildings constructed exceed 30 feet from the Fire Department apparatus access roadway. The roadway shall be extended to within 150 feet of all portions of the exterior walls when measured by an unobstructed route around the exterior of the building.

4. The maximum allowable grade shall not exceed 15% except where topography makes it impractical to keep within such grade. In such cases, an absolute maximum of 20% will be allowed for up to 150 feet in distance. The average maximum allowed grade, including topographical difficulties, shall be no more than 17%. Grade breaks shall not exceed 10% in ten feet.

5. Turning radii shall not be less than 32 feet. This measurement shall be determined at the centerline of the road. A Fire Department approved turning area shall be provided for all driveways exceeding 150 feet in-length.

6. The development may require fire flows up to 5,000 gallons per minute at 20 pounds per square inch residual pressure for up to a five-hour duration. Final fire flows will be based on the total square footage of the buildings, the types of construction used, and if the building is equipped with an approved automatic fire sprinkler system.

7. Fire hydrant spacing shall be 300 feet and shall meet the following requirements:

   a) No portion of lot frontage shall be more than 200 feet via vehicular access from a public fire hydrant.

   b) No portion of a building shall exceed 400 feet via vehicular access from a properly spaced public fire hydrant.

   c) Additional hydrants will be required if hydrant spacing exceeds specified distances.

8. Fire sprinkler systems are required in some residential and most commercial occupancies. Automatic fire sprinklers shall be in compliance with applicable

Fire and Building Code requirements along with any applicable departmental regulations.

9. Specific fire and life safety requirements for the construction phase will be addressed at the building fire plan check. There may be additional requirements during this time.

10. Should any questions arise, please contact the County of Los Angeles Fire Department, Land Development Unit Inspector, Juan Padilla, at (323) 890-4243 or at Juan.Padilla@fire.lacounty.gov.

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

1. The statutory responsibilities of the County of Los Angeles Fire Department, Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones, archeological and cultural resources, and the County Oak Tree Ordinance.

2. Under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured at 4½ feet above mean natural grade. An Oak Tree Permit is required for this project. Specific questions regarding oak tree permit requirements should be directed to the Los Angeles County Department of Regional Planning at (213) 974-6411.

3. This property is located in an area described by the Forester and Fire Warden as being in a Fire Hazard Severity Zone. The development of this project must comply with all Fire Hazard severity Zone code and ordinance requirements for fuel modification. Specific questions regarding fuel modification requirements should be directed to the Fuel Modification Office at (626) 969-2375.

HEALTH HAZARDOUS MATERIALS DIVISION:

1. The Health Hazardous Materials Division has no objection to the proposed project.

If you have any additional questions, please contact this office at (323) 890-4330.

Very truly yours,

Frank Vidales

FRANK VIDALES, CHIEF, FORESTRY DIVISION

SUBJECT: Comments on Draft Environmental Impact Report (DEIR) for the Ford Theatres Project
2580 Cahuenga Boulevard East, Los Angeles, CA 90068

Dear Ms. King: Ms. King –

Thank you for the opportunity to review the Draft EIR for the Ford Theatres Project. It is with great pleasure that I write this letter in support of the proposed rehabilitation of the existing Ford Amphitheatre and the development of the Ford Terrance, the Ford Plaza, the Transit Center and a hiking trail all within the current boundaries of the Ford Theatres site.

The Ford Theatre is one of the oldest performing arts venues in Los Angeles and each year the Ford partners with L.A. County-based arts organizations to present an eclectic season of culturally diverse music, dance, theatre, film and family events to serve the public.

I am excited about the proposed natural hiking trail that will be accessible from both the public and theater users alike. The hillside trail will be able to provide optimal views of our most famous landmarks in the City such as the iconic Hollywood Sign, the Griffith Park Observatory, Capitol Records as well as spectacular view of Hollywood.

The addition of the Transit Center which will provide a much needed designated area for bus and valet drop-off as well as a three-level parking structure to mitigate the traffic impacts during Ford's scheduled season.

This project has my strong support and I thank you for your consideration of these comments. If you have any questions regarding this letter or any other matter, please do not hesitate to phone me at (213) 485-3337.

Sincerely,

TOM LABONGE
Councilmember, 4th District
City of Los Angeles

RE: The Ford Theatres Project

Dear Ms. King:

The Cahuenga Pass Property Owners Association represents the community in the Cahuenga Pass between Mulholland Drive to the south, the 101 Freeway to the east and Lankershim Boulevard to the north. On behalf of this community, I wish to express our support for the Ford Theatres Project as described in the Draft EIR, providing the below-noted traffic mitigation is included in the project.

Currently our community and those of the Hollywood Knolls and Manor have no safe way to walk to the Ford Theatre. Since we wish to enjoy your theatre without having to get into our cars and experience the increased traffic and parking issues, we propose that the current sidewalk along Cahuenga Boulevard East from the Ford Theatre to the Cahuenga Hills Tennis Condominiums be extended to Lakeridge Road. The distance of the proposed extension is less than two tenths of a mile.

Thank you for your consideration of this requested traffic mitigation.

Respectfully,

Krista Michaels

Re: The Ford Theatres Project

Dear Ms. King,

The Board of Directors of Hollywood Heritage, its Preservation Issues Committee and its members, thank you for the opportunity to review and comment on The Ford Theatres Project, and the accompanying Draft Environmental Impact Report (DEIR). This is a very important project to the cultural and historic community in the Cahuenga Pass, and we look forward to working with the Ford and the Hollywood Bowl to develop the Pass as an historic and cultural destination. The vision for the Ford project speaks to that common goal. Hollywood Heritage would like to participate in a working coalition to further refine the concepts in the Master Plan.

For three decades Hollywood Heritage has been an advocate of the preservation and protection of Hollywood's historic resources. We support the goal of preserving what is most significant in Hollywood, while encouraging responsible new and infill development. Our organization has nominated many of the current Historic Cultural Monuments, listed the Hollywood Boulevard Commercial and Entertainment District in the National Register of Historic Places at the national level of significance, provided technical assistance to developers and owners of significant properties, and participated in numerous public policy discussions involving historic resources. These efforts have resulted in the rehabilitation of significant landmarks, landscapes, institutions and districts in Hollywood.

The Ford/Pilgrimage Theater property is one of the most important historic and cultural venues in the region. The Ford is a very rare type of resource and one with special significance to Southern California. It has been evaluated as a potential historic resource

since 1994 and its status and character-defining spaces, materials, and features confirmed in GPA's latest research and determined eligible for listing in the National Register of Historic Places.

Hollywood Heritage has reviewed The Ford Theatres Project Draft Environmental Impact Report (State Clearinghouse no. 2014021013) and the John Anson Ford Theatre County of Los Angeles Historic Resource Report (GPA 2013/2014 Improvements). In addition, Hollywood Heritage received a presentation from the Ford Theatres Project representatives on Wednesday June 25, 2014.

The organization also reviewed the categorical exemption of 2013 which authorized limited improvements to the Amphitheatre, including hillside stabilization, stage reconstruction, disabled access and code compliant improvements, upgrade to theatrical, mechanical and electrical systems. Compatible stone-clad retaining walls and drainage improvements at the rear of the stage stabilized the existing slope in this area. The existing two level concrete stage was removed, and new flooring added. Rehabilitation of portions of the stage buildings and towers included the return of the original color scheme. New doors and windows were installed. These activities addressed long-deferred maintenance and needed repairs and improved the theatrical infrastructure and performer amenities. Based on the findings of the Historic Resource Report of September 2013, this work was consistent with the Secretary of the Interior's Standards and did not impair the significance of the historic property.

Review of this material, discussion at the June 25 meeting, and discussions with the Los Angeles Conservancy have led to an understanding of the direction of the Master Plan project. The division of the scope of work developed for the categorical exemption and the phases of the Master Plan remain somewhat unclear. Work on the Amphitheatre in its entirety must meet the Secretary of the Interior's Standards to ensure that historic materials are not impacted unnecessarily. Further definition should be provided in the Final EIR and its mitigation measures.

CEQA guidelines define a project as having a significant environmental impact when the project causes a substantial adverse change in the significance of a historical resource as defined by the California Environmental Quality Act (CEQA), Section 15064. The City of Los Angeles CEQA Thresholds Guide (2006, p. D.3-3) maintains that a project would have a significant impact on historic resources if the project results in a substantial adverse change in the significance of a historic resource by construction that reduces the integrity or significance of important resources on the site or in the vicinity via alteration of the resource's immediate surroundings. The Ford has indicated its willingness to create a project which does not cause substantial adverse change.

DESCRIPTION OF THE PROJECT

The Master Plan Project Site is approximately 32 acres, and includes the Ford Theatres, one of the oldest performing arts venues in Los Angeles and one of its most historic. The Project Site is currently developed with an open-air 1,196-seat Amphitheatre with support spaces as well as a former motel building currently used as staff offices. The Master Plan proposes improvements that would result in approximately 47,550 net square feet of new facilities (parking structures, flex space, a 299 seat theatre) and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site, for a total of 96,300 new square feet.

As outlined in the DEIR, the Project includes rehabilitation of portions of the existing Amphitheatre and development of areas termed the "Ford Terrace", the "Ford Plaza", the "Transit Center" and a hiking trail, all within the current boundaries of the Ford Theatres site. The five major areas are summarized as follows:

- Amphitheatre Rehabilitation and Improvements: hillside stabilization, stage reconstruction, disabled access and code compliance improvements, improved theatrical systems, infrastructure improvements and related upgrades, a sound wall along the rear of the Amphitheatre, and a retractable shade structure for the Amphitheatre.

- The Ford Terrace: a two-story structure with one level of office space and a lower-level concessions area and a raised plaza deck above a service level. This part of the Plan contemplates removal of the existing concessions building and the re-purposing of the 87-seat [Inside] the Ford space as a self-serve food marketplace area and for storage.

- The Ford Plaza: A plaza deck atop a three level parking structure to feature a restaurant, a 299-seat theatre, a box office, a conference room, office, and visitor amenities. This aspect of the Plan includes conversion of the existing box office to a museum/gallery.

- The Transit Center: a designated area for bus and valet drop-off, and the construction of a three-level parking structure and a 99-seat event space. The aspect of the Plan includes removal of a former motel building.

- Hiking Trail: An approximate 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza.

GENERAL COMMENTS

For clarity, the DEIR should include a graphic or description of the work performed under the 2013 Categorical Exemption and those proposed under the Master Plan. A project of this nature is complex, and impacts from individual actions can have a cumulative effect on the integrity of the resource.

The DEIR should also clarify the historic boundaries of the property and should include information about the Christine Stevenson Memorial Cross, originally a component of the historic Pilgrimage venue.

More discussion is necessary of the historic site design as a whole. This very important aspect of the property is currently discussed only as the "setting" for the amphitheatre. The site's design is a character-defining feature: the amphitheatre nestled in a ravine, using a natural planted hillside as the stage backdrop (characteristic of Greek amphitheatres) but surprisingly oriented into the upslope rather than a long view orientation. The long central axial promenade up to the amphitheatre is character-defining, and has already been compromised by more modern additions. Historic plant materials, native stone retaining walls, controlled views, and dark surroundings contribute to this naturalistic design style so evocative of its era.

The DEIR should describe in more detail what changes are going to be made in the appearance of the landscape and geography. Some hill areas closest to Cahuenga East appear to be leveled. This appears to be a major landscape change as there are currently three drives, one for parking, one for delivery and one to the county offices. The architectural illustration shows a rather flat, even plane, which indicates reshaping the land.

Hollywood Heritage supports the proposal of a hiking trail that encompasses the property. We would like to contribute our historic knowledge to this feature of the Project. The hiking trail should stop at key viewing points to help people locate important places in Hollywood.

In addition to collaborating on the hiking trail, Hollywood Heritage would like to work with the Ford on the proposed development of the Museum. Hollywood Heritage has a good deal of Pilgrimage Theatre memorabilia which was donated by the Ford.

EVALUATION OF THE RESOURCE

Hollywood Heritage commends the project team for a thorough discussion of the historic significance and character-defining features of the property and concurs that the property is currently eligible for the National Register of Historic Resources. However, instead of a primary concentration on a few buildings, Hollywood Heritage feels that the appropriate framework for evaluation of the property as a whole is as a cultural landscape, defined by the National Park Service as is a “geographic area, including both

cultural and natural resources …, associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values."

There are four general types of cultural landscapes, not mutually exclusive: historic sites, historic designed landscapes, historic vernacular landscapes, and ethnographic landscapes." The Ford property would be considered a "Vernacular Landscape", which is defined as "a landscape that evolved through use by the people whose activities or occupancy shaped that landscape. Through social or cultural attitudes of an individual, family or a community, the landscape reflects the physical, biological, and cultural character of those everyday lives." Both the natural and built environment of the property should be considered when examining the Ford as a cultural landscape.

TREATMENT OF THE RESOURCE

All features identified by GPA as primary and secondary contributing resources are significant. Removal of any of these materials and features must be carefully considered.

The DEIR states that the proposed improvements would be designed to be consistent with the Secretary of the Interior Standards for historic property rehabilitation. The project proposes to demolish one ancillary historic building and potentially more of the character-defining landscape features. The sound wall and shade structure proposed for the Amphitheatre have the potential to diminish the character of the space. Careful justification statements and design of these elements will help to clarify the impact. A more robust statement of how these aspects of the project meet the Standards and the mitigation measures proposed to achieve them is needed.

COMPATIBLE NEW CONSTRUCTION

Hollywood Heritage congratulates the Ford on retaining a highly qualified historic architect to guide the rehabilitation of the historic structures, a very capable historic preservation consultant to assemble the historic documentation, and a knowledgeable landscape architect to formulate an approach to the landscape which will retain the character of this historic setting. The projects begun under the Categorical Exemption in 2013 should provide a foundation for the policies and decisions that will be needed to successfully complete the programmatic goals while retaining important character-defining features of the landscape, circulation and recreation areas, and the historic theatre complex.

The new construction proposed is discussed with reference to the Secretary of the interior's Standards for building additions, not as components of an historic vernacular landscape. The site, although altered, still is a vernacular landscape with its own style, character, and significance. Care should be taken to ensure that the magnitude of new construction does not overwhelm this.

IDENTIFICATION OF SURROUNDING RESOURCES

Additional information about the impacts the proposal will have on surrounding historic resources including the Pilgrimage Cross and Whitley Heights is needed.

The cross was built in 1923 as a monument to Christine Wetherill Stevenson and was part of the original Pilgrimage property. Formally the feature is referred to as the "Hollywood Pilgrimage Memorial Monument." Hollywood Heritage purchased the Cross at the request of the County. While the Cross has been replaced, the feature should be acknowledged as part of the original property. Hollywood Heritage transferred the Cross to High Adventure Ministers. In 1993 High Adventure Ministries built the current cross standing 33 feet tall. In 1997, the Church on the Way took over the care and maintenance of the cross on the Cahuenga Pass.

RECOMMENDED MITIGATION MEASURES

Hollywood Heritage recommends that additional mitigation measures be added to the one current measure. That measure requires the participation of a qualified historic preservation professional, but does not adequately define their role or responsibilities. In order to ensure that the Master Plan will comply with the Standards and thus avoid significant impacts (the stated intent in the DEIR), Hollywood Heritage requests that the following measures be added:

Prepare a Cultural Landscape/Historic Structure Report prior to implementation of Master Plan components. Historic documentation, plans, and specifications prepared for the 2013 Categorical Exemption project should form the basis for a Cultural Landscape/Historic Structure Report. The work performed under the Categorical Exemption should be added to the chronology of site development presented in the 2013 Historic Resource Report and in the Cultural Resource Technical Report of the DEIR.

Using these reports, prepare a Preservation Plan that will ensure that the proposed components of the Master Plan continue to meet the Secretary of the Interior's Standards and do not diminish the physical integrity and character-defining features of the resource. A complete Historic Structures Report which includes a detailed scope of work for each of the proposed component will help to ensure that all aspects of the Plan meet the Standards. The benefit of this approach is two-fold: to provide a baseline of existing conditions and character-defining features, and to ensure that implementation does not result in loss of status for the resource. Justify the approach to removal of historic stone retaining walls. Provide a treatment plan for any remaining stone walls, and explore replacement in kind if not feasible. The Master Plan should be more informed by this historic site design. A Cultural Landscape Report will help to identify the site features which should guide future improvements. Amphitheaters are a recognized type of feature by the Cultural Landscape Foundation.

Supplement the Cultural Landscape/Historic Structures Report with a set of design guidelines which address site design and character-defining features. To ensure the

continued eligibility of the site, the aesthetic impact of proposed new construction to ensure that new structures should be designed in a manner that is both compatible and appropriate in scale and massing to protect the integrity of the historic amphitheater structure.

Confer with the State Office of Historic Preservation to ensure that the Ford property will remain eligible for listing in the NR after project implementation.

Retain the historic concession stand as part of the Ford Terrace component.

CONCLUSION

Restoration of the Ford Theatres brings continued activity and life to an historic and beloved location. This is highly desired. However, the Master Plan appears to indicate a shift from an isolated, nature-based and formally organized setting to a postmodern, urbanized, and brightly lit design. While not reaching a threshold of significant adverse effect, there is likely a preferred variation in the future design which can be more consistent with the historic cultural landscape. If the Ford is more visible as a cultural resource, the entire Cahuenga Pass area will be enhanced.

The additional mitigation measures proposed above will ensure that the project will not adversely impact the John Anson Ford Theatre's continued eligibility for listing in the National Register of Historic Places and that the entire project (landscape, theatre rehabilitation, new construction) meets the Secretary of the Interior's Standards.

All proposed modifications, including stage reconstruction and the addition of a retractable shade structure, should be analyzed against the venue's continued eligibility for listing in the National Register. Existing stone retaining walls will be retained or replaced, or be rebuilt in a manner that meets the Secretary of the Interior's Standards for the Treatment of Historic Properties.

Hollywood Heritage appreciates the efforts of the Ford's management and its project team. Our organization believes in the sensitive development of the historic Cahuenga Pass area as a venue for the arts and will work diligently with the team to achieve the goals of the Ford and to preserve and protect the historic and cultural resources on the site and adjacent to it. Our archives and professional technical assistance is at your disposal. Please feel free to contact us at (323) 874-4005 should you have any questions.

Sincerely,

Bryan Cooper

RE: The Ford Theatres Project, 2580 Cahuenga Boulevard East

Dear Ms. King:

On behalf of the Los Angeles Conservancy, thank you for the opportunity to comment on the draft environmental impact report (EIR) for the Ford Theatres Project. The Ford Theatres is significant as one of the oldest performing arts venues in Los Angeles still in use, as an example of an early twentieth century amphitheater, and for its association with architect William Lee Woollett. It was determined eligible for listing in the National Register of Historic Places in 1994 and is listed in the California Register of Historical Resources.

The Conservancy previously submitted comments on the Notice of Preparation (NOP) in March 2014, and our comments addressed various aspects relating to the rehabilitation of the historic amphitheater. With the release of the draft EIR, we've recently learned that several of the planned improvements for the amphitheater were previously approved through a Notice of Exemption prior to the NOP's release.

We fully understand the programming needs of the Ford Theatres and recognize that the County has long served as a good steward of the historic venue. The creation of a list documenting primary and secondary character-defining features of the Ford Theatres site as part of the EIR is an important tool for understanding the significance of various features of the venue as it evolved over time. While this list provides invaluable information, it does not offer guidance for the treatment of these character-defining features in the future; the draft EIR provides generalized language specifying the application of the *Secretary of the Interior's Standards* for proposed work.

The Conservancy recommends that the County expand upon its stewardship of the Ford Theatres through the creation of site master plan that establishes some baseline documentation of the site and can inform and guide any future changes. Given the historical significance of the site, we strongly advise that a Historic Structure Report (HSR) be prepared for the Ford Theatres in conjunction with a Preservation Plan that can guide such areas as the implementation of recommendations for the treatment of historic materials and character-defining features.

About the Los Angeles Conservancy:
The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 6,500 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please feel free to contact me at (213) 430-4203 or afine@laconservancy.org should you have any questions.

Sincerely,

Adrian Scott Fine
Director of Advocacy

RE: The Ford Theaters Project Draft EIR Comments

Dear Ms. King:

The Outpost Homeowners Association represents the 475 homes in Outpost Canyon in the area between the Hollywood Bowl and Runyon Canyon Park. Our neighborhood streets are frequently utilized by drivers connecting between the Hollywood area and San Fernando Valley as they seek to avoid congestion in the Cahuenga Pass. We are therefore very concerned about any proposed development that would impact traffic conditions in the Cahuenga Pass.

We provided a comment letter during your scoping comment period and feel that our issues and requested impact analyses were completely ignored. We therefore find that it would be futile to provide detailed comments on the DEIR as we expect that they will be ignored/dismissed as well. We feel that the traffic analysis in the DEIR was completely inadequate and biased in favor of the project by underestimating its potential impacts.

Our concerns relate to the magnitude of change that will result from the County's proposed redevelopment of the John Anson Ford Theater. The number of annual events at the theaters will increase from an average of 184 today, to 331 in the future, an 80% increase. This will add traffic from the daily rehearsals; not just the artists/performers, but set designers, lighting technicians, sound people, etc., plus all the deliveries of food and beverage, refuse removal, etc. The annual attendance at the theaters will increase from 54,640 to 93,725, a 72% increase. Parking capacity will increase form 350 parking spaces to 500, and the number of employees on site will increase from 20 to 105. And yet the traffic analysis in the DEIR contends that there will be virtually no increase in traffic generated by the theaters.

The intensification of uses at the theaters will significantly increase traffic to and from the site on a daily basis due to additional employees as well as on event days, the number of which will increase substantially. We requested that you quantify the impacts of these increased vehicle trips on Cahuenga Boulevard East and West, Highland Avenue, Mulholland Drive and Outpost Drive. This reasonable request was ignored in favor of a much smaller study area focused only on the immediate vicinity of the project. The intersection of Cahuenga West at Mulholland/Woodrow Wilson, a key bottleneck in the Cahuenga Pass was ignored.

Outpost Drive was recently reclassified by the City of Los Angeles as a Local Street, downgraded from a Collector, reflecting the City's policy directive to maintain Outpost as a low-volume, neighborhood street. Traffic will be added to Outpost Drive by the proposed project, warranting a contribution of funds toward the Outpost Neighborhood Traffic Management Plan as an appropriate mitigation measure.

We are also concerned about the cumulative effect of all of the entertainment venues in Hollywood that result in street closures and gridlock in the Cahuenga Pass. These include all of the events at the Hollywood Bowl (In addition to the Philharmonic season, the Bowl season has been expanded to include many rental events as early as April and as late as October), the TCL Chinese Theater, the El Capitan and now the Ford Theaters. The EIR failed to quantify how the increase in events from 184 to 331 will contribute to the cumulative impact of street closures and traffic clogged streets, which cause motorists to seek alternate routes through our neighborhood streets. We feel that it will be a substantial contribution to this cumulative impact. The he

In summary; the traffic analysis has lost sight of the forest for the trees. It focuses on the small number of cars added at a limited number of intersections immediately adjacent to the Theaters and it misses the bigger picture; the cumulative impact of more events on more days, superimposed on the other events already congesting the Cahuenga Pass causing motorists to cut through our neighborhood. This project might not cause the cut through traffic to be higher on any given day, but it will cause it to be higher on many more days of the year.

We appreciate the opportunity to submit comments on the Draft EIR. We just wish that the County of Los Angeles and its consultants were more serious about honestly disclosing and mitigating the impacts of this project on the neighborhoods that surround it. This is a very important project to Los Angeles County and one that will have a lasting impact on our neighborhood. We are disappointed that these issues of importance to the Outpost Homeowners Association were not seriously addressed in the DEIR.

Sincerely,

Outpost HOA
Michael P. Meyer, President

Subject: Notice of Completion and Availabilty of Draft EIR (State Clearinghouse No. 2014021013

Dear Kathline,

We live at 2285 La Granada Drive, around the corner from the Ford and have a few questions regarding your summary memo of June 23, 2014:
1) It is unclear from the memo if there will be one or two three-story parking structures. It/they are mentioned both in your Ford Plaza description AND your Transit Center description.
2) Regardless of answer to the question above, how many on-site parking spaces will exist if the project is approved and built? How does that number relate to the number of patrons the site will accommodate?
3) Will satellite parking with bus transport be part of the plan? We ask because the Transit Center would seem to accommodate "bus and valet drop-off."
4) You mention that the number of events is going to increase. Will the season also be extended so that traffic becomes a year-round challenge?

Thanks you in advance.

Yours very truly,
Jeff Brown

Chief Planner
County of Los Angeles, Department of Parks and Recreation
510 South Vermont Avenue, Room 201
Los Angeles, CA 90020

Attention: Formal response to the Ford Theatre Project Draft EIR.

I am located on Hillpark Drive at the Highlands Owners Association. This is a 192 unit condominium complex located next to the Hollywood freeway and northwest of the Ford Theatre and up from the Pilgrimage Bridge off of Cahuenga West and Hillpark drive. I have lived at this location since 1992. I am not a traffic expert, a city planner, nor an engineer. However, I am someone who lives in the Cahuenga Pass for the past 22 years and has experience traveling through and within the Pass on a daily basis. That makes me an expert on the traffic patterns and congestion. I start my trek to work from within the Pass and leave around 8:30 to 9:15 in the morning and return from work or errands anywhere from 5:30 usually 6pm through 7:30 pm in the evening on weekdays. Work is located in Glendale, California where the standard route is up Barham over to Forest Lawn and on to the eastbound 134 Freeway.

I am writing in response to the draft EIR for the Ford Theatre project. I am sure there are concerns regarding noise and possibly exposed cuts in the hillside never mind a host of other environmental impacts. Since I live across the canyon I am not going to speak to these topics. Rather, this document focuses almost exclusively on traffic concerns, haul routes, emergency vehicles and services, and noise. And, specifically about the increased traffic during construction and then after construction associated with the ongoing and increased number of events at the Ford Theatre. On the surface, the increase in traffic volume seems minimal. If each event is attended at full capacity the increase would amount to about 300 additional people. The real issue is the significant increase in traffic due to the increase in events, 184 events today growing to approximately 331 events annually. This is according to the original proposal document released back in early 2014. This is If this is one event per day, essentially, the Ford Theatre would be increasing the traffic volumes from 51 % to 93% of the days of the year. This is a significant impact. Later on in this letter I will be speaking to why this is a relevant point.

In the introduction of the Traffic, Access, and Parking (section K), speaks to the desire for the City and County to improve the traffic conditions. And, I think these agencies would like to insure that pressure is placed on developments to study the existing and identify additional traffic trips made based on the construction of the proposed project. Additionally, "The Congestion Management Program (CMP) is a State-mandated program enacted by the state legislature to address the increasing concern that urban congestion is affecting the economic vitality of the State, in this case the heart of Hollywood in an around the Cahuenga Pass, and diminishing the quality of life in our community. Stated differently, a lot of Angelenos avoid the Cahuenga Pass

and want nothing to do with visiting this area due to the excessive congestion, at times almost grid lock. This affects the economics in Hollywood, the Hollywood Bowl, and the Ford Theatre today and in the future after the project. Basically, locals are not visiting these venues and purchasing services because it is too difficult to make the TRIP, affecting the economics. Further the City of Los Angeles's General Plan related to Transportation states to "…provide adequate accessibility to commerce, work opportunities, and essential services and to maintain acceptable levels of mobility for all those who live, work, travel, or move goods in the City. It seems to me the Ford Theatre, a Los Angeles County operation, needs to take the opportunity to collaborate with the other major agencies and create a multi-jurisdictional project, along with the Bike Czar, CalTrans, the City of Los Angeles, Hollywood Bowl, City of Burbank, City of Hollywood, Universal, and the other entertainment companies to identify a fundamental shift in approach to traffic in the Cahuenga Pass. More on this later.

Quite simply, traffic congestion in the Cahuenga Pass is horrid. This is a subjective statement. Based on experience and observation traveling the Pass daily in the morning around 9 am and evening around 6 or 6:30 it is a level D or E based on the chart in Appendix L on page 15. For example, if I am traveling on Forest Lawn heading toward Hollywood from Burbank and make the left on to Barham, that intersection during the evening rush hour (at 6pm or later) can take an additional 10 to 15 minutes and I may be queued up and cycle through 5-7 signal light cycles. The # of cars in the queue for this light on Forest Lawn can be up to quarter mile back up. Then to travel up Barham to Barham and Cahuenga east might take an additional 10 to 15 minutes. Then to make the left on Cahuenga West might take a few more minutes and 1 additional light cycle. Traveling past Mulholland to Hillpark drive on a Hollywood Bowl night at say between 6:30 to 7:30 pm at night might take an additional 15 to 20 minutes. Again on a Hollywood Bowl night it is not uncommon for the traffic to back up from the Hollywood Bowl entrance all the way up the hill on Cahuenga West past the Pilgrimage bridge to Mulholland and at times up to Barham Blvd. This is further documented by the backup at the Highland Flyover (exit on the southbound 101 freeway to Highland Blvd that actually places you on Cahuenga West between Hillpark and the Pilgrimage Bridge. Further, the congestion is so bad and the back up from the Hollywood Bowl on to the freeway is so long, Caltrans now has a permanent light flashing, display posted of traffic congestion. You may want to check in with Caltrans if they have a record of how often or what nights this display is used. So, the contrast is during off peak hours it might take me 5-7 minutes to travel this route and on a heavily congested evening could take upwards of 45 minutes to travel this 4-5 mile stretch. This is the definition of "horrid". Adding the kind of traffic volume on streets that are already clogged appears to be studied in the Draft EIR. The reason I state seems to be, is that the numbers that are presented in Appendix L do not seem representative of what homeowners in the Cahuenga Pass experience on a daily basis. The good news is that there was a traffic study and my comments about the timing of the traffic study were adjusted to accommodate actual traffic congestion not the definition from previous traffic study of the definition of "rush hour". The bad news is that it is unclear the exact location within the 8 intersections where the data was collected from. All pivotal intersections but which actual streets and lanes contained the sensors? The rest of the letter will speak to:

- why and where there are concerns surrounding the data
- accurately representing the true congestion
- other concerns or statements or conclusions drawn within the Draft EIR
- request for further investigation

- request answers to questions generated prompted by the data collected and the assumptions made based on this said date.

It is critical that the Draft EIR incorporates first-hand look at the traffic issues experienced today in the Cahuenga Pass. I do question the data in light of the Level of Service defined in Appendix L page 15 and the assessments provided at the eight intersections. For Intersections 1, 2, and 5 the data presented is probably representative of the data collection period. I wonder why Intersection 3 is missing from Appendix L , Table 3, page 30. It seems unbelievable that the data collected at intersections # 3 (that is found in the traffic section IV K-17 but missing from the Appendix L) is listed as Level A, along with intersection 4, along with intersection 7.

For example, diving in to a little more detail to determine what is happening with the Level of Service at the Pilgrimage bridge (intersections 3 and 4), where was the data collected? Was the data collected on the bridge as the traffic approaches Cahuenga East and West or actually recorded based on the traffic on Cahuenga East and West. Meaning,

1. At intersection # 3, was the data collected across the four lanes of traffic heading southbound on Cahuenga West including the left turn lane as well as northbound or only one of the four:
   A. South bound lanes including the left turn lane
   B. Just the left turn lane
   C. The one Northbound lane
   D. heading west across the Pilgrimage bridge

   And, were the locations different if data reflected current traffic without the project, current traffic with the project, future traffic (20 years out) without the project, future traffic (20 years out) with the project?

   ASK: Please respond with the specific location (actual streets and lanes) of the data sensors and collection

2. At intersection # 4, was the data collected across the three lanes of traffic heading Northbound on Cahuenga East including the left turn lane as well as the one southbound lane, or only one of the five
   A. one South bound lane
   B. the three Northbound lanes
   C. just the left turn lane in the Northbound lane,
   D. heading east across the Pilgrimage bridge or
   E. heading east exiting the Ford Theatre project opposite the Pilgrimage bridge?

   And, were the locations different if data reflected current traffic without the project, current traffic with the project, future traffic (20 years out) without the project, future traffic (20 years out) with the project?

   ASK: Please respond with the specific location (actual streets and lanes) of the data sensors and collection

3. What was the calculation used to determine the LOS? Meaning, was the data collected across the designated AM, PM, and weekday event time periods and then averaged? Was additional mathematical formulas applied the understated to reflect the "Delay/V/C"?

4. I realize the report provided the time periods of data collection went above and beyond by extending the hours of the study to reflect more accurately the heavy congestion periods in the Cahuenga Pass. (see page 13 of the Section K: Traffic, Access, and Parking. This is appreciated considering the feedback in the original response back on 3/11/14 (see attached letter).

5. On page 22 of Section K, there is a reference to the construction related deliveries will be scheduled outside of commuter peak hours. There is specific reference that:
    A. construction workers would arrive at the project before 7 am.
    B. And leave either before 4pm or after 6pm.

    Three points come to mind:
    1. According to the County code requirements, construction cannot occur the hours before 7 am on weekdays. And, there is a separate requirement regarding noisy construction work. So, if the bulk of the workers arrive before 7 am will they all stand around and do quite work (when the heavy earth movement is occurring)?
    2. Commuter and event congestion really starts at 5:30 and runs through 8 pm or 8:30 depending upon the event.
    3. I am not sure how these arrival and departure times improve things for the roadways surrounding the project and reduce "counted requisite TRIPS".

    ASK: Please respond with the specific details why these numbers were provided and how that calculates (either increases or decreases) the total number of inbound and outbound TRIPS

6. The TRIP generation also seems suspect or some mathematical algorithm was used that does not equate to reality for the average driver in Los Angeles. One vehicle one person. If you review the numbers provided in Section K: Traffic, Access, and Parking on page 24 I am not sure how the report arrived at:

    A. 176 daily construction worker Trips (88 inbound / 88 outbound
    B. 64 haul trucks (32 inbound / 32 outbound
    C. 30 daily construction material delivery trucks (15 inbound / 15 outbound

I don't state the issue to the numbers based on the shear # of daily construction works, trucks hauling dirt or deliveries. I question this data as you move to the next point on the total number of inbound and outbound trips. Keep reading as I make my two points about these TRIP numbers:

1. Not sure of the hours of the truck hauls but if you do the math 107,094 cubic yards of dirt divided by 14 cubic yards per truck and there are 64 daily deliveries (32 inbound and 32 outbound), this dirt hauling would take 119.5 days (64 * 14 = 896 cubic yards per day. 107,095 / 896 = 119.5 days. If the hauling occurred 6 days out of the week, since

according to the County Code, no loud construction noise on Sundays, this could take upwards of 19.9 weeks.

ASK: is this the expected timeframe and approach for the hauling of dirt?

2. On page 25 in Section K, Traffic, Access, and Parking, it shows five bullet points about the inbound and outbound TRIPS. It may be I am not calculating correctly but it looks like there are 221 inbound trips and only 76 outbound TRIPS. Please clarify these numbers. Not sure if there is averaging and rounding up and rounding down that skew the numbers. What it looks like is that people in vehicles arrive but they never leave? Maybe the construction workers are arriving by car and leaving by bus?

ASK: Is it possible that people in vehicles arrive to the Project Site but they never leave?

7. The next questionable set of numbers in Section K, Traffic, Access, and Parking talks about the Trip distribution traffic assignment. In the paragraph a top of page 27 it talks about the approximate percentage of traffic that would be assigned to north of the project, south of the project, and to/from the US-101 and the Project Site. The issue is not the distribution but the percentage. Not sure how you can end up with 160 % if the traffic is split in three areas: 50 percent to the North, 50 percent to the south, and 60 percent to/from US 101 and the Project Site. One might conclude from these numbers that congestion exceeds capacity by 160 % which might reflect reality that we are living with level E and F LOS.

   ASK: Please explain further what is being attempted.

8. In Section K, Traffic, Access, and Parking, there is a point being made surrounding CMP, Congestion Management Program indicating based on the inbound and outbound TRIPS and the percentage of distribution that this project is no CMP impact and no additional analysis of freeway segments is required per the CMP Criteria. That assumes the TRIP calculations are correct. I contend that the TRIP numbers are questionable along with the Percentage of traffic distribution.

   ASK: Please justify the numbers identified in this paragraph on page 29 and how that compares to the numbers identified on page 25, and the details covered on page 24 breaking down the specific TRIPS.

9. More importantly, I am not sure how the report can justify the low number of net new TRIPs considering the number of additional days of events. Maybe the additional seating to the project justifies the lower number of net new TRIPs. I am just not sure how this project is able to justify this low number considering the number of new events. Again, the real issue is the significant increase in traffic due to the increase in events, 184 events today growing to approximately 331 events annually. If this is one event per day, essentially, the Ford Theatre would be increasing the traffic volumes from 51 % to 93%. This low TRIPs needs to be explained or recalculated in a way to reflect these 147 added events. (see original Ford Theatre report initially released at the beginning of 2014.

   ASK: Please clarify how the numbers justify the low number of TRIPS

10. Looks like the looks like the export of dirt shifted from 83,774 cubic yards of dirt to 107,095. Please confirm if this change in export is correct? Will the amount of cubic yards of dirt change again?

ASK: please confirm the amount of cubic yards of dirt today and did the amount change?

11. If the Ford theatre is planning to add 147 net new events according to their own report, how can the Draft EIR actually state that the new trips adjusted for the observed distribution in the vicinity of the Project Site can actually say 35 net new trips in the weekday, approximately 18 net new trips in the weekday evenings and 92 net new events on the weekends found on page 29 of section IV.K Traffic, Access, and Parking

    ASK: These net new #s could be accurate for existing events. What are the net new #s for 147 additional events at the Ford theatre?

12. Emergency vehicles: Today with the excessive congestion along Cahuenga East and Cahuenga West, the emergency vehicles out of Station 76 often are unable to traverse these streets. There are no shoulders for the cars to move, with or without sirens. Sirens do no good if there is nowhere for the cars to move.

    ASK: Please explain how the added congestion from construction vehicles and added events are not going to impact emergency vehicle travel?

13. Looks like my comments from my 3/11/14 letter were heard. There are references to improving pedestrian access. This is a good thing. And, it speaks to a reference could be considered "transportation-friendly" and "fair and equitable access to the residents" with a limited cost to the project. This could also increase customers without increasing net new TRIPs to the Ford Theatre.

    Repeating what is in my prior letter: Any opportunity to increase pedestrian traffic to and from the Ford Theatre should be considered. For example, today, there are no pedestrian options for people, once they travel over the Pilgrimage Bridge to cross Cahuenga East to the Ford Theatre. There is a metal barrier on one side essentially blocking or hindering pedestrian crossing over Cahuenga East. And, there is no longer a button to push to trigger the signal for a walk sign like you see in regular intersections.

    ASK: This should be studied and included in the plans to encourage or increase walking traffic.

14. We need to understand during construction and once the events start if the decibel levels will increase significantly from what they are today. At first glance, it doesn't appear that the Highland's Owners Association will be affected by noise from the Ford Theatre. However, it does need to be studied to be sure if there are any issues. In any case, the EIR needs to identify mitigations and options for such issues.

    ASK: The ambient noise level needs to be investigated as part of the EIR.

15. There are references that the Pilgrimage bridge has a speed limit of 35 mph on page Appendix L page 19. There is no speed limit posted on the Pilgrimage bridge.

    ASK: Can you explain how the speed on a two lane bridge could be set to 35 mph?

16. There is a reference that no significant impacts occurred even when extending past the Study Area. Specifically, in Appendix L, page 16. "The Project Study Area was designed to ensure the all potentially significantly impacted intersections, prior to any mitigations, were analyzed, and the boundary of the Study Area was extended, as necessary, to confirm that there were no significant impacts at or outside the boundary of the Study Area."

    There are two points to be made about this proclamation:

    A. Due to the excessive congestion in the Cahuenga Pass, any construction, maintenance or added construction traffic like truck hauling causes severe backups and queuing at the intersections.
    B. The Study area really needs to be extended to include:
        1. Cahuenga West up through the on ramp to the 101 Freeway north of Barham.
        2. Barham Blvd from Cahuenga West toward Burbank down and including the Barham and Forest Lawn intersection
        3. Since traffic queues up at Cahuenga East and the Pilgrimage bridge at the Ford Theatre Project traveling southbound to North Cahuenga Blvd to at least to Franklin Blvd, Hollywood Blvd, and Sunset Blvd.
    C. Although stated differently in the report, there are multiple intersections without left turn lanes. These intersections alone when vehicles are attempting to make the left hand turn can cause severe backups affecting traffic congestion up and down the Cahuenga Pass. Backups can occur upwards of a quarter to a half a mile. Intersections include:
        1. Cahuenga West and Mulholland Blvd – northbound.
           Note: this intersection is south of Cahuenga West and Barham
        2. Barham Blvd and Blair Drive – heading toward Burbank just below Lake Hollywood Blvd.

    ASK: Please provide clarification on:

        1. how these intersections without a left hand turn lane affect congestion
        2. should the study area include one or both of these intersections

17. The reason the last point is severely relevant depends upon the ultimate haul route. Although in the report in Section IV.K page 24 it states the "anticipated" haul route might be inbound "…access the Project Site traveling northbound on Cahuenga Blvd East from the Hollwyood Freeway (US-101) and [outbound] would exit the Project Site onto Cahuenga Blvd East and travel northbound on Cahuenga Blvd East to the Hollywood Freeway. The report does not indicate the full route. The point of this entry is two-fold:
    A. Depending upon the streets traveled for the haul route, for example Barham to Forest Lawn, then the recommendation in this letter is that the Study area needs to be extended to include these intersections. Especially since, Barham and Cahuenga East based on the data reported in the Draft EIR in Appendix L indicates on weekday AM is a LOS F and weekday PM is a LOS D.
    B. If the plan is to proceed with the haul route as anticipated then it makes sense to extend the Study Area to include intersections of Cahuenga North in the southbound direction toward Franklin Blvd, Hollywood Blvd, and Sunset Blvd.

ASK: include these additional intersections south of the project and north and east of the project to anticipate impacts from the project both during Construction and after the Project is implemented. In either case, both parts of the Cahuenga Pass will be impacted.

18. The traffic study did take in to account midweek evening event traffic when both the Ford Theatre and the Hollywood Bowl events were occurring simultaneously. Don't know if this was a light Hollywood Bowl night or one of the heavily attended event night at the Hollywood Bowl.

    ASK: provide more details about whether the study included a Hollywood Bowl event that experienced peak or very high attendance.

19. The traffic study does not indicate if the data collection occurred on a night when the Hollywood Blvd street closure was in effect.

    ASK: provide more data if Hollywood Blvd was closed on the day or night of the data collection.

The Ford Theatre Project wants to increase their events which in turn will increase their traffic. Since the Ford Theatre is starting out with traffic congestion that is essentially at a level D or F it may be that they cannot just add any more events without addressing traffic. The Draft EIR is making a claim that the new trips adjusted for the observed distribution in the vicinity of the Project Site can actually say 35 net new trip sin the weekday an peak hour, approximately 18 net new trips in the weekday evenings and 92 net new events on the weekends if the Ford theatre is planning to add 147 net new events according to their own report. Based on these numbers the Draft EIR on section IV,K page 29 Congestion Management Program requirements are met based on the # of net new trips. And, therefore since these net new #s are less than 150 trips in either direction during the weekday morning and afternoon peak hours, no CMP impact would occur and no additional analysis of freeway segments is required per the CMP criteria. Again, this is why I am asking to have a review of the TRIP #s in general and the net new TRIPS.

Rather than declaring they are exempt from further analysis, I would suggest the project team looks at this as an opportunity to trigger a multi-jurisdictional or multi-agency project to make significant changes in streets and/or highways that make improvements in capacity that in turn reduces exponentially the traffic congestion. Stated differently, BE A LEADER!

As mentioned during the public hearing and again in my letter date 3/11/2014, this is an opportunity for a key development project to take a bold step and produce a truly innovative approach to traffic congestion and corresponding mitigations. This could be a project that uses creative solutions, collaboration amongst multiple agencies and multiple interests for the greater improvement of traffic congestion in the Cahuenga Pass. There is great interest by the bike Czar to implement bike paths in the Cahuenga Pass

A. Obviously, LA City and LA County can provide contributions to improve the streets to alleviate congestion. And, they are key stakeholder for this project.
B. In the past year, there is a large push to implement bike lanes through the Cahuenga Pass. This area is critical and is considered the "backbone" to join the valley with the city. As a result, there is a vested interest in adding bike lanes. Due to the congestion we cannot afford to trade

traffic lanes for bike lanes. Need to figure out a way to maintain or enhance the traffic lanes and add bike lanes. This is an opportunity to work with the Bike Czar and the Major to figure out a creative solution so we maintain traffic lanes and widen the street (and add bike and pedestrian routes).

C. One idea proposed is to cantilever over the slopes above the Hollywood Freeway to widen both Cahuenga West and East. The response received was that would "cost too much money". My response to that is that it depends upon how much the projected change is wanted or needed. This could be accomplished by a multi-jurisdictional project.
D. There are other stakeholders who have a vested interest in a solution who may want to sign up to contribute to the solution. I am thinking of the City of Hollywood, City of Burbank, MTA, Hollywood Bowl (LA Philharmonic), Trizacon Complex (Hollywood and Highland), Universal Studios, Warner Brothers, and other entertainment companies just to name a few.

Seize the opportunity. This project could be held up as shining example of how projects could be run in a way to improve congestion and circulation in difficult economic times. If you pull the resources and partner with other agencies in the city and county might be ripe for solution that could provide a larger solution.

Based on my participation on February 18th and June 23rd a review of the Ford Theatre Project Draft EIR these are my comments / recommendations and questions to continue shaping the Draft EIR. Basically, things to consider based on unique aspects of the Cahuenga Pass where the Ford Theatre resides.

Sincerely,

Amy Cutter

Subject: Ford Theater Impact

I live at 2336 Lorenzo Drive, on the back side of the hill behind/around the Ford Theater stage. For years, my neighbors and I have worked to keep the county apprised of homeless encampments on the hillside above our homes. Their cooking fires are a great danger to our entire neighborhood, especially during our constant dry weather. Their unsightly, unhealthy garbage is also a problem. The Ford Theater hiking trail has been one of the primary sources of access to the hillside for these people.

The county has responded to our information and requests with repeated sweeps removing these people from the hillside. It has been our hope that the hiking trail would be closed. Are we really going to "improve" the trail and ensure its continuance? Does the Ford Theater really need a hiking trail to justify it's existence?

I am in favor of rehabilitation of the Amphitheater and development of new facilities for the performing arts at the Ford, but I am vehemently opposed to any further development of the hiking trail. In the interest of public safety, please consider amending your plans to include shutting down the hiking trail, and fencing off all public access points to the adjacent hillside areas.

Public Meeting for the Environmental Impact Report Regarding the Ford Theatres Project
July 14, 2014

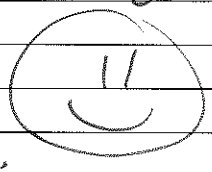
Written Comment Form

The purpose of the Public Meeting is to provide an overview of the findings of the Draft EIR. Comments can be submitted at this Public Meeting or sent via mail or email to the addresses below. The deadline for submitting written comments to the County is August 8, 2014. In the space below (and on additional pages, if necessary, or in a format of your choosing), please provide any written comments you may have concerning the Draft EIR for the Project. Your comments will then be considered during preparation of the Final EIR.

Please leave this form in the box provided or deliver via e-mail, U.S. mail or fax. Please address to Kathline J. King, County of Los Angeles, Department of Parks and Recreation, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020. Email address is kking@parks.lacounty.gov and fax is (213) 639-3959. If sent via U.S. mail, please add postage.

Name: Marci Diller
Address: 2370 San Marco Dr.
Hollywood, CA 90068

I came to the meeting with concerns over hiking trail, more people/traffic, and proper spending for renovations/improvements. I am leaving very encouraged and excited to watch Ford grow. I look foward to becoming more involved.



① concern is protecting our Hwd Hills wildlife.

Re: EIR on the Ford Theatres Project

Dear Ms. Rupert,

Please address the following concerns in the EIR

The Designs done by Brenda Levin were beautiful and I have no comments to make about that. My main comments have to do with Traffic, although I have concerns over what will happen during construction to the wildlife in the area.

Cahuenga east is a heavily trafficked road which is at times is either a one or two lane road traveling north from Odin to Barham. There is only one lane of traffic going south from the Pilgrimage Bridge to Odin. The Bridge is the only east west access into the Ford Theatre area and it is very antiquated and frequently backed up with north and south bound traffic on Highland turning east to go from Cahuenga West to Cahuenga East.

During construction this intersection will become more of a nightmare than it is now. The designated times for rush hour(s) cannot be applied since our traffic begins before, during, and after so called rush hour(s). The light at Cahuenga and Odin backs up traffic all the way south, sometimes as far south as Santa Monica Blvd, but most often to Fountain. And this is when there is NO event at the Bowl.

I would suggest a very long and hard look at how you are planning to deal with this during the construction phase. Trucks going in and out of the property will most likely cause a problem, not just to the surrounding neighborhoods but to the general public who use Cahuenga as a pass thru to Burbank and the Valley. The word needs to get out before construction for people to avoid the area and take another route. The people who live here have no choice, but you need to give choices to the others, much like what was done during the 405 construction. Lot's of publicity. Signs placed far enough south and north telling people to avoid the area. And no construction during Bowl season and their pre Bowl events or post Bowl events.

Also the neighborhood would not be in favor of more concerts that bring more traffic into our already over congested streets.

Sincerely,

Joyce and Stanley Dyrector

Subject: Ford Theater expansion plans

Dear Ms. King,

I live on Cahuenga Terrace by the Ford Theater and my property sits right behind a trail that leads up to the Pilgrimage Cross. For decades, I've lived in constant fear of brushfire because homeless persons regularly use the hiking trail to set up tents and encampments where they smoke and cook and drink. I read that the Ford Theater plans to enhance the hiking trail and I want to urge you to reconsider this as it puts all of us living in the Hollywood Dell in danger.

After years of campaigning with the police and fire departments, we finally got a No Tresspassing sign, with the municipal code listed, put up in the path of the trail. Therefore, it is now officially unlawful to access that area. Why would the Ford Theater flagrantly disregard the law?

I unfortunately am working the night shift on Monday, July 14, or I would raise my concerns at the information meeting, but I did ask my neighbors to attend, so I hope this component of the expansion plan will be explained in detail as well as safety issues realting to it.

Please undertsand that I am happy that the Ford will get needed improvements and increased space, but there is no need to invite trouble, and frankly grave danger, with a new and improved hiking trail in a brush fire zone where homes are only yards away.

Thank you very much for your consideration,

Subject: Ford Theater Project

Kathline,

i am happy to see that there will be a nice and overdue improvement for the theater. I am a resident in the pass, at the Highlands complex across the 101 from the Ford. I have a great concern what the traffic will be like when this project in happening. Just a quick question. will the pilgrimage bridge be replaced or widened for the influx of new traffic that will be coming to ford. i know the city is planning on taking away one lane of Cahuenga West traffic for a bike lane. That in itself seems rather frightening, especially during Bowl season.

Please advise and thank you,

Greg Johnson

> On the third page of the attachment, Board meeting transcript 12-18-12, numbered page 25, Supervisor Yaroslavsky's comments are not properly identified. He is the speaker, who addresses the Chair on line 14 to the end of the page. Inadvertent or not, this error should be corrected by the Executive Office. Supervisor Yaroslavsky deserves credit for responding to CRD3's concern about how, specifically, we were spending the 17 million dollars earmarked for the Ford. {This does not include the raise for Mr. Davis and the recent $7500 gift}
>
> *YAROSLAVSKY: "The scope of the work to be implemented by the Foundation includes the repair and or replacement of performance equipment, fixtures and infrastructure, including heating, ventilation and air conditioning, utilities and fire protection systems. That is essentially the project, the first phase of the project. The CEO Board letter more than adequately addressed the scope of the work. Thank you."*
>
> Ask yourself, if your mother reported that she was spending another $17 million dollars to repair or replace 'performance equipment, fixtures and infrastructure' if the above description would be sufficient.

There is a big difference between repairing an air conditioner and installing a brand new one. Remember, the 1200 seat amphitheatre is an outdoor facility, so its safe to say the 'heating, ventilation and air con' referred to by the Supervisor is for the 87 seat [Inside] theatre.

Joel, if you could send me a copy of the master plan and all of it's phases, it would make the project go down smoother for the public. The devil is in the details and we do have to let the chips fall where they may, but arts supporters everywhere want to know what specifically is happening and what mechanism is in place for the selection of a restaurateur etc. Hopefully not more Patina group who have fallen down in quality as they've expanded.

If you don't respond appropriately by directing me to the documents online or sending them on in PDF I could widen out the reach of this inquiry. Levin must be very well-respected and could have someone in her office forward over something with Zev's permission.

Cheers.

CRD3: "ITEM NO. 12 IS THE FORD AMPHITHEATER, WHICH I, FRANKLY, CHERISH, AND WE ARE SPENDING 10 MILLION OR ALMOST 10 MILLION ON MORE UNSPECIFIED UPGRADES. LAST YEAR WE SPENT APPROXIMATELY 6 OR 7 MILLION ON UNSPECIFIED UPGRADES. HERE'S MY TINY LITTLE RESIDENT REQUEST. COULD WE SPECIFY WHAT THOSE UPGRADES ARE? BECAUSE THEN I THINK IT WOULD BE EASIER TO FOLLOW AND ENJOY AS THESE THINGS BLOSSOM. FOR EXAMPLE, I THINK WE WERE VERY CLEAR ABOUT THE YAROSLAVSKY RESTROOM AT THE HOLLYWOOD BOWL ACROSS THE STREET. AND I JUST THINK IT'S NICE TO KNOW WHAT WE'RE FIXING UP BECAUSE IT WAS NOT IN THE DOCUMENTATION.

Wow! The below upgrade at the classic Capitol in Port Chester, only cost $2 million!!!
December 31, 2012, 2:48 pm2 Comments

Promoter Who Revamped Capitol Theater Buys It

The concert promoter who revitalized the Capitol Theater in Port Chester, N.Y., this year as a rock music hall has bought that landmark building from its previous owner. The promoter, Peter Shapiro, who is also a partner in the Brooklyn Bowl, said he paid $11.5 million for the 1,800-seat theater, closing a deal on Friday with the previous owner, Marvin Ravikoff.

Mr. Shapiro had been leasing the building, which in recent years Mr. Ravikoff rented out for only corporate events and private parties. But last summer Mr. Shapiro spent more than **$2 million refurbishing the space and installing a modern lighting and sound system** with an eye toward restoring its status as a rock-'n'-roll mecca.

Since September, when the theater reopened with a Bob Dylan concert, Mr. Shapiro has promoted more than 50 rock shows, showcasing acts including My Morning Jacket and Fiona Apple, and a well-received series of reunion shows by the Rascals. "I'm doubling down," Mr. Shapiro said. "I decided to have this theater for the rest of my life."

A version of this article appeared in print on 01/01/2013, on page C2 of the NewYork edition with the headline: Promoter Buys Capitol Theater.

WHITNEY ENGERAN CORDOVA: HI. GOOD MORNING, MR. CHAIRMAN, MEMBERS OF THE BOARD. MY NAME IS WHITNEY ENGERAN CORDOVA, I'M SENIOR DIRECTOR OF PUBLIC HEALTH FOR A.I.D.S. HEALTHCARE FOUNDATION. I'M SPEAKING TO ITEMS 25 AND 26, SOLE-SOURCE CONTRACTS FOR SERVICES. A.H.F. HAS INDICATED, A.I.D.S. HEALTHCARE FOUNDATION HAS INDICATED IN A LETTER TO DR. FIELDING DATED DECEMBER 17, 2012, OBJECTS TO SOLE-SOURCE CONTRACTS WITHOUT BIDS FOR THESE SERVICES. WE HAVE FILED A PROTEST, BELIEVE THAT THEY ARE PROCEDURALLY FLAWED AND BAD POLICY AND ASK THAT THEY BE WITHDRAWN. WE HAVE HEARD FAR TOO MANY TIMES FROM D.H.S.P. THAT DEADLINES ARE APPROACHING OR THAT THERE'S INSUFFICIENT TIME TO DO A PROPER BID. THESE EXCUSES SHOULD NOT OVERRIDE THE PUBLIC'S INTERESTS AND WE HOPE THAT THE BOARD WILL EXERCISE OVERSIGHT IN MAKING D.H.S.P. ACT MORE RESPONSIBLY AND DO THAT WHICH THEY ARE CONSTITUTED TO DO, BID AND PURCHASE SERVICES FOR THE CITIZENS OF LOS ANGELES COUNTY IN ACCORDANCE WITH THE LAW AND PRACTICES ESTABLISHED WITHOUT ABUSING IT OR YOU WITH THESE REQUESTS. THANK YOU FOR YOUR ATTENTION.

SUP. KNABE: THANK YOU, WHITNEY. WOULD THE DEPARTMENT LIKE TO RESPOND, PLEASE? MR. FIELDING OR SOMEONE FROM HIS STAFF HERE TO RESPOND?

CYNTHIA HARDING: GOOD MORNING. THIS IS CYNTHIA HARDING, DEPUTY DIRECTOR FOR THE DEPARTMENT OF PUBLIC HEALTH. AND WE UPHOLD OUR RECOMMENDATIONS TO THE BOARD TO APPROVE THESE SOLE- SOURCE CONTRACTS THAT WERE PULLED TOGETHER AND DEVELOPED. FOLLOWING ALL OF THE BOARD'S POLICIES AND QUALIFICATIONS, WE FEEL THAT THE AGENCIES WE'RE RECOMMENDING HAVE A UNIQUE SET OF QUALIFICATIONS AND EXPERTISE TO PROVIDE THE SERVICES OUTLINED IN THE SCOPES OF WORK AND THEREFORE BELIEVE THAT WE HAVE NOT VIOLATED ANYTHING IN PRESENTING THEM TO YOU FOR RECOMMENDATION TODAY.

SUP. RIDLEY-THOMAS, CHAIRMAN: ALL RIGHT. THANK YOU VERY MUCH. ANY FURTHER COMMENT ON IT? SUPERVISOR YAROSLAVSKY?

SUP. YAROSLAVSKY: WE'RE STILL IN THE MULTIPLE ITEMS, CORRECT?

SUP. RIDLEY-THOMAS, CHAIRMAN: YES. WE ARE IN MULTIPLE ITEMS. ARE WE DONE WITH?

SUP. KNABE: THIS IS REGARDS 25 AND 26.

SUP. YAROSLAVSKY: I WANT TO ADDRESS SOMETHING ON ITEM 12.

SUP. RIDLEY-THOMAS, CHAIRMAN: YES. ON THE MATTER OF SOLE-SOURCE, I THINK IT CAME UP AT THE LAST BOARD MEETING

PERTAINING TO THE DEPARTMENT OF HEALTH SERVICES. I THINK THE REQUEST WAS MADE TO GET FEEDBACK FROM THE SAID DEPARTMENT REGARDING ANY PATTERN OF SOLE SOURCING AND THE PREPONDERANCE OF SUCH. THE SAME MAY BE APPLICABLE IN THE CASE OF THE DEPARTMENT OF PUBLIC HEALTH. SO, MR. FUJIOKA WITH RESPECT TO THOSE TWO OFFICES -- MR. FUJIOKA? WITH RESPECT TO THOSE TWO OFFICES IN TERMS OF SOLE SOURCE, IT MIGHT BE USEFUL FOR A REPORT TO COME BACK TO EACH BOARD OFFICE AS TO THE PREPONDERANCE OR THE PATTERN OF SOLE SOURCING. IT WOULD BE USEFUL FOR THE BOARD TO HAVE KNOWLEDGE OF THE SAME. THAT WAS REQUESTED REGARDING D.H.S. LAST WEEK, DEPARTMENT OF PUBLIC HEALTH THIS WEEK. SO WHEN WE RETURN, IF YOU COULD GIVE AN UPDATE TO THE BOARD, IT WOULD BE USEFUL. THANK YOU VERY MUCH. SUPERVISOR YAROSLAVSKY, YOU WANTED TO RAISE AN ISSUE? MR. CHAIRMAN, I JUST WANTED TO VERY SUCCINCTLY ADDRESS THE COMMENTS THAT WERE MADE ON ITEM NO. 12. IN THE C.E.O.'S BOARD LETTER, THIS IS ON THE JOHN ANSON FORD THEATER, I'LL JUST QUOTE FROM PAGE 2. THE SCOPE OF WORK TO BE IMPLEMENTED BY THE FOUNDATION INCLUDES THE REPAIR AND/OR REPLACEMENT OF PERFORMANCE EQUIPMENT, FIXTURES AND INFRASTRUCTURE, INCLUDING HEATING, VENTILATION AND AIR CONDITIONING UTILITIES AND FIRE PROTECTION SYSTEMS. THAT IS ESSENTIALLY THE PROJECT, THE FIRST PHASE OF THIS PROJECT. THE C.E.O. BOARD LETTER MORE THAN ADEQUATELY ADDRESSED THE SCOPE OF THE WORK. THANK YOU.

Subject: Benchmarking the Zev Anson Ford renovation...

I now have the master plan and budget documents for the dream Zev is trying to make reality.

January 26, 2013

As Open as the Genre It Celebrates

By **NATE CHINEN**

SAN FRANCISCO — Hours before the opening-night concert for the SFJazz Center here on Wednesday, Randall Kline stood on the floor of the Robert N. Miner Auditorium and briefly slipped into reverie. Onstage, a few feet away, the pianist McCoy Tyner and the vibraphonist Bobby Hutcherson were testing out acoustics and rekindling a partnership; others scurried about, giving the room an expectant hum.

“I’m sorry, you’ll have to excuse me,” said Mr. Kline, the founder and executive artistic director of SFJazz, as he took it all in, finally snapping some pictures with his phone. “We’ve been working toward this moment for so long, it almost feels surreal.”

In one sense he was referring to the history of SFJazz, a presenting organization that began as a weekend festival called Jazz in the City in 1983 and now ranks among the leaders in its field. But he was also speaking more tangibly about the center, a $64

million, 35,000-square-foot building that suggests a physical manifestation of his organization's ideals.

An approachable three-story structure in glass and concrete, the SFJazz Center is being billed as the nation's first free-standing building created for jazz. And if the careful wording of that claim suggests a hedge against comparisons with Frederick P. Rose Hall — the $128 million home of Jazz at Lincoln Center, ensconced within the Time Warner Center in Manhattan — it hardly diminishes the extraordinary scope and promise of SFJazz's achievement.

"It's an impressive building, and has a certain grandeur," said the saxophonist Joshua Redman on Wednesday. "But it also feels kind of down-to-earth, and like it's part of the neighborhood." (Mr. Redman, a former artistic director of SFJazz, happened to be warming up in the center's Joshua Redman dressing room.)

The jazz circuit in this country has always relied on a network of nightclubs, but there are far fewer now than there once were — and not just in San Francisco, which counts Yoshi's as the exception that proves the rule. For 30 years SFJazz was nomadic, using spaces like the Herbst Theater and Grace Cathedral. Mr. Kline began thinking about a dedicated home more than a decade ago, eager to solidify an identity and establish a consistent standard of production.

In 2004 he shared his vision with the Bay Area architect Mark Cavagnero. After weighing options like a partnership with the San Francisco Symphony, they set their sights on a property occupied by an auto repair shop in the emergent-chic Hayes Valley neighborhood (and just a block away from Davies Symphony Hall). Mr. Cavagnero began drawing up designs.

But the idea of a purpose-built structure wasn't necessarily an easy sell with the SFJazz board: as some members pointed out, the organization had flourished for years without it. One thing that helped Mr. Kline's cause was the focus and passion of his argument about permanence; another was a lead gift of $20 million, which he had secured from an anonymous benefactor.

One core principle for the new building, through many rounds of planning, was that it would be a community center as much as a concert hall. To that end, the glass exterior conveys a literal and conceptual transparency, while the second-floor lobby is bracketed by bars and balconies. (A pair of commissioned murals depicting jazz scenes, by the artists Sandow Birk and Elyse Pignolet, adorn the lobby walls.) The Joe Henderson Lab, a secondary 80-seat performance space that will accommodate workshops and other gatherings, sits at ground level, its goings-on visible to passers-by.

And while a street-level cafe called South at SFJazz won't open for business until next month, it will be run by Charles Phan, the influential chef and owner of the Slanted Door restaurant group. It will be open all day, serving customers who aren't SFJazz patrons, which Mr. Kline said was the point.

As for the feel of the auditorium, Mr. Cavagnero said, "I started looking at these Unitarian churches, because they're places that are about people meeting, and there is no formal power relationship; it's about everyone being equal."

He said he drew particular inspiration from Frank Lloyd Wright's Unity Temple and Louis Kahn's First Unitarian Church, adopting similar proportions for the hall. Its steeply raked seating plan offers good sightlines, and even a sense of intimacy, from just about every vantage. (One row of balcony seats, which peers down from behind the stage, is likely to become a prized perch for music students looking to get inside the action.)

Mr. Kline, whose own set of references included a range of nonsacramental spaces like the Brooklyn Lyceum and the Fat Cat in Greenwich Village, put it this way: "We wanted the focused feeling of a concert hall but the relaxed proximity of a club."

The sound in the cubelike auditorium, which was designed with input from the theater consultant Len Auerbach and the acoustician Sam Berkow, runs toward the drier end of the spectrum: generally better for jazz than the reverberant standard of a classical hall, which can drown a group in cymbal wash. Wooden slats running along the walls disperse sound while adding a low-key visual flair.

It will take a little while for sound technicians to get to know the room; during Wednesday's concert, which featured an honor roll of musicians with established ties to SFJazz, there were some inconsistencies. But the natural drum sound was a winner: Jeff Ballard came across crisply behind Mr. Redman and the tenor saxophonist Joe Lovano on "Blackwell's Message," a tune by Mr. Lovano. And there was a pristine hush in the air during a first-time duet by the pianist Chick Corea and the guitarist Bill Frisell.

Wednesday was the kickoff for an opening-week festival that also featured concerts by Mr. Tyner, Mr. Hutcherson, the SFJazz Collective and the organization's five resident artistic directors this season: Mr. Frisell, the violinist Regina Carter, the pianist Jason Moran, the alto saxophonist Miguel Zenón and the percussionist John Santos.

The programming — not just this week but throughout a 30th-anniversary season that will feature multi-night appearances by the pianist Brad Mehldau, the fado singer Ana

Moura, the tabla player Zakir Hussain and the banjoist Béla Fleck — speaks to an inherent curiosity in the SFJazz psyche, an eagerness to tease out unlikely connections. (One immediately talked-about component of Mr. Moran's residency, in May, will be an improvised collaboration with local skateboarders.)

And to the extent that the SFJazz Center has enabled that breadth of style and approach, it disarms the very comparisons it invites. Jazz at Lincoln Center, taking its cue from Wynton Marsalis, its artistic director, has always used its programming to express a firm conviction about what jazz is (and by strong implication, what it isn't — or what isn't it). Mr. Kline and his team aren't naturally inclined toward that definitive sort of mission, and it's fortunate that they don't have to be.

A permanent home is a sign of hard-fought maturity; it demands that an organization be understood on its own terms. That will increasingly be the case for SFJazz — and yet the bicoastal symmetry has its uses, at least for now.

"Jazz at Lincoln Center has been incredibly successful," said Mr. Redman, "and if SFJazz can be successful, maybe one of the legacies will be that in the foreseeable future, they won't be the only two. There'll be other venues, other buildings for jazz that can enter the discussion. I think that would be fantastic."

Do you happen to have the drawings I gave you last year? The Zev Anson Ford is back in a robust way tomorrow at item 12 tomorrow -- $76,464,000 in Cap Improve money is a lot!!!

It's way too much… and sneaky. Or maybe it's not sneaky. Is someone covering this?

Each of the last years, Zev has been squirreling away this and that…. see below. But the County Arts money… should not be poured into a place across from Hollywood bowl…
that will never quite be all that.... It's nice as is as a piece of faded glory. What is actually going on is a fancy parking lot and office structure… for the Arts Dept.

The Zev Signature series is expensive… really expensive. Tx $80, $60, $40 ?

Young Musicians Foundation: *Gamer Jams: Music Behind the Screen*
FRI Sept. 27, at 8:30PM

Pairing classical music with pop culture, **Young Musicians Foundation** offers a one-of-a-kind show as they highlight a rich but often overlooked component of the video game industry. Led by conductor **Roger Kalia**, the 65-member youth orchestra will perform the soundscapes of popular video games in *Gamer Jams: Music Behind the Screen*. Audiences will be immersed in the digital world of the ultimate pop medium through a display of live music, synchronized lighting and video projection.

Tickets: $80, $60, $40
Subscribers & Friends of the Ford: $64, $48, $32

Subject: CRD3 -- The Zev Anson Ford... soundproofing the 101

The following bits caught my attention:

May 29, 2012 - Wendell (Adam) Davis salary supplement ($ amount unknown):
http://file.lacounty.gov/bos/supdocs/68684.pdf

July 3 2012 - $7.5 million
http://file.lacounty.gov/bos/supdocs/69569.pdf

Sept. 25, 2012 - $7,500
Supervisor Yaroslavsky
Ford Theatre Foundation in the amount of $7,500 (12-4279)

Dec 18, 2012 - $9.745 million
http://file.lacounty.gov/bc/q4_2012/cms1_187901.pdf

So I filed a PRA for Master Plan - which you now have...

Things I would like to know...

How many people attended the public input meetings (2 were held)? Was a record made of the attendees and their backgrounds? One would assume these were the most self-interested members of the public. Since public dollars will fund the County's "reinvestment" in the master plan including considerable expansion of existing facilities, one would like to see a showing of real public engagement in the process rather than just the affluent patrons and staff closest to the Ford, both of whom stand to gain the most from this massive public expenditure. How were these public meetings noticed and advertised? Where were they held? Was public transit accessible for attendees?

Have any demand studies been done of whether there is really a need for this facility expansion within the County's theatre arts community (both public and private)? Considering its out-of-the-way location and poor parking capacity, wouldn't the County get a bigger bang for its buck by investing in a facility that is more connected to existing public access and does not require a huge investment in parking structures? Is there an endowment and capital campaign planned along with this in order to demonstrate a wide and deep desire for the

public to co-invest in this master plan so this does not turn out to be a white elephant that leaves the public having to pay the long-term legacy costs for an under-utilized facility? In addition to the expensive access challenges, does it make sense to invest in more use of a facility that has such big noise issues? Rather than spend gobs of money mitigating the 101 noise issues, why not invest in another County facility that doesn't present these problems in the first place? How many days does Disney Hall sit idle and likewise for other similar arts venues in LA County?

Page 12 of the master plan is hilarious - cites a need for venues "woven into the fabric of city life." The Ford will NEVER be that without a huge outlay completely out of scale for its importance to our civic life and vitality. The Ford failed as a private facility and has limped along as a viable facility only through ongoing public subsidy. Nothing suggests a private operator would ever consider making this kind of investment absent some kind of market analysis. So why should the County?

Basically this a chance for the very affluent communities around the Ford to have their own "private" community center that will suck vitality and customers from other nearby civic areas while further worsening community isolation and class segregation. Why should someone from a fancy Hollywood Hills subdivision venture to downtown LA or even Hollywood or Studio City if they can isolate themselves in their own little "arts village" nestled in the hills just a few minutes drive from their expensive homes?

Pork/Patronage opportunities for Zev and Co.:

1) Restaurant concession
2) Likely in conjunction with (1) above, a catering/private event space concession subsidised at great public expense with huge parking facility, security and landscaping - bar mitzvahs and corporate retreats will be charged top-dollar, yet the public will be unlikely to get the premium though they will be left with the economic consequences of this activity being sucked from elsewhere
3) Museum/gallery space will likely be a valuable addition to some well-to-do donor of Zev's who needs to give their pet not-for-profit something to do

This will be a big stimulus program for all the affluent kids who can't find real jobs but are happy to be buoyed by the County's generous arts programming while public safety gets cut in Montabello.

In true Zev fashion, this presents itself as an innocuous, politically correct arts boost, but it is really a massive disguised re-distribution of precious arts funding to help an already over-served area and does nothing to help the overall arts profile in the rest of the County.
Thank you.

Updated: August 5, 2014 -- following August 5th board meeting:
http://www.latimes.com/local/countygovernment/la-me-park-property-tax-20140806-1-story.html

"...under the keen stewardship of the program, the Regional Park & Open Space District that was created to administer Proposition A has generated $256 million worth of "Excess Funds" that have also been made available for park and open space purposes."

What should be done with funds that remain unspent?

However, in the waning years of the assessment it becomes a drafting error in which the "last" 20% never gets spent. How can this problem be solved?

How does the Department of Parks & Recreation propose to administer the wind-down of Proposition A once Proposition A funding is no longer available?

by Alisa Bellinkoff Katz, Yaroslavsky's Chief Deputy...

MOTION http://file.lacounty.gov/bos/supdocs/73922.pdf

AGN. NO. ___)
M OTION BY SUPERVISOR ZEV YAROSLAVSKY January 22, 2013
By any standard, Proposition A – the Los Angeles County Safe Neighborhood Parks Propositions of 1992 and 1996 – has been a tremendous success. Hundreds of park, recreation, beach, open space, museum, senior citizen centers, and at-risk youth facilities have been bought, built, renovated and expanded in every area of the county, providing benefits to every resident and every property owner. Almost every project proposed in the measures has been completed, and we are on track to complete the rest, at the projected cost of $859 million, within the next few years. Additionally, through its keen stewardship of the program, the Regional Park & Open Space District that was created to administer Proposition A has generated $256 million worth of "Excess Funds" that have also been made available for park and open space purposes. Each of these measures imposed an assessment for a period of 22 years. The

assessment for Proposition A of 1992 will expire after fiscal year 2014-15, and the assessment for Proposition A of 1996 will expire after fiscal year 2018-19. The Regional Park & Open Space District (RPOSD), of which this Board is the Board of Directors, should consider whether and how a new park funding measure might be

implemented to take the place of Proposition A. In addition, the RPOSD should examine issues that will arise in the next few years in connection with the impending phase-out, and take action where necessary to ensure a smooth transition to whatever may come next.

These issues include the following:

A. Each of these assessments lasts for 22 years, but each also allows for a slight change in administration after 20 years. On that date, which occurs on July 1, 2013 for the 1992 assessment, the requirement to spend 80% of the assessment for capital outlay is removed. If the Board agrees, this could allow the RPOSD to recoup its full administrative costs, which have in recent years exceeded the 5% of assessment otherwise available to it.

B. The expiration of the 80% capital outlay requirement will also allow agencies to expend a portion of Excess Funds for Maintenance & Servicing, if the Board agrees.

C. The measure allows only 80% of "available" excess to be spent every year on "Excess Funds" projects. This provision was placed in the measure to ensure that funds were handled in a fiscally conservative fashion. However, in the waning years of the assessment it becomes a drafting error in which the "last" 20% never gets spent. How can this problem be solved?

D. Of the $540 million allocated for projects under the 1992 Proposition, $535 million has been committed and $518 million has been paid out. Of the $319 million allocated for projects under the 1996 Proposition, $304 million has been committed and $282.5 million has been paid out. Of the $256.6 million

made available in "Excess Funds," almost $150 million has been allocated but only $79 million has been paid out. There is also an unspent balance of approximately $47 million in the Maintenance & Servicing fund. Should a firm deadline be established for the actual expenditure of these funds? What should be done with funds that remain unspent?

E. Some funds have been allocated to agencies and so technically have been "spent" by the RPOSD; however, the monies have not actually been used to buy or build park or open space projects. Should a firm deadline be established for the actual expenditure of these funds on projects?

F. It appears likely that all funds will not have been expended before the collection of assessments comes to an end. How does the Department of Parks & Recreation propose to administer the wind-down of Proposition A once Proposition A funding is no longer available?

These and other questions should be resolved as quickly as possible so that we can ensure an orderly and successful phase-out of Propositions A of 1992 and 1996.

I, THEREFORE, MOVE that the Board direct the Regional Park & Open Space District, in consultation the CEO, County Counsel, financial advisors and consultants as necessary, to prepare the following:

1. A report summarizing the projects completed with Proposition A funding to date;
2. An assessment of the need for capital outlay to buy and build park and open space projects during the next 10 and 20 years in Los Angeles County;
3. A legal analysis of potential mechanisms to raise the funds identified in Item 2., above;
4. A report in response to the phase-out issues identified as A. to F. in the preamble to this motion.

Subject: CRD3 -- The County's FY 11-12 Civic Art Program Report is out!!!

http://file.lacounty.gov/bc/q1_2013/cms1_190762.pdf

Don't miss the bureaucratic work of art on page one of the report... the CC list... call it a japanese neoclassical arrangement on the title Executive Officer...*Chief Executive Officer*, *Deputy Chief Executive Officer*, *Acting Senior Assistant Executive Officer*, *Senior Manager, Chief Executive Office.*

I'll riff for a moment... how about: *Acting Senior Assistant Chief Deputy Executive Officer ... in training.* lol

But nary a word about old John Anson Ford. Which I found surprising. You'd think plenty of local artists would be cooking up installations. For some reason not too much noise re: the Zev Anson Ford... (other than the 101) Sorry.

Anyway, the Civic Art report is interesting. They spend a lot of real money on art and presumably artists -- and a few (not enough) school programs. [my point about blowing through 70 million on a restaurant venue].

I do worry wince when I see a $304,000 mural for the Bob Hope Patriotic hall. Not because I don't love murals, I do, in fact. The Bob Hope Patriotic Hall restoration commenced in 2006, cost $48 million dollars...and still isn't done-- doh! I'll spare you a conniption here-

Seeing the San Angelo Multi-purpose Center among the listed projects tugged on my heart strings for the artist, Mara Lonner.
I remember July 17, 2012 when Gloria Molina for no stated reason flushed a $292,000 net-zero energy design down the proverbial toilet, along with Mara's work, I think. Maybe it will survive. I'm sure she got to keep her small check, but as you know, a successful commission can be more valuable for a local artist. It was very weird, because the architect, Michael

Lehrer, who is highly respected, told me that the project was already out to bid... That's a huge red flag -- all the community engagement stuff had already happened. Lehrer is an award winning architecture firm and the chap was geniunely flummoxed. Molina swung the axe, but nobody quite knows why. Like a movie star who won't wear the custom made dress. If I were the producer, I'd say "put it on, It's net-zero energy and it cost 300 grand!"
http://file.lacounty.gov/bos/supdocs/69869.pdf

San Angelo Multi-Purpose Center
Artist Mara Lonner worked closely with the project architect to design a 37-foot long lasercut steel artwork that reaches across the entire the south wall of the building. Three larger-than-life bronze flowers will blossom from the two dimensional panels. The back of the artwork will be coated with a florescent paint to create a halo glow, adding to the dynamic cast shadows of the patterned pieces.

The cat is out of the bag, big meeting on the jails Tuesday March 19, 2013, including S-1, a preview of the nearly 1 Billion dollar plan to build a new Men's Central Jail at 11am. S-5 is at 1pm, where the Sheriff and his posse report back on his self-improvement efforts, from this year's Sheriff of the year. According to the Sheriff, there have been 1572 town meetings in the jails since October 2011. Which you may not know is nearly three a day. The Board of Supervisors has one Board meeting in the time the Sheriff has 21 Town Meetings.

Subject: CRD3 -- Get Smarter 10/4/12 -- LA County Maritime Operations

Wendy Watanabe the fearless Auditor Controller of Los Angeles County has finally slipped her report on the Sheriff's Maritime division into the mix. It's only four months late but given what we already know - it is not at all encouraging.

Turns out there are four separate Sheriff units that comprise the Sheriff's Maritime operations - three are managed, if you can call it that, by the Sheriff's Field Operations Region II division. The Special Enforcement Bureau which constitutes about a third of the fleet is run by the Homeland Security division.

THE UNITS
-Marina del Rey (MDR) w/ emphasis on county coastline near Marina and Santa Monica Bay.
-Parks Bureau patrols Castaic and Pyramid Lakes.
-Avalon Station patrols Catalina and San Clemente Islands.
-Special Enforcement Bureau (SEB) conducts specialized missions in county waterways.

ADMINISTRATIVE OVERSIGHT
It is not a surprise that according to Wendy Watanabe - who should be pictured, wearing a life-vest to highlight the absurdity of her signing off on the Get Smart Sonar vessel in June - to slip under a September 30, 2012 funding deadline, has determined, five months after setting out on this voyage, that Sheriff Baca needs to improve the tracking of maritime operations and cost.

At this time shockingly, a basic level of accountability is simply not happening... at all!!!

-None of the units track vessel usage.
-Maritime units do not always track objectives and resources for operations and activities.
-No standard or benchmarks have been established to evaluate maritime operations.

THE FLEET
The Sheriff has 30 vessels, but since he does not track vessel usage or maritime activities, Watanabe was unable to determine if this was enough. Any suggestion that this division needs beefing up is insane, to use the official term. (See Get Smart Recap)

-MDR has six vessels, but only three are available on any given day and the unit uses only two.
[This is not a riddle.]

-SEB has no information about its activities.
[Red Flag]

-AVALON station management complained that inboard gasoline engines, have a greater risk of explosion, so new boats.... See OMG -- (See Get Smart Recap)

STAFFING

MDR Station claim they do not have enough deputy boat operators to cover the maritime shifts they currently work. Often one deputy, sometimes with limited experience, as opposed to a minimum of two, operate vessels alone, creating safety risks.

Watanabe notes that without activity and staffing information it's difficult to assess what's really needed.

VESSEL ACQUISITION AND OPERATING COST

Watanabe's analysis reveals that 18 of the 30 vessels were acquired through grants or donations. Obviously there is big difference between state funding and a donor gift. Watanabe's report has no specificity. 3 vessels were purchased with county funds.

For the remaining 9 vessels the Sheriff could not produce acquisition method or cost and did not record these 9 vessels in the county's eCAPS accounting system, as required by county fiscal policy.
[Tanaka-ccounting]

For this reason the auditor, who may or may not get seasick, was unable to assess the value of these 9 vessels. The 21 registered vessels were estimated to have cost 7.1 million.

Since the Sheriff does not separately track operating costs, they are seamlessly blended into unit or patrol stations total operating costs.

Watanabe's recommendations:

Sheriff's management:

1. Improve the tracking and evaluation of maritime operations' objectives, resource usage, and activities.
2. Evaluate their current vessels to ensure they are appropriate for their unassigned usage.
3. Evaluate maritime unit staffing, and consider training additional deputies to operate vessels.
4. Evaluate the feasibility of obtaining customs officer cross-designation for boat operators in other appropriate Sheriff's units.
5. Record all vessels in eCAPS, including the acquisition method and total cost/value of acquiring and outfitting vessels for use.
6. Consider tracking maritime costs separately.
7. Evaluate the feasibility of consolidating all maritime operations into an existing single unit.

CRD3 recommendations:

Get rid of both Tanaka and Baca

Though it is tempting to wait for the Aero Bureau division audit, inform the public immediately as to yet another piece of the puzzle that points to the management change desperately needed in the Sheriff's department. If the feeling is, 'Steady As She Blows', after consuming the attached and below - including a dazzling exchange on the status of the Electronic Monitoring program, at end of GET SMART recap doc...

I would be very surprised.

Sheriff Lee Baca -- 7-27-12 CCJV Transcript -- Page 200 (11 of PDF in attached packet) -

"And what I'm saying is what's problematic here is that everyone's to blame and I'll take the blame for everyone because of my position as the Sheriff." [Line 14-17]

"I know the policy. And I know how to write policy. And so I've written several policies here that are critical to your commission. I appointed Paul Tanaka as the undersheriff because he's uniquely qualified for this position. You go through two recessions and you're losing hundreds of millions of dollars for the public service mission, you do need a C.P.A. I've had non C.P.A financial officers, they do a terrific job. But when it comes to the hard times, they don't do a terrific job. And when we ran the budget over 25 million and I told the Board of Supervisors I was going to pay back the 25 million in the next fiscal year. I'm the only department that ever ran over their budget and paid it back. **So there's a lot of things that Mr. Tanaka is able to do that he probably doesn't get enough credit for.** When it comes down to the so-called values and standards of the departments, which I have cherished and I helped write, I don't believe in talking about things in a way that confuses the deputies or confuses anybody."

Report of the Citizens' Commission on Jail Violence - Page 51

"By contrast, LASD **provisions on the use of force are neither comprehensive nor easy to understand.** There is no single, comprehensive, and organized policy, and the various provisions do not reflect unified higher-level principles governing all policies related to the use of force. Use of force provisions are scattered in seemingly random chapters and subsections in the Manual, as well as in unit directives, facility memoranda and other written orders. **A deputy or supervisor would need to spend hours even to locate -- let alone read and understand -- the various provisions relating to the use of force scattered throughout thousands of pages in the Manual.** For example, the force reporting provisions follow a provision concerning the rent control laws and are located hundreds of pages after policies describing when force is appropriate."

COPYPASTE:

Zev's Blog: A boatload of homeland security

January 10, 2012

Sheriff's officials are hoping to soon have a second terrorist-fighting boat patroling the waters off L.A. County.

Its crews have secured evidence from offshore pot busts. Its advanced sonar helped locate wreckage from a mid-air plane crash off the coast three years ago.

But mostly the Ocean Rescue II spends its days scanning for a threat that its crew hopes will never appear on any law enforcement blotter: the possibility that weapons of mass destruction might be smuggled into the massive **Port of Los Angeles.**

"This boat essentially provides homeland security for the entire L.A.County coast," says **Los Angeles County Sheriff**'s Lt. Jack Ewell, who has worked on the 55-foot-long, super-high-tech vessel since its deployment in the port three years ago.

Paid for with a **$2.25 million federal grant** from the Department of Homeland Security and operated by a rotating 3-man crew from the sheriff's special enforcement bureau, the Ocean Rescue II can scan ship hulls for traces of biological,

radiological, chemical and nuclear weapons and can transmit the data to onshore labs in real time. Its sonar sees threats in the murkiest waters; its remote underwater vehicle can pluck bombs from ship bottoms and retrieve evidence 3,000 feet underwater.

"It's pretty unique," says David Gutierrez, vice-president of manufacturing at Willard Marine in Anaheim, which custom-built the vessel for the Sheriff's Department. "It looks like just a standard boat with a lot of bells and whistles, but it's a very important piece of equipment at the port."

But the combination of all that technology and salt air is an ongoing issue: "You have to keep it painted, maintain the engines—to keep a boat like that working 7 days a week requires a lot of maintenance," Ewell says.

"It's like a patrol car," agrees Gutierrez. "It has to always be ready to go."

This, Ewell says, is why the sheriff **hopes to bring in a backup** with the help of a $3 million federal grant won by the department last year.

"A second boat will give us the capability to rotate vessels, or to have two boats in the water at the same time," Ewell says.

It also will add to the sheriff's already impressive counter-terrorism arsenal, which includes a radiation-detecting helicopter and a biological- and chemical-weapon-sniffing Labrador named Johnny Ringo.

At least eight of the 34 boats in the sheriff's department fleet are assigned to the Special Enforcement Bureau, which includes the Homeland Security Division where Ewell works. Another dozen—including an offshore vessel with nuclear detection capabilities—patrol out of Marina del Rey or Catalina Island.

Backing them up, of course, are maritime forces from the U.S. Coast Guard as well as port-stationed boats manned by the Long Beach police, the Port of Los Angeles police and other law enforcement agencies.

The stakes are high, Ewell explains.

"It's been estimated that an incident that shut down the port here would cost theU.S.economy $2 billion a day," he says. "Forty percent of the nation's imports come through here, and our coastal region is heavily populated. It would devastate the region if anything were to affect the port."

So far, Ewell says, the boat's daily scanning hasn't uncovered any dirty bombs. ("Believe me, you'd know it if they did.")

But it has been put to other uses. In April 2010, for instance, the sheriff's department used it to help secure **a large cache of marijuana** from an isolated cove on Catalina Island where a smuggler's boat had been stranded.

And in 2009, when two private planes **collided in mid-air** off the coast of Long Beach, Ewell says, "the boat was used for two weeks straight to recover parts of the planes, and to **find the victims**and return the remains to their families."

The second boat, if authorized next week by the Board of Supervisors, would similarly do double duty, Ewell says. Like Ocean Rescue II, it is expected to be equipped with advanced life support equipment, and to be set up for large-scale diver operations.

"We'll use it on medical emergencies, criminal investigations, plane crashes," he says. "The way budgets are these days, you have to get a lot of bang from the buck."

Subject: CRD3 -- Public Request to post the John Anson Ford Master Plan on the Supplemental Agenda

Hi, Adam:
Thanks for reaching out.

We have not met, but I am familiar with your work. As you know by now, I adore the open air vibe at the John Anson Ford and I'm a bit an open government aficionado, too.

The public is going to put more than $10 million dollars in precious cap improvement money into a project next Tuesday, but do not have the full picture that you and Ms. Zucker and others presumably have, like what is the total budget? Are you aware of how much money has been approved for work at the John Anson Ford in the last few years?

-How much of that work that was previously earmarked has actually been completed?
-What is the master plan?
-How does this $10,000,000 relate to the master plan?
-What is the total cost of the project and timeline?
-How much is for the new offices & parking?

-How much is for the restaurant/gallery?

I remember when Michael Govan came down recently with Ms. Pisano, he was chastised by a cranky Supervisor who shall remain nameless, after giving a detailed presentation that I thought was quite strong, because he did not bring visual aids on the LACMA plans.

On the John Anson Ford project the pubic has seen nothing, as far as I know. The master plan and related studies have never been posted or made public. Is that right?

I only know that those materials exist because I attended a board meeting and asked about it. The third district public affairs maven directed me to do a public records act request, which, reluctantly, and at my expense, I did. But, as Supervisor Yaroslavsky, once told me, "you are only one resident from District 3."

He's right.

As a preservationist, I have my own opinion, but what about everybody else?

It seemed to me that there were only two lightly attended workshops some years ago, and I remember wondering if those who attended the workshops were individuals close to the project? Were they? Did the department of regional planning do a mailer? I am pleased that you intend to have more meetings because in no way was the outreach on this robust and the public has a big appetite for outreach details… it's zeitgeisty.

It is essential, therefore, that the master plan and the studies and the renovation program be posted for several weeks so that people can understand and then fully embrace what is happening… or perhaps raise issues or concerns.

Adam, I assume that you and Laura take seriously the obligation and responsibility to make plans for exciting public works PUBLIC before approval.

I'll copy Alisa B. Katz, Zev's Chief of staff, and ask her if this is the last chance that the public has to understand the project before the money is committed, but regardless of her response, because Ms. Katz is understandably busy, please post a reasonable roadmap tomorrow on the supplemental agenda -- sometimes referred to [in anger] as the Green sheet!!

Laura attended this Tuesday's meeting, so she knows what I mean.

I want you to know that everybody adores the arts community downtown, in fact, Supervisor Knabe was specifically identified as an Arts Champion! [Disclosure: it was from a nice chap who he was honoring with scroll, but it's actually true -- all the supervisors are -- Knabe's been funding Opera for educators for years!]

Anyway, the takeaway from the standing room only meeting was that capital improvement money needs to be distributed where it is most needed, and the supervisors need to be prepared to go to the mat to explain the priorities to their many and varied constituents. Next Tuesday...

Kindly confirm receipt.

Dear Mr. Preven,

Thank you for your interest in the Ford Theatres project. We are working to send up a public scoping meeting in the coming weeks. I will make sure you are invited to this meeting. If you have any questions please feel free to contact me.

Best,

Adam Davis

> "Thank you, Sir. Item 12 today was delayed. And apparently we do need a Vin Scully down here, as Supervisor Yaroslavsky intimated last week, or a couple weeks ago. Item 12 was some capital improvement projects. And the reason why it was contentious is because of the different district offices were getting theirs and one getting the other, one getting this and that. Supervisor Yaroslavsky got a $10 million John Anson Ford delivery. But unfortunately that money was one in a series of deliveries of money. And

Laura Zucker, who is the head of the LA County arts, has agreed to post the plan, the master plan for the John Anson Ford redo that's coming up down the road. And then we'll all get a chance to look at it before next week. I appreciate that and look forward to scrutinizing it the way we would in any community, like Mark Ridley-Thomas's or Mayor Antonovich's or Gloria Molina's or or yours, Sir. Like with county golf. Thank you."

Sent: Thu, Oct 3, 2013 12:41 am
Subject: CRD3 -- 5of6 -- Community Development Commission to accept up to $10,000,000 in First 5 LA funds --

Authorize the Community Development Commission to accept up to $10,000,000 in First 5 LA funds into Fiscal Year 2013-14 approved budget http://file.lacounty.gov/bos/supdocs/79953.pdf

"This is a First 5 matter. We're essentially accepting these dollars for the purposes of our moving forward with the implementation of services to youth and their families. This adds to the $25 million that was adopted last year. And we are taking advantage of the good work of the community development commission for this purpose."
Mark Ridley-Thomas

Does that mean that the Antelope Valley's growth in homelessness and reduction of capacity would be considered? And if so, how would that be?
Mike Antonovich

"Given the motion and the timeline that's before us, time is an urgent matter. The First 5 board has an expectation that this N.O.F.A. be out by the end of october."
Sean Rogan

"Dr. Southard, yesterday at the blue ribbon commission, the issue came up with the department of children and family services, the department of public health, health services and l.A.S.H.A. That they have trouble getting the mental health information from our departments of mental health on homeless

families and other families in distress. Why can't a portion of the grant funds be used to create a system to ensure communication among departments and agencies to provide those services to the homeless families?"
Mike Antonovich

"If there are obstacles that are related to financing of systems to assist the provision of that information, mental health department would be eager to find resources to do that."
Marv Southard

"Next week would be too late?"
Mike Antonovich

"It would mean it would be two weeks. That's the problem."
Mark Ridley-Thomas

"We were told that the department of mental health was not sharing that information. So if we could have a report back from the C.E.O. On that precise issue."
Mike Antonovich

"Certainly, Supervisors."
Marv Southard

"Through sequestration and budget cuts, H.U.D. Is messaging that our jurisdiction should anticipate about an 8 percent-- 5 to 8 percent cut in homeless service dollars. So here in Los Angeles and the Los Angeles continuum of care, we have about a $7 million potential reduction in funding that can come in and serve programs that are already operating."
Mike Arnold

"I have a question. It claims that it's all for subsidies. Is there any administrative costs that C.D.C. Is taking from it?"
Gloria Molina

"Yes. 8 percent."
Mike Arnold

"8 percent of how much?"
Gloria Molina

"Half of what it was before."
Mark Ridley-Thomas

"I'm sorry."
Gloria Molina

"Half of what it was before. "
Mark Ridley-Thomas

"Half of what it was before? They shouldn't get any. So how much is that out of this amount?"
Gloria Molina

"$800,000 for the $10 million. "
Sean Rogan

"It was 15 before, correct? And fully justified as such. On the 25 [million] it was 15 [percent], was it not?
Mark Ridley-Thomas

"I don't know what the exact number is so I don't want to be misquoted."
Sean Rogan

"But you know i'm somewhere in the region. And you argued as hard as you could to make sure that the administrative fee was such that you could do the best job that the agency could do. And the fact of the

matter is what's fair is fair. And we are now moving with roughly 8 percent. And we will get every ounce of our money's worth because we've turned to this agency because they consistently have done what we think is a reputable job. And we thank you. And 5 percent sounds better. Anything more for now? Supervisor?"
Mark Ridley-Thomas

"He wanted 15 percent from you, too? "
Zev Yaroslavsky

"Yeah, he did."
Mark Ridley-Thomas

"Son of a gun."
Zev Yaroslavsky

"It's really shameful. They already do this work. And I just can't believe they'd take any administrative money into it. It's children's money."
Gloria Molina

"All right. Thanks very much."
Mark Ridley-Thomas

"All right. Mr. Chairman, I just want to say that I think Sean and his department have done a really good job on administering this program. The program you're about to embark under, the one we did last year, they came in with a gun to your head with no time left to do it. You administered it. You got the money out. You got the contracts signed. The money is getting out the door really, from my point of view in record time. Somebody was going to have to pay for it. We were going to have to pay somebody to do it. If we didn't pay C.D.C., we would have to pay the consultant to do it. This is a better deal and they know what they're doing. So I just wanted to say that, leaving all joking aside, that Sean has delivered and that's pretty good."
Zev Yaroslavsky

"Thank you very much, Supervisor Yaroslavsky. Any further comment on the matter?"
Mark Ridley-Thomas

"Yes, I think I have to. This wasn't a criticism of Sean and his work. He does great work. I just think it should have been a straight up subsidy that First 5 could have done instead of relaying it here.
Gloria Molina

"All right. Thanks very much. The item is before us. Are there any objections to moving forward With the item as amended?"
Mark Ridley-Thomas

"Yes. I'd like to abstain as it's a new term around here."
Gloria Molina

"A term of art."
Mark Ridley-Thomas

"Not new."
Zev Yaroslavsky

"New and improved."
Mark Ridley-Thomas

"It hasn't been new since Ridley-Thomas got here. [Laughter]."
Zev Yaroslavsky

"Well, I'm glad to know that I've made a contribution. Thank you so much."
Mark Ridley-Thomas

CRD3: The Community Development Commission was found in June to have serious INTERNAL CONTROL issues
after KCET ran a piece on Knabe "Family Ties" and in particular, a toxic Enterprise Rental Car procurement. www.socalconnected.org - search for "family ties"
Also, in July 2012, $87.3 million from First 5 LA was transferred to the county's health and mental health departments to fight childhood obesity, provide Ins. coverage for children and substance abuse treatment for parents. Sheila Shima of CEO said the money would be held in a... *special county fund* in order to streamline administrative processes. Molina may have had it right, a classic "rip-off."

http://egpnews.com/2012/08/supervisor-calls-87-3m-in-funding-for-children's-programs-a-'rip-off'/

Subject: CRD3 -- Community Development Commission -- LACK OF INTERNAL CONTROL

http://file.lacounty.gov/bos/supdocs/77626.pdf

This item buried late last week, and not scheduled before the board, is a great example of why the auditor is practically useless. It was only a couple weeks ago that Watanabe was lauded for securing $742,000,000 in CRA money by investing $1,000,0000 in overtime, yet it appears that the CDC is apparently underspending it's budget by almost $100 million annually. Worse, this was/is during one of the hardest economic periods in years. Arggh. That's like 20% of the money earmarked, but not invested...in the community. See attached page 18 for the reasons. For CRD3, it makes no sense and quite frankly, doesn't cut it.

As always, with run-of-the-mill county bungling, all of the following problems are merely relics from a bygone era (2010)...."relax, we've already improved everything." Like the jails, and the DCFS. A brand new procurement team leader, identified as a lawyer, has been brought in to remedy the appalling mismanagement. It better not be Mike Gennaco. The former procurement officer has apparently left.

-CDC supervision of overtime has been lax at best.

-CDC Management has kept no written justifications for Sole Source purchasing.

The auditor also found that the CDC staff did not always follow the commission's contracting procedures. Those procedures are being completely rewritten by July 1, 2013, yet we have not heard back from Ellen Sandt or Mr. Yaroslavsky about the countywide initiative to improve this category.

Apparently, evaluators did not always sign conflict of interest statements and evaluator comments did not always adequately support the assigned scores. Dates for approvals were left off documents so it was hard to tell the sequence of approval.

In one 1.2 million dollar contract, [most of this stuff was 2010, so why it took three years is baffling] CDC did not document their method for selecting a shortlist vendor, or indicate how vendors would be selected. Nor did CDC have any written procedures for selecting proposers from a list of qualified vendors. Important to remmeber that the Board of supervisors is the overseeing board for this group, personally. They could install folks who would pay attention, but that would involve relinquishing control.

Auditor found invoices where CDC paid higher rates than specified in the contract and one instance where CDC did not take an available discount.

CDC staff have not been "signing conflict of interest statements before evaluating proposals" as is required.

Bottom line, "contract solicitation outreach efforts" are bad to extra bad. For the six solicitations reviewed, CDC staff did not document when the solicitation notices were mailed to vendors and the auditor could not determine if the notices were timely or, in many cases, who they were sent to. PFFFFT.

Anyone remember ...Enterprise rent a car ... an Englander Knabe & Allen client have benefited from these lax protocols. (see below)

CDC must ensure that proposal scores are adequately supported. The Auditor found numerous instances where comments did not support the assigned scores. Two of five (40%) of the five evaluations reviewed were not scored in accordance with CDC procedures.

Now, CDC has some new procedures that will be unveiled July 1, 2013.

Let's ALL look the new procedures over together to be sure they are clean and simple. And the public wants
the report back to Mike D. Antonovich, on what actions have been taken in connection with the Enterprise rental car imbroglio.

Eric Preven

CRD3 -- If it walks like a duck and it quacks like a duck... it could be bid-rigging!!! (Enterprise)

From **esp3800** esp3800@aol.com hide details

To **jlacey** jlacey@da.lacounty.gov, **kamala.harris** kamala.harris@doj.ca.gov

Cc **newstips** newstips@latimes.com, **constituent** constituent@auditor.lacounty.gov, **fraudnet** fraudnet@gsa.gov

Find the link below for the report back from the Auditor-Controller that we've all been waiting for following last year's KCET piece on Knabe "Family Ties" and in particular, the toxic Enterprise Rental Car procurement. www.socalconnected.org - search for "family ties"

http://file.lacounty.gov/bc/q1_2013/cms1_189487.pdf

The report by the Auditor Controller confirms key findings "by the media" and concludes that "Community Development Commission's (CDC) outreach was substantially inadequate given the many competitors in the retail vehicle leasing industry in Southern California" but the investigators found "no evidence showing familiar business relationships between the three enterprise employees and four CDC employees involved with the solicitation."

CRD3: This type of investigation ought to be conducted by law enforcement not The Office of County Investigations (OCI). Time and time again this group provides an unwanted cushion for even the most hard to stomach actions and or omissions that may constitute serious criminal misconduct. Watanabe who is an auditor appointed by the Board will admit that such wrongdoing is for the District Attorney, Attorney General or Federal investigators to determine.

On January 15, 2013, prior to publishing this report back that had been called for urgently by Supervisor Antonovich, OCI "met with CDC management." The CDC expressed general agreement with the findings and recommendations. They will respond in 30 days.

CRD3: This explicitly subverts the protocol the public expects - which is a thorough dragging out into the light of day. A credible independent investigation by law enforcement is needed without further delay.

Matt Knabe (Lobbyist for Enterprise) and Don Knabe (Voting member of Community Development Commission)
The Board of Supervisors currently serves as the Commissioners of the CDC setting policy for the agency. In Fiscal Year 2012-2013 the agency has a budget of $485 million and a total staff size of 551. Over 74 percent of the CDC's funding comes from the U.S. Department of Housing and Urban Development (HUD).

Matt Knabe told investigators that he was unaware of the CDC's vehicle leasing and fleet services solicitation until the proposed contract with Enterprise appeared on the board's agenda for March 6, 2012 -- http://file.lacounty.gov/bos/supdocs/66779.pdf ;
Mr. Matt Knabe told the auditor controller that "no one from his firm (EKA) had any contact with Don Knabe about the solicitation." The investigators found no evidence to support any attempts to influence the award of this fleet services contract" worth nearly 2 million dollars.

CRD3: That's nice, but the public is not willing to take Matt Knabe at his word alone. Too many issues have arisen, and the notion of he himself conducting an investigation among his employees is insufficient to restore confidence. Matt Knabe attended the Board meeting on March 6 and or March 13, 2012 presumably to help Santos Kreimann and his client, Modern Parking Inc., to secure a deal to manage more than 10,000 parking spaces for County Beaches and Harbors, over spectacular objection. This matter was also addressed in the Socal Connected piece. Modern Parking Inc. has subsequently stopped lobbying with EKA and the lobbying firm has added Standard Parking as its new Parking client. Though this practice may be common it begs numerous questions as to who, specifically, is controlling the awarding of county contracts. [EKA recently dumped Come Land Maintenance and picked up Diamond Contract Services in the janitorial sector -- worthy of careful scrutiny.]

Mr. Kreimann completed his ethics training on December 3, 2012, after years of serving as Director of Beaches and Harbors without AB1234 ethics training, as is required. A critical part of Mr. Kreimann's job in that role is to meet behind closed-doors with Marina del Rey developers, some of whom may now be experiencing investigation by the District Attorney regarding various Assessor-related malfeasances. For the last nine months Mr. Kreimann has played a key role in the Assessor's office as, CEO Bill Fujioka's 'exceptional manager'. He has allegedly been sorting through cases to determine which may require further review by the DA's Public Integrity Division. This type of sifting should obviously not be done by the man who worked closely with numerous Marina del Rey developers. The public takes exception with that 'exceptional' arrangement.

Executive Director, Sean Rogan
Investigators interviewed the CDC's Executive Director, Sean Rogan, who stated that he was "100% confident that there was absolutely no influence in regards to the Supervisor's son." He added that, "There certainly wasn't any political influence or lobby pressure."

CRD3: How Mr. Rogan knows that, is of great interest. He must mean he felt no pressure of any kind himself. Also of interest for the public is how in the world such a boldly, toxic-on-its-face, solicitation containing the following passage could pass muster for the county board of supervisors...?

"Enterprise was the only company that responded to the request. Based on Enterprise being the only respondent, Commission staff has concluded that Enterprise is the only vendor in the area available to provide the needed services."
[...the area is Southern California!]

Mr. Rogan claims a contract analyst came to him in December 2012 saying he failed to act appropriately and correct outreach details, because he/she was simply too embarrassed. The CDC represented to the board that they had sent an email to 50 firms in the fleet rental business. In fact they only sent the Request for Information (RFI) to 16, but the document attached to the CDC's email did not clearly inform potential vendors what content was expected and an exhibit that was to accompany the RFI and list the vehicles to be acquired was not included with the email.

Only 10 of the 16 firms were actually in the business of automobile fleet rental. But these ten firms stated that they had no recollection of receiving an email solicitation. Four firms told investigators that they would have been interested in bidding, had they received the RFI.

The CDC failed to contact over 60 entities in the business of fleet rental. They received just one bid. *CRD3: Pffft.*

The CDC violated its own policy of not advertising for procurements over $10,000 on their website and the county's website.

"Substantially inadequate outreach" is a gross understatement.

CRD3 conclusion: The Enterprise deal was rigged. If it walks like a duck and quacks like a duck it is a duck. There is no way that this happened by chance. This was a rigged bid. We don't yet know by whom, but the OCI report merely confirms that nobody wants to confess to any crimes at this time. That is of course expected. This matter requires the attention of credible independent investigators - other than Mr. Kreimann - who are experienced at enforcing bid-rigging and collusion laws. The un-named 'contract analyst' who may be scapegoated here, needs to be protected by civil rights organizations and applicable whistleblower rules and guidelines.

A full wide investigation is long overdue.

Thank you for your interest in county government.

Eric Preven
The County Resident from District 3
818-762-7719
818-645-2616 mobile

From March 6, 2012 -
1-D. Recommendation: Approve and authorize the Executive Director to negotiate, execute, and if necessary, terminate a five-year contract with Enterprise Fleet Management using up to a total of $1,750,000 in Commission and Housing Authority program funds for all five years

On motion of Supervisor Ridley-Thomas, seconded by **Supervisor Knabe**, this item was approved.

CRD3 notes:
-- no RFP cuz nobody was interested in providing cars to county ???

On December 20, 2011, a RFI was issued to determine the feasibility of utilizing leased vehicles with a full maintenance service program for the Community Development Commission.

This letter recommends approval of a five-year lease contract with Enterprise Fleet Management

(Enterprise) to **provide 61 new** leased vehicles and a full maintenance service program for those vehicles as well as a maintenance program for **17 existing vehicles** being retained by the Commission. **The vehicles will be used by Commission and Housing Authority staff.**

78 company cars -- for 650 employees -- w/ maint agreement ???

On March 9, 2010, the Board approved a similar agreement with Enterprise for the lease of five vehicles to be used for the **Section 8 inspectors** in Lancaster as a pilot program. This program has proven successful, and when implemented agency-wide, will significantly reduce fleet costs. In Fiscal Year 2011-2012, the total fleet annual budget was over **$880,000**, with the average vehicle age of approximately 8 years with over 76,000 miles. The move to Enterprise will replace the aged existing fleet with new models and reduce the size of the fleet pool by allowing staff to rent additional vehicles from Enterprise daily as needed. The estimated fleet budget in future years will be approximately $580,000, which includes approximately $350,000 per year for the Enterprise contract, plus fuel, miscellaneous maintenance costs and administrative expenses. This represents an estimated savings of approximately $300,000 per year.

The Commission issued a Request for Information (RFI) for the purpose of seeking information regarding leased vehicles with full maintenance service programs. Enterprise was the only company that responded to the request. **Based on Enterprise being the only respondent, Commission staff has concluded that Enterprise is the only vendor in the area available to provide the needed services.**

This item on tomorrow's schedule…re: the proposed partnership schedule… etc.

http://file.lacounty.gov/bos/supdocs/82834.pdf

12. Recommendation: Approve the proposed roster for the John Anson Ford Amphitheatre's 2014 season; and authorize the Executive Director to make the necessary expenditures within the approved Fiscal Year 2013-14 budget to implement the program. (14-0391)

FORD AMPHITHEATRE
PROPOSED 2014 SUMMER PARTNERSHIP SEASON

*indicates organizations new to Partnership Program

Bellydance Evolution*
Alice in Wonderland
Middle Eastern dance is fused with Western forms in a retelling of this classic story.

Chris Isaacson Presents, LLC*
Broadway Under the Stars
Two evenings with Tony Award-winning artists sharing treasured memories and songs from popular Broadway shows.

Eastside Luv*
English as a Second Language

An evening of live music by L.A. Latino groups and DJ sets mixing a range of classic Mexican, American and European rock hits.

Rong Music & Entertainment*
Cosmic Boogie
An evening of experimental and new age music.

I thought they were going to redo the stage last year… and are these the dressing rooms, one wonders that are going
to be soundproofed…? Sigh.

"This summer, the season will conclude approximately 30 days earlier than in previous years to accommodate the schedule of capital improvements planned during the amphitheatre off-season starting on September 15. Anticipated improvements will include reconstruction of the Ford's stage, installation of a comprehensive drainage system for the amphitheatre, renovation of backstage artist dressing and green rooms, stabilization of the hillside and improvements to the hard and planted landscape to mitigate erosion, and a redesign of theatrical lighting and sound systems."

> Subject: CRD3 -- John Anson Ford Scoping meeting…. & Request for Radius map
>
> Very odd but pleasant enough meeting in the small Ford theatre… numerous concerns from locals re: traffic congestion etc.
> Architect Brenda Levin was there… who Zev celebrates (on her website) because she brings a sense of 'common ownership and civic pride' and Zucker & Davis were there too. I was disappointed that there was no model, no presentation form Laura or Adam… or Levin explaining… or introducing [Insert Eli Broad-type] who is going to take us home on this!!!! It was a format… best described as follow the sketchy posters and county spinners will answer your questions…
>
> There was a fire retardant blanket that the county team would occasionally inflate to smother a hot questioner. hehe. I jest, but I delivered my message about transparency.
>
> They made it seem like… oh, we have no idea, the EIR has to come back, then we'll have a better idea… As you know, the EIR is a safe zone - that gives any agency official an excuse to throw their hands up in the air…dunno! "Need to wait for the EIR!"
>
> And the funding, they claimed, not approved. I said, what about the 20+ million that has been earmarked over the last couple years… including the $10 million, last week. Brenda Levin reminded me that the overall budget was over $100,000,000 million … I had thought $75,000,000… you corrected me to $60,000,000…
>
> The current work, going on now, according to Levin, who made it seem like she's supervising is a very expensive painting of the two old towers. (Argh) Caught my attention, that the new wooden stage (outdoor) won't be installed until next 2015 off season… she said the new seats were nice. The 299 theatre seems to be…a tool for managing director Davis to be able to provide a year round house to accommodate some demand…he did not elaborate.
>
> And oddly he complained to me that folks won't come to Ford because they don't like stacked parking and the restaurant isn't good. Another chap said Crumbles who currently have the conession, cater to the

crowd… in a cool artsy local way… for a swedish performance they do swedish meatballs…for a mexican folkloric… tamales, for a korean dance… kimchee.

so I don't understand. I told Maria Chong-Castillo, Zev's deputy, we should call the new restaurant, Zev's or maybe Maria's? She winced...

I asked about the increase from 79 or so perfs a season to over 300… this caught the attention of a neighborhood council rep who was there. He left early, when he saw there was no there, there.

The presentation about what is happening was almost non-existent, beyond those photos we've seen. I don't think I saw anything new… a lot of weird EIR talk… from county consultants who, one had the feeling just came from,
the visioning process in marina del rey…

There was one persistent theme…

A number of folks asked about city approvals and the response was always the same…" this is county jurisdiction. "

But someone pressed… but the Mulholland view council… (tk) do you need their approval?

See Zev.

I was reminded that I asked for a PDF copy of the December 12, 2012 "Right of Entry Permit" for the John Anson Ford.
I'll keep you posted. {pardon the informality… I'm running.}

Re: Request for Radius Map and Outreach Information

Dear Mr. Preven:

This is in response to your Public Records Act request made on February 18, 2014 for a copy of a radius map and a description of the mailing outreach regarding the radius map.

We have completed our search and have determined that there is 1 page of document responsive to your request. A copy of the radius is enclosed.

With respect to outreach information, there are as follows:

Agency List: 113 - 105 Fed Express, 7 certified mails, 1 in person filing at County Clerk.

Fed Ex: 104 addresses

State Clearinghouse Package: 1 address (shipped Fed Ex)

Certified Mail (PO Boxes): 7 addresses

County Clerk: Filed the notice in person

Owners List: 756 - mailed by mailing house, regular mail

Occupants List: 389 - mailed by mailing house, regular mail

Total number of stakeholders who received the email blast from the Arts Commission: 451

If you have any questions, please contact me at (213) 974-2163.

Very truly yours,

JOHN F. KRATTLI

> Bumps, but not actual pay increases, for the Zev Anson Ford gang.
>
> Attached is the budget for Arts Commission (and Animal Control for benchmarking) -- I just wanted to understand the 'increase in staff' and 'size and scope' of the arts edu programming-- but the arts commish budget doesn't track any budgeted positions like other county depts. This must have to do with the Foundation running things. But, has the staff increased substantially?
>
> I think so. Can you ask Joel to send over an accurate staff list with salaries.
>
> In the recent past I barked about an unidentified supplement being generously provided to Zucker and Davis -- nothing wrong with generous supplements, but they ought to be disclosed. This is a PRA 6250 et seq. to see all previous, current and planned, salary supplements for Laura Zucker and Adam Davis dba

Wendell*, including any other compensation packages, to ensure that we are benchmarking with the field, and not lagging.

Arts development is so important and it is absolutely critical that we not lose this team and thus I request a delay pending a full review of the ARTS commission budget in advance of the upcoming budget hearing in June.

During the April/May campaign, 3rd district candidates suggested that we were not spending enough $ on art... and not equitably enough.

Let's get a report, to be clear.

I propose an Special Item (S-1) on all of the great Art stuff we have been admirably doing... inclusive of the challenges, that the commission may have encountered. I think it should be a co-presentation between the CEO's Brence Culp, who has roots in the 3rd district and knowledge about the great work that is being done, supplementally, including a variety of AECOM upgrades. We should also have Brenda Levin, Zev's favorite architect pontificate briefly about the ongoing EIR... and master plan budget. We've payed her a lot it would be good to hear her wax poetic about the great plan.

Eric Preven

67-C Recommendation to adjust the salary range for two (2) non-represented classifications in the department of the Executive Office of the Board of Supervisors. The justification for this request is to recognize the expanding role of the Arts Commission since its original allocation, most notably in the size and scope of the arts education programs as well as a notable increase in the size of the staff under the Director.

"Specifically, we are recommending a salary range increase for the position of Executive Director, Arts Commission from salary range R12 to R15."

"The projected budgeted annual cost for the salary changes is estimated to total $36,721"

"Please note, we are recommending changes in the salary range designations, not actual pay increases for the current incumbent."

Monthly....

R15 = Approx. $13,208.42

Item #8807
$10,631.85 EXEC DIRECTOR,ARTS COMMISSION N23 R12

Item #8808
$10,631.85 EXEC DIRECTOR,ARTS COMMISSION(UC) N23 R12

67-C. Chief Executive Officer's recommendation: Approve the introduction of an ordinance amending County Code, Title 6 - Salaries, to adjust the salary range for the Executive Director, Arts Commission, and the Executive Director, Arts Commission (Unclassified), in the Executive Office of the Board of Supervisors to recognize the expanding role of the Arts Commission since its original allocation. (Relates to Agenda No. 67-D) (14-2762)

Board Letter

FUND	FUNCTION	ACTIVITY
GENERAL FUND	PUBLIC PROTECTION	OTHER PROTECTION

Mission Statement

The Department of Animal Care and Control, operating under State law and County ordinance, provides for public safety in the community through the removal and impoundment of domestic animals and livestock in the unincorporated areas of the County and contract cities. Central to the core mission of the Department is enforcement of applicable animal control laws, medical care and sheltering of impounded animals, recovery and redemption of lost animals with their owners, adoption and placement of available animals, investigation of animal cruelty and dangerous animal complaints, rabies vaccinations, and licensing of dogs and cats. The Department also provides for public education programs, spay and neuter surgeries and evacuation of animals during local and regional emergencies. The Department operates six animal shelters which have veterinary medical clinics as part of their operations. Department costs are partially offset by revenue from pet licenses, income from contract cities, and fees collected for various activities in the shelters.

2014-15 Budget Message

The 2014-15 Recommended Budget reflects an overall increase in NCC of $1.0 million primarily due to Board-approved increases in salaries and employee benefits, funding for 10.0 positions for the Antelope Valley Communication Center, 3.0 positions for the Major Case Unit, one-time funding for the replacement of the Voice Recorder System, and aging vehicles. These increases are partially offset by the deletion of one-time funding for safety equipment, vehicles, and a video surveillance system.

Critical/Strategic Planning Initiatives

The Department of Animal Care and Control will continue to enhance revenue and develop more efficient processes for the delivery of its services. The primary efforts will be the implementation of the Antelope Valley Communication Center to streamline response to service calls from constituents in the Antelope Valley and offset the workload from the existing communication center, and augmentation of staff in the department's Major Case Unit. The Department is contemplating an enterprise solution for mobile connectivity to provide field staff and service vehicles access to data and updates through real time connectivity to the department's network and shelter management system.

This endeavor will significantly enhance the efficiency of the officers in the field by providing mobile access to licensing information, and report writing in the field. The deployment of video surveillance continues to be a high priority for the department, ensuring the safety of our employees, the public, and animals in our care; and provides a secure environment, improves workforce accountability, and discourages theft and other inappropriate conduct. The department has been finalizing its 2020 plan. This is a five year plan for fiscal years 2015-16 through 2019-20 that focuses on two key areas of need: facilities improvement and replacement; and staffing requirements. In the interim, the refurbishment of aged kennel buildings and other animal housing facilities continues to be a primary focus of the department's facility management strategy.

Changes From 2013-14 Budget

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
2013-14 Final Adopted Budget	**38,018,000**	**0**	**14,659,000**	**23,359,000**	**371.0**
New/Expanded Programs					
1. Antelope Valley (AV) Communication Center: Reflects an increase in salaries and employee benefits and services and supplies to fund 6.0 Intermediate Typist Clerks, 1.0 Supervising Typist Clerk, 2.0 Animal Control Officer I, and 1.0 Animal Control Officer II positions at the new AV Communication Center.	706,000	--	--	706,000	10.0
2. Major Case Unit: Reflects funding for 3.0 additional Animal Control Officer II positions to conduct criminal investigations.	242,000	--	--	242,000	3.0
Other Changes					
1. Salaries and Employee Benefits: Primarily reflects Board-approved increases in salaries and health insurance subsidies.	589,000	--	--	589,000	--
2. Retirement: Reflects an increase primarily due to prior-year losses in Los Angeles County Employees Retirement Association's investment portfolio and revised investment return assumptions.	259,000	--	--	259,000	--
3. Countywide Cost Allocation Adjustment: Reflects an adjustment in rent charges to comply with Federal Office of Management and Budget claiming guidelines (2CFR Section 225).	132,000	--	--	132,000	--
4. One-Time Funding: Reflects the deletion of one-time funding for safety equipment, vehicles, video surveillance and a public address system.	(1,275,000)	--	--	(1,275,000)	--
5. Reclassification: Reflects the reclassification of a Warehouse Worker II to Procurement Assistant II position.	--	--	--	--	--
6. Voice Recorder System: Reflects one-time funding for the replacement of the Voice Recorder System.	150,000	--	--	150,000	--

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
7. Ongoing Funding: Reflects the transfer of ongoing funding to the Provisional Financing Uses budget unit.	(68,000)	--	--	(68,000)	--
8. Vehicle Replacement: Reflects one-time funding for the replacement of five aging vehicles.	250,000	--	--	250,000	--
9. Unavoidable Costs: Reflects changes in worker's compensation costs due to anticipated benefit increases and escalating medical cost trends and an increase in retiree health premiums, fully offset by a reduction in unemployment insurance costs and services and supplies.	--	--	--	--	--
Total Changes	**985,000**	**0**	**0**	**985,000**	**13.0**
2014-15 Recommended Budget	**39,003,000**	**0**	**14,659,000**	**24,344,000**	**384.0**

Unmet Needs

The Department's unmet needs request include funding for volunteer and medical programs. Additionally, the Department is requesting funding for replacement of asphalt in the perimeter of the kennel buildings and parking lots at all of the department's care centers, replacement of kennels at the Carson, Baldwin Park, Lancaster and Downey care centers, a mobile connectivity solution for field access to the department's network and shelter management system, implementation of a CCTV system at the Downey Care Center, and implementation of countywide dead animal removal services.

Departmental Program Summary

1. Animal Housing

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	9,351,000	--	4,637,000	4,714,000	99.0
Less Administration	--	--	--	--	--
Net Program Costs	9,351,000	--	4,637,000	4,714,000	99.0

Authority: Mandated program - California Food and Agriculture Sections 30501, 31101, 31105, and 31602 and California Penal Code Section 597.

The program includes: (1) impound, housing, and provision of medical care to stray and abandoned animals; (2) return of licensed, micro-chipped, or tagged animals to owners of record; (3) adoption of available animals to the public, animal rescues, and adoption partners; and (4) emergency sheltering of animals displaced by wildfires or other disasters.

2. Revenue Services (Licensing and Canvassing)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	3,947,000	--	3,947,000	--	50.0
Less Administration	--	--	--	--	--
Net Program Costs	3,947,000	--	3,947,000	--	50.0

Authority: Mandated program - California Food and Agricultural Code Sections 30801-05, 30952, 31105-08, 31252, 31254, and 32252-53 and Los Angeles County Code Section 10.20.030.

The Licensing program is responsible for the maintenance of new license information and processing of annual renewal notices to animal owners in the unincorporated areas of the County and contract cities.

The Canvassing program performs neighborhood animal license enforcement at residences and other locations in the unincorporated areas of the County and contract cities. Department representatives collect past due licenses, verify rabies vaccination compliance, and perform annual inspections of businesses that care for, sell, or house animals.

3. Field Services (Includes Call Center)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	11,912,000	--	5,106,000	6,806,000	146.0
Less Administration	--	--	--	--	--
Net Program Costs	11,912,000	--	5,106,000	6,806,000	146.0

Authority: Mandated program - California Food and Agriculture Code Sections 30501, 31101, 31105, and 31602 and California Penal Code Section 597.

Responds to calls in the unincorporated areas of the County and contract cities for the capture and removal of dangerous and aggressive, stray, and unwanted dogs, cats, and other non-wildlife animals. Provides direct customer services including the removal of dead animals from the public and acceptance of relinquished animals. Assists other public service agencies in providing emergency services during natural or man-made disasters.

4. Medical Services (Shelter and Clinic)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	5,356,000	--	969,000	4,387,000	31.0
Less Administration	--	--	--	--	--
Net Program Costs	5,356,000	--	969,000	4,387,000	31.0

Authority: Mandated program - California Food and Agricultural Code Sections 30501, 30503, 31101, 31105, 31602, and 31751.3.

Provides general medical services to stray, relinquished, and abandoned animals brought in from the field by Animal Control officers and the public. Medical Services provides examinations, vaccinations, deworming, treatment, surgical repair, and surgical sterilization consistent with the Spay and Neuter Program, and services provided by private veterinarians.

5. Special Enforcement (Includes Spay and Neuter Program, Major Case, and Critical Case Processing Unit)

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	2,075,000	--	--	2,075,000	25.0
Less Administration	--	--	--	--	--
Net Program Costs	2,075,000	--	--	2,075,000	25.0

Authority: Spay and Neuter Program: Mandated program - California Food and Agricultural Code Sections 30503 and 31751.3. Major Case Unit: Mandated program - California Food and Agricultural Code Sections 31645 and 31646; California Penal Code Sections 399.5, 597, and 599aa; and Los Angeles County Code Sections 10.20.280, 10.28.020, 10.28.270, and 10.40.010.

The Spay and Neuter Program supports the mandated spaying or neutering of all shelter dogs or cats prior to adoption and the County's mandated program in the unincorporated communities of the County.

The Major Case Unit responds to calls or requests, investigates, and prosecutes incidents of animal cruelty or dangerous animals.

The Critical Case Processing Unit conducts administrative hearings to determine whether offending dogs are potentially dangerous or vicious, and to investigate and process potentially dangerous and vicious dog cases.

6. Administration

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	6,362,000	--	--	6,362,000	33.0
Less Administration	--	--	--	--	--
Net Program Costs	6,362,000	--	--	6,362,000	33.0

Authority: Non-mandated, discretionary program.

Administration provides the support required for the ongoing operations of the Department. This includes the executive office, budget and fiscal services, contract development and monitoring, human resources, fleet management, and information technology.

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos

FUND	FUNCTION	ACTIVITY
GENERAL FUND	RECREATION & CULTURAL SERVICES	CULTURAL SERVICES

Mission Statement

To foster excellence, diversity, vitality, understanding, and accessibility of the arts in the County. The Arts Commission provides leadership in cultural services for the County, including information and resources for the community, artists, educators, arts organizations, and municipalities.

2014-15 Budget Message

The 2014-15 Recommended Budget reflects a net increase of $99,000 primarily due to restoring funding for the Organizational Grant, unavoidable cost increases, and Board-approved increases in salaries and employee benefits, partially offset by the deletion of one-time funding for the Organizational Grant program and Ford Theatre programs.

Critical/Strategic Planning Initiatives

- Continue a multi-year initiative to implement the Board-adopted *Arts for All* strategic plan to make the arts core in K-12 for 1.7 million students in the County by developing ongoing systems for data collection that will inform *Arts for All* planning processes, as well as provide evidence of changes in arts education offerings in the region over time.
- Institute a number of new systems to improve grants and professional development programs, including the development of new guidelines for the FY 2015-16 Organizational Grant Program.
- Continue implementation of the Master Plan for the current and future facilities of the John Anson Ford Theatres focusing on upgrades to the theatre itself, including amphitheatre stage reconstruction, new retaining walls and landscaping on the hillside, and tenant improvements consisting of additional dressing rooms, a new green room, and Americans with Disabilities Act improvements.
- Implement, through the Los Angeles County Open Spaces District grant funds, a new Civic Art Graffiti Abatement Project which will create innovative arts based projects.

Changes From 2013-14 Budget

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
2013-14 Final Adopted Budget	**10,813,000**	**669,000**	**1,446,000**	**8,698,000**	**0.0**
Other Changes					
1. Salaries and Employee Benefits: Primarily reflects Board-approved increases in salaries and health insurance subsidies.	146,000	12,000	--	134,000	--
2. Retirement: Reflects an increase primarily due to prior-year losses in Los Angeles County Employees Retirement Association's investment portfolio and revised investment return assumptions.	63,000	6,000	--	57,000	--
3. One-Time funding: Reflects the deletion of one-time funding provided for the Organizational Grant ($200,000), Jazzed and Motivated ($6,000), and Signature Series at the Ford ($375,000).	(581,000)	--	--	(581,000)	--
4. Organizational Grant: Reflects an increase in funding ($400,000) to fully restore the program to $4,518,000 as well as funding to cover the licensing fees for the California Cultural Data Project ($36,000).	436,000	--	--	436,000	--
5. Civic Art: Reflects one-time funding for Art Asset Management and Inventory ($240,000), and project management ($95,000).	335,000	335,000	--	--	--
6. Unavoidable Costs: Reflects funding for unavoidable production cost increases for the Holiday Celebration ($21,000), and minimum wage increases for the Arts Internship program ($14,000) and temporary staff at the Ford Theatre ($18,000).	53,000	--	--	53,000	--
7. Ministerial Adjustments: Reflects appropriation and revenue adjustments for the Arts Education and Civic Art programs based on anticipated revenue changes.	(105,000)	--	(105,000)	--	--
Total Changes	**347,000**	**353,000**	**(105,000)**	**99,000**	**0.0**
2014-15 Recommended Budget	**11,160,000**	**1,022,000**	**1,341,000**	**8,797,000**	**0.0**

Unmet Needs

The Arts Commission's critical unmet needs include additional funding and positions for the Administration, Civic Art, John Anson Ford Theatre and Organizational Grant program as well as full restoration of the Free Concerts program.

Departmental Program Summary

1. Organizational Grants and Professional Development

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	4,922,000	--	16,000	4,906,000	--
Less Administration	--	--	--	--	--
Net Program Costs	4,922,000	--	16,000	4,906,000	--

Authority: Non-mandated, discretionary program.

The program provides financial support, technical assistance, and professional development services to 370 non-profit arts organizations annually. Programs assist and strengthen non-profit organizations and municipal programs to provide arts services to enrich the lives of County residents. All applications undergo a rigorous peer panel review and scoring process to determine the quality of proposed projects and services, which are then approved by the Board. Grantees are provided additional opportunities, which include in-depth leadership training for executive, artistic, and managing directors; workshops on advancement and capacity building topics such as human resources, marketing, board development, and fundraising; grant application workshops; and scholarships for arts administrators to take courses at the Center for Non-profit Management and Long Beach Non-profit Partnership, and to attend local conferences.

2. Arts Internships

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	695,000	--	45,000	650,000	--
Less Administration	--	--	--	--	--
Net Program Costs	695,000	--	45,000	650,000	--

Authority: Non-mandated, discretionary program.

The program provides approximately 125 paid 10-week summer internships for undergraduate college students at 105 performing and literary arts non-profits and municipal arts agencies. In addition, interns participate in an arts summit. This program develops future arts leaders to serve in staff positions, as board members, and volunteers in organizations that provide cultural services to County residents. The program works in partnership with the Getty Foundation, which supports internships in visual arts organizations.

3. Arts Education

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	1,407,000	--	900,000	507,000	--
Less Administration	--	--	--	--	--
Net Program Costs	1,407,000	--	900,000	507,000	--

Authority: Non-mandated, discretionary program.

The Arts Commission provides leadership for the 2002 Board-adopted *Arts for All*, a countywide collaboration working to create vibrant classrooms, schools, communities, and economies through the inclusion of the arts as core curriculum for each of our 1.6 million public K-12 students. Key strategies include: 1) assisting school districts in planning and implementing arts education; 2) building capacity of both teachers and community artists to deliver high-quality arts instruction; 3) publishing online directories of arts education programs for students and educators; and 4) collecting, analyzing, and sharing data to track progress and inform strategy.

4. Community Programs - John Anson Ford Theatres

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	1,196,000	--	48,000	1,148,000	--
Less Administration	--	--	--	--	--
Net Program Costs	1,196,000	--	48,000	1,148,000	--

Authority: Non-mandated, discretionary program.

Operates and programs the John Anson Ford Theatres and supports its flagship program, the Ford Amphitheatre Summer Partnership Program, which provides resources to County resident arts organizations and assists them to successfully present performances in its historic 1,200 seat amphitheatre. This appropriation does not reflect earned income, which is deposited in the Ford Theatre Special Development Fund, and contributed income, which is in the budget of the Ford Theatre Foundation, the non-profit fundraising arm of the Ford.

5. Community Programs – Holiday Celebration

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	949,000	--	332,000	617,000	--
Less Administration	--	--	--	--	--
Net Program Costs	949,000	--	332,000	617,000	--

Authority: Non-mandated, discretionary program.

The County Holiday Celebration, which celebrated its 54th year in 2013, is a three-hour music and dance production held every December 24th at the Music Center's Dorothy Chandler Pavilion. The show is free to the public and honors the diverse cultures and holiday traditions that are celebrated in the many communities of the County. The Holiday Celebration is broadcast live on KCET and streamed on the Internet and is watched by an estimated one million local viewers. The program is also aired on the Armed Forces Network, bringing the show to United States service men and women living on military bases around the world.

6. Community Programs – Free Concerts in Public Sites

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	30,000	--	--	30,000	--
Less Administration	--	--	--	--	--
Net Program Costs	30,000	--	--	30,000	--

Authority: Non-mandated, discretionary program.

Free Concerts in Public Sites includes concerts and participatory workshops that are free to the public. Events include concerts at non-profit, municipal, and County sites which apply for funding from the Board to support musician fees, and interactive music and dance workshops designed to engage communities in the performing arts by encouraging direct participation in diverse art forms.

7. Civic Art

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	1,022,000	1,022,000	--	--	--
Less Administration	--	--	--	--	--
Net Program Costs	1,022,000	1,022,000	--	--	--

Authority: Non-mandated, discretionary program.

The program provides leadership in the development of high quality civic spaces by integrating the work of artists into the planning, design, and construction of County infrastructure and facilities. The program encourages innovative approaches to civic art and provides access to artistic experiences of the highest caliber to residents and visitors of the County. It also provides educational resources and ensures stewardship to foster broad public access to artwork owned by the County. The program has developed and maintains the records and inventory for County-owned civic artwork.

8. Administration

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Total Program Costs	939,000	--	--	939,000	--
Less Administration	--	--	--	--	--
Net Program Costs	939,000	--	--	939,000	--

Authority: Non-mandated, discretionary program.

The administrative unit, which is made up of five staff positions, oversees the Arts Commission's strategic planning, budgeting, private sector fundraising, human resources, information technology (IT), marketing and communications, and provides support for the 15 Arts Commissioners appointed by the Board. This appropriation also includes general administrative and IT supplies.

	Gross Appropriation ($)	Intrafund Transfer ($)	Revenue ($)	Net County Cost ($)	Budg Pos
Net Program Costs	11,160,000	1,022,000	1,341,000	8,797,000	0.0

Kathline J. King

To: Kathline J. King
Subject: Ford Theater Hiking Trail concern

Dear Ms. King,

I live on Cahuenga Terrace, which is next door to the John Anson Ford Theater and my neighbors have told me about the plans to renovate the compound, add new structures, increase capacity and improve upon the hiking trail. This concerns me deeply because that hiking trail has attracted homeless encampments for decades and we who live in this neighborhood are under constant threat from wild fires that result from carelessness from these individuals. I am worried that making the hiking trail easier to access is only going to lure more smokers, campers, etc. who, homeless or not, could easily start a fire along the trail and destroy homes in its wake.

There is already a No Tresspassing sign posted along the trail; are you or the Ford people planning to get it removed somehow?

I intend to discuss this with the local fire department to see if this is something we can forestall until proper safety measures are in place. I also understand that there was a meeting about it last week and I was unable to attend; perhaps you or someone from your office could make a statement explaining how the trail will be maintained, monitored, etc. so the neighborhood can rest a little easier.

I am all for the expansion of the Ford Theater as I enjoy it and attend shows there often, however fire danger is another thing entirely and with the drought and dry hot weather coming our way, encouraging hikers to the area is just not wise. I hope you will see my point and pass this along to the people involved.

Thank you,

A. Sandoval

I. Executive Summary

I. Executive Summary

In accordance with California Environmental Quality Act (CEQA) Guidelines Section 15123, this section of this Draft Environmental Impact Report (EIR) contains a brief summary of the Ford Theatres Project (the Project) and its potential environmental effects. More detailed information regarding the Project and its potential environmental effects is provided in the following sections of this Draft EIR. Also included in this section of this Draft EIR is an overview of the purpose and focus of this Draft EIR, a general description of the Project, a description of the organization of this Draft EIR, an overview of the Project, a general description of areas of controversy and issues to be resolved, including the choice among alternatives and whether or how to mitigate any potential effects of the Project, a description of the public review process for this Draft EIR, and a summary of the alternatives to the Project evaluated in this Draft EIR.

1. Purpose of this Draft EIR

As described in Section 15123(a) and 15362 of the CEQA Guidelines, an EIR is an informational document that will inform public agency decision-makers and the public of the significant environmental effects of a project, identify possible ways to minimize, or avoid, any significant effects, and describe reasonable project alternatives. Therefore, the purpose of this Draft EIR is to focus the discussion on the Project's potential environmental effects that the County of Los Angeles (County) , as the Lead Agency, has determined to be, or potentially may be significant. In addition, feasible mitigation measures are recommended, when applicable, that could reduce or avoid the Project's significant environmental impacts.

This Draft EIR serves as the environmental document for all actions associated with the Project. This EIR is a "Project EIR" as defined by Section 15161 of the State CEQA Guidelines and, as such, serves as an informational document for the general public and Project decision-makers. This Draft EIR is also intended to cover all State, regional and local government discretionary approvals that may be required to construct or implement the Project.

2. Draft EIR Focus and Effects Found Not to Be Significant

In accordance with Section 15128 of the CEQA Guidelines, an EIR shall contain a brief statement indicating reasons that various possible significant effects of a project were determined not to be significant and not discussed in detail in the Draft EIR. An Initial Study was prepared for the Project and a Notice of Preparation (NOP) was distributed for public comment to the State Clearinghouse, Office of Planning and Research, responsible agencies, and other interested parties on February 7, 2014 for a 30-day review period. The Initial Study, NOP, and NOP comment letters are included in Appendix A of this Draft EIR. The Initial Study provides a detailed discussion of the potential environmental impact areas and the reasons that each environmental topic is or is not analyzed further in this Draft EIR. The County determined through the Initial Study the potential for significant impacts in the following environmental issue areas would be evaluated in the Draft EIR:

- Aesthetics (including views, light, and glare)
- Air Quality
- Greenhouse Gas Emissions
- Biological Resources
- Cultural Resources (including historic resources, and archaeological and paleontological resources)
- Geology and Soils
- Hydrology and Surface Water Quality (including groundwater)
- Land Use and Planning
- Noise
- Public Services (including fire protection and police protection)
- Traffic, Access, and Parking
- Utilities and Service Systems (including water and energy)

The Los Angeles County Department of Parks and Recreation determined through the Initial Study that the Project would not have the potential to cause significant impacts related to agriculture and forest resources, hazards and hazardous materials, mineral resources, population and housing, some public services (including schools, parks, and

libraries), recreation, and some utilities and service systems (including wastewater and solid waste). Therefore, these areas were not analyzed in this Draft EIR. The Initial Study demonstrating that no significant impacts would occur for these issue areas is included in Appendix A of this Draft EIR.

3. Draft EIR Organization

This Draft EIR is comprised of the following sections:

I. Executive Summary. This section describes the purpose of this Draft EIR, Draft EIR focus and effects found not to be significant, Draft EIR organization, Project summary, areas of controversy and issues to be resolved, public review process, summary of alternatives, and a summary of environmental impacts, project design features, and mitigation measures.

II. Project Description. This section describes the Project location, existing conditions, Project objectives, and characteristics of the Project.

III. Environmental Setting. This section contains a description of the existing physical and built environment and a list of related projects anticipated to be built within the Project vicinity.

IV. Environmental Impact Analysis. This section contains the environmental setting, Project and cumulative impact analyses, mitigation measures, and conclusions regarding the level of significance after mitigation for each of the following environmental issues: aesthetics, views, light, and glare; air quality; greenhouse gas emissions; biological resources; cultural resources; geology and soils; hydrology, surface water quality, and groundwater; land use and planning; noise; fire protection; police protection; traffic, access, and parking; water; and energy.

V. Alternatives. This section provides an analysis of a reasonable range of alternatives to the Project including: No Project/No Build Alternative; Reduced Project Alternative; and Simultaneous Even Schedules Alternative.

VI. Other CEQA Considerations. This section provides an analysis of the significant irreversible changes in the environment and potential secondary effects that would result from the Project. This section also analyzes potential growth-inducing impacts of the Project and potential secondary effects caused by the implementation of the mitigation measures for the Project. Lastly, a summary of the possible effects of the Project that were determined not to be significant within the Initial Study is provided.

VII. References. This section lists the references and sources used in the preparation of this Draft EIR.

VIII. List of Preparers. This section lists the persons, public agencies, and organizations that were consulted or contributed to the preparation of this Draft EIR.

IX. Acronyms and Abbreviations. This section provides a list of acronyms and abbreviations used in this Draft EIR.

This Draft EIR includes the environmental analysis prepared for the Project and appendices as follows:

- Appendix A—Initial Study/NOP/NOP Comment Letters
- Appendix B—Tree Survey
- Appendix C—Air Quality Worksheets
- Appendix D—Greenhouse Gas Emissions Worksheets
- Appendix E—Biological Resource Assessment
- Appendix F—Historic Resources Report
- Appendix G—Archaeological and Paleontological Resources Records Searches
- Appendix H—Geotechnical Reports
- Appendix I—Hydrology and Water Quality Report
- Appendix J—Noise Worksheets
- Appendix K—Correspondence from Public Service Providers
- Appendix L—Traffic Study
- Appendix M—Water System and Supply Study
- Appendix N—Electricity and Natural Gas Estimates and Will Serve Letters
- Appendix O—The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park

4. Background and Existing Site Conditions

The Ford Theatres, one of the oldest performing arts venues in Los Angeles, are owned by the County of Los Angeles and operated through a three-way partnership between the Los Angeles County Department of Parks and Recreation, the Los Angeles County Arts Commission, and the Ford Theatre Foundation. The site of the existing Amphitheatre was originally owned by Christine Wetherhill Stevenson and Chauncey D. Clark who together provided for the construction of an outdoor amphitheatre to host Stevenson's *The Pilgrimage Play*. This play was performed in a wooden amphitheatre from 1920 to 1929, until the original structure was damaged by a brush fire in October 1929. The existing Amphitheatre, built on the same site as the original Amphitheatre, opened in 1931 and in 1941 the existing Amphitheatre and the land surrounding it was deeded to the County of Los Angeles. *The Pilgrimage Play* was performed at the Amphitheatre from 1931 until 1964, when a lawsuit forced its closure due to the play's religious nature. In 1976, the existing Amphitheatre, previously known as the Pilgrimage Theatre, was renamed the John Anson Ford Theatre in honor of the late Los Angeles County Supervisor's significant support of the arts. The Amphitheatre was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places.

The Project Site comprises an approximately 32-acre County of Los Angeles regional park within the Hollywood Hills. The Project Site is currently developed with an open-air 1,196-seat Amphitheatre and associated support spaces (i.e., dressing rooms, performer restrooms, green room); an 860-square-foot projection booth and control room located above the Amphitheatre seating; an 87-seat indoor venue referred to as [Inside] the Ford; a two-story, approximately 320-square-foot concessions building; a 365-square-foot box office; a plaza and picnic area referred to as the Edison Plaza; surface parking areas; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission, and the Los Angeles Philharmonic. The Project Site also includes one cell tower and associated structures along the northwest portion of the Project Site and an additional cell tower along the northwestern property boundary. Other facility support spaces, such as storage and maintenance areas and restrooms, are also located throughout the Project Site. Landscaping is provided along driveways, surface parking areas, and pedestrian pathways. Additionally, while there are no designated hiking trails within the Project Site, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails.

The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise of approximately 3,580 square feet. Overall, approximately 3.5 acres of the 32-acre Project Site comprises developed area,

including the existing structures described above and asphalt-paved surface parking areas. The remaining areas (approximately 28.5 acres) are comprised of undeveloped open space.

Access to the Project Site is available via four driveways along the east side of Cahuenga Boulevard East. Pedestrian access to the Project Site is available from several locations along Cahuenga Boulevard East, including via the four driveways described as well as a walkway located in front of the former motel. The Amphitheatre, including the [Inside] the Ford Theatre, Edison Plaza, and the concessions building are currently enclosed within a wrought iron perimeter fence with wrought iron entry and exit gates at the main entrance and secondary entrance.

The Project Site can accommodate approximately 350 to 380 vehicles in a stacked parking configuration within three surface parking areas. Two surface parking lots are located along Cahuenga Boulevard East, while a third surface parking lot, providing only ADA parking spaces, is located adjacent to the secondary entrance at the Amphitheatre level. During events, additional parking is available off-site at the Universal City/Studio City Metro Red Line Station. A shuttle is provided to and from the station parking and the Project Site during evening events.

Lighting within the Project Site includes pole lighting within the surface parking and entry areas, exterior building lighting, stage and production lighting, and security lighting. Signage consists of an electronic sign identifying the Ford Theatres along Cahuenga Boulevard East, near one of the southern driveways, and wayfinding signage internal to the Project Site. An illuminated sign identifying the Ford Amphitheatre is also located on the wall running along the top of the Amphitheatre wall, which was installed to attenuate noise from the Hollywood Freeway.

5. Description of the Project

a. Overview of the Proposed Development

The Ford Theatres Project is proposed to enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users. The Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and plaza deck featuring a

restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, an event space, and a maintenance facility; and (5) a 0.75-mile hiking trail.

(1) Amphitheatre Rehabilitation Improvements

Within the Amphitheatre, the Project would replace the existing approximately 860-square-foot projection booth and control room located to the rear and above the Amphitheatre seating with a new 800-square-foot projection booth and control room. Existing lighting positions along the back of the Amphitheatre would also be removed and replaced with an upgraded lighting platform that would be integrated within a new sound wall proposed along the rear of the Amphitheatre. The proposed sound wall could measure up to 48 feet in height. In addition, a retractable shade structure would provide cover for the Amphitheatre during day time performances.

(2) Ford Terrace

North of the Amphitheatre, the existing circular driveway and disabled parking adjacent to the secondary entrance would be modified to accommodate a dedicated artist performance entry and provide for a two-story office and concessions building and an approximately 3,750-square-foot plaza, collectively referred to as the Ford Terrace. The two-story building would include approximately 2,500 square feet of office space in one level above an approximately 2,500-square-foot concessions area at the first level. To the west of the two-story building would be a raised plaza deck that would serve pre- and post performance concessions, private receptions, and intermission concessions. Beneath the plaza, the modified driveway would form a service level referred to as the Service Court providing a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup, as well as fire department access. An approximately 1,570-square-foot workshop to support performances would also be provided within the Service Court adjacent to the loading dock. To provide for these improvements, the Project would require removal of the existing two-story approximately 320-square-foot concessions building located adjacent to the secondary entrance. Disabled parking currently located adjacent to the secondary entrance would be accommodated within the parking structures proposed as part of the Project.

In addition, the existing approximately 1,895-square-foot, 87-seat [Inside] the Ford located at the lower level of the Amphitheatre and the associated lighting, stage, and theatrical amenities would be repurposed as a self-serve food marketplace area and provide space for storage. New ADA-accessible restrooms would also be provided at the lower level.

(3) Ford Plaza

West of the Amphitheatre, generally within the existing south surface parking area, the Project proposes the Ford Plaza. The Ford Plaza would include a three-level parking structure, which would provide approximately 250 parking spaces. A plaza deck providing approximately 45,000 square feet of outdoor plaza areas would be created above the parking structure. As part of the Ford Plaza, the existing 365-square-foot box-office would be repurposed as a museum/gallery for the Ford Theatres and just west of the existing box office an approximately 560-square-foot box office would be constructed. In addition, a three-story building providing approximately 17,600 square feet of office uses and approximately 1,200 square feet of shops/visitor amenities would be located adjacent to the new box office. At the southern boundary of the Ford Plaza, an approximately 1,000-square-foot conference room would be built to support the adjacent office space. Adjacent to the conference room would be an outdoor area that could accommodate small informal performances, musical entertainment, and/or overflow/support monitors to view events occurring within the indoor venues. North of these uses within the Ford Plaza would be an approximately 3,900-square-foot, 150-seat restaurant that would include a 1,300-square-foot kitchen/bar and a 2,600-square-foot indoor seating area. An approximately 1,000-square-foot outdoor seating area would also be included. East of the restaurant, an indoor performance venue comprised of approximately 8,000 square feet and including 299 seats would be provided. This facility would feature acoustic treatments, a proscenium stage and full theatrical lighting and rigging that would be able to accommodate multi-disciplinary performances. Backstage spaces within the new venue would include performer restrooms, dressing rooms, and a prep area for special events.

(4) Transit Center

A Transit Center consisting of a bus/van loading and unloading zone, a three-level parking structure referred to as the north parking structure, a rehearsal and event space referred to as the Flex Space, and a maintenance area would be constructed along the northwestern extent of the Project Site. Specifically, upon entering the Ford Theatres from the existing primary access at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, the Transit Center would provide a staging area for buses to load and unload. From this area, vehicles would also be directed south to the parking structure within the Ford Plaza or north to the three-level parking structure proposed within the Transit Center. The north parking structure would provide approximately 250 parking spaces. Approximately 8,300-square-foot Flex Space would be constructed at the lowest level of the parking structure. The Flex Space would provide approximately 99 retractable seats and would include full theatrical lighting, performer restrooms, dressing rooms, and a prep area for special events. A plaza area referred to as the Transit Plaza would also be located below the parking structure. At the upper deck of the parking structure, an approximately 6,300-square-foot maintenance area consisting of office, storage, garage, and yard areas

would be provided. To provide for these improvements, the Project would require removal of the existing two-story approximately 10,500-square-foot former motel building currently used as office space for Ford Theatre Foundation, Los Angeles County Arts Commission, and Philharmonic staff.

(5) Hiking Trail

The Project would also include a 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The trail would be approximately four feet in width and would feature natural-type fencing as well as "sutter wall" style retaining walls, where required or necessary, and cut-in granite steps where areas of steep terrain are proposed. Hand-railing may also be provided at the steps. The trail alignment may utilize portions of existing user-established informal trails. The hours of operation for use of the trail would observe standard park hours of sunrise to sunset.

Overall, implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

b. Project Design

The proposed improvements would be designed to complement the existing historic character of the Ford Theatres. The Project is designed to be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings (1995) Weekes and Grimmer. The new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. The Project is also designed to minimize building footprints and remain primarily within the developed areas of the Project Site. Specifically, upon buildout of the Project, approximately 4.3 acres of the 32-acre Project Site would comprise developed area, an increase of 0.8 of an acre. The remaining approximately 27.7 acres would comprise undeveloped open space. In addition, to reduce the massing, the new buildings and parking structures in particular would be integrated into the existing topography of the Project Site. Building heights would range from approximately 15 feet to 67.5 feet in height as measured from adjacent grade with elevations ranging from 515 feet to 610 feet above sea level. Materials, such as wood, brick, stucco, metal panels, concrete and glass are anticipated to be used in the construction of the buildings. The new buildings and infrastructure would also be designed to be environmentally sustainable and to achieve certification under the U.S. Green Building Council's Leadership in Energy Efficiency and Design (LEED®) or equivalent green

building standards. In addition, the Project would be designed to meet the County's green building requirements.

c. Access and Parking

Access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some on-site configuration and circulation modifications. In addition, to facilitate access and circulation within the Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The northernmost driveway, which is currently used primarily for egress at the end of events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from the north parking structure. The proposed driveway between the northernmost driveway and the main entrance would provide right-turn only egress from the Transit Center and the parking structure. The driveway at Pilgrimage Bridge and Cahuenga Boulevard East, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. The southern driveways would also be maintained in their existing locations with the southernmost driveway providing ingress to the south parking structure and the other driveway providing egress. At the driveway providing egress from the south parking structure, the Project proposes a new signal to allow for safer left turns from the driveway to Cahuenga Boulevard East. Ingress and egress to the south parking structure would also be provided from the main entrance. Within the Project Site, access to the Amphitheatre would continue to be provided at the existing main entrance. In addition, new pedestrian pathways would be provided for access to the new areas. As described above, the existing circular driveway at the secondary entrance would be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access. The Project would also include bicycle amenities.

Upon buildout of the Project, parking would be provided within two new three-level parking structures that would generally be located within the existing north and south surface parking areas that would be removed as part of the Project. Upon completion, the Project would provide a total of approximately 500 parking spaces within two parking structures and a net increase of approximately 120 to 150 parking spaces, including additional ADA parking spaces. Parking would also continue to be available at the Universal City/Studio City Metro Red Line Station. A shuttle would continue to be provided to and from the Ford Theatres during evening events. In addition, use of the Ford Theatres parking facilities by the Hollywood Bowl may continue.

d. Landscaping

A variety of native and drought tolerant plant material would be used to enhance and complement the existing plant material on the hillside. In addition, mature native trees would be planted and enhanced with complementary native vegetation. To screen off-site views of the south parking structure, the proposed landscape would berm up to cover the exposed areas of the parking structure, thereby bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. In addition, along the proposed trail, landscape improvements may include habitat restoration and enhanced plantings.

Implementation of the Project would require the removal of approximately 146 trees, including cypress, pine, palm, eucalyptus, ficus, sycamore, oak, and olive trees. This number includes the trees proposed to be removed as part of the approved Amphitheatre improvements. The Project would also relocate approximately 20 trees throughout the Project Site. As part of the Project, trees to be removed would be replaced on a minimum 1:1 basis.

e. Lighting and Signage

The Project would feature illuminated building façades on the north parking structure, the new theatre, the restaurant, and the proposed sound wall. In addition, the Project would include exterior lighting along vehicular and pedestrian pathways and at the upper level of the north parking structure for security and wayfinding purposes. Accent lighting to highlight architectural features, landscape elements, and the Project's signage would also be incorporated. Lighting throughout the plaza areas would also be provided. The Project would also include new theatrical lighting within the Amphitheatre. Light fixture control devices could be implemented, as necessary, to minimize glare.

Project signage would include various identity signs including a central identity sign. The identity signs may include the existing Ford Theatres sign along Cahuenga Boulevard East, which would be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance. In addition, a large sign identifying the Ford Theatres would be placed along the proposed sound wall. This sign is anticipated to be illuminated. The proposed sound wall and sign would replace the existing wall and sign along the top of the Amphitheatre wall. Monitors that would be used for a variety of purposes such as publicizing events, promoting the available food services, assisting in wayfinding, and for broadcasting sold-out events may also be provided in the plaza areas and other public spaces throughout the Project Site. The Project would also include interpretive signage along the proposed hiking trail and throughout the Project Site to provide information about the history of the Ford

Theatres, Ford programs and local flora and fauna. Lastly, wayfinding signs would be located throughout the Project Site, including at parking structure entrances and elevators.

f. Utilities

The Project would provide a generator east of the office and concessions building within the Ford Terrace and north of the building would be a service yard and transformers. An approximately 2,200-square-foot central utility plant is also proposed east of the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, the Project could provide a decentralized air-cooling system. Additional transformers would be installed within the Ford Plaza adjacent to the 299-seat theatre, at the central utility plant, at the north entrance of the north parking structure, and near the south trailhead termination. Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles along Cahuenga Boulevard East. These electrical poles could measure up to 65 feet in height. In addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. Other utility improvements proposed as part of the Project would include new natural gas service, sewer and water connections, and drainage improvements. The Project would also integrate and relocate the existing cell towers and associated structures to allow construction of the Transit Center.

g. Fire Protection and Security Features

As the Project Site is located in a Very High Fire Hazard Severity Zone, a fuel modification plan would be required to minimize the risk of wildfires. The fuel modification plan for the Project would set forth buffer zones around the proposed structures. The fuel modification plan would also specify requirements pertaining to landscape irrigation, thinning and removal of brush and dead plant materials, removal of non-native plant species, and maintenance of the buffer zones. A preliminary fuel modification plan has been prepared by the Project in consultation with the Los Angeles County Fire Department, and is included in Section IV.J.1, Public Services—Fire Protection of this Draft EIR. A final fuel modification plan would be submitted to the Los Angeles County Fire Department for approval prior to the issuance of Project construction permits. The Project would also include an upgraded fire system, including the installation of on-site fire hydrants and new water connections. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project's design would also incorporate security features to provide for the safety of on-site employees and visitors. These features would include high-definition surveillance cameras, and signage along the hiking trail. Entryways, lobbies, and parking areas would also be well illuminated and designed to eliminate areas of concealment.

h. Project Construction and Scheduling

The Project could be implemented in several phases to provide flexibility to continue operating the Ford Theatres during construction. Construction of the Project may be completed as early as 2020. In the event construction of the Project occurs as one phase, or in consolidated phases, the Ford Theatres would be expected to close and no events would be held until buildout of the Project or completion of the phase(s) under construction. It is estimated that the Project would require approximately 107,094 cubic yards of export. Based on the proximity of the Hollywood Freeway to the Project Site, it is anticipated that haul trucks and delivery trucks would access the Project Site traveling northbound on Cahuenga Boulevard East from the Hollywood Freeway (US-101) and would exit the Project Site onto Cahuenga Boulevard East and travel northbound on Cahuenga Boulevard East to the Hollywood Freeway. As part of the Project, a Construction Management Plan would be implemented during construction to manage construction traffic and ensure that adequate and safe access and parking remains available during construction activities. Construction worker parking and construction staging would be accommodated on-site. Construction activities would comply with Section 12.08.440 of the Los Angeles County Code, which prohibits noise-generating construction activities between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays in the absence of certain emergencies.

6. Necessary Approvals

Discretionary approvals from the County of Los Angeles Board of Supervisors will be necessary for the Ford Theatres Foundation to implement the Project.

7. Areas of Controversy/Issues to be Resolved

Potential areas of controversy and issues to be resolved by the County's decision-makers may include those environmental issue areas where the potential for a significant unavoidable impact has been identified. As evaluated in this Draft EIR, the Project would not result in significant and unavoidable impacts with regard to the environmental topics presented herein. However, based on the NOP comment letters provided in Appendix A, issues known to be of concern in the community included, but were not limited to traffic, noise, and wildfire risk. Refer to Appendix A for copies of the NOP comment letters. Decision makers will need to chose among alternatives and determine whether to impose mitigation measures to avoid potential environmental impacts.

8. Public Review Process

The County Department of Parks and Recreation prepared an Initial Study and circulated an NOP for public comment to the State Clearinghouse, Office of Planning and Research, responsible agencies, and other interested parties on February 7, 2014, for a 30-day review period. In addition, a public scoping meeting was conducted on February 18, 2014. The Initial Study, NOP, and NOP comment letters are included in Appendix A of this Draft EIR.

This Draft EIR is being circulated for a 45-day public comment period. Following the public comment period, a Final EIR will be prepared that will include responses to the environmental issues raised during that comment period regarding this Draft EIR.

9. Summary of Alternatives

This Draft EIR examined three alternatives to the Project in detail, which include: No Project/No Build; Reduced Project; and Simultaneous Event Schedules. A general description of these Alternatives is provided below. This Draft EIR also identified alternatives that were considered for analysis but rejected as infeasible. Please refer to Section V, Alternatives, of this Draft EIR for a more detailed description of the alternatives considered and rejected as well as a description of the alternatives evaluated in detail and a comparative analysis of the impacts of these alternatives with those of the Project.

Alternative 1: No Project/No Build Alternative

Alternative 1, the No Project/No Build Alternative assumes the Project would not be approved and the existing environment would be maintained, with the exception of the previously approved Amphitheatre improvements and other on-going routine interior and exterior maintenance improvements. The previously approved Amphitheatre improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. The previously approved Amphitheatre improvements will occur internal to the Project Site, within the boundaries of the existing Amphitheatre. This Alternative would not result in any changes to the existing operations at the Ford Theatres. The site plan under this Alternative would resemble existing conditions, as illustrated in Figure II-2 in Section II, Project Description of this Draft EIR.

Alternative 2: Reduced Project Alternative

The Reduced Project Alternative would develop the Project Site similar to the Project and would include the same components as the Project as follows: rehabilitation of

certain portions of the existing Amphitheatre, the Ford Terrace, the Ford Plaza, the Transit Center, and a 0.75-mile hiking trail. However, the Reduced Project Alternative would not include development of the 299-seat theatre within the Ford Plaza. In addition, under this Alternative, the 99-seat Flex Space proposed within the Transit Center would be relocated to the area of the 299-seat theatre as proposed by the Project. With the relocation of the Flex Space from the Transit Center to the Ford Plaza under this Alternative, the footprint of the Transit Center would be reduced but would continue to feature a designated area for bus and valet drop-off, a three-level parking structure, and a maintenance facility. All other components and features of the Project as described in Section II, Project Description, of this Draft EIR would be maintained under the Reduced Project Alternative. Further, under Alternative 2, building heights and architectural features would be similar to the building heights and architectural features of the Project.

Overall, implementation of this Alternative would result in approximately 39,550 net new square feet compared to the Project's approximately 47,550 net new square feet of development. As such, this Alternative would reduce the proposed net new development by approximately 8,000 square feet or approximately 17 percent. Additionally, this Alternative would provide for 12 net new seats within the Project Site in comparison to the Project's 311 net new seats. In addition, while this Alternative would not provide the 299-seat theatre, the number of annual events and attendees would increase but would be reduced when compared to the Project.

Alternative 3: Simultaneous Event Schedules Alternative

The Simultaneous Event Schedules Alternative would include the development of the same components as the Project but with long term flexibility in the scheduling of events within the Amphitheatre and proposed 299-seat theatre. Specifically, under Alternative 3, events held in the Amphitheatre, the 299-seat theatre, and the Flex Space would be able to have simultaneous events with concurrent start times whereas under the Project, events held in the Amphitheatre and the 299-seat theatre would have staggered start times of at least 45 minutes after 6:00 P.M. on weekday evenings to reduce traffic impacts. As with the Project, Alternative 3 would comprise the following: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, 99-seat Flex Space, and maintenance facility; and (5) a 0.75-mile hiking trail. These components would be developed within the Project Site in the same manner as proposed under the Project described in Section II, Project Description, of this Draft EIR.

The estimated increases in annual events and attendance projected to occur under the Project would also remain under this Alternative.

10. Summary of Environmental Impacts and Mitigation Measures

Table I-1 on page I-17 provides a summary of the environmental impacts of the project. As summarized therein, implementation of the Project would not result in significant impacts to any of the environmental issues evaluated in this Draft EIR which could not be reduced with compliance with regulatory requirements and the implementation of project design features and mitigation measures.

Table I-1
Summary of Impacts Under the Project

Environmental Issue	Project Impact
A. AESTHETICS, VIEWS, LIGHT, AND GLARE	
Aesthetics	Less Than Significant
Views	Less Than Significant
Light	Less Than Significant
Glare	Less Than Significant
B. AIR QUALITY	
Construction–Regional Emissions	Less Than Significant
Construction–Localized Emissions	Less Than Significant
Operational–Regional Emissions	Less than Significant
Operational–Localized Emissions	Less than Significant
Toxic Air Contaminants	Less than Significant
Odors	Less than Significant
C. GREENHOUSE GAS EMISSIONS	Less than Significant
D. BIOLOGICAL RESOURCES	Less Than Significant with Mitigation
E. CULTURAL RESOURCES	
Historic Resources	Less Than Significant with Mitigation
Archaeological Resources	Less Than Significant with Mitigation
Paleontological Resources	Less Than Significant with Mitigation
F. GEOLOGY AND SOILS	Less Than Significant with Mitigation
G. HYDROLOGY, SURFACE WATER QUALITY, AND GROUNDWATER	
Surface Water Hydrology	Less Than Significant
Surface Water Quality	Less Than Significant
Groundwater	Less Than Significant
H. LAND USE AND PLANNING	Less Than Significant
I. NOISE	
Construction Noise	Less Than Significant
Construction Vibration	Less Than Significant
Operational Noise	Less Than Significant
J.1. PUBLIC SERVICES–FIRE PROTECTION	Less Than Significant
J.2. PUBLIC SERVICES–POLICE PROTECTION	Less Than Significant
K. TRAFFIC, ACCESS, AND PARKING	
Traffic	Less Than Significant
Congestion Management Program	Less Than Significant
Access and Circulation	Less Than Significant
Parking	Less Than Significant

Table I-1 (Continued)
Summary of Impacts Under the Project

Environmental Issue	Project Impact
L.1. UTILITIES AND SERVICE SYSTEMS—WATER	Less Than Significant
L.2. UTILITIES AND SERVICE SYSTEMS—ENERGY AND ENERGY CONSERVATION	Less Than Significant

A. Aesthetics, Views, Light, and Glare

a. Analysis of Project Impacts

(1) Aesthetics

(a) Construction Impacts

The removal of on-site structures, surface parking areas, and landscaping would not cause the loss of unique visual resources (i.e., the surrounding hillsides and historic Amphitheatre) or prominent existing features that contribute positively to the existing visual character and quality of the Project Site. As such, the Project's construction activities would not substantially degrade the existing visual character of the Project Site or the surrounding area. Therefore, aesthetics impacts associated with construction would be less than significant.

(b) Operational Impacts

The Project would provide new performing arts and support facilities that would be consistent with and build on the existing uses on the Project Site and in the surrounding community. Implementation of the Project would result in the removal of the existing former motel building currently used as office space; the projection booth and control room, which is not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; the concessions building, which is also not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; and surface parking areas and landscaping. As illustrated in the conceptual site plans provided in Section II, Project Description, of this Draft EIR, the Project would develop new structures and landscaping that would be primarily confined to areas of the Project Site that have already been developed.

While the presence of new development would invariably alter the aesthetic character of the Project Site, the Project would employ a cohesive site design in part by ensuring architectural compatibility and integration with the surrounding environment. The Project would also rehabilitate the existing historic Amphitheatre and would not result in the

removal or alteration of existing features that contribute positively to the visual character of the Project Site and surrounding area. Overall, the new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. Similarly, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. As such, the Project would not substantially degrade the existing visual character or quality of the Project Site or surrounding area. Impacts related to aesthetics would be less than significant.

(2) Views

Overall, while Project implementation would modify existing public views along Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway, the proposed structures would not dominate the viewshed along Cahuenga Boulevard. Rather, the Project has been intentionally designed to limit the building footprint within areas already developed so as to preserve the natural setting of the Project Site. Accordingly, public views of the Project Site would continue to feature a semi-urban environment with a background of rolling hills, pockets of trees, and landscaping. Thus, the Project would not have a substantial adverse effect on a scenic vista, and view impacts would be less than significant.

(3) Light

(a) Construction Impacts

Substantial lighting is not anticipated during construction within the Project Site as most construction activities would occur during daylight hours. However, the Project may include lighting for construction activities occurring in the early evening during the winter season. Outdoor lighting sources such as floodlights, spot lights, and/or headlights associated with construction equipment and hauling trucks would typically accompany construction activities during this period. To the extent evening construction includes artificial light sources, such use would be temporary and would cease upon completion of proposed Project construction. Further, construction-related illumination would be used for safety and security purposes only. Additionally, as set forth in Project Design Feature A-1, construction lighting would be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary. Construction lighting, while potentially bright, would be highly focused on the particular area undergoing work. Therefore, given that the majority of construction activities for the Project would be primarily confined to areas of the Project Site that have already been developed, which are separated from residential uses to the north, east, and south by open space and intervening topography, the surrounding uses would not be anticipated to be substantially affected by construction

lighting. Thus, light impacts associated with proposed construction activities would be less than significant.

(b) Operational Impacts

Based on visual simulations provided in Section IV.A, Aesthetics, Views, Light, and Glare, of this Draft EIR, lighting associated with the proposed light boxes would be the most distinguishable light source as viewed from Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway. However, as illustrated, the light boxes would not feature so prominently such that the light boxes would emanate light that would be inconsistent with the existing light sources in the vicinity of the Project Site. In addition, there are no residential properties or other sensitive uses immediately surrounding the Project Site, and any light emanating from the proposed Project lighting would be directed within the Project Site. Further, lighting associated with the proposed theatrical lighting would be consistent with the existing lighting within the Amphitheatre. Also, in accordance with Project Design Feature A-2, Project lighting, where applicable, would incorporate shielding and aiming to prevent glare and light spill and the upward emition of light and Project lighting would not exceed 2 foot-candles outside of the Project Site boundary. Therefore, due to the types of proposed lighting and measures employed to minimize light pollution, the Project would not create a new source of substantial light that would adversely affect day or nighttime views in the area. Thus, impacts related to Project lighting would be less than significant.

(4) Glare

(a) Construction Impacts

Daytime glare could potentially accompany construction activities if reflective construction materials were positioned in highly visible locations where the reflection of sunlight could occur. However, any glare would be highly transitory and short-term, given the movement of construction equipment and materials within the construction area and the temporary nature of construction activities within each area of the Project Site. In addition, large, flat surfaces that are usually required to generate substantial glare are not typically an element of construction activities. Furthermore, the potential for nighttime glare associated with construction is unlikely as most construction activities would occur during the day, and any construction activities occurring in the early evening during the winter season would be limited and temporary. As such, the Project would not result in a significant impact related to construction glare.

(b) Operational Impacts

Building materials for the Project would likely include plaster, concrete, metal panels, fritted glass, and cement board. In accordance with Project Design Feature A-3, exterior

windows, glass, and metal used on building surfaces would be non-reflective or treated with a standard low-reflective or non-reflective glazing. As such, sunlight reflected from the surfaces of proposed structures would not be expected to generate substantial daylight glare. The replacement of existing surface parking areas with structured parking would also reduce the potential for daytime glare from windows of parked vehicles. Overall, the Project would not create a new source of substantial glare which would adversely affect day or nighttime views. Therefore, glare impacts would be less than significant.

b. Cumulative Impacts

(1) Aesthetics

None of the related projects are located sufficiently close to the Project Site to enter the same field of view as the Project. Specifically, the nearest related project (Related Project No. 22) to the Project Site is located approximately 0.8 mile southwest of the Project Site. Therefore, given its location and distance from the Project Site and intervening development, Related Project No. 22 would not be within the same field of view as the Project. Notwithstanding, similar to the Project, future developments would be expected to occur in accordance with adopted plans, regulations, and guidelines such as height limits, density, and setback requirements, and would be reviewed by the County or City to ensure consistency with adopted guidelines and standards that relate to aesthetics. Further, many of the related projects in the area represent infill development that is not expected to be out of scale or character with the existing visual environment, as ensured through the County's and the City's environmental review processes. Therefore, cumulative impacts relative to aesthetics would be less than significant.

(2) Views

Based on the distance of the related projects and intervening development, none of the related projects would affect views along Cahuenga Boulevard in the area of the Project Site or block views of the hillsides surrounding the Project Site. As such, future development in the Project area would not be expected to cumulatively obstruct public views of valued visual resources within and in the immediate vicinity of the Project Site and cumulative impacts relative to views would be less than significant.

(3) Light

Development of the Project, as well as the other related projects in the area, would introduce new or expanded sources of artificial light. Consequently, ambient light levels in the Hollywood area may increase overall. However, given the proximity of the related projects to the Project Site, the additional artificial light sources introduced by these projects would not significantly alter the existing lighting environment that currently exists in

the immediate Project area. In addition, each of the related projects would be required to comply with regulatory requirements which address light spill and brightness. As a result, cumulative impacts relative to light would be less than significant.

(4) Glare

With regard to glare, only related development immediately adjacent to Project structures would have the potential to create glare that could collectively pose impacts affecting a given off-site use, property, or activity. Due to the distance of the related projects from the Project Site, it is unlikely that glare could have a combined effect from a particular vantage point. In addition, it is anticipated that the related projects in the vicinity of the Project Site would be subject to discretionary review to ensure that building materials to be used would not create significant sources of glare. Further, since the Project's glare impacts would be less than significant, the Project would not contribute to any cumulative increase in glare in combination with the related projects. As such, cumulative glare impacts would be less than significant.

c. Project Design Features

Project Design Feature A-1: During construction, lighting shall be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary.

Project Design Feature A-2: Project lighting shall incorporate shielding and aiming to prevent glare, light spill, and the upward emition of light and shall not exceed 2 foot-candles outside of the Project Site boundary.

Project Design Feature A-3: Exterior windows, glass, and metal used on building surfaces shall be non-reflective or treated with a standard low-reflective or non-reflective glazing.

d. Mitigation Measures

Impact related to aesthetics, views, light, and glare would be less than significant. No mitigation measures would be necessary.

e. Conclusion

Project-level and cumulative impacts related to aesthetics, views, light, and glare would be less than significant.

B. Air Quality

a. Analysis of Project Impacts

(1) Construction Impacts

(a) Regional Construction Impacts

Construction of the Project has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and construction activities. Mobile source emissions, primarily NOX, would result from the use of construction equipment such as dozers, loaders, and cranes. During the finishing phase of a building, paving operations and the application of architectural coatings (e.g., paints) and other building materials would potentially release VOCs. The Project's maximum regional emissions associated with construction would not exceed any of the daily significance thresholds set forth by the South Coast Air Quality Management District (SCAQMD). Therefore, regional emissions during construction of the Project would result in a less than significant air quality impact.

(b) Localized Construction Impacts

Maximum localized construction emissions for off-site sensitive receptors would not exceed any of the SCAQMD-recommended localized screening thresholds. Therefore, localized emissions during construction of the Project would result in a less than significant air quality impact.

(c) Toxic Air Contaminants

The greatest potential for toxic air contaminant (TAC) emissions during construction would be from diesel particulate emissions associated with heavy equipment operations during grading and excavation activities. Because the construction schedule estimates that the phases which require the most heavy-duty diesel vehicle usage, such as site grading/excavation, would last for a short duration (e.g., approximately six months), construction of the Project would not result in a substantial, long-term (i.e., 70-year) source of TAC emissions. In addition, there would be no residual emissions or corresponding individual cancer risk after construction. As such, Project-related TAC impacts during construction would be less than significant.

(e) Odors

During construction of the Project, activities associated with the operation of diesel-powered construction equipment, asphalt paving operations, and the application of architectural coatings and solvents may produce perceptible odors. The Project would comply with applicable regulatory requirements regarding construction activities and odors. With compliance with applicable rules and regulations, impacts associated with objectionable odors during Project construction would be less than significant.

(2) Operational Impacts

(a) Regional Operational Impacts

Regional emissions resulting from operation of the Project would not exceed any of the SCAQMD's daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

An analysis of daily operational emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The analysis shows that the net overall operational emissions associated with the Project under existing conditions (2014) would be higher than the estimated emissions at Project build-out (2020). This increase is exclusively a function of the change in default CalEEMod emission factors from 2020 to 2014 (i.e., vehicular fleet mix is cleaner in subsequent years as a result of cleaner newer vehicles). As with the Project build-out (2020) analysis year, the Project (2014) analysis would not exceed any of the established SCAQMD daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

(b) Localized Operational Impacts

Operation of the Project would not introduce any major new sources of air pollution within the Project Site. As such, on-site operational emissions would not exceed any of the localized significance thresholds.

An analysis of daily operational on-site emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The analysis shows that the net overall operational on-site emissions associated with the Project under existing conditions (2014) would be similar to the estimated emissions during Project build-out (2020). As with the Project build-out (2020) analysis year, on-site operational emissions under existing conditions would not exceed any of the localized significance thresholds. Therefore, localized impacts from on-site emission sources would be less than significant.

In addition, the Project would not cause any new or exacerbate any existing CO hotspots, and, as a result, impacts related to localized mobile-source CO emissions would be less than significant.

(c) Toxic Air Contaminants

The primary sources of potential air toxics associated with Project operations include diesel particulate matter from delivery trucks (e.g., truck traffic on local streets and idling on adjacent streets). Although there would be an increase in the total Project Site square footage and presumably a slight increase in the number of delivery trucks, compliance with applicable rules and regulations would substantially limit potential emissions from deliveries. As such, the Project would not be considered a substantial source of diesel particulate matter and potential air toxic contaminant impacts would be less than significant.

Typical sources of acutely and chronically hazardous TACs include industrial manufacturing processes (e.g., chrome plating, electrical manufacturing, petroleum refinery). The Project would not include these types of potential industrial manufacturing process sources. As such, the Project would not release substantial amounts of TACs, and no significant impact on human health would occur.

(d) Odors

The Project does not include any uses identified by the SCAQMD as being associated with odors. However, the Project does include a restaurant which would have the potential to emit odors through cooking and charbroilers. The Project would minimize the release of odors from the proposed restaurant with odor reducing equipment as necessary. Garbage collection areas for the Project would also be covered and situated away from the property line and sensitive uses. Good housekeeping practices would be sufficient to prevent objectionable odors from garbage collection areas. Therefore, potential odor impacts would be less than significant.

(3) SCAQMD CEQA Air Quality Handbook Policy Analysis

The determination of AQMP consistency is primarily based on the long-term influence of the Project on air quality in the Air Basin. Project development would not have a significant short-term or long-term impact on the region's ability to meet State and federal air quality standards. Also, the Project would be consistent with the goals and policies of the AQMP for the control of fugitive dust. The Project's long-term influence would also be consistent with the goals and policies of the AQMP. Therefore, the Project is considered consistent with the SCAQMD's AQMP.

b. Cumulative Impacts

(1) Construction Impacts

According to the SCAQMD, individual construction projects that exceed the SCAQMD's recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the Air Basin is in non-attainment. Construction-related daily emissions at the Project Site would not exceed any of the SCAQMD's regional or localized significance thresholds. Thus, the Project's contribution to cumulative construction-related regional emissions would not be cumulatively considerable and therefore would be less than significant. Construction of the Project also would have a less-than-significant impact with regard to localized emissions. Therefore, the Project's contribution to cumulative air quality impacts due to localized emissions would also not be cumulatively considerable and therefore would be less than significant.

Similar to the Project, the greatest potential for TAC emissions at each related project would generally involve diesel particulate emissions associated with heavy equipment operations during demolition and grading/excavation activities. Construction activities at each related project would not result in a long-term (i.e., 70-year) substantial source of TAC emissions. Additionally, the SCAQMD CEQA guidance does not require a health risk assessment for short-term construction emissions. It is therefore not meaningful to evaluate long-term cancer impacts from construction activities which occur over relatively short durations. As such, cumulative toxic emission impacts during construction would be less than significant.

Also similar to the Project, via mandatory compliance with SCAQMD Rules, it is anticipated that construction activities or materials used in the construction of the related projects would not create objectionable odors. Thus, odor impacts from the related projects are anticipated to be less than significant individually, as well as cumulatively in conjunction with the Project.

(2) Operational Impacts

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. Operational emissions from the Project would not exceed any of the SCAQMD's regional or localized significance thresholds during Project build-out (2020) or under existing conditions (2014). Therefore, the emissions of non-attainment pollutants and precursors generated by Project operation would not be cumulatively considerable.

With respect to TAC emissions, neither the Project nor any of the related projects (which are largely residential, retail/commercial, and office uses), would represent a substantial source of TAC emissions, which are typically associated with large-scale industrial, manufacturing, and transportation hub facilities. As such, cumulative TAC emissions during long-term operations would be less than significant. In addition, the Project would not result in any substantial sources of TACs that have been identified by the California Air Resources Board's Land Use Guidelines, and thus, would not contribute to a cumulatively considerable impact.

With respect to potential odor impacts, neither the Project nor any of the related projects (which are primarily residential, retail, and office uses) have a high potential to generate odor impacts. Thus, potential odor impacts from related projects are anticipated to be less than significant. The Project would not result in odor impacts, and, thus, would not contribute to a cumulative odor impact.

c. Project Design Features

No specific project design features are proposed with regard to air quality.

d. Mitigation Measures

Project-level and cumulative impacts with regard to air quality would be less than significant. Therefore, no mitigation measures are required.

e. Conclusion

Project-level and cumulative impacts with regard to air quality would be less than significant.

C. Greenhouse Gas Emissions

a. Analysis of Project Impacts

Construction emissions are typically associated with demolition, site preparation, excavation, grading, and construction-related equipment and vehicular activity. Construction of the Project is estimated to generate a total of 1,442 metric tons of CO_2e. As recommended by the SCAQMD, the total GHG construction emissions were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the Project's annual GHG emissions inventory.

The GHG emissions for the Project taking into consideration implementation of project design features included throughout this Draft EIR, the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates demonstrates that the Project has incorporated sustainability design features to reduce vehicle miles traveled and the Project's potential impact with respect to GHG emissions. The Project's GHG emissions reduction of 16.4 percent compared to the "business as usual" (BAU) scenario constitutes an equivalent or larger break from BAU than has been determined by CARB to be necessary to meet AB 32's goals (i.e., 16 percent reduction). Therefore, the Project would not have a significant impact on the environment due to its GHG emissions. In addition, the Project would be consistent with CARB's *Climate Change Scoping Plan* for the implementation of AB 32 and would comply with the County of Los Angeles Green Building Standards. Therefore, the Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

b. Cumulative Impacts

Although the Project is expected to emit GHGs, the emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. A project's GHG emissions typically would be very small in comparison to state or global GHG emissions and, consequently, they would, in isolation, have no significant direct impact on climate change. Overall, implementation of project design features included throughout this Draft EIR, compliance with the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates would contribute to GHG reductions. These reductions represent a reduction from BAU and support State goals for GHG emissions reduction. As such, the Project would support State goals for GHG emissions reduction and be consistent with AB 32. The Project also would comply with the County of Los Angeles Green Building Standards, which emphasizes improving energy conservation and energy efficiency, increasing renewable energy generation, and changing transportation and land use patterns to reduce auto dependence. The related projects would also be anticipated to comply with many of the same emissions reduction goals and objectives as the Project. In the absence of adopted standards and established significance thresholds, and given the Project's consistency with State, regional, and local GHG emission reduction goals and objectives, the Project's impacts are concluded to be less than significant and not cumulatively considerable.

c. Project Design Features

No specific project design features beyond the Project improvements discussed in Section II, Project Description, of this Draft EIR are proposed with regard to greenhouse gas emissions.

d. Mitigation Measures

The Project would comply with applicable regulatory requirements, including the provisions set forth in the 2013 CALGreen Code that have been incorporated into the County of Los Angeles Green Building Standards Code. Impacts related to climate change would be less than significant, and no mitigation measures are required.

e. Conclusion

Impacts with regards to GHG emissions would be less than significant.

D. Biological Resources

a. Analysis of Project Impacts

(1) Potential Vegetation Community Impacts

No special-status plant communities are located in the Biological Study Area (BSA). Native plant communities that occur in the study area include chaparral scrub, which is common in undeveloped areas of southern California. As this native plant community is not listed as a special-status plant community, potential impacts to existing plant communities associated with the Project would be less than significant and no mitigation measures are required.

(2) Potential Regulatory Status Plant Species Impacts

The Project would include rehabilitation of portions of the existing Amphitheatre and development of new structures, including improvements to the exterior landscape and development of a hiking trail. Construction along the proposed hiking trail and within the existing landscaped areas would require vegetation removal. In addition, on a yearly basis, vegetation would be thinned up to 200 feet from all new structures in an effort to reduce fire risk in the area. Such activities could directly or indirectly impact identified special-status plant species that occur within the BSA. With implementation of Mitigation Measures D-1 and D-2, potentially significant impacts to special-status plant species associated with the Project would be reduced to a less than significant level.

(3) Potential Regulatory Status Wildlife Species Impacts

(a) Construction

(i) Regulatory Status Bird Species

The coastal California gnatcatcher is identified as a species of concern by the California Department of Fish and Wildlife and would have the potential to occur in the BSA as the chaparral and sage scrub communities located in the BSA are suitable habitats for the coastal California gnatcatcher. While the potential for the coastal California gnatcatcher to occur in the BSA during construction is considered low, absence cannot be confirmed without additional surveys. As such, the Project could result in potentially significant direct impacts to the coastal California gnatcatcher. In addition, as this species is non-migratory, construction activities could result in indirect impacts on coastal California gnatcatcher species through noise disturbance and vegetation removal if they were to be in the BSA during construction. Annual vegetation thinning required out to 200 feet from all new structures would also reduce habitat for coastal California gnatcatcher. Implementation of Mitigation Measure D-3 would reduce potential impacts to a less than significant level.

Migratory birds and raptors also have the potential to occur in the BSA given the large areas of trees, vegetation, and buildings that could create the potential for migratory birds and raptors to nest. Construction activities could result in impacts on nesting birds through noise disturbance and vegetation removal if they were in the BSA during construction. Implementation of Mitigation Measure D-4 would reduce potentially significant impacts to migratory birds to a less than significant level.

(ii) Regulatory Status Small Mammal Species

The BSA includes undisturbed habitat that could be impacted as a result of construction activities. Sensitive wildlife species with the potential to occur within this habitat includes the coast horned lizard *(Phrynosoma blainvillii)* and the San Diego desert woodrat *(Neotoma lepida intermedia)*, both of which are considered species of concern by CDFW. Construction activities, including noise disturbance and vegetation removal could impact these species if they are present within the BSA during Project construction. With implementation of Mitigation Measure D-5, potential impacts to wildlife species would be reduced to a less than significant level.

(iii) Regulatory Status Bat Species

Four bat species have been identified with the potential to occur within the BSA. All species are identified as species of concern by the California Department of Fish and Wildlife with the exception of the hoary bat, which has a state rank of “S4”. The BSA

includes large trees, vegetation, and buildings that could provide roosting habitats for bats. Construction activities would result in noise disturbance and vegetation removal that could impact the bats if they are present during construction. Implementation of Mitigation Measures D-6 and D-7 would reduce potential impacts to bats to a less than significant level.

(b) Operation

Implementation of the Project would increase lighting, noise, and human activity within the Project Site, which could potentially deter wildlife occurring within the BSA from the area and reduce their ability to forage. In addition, the development of the proposed hiking trail would increase the risk for wildlife-human interactions within the Project Site. Furthermore, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path and reduce further disturbance of the hillside may prevent wildlife access to foraging areas and reduce their ability to move through the area. With implementation of Mitigation Measures D-8 through D-10, potential impacts to wildlife species during operation of the Project would be reduced to a less than significant level.

(4) Oak Tree Impacts

During the tree survey conducted for the Project, one coast live oak was identified for removal as part of the previously approved Amphitheatre improvements and four coast live oak trees have been identified for potential relocation. The oak tree previously contemplated for removal as part of the approved Amphitheatre improvements measured four inches in trunk diameter at four and one-half feet above mean natural grade. The remaining oak trees proposed to be relocated within the Project Site measured eight, ten, twelve, and fourteen inches in trunk diameter at four and one-half feet above mean natural grade. In accordance with the Los Angeles County Oak Tree Ordinance, a permit would be required for the removal or relocation of oak trees measuring eight inches in trunk diameter or greater. As such, a permit would be required for the relocation of the four oak trees. As these trees are proposed to be relocated within the Project Site, the Project would not result in the permanent loss of protected trees and potential impacts to oak trees would be less than significant. Mitigation Measure D-11, provided below, would ensure the relocation of the oak trees is consistent with the Los Angeles County Oak Tree Ordinance. Mitigation Measure D-11 further outlines the procedures to be followed should the oak trees be protected in place.

(5) Regional Connectivity/Wildlife Movement

There are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Notwithstanding, development of the Project

would occur primarily within the already developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. As such, the Project would not be expected to result in an increased barrier to local wildlife movement. In addition, the proposed trail alignment would generally follow the alignment of existing user-created trails, which potential wildlife in the area would already be accustomed to. Furthermore, while implementation of the proposed hiking trail would increase human activity in the hillside areas, wildlife movement typically occurs during nighttime when access to the hiking trail would not be permitted. Additionally, in accordance with Mitigation Measure D-9 provided below, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, the Project is not anticipated to negatively impact wildlife movement within the open space areas of the Project Site and the open space areas to the north and east of the Project Site. Impacts with regard to wildlife movement would be less than significant and no mitigation measures would be required.

(6) Fire Hazard Areas

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist within the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. Fires within the Project Site could result in potential impacts on existing vegetation communities, special status species, and wildlife if a fire were to spread beyond the developed areas of the Project. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, impacts with respect to wildfire risk would be less than significant.

b. Cumulative Impacts

The related projects include mostly infill developments that contain limited native vegetation or suitable habitats for wildlife species. Due to their generally

developed/disturbed nature and lack of native vegetation and habitats, the related project sites do not contribute to the long-term sustainability of natural communities and, therefore, would not have a significant impact on biological resources on a cumulative basis In addition, as with the Project, any potential impacts to biological resources resulting from development of the related projects would likely be subject to mitigation as part of the environmental review process, thereby avoiding or minimizing potential impacts to biological resources. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts to biological resources.

As previously discussed, the Project would not have a significant adverse effect on any designated regional wildlife movement corridors as there are no regional wildlife movement corridors within or adjacent to the Project Site. Based on the location of the related projects within highly urbanized areas and the proximity of the related projects to large expanses of open space, the related project sites do not provide the type of environment that would attract wildlife to those sites or use those sites to reach nearby open space areas where such wildlife are known to exist. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts with regards to wildlife movement.

c. Project Design Features

No specific project design features are proposed with regard to biological resources.

d. Mitigation Measures

Special-Status Plant Species

Mitigation Measure D-1: Prior to construction, a qualified botanist shall conduct rare plant surveys throughout the Project area. In the event special status species are found during surveys, avoidance measures shall be implemented based on the recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented, in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Surveys shall be conducted during the appropriate blooming period to the extent feasible. If surveys cannot be conducted within the appropriate blooming period, or if the presence for any species cannot be ruled out for any other reason, avoidance measures shall be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented in consultation with the United States Fish and

Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Mitigation Measure D-2: If it is determined that special status plants would be directly impacted as a result of the Project, an on- or off-site restoration plan shall be prepared by a qualified botanist, in coordination with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

The restoration plan shall be implemented prior to the completion of the Project. The plan shall include the following: receiver locations; number of plants to be replanted and the methods of replanting; maintenance and monitoring requirements; and measures necessary for the establishment of self-sustaining populations in suitable open space areas to ensure the long-term survivability of the species in the vicinity.

Annual monitoring for at least five (5) years shall be required to ensure no-net-loss of acres of habitat for the species. The acreage ratio of lost special-status plant species habitat to habitat replaced shall be coordinated with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable, but shall be no less than 1:1.

Coastal California Gnatcatcher

Mitigation Measure D-3: Within a year prior to construction, protocol level surveys for the coastal California gnatcatcher shall be conducted within 300 feet of suitable habitat by a qualified biologist/ornithologist according to the United States Fish and Wildlife Service survey guidelines. The surveys shall include, at a minimum, a thorough examination of all suitable habitat within the Project area and vicinity for the coastal California gnatcatcher or its sign. The final survey methodology shall be determined in coordination with the United States Fish and Wildlife Service. A summary report shall be prepared upon completion of these activities and submitted to the United States Fish and Wildlife Service.

If, following protocol level surveys, no gnatcatchers are detected, but construction is delayed more than one year, additional surveys may be required, at the discretion of the United States Fish and Wildlife Service, to ensure that no gnatcatchers have moved into the area. If evidence of the coastal California gnatcatcher is found within the Project area during surveys, consultation with the United States Fish and Wildlife Service shall be conducted, and any requirements of the regulatory agencies regarding protection of the species shall be implemented.

Migratory Birds and Raptors

Mitigation Measure D-4: The following measures shall be implemented during construction to minimize impacts on nesting birds and raptors:

a. Construction in areas that include trees, vegetation, or buildings that may provide nesting habitats for bird and raptors shall be reduced to the maximum extent feasible.

b. Trimming and removal of vegetation and trees shall be minimized and performed outside of the nesting season (February 15 to September 15) to the extent feasible.

c. In the event trimming or removal of vegetation and trees must be conducted during the nesting season, nesting bird surveys shall be completed by a qualified biologist no more than 48 hours prior to trimming or clearing activities to determine if nesting birds are within the affected vegetation. Nesting bird surveys shall be repeated if trimming or removal activities are suspended for five days or more.

d. In the event construction is scheduled during bird nesting season, nesting bird surveys shall be completed no more than 48 hours prior to construction to determine if nesting birds, raptors, or active nests are in or within 500 feet of the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more.

e. In the event nesting birds or raptors are found in the construction area, appropriate buffers (typically 300 feet for songbirds and up to 500 feet for raptors) shall be implemented, in coordination with the California Department of Fish and Wildlife, to ensure that nesting birds and active nests are not harmed. Buffers shall include fencing or other barriers around the nests to prevent any access to these areas and shall remain in place until birds have fledged and/or is no longer active, as determined through coordination with the California Department of Fish and Wildlife.

Special-Status and General Wildlife Species

Mitigation Measure D-5: A qualified biologist shall complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more. If any wildlife species are identified, appropriate measures shall be developed and implemented to avoid impacts on these wildlife species, in consultation with resource agencies as applicable.

Bats

Mitigation Measure D-6: To the extent feasible, tree and building removal shall be scheduled during the non-breeding and active season for bats (typically October and November). Prior to construction, surveys shall be conducted by a qualified bat specialist to identify the presence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in cavities in the area, either in trees or in structures, shall be safely evicted under the direction of a bat specialist and under consultation with the California Department of Fish and Wildlife.

Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the California Department of Fish and Wildlife shall be installed and maintained to prevent bats from roosting in these cavities prior to and during construction. A summary report shall be prepared upon completion of these activities and submitted to the California Department of Fish and Wildlife.

Pre-construction bat surveys shall be conducted by a qualified bat specialist no more than seven (7) days prior to the removal of any trees within the Project area to confirm that exclusionary measures have been successful and there are not bats within the construction area. If no roosting bats are detected, no further surveys are required provided the tree removal is conducted within seven (7) days. If removal is delayed more than seven (7) days, additional surveys shall be conducted no more than seven (7) days prior to tree removal to ensure that no bats have moved into the area.

Mitigation Measure D-7: Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in the Project area. In the event a maternal colony of bats is found in the construction area, the California Department of Fish and Wildlife shall be consulted, and no work shall be conducted within 100 feet of the roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the California Department of Fish and Wildlife. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No clearing and grubbing shall be authorized adjacent to the site. Combustion equipment, such as generators, pumps, and vehicles, shall not to be parked nor operated under or adjacent to the roosting site. Construction personnel shall not enter into areas beneath the colony, especially during the evening exodus.

General Wildlife Species

Mitigation Measure D-8: Amphitheatre lighting shall be designed to focus downward on the developed areas of the Project area and minimize light spillover onto adjacent open space areas.

Mitigation Measure D-9: Fencing associated with the proposed hiking trail shall be designed to be low in height with openings between posts and rails to allow the movement of wildlife to pass over or through the fence.

Mitigation Measure D-10: Trash receptacles that are not accessible to wildlife shall be used along the proposed hiking trail and within open areas of the Project Site to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. Signage shall also be place along the trail to encourage hikers to stay within the designated trail boundary.

Oak Trees

Mitigation Measure D-11: The following measures shall be implemented to minimize impacts on oak trees:

a. Oak trees measuring eight (8) inches or more in diameter at four and one-half (4.5) feet above mean natural grade shall be protected in place unless specifically permitted by the County of Los Angeles through the Los Angeles County Tree Ordinance.

b. Prior to construction, protection fencing shall be installed outside of the drip line of an oak tree to be protected in place during construction to minimize damage from equipment storage, debris dumping, parking, etc. within oak tree protected zones.

c. Oak trees that are relocated shall be done so in a manner consistent with the Los Angeles County Oak Tree Ordinance.

e. Conclusion

(1) Vegetation Communities

No special-status plant communities are located in the study area and impacts to vegetation communities would be less than significant.

(2) Regulatory Status Plant Species

Implementation of Mitigation Measures D-1 and D-2 would reduce potentially significant impacts to special status plants to less than significant levels.

(3) Regulatory Status Wildlife Species

(a) Regulatory Status Bird Species

Implementation of Mitigation Measures D-3 and D-4 would reduce potentially significant impacts to special status bird species to less than significant levels.

(b) Regulatory Status Small Mammal Species

Implementation of Mitigation Measure D-5 would reduce potential impacts to regulatory status small mammal species to a less than significant level.

(c) Regulatory Status Bat Species

Implementation of Mitigation Measures D-6 and D-7 would reduce potential impacts to regulatory status bat species to a less than significant level.

Additionally, with implementation of Mitigation Measures D-8 through D-10, overall potential impacts to wildlife species would be reduced to a less than significant level.

(4) Oak Tree Protection

In accordance with Mitigation Measure D-11, removal or relocation of any oak trees within the Project Site would adhere to the Los Angeles County Tree Protection Ordinance. Therefore, implementation of Mitigation Measure D-11 and compliance with the Los Angeles County Tree Protection Ordinance would reduce impacts to oak trees to a less than significant level.

(5) Regional Connectivity/Wildlife Movement

There are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Furthermore, development of the Project would occur primarily within the developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. Additionally, in accordance with Mitigation Measure D-9, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, Project impacts with regard to wildlife movement would be less than significant.

In conclusion, with implementation of the mitigation measures provided above, the Project would result in less than significant impacts to biological resources.

E. Cultural Resources

a. Analysis of Project Impacts

(1) Historical Resources

(a) Potential Impacts Related to Previously Approved Amphitheatre Improvements

In September 2013, the County of Los Angeles prepared and approved a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the rehabilitation of portions of the existing Amphitheatre consistent with the Secretary of Interior Standards for the Treatment of Historic Properties. These improvements will include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. These improvements were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards. Therefore, no significant impacts with regards to historic resources would occur as a result of implementation of the previously approved Amphitheatre improvements.

(b) Potential Impacts Related to Other Improvements

Overall, impacts with regards to historic resources associated with the Project have the potential to be significant as the specific design details of the Project have not been finalized. However, with implementation of Mitigation Measure E-1, provided below, such impacts would be reduced to a less than significant level.

(2) Archaeological Resources

The results of the records search indicate there are no known archaeological sites or isolates located within a 0.5-mile radius of the Project Site or within the Project Site. While the majority of the Project would be developed within areas that have been subject to disturbance in the past, some portions of the Project would extend to previously undisturbed areas. As such, there is the possibility that archaeological resources could be discovered. With implementation of Mitigation Measures E-2 and E-3, provided below, potential impacts related to archaeological resources would be reduced to a less-than-significant level.

(3) Paleontological Resources

As described in the paleontological records search, excavations in the igneous rocks exposed in much of the Project Site would not uncover any recognizable fossils. However, excavations in the Topanga Formation deposits intercalated with the igneous rocks may encounter significant vertebrate fossils. Therefore, the potential exists for paleontological resources to be uncovered during construction activities and impacts associated with paleontological resources could be potentially significant. With implementation of Mitigation Measure E-4, any potential impacts related to paleontological resources would be reduced to a less than significant level.

b. Cumulative Impacts

As previously evaluated, potential impacts to historic resources associated with the Project would be less than significant with implementation of Mitigation Measure E-1. Additionally, based on the unique use and features of the Project Site as well as the area of the related projects, it is not expected that the related projects would impact historic resources of the same character (based on context, building type, evaluation, and designation) as that which is present within the Project Site. In addition, due to the distance of the related projects to the Project Site, the closest of which is approximately 0.8 mile from the Project Site (Related Project No. 22), the related projects are not anticipated to impact the historic features within the Project Site. Therefore, cumulative impacts on historic resources would be less than significant.

As discussed above, potential impacts to archaeological and paleontological resources associated with the Project would be less than significant with implementation of Mitigation Measures E-2 through E-4. With regard to potential cumulative impacts related to archaeological and paleontological resources, the related projects area is urbanized and has been disturbed and developed over time. As with the Project, in the event that archaeological and paleontological resources are uncovered, each related project would be required to comply with applicable regulatory requirements. In addition, as part of the environmental review processes for the related projects, it is expected that mitigation measures would be established as necessary to address the potential for uncovering archaeological and paleontological resources. Thus, cumulative impacts associated with archaeological and paleontological resources would be less than significant.

c. Project Design Features

No specific project design features are proposed with respect to cultural resources.

d. Mitigation Measures

Mitigation Measure E-1: To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Mitigation Measure E-2: If a unique archaeological resource is discovered during Project construction activities, work in the area shall cease and deposits shall be treated in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. In addition, if it is determined that an archaeological site is a historical resource, the provisions of Section 21084.1 of the Public Resources Code and CEQA Guidelines Section 15064.5 shall be implemented.

Mitigation Measure E-3: If human remains are encountered during construction, work in the affected area and the immediate vicinity shall be halted immediately. The construction manager at the Project Site shall be contacted, and shall notify the County Coroner. If the County Coroner determines the remains to be Native American, the archaeologist and Native American monitor shall then be contacted, if they are not on-site at the time, as well as the responsible lead agency of the discovery, who in turn shall notify the Native American Heritage Commission. Disposition of the human remains and any associated grave goods shall be in accordance with California Health and Safety Code Section 7050.5 and Public Resources Code Sections 5097.91 and 5097.98, as amended. The archaeologist and the Native American monitor, with the concurrence of the County, shall determine the area of potential impact and the timing when construction activities can resume.

Mitigation Measure E-4: A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur. The frequency of inspections shall be based on consultation with the paleontologist and shall depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If paleontological materials are encountered, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed material to facilitate evaluation

and, if necessary, salvage. The paleontologist shall assess the discovered material(s) and prepare a survey, study or report evaluating the impact. The paleontologist's survey, study or report shall contain a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Applicant shall comply with the recommendations of the evaluating paleontologist, as contained in the survey, study or report, and a copy of the paleontological survey, study or report shall be submitted to the Los Angeles County Natural History Museum. Ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the satisfaction of the paleontologist.

e. Conclusion

As evaluated above, potential impacts to the on-site historic resource would be reduced to a less than significant level with implementation of Mitigation Measures E-1. In addition, following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, the Ford Theatres would continue to be eligible for listing in the National Register and the California Register and the significance of the historic resource would not be materially impaired by the Project.

With implementation of Mitigation Measures E-2 and E-3, as set forth above, impacts to archaeological resources would be reduced to a less than significant level. With implementation of Mitigation Measure E-4, potential impacts to paleontological resources would be reduced to a less than significant level.

F. Geology and Soils

a. Analysis of Project Impacts

(1) Strong Seismic Ground Shaking

As with any new development in the State of California, Project building design and construction would be required to conform to the current seismic design provisions of the California Building Code to minimize potential seismic impacts. In addition, construction of the Project would be required to adhere to the seismic safety requirements contained in the Los Angeles County Building Code. The Project would also be required to comply with the site plan review and permitting requirements of the County of Los Angeles Department of Public Works, Building and Safety Division, including the recommendations provided in site-specific geotechnical reports subject to Building and Safety Division's review and

approval, as reflected in Project Design Feature F-1 and Project Design Feature F-2, above. Compliance with regulatory requirements and implementation of project design features would ensure Project construction adheres to the seismic safety requirements contained in the State and County Building Codes and that site-specific engineering recommendations are implemented in accordance with a design-level geotechnical investigation. Therefore, the Project would not expose people or structures to potential substantial adverse effects associated with seismic ground shaking, and impacts would be less than significant.

(2) Liquefaction and Lateral Spreading

Portions of the Project Site are located within an area that has been identified by the State as being potentially susceptible to liquefaction. Given the Project Site's location within an area potentially susceptible to liquefaction, significant impacts with regard to liquefaction and lateral spreading could occur. Accordingly, Mitigation Measure F-1 is provided below to require that Project construction involve a combination of ground modification (remedial grading) and/or structural enhancements that would address potential liquefaction hazards. In addition, Project construction would adhere to the seismic safety requirements contained in the California and County Building Codes applicable to liquefaction and lateral spreading. With compliance with regulatory requirements and incorporation of the recommended structural enhancements into the design and construction of the Project, the Project would not expose people or structures to potential substantial adverse effects related to liquefaction and lateral spreading, and potential impacts would be reduced to a less than significant level.

(3) Landslides and Slope Stability

Based on the Seismic Hazard Zone Map for the Hollywood Quadrangle, a portion of the Project Site is located within an area that has been identified by the State as being susceptible to seismically-induced landslides. Based on the site-specific conditions observed as part of the geotechnical investigations, the Project Site is primarily susceptible to shallow landslide events such as debris flows and rockfalls associated with the natural slopes of the Project Site. As such, the Project could result in potentially significant impacts with regard to landslides and slope stability. The results of the stability analyses indicate the Project Site would attain sufficient stability with minor surficial grading and the incorporation of slope reinforcement measures as specified in Mitigation Measure F-2. In addition, for protection against potential future rockfalls, Mitigation Measure F-2 also includes the installation of flexible barriers. Therefore, with implementation of Mitigation Measure F-2, the Project would not expose people or structures to potential substantial adverse effects related to landslides or slope failures, and impacts would be less than significant.

(4) Erosion

Sedimentation and erosion could potentially occur as a result of exposed soils during Project construction. However, construction activities would occur in accordance with erosion control requirements, including grading and dust control measures, imposed by the County pursuant to grading permit regulations. In addition, as part of the Storm Water Pollution Prevention Plan, Best Management Practices would be implemented during construction to reduce sedimentation and erosion levels to the maximum extent possible. The Project also would comply with South Coast Air Quality Management District Rule 403, which requires the implementation of best available fugitive dust control measures during active construction periods capable of generating fugitive dust emissions. With compliance with regulatory requirements and implementation of appropriate Best Management Practices, impacts with respect to soil erosion and the loss of topsoil associated with Project construction would be less than significant.

Project operations could result in a limited degree of soil erosion from vegetated areas. However, the Project would be required to have a Low Impact Development Plan in place during the operational life of the Project in compliance with National Pollutant Discharge Elimination System permit requirements. The Low Impact Development Plan would include Best Management Practices which would reduce on-site erosion from vegetated areas within the Project Site. With compliance with these regulatory requirements, impacts with respect to sedimentation and erosion during operation would be less than significant.

(5) Corrosive Soils

Corrosion testing performed suggests the soils within the Project Site could be corrosive to concrete and ferrous metals. Corrosion testing would be performed, as required by the County Building Code, and final recommendations for concrete would be made in accordance with the latest California Building Code requirements. With compliance with all regulatory requirements and implementation of the recommendations set forth in the Geotechnical Reports as well as any subsequent recommendations, as applicable, impacts related to corrosion would be less than significant.

b. Cumulative Impacts

Cumulative growth through 2020 (inclusive of the 27 related projects) would expose a greater number of people to seismic and other secondary hazards. However, as with the Project, related projects and other future development projects in the area would be subject to established guidelines and regulations pertaining to building design and seismic safety, including those set forth in the California Building Code and Los Angeles County Building

Code (or City of Los Angeles Building Code requirements, as appropriate). Therefore, with adherence to such regulations, cumulative impacts with regard to geology and soils would be less than significant.

c. Project Design Features

Project Design Feature F-1: Prior to the issuance of a grading permit(s), the Applicant shall submit to the County of Los Angeles Department of Public Works for review and approval a final design-level geotechnical investigation report that complies with all applicable State and local code requirements based on final Project designs prepared by a registered civil engineer and certified engineering geologist. The geotechnical investigation report shall include recommendations for the specific building locations and design including those pertaining to site preparation, fills and compaction, foundations, etc. The geotechnical investigation report shall be prepared to the written satisfaction of the Los Angeles Department of Public Works—Building and Safety Division.

Project Design Feature F-2: Project design and construction shall comply with all applicable current building codes and standards, including those established by the California Geological Survey's "Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication No. 117;" the Uniform Building Code as adopted by the County of Los Angeles; State and County laws, ordinances and Code requirements; and the recommendations set forth in a final geotechnical investigation(s).

d. Mitigation Measures

Mitigation Measure F-1: Project grading shall include a combination of ground modification and/or structural enhancements in areas subject to liquefaction to reduce the risk to an acceptable level (as defined by the California Geological Survey in Special Publication 117a, Chapter 2). Ground modification shall consist of the removal and replacement of undocumented fill with engineered fill. Subsequently, foundations shall be supported on conventional shallow footing systems established on engineered fill or undisturbed bedrock.

Mitigation Measure F-2: In order to minimize, capture, and manage debris flows and rockfalls, the Project shall incorporate a combination of the following measures:

- Remove and recompact loose surficial material and remove rock fall accumulations;

- Construct storm drain and catch basins in swales above proposed retaining walls to provide an outlet for rainfall runoff and to catch eroded materials. Regular maintenance of catch basins to remove eroded materials shall be performed to preserve the basin and drain functionality;
- Install retaining walls; and
- Install flexible barriers or anchored mesh net.

e. Conclusion

With compliance with all regulatory requirements and implementation of the project design features and mitigation measures described above, Project-level impacts related to geology and soils would be less than significant. In addition, cumulative impacts with regard to geology and soils would be less than significant.

G. Hydrology, Surface Water Quality, and Groundwater

a. Analysis of Project Impacts

(1) Construction Impacts

(a) Surface Water Hydrology and Water Quality

Construction of the Project would require onsite demolition, grading, and excavation activities. Such construction activities would have the potential to temporarily alter existing drainage patterns and flows within the Project Site by exposing the underlying soils and making the Project Site temporarily more permeable. Exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, construction activities such as earth moving, maintenance/operation of construction equipment, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. Onsite watering activities to reduce airborne dust could also contribute to pollutant loading in runoff. The main pollutant of concern during construction would be sediment or soil particles that would become detached by water and wind. In accordance with the requirements of the Construction General Permit, the Project would implement a Storm Water Pollution Prevention Plan that would specify best management practices (BMPs) to be used during construction to manage runoff flows and erosion and prevent pollution. BMPs would also be provided to target pollutants of concern and be designed to reduce runoff and pollutant levels in runoff during construction. Further, implementation of BMPs such as sandbag barriers and other sediment barriers

would serve to maintain the existing drainage flow paths and discharge points during construction.

Through compliance with all NPDES Construction General Permit requirements, including the preparation and implementation of a Storm Water Pollution Prevention Plan, implementation of BMPs, and compliance with applicable County grading regulations, construction of the Project would not violate any water quality standards; substantially alter the existing drainage pattern of the Project Site and surrounding area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site; create or contribute runoff water which would exceed the capacity of the existing stormwater drainage system or provide substantial additional sources of polluted runoff and otherwise substantially degrade water quality. In addition, Project construction would not require or result in the construction of new stormwater drainage facilities which could cause significant environmental effects. As such, impacts to surface water hydrology and water quality during construction would be less than significant.

(b) Groundwater

No water supply wells are located at the Project Site or within one mile of the Project Site that could be impacted by construction, nor would the Project include the construction of water supply wells. In addition, as noted above, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater is not expected to be encountered within the Project Site. Furthermore, groundwater was not encountered during recent on-site explorations conducted within the Project Site. Accordingly, it is not expected that groundwater would be encountered during construction that would require temporary or permanent dewatering operations. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Additionally, compliance with all applicable federal, State, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater. As such, Project construction would not result in a significant impact with regard to groundwater.

(2) Operational Impacts

(a) Surface Water Hydrology

With implementation of the Project, the amount of impervious area would increase from approximately 11 percent to 13 percent. Accordingly, Project development would increase the amount of stormwater flow and volume. In addition, development of the Project would change existing drainage areas by bisecting existing tributary flows. With

Project development, the total flow rate for the Project Site would increase from 119.92 cubic feet per second to 123.44 cubic feet per second and the total collected volume would increase from 381,586 cubic feet to 392,476 cubic feet. Although the runoff volume would increase as a result of an increase in impervious area, in accordance with NPDES and County requirements as set forth in Project Design Feature G-2, a Low Impact Development Plan would be prepared and implemented for the Project that would specify BMPs to promote bioretention or other functions to detain water onsite to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County Department of Public Works. Therefore, with compliance with regulatory requirements, the Project would not substantially alter the existing drainage pattern of the site or area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site, and would not create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, or require the construction of new stormwater drainage facilities. As such, operation of the Project would result in a less-than-significant impact on surface water hydrology.

(b) Surface Water Quality

As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. As part of the NPDES and County requirements, a Low Impact Development Plan would be prepared for the Project which would outline the stormwater treatment measures or post-construction BMPs required to control pollutants of concern associated with storm events up to the 0.75-inch precipitation level. BMPs would include source control and treatment control BMPs to remove pollutants from stormwater discharges. As the Project Site currently does not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces, implementation of BMPs to capture and naturally filter stormwater from the Project Site would result in an improvement in surface water quality runoff from the Project Site compared to existing conditions. Therefore, with compliance with NPDES and County requirements which would require the implementation of BMPs that would serve to improve runoff from the Project Site, operation of the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality. Thus, operational impacts on surface water quality would be less than significant.

(c) Groundwater

As discussed in the Hydrology and Water Quality Report, the soils underlying the Project Site are not conducive to infiltration as they are underlain by bedrock.

Notwithstanding, no water supply wells are located within the Project Site or within one mile of the Project Site and, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater does not occur within the Project Site. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination. As such, operation of the Project would not result in significant impacts to groundwater.

b. Cumulative Impacts

(1) Surface Water Hydrology and Water Quality

The Project in conjunction with the cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) through 2020 would cumulatively increase stormwater runoff flows and could possibly increase the amount of pollutants potentially resulting in cumulative impacts to surface water hydrology and water quality. However, as with the Project, cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) would be subject to NPDES and local requirements, including implementation of Storm Water Pollution Prevention Plans, Standard Urban Stormwater Mitigation Plans, and Low Impact Development Plans with appropriate BMPs to manage stormwater runoff and water quality during construction and operation. Furthermore, the local jurisdiction would review each future development project on a case-by-case basis to ensure sufficient local and regional drainage capacity is available to accommodate stormwater runoff. Therefore, with compliance with applicable laws, rules and regulations, cumulative impacts on surface water hydrology and water quality would be less than significant.

(2) Groundwater

As described above, no water supply wells, spreading grounds, or injection wells are located within a one-mile radius of the Project Site. In addition, Project development would not involve the temporary or permanent extraction of groundwater from the Project Site or otherwise use the groundwater. Furthermore, while implementation of the Project would result in an increase in impervious surface area, per County requirements, the Project would implement BMPs to capture the first flush or first 0.75-inch of rainfall for any storm event and offset the potential reduction in percolation resulting from Project development. However, development of the related projects could result in changes in impervious surface area within their respective project sites which would decrease the potential for groundwater recharge. As the related projects are located in a highly urbanized area, any reduction in groundwater recharge due to the overall net change in impervious area within

the related project sites would be minimal in the context of the regional groundwater basin. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. As with the Project, the related projects would be unlikely to cause or increase groundwater contamination because compliance with existing statutes and regulations would similarly prevent the related projects from affecting or expanding any potential areas affected by contamination, or increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated. Therefore, cumulative impacts to groundwater would be less than significant.

c. Project Design Features

Project Design Feature G-1: Prior to the issuance of a grading permit, the Applicant shall provide evidence to the County of Los Angeles Department of Public Works, as appropriate, that a Notice of Intent has been filed with the State Water Resources Control Board for coverage under the Construction General Permit and a certification that a Stormwater Pollution Prevention Plan has been prepared. Such evidence would consist of a copy of the Notice of Intent stamped by the State Water Resources Control Board or Los Angeles Regional Water Quality Control Board, or a letter from either agency stating that the Notice of Intent has been filed. The Stormwater Pollution Prevention Plan would include a menu of Best Management Practices to be selected and implemented based on the phase of construction and the weather conditions to effectively manage stormwater runoff and control erosion. Best Management Practices to be implemented as part of the Project could include, but not be limited to, the following:

- Erosion Control BMPs to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of disturbance, stabilizing disturbed areas, and protecting slopes/channels;
- Sediment Control BMPs, which are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping sediments on-site and controlling the site boundaries;
- Wind Erosion Control BMPs, which consist of applying water to prevent or minimize dust nuisance;

- Tracking Control BMPs, which consist of preventing or reducing the tracking of sediment off-site by vehicles leaving the construction area. These BMPs include street sweeping and vacuuming. The construction site would have a stabilized construction entrance to prevent off-site tracking of sediment and debris;
- Non-Stormwater Management BMPs, which are also referred to as "good housekeeping practices" involve keeping a clean, orderly construction site; and
- Waste Management and Materials Pollution Control BMPs consist of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater runoff or discharges through the proper management of construction waste.

Project Design Feature G-2: Prior to issuance of a building permit, the Applicant shall prepare and submit for review and approval a Low Impact Development Plan that would include Best Management Practices and demonstrate compliance with Low Impact Development Ordinance requirements to the Los Angeles County Department of Public Works, Building and Safety, as applicable. Specific Best Management Practices to be implemented as part of the Low Impact Development Plan for the Project to manage post-construction stormwater runoff would include, but not be limited to, the following:

- Installation of catch basins, planter drains, and building roof drain downspouts throughout the Project Site to collect roof and site runoff and direct stormwater away from structures and to potential infiltration systems.
- Installation of filter inserts to catch basins to improve the quality of stormwater runoff from the Project Site.
- Promote evapotranspiration and infiltration, and the use of native and/or drought tolerant plants
- Promote bioretention through the use of underground retention tanks and/or rainwater harvesting;
- Design material storage areas and loading docks within structures or enclosures to prevent leaks or spills of pollutants from entering the storm drain system;
- Design post-construction structural or treatment control BMPs to infiltrate stormwater runoff. Stormwater treatment facilities and systems would be designed to meet the requirements of the LID Ordinance.

d. Mitigation Measures

The Project would result in less than significant impacts to surface water hydrology, water quality, and groundwater during construction and operation. No mitigation measures would be required.

e. Conclusion

Impacts to surface water hydrology, water quality, and groundwater would be less than significant.

H. Land Use

a. Analysis of Project Impacts

(1) Consistency with Local Plans and Applicable Policies

The Project would support policies of the County's General Plan, General Goals and Policies Chapter regarding the preservation of open space areas and cultural resources, encouraging cultural and social diversity, and environmental sustainability. The Project would also support various policies of the Conservation and Open Space Element by incorporating a variety of sustainability features and maximizing the preservation of the Project Site's existing open space areas, thus maintaining the natural and scenic character of the area. With regards to the Land Use Element, the Project would support compatibility with the existing development of the Project Site and the preservation of surrounding uses and open space. The Project would further support policies of the Transportation Element by providing a new traffic signal to allow for safer left turns from the southern (egress) driveway to Cahuenga Boulevard East; providing one new driveway between the northernmost driveway and the main entrance to facilitate access and circulation with the proposed Transit Center; and reconfiguring the northernmost driveway to provide vehicles with direct access to the proposed maintenance facility and allow egress from the north parking structure, thereby improving the flow of vehicles within and adjacent to the Project Site. The Project would also encourage use of public transit by continuing to promote parking at the Universal City/Studio City Metro Red Line Station where a shuttle would continue to be provided to and from the Ford Theatres during evening events. Additionally, with the implementation of water conservation features and the provision of necessary utility improvements, the Project would support applicable policies of the Water and Waste Management Element. The Project would also support policies of the Safety Element and would coordinate with the County and City Fire Departments and implement recommended guidelines regarding wildland fire prevention to reduce fire hazards. Overall, the Project

would be generally consistent with the intent and applicable policies of the County General Plan.

While development of the Project Site is governed by the County General Plan and the Los Angeles County Code, a consistency analysis with relevant policies of the City General Plan was also conducted. As detailed in Section IV.H, Land Use, of this Draft EIR, the Project would support policies of the General Plan Framework Land Use Chapter regarding the establishment of new open space opportunities to serve the needs of existing and future residents. In addition, as off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Land Use Chapter regarding preservation of and compatibility with the scale and character of the City's residential neighborhoods. The Project would also be consistent with the relevant objectives and policies of the General Plan Framework's Urban Form and Neighborhood Design Chapter through the development and improvement of community facilities which would serve to meet the performing arts and recreational needs at a City- and County-wide level. Additionally, with the conservation of the majority of the Project Site's open space areas, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Open Space and Conservation Chapter, which guides the provision, management, and conservation of the City's public open space resources. The Project would also provide for necessary infrastructure improvements and would therefore be generally consistent with the relevant goals, objectives, and policies of the General Plan Framework's Infrastructure and Public Services Chapter. Furthermore, with the continued use of the Project Site as a public regional park and performing arts center, the Project would be consistent with the Project Site's land use designation as a public facility as set forth by the Hollywood Community Plan and Hollywood Community Plan Update. In summary, the Project would be generally consistent with relevant policies of the City General Plan.

With regard to zoning, the Los Angeles County Planning and Zoning Code regulates development of unincorporated areas of the County through land use designations and development standards regarding allowable uses, density, height, and design. As the Project Site is not located within an unincorporated area of the County, land use and zoning designations have not been established by the County for the Project Site. However, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements. The Project Site is located within the City of Los Angeles and is zoned per the City of Los Angeles Municipal Code. With implementation of the Project, the Project Site would continue to be used as a public regional park and performing arts center. As such, the Project would be consistent with the City of Los Angeles zoning of the Project Site for Public Facilities. In addition, while some of the proposed buildings and structures would

exceed 30 feet in height, the Project has been intentionally designed to be compatible with the massing, size, and scale of the existing structures.

(2) Consistency with Regional Plans

As analyzed in Section IV.H, Land Use, of this Draft EIR, the Project would be generally consistent with the Southern California Association of Governments' 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, Growth Vision Report, and Regional Comprehensive Plan. Additionally, as discussed in Section IV.B, Air Quality, of this Draft EIR, Project development would not have a significant long-term impact on the region's ability to meet State and federal air quality standards. The Project would therefore be consistent with the goals and policies of the SCAQMD's Air Quality Management Plan. Further, as discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, the Project would not conflict with the Congestion Management Program as it would not result in significant impacts to the nearby Congestion Management Program intersections or freeway monitoring locations.

(3) Conclusion Regarding Impacts Relative to Land Use Consistency

Based on the analysis provided above, the Project would be generally consistent with the adopted County and City General Plans and with relevant environmental policies in other applicable plans. As such, the Project's impacts related to land use consistency would be less than significant.

b. Cumulative Impacts

Future growth through 2020 (the Project's buildout year) as a result of related projects and general ambient growth would have the potential to alter the existing land use environment due to infill development at increased densities, conversions of vacant land to new development, and/or conversions of land uses. However, future development projects would be subject to existing zoning and land use designations as well as environmental review by the County or City. Therefore, such future projects are not expected to fundamentally alter the existing land use relationships in the community.

The closest related project to the Project Site is Related Project No. 22, located approximately 0.8-mile southwest of the Project Site. Given its distance from the Project Site and intervening land uses, Related Project No. 22 would not combine with the Project to create any incompatibility with surrounding land uses. Additionally, as the Project would be compatible with existing surrounding land uses and would be generally consistent with applicable land use plans and policies, the Project would not contribute to significant cumulative land use compatibility or consistency impacts. The balance of the related

projects would not cause cumulative land use impacts due to distance and/or existing intervening development. As such, cumulative impacts with regard to land use would be less than significant.

c. Project Design Features

No specific project design features beyond the project improvements discussed in Section II, Project Description, of this Draft EIR are proposed with regard to land use.

d. Mitigation Measures

Based on the above analysis, the Project would be generally consistent with applicable land use plans, policies, and regulations and no significant impacts with regard to land use would occur. Thus, no mitigation measures would be required.

e. Conclusion

Impacts related to land use would be less than significant.

I. Noise

a. Analysis of Project Impacts

(1) Construction Noise

(a) On-Site Construction Noise

Noise impacts from Project construction activities occurring within or adjacent to the Project Site would be a function of the noise generated by construction equipment, the location of the equipment, the timing and duration of the noise-generating construction activities, and the relative distance to noise sensitive receptors. Construction activities would generally include demolition, grading and excavation, and building construction. Each stage of construction would involve the use of various types of construction equipment and would, therefore, have its own distinct noise characteristics. Noise from construction equipment would generate both steady-state and episodic noise that could be heard within and adjacent to the Project Site. The estimated construction noise levels at the nearest off-site receptors R1, R2 and R4 would be well below the existing daytime ambient noise levels. At receptor R3, the estimated construction-related noise levels would be consistent with the lowest measured ambient noise levels. The estimated construction-related noise levels would be below the Project significance threshold. Therefore, noise

impacts associated with the Project's on-site construction activities would be less than significant.

(b) Off-Site Construction Traffic Noise

The major noise sources associated with off-site construction trucks would be associated with haul and delivery trucks. Based on an eight-hour workday and a uniform distribution of trips, there would be a maximum of 12 truck trips per hour during the peak construction period. The noise level generated by haul trucks during the peak construction period would be well below the existing daytime ambient noise level at the noise sensitive receptors along the haul routes. Therefore, noise impacts from off-site construction traffic would be less than significant.

(2) Construction Vibration

Project construction activities would generate ground-borne vibration during site demolition and excavation/grading activities when heavy construction equipment, such as large bulldozers, would be used. Vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. The estimated vibration velocity levels (from all construction equipment) would be well below the significance thresholds. Therefore, vibration impacts associated with potential building damage to off-site building structures during construction activities would be less than significant.

With regard to potential building damage to the on-site historic Amphitheatre, vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. Therefore, on-site vibration impacts associated with building damage could be significant. With implementation of Mitigation Measure I-3, which would require that construction activities in close proximity (within approximately 20 feet) of the existing Amphitheatre structure utilize smaller equipment, such as a small bulldozer and handheld compactors, vibration levels would be reduced to less than 0.12 PPV. Therefore, with implementation of this mitigation measure, potential on-site vibration impacts with respect to building damage would be reduced to less than significant.

Relative to potential human annoyance impacts associated with the generation of on-site vibration, the estimated ground-borne vibration levels from construction equipment would be below the significance threshold for human annoyance at all off-site sensitive receptors. Therefore, on-site vibration impacts on human annoyance during construction would be less than significant.

Haul trucks during construction would generate ground-borne vibration as they travel along the Project designated haul routes. Thus, an analysis of potential vibration impacts associated with building damage and human annoyance from ground-borne vibration along the local haul route was conducted. Based on FTA data, the vibration generated by a typical truck would be approximately 63 VdB (0.006 PPV) at a distance of 50 feet from the truck. At the shortest distance between haul trucks and sensitive receptors, haul/delivery trucks would be approximately 10 feet from nearby sensitive receptors along Cahuenga Boulevard East. Vibration levels generated by the haul trucks at this distance would be 0.063 PPV, which would be well below the building damage threshold of 0.2 PPV for the residential buildings along Cahuenga Boulevard East. In addition, vibration levels generated by Project construction trucks along the haul routes would be similar to the existing truck traffic already traveling on the same roads. Therefore, potential impacts associated with vibration from delivery/haul trucks traveling along the designated haul routes would be less than significant.

(3) Operational Noise

(a) On-Site Stationary Noise Sources

(i) Mechanical Equipment

As part of the Project, new mechanical equipment would be located in various locations throughout the Project Site. Although operation of this equipment would generate noise, Project Design Feature I-1 would ensure compliance with the County's Noise Ordinance, which would limit noise from mechanical equipment from exceeding the ambient noise levels on the premises of other occupied properties. In addition, as the Project's mechanical equipment would be designed to minimize noise to on-site uses and patrons, noise levels to off-site receptors from mechanical equipment would be further reduced. Therefore, noise impacts from mechanical equipment would be less than significant.

(ii) Outdoor Areas

The Project includes two outdoor plazas at the Ford Terrace, the Transit Plaza, and Ford Plaza. In addition, the Project would include a restaurant located at the Ford Plaza that would feature an outdoor seating area with an amplified sound system. In accordance with the County's Noise Ordinance, the amplified sound system would be designed so as not to exceed a maximum noise level of 90 dBA (L_{eq}) at the restaurant outdoor seating area. Overall, the estimated noise levels from the plaza areas would not exceed the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from outdoor spaces would be less than significant.

(iii) Transportation Facilities

Sources of noise within the parking structures would primarily include car movements (i.e., engine noise), doors opening, people talking, and intermittent car alarms. The Project would also introduce a new Transit Center at the north parking structure that would include a staging area for buses to load and unload. It is anticipated that there would be up to 10 buses loading/unloading at the Transit Center at any given time. The estimated noise levels from the parking structures and the Transit Center would be below the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from the parking structures and Transit Center operations would be less than significant.

(iv) Performance Spaces

The analysis for the performance spaces accounted for audience cheering as well as an amplified sound system. As specified by Project Design Feature I-2, the proposed amplified sound system for the Amphitheatre would be designed to generate a maximum sound level of 95 dBA (L_{eq}) at as measured in "slow" response at the house mixer location. Similarly, the assumed sound levels generated by the amplified sound system inside the 299 seat theater and the 99 seat Flex Space would be approximately 95 dBA (L_{eq}). In addition, in accordance with Project Design Feature I-3, the building structure of the 299-seat theatre and the Flex Space would be designed to provide a minimum 25 dBA noise reduction. The estimated noise levels from the performance spaces would be well below the ambient noise levels at receptors R2 and R4. The estimated noise levels from the Amphitheatre amplified sound systems at receptors R1 and R3 would be approximately 0.5 dBA and 2.7 dBA higher than the existing ambient noise levels. However, the measured ambient noise levels do not include the existing Amphitheatre operation-related activities, which would result in higher ambient noise levels due to noise generated from performances within the Amphitheatre. It is further noted that the noise levels from the new 299-seat theatre and Flex Space would be contained within the building structures and are estimated to be well below the existing ambient noise levels. Therefore, the noise levels from the performance spaces including the new facilities would be similar to existing conditions with the Amphitheatre being in operation. As such, noise impacts from the performance spaces would be less than significant.

(v) Loading Dock/Trash Collection Areas

The Project would include a new Service Court, which would include a new loading dock and trash/recycling areas. Based on measured noise levels from typical loading dock facilities, delivery trucks (while idling at the loading dock) could generate noise levels of approximately 71 dBA (L_{eq}) at a distance of 50 feet from the noise source. In addition, trash compactors would generate noise levels of approximately 66 dBA (L_{eq}) at a distance of 50 feet. The estimated noise levels from the loading dock/trash collection areas would

be well below the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from loading dock/trash collection operations would be less than significant.

(b) Off-Site Traffic (Mobile Sources)

(i) Future plus Project

Future roadway noise levels were calculated along 11 off-site roadway segments in the vicinity of the Project Site. The calculated CNEL levels overestimate noise levels as they are calculated in front of the roadways and do not account for the presence of any physical sound barriers or intervening structures. The Project would result in a maximum increase of 0.2 dBA (peak-hour L_{eq} and 24-CNEL) in traffic-related noise levels along Odin Avenue during both the weekday and weekend. The estimated noise increase due to Project-related traffic would be well below the 3 dBA significance threshold. Therefore, off-site traffic noise impacts associated with future plus Project conditions would be less than significant.

(ii) Existing plus Project

An additionally analysis was conducted to determine the potential noise impacts based on the increase in noise levels due to Project-related traffic compared with the existing baseline traffic noise conditions. The maximum Project-related traffic noise increase would be 0.2 dBA CNEL along Odin Avenue. The estimated increase in off-site traffic noise levels would be below the 3-dBA CNEL significance threshold. Therefore, off-site traffic noise impacts associated with the existing plus Project traffic conditions would be less than significant.

(c) Composite Noise Level Impacts from Project Operations

In addition to considering the potential noise impacts to neighboring noise-sensitive receptors from each specific off-site and on-site noise source, an evaluation of the potential composite noise level increase (i.e., noise levels from all noise sources combined) at the analyzed sensitive receptor locations was also performed. The Project would result in an increase of 1.0 dBA at Location R3 up to 1.4 dBA at Location R1. No noise increase is anticipated at receptor Locations R2 and R4. The estimated increases in noise levels due to Project operation would be below the 3 dBA CNEL significance threshold. Therefore, composite noise level impacts due to the Project operations would be less than significant.

b. Cumulative Impacts

(1) Construction Noise and Vibration

Noise from construction of development projects is typically localized and has the potential to affect areas within 500 feet from the construction site. Thus, noise from construction activities for two projects within 1,000 feet of each other can contribute to a cumulative noise impact for receptors located midway between the two construction sites. The nearest related project is Related Project No. 22 (a hotel development at 1841 Highland Avenue), which is approximately 0.8-mile from the Project Site. Other related projects are located further from the Project Site. Due to the distance attenuation and intervening buildings between the related projects, cumulative noise impacts from construction activities would be less than significant.

Additionally, as ground-borne vibration decreases rapidly with distance, potential vibration impacts due to construction activities are generally limited to buildings/structures that are located in close proximity of the construction site (i.e., within 50 feet). As indicated above, the nearest related project is approximately 0.8-mile from the Project Site. Therefore, due to the rapid attenuation characteristics of ground-borne vibration, there is no potential for a cumulative construction impact with respect to ground-borne vibration.

(2) Operational Noise

Due to provisions set forth in the LAMC that limit stationary source noise from items such as roof-top mechanical equipment, noise levels would be less than significant at the property line for each related project. In addition, with implementation of regulatory requirements and proposed Project design features, noise impacts associated with operations within the Project Site would be less than significant. Based on the distance of the related projects from the Project Site and the noise levels associated with the Project, cumulative stationary source noise impacts associated with operation of the Project and related projects would be less than significant.

The Project and other related development in the area would produce traffic volumes (off-site mobile sources) that would generate roadway noise. Cumulative traffic volumes during a typical weekday would result in a maximum increase of 1.9 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. During a typical weekend, the maximum cumulative traffic noise increase would be 2.5 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. At all other analyzed roadway segments, the increase in cumulative traffic noise would be lower. Thus, the cumulative traffic noise increase would be below the 3 dBA significance threshold. Therefore, cumulative noise impacts due to off-site mobile noise sources

associated with the Project, future growth, and related projects would be less than significant.

c. Project Design Features

Project Design Feature I-1: Project-related outdoor mechanical equipment shall be designed to meet the County's Noise Ordinance.

Project Design Feature I-2: The design of the Project amplified sound system for the Amphitheater shall include the sound level regulator programmed to a maximum sound level of 95 dBA, as measured in "slow" response, at the house mixer locations.

Project Design Feature I-3: The building structure for the 299-seat theatre and the Flex Space shall provide a minimum 25 dBA indoor to outdoor noise reduction.

d. Mitigation Measures

(1) Construction

Mitigation Measure I-1: Power construction equipment (including combustion engines), fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards). All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated.

Mitigation Measure I-2: Project construction shall not include the use of driven pile systems.

Mitigation Measure I-3: Contractor shall utilize smaller construction equipment, such as, small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure.

(2) Operation

Operation of the Project would not result in a significant impact to the off-site noise sensitive receptors. Therefore, no mitigation measures would be required.

e. Conclusion

(1) Construction

Compliance with regulatory requirements and implementation of the mitigation measures would reduce noise and vibration impacts associated with Project construction to a less than significant level. As discussed above, cumulative construction noise and vibration impacts would also be less than significant.

(2) Operation

Project-level and cumulative impacts with regard to operational noise would be less than significant.

J.1. Public Services—Fire Protection

a. Analysis of Project Impacts

(1) Construction Impacts

Project construction could temporarily increase the demand for fire protection and emergency medical services within the Project Site as construction activities could potentially expose combustible materials such as wood, plastics, sawdust, covers and coatings, to sources of ignition from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings, and lighted cigarettes. In compliance with Occupational Safety and Health Administration and Fire and Building Code requirements, construction managers and supervisory personnel would be trained in emergency response and fire safety operations, including the monitoring and management of life safety systems and facilities, and maintaining fire suppression equipment such as fire extinguishers on-site. Additionally, the Project would comply with County requirements to ensure brush clearance and other applicable measures are followed to reduce the likelihood of fire spreading through the surrounding undeveloped hillsides. Therefore, construction impacts on fire protection and emergency medical services would be less than significant.

Emergency access for City Fire Department vehicles within the Project Site and the surrounding vicinity could also be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. However, the Project would implement a Construction Management Plan during construction of the Project, wherein traffic

management personnel and appropriate signage would be employed as necessary to ensure emergency access to the Project Site and vicinity is maintained. In addition, construction worker and haul truck trips would generally occur outside the typical weekday commuter morning and afternoon peak periods. Further, emergency vehicles would utilize emergency sirens to clear a path of travel or drive in opposing traffic lanes to avoid heavy traffic. As such, impacts related to emergency access would be less than significant.

(2) Operational Impacts

(a) Facilities and Equipment

The Project does not include the development of any new residential uses and, as such, would not increase the permanent residential population within the service area of Fire Station No. 76. However, the Project would generate an increase in the daytime population at the Project Site associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. As such, the Project's increase in the population within the Project Site would increase the demand for LAFD fire protection and emergency medical services. However, as indicated by the LAFD, no changes are currently proposed within Battalion 5, which includes the fire station that services the Project Site. In addition, the Project would incorporate building design features that comply with County and City fire safety requirements, as applicable, including, but not limited to, use of fire-resistant building materials where appropriate, smoke detection and fire alarm systems, automatic sprinkler systems, and portable fire extinguishers. Further, as set forth in Project Design Feature J.1-1, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required. Implementation of a fuel modification plan would serve to provide adequate defensible space around all potentially combustible structures within a fire environment. Compliance with applicable regulatory requirements would ensure that adequate fire prevention features would be provided that would reduce the demand for firefighting services. Therefore, based on the type of development proposed and the availability of existing LAFD facilities, impacts with regard to LAFD facilities and equipment associated with the Project would be less than significant.

(b) Response Distance and Emergency Access

Section 57.507.3.3 of the Los Angeles Municipal Code sets forth a response distance for industrial and commercial uses of one mile from fire stations with an engine company and 1.5 miles from fire stations with a truck company. Fire Station No. 76 is located approximately one mile northwest of the Project Site and is equipped with one engine and one ambulance. Therefore, the Project would be located within the required emergency response distance. In addition, upon implementation of the Project, access to

the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. Furthermore, the Project would incorporate specific access recommendations provided by the County Fire Department and LAFD as set forth in Project Design Feature J.1-2. Additionally, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest disaster route along Highland Avenue. The drivers of emergency vehicles also normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and LAFD. Therefore, Project-related traffic is not anticipated to impair the LAFD from responding to emergencies at the Project Site or the surrounding area. Impacts with regard to response distance and emergency access would be less than significant.

(c) Fire Flow

With implementation of a fire sprinkler system within all of the buildings proposed as set forth in Project Design Feature J.1-3, the required fire flow set forth by the County Fire Department would be 4,000 gallons per minute (gpm) at a pressure of 20 psi. Domestic and fire water service is currently provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. The water main can provide approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include the installation of two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East as provided in Project Design Feature J.1-4. In addition, the Project would include the installation of four private fire hydrants on-site And, as set forth in Project Design Feature J.1-5, booster pumps would be required for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. As provided in Project Design Feature J.1-6, the enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. With construction of the proposed onsite fire water system improvements, the Project would meet the fire flow requirements set forth by the County Fire Department and LAFD. Therefore, impacts regarding fire flow would be less than significant.

(d) Wildfire Risk

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist near the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County

requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, as previously described, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, implementation of the Project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. Impacts with respect to wildfire risk would be less than significant.

b. Cumulative Impacts

A number of the identified related projects and ambient growth projections fall within the service areas of Fire Station Nos. 76, 27, and 41. Several of the related projects include residential uses, which would increase the residential population of Fire Station No. 76, the "first-in" station for the Project Site, as well the secondary fire stations available to provide service to the Project Site. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population of the area and thus also increase the demand on fire services. In conjunction with the Project, this growth would cumulatively generate the need for additional fire protection services. However, similar to the Project, the related projects and all other future development projects would be subject to discretionary review by the LAFD to ensure that sufficient fire safety and hazards measures are implemented to reduce potential impacts to fire protection and emergency medical services. Furthermore, each related project would be required to comply with regulatory requirements related to fire safety, access, and fire flow.

Additionally, LAFD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, trucks and engines, ambulances, other special apparatuses, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Therefore, cumulative impacts on fire protection and emergency medical services would be less than significant.

c. Project Design Features

Project Design Feature J.1-1: A final fuel modification plan shall be prepared for the Project for review and approval by the County of Los Angeles Fire Department Fuel Modification Unit. The fuel modification plan shall include 30 foot and 200 foot buffer zones from all new structures. The 30 foot buffer zone shall provide for replanting of low-growing, irrigated drought-tolerant plant material as a means to prevent erosion and transition to the native character of the Project Site. The 200 foot buffer zone shall provide for seasonal clearing of brush and, as needed, pruning of trees to reduce the amount of potential plant material that could fuel a fire.

Project Design Feature J.1-2: Fire department access shall be provided to within 150 feet of building openings. The final design of the access driveways and internal roadways shall be coordinated with the County Fire Department and LAFD, as applicable. The proposed circular, fire department turn-around shall be a pumper truck-sized turn-around.

Project Design Feature J.1-3: The Project shall provide automatic fire sprinkler systems, approved by the County Fire Department, within all of the new buildings. With installation of fire sprinkler systems within all of the new buildings, the required fire flow shall be 4,000 gallons per minute with a residual pressure of 20 pounds per square inch.

Project Design Feature J.1-4: To accommodate the required fire flow, the Project shall provide two connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East.

Project Design Feature J.1-5: The Project shall provide fire hydrants within the Project Site as coordinated with the County Fire Department and LAFD. Booster pumps shall be provided for all proposed fire hydrants to meet the minimum fire flow rate and pressure requirements of the Project.

Project Design Feature J.1-6: The proposed fire system shall be a dedicated separate fire service system with no shared connections to the domestic supply lines.

d. Mitigation Measures

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant. Therefore, no mitigation measures are required.

e. Conclusion

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant.

J.2. Public Services—Police Protection

a. Analysis of Project Impacts

(1) Construction Impacts

Construction sites can be sources of nuisances and hazards, inviting theft and vandalism. When not properly secured, construction sites can contribute to a temporary increased demand for police protection services. Pursuant to Project Design Feature J.2-1, in consultation with the County of Los Angeles Sheriff's Department Parks Bureau, the Project would include the implementation of temporary security measures during construction, which could include on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction areas. In addition, equipment and building materials would be removed or secured during non-construction hours. With implementation of these measures, potential impacts associated with theft and vandalism during construction activities would be less than significant.

Emergency access for LASD and LAPD vehicles within the Project Site and the surrounding vicinity could be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. It is noted however that the construction-related traffic generated by the Project would not significantly impact LASD or LAPD response times within the Project vicinity since the drivers of police vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, most, if not all, of the construction worker and haul truck trips would occur outside the typical weekday commuter morning and afternoon peak periods, reducing the potential for traffic-related conflicts. The Project would also implement a Construction Management Plan during Project construction, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure adequate and safe access to the Project Site and vicinity is maintained. With implementation of the project design features, including the Construction Management Plan, construction of the Project would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities.

Therefore, impacts on police protection services during Project construction would be less than significant.

(2) Operational Impacts

The Project does not include the development of any residential uses and, as such, would not increase the permanent residential population within the service area of the Parks Bureau South Zone or the Hollywood Community Police Station. However, the Project would generate a daytime population associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. The County currently operates an alarm system which is monitored by the LASD. In addition, security guards for events and overnight security shifts are currently contracted by the LASD. In consultation with LASD, these existing security and safety features would be continued and enhanced pursuant to Project Design Feature J.2-2. According to the LASD, implementation of the features set forth in Project Design Feature J.2-2 would serve to reduce the potential for criminal activities and assist law enforcement efforts. In addition, based on a preliminary review of the proposed improvements, the LAPD indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. The LAPD has also indicated that upon completion of the Project, the Applicant shall provide the LAPD Hollywood area commanding office with a diagram of each portion of the property, including access routes. Implementation of this project design feature would facilitate LAPD response. Therefore, the Project would not result in a demand for additional services that would exceed the capability of the LASD or the LAPD to serve the Project Site and impacts would be less than significant.

With respect to emergency access to the Project Site during Project operations, the analysis provided in Section IV.K, Traffic, Access, and Parking, of this Draft EIR demonstrates that Project development would result in a less than significant impact on access and local traffic conditions (i.e., nearby intersections). Therefore, the additional traffic generated by the Project would not significantly impact emergency vehicle access or response times for either the LASD or LAPD.

Based on the above, with implementation of the project design features, Project operation would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services during Project operation would be less than significant.

b. Cumulative Impacts

The geographic context for the cumulative impact analysis is the service area of the LASD's Parks Bureau South Zone and the LAPD's Hollywood Community Police Station. The Project in conjunction with identified related projects and forecasted growth through 2020 (i.e., the Project's buildout year) within these service areas would cumulatively increase the demand for police protection. All of the identified related projects fall within the service boundaries of the Hollywood Community Police Station service area. Notwithstanding, as previously described, the LASD's Parks Bureau provides law enforcement services to County facilities, including parks, lakes, golf courses, and special event venues. The related projects do not include the development of such uses. As such, the Project in combination with the related projects would not contribute to a cumulative increase in the demand for LASD Parks Bureau police protection services. Therefore, cumulative impacts on LASD Parks Bureau police protection services would be less than significant.

With regard to the LAPD, several of the related projects include residential uses, which would increase the permanent residential population within the Hollywood Community Police Station service area. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population in the area. Along with other anticipated growth through 2020, this would further increase the demand for police protection services. The Project would not develop residential units, and thus would not generate a residential population. Therefore, the Project would not contribute to a cumulative increase in the residential service population of the Hollywood Community Police Station. In addition, as previously discussed, based on a review of the Project, the LAPD has indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. Therefore, the Project's contribution to the cumulative demand for police protection services provided by the LAPD would not be cumulatively considerable. Additionally, as with the Project, each related project would be subject to the City's routine construction permitting process, which includes a review by the LAPD to ensure that sufficient security measures are implemented to reduce potential impacts to police protection services. Furthermore, the LAPD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, vehicles, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Through the City's regular budgeting efforts, the LAPD's resource needs would be identified and monies allocated according to the priorities at the time. Based on the above, the Project's contribution to cumulative impacts to police protection services would not be cumulatively considerable and, as such, cumulative impacts on police protection services would be less than significant.

c. Project Design Features

Project Design Feature J.2-1: During construction, the Applicant shall implement temporary security measures including, but not limited to, on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction area. Large mounds of dirt/debris/building materials and fence covers/screens shall be avoided. Equipment and building materials shall be removed or secured during non-construction hours.

Project Design Feature J.2-2: During operation, the Applicant shall implement security measures including, but not limited to:

- High-definition surveillance cameras. The cameras shall be placed along pedestrian pathways, gathering areas, and at driveways on Cahuenga Boulevard East. The camera system shall allow law enforcement agencies to view live feed remotely, shall be equipped with a hard drive capable of storing video for 15 days, and shall be capable of transferring video to disc or USB storage devices.
- Configure proposed public restrooms such that entrances are oriented towards the main event area or other high-visibility areas. The restrooms shall be secured after hours to prevent vandalism, theft, and use by transients.
- Adequate lighting and high definition surveillance cameras within the parking structures. Points of entry and egress shall be equipped with traffic control devices, and a parking lot attendant shall be employed during events.
- Signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail shall also be well-marked to prevent users from getting lost and the brush next to the trail shall be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas shall not be built along the trail.

Project Design Feature J.2-3: Upon completion of the Project, the Applicant shall provide the Los Angeles Police Department Hollywood Area commanding officer with a diagram of each portion of the property. The diagram shall include access routes and additional information that might facilitate police response.

d. Mitigation Measures

Project-level and cumulative impacts with regard to police protection services would be less than significant. Therefore, no mitigation measures are required.

e. Conclusion

Project-level and cumulative impacts with regard to police protection services would be less than significant.

K. Traffic, Access, and Parking

a. Analysis of Project Impacts

(1) Traffic

(a) Construction Impacts

During the most intense construction phase, it is anticipated that construction activities would generate approximately 176 daily construction worker trips. In addition, based on a passenger car equivalency factor of 2.0, the 64 haul truck trips per day and the 30 daily delivery truck trips would be equivalent to 188 passenger car trips per day. Therefore, Project construction could generate a total of approximately 364 trips per day based on the construction phase. However, given the typical construction hours the Project would comply with, the majority of these trips would occur during off-peak hours. As such, Project construction would not be expected to result in a significant impact at any of the analyzed intersections. In addition, the Project would include implementation of a Construction Management Plan to minimize the amount and effect of construction traffic. As outlined in Project Design Feature K-1, the Construction Management Plan would prohibit construction workers, haul trucks and delivery trucks from parking, staging, or queuing along the surrounding residential streets.

(b) Operational Impacts

(i) Existing with Project Intersection Conditions

Based on the traffic analysis for Existing with Project Conditions, five of the eight intersections are projected to operate at LOS D or better during the analyzed periods. The remaining three intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these three intersections are the same intersections currently operating at LOS E or F under Existing Conditions. The addition of Project traffic to the study intersections would not exceed applicable significance thresholds. Therefore,

the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Existing with Project Conditions.

(ii) Future (Year 2020) with Project Intersection Conditions

Based on the traffic analysis for Future (Year 2020) with Project Conditions, four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these four intersections are the same intersections projected to operate at LOS E or F under Future Conditions (without the Project). Similar to the Existing with Project Conditions scenario, Project traffic would contribute a small increase in the V/C ratios at most study intersections. Therefore, the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Future with Project Conditions.

(2) Congestion Management Program

(a) CMP Freeway Analysis

Based on the distribution of traffic in the vicinity of the Project Site, approximately 60 percent of the Project traffic was assigned to/from the US-101 and the Project Site. According to the trip generation estimates, the Project is expected to generate approximately 35 net new trips in the weekday A.M. peak hour, approximately 60 net new trips in the weekday P.M. peak hour, approximately 18 net new trips in the weekday evening peak hour, approximately 92 net new trips in the Saturday midday peak hour, and approximately 92 net new trips in the Saturday evening peak hour. The Project would add fewer than 150 trips in either direction during the weekday morning and afternoon peak hours. Therefore, no CMP impact would occur and no additional analysis of freeway segments is required per the CMP criteria.

(b) CMP Arterial Monitoring Stations

The CMP arterial monitoring stations closest to the Project Site are located at intersections of Santa Monica Boulevard & Highland Avenue and Cahuenga Boulevard & Lankershim Boulevard. Based on the Project trip generation and trip distribution patterns, the Project is estimated to add fewer than five trips to each of the arterial monitoring stations during the morning and afternoon peak hours. Therefore, the Project would not add more than 50 vehicle trips during the morning and afternoon peak hours at CMP arterial monitoring stations. Therefore, the Project's CMP arterial impacts are considered to be less than significant, and no further analysis is required.

(c) CMP Transit Analysis

(i) Construction

Project construction would not require the relocation or removal of the existing Metro transit stop adjacent to the Project Site or other transit stops in the vicinity of the Project Site. As such, Project development would not result in significant impacts on transit access.

(ii) Operation

Based on Metro's CMP methodology for estimating transit trips, the Project would generate an estimated increase in transit riders of approximately three net new transit trips in the weekday morning peak hour and two net new transit trips in the weekday afternoon peak hour. The study area is served by numerous established transit routes, including the Metro Red Line, two Metro bus lines, and one LADOT bus line. Distribution of the Project transit trips to the transit routes available in the area would result in less than one new transit user for each transit line during the peak hours. Consequently, the total available capacity of the transit lines within the study area during the morning and afternoon peak hours is anticipated to more than accommodate the limited net additional trips during the morning and afternoon peak periods. Therefore, Project impacts on existing or future transit services in the study area would be less than significant.

(3) Access and Circulation

(a) Emergency Access

(i) Construction

Construction activities for the Project would be concentrated within the Project Site with limited off-site activities for implementation of any necessary utility improvements. As outlined in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls, including provisions to prohibit construction equipment or material deliveries within the public right-of-way and the use of flag persons to improve traffic flow. Implementation of such provisions would ensure adequate emergency access to residences adjacent to the Project Site. In addition, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, access to the Project Site would continue to be available during construction of the Project. Thus, any potential emergency access impacts from Project-related construction would be less than significant.

(ii) Operation

Upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. In addition, the Project would incorporate specific emergency access recommendations provided by the County Fire Department and the City of Los Angeles Fire Department as set forth in Project Design Feature J.1-2 included in Section IV.J.1, Public Services—Fire Protection, of this Draft EIR. Furthermore, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Notwithstanding, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and the City of Los Angeles Fire Department. Therefore, the Project would not result in inadequate emergency access and impacts would be less than significant.

(b) Bicycle and Pedestrian Access

(i) Construction

Construction of the Project would primarily be contained within the boundaries of the Project Site and would not affect the adjacent street system. In addition, as outlined in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls and address any temporary lane or sidewalk closures, if necessary. Thus, any potential access impacts from Project-related construction would be less than significant.

(ii) Operation

Existing pedestrian facilities would remain with implementation of the Project. As such, pedestrian access to the Project Site would continue to be available from the sidewalks currently provided along Cahuenga Boulevard East. In addition, as part of the Project, on-site pedestrian circulation would be improved by accommodating parking within two new parking structures and providing designated pedestrian pathways to and from the parking structures and the on-site uses, thereby eliminating the pedestrian-vehicular conflicts associated with a stacked parking configuration. With the implementation of the Transit Center and modifications to the driveways described above, the Project would also improve access and circulation for vehicles and shuttles.

Bicycle lanes in the study area currently exist on North Cahuenga Boulevard between Odin Avenue and Yucca Street. In addition, there are two streets designated as bicycle routes: Odin Avenue between Highland Avenue and North Cahuenga Boulevard and Wilcox Avenue south of North Cahuenga Boulevard. As these facilities do not cross the access locations to the Project Site, the Project would not affect existing designated bicycle lanes and routes in the study area. Notwithstanding, the existing sidewalks, access driveways, and lane configurations would be maintained with the Project. In addition, the Project would include bicycle amenities (e.g., bicycle parking and bicycle-friendly amenities) located throughout the Project Site.

In summary, the Project would not decrease the performance or safety of the existing circulation system and no significant impacts with regard to pedestrian and bicycle facilities are expected to result due to the design or placement of Project access points.

(4) Parking

(a) Construction

During construction of the Project, parking for employees and construction workers would be provided on-site. In addition, the Construction Management Plan outlined in Project Design Feature K-1, would address and manage on-site parking for employees and construction workers within the Project Site. Therefore, Project construction would not result in a significant impact with regard to the availability of parking.

(b) Operation

An assessment of parking demand was conducted for several potential scenarios, including on a non-event day and during event days with varying attendance levels. The peak parking demand for the Project during the scenarios analyzed was estimated based on a combination of the Project's unique operational characteristics, including attendance levels, anticipated visitor arrival and departure patterns, empirical data from existing operations, industry-wide parking demand rates, average vehicle ridership rates, mode split (e.g., arriving by transit, walk, bicycle, etc.), internal capture (e.g., between the restaurant and the theatre uses), and employee data. As part of the Project, parking is proposed within two new parking structures, which are proposed to provide a total of 500 parking spaces (250 parking spaces in each structure). Parking within the parking structures could be expanded by approximately 75 spaces with the use of attendant assisted parking for a total of 575 parking spaces provided on-site. Additional parking at the Universal City/Studio City Metro Red Line Station would also continue to be available to accommodate the parking needs of the Project. Further, as outlined in Project Design Feature K-3, the Project would include implementation of a Parking and Traffic Management Plan to address the varying parking needs of the Project. The peak parking

demands for the different operation conditions would be accommodated based on the number of parking spaces to be provided and with implementation of the strategies set forth in the Parking and Traffic Management Plan, including a combination of existing on-site parking facilities, operational measures to increase parking supply such as attendant-assisted parking, employee parking management, and continued use of the parking spaces and shuttle from the Universal City/Studio City Metro Red Line Station for employees and patrons. Therefore, a sufficient number of parking spaces would be available to serve the estimated peak parking demand during a non-event day and during the analyzed event day scenarios, and Project impacts with regard to parking would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

(5) Summary of Impact Analysis

As provided by the analysis presented above, the Project would not result in significant impacts with regard to the local or regional transportation system, including intersections, highways, transit, and pedestrian and bicycle facilities. As such, the Project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, or conflict with an applicable congestion management program. In addition, the Project would not result in inadequate emergency access. Therefore, as demonstrated in the analysis above, impacts with regard to these topics would be less than significant.

(6) Consistency with Regulatory Framework

As analyzed above, the Project would not result in significant impacts to public transit, bicycle, or pedestrian facilities and therefore would not decrease the performance or safety of such facilities. In addition, with implementation of the Project, the County would continue to promote several modes of transportation including walking, biking, or public transportation. Therefore, the Project would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities and such impacts would be less than significant.

b. Cumulative Impacts

(1) Traffic

(a) Construction

The related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, are not located in close proximity to the Project Site and may or may not be developed within the same construction schedule as the Project. In addition, as all of the related projects are located within the jurisdiction of LADOT, per standard City practice, the construction of large development projects would occur in accordance with project-specific construction management plans, as is the case with the Project. As the construction management plans are reviewed and approved by LADOT, it is anticipated that through this process, LADOT would coordinate construction activities among the related projects that would have the potential to result in cumulative intersection impacts. In addition, as analyzed above, the Project would not result in significant impacts at any of the intersections within the study area during construction. Further, implementation of the Construction Management Plan, as outlined in Project Design Feature K-1, would manage construction-related traffic in the study area. Thus, given the distance of the Project Site to the related Projects and the construction management plans that would be in place for the Project and the related projects, the Project's contribution to cumulative construction-related traffic impacts would not be cumulatively considerable and cumulative impacts would be less than significant.

(b) Operation

Implementation of the Project in conjunction with the related projects identified in Section III, Environmental Setting, of this Draft EIR, and projected regional growth would increase the amount of traffic in the study area. The analysis of Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS. This analysis demonstrates that four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. The Project would not contribute to any significant impacts to these intersections and the Project's contribution to cumulative impacts would not be cumulatively considerable. As such, cumulative impacts would be less than significant.

(2) Congestion Management Program

The Project would not add more than 50 vehicle trips during the A.M. and P.M. peak hours at the CMP arterial monitoring stations nearest to the Project Site. In addition, the Project would add less than 150 trips along the nearest freeway segment serving the

Project Site in either direction during either peak hour. Further, the Project would not result in significant impacts to public transit. Thus, no CMP impact would occur under the Project and, as a result, the Project's contribution to cumulative impacts would not be cumulatively considerable. Thus, the Project's cumulative impacts would be less than significant.

(3) Access and Circulation

(a) Emergency Access

As described above, the analysis of the Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS in the study area. This analysis concluded that the Project would result in less-than-significant impacts to study intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Therefore, the Project's cumulative impacts would not be cumulative considerable. In addition, as with the Project, it is anticipated that related projects would continue to consult with the applicable Police and Fire departments regarding emergency access requirements and implement specific emergency access requirements. Additionally, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Therefore, the Project's cumulative impacts to emergency would be less than significant.

(b) Bicycle and Pedestrian Access

As provided above, Project impacts to bicycle and pedestrian access would be less than significant. Based on the proximity of the Project Site to the related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, development of the Project in conjunction with the related projects would not be expected to impact any existing shared bicycle and pedestrian facilities. Additionally, as with the Project, the applicants of the related projects would be required to design and construct their projects in conformance with applicable standards regarding sight distance, sidewalks, crosswalks, and pedestrian movement controls. Therefore, cumulative impacts would be less than significant.

(4) Parking

The parking demand associated with the Project would not contribute to the cumulative demand for parking in the vicinity of the Project Site as a result of development of the Project and related projects. Specifically, the related projects are sufficiently separated from the Project Site such that they would not share parking supplies. Therefore, cumulative parking impacts would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site

and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

c. Project Design Features

Project Design Feature K-1: Construction Management Plan

The Ford Theatre Foundation shall prepare a construction traffic management plan, including haul routes and staging plans, as necessary and satisfactory to the County. The construction traffic management plan would be based on the nature and timing of the specific construction activities and shall include the following elements as appropriate:

- Prohibition of construction worker parking and other construction-related vehicles on adjacent residential streets.
- Provisions to prohibit construction equipment or material deliveries within the public right-of-way.
- Provisions for temporary traffic control during all construction activities adjacent to public rights-of-way to improve traffic flow on public roadways (e.g., flag persons).
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets.
- Provisions of safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers, as appropriate.
- Provisions to accommodate the equipment storage and truck staging on-site.
- Scheduling of construction-related deliveries, haul trips, etc., so as to occur outside of the commuter peak hours to the extent feasible.
- Obtaining the required permits for truck haul routes from the City prior to issuance of any permit for the Project.

Project Design Feature K-2: The Ford Theatre's shall stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 p.m. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons.

Project Design Feature K-3: Parking and Traffic Management Plan

The Ford Theatre Foundation shall prepare a Parking and Traffic Management Plan including parking and traffic management measures and transportation demand management strategies. The Parking and Traffic Management Plan could include, but not be limited to, the following:

- Provide directions and location maps with the parking options available for visitors in web postings, real time mobile applications, marketing, notification and media materials, etc.
- Post directions and maps showing truck routes for deliveries, construction vehicles, and other trucks.
- Encourage alternate travel options (transit and shuttle service) for visitors in event-related marketing/media information.
- Manage the use of all parking spaces in the on-site parking garages to maximize parking efficiency and avoid underutilization of parking spaces.
- Identify locations for bus drop-off/pick-up and staging.
- Provide valet assist parking in at least one parking garage to maximize parking circulation and capacity where possible during large events.
- Require employees and staff to park within designated areas.
- Implement Transportation Demand Management strategies for employees to reduce trips during the congested periods and travel via other modes besides driving alone (e.g., carpooling, flexible or alternative work schedules, transit incentives, parking incentives for carpools and vanpools, etc.)
- Provide bicycle amenities (bicycle racks, lockers, etc.).

d. Mitigation Measures

The Project would result in less than significant impacts to traffic, access, and parking. No mitigation measures would be required.

e. Conclusion

(1) Traffic

The Project would not result in significant impacts during Project construction or operation along the analyzed intersections under Existing with Project Conditions or Future (Year 2020) with Project Conditions.

(2) Congestion Management Plan

No significant impacts to CMP arterial monitoring stations or freeway segments would occur. In addition, the Project's transit impacts would be less than significant.

(3) Access and Circulation

Project access impacts as well as impacts related to pedestrian/bicycle facilities would be less than significant.

(4) Parking

Project impacts related to parking would be less than significant.

L.1. Utilities and Service Systems—Water

a. Analysis of Project Impacts

(1) Construction

The amount of water used during construction would vary depending on the conditions of soils, weather, size of the construction site, and site-specific operations. It is estimated that a total of approximately 650,000 to 800,000 gallons of water could be used throughout construction of the Project. It is noted however that this increase in water demand associated with Project construction would be temporary in nature and would occur intermittently throughout construction as needed. In addition, as concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years.

The Project would require construction of new, on-site water distribution lines to serve the proposed uses. Construction impacts associated with the installation of water distribution lines are expected to be confined to trenching in order to place the lines below surface. As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. In addition, prior to ground disturbance, Project contractors would coordinate with LADWP to identify the locations and depth of all lines. LADWP would also be notified in advance of proposed ground disturbance activities to avoid water lines and disruption of water service.

Based on the above, sufficient water supplies would be available to accommodate Project construction activities and, while the Project would require the construction of upgraded infrastructure facilities, the construction of such infrastructure improvements would not cause significant environmental effects. As such, construction-related impacts to water supply and infrastructure would be less than significant.

(2) Operation

(a) Water Supply

It is estimated that the Project would have an average daily domestic water demand of approximately 17,470 gallons per day (gpd). When accounting for the existing total Project Site water demand of approximately 6,529 gpd, the Project would result in a net increase in average daily water demand of approximately 10,941 gpd. However, as noted in the Water System and Supply Study included in Appendix XX of this Draft EIR, since development of the water demand rates from the California Plumbing Code used to calculate the Project's water demand, most water fixtures, including those that would be implemented as part of the Project, now have reduced flow rates by 50 percent. Therefore, when accounting for typical flow rates of existing water fixtures, the water demand of the Project is estimated to be approximately 5,471 gpd or approximately 6.13 acre-feet per year (assuming constant water use throughout the year). It is noted that the Project's estimated water demand is likely conservative as it does not account for additional water conservation features that would be implemented by the Project, including those required by the County as part of the County's Green Building Program. These water saving features, which could include updated landscaping and modern irrigation, would reduce the Project's net increase in water demand accordingly.

As concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years (i.e., 2020). The Project's estimated net increase in water demand of approximately 6.13 acre-feet per year would comprise approximately 0.0009 percent of the water demand for the City in 2020 during an average year, single-dry year, and multiple-dry year period. Therefore, the Project would be well within the available and projected water supplies for normal, single-dry, and multiple-dry years through the year 2035 and, as such, LADWP would be able to meet the water demand for the Project as well as existing and planned water demands of its future service area. Therefore, the Project's operation-related impacts on water supply would be less than significant.

(b) Water Infrastructure

Water service to the Project Site would continue to be supplied by LADWP for domestic and fire protection uses. While domestic water demand is typically the main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity.

With implementation of an approved automatic fire sprinkler system within all of the buildings proposed, the required fire flow would be 4,000 gpm at a pressure of 20 psi. Based on pressure flow reports obtained from LADWP, the existing 8-inch LADWP water main in Cahuenga Boulevard East provides a flow of approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East. The Project would also include the installation of four private fire hydrants and provide booster pumps for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project would also provide new, on-site water distribution lines to serve the proposed uses.

With implementation of the proposed water infrastructure improvements described above, the Project would not exceed the available capacity within the distribution infrastructure that would serve the Project Site. Therefore, the Project would not result in operation-related impacts to water infrastructure and impacts would be less than significant.

b. Cumulative Impacts

(1) Water Supply

The 2010 Urban Water Management Plan prepared by LADWP accounts for existing development within the City, as well as projected growth through the year 2035 based on demographic growth projections in the Southern California Association of Governments' 2008 Regional Transportation Plan. Additionally, under the provisions of Senate Bill 610, LADWP is required to prepare a comprehensive water supply assessment for every new development "project" (as defined by Section 10912 of the Water Code) within its service area that reaches certain thresholds. The types of projects that are subject to the requirements of SB 610 tend to be larger projects that may or may not have been included within the growth projections of the 2010 Urban Water Management Plan. The water supply assessment for such projects would evaluate the quality and reliability of existing and projected water supplies, as well as alternative sources of water supply and measures

to secure alternative sources if needed. Continued efforts by LADWP to secure the reliability of water supplies in the future, combined with project-specific requirements to conduct analyses to ensure the availability of sufficient water supply to meet demand are expected to continue through 2020 (the Project's buildout year) and beyond. Based on LADWP's 2010 Urban Water Management Plan water demand projections through 2035 and the service area reliability assessment conducted by the LADWP, LADWP determined that it would be able to reliably provide water to its customers through the year 2035. As such, LADWP would be able to meet the water demand for the Project and the related projects.

Compliance of the Project with regulatory requirements that promote water conservation such as the County's Green Building Program, as well as Assembly Bill 32 which is discussed in detail in Section IV.C, Greenhouse Gas Emissions, of this Draft EIR, would also assist in assuring that adequate water supply is available on a cumulative basis.

Based on the above, it is anticipated that LADWP would be able to supply the demands of the Project, the related projects, and future growth through 2020 and beyond. Therefore, cumulative impacts on water supply would be less than significant

(2) Water Infrastructure

The geographic context for the cumulative impact analysis on water infrastructure is the vicinity of the Project Site. Development of the Project and future new development in the vicinity of the Project Site would cumulatively increase demands on the existing water infrastructure system. However, new development projects would be subject to LADWP review (or applicable jurisdiction) to assure that the existing public utility facilities would be adequate to meet the domestic and fire water demands of each project, and individual projects would be subject to LADWP requirements regarding infrastructure improvements needed to meet respective water demands, flow and pressure requirements, etc. Furthermore, LADWP, Los Angeles Department of Public Works, and the Los Angeles Fire Department would conduct ongoing evaluations to ensure facilities are adequate. Therefore, cumulative impacts on the water infrastructure system would be less than significant.

c. Project Design Features

Project Design Feature L.1-1: The Project shall install new on-site water connections, where necessary, to distribute water within the Project Site.

Project Design Feature L.1-2: The Project shall implement water conservation features, including, but not limited to: high-efficiency toilets and

urinals, auto lavatory faucets, use of “tankless” or “on demand” water heaters, drought-tolerant planting, minimal irrigation system, use of permeable surfaces, weather-based irrigation controller with rain shutoff, use of a separate water meter (or sub meter), flow sensor, and master valve shutoff for irrigated landscape areas.

d. Mitigation Measures

As the Project would have a less than significant impact on water supply and water infrastructure during construction and operation, mitigation measures are not required.

e. Conclusion

Project-level and cumulative impacts on water supply and water infrastructure would be less than significant.

L.2. Utilities and Service Systems—Energy and Energy Conservation

a. Analysis of Project Impacts

(1) Energy Demand

(a) Construction

(i) Electricity

Electricity consumption during Project construction would vary throughout Project construction based on the construction activity (i.e., grading, building construction, etc.). However, the electricity consumption that would occur due to Project construction activities would be offset by the reduction in electricity consumption resulting from the demolition of existing uses and would be temporary in nature.

Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles that would be installed along Cahuenga Boulevard East. In addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. Overall, demolition and construction activities would require limited electricity consumption and would not be expected to have

any adverse impact on available electricity supplies and infrastructure. Therefore, construction-related impacts to electricity supply and infrastructure would be less than significant.

(ii) Natural Gas

Construction of the Project, including new buildings and facilities, typically would not involve the consumption of natural gas. Thus, there would be no demand generated by construction. The Project would, however, involve installation of new natural gas connections to serve the Project Site. Since the Project is located in an area already served by existing natural gas infrastructure, the Project would likely not require extensive infrastructure improvements to serve the Project Site. Construction impacts associated with the installation of natural gas connections are expected to be confined to trenching in order to place the lines below surface. As previously discussed, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. In addition, prior to ground disturbance, Project contractors would notify and coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service. Therefore, construction-related impacts to natural gas supply and infrastructure would be less than significant.

(b) Operation

(i) Electricity

Project operations would increase the existing demand for electricity. Based on the electricity demand estimates, the Project's peak electricity demand would be approximately 2,105 KW of electricity per year. When accounting for the existing electricity usage of the former motel building, which would be removed as part of the Project, the Project's net peak electricity demand would be reduced to 2,065 KW per year. The estimated electrical consumption is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features. LADWP forecasts that in the 2020-2021 fiscal year, the annual electricity sold within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW.[1] The Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Therefore, it is anticipated that LADWP's existing and planned electricity capacity and electricity supplies would be sufficient to support the Project's demand. In addition, LADWP has indicated that electric service to meet the Project is available and would be provided in accordance with LADWP's Rules and Regulations. While the availability of electricity is dependent upon adequate generating

capacity and fuel supplies, the estimated power requirement for the Project is part of the total load growth forecast for the City and has been taken into account in the planned growth of the City's power system. Thus, operational impacts associated with the Project's consumption of electricity would be less than significant.

(ii) Natural Gas

Operation of the Project would result in an increase in the consumption of natural gas for the heating of spaces and water, and cooking at the proposed restaurant. Based on the natural gas demand estimates, the Project's natural gas demand is estimated to be approximately 8,500 cubic feet per hour. This estimated natural gas demand is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features. In addition, as existing natural gas usage associated with the former motel building is unknown, the Project's estimated natural gas demand does not account for existing natural gas usage within the former motel building, which would be removed as part of the Project.

Based on the Project's estimated yearly natural gas consumption of 496,400 Therms per year, the Project would account for approximately 0.007 percent of the forecast for the 2020 natural gas consumption throughout SoCalGas' planning area. Given the limited percentage of total demand represented by the Project, SoCalGas' planned demand forecasts likely account for Project development. In addition, SoCalGas has indicated that natural gas facilities are available in the area of the Project Site. Further, the Project would incorporate compliance measures to address applicable energy regulations and requirements. As such, operational impacts associated with the consumption of natural gas would be less than significant.

(2) Energy Conservation

Green building design and construction practices would be implemented as part of the Project in compliance with the County's Green Building Ordinance. Accordingly, the Project would incorporate the County's Green Building Standards, including compliance with the California Energy Code. Design features that could be implemented would include, but not be limited to, light colored or "cool" roofs, efficient lighting and lighting control systems, energy-efficient heating and cooling systems and controls. In addition, the Project would incorporate a variety of water conservation features that would also promote energy conservation. Further, as part of the Project, the County would continue to promote the use of alternative modes of transportation by providing shuttles to and from the Universal City/Studio City Metro Red Line Station, thereby reducing energy usage associated with additional Project vehicles. Overall, the Project would be designed and

constructed in accordance with state and local green building standards that would serve to reduce the energy demand of the Project. Additionally, based on the above, the Project's energy demand would be within the existing and planned electricity and natural gas capacities of LADWP and SoCalGas, respectively. Therefore, development of the Project would not cause wasteful, inefficient, and unnecessary consumption of energy and would be consistent with the intent of Appendix F of the CEQA Guidelines.

b. Cumulative Impacts

(1) Electricity

The Project in conjunction with forecasted 2020 growth in LADWP's service area would increase electricity consumption and thus, would cumulatively increase the need for additional electricity supplies and infrastructure capacity. LADWP forecasts that in the 2020-2021 fiscal year, electricity consumption within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW. Future cumulative growth expected during this period within LADWP's service area is accounted for in this forecast. As discussed above, Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Based on this small percentage, the Project's contribution to the cumulative electricity demand would not be substantial. In addition, based on the types of uses proposed by the related projects, it is anticipated that the related projects would similarly comprise a limited percentage of the forecasted total electricity demand within LADWP's service area in 2020. Further, as future electrical demand estimates factor in cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, within LADWP's service area. Although the Project, related projects, and other future development would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for LADWP's service area. Additionally, like the Project, related projects would be expected to incorporate energy conservation features, comply with applicable regulations including the City's and County's Green Building Ordinance, and incorporate mitigation measures, as necessary. Accordingly, the Project's contribution to cumulative impacts related to electricity consumption would be less than significant.

Electricity infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by LADWP are ongoing. It is expected that LADWP would continue to expand delivery capacity as needed to meet demand increases within its service area. Development projects, inclusive of the related projects, within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as necessary. As such, cumulative impacts with respect to electricity infrastructure would be less than significant.

(2) Natural Gas

Buildout of the Project, related projects, and other future development projects in SoCalGas' service area is expected to increase natural gas consumption and thus cumulatively increase the need for additional natural gas supplies and infrastructure capacity. The California Energy Commission estimates natural gas consumption within SoCalGas' planning area will increase to 7,263 million Therms in 2020 (Project buildout year). Future 2020 cumulative growth within SoCalGas' service area is accounted for in this forecast. As previously indicated, the Project's annual natural gas usage would represent approximately 0.007 percent of the forecasted total consumption in 2020. It is anticipated that given the type of developments proposed by the related projects, the related projects would similarly comprise a limited percentage of the forecasted total consumption within SoCalGas' service area in 2020. Further, as future natural gas demand estimates factor in cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, in SoCalGas' service area. Although related projects would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for SoCalGas' service area. Furthermore, like the Project, the related projects and any other future development would be expected to incorporate energy conservation features, comply with applicable regulations including the County's Green Building Ordinance, and incorporate mitigation measures, as necessary, to address natural gas demands. Accordingly, the Project's contribution to cumulative impacts related to natural gas would be less than significant.

Natural gas infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SoCalGas occur as needed. It is expected that SoCalGas' would continue to expand delivery capacity if necessary to meet demand increases within its service area. Development projects within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as appropriate. As such, cumulative impacts with respect to natural gas infrastructure would be less than significant.

c. Project Design Features

No specific project design features beyond the project improvements discussed in Section II, Project Description, of this Draft EIR are proposed with regard to energy and energy conservation.

d. Mitigation Measures

As discussed above, the Project's impacts on energy and energy conservation would be less than significant. As such, no mitigation measures would be required.

e. Conclusion

As indicated above, the Project's impacts on energy and energy conservation would be less than significant.

II. Project Description

II. Project Description

1. Introduction

The County of Los Angeles proposes improvements to the John Anson Ford Theatres (the Project) located at 2580 Cahuenga Boulevard East in the Hollywood Community of the City of Los Angeles (the Project Site). The Ford Theatres, one of the oldest performing arts venues in Los Angeles, are owned by the County of Los Angeles and operated through a three-way partnership between the Los Angeles County Department of Parks and Recreation, the Los Angeles County Arts Commission, and the Ford Theatre Foundation.

The Project includes the rehabilitation of portions of the existing 1,196-seat historic Amphitheatre and the development of approximately 59,230 square feet of new buildings and approximately 48,750 square feet of outdoor plaza areas, all within the current boundaries of the Ford Theatres property and primarily within the areas of the Project Site already developed. These improvements, which would be developed in several phases, would include a 299-seat theatre, a multi-purpose flex space, a restaurant, office spaces, enhanced parking facilities, support facilities, and visitor amenities. The Project would also provide for improved exterior landscape areas and enhanced vehicle and pedestrian circulation. An approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the proposed parking facilities is also proposed. These improvements would enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational destination open daily for a wide variety of users.

2. Project Location

The Project Site comprises an approximately 32-acre County of Los Angeles regional park within the Hollywood Hills located approximately six miles northwest of downtown Los Angeles and approximately 12 miles east of the Pacific Ocean. As shown in Figure II-1 on page II-2, primary regional access is provided by US 101 (Hollywood Freeway), which runs north-south west of the Project Site. The major arterials providing regional and sub-regional access to the Project Site vicinity include Cahuenga Boulevard, Highland Avenue, and Franklin Avenue.

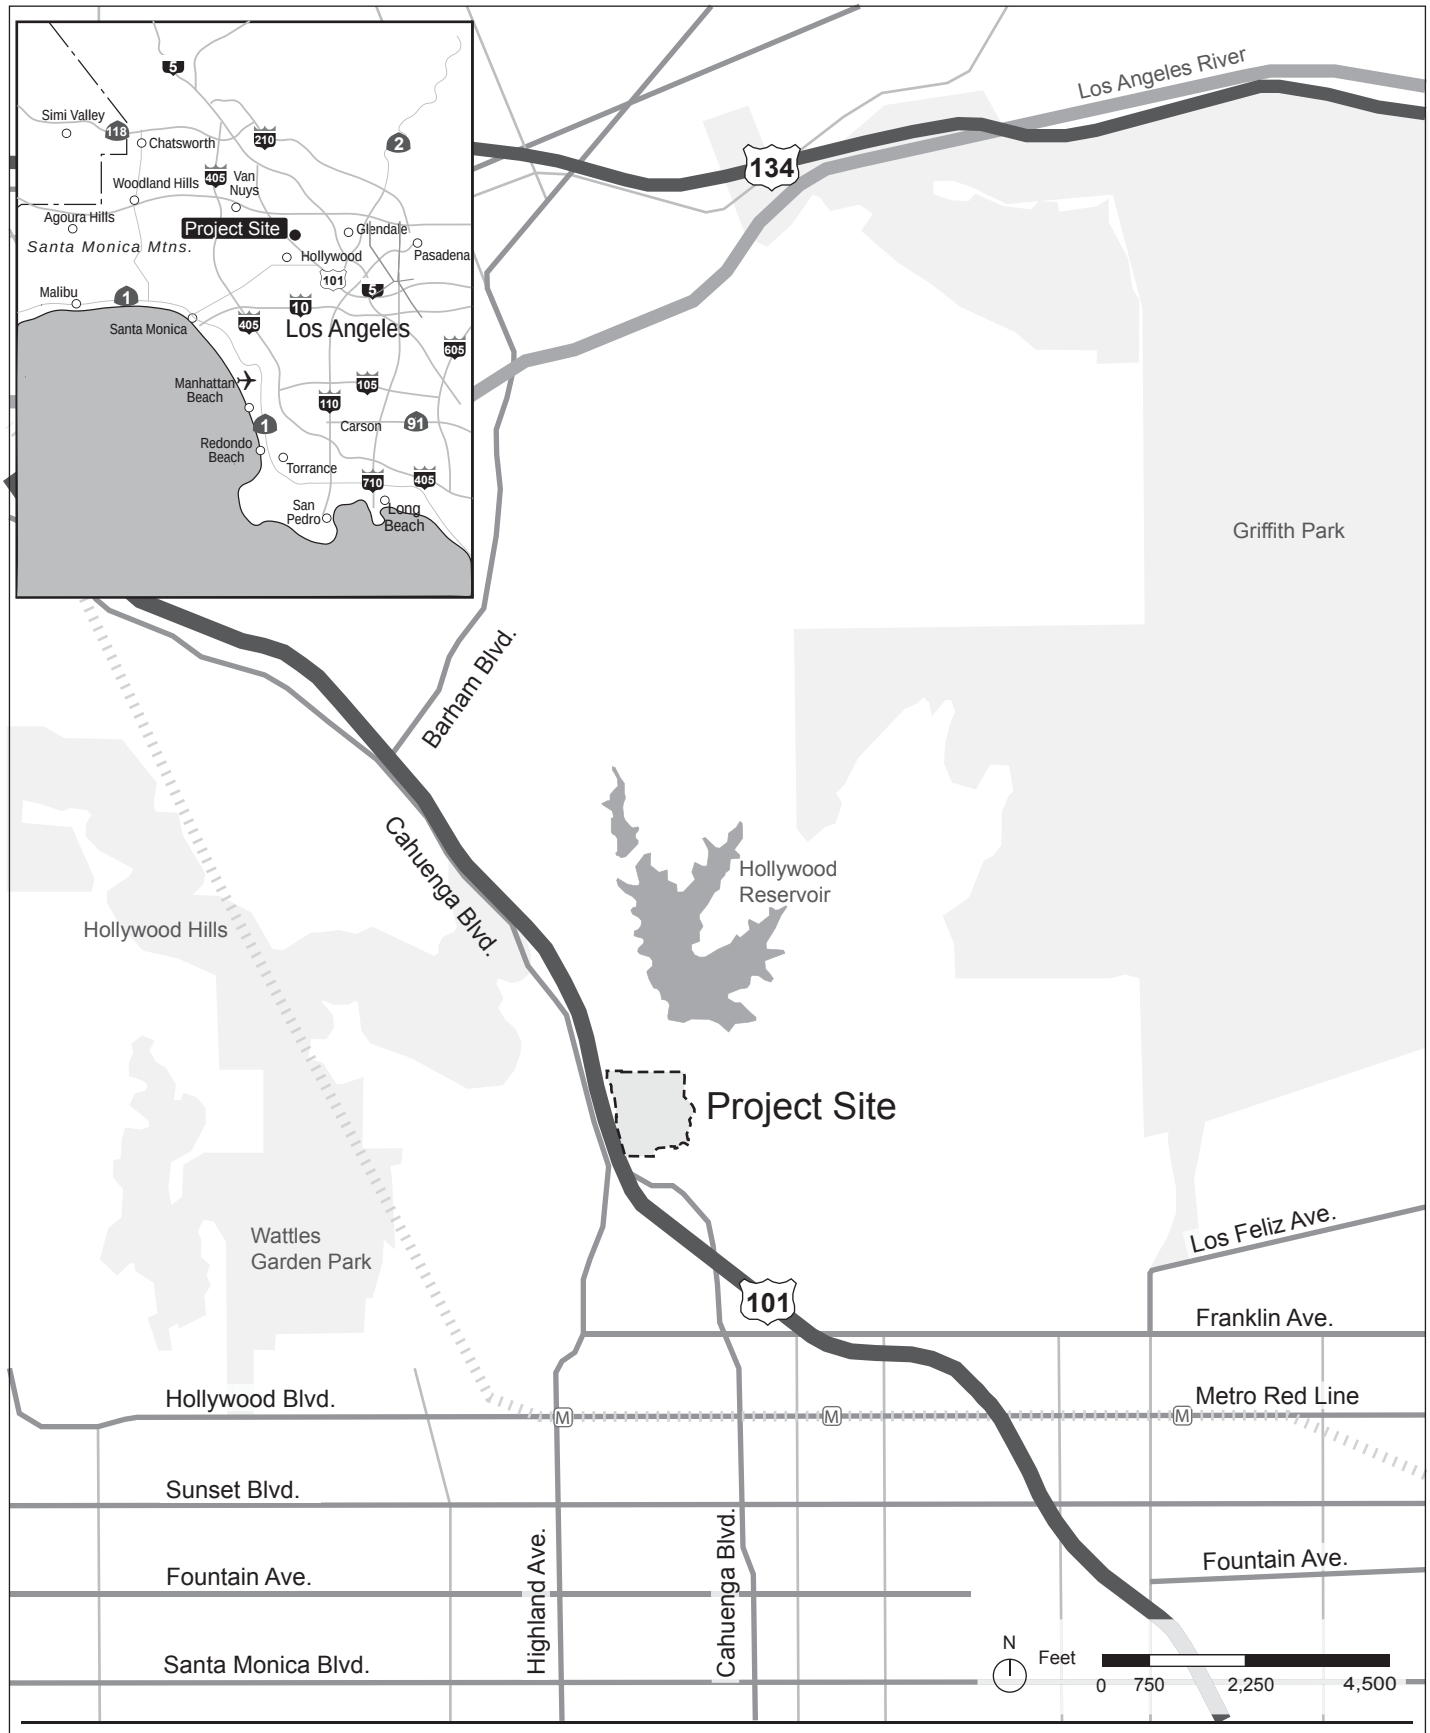

Figure II-1
Regional Location Map

Source: Google Earth, 2013.

3. Background and Existing Project Site Conditions

a. Background

The site of the existing Amphitheatre was originally owned by Christine Wetherhill Stevenson and Chauncey D. Clark who together provided for the construction of an outdoor amphitheatre to host Stevenson's *The Pilgrimage Play*. This play was performed in a wooden amphitheatre from 1920 to 1929, until the original structure was damaged by a brush fire in October 1929. The existing Amphitheatre, built on the same site as the original amphitheatre, was constructed of board-formed concrete, and was designed in the style of ancient Judaic architecture to resemble the gates of Jerusalem. The existing Amphitheatre opened in 1931 and in 1941 the existing Amphitheatre and the land surrounding it was deeded to the County of Los Angeles. *The Pilgrimage Play* was performed at the Amphitheatre from 1931 until 1964, when a lawsuit forced its closure due to the play's religious nature. In 1976, the existing Amphitheatre, previously known as the Pilgrimage Theatre, was renamed the John Anson Ford Theatre in honor of the late Los Angeles County Supervisor's significant support of the arts. The Amphitheatre was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register of Historic Places.

Today, the Los Angeles County Arts Commission operates the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. The Ford Theatre Foundation, in partnership with the Los Angeles County Arts Commission and the Department of Parks and Recreation, supports programs that nurture artists, arts organizations and community, providing a gateway for the people of greater Los Angeles to discover and appreciate cultures of their region and the world. The Ford Theatres programming builds capacity of the arts organizations with which it partners, not only to produce work for the Amphitheatre stage, but also to strengthen the regional arts ecology. The Arts Commission provides technical assistance and marketing support to artists and organizations participating in its flagship Partnership Program and returns approximately 75 percent to 95 percent of earned ticket revenue to partner artists. Through this program the County has created opportunities for nearly 200 arts organizations in Los Angeles County to expand their audiences, push their creative boundaries, embrace artistic innovations, and raise their visibility and fundraising capacities. However, site challenges currently restrict the number of visitors and the kinds of programming that can be accommodated at the Ford Theatres.

b. Existing Project Site Conditions

As shown in the aerial photograph provided in Figure II-2 on page II-4, the approximately 32-acre Project Site currently includes the open-air 1,196-seat Amphitheatre

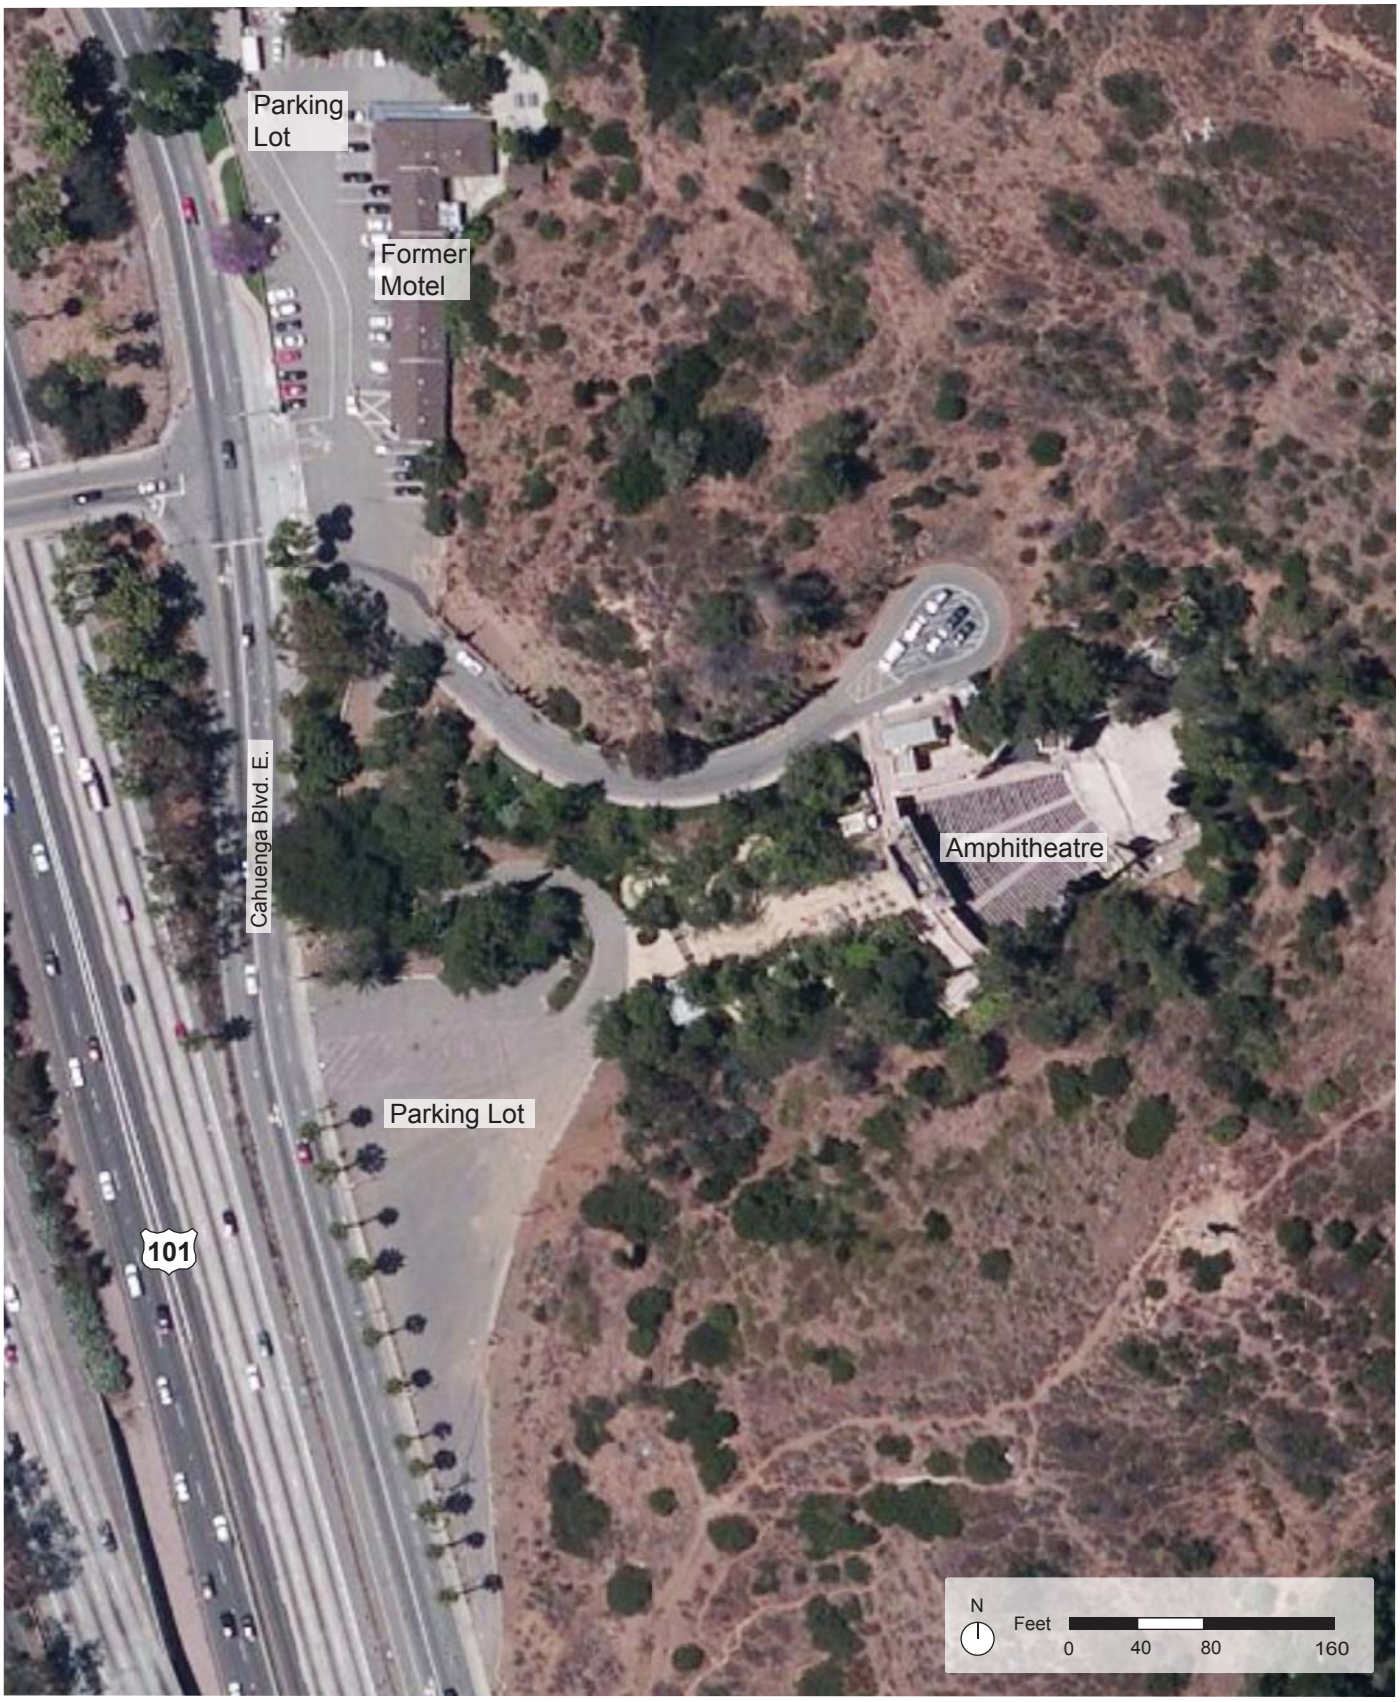

Figure II-2
Existing Ford Facilties

Source: Google Earth, 2013.

with support spaces (i.e., dressing rooms, performer restrooms, green room) below; an 860-square-foot projection booth and control room located above the Amphitheatre seating; an indoor venue located below the Amphitheatre providing approximately 87 seats referred to as [Inside] the Ford; a two-story, approximately 320-square-foot concessions building; a 365-square-foot box office; a plaza and picnic area referred to as Edison Plaza; surface parking areas; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission, and the Los Angeles Philharmonic. The Project Site also includes one cell tower and associated structures along the northwest portion of the Project Site and an additional cell tower along the northwestern property boundary. Other facility support spaces, such as storage and maintenance areas and restrooms, are also located throughout the Project Site. Landscaping is provided along driveways, surface parking areas, and pedestrian pathways. Additionally, while there are no designated hiking trails within the Project Site, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails. As shown further below in Table II-1 on page II-15, the existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. Overall, approximately 3.5 acres of the 32-acre Project Site comprises developed area, including the existing structures described above and asphalt-paved surface parking areas. The remaining areas (approximately 28.5 acres) are comprised of undeveloped open space.

As illustrated in Figure II-3 on II-6, the topography of the Project Site is widely varied from moderately sloping surface parking areas along the western portion of the Project Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions of the Project Site. Based on the varying topography of the Project Site, the buildings and structures within the Project Site similarly feature varying heights ranging from approximately 15 feet from adjacent grade (approximately 547 feet above sea level) to approximately 62 feet from adjacent grade (approximately 574 feet above sea level). The Amphitheatre and associated structures and support spaces are primarily located internal to the Project Site, nestled within the surrounding hillsides, while the former motel building and surface parking areas front Cahuenga Boulevard East. As such, views of the Project Site along Cahuenga Boulevard and the Hollywood Freeway are limited to the former motel building, surface parking areas, electronic sign identifying the Ford Theatres, perimeter walls and landscaping, and the vegetated hillsides. Views of portions of the main Amphitheatre gate/entrance and the stairway leading to the Amphitheatre as well the wall running along the top of the Amphitheatre and associated signage are available in the background.

Access to the Project Site is available via four driveways along the east side of Cahuenga Boulevard East. The northernmost driveway, located north of the intersection of

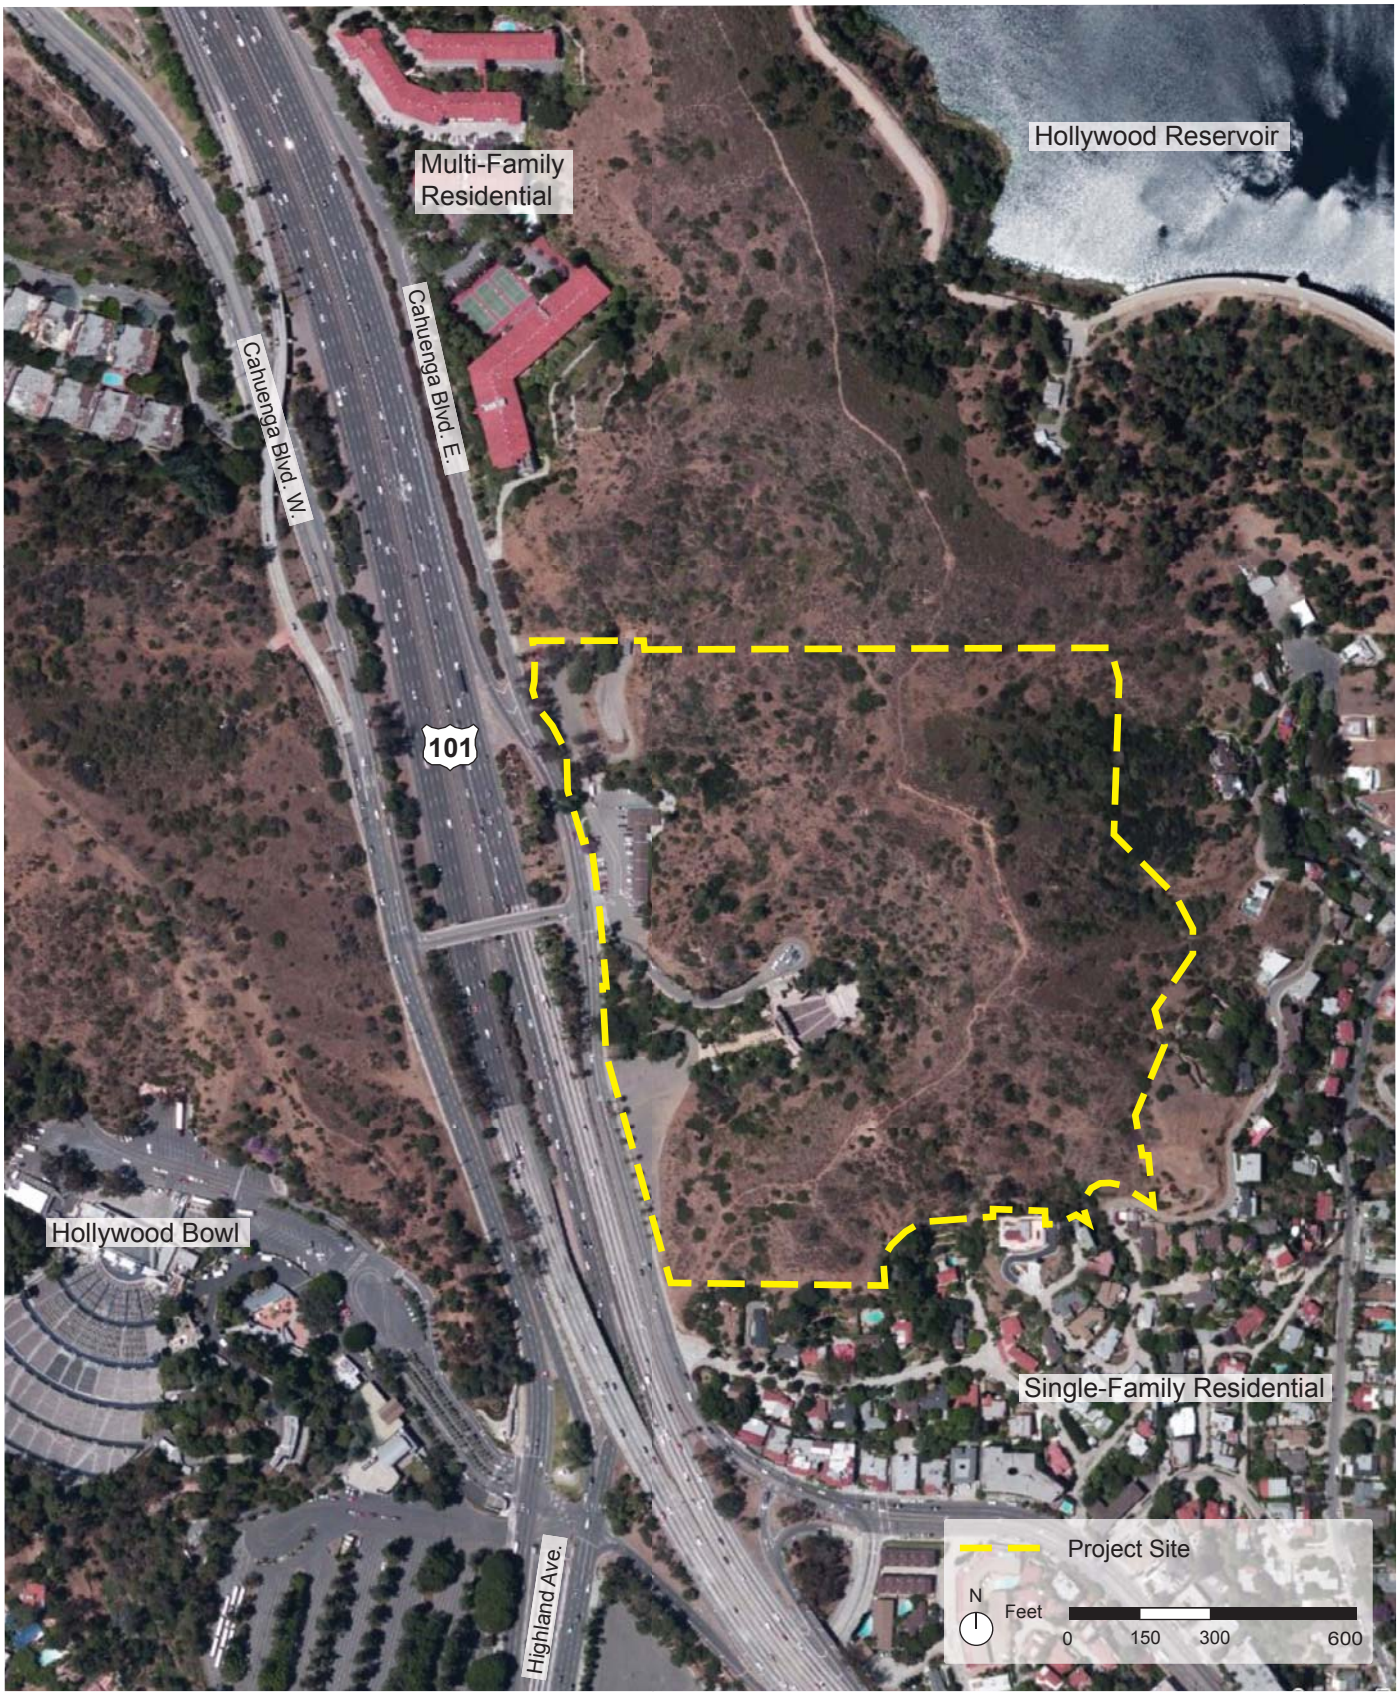

Figure II-3
Aerial Photograph of the Project Site and Surrounding Vicinity

Source: Google Earth, 2013.

Cahuenga Boulevard East and Pilgrimage Bridge, is primarily used for egress at the end of events and is occasionally used for overflow stacked parking. The driveway at Pilgrimage Bridge and Cahuenga Boulevard East provides primary access to the Project Site. During events, this driveway is used for patrons entering by passenger vehicle and for shuttle access from the Universal City/Studio City Metro Red Line Station. During non-event times, this driveway serves as the main ingress and egress point for employees and vendors. The southern driveways, located south of the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, are primarily used for egress from the southern surface parking lot at the end of events. Within the Project Site, pedestrian access to the Amphitheatre is available from the main entrance located at the bottom of the entryway adjacent to the box office, and from a secondary entrance located at the Amphitheatre level, adjacent to the circular driveway. During events, the circular driveway at the secondary entrance at the Amphitheatre level serves as the performer entrance to the lower level Amphitheatre support spaces, shuttle and vehicular loading and unloading, and media truck parking. The circular driveway also provides access for trash pickup and fire truck staging. Pedestrian access to the Project Site is available from several locations along Cahuenga Boulevard East, including via the four driveways described, as well as a walkway located in front of the former motel. The Amphitheatre, including the [Inside] the Ford Theatre, Edison Plaza, and the concessions building are currently enclosed within a wrought iron perimeter fence with wrought iron entry and exit gates at the main entrance and secondary entrance.

The Project Site currently provides approximately 350 to 380 stacked parking spaces within three surface parking areas that are comprised of asphalt and dirt areas. Two surface parking lots, referred to herein as the north parking lot and the south parking lot, are located along Cahuenga Boulevard East. A third surface parking lot, providing disabled parking spaces, is located adjacent to the secondary entrance at the Amphitheatre level. During events, parking is also available at the Universal City/Studio City Metro Red Line Station. A shuttle is provided to and from the Ford Theatres during evening events. The Hollywood Bowl also utilizes the existing parking facilities at the Ford Theatres during non-event days or during low-attendance events at the Ford Theatres.

Lighting within the Project Site includes pole lighting within the surface parking and entry areas, exterior building lighting, stage and production lighting, and security lighting. Signage consists of an electronic sign identifying the Ford Theatres along Cahuenga Boulevard East, near one of the southern driveways, and wayfinding signage internal to the Project Site. An illuminated sign identifying the Ford Amphitheatre is also located on the wall running along the top of the Amphitheatre wall, which was installed to attenuate noise from the Hollywood Freeway.

As provided further below in Table II-2 on page II-20, the Ford Theatres currently hosts an average of approximately 184 events throughout the year, including 84 events within the Amphitheatre from May through October and approximately 100 events within the [Inside] the Ford from November through April. An average of approximately 50,640 people attend events within the Amphitheatre during the May through October event season and approximately 4,000 people attend events within the November through April event season for a total event season attendance of approximately 54,640 people. During the event season, the hours of operation for the Ford Theatres are from 8:00 A.M. to 11:00 P.M., Monday through Sunday. Currently, there are approximately 20 County Arts Commission, County Department of Parks and Recreation, and Ford Theatre Foundation employees and up to 140 Los Angeles Philharmonic employees within the Project Site.

As noted above, the Ford Theatres are operated through a three-way partnership between the Los Angeles County Department of Parks and Recreation, the Los Angeles County Arts Commission, and the Ford Theatre Foundation.

c. Approved Amphitheatre Improvements

In September 2013, the County of Los Angeles approved and prepared a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the restoration and rehabilitation of portions of the existing Amphitheatre consistent with the Secretary of Interior Standards for the Treatment of Historic Properties. As described in more detail below, these improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades.

The hillside stabilization improvements will include the installation of compatible stone-clad retaining walls and drainage improvements along the rear of the stage to stabilize the existing slope and reduce runoff from the surrounding hillside. The stage reconstruction will include the removal of the existing two-level concrete Amphitheatre stage structure to allow the installation of an improved stage structure, including the placement of new and upgraded foundations that meet current code requirements; new wood stage flooring and supports; an under stage drainage system; enhanced stage support and ADA-compliant performer spaces; and new ADA-compliant restroom facilities and associated plumbing. Code-required upgrades for fire/life safety and disabled access will also be implemented. Theatrical systems infrastructure improvements include

improvements to the stage pit such as new steps and traps.[1] In addition, new energy-efficient theatrical and audio-visual infrastructure to replace existing antiquated systems, including a lighting/sound proscenium truss and lighting towers, will also be implemented. Other improvements involve the rehabilitation of portions of the stage buildings and towers, including the removal of the exterior paint to provide water-resistant surfaces and to return the structures to their original color, and the installation of new roofing, windows, doors, and interior infrastructure for power, heating, and air conditioning. A new addition at stage left to accommodate an audio rack room and related heating, ventilation, and air conditioning will also be provided.[2] As part of these improvements, approximately 24 trees are anticipated to be removed based on their health, root structure, and impact to the stabilization of the adjacent hillside. Such trees will be replaced with new landscaping, including new trees and shrubs. Where feasible, some of the trees proposed to be removed may be relocated throughout the Project Site.

Implementation of these improvements will provide enhanced theatrical infrastructure and performer amenities and will address long-deferred maintenance and needed repairs, including mitigation of water infiltration and provision of slope stabilization.

4. Surrounding Uses

As shown in the aerial photograph provided in Figure II-3 on page II-6, the area surrounding the Project Site includes a mix of residential uses and open space. Specifically, the Project Site is bounded by 4-story multi-family residential buildings and open space to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The uses north, south, and east of the Project Site are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site.

The Hollywood Bowl, also a County-owned historically significant cultural destination, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.[3]

---

[1] *Since approval of the restoration and rehabilitation Amphitheatre improvements set forth in the Notice of Exemption, the proposed theatrical systems infrastructure improvements have been modified to exclude the proposed traps.*

[2] *Since approval of the Notice of Exemption, the restoration and rehabilitation Amphitheatre improvements have been modified to exclude the proposed addition at stage left.*

[3] *The Hollywood Bowl comprises approximately 70 acres and includes an Amphitheatre with a seating capacity of approximately 17,376; four surface parking lots, with approximately 2,700 parking spaces,*
(Footnote continued on next page)

5. Project Purpose and Objectives

Section 15124(b) of the California Environmental Quality Act (CEQA) Guidelines states that the project description shall contain "a statement of the objectives sought by the proposed project." Section 15124(b) of the CEQA Guidelines further states that "the statement of objectives should include the underlying purpose of the project." The underlying purpose of the Project is to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource. The Project's specific objectives are as follows:

Historic Rehabilitation of the Amphitheatre

- Preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County.

- Provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination.

Additional Artist and Patron Site Enhancements

- Support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences.

and a valet parking area; 15 picnic areas; concession services; box offices; a museum; and other visitor shops and amenities.

- Repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

- Enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress.

- Further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

- Create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures.

- Enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views of surrounding iconic landmarks from a formal trail within the park boundary.

- Mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre.

- Provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre.

- Provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community.

- Provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

6. Description of the Project

a. Overview of the Proposed Development

The Ford Theatres Project is proposed to enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users. The Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and plaza deck featuring a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, an event space, and a maintenance facility; and (5) a 0.75-mile hiking trail. Conceptual site plans illustrating the development of the Project are provided in Figure II-4 and Figure II-5 on pages II-13 and II-14. In addition, Table II-1 on page II-15 provides a summary of the proposed improvements. A more detailed discussion of the proposed improvements is provided below.

(1) Amphitheatre Rehabilitation Improvements

Within the Amphitheatre, the Project would replace the existing approximately 860-square-foot projection booth and control room located to the rear and above the Amphitheatre seating with a new 800-square-foot projection booth and control room. The existing projection booth and control room is not a character-defining feature of the Amphitheatre and includes an access stair that obstructs the primary audience circulation at the Amphitheatre level. The new projection booth and control room would be designed to enable the return of the walkway at the Amphitheatre level to its original condition. Existing lighting positions along the back of the Amphitheatre would also be removed and replaced with an upgraded lighting platform that would be integrated within a new sound wall proposed along the rear of the Amphitheatre. The proposed sound wall, which could measure up to 48 feet in height, is intended to enhance performances by shielding the Amphitheatre from traffic noise from Cahuenga Boulevard and the Hollywood Freeway. In addition, a retractable shade structure would provide cover for the Amphitheatre during day time performances.

(2) Ford Terrace

As shown in Figure II-5 on page II-14, north of the Amphitheatre the existing circular driveway and disabled parking adjacent to the secondary entrance would be modified to

Parking	350 to 380 spaces			500 spaces		120 to 150 spaces		500 spaces	

( ) denotes negative number

[a] *This includes the proposed expansion of the men's restroom on the mezzanine level.*

[b] *Includes the approximately 2,500-square-foot concessions area within the Ford Terrace and the approximately 3,900-square-foot restaurant within the Ford Plaza. Note the 1,000-square-foot outdoor seating area of the restaurant is not included in the concessions/restaurant square footage.*

[c] *Includes approximately 2,500 square feet of office area within the Ford Terrace, the approximately 17,600-square-foot three-story office building within the Ford Plaza, the 560-square-foot box office, the 1,000-square-foot conference room, and approximately 2,500 square feet of office space within the Transit Center associated with the maintenance area.*

[d] *Includes the approximately 2,000-square-foot garage and 1,000-square-foot yard within the maintenance area.*

[e] *Includes the approximately 1,570-square-foot workshop within the Ford Terrace and 800 square feet of storage area as part of the maintenance area.*

Source: Levin and Associates, December 2013.

accommodate a dedicated artist performance entry and provide for a two-story office and concessions building and an approximately 3,750-square-foot plaza collectively referred to as the Ford Terrace. The two-story building would include approximately 2,500 square feet of office space in one level above an approximately 2,500-square-foot concessions area at the first level. To the west of the two-story building would be a raised plaza deck that would serve pre- and post performance concessions, private receptions, and intermission concessions. The plaza would feature landscaped raised planters with built-in benches along the perimeter and a sound wall along the eastern perimeter of the plaza. Access to the plaza would be from a staircase from the existing Amphitheatre walkway and an accessible ramp that would encircle the existing elevator tower. Beneath the plaza, the modified driveway would form a service level referred to as the Service Court providing a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup, as well as fire department access. An approximately 1,570-square-foot workshop to support performances would also be provided within the Service Court adjacent to the loading dock. To provide for these improvements, the Project would require removal of the existing two-story approximately 320-square-foot concessions building located adjacent to the secondary entrance. In addition, disabled parking located adjacent to the secondary entrance would be accommodated within the parking structures proposed as part of the Project, as described further below.

In addition, the existing approximately 1,895-square-foot, 87-seat [Inside] the Ford located at the lower level of the Amphitheatre and the associated lighting, stage, and theatrical amenities would be re-purposed as a self-serve food marketplace area and provide space for storage. New ADA-accessible restrooms would also be provided at the lower level.

(3) Ford Plaza

West of the Amphitheatre, generally within the existing south surface parking area, the Ford Plaza would be developed and would include a three-level parking structure, referred to as the south parking structure, which would provide approximately 250 parking spaces. A plaza deck that would serve as the primary gathering space for the Ford Theatres would be created above the parking structure. The plaza deck would create approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides. As part of the Ford Plaza, the existing 365-square-foot box office located at the main entrance would be repurposed as a museum/gallery for the Ford Theatres and just west of the existing box office an approximately 560-square-foot box office would be constructed. A three-story building providing approximately 17,600 square feet of office uses and approximately 1,200 square feet of shops/visitor amenities would be located adjacent to the new box office. This three-story building would terrace south at the foothill of the plaza level. In addition, at the southern boundary of the Ford Plaza, an approximately 1,000-square-foot

conference room would be built to support the adjacent office space. Adjacent to the conference room would be an outdoor area that could accommodate small informal performances, musical entertainment, and/or overflow/support monitors to view events occurring within the indoor venues. North of these uses within the Ford Plaza would be an approximately 3,900-square-foot, 150-seat restaurant that would include a 1,300-square-foot kitchen/bar and a 2,600-square-foot indoor seating area. An approximately 1,000-square-foot outdoor seating area would also be included. The restaurant would serve as the main cooking facility for the site concessions and would provide a flagship ambiance with visibility from main transportation routes. East of the restaurant, an indoor performance venue comprised of approximately 8,000 square feet and including 299 seats would be provided. This facility would feature acoustic treatments, a proscenium stage and full theatrical lighting and rigging that would be able to accommodate multi- disciplinary performances. Backstage spaces within the new venue would include performer restrooms, dressing rooms, and a prep area for special events. The lobby would feature a glass curtain-wall system with pivoting doors to create an indoor/outdoor space at the edge of the Ford Plaza. This facility would expand upon and enhance the existing [Inside] the Ford programming and would eliminate the challenge of sound bleeding between the [Inside] the Ford space as it is located underneath the Amphitheatre seating area.

(4) Transit Center

A Transit Center consisting of a bus/van loading and unloading zone, a three-level parking structure referred to as the north parking structure, a rehearsal and event space referred to as the Flex Space, and a maintenance area would be constructed along the northwestern extent of the Project Site. Specifically, upon entering the Ford Theatres from the existing primary access at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, the Transit Center would provide a staging area for buses to load and unload. From this area, vehicles would also be directed south to the parking structure within the Ford Plaza or north to the three-level parking structure proposed within the Transit Center. The north parking structure would provide approximately 250 parking spaces. The approximately 8,300-square-foot Flex Space would be constructed at the lowest level of the parking structure. The Flex Space would provide approximately 99 retractable seats and would include full theatrical lighting, performer restrooms, dressing rooms, and a prep area for special events. A plaza area referred to as the Transit Plaza would also be located below the parking structure. The upper deck of the parking structure would extend over the Flex Space and the Transit Plaza. At the upper deck, an approximately 6,300-square-foot maintenance area consisting of office, storage, garage, and yard areas would be provided. To provide for these improvements, the Project would require removal of the existing two-story approximately 10,500-square-foot former motel building currently used as office space for Ford Theatre Foundation, Los Angeles County Arts Commission, and Philharmonic staff.

(5) Hiking Trail

As illustrated in Figure II-4 on page II-13, the Project would also include a 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The trail would be approximately four feet in width and would feature natural-type fencing as well as "sutter wall" style retaining walls, where required or necessary, and cut-in granite steps where areas of steep terrain are proposed. Hand-railing may also be provided at the steps. The trail alignment may utilize portions of existing user-established informal trails. The hours of operation for use of the trail would observe standard park hours of sunrise to sunset.

Overall, as provided above in Table II-1 on page II-15, implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

To evaluate the operational changes of the Ford Theatres associated with implementation of a Master Plan for the site, the County and the Ford Theatre Foundation, in consultation with Community Arts Resources, Inc., prepared the report titled *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park*, included as Appendix O of this Draft EIR. The Project was derived from the Master Plan process and includes some of the same components envisioned in the Master Plan, with modifications. As analyzed in *The Ford, Transformed* report and summarized in Table II-2 on page II-20, with the new event spaces to be provided, the average number of annual events is estimated to increase from 184 events to approximately 331 events and the average number of annual attendees is estimated to increase from 54,640 people to approximately 93,725 people. As provided in Table II-2, events within the Amphitheatre would continue to be held from May through October. In addition, events within the proposed Flex Space and the proposed 299-seat theatre would be held year round will scheduled periods of down time for maintenance.

The hours of operation at the Ford Theatres would continue to be from 8:00 A.M. to 11:00 P.M., Monday through Sunday. To accommodate the increase in programming, it is anticipated that existing County Arts Commission, County Department of Parks and Recreation, and Ford Theatre Foundation staffing within the Project Site would increase from approximately 20 employees to up to 105 employees or an increase of approximately 85 employees. In addition, the existing 140 Los Angeles Philharmonic employees within the Project Site are anticipated to relocate their offices off-site. With the relocation of these employees, the Project would result in an overall net decrease of employees on-site.

Table II-2
Summary of Events and Attendance

Facility	Existing Schedule			Future Expanded Schedule		
	Number of Shows	Average Attendance per Event	Total Series Attendance	Number of Shows	Average Attendance per Event	Total Series Attendance
Amphitheatre 1,196 seats May--October						
Partner Events	40	760	30,400	40	850	34,000
Rental Events	20	700	14,000	20	800	16,000
Family Events	8	620	4,960	16	600	9,600
J.A.M. Sessions	16	80	1,280	20	100	2,000
Total Attendance			*50,640*			*61,600*
Inside the Ford 87 seats November–April						
Partner Events	90	40	3,600			
Rental Events	10	40	400			
Total Attendance			*4,000*			
New Theatre 299 seats year round						
Partner Events				160	165	26,400
Rental Events				15	165	2,475
Total Attendance						*28,875*
Flex Space 99 seats year round						
Rentals				10	75	750
Open Rehearsals and Readings				50	50	2,500
Total Attendance						*3,250*
Total Events			**184**			**331**
Total Audience			**54,640**			**93,725**

Source: The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park, Community Arts Resources, Inc., October 2012.

b. Design

The proposed improvements would be designed to complement the existing historic character of the Ford Theatres. The Project is designed to be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings (1995) Weekes and Grimmer. The new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity by avoiding any substantial adverse change in the significance of an historic resource. The Project is also designed to minimize building footprints and remain primarily within the developed areas of the Project Site. Specifically, implementation of the Project would further develop portions of the existing 3.5 acres of developed area within the Project Site and would extend onto approximately 0.8 acres of undeveloped area. Upon buildout of the Project, approximately 4.3 acres of the 32-acre Project Site would comprise developed area. The remaining approximately 27.7 acres would comprise undeveloped open space. In addition, to reduce the massing, the new buildings and parking structures in particular would be integrated into the existing topography of the Project Site. Building heights would range from approximately 15 feet to 67.5 feet in height as measured from adjacent grade with elevations ranging from 515 feet to 610 feet above sea level. Materials, such as wood, brick, stucco, metal panels, concrete and glass are anticipated to be used in the construction of the buildings.

The new buildings and infrastructure would also be designed to be environmentally sustainable and to achieve certification under the U.S. Green Building Council's Leadership in Energy Efficiency and Design (LEED®). The Project would also be designed to meet the County's green building requirements. Design features to reduce energy use throughout the buildings would include natural ventilation, use of daylighting controls, efficient lighting, and efficient mechanical systems and equipment through the implementation of a new central plant, transformers, and a generator. Water use would be reduced by the installation of water-efficient fixtures, equipment, and systems. Water use in irrigation would also be reduced by the use of native, drought-tolerant landscape and efficient irrigation systems. In addition, local air quality would be enhanced by the reduction of VOC-containing construction materials. Construction activities would also make use of local, recycled, and renewable materials where possible and reuse construction materials such as grading debris within the Project Site. Similarly, the use of renewable and recyclable materials during construction, and the diversion of waste materials from landfills, would reduce long-term environmental effects of the Project. The Project would also enhance on-site recycling as part of its operations.

c. Access and Parking

Access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some on-site configuration and circulation modifications. In addition, to facilitate access and circulation within the Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The northernmost driveway, which is currently used primarily for egress at the end of events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from the north parking structure. The proposed driveway between the northernmost driveway and the main entrance would provide right-turn only egress from the Transit Center and the parking structure. The driveway at Pilgrimage Bridge and Cahuenga Boulevard East, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. The southern driveways would also be maintained in their existing locations with the southernmost driveway providing ingress to the south parking structure and the other driveway providing egress. At the driveway providing egress from the south parking structure, the Project proposes a new signal to allow for safer left turns from the driveway to Cahuenga Boulevard East. Ingress and egress to the south parking structure would also be provided from the main entrance. Within the Project Site, access to the Amphitheatre would continue to be provided at the existing main entrance. In addition, new pedestrian pathways would be provided for access to the new areas. As described above, the existing circular driveway at the secondary entrance would be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access. The Project would also include bicycle amenities.

Upon buildout of the Project, parking would be provided within two new three-level parking structures that would generally be located within the existing north and south surface parking areas that would be removed as part of the Project. Upon completion, the Project would provide a total of approximately 500 parking spaces within two parking structures and a net increase of approximately 120 to 150 parking spaces, including additional ADA parking spaces. Parking would also continue to be available at the Universal City/Studio City Metro Red Line Station. A shuttle would continue to be provided to and from the Ford Theatres during evening events. In addition, use of the Ford Theatres parking facilities by the Hollywood Bowl may continue.

d. Landscaping

A variety of native and drought tolerant plant material would be used to enhance and complement the existing plant material on the hillside. In addition, mature native trees

would be planted and enhanced with complementary native vegetation. To screen off-site views of the south parking structure, the proposed landscape would berm up to cover the exposed areas of the parking structure, thereby bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. In addition, along the proposed trail, landscape improvements may include habitat restoration and enhanced plantings.

Implementation of the Project would require the removal of approximately 143 trees, including cypress, pine, palm, eucalyptus, ficus, sycamore, and olive trees. This number includes the trees proposed to be removed as part of the approved Amphitheatre improvements described above. The Project would also relocate approximately 20 trees throughout the Project Site. As part of the Project, trees to be removed would be replaced on a minimum 1:1 basis.

e. Lighting and Signage

The Project would feature illuminated building façades on the north parking structure, the new theatre, the restaurant, and the proposed sound wall. In addition, the Project would include exterior lighting along vehicular and pedestrian pathways and at the upper level of the north parking structure for security and wayfinding purposes. Accent lighting to highlight architectural features, landscape elements, and the Project's signage would also be incorporated. Lighting throughout the plaza areas would also be provided. The Project would also include new theatrical lighting within the Amphitheatre. Light fixture control devices could be implemented, as necessary, to minimize glare.

Project signage would include various identity signs including a central identity sign. The identity signs may include the existing Ford Theatres sign along Cahuenga Boulevard East, which would be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance. The Project would also include internally illuminated graphic signs along the façades of the new theatre, the north parking structure, and the restaurant. In addition, a large sign identifying the Ford Theatres would be placed along the proposed sound wall. This sign is anticipated to be illuminated. The proposed sound wall and sign would replace the existing wall and sign along the top of the Amphitheatre wall. Monitors that would be used for a variety of purposes such as publicizing events, promoting the available food services, assisting in wayfinding, and for broadcasting sold-out events may also be provided in the plaza areas and other public spaces throughout the Project Site. The Project would also include interpretive signage along the proposed hiking trail and throughout the Project Site to provide information about the history of the Ford Theatres, Ford programs and local flora and fauna. Lastly, wayfinding signs would be located throughout the Project Site, including at parking structure entrances and elevators.

f. Utilities

The Project would provide a generator east of the office and concessions building within the Ford Terrace and north of the building would be a service yard and transformers. An approximately 2,200-square-foot central utility plant is also proposed east of the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. The central utility plant would include cooling towers, chillers, a fire pump and other associated equipment. Alternatively, the Project could provide a decentralized air-cooled system. Additional transformers would be installed within the Ford Plaza adjacent to the 299-seat theatre, at the central utility plant, at the north entrance of the north parking structure, and near the south trailhead termination. Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles along Cahuenga Boulevard East. These electrical poles could measure up to 65 feet in height. In addition, temporary electrical poles could be installed within the Project Site until full build-out of the Project. Other utility improvements proposed as part of the Project would include new natural gas service, sewer and water connections, and drainage improvements. As shown above in Figure II-4 on page II-13, the Project would also integrate and relocate the existing cell towers and associated structures to allow construction of the Transit Center.

g. Fire Protection and Security Features

As the Project Site is located in a Very High Fire Hazard Severity Zone, a fuel modification plan would be required to minimize the risk of wildfires. The fuel modification plan for the Project would set forth buffer zones around the proposed structures. The fuel modification plan would also specify requirements pertaining to landscape irrigation, thinning and removal of brush and dead plant materials, removal of non-native plant species, and maintenance of the buffer zones. One of the primary goals of the fuel modification plan and associated landscaping and irrigation would be to provide adequate defensible space around all potentially combustible structures within a fire environment. Accordingly, routine landscape maintenance would be required per the County Fire Department's Fuel Modification Plan Guidelines. A preliminary fuel modification plan has been prepared by the Project in consultation with the Los Angeles County Fire Department, and is included in Section IV.J.1, Public Services—Fire Protection of this Draft EIR. A final fuel modification plan would be submitted to the Los Angeles County Fire Department for approval prior to the issuance of Project construction permits. The Project would also include an upgraded fire system, including the installation of on-site fire hydrants, as illustrated in Section IV.J.1, Public Services—Fire Protection, and an upgraded water supply line. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. Refer to Section IV.J.1, Public Services—Fire Protection, of this Draft EIR, for further discussion.

The Project's design would also incorporate security features to provide for the safety of on-site employees and visitors. These features would include high-definition surveillance cameras and signage along the hiking trail. Entryways, lobbies, and parking areas would also be well illuminated and designed to eliminate areas of concealment.

7. Project Construction and Scheduling

The Project could be implemented in several phases to provide flexibility to continue operating the Ford Theatres during construction. Construction of the Project may be completed as early as 2020. In the event construction of the Project occurs as one phase, or in consolidated phases, the Ford Theatres would be expected to close and no events would be held until buildout of the Project or completion of the phase(s) under construction. Construction activities would include demolition of several existing facilities, grading and excavation, and construction of new structures and related infrastructure. It is estimated that the Project would require approximately 107,094 cubic yards of export. Based on the proximity of the Hollywood Freeway to the Project Site, it is anticipated that haul trucks and delivery trucks would access the Project Site traveling northbound on Cahuenga Boulevard East from the Hollywood Freeway (US-101) and would exit the Project Site onto Cahuenga Boulevard East and travel northbound on Cahuenga Boulevard East to the Hollywood Freeway. As part of the Project, a Construction Management Plan would be implemented during construction to manage construction traffic and ensure that adequate and safe access and parking remains available during construction activities. Construction worker parking and construction staging would be accommodated on-site. Construction activities would comply with Section 12.08.440 of the Los Angeles County Code, which prohibits noise-generating construction activities between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays in the absence of certain emergencies.

8. Necessary Approvals

Discretionary approvals from the County of Los Angeles Board of Supervisors will be necessary for the Ford Theatres Foundation to implement the Project.

III. Environmental Setting

III. Environmental Setting

A. Overview of Environmental Setting

This section of the Draft EIR provides an overview of the existing regional and local setting in which the Project Site is located, and a brief description of the existing conditions at the Project Site. Detailed environmental setting information is provided in each of the environmental issue analyses found in Section IV (Environmental Impact Analysis) of this Draft EIR. In addition, Section II, Project Description, of this Draft EIR, provides additional information regarding existing conditions at the Project Site.

1. Project Location and Environmental Setting

The Project Site comprises an approximately 32-acre County of Los Angeles regional park in the Hollywood Community of the City of Los Angeles. Within a regional context, the Project Site is located in the Hollywood Hills adjacent to Cahuenga Boulevard East where Cahuenga Boulevard parallels the Hollywood Freeway. The Project Site is owned by the County of Los Angeles and operated through a three-way partnership between the Los Angeles County Department of Parks and Recreation, the Los Angeles County Arts Commission, and the Ford Theatre Foundation.

As illustrated in the aerial photograph of the Project Site and the surrounding vicinity provided in Section II, Project Description, of this Draft EIR, the majority of the 32-acre Project Site consists mostly of undeveloped hillsides with the developed areas of the Project Site concentrated along the north- and southwest portions of the Project Site. Given the location of the Project Site in the Hollywood Hills, the topography of the Project Site is widely varied from moderately sloping surface parking areas along the western portion of the Project Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions of the Project Site.

Existing uses within the Project Site include an open-air 1,196-seat Amphitheatre with support spaces (i.e., dressing rooms, performer restrooms, green room) below; an 860-square-foot projection booth and control room located above the Amphitheatre seating; the 87-seat [Inside] the Ford Theatre; a two-story, approximately 320-square-foot concessions building; a 365 square-foot box office; Edison Plaza and picnic area; surface parking areas providing approximately 350 to 380 stacked parking spaces; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission, and the Los Angeles Philharmonic.

The Project Site also includes one cell tower and associated structures along the northwest portion of the Project Site and an additional cell tower located further northwest, near the Project Site boundary. Other facility support spaces, such as storage and maintenance areas and restrooms, are also located throughout the Project Site. Landscaping is provided along driveways, surface parking areas, and pedestrian pathways. Additionally, while there are no designated hiking trails within the Project Site, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails.

The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza areas comprise approximately 3,580 square feet. Overall, approximately 3.5 acres of the 32-acre Project Site comprises developed areas, including the existing structures described above and asphalt-paved surface parking areas. The remaining areas (approximately 28.5 acres) are comprised of undeveloped open space.

Based on the varying topography of the Project Site, the buildings and structures within the Project Site similarly feature varying heights ranging from approximately 15 feet from adjacent grade (approximately 547 feet above sea level) to approximately 62 feet from adjacent grade (approximately 574 feet above sea level). As the Amphitheatre and associated structures and support spaces are primarily located internal to the Project Site and nestled within the surrounding hillsides, views of the Project Site along Cahuenga Boulevard and the Hollywood Freeway are limited to the former motel building, surface parking areas, electronic sign identifying the Ford Theatres, perimeter walls and landscaping, and the vegetated hillsides. Views of portions of the main Amphitheatre gate/entrance and the stairway leading to the Amphitheatre as well the wall running along the top of the Amphitheatre and associated signage are available in the background.

The area surrounding the Project Site includes a mix of residential uses and open space. Specifically, the Project Site is bounded by 4-story multi-family residential buildings and open space associated with the Hollywood Reservoir to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The majority of these uses are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site.

The Hollywood Bowl, also a County-owned historically significant cultural destination, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.[1]

2. Land Use Plans

Land use plans applicable to the Project Site include the County of Los Angeles General Plan, the Southern California Association of Governments' 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, Growth Vision Report, and 2008 Regional Comprehensive Plan; the South Coast Air Quality Management District's 2012 Air Quality Management Plan; and the Metropolitan Transportation Authority's 2010 Congestion Management Plan.

It is noted that while the Project Site is located within the City, the approximately 32 acres of land comprising the Project Site are owned by the County of Los Angeles. Accordingly, the Project Site is not subject to the City General Plan or the Los Angeles Municipal Code. The City General Plan and the Los Angeles Municipal Code are described in the land use analysis and the consultation process on general plan consistency is discussed in Section IV.H, Land Use, of this Draft EIR.

[1] *The Hollywood Bowl comprises approximately 70 acres and includes an Amphitheatre with a seating capacity of approximately 17,376; four surface parking lots, with approximately 2,700 parking spaces, and a valet parking area; 15 picnic areas; concession services; box offices; a museum; and other visitor shops and amenities.*

III. Environmental Setting
B. Related Projects

The California Environmental Quality Act (CEQA) Guidelines (Section 15130(a)) requires that an Environmental Impact Reports (EIR) discuss the cumulative impacts of a project when the project's incremental effect is "cumulatively considerable." As set forth in Section 15065(a)(3) of the CEQA Guidelines, "cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. In accordance with CEQA Section 15130(a)(3), a project's contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact. In addition, the lead agency is required to identify facts and analysis supporting its conclusion that the contribution will be rendered less than cumulatively considerable.

CEQA Guidelines Section 15130(b) further provides that the discussion of cumulative impacts reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. Rather, the discussion is to "be guided by the standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute."

CEQA states that complying with one of the following two protocols is necessary to provide an adequate discussion of significant cumulative impacts:

(A) A list of past, present, and probable future projects producing related or cumulative impacts including, if necessary, those projects outside the control of the agency; or

(B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

Cumulative study areas are defined based on an analysis of the geographical scope relevant to each particular environmental issue. Therefore, the cumulative study area for each individual environmental impact issue may vary. For example, a cumulative land use impact generally may only affect the compatibility of uses within the vicinity of the project site, while a cumulative air quality impact may affect the entire South Coast Air Basin. The specific boundaries and the projected growth within those boundaries for the cumulative study area of each environmental issue, are identified in the applicable environmental issue section in Section IV, Environmental Impact Analysis, of this Draft EIR.

A list of proposed development projects in the area of the Project that could affect conditions in the Project area (e.g., by adding traffic volumes to study area intersections and/or generating population increases) was prepared based on information obtained primarily from the City of Los Angeles Department of Transportation. A total of 27 potential related development projects have been identified within the vicinity of the Project Site for inclusion in the cumulative impact analysis for this EIR. These related projects are in varying stages of the approval/entitlement/development process and consist of a variety of land uses reflecting the diverse range of land uses in the vicinity of the Project Site. They include residential, mixed-use, office, commercial, restaurant, retail, and institutional projects. These related projects would occur primarily as urban in-fill within the existing land use fabric of the area.

The related projects are listed in Table III-1 on page III-6, which identifies the location of each related project along with the types of land uses. The locations of the related projects are shown in Figure III-1 on page III-8. It is noted that some of the related projects may not be built out by 2020 (the Project's build out year), may never be built, or may be approved and built at reduced densities. To provide a conservative forecast, the future baseline forecast assumes that all of the related projects are fully built out by 2020.

IV. Environmental Impact Analysis

IV. Environmental Impact Analysis

A. Aesthetics, Views, Light, and Glare

1. Introduction

This section analyzes the Project's potential impacts on aesthetics, views, light, and glare. A brief description of each of these environmental issues is provided below.

a. Aesthetics

Aesthetics refers to the overall visual quality of an area. The analysis of aesthetics focuses on the Project's visual relationship with existing and planned land uses in the Project area. The analysis considers qualities related to visual character, such as density, massing, setbacks, color, and the general composition of aesthetic features, as well as the relationships between these elements. The analysis also considers both natural and man-made/urban features with aesthetic value. The potential adverse visual quality impacts considered within the analysis include the loss of existing features of aesthetic value and the introduction of contrasting features that contribute to a decline in overall visual character (e.g., the introduction of contrasting features that overpower familiar features, eliminate context or associations with history, or create visual incompatibility where there may have been apparent efforts to maintain or promote a thematic or consistent character).

b. Views

The analysis of views assesses the Project's potential impacts on visual access to valued visual resources (e.g., mountain ranges, historic buildings, etc.). The analysis considers the Project's distance from valued visual resources, the topography of the Project area, and existing view obstructions. The analysis considers focal views (i.e., views of a particular object, scene, setting, or feature of visual interest) and panoramic views or vistas (i.e., views of a large geographic area for which the view may be wide and extend into the distance). Existing views of value, both of and across the Project Site are identified and considered. Further, a number of development characteristics, such as building height, mass, and density, are considered as they directly relate to view obstruction.

c. Light

The analysis of light impacts assesses the potential effects of the Project's nighttime light from both point sources (e.g., illuminated building façades, street light poles, vehicle headlights) and indirect sources (i.e., reflected light) on light-sensitive land uses such as residences. Such uses are recognized as light-sensitive because they are typically occupied by persons who have expectations of privacy during evening hours and who are subject to disturbance by bright light sources.

d. Glare

Glare is caused by the reflection of sunlight or artificial light from highly polished surfaces, such as window glass or reflective materials, and, to a lesser degree, from broad expanses of light-colored surfaces. Daytime glare generation is common in urban areas and is typically associated with mid- to high-rise buildings with exterior façades largely or entirely comprised of highly reflective glass or mirror-like materials from which the sun can reflect, particularly following sunrise and prior to sunset. Daytime glare generation is typically related to sun angles, although glare resulting from reflected sunlight can occur regularly at certain times of the year. Glare can also be produced during evening and nighttime hours by artificial light directed toward a light-sensitive land use.

2. Environmental Setting

a. Regulatory Framework

(1) Aesthetics and Views

(a) Los Angeles County Code

The Los Angeles County Code regulates development through land use regulations and development standards regarding the allowable type, density, height, and design of new development projects. As detailed in Section IV.H, Land Use, of this Draft EIR, with the continuation and enhancement of the existing uses within the Project Site, the Project would be consistent with its current use and designation as a public facility.

(b) Los Angeles County General Plan

The Los Angeles County General Plan (County General Plan) directs future growth and development in the County's unincorporated areas and establishes goals, policies, and objectives that pertain to the County as a whole. As it relates to the evaluation of aesthetics, the Conservation and Open Space Element of the County General Plan sets forth policies for the open space-related resources in the County, including scenic

resources. To protect areas of significant natural resources, the Conservation and Open Space Element recommends the retention of non-urban or open space areas and places special emphasis on the protection of hillside character. The Conservation and Open Space Element also includes goals to protect sites of historical, archaeological, scenic, and scientific value. Similarly, the Land Use Element of the General Plan addresses the protection of natural and scenic resources, with objectives to include high quality design in development projects and ensure sensitivity to and compatibility with natural, ecological, scenic, cultural, and open space resources. The Land Use Element further reinforces General Plan policies for conserving natural and ecological resources.

(2) Light and Glare

The County of Los Angeles and City of Los Angeles enforce the building code requirements of the California Code of Regulations as summarized below.

(a) California Code of Regulations, Title 24

Title 24 of the California Code of Regulations (CCR), also known as the California Building Standards Code, consists of regulations to control building standards throughout the State. The following components of Title 24 include standards related to lighting:

(i) California Building Code (Title 24, Part 1) and California Electrical Code (Title 24, Part 3)

The California Building Code (Title 24, Part 1) and the California Electrical Code (Title 24, Part 3) stipulate minimum light intensities for pedestrian pathways, circulation ways, and paths of egress.

(ii) California Energy Code (Title 24, Part 6)

The California Energy Code (CEC) stipulates allowances for lighting power and provides lighting control requirements for various lighting systems, with the aim of reducing energy consumption through efficient and effective use of lighting equipment. Section 147 of the CEC sets forth outdoor lighting allowances in terms of watts per area for lighting sources other than signage.

(iii) California Green Building Standards Code (Title 24, Part 11)

The California Green Building Standards Code, which is Part 11 of Title 24, is commonly referred to as the CALGreen Code. The CALGreen Code stipulates maximum allowable light levels, efficiency requirements for lighting, miscellaneous control requirements, and light trespass requirements for electric lighting and daylighting.

In April 2011, Section 5.106.8 of the CALGreen Code, which applies to non-residential uses, was amended in response to a public petition regarding concerns over security aspects of the light pollution reduction provisions. The revised provisions require outdoor lighting systems to be designed and installed to comply with the following:

- The minimum requirements in the CEC for Lighting Zones 1–4 as defined in Chapter 10 of the California Administrative Code;
- Backlight, Uplight and Glare (BUG) ratings as defined in the Illuminating Engineering Society of North America's Technical Memorandum on Luminaire Classification Systems for Outdoor Luminaires (IESNA TM-15-07); and
- Allowable BUG ratings not exceeding those shown in Table A5.106.8 in Section 5.106.8 of the CALGreen Code.

(b) City of Los Angeles Municipal Code

The Los Angeles Municipal Code (LAMC) sets forth specific regulations regarding lighting. Although not required, the Project will comply with the following relevant LAMC provisions regarding lighting:

- Chapter 1, Article 2, Sec. 12.21 A 5(k). All lights used to illuminate a parking area shall be designed, located and arranged so as to reflect the light away from any streets and adjacent premises.
- Chapter 1, Article 4.4, Sec. 14.4.4 E. No sign shall be arranged and illuminated in such a manner as to produce a light intensity greater than 3 foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property.
- Chapter 9, Article 3, Div. 1, Sec. 93.0117(b). No exterior light may cause more than 2 foot-candles of lighting intensity or generate direct glare onto exterior glazed windows or glass doors on any property containing residential units; elevated habitable porch, deck, or balcony on any property containing residential units; or any ground surface intended for uses such as recreation, barbecue or lawn areas or any other property containing a residential unit or units.

b. Existing Conditions

(1) Aesthetics

(a) Project Site

As detailed in Section II, Project Description, of this Draft EIR, the Project Site comprises an approximately 32-acre County of Los Angeles regional park located within the Hollywood Hills, adjacent to Cahuenga Boulevard East and the Hollywood Freeway. The Project Site includes the open-air Amphitheatre with support spaces (i.e., dressing rooms, performer restrooms, green room) below; a projection booth and control room located above and to the rear of the Amphitheatre seating; the [Inside] the Ford Theatre; a concessions building; a box office; Edison Plaza and picnic area; surface parking areas; and a former motel building currently used as office space. In addition, two surface parking areas, referred to as the north parking lot and the south parking lot, are located along Cahuenga Boulevard East, and a third surface parking lot, providing disabled parking spaces, is located adjacent to the upper gate. The Project Site also includes one cell tower and associated structures along the northwest portion of the Project Site, adjacent to the north surface parking lot, and an additional cell tower near the northwestern property boundary.

Photographs of the Project Site from various vantage points along Cahuenga Boulevard are provided in Figure IV.A-1 on page IV.A-6 and in Figure IV.A-2 on page IV.A-7. As shown therein, due to the Project Site's location in the Hollywood Hills, the topography of the Project Site is widely varied from moderately sloping surface parking areas along the western portion of the Project Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions of the Project Site. The visual character of the Project Site as viewed from off-site is predominantly defined by the former motel building, surface parking areas, the electronic sign identifying the Ford Theatres, perimeter walls, and mature landscaping. The surrounding hillsides, which protrude from the existing uses facing Cahuenga Boulevard East, also define the visual character of the Project Site. Additionally, in the background, portions of the Amphitheatre main gate/entrance and the wall running along the top of the Amphitheatre wall installed to attenuate noise from the Hollywood Freeway and provide site identification also contribute to the visual character of the Project Site as viewed from off-site.

(b) Surrounding Area

Land uses surrounding the Project Site include a mix of residential uses and open space. Specifically, to the north of the Project Site is a 4-story multi-family residential development and open space. To the east and south of the Project Site are single- and

multi-family residential uses with some undeveloped open space interspersed with residential uses to the east. West of the Project Site is Cahuenga Boulevard East and the Hollywood Freeway. The uses surrounding the Project Site to the north, east, and south are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site, with no direct line of sight to or from the developed areas of the Project Site. The Hollywood Bowl, also a County-owned historically significant cultural destination, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.[1] While some areas surrounding the Project Site exhibit a natural, semi-developed character that is enhanced by the surrounding undeveloped hillsides, the area immediately west and further south of the Project Site presents an urbanized quality characterized by major arterials, the Hollywood Freeway, and dense development.

(2) Views

Valued visual and scenic resources in the Project area include views of the hillsides. While historic resources are also considered valued visual and scenic resources, the historic Amphitheatre is located internal to the Project Site and nestled in the hillsides and, as such, views of the historic Amphitheatre are generally not available from uses surrounding the Project Site.

Given the varying topography of the Project Site and surrounding area, public views of the Project Site and surrounding hillsides are available from a variety of vantage points. Long-range panoramic views of the Project Site and surrounding area are available from several segments of Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway, with intermittent obstruction due to intervening topography and vegetation. Portions of trails in the Hollywood Hills also may afford views of the Project Site. In general, the long-range views in the area typically feature sloping hillsides, pockets of trees, and landscaping.

Short-range public views of the Project Site are primarily available from Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway. Views of the Project Site from along several public vantages in the vicinity of the Project Site are illustrated above in Figure IV.A-1 on page IV.A-6 and in Figure IV.A-2 on page IV.A-7. As shown, short-range views of the Project Site are generally limited to the former motel building, surface parking areas, electronic sign identifying the Ford Theatres, perimeter walls and landscaping, and

[1] *The Hollywood Bowl comprises approximately 70 acres and includes an Amphitheatre with a seating capacity of approximately 17,376; four surface parking lots, with approximately 2,700 parking spaces, and a valet parking area; 15 picnic areas; concession services; box offices; a museum; and other visitor shops and amenities.*

the vegetated hillsides. Views of portions of the main Amphitheatre gate/entrance and the stairway leading to the Amphitheatre as well the wall running along the top of the Amphitheatre and associated signage are also available in the background. Private views of the Project Site from single- and multi-family residential uses east and south of the Project Site may also be available but would be limited to the open space areas of the Project Site since the developed areas of the Project Site are generally separated from these uses by open space and intervening steep hillsides.

(3) Light

The Project Site lies within a semi-urbanized area, characterized by low to moderate ambient nighttime artificial light levels. Characteristic of an urban area, night lighting in the Project vicinity results from several types of artificial light sources including street lights, automobile lights, residential uses, and parking facilities. Existing lighting within the Project Site itself consists of exterior building lighting, lighting along pathways for security and wayfinding purposes, pole lighting within the surface parking areas, and stage and production lighting.

(4) Glare

Daytime glare is generally associated with reflected sunlight from buildings with highly reflective surfaces or from vehicles parked in surface parking areas. Existing buildings and structures within the Project Site include a variety of building materials such as rock walls, plaster, wood doors, and concrete, which are not characterized as highly reflective surfaces. Sensitive receptors with respect to glare include motorists along Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway. While occasional and temporary bright light sources used for performances that cause glare may be present within the Amphitheare, off-site glare from these sources is limited due to the topography of the Project Site. In addition, residential uses in the vicinity of the Project Site are sufficiently distant from the Project Site and separated from the existing buildings, structures, and surface parking so as not to be affected by any potential glare generated within the Project Site.

3. Environmental Impacts

a. Methodology

(1) Aesthetics

The analysis of aesthetics considers the visual character and quality of the area immediately surrounding the Project Site and the impacts of the Project with respect to the existing aesthetic environment. The analysis considers the physical aspects of the Project

and its associated design features, as well as an evaluation of conceptual renderings showing future conditions at representative locations. The analysis is based on the following two-step process:

- Step 1: Describe the massing and general scale of proposed Project buildings. Consider other factors such as setbacks and open space, which may be anticipated on the basis of the proposed project design features.

- Step 2: Compare the expected appearance of the Project Site after Project implementation to the existing site appearance and character of adjacent uses and determine whether and/or to what extent a change of the visual character of the area could occur (considering factors such as the blending/contrasting of new and existing buildings given the proposed uses, density, height, bulk, setbacks, signage, architectural styles, etc.).

(2) Views

The analysis of views evaluates the changes to existing views that may result from development of the Project to determine if valued view resources are visible in the Project Site, and, if so, whether the visual access to such resources would be blocked or diminished as a result of the Project. In general, views are closely tied to topography and distance from a view resource. The identification of available views within the Project Site was accomplished through photographic documentation and topographic analysis. The analysis is based on the Project's characteristics, particularly building heights and massing, and an evaluation of conceptual renderings showing future conditions at representative locations.

To determine whether a potential view impact would occur, a five-step process is used to weigh several considerations, as follows:

- Step 1: Define the view resources that could be affected by Project development.

- Step 2: Identify the potential obstruction of view resources as a result of development of the Project Site.

- Step 3: Evaluate whether a potential obstruction would substantially alter the view. The "substantiality" of an alteration in views is somewhat subjective and dependent on many factors. In this case, an obstruction in the view of a particular view resource is considered substantial if it exhibits all of the following traits: (1) the area viewed contains a valued view resource; (2) the obstruction of the resource covers more than an incidental/small portion of the resource; and (3) the obstruction would occur along a public view area.

- Step 4: Consider whether the Project includes design features that offset the potential alteration or loss of views of a particular valued view resource.

- Step 5: Consider whether the view blockage is permanent, as viewed from a scenic vantage point; or whether the blockage would be momentary, as viewed from a moving vehicle.

(3) Light and Glare

The analysis of light and glare evaluates the effects of new sources of light and glare that would be introduced by the Project and the extent to which Project light and glare sources would affect off-site light-sensitive uses. In addition, the analysis evaluates the extent to which daytime glare sources associated with the Project would interfere with the operation of motor vehicles along representative transportation corridors adjacent to the Project Site.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts associated with aesthetics, views, light, and glare would be significant if the Project would:

- Have a substantial adverse effect on a scenic vista;

- Substantially damage scenic resources including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway;

- Substantially degrade the existing visual character or quality of the site and its surroundings; or

- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

As discussed in the Initial Study prepared for the Project Site, included in Appendix A of this Draft EIR, while the Project Site contains scenic resources (the historic Amphitheatre and surrounding hillsides), no designated scenic highways are located in the vicinity of the Project Site. In addition, the historic Amphitheatre is internal to the Project Site and is not visible from Cahuenga Boulevard. Therefore, the Project would not substantially damage scenic resources within a state scenic highway. As such, no further analysis of this issue is necessary.

c. Project Design Features

In addition to the proposed Project improvements summarized below and described in further detail in Section II, Project Description, of this Draft EIR, the Project would implement the following specific project design features with regards to aesthetics, views, light, and glare.

Project Design Feature A-1: During construction, lighting shall be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary.

Project Design Feature A-2: Project lighting shall incorporate shielding and aiming to prevent glare, light spill, and the upward emition of light and shall not exceed 2 foot-candles outside of the Project Site boundary.

Project Design Feature A-3: Exterior windows, glass, and metal used on building surfaces shall be non-reflective or treated with a standard low-reflective or non-reflective glazing.

d. Proposed Project Improvements

As described in detail in Section II, Project Description of this Draft EIR, the Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, and event space; and (5) a 0.75-mile hiking trail.

Proposed buildings would be designed to complement the existing historic character of the Ford Theatres and be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings. The new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. The new buildings and parking structures in particular would be integrated into the existing topography of the Project Site. Building heights would range from approximately 15 feet to 67.5 feet in height as measured from adjacent grade with elevations ranging from 515 feet to 610 feet. The Project has also been designed to minimize building footprints and remain primarily within the developed areas of the Project

Site. In addition, a variety of native and drought tolerant plant material would be used to enhance and complement the existing plant material on the hillside. Mature native trees would also be planted to enhance the native vegetation and trees to be removed would be replaced on a minimum 1:1 basis. Further, the proposed landscaping along the perimeter of the south parking structure would berm up to cover the exposed areas of the parking structure, thereby screening off-site views of the south parking structure and bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard street edge. Along the proposed trail, landscape improvements may include habitat restoration and enhanced plantings. As part of the Ford Plaza, the Project would also create approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides.

The Project also proposes additional lighting to be installed, including accent lighting to highlight architectural features, landscape elements, and the Project's signage; light boxes on the north parking structure, the new theatre, the restaurant, and the proposed sound wall to illuminate the façades; exterior lighting to provide clear identification of circulation, gathering spaces, parking facilities and for security purposes; and new theatrical lighting within the Amphitheatre.

Project signage would include various identity signs including a central identity sign. The identity signs may include the existing Ford Theatres sign along Cahuenga Boulevard East, which would be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance. The Project would also include internally illuminated graphic signs along the façades of the new theatre, the north parking structure, and the restaurant. In addition, an enhanced sound wall and associated signage would replace the existing wall and signage running along the top of the Amphitheatre. This sign is anticipated to be illuminated. Monitors that would be used for a variety of purposes such as publicizing events, promoting the available food services, assisting in wayfinding, and for broadcasting sold-out events may also be provided in the plaza areas and other public spaces throughout the Project Site. The Project would also include interpretive signage along the proposed hiking trail and throughout the Project Site to provide information about the history of the Ford Theatres, Ford programs and local flora and fauna. Lastly, wayfinding signs would be located throughout the Project Site, including at parking structure entrances and elevators.

e. Analysis of Project Impacts

(1) Aesthetics

(a) Construction

Although temporary in nature, construction activities can disrupt the general order and aesthetic character of an area. During Project construction, the visual appearance of the Project Site would be altered due to the removal of existing buildings, surface parking areas, and landscaping. Other construction activities, including site preparation and grading, the staging of construction equipment and materials, and the construction of foundations, new structures, and outdoor open space areas would also alter the visual quality of the Project Site. These construction activities would be visible along Cahuenga Boulevard and the Hollywood Freeway. It is noted however that based on the Project Site's location and surrounding uses as well as the limited availability of sidewalks in the area, the vicinity of the Project Site is likely not an area well-traveled by pedestrians. As such, any change in the visual quality of the Project Site experienced by pedestrians walking along Cahuenga Boulevard East or waiting at the bus stop fronting the Project Site would be brief and short-term during the duration of construction activities. Similarly, any construction activities visible to motorists along Cahuenga Boulevard and the Hollywood Freeway would be brief due to travel speeds along the roadways. It should also be noted that since the Project has been intentionally designed to minimize building footprints, the majority of construction activities for the Project would be primarily confined to areas of the Project Site that have already been developed, thereby preserving the general visual character of the Project represented by the landscaped rolling hills in the background. Further, changes in the visual character and quality of the Project Site associated with construction activities for the proposed hiking trail as experienced by private properties north, east, and south of the Project Site would be limited due to distance and intervening topography. Additionally, while the removal of some existing trees and vegetation along Cahuenga Boulevard East would temporarily reduce the visual quality along the roadway during Project construction, most of the existing landscaping along Cahuenga Boulevard East, which includes several mature trees, would be retained. Ultimately, substantial new landscaping would be introduced, including within the Ford Plaza and along Cahuenga Boulevard East.

Based on the above, the removal of on-site structures, surface parking areas, and landscaping would not cause the loss of unique visual resources (i.e., the surrounding hillsides and historic Amphitheatre) or prominent existing features that contribute positively to the existing visual character and quality of the Project Site. As such, the Project's construction activities would not substantially degrade the existing visual character of the Project Site or the surrounding area. Therefore, aesthetics impacts associated with construction would be less than significant.

(b) Operation

The Project would provide new performing arts and support facilities that would be consistent with and build on the existing uses on the Project Site and in the surrounding community. Implementation of the Project would result in the removal of the existing former motel building currently used as office space; the projection booth and control room, which is not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; the concessions building, which is also not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; and surface parking areas and landscaping. As illustrated in the conceptual site plans provided in Section II, Project Description, of this Draft EIR, the Project would develop new structures and landscaping that would be primarily confined to areas of the Project Site that have already been developed.

The proposed buildings would feature a variation in building heights ranging from approximately 15 feet to 67.5 feet as well as a variation in building planes to reduce massing. In addition, the Project would locate taller structures internal to the Project Site. In particular, the proposed Ford Terrace, which would feature a height of approximately 67.5 feet, would be located directly north of the Amphitheatre, within areas of the Project Site mostly screened from off-site views due to intervening topography. The north and south parking structures, which are proposed along Cahuenga Boulevard East, would measure approximately 52 feet and 35 feet, respectively. The restaurant, also proposed along Cahuenga Boulevard East, would extend 25 feet above the Ford Plaza deck. In addition, the proposed 299-seat theatre, which would be located east of the restaurant, would measure approximately 60 feet in height above the Ford Plaza deck. Other structures located internal to the Project Site, such as the proposed box office, Flex Space, conference room, and three-story office building would vary in heights measuring approximately 15 feet, 40 feet, 25 feet, and 56 feet, respectively. It is noted that the 40-foot height of the Flex Space is included within the height of the proposed north parking structure, which would measure approximately 52 feet in height. As such, the placement of the Flex Space within the north parking structure would effectively integrate these structures within the Project Site and visually appear as one building. As with existing conditions, the proposed sound wall, which could measure up to 48 feet in height and replace the existing wall running along the top of the Amphitheatre, would continue to contribute to the visual character and quality of the Project Site in the background. The western façade of the sound wall is proposed to consist of light-colored decorated glass with similarly non-intrusive site identification signage. Overall, building materials and architectural elements would be employed to provide texture, visual interest, and variety to the building façades. In addition, proposed structures would be designed to complement the existing historic character of the Ford Theatres and be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings.

Conceptual renderings of the proposed facilities as viewed from off-site and from within the Project Site are illustrated in Figure IV.A-3 through Figure IV.A-5 on pages IV.A-17 through IV.A-19. As demonstrated therein, while the Project would increase the height, density, and mass of on-site structures along the northwestern and southwestern portions of the Project Site, such development would not contrast sharply with the existing development within the Project Site or surrounding area. Specifically, the majority of the new development would be confined to areas of the Project Site that are already developed and the new structures would be integrated into the existing canyon setting of the Project Site that physically separates on-site buildings from off-site areas. As shown in Figure IV.A-3, the south parking structure would be built into the existing topography of the Project Site and would include landscaping throughout its perimeter along Cahuenga Boulevard East that would berm up to cover the exposed areas of the parking structure, thereby screening the parking structure and bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. Similarly, as illustrated in the conceptual site plans provided in Section II, Project Description, of this Draft EIR, a variety of landscaping would be provided along Cahuenga Boulevard East in the area of the north parking structure which would serve to shield portions of the north parking structure. Additionally, the proposed three-story office building would terrace south at the foothill of the Ford Plaza level into the hillside, which would serve to effectively integrate the building into the Project Site and reduce its height and massing.

Project lighting and signage would also influence the visual character of the Project Site. As illustrated above in Figure IV.A-3 on page IV.A-17 and in Figure IV.A-4 on page IV.A-18, proposed Project lighting would be of low intensity and would be designed to be non-intrusive to adjacent uses and be integrated within the buildings and overall Project Site. While the proposed light boxes would be visible along Cahuenga Boulevard and the Hollywood Freeway, the light boxes would be integrated within the architecture of the buildings and would not degrade the existing visual character of the Project Site. Rather, the proposed light boxes would enhance the Cahuenga Boulevard East frontage and highlight the hillsides and natural setting of the Project Site.

Project signage would consist primarily of signs to identify the Ford Theatres and the new facilities and information signs to direct vehicular and pedestrian circulation. Proposed signs may be mounted on walls and posts and may be backlit or illuminated with landscape lights. As part of the signage program for the Project, the existing Ford Theatres sign along Cahuenga Boulevard East may be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided at the main entrance. In either scenario, the sign would serve to enhance the main entrance to the Project Site and would be consistent with the existing visual character of the Project Site. Similarly, the proposed sign along the replacement sound wall at the top of the Amphitheatre would reflect the character of the Project Site and surrounding area. In general, proposed signage would be

Conceptual Rendering - View from Ampitheatre Entrance Looking East

Source: Levin and Associates, 2014.

consistent with the visual character of the Ford Theatres and would be compatible with existing signage.

Other features which could potentially alter the existing visual character of the Project Site include the removal of existing landscaping, including trees along the perimeter of the Project Site. As described in Section II, Project Description, of this Draft EIR, the Project would involve the removal of approximately 143 trees. The Project would also relocate approximately 20 trees throughout the Project Site. The trees proposed to be removed or relocated within the Project Site are primarily located internal to the Project Site and are of varying species, maturity, size, and condition, as detailed in the Tree Survey included in Appendix E of this Draft EIR. Ultimately, the Project would enhance the existing landscaping by providing a series of courtyards and plazas throughout the Project Site and a implementing a landscaping plan that would visually enhance the Ford Theatres. In addition, as part of the Project's landscape plan, trees to be removed would be replaced on a minimum 1:1 basis.

The Project may also include the installation of approximately 15 to 17 overhead electrical poles along Cahuenga Boulevard East to provide electrical service for the Project in the event underground utility lines cannot be provided. While the installation of these electrical poles, which could measure up to 65 feet in height, would invariably alter the aesthetic character of the Project Site, the poles to be installed would be typical of those found in the current market and would not be visually inconsistent in terms of size with the existing urban infrastructure within and in the vicinity of the Project Site, including street lamps and existing utility poles and associated overhead power lines currently found along Cahuenga Boulevard East and within the Project Site itself. Further, the relocation and integration of the existing cell towers as one cell tower would not result in a substantial change in the existing visual character of the Project Site as the new cell tower would be relocated within a few feet of the existing tower located adjacent to the north surface parking lot.

While the presence of new development would alter the aesthetic character of the Project Site, the Project would employ a cohesive site design in part by ensuring architectural compatibility and integration with the surrounding environment. The Project would also rehabilitate the existing historic Amphitheatre and would not result in the removal or alteration of existing features that contribute positively to the visual character of the Project Site and surrounding area. Overall, the new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. Similarly, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. As such, the Project would not substantially degrade the existing visual

character or quality of the Project Site or surrounding area. Impacts related to aesthetics would be less than significant.

(2) Views

As previously identified, valued visual resources within the Project Site include the hillsides surrounding the existing developed areas of the Project Site as well as the historic portions of the Amphitheatre, which are generally only visible from areas within the Project Site. Publicly available long-range panoramic views of the Project Site are available from segments of nearby roadways including Cahuenga Boulevard and Pilgrimage Bridge as well as the Hollywood Freeway, with intermittent obstruction due to intervening structures, topography, and vegetation. As shown above in Figure IV.A-3 on page IV.A-17 and in Figure IV.A-4 on page IV.A-18, traveling north along Cahuenga Boulevard East, the Project would visually fill-in the existing surface parking areas fronting Cahuenga Boulevard East with a new restaurant, 299-seat indoor theatre, parking structures, landscaping, and landscaped plazas with limited views of other Project components available in the background. However, given the topography of the Project Site and the location of existing development within a canyon setting, the natural hillsides would remain a prominent feature from these public locations. In addition, as previously described, the proposed structures would include architectural features that would serve to integrate the buildings within the Project Site and be compatible with the existing uses to remain and the surrounding vicinity. The proposed landscaping, building modulation, and architectural features would serve to soften and integrate the proposed structures within the natural setting of the Project Site. Proposed structures fronting Cahuenga Boulevard East would be noticeably visible. However, the architectural features, light-colored materials, and perimeter landscaping to be introduced as part of the Project would soften the visual effect on views.

The existing cell towers, which would be relocated and integrated as one cell tower within a few feet of the existing cell tower located adjacent to the north surface parking lot, would also continue to be visible from certain public vantages in the vicinity of the Project Site and would be consistent with existing views. Additionally, should electrical service for the Project be provided via overhead electrical poles along Cahuenga Boulevard East, which could measure up to 65 feet in height, the poles would not block views given their slim profile and the presence of nearby similar infrastructure. Therefore, while views of the poles would be available, the poles would be anticipated to be visually consistent with the existing urban infrastructure in the Project Site vicinity, including existing street lamps and utility poles and associated overhead power lines.

With regard to private views, due to the topography of the Project Site and surrounding area and the location of existing development within a canyon setting, views of the Project Site from private properties in the vicinity are generally limited to the hillsides north, east, and south within the Project Site. As described above, the new buildings would

be located in the vicinity of existing development and would be integrated with the topography of the site. Thus, with the possible exception of views of portions of the proposed hiking trail, private views of the primary areas proposed to be developed would not be available. Additionally, given the materials that would be used to create a natural trail and the enhanced vegetation and intermittent nature signs that would be placed throughout the extent of the trail, views of the proposed hiking trail would be consistent with the natural setting of the Project Site.

Overall, while Project implementation would modify existing public views along Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway, the proposed structures would not dominate the viewshed along Cahuenga Boulevard. Rather, the Project has been intentionally designed to limit the building footprint within areas already developed so as to preserve the natural setting of the Project Site. Accordingly, public views of the Project Site would continue to feature a semi-urban environment with a background of rolling hills, pockets of trees, and landscaping. Thus, the Project would not have a substantial adverse effect on a scenic vista, and view impacts would be less than significant.

(3) Light

(a) Construction

Substantial lighting is not anticipated during construction within the Project Site as most construction activities would occur during daylight hours. However, the Project may include lighting for construction activities occurring in the early evening during the winter season. Outdoor lighting sources such as floodlights, spot lights, and/or headlights associated with construction equipment and hauling trucks would typically accompany construction activities during this period. To the extent evening construction includes artificial light sources, such use would be temporary and would cease upon completion of proposed Project construction. Further, construction-related illumination would be used for safety and security purposes only. Additionally, as set forth above in Project Design Feature A-1, construction lighting would be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary. Construction lighting, while potentially bright, would be highly focused on the particular area undergoing work. Therefore, given that the majority of construction activities for the Project would be primarily confined to areas of the Project Site that have already been developed, which are separated from residential uses to the north, east, and south by open space and intervening topography, the surrounding uses would not be anticipated to be substantially affected by construction lighting. Thus, light impacts associated with proposed construction activities would be less than significant.

(b) Operation

As previously described, the Project proposes additional lighting to be installed, including accent lighting to highlight architectural features, landscape elements, and the Project's signage; light boxes on the north parking structure, the new theatre, the restaurant, and the proposed sound wall to illuminate the façades; exterior lighting to provide clear identification of circulation, gathering spaces, parking facilities and for security purposes; and new theatrical lighting within the Amphitheatre. As shown above in Figure IV.A-3 on page IV.A-17 and in Figure IV.A-4 on page IV.A-18, lighting associated with the proposed light boxes would be the most distinguishable light source as viewed from Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway. However, as illustrated, the light boxes would not feature so prominently such that the light boxes would emanate light that would be inconsistent with the existing light sources in the vicinity of the Project Site. In addition, there are no residential properties or other sensitive uses immediately surrounding the Project Site, and any light emanating from the proposed Project lighting would be directed within the Project Site. Further, lighting associated with the proposed theatrical lighting would be consistent with the existing lighting within the Amphitheatre. Also, in accordance with Project Design Feature A-2 provided above, Project lighting, where applicable, would incorporate shielding and aiming to prevent glare and light spill and the upward emission of light and Project lighting would not exceed 2 foot-candles outside of the Project Site boundary. Therefore, due to the types of proposed lighting and measures employed to minimize light pollution, the Project would not create a new source of substantial light that would adversely affect day or nighttime views in the area. Thus, impacts related to Project lighting would be less than significant.

(4) Glare

(a) Construction

Daytime glare could potentially accompany construction activities if reflective construction materials were positioned in highly visible locations where the reflection of sunlight could occur. However, any glare would be highly transitory and short-term, given the movement of construction equipment and materials within the construction area and the temporary nature of construction activities within each area of the Project Site. In addition, large, flat surfaces that are usually required to generate substantial glare are not typically an element of construction activities. Furthermore, the potential for nighttime glare associated with construction is unlikely as most construction activities would occur during the day, and any construction activities occurring in the early evening during the winter season would be limited and temporary. As such, the Project would not result in a significant impact related to construction glare.

(b) Operation

Daytime glare can result from sunlight reflecting from a shiny surface that would interfere with the performance of an off-site activity. Reflective surfaces can be associated with window glass and polished surfaces, such as metallic trim. Sun reflection can also occur with reflected light from parked vehicles. Building materials for the Project would likely include plaster, concrete, metal panels, fritted glass, and cement board. In accordance with Project Design Feature A-3 provided above, exterior windows, glass, and metal used on building surfaces would be non-reflective or treated with a standard low-reflective or non-reflective glazing. As such, sunlight reflected from the surfaces of proposed structures would not be expected to generate substantial daylight glare. The replacement of existing surface parking areas with structured parking would also reduce the potential for daytime glare from windows of parked vehicles. Overall, the Project would not create a new source of substantial glare which would adversely affect day or nighttime views. Therefore, glare impacts would be less than significant.

4. Cumulative Impacts

The geographic context for the cumulative impact analysis of aesthetics, views, light, and glare is the immediate Project vicinity. As such, impacts are typically localized. In general, only development within the same viewshed has the potential for cumulative effects. While projects located at a distance from one another may appear within the same panoramic view, the overall effect that a particular development or structure(s) has on aesthetics, view, light, and glare generally decreases with distance. Therefore, of the future development through 2020 (i.e., the Project buildout year) in the surrounding area, only those projects sufficiently close to influence the visual character of the immediate Project area or affect the same off-site sensitive uses could pose cumulative effects in conjunction with the Project. As indicated in Table III-1 and mapped in Figure III-1 within Section III, Environmental Setting, of this Draft EIR, there are 27 related projects in the general Project vicinity. The nearest related project is Related Project No. 22, located approximately 0.8 mile southwest of the Project Site at 1841 Highland Avenue. This related project includes the development of an approximately 100-room hotel.

a. Aesthetics

As illustrated in Figure III-1 in Section III, Environmental Setting, of this Draft EIR, none of the related projects are located sufficiently close to the Project Site to enter the same field of view as the Project. Specifically, the majority of the related projects are located further southwest of the Project Site along Highland Avenue and beyond. As described above, the nearest related project to the Project Site is located approximately 0.8 mile southwest of the Project Site. Therefore, given its location and distance from the Project Site and intervening development, Related Project No. 22 would not be within the

same field of view as the Project. Notwithstanding, similar to the Project, future developments would be expected to occur in accordance with adopted plans, regulations, and guidelines such as height limits, density, and setback requirements, and would be reviewed by the County or City to ensure consistency with adopted guidelines and standards that relate to aesthetics. Further, many of the related projects in the area represent infill development that is not expected to be out of scale or character with the existing visual environment, as ensured through the County's and the City's environmental review processes. Therefore, cumulative impacts relative to aesthetics would be less than significant.

b. Views

Based on the distance of the related projects and intervening development, none of the related projects would affect views along Cahuenga Boulevard in the area of the Project Site or block views of the hillsides surrounding the Project Site. As such, future development in the Project area would not be expected to cumulatively obstruct public views of valued visual resources within and in the immediate vicinity of the Project Site and cumulative impacts relative to views would be less than significant.

c. Light

Development of the Project, as well as the other related projects in the area, would introduce new or expanded sources of artificial light. Consequently, ambient light levels in the Hollywood area may increase overall. However, given the proximity of the related projects to the Project Site, the additional artificial light sources introduced by these projects would not significantly alter the existing lighting environment that currently exists in the immediate Project area. In addition, each of the related projects would be required to comply with regulatory requirements which address light spill and brightness. As a result, cumulative impacts relative to light would be less than significant.

d. Glare

With regard to glare, only related development immediately adjacent to Project structures would have the potential to create glare that could collectively pose impacts affecting a given off-site use, property, or activity. Due to the distance of the related projects from the Project Site, it is unlikely that glare could have a combined effect from a particular vantage point. In addition, it is anticipated that the related projects within the vicinity of the Project Site would be subject to discretionary review to ensure that building materials to be used would not create significant sources of glare. In addition, since the Project's glare impacts would be less than significant, the Project would not contribute to

any cumulative increase in glare in combination with the related projects. As such, cumulative glare impacts would be less than significant.

5. Mitigation Measures

Impact related to aesthetics, views, light, and glare would be less than significant. No mitigation measures would be necessary.

6. Conclusion

Project-level and cumulative impacts related to aesthetics, views, light, and glare would be less than significant.

IV. Environmental Impact Analysis
B. Air Quality

1. Introduction

This section of the Draft EIR addresses the air emissions generated by construction and operation of the Project. The analysis also addresses the consistency of the Project with the air quality policies set forth within the South Coast Air Quality Management District (SCAQMD)'s Air Quality Management Plan (AQMP) and the County of Los Angeles General Plan. The analysis of Project-generated air emissions focuses on whether the Project would cause an exceedance of an ambient air quality standard or SCAQMD significance threshold. Calculation worksheets, assumptions, and model outputs used in the analysis are included in Appendix C of this Draft EIR.

2. Environmental Setting

a. Air Quality Background

The Project is located within the South Coast Air Basin (Air Basin), an approximately 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Air Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, in addition to the Coachella Valley area in Riverside County. The regional climate within the Air Basin is considered semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. The air quality within the Air Basin is primarily influenced by meteorology and a wide range of emissions sources, such as dense population centers, heavy vehicular traffic, and industry.

Air pollutant emissions within the Air Basin are generated primarily by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point and area sources. Point sources occur at a specific location and are often identified by an exhaust vent or stack. Examples include boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and include such sources as residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and some consumer products. Mobile sources refer to emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either

on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment such as when high winds suspend fine dust particles.

Both the federal and State governments have established ambient air quality standards for outdoor concentrations of various pollutants in order to protect the public health and welfare. These pollutants are referred to as "criteria air pollutants" as a result of the specific standards, or criteria, which have been adopted for them. The national and State standards have been set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. The national and State criteria pollutants and the applicable standards are listed in Table IV.B-1 on page IV.B-3.

b. Air Pollution and Potential Health Effects

Certain air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, due to their presence in elevated concentrations in the atmosphere. Such pollutants have been identified and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality within the Air Basin. The criteria air pollutants for which national and state standards have been promulgated and which are most relevant to current air quality planning and regulation in the Air Basin include ozone (O_3), respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and vinyl chloride (VC). In addition, toxic air contaminants (TAC) are of concern in the Air Basin. Each of these is briefly described below.

(1) Criteria Pollutants

(a) Ozone (O_3)

Ozone is a gas that is formed when volatile organic compounds (VOCs) and nitrogen oxides (NO_X)—both byproducts of internal combustion engine exhaust—undergo slow photochemical reactions in the presence of sunlight. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable. An elevated level of ozone irritates the lungs and breathing passages, causing coughing and pain in the chest and throat, thereby increasing susceptibility to respiratory infections and reducing the ability to exercise. Effects are more severe in people with asthma and other respiratory ailments. Long-term exposure may lead to scarring of lung tissue and may lower lung efficiency.

Table IV.B-1
Ambient Air Quality Standards

Pollutant	Averaging Period	California Standard[a]	Federal Standard[a]	SCAQMD Attainment Status[b]	
				California Standard[c]	Federal Standard[d]
Ozone (O_3)	1 hour	0.09 ppm (180 µg/m^3)	—	Non-Attainment (Extreme)	—
	8 hour	0.07 ppm (137 µg/m^3)	0.075 ppm (147 µg/m^3)	Non-Attainment	Non-Attainment
Respirable Particulate Matter (PM_{10})	24 hour	50 µg/m^3	150 µg/m^3	Non-Attainment	Non-Attainment
	Annual	20 µg/m^3	—		
Fine Particulate Matter ($PM_{2.5}$)	24 hour	—	35 µg/m^3	Non-Attainment	Non-Attainment
	Annual	12 µg/m^3	12 µg/m^3		
Carbon Monoxide (CO)	1 hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	Attainment	Attainment
	8 hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)		
Nitrogen Dioxide (NO_2)	1 hour	0.18 ppm (339 µg/m^3)	0.10 ppm (188 µg/m^3)	Non-Attainment	Unclassified/ Attainment
	Annual	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)		
Lead (Pb)	30 day average	1.5 µg/m^3	—	Non-Attainment	Non-Attainment
	Rolling 3 month average	—	0.15 µg/m^3		
Sulfur Dioxide (SO_2)	1 hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)	Attainment	Attainment
	3 hour	—	0.5 ppm (1,300 µg/m^3)		
	24 hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)		
	Annual	—	0.03 ppm (80 µg/m^3)		
Hydrogen Sulfide (H_2S)	1 hour	0.03 ppm (42 µg/m^3)	—	Unclassified	—
Vinyl Chloride	24 hour	0.01 ppm (26 µg/m^3)	—	Unclassified	—
Sulfates	24 hour	25 µg/m^3	—	Attainment	—
Visibility-Reducing Particles	8 hour	Extinction coefficient of 0.23 per kilometer (visibility of 10 miles or more due to particles when relative humidity is less than 70 percent)	—	Unclassified	—

(b) Particulate Matter (PM_{10} and $PM_{2.5}$)

The human body naturally prevents the entry of larger particles into the body. However, small particles, with an aerodynamic diameter equal to or less than 10 microns (PM_{10}) and even smaller particles with a aerodynamic diameter equal to or less than 2.5 microns ($PM_{2.5}$), can enter the body and are trapped in the nose, throat, and upper respiratory tract. These small particulates could potentially aggravate existing heart and lung diseases, change the body's defenses against inhaled materials, and damage lung tissue. The elderly, children, and those with chronic lung or heart disease are most sensitive to PM_{10} and $PM_{2.5}$. Lung impairment can persist for two to three weeks after exposure to high levels of particulate matter. Some types of particulates could become toxic after inhalation due to the presence of certain chemicals and their reaction with internal body fluids.

(c) Carbon Monoxide (CO)

CO is primarily emitted from combustion processes and motor vehicles due to incomplete combustion of fuel. Elevated concentrations of CO weaken the heart's contractions and lower the amount of oxygen carried by the blood. It is especially dangerous for people with chronic heart disease. Inhalation of CO can cause nausea, dizziness, and headaches at moderate concentrations and can be fatal at high concentrations.

(d) Nitrogen Dioxide (NO_2)

NO_2 is a byproduct of fuel combustion and major sources include power plants, large industrial facilities, and motor vehicles. The principal form of nitrogen oxide produced by combustion is nitric oxide (NO), which reacts quickly to form NO_2, creating the mixture of NO and NO_2 commonly called NO_X. NO_2 absorbs blue light and results in a brownish-red cast to the atmosphere and reduced visibility. NO_2 also contributes to the formation of PM_{10}. Nitrogen oxides irritate the nose and throat, and increase one's susceptibility to respiratory infections, especially in people with asthma. The principal concern of NO_X is as a precursor to the formation of ozone.

Effective April 12, 2010, the United States Environmental Protection Agency (USEPA) set a new 1-hour NO_2 standard at 0.10 part per million (188 $\mu g/m^3$).[1] To attain this standard, the three-year average of the 98th percentile of the daily maximum 1-hour average must not exceed 0.1 ppm. The USEPA cited evidence that short-term NO_2 exposures could contribute to adverse respiratory effects including increased asthma symptoms, worsened control of asthma, and an increase in respiratory illnesses and symptoms. The USEPA also identified that NO_2 concentrations on or near major roads can be approximately 30 to 100 percent higher than concentrations in the surrounding community, which could contribute to health effects for at-risk populations, including people with asthma, children, and the elderly.

(e) Sulfur Dioxide (SO_2)

Major sources of SO_2 include power plants, large industrial facilities, diesel vehicles, and oil-burning residential heaters. Emissions of sulfur dioxide aggravate lung diseases, especially bronchitis. It also constricts the breathing passages, especially in asthmatics and people involved in moderate to heavy exercise. SO_2 potentially causes wheezing, shortness of breath, and coughing. High levels of particulates appear to worsen the effect of sulfur dioxide, and long-term exposures to both pollutants leads to higher rates of respiratory illness.

(f) Lead (Pb)

Lead is emitted from industrial facilities and from the sanding or removal of old lead-based paint. Smelting or processing the metal is the primary source of lead emissions, which is primarily a regional pollutant. Lead affects the brain and other parts of the body's

[1] *USEPA, Final Revisions to the Primary National Ambient Air Quality Standard for Nitrogen Dioxide (NO_2), General Overview, Office of Air and Radiation Office of Air Quality Planning and Standards, January 2010, p. 11-12.*

nervous system. Exposure to lead in very young children impairs the development of the nervous system, kidneys, and blood forming processes in the body.

(g) Volatile Organic Compounds (VOCs)

VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids. Some VOCs are also classified by the State as toxic air contaminants. While there are no specific VOC ambient air quality standards, VOC is a prime component (along with NO_X) of the photochemical processes by which such criteria pollutants as ozone, nitrogen dioxide, and certain fine particles are formed. They are thus regulated as "precursors" to formation of those criteria pollutants.

(h) Vinyl Chloride (VC)

VC is a chemical building block, or monomer, used in the production of polyvinyl chloride (PVC). PVC is used to make materials, including pipes, used in the construction, packaging, electrical, and transportation industries. Major sources of VC include PVC production and fabrication facilities and, at the other end of PVC's life cycle, as PVC deteriorates, landfills and publicly-owned treatment works. VC is carcinogenic. Exposure to VC has been associated with a rare cancer, liver angiosarcoma, in workers, and with tumors of the liver, lungs, mammary glands and the nervous system in animals. The state ambient air quality standard reflects the limit of detection for VC in ambient air when the standard was promulgated, in 1978. By 1990, when state staff prepared the technical support document for identifying VC as a TAC, VC had not been detected in ambient air at any of the samplers in CARB's TAC monitoring network, although ambient hot spot sampling had detected VC at levels up to 150 percent of the standard. VC is primarily of concern as a carcinogenic TAC at hot spots. It is regulated as a TAC to allow implementation of health-protective control measures at levels below the ambient standard.[2]

(i) Hydrogen Sulfide (H_2S)

H_2S is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation. Breathing H_2S at levels above the State standard could result in exposure to a very disagreeable odor.

---

[2] *CARB, Proposed Identification of Vinyl Chloride as a Toxic Air Contaminant. Staff Report/Executive Summary, October 1990, www.arb.ca.gov/toxics/id/summary/vinyl.pdf, accessed March 5, 2014.*

(2) Toxic Air Contaminants (TACs)

TACs refer to a diverse group of "non-criteria" air pollutants that can affect human health, but have not had ambient air quality standards established for them. This is not because they are fundamentally different from the pollutants discussed above, but because their effects tend to be local rather than regional. TACs are classified as carcinogenic and noncarcinogenic, where carcinogenic TACs can cause cancer and noncarcinogenic TAC can cause acute and chronic impacts to different target organ systems (e.g., eyes, respiratory, reproductive, developmental, nervous, and cardiovascular).

The California Air Resources Board (CARB) and the Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified, or "listed," as a TAC in California. The complete list of such substances is located at www.arb.ca.gov/toxics/id/taclist.htm.

Diesel PM (DPM), which is emitted in the exhaust from diesel engines, was listed by the State as a TAC in 1998. DPM has historically been used as a surrogate measure of exposure for all diesel exhaust emissions. DPM consists of fine particles (fine particles have a diameter less than 2.5 µm), including a subgroup of ultrafine particles (ultrafine particles have a diameter less than 0.1 µm). Collectively, these particles have a large surface area which makes them an excellent medium for absorbing organics. The visible emissions in diesel exhaust include carbon particles or "soot." Diesel exhaust also contains a variety of harmful gases and cancer-causing substances.

Exposure to DPM may be a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. DPM levels and resultant potential health effects may be higher in close proximity to heavily traveled roadways with substantial truck traffic or near industrial facilities. According to CARB, DPM exposure may lead to the following adverse health effects: (1) Aggravated asthma; (2) Chronic bronchitis; (3) Increased respiratory and cardiovascular hospitalizations; (4) Decreased lung function in children; (5) Lung cancer; and (6) Premature deaths for people with heart or lung disease.[3,4]

To provide a perspective on the contribution that DPM has on the overall Statewide average ambient air toxics potential cancer risk, CARB evaluated risks from specific

[4] *CARB, Fact Sheet: Diesel Particulate Matter Health Risk Assessment Study for the West Oakland Community: Preliminary Summary of Results, March 2008, www.arb.ca.gov/ch/communities/ra/westoakland/documents/factsheet0308.pdf, accessed March 5, 2014.*

compounds using data from CARB's ambient monitoring network. CARB maintains a 21-site air toxics monitoring network which measures outdoor ambient concentration levels of approximately 60 air toxics. CARB has determined that, of the top ten inhalation risk contributors, DPM contributes approximately 71 percent of the total potential cancer risk.[5]

c. Regulatory Framework

The Project Site and vicinity are subject to federal, State, and local air quality laws and regulations. A number of plans and policies have been adopted by various agencies that address air quality concerns. Those laws, regulations, plans, and policies that are relevant to the Project are discussed below.

(1) Criteria Pollutants

(a) Federal

The Federal Clean Air Act (CAA) was first enacted in 1955 and has been amended numerous times in subsequent years, with the most recent amendments in 1990. At the federal level, the USEPA is responsible for implementation of some portions of the CAA (e.g., certain mobile source and other requirements). Other portions of the CAA (e.g., stationary source requirements) are implemented by state and local agencies.

The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA which are most applicable to the Project include Title I (Nonattainment Provisions) and Title II (Mobile Source Provisions).

Title I provisions are implemented for the purpose of attaining NAAQS. Table IV.B-1 on page IV.B-3 shows the NAAQS currently in effect for each criteria pollutant and their relative attainment status. The CAA provides deadlines for meeting the NAAQS within the Air Basin including the following: (1) 1-hour O_3 by the year 2010; (2) 8-hour O_3 by the year 2024; (3) PM_{10} by the year 2006; and (4) $PM_{2.5}$ by the year 2015. Although the deadline for PM_{10} has passed, the Air Basin met the PM_{10} standard in 2006 at all stations except for western Riverside. In addition, the only air monitoring station that is currently exceeding or projected to exceed the 24-hour $PM_{2.5}$ standard is within western Riverside.[6] Los Angeles

[5] *SCAQMD 2000. "Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-II)." Draft Report. South Coast Air Quality Management District, Diamond Bar, California. Executive summary.*

[6] *South Coast Air Quality Management District, 2012 AQMP.*

County exceeds the lead NAAQS as the result of a large lead-acid battery recycling facility near downtown Los Angeles. As demonstrated in the 2012 Lead State Implementation Plan for Los Angeles County, Los Angeles County will meet the NAAQS for lead by the year 2016.

Nonattainment designations are categorized into seven levels of severity: (1) basic; (2) marginal; (3) moderate; (4) serious; (5) severe-15; (6) severe-17; and (7) extreme.[7] On June 11, 2007, the USEPA reclassified the Air Basin as a federal "attainment" area for CO and approved the Air Basin's CO maintenance plan.[8] The Air Basin fails to meet national standards for O_3, PM_{10}, and $PM_{2.5}$ and, therefore, is considered a federal "non-attainment" area for these pollutants. In addition, Los Angeles County fails to meet the national standard for lead and, therefore, is considered a federal "non-attainment" area for lead.

Title II of the CAA pertains to mobile sources, such as cars, trucks, buses, and planes. Reformulated gasoline and automobile pollution control devices are examples of the mechanisms the USEPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emission standards for vehicles, which have been strengthened in recent years to improve air quality. For example, the standards for NO_X emissions have been lowered substantially and the specification requirements for cleaner burning gasoline are more stringent.

(b) State

The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of the State to achieve and maintain the California Ambient Air Quality Standards (CAAQS) by the earliest practicable date. The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (Cal EPA), is responsible for the coordination and administration of both State and federal air pollution control programs within California. In this capacity, the CARB conducts research, sets State ambient air quality standards, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. The CARB establishes emissions standards for motor vehicles sold in California, consumer products, and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. Table IV.B-1 on page IV.B-3 includes the CAAQS currently in effect for each of the criteria pollutants as well as other pollutants recognized by the State. As shown in Table IV.B-1,

---

[7] *The "-15" and "-17" designations reflect the number of years within which attainment must be achieved.*

[8] *"Approval and Promulgation of Implementation Plans and Designation of Areas for Air Quality Planning Purposes: California, Final Rule." Federal Register 72 (11 May 2007):26718-26721.*

the CAAQS include more stringent standards than the national ambient air quality standards.

The CARB published the *Air Quality and Land Use Handbook* on April 28, 2005 (the "CARB Handbook"), to serve as a general guide for considering health effects associated with siting sensitive receptors proximate to sources of TAC emissions. The recommendations provided therein are voluntary and do not constitute a requirement or mandate for either land use agencies or local air districts. The goal of the guidance document is to protect sensitive receptors, such as children, the elderly, acutely ill, and chronically ill persons, from exposure to TAC emissions. Some examples of CARB's siting recommendations include the following: (1) avoid siting sensitive receptors within 500 feet of a freeway, urban road with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day; (2) avoid siting sensitive receptors within 1,000 feet of a distribution center (that accommodates more than 100 trucks per day, more than 40 trucks with operating transport refrigeration units per day, or where transport refrigeration unit operations exceed 300 hours per week); and (3) avoid siting sensitive receptors within 300 feet of any dry cleaning operation using perchloroethylene and within 500 feet of operations with two or more machines.

(c) Regional

(i) South Coast Air Quality Management District

The SCAQMD shares responsibility with CARB for ensuring that all State and federal ambient air quality standards are achieved and maintained throughout all of Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino counties. The SCAQMD has jurisdiction over an area of approximately 10,743 square miles. This area includes all of Orange County and Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Air Basin is a subregion of the SCAQMD jurisdiction.

In order to meet the CAAQS and NAAQS, the SCAQMD has adopted a series of Air Quality Management Plans (AQMPs). The 2012 AQMP incorporates the latest scientific and technological information and planning assumptions, including SCAG's 2012 Regional Transportation Plan/Sustainable Communities Strategy (2012–2035 RTP/SCS) and updated emission inventory methodologies for various source categories. The 2012 AQMP also includes the new and changing federal requirements, implementation of new technology measures, and the continued development of economically sound, flexible compliance approaches.

The AQMP provides emissions inventories, ambient measurements, meteorological episodes, and air quality modeling tools. The AQMP also provides policies and measures to guide responsible agencies in achieving federal standards for healthful air quality in the Basin. It also incorporates a comprehensive strategy aimed at controlling pollution from all sources, including stationary sources, on-road and off-road mobile sources, and area sources.

The SCAQMD adopts rules and regulations to implement portions of the AQMP. Several of these rules may apply to construction or operation of the Project. For example, SCAQMD Rule 403 requires the implementation of best available fugitive dust control measures during active construction periods capable of generating fugitive dust emissions from on-site earth-moving activities, construction/demolition activities, and construction equipment travel on paved and unpaved roads.

Although the SCAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate the air quality issues associated with new development projects within the Air Basin, such as the Project. Instead, the SCAQMD published the *CEQA Air Quality Handbook* in November 1993 to assist lead agencies, as well as consultants, project proponents, and other interested parties, in evaluating potential air quality impacts of projects proposed in the Air Basin. The *CEQA Air Quality Handbook* provides standards, methodologies, and procedures for conducting air quality analyses in EIRs and was used extensively in the preparation of this analysis. The SCAQMD is currently in the process of replacing the *CEQA Air Quality Handbook* with the *Air Quality Analysis Guidance Handbook*.

In order to assist the CEQA practitioner in conducting an air quality analysis in the interim while the replacement *Air Quality Analysis Guidance Handbook* is being prepared, supplemental guidance/information is provided on the SCAQMD website (www.aqmd.gov/ceqa/hdbk.html) and includes: (1) EMFAC 2011 on-road vehicle emission factors; (2) background CO concentrations; (3) localized significance thresholds; (4) mitigation measures and control efficiencies; (5) mobile source toxics analysis; (6) off-road mobile source emission factors; (7) $PM_{2.5}$ significance thresholds and calculation methodology; and (8) updated SCAQMD Air Quality Significance Thresholds. The SCAQMD also recommends using approved models to calculate emissions from land use projects, such as CalEEMod. These recommendations were followed in the preparation of this analysis.

The SCAQMD has also adopted land use planning guidelines in the *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning* (May 2005), which considers impacts to sensitive receptors from facilities that emit TAC emissions. SCAQMD's siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for sensitive land uses proposed in proximity of

freeways and high-traffic roads, and the same siting criteria for distribution centers and dry cleaning facilities). The SCAQMD's document introduces land use-related policies that rely on design and distance parameters to minimize emissions and lower potential health risk. SCAQMD's guidelines are voluntary initiatives recommended for consideration by local planning agencies.

(ii) Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties, and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG coordinates with various air quality and transportation stakeholders in Southern California to ensure compliance with the federal and State air quality requirements, including the Transportation Conformity Rule and other applicable federal, State, and air district laws and regulations. As the federally designated Metropolitan Planning Organization (MPO) for the six-county Southern California region, SCAG is required by law to ensure that transportation activities "conform" to, and are supportive of, the goals of regional and State air quality plans to attain the NAAQS. In addition, SCAG is a co-producer, with the SCAQMD, of the transportation strategy and transportation control measure sections of the AQMP for the Basin. With regard to future growth, SCAG has prepared the Regional Transportation Plan (RTP) which provides population, housing, and employment projections for cities under its jurisdiction. The growth projections in the RTP are based on projections originating under County and City General Plans. The RTP growth projections are used in the preparation of the air quality forecasts and consistency analysis included in the SCAQMD's AQMP.

(d) Local

(i) County of Los Angeles General Plan

Local jurisdictions, such as the County of Los Angeles, have the authority and responsibility to reduce air pollution through their police power and decision-making authority. Specifically, the County is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. Refer to Section IV.H, Land Use, of this Draft EIR for a listing of the General Plan policies that pertain to air quality.

(2) Toxic Air Contaminants

The California Air Toxics Program (see www.arb.ca.gov/toxics/toxics.htm) was established in 1983, when the California Legislature adopted AB 1807 to establish a two-step process of risk identification and risk management to address potential health effects from exposure to toxic substances in the air. In the risk identification step, CARB and the

Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified, or "listed," as a toxic air contaminant (TAC) in California. Since inception of the program, a number of such substances have been listed (see www.arb.ca.gov/toxics/id/taclist.htm). In 1993, the California Legislature amended the program to identify the 189 federal hazardous air pollutants (HAPs) as TACs.

In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce risk. Based on results of that review, CARB has promulgated a number of airborne toxic control measures (ATCMs), both for mobile and stationary sources (see www.arb.ca.gov/toxics/atcm/atcm.htm). In 2004, CARB adopted an ATCM to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In addition to limiting exhaust from idling trucks, CARB recently promulgated emission standards for off-road diesel construction equipment such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation, adopted by the CARB on July 26, 2007, aims to reduce emissions by installation of diesel particulate filters and encouraging the replacement of older, dirtier engines with newer emission controlled models. Implementation is staggered based on fleet size, with the largest operators beginning compliance in 2014.[9]

The AB 1807 program is supplemented by the AB 2588 Air Toxics "Hot Spots" program, which was established by the California Legislature in 1987. Under this program, facilities are required to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks if present. In 1992, the AB 2588 program was amended by SB 1731 to require facilities that pose a significant health risk to the community to reduce their risk through implementation of a risk management plan.

SCAQMD has adopted two rules to limit cancer and noncancer health risks from facilities located within its jurisdiction. Rule 1401 (New Source Review of Toxic Air Contaminants) regulates new or modified facilities, and Rule 1402 (Control of Toxic Air Contaminants from Existing Sources) regulates facilities that are already operating.

[9] *CARB, In-Use Off-Road Diesel Vehicle Regulation, www.arb.ca.gov/msprog/ordiesel/ordiesel.htm, last reviewed September 13, 2013, accessed March 5, 2014.*

Rule 1402 incorporates requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities.

d. Existing Air Quality Conditions

(1) Regional Air Quality

The Southern California region lies in the semi-permanent high-pressure zone of the eastern Pacific. As a result, the climate is mild, tempered by cool sea breezes. The usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The extent and severity of the air pollution problem in the Air Basin is a function of the area's natural physical characteristics (weather and topography), as well as man-made influences (development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and dispersion of pollutants throughout the Air Basin, making it an area of high pollution potential.

The greatest air pollution impacts throughout the Air Basin occur from June through September. This condition is generally attributed to the large amount of pollutant emissions, light winds, and shallow vertical atmospheric mixing. This frequently reduces pollutant dispersion, thus causing elevated air pollution levels. Pollutant concentrations in the Air Basin vary with location, season, and time of day. Ozone concentrations, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Air Basin and adjacent desert. Over the past 30 years, substantial progress has been made in reducing air pollution levels in Southern California. However, the Air Basin still fails to meet national standards for ozone, PM_{10}, and $PM_{2.5}$. In addition, Los Angeles County still fails to meet the national standard for lead.

The SCAQMD has released an Air Basin-wide air toxics study (MATES III, Multiple Air Toxics Exposure Study, September 2008). The MATES III Study represents one of the most comprehensive air toxics studies ever conducted in an urban environment. The Study was aimed at estimating the cancer risk from toxic air emissions throughout the Air Basin by conducting a comprehensive monitoring program, an updated emissions inventory of toxic air contaminants, and a modeling effort to fully characterize health risks for those living in the Air Basin. The Study concluded that the average carcinogenic risk from air pollution in the Air Basin is approximately 1,200 in one million over a 70-year duration. Mobile sources (e.g., cars, trucks, trains, ships, aircraft, etc.) represent the greatest contributors. Approximately 85 percent of the risk is attributed to diesel particulate emissions, approximately 10 percent to other toxics associated with mobile sources (including benzene, butadiene, and formaldehyde), and approximately five percent of all

carcinogenic risk is attributed to stationary sources (which include industries and other certain businesses, such as dry cleaners and chrome plating operations).

As part of the MATES III Study, the SCAQMD prepared a series of maps that show regional trends in estimated outdoor inhalation cancer risk from toxic emissions, as part of an ongoing effort to provide insight into relative risks. The maps' estimates represent the number of potential cancers per million people associated with a lifetime of breathing air toxics (24 hours per day outdoors for 70 years) in parts of the area. The MATES III map is the most recently available map to represent existing conditions near the Project area. The estimated cancer risk for the vast majority of the urbanized area within the Air Basin ranges from 251 to 3,692 cancers per million over a 70-year duration.[10] Generally, the risk from air toxics is lower near the coastline and it increases inland, with higher risks concentrated near large diesel sources (e.g., freeways, airports, and ports).

(2) Local Air Quality

Air pollutant emissions are generated in the local vicinity by stationary and area-wide sources, such as commercial and industrial activity, space and water heating, landscape maintenance, consumer products, and mobile sources primarily consisting of automobile traffic. Motor vehicles are the primary source of pollutants in the local vicinity.

(a) Existing Pollutant Levels at Nearby Monitoring Stations

The SCAQMD maintains a network of air quality monitoring stations located throughout the Air Basin and has divided the Air Basin into 27 source receptor areas (SRAs) in which 31 monitoring stations operate. Figure IV.B-1 on page IV.B-16 shows the locations of the SRAs located in central Los Angeles County. The Project Site is located within SRA 1, which covers the Central Los Angeles area. The monitoring station most representative of the Project Site is the North Main Street Station, located at 1630 North Main Street in the City of Los Angeles, approximately 6.9 miles southeast of the Project Site. Criteria pollutants monitored at this station include PM_{10}, $PM_{2.5}$, O_3, CO, NO_2, lead, and sulfate. Table IV.B-2 on page IV.B-17 identifies the national and State ambient air quality standards for relevant air pollutants along with the ambient pollutant concentrations that have been measured in SRA 1 through the period of 2010 to 2012.

(b) Existing Health Risk in the Surrounding Area

As shown above in Figure IV.B-2 on page IV.B-19, based on the Mates III Study, the Project Site is located within a cancer risk zone of 940 in one million over a 70-year duration. The cancer risk in this area is predominately related to nearby sources of diesel particulate (e.g., the Hollywood Freeway (US-101)). In general, the risk at the Project Site is comparable with other urbanized areas in the central Los Angeles area that are near large diesel sources (e.g., freeways, airports, and ports).

(c) Surrounding Uses

As shown in Figure IV.B-3 on page IV.B-20, the area surrounding the Project Site includes a mix of residential uses and open space. Specifically, the Project Site is bounded by 4-story multi-family residential buildings and open space to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The majority of these uses are separated from the developed areas of the Project Site by

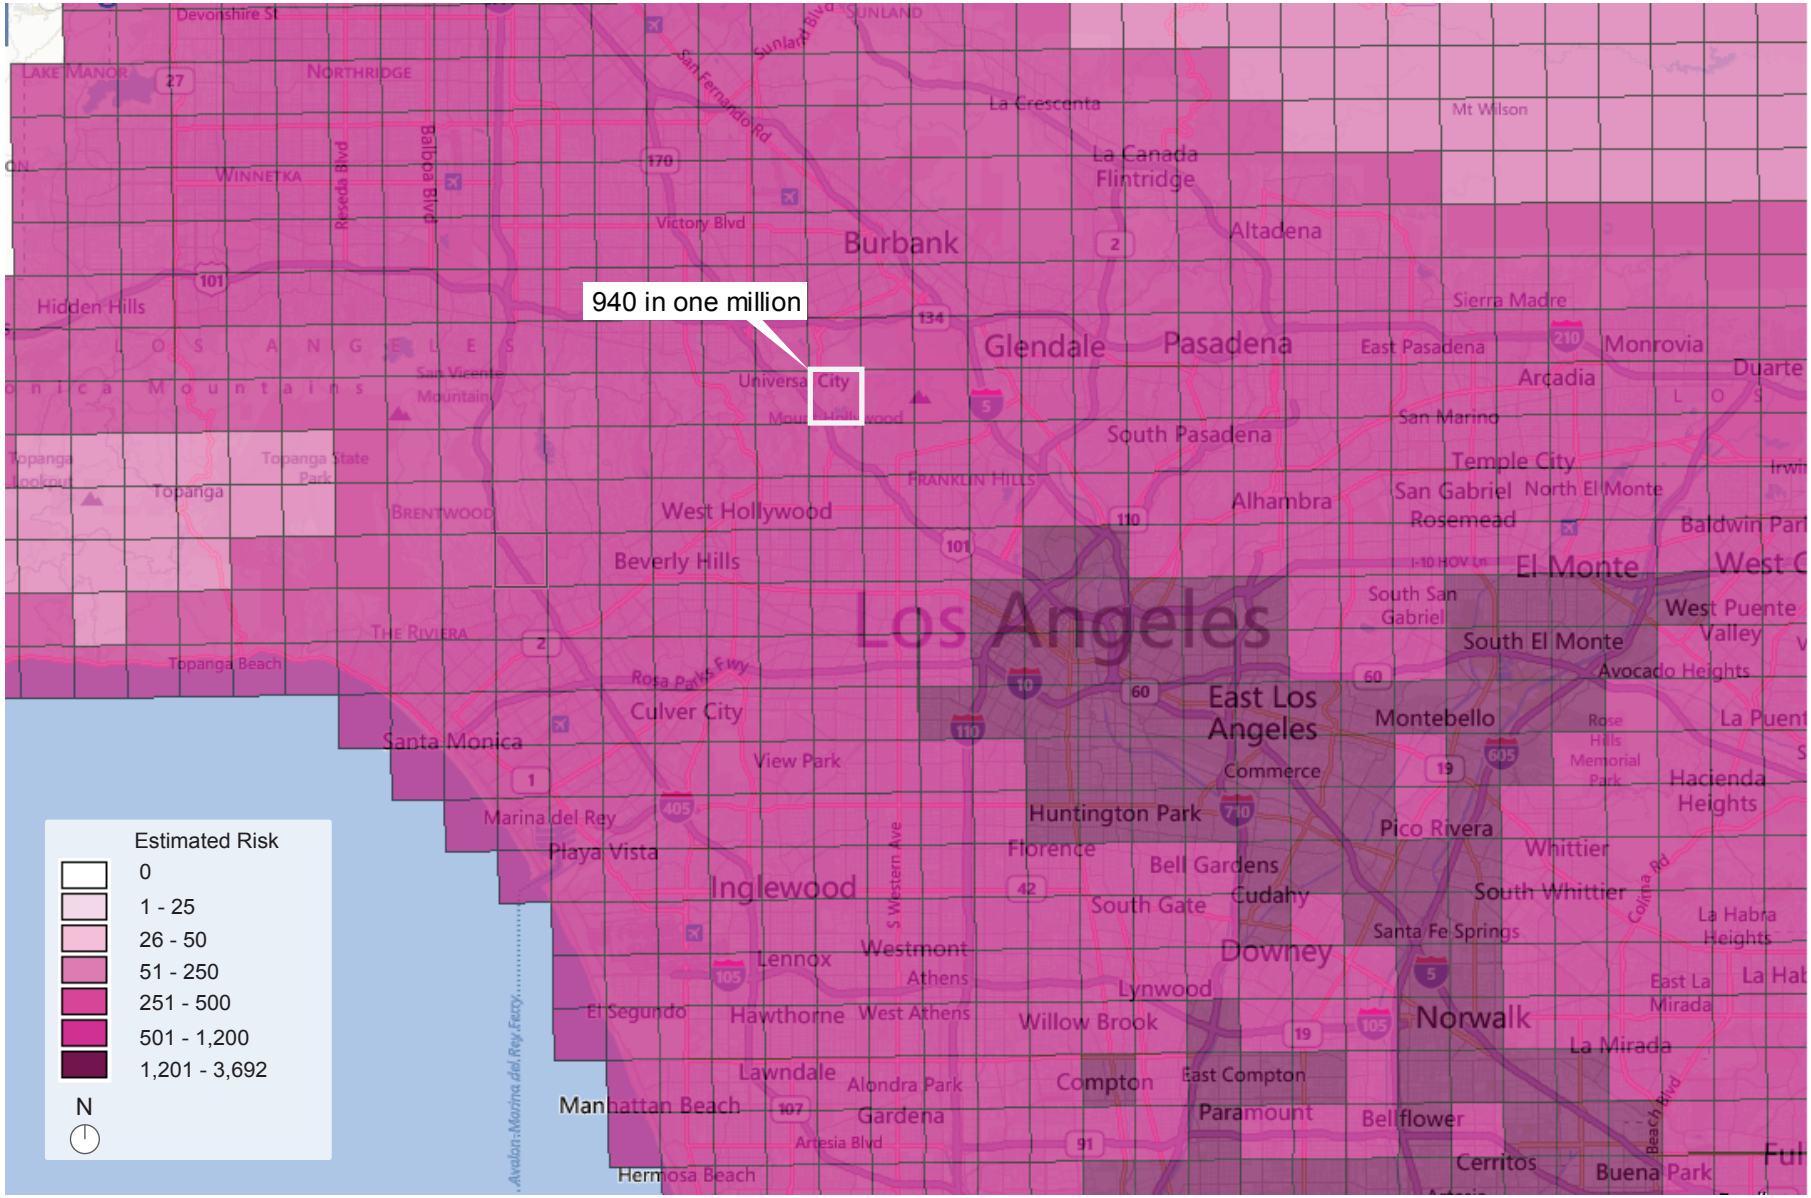

Figure IV.B-2
MATES III Total Cancer Risk for Project Area

Source: South Coast AQMD, 2013.

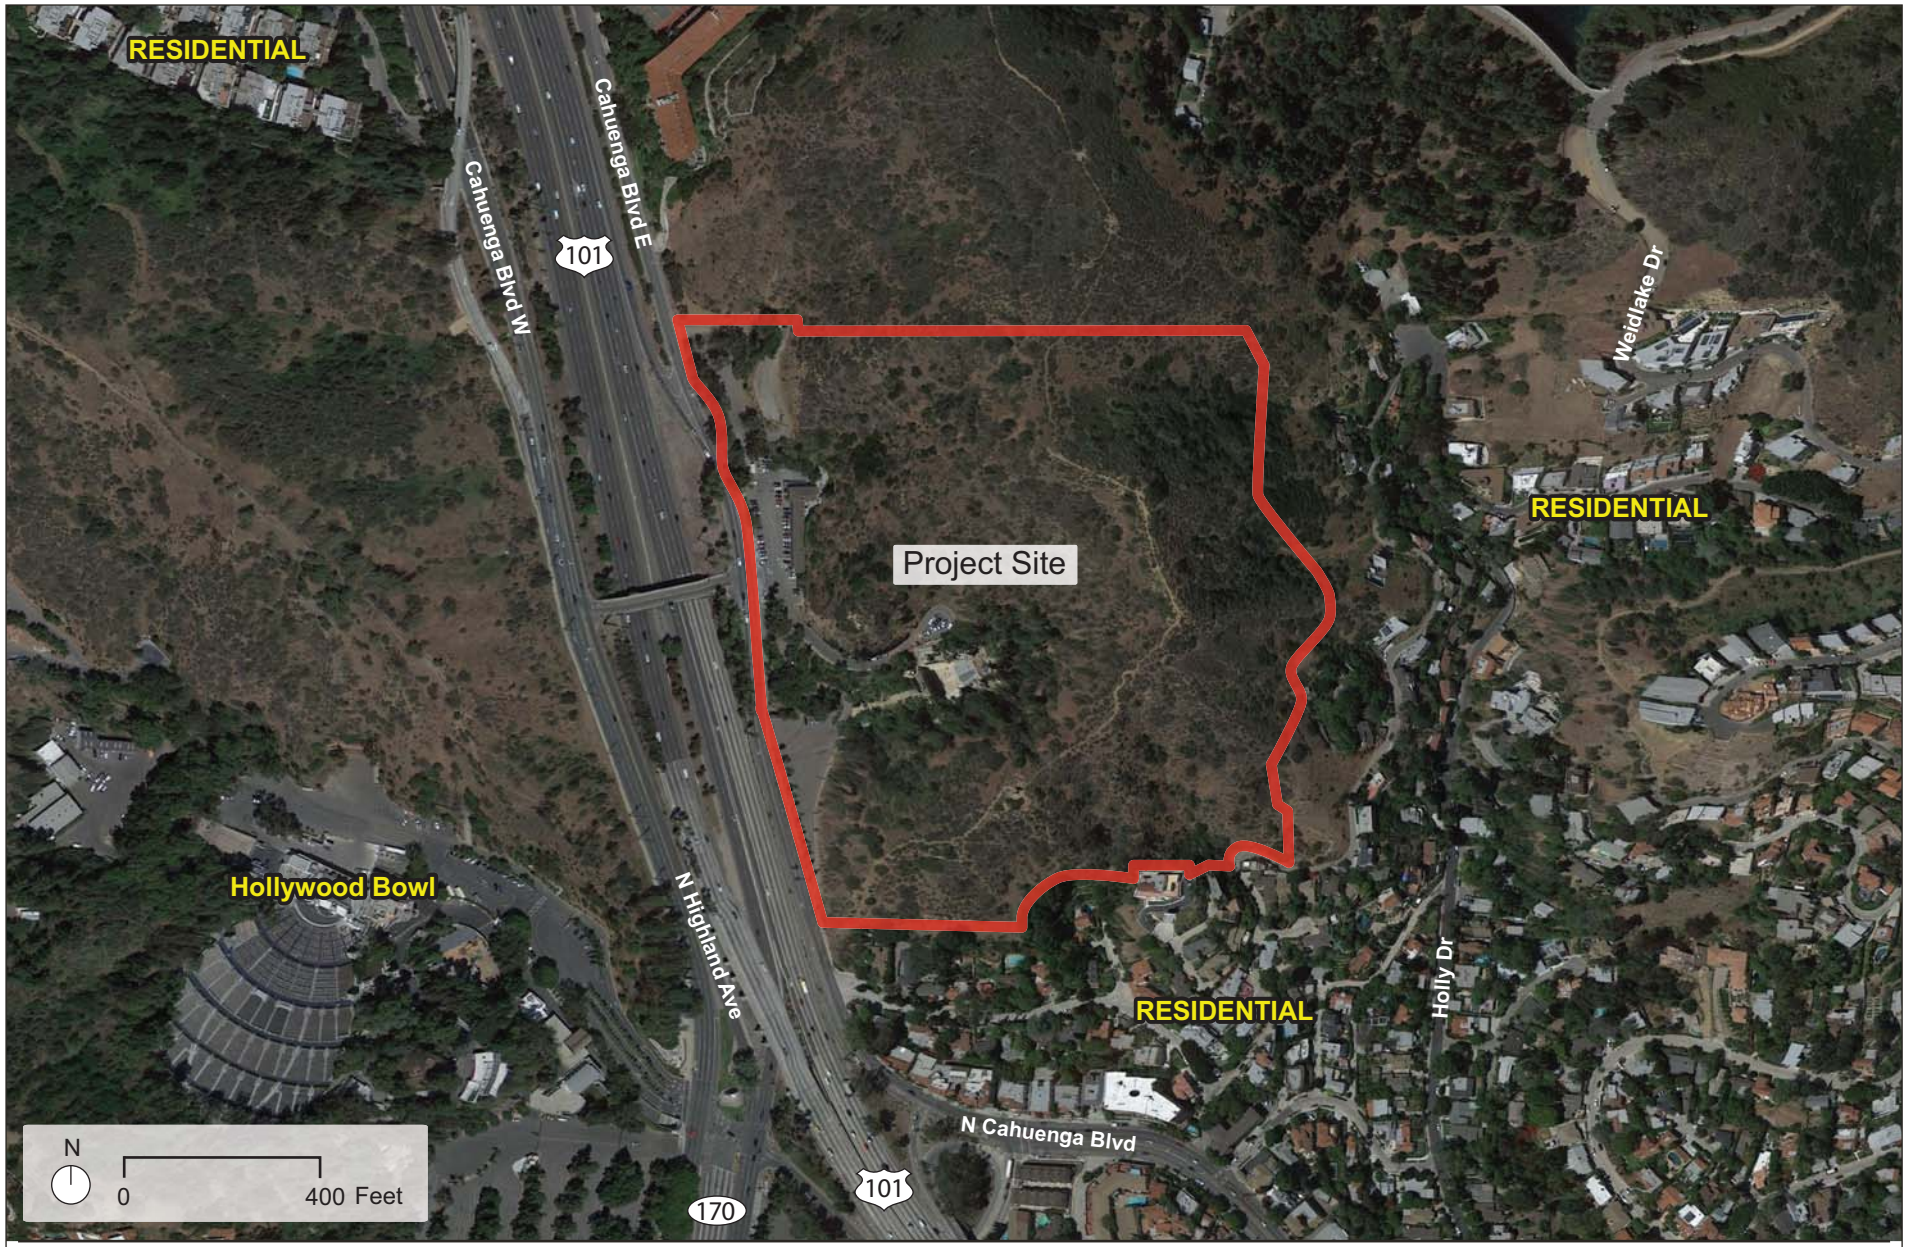

Figure IV.B-3
Air Quality Sensitive Receptors

Source: Google Earth Pro, 2014.

open space areas and the steep topography formed by the canyon setting of the Project Site. The Hollywood Bowl, also a County-owned historically significant cultural destination, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.

Some population groups including children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to air pollution than others. Sensitive land uses in the Project vicinity include residential uses discussed above and are shown in Figure IV.B-3 on page IV.B-20.

(d) Existing Project Site Emissions

The approximately 32-acre Project Site currently includes the open-air 1,196-seat Amphitheatre with support spaces (i.e., dressing rooms, performer restrooms, green room) below; an 860-square-foot projection booth and control room located above the Amphitheatre seating; an indoor venue located below the Amphitheatre providing approximately 87 seats referred to as [Inside] the Ford; a two-story, approximately 320-square-foot concessions building; a 365-square-foot box office; a plaza referred to as Edison Plaza and a picnic area; surface parking areas; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission, and the Los Angeles Philharmonic. Other facility support spaces such as storage and maintenance areas and restrooms are also located throughout the Project Site. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet while the outdoor plaza areas comprise approximately 3,580 square feet.

Existing operations generate air pollutant emissions from a variety of sources. Mobile source emissions are generated by motor vehicle trips to and from the Project Site. Area source emissions are generated by maintenance equipment, landscape equipment, and use of products that contain solvents. An estimate of these emissions is presented in Table IV.B-3 on page IV.B-22.

3. Environmental Impacts

a. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to air quality would be significant if the Project would:

- Conflict with or obstruct implementation of the applicable air quality plan;

Table IV.B-3
Existing Project Site Regional Operational Emissions
(pounds per day)

Emission Source	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Area	4	<1	<1	<1	<1	<1
Mobile	6	16	63	<1	8	2
Total Existing Emissions	**10**	**16**	**63**	**<1**	**8**	**2**

Source: Matrix Environmental, 2014.

- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;

- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)? Expose sensitive receptors to substantial pollutant concentrations; or

- Create objectionable odors affecting a substantial number of people.

(1) Construction Emissions

In the context of the questions above from Appendix G of the CEQA Guidelines, the specific thresholds of significance for construction air quality emissions are based on the thresholds set forth by the SCAQMD. Specifically, based on criteria set forth in the SCAQMD's *CEQA Air Quality Handbook*,[11] the Project would have a significant impact with regard to construction emissions if any of the following would occur:

- Regional emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed threshold levels: (1) 100 pounds per day for NO_X; (2) 75 pounds a day for VOC; (3) 150 pounds per day for PM_{10} or SO_X; (4) 55 pounds per day for $PM_{2.5}$; and (5) 550 pounds per day for CO.

- Maximum on-site daily localized emissions exceed the Localized Significance Thresholds (LST), resulting in predicted ambient concentrations in the vicinity of the Project Site greater than the most stringent ambient air quality standards for CO (20 ppm [23,000 µg/m^3] over a 1-hour period or 9.0 ppm [10,350 µg/m^3]

[11] *SCAQMD, CEQA Air Quality Handbook, www.aqmd.gov/ceqa/handbook/signthres.pdf, accessed March 7, 2014.*

averaged over an 8-hour period) and NO_2 (0.18 ppm [338.4 µg/m^3] over a 1-hour period, 0.1 ppm [188 µg/m^3] over a three-year average of the 98th percentile of the daily maximum 1-hour average, or 0.03 ppm [56.4 µg/m^3] averaged over an annual period).

- Maximum on-site localized PM_{10} or $PM_{2.5}$ emissions during construction exceed the applicable LSTs, resulting in predicted ambient concentrations in the vicinity of the site to exceed the incremental 24-hr threshold of 10.4 µg/m^3 or 1.0 µg/m^3 PM_{10} averaged over an annual period.

(2) Operational Emissions

In the context of the questions above from Appendix G of the CEQA Guidelines, the specific thresholds of significance for operation air quality emissions are based on the thresholds set forth by the SCAQMD. Specifically, based on criteria set forth in the SCAQMD's *CEQA Air Quality Handbook*,[12] the Project would have a significant impact on air quality from project operations if any of the following would occur:

- Regional emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed threshold levels: (1) 55 pounds per day for NO_X; (2) 55 pounds a day for VOC; (3) 150 pounds per day for PM_{10} or SO_X; (4) 55 pounds per day for $PM_{2.5}$; and (5) 550 pounds per day for CO.[13]

- Maximum on-site daily localized emissions exceed the Localized Significance Thresholds (LST), resulting in predicted ambient concentrations in the vicinity of the Project Site greater than the most stringent ambient air quality standards for CO (20 parts per million (ppm) over a 1-hour period or 9.0 ppm averaged over an 8-hour period) and NO_2 (0.18 ppm over a 1-hour period, 0.1 ppm over a 3-year average of the 98th percentile of the daily maximum 1-hour average, or 0.03 ppm averaged over an annual period).[14]

- Maximum on-site localized operational PM_{10} and $PM_{2.5}$ emissions exceed the incremental 24-hr threshold of 2.5 µg/m^3 or 1.0 µg/m^3 PM_{10} averaged over an annual period.[15]

[15] *SCAQMD, Final-Methodology to Calculate Particulate Matter (PM) 2.5 and $PM_{2.5}$ Significance Thresholds, October 2006.*

- The project causes or contributes to an exceedance of the California 1-hour or 8-hour CO standards of 20 or 9.0 ppm, respectively; or

- The project creates an odor nuisance pursuant to SCAQMD Rule 402 (i.e., objectionable odor at the nearest sensitive receptor).

(3) Toxic Air Contaminants

In the context of the questions above from Appendix G of the CEQA Guidelines, the specific thresholds of significance for toxic air contaminant impacts are based on the thresholds set forth by the SCAQMD. Specifically, based on criteria set forth in the SCAQMD's *CEQA Air Quality Handbook*,[16] the Project would have a significant impact on air quality from toxic air contaminants if any of the following would occur:[17]

- The Project emits carcinogenic or toxic air contaminants that exceed the maximum incremental cancer risk of 10 in one million or an acute or chronic hazard index of 1.0.[18] For projects with a maximum incremental cancer risk between 1 in one million and 10 in one million, a project would result in a significant impact if the cancer burden exceeds 0.5 excess cancer cases.

- Hazardous materials associated with on-site stationary sources result in an accidental release of air toxic emissions or acutely hazardous materials posing a threat to public health and safety.

- The Project would be occupied primarily by sensitive individuals within 0.25 mile of any existing facility that emits air toxic contaminants which could result in a health risk for pollutants identified in District Rule 1401.

(4) Consistency with Applicable Air Quality Plans

Section 15125 of the State CEQA Guidelines requires an analysis of project consistency with applicable governmental plans and policies. In accordance with the SCAQMD's *CEQA Air Quality Handbook*,[19] the following criteria were used to evaluate the

---

[16] *SCAQMD, CEQA Air Quality Handbook, www.aqmd.gov/ceqa/handbook/signthres.pdf, accessed March 7, 2014.*

[17] *SCAQMD, CEQA Air Quality Handbook, Chapter 6 (Determining the Air Quality Significance of a project) and Chapter 10 (Assessing Toxic Air Pollutants), April 1993.*

[18] *Hazard index is the ratio of a toxic air contaminant's concentration divided by its Reference Concentration, or safe exposure level. If the hazard index exceeds one, people are exposed to levels of TACs that may pose noncancer health risks.*

[19] *SCAQMD, CEQA Air Quality Handbook, April 1993. p. 12-3.*

Project's consistency with SCAQMD and SCAG regional plans and policies, including the AQMP:

- Will the Project result in any of the following:
  - An increase in the frequency or severity of existing air quality violations;
  - Cause or contribute to new air quality violations; or
  - Delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP?
- Will the Project exceed the assumptions utilized in preparing the AQMP?
  - Is the Project consistent with the population and employment growth projections upon which AQMP forecasted emission levels are based;
  - Does the Project include air quality mitigation measures; or
  - To what extent is Project development consistent with the AQMP land use policies?
- The Project's impacts with respect to these criteria are discussed to assess the consistency with the SCAQMD's AQMP and SCAG regional plans and policies.

b. Air Quality Analysis Methodology

This analysis focuses on the potential change in the air quality environment due to implementation of the Project. Air pollutant emissions associated with the Project would result from construction and operation of the proposed development. Specific analysis methodologies are discussed below.

(1) Construction Emissions Methodology

(a) Regional

Daily regional emissions during construction were forecasted by assuming a conservative start date (i.e., assuming all construction would occur at the earliest feasible date) and applying the mobile-source and fugitive dust emissions factors derived from the SCAQMD recommended California Emissions Estimator Model (CalEEMod). Details of the modeling assumptions and emission factors are provided in Appendix C of this Draft EIR. The calculations of the emissions generated during Project construction activities reflect the types and quantities of construction equipment that would be used to remove existing pavement; grade and excavate the Project Site; construct the proposed buildings and

related improvements; and plant new landscaping within the Project Site. Construction tasks were aggregated to reflect overlapping tasks and identify the maximum construction emissions occurring over the course of Project construction.

(b) Localized

The localized effects from the on-site portion of daily emissions were evaluated at sensitive receptor locations potentially impacted by the Project according to the SCAQMD's LST methodology, which uses on-site mass emissions rate look-up tables and Project-specific modeling, where appropriate.[20] SCAQMD provides LSTs applicable to the following criteria pollutants: NO_X, CO, PM_{10}, and $PM_{2.5}$. SCAQMD does not provide an LST for SO_2, since land use development projects typically result in negligible construction and long-term operation emissions of this pollutant. Since VOCs are not a criteria pollutant, there is no ambient standard or SCAQMD LST for VOCs. Due to the role VOCs play in ozone formation, it is classified as a precursor pollutant, and only a regional emissions threshold has been established.

LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or State ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area and distance to the nearest sensitive receptor. For PM_{10} and $PM_{2.5}$, LSTs were derived based on requirements in SCAQMD Rule 403, Fugitive Dust. The mass rate look-up tables were developed for each source receptor area and can be used to determine whether or not a project may generate significant adverse localized air quality impacts. SCAQMD provides LST mass rate look-up tables for projects with active construction areas that are less than or equal to 5 acres. For projects that exceed 5 acres, the 5-acre LST look-up values can be used as a screening tool to determine which pollutants require detailed analysis.[21] This approach is conservative as it assumes that all on-site emissions would occur within a 5-acre area and would over predict potential localized impacts (i.e., more pollutant emissions occurring within a smaller area and within closer proximity to potential sensitive receptors). If the project exceeds the LST look-up values, then the SCAQMD recommends that project specific air quality modeling be performed.

[20] *SCAQMD, LST Methodology Appendix C-Mass Rate LST Look-up Table, www.aqmd.gov/ceqa/handbook/LST/appC.pdf, revised October 2009, accessed March 7, 2014.*

[21] *Telephone Conversation, Ian MacMillan, SCAQMD CEQA Program Supervisor, November 10, 2011.*

(2) Operational Emissions Methodology

(a) Regional

Analysis of the Project's likely impact on regional air quality during long-term Project operations (i.e., after construction is complete) looks at three types of sources: (1) mobile; (2) area; and (3) energy. Mobile source emissions are generated by the increase in motor vehicle trips to and from the Project Site associated with operation of the Project. Area source emissions are generated by, among other things, landscape equipment, an emergency generator, and the use of consumer products. Energy source emissions are generated as a result of activities in buildings for which natural gas is used (e.g., natural gas for heat or cooking).

Similar to construction, SCAQMD's CalEEMod software was used for the evaluation of Project operational emissions. CalEEMod was used to calculate mobile source emissions, on-road fugitive dust, architectural coatings, landscape equipment, and energy use. To determine if a significant air quality impact would occur, the net increase in regional operational emissions generated by the Project was compared against the SCAQMD's significance thresholds.[22]

(b) Localized

The general procedure for evaluating localized impacts from project operations is to evaluate any new or modified stationary combustion sources, and to study the likely effect on CO concentrations of induced traffic at nearby intersections.

Effects related to the operation of stationary-source combustion equipment associated with the Project, and associated PM_{10} emissions, are evaluated by conducting a screening-level analysis followed by a more detailed analysis (i.e., dispersion modeling) as necessary. The screening-level analysis consists first of reviewing the Project and related projects to identify any new or modified stationary-source combustion equipment. Then, if such equipment is identified, the potential significance of its impact is evaluated qualitatively in light of applicable regulations and operating parameters and a comparison to SCAQMD LSTs. If the screening level evaluation does not rule out significant impacts, a more detailed analysis is conducted. For the detailed analysis, downwind sensitive receptor locations are identified, and site-specific dispersion modeling is conducted to

[22] *SCAQMD Air Quality Significance Thresholds (Rev. March 2011), www.aqmd.gov/ceqa/handbook/signthres.pdf. SCAQMD based these thresholds in part on the federal Clean Air Act, and, to enable defining "significant" for CEQA purposes, defined the setting as the South Coast Air Basin. (See SCAQMD, CEQA Air Quality Handbook, April 1993, pp. 6-1–6-2.).*

estimate project impacts. The detailed analysis is conducted using EPA's preferred regulatory dispersion model (AERMOD).

Localized CO concentrations are evaluated using a screening method based on the California Line Source (CALINE4) microscale dispersion model, developed by Caltrans, in combination with EMFAC 2011 emission factors. The screening method enables the user to manually calculate local CO concentrations resulting from motor vehicles using the Project's Transportation Study.[23] If the screening method does not rule out significant impacts for an intersection, then detailed analysis using CALINE4 is conducted. In traffic studies, the term "level of service" (LOS) describes traffic performance at intersections or along roadway segments, and is generally expressed as a letter grade (A through F, with an F grade meaning the worst-flowing traffic). Traffic researchers and planning agencies generally assign LOS ratings to intersections based on the ratio of traffic volume (or demand) to capacity (V/C). Lower V/C ratios correspond to better performance (freer-flowing traffic). SCAQMD suggests conducting a CO hotspots analysis according to a Caltrans protocol for any intersection where a project would worsen the LOS by a level to any level below C, and for any intersection rated D or worse where the project would increase the V/C ratio by two percent or more. Projected CO concentrations of the Project were compared to ambient air quality standards and incremental increase thresholds to determine whether CO impacts from operation would be significant.

(3) Toxic Air Contaminants Impacts (Construction and Operations)

Potential TAC impacts are evaluated by conducting a screening-level analysis followed by a more detailed analysis (i.e., dispersion modeling), as necessary. The screening-level analysis consists of reviewing the Project to identify any new or modified TAC emissions sources. If the qualitative evaluation does not rule out significant impacts from a new source, or modification of an existing TAC emissions source, a more detailed analysis is conducted. For the detailed analysis, downwind sensitive receptor locations are identified, and site-specific dispersion modeling is conducted to estimate Project impacts. Based on this methodology, it was determined that a screening-level analysis was sufficient to address construction and operation of the Project.

(4) Odor Impacts (Construction and Operations)

Potential odor impacts are evaluated by conducting a screening-level analysis followed by a more detailed analysis (i.e., dispersion modeling) as necessary. The screening-level analysis consists of reviewing the Project to identify new or modified odor

[23] *Gibson Transportation Consulting, Inc., Transportation Study for the Ford Theatres Project, April 2014. See Appendix L of this Draft EIR.*

sources. If the qualitative evaluation does not rule out significant impacts from a new source, or modification of an existing odor source, a more detailed analysis is conducted. If so, then downwind sensitive receptor locations are identified, and site-specific dispersion modeling is conducted to estimate Project impacts. For this Project, the screening-level analysis is sufficient.

(5) Existing Conditions Analysis

An analysis of future conditions when the Project becomes operational in 2020 would contribute to a meaningful assessment of the Project's impacts. However, in order to provide for full disclosure of potential impacts, this analysis also addresses existing conditions without the Project compared to existing conditions with the Project, assuming emission factors for Project buildout based on the time of the Notice of Preparation (NOP). All analyses were conducted consistent with the methodologies (e.g., same models and calculation procedures) discussed above for Project-specific impacts.

c. Project Design Features

No specific project design features are proposed with regard to air quality. The Project would incorporate certain features to support and promote environmental sustainability as described in Section II, Project Description, of this Draft EIR.

d. Analysis of Project Impacts

(1) Construction

(a) Regional Construction Impacts

As described in Section II, Project Description, of this Draft EIR, Project construction is anticipated to occur over several phases and may be completed as early as 2020. Construction activities for the Project would include demolition of several existing facilities, grading and excavation, and construction of new structures and related infrastructures. It is estimated that the Project would require approximately 107,094 cubic yards of soil export.

Construction of the Project has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and construction activities. Mobile source emissions, primarily NO_X, would result from the use of construction equipment such as dozers, loaders, and cranes. During the finishing phase of a building, paving operations and the application of architectural coatings (e.g., paints) and other building materials would potentially release VOCs. The assessment of construction air quality impacts

considers each of these potential sources. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation and, for dust, the prevailing weather conditions.

In order to provide a conservative analysis, it was assumed that all construction activities would be completed within the minimum timeframe anticipated for construction rather than in phases, which provides for the maximum overlap of construction components within the Project's overall development period. Additional details of construction activities (i.e., demolition, site preparation/excavation, and building construction/finishing) and the equipment that would be used during Project construction are provided in Appendix C of this Draft EIR.

The emissions levels in Table IV.B-4 on page IV.B-31 represent the highest daily emissions projected to occur during construction. As presented in Table IV.B-4, construction-related daily maximum regional construction emissions would not exceed any of the SCAQMD daily significance thresholds. Therefore, regional construction emissions resulting from the Project would result in a less-than-significant air quality impact.

It should be noted that the emissions estimates presented in Table IV.B-4 are conservative because they do not take into account recently promulgated emission standards for off-road diesel construction equipment such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles which will further reduce emissions. Thus, actual emissions from the Project would be less than those presented above.

(b) Localized Impacts from On-Site Construction Activities

A conservative estimate of maximum on-site daily emissions for NO_X, PM_{10}, $PM_{2.5}$, and CO was compiled for construction activity and compared to the applicable screening thresholds based on construction site acreage and the distance to the closest sensitive receptor. The localized construction air quality analysis was conducted using the methodology promulgated by the SCAQMD. Look-up tables provided by the SCAQMD were used to determine localized construction emissions thresholds for the Project.[24] LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or State ambient air quality standard and are based on the most recent background ambient air

[24] *SCAQMD, LST Methodology Appendix C-Mass Rate LST Look-up Table, www.aqmd.gov/ceqa/handbook/LST/appC.pdf, revised October 2009, accessed March 7, 2014.*

Source: Matrix Environmental, 2014.

quality monitoring data (2010–2012) for the Project area presented in Table IV.B-2 on page IV.B-17. Although the trend shown in Table IV.B-2 demonstrates that ambient air quality is improving in the area, the localized construction emissions analysis conservatively did not apply a reduction in background pollutant concentrations for subsequent years of construction. By doing so, the allowable pollutant increment to not exceed an ambient air quality standard is more stringent. The analysis is based on existing background ambient air quality monitoring data (2010–2012).

The maximum daily localized emissions from Project construction and LSTs are presented in Table IV.B-5 on page IV.B-32. As presented in Table IV.B-5, maximum localized construction emissions for off-site sensitive receptors would not exceed any of the SCAQMD-recommended localized screening thresholds. Therefore, localized construction emissions resulting from the Project would result in a less-than-significant air quality impact.

Table IV.B-5
Estimate of Maximum Localized Project Construction Emissions
(pounds per day)

[a] *PM_{10} and $PM_{2.5}$ emissions estimates are based on compliance with SCAQMD Rule 403 requirements for fugitive dust suppression.*

[b] *Maximum active construction activities would occur on approximately 5 acres at a distance of approximately 100 meters from sensitive land uses (the shortest distance to residential receptors along Cahuenga Terrace). Therefore, potential localized construction impacts were evaluated using SCAQMD's LSTs for Source Receptor Area 1 (5 acres at a distance of 100 meters).*

Source: Matrix Environmental, 2014.

(c) Toxic Air Contaminants

The greatest potential for TAC emissions during construction would be from diesel particulate emissions associated with heavy equipment operations during grading and excavation activities. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of TACs over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. Because the construction schedule estimates that the phases which require the most heavy-duty diesel vehicle usage, such as site grading/excavation, would last for a much shorter duration (e.g., approximately six months), construction of the Project would not result in a substantial, long-term (i.e., 70-year) source of TAC emissions. Additionally, the SCAQMD CEQA guidance does not require a health risk assessment for short-term construction emissions. It is therefore not meaningful to evaluate long-term cancer impacts from construction activities which occur over a relatively short duration. In addition, there would be no residual emissions or corresponding individual cancer risk after construction. As such, Project-related TAC impacts during construction would be less than significant.

(d) Odors

Construction operations, including asphalt paving operations, may produce perceptible odors. Dust and diesel odors are typical near construction sites. Large

diesel-powered vehicles are frequently present during construction activities. Diesel exhaust from vehicles is not typically a health concern unless vehicles operate or idle in close proximity to structural air intakes, pedestrian areas, or sensitive receptors. The operation of diesel-powered construction equipment could generate nuisance diesel odors at nearby receptors.

In accordance with Sections 2485 in Title 13 of the California Code of Regulations (CCR), the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location. With regards to the operation of any stationary, diesel-fueled, compression-ignition engines, Section 93115 in Title 17 of the CCR specifies fuel and fuel additive requirements and emission standards.[25] Compliance with these requirements would minimize the potential nuisance of diesel odors during construction to a less-than-significant level.

Other potential sources that may emit odors during construction activities include the use of architectural coatings and solvents. SCAQMD Rule 1113 limits the amount of VOC content from architectural coatings and solvents. As a result of the Project's mandatory compliance with applicable SCAQMD rules and regulations, construction activities and materials would result in less-than-significant impacts with regard to odors.

(2) Operational Impacts

(a) Regional Operational Impacts

As discussed above, SCAQMD's CalEEMod was used to calculate regional mobile source emissions, on-road fugitive dust, and emissions from architectural coatings, landscape equipment, and energy use. Diesel Emergency generator emissions were calculated using USEPA's Compilation of Air Pollutant Emission Factors (AP-42) and SCAQMD BACT requirements.

As shown in Table IV.B-6 on page IV.B-34, regional emissions resulting from operation of the Project are not expected to exceed any of the SCAQMD's daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

---

[25] *The CARB adopts airborne toxic control measures (ATCMs) to reduce emissions of TACs. On February 26, 2004, the CARB adopted an ATCM for stationary compression-ignition (CI) engines (17 CCR 93115) to control diesel particulate matter, which was declared a TAC in 1998. The ATCM applies to all stationary diesel-fueled engines greater than 50 brake-horsepower installed before January 1, 2005, and all new stationary diesel engines installed on or after January 1, 2005. The purpose of this ATCM is to protect public health by reducing emissions of diesel PM, with a goal of reducing overall diesel PM in 2020 from this source category by 80 percent from 2002 baseline emissions.*

Source: Matrix Environmental, 2014.

An analysis of daily operational emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The results of these calculations and associated SCAQMD thresholds are presented in Table IV.B-7 on page IV.B-35. As shown in Table IV.B-7, the net overall operational emissions associated with the Project under existing conditions (2014) would be higher than the estimated emissions at Project build-out (2020) provided in Table IV.B-6. This increase is exclusively a function of the change in default CalEEMod emission factors from 2020 to 2014 (i.e., vehicular fleet mix is cleaner in subsequent years as a result of cleaner newer vehicles). As with the Project build-out (2020) analysis year, the Project (2014) analysis would not exceed any of the established SCAQMD daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

(b) Localized Operational Impacts

Operation of the Project would not introduce any major new sources of air pollution within the Project Site. Emissions estimates for criteria air pollutants from on-site sources are presented in Table IV.B-8 on page IV.B-35. The SCAQMD LST mass rate look-up tables, which apply to projects that have active areas that are less than or equal to 5 acres in size, were conservatively used to evaluate potential localized impacts. As shown in Table IV.B-8, on-site operational emissions would not exceed any of the LSTs.

Exceed Threshold?	**No**	**No**	**No**	**No**

[a] *Operational activities would occur on approximately 5 acres at a distance of approximately 100 meters from sensitive land uses.*

Source: Matrix Environmental, 2014.

An analysis of daily operational on-site emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The results of these calculations and associated SCAQMD thresholds are presented in Table IV.B-9 on page IV.B-37. As shown in Table IV.B-9, the net overall operational on-site emissions associated with the Project (2020) under existing conditions (2014) would be similar to the estimated emissions during Project build-out (2020) provided in Table IV.B-8 on page IV.B-35. As with the Project build-out (2020) analysis year, on-site operational emissions under existing conditions would not exceed any of the LSTs. Therefore, localized impacts from on-site emission sources would be less than significant.

The SCAQMD recommends an evaluation of potential localized CO impacts when a project causes the level of service (LOS) at a study intersection to worsen from C to D, or if a project increases the volume-to-capacity (V/C) ratio at any intersection rated D or worse by 2 percent or more. As detailed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, Project traffic volumes would not meet these criteria at any intersection locations for the Project (2014) or (2020) conditions. Thus, the Project would not cause any new or exacerbate any existing CO hotspots, and, as a result, impacts related to localized mobile-source CO emissions would be less than significant.

(3) Toxic Air Contaminants

When considering potential air quality impacts under CEQA, consideration is given to the location of sensitive receptors within close proximity of land uses that emit toxic air contaminants (TACs). The CARB has published and adopted the *Air Quality and Land Use Handbook: A Community Health Perspective* (2005), which provides recommendations regarding the siting of new sensitive land uses near potential sources of air toxic emissions (e.g., freeways, distribution centers, rail yards, ports, refineries, chrome plating facilities, dry cleaners, and gasoline dispensing facilities). The SCAQMD adopted similar recommendations in its *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning* (2005). Together the CARB and SCAQMD guidelines recommend siting distances for both the development of sensitive land uses in proximity to TAC sources, and the addition of new TAC sources in proximity to existing sensitive land uses.

The primary sources of potential air toxics associated with Project operations include diesel particulate matter from delivery trucks (e.g., truck traffic on local streets and idling on adjacent streets). The SCAQMD recommends that health risk assessments be conducted for substantial sources of diesel particulate matter (e.g., truck stops and warehouse distribution facilities) and has provided guidance for analyzing mobile source diesel emissions. Based on this guidance, the Project is not considered to be a substantial source of diesel particulate matter warranting a refined HRA. In addition, the

Table IV.B-9

[a] *Operational activities would occur on approximately 5 acres at a distance of approximately 100 meters from sensitive land uses.*

Source: Matrix Environmental, 2014.

CARB-mandated ATCM limits diesel-fueled commercial vehicles (delivery trucks) to idle for no more than 5 minutes at any given time which would further limit diesel particulate emissions.

Based on the low incremental increase in the number and long-term (annual average) activity of the on-site TAC sources, the Project would not warrant the need for a refined health risk assessment, and potential TAC impacts would be less than significant.

Typical sources of acutely and chronically hazardous TACs include industrial manufacturing processes (e.g., chrome plating, electrical manufacturing, petroleum refinery). The Project would not include these types of potential industrial manufacturing process sources. It is expected that quantities of hazardous TACs located on-site would be below thresholds warranting further study under California Accidental Release Program (CalARP). As such, the Project would not release substantial amounts of TACs, and impacts on human health would be less than significant.

(4) Odors

According to the SCAQMD's *CEQA Air Quality Handbook*, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food

processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project does not include any uses identified by the SCAQMD as being associated with odors. However, the Project does include restaurant uses which have the potential to emit odors through cooking and charbroilers. The project would minimize the release of odors from restaurant uses with odor reducing equipment as necessary. Garbage collection areas for the Project would be covered and situated away from the property line and sensitive uses. Good housekeeping practices would be sufficient to prevent objectionable odors from garbage collection areas. As the proposed uses would not be a source of odors, potential odor impacts would be less than significant.

(5) SCAQMD CEQA Air Quality Handbook Policy Analysis

The following analysis addresses the Project's consistency with SCAQMD and SCAG policies, inclusive of all regulatory requirements. In accordance with the procedures established in the SCAQMD's *CEQA Air Quality Handbook*, the following criteria are required to be addressed in order to determine the Project's consistency with SCAQMD and SCAG policies:

- Will the project result in any of the following:
  - An increase in the frequency or severity of existing air quality violations; or
  - Cause or contribute to new air quality violations; or
  - Delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
- Will the project exceed the assumptions utilized in preparing the AQMP?

As discussed in the preceding Section IV.B.3.d, localized concentrations of PM_{10}, $PM_{2.5}$, CO, and NO_2 have been analyzed for the Project. A summary of this analysis is provided below. SO_2 and VOC emissions were analyzed on a regional basis since SCAQMD has not established significance thresholds for localized concentrations of SO_2 and VOCs. Notwithstanding, given the Project's construction activities and proposed uses, SO_2 emissions would be negligible during construction and long-term operations, and therefore would not have the potential to cause or affect a violation of the SO_2 ambient air quality standard. Since VOCs are not a criteria pollutant, there is no ambient standard or localized threshold for VOCs. Due to the role VOCs play in ozone formation, it is classified as a precursor pollutant and only a regional emissions threshold has been established.

Particulate matter is the primary pollutant of concern during construction activities, and therefore, the Project's PM_{10} and $PM_{2.5}$ emissions during construction were analyzed

(1) to ascertain potential effects on localized concentrations and (2) to determine if there is a potential for such emissions to cause or affect a violation of the ambient air quality standards for PM_{10} and $PM_{2.5}$. The results of the analyses indicate that the increases in PM_{10} and $PM_{2.5}$ emissions during construction would not exceed the SCAQMD-recommended significance thresholds at sensitive receptors in proximity to the Project Site. Additionally, the Project's maximum potential NO_X and CO daily emissions during construction were analyzed to ascertain potential effects on localized concentrations and to determine if there is a potential for such emissions to cause or affect a violation of an applicable ambient air quality standard. As shown in Table IV.B-5 on page IV.B-32, CO and NO_X would not exceed the SCAQMD-recommended significance thresholds and would not have a long-term impact on the region's ability to meet State and federal air quality standards. Therefore, Project construction would not result in a significant impact with regard to localized air quality.

Because the Project would not introduce any substantial stationary sources of emissions, CO is the preferred benchmark pollutant for assessing local area air quality impacts from post-construction motor vehicle operations. Based on methodologies set forth by the SCAQMD, one measure of local area air quality impacts that can indicate whether the Project would cause or affect a violation of an air quality standard would be based on the estimated CO concentrations at selected receptor locations located in close proximity to the Project Site. As indicated earlier, no intersections met the SCAQMD criteria requiring a CO hotspot analysis, and impacts would be less than significant. Therefore, no violations of the State and federal CO standards are projected to occur.

As discussed above, a screening-level analysis of potential localized operational impacts from on-site activities was conducted. Based on the analysis, localized CO, NO_2, PM_{10}, and $PM_{2.5}$ operational impacts would be less than significant.

With respect to the second criterion for determining consistency with SCAQMD and SCAG air quality policies, it is important to recognize that air quality planning within the Air Basin focuses on the attainment of ambient air quality standards at the earliest feasible date. Projections for achieving air quality goals are based on assumptions regarding population, housing, and growth trends. Thus, the SCAQMD's second criterion for determining project consistency focuses on whether or not the Project exceeds the assumptions utilized in preparing the forecasts presented in the AQMP. Determining whether or not a Project exceeds the assumptions reflected in the AQMP involves the evaluation of three criteria: (1) consistency with the population, housing, and employment growth projections; (2) Project mitigation measures; and (3) appropriate incorporation of AQMP land use planning strategies. The following discussion provides an analysis of each of these three criteria.

- Is the project consistent with the population, housing, and employment growth projections upon which AQMP forecasted emission levels are based?

A project is consistent with the AQMP in part if it is consistent with the population, housing, and employment assumptions that were used in the development of the AQMP. In the case of the 2012 AQMP, two sources of data form the basis for the projections of air pollutant emissions: the City of Los Angeles General Plan and SCAG's *Regional Transportation Plan (RTP)*.[26] In April 2012, SCAG adopted the 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012–2035 RTP/SCS), which is included in the 2012 AQMP. The 2012–2035 RTP/SCS provides socioeconomic forecast projections of regional population growth. The population, housing, and employment forecasts which are adopted by SCAG's Regional Council are based on the local plans and policies applicable to the specific area; these are used by SCAG in all phases of implementation and review. For purposes of using the most current available data, the 2012–2035 RTP/SCS data were used in this analysis. Please refer to Section IV.H, Land Use, of this Draft EIR for additional information regarding the Project's consistency with the 2012–2035 RTP/SCS.

According to SCAG's 2012–2035 RTP/SCS, the forecasted employment for the City of Los Angeles Subregion will grow by approximately 75,448 jobs between 2014 and 2020.[27] The Project would generate approximately 85 net new employees. Thus, Project employment would account for 0.1 percent of the employment growth forecasted by SCAG in the City of Los Angeles Subregion between 2014 and 2020. Such levels of employment growth are consistent with the employment forecasts for the subregion as adopted by SCAG. Because these same projections form the basis of the 2012 AQMP, it can be concluded that the Project would be consistent with the projections in the AQMP.

- Does the project implement all feasible air quality mitigation measures?

The Project would comply with all applicable regulatory standards as required by the SCAQMD, as summarized above. The Project design would also support and promote environmental sustainability as described in Section II, Project Description, of this Draft EIR. While these features are designed primarily to reduce greenhouse gas emissions, they would also serve to reduce the criteria air pollutants discussed herein. Furthermore,

---

[26] *While the Ford Theatres are owned and operated by the County of Los Angeles, the Project Site is located within the City of Los Angeles. Accordingly, employment growth rates for the City of Los Angeles were used for purposes of evaluating whether development of the Project would be consistent with forecasts which were adopted by SCAG.*

[27] *Based on a linear interpolation of 2010–2020 data.*

no significant air quality impacts would occur. As such, the Project meets this AQMP consistency criterion.

- To what extent is project development consistent with the land use policies set forth in the AQMP?

With regard to land use developments such as the Project, air quality policies focus on the reduction of vehicle trips and vehicle miles traveled. As discussed in Section IV.H, Land Use, of the Draft EIR, the Project would serve to implement a number of air quality-related policies upheld by the County of Los Angeles and SCAG. The Project is designed to reduce vehicle trips through transit and internal trip capture. During events, parking is available at the Universal City/Studio City Metro Red Line Station, where a shuttle is provided to and from the Project. Also, the Project would result in a 50 percent internal trip capture reduction for restaurant uses and a 15 percent transit reduction for visitors and employees that would use transit. Implementation of these sustainability features in return contributes to a reduction in air quality emissions via a reduction in vehicle trips and vehicle miles traveled. As the Project implements the SCAQMD's objective of reducing vehicle miles traveled and related vehicular air emissions, the Project would be consistent with AQMP land use policies.

In conclusion, the determination of AQMP consistency is primarily based on the long-term influence of the Project on air quality in the Air Basin. Project development would not have a significant short-term or long-term impact on the region's ability to meet State and federal air quality standards. Also, the Project would be consistent with the goals and policies of the AQMP for the control of fugitive dust. As discussed above, the Project's long-term influence would also be consistent with the goals and policies of the AQMP. Therefore, the Project is considered consistent with the SCAQMD's AQMP.

4. Cumulative Impacts

a. Construction

With respect to the Project's construction-period air quality emissions and cumulative Basin-wide conditions, the SCAQMD has developed strategies (e.g., SCAQMD Rule 403) to reduce criteria pollutant emissions outlined in the AQMP pursuant to Federal CAA mandates. The Project would comply with all applicable regulatory requirements, including SCAQMD Rule 403 requirements, as discussed above. In addition, the Project would comply with adopted AQMP emissions control measures. Per SCAQMD rules and mandates as well as the CEQA requirement that significant impacts be mitigated to the extent feasible, all construction projects Basin-wide would comply with these same

requirements (i.e., SCAQMD Rule 403 compliance) and would also implement all feasible mitigation measures when significant impacts are identified.

According to the SCAQMD, individual construction projects that exceed the SCAQMD's recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the Air Basin is in non-attainment. Construction-related daily emissions at the Project Site would not exceed any of the SCAQMD's regional or localized significance thresholds. Thus, the Project's contribution to cumulative construction-related regional emissions would not be cumulatively considerable and therefore would be less than significant. Construction of the Project also would have a less-than-significant impact with regard to localized emissions. Therefore, the Project's contribution to cumulative air quality impacts due to localized emissions would also not be cumulatively considerable and therefore would be less than significant.

Similar to the Project, the greatest potential for TAC emissions at each related project would generally involve diesel particulate emissions associated with heavy equipment operations during demolition and grading/excavation activities. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of TACs over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. Construction activities at each related project would not result in a long-term (i.e., 70-year) substantial source of TAC emissions. Additionally, the SCAQMD CEQA guidance does not require a health risk assessment for short-term construction emissions. It is therefore not meaningful to evaluate long-term cancer impacts from construction activities which occur over relatively short durations. As such, cumulative toxic emission impacts during construction would be less than significant.

Also similar to the Project, potential sources that may emit odors during construction activities at each related project would include the use of architectural coatings and solvents. SCAQMD Rule 1113 limits the amount of volatile organic compounds from architectural coatings and solvents. Via mandatory compliance with SCAQMD Rules, it is anticipated that construction activities or materials used in the construction of the related projects would not create objectionable odors. Thus, odor impacts from the related projects are anticipated to be less than significant individually, as well as cumulatively in conjunction with the Project.

b. Operation

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific

impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. Operational emissions from the Project would not exceed any of the SCAQMD's regional or localized significance thresholds during Project build-out (2020) or under existing conditions (2014). Therefore, the emissions of non-attainment pollutants and precursors generated by Project operation would not be cumulatively considerable.

With respect to TAC emissions, neither the Project nor any of the related projects (which are largely residential, retail/commercial, and office uses), would represent a substantial source of TAC emissions, which are typically associated with large-scale industrial, manufacturing, and transportation hub facilities. The Project and related projects would be consistent with the recommended screening level siting distances for TAC sources, as set forth in CARB's Land Use Guidelines, and the Project and related projects would not result in a cumulative impact requiring further evaluation. However, the Project and each of the related projects would likely generate minimal TAC emissions related to the use of consumer products and landscape maintenance activities, among other things. Pursuant to California Assembly Bill 1807, which directs the CARB to identify substances as TACs and adopt ATCMs to control such substances, the SCAQMD has adopted numerous rules (primarily in Regulation XIV) that specifically address TAC emissions. These SCAQMD rules have resulted in and will continue to result in substantial Basin-wide TAC emissions reductions. As such, cumulative TAC emissions during long-term operations would be less than significant. In addition, the Project would not result in any substantial sources of TACs that have been identified by the California Air Resources Board's Land Use Guidelines, and thus, would not result in a cumulatively considerable impact.

c. Odors

With respect to potential odor impacts, neither the Project nor any of the related projects (which are primarily residential, retail, and office uses) have a high potential to generate odor impacts.[28] Furthermore, any related project that may have a potential to generate objectionable odors would be required by SCAQMD Rule 402 (Nuisance) to implement BACT to limit potential objectionable odor impacts to a less-than-significant level. Thus, potential odor impacts from related projects are anticipated to be less than significant. The Project would not result in odor impacts, and, thus, would not have a cumulatively considerable impact.

[28] *According to the SCAQMD CEQA Air Quality Handbook, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding.*

5. Mitigation Measures

Project-level and cumulative impacts with regard to air quality would be less than significant. Therefore, no mitigation measures are required.

6. Conclusion

Project-level and cumulative impacts with regard to air quality would be less than significant.

IV. Environmental Impact Analysis
C. Greenhouse Gas Emissions

1. Introduction

This section provides a discussion of global climate change, existing regulations pertaining to global climate change, an inventory of the approximate greenhouse gas (GHG) emissions that would result from the Project, and an analysis of the significance of the impact of these GHGs. Calculation worksheets, assumptions, and model outputs used in the analysis are contained in Appendix D of this Draft EIR.

2. Environmental Setting

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation, and storms. Global warming, a related concept, is the observed increase in average temperature of the Earth's surface and atmosphere. One identified cause of global warming is an increase of GHGs in the atmosphere. GHGs are those compounds in the Earth's atmosphere that play a critical role in determining the Earth's surface temperature.

The Earth's natural warming process is known as the "greenhouse effect." It is called the greenhouse effect because the Earth and the atmosphere surrounding it are similar to a greenhouse with glass panes in that the glass allows solar radiation (sunlight) into the Earth's atmosphere, but prevents radiative heat from escaping, thus warming the Earth's atmosphere. Some levels of GHGs keep the average surface temperature of the Earth close to a hospitable 60 degrees Fahrenheit. However, it is believed that excessive concentrations of anthropogenic GHGs in the atmosphere can result in increased global mean temperatures, with associated adverse climatic and ecological consequences.

Scientists studying the particularly rapid rise in global temperatures have determined that human activity has resulted in increased emissions of GHGs, primarily from the burning of fossil fuels (from motor vehicle travel, electricity generation, consumption of natural gas, industrial activity, manufacturing, etc.), deforestation, agricultural activity, and the decomposition of solid waste. Scientists refer to the global warming context of the past

century as the "enhanced greenhouse effect" to distinguish it from the natural greenhouse effect.[1]

Changes in atmospheric concentrations of GHGs and aerosols, land cover, and solar radiation alter the energy balance of the climate system. Global GHG emissions due to human activities have grown since pre-industrial times, with an increase of 70 percent between 1970 and 2004. The annual emissions of carbon dioxide (CO_2) grew by about 80 percent between 1970 and 2004. Atmospheric concentrations of CO_2 and methane (CH_4) in 2005 exceed by far the natural range over the last 650,000 years. Global increases in CO_2 concentrations are due primarily to fossil fuel use, with land-use change providing another significant but smaller contribution. Studies have concluded that it is very likely that the observed increase in CH_4 concentration is predominantly due to agriculture and fossil fuel use.[2]

In August 2007, international climate talks held under the auspices of the United Nations Framework Convention on Climate Change (UNFCCC) led to the official recognition by the participating nations that global emissions of GHG must be reduced. According to the "Ad Hoc Working Group on Further Commitments of Annex I Parties under the Kyoto Protocol," avoiding the most catastrophic events forecast by the United Nations Intergovernmental Panel on Climate Change (IPCC) would entail emissions reductions by industrialized countries in the range of 25 to 40 percent below 1990 levels. Because of the Kyoto Protocol's Clean Development Mechanism, which gives industrialized countries credit for financing emission-reducing projects in developing countries, such an emissions goal in industrialized countries could ultimately spur efforts to cut emissions in developing countries, as well.[3]

As reported by SCAG: "Global warming poses a serious threat to the economic well-being, public health and natural environment in southern California and beyond. The potential adverse impacts of global warming include, among others, a reduction in the quantity and quality of water supply, a rise in sea level, damage to marine and other ecosystems, and an increase in the incidences of infectious diseases. Over the past few decades, energy intensity of the national and State economy has been declining due to the shift to a more service-oriented economy. California ranked fifth lowest among the states in CO_2 emissions from fossil fuel consumption per unit of Gross State Product. However, in terms of total CO_2 emissions, California is second only to Texas in the nation and is the

2 *Ibid.*

3 *United Nations Framework Convention on Climate Change, Press Release—Vienna UN Conference Shows Consensus on Key Building Blocks for Effective International Response to Climate Change, August 31, 2007.*

12th largest source of climate change emissions in the world, exceeding most nations. The SCAG region, with close to half of the State's population and economic activities, is also a major contributor to the global warming problem."[4]

a. GHG Background

By definition, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3).[5] Carbon dioxide is the most abundant GHG. Other GHGs are less abundant, but have higher global warming potential than CO_2. Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO_2, denoted as CO_2e. Forest fires, decomposition, industrial processes, landfills, and consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions. A general description of the GHGs discussed is provided in Table IV.C-1 on page IV.C-4.

Global Warming Potentials (GWPs) are one type of simplified index based upon radiative properties that can be used to estimate the potential future impacts of emissions of different gases upon the climate system in a relative sense. GWP is based on a number of factors, including the radiative efficiency (heat-absorbing ability) of each gas relative to that of CO_2, as well as the decay rate of each gas (the amount removed from the atmosphere over a given number of years) relative to that of CO_2. A summary of the atmospheric lifetime and GWP of selected gases is presented in Table IV.C-2 on page IV.C-5. As indicated below, GWP range from 1 to 22,800.

b. Projected Impacts of Global Warming in California

According to the 2006 California Climate Action Team (CAT) Report, temperature increases arising from increased GHG emissions potentially could result in a variety of impacts to the people, economy, and environment of California associated with a projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. If emissions from GHGs are not reduced substantially, the warming increase could have the following consequences in California:[6]

Table IV.C-1
Description of Identified Greenhouse Gases

Greenhouse Gas	General Description
Carbon Dioxide (CO_2)	An odorless, colorless GHG, which has both natural and anthropocentric sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic (human caused) sources of carbon dioxide are burning coal, oil, natural gas, and wood.
Methane (CH_4)	A flammable gas and is the main component of natural gas. When one molecule of methane is burned in the presence of oxygen, one molecule of carbon dioxide and two molecules of water are released. There are no ill health effects from methane. A natural source of methane is the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain methane, which is extracted for fuel. Other sources are from landfills, fermentation of manure, and cattle.
Nitrous Oxide (N_2O)	A colorless GHG. High concentrations can cause dizziness, euphoria, and sometimes slight hallucinations. Nitrous oxide is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used in rocket engines, race cars, and as an aerosol spray propellant.
Hydrofluorocarbons (HFCs)	Chlorofluorocarbons (CFCs) are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were first synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. Because they destroy stratospheric ozone, the production of CFCs was stopped as required by the Montreal Protocol in 1987. HFCs are synthetic man-made chemicals that are used as a substitute for CFCs as refrigerants. HFCs deplete stratospheric ozone, but to a much lesser extent than CFCs.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above the earth's surface are able to destroy the compounds. PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.
Sulfur Hexafluoride (SF_6)	An inorganic, odorless, colorless, non-toxic, and nonflammable gas. SF_6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Table IV.C-2
Atmospheric Lifetimes and Global Warming Potentials

Gas	Atmospheric Lifetime (years)	Global Warming Potential (100-year time horizon)
Carbon Dioxide	50–200	1
Methane	12 (+/-3)	25
Nitrous Oxide	114	298
HFC-23	270	14,800
HFC-134a	14	1,430
HFC-152a	1.4	124
PFC-14: Tetrafluoromethane (CF_4)	50,000	7,390
PFC-116: Hexafluoroethane (C_2F_6)	10,000	12,200
Sulfur Hexafluoride (SF_6)	3,200	22,800

Source: IPCC, 2007, www.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html, accessed February 12, 2013.

- The Sierra snowpack would decline between 70 and 90 percent, threatening California's water supply;
- Attainment of air quality standards would be impeded by increasing emissions, accelerating chemical processes, and raising inversion temperatures during stagnation episodes;
- Erosion of California's coastlines would increase as well as sea water intrusion;
- Pest infestation and vulnerability to fires of the State's forests would increase; and
- Rising temperatures would increase power demand, especially in the summer season.

With regards to public health, as reported by the Center for Health and the Global Environment at the Harvard Medical School, the following are examples of how climate change can affect cardio-respiratory disease: (1) pollen is increased by higher levels of atmospheric CO_2; (2) ground-level ozone or photochemical smog, which is the reaction of oxides of nitrogen (NO_X) and VOC and which are "tailpipe emissions," is temperature dependent (i.e., heat increases smog); ground-level ozone, which is also increased by higher levels of ultraviolet B radiation from stratospheric ozone depletion, has been shown to cause asthma in children and to trigger attacks and causes increased morbidity and mortality in those with chronic obstructive pulmonary disease; (3) heat waves can result in temperature inversions, leading to trapped masses or unhealthy air contaminants by smog,

particulates, and other pollutants; and (4) the incidence of forest fires is increased by drought secondary to climate change and to the lack of spring runoff from reduced winter snows; these fires can create smoke and haze which can settle over urban populations causing acute and exacerbating chronic respiratory illness.[7]

c. Regulatory Framework

In response to growing scientific and political concern with global climate change, Federal and State entities have adopted a series of laws to reduce emissions of GHGs to the atmosphere.

(1) Federal

(a) Federal Clean Air Act

The U.S. Supreme Court ruled in *Massachusetts v. Environmental Protection Agency*, 127 S.Ct. 1438 (2007), that CO_2 and other GHGs are pollutants under the federal Clean Air Act, which the USEPA must regulate if it determines they pose an endangerment to public health or welfare. The U.S. Supreme Court did not mandate that the USEPA enact regulations to reduce GHG emissions. Instead, the court found that the USEPA could avoid taking action if it found that GHGs do not contribute to climate change or if it offered a "reasonable explanation" for not determining that GHGs contribute to climate change.

On April 17, 2009, the USEPA issued a proposed finding that GHGs contribute to air pollution that may endanger public health or welfare. On April 24, 2009, the proposed rule was published in the Federal Register under Docket ID No. EPA-HQ-OAR-2009-0171. The USEPA stated that high atmospheric levels of GHGs "are the unambiguous result of human emissions, and are very likely the cause of the observed increase in average temperatures and other climatic changes." The USEPA further found that "atmospheric concentrations of greenhouse gases endanger public health and welfare within the meaning of Section 202 of the Clean Air Act." The findings were signed by the Administrator on December 7, 2009. The final findings were published in the Federal Register on December 15, 2009. The final rule was effective on January 14, 2010.[8] While these findings alone do not impose any

---

[7] *Epstein, Paul R. et al., Urban Indicators of Climate Change, Report from the Center for Health and the Global Environment, Harvard Medical School and the Boston Public Health Commission, August 2003, unpaginated.*

[8] *United States Environmental Protection Agency website, Climate Change (www.epa.gov/climate-change/endangerment.html).*

requirements on industry or other entities, this action is a prerequisite to regulatory actions by the EPA, including but not limited to GHG emissions standards for light-duty vehicles.

On July 20, 2011, the EPA published its final rule deferring GHG permitting requirements for carbon dioxide emission from biomass-fired and other biogenic sources until July 21, 2014. Environmental groups have challenged the deferral. In September 2011, EPA released an "Accounting Framework for Biogenic CO_2 Emissions from Stationary Sources," which analyzes accounting methodologies and suggests an implementation for biogenic carbon dioxide emitted from stationary sources.

On April 4, 2012, EPA published a proposed rule to establish, for the first time, a new source performance standard for GHG emissions. Under the proposed rule, new fossil fuel–fired electric generating units larger than 25 MW are required to limit emissions to 1,000 pounds CO_2/MWh on an average annual basis, subject to certain exceptions. In addition, on April 17, 2012, EPA issued emission rules for oil production and natural gas production and processing operations.

(b) Federal Corporate Average Fuel Economy Standards

In response to the *Massachusetts v. Environmental Protection Agency* ruling, President Bush issued an executive order on May 14, 2007, directing the USEPA , the United States Departments of Transportation (USDOT), and the USDOE to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. On December 19, 2007, the Energy Independence and Security Act of 2007 (H.R. 6; Pub. L. 110-140) was signed into law.

The Energy Independence and Security Act of 2007 created new federal requirements for increases in fleet-wide fuel economy for passenger vehicles and light trucks. The federal legislation requires a fleet-wide average of 35 miles per gallon to be achieved by 2020. The National Highway Traffic Safety Administration is directed to phase in requirements to achieve this goal. Analysis by the California Air Resources Board (CARB) suggests that attainment of this goal will require an annual improvement of approximately 3.4 percent between 2007 and 2020.[9] In addition to setting increased CAFE standards for motor vehicles, the Energy Independence and Security Act of 2007 included other provisions: (1) renewable fuel standard (Section 202); (2) appliance and lighting efficiency standards (Sections 301–325); and (3) building energy efficiency (Sections 411–441). Additional provisions addressed energy savings in government and

[9] *CARB comparison between Pavley Assembly Bill 1493 and the Federal 2007 CAFE standards (www.arb.ca.gov/cc/ccms/ab1493_v_cafe_study.pdf).*

public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

On July 1, 2009, the EPA granted California a waiver which enables the state to enforce stricter tailpipe emissions on new motor vehicles. In addition, on May 19, 2009, President Obama announced a new National Fuel Efficiency Policy aimed at increasing fuel economy and reducing GHG pollution.[10] On September 15, 2009, the EPA and the Department of Transportation's National Highway Traffic Safety Administration issued a joint proposal to establish a national program consisting of new standards for model year 2012 through 2016 light-duty vehicles that will reduce GHG emissions and improve fuel economy. The proposed standards would be phased in and would require passenger cars and light-duty trucks to comply with a declining emissions standard. In 2012, passenger cars and light-duty trucks would have to meet an average emissions standard of 295 grams of CO_2 per mile and 30.1 miles per gallon. By 2016, the vehicles would have to meet an average standard of 250 grams of CO_2 per mile and 35.5 miles per gallon.

(2) State

(a) California Assembly Bill 1493

Assembly Bill 1493, passed in 2002, requires the development and adoption of regulations to achieve "the maximum feasible reduction of greenhouse gases" emitted by noncommercial passenger vehicles, light-duty trucks, and other vehicles used primarily for personal transportation in the State. CARB originally approved regulations to reduce GHGs from passenger vehicles in September 2004, with the regulations to take effect in 2009. On September 24, 2009, CARB adopted amendments to these "Pavley" regulations that reduce GHG emissions in new passenger vehicles from 2009 through 2016.[11] Although setting emission standards on automobiles is solely the responsibility of the EPA, the Federal Clean Air Act allows California to set state-specific emission standards on automobiles if the state first obtains a waiver from the EPA. As stated above, the EPA granted California that waiver on July 1, 2009. A comparison between the Assembly Bill 1493 standards and the Federal Corporate Average Fuel Economy was completed by CARB and is available at www.arb.ca.gov/cc/ccms/reports/ab1493_v_cafe_study.pdf. The emission standards become increasingly more stringent through the 2016 model year. California is also committed to further strengthening these standards beginning with 2020 model year vehicles to obtain a 45-percent GHG reduction in comparison to the 2009 model year.

(b) Executive Order S-1-07 (California Low Carbon Fuel Standard)

Executive Order S-1-07, the Low Carbon Fuel Standard (issued on January 18, 2007), requires a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020. Regulatory proceedings and implementation of the Low Carbon Fuel Standard have been directed to CARB. The Low Carbon Fuel Standard has been identified by CARB as a discrete early action item in the adopted *Climate Change Scoping Plan* (discussed in Section IV.C.2.2.c(2)(e) (below). CARB expects the Low Carbon Fuel Standard to achieve the minimum 10-percent reduction goal; however, many of the early action items outlined in the *Climate Change Scoping Plan* work in tandem with one another. To avoid the potential for double-counting emission reductions associated with AB 1493 (see previous discussion), the *Climate Change Scoping Plan* has modified the aggregate reduction expected from the Low Carbon Fuel Standard to 9.1 percent. In accordance with the *Climate Change Scoping Plan*, this analysis incorporates the modified reduction potential for the Low Carbon Fuel Standard. CARB released a draft version of the Low Carbon Fuel Standard in October 2008. The final regulation was approved by the Office of Administrative Law and filed with the Secretary of State on January 12, 2010; the Low Carbon Fuel Standard became effective on the same day.

(c) Executive Order S-3-05

Executive Order S-3-05, issued in June 2005, established GHG emissions targets for the State, as well as a process to ensure the targets are met. The order directed the Secretary for California EPA to report every two years on the State's progress toward meeting the Governor's GHG emission reduction targets. As a result of this executive order, the California Climate Action Team (CAT), led by the Secretary of the California EPA, was formed. The CAT is made up of representatives from a number of State agencies and was formed to implement global warming emission reduction programs and reporting on the progress made toward meeting statewide targets established under the Executive Order. The CAT reported several recommendations and strategies for reducing GHG emissions and reaching the targets established in the Executive Order.[12] The statewide GHG targets are as follows:

- By 2010, reduce to 2000 emission levels;
- By 2020, reduce to 1990 emission levels; and
- By 2050, reduce to 80 percent below 1990 levels.

[12] *California Climate Action Team, Climate Action Team Report to Governor Schwarzenegger and the Legislature, March 2006.*

The CAT stated that smart land use is an umbrella term for strategies that integrate transportation and land-use decisions. Such strategies generally encourage jobs/housing proximity, promote transit-oriented development (TOD), and encourage high-density residential/commercial development along transit corridors. These strategies develop more efficient land-use patterns within each jurisdiction or region to match population increases, workforce, and socioeconomic needs for the full spectrum of the population. "Intelligent transportation systems" is the application of advanced technology systems and management strategies to improve operational efficiency of transportation systems and the movement of people, goods, and service.[13]

(d) California Global Warming Solutions Act of 2006 (AB 32)

The California Global Warming Solutions Act of 2006 (also known as AB 32) commits the State to achieving the following:

- By 2010, reduce to 2000 GHG emission levels; and
- By 2020, reduce to 1990 levels.

To achieve these goals which are consistent with the CAT GHG targets for 2010 and 2020, AB 32 mandates that CARB establish a quantified emissions cap, institute a schedule to meet the cap, implement regulations to reduce statewide GHG emissions from stationary sources consistent with the CAT strategies, and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. Many of the regulations required to meet the goals under AB 32 have been adopted and were to be implemented no later than January 1, 2012.[14]

(e) Climate Change Scoping Plan

In 2008, CARB approved a *Climate Change Scoping Plan* as required by AB 32.[15] The *Climate Change Scoping Plan* proposes a "comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve our environment, reduce our

---

[13] *California Environmental Protection Agency, Climate Action Team Report to Governor Schwarzenegger and the Legislature, March 2006, p. 58.*

[14] *CARB's list of discrete early action measures that could be adopted and implemented before January 1, 2010, was approved on June 21, 2007. The three adopted discrete early action measures are: (1) a low-carbon fuel standard, which reduces carbon intensity in fuels state-wide; (2) reduction of refrigerant losses from motor vehicle air conditioning system maintenance; and (3) increased methane capture from landfills, which includes requiring the use of state-of-the-art capture technologies.*

[15] *Climate Change Proposed Scoping Plan was approved by CARB on December 11, 2008.*

dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health."[16] The *Climate Change Scoping Plan* has a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 implementation fee to fund the program.

The *Climate Change Scoping Plan* calls for a "coordinated set of solutions" to address all major categories of GHG emissions. Transportation emissions will be addressed through a combination of higher standards for vehicle fuel economy, implementation of the Low Carbon Fuel Standard, and greater consideration to reducing trip length and generation through land use planning and transit-oriented development. Buildings, land use, and industrial operations will be encouraged and, sometimes, required to use energy more efficiently. Utility energy supplies will change to include more renewable energy sources through implementation of the Renewables Portfolio Standard.[17] Additionally, the *Climate Change Scoping Plan* emphasizes opportunities for households and businesses to save energy and money through increasing energy efficiency. It indicates that substantial savings of electricity and natural gas will be accomplished through "improving energy efficiency by 25 percent."

The *Climate Change Scoping Plan* identifies a number of specific issues relevant to the Project including:

- The potential of using the green building framework as a mechanism which could enable GHG emissions reductions in other sectors (i.e., electricity, natural gas), noting that:

  > "A Green Building strategy will produce greenhouse gas saving through buildings that exceed minimum energy efficiency standards, decrease consumption of potable water, reduce solid waste during construction and operation, and incorporate sustainable materials. Combined these measures can also contribute to healthy indoor air quality, protect human health and minimize impacts to the environment."

- The importance of supporting the Department of Water Resources' work to implement the Governor's objective to reduce per capita water use by 20 percent by 2020. Specific measures to achieve this goal include water use efficiency,

---

[16] *Climate Change Scoping Plan, CARB, December 2008, www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm.*

[17] *For a discussion of Renewables Portfolio Standard, refer to subsection 2(d), California Renewables Portfolio Standard.*

water recycling, and reuse of urban runoff. The *Climate Change Scoping Plan* notes that water use requires significant amounts of energy, including approximately one-fifth of state-wide electricity.

- Encouraging local governments to set quantifiable emission reduction targets for their jurisdictions and use their influence and authority to encourage reductions in emissions caused by energy use, waste and recycling, water and wastewater systems, transportation, and community design.

Subsequent to adoption of the *Climate Change Scoping Plan*, a lawsuit was filed challenging CARB's approval of the *Climate Change Scoping Plan Functional Equivalent Document* (*FED to the Climate Change Scoping Plan*). On May 20, 2011 (Case No. CPF-09-509562), the court found that the environmental analysis of the alternatives in the *FED to the Climate Change Scoping Plan* was not sufficient under CEQA. CARB staff prepared a revised and expanded environmental analysis of the alternatives and the *Supplemental FED to the Climate Change Scoping Plan* was approved on August 24, 2011 (*Supplemental FED*). The *Supplemental FED* indicated that there is the potential for adverse environmental impacts associated with implementation of the various GHG emission reduction measures recommended in the *Climate Change Scoping Plan*.

Forecasting the amount of emissions that would occur in 2020 if no actions are taken was necessary to assess the scope of the reductions California has to make to return to the 1990 emissions level by 2020 as required by AB 32. The no-action scenario is known as "business-as-usual" or BAU. The California Air Resources Board originally defined the BAU scenario as emissions in the absence of any GHG emission reduction measures discussed in the Climate Change Scoping Plan.

As part of the *Supplemental FED*, CARB updated the projected 2020 BAU emissions inventory based on current economic forecasts (i.e., as influenced by the economic downturn) and emission reduction measures already in place, replacing its prior 2020 BAU emissions inventory. CARB staff derived the updated emissions estimates by projecting emissions growth, by sector, from the state's average emissions from 2006–2008. Specific emission reduction measures included are the million-solar-roofs program, the AB 1493 (Pavley I) motor vehicle GHG emission standards, and the Low Carbon Fuels Standard.[18] In addition, CARB has factored into the 2020 BAU inventory emissions reductions associated with 33-percent Renewable Energy Portfolio Standard (RPS) for

[18] *Pavley I are the first GHG standards in the nation for passenger vehicles and took effect for model years starting in 2009 to 2016. Pavley I could potentially result in 27.7 million metric tons CO_2e reduction in 2020. Pavley II will cover model years 2017 to 2025 and potentially result in an additional reduction of 4.1 million metric tons CO_2e.*

electricity generation. The updated BAU estimate of 507 million metric tons CO_2e by 2020 requires a reduction of 80 million metric tons CO_2e, or a 16-percent reduction below the estimated BAU levels to return to 1990 levels (i.e., 427 million metric tons CO_2e) by 2020.[19,20]

The CARB 2020 BAU projection for GHG emissions in California was originally estimated to be 596 million metric tons carbon dioxide equivalent ($MMTCO_2e$). The updated CARB 2020 BAU projection in the *Supplemental FED* is approximately 545 $MMTCO_2e$.[21, 22] Considering the updated BAU estimate of 545 $MMTCO_2e$ by 2020, CARB estimates a 21.7-percent reduction below the estimated statewide BAU levels is necessary to return to 1990 emission levels (i.e., 427 $MMTCO_2e$) by 2020, instead of the approximate 28.4-percent BAU reduction previously reported under the original Climate Change Scoping Plan (2008). CARB also provided a lower 2020 BAU inventory forecast of approximately 507 $MMTCO_2e$, which took credit for certain GHG emission reduction measures already in place. When this lower forecast is used, the necessary reduction from BAU is approximately 16 percent. Section IV.C.3.b.3 herein contains additional discussion of the *Supplemental FED*, the updated BAU estimate, and the required reduction from BAU to meet AB 32's mandate. CARB is required to update the AB 32 Scoping Plan every five years. On February 10, 2014, CARB released a Draft Update to the AB 32 Scoping Plan that highlights California's progress toward meeting the 2020 GHG emission reduction mandate and builds upon the original Climate Change Scoping Plan (2008) with new strategies and recommendations. The Draft Update also defines CARB's climate change priorities for the next five years and sets the groundwork to reach California's long-term climate goals.[23]

(f) California Renewables Portfolio Standard

The California Renewables Portfolio Standard (RPS) program (2002, Senate Bill [SB] 1078) requires that 20 percent of the available energy supplies are from renewable energy sources by 2017. In 2006, SB 107 accelerated the 20 percent mandate to 2010. These mandates apply directly to investor-owned utilities. On April 12, 2011, California Governor Jerry Brown signed into law Senate Bill 2X, which modified California's RPS program to require that both public and investor-owned utilities in California receive at least 33 percent of their electricity from renewable sources by the year 2020. California Senate Bill 2X also requires regulated sellers of electricity to meet an interim milestone of procuring 25 percent of their energy supply from certified renewable resources by 2016. These levels of reduction are consistent with the Los Angeles Department of Water and Power's (LADWP) commitment to achieve 35 percent renewables by 2020.

In 2011, LADWP indicated that 20 percent of its electricity came from renewable resources in Year 2010. Therefore, under Senate Bill 2X, LADWP must increase its electricity from renewable resources by an additional 13 percent to comply with the RPS of 33 percent.[24]

(g) California Senate Bill 1368

California SB 1368, a companion bill to AB 32, requires the California Public Utilities Commission (CPUC) and the CEC to establish GHG emission performance standards for the generation of electricity. These standards will also generally apply to power that is generated outside of California and imported into the State. SB 1368 provides a mechanism for reducing the emissions of electricity providers, thereby assisting CARB to meet its mandate under AB 32. On January 25, 2007, the CPUC adopted an interim GHG Emissions Performance Standard, which is a facility-based emissions standard requiring that all new long-term commitments for baseload generation to serve California consumers be with power plants that have GHG emissions no greater than a combined cycle gas turbine plant. That level is established at 1,100 pounds of CO_2 per megawatt-hour. Further, on May 23, 2007, the CEC adopted regulations that establish and implement an identical Emissions Performance Standard of 1,100 pounds of CO_2 per megawatt-hour (see CEC Order No. 07-523-7).

(h) California Senate Bill 97

On June 19, 2008, the California Office of Planning and Research (OPR) released a technical advisory on addressing climate change. This guidance document outlines

[24] *Website www.ladwpnews.com/go/doc/1475/987799/.*

suggested components to CEQA disclosure: quantification of GHG emissions from a project's construction and operation; determination of significance of the project's impact to climate change; and if the project is found to be significant, the identification of suitable alternatives and mitigation measures.

California Senate Bill 97, passed in August 2007, is designed to work in conjunction with the California Environmental Quality Act (CEQA) and AB 32. Senate Bill 97 requires the OPR to prepare and develop guidelines for the mitigation of GHG emissions or the effects thereof, including but not limited to effects associated with transportation and energy consumption. These guidelines were required to be transmitted to the Resources Agency by July 1, 2009, to be certified and adopted by January 1, 2010. The OPR submitted the Proposed Draft Guideline Amendments for Greenhouse Gas Emissions to the Secretary for Natural Resources on April 13, 2009. The California Natural Resources Agency conducted formal rulemaking in 2009 and adopted the Guideline Amendments on December 30, 2009, which address the specific obligations of public agencies when analyzing GHG emissions under CEQA to determine a project's effects on the environment.

However, neither a threshold of significance nor any specific mitigation measures are included or provided in these CEQA Guideline Amendments.[25] The Guideline Amendments require a lead agency to make a good-faith effort, based on the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. The Guideline Amendments give discretion to the lead agency whether to: (1) use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use; and/or (2) rely on a qualitative analysis or performance-based standards. Further, the Guideline Amendments identify three factors that should be considered in the evaluation of the significance of GHG emissions:

1. The extent to which a project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and

[25] *See 14 Cal. Code Regs. §§ 15064.7 (generally giving discretion to lead agencies to develop and publish thresholds of significance for use in the determination of the significance of environmental effects), 15064.4 (giving discretion to lead agencies to determine the significance of impacts from GHGs).*

3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.[26]

The administrative record of the promulgation of the Guidelines Amendments also clarify "that the effects of greenhouse gas emissions are cumulative, and should be analyzed in the context of California Environmental Quality Act's requirements for cumulative impact analysis."[27]

The California Natural Resources Agency is required to periodically update the guidelines to incorporate new information or criteria established by CARB pursuant to AB 32. Senate Bill 97 applies retroactively to any environmental impact report, negative declaration, mitigated negative declaration, or other document required by CEQA, which has not been finalized.

(i) California Senate Bill 375

Acknowledging the relationship between land use planning and transportation sector GHG emissions, California SB 375 was passed by the State Assembly on August 25, 2008, and signed by the Governor on September 30, 2008. This legislation links regional planning for housing and transportation with the GHG reduction goals outlined in AB 32. Reductions in GHG emissions would be achieved by, for example, locating employment opportunities close to transit. Under the bill, each Metropolitan Planning Organization would be required to adopt a Sustainable Community Strategy to encourage compact development so that the region will meet a target, created by CARB, for reducing GHG emissions.

Metropolitan Planning Organizations are required to identify strategies to reduce passenger vehicle miles traveled and trips that achieve these targets in a Sustainable Community Strategy. If the Sustainable Community Strategy is unable to achieve the regional GHG emissions reduction targets, than the Metropolitan Planning Organization is required to prepare an alternative planning strategy that shows how the GHG emissions reduction target could be achieved through alternative development patterns, infrastructure, and/or transportation measures. Metropolitan Planning Organizations have no land use authority at the local level as the majority of land use decisions are vested with local

[26] *14 Cal. Code Regs. § 15064.4(b).*

[27] *Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources (April 13, 2009).*

governments. Therefore, local-level participation in regional efforts will be critical to the success of any Sustainable Community Strategy or alternative planning strategy.

(j) Title 24 Energy Efficiency Standards

California's Energy Efficiency Standards for Residential and Nonresidential Buildings, located at Title 24, Part 6 of the California Code of Regulations and commonly referred to as "Title 24," were established in 1978 in response to a legislative mandate to reduce California's energy consumption. Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods.[28]

An update to Title 24 was adopted by the CEC on April 23, 2008. The 2008 standards apply to building permits for which an application was submitted on or after January 1, 2010. The CEC adopted the 2008 changes to the Building Energy Efficiency Standards to respond to the mandates of AB 32 and to pursue California energy policy that energy efficiency is the resource of first choice for meeting California's energy needs.

The most recent amendments to Title 24 became effective January 1, 2014; however, effective date for the energy provisions was revised to July 1, 2014.[29] As such, the 2010 California Energy Code will remain in effect until July 1, 2014. The most recent amendments to Title 24 continue to improve upon the current standards for new construction of, and additions and alternations to, residential and nonresidential buildings to meet the mandates of AB 32 and to pursue California's energy policy that energy efficiency is the resource of first choice for meeting California's energy needs.[30]

(k) California Green Building Standards

The California Green Building Standards Code, which is Part 11 of the California Code of Regulations, is commonly referred to as the CALGreen Code. The 2008 edition, the first edition of the CALGreen Code, contained only voluntary standards. The 2010 CALGreen Code is a code with mandatory requirements for State-regulated buildings, and structures throughout California beginning on January 1, 2011. The 2010 CALGreen Code

---

[28] *See www.energy.ca.gov/title24/ for additional information.*

[29] *California Energy Commission, Revised Effective Date for the 2013 California Building Energy Efficiency Standards, www.energy.ca.gov/title24/2013standards/2013_standards_revised_effective_date.html, accessed March 7, 2014.*

[30] *See www.energy.ca.gov/title24/2013standards/index.html.*

contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation and more. The code provides for design options allowing the designer to determine how best to achieve compliance for a given site or building condition. The code also requires building commissioning which is a process for the verification that all building systems, like heating and cooling equipment and lighting systems are functioning at their maximum efficiency.

The 2013 CALGreen Code will go into effect on July 1, 2014. There are a number of important updates in the 2013 code, such as: (1) an extensive update of California`s Energy Code; (2) updated CALGreen-requirements for nonresidential building alterations and additions; and (3) new plumbing code provisions pertaining to greywater and rainwater catchments.

(3) Regional

(a) South Coast Air Quality Management District

The Southern California Air Quality Management District (SCAQMD) adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:

- Phase out the use and corresponding emissions of chlorofluorocarbons, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;
- Phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons by the year 2000;
- Develop recycling regulations for hydrochlorofluorocarbons (e.g., SCAQMD Rules 1411 and 1415);
- Develop an emissions inventory and control strategy for methyl bromide; and
- Support the adoption of a California GHG emission reduction goal.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds.[31] Within its October 2008 document, the SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/ residential projects that emit greater than 3,000 metric tons per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where the SCAQMD is lead agency. However, the SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects) and has formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds.[32] SCAQMD's Working Group has not convened since the fall of 2010.

(b) Southern California Association of Governments

On April 4, 2012, the Regional Council of the Southern California Association of Governments (SCAG) adopted the 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy: Towards a Sustainable Future (2012–2035 RTP/SCS). Within the RTP, the SCS demonstrates the region's ability to attain and exceed the GHG emission-reduction targets set forth by the ARB. The SCS outlines the region's plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The regional vision of the SCS maximizes current voluntary local efforts that support the goals of SB 375, as evidenced by several Compass Blueprint Demonstration Projects and various county transportation improvements. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and complements the proposed transportation network that emphasizes system preservation, active transportation, and transportation demand management measures. Finally, the 2012–2035 RTP/SCS fully integrates the two subregional SCSs prepared by the Gateway Cities and Orange County Council of Governments. On June 4, 2012, CARB accepted SCAG's quantification of GHG emission reductions from the 2012–2035 RTP/SCS and the determination that the 2012–2035 RTP/SCS would, if implemented, achieve the 2020 and 2035 GHG emission reduction targets established by CARB.[33]

(4) Local

(a) County of Los Angeles Community Climate Action Plan (CCAP)

Los Angeles County is in the process of developing a Community Climate Action Plan (CCAP) to mitigate and avoid GHG emissions associated with community (not municipal) activities in unincorporated Los Angeles County. The CCAP will address emissions from building energy land use and transportation, water consumption and waste generation, and lay out the County's path to a sustainable future that achieves identified GHG reductions. Ultimately, the CCAP and associated GHG reduction measures will be incorporated into the Los Angeles County General Plan 2035.

The draft CCAP was published for public review in January 2014. As it is a draft document, and has not yet been adopted by the County, this discussion is provided for informational purposes only.

(b) County of Los Angeles Green Building Ordinance

Three ordinances were adopted by the County in furtherance of its "Green Building Program" in October 2008, and became effective in January 2009. One of those ordinances, known as the green building standards ordinance, applied to four categories of development, with corresponding requirements for each: (1) small residential and nonresidential projects; (2) medium-sized residential projects; (3) medium-sized (i.e., 10,000 to 25,000 square feet) nonresidential, commercial, mixed-use, or first-time tenant improvement projects; and, (4) large nonresidential, commercial, mixed-use, or first-time tenant improvement projects greater than 25,000 square feet, and all new high-rise buildings greater than 75 feet in height.

In 2013, and in response to mandates set forth in CALGreen, the County adopted the Los Angeles County Green Building Standards Code (Title 31), which adopts and incorporates by reference specified provisions of the 2013 CALGreen Code.[34] The purpose of Title 31 is to facilitate sustainability via planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and, environmental air quality. Title 31 is currently being revised to provide clarity for the development community, ensure consistency with the State and other local agencies, and advance sustainable construction standards in the County.

[34] *The County's 2008 ordinances are being repealed, and the more recently adopted Title 31 requirements will apply to this Project.*

d. Existing Conditions

(1) Existing Statewide Greenhouse Gas Emissions

GHGs are the result of both natural and human-influenced activities. Regarding human-influenced activities, motor vehicle travel, consumption of fossil fuels for power generation, industrial processes, heating and cooling, landfills, agriculture, and wildfires are the primary sources of GHG emissions. Without human intervention, the Earth maintains an approximate balance between the emission of GHGs into the atmosphere and the storage of GHGs in oceans and terrestrial ecosystems. Events and activities, such as the industrial revolution and the increased combustion of fossil fuels (e.g., gasoline, diesel, coal, etc.), have contributed to the rapid increase in atmospheric levels of GHGs over the last 150 years. As reported by the California Energy Commission (CEC), California contributes 1.4 percent of global and 6.2 percent of national GHG emissions.[35] It should be noted that California represents approximately 12 percent of the national population. Approximately 80 percent of GHGs in California are carbon dioxide produced from fossil fuel combustion. The current California GHG inventory compiles statewide anthropogenic GHG emissions and sinks (carbon storage, such as from trees) from years 2004 to 2010. It includes estimates for CO_2, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, and perfluorocarbons. The GHG inventory for California is presented in Table IV.C-3 on page IV.C-22.

(2) Existing Project Site Emissions

The approximately 32-acre Project Site currently includes the open-air 1,196-seat Amphitheatre with support spaces (i.e., dressing rooms, performer restrooms, green room) below; an 860-square-foot projection booth and control room located above the Amphitheatre seating; an indoor venue located below the Amphitheatre providing approximately 87 seats referred to as [Inside] the Ford; a two-story, approximately 320-square-foot concessions building; a 365-square-foot box office; a plaza referred to as Edison Plaza and a picnic area; surface parking areas; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles Arts Commission, and the Los Angeles Philharmonic. Other facility support spaces such as storage and maintenance areas and restrooms are also located throughout the Project Site. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet while the outdoor plaza areas comprise approximately 3,580 square feet.

---

Mobile source emissions are generated by motor vehicle trips to and from the Project Site. Existing on-site operations generate GHG emissions from a variety of sources. The consumption of fossil fuels to generate electricity and to provide heating and hot water for the Project Site creates GHG emissions. Other sources at the Project Site that would be associated with embodied energy and subsequent generation of GHG emissions include water usage, wastewater generation, and solid waste generation and disposal. Table IV.C-4 on page IV.C-24 presents the GHG emissions associated with the existing land uses.

3. Environmental Impacts

a. Thresholds of Significance

Until the passage of AB 32, CEQA documents generally did not evaluate GHG emissions or impacts on global climate change. Rather, the primary focus of air pollutant analysis in CEQA documents was the emission of criteria pollutants, or those identified in the California and federal Clean Air Acts as being of most concern to the public and government agencies (e.g., toxic air contaminants). With the passage of AB 32 and SB 97, CEQA documents now contain a more detailed analysis of GHG emissions. However, the analysis of GHGs is different from the analysis of criteria pollutants. Since the half-life of CO_2 is approximately 100 years, GHGs affect the global climate over a relatively long timeframe. Conversely, for criteria pollutants, significance thresholds/impacts are based on daily emissions; and the determination of attainment or non-attainment are based on the daily exceedance of applicable ambient air quality standards (e.g., 1-hour and 8-hour

Table IV.C-4

exposures). Also, the scope of criteria pollutant impacts is local and regional, while the scope of GHG impacts is global.

In its January 2008 CEQA and Climate Change white paper, the California Air Pollution Control Officers Association (CAPCOA) identified a number of potential approaches for determining the significance of GHG emissions in CEQA documents. In its white paper, CAPCOA suggests making significance determinations on a case-by-case basis when no significance thresholds have been formally adopted by a lead agency. One of the potential approaches identified in the CAPCOA white paper, Threshold 1.1, would require a project to meet a percent reduction target. This target would be based on the average reduction from BAU emissions identified by CARB as necessary to satisfy AB 32's mandate of returning to 1990 levels of GHG emissions by 2020. CARB has calculated the necessary reduction to be approximately 16 percent from "business-as-usual." [36]

OPR's recommended amendments to the CEQA Guidelines for GHGs were adopted by the Resources Agency on December 30, 2009. Analysis of GHG emissions in a CEQA document presents unique challenges to lead agencies. However, such analysis must be consistent with existing CEQA principles and, therefore, the amendments comprise relatively modest changes to various portions of the existing CEQA Guidelines. The amendments add no additional substantive requirements; rather, the Guidelines merely assist lead agencies in complying with CEQA's existing requirements. Modifications address those issues where analysis of GHG emissions may differ in some respects from

[36] *CARB, Supplement to the AB 32 Scoping Plan FED, Table 1.2-2, Updated 2020 Business-as-Usual Emissions Forecast, www.arb.ca.gov/cc/scopingplan/document/final_supplement_to_sp_fed.pdf.*

more traditional CEQA analysis. Other modifications clarify existing law that may apply both to an analysis of GHG emissions as well as more traditional CEQA analyses.

The following two questions relating to the effects of GHGs were added to the CEQA Guidelines, Appendix G (Environmental Checklist).

- Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- Would the project conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs?

Section 15064.4 of the CEQA Guidelines was adopted to assist lead agencies in determining the significance of the impacts of GHGs. Consistent with developing practice, this section urges lead agencies to quantify GHG emissions of projects where possible and includes language necessary to avoid an implication that a "life-cycle" analysis is required. In addition to quantification, this section recommends consideration of several other qualitative factors that may be used in the determination of significance (i.e., extent to which the project may increase or reduce GHG emissions; whether the project exceeds an applicable significance threshold; and extent to which the project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs). The amendments do not establish a threshold of significance. Lead agencies are called on to establish significance thresholds for their respective jurisdictions in which a lead agency may appropriately look to thresholds developed by other public agencies, or suggested by other experts, such as CAPCOA, so long as any threshold chosen is supported by substantial evidence (see CEQA Guidelines Section 15064.7(c)). The CEQA Guidelines amendments also clarify that the effects of GHG emissions are cumulative, and should be analyzed in the context of CEQA's requirements for cumulative impact analysis.[37] (see CEQA Guidelines Section 15130(f)).

Although GHG emissions can be quantified, CARB, SCAQMD and the County of Los Angeles, have yet to adopt project-level significance thresholds for GHG emissions that would be applicable to the Project. [38]

---

[37] *See generally Section 15130(f); see also Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources (April 13, 2009).*

[38] *The South Coast Air Quality Management District has formed a GHG Significance Threshold Working Group. More information on this Working Group is available at www.aqmd.gov/ceqa/handbook/GHG/GHG.html.*

Assessing the significance of a project's contribution to cumulative global climate change involves: (1) developing pertinent inventories of GHG emissions; and (2) considering project consistency with applicable emission reduction strategies and goals, such as those set forth by AB 32. Based on the foregoing, a project that generates GHG emissions, either directly or indirectly, would have a significant impact if the project:

- Emissions reduction does not constitute an equivalent or larger break from "business-as-usual" than has been determined by CARB to be necessary to meet the state AB 32 goals; or
- Conflicts with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

b. Methodology

The California Climate Action Registry (Climate Registry) General Reporting Protocol provides basic procedures and guidelines for calculating and reporting GHG emissions from a number of general and industry-specific activities.[39] The General Reporting Protocol is based on the "Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard" developed by the World Business Council for Sustainable Development and the World Resources Institute through "a multi-stakeholder effort to develop a standardized approach to the voluntary reporting of GHG emissions."[40] Although no numerical thresholds of significance have been developed, and no specific protocols are available for land use projects, the General Reporting Protocol provides a basic framework for calculating and reporting GHG emissions from the project. The information provided in this section is consistent with the General Reporting Protocol's reporting requirements.

The General Reporting Protocol recommends the separation of GHG emissions into three categories that reflect different aspects of ownership or control over emissions. They include the following:

- Scope 1: Direct, on-site combustion of fossil fuels (e.g., natural gas, propane, gasoline, and diesel).
- Scope 2: Indirect, off-site emissions associated with purchased electricity or purchased steam.

---

[39] *California Climate Action Registry, General Reporting Protocol Version 3.1, January 2009, www.climateregistry.org/resources/docs/protocols/grp/GRP_3.1_January2009_FINAL.pdf.*

[40] *California Climate Action Registry General Reporting Protocol, Version 3.1, January 2009, www.climateregistry.org/resources/docs/protocols/grp/GRP_3.1_January2009.pdf.*

- Scope 3: Indirect emissions associated with other emissions sources, such as third-party vehicles and embodied energy.[41]

The General Reporting Protocol provides a range of basic calculations methods. However, the General Reporting Protocol calculations are typically designed for existing buildings or facilities. These retrospective calculation methods are not directly applicable to planning and development situations where buildings do not yet exist.

CARB recommends consideration of indirect emissions to provide a more complete picture of the GHG footprint of a facility. Annually reported indirect energy usage aids the conservation awareness of a facility and provides information to CARB to be considered for future strategies.[42] For example, CARB has proposed requiring the calculation of direct and indirect GHG emissions as part of the AB 32 reporting requirements. Additionally, the Office of Planning and Research has noted that lead agencies "should make a good-faith effort, based on available information, to calculate, model, or estimate… GHG emissions from a project, including the emissions associated with vehicular traffic, energy consumption, water usage and construction activities."[43] Therefore, direct and indirect emissions have been calculated for the Project.

A fundamental difficulty in the analysis of GHG emissions is the global nature of the existing and cumulative future conditions. Changes in GHG emissions can be difficult to attribute to a particular planning program or project because the planning effort or project may cause a shift in the locale for some type of GHG emissions, rather than causing "new" GHG emissions. As a result there is a lack of clarity as to whether a project's GHG emissions represent a net global increase, reduction, or no change in GHGs that would exist if the project were not implemented. The analysis of the Project's GHG emissions is particularly conservative in that it assumes all of the GHG emissions are new additions to the atmosphere.

The California Emissions Estimator Model (CalEEMod) is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from a

---

[41] *Embodied energy is a scientific term that refers to the quantity of energy required to manufacture and supply to the point of use a product, material, or service.*

[42] *CARB, Initial Statement of Reasons for Rulemaking, Proposed Regulation for Mandatory Reporting of Greenhouse Gas Emissions Pursuant to the California Global Warming Solutions Act of 2006 (AB 32), Planning and Technical Support Division Emission Inventory Branch, October 19, 2007.*

[43] *OPR Technical Advisory, p. 5.*

variety of land use projects. CalEEMod was developed in collaboration with the air districts of California. Default data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions. The model is considered by the SCAQMD to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.[44]

(1) Construction

The Project's construction emissions were calculated using CalEEMod Version 2013.2.2. Details of the modeling assumptions and emission factors are provided in Appendix D of this Draft EIR. The calculations of the emissions generated during Project construction activities reflect the types and quantities of construction equipment that would be used to complete the proposed construction activities. The information needed to characterize GHG emissions from the manufacture, transport, and the end-of-life of construction materials would be speculative at the CEQA analysis level. Therefore, the construction analysis does not assess such GHG emissions.

In accordance with the SCAQMD's guidance, GHG emissions from construction were amortized over the lifetime of the Project. The SCAQMD defines the lifetime of a project as 30 years. Therefore, total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate comparable to operational emissions.

(2) Operation

Similar to construction, the SCAQMD recommended CalEEMod is used to calculate potential GHG emissions generated new land uses on the Project Site including mobile sources, electricity, natural gas, water usage/wastewater generation, and solid waste generation and disposal.

Mobile source emission calculations associated with operation of the new land uses use a projection of annual vehicle miles traveled, which is derived from the Transportation Study prepared for the Project.[45] These values account for the daily and seasonal variations in trip frequency and length associated with new patrons, employee, and visitor trips to and from the Project Site and other activities that require a vehicle trip. CalEEMod

calculates GHG emissions from all other sources based on the increase in specific number of seats or square footages of the Project.

(3) Consistency with Assembly Bill 32

A particularly illustrative method to determine consistency with AB 32, and one that has the co-benefit of being based on a quantification of emissions, is to compare a project's emissions as proposed to that project's emissions if it were to be built using BAU design, methodology, and technology. If a project constitutes an equivalent or larger break from BAU than has been determined by CARB to be necessary to meet AB 32's goals for 2020, then that project can be considered consistent with AB 32 and, therefore, will not have a significant impact on the environment due to its GHG emissions. While not project-specific, this is the average level of emissions reduction performance that would need to be achieved across all sectors of the economy to meet AB 32 goals. This section uses a reduction from BAU methodology to determine consistency with AB 32. This approach mirrors the concepts used in the CARB's *Climate Change Scoping Plan* for the implementation of AB 32.

Evaluating the proposition that a project constitutes a break from BAU requires providing a quantitative estimate of BAU based on the specific circumstances of the project in the context of relevant State activities and mandates. This essentially requires three GHG emissions inventories (as follows):

- Baseline, existing environmental setting, GHG emissions;
- BAU project GHG emissions; and
- "As proposed" project GHG emissions with project design features.

The analysis in this section includes potential emissions under BAU scenarios and from the Project at build-out based on actions and mandates expected to be in force in 2020. Early-action measures identified in the *Climate Change Scoping Plan* that have not been approved were not credited in this analysis. By not speculating on potential regulatory conditions, the analysis takes a conservative approach that likely overestimates the Project's GHG emissions at build-out.

Local governments as well as others use 2020 as a target date for GHG reductions. It is also an important target date for supporting legislation and regulation, including mandates for implementation of the Low Carbon Fuel Standard and the Federal Corporate

Average Fuel Economy standards. This 2020 target date reflects California's AB 32 mandate for GHG emissions reductions based on the following CARB timeline:[46]

- January 1, 2009: CARB adopts a "scoping plan" indicating how emissions reductions will be achieved.
- January 1, 2010: Early-action measures take effect.
- January 1, 2012: GHG rules and market mechanisms adopted by CARB are legally enforceable.
- December 31, 2020: Deadline for achieving the 2020 GHG emission cap.

A BAU scenario is used to establish a comparison with project-generated GHG emissions. The BAU scenario does not consider site-specific conditions, project design features, or prescribed mitigation measures. As an example, a BAU scenario would apply a base ITE trip-generation rate for the project and would not consider site-specific benefits resulting from the proposed mix of uses (e.g., internal trip reductions) or transit use. The analysis below establishes BAU as complying with the minimum performance level required under Title 24. But consistent with the *Supplemental FED's* calculation of the 16-percent reduction below BAU required to meet AB 32's mandate, the BAU scenario here does consider state mandates that were already in place when CARB prepared the *Supplemental FED* (e.g., Pavley I Standards, full implementation of California's Statewide Renewables Portfolio Standard beyond current levels of renewable energy, and the California Low Carbon Fuel Standard).

Emissions calculations for the Project include credits or reductions for the project features set forth in this Draft EIR, such as reductions in energy or water demand. In addition, as mobile source GHG emissions are directly dependent on the number of vehicle trips, a decrease in the number of Project generated trips as a result of project features will provide a proportional reduction in mobile source GHG emissions. This scenario conservatively did not include actions and mandates that are not already in place but are expected to be in force in 2020 (e.g., Pavley II), which could further reduce GHG emissions from use of light-duty vehicles by 2.5 percent.

c. Project Design Features

A complete description of the Project and associated development characteristics, including compliance with the County's green building requirements and designing Project

[46] *California Air Resources Board, www.arb.ca.gov/cc/cc.htm*

buildings to achieve certification under the U.S. Green Building Council's Leadership in Energy Efficiency and Design (LEED®), is provided in Section II, Project Description, of this Draft EIR. No specific project design features beyond the project improvements discussed in Section II, Project Description, of this Draft EIR are proposed with regard to greenhouse gas emissions.

d. Analysis of Project Impacts

The Project would have the potential to result in direct and indirect GHG emissions generated by different types of buildings, land uses, and emissions sources, potentially including:

- Construction: Emissions associated with demolition, site preparation, excavation, limited grading, and construction-related equipment and vehicular activity;
- Area Source: Emissions associated with consumer products and landscape equipment;
- Transportation: Emissions associated with Project-generated vehicular operations;
- Building Operations: Emissions associated with space heating and cooling, water heating, and lighting;
- Water: Emissions associated with energy used to pump, convey, deliver, and treat water; and
- Solid Waste: Emissions associated with waste streams (embodied energy of materials).

(1) Construction Impacts

GHG emissions during construction were forecasted by assuming a conservative start date (i.e., assuming all construction occurs at the earliest feasible date) and calculated using CalEEMod. Details of the modeling assumptions and emission factors are provided in Appendix D of this Draft EIR. The calculations of the emissions generated during Project construction activities reflect the number of haul/delivery truck trips, employee trips, and types and quantities of construction equipment that would be used to remove existing structures and construct the proposed buildings, and plant new landscaping, within the Project Site.

As presented in Table IV.C-5 on page IV.C-33, construction of the Project is estimated to generate a total of 1,442 metric tons of CO_2e. As recommended by the SCAQMD, the total GHG construction emissions were amortized over the 30-year lifetime

Table IV.C-5

of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the project's annual GHG emissions inventory.[47] A complete listing of the construction equipment by on-site and off-site activities, duration, and emissions estimation model input assumptions used in this analysis is included within the emissions calculation worksheets that are provided in Appendix D of this Draft EIR.

(2) Operational Impacts

(a) Area Source Emissions

Area source emissions were calculated using the CalEEMod emissions inventory model, which includes landscape equipment and use of consumer products. CalEEMod default values for types of sources and emission factors were used for both the BAU and Project scenarios. As shown in Table IV.C-6 on page IV.C-34, the Project is expected to result in less than one metric ton of CO_2e per year from area sources.

(b) Electricity and Natural Gas

GHGs are emitted as a result of activities in buildings when electricity and natural gas are used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; when this occurs in a building, it is a direct emission source associated with that building. GHGs are also emitted during the generation of electricity from fossil fuels. When electricity is used in a building, the electricity generation typically takes place off-site at the power plant; electricity use in a building generally causes emissions in an indirect manner.

[47] *SCAQMD Governing Board Agenda Item 31, December 5, 2008*

Table IV.C-6
Annual GHG Emissions Summary
(Metric Tons of Carbon Dioxide Equivalent)

Scope	No Project (Comparison Purposes)	"Business-as-Usual" Project	Project	Difference	Project's Break from "Business-as-Usual"
Area	<1	<1	<1	156	<0%
Energy	270	1,348	1,193	347	-12%
Mobile	480	1,623	1,277	0	-21%
Solid Waste	8	49	49	0	0%
Water/Wastewater	14	44	35	9	-20%
Construction	0	48	48	0	0%
Total Emission	**772**	**3,112**	**2,587**	**525**	**-16.4%**

Source: Matrix Environmental, 2014.

Electricity and natural gas emissions were calculated using the CalEEMod emissions inventory model, which multiplies an estimate of the energy usage by applicable emissions factors chosen by the utility company. GHG emissions from electricity use are directly dependent on the electricity utility provider. In this case, GHG intensity factors for LADWP were selected in CalEEMod. Energy use in buildings is divided into energy consumed by the built environment and energy consumed by uses that are independent of the construction of the building, such as plug-in appliances. CalEEMod calculates energy use from systems covered by Title 24 (e.g., heating, ventilation, and air conditioning [HVAC] system, water heating system, and lighting system); energy use from lighting; and energy use from office equipment, appliances, plug-ins, and other sources not covered by Title 24 or lighting. CalEEMod default electricity and natural gas usage rates for each applicable land use were selected for the BAU scenario in this analysis. Compliance with specific mandatory requirements of the CALGreen Code, a 15 percent minimum reduction in energy use from systems covered by Title 24 and lighting was applied to the Project.

As shown in Table IV.C-6, the Project is expected to result in a total of 1,192 metric tons of CO_2e per year from energy sources, which would be a reduction of approximately 12 percent in comparison to the BAU scenario.

(c) Mobile Source Emissions

Mobile source operational emissions were calculated based on the project trip generation estimates provided for the Project by Gibson Transportation Consulting, Inc.[48] As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, to calculate daily trips, the number of seats for the theater use and the amount of building area for the commercial use were multiplied by the applicable trip generation rates based on the Institute of Transportation Engineers (ITE)'s, *Trip Generation, 9th Edition*. Annual trips were then calculated based on the projected annual attendance. The Project trip generation estimate accounts for internal trip reduction and transit use. Please refer to Section IV.K, Traffic, Access, and Parking, of the Draft EIR for more details regarding trip reduction measures.

As shown in Table IV.C-6 on page IV.C-34, the Project is expected to result in a total of 1,227 metric tons of CO_2e per year from mobile sources, which would be a reduction of approximately 21 percent in comparison to the BAU scenario.

(d) Water Usage and Wastewater Generation Emissions

GHG emissions are related to the energy used to convey, treat and distribute water and wastewater. Thus, these emissions are generally indirect emissions from the production of electricity to power these systems. Three processes are necessary to supply potable water: (1) supply and conveyance of the water from the source; (2) treatment of the water to potable standards; and (3) distribution of the water to individual users. After use, the wastewater is treated and reused as reclaimed water.

Emissions related to water usage and wastewater generation were calculated using the CalEEMod emissions inventory model, which multiplies an estimate of the water usage by the applicable energy intensity factor to determine the embodied energy necessary to supply potable water. GHG emissions are then calculated based on the amount of electricity consumed multiplied by the GHG intensity factors for the utility provider. In this case, embodied energy for Southern California supplied water and GHG intensity factors for LADWP were selected in CalEEMod. Please refer to Section IV.L.1, Utilities and Service Systems—Water Supply, of this Draft EIR, for additional details on the Project's potential impacts to water supply. Compliance with specific mandatory requirements of the CALGreen Code, a 20 percent minimum reduction in water usage and wastewater generation was applied to the Project.

---

[48] *Gibson Transportation Consulting, Inc., Transportation Study for the 11750 Wilshire Boulevard Project, Los Angeles, California, January 2014. See Appendix L of this Draft EIR.*

As shown in Table IV.C-6 on page IV.C-34, the Project is expected to result in 35 $MTCO_2e$ per year from water usage and wastewater generation, which would be a reduction of approximately 20 percent in comparison to the BAU scenario.

(e) Solid Waste

Emissions related to solid waste were calculated using the CalEEMod emissions inventory model, which multiplies an estimate of the waste generated by applicable emissions factors provided in Section 2.4 of AP-42. CalEEMod default solid waste generation rates for each applicable land use were selected for this analysis. As shown in Table IV.C-6, the Project is expected to result in 49 metric tons of CO_2e from solid waste generation.

(3) Combined Construction and Operational Impacts

As shown in Table IV.C-6, the GHG emissions for the Project taking into consideration implementation of project design features included throughout this Draft EIR, the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates illustrates that the Project has incorporated sustainability design features to reduce VMTs and the Project's potential impact with respect to GHG emissions. The Project's GHG emissions reduction of 16.4 percent compared to the BAU scenario constitutes an equivalent or larger break from BAU than has been determined by CARB to be necessary to meet AB 32's goals (i.e., 16 percent reduction).[49] Therefore, the Project would not have a significant impact on the environment due to its GHG emissions. As discussed under Cumulative Impacts, the Project would be consistent with CARB's *Climate Change Scoping Plan* for the implementation of AB 32 and would comply with the County of Los Angeles Green Building Standards. Therefore, the Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

4. Cumulative Impacts

Although the Project is expected to emit GHGs, the emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. The resultant consequences of that climate change can cause adverse environmental effects. A

[49] *As discussed above, the Project scenario conservatively did not include actions and mandates that are not already in place but are expected to be in force in 2020 (e.g., Pavley II), which could further reduce GHG emissions from use of light-duty vehicles by 2.5 percent.*

project's GHG emissions typically would be very small in comparison to state or global GHG emissions and, consequently, they would, in isolation, have no significant direct impact on climate change. The State has mandated a goal of reducing statewide emissions to 1990 levels by 2020, even though statewide population and commerce is predicted to continue to expand. In order to achieve this goal, the CARB is in the process of establishing and implementing regulations to reduce statewide GHG emissions. However, currently there are no applicable CARB, SCAQMD, or County of Los Angeles significance thresholds or specific reduction targets, and no approved policy or guidance to assist in determining impact significance at the project or cumulative levels. Additionally, there is currently no generally accepted methodology to determine whether GHG emissions associated with a specific project represents new emissions or existing, displaced emissions.

Table IV.C-6 on page IV.C-34 illustrates that implementation of project design features included throughout this Draft EIR, the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates would contribute to GHG reductions. These reductions represent a reduction from BAU and support State goals for GHG emissions reduction. The methods used to establish this relative reduction are consistent with the approach used in the CARB's *Climate Change Scoping Plan* for the implementation of AB 32.

The Project is consistent with the approach outlined in CARB's *Climate Change Scoping Plan*, particularly its emphasis on the identification of emission reduction opportunities that promote economic growth while achieving greater energy efficiency and accelerating the transition to a low-carbon economy. In addition, as recommended by CARB's *Climate Change Scoping Plan*, the Project would use "green building" features as a framework for achieving cross-cutting emissions reductions.

The Project also would comply with the County of Los Angeles Green Building Standards Code, which emphasizes improving energy conservation and energy efficiency, increasing renewable energy generation, and changing transportation and land use patterns to reduce auto dependence. Implementation of project design features included throughout this Draft EIR would advance these objectives. Further, the related projects would also be anticipated to comply with many of these same emissions reduction goals and objectives (e.g., the County of Los Angeles Green Building Standards Code).

As part of SCAG's 2012-2035 SCS/RTP, a reduction in VMT within the region is a key component to achieve the 2020 and 2035 GHG emission reduction targets established by CARB. The Project results in a VMT reduction of 21 percent in comparison to BAU, and as such, would be consistent with the SCS/RTP.

With implementation of the project design features included throughout this Draft EIR, the Project results in a 16.4 percent reduction in GHG emissions from BAU. As such, the Project would be consistent with AB 32.

Given the Project's consistency with State, SCAG, and County of Los Angeles GHG emission reduction goals and objectives, the Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. In the absence of adopted standards and established significance thresholds, and given this consistency, the Project's impacts are concluded to be less than significant and not cumulatively considerable.

5. Mitigation Measures

The Project would comply with applicable regulatory requirements, including the provisions set forth in the 2013 CALGreen Code that have been incorporated into the County of Los Angeles Green Building Standards Code. Impacts related to climate change would be less than significant, and no mitigation measures are required.

6. Conclusion

Impacts with regards to climate change would be less than significant.

IV. Environmental Impact Analysis
D. Biological Resources

1. Introduction

The purpose of this section is to characterize the biological resources that currently occur on the Project Site, identify sensitive biological resources that are known to occur or have the potential to occur on-site, assess the potential significance of impacts to these biological resources from the Project, and recommend mitigation measures to avoid, minimize, or reduce the significance of any potential impacts. The analysis is based on the *Biological Resource Assessment for the Ford Theatres Project* (Biological Resource Assessment) prepared by GPA Environmental (June 2014), which is included as Appendix E of this Draft EIR.

2. Environmental Setting

a. Existing Regulatory Framework

The following discussion identifies federal, State and local environmental regulations and policies that serve to protect sensitive biological resources relevant to the California Environmental Quality Act (CEQA) review process.

(1) Federal

(a) Federal Endangered Species Act

The Federal Endangered Species Act (FESA) of 1973, as amended, provides the regulatory framework for the protection of plant and animal species (and their associated critical habitats), which are formally listed, proposed for listing, or candidates for listing as endangered or threatened under the FESA. The FESA has four major components: (1) provisions for listing species; (2) requirements for consultation with the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service; (3) prohibitions against "taking" of listed species; and (4) provisions for permits that allow an incidental "take." A "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to collect or attempt to engage in any such conduct (16 U.S.C. § 1532). Section 10 of the FESA allows the "incidental take" of federally listed endangered or threatened species by non-federal agencies through the issuance of an

incidental take permit. In order to obtain an incidental take permit, a Habitat Conservation Plan must be submitted to the appropriate federal agency, specifying the impacts that would result from the project, and how these impacts would be minimized or mitigated. The FESA also discusses recovery plans and the designation of critical habitat for listed species.

(b) The Migratory Bird Treaty Act

The Federal Migratory Bird Treaty Act (MBTA) (16 U.S.C. Sections 703 et seq.; Title 50 C.F.R. Part 10 and Part 21) protects migratory birds, their occupied nests, and their eggs from disturbance or destruction. The MBTA also prohibits the taking, killing, possessing, transporting, and importing of migratory birds, parts of migratory birds, and their eggs and nests, except when specifically authorized by the Department of the Interior. As used in the MBTA, the term "take" is defined as "to pursue, hunt, capture, collect, kill or attempt to pursue, hunt, shoot, capture, collect or kill, unless the context otherwise requires." With a few exceptions, most birds are considered migratory under the MBTA. Disturbances that cause nest abandonment and/or loss of reproductive effort or loss of habitat upon which these birds depend would be in violation of the Migratory Bird Treaty Act.

(2) State

(a) California Endangered Species Act

The State of California enacted laws similar to the FESA, including the California Native Plant Protection Act enacted in 1977 and the California Endangered Species Act (CESA) enacted in 1984. The CESA expanded upon the original Native Plant Protection Act and enhanced legal protection for plants, but the Native Plant Protection Act remains part of the California Fish and Game Code. To align with the FESA, CESA created the categories of "endangered" and "threatened" species. It converted all animals previously determined "rare" by the California Fish and Game Commission into threatened species in the CESA, but did not do so for rare plants. These laws provide the legal framework for the protection of California-listed endangered, threatened, and rare plant and animal species. Under Section 2080.1 of the California Fish and Game Code, if a species is both federally and State listed, a consistency determination agreeing with the protections outlined in the FESA permits is required if a project would impact a listed species. Under Section 2081, if a species is State-listed only, consultation with CDFW is required in order to obtain an incidental take permit if the project could result in take of a State-listed species. If no take would result, concurrence with the CDFW is required.

(b) State Fully Protected Species and Species of Special Concern

The classification of "fully protected" was the CDFW's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under CESA and/or FESA. The California Fish and Game Code sections (Section 551, 5050, 3511, 4700) dealing with "fully protected" species state that these species "may not be taken or possessed at any time and no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected species," although take may be authorized for necessary scientific research. This language makes the "fully protected" designation the strongest and most restrictive regarding the "take" of these species. In 2003, the California Fish and Game Code sections dealing with fully protected species were amended to allow the CDFG to authorize take resulting from recovery activities for State-listed species.

Species of special concern are broadly defined as animals that are: extirpated from the State or, in the case of birds, in its primary seasonal or breeding role; not listed under the CESA, but which meet the State definition of threatened or endangered; experiencing, or formerly experienced, declining numbers that could result in listing; and which have naturally small populations exhibiting high susceptibility to risk from any factor, which could lead to declines that would qualify the species for State threatened or endangered status. This designation is intended to result in special consideration for these animals by the CDFW, land managers, consulting biologists, and others, and is intended to focus attention on the species to help avert the need for listing under FESA and CESA, and recovery efforts that might ultimately be required. This designation is also intended to stimulate collection of additional information on the biology, distribution, and status of poorly known at-risk species, and focus research and management attention on them. Although these species generally have no special legal status, they are given special consideration under CEQA during project review.

(c) California Department of Fish and Wildlife "Special Animals and Plants"

"Special Animals" and "Special Plants" is a general term that refers to all of the taxa the California Natural Diversity Database (CNDDB) tracks, regardless of their legal or protection status. Any species included in the CNDDB is considered a "special animal" or a "special plant," and the list includes species that are officially listed or are candidates for listing as endangered, threatened, or rare at the federal or State level; considered by the CDFW to be a species of special concern; listed by various other State or federal agencies or by various conservation organizations; are biologically rare, very restricted in distribution, declining throughout their range, or have a critical, vulnerable stage in their life cycle; threatened with extirpation; and associated with a habitat that is declining.

(d) California Fish and Game Code Sections 3503, 3513, & 3800

According to Section 3503 of the California Fish and Game Code it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically protects birds in the orders Falconiformes and Strigiformes (birds-of-prey). Section 3513 and 3800 essentially overlaps with the Migratory Bird Treaty Act, prohibiting the take or possession of any migratory non-game bird. "Migratory birds" include all nongame, wild birds found in the U.S., except for the house sparrow *(Passer domesticus),* European starling *(Sturnus vulgaris),* and rock pigeon *(Columba livia).* Disturbance that causes nest abandonment and/or loss of reproductive effort is considered a "take" by the CDFW.

(e) California Native Plant Society

The California Native Plant Society (CNPS) publishes and maintains an *Inventory of Rare and Endangered Plants of California*, which includes information regarding the distribution, ecology, rarity, and legal status of over 2,000 rare plants that occur in California. Plants on Lists 1A, 1B, and 2 of the CNPS Inventory consist of plants that may qualify for listing, and are required to be analyzed under CEQA during project review. Although plants on List 3 and 4 have little or no protection under CEQA, they are usually included in project review.

(f) Sensitive Vegetation Communities

Sensitive vegetation communities are natural communities and habitats that are either unique, of relatively limited distribution in the region, or of particularly high wildlife value. These resources have been defined by federal, State, and local conservation plans, policies or regulations. The CDFW ranks such vegetation communities as "threatened" or "very threatened" and keeps records of their occurrences in the CNDDB as described above. Sensitive vegetation communities are also identified by the CDFW on its List of California Natural Communities Recognized by the CNDDB.

(g) Natural Community Conservation Planning Act of 2003

The Natural Community Conservation Planning (NCCP) program was developed under California's Natural Community Conservation Planning Act of 1991 (superseded by NCCP Act of 2003), and is a cooperative effort to protect habitats and species that have begun to decline. The primary objective of the program is to conserve natural communities while accommodating compatible land use. A local agency works with landowners and environmental organizations, with guidance from CDFW and USFWS, to develop a natural community conservation plan.

(3) Local

(a) Los Angeles County General Plan

The Conservation and Open Space Elements of the Los Angeles County General Plan include the Significant Ecological Area (SEA) Program. SEAs support valuable habitat for rare, threatened, or endangered species, and are important for the conservation of biological diversity in the County. The objective of the SEA Program is to preserve the genetic and physical diversity of the County by designing biological resource areas that are self-sustaining. The program intends to ensure that privately held lands within the SEAs retain the right of reasonable use, while avoiding activities and development projects that are incompatible with the long-term survival of the SEAs. The Griffith Park SEA is approximately 0.50 mile north of the Project survey area; however, the Project is not located within a designated SEA.

(b) Los Angeles County Oak Tree Ordinance

The Los Angeles County Oak Tree Ordinance was established to recognize oak trees as significant, historical, aesthetic, and ecological resources. Under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage, or encroach into the protected zone of any oak tree *(Quercus sp.)* measuring 8 inches or more in diameter at 4.5 feet above mean natural grade. For oaks with multiple trunks, this includes a combined diameter of 12 inches or more for the two largest trunks.

b. Existing Conditions

(1) Physical Characteristics

As described in Section II, Project Description, of this Draft EIR, the Project Site comprises an approximately 32-acre County of Los Angeles regional park. The topography of the Project Site is widely varied from moderately sloping surface parking areas along the western portion of the Project Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions of the Project Site. Ornamental landscaping is provided along driveways, surface parking areas, and pedestrian pathways.

The study area with regards to biological resources, identified in the Biological Resource Assessment as the Biological Study Area (BSA), includes areas that could be impacted by the Project, either temporarily or permanently, and includes areas that could be indirectly affected by noise or other disturbances associated with the Project. The BSA determined for the Project encompasses approximately 18.2 acres of land and includes the areas of the proposed Amphitheatre improvements (Area A), the Ford Terrace (Area A),

the Ford Plaza (Area B), the Transit Center (Area C), and the proposed trail alignments, as shown in Figure IV.D-1 on page IV.D-7. In addition to the proposed development areas, Areas A, B, and C include the surrounding vegetation. Further, the hiking trail area consists of the proposed hiking trail alignment as well as a 15-foot buffer on either side of the trail.

(2) Vegetation and Plant Communities

Plant communities within the BSA include chaparral, ruderal, and ornamental landscaped areas, as illustrated in Figure IV.D-2 on page IV.D-8. As shown therein, the chaparral communities are located on the hillside primarily to the east of the existing developed areas. Ornamental and ruderal plant communities border the north surface parking lot. Non-native ornamental species have also been planted south and east of the Amphitheatre to provide an aesthetically pleasing backdrop to the Amphitheatre stage and at the entrance and surrounding the parking areas and box office. Attachment B of the Biological Resource Assessment, included as Appendix E of this Draft EIR, provides a complete list of plant and tree species observed during the biological surveys.

(a) Chaparral

The hillsides surrounding Areas A and C, and the proposed trail alignment, are vegetated with native chaparral species. The dominant species are laural sumac *(Malosma laurina)*, California buckwheat (*Eriogonum fasiculatum*), and black sage *(Salvia mellifera)*. Co-dominant species include California brickelbush *(Brickellia californica)* and non-native annual grasses.

(b) Ornamental

The terraces at the foot of the hillside in Area A, and at the entrance to the parking lots and box office in Areas B and C, are planted with non-native ornamental plant species. The most common species observed include juniper *(Juniperus chinensis)*, Mexican fan palm *(Washingtonia robusta)*, and lantana *(Lantana sp.)*. There is an overstory of pine species (*Pinus* sp.), which were likely planted in the BSA. Coast live oak trees (*Quercus agrifolia)* were also observed in Areas A and B of the BSA.

(3) Wildlife Populations

Wildlife species observed during the biological field surveys conducted on December 11 and December 16, 2013, include black phoebe *(Sayornis nigricans)*, California towhee *(Melozone crissalis)*, yellow-rumped warbler *(Setophaga coronata)*, Anna's hummingbird (*Calypte anna*), American crow (*Corvus brachyrhynchos*), red-tailed hawk (*Buteo jamaicensis*), turkey vulture (*Cathartes aura*), western scrub jay (*Aphelocoma*

californica), woodpecker (*Picoides* sp.), kingbird (*Tyrannus* sp.), and western fence lizard (*Sceloporus occidentalis*). Based on personal communication with an on-site theatre production manager, mule deer, bobcats, and coyotes are also known to forage in the BSA, and an individual mountain lion (*Puma concolor*) is known to frequent the Griffith Park area. In addition, deer and coyote scat were observed in the hills during surveys.

(4) Sensitive Resources with Potential to Occur

The following discussion describes the sensitive plant and wildlife species with potential to occur within the BSA based on their geographical range. These species have been afforded special status and/or protection by federal, State, or local resource conservation agencies and organizations because of the species' limited or declining population size or limited distribution. Also discussed are habitats that are of relatively limited distribution or of particular value to wildlife. Determinations on whether sensitive resources could potentially occur within the BSA are based on: a record reported in the CNDDB and/or the presence of suitable habitat.

(a) Sensitive Plant Communities

No special-status plant communities are located in the BSA. Native plant communities that occur in the BSA include chaparral scrub, which is common in undeveloped areas of southern California.

(b) Sensitive Plant Species

The following describes special-status plant species that have the potential to occur within the BSA. Special-status plant species determined to have no potential to occur in the BSA can be found in Table 1 of the Biological Resource Assessment included in Appendix E of this Draft EIR.

Slender mariposa-lily

The Slender mariposa-lily *(Calochortus clavatus* var. *gracilis)* is a perennial herb found in foothill canyons, chaparral and coastal scrub habitats. The slender mariposa-lily occurs at an elevation range of 1,050 to 3,281 feet and has a blooming period from March to June. The plant species has a CNPS Listing of 1B, indicating the plant species is rare, threatened, or endangered in California and elsewhere.

Plummer's mariposa-lily

The Plummer's mariposa-lily *(Calochortus plummerae)* is a perennial herb found in chaparral, foothill woodland, yellow pine forest, coastal sage scrub, and valley grassland

habitats. The Plummer's mariposa-lily occurs at an elevation range of 328 to 5,577 feet and has a blooming period from May to July. The plant species has a CNPS Listing of 4, indicating the plant species is of limited distribution.

Parry's spineflower

The Parry's spineflower *(Chorizanthe parryi var. parryi)* is an annual herb found in chaparral and coastal sage scrub communities. The Parry's spineflower occurs at an elevation range of 902 to 4,003 feet and has a blooming period from April to June. The plant species has a CNPS Listing of 1B, indicating the plant species is rare, threatened, or endangered in California and elsewhere.

Palmer's grapplinghook

The Palmer's grapplinghook *(Harpagonella palmeri)* is an annual herb found in chaparral and coastal sage scrub communities, and valley and foothill grassland. The Palmer's grapplinghook occurs at an elevation range of 66 to 3,133 feet and has a blooming period from March to May. The plant species has a CNPS Listing of 4, indicating the plant species is of limited distribution.

Mesa horkelia

The Mesa horkellia *(Horkelia cuneata var. puberula)* is a perennial herb found in cismontane woodland, chaparral, and coastal sage scrub in sandy or gravelly soils habitats. The Mesa horkellia occurs at an elevation range of 203 to 2,657 feet and has a blooming period from February to September. The plant species has a CNPS Listing of 1B, indicating the plant species is rare, threatened, or endangered in California and elsewhere.

Robinson's pepper-grass

The Robinson's pepper-grass *(Lepidium virginicum var. robinsonii)* is an annual herb found in chaparral and coastal scrub habitats. The Robinson's pepper-grass occurs at an elevation range of 3 to 2,904 feet and has a blooming period from January to July. The plant species has a CNPS Listing of 4, indicating the plant species is of limited distribution.

(c) Sensitive Wildlife Species

The following describes special-status wildlife species that have the potential to occur within the BSA. Special-status wildlife species determined to have no potential to occur in the study area can be found in Table 2 of the Biological Resource Assessment included in Appendix E of this Draft EIR.

Gertsch's socalchemmis spider

The Gertsch's socalchemmis spider *(Socalchemmis gertschi)* is found in sage scrub, chaparral, oak woodland, coniferous forest, and rocky habitats in non-arid climates. The species is ranked by the CDFW as S1, indicating there are less than 1,000 individuals or less than 2,000 acres of habitat.

Coastal whiptail

Coastal whiptail *(Aspidoscelis tigris stejnegeri)* is found in chaparral, woodland, and riparian habitats in open, dry areas. The species is ranked by the CDFW as S2S3. S2 indicates there are between 1,000 and 3,000 individuals or 2,000 to 10,000 acres of habitat. S3 indicates there are between 3,000 and 10,000 individuals or 10,000 to 50,000 acres of habitat.

Coast horned lizard

The Coast horned lizard *(Phrynosoma blainvillii)* is found in grasslands, coniferous forests, woodlands, and chaparral in areas of loose soil and low vegetation. The Coast horned lizard can be found at sea level to elevations up to 8,000 feet. It is listed as a species of concern, as identified by CDFW.

Coastal California gnatcatcher

The Coastal California gnatcatcher *(Polioptila californica californica)* is found in chaparral, grassland, and riparian areas near sage scrub. The Coastal California gnatcatcher requires variable amounts of semi-open sage scrub dominated by California sagebrush on shallow slope gradients. It is listed as threatened under the FESA and as a species of concern by CDFW.

Pallid bat

The Pallid bat *(Antrozous pallidus)* is found in rocky, mountainous areas near water or open, sparsely vegetated grasslands. Pallid bats roost in attics, rock cracks, buildings, and caves. It is listed as a species of concern by CDFW.

Western mastiff bat

The Western mastiff bat *(Eumops perotis californicus)* is a cliff dwelling species that generally roosts under rock slabs or crevices in large boulders or buildings. Foraging habitat includes dry desert washes, flood plains, chaparral, oak woodland, grassland, and agricultural areas. It is listed as a species of concern by CDFW.

Hoary bat

Hoary bats *(Lasiurus cinereus)* primarily roost in the foliage of coniferous and deciduous trees but have also been observed in caves, beneath rock ledges, and in buildings. The species is ranked by the CDFW as S4 indicating the species is secure within California with some threat or narrow habitat.

San Diego desert woodrat

The San Diego desert woodrat *(Neotoma lepida intermedia)* is found in high desert areas, chaparral, sagebrush flats, pinyon-juniper pine, and Joshua trees. It is listed as a species of concern by CDFW.

Pocketed free-tailed bat

The Pocketed free-tailed bat *(Nyctinomops fermorosaccus)* generally roosts in crevices of cliffs, high rocky outcrops, and slopes, but may also be found roosting in buildings, caves, and under roof tiles. The Pocketed free-tailed bat forages in desert shrub and pineoak forests. It is listed as a species of concern by CDFW.

Big free-tailed bat

The Big free-tailed bat *(Nyctinomops macrotis)* is found in arid, rocky habitats, and has been found in desert shrub, woodlands and evergreen forests. This species mainly roosts in crevices of cliffs, but has also been documented in buildings, caves and tree cavities. It is listed as a species of concern by CDFW.

(5) Oak Tree Protection

Coast live oak trees (*Quercus agrifolia)* were observed in Areas A and B of the BSA. As described above, oak trees are subject to the County of Los Angeles Oak Tree Ordinance. During the tree survey conducted as part of the Project included in Appendix B of this Draft EIR, five oak trees were identified for potential removal or relocation. These oak trees measured 4, 8, 14, 12, and 10 inches at 4.5 feet above mean natural grade. It is noted that the oak tree measuring 4 inches in trunk diameter was previously contemplated for removal as part of the approved Amphitheatre improvements. The remaining four oak trees would be relocated within the Project Site. The oak tree previously contemplated for removal as part of the approved Amphitheatre improvements is located east of the Amphitheatre within the ornamental landscaped area. The four oak trees proposed to be relocated are located west of the Amphitheatre, two adjacent to the south surface parking lot and two are adjacent to the circular driveway. In accordance with the Los Angeles

County Oak Tree Ordinance, County authorization would be required for the relocation of the four oak trees measuring 8, 10, 12, and 14 inches in diameter.

(6) Regional Connectivity/Wildlife Movement

The Project Site, inclusive of the BSA, is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Notwithstanding, according to the CDFW Biogeographic Information and Observation System Habitat Connectivity Viewer, the BSA is located within an undisturbed habitat block that includes native plant and wildlife species. Therefore, the Project Site and the surrounding open space areas may be used for wildlife movement. From a regional perspective, the Project Site is situated in the Hollywood Hills adjacent to Cahuenga Boulevard East where Cahuenga Boulevard parallels the Hollywood Freeway. Uses surrounding the Project Site include 4-story multi-family residential buildings and open space to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The Hollywood Reservoir and associated open space are also located further north-northeast of the Project Site. The presence of Cahuenga Boulevard and the Hollywood Freeway immediately west of the Project Site presents a physical barrier to wildlife movement to or from the areas west of the Project Site. In addition, given the surrounding development to the north, south, and east of the Project Site comprising primarily of residential uses interspersed with scattered open space areas, any potential wildlife movement occurring within and surrounding the BSA would likely be limited to local movement within the adjacent open space areas to the north, south, and east of the BSA. As such, the BSA is not likely to support wildlife movement on a regional scale.

(7) Jurisdictional Delineation of Wetlands

A review of the USFWS' National Wetlands Inventory indicated that there are riverine wetlands within the BSA, north of the Amphitheatre. This area was studied during the biological field survey and was determined to be a cement drainage slough with tarps and sandbags stacked on either side of the drainage to prevent erosion. The drainage does not contain wetland vegetation or connect to other waterways, and is not considered jurisdictional. No other jurisdictional features were identified in the BSA. With respect to the Project's potential impacts to hydrology and water quality, refer to Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR.

3. Environmental Impacts

a. Methodology

Preparation of the Biological Resource Assessment was prepared through: (1) delineation of the Biological Study Area; (2) literature review; and (3) on-site field investigation. As previously described, the BSA includes the area that could be impacted by the Project, either temporarily or permanently, and includes areas that could be indirectly affected by noise or other disturbances.

Relevant literature regarding the biological resources documented near the BSA was reviewed, including the California Natural Diversity Database and the Biogeographic Information and Observation System Habitat Connectivity Viewer to determine habitat connectivity in the BSA. The CNDDB and the Biogeographic Information and Observation System Habitat Connectivity Viewer are managed and updated by the CDFW. A database query was conducted for the Hollywood, Inglewood, Venice, Beverly Hills, Pasadena, Van Nuys, Burbank, Los Angeles, and South Gate 7.5-minute U.S. Geological Survey (USGS) quadrangles from the CNDDB Rarefind 5 online database. A review of the USFWS official species list of species designated as threatened or endangered that have the potential to occur on-site within the BSA was also completed.

On-site field surveys within the BSA were conducted on December 11, 2013, and December 16, 2013. This included foot surveys in which all vegetation communities within the BSA were surveyed, and all plant and wildlife species within the BSA were inventoried to the extent feasible to verify the presence or absence of protected species.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to biological resources would be significant if the Project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;

- Have a substantial adverse effect, either on any riparian habitat or other sensitive natural community identified in the local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;

- Have a substantial adverse effect on federally protected wetlands as defined by section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

As evaluated in the Initial Study included as Appendix A of this Draft EIR, the Project would be located within a canyon setting where there are no known federally protected waters or wetlands as defined by Section 404 of the Clean Water Act. In addition, the Project would not be located within an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan. Therefore, no impact would occur with regards to protected wetlands or habitat conservation plans, and no further analysis of these issues is provided in the analysis of Project impacts below.

c. Project Design Features

No specific project design features are proposed with regard to biological resources.

d. Analysis of Project Impacts

(1) Potential Vegetation Community Impacts

As previously discussed, no special-status plant communities are located in the BSA. Native plant communities that occur in the study area include chaparral scrub, which is common in undeveloped areas of southern California. As this native plant community is not listed as a special-status plant community, potential impacts to existing plant communities associated with the Project would be less than significant and no mitigation measures are required.

(2) Potential Regulatory Status Plant Species Impacts

As described above, special-status plant species with the potential to occur within the BSA include Slender mariposa-lily, Plummer's mariposa-lily, Parry's spineflower, Palmer's grapplinghook, Mesa horkellia, and the Robinson's pepper-grass. The slender mariposa-lily, Parry's spineflower, and mesa horkellia are listed on the CNPS as rare, threatened, or endangered. The Plummer's mariposa-lily, Palmer's grapplinghook, and Robinson's pepper-grass are listed as a plant species of limited distribution. The Project would include rehabilitation of portions of the existing Amphitheatre and development of new structures, including improvements to the exterior landscape and development of a hiking trail. Construction along the proposed hiking trail and within the existing landscaped areas would require vegetation removal. In addition, on a yearly basis, vegetation would be thinned up to 200 feet from all new structures in an effort to reduce fire risk in the area. Such activities could directly or indirectly impact identified special-status plant species that occur within the BSA. Accordingly, Mitigation Measures D-1 and D-2 are provided below to require completion of rare plant surveys, implementation of avoidance measures, and preparation of a restoration plan in the event special status plant species are directly impacted by Project construction. With implementation of Mitigation Measures D-1 and D-2, potentially significant impacts to special-status plant species associated with the Project would be reduced to a less than significant level.

(3) Potential Regulatory Status Wildlife Species Impacts

(a) Construction

(i) Regulatory Status Bird Species

The coastal California gnatcatcher is identified as a species of concern by the CDFW and would have the potential to occur in the BSA as the chaparral and sage scrub communities located in the BSA are suitable habitats for the coastal California gnatcatcher. According to the CNDDB, the most recent recording of this species was documented approximately 6 miles northwest of the BSA in 1991. Therefore, the potential for the coastal California gnatcatcher to occur in the BSA during construction is considered low. However, absence cannot be confirmed without additional surveys. As such, the Project could result in potentially significant direct impacts to the coastal California gnatcatcher. In addition, as this species is non-migratory, construction activities could result in indirect impacts on coastal California gnatcatcher species through noise disturbance and vegetation removal if they were to be in the BSA during construction. Annual vegetation thinning required out to 200 feet from all new structures would also reduce habitat for coastal California gnatcatcher. Accordingly, Mitigation Measure D-3 is included below to require protocol-level surveys within the year prior to construction, and any additional surveys, as necessary, if the coastal California gnatcatcher or its sign is detected.

Implementation of Mitigation Measure D-3 would reduce potential impacts to a less than significant level.

Migratory birds and raptors also have the potential to occur in the BSA given the large areas of trees, vegetation, and buildings that could create the potential for migratory birds and raptors to nest. Construction activities could result in impacts on nesting birds through noise disturbance and vegetation removal if they were in the BSA during construction. As such, Mitigation Measure D-4 is provided below to require that construction activities be scheduled outside of the nesting season, nest bird surveys be conducted if construction is scheduled during bird nesting season, and buffers and avoidance be created to prevent impacts to migratory birds. Implementation of Mitigation Measure D-4 would reduce potentially significant impacts to migratory birds to a less than significant level.

(ii) Regulatory Status Small Mammal Species

The BSA includes undisturbed habitat that could be impacted as a result of construction activities. Sensitive wildlife species with the potential to occur within this habitat includes the coast horned lizard and the San Diego desert woodrat, both of which are considered species of concern by CDFW. Construction activities, including noise disturbance and vegetation removal could impact these species if they are present within the BSA during Project construction. Mitigation Measure D-5, provided below, would require pre-construction surveys prior to construction to determine the presence or absence of wildlife in the construction area. With implementation of Mitigation Measure D-5, impacts to wildlife species would be reduced to a less than significant level.

(iii) Regulatory Status Bat Species

Four bat species have been identified with the potential to occur within the BSA. This includes the pallid bat, western mastiff bat, hoary bat, and the pocketed free-tailed bat. All are identified as species of concern by the CDFW with the exception of the hoary bat, which has a State rank of "S4." The BSA includes large trees, vegetation, and buildings that could provide roosting habitats for bats. Construction activities would result in noise disturbance and vegetation removal that could impact the bats if they are present during construction. Accordingly, Mitigation Measures D-6 and D-7 are included below to require that bat surveys be conducted prior to construction, non-breeding bats be identified and be safely evicted from the roosting habitat, and that no work be conducted within 100 feet of the roosting site of a maternal colony. Implementation of Mitigation Measures D-6 and D-7 would reduce potential impacts to bats to a less than significant level.

(b) Operation

Implementation of the Project would increase lighting, noise, and human activity within the Project Site, which could potentially deter wildlife occurring within the BSA from the area and reduce their ability to forage. In addition, the development of the proposed hiking trail would increase the risk for wildlife-human interactions within the Project Site. Furthermore, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path and reduce further disturbance of the hillside may prevent wildlife access to foraging areas and reduce their ability to move through the area. Mitigation Measures D-8 through D-10, provided below, would require that Amphitheatre lighting be designed to focus downward on the developed areas of the Project area; the use of trash receptacles that are not accessible to wildlife along the proposed hiking trail to reduce the potential for wildlife-human interaction; and that fencing be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. With implementation of these mitigation measures, potential impacts to wildlife species during operation of the Project would be reduced to a less than significant level.

Regarding the potential for erosion within the Project Site, refer to Section IV.F, Geology and Soils, of this Draft EIR. As discussed therein, the Project would include best management practices in accordance with the County's Low Impact Development Standards Manual to address on-site erosion within the Project Site. Therefore, no substantial erosion is anticipated to occur within the Project Site that could adversely affect wildlife species occurring within the BSA or moving through the Project Site.

(4) Oak Tree Impacts

As previously described, during the tree survey conducted for the Project, one coast live oak was identified for removal as part of the previously approved Amphitheatre improvements and four coast live oak trees have been identified for potential relocation. The oak tree previously contemplated for removal as part of the approved Amphitheatre improvements measured 4 inches in trunk diameter at 4.5 feet above mean natural grade. The remaining oak trees proposed to be relocated within the Project Site measured 8, 10, 12, and 14 inches in trunk diameter at 4.5 feet above mean natural grade. In accordance with the Los Angeles County Oak Tree Ordinance, a permit would be required for the removal or relocation of oak trees measuring 8 inches in trunk diameter or greater. As such, a permit would be required for the relocation of the four oak trees measuring 8, 10, 12, and 14 inches in trunk diameter. As these trees are proposed to be relocated within the Project Site, the Project would not result in the permanent loss of protected trees and potential impacts to oak trees would be less than significant. Mitigation Measure D-11, provided below, would ensure the relocation of the oak trees is consistent with the Los Angeles County Oak Tree Ordinance. Mitigation Measures D-11 further outlines the procedures to be followed should the oak trees be protected in place.

(5) Regional Connectivity/Wildlife Movement

As previously discussed, there are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Notwithstanding, development of the Project would occur primarily within the already developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. As such, the Project would not be expected to result in an increased barrier to local wildlife movement. In addition, the proposed trail alignment would generally follow the alignment of existing user-created trails, which potential wildlife in the area would already be accustomed to. Furthermore, while implementation of the proposed hiking trail would increase human activity in the hillside areas, wildlife movement typically occurs during nighttime when access to the hiking trail would not be permitted. Additionally, in accordance with Mitigation Measure D-9 provided below, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, the Project is not anticipated to negatively impact wildlife movement within the open space areas of the Project Site and the open space areas to the north and east of the Project Site. Impacts with regard to wildlife movement would be less than significant.

(6) Fuel Modification and Fire Risk

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist within the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. Fires within the Project Site could result in potential impacts on existing vegetation communities, special status species, and wildlife if a fire were to spread beyond the developed areas of the Project. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. A preliminary fuel modification plan has been prepared for the Project and is illustrated in Figure IV.J.1-2 in Section IV.J.1, Public Services—Fire Protection, of this Draft EIR. As shown therein, the preliminary fuel modification plan includes 30-foot and 200-foot buffer zones from all new structures. The 30-foot buffer zone would provide for replanting of

low-growing, irrigated drought-tolerant plant material as a means to prevent erosion and transition to the native character of the Project Site. The 200-foot buffer zone would provide for seasonal clearing of brush and, as needed, pruning of trees to reduce the amount of potential plant material that could fuel a fire. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, impacts with respect to wildfire risk would be less than significant.

4. Cumulative Impacts

Cumulative impacts are impacts to biological resources that are a consequence of aggregate past, present, and foreseeable impacts of the Project and other projects located within the vicinity of the Project Site. To evaluate cumulative impacts, the Project in combination with the related projects identified in Section III, Environmental Setting of this Draft EIR, were analyzed.

The related projects include mostly infill developments that contain limited native vegetation or suitable habitats for wildlife species. Due to their generally developed/ disturbed nature and lack of native vegetation and habitats, the related project sites do not contribute to the long-term sustainability of natural communities and, therefore, would not have a significant impact on biological resources on a cumulative basis (including vegetation communities, regulatory status animal or plant species, or protected trees). In addition, as with the Project, any potential impacts to biological resources resulting from development of the related projects would likely be subject to mitigation as part of the environmental review process, thereby avoiding or minimizing potential impacts to biological resources. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts to biological resources.

As previously discussed, the Project would not have a significant adverse effect on any designated regional wildlife movement corridors as there are no regional wildlife movement corridors within or adjacent to the Project Site.. Based on the location of the related projects within highly urbanized areas and the proximity of the related projects to large expanses of open space, the related project sites do not provide the type of environment that would attract wildlife to those sites or use those sites to reach nearby open space areas where such wildlife are known to exist. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts with regards to wildlife movement.

5. Mitigation Measures

Special-Status Plant Species

Mitigation Measure D-1: Prior to construction, a qualified botanist shall conduct rare plant surveys throughout the Project area. In the event special status species are found during surveys, avoidance measures shall be implemented based on the recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented, in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Surveys shall be conducted during the appropriate blooming period to the extent feasible. If surveys cannot be conducted within the appropriate blooming period, or if the presence for any species cannot be ruled out for any other reason, avoidance measures shall be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Mitigation Measure D-2: If it is determined that special status plants would be directly impacted as a result of the Project, an on- or off-site restoration plan shall be prepared by a qualified botanist, in coordination with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

The restoration plan shall be implemented prior to the completion of the Project. The plan shall include the following: receiver locations; number of plants to be replanted and the methods of replanting; maintenance and monitoring requirements; and measures necessary for the establishment of self-sustaining populations in suitable open space areas to ensure the long-term survivability of the species in the vicinity.

Annual monitoring for at least five (5) years shall be required to ensure no-net-loss of acres of habitat for the species. The acreage ratio of lost special-status plant species habitat to habitat replaced shall be coordinated with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable, but shall be no less than 1:1.

Coastal California Gnatcatcher

Mitigation Measure D-3: Within a year prior to construction, protocol level surveys for the coastal California gnatcatcher shall be conducted within

300 feet of suitable habitat by a qualified biologist/ornithologist according to the United States Fish and Wildlife Service survey guidelines. The surveys shall include, at a minimum, a thorough examination of all suitable habitat within the Project area and vicinity for the coastal California gnatcatcher or its sign. The final survey methodology shall be determined in coordination with the United States Fish and Wildlife Service. A summary report shall be prepared upon completion of these activities and submitted to the United States Fish and Wildlife Service.

If, following protocol level surveys, no gnatcatchers are detected, but construction is delayed more than one year, additional surveys may be required, at the discretion of the United States Fish and Wildlife Service, to ensure that no gnatcatchers have moved into the area. If evidence of the coastal California gnatcatcher is found within the Project area during surveys, consultation with the United States Fish and Wildlife Service shall be conducted, and any requirements of the regulatory agencies regarding protection of the species shall be implemented.

Migratory Birds and Raptors

Mitigation Measure D-4: The following measures shall be implemented during construction to minimize impacts on nesting birds and raptors:

a. Construction in areas that include trees, vegetation, or buildings that may provide nesting habitats for bird and raptors shall be reduced to the maximum extent feasible.

b. Trimming and removal of vegetation and trees shall be minimized and performed outside of the nesting season (February 15 to September 15) to the extent feasible.

c. In the event trimming or removal of vegetation and trees must be conducted during the nesting season, nesting bird surveys shall be completed by a qualified biologist no more than 48 hours prior to trimming or clearing activities to determine if nesting birds are within the affected vegetation. Nesting bird surveys shall be repeated if trimming or removal activities are suspended for five days or more.

d. In the event construction is scheduled during bird nesting season, nesting bird surveys shall be completed no more than 48 hours prior to construction to determine if nesting birds, raptors, or active nests are in or within 500 feet of the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more.

e. In the event nesting birds or raptors are found in the construction area, appropriate buffers (typically 300 feet for songbirds and up

to 500 feet for raptors) shall be implemented, in coordination with the California Department of Fish and Wildlife, to ensure that nesting birds and active nests are not harmed. Buffers shall include fencing or other barriers around the nests to prevent any access to these areas and shall remain in place until birds have fledged and/or is no longer active, as determined through coordination with the California Department of Fish and Wildlife.

Special-Status and General Wildlife Species

Mitigation Measure D-5: A qualified biologist shall complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more. If any wildlife species are identified, appropriate measures shall be developed and implemented to avoid impacts on these wildlife species, in consultation with resource agencies as applicable.

Bats

Mitigation Measure D-6: To the extent feasible, tree and building removal shall be scheduled during the non-breeding and active season for bats (typically October and November). Prior to construction, surveys shall be conducted by a qualified bat specialist to identify the presence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in cavities in the area, either in trees or in structures, shall be safely evicted under the direction of a bat specialist and under consultation with the California Department of Fish and Wildlife.

Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the California Department of Fish and Wildlife shall be installed and maintained to prevent bats from roosting in these cavities prior to and during construction. A summary report shall be prepared upon completion of these activities and submitted to the California Department of Fish and Wildlife.

Pre-construction bat surveys shall be conducted by a qualified bat specialist no more than seven (7) days prior to the removal of any trees within the Project area to confirm that exclusionary measures have been successful and there are not bats within the construction area. If no roosting bats are detected, no further surveys are required provided the tree removal is conducted within seven (7) days. If removal is delayed more than seven (7) days, additional surveys shall be conducted no more than seven (7) days prior to tree removal to ensure that no bats have moved into the area.

Mitigation Measure D-7: Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in the Project area. In the event a maternal colony of bats is found in the construction area, the California Department of Fish and Wildlife shall be consulted, and no work shall be conducted within 100 feet of the roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the California Department of Fish and Wildlife. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No clearing and grubbing shall be authorized adjacent to the site. Combustion equipment, such as generators, pumps, and vehicles, shall not to be parked nor operated under or adjacent to the roosting site. Construction personnel shall not enter into areas beneath the colony, especially during the evening exodus.

General Wildlife Species

Mitigation Measure D-8: Amphitheatre lighting shall be designed to focus downward on the developed areas of the Project area and minimize light spillover onto adjacent open space areas.

Mitigation Measure D-9: Fencing associated with the proposed hiking trail shall be designed to be low in height with openings between posts and rails to allow the movement of wildlife to pass over or through the fence.

Mitigation Measure D-10: Trash receptacles that are not accessible to wildlife shall be used along the proposed hiking trail and within open areas of the Project Site to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. Signage shall also be place along the trail to encourage hikers to stay within the designated trail boundary.

Oak Trees

Mitigation Measure D-11: The following measures shall be implemented to minimize impacts on oak trees:

a. Oak trees measuring eight (8) inches or more in diameter at four and one-half (4.5) feet above mean natural grade shall be protected in place unless otherwise specifically permitted by the County of Los Angeles

b. Prior to construction, protection fencing shall be installed outside of the drip line of an oak tree to be protected in place during construction to minimize damage from equipment storage, debris dumping, parking, etc. within oak tree protected zones.

c. Oak trees that are relocated shall be done so in a manner consistent with the Los Angeles County Oak Tree Ordinance.

6. Conclusion

a. Vegetation Communities

Native plant communities that occur in the Project area include chaparral scrub, which is not designated as special-status plant community. No special-status plant communities are located in the study area and impacts to vegetation communities would be less than significant.

b. Regulatory Status Plant Species

Construction along the proposed hiking trail and within the existing landscaped areas would require vegetation removal that could impact the special-status plant species. Implementation of Mitigation Measures D-1 and D-2 would reduce potentially significant impacts to special status plants to less than significant levels.

c. Regulatory Status Wildlife Species

(1) Regulatory Status Bird Species

Potential impacts to the coastal California gnatcatcher and nesting birds as a result of noise disturbance and vegetation removal could be considered potentially significant prior to mitigation. Implementation of Mitigation Measures D-3 and D-4 would reduce potentially significant impacts to special status bird species to less than significant levels.

(2) Regulatory Status Small Mammal Species

Potential impacts to up to two regulatory status small mammal species during construction as a result of noise disturbance and vegetation removal could be considered potentially significant prior to mitigation. Implementation of Mitigation Measure D-5 would reduce impacts to regulatory status small mammal species to a less than significant level.

(3) Regulatory Status Bat Species

Potential impacts to up to four regulatory status bat species during construction as a result of noise disturbance and vegetation removal could be considered potentially significant prior to mitigation. Implementation of Mitigation Measures D-6 and D-7 would reduce impacts to regulatory status bat species to a less than significant level.

Additionally, with implementation of Mitigation Measures D-8 through D-10, overall potential impacts to wildlife species would be reduced to a less than significant level.

d. Oak Tree Protection

In accordance with Mitigation Measure D-11, removal or relocation of any oak trees within the Project Site would be subject to County review consistent with the Los Angeles County Tree Protection Ordinance. Therefore, implementation of Mitigation Measure D-11 and compliance with the Los Angeles County Tree Protection Ordinance would reduce impacts to oak trees to a less than significant level.

e. Regional Connectivity/Wildlife Movement

As evaluated above, there are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Furthermore, development of the Project would occur primarily within the developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. Additionally, in accordance with Mitigation Measure D-9 provided above, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, Project impacts with regard to wildlife movement would be less than significant.

In conclusion, with implementation of the mitigation measures provided above, the Project would result in less than significant impacts to biological resources.

IV. Environmental Impact Analysis
E. Cultural Resources

1. Introduction

This section provides an analysis of the Project's potential impacts associated with cultural resources, including historic, archaeological and paleontological resources. The analysis of historic resources is based on the *Ford Theatres Project Historic Resource Report (Historic Resource Report)* prepared by Galvin Preservation Associates (May 14, 2014) included as Appendix F of this Draft EIR. In addition, the analysis of potential impacts on archaeological and paleontological resources is based on the records searches included as Appendix G of this Draft EIR, and a review of existing conditions within the Project Site.

2. Environmental Setting

a. Regulatory Framework

Numerous laws and regulations require federal, state, and local agencies to consider the effects of a project on cultural resources. The National Historic Preservation Act of 1966, as amended, the California Environmental Quality Act (CEQA), and the California Register of Historical Resources are the primary laws governing historical, archaeological and paleontological resources of national, state and local significance within the Project vicinity. A summary of these laws and regulations is provided below.

(1) Federal—National Register of Historic Places

Authorized under the National Historic Preservation Act of 1966, as amended, the National Register of Historic Places (National Register) is "an authoritative guide to be used by federal, State, and local governments, private groups and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[1] The National Register recognizes properties that are significant at the national, State, and local levels.

[1] *Title 36 Code of Federal Regulations Part 60.2.*

To be eligible for listing in the National Register, a property must be at least 50 years of age (unless the property is of "exceptional importance") and possess significance in American history and culture, architecture, or archaeology. A property of potential significance must meet one or more of the following criteria for listing in the National Register:

a) *Associated with events that have made a significant contribution to the broad patterns of our history; or*

b) *Associated with the lives of persons significant in our past; or*

c) *Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or*

d) *Yield, or may be likely to yield, information important in prehistory or history.*

In addition to meeting any or all of the criteria listed above, a property nominated for listing on the National Register of Historic Places must have integrity. As defined in the *National Register Bulletin 15*, integrity is "the ability of a property to convey its significance."[2] The National Park Service recognizes seven aspects or qualities of integrity: feeling, association, workmanship, location, design, setting, and materials. The following is excerpted from the *National Register Bulletin, How to Apply the National Register Criteria for Evaluation,* which provides guidance on the interpretation and application of these factors:[3]

- *Feeling:* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association:* is the direct link between an important historic event or person and a historic property.
- *Workmanship:* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

---

[2] *National Register Bulletin 15. How to Apply the National Register Criteria for Evaluation. Washington DC: U.S. Department of the Interior, National Park Service, 1997.*

[3] *Ibid.*

- *Location:* is the place where the historic property was constructed or the place where the historic event took place.

- *Design:* is the combination of elements that create the form, plan, space, structure, and style of a property.

- *Setting:* is the physical environment of a historic property.

- *Materials:* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

In assessing a property's integrity, the National Park Service also recognizes that properties change over time. Therefore, as described in the *National Register Bulletin 15*, "it is not necessary for a property to retain all of its historic physical features or characteristics. The property must retain, however, the essential physical features that enable it to convey its historic identity."

To be eligible for listing in the National Register, a property must also be significant within a historic context. According to the National Register Bulletin 15, historic contexts are "those patterns, themes, or trends in history by which a specific… property or site is understood and its meaning… is made clear." A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Additionally, the National Park Service defines the period of significance as "the length of time when a property was associated with important events, activities or persons, or attained the characteristics which qualify it for… listing" in national, State or local registers. A period of significance can be "as brief as a single year… [or] span many years." It is based on "specific events directly related to the significance of the property," for example, the date of construction, years of ownership, or length of operation as a particular entity.

(2) State

The California Office of Historic Preservation (OHP), a division of the California Department of Parks and Recreation, implements the policies of the National Historic Preservation Act on a statewide level. The OHP also carries out the duties as set forth in the Public Resources Code and maintains the California Historic Resources Inventory and California Register of Historical Resources. The State Historic Preservation Officer (SHPO) is an appointed official who implements historic preservation programs within the state. Also implemented at the state level, CEQA requires the identification and mitigation

of substantial adverse impacts that may affect the significance of identified historical resources and archaeological resources as part of the environmental review process conducted under CEQA.

(a) California Register of Historical Resources

The California Register of Historical Resources (California Register) was enacted in 1992, and its regulations became official in January 1, 1998. The California Register of Historical Resources is an authoritative guide used by state and local agencies, private groups, and citizens to identify the State's historic resources and indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change.[4] The criteria for eligibility for listing in the California Register are based upon National Register criteria. To be eligible for listing in the California Register, a property generally must be at least 50 years of age and must possess significance at the local, State, or national level, under one or more of the following criteria:

1. *Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.*

2. *Associated with the lives of persons important to local, California or national history.*

3. *Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.*

4. *Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.*

The California Register consists of properties that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register and those formally determined eligible for (Category 2 in the State Inventory of Historical Resources), or listed in (Category 1 in the State Inventory), the National Register.

[4] *California Public Resources Code, Section 5024.1(a).*

- State Historical Landmarks No. 770 and all consecutively numbered state historical landmarks following No. 770. For state historical landmarks preceding No. 770, the Office of Historic Preservation shall review their eligibility for the California Register in accordance with procedures to be adopted by the State Historical Resources Commission (Commission).

- Points of historical interest which have been evaluated by the OHP and recommended for listing by the Commission for inclusion in the California Register in accordance with criteria adopted by the Commission.

Historic resources eligible for listing in the California Register may include buildings, sites, structures, objects, and historic districts. Resources less than 50 years of age may be eligible if it can be demonstrated that sufficient time has passed to understand its historical importance. While the enabling legislation for the California Register is less rigorous with regard to the issue of integrity, there is the expectation that properties reflect their appearance during their period of significance.[5]

(b) California Environmental Quality Act

CEQA requires a lead agency to analyze whether historic and/or archaeological resources may be adversely impacted by a project. Under CEQA, Public Resources Code Section 21084.1, a "project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment." This statutory standard involves a two-part inquiry. The first involves a determination of whether the project involves a historic resource. If so, the lead agency must determine whether the project may involve a "substantial adverse change in the significance" of the resource. CEQA Guidelines Section 15064.5 provides, for the purposes of CEQA compliance, the term "historical resources" shall include the following:

- A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (Public Resources Code Section 5024.1, Title 14 California Code of Regulations, Section 4850 et seq.).

- A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the Public Resources Code or identified as significant in a historical resource survey meeting the requirements in Section 5024.1(g) of the Public Resources Code, shall be presumed to be historically or culturally significant. Public agencies must treat such resources as significant unless the

[5] *California Public Resources Code Section 4852.*

preponderance of evidence demonstrates that it is not historically or culturally significant.

- Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources (Public Resources Code Section 5024.1, Title 14 California Code of Regulations, Section 4852).

The fact that a resource is not listed in, or determined to be eligible for listing in the California Register, not included in a local register of historical resources (pursuant to Section 5020.1(k) of the Public Resources Code), or identified in a historical resources survey (meeting the criteria in Section 5024.1(g) of the Public Resources Code) does not preclude a lead agency from determining that the resource may be a historical resource as defined in Public Resources Code Sections 5020.1(j) or 5024.1.

CEQA Guidelines Section 15064.5 also provides that "[s]ubstantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired." Material impairment occurs when a project materially alters or demolishes in an adverse manner "those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion" in the California Register or a local historic registry or that justify its eligibility for inclusion. As further set forth in CEQA Guidelines Section 15064.5, "[g]enerally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historical resource." The Secretary of the Interior's Standards (Standards) are not intended to be prescriptive, but instead provide general guidance. Not every Standard would necessarily apply to every aspect of a project, nor is it necessary to comply with every Standard to achieve compliance. For a project to comply with the Standards, it must achieve a balance of continuity and change. The Standards, as codified in 36 Code of Federal Regulations Section 67.7, are as follows:

1. *A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.*

2. *The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.*

3. *Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other buildings, will not be undertaken.*

4. *Changes to a property that have acquired historic significance in their own right will be retained and preserved.*

5. *Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.*

6. *Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.*

7. *Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.*

8. *Significant archeological resources affected by a project will be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.*

9. *New additions, exterior alterations, or related new construction will not destroy historic materials that characterize the property. The new work shall be differentiated from the old and will be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.*

10. *New additions and adjacent or related new construction will be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.*

CEQA also considers project impacts to "a unique archaeological resource." In accordance with CEQA, Public Resources Code Section 21083.2(g), a unique archaeological resource is defined as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability of meeting any of the following criteria:

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information; or
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person [Public Resources Code Section 21083.2(g)].

CEQA requires the lead agency to consider whether a project would have a significant effect on unique archaeological resources or resources eligible for listing in the California Register of Historic Resources, and to avoid these resources when feasible or mitigate any effects to less than significant levels (Public Resources Code Section 21083.2 and Section 21084.1). CEQA Guidelines Section 15064.5(c)(4) notes that if an archaeological resource is neither a unique archaeological resource nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment.

CEQA Guidelines Section 15064.5(e) provides procedures to be followed in the event of the accidental discovery of human remains. If remains are discovered, the county coroner shall examine the remains to determine the nature of the remains and cause of death. If the remains are determined to be of Native American origin, the county coroner shall contact the Native American Heritage Commission, which would then identify the person or persons it believes to be the most likely descendent(s) of the deceased Native American. The most likely descendent may make recommendations for the excavation work and for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods. Under certain conditions, the landowner or his authorized representative may rebury the human remains and associated grave goods with appropriate dignity on the property in a location not subject to further disturbance. Native American burials in California are protected by Public Resources Code Sections 5097.9–5097.991 and Section 7050 of the Health and Safety Code.

Paleontological resources are also afforded protection under CEQA. Appendix G of the CEQA Guidelines provides guidance relative to significant impacts on paleontological resources, which states, "a project will normally result in a significant impact on the environment if it will…disrupt or adversely affect a paleontological resource or site or

unique geologic feature, except as part of a scientific study." Section 5097.5 of the Public Resources Code also specifies that any unauthorized removal of paleontological remains is a misdemeanor. Further, the California Penal Code Section 622.5 sets the penalties for the unauthorized damage or removal of paleontological resources.

(c) California Health and Safety Code

Sections 7050.5, 7051, and 7054 of the California Health and Safety Code address the illegality of interference with human burial remains (except as allowed under applicable sections of the Public Resources Code), and the disposition of Native American burials in archaeological sites. It protects such remains from disturbance, vandalism, or inadvertent destruction, and establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project, including treatment of the remains prior to, during, and after evaluation, and reburial procedures.

(d) Senate Bill 18

Government Code Section 65352.3 (Senate Bill 18) requires local governments to consult with California Native American tribes identified by the California Native American Heritage Commission prior to the adoption or amendment of a general plan, area plan or specific plan for the purpose of protecting traditional tribal cultural places. The State Office of Planning and Research's technical advice series recommends that agencies solicit the concerns of Native Americans and other interested persons and corporate entities, including, but not limited to, museums, historical commissions, associates and societies as part of the process of cultural resources inventory.

b. Existing Conditions

(1) Historical Background

The existing 1,196-seat Amphitheatre was built in 1920 as the site of the *Pilgrimage Play*, a 12-part Passion Play depicting the life and death of Jesus Christ. Hence the original name of the Amphitheatre was the Pilgrimage Theatre. The author of the play, Christine Wetherill Stevenson, believed the rugged beauty of the Cahuenga Pass would provide a dramatic outdoor setting for the play. Together with Chauncey D. Clark and other investors, Wetherill Stevenson purchased the land on which the Hollywood Bowl now sits for the purposes of building a theatre. The other investors disagreed with Stevenson's idea of building a theatre solely for religious productions; therefore, the investors acquired the land from Wetherill Stevenson. Stevenson then purchased the land across the Hollywood Bowl property. A wood amphitheatre was built on that site with the help of volunteers. Taking advantage of the box canyon, the stage was set against a natural backdrop of

chaparral and cypress growing up the hillside. The design and layout of the original amphitheatre was prepared by architect Bernard Maybeck.

H. Ellis Reed was hired to produce and direct the Pilgrimage Play, which was performed by local actors every summer from 1920 to 1929 until a brush fire destroyed the original wood structure. While attending Hollywood High School, Fay Wray appeared in the play. Other actors who performed at the Pilgrimage Theatre included Gale Gordon, Peggy Converse, Rachel Ames, and Addison Richards.

Wetherill Stevenson died in 1922, just two years after the play opened. An electrically illuminated cross was erected on the hill above the Amphitheatre and dedicated in her honor in 1923. After Wetherill Stevenson's death, *Los Angeles Times* owner Harry Chandler acquired his share of the property and performance rights to the Pilgrimage Play from her estate.

The present Amphitheatre was built on the same site as the original theatre and opened in 1931. The orientation of the seating area and location of the stage generally remained the same, and some of the original stone was incorporated into the new structure along the areas to the right and left of the seating area. The Amphitheatre is constructed of board-formed poured-in-place concrete and designed in the style of ancient Judaic architecture to resemble the gates of Jerusalem.

The architect of the existing Amphitheatre, William Lee Woollett, was born in Albany, New York and came from a long line of architects. Following in his father's footsteps, William Lee Woollett studied architecture at the Massachusetts Institute of Technology and after working for the Boston firm Femur and Page, he returned to Albany in 1896 to set up his own practice. After the fire and earthquake in San Francisco, William Lee went out to investigate the prospects of starting an office there in 1909. He stayed in California and later gained considerable recognition for his State Armories in San Francisco and Los Angeles, numerous schools, office buildings, theatres, and houses. William Lee Woollett's son, William Woollett, and grandson Joseph L. continue to practice architecture in California.

The Pilgrimage Play continued to be performed following the opening of the existing Amphitheatre in 1931, but was not performed during the 1938 season. Production of the Pilgrimage Play resumed in 1939 and continued to be performed until 1964, interrupted only by World War II, when the structure was converted to dormitories for servicemen.

Originally, patrons arrived to the Amphitheatre mostly by streetcar. As the number of patrons arriving by automobile transportation increased, improvements to driveways and parts of the grounds were re-graveled and re-surfaced. Schools, churches, civic

organizations, and other groups often purchased large blocks of tickets and made annual excursions to see the play together. The venue became even more accessible by automobile and bus when the Hollywood Parkway opened in 1940. Parking areas were also expanded at this time.

In 1941, the land was deeded to the County of Los Angeles. The Pilgrimage Play continued to be presented until a lawsuit in 1964 forced its closure because of its religious nature. Opponents argued that expending public funds on a religious play violated the principle of the separation of church and state.

The County continued to use the Amphitheatre for a variety of concerts and performances, but public attendance dwindled. The structure gradually deteriorated until the late County Supervisor John Anson Ford obtained funding for capital improvements, several decades ago. The Pilgrimage Theatre was renamed the John Anson Ford Amphitheatre in his honor by former County Supervisor Edmund D. Edelman. The Amphitheatre was used intermittently for Shakespearean plays, jazz concerts, and dance performances until former County Supervisor Edmund D. Edelman authorized the revival of the venue by the Los Angeles County Arts Commission with the creation of the Ford Amphitheatre Season (originally called “Summer Nights at the Ford”) in 1993.

The indoor theatre space at the Ford Theatres was rented by Center Theatre Group, which made it the home of their second stage “Taper Too” from 1972 to 1997. In 1998, the space was extensively renovated and reverted to the County for use and was renamed [Inside] the Ford. Improvements were also made to the stage, backstage, and public areas of the Ford Theatres. Additional funds were spent between 1999 and 2000 to make the facility ADA (Americans with Disabilities Act) compliant. These improvements included an elevator for the three-level structure, the construction of the new entryway, and Edison Plaza.

(2) Architectural Description

The 32-acre Project Site, located in the Hollywood Hills on the east side of the Cahuenga Pass, consists of natural and man-made features, the largest of which is the 1,196-seat Amphitheatre. Other structures within the Project Site include the concessions building, the box office, and a post-war motel building that is used as office space for the Ford Theatre Foundation, Los Angeles County Arts Commission, and Los Angeles Philharmonic. Surface parking lots are also located off Cahuenga Boulevard East on the western edge of the Project Site. From the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge, a road leads up to the Amphitheatre ending in a cul-de-sac. This road is lined with trees on the north and a sidewalk and a wrought iron fence on the south. The cul-de-sac includes handicapped parking spaces and a loading zone. The

landscaping within the Project is diverse, featuring a variety of native and non-native trees, grasses, and shrubs.

The entryway to the Amphitheatre from the south parking lot was constructed in 2000. It consists of winding paths that create a gradual climb from the box office up to the Amphitheatre, past a water feature, various species of trees and plants, and pocket picnic areas. The Amphitheatre generally has an east-west orientation and is situated in a box canyon. The seating area is on the west, while the stage and back stage area is to the east. The arched entrance is centered and recessed at the base of the outside wall. It is flanked by convex and concave concrete walls with different surface textures. These different surface textures are found throughout the structure. In some cases the boards used to form the concrete walls were laid vertically and in other cases they were laid horizontally. The mixture of the concrete is also inconsistent. In some cases it has a heavy aggregate and in other cases a fine one. Above the arched entrance is a pointed arched parapet. The pointed arched doorway on the inside wall has been closed. The door next to the arched entrance leads to the entry of the [Inside] the Ford Theatre.

Grand staircases are located on each side of the arched entrance that leads to the promenade level and entrance to the Amphitheatre seating. The one on the south marches up the outer wall, while the one on the north is situated between the inner and outer walls. The north staircase bifurcates to lead to the concessions building and the Amphitheatre lobby at Door A, while the south staircase leads to the Amphitheatre lobby at Door D. The back inside wall of the Amphitheatre seating area is interrupted by four heavy double wood paneled doors decorated with a recessed grill pattern. These doors are situated in rectangular openings and lead to the seating aisles. On the upper level is a stucco clad addition housing the projection booth and control room. On top of the stucco clad addition is a platform, accessible from a door and staircase on the inside of the addition, used for follow-spot operators and equipment. Also attached is a tall corrugated metal parapet wall running along the top of the Amphitheatre wall. The wall was added to reduce the sound from Cahuenga Boulevard and the Hollywood Freeway. These two major additions have not altered the original structure, but merely rest on top of the walls. The Amphitheatre seating consists of individual metal frame with plastic seat theatre type chairs and is not original. The north and south walls of the seating area are stepped downward towards the stage. The stage has upper and lower levels and is flanked by two elaborate two-story towers with crenellated parapets. These towers were added in 1945, the same time the stage was enlarged. Rustic stonework forms the foundation for the stage and the walls at the rear of the stage. The stone appears to be local, and the various colors, shapes, and size suggest that the walls were constructed and repaired over time. The hillside with stone retaining walls encloses the Amphitheatre on the east. The stone on the south side of the seating area may have been recycled from the 1920 structure.

The concession building, located near the cul-de-sac of the service road on the north side of the Amphitheatre was originally designed as the box office. It is a two-story building with a flat roof and stucco exterior. A shade structure is located on the north and west elevations where patrons place and receive orders from windows. Second story windows are covered by security bars. The box office, located just outside of the main entrance, east of the south surface parking lot, was originally designed as the caretaker's cottage. The box office is a one-story building with a flat roof and stucco exterior. The building has two levels, which is reflected in the stepped massing. The ticket windows are located on the north elevation and are covered by an awning.

c. Evaluation of Historic Eligibility

The Ford Theatres was evaluated as a potential historic resource in 1994 and determined eligible for listing in the National Register. As described above, properties that have been determined eligible for listing in the National Register are automatically included in the California Register. Properties that are listed in the California Register are considered to be historic resources subject to CEQA. Based on the date of the original evaluation 20 years ago and the changes that have been made to the property since the original evaluation, the Ford Theatres was re-evaluated to determine eligibility for listing in the National Register, as provided below.

As previously described, the post-war motel building, located northeast of the primary entrance from the Pilgrimage Bridge, is currently used as office space by the Ford Theatre Foundation, Los Angeles County Arts Commission, and the Los Angeles Philharmonic staff. A 1954 aerial photograph of the Project Site illustrates the motel is a remnant of a large motel complex that originally included two other buildings of equal size. Alterations to the former motel building include the replacement of doors, windows on the first story, and possibly the exterior cladding. Due to the alterations, this former motel building has no genuine potential to qualify as a historic resource.

(1) National Register of Historic Places

(a) Criterion A

To be eligible for the National Register under Criterion A, a resource must have a direct association with events that have made a significant contribution to the broad patterns of our history. The Ford Theatres is eligible for listing in the National Register under Criterion A at the local level in the context of the cultural history of Los Angeles. It is significant as one of the oldest performing arts sites in Los Angeles still in use. The Ford Theatres, like other theatres in Los Angeles, represents the personal vision of an individual on a quest to bring the performing arts to Los Angeles. Christine Wetherill Stevenson sought to promote open-air dramas focusing on the lives of great religious leaders. As the

founder of the Theater Arts Alliance in 1918, she spearheaded the search for a natural setting to build an amphitheatre to produce the plays. She and Mrs. Chauncy Clarke first purchased 65 acres that became the site of the Hollywood Bowl. After parting ways with the Theater Arts Alliance, she purchased the site across from the Hollywood Bowl, now the Project Site, and had constructed a wood amphitheatre. She hired director H. Ellis Reed to produce the drama of the *Life of Christ*, which she wrote herself. The play opened in 1920 and was performed every summer until 1964, with only brief interruptions. Although Wetherill Stevenson died in 1922, the Amphitheatre she created lived on. The period of significance for this context would be 1931 when the new Amphitheatre was constructed through 1964 when the Pilgrimage Play ceased production.

(b) Criterion B

To be eligible for listing in the National Register under Criterion B, a property must be associated with the lives of persons significant in our past. Many persons have worked, performed, and attended the Ford Theatres since it was constructed. There are two individuals with a close association with the Amphitheatre: Christine Wetherill Stevenson and former County Supervisor John Anson Ford. The Amphitheatre would not be considered significant for its association with Wetherill Stevenson because she died in 1922, and thus, did not play a part in the design or construction of the existing Amphitheatre, although the play she wrote was performed there for decades. While John Anson Ford was instrumental in revitalizing the Amphitheatre, his efforts took place too recently to be considered historically significant. Therefore, the Ford Theatres is ineligible for listing in the National Register under Criterion B.

(c) Criterion C

To be eligible for listing under Criterion C, a property must embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction. The Ford Theatres was constructed of board-formed poured-in-place concrete, which was a popular method of construction during the Great Depression. Therefore, the Amphitheatre would not be significant for its method of construction because it was neither innovative nor unique. However, as one of only five outdoor theatres in Los Angeles remaining from the early 20th century, the Ford Theatres is significant as a type. Specifically, the Ford Theatres embodies the distinguishing characteristics of a type–an early 20th century amphitheatre–in its overall plan, sequencing of spaces, concrete walls and support system, monumental main entrance and staircases, minimal ornamentation, open-air seating, and stage area that blends into the canyon.

The Amphitheatre is also significant for its association with the architect William Lee Woollett. Woollett was known for his flamboyant approach to ornament and rather liberal

view of architectural historicism. His best-known extant work is his collaboration with Albert C. Martin on the Million Dollar Theater (1918). This was the first building he designed after moving to Los Angeles from San Francisco. He also designed interior murals for the Paramount Theater (1920), prepared plans for the Santa Monica Pier Amusement Company to reflect Pompeian architecture, and designed a theatre in Venice. An artist as well, Woollett's non-architectural works included murals, set designs, and sculptures. He often wrote articles about architecture and urban planning in trade magazines and professional journals. Active in civic affairs, he was appointed to the Municipal Arts Commission in 1933 and helped draft the Cultural Heritage Ordinance in 1962. The Cultural Heritage Ordinance established the Cultural Heritage Commission, and Woollett became the founding president. Woollett is considered a master for the quality of his work and for his contributions to the profession. The Ford Theatres represents one of his larger and more prominent commissions. The corbelled arches and crenellated parapets prominently displayed reflect a free and largely speculative interpretation of the architecture of the Holy Land.

(d) Criterion D

Criterion D was not considered as it generally applies to archaeological resources.

(e) Integrity

As discussed above, to be eligible for listing in the National Register, properties must retain their physical integrity from the period in which they gained significance. In the case of architecturally significant properties, the period of significance is normally the date of construction. For historically significant properties, the period of significance is usually measured by the length of the associations. As such, the period of significance for the Ford Theatres is 1931 to 1964; the year the building was constructed through the period when the Pilgrimage Play was still performed. While some factors of integrity are more important than others, depending on the property, a majority of the seven recognized factors should be retained. The Amphitheatre retains its integrity of location, materials, workmanship, feeling, and association. Its integrity of setting and design has been diminished by changes that post-date the period of significance; however, they are still adequate. Overall, the Amphitheatre retains sufficient integrity to convey its significance as follows:

- *Location—The place where the historic property was constructed or the place where the historic event occurred*.
  - The Ford Theatres has not been moved. Therefore, its integrity of location has been retained.
- *Setting—The physical environment of the historic property.*

- The vast majority of the 32-acre Project Site has not been improved. The surrounding hillsides continue to be covered with native and non-native trees, shrubs, and grasses that blend into the neighboring landscape. Surface parking lots and driveways have been enlarged, paved, and repaved; however, they are concentrated on the west side of the Project Site and are visually disconnected from the Amphitheatre. The entryway to the Amphitheatre from the south parking lot, constructed in 2000, represents the most significant change to the setting since 1964. Historic photographs depict a long, wide, nearly straight flight of steps to the front of the Amphitheatre. The new winding paths and landscaping create a more organized and formal approach that did not exist historically. Therefore, the overall integrity of setting is low.

- *Materials—The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.*

  - Most of the changes to the Amphitheatre since 1964 have involved the addition, not the removal of, materials. The original poured-in-place concrete walls and support system and wood doors and screens are still present. Some wood doors have been replaced; however, the new doors are identical to the old doors. Since the key materials remain, the integrity of materials has been retained.

- *Design—The combination of elements that create the form, plan, space, structure, and style of a property.*

  - A number of alterations to the Amphitheatre since 1964 have muddled the design. These include the new entryway and elevator in the front and the sound walls along the upper level and sides of the seating area. However, the 1931 fabric remains remarkably distinguishable from these later additions because it is characterized by the poured-in-place concrete walls and support system that remain evident throughout the stage, house, and seating area. Furthermore, the reoccurring design motifs, based upon the architecture of the Holy Land, including the heavy wood doors and screens, pointed arched openings, and religious symbols are still present and visible. Therefore, the integrity of design is fair.

- *Workmanship—The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.*

  - The techniques used in the construction of the Amphitheatre are in full display. The boards and different types of concrete used in the construction of the building can be seen in the textures and patterns on the walls. The hand-chiseled wood doors and screens reveal the workmanship of the carpenters who created them. However, it must be noted that the doors are mostly reproductions. While the original design and material has been

preserved, the workmanship from the period no longer remains. However as a whole, the integrity of workmanship in the Amphitheatre is sufficient.

- *Feeling—A property's expression of the aesthetic or historic sense of a particular period of time.*
  - This aspect of integrity is the most difficult to assess because it depends on individual perceptions. It results from the presence of physical features that, taken together, convey the property's historic character. Therefore, the Ford Theatres retains its integrity of feeling, because it still feels like an Amphitheatre from the 1930s.
- *Association—The direct link between an important event or person and a historic property.*
  - The Amphitheatre is associated with a pattern of events, the history of the performing arts in Los Angeles. The key features from the period of significance remain, including the poured-in-place concrete structure and support system, basic plan of the building, seating area, and stage. Therefore, the Amphitheatre retains its integrity of association.

(2) California Register of Historical Resources

As described above, the criteria for eligibility for listing in the California Register are based upon National Register criteria. In addition, properties that have been determined eligible for listing in the National Register are automatically included in the California Register. Therefore, the Ford Theatres is also eligible for listing in the California Register for the same reasons noted above.

(3) Character–Defining Features

Character-defining features are the architectural components that contribute to a building's sense of time and place. National Register *Preservation Brief #17: Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving Their Character* states:

> *A complete understanding of any property may require documentary research about its style, construction, function, its furnishings or contents; knowledge about the original builder, owners, and later occupants; and knowledge about the evolutionary history of the building. Even though buildings may be of historic, rather than architectural significance, it is their tangible elements that embody its significance for association with specific events or persons and it is those tangible elements both on the exterior and interior that should be preserved.*

The character-defining features of buildings can be generally grouped into three categories: the overall visual character of a building, the exterior materials and craftsmanship, and the interior spaces, features, and finishes. The relative importance of character-defining features depends on the level of craftsmanship, visibility, and integrity. In addition, some character-defining features are more important than others in conveying the significance of the building.

The Ford Theatres is significant in the cultural history of Los Angeles, specifically the performing arts, at the local level. It also exemplifies the outdoor theatre movement as an excellent example of an early 20th century amphitheatre. The period of significance of the property is 1931 to 1964; the year the Amphitheatre was constructed through the period when the Pilgrimage Play was still performed. A review of the character-defining features of the Ford Theatres is provided in Table I of the Historic Resource Report included in Appendix F of this Draft EIR. Features which are determined to be character-defining features of the Ford Theatres are described as either "primary" or "secondary" character-defining features. Primary character-defining features are considered the most important elements contributing to the significance of the property, while secondary features are considered less important.

As listed in Table I of the Historic Resource Report, primary character-defining features of the Ford Theatres include the following:

- Plan—The overall plan of the Amphitheatre and the sequencing of the spaces are primary character-defining features because they are original and essential elements of the Amphitheatre.

- Materials—As the poured-in-place concrete construction is typical of the era during its construction, the concrete found in the Amphitheatre is a primary character-defining feature. The charcoal stone along the south wall of the seating area is also a primary character-defining feature as it was likely salvage from the 1920 amphitheatre structure that was destroyed by fire, and used in the construction of the existing Amphitheatre in 1931.

- Stone—The original stone was used in the construction of the existing Amphitheatre in 1931 along the north wall of the seating area, the stairs on the stage, and the retaining walls and stairs behind the stage. This stone is still present and appears to have been quarried from the Project Site. It is a primary character-defining feature because it was added during the period of significance and is highly visible.

- Staircases—The north and south staircases near the main entrance are primary character-defining features because they are original and key design elements that contribute to the monumental feeling of the Amphitheatre.

- Wood Doors (original)—The original wood doors are primary character-defining features because they are original, exhibit craftsmanship from the period, and are key design elements.

- Wood Screens—The wood screens are primary character-defining features because they are original, exhibit craftsmanship from the period, and are key design elements.

- Seating Area—The open-air seating area is a primary character-defining feature because it is an essential element of the Amphitheatre.

- Main Stage—The main stage is a primary character-defining feature because it is an essential element of the Amphitheatre.

- Stage Left and Right Towers—The stage left and right towers were constructed in 1945. They are primary character-defining features because they were constructed during the period of significance and are essential elements of the Amphitheatre.

Secondary character-defining features of the Ford Theatres include the following:

- Wood Doors (reproduction)—The double wood doors to the seating area and stage towers, as well as others, were reproduced. They are secondary character-defining features because they maintain the historic design, but not the historic workmanship.

- Religious Symbols—Religious symbols, including crosses in concrete relief, are secondary character-defining features because they are original, but minor design elements.

- Concession Building—The concession building is a secondary character-defining feature. Although it was constructed during the period of significance, it has been altered. Therefore, only the height, shape, massing, flat roof, stucco exterior, and second-story windows are considered character-defining features. The interior, service windows on the north elevation, or surrounding pergola are not considered character-defining features.

- Box Office—The box office is a secondary character-defining feature. Although it is an original element of the Amphitheatre, it has been altered. Therefore, only the height, shape, massing, flat roof, and stucco exterior are considered character-defining features. The interior or box office windows on the north elevation are not character-defining features.

d. Archaeological Resources

Archaeology is the recovery and study of material evidence of human life and culture of past ages. On January 15, 2014, a cultural resources records search was conducted through the South Central Coastal Information Center located at the California State University, Fullerton. The results of the records search, which is included in Appendix G of this Draft EIR, indicate there are no known archaeological sites or isolates, which are artifacts not associated with an archaeological site, located within a 0.5-mile radius of the Project Site or within the Project Site. The records search notes that this does not preclude the potential for an archaeological site to be identified during activities associated with the Project.

e. Paleontological Resources

Paleontology is the study of fossils, which are the remains of ancient life forms. On January 27, 2014, a project-specific paleontological records search was conducted through the Natural History Museum of Los Angeles County. The results of the paleontological records search, which is included in Appendix G of this Draft EIR, indicate there are no known vertebrate fossil localities located within the Project Site.

As detailed in the paleontological records search, much of the Project Site has exposures of intrusive or volcanic basaltic igneous rocks that would likely not contain any fossils. Placed between the igneous rocks are exposures of the marine middle Miocene Topanga Formation (also referred to in this area as the Middle Topanga Formation). The closest known vertebrate fossil locality in the Topanga Formation is located approximately 2.1 miles northwest of the Project Site. Locality LACM 1084 documents the occurrence of *Paleoparadoxia*, a member of an extinct group of peculiar marine mammals called the Desmostylia. Approximately 2.8 miles northwest of the Project Site is an additional Topanga Formation vertebrate fossil locality, LACM 6969, which was collected during construction of the Metrorail Universal City subway station. Locality LACM 6969 produced a fossil fish fauna containing specimens of grunion, Atherinidae, herrings, *Etringus*, *Ganolytes*, and *Sardinella*, codlets, Bregmacerotidae, bigeyes, Priacanthidae, croakers, Sciaenidae, mackerels, Scombridae, and boarfishes, Caproidae.

3. Environmental Impacts

a. Methodology

The Project's Historic Resource Report provided in Appendix F is based in part on a review of previous historic evaluations, field inspections, archival research, and analysis of historic photographs and maps. Based on the regulations and criteria summarized above,

the Historic Resource Report assessed the significance, integrity, period of significance, and character-defining features of the property. As previously described, under CEQA, the evaluation of impacts to historic resources consists of a two-part inquiry: (1) a determination of whether the project site contains or is adjacent to a historically significant resource or resources, and if so; (2) a determination of whether the project will result in a "substantial adverse change" in the significance of the resource or resources. While compliance with the Secretary of the Interior's Standards (Standards) generally results in a less than significant impact on historic resources under CEQA, noncompliance does not necessarily equal the material impairment of historic resources. Historic resources can continue to retain sufficient integrity to convey their significance, even if they are altered in a manner that does not comply with the Standards. Thus, the analysis of Project impacts was based on whether the Project complies with the Standards and whether the Project would affect the integrity of the Ford Theatres and therefore its eligibility for inclusion in the California Register.

To address potential impacts associated with archaeological and paleontological resources, formal records searches were conducted to assess the archaeological and paleontological sensitivity of the Project Site and vicinity. In addition, an evaluation of existing conditions and previous disturbances within the Project Site, the geology of the Project Site, and the anticipated depths of grading were used to determine the potential for uncovering archaeological and paleontological resources.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to cultural resources would be significant if the Project would:

- Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5;
- Cause a substantial adverse change in the significance of an archaeological resource as defined in Section 15064.5;
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; or
- Disturb any human remains, including those interred outside of formal cemeteries.

c. Project Design Features

No specific project design features are proposed with respect to cultural resources.

d. Analysis of Project Impacts

(1) Historic Resources

(a) Potential Impacts Related to Previously Approved Amphitheatre Improvements

As described in Section II, Project Description, of this Draft EIR, in September 2013, the County of Los Angeles prepared and approved a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/ Rehabilitation (Class 31) for the rehabilitation of portions of the existing Amphitheatre consistent with the Secretary of Interior Standards for the Treatment of Historic Properties. These improvements will include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. These improvements were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards. Therefore, no significant impacts with regards to historic resources would occur as a result of implementation of the previously approved Amphitheatre improvements.

(b) Potential Impacts Related to Other Improvements

(i) Amphitheatre

The other proposed Amphitheatre improvements, including the replacement of the existing projection booth and control room and existing lighting positions, and the addition of a new sound wall and retractable shade structure would be consistent with the historic use of the Amphitheatre (Standard #1) and would not involve the removal of any primary character-defining features (Standard #5). In addition, these improvements would be clearly differentiated from the original concrete structure (Standard #9) and could be removed in the future without negatively impacting the original concrete structure (Standard #10).

With regard to the integrity of the Ford Theatres, the proposed Amphitheatre improvements would provide for the return of the walkway at the Amphitheatre level to its original condition, which is currently obstructed by an access stair that would be removed as part of the Project. Further, while the proposed Amphitheatre improvements would be visible, such improvements would be behind the audience during performances and would not affect the way performances are experienced. Covered in sound absorbent panels, these improvements would also present a fairly plain and neutral backdrop for the historic architecture. Additionally, a screen of semi-transparent panels proposed to be provided outside of the seating area would have a lighter feel than the existing corrugated metal. As

such, the integrity of the Ford Theatres would be retained with implementation of the proposed Amphitheatre improvements.

Based on the above, there will be no substantial adverse change in the significance of the Ford Theatres as a historic resource from this component. However, due to the fluid nature of the architectural design until the approval of final design plans, impacts with regards to historic resources associated with the proposed Amphitheatre improvements could be potentially significant. Therefore, Mitigation Measure E-1 is provided below to ensure compliance with the Standards. With implementation of Mitigation Measure E-1, potentially significant impacts would be reduced to a less than significant level.

(ii) Ford Terrace

As this component of the Project primarily involves new construction, the most applicable Standards are #9 and #10. Given the fluid nature of the architectural design until the approval of final plans, it is difficult to ascertain the compatibility between the new construction and the historic Amphitheatre. Therefore, Mitigation Measure E-1 is provided below to ensure compliance with the Standards.

With regard to character-defining features, implementation of the Ford Terrace improvements would not involve the removal of any primary character-defining features. In addition, while the proposed improvements would require removal of the concessions building, which is a secondary character-defining feature, such removal would not in and of itself constitute an impact on a historic resource because the concessions building does not have any significance separate and apart from the Amphitheatre.

As it pertains to the integrity of the Ford Theatres, the proposed Ford Terrace improvements would have a minimal visual impact on the Amphitheatre from within the seating area given the intervening structures and would not affect the way performances are experienced within the Amphitheatre. Further, the repurposing of the existing [Inside] the Ford Theatre would not negatively affect the integrity of the Ford Theatres as it would not involve the alteration or removal of any character-defining features. Overall, removal of the concessions building and implementation of the Ford Terrace improvements would further diminish the integrity of setting of the Ford Theatres.

In summary, while the existing Amphitheatre would be altered due to the removal of the concession building and the proposed construction, the Ford Terrace improvements are not anticipated to result in a substantial adverse change in the significance of the Ford Theatres as a historic resource as it would continue to be eligible for listing in the California Register. However, due to the fluid nature of the architectural design until the approval of final design plans, impacts with regards to historic resources associated with the proposed

Ford Terrace improvements could be potentially significant. Therefore, Mitigation Measure E-1 is provided below to ensure compliance with the Standards. With implementation of Mitigation Measure E-1, potentially significant impacts would be reduced to a less than significant level.

(iii) Ford Plaza

The proposed Ford Plaza would comply with Standard #9 since the proposed improvements would not destroy any historic materials, would be clearly distinguishable as new, and would be appropriately scaled to the Project Site. The proposed improvements would also comply with Standard #10 because they could be removed in the future without negatively impacting the historic resource. Within the area of the proposed Ford Plaza, the existing box office has been identified as a secondary character-defining feature. While the box office is an original element of the Amphitheatre, it has been altered. Therefore, only the height, shape, massing, flat roof, and stucco exterior are considered character-defining features. The interior or box office windows on the north elevation are not considered character-defining features. As part of the Ford Plaza improvements, the box office would be repurposed as a museum, which could potentially affect the character-defining features of the box office.

With regard to the integrity of the setting of the Ford Theatres, the Ford Plaza would represent an increase in the utilization of the property. Therefore, while the Project Site would primarily comprise undeveloped open space, the Ford Plaza would further diminish the integrity of setting and would compromise the integrity of feeling of the Ford Theatres from a singular cultural venue to a larger cultural and recreational destination.

Based on the improvements proposed as part of the Ford Plaza, it is not anticipated that such improvements would result in a substantial adverse change in the significance of the Ford Theatres as a historic resource. However, due to the fluid nature of the architectural design until the approval of final design plans, particularly the proposed design of the repurposed box office, impacts with regards to a historic resource could be potentially significant. Therefore, Mitigation Measure E-1 is provided below to ensure that any alterations to the box office comply with the Standards. With implementation of Mitigation Measure E-1, potentially significant impacts would be reduced to a less than significant level.

(iv) Transit Center

As this component of the Project involves new construction, the only applicable Standards are #9 and #10. Due to the distance between the proposed Transit Center and the Amphitheatre, the requirement for compatibility between the new and old (Standard #9) and the concept of reversibility (Standard #10) rooted in these two Standards is not

paramount. Notwithstanding, the design of the Transit Center would be differentiated from the original Amphitheatre construction and such improvements could be removed without affecting the Amphitheatre. The north parking lot and former motel building proposed to be removed as part of this component are not character-defining features of the Ford Theatres. In addition, as described above, the former motel building has no genuine potential to qualify individually as a historic resource

The proposed Transit Center improvements would not negatively affect the integrity of the Ford Theatres due to the area's proximity to Cahuenga Boulevard and the Pilgrimage Bridge, the relatively flat topography, and the fact that it is visually disconnected from the historic Amphitheatre.

Based on the above, the proposed Transit Center improvements would result in a less than significant impact to a historic resource and no mitigation measures are required.

(v) Hiking Trail

None of the Standards are applicable to the area of the proposed hiking trail because there are no character-defining features in this portion of the Project Site that are related to the historic significance of the Ford Theatres. In addition, the trail would not be visually intrusive or reduce the integrity of the Ford Theatres. Therefore, no significant impacts with regards to historic resources would occur from this component and no mitigation measures are required.

(c) Summary of Potential Impacts to Historic Resources

Overall, impacts with regards to historic resources associated with the Project have the potential to be significant as the specific design details of the Project have not been finalized. However, with implementation of Mitigation Measure E-1, provided below, such impacts would be reduced to a less than significant level.

(2) Archaeological Resources

As previously described, the results of the records search indicate there are no known archaeological sites or isolates located within a 0.5-mile radius of the Project Site or within the Project Site. While the majority of the Project would be developed within areas that have been subject to disturbance in the past, some portions of the Project would extend to previously undisturbed areas. As such, there is the possibility that archaeological resources could be discovered. Without mitigation measures, impacts associated with archaeological resources could be potentially significant. However, with implementation of Mitigation Measures E-2 and E-3, provided below, potential impacts related to archaeological resources would be reduced to a less-than-significant level.

(3) Paleontological Resources

As described in the paleontological records search included in Appendix G of this Draft EIR, excavations in the igneous rocks exposed in much of the Project Site would not uncover any recognizable fossils. However, excavations in the Topanga Formation deposits intercalated with the igneous rocks may encounter significant vertebrate fossils. Therefore, the potential exists for paleontological resources to be uncovered during construction activities and impacts associated with paleontological resources could be potentially significant. Without mitigation measures, potential impacts associated with paleontological resources could be potentially significant. However, with implementation of Mitigation Measure E-4, any potential impacts related to paleontological resources would be reduced to a less than significant level.

4. Cumulative Impacts

As provided in Section III, Environmental Setting, of this Draft EIR, there are 27 related projects located within approximately one and one-half mile of the Project Site. Collectively, the related projects near the Project Site involve a variety of residential (e.g., condominiums, apartment), office, mixed-use, commercial, retail, restaurant, and institutional uses, consistent with existing uses in the area.

While impacts to historic resources tend to be site-specific, a cumulative impact analysis of historic resources determines whether the impacts of a project and the related projects in the surrounding area, when taken as a whole, would substantially diminish the number of historic resources within the same or similar context or property type. Specifically, cumulative impacts would occur if the Project and related projects affect local resources with the same level or type of designation or evaluation, affect other structures located within the same historic district, or involve resources that are significant within the same context as resources associated with the Project.

As previously evaluated, potential impacts to historic resources associated with the Project would be less than significant with implementation of Mitigation Measure E-1. As also discussed, the Ford Theatres is eligible for listing in the National Register under Criterion A as one of the oldest performing arts sites in Los Angeles still in use, and eligible under Criterion C as one of only five outdoor theatres in Los Angeles remaining from the early 20th Century. Based on the unique use and features of the Project Site as well as the area of the related projects, it is not expected that the related projects would impact historic resources of the same character (based on context, building type, evaluation, and designation) as that which is present within the Project Site. In addition, due to the distance of the related projects to the Project Site, the closest of which is approximately 0.8 mile from the Project Site (Related Project No. 22), the related projects are not

anticipated to impact the historic features within the Project Site. Therefore, cumulative impacts on historic resources would be less than significant.

As discussed above, potential impacts to archaeological and paleontological resources associated with the Project would be less than significant with implementation of Mitigation Measures E-2 through E-4. With regard to potential cumulative impacts related to archaeological and paleontological resources, the related projects area is urbanized and has been disturbed and developed over time. As with the Project, in the event that archaeological and paleontological resources are uncovered, each related project would be required to comply with applicable regulatory requirements. In addition, as part of the environmental review processes for the related projects, it is expected that mitigation measures would be established as necessary to address the potential for uncovering archaeological and paleontological resources. Thus, cumulative impacts associated with archaeological and paleontological resources would be less than significant.

5. Mitigation Measures

Mitigation Measure E-1: To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Mitigation Measure E-2: If a unique archaeological resource is discovered during Project construction activities, work in the area shall cease and deposits shall be treated in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. In addition, if it is determined that an archaeological site is a historical resource, the provisions of Section 21084.1 of the Public Resources Code and CEQA Guidelines Section 15064.5 shall be implemented.

Mitigation Measure E-3: If human remains are encountered during construction, work in the affected area and the immediate vicinity shall be halted immediately. The construction manager at the Project Site shall be contacted, and shall notify the County Coroner. If the County Coroner determines the remains to be Native American, the archaeologist and Native American monitor shall then be contacted, if they are not on-site at the time, as well as the responsible lead agency of the discovery, who in turn shall notify the Native American Heritage Commission. Disposition of the human remains and any associated grave goods shall be in accordance with California Health and Safety Code Section 7050.5 and Public Resources Code Sections 5097.91 and 5097.98, as amended. The archaeologist and

the Native American monitor, with the concurrence of the County, shall determine the area of potential impact and the timing when construction activities can resume.

Mitigation Measure E-4: A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur. The frequency of inspections shall be based on consultation with the paleontologist and shall depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If paleontological materials are encountered, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed material to facilitate evaluation and, if necessary, salvage. The paleontologist shall assess the discovered material(s) and prepare a survey, study or report evaluating the impact. The paleontologist's survey, study or report shall contain a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Applicant shall comply with the recommendations of the evaluating paleontologist, as contained in the survey, study or report, and a copy of the paleontological survey, study or report shall be submitted to the Los Angeles County Natural History Museum. Ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the satisfaction of the paleontologist.

6. Conclusion

As evaluated above, potential impacts to the on-site historic resource would be reduced to a less than significant level with implementation of Mitigation Measures E-1, which would ensure that the Project design complies with the Standards. In addition, following implementation of the Project in accordance with the applicable Standards, the integrity of the Ford Theatres as a whole would be sufficient to convey its historical significance. Therefore, the Ford Theatres would continue to be eligible for listing in the National Register and the California Register and the significance of the historic resource would not be materially impaired by the Project.

With implementation of Mitigation Measures E-2 and E-3, as set forth above, impacts to archaeological resources would be reduced to a less than significant level. With

implementation of Mitigation Measure E-4, potential impacts to paleontological resources would be reduced to a less than significant level.

IV. Environmental Impact Analysis

F. Geology and Soils

1. Introduction

This section of the Draft EIR analyzes the Project's potential impacts with regard to the geologic and geotechnical hazards specific to the Project Site. The analysis is based on the *Preliminary Geotechnical Evaluation, John Anson Ford Theatres Master Plan* (February 7, 2013); *Geotechnical Exploration Report, Off-Season Two Improvements* (September 10, 2013); and *Addendum No. 3 to Geotechnical Exploration Report, Off-Season Three and Four Improvements* (February 28, 2014), prepared by Leighton Consulting, Inc. These documents (collectively referred to herein as the Geotechnical Reports) are included as Appendix H of this Draft EIR.

2. Environmental Setting

a. Regulatory Framework

(1) State of California

(a) Alquist–Priolo Earthquake Fault Zoning Act

The Alquist–Priolo Earthquake Fault Zoning Act (Public Resources Code Section 2621) was enacted by the State of California in 1972 to address the hazard of surface faulting to structures for human occupancy.[1] The Alquist–Priolo Earthquake Fault Zoning Act was a direct result of the 1971 San Fernando Earthquake, which was associated with extensive surface fault ruptures that damaged homes, commercial buildings, and other structures. The primary purpose of the Alquist–Priolo Earthquake Fault Zoning Act is to prevent the construction of habitable buildings on the surface traces of active faults. The Alquist–Priolo Earthquake Fault Zoning Act is also intended to increase safety and minimize the loss of life during and immediately following earthquakes by facilitating seismic retrofitting to strengthen buildings against ground shaking.

[1] *The Act was originally entitled the Alquist–Priolo Geologic Hazards Zone Act.*

The Alquist–Priolo Earthquake Fault Zoning Act requires the State Geologist to establish regulatory zones, known as "Earthquake Fault Zones," around the surface traces of active faults; issue maps defining areas of potential surface rupture to assist cities and counties in planning, zoning, and building regulation functions; and continually review new geologic and seismic data, revise existing zones, and delineate additional earthquake fault zones when warranted by new information. Local agencies must enforce the Alquist–Priolo Earthquake Fault Zoning Act in the development permit process by requiring a geologic investigation prepared by a licensed geologist to demonstrate that buildings will not be constructed across active faults. If an active fault is found, habitable structures must be set back a minimum of 50 feet. The Alquist–Priolo Earthquake Fault Zoning Act and its regulations are presented in California Department of Conservation, California Geological Survey (CGS), Special Publication 42, *Fault-Rupture Hazard Zones in California*.

(b) Seismic Safety Act

The California Seismic Safety Commission was established by the Seismic Safety Act in 1975 with the intent of providing oversight, review, and recommendations to the Governor and State Legislature regarding seismic issues. The California Seismic Safety Commission's name was changed to Alfred E. Alquist Seismic Safety Commission in 2006. Since then, the Commission has adopted several documents based on recorded earthquakes, including:[2]

- Research and Implementation Plan for Earthquake Risk Reduction in California 1995 to 2000, report dated December 1994;
- Seismic Safety in California's Schools, "Findings and Recommendations on Seismic Safety Policies and Requirements for Public, Private, and Charter Schools," report dated December 2004;
- Findings and Recommendations on Hospital Seismic Safety, report dated November 2001; and
- Commercial Property Owner's Guide to Earthquakes Safety, report dated October 2006.

(c) Seismic Hazards Mapping Act

The State of California passed the Seismic Hazards Mapping Act of 1990 (Public Resources Code Sections 2690-2699) to address the effects of strong ground shaking,

[2] *Alfred E. Alquist Seismic Safety Commission. Publications, www.seismic.ca.gov/pub.html, accessed March 25, 2014.*

liquefaction, landslides, and other ground failures due to seismic events. Under the Seismic Hazards Mapping Act, the State Geologist is responsible for identifying and mapping seismic hazards zones (e.g., for strong ground shaking, liquefaction, landslides, and other ground failures due to seismic events) as part of the California Geological Survey, formerly known as the California Division of Mines and Geology. The CGS zone maps are used by local governments for planning purposes. For projects within seismic hazards zones, the Seismic Hazards Mapping Act requires developers to conduct geological investigations and incorporate appropriate mitigation measures into project designs before building permits are issued.

State publications supporting the requirements of the Seismic Hazards Mapping Act include the CGS Special Publication 117, *Guidelines for Evaluating and Mitigating Seismic Hazards in California* and CGS Special Publication 118, *Recommended Criteria for Delineating Seismic Hazard Zones in California*. The objectives of Special Publication 117 are to assist in the evaluation and mitigation of earthquake-related hazards for projects within designated zones where investigations are required and to promote uniform and effective statewide implementation of the Seismic Hazards Mapping Act. Special Publication 118 presents criteria to assist the State Geologist in fulfilling its obligation under the Seismic Hazards Mapping Act.

(d) California Building Code

The California Building Code (California Code of Regulations, Title 24) is a compilation of building standards, including seismic safety standards for new buildings. The purpose of the California Building Code is to establish minimum standards for safeguarding public health and safety through structural strength, means of egress facilities, and general stability by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all building and structures. The California Building Code applies to all occupancies in California, except where stricter standards have been adopted by local agencies. The State recently adopted the 2013 California Building Code, which became effective on January 1, 2014.[3] Specific California Building Code building and seismic safety regulations have been incorporated by reference in the Los Angeles County Building Code (County Building Code).

The California Building Standards Code, which includes the California Building Code as well as other related codes (e.g., California Electrical Code and California Plumbing Code, among others), is based on the International Building Code, with the addition of California amendments based on the American Society of Civil Engineers Minimum Design

[3] *California Building Standards Commission, California Building Standards Code (Title 24, California Code of Regulations), www.bsc.ca.gov/codes.aspx, accessed March 31, 2014.*

Standards 7-10. The California Building Standards Code establishes requirements for general structural design and methods for determining earthquake loads, as well as other loads (flood, snow, wind, etc.), for inclusion in building codes. The provisions of the California Building Standards Code apply to the construction, alteration, movement, replacement, and demolition of every building or structure, and any connected appurtenances, throughout California.

Earthquake design requirements take into account the occupancy category of a structure, site class, soil classifications, and various seismic coefficients, which are used to determine the appropriate Seismic Design Category for a project. The Seismic Design Category is a classification system that combines occupancy categories with the level of expected ground motions at the site and ranges from Seismic Design Category A (very small seismic vulnerability) to Seismic Design Category E/F (very high seismic vulnerability and near a major fault). Design specifications for the structure are then determined according to the applicable Seismic Design Category.

(2) County of Los Angeles

(a) Los Angeles County General Plan

As discussed in greater detail in Section IV.H, Land Use and Planning, of this Draft EIR, the Los Angeles County (County) General Plan directs future growth and development in the County's unincorporated areas and establishes goals, policies, and objectives that pertain to the entire County. The current General Plan, adopted in 1980, includes relevant policies that focus on the enforcement of standards and requirements that reduce seismic and geologic hazards as well as promoting seismically resistant lifelines that serve the County and connect to surrounding areas. Additional discussion of hillside management issues addressed in the General Plan is provided below under Los Angeles County Hillside Requirements. The General Plan policy consistency analysis provided in IV.H, Land Use and Planning, indicates the Project would be consistent with relevant General Plan polices related to geology and soils.

(b) Los Angeles County Building Code

The 2014 County Building Code, effective January 1, 2014, is based on the 2013 California Building Code and the 2012 International Building Code. Relevant provisions address site grading, cut and fill slope design, soil expansion, geotechnical investigations before and during construction, slope stability, allowable bearing pressures and settlement below footings, effects of adjacent slopes on foundations, retaining walls, basement walls, shoring of adjacent properties, and potential primary and secondary seismic effects. The Los Angeles County Department of Public Works (LACDPW) Building and Safety Division is responsible for implementing the provisions of the County Building Code.

(c) Los Angeles County Hillside Requirements

The County sets forth development requirements for Hillside Management Areas in its Hillside Management Area Ordinance (County Code Section 22.56.215). The Ordinance does not preclude development within hillside areas, but rather ensures that development maintains, and where possible enhances, the natural topography, resources, and amenities of the hillside management areas.

The County's current General Plan also addresses hillside development in Appendix A of the Land Use Element, which provides Hillside Management/Performance Review Procedures for development projects in hillside areas. Based on an overarching policy to "manage development in hillside areas to protect their natural and scenic character and to reduce risks from fire, flood, mudslide, erosion and landslide," the review process is intended to ensure site suitability, public safety, and resource protection, and to protect scenic and open lands.[4] With respect to urban hillside management areas, the Hillside Management/Performance Review Procedures serve to ensure that development in urban hillside areas is safe, functionally and attractively designed, and compatible with surrounding uses. General conditions for development are specified and address slope/density standards for residential uses, density transfers from steeper to more level land, and natural or open space standards. Applicable performance review criteria address public safety and quality of design. Finally, the Performance Review Procedures identify findings required for the approval of hillside development.

b. Existing Conditions

(1) Regional Geology

The Project Site is located on the south flank of the eastern Santa Monica Mountains within the Transverse Ranges Geomorphic Province of California. The distinctive uplifted east-west trending geomorphic features of the Transverse Ranges were formed as a result of the compressive forces between the converging Pacific and North American Plates. The Santa Monica Mountains in this area expose north-trending, fault bound blocks containing an assemblage of older Tertiary-age marine and non-marine sedimentary and intrusive and extrusive volcanic rocks. An east-west trending ridge, in line with the main crest of the Santa Monica Mountains, is the principal topographic feature of the area. Cahuenga Pass, a low gap in the ridge, separates this ridge from the main crest of the Santa Monica Mountains formed largely as a result of erosion of soft shale outcrops and resistant sandstone formations to the east.

---

[4] *County of Los Angeles General Plan Land Use Element, Appendix A, page III-59.*

The present physiographic setting of the Project Site is predominantly northwest to west-facing steep sided to near-vertical (ridge forming sandstone) terrain along the eastern side of the Project Site. The topographic relief across the Project Site varies between approximately 510 feet above mean sea level (msl) along the western portion of the Project Site, adjacent to Cahuenga Boulevard East, to approximately 944 feet above msl along the ridgeline to the east of the existing former motel building. The existing topographic features are related to tectonic uplift, ridgeline erosion, erosion of soft shales, and intrusive-extrusive basaltic flows.

(2) Local Geology

(a) Geologic Units

The surficial geologic units encountered at the Project Site include recent and Quaternary-age sediments that form a thin mantle over bedrock belonging to the Topanga Formation. These surficial geologic units include undocumented artificial fill associated with the previous development of the Project Site; debris flows and surficial failures; rockfalls; colluvium or slopewash overlying Topanga Formation Bedrock, which includes Sandstone and Tertiary age extrusive volcanic rocks.

(b) Geologic Structure

Regional uplift of the Santa Monica Mountains is primarily the result of movement along the Santa Monica and Hollywood Faults combined with extrusive igneous intrusions that once occurred along linear fissures in oceanic crust.

(3) Faulting and Seismicity

A fault is defined as a fracture along which rocks or soil on one side have been displaced with respect to those on the other side. In accordance with CGS criteria, a fault is considered active if it has demonstrated surface displacement in the last 11,700 years (i.e., generally corresponding to the Holocene epoch). Faults that have demonstrated movement between 11,700 and 1.6 million years ago (i.e., during the Quaternary period), but lack strong evidence of Holocene movement, are classified as potentially active. Faults that have not moved since the beginning of the Quaternary period are deemed inactive.

The seismically active southern California region is crossed by numerous active and potentially active faults and is underlain by several blind thrust faults, which are low angle reverse faults with no surface exposure. Based on a review of maps and information developed by the CGS, the Project Site does not contain any known active faults and is not within an Alquist–Priolo Earthquake Fault Zone. Faults within close proximity to the Project Site are shown in Figure IV.F-1 on page IV.F-7. Per the latest CGS fault database, the

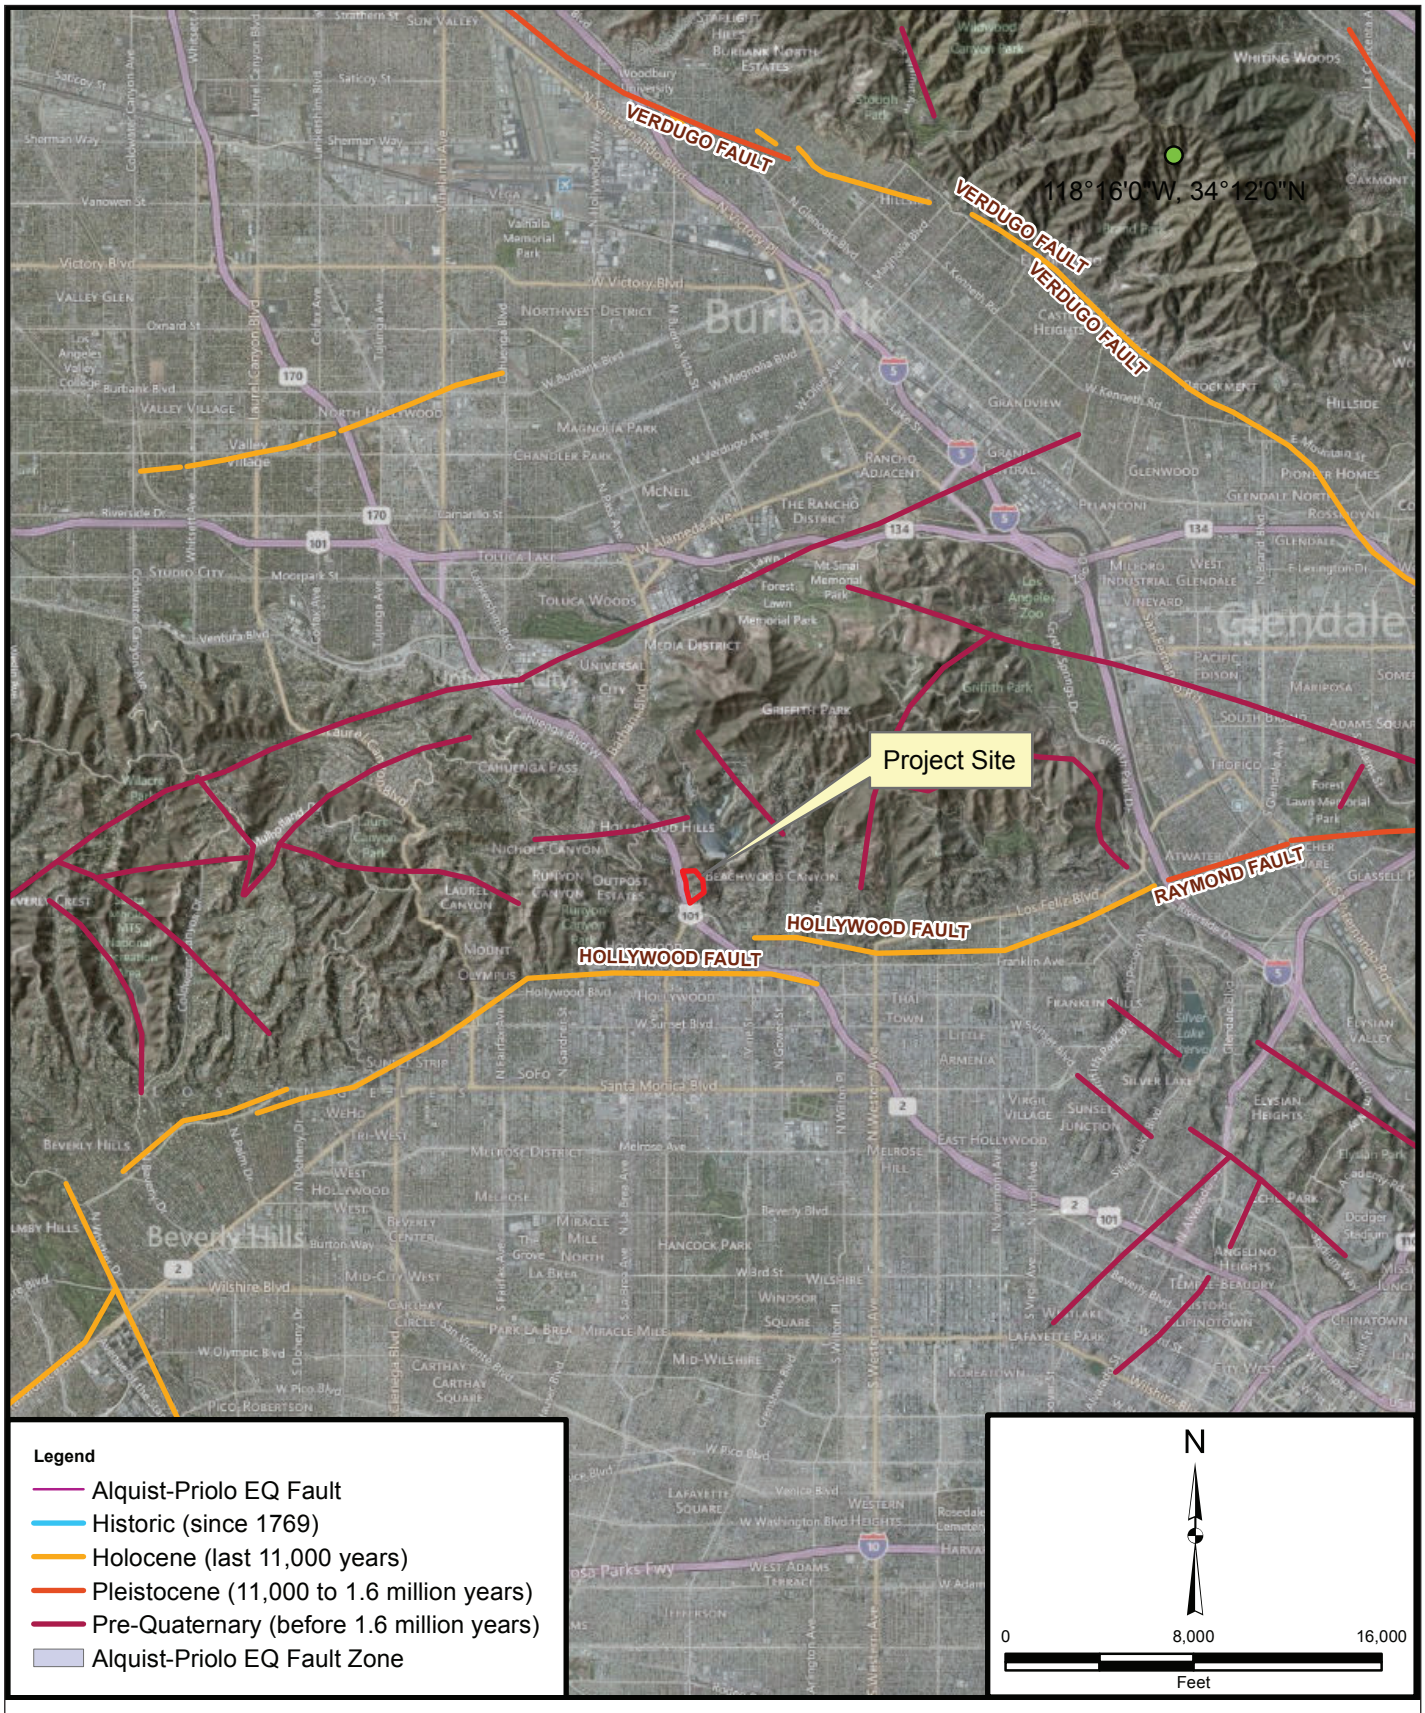

Figure IV.F-1
Regional Fault Map

Source: Leighton Consulting, Inc. 2013

major active and potentially active fault systems that could produce significant ground shaking at the Project Site include the Hollywood and Santa Monica Fault Zones, and the Upper Elysian Park Thrust Fault. A brief description of the major active fault systems in the Project Site vicinity is provided below.

(a) Hollywood Fault

The Hollywood Fault is located approximately 0.4 mile south of the Project Site extending for nearly 17 km through densely populated areas including the cities of Beverly Hills, West Hollywood and the Hollywood district of Los Angeles. The Hollywood Fault is part of a greater than 200-kilometer-long west trending system of oblique, reverse, and left lateral faults that is truncated on the west by the north-northwest trending erosional escarpment known locally as the West Beverly Hills Lineament marking the presumed left step between the Santa Monica Fault and the Hollywood Fault. Based on geomorphic evidence, stratigraphic correlation between exploratory borings, and fault trenching studies, this fault is considered active and has recently been assigned to a preliminary Alquist–Priolo earthquake fault zone by the California Geological Survey due to re-evaluation of published and unpublished research.[5]

The Hollywood Fault has not produced any damaging earthquakes during the historical period and has had relatively minor micro-seismic activity. It is estimated that the Hollywood Fault is capable of producing a maximum magnitude (Mw) 6.4 earthquake.

(b) Santa Monica Fault Zone

The Santa Monica Fault Zone, located approximately 1.4 miles southwest of the Project Site, is part of the west trending Transverse Ranges Southern Boundary fault system. The Santa Monica Fault extends east from the coastline in Pacific Palisades through Santa Monica and West Los Angeles and merges with the Hollywood Fault near the West Beverly Hills Lineament in Beverly Hills. Based on geomorphic evidence and fault trenching studies, the Santa Monica Fault is considered active by the State Geologist but has not been assigned as an Alquist-Priolo earthquake fault zone. It is estimated that the Santa Monica Fault is capable of producing a maximum magnitude (Mw) 6.6 earthquake.

[5] *California Geological Survey Fault Evaluation Report FER 253, The Hollywood Fault in the Hollywood 7.5' Quadrangle, Los Angeles County, Calfifornia by Hernandez, J.L., Treiman, J.A., February 14, 2014.*

(c) Upper Elysian Park Anticulinorium

Blind or buried thrust faults are faults without surface expression but are a significant source of seismic activity. They are typically broadly defined based on the analysis of seismic wave recordings of hundreds of small and large earthquakes in the southern California area. Due to the buried nature and shallow dip of thrust faults, their existence is sometimes not known until they produce an earthquake. The Elysian Park Anticlinorium is a southward verging anticline approximately 12.4 miles long with a curved, southward-convex axis, lying between the Hollywood Fault on the northwest through the Silver Lake District to the right lateral East Montebello Fault on the east in the City of San Gabriel. Uplift along the structure has produced the Elysian, Repetto, and Monterey Park Hills. The CGS has estimated a maximum magnitude (Mw) 6.4 earthquake for the Elysian Park Thrust fault system.

(d) Seismicity

As with most of Southern California, the Project Site may be subject to future seismic shaking during earthquakes generated by any of the surrounding active faults. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. A number of earthquakes of moderate to major magnitude have occurred in the Southern California area within the last 100 years. According to the United States Geological Survey one of the most recent local earthquakes was a maximum magnitude (Mw) 3.4 earthquake that occurred on September 7, 2012, approximately 3.4 miles southwest of the Project Site. This earthquake is believed to be attributed to movement along the San Vicente Blind thrust fault.[6]

(4) Liquefaction and Lateral Spreading

Liquefaction is the loss of soil strength or stiffness due to a buildup of pore-water pressure during severe ground shaking. Liquefaction is associated primarily with loose (low density), saturated, fine- to medium-grained, cohesionless soils. According to the State Seismic Hazard Zones Map for the Hollywood Quadrangle illustrated in Figure IV.F-2 on page IV.F-10, portions of the Project Site are located within an area that has been identified by the State as being potentially susceptible to liquefaction. As shown in Figure IV.F-2, State-mapped areas of liquefaction are confined to the western boundary of

[6] *According to the USGS, on March 17, 2014, a maximum magnitude 4.4 earthquake occurred approximately 8 miles west of the Project Site along the northern edge of the Santa Monica Mountains. The fault on which the movement occurred is unknown.*

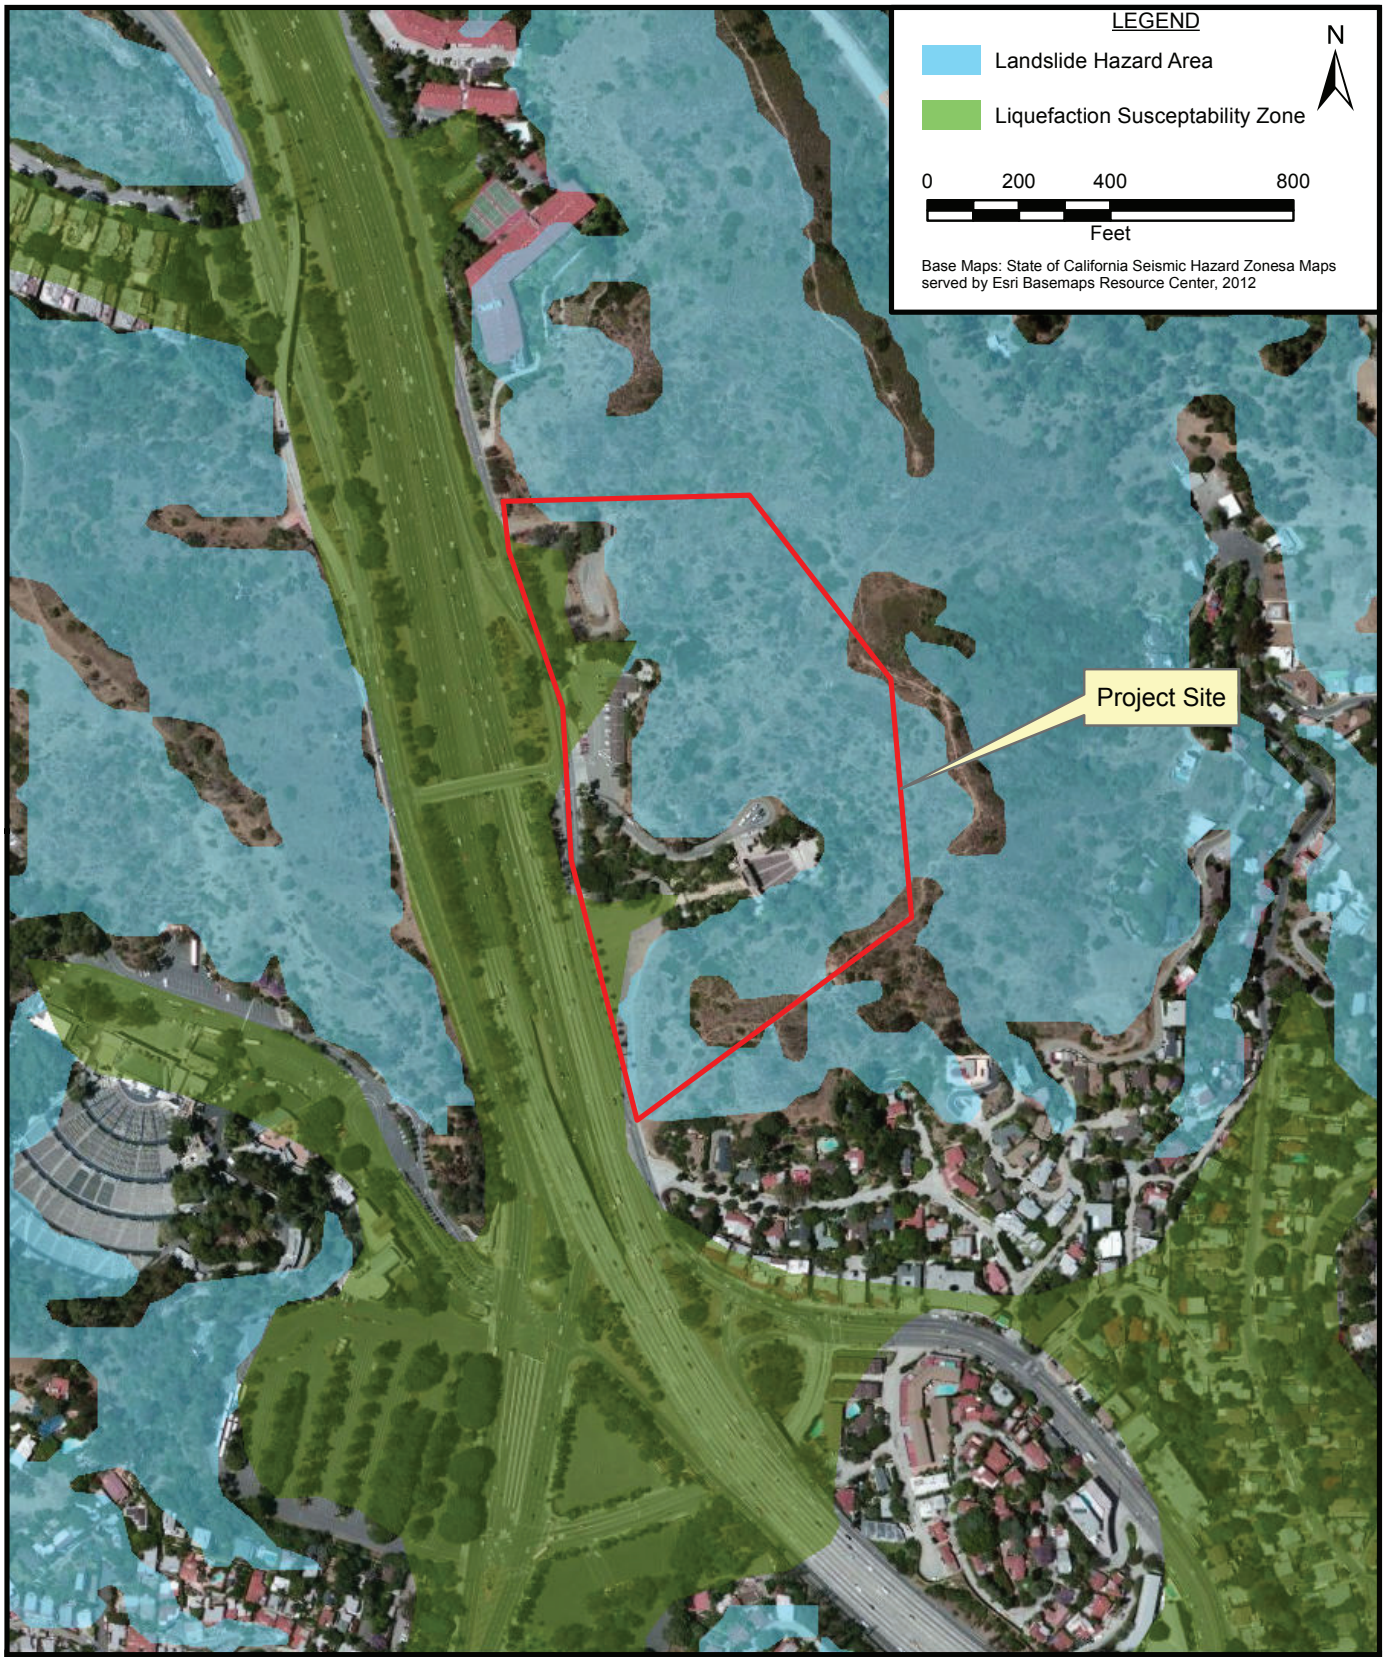

Figure IV.F-2
Seismic Hazards Map

Source: Leighton Consulting, Inc. 2013

the Project Site, along Cahuenga Boulevard East and portions of the north and south parking lots.

Lateral spreading is a phenomenon in which large blocks of intact, non-liquefied soil move downslope on a liquefied soil layer. Lateral spreading is often a regional event. For lateral spreading to occur, a liquefiable soil zone must be laterally continuous, unconstrained laterally in at least one direction and free to move along sloping ground. Due to the topographic relief and the potential for liquefaction within portions of the Project Site, there is a potential for lateral spreading within the Project Site.

(5) Landslides and Slope Stability

Based on the Seismic Hazard Zone Map for the Hollywood Quadrangle provided in Figure IV.F-2 on page IV.F-10, the hillside portions of the Project Site are located within an area that has been identified by the State as being susceptible to seismically induced landslides. Based on geotechnical investigations within the Project Site, deep seated landslides, in which the sliding surface is deeply located, are not mapped within the Project Site.[7] However, shallow landslides, such as debris flows and rockfalls associated with either seismic activity or with the natural slopes of the Project Site, have been observed within the Project Site. In particular, debris flow areas were encountered during subsurface investigations at the Project Site, and subsequent verbal conversations with Ford Theatres personnel confirmed debris flows have occurred at the Project Site during substantial rainfall events. Areas of thick accumulation of surficial materials, predominately highly weathered basalt, have the potential to develop into debris flows. Further, field mapping and geologic analysis of the sandstone rock outcrops exposed in the southern portion of the Project Site indicated the presence of intersecting pairs of joint sets and conjugate fault planes within the sandstone outcropping. Due to local orientations of the joint sets, the presence of fractured, freshly exposed rock faces, and damage to a steel H-beam installed to provide structural support for the existing retaining walls, the potential exists for detachment and downslope translation of rock.

(6) Settlement

Dynamic compaction may also occur during a major earthquake. Typically, settlements occur in thick beds of dry and loose sands. Since the Project Site is underlain predominantly by bedrock, the potential for seismically induced settlement within the Project Site is low.

---

[7] *Personal community with Leighton Consulting, Inc., March 2014.*

(7) Tsunami, Seiche, and Flooding

Tsunamis are large ocean waves generated by sudden water displacement due to a submarine earthquake, landslide, or volcanic eruption. As described above, the Project Site is situated at elevations higher than 500 feet above msl and is approximately 12 miles east of the Pacific Ocean. In addition, the Project Site is not mapped as a tsunami inundation area.[8] Therefore, the Project Site would not be affected by a tsunami.

Seiches are large wave oscillations generated in enclosed bodies of water, which can be caused by ground shaking during an earthquake and can result in inundation. The nearest enclosed body of water to the Project Site is the Hollywood Reservoir, which is located northeast of the Project Site. Based on the proximity of the Hollywood Reservoir to the Project Site and the location and varying ridgeline elevations between the Project Site and the Hollywood Reservoir, the seiche risk at the Project Site is considered low. Therefore, the Project Site is not anticipated to be affected by a seismically induced seiche.

Other forms of inundation include structural failures of dams due to factors including earthquakes, which can result in the flooding of areas located downstream. According to the County of Los Angeles Seismic Safety Element and the City of Los Angeles Safety Element, the Project Site is not located within a potential inundation area associated with the Hollywood Reservoir. In addition, it is noted that the Mulholland Dam, which impounds the Hollywood Reservoir, is continually monitored by the Army Corp of Engineers to guard against the threat of dam failure. Further, the possibility of dam failures during an earthquake has been evaluated by the California Division of Mines and Geology in an earthquake planning scenario for a magnitude 8.3 earthquake on the San Andreas fault and a magnitude 7.0 earthquake on the Newport Inglewood Fault Zone. The analyses indicated the catastrophic failure of a dam as a result of an earthquake is highly unlikely. It is also noted that current design practices, dam review, and modification or total reconstruction of existing dams are intended to ensure that all dams are capable of withstanding the maximum earthquake for that particular site. Therefore, the potential for the Project Site to be inundated as a result of dam failure is considered low.

(8) Expansive Soils

Based on geotechnical explorations at the Project Site, the near surface soils are generally granular with localized silt and clay layers. Results of expansion index tests indicate that the onsite soils have a low expansion potential.

---

[8] *California Department of Conservation, Los Angeles County Tsunami Inundation Maps, www.conservation.ca.gov/cgs/geologic_hazards/Tsunami/Inundation_Maps/LosAngeles/Pages/LosAngeles.aspx, accessed March 27, 2014.*

(9) Corrosive Soils

Corrosive soils are characterized by their ability to degrade concrete and corrode ferrous materials in contact with water or soil. In particular, concrete is susceptible to corrosion when it is in contact with soil or water that contains high concentrations of soluble sulfates. Results of laboratory testing indicate soluble sulfate contents of 73 and 175 parts per million (ppm), which range from negligible to moderate sulfate exposure. Results of laboratory testing also indicate Project Site soils are highly corrosive to ferrous metals.

3. Environmental Impacts

a. Methodology

To evaluate potential hazards relative to geology and soils, several Geotechnical Reports were prepared by Leighton Consulting, Inc., as provided in Appendix H of this Draft EIR. Preparation of the Geotechnical Reports included review of relevant literature and materials, geologic mapping, geophysical survey, geotechnical exploration (i.e., exploratory soil borings), laboratory testing, and conceptual-level engineering analyses.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts associated with geology and soils would be significant if the Project would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist–Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault; Refer to Division of Mines and Geology Special Publication 42.
  - Strong seismic ground shaking;
  - Seismic-related ground failure, including liquefaction;
  - Landslides;
- Result in substantial soil erosion or the loss of topsoil;
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;

- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property; or

- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

As discussed in the Initial Study prepared for the Project, provided in Appendix A of this Draft EIR, the closest active fault to the Project Site is the Hollywood Fault, which is located approximately 0.4 mile south of the Project Site.[9] As such, the Project Site is not within a currently established Alquist–Priolo Earthquake Fault Zone for surface fault rupture hazards.[10] In addition, based on a review of the preliminary 2014 Earthquake Fault Zone Map for the Hollywood Quadrangle released by the California Geological Survey on January 8, 2014, the Project Site would not be within an Alquist–Priolo Earthquake Fault Zone associated with the Hollywood Fault.[11] Therefore, potential impacts associated with rupture of a known earthquake fault would be less than significant. Additionally, since the Project Site is located within a community served by existing sewer infrastructure, wastewater generated by the Project would be accommodated via connections to the existing sewage infrastructure located in the Project area. As such, the Project would not require the use of septic tanks or alternative wastewater disposal systems. Thus, the Project would not result in impacts related to the ability of soils to support septic tanks or alternative wastewater disposal systems. Therefore, further analysis of these issues is not necessary.

c. Project Design Features

Project Design Feature F-1: Prior to the issuance of a grading permit(s), the Applicant shall submit to the County of Los Angeles Department of Public Works for review and approval a final design-level geotechnical investigation report that complies with all applicable State and local code requirements based on final Project designs prepared by a registered civil engineer and certified engineering geologist. The geotechnical investigation report shall include recommendations for the specific building locations and design including those pertaining to site preparation, fills and compaction,

---

[9] *Preliminary Geotechnical Evaluation, John Anson Ford Theatres Master Plan, Leighton Consulting. February 7, 2013.*

[10] *Ibid.*

[11] *California Department of Conservation. California Geological Survey, Earthquake Fault Zones, Hollywood Quadrangle, Preliminary Review Map, www.consrv.ca.gov/cgs/rghm/ap/Documents/Hollywood_EZRIM.pdf, released January 8, 2014..*

foundations, etc. The geotechnical investigation report shall be prepared to the written satisfaction of the Los Angeles Department of Public Works—Building and Safety Division.

Project Design Feature F-2: Project design and construction shall comply with all applicable current building codes and standards, including those established by the California Geological Survey's "Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication No. 117;" the Uniform Building Code as adopted by the County of Los Angeles; State and County laws, ordinances and Code requirements; and the recommendations set forth in a final geotechnical investigation(s).

d. Analysis of Project Impacts

(1) Strong Seismic Ground Shaking

The Project Site is located within the seismically active region of Southern California and most of Southern California is potentially subject to strong ground motion from movement along a fault or fault zone. Ground shaking can occur in areas adjacent to an earthquake epicenter, as well as in more distant areas for many miles in all directions. Thus, the Project Site could be subject to strong seismic ground shaking and impacts associated with seismic ground shaking could be potentially significant. However, strong ground shaking is common to Southern California, and potential damage caused by seismic shaking is typically reduced through proper structural design and construction techniques that are required as part of compliance with state and local seismic regulations.

As with any new development in the State of California, Project building design and construction would be required to conform to the current seismic design provisions of the California Building Code to minimize potential seismic impacts. In addition, construction of the Project would be required to adhere to the seismic safety requirements contained in the Los Angeles County Building Code. The Project would also be required to comply with the site plan review and permitting requirements of the County of Los Angeles Department of Public Works, Building and Safety Division, including the recommendations provided in site-specific geotechnical reports subject to Building and Safety Division's review and approval, as reflected in Project Design Feature F-1 and Project Design Feature F-2, above. Compliance with regulatory requirements and implementation of project design features would ensure Project construction adheres to the seismic safety requirements contained in the State and County Building Codes and that site-specific engineering recommendations are implemented in accordance with a design-level geotechnical investigation. Therefore, the Project would not expose people or structures to potential substantial adverse effects associated with seismic ground shaking, and impacts would be less than significant.

(2) Liquefaction and Lateral Spreading

As discussed above, portions of the Project Site are located within an area that has been identified by the State as being potentially susceptible to liquefaction. As shown in Figure IV.F-2 on page IV.F-10, these areas are confined to the western boundary of the Project Site, adjacent to Cahuenga Boulevard East and within portions of the north and south parking lots. Given the Project Site's location within an area potentially susceptible to liquefaction, significant impacts with regard to liquefaction and lateral spreading could occur. Accordingly, Mitigation Measure F-1 is provided below to require that Project construction involve a combination of ground modification (remedial grading) and/or structural enhancements that would address potential liquefaction hazards.[12] In addition, Project construction would adhere to the seismic safety requirements contained in the California and County Building Codes applicable to liquefaction and lateral spreading. With compliance with regulatory requirements and incorporation of the recommended structural enhancements into the design and construction of the Project, the Project would not expose people or structures to potential substantial adverse effects related to liquefaction and lateral spreading, and potential impacts would be reduced to a less than significant level.

(3) Landslides and Slope Stability

As described above, based on the Seismic Hazard Zone Map for the Hollywood Quadrangle, a portion of the Project Site is located within an area that has been identified by the State as being susceptible to seismically induced landslides. Based on the site-specific conditions observed as part of the geotechnical investigations, the Project Site is primarily susceptible to shallow landslide events such as debris flows and rockfalls associated with the natural slopes of the Project Site. As such, the Project could result in potentially significant impacts with regard to landslides and slope stability. Slope stability analyses were conducted for the Project Site and are included within the Geotechnical Reports provided in Appendix H of this Draft EIR. The results of the stability analyses indicate the Project Site would attain sufficient stability with minor surficial grading and the incorporation of slope reinforcement measures as specified in the Geotechnical Report and set forth in Mitigation Measure F-2 provided below, including removal of loose slope materials, repair of the existing damaged crib wall, and installation of retaining walls. In addition, as provided in Mitigation Measure F-2, flexible barriers would also be installed for protection against potential future rockfalls. With implementation of the recommended features and measures set forth in Mitigation Measure F-2 below into the design and construction of the Project, the Project would not expose people or structures to potential

---

[12] *Personal communication with Leighton Consulting, Inc., March 2014. Detailed site grading and structural recommendations are included in the Geotechnical Reports provided in Appendix H of this Draft EIR.*

substantial adverse effects related to landslides or slope failures, and potential impacts would be reduced to a less than significant level.

(4) Erosion

Sedimentation and erosion could potentially occur as a result of exposed soils during Project construction. However, construction activities would occur in accordance with erosion control requirements, including grading and dust control measures, imposed by the County pursuant to grading permit regulations. In addition, as discussed in detail in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, the Project would be required to have a Storm Water Pollution Prevention Plan pursuant to the National Pollutant Discharge Elimination System permit requirements. As part of the Storm Water Pollution Prevention Plan, Best Management Practices would be implemented during construction to reduce sedimentation and erosion levels to the maximum extent possible. The County of Los Angeles, as part of normal project approval and construction practice, monitors compliance with these requirements. The Project also would comply with South Coast Air Quality Management District Rule 403, which requires the implementation of best available fugitive dust control measures during active construction periods capable of generating fugitive dust emissions from on-site earth-moving activities, construction/demolition activities, and construction equipment travel on paved and unpaved roads, as discussed in Section IV.B, Air Quality, of this Draft EIR. With compliance with regulatory requirements and implementation of appropriate Best Management Practices, impacts with respect to soil erosion and the loss of topsoil associated with Project construction would be less than significant.

Project operations could result in a limited degree of soil erosion from vegetated areas. However, as discussed further in Section IV.G, Hydrology and Water Quality, of this Draft EIR, the Project would be required to have a Standard Urban Stormwater Mitigation Plan in place during the operational life of the Project in compliance with National Pollutant Discharge Elimination System permit requirements. The Standard Urban Stormwater Mitigation Plan would include Best Management Practices developed, in part, based on the County's Low Impact Development Standards Manual, which would reduce on-site erosion from vegetated areas within the Project Site. With compliance with these regulatory requirements, impacts with respect to sedimentation and erosion during operation would be less than significant.

(5) Corrosive Soils

As previously discussed, corrosion testing performed suggest the soils within the Project Site could be corrosive to concrete and ferrous metals. Corrosion testing would be performed, as required by the County Building Code, and final recommendations for concrete would be made in accordance with the latest California Building Code

requirements. With compliance with all regulatory requirements and implementation of the recommendations set forth in the Geotechnical Reports as well as any subsequent recommendations, as applicable, impacts related to corrosion would be less than significant.

4. Cumulative Impacts

Due to the site-specific nature of geological conditions (i.e., soils, geological features, seismic features, etc), geology impacts are typically assessed on a project-by-project basis, rather than on a cumulative basis. Nonetheless, cumulative growth through 2020 (inclusive of the 27 related projects identified in Section III, Environmental Setting, of this Draft EIR) would expose a greater number of people to seismic and other secondary hazards. However, as with the Project, related projects and other future development projects in the area would be subject to established guidelines and regulations pertaining to building design and seismic safety, including those set forth in the California Building Code and Los Angeles County Building Code (or City of Los Angeles Building Code requirements, as appropriate). Therefore, with adherence to such regulations, cumulative impacts with regard to geology and soils would be less than significant.

5. Mitigation Measures

Mitigation Measure F-1: Project grading shall include a combination of ground modification and/or structural enhancements in areas subject to liquefaction to reduce the risk to an acceptable level (as defined by the California Geological Survey in Special Publication 117a, Chapter 2). Ground modification shall consist of the removal and replacement of undocumented fill with engineered fill. Subsequently, foundations shall be supported on conventional shallow footing systems established on engineered fill or undisturbed bedrock.

Mitigation Measure F-2: In order to minimize, capture, and manage debris flows and rockfalls, the Project shall incorporate a combination of the following measures:

- Remove and recompact loose surficial material and remove rock fall accumulations;
- Construct storm drain and catch basins in swales above proposed retaining walls to provide an outlet for rainfall runoff and to catch eroded materials. Regular maintenance of catch basins to remove eroded materials shall be performed to preserve the basin and drain functionality;
- Install retaining walls; and
- Install flexible barriers or anchored mesh net.

6. Conclusion

With compliance with all regulatory requirements and implementation of the project design features and mitigation measures described above, Project-level impacts related to geology and soils would be less than significant. In addition, cumulative impacts with regard to geology and soils would be less than significant.

IV. Environmental Impact Analysis

G. Hydrology, Water Quality, and Groundwater

1. Introduction

This section analyzes the Project's potential impacts with regard to hydrology, water quality, and groundwater. This analysis is based on the *Hydrology & Water Quality Technical Report (Based on 50-Year Storm Design) for John Anson Ford Theatres Project* (Hydrology and Water Quality Report) prepared by Mollenhauer in March 2014. The Hydrology and Water Quality Report is included as Appendix I of this Draft EIR.

2. Environmental Setting

a. Regulatory Framework

(1) Federal

(a) Clean Water Act

The Clean Water Act (CWA) was first introduced in 1948 as the Water Pollution Control Act. The CWA authorizes federal, State, and local entities to cooperatively create comprehensive programs for eliminating or reducing the pollution of state waters and tributaries. The primary goals of the CWA are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and to make all surface waters fishable and swimmable. As such, the CWA forms the basic national framework for the management of water quality and the control of pollutant discharges. The CWA sets forth a number of objectives in order to achieve the above-mentioned goals, including regulating pollutant and toxic pollutant discharges; providing for water quality that protects and fosters the propagation of fish, shellfish and wildlife; developing waste treatment management plans; and developing and implementing programs for the control of non-point sources of pollution.[1] The State Water Resources Control Board (SWRCB) and the Regional Water

[1] *Non–point sources of pollution are carried through the environment via elements such as wind, rain, or stormwater and are generated by diffuse land use activities (such as runoff from streets and sidewalks or agricultural activities) rather than from an identifiable or discrete facility.*

Quality Control Board (RWQCB) are the primary state agencies responsible for implementing the Clean Water Act and regulating the activities and factors that affect or have the potential to affect water quality in the State.

The Clean Water Act provides the legal framework for several water quality regulations including the National Pollutant Discharge Elimination System (NPDES), effluent limitations, water quality standards, pretreatment standards, anti-degradation policy, non-point source discharge programs, and wetlands protection. A NPDES permit is required for all discharges of pollutants to waters of the United States from any point source. Federal regulations issued in November 1990 and revised in 2003 expanded the original scope of the NPDES program to include the permitting of stormwater discharges from construction sites that disturb areas larger than one acre. Stormwater discharges from construction sites with a disturbed area of one or more acres require either an individual NPDES permit or coverage under the Construction General Permit. The latter is accomplished by completing a construction site risk assessment to determine the appropriate coverage level; preparing a Stormwater Pollution Prevention Plan (SWPPP), including site maps, a Construction Site Monitoring Program (CSMP), and sediment basin design calculations; for projects located outside of a Phase I or Phase II permit area, completing a post-construction water balance calculation for hydromodification controls; and completing a Notice of Intent. The primary objective of the SWPPP is to identify and apply proper construction, implementation, and maintenance of Best Management Practices (BMPs) to reduce or eliminate pollutants in stormwater discharges and authorized non-stormwater discharges from the construction site during construction. The SWPPP also outlines the monitoring and sampling program required for the construction site to verify compliance with discharge Numeric Action Levels (NALs) set by the Construction General Permit. In addition to regulating non-stormwater discharges, the CWA sets forth water quality standards based on a water body's designated beneficial uses (e.g., wildlife habitat, agricultural supply, fishing etc.), along with water quality criteria necessary to support those uses. Water quality criteria are either prescribed concentrations or levels of constituents such as lead, suspended sediment, and fecal coliform bacteria, or narrative statements which represent the quality of water that support a particular use.

When designated beneficial uses of a particular receiving water body are being compromised by water quality, Section 303(d) of the CWA requires identifying and listing that water body as "impaired." Once a water body has been deemed impaired, a Total Maximum Daily Load (TMDL) must be established for the pollutant(s) or flows causing the impairment. A TMDL is an estimate of the total load of pollutants from point, non-point, and natural sources that a water body may receive without exceeding applicable water quality standards. Those facilities and activities that are discharging into the water body, collectively, must not exceed the TMDL. The United States Environmental Protection

Agency (USEPA) oversees the 303(d) program and either the USEPA or the SWRCB establishes the TMDL schedule for individual constituents.

In addition to trash and debris, common pollutants of concern that have the potential to affect water quality generally fall into one of the following seven categories: sediments, nutrients, bacteria/viruses, oil/grease, metals, organic compounds, and pesticides.

(b) Federal Anti-Degradation Policy

The federal Anti-Degradation Policy requires states to develop statewide anti-degradation policies and identify methods for implementing them.[2] Pursuant to the CFR, state anti-degradation policies and implementation methods must, at a minimum, protect and maintain: (1) existing in-stream water uses; (2) existing water quality where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource. State permitting actions must be consistent with the federal Anti-Degradation Policy.

(2) State

(a) Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (embodied in the California Water Code) established the principal California legal and regulatory framework for water quality control. This Act includes provisions to address the requirements of the Clean Water Act, including NPDES permitting, dredge and fill programs, and civil and administrative penalties. Regulations promulgated as a result of the Porter-Cologne Act are codified in Sections 13000–14958 of the California Water Code. The Porter-Cologne Act is broad in scope and addresses issues relating to the conservation, control, and utilization of the water resources of the State. Under the Porter-Cologne Act, the quality of all the waters of the State (including groundwater and surface water) must be protected for the use and enjoyment by the people of the State.

Under the California Water Code, the State of California is divided into nine regions governed by regional boards that under the guidance and review of the SWRCB implement and enforce provisions of the California Water Code and the Clean Water Act. The Project Site is located within Region 4, also known as the Los Angeles Region, and governed by the Los Angeles RWQCB (LARWQCB).

---

[2] *40 Code of Federal Regulations Section 131.12.*

Section 13050 of the California Water Code defines "pollution," "contamination," and "nuisance." Briefly defined, pollution means an alteration of water quality such that it unreasonably affects the beneficial uses of water. Contamination means an impairment of water quality to the degree that it creates a hazard to the public health. Nuisance is defined as anything that is injurious to health, is offensive to the senses, or is an obstruction to property use, and which affects a considerable number of people.

(b) California Antidegradation Policy

The California Antidegradation Policy, otherwise known as the *Statement of Policy with Respect to Maintaining High Quality Water in California* was adopted by the SWRCB (State Board Resolution No. 68-16) in 1968. Unlike the Federal Antidegradation Policy, the California Antidegradation Policy applies to all waters of the State, not just surface waters. The policy states that whenever the existing quality of a water body is better than the quality established in individual Basin Plans, such high quality shall be maintained and discharges to that water body shall not unreasonably affect present or anticipated beneficial use of such water resource.

(c) California Toxic Rule

The California Toxic Rule establishes water quality criteria for certain toxic substances to be applied to waters in the State. The California Toxic Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the LARWQCB as having beneficial uses protective of aquatic life or human health.

(d) National Pollutant Discharge Elimination System

(i) Construction

The Clean Water Act requires coverage under a NPDES construction permit for stormwater discharges to surface waters associated with various construction activities, except activities that result in disturbance of less than one acre of total land area which are not part of a larger common plan of development or sale. The SWRCB has issued a statewide NPDES Construction General Permit for stormwater discharges from construction site (Water Quality Order No. 2009-0009-DWQ). Any project that disturbs an area more than one acre, as well as linear underground/overhead projects disturbing over one acre require a Notice of Intent to discharge under the Construction General Permit. The Construction General Permit includes three levels of risk for construction sites based on calculated project sediment and receiving water risk. The Construction General Permit includes measures to eliminate or reduce pollutant discharges through implementation of a Stormwater Pollution Prevention Plan, which describes the implementation and

maintenance of Best Management Practices to reduce or eliminate pollutants in stormwater discharges and authorized non-stormwater discharges from the site during construction. The Construction General Permit contains receiving water limitations that require stormwater discharges to not cause or contribute to a violation of any applicable water quality standard. The permit also requires implementation of programs for visual inspections and sampling for specified constituents (e.g., nonvisible pollutants). In addition, based upon particular project risk levels, monitoring is required for stormwater discharges.

(ii) Operation

In accordance with Section 402(p) of the Clean Water Act, municipal NPDES permits prohibit the discharge of non-stormwater except under certain conditions and require controls to reduce pollutants in discharges to the maximum extent practicable. Such controls include BMPs, as well as system, design, and engineering methods. A municipal NPDES permit has been issued to the County and 84 incorporated cities. Under the Los Angeles County Municipal NPDES Permit, permittees are required to implement a development planning program to address stormwater pollution. These programs require project applicants for certain types of projects to implement a Low Impact Development (LID) Plan for review and approval by the Director of Public Works.[3] The LID Plan shall identify stormwater quality control measures or BMPs to reduce the volume of runoff and associated discharge of pollutants in stormwater which must be incorporated into the design plans of new development and redevelopment. In combination, these BMPs must be sufficiently designed and constructed to treat or filter a specified volume of water referred to as the stormwater quality design volume during a 0.75-inch, 24-hour storm event or an 85th percentile, 24-hour rain event as determined from the Los Angeles County 85th percentile precipitation isoheytal map, whichever is greatest.

(e) California Green Building Standards Code

The California Green Building Standards Code (CALGreen Code), Part 11 of the California Building Standards Code (Title 24) is designed to improve public health, safety, and general welfare by utilizing design and construction methods that reduce the negative environmental impact of development and encourage sustainable construction practices.

The CALGreen Code provides mandatory direction to developers of all new construction and renovations of residential and non-residential structures with regard to all aspects of design and construction, including but not limited to site drainage design,

[3] *In communication with the County of Los Angeles Department of Public Works, the previous Standard Urban Stormwater Mitigation Plan requirements have been superseded and replaced by the County's Low Impact Development requirements.*

stormwater management, and water use efficiency. Required measures are accompanied by a set of voluntary standards designed to encourage developers and cities to aim for a higher standard of development.

(3) Local

(a) County of Los Angeles Hydrology Manual

The Los Angeles County Department of Public Works' Hydrology Manual requires projects to have drainage facilities to meet the Urban Flood level of protection, which is defined as runoff from a 25-year frequency storm falling on a saturated watershed.[4] A 25-year frequency design storm has a probability of 1/25 of being equaled or exceeded in any year.

(b) Low Impact Development Ordinance

On November 18, 2008, the Los Angeles County Board of Supervisors passed the Low Impact Development ordinance. This 2008 LID Ordinance was updated in November 2013 to incorporate the requirements of the County's 2012 MS4 Permit, including the requirement that new development and redevelopment projects retain, on-site, a specified volume of stormwater runoff from a design storm event. The LID ordinance focuses on water resources and specifies stormwater handling and treatment requirements that protect streams, groundwater, surface water quality, and natural drainage characteristics. Chapter 12.84 of the County Code requires the use of LID principles in development projects. As set forth in the updated LID Ordinance, the intent of the LID Ordinance is to lessen the adverse impacts of stormwater runoff from development and urban runoff on natural drainage systems, receiving waters and other water bodies; minimize pollutant loadings from impervious surfaces by requiring development projects to incorporate property designed, technically appropriate BMPs and other LID strategies; and minimize erosion and other hydrologic impacts on natural drainage systems by requiring development projects to incorporate property designed, technically appropriate hydromodification control development principles and technologies. Site preservation practices coupled with BMPs that rely on the environmental services of vegetation and soils or systems that mimic these services comprise the control approach of LID. These practices, taken in aggregate, limit the observed hydromodification on a developed site and present a more comprehensive and beneficial control approach.

(c) Stormwater Quality Management Program

The Los Angeles County NPDES Permit, as discussed above, contains provisions for implementation of the Stormwater Quality Management Program (SQMP) by the Co-Permittees. The SQMP states that Permittees are required to implement the most effective combination of Best Management Practices for stormwater/urban runoff pollution control. The objective of the SQMP is to reduce pollutants in urban stormwater discharges to the Maximum Extent Practicable in order to attain Water Quality Objectives and to protect the beneficial uses of receiving waters in Los Angeles County.

b. Existing Conditions

(1) Surface Water Hydrology

(a) Regional

As shown in Figure IV.G-1 on page IV.G-8, the Project Site is located within the Santa Monica Bay Watershed Management Area in the Los Angeles Basin. The Santa Monica Bay Watershed Management Area encompasses an area of 414 square miles. The northern boundary of the Santa Monica Bay Watershed extends from the crest of the Santa Monica Mountains and the Ventura–Los Angeles County line through downtown Los Angeles to the Pacific Ocean. The boundary then extends south and west across the Los Angeles plain to include the area east of Ballona Creek and north of the Baldwin Hills.

Surface water flows into the Santa Monica Bay through 28 catchment basins that are further grouped into nine subwatershed areas. As shown in Figure IV.G-1, these nine subwatershed areas include the North Coast; Malibu Creek; Topanga Creek; Santa Monica Canyon; Pico–Kenter; Ballona Creek; El Segundo–LAX; South Bay; and Palos Verdes. The Project Site is specifically located within the Ballona Creek subwatershed area.

The Ballona Creek is a 9-mile-long flood protection channel that drains into the Los Angeles basin to the Pacific Ocean, from the Santa Monica Mountains on the north, the Harbor Freeway (I-110) on the east, and Baldwin Hills on the south. The Ballona Creek Watershed covers a land area of approximately 130 square miles and comprises all or parts of the cities of Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, West Hollywood, and unincorporated Los Angeles County as shown in Figure IV.G-2 on page IV.G-9. Land uses within the watershed consist of 64 percent residential, 8 percent commercial, 4 percent industrial, and 17 percent open space. There are three tributaries that enter into the Ballona Creek Watershed, including Centinela Creek, Sepulveda Canyon Channel, and Benedict Canyon Channel, in addition to numerous storm drains. The Ballona Creek is designed to discharge approximately 71,400 cubic feet per second (cfs) from a 50-year frequency storm event into the Santa Monica Bay.

(b) Local

Drainage from the Project Site primarily sheet flows to Cahuenga Boulevard East via a series of bubbler catch basins and curb drains. The Project Site's runoff is then conveyed to an underground storm drain pipe owned and maintained by the City of Los Angeles via curb-open catch basins in Cahuenga Boulevard East. After entering the underground storm drain pipe at Cahuenga Boulevard East, the drainage from the Project Site is conveyed through an underground pipe network that flows south and west through various drainage pipes owned by the City of Los Angeles and the Los Angeles County Flood Control District and ultimately discharging into the Pacific Ocean from Ballona Creek.

(c) On-Site

As shown in Figure IV.G-3 on page IV.G-11, the Project Site has been divided into 14 drainage areas (identified herein as drainage areas A through N) based on the drainage patterns and flow paths of stormwater that are tributary to a common point or area.

As shown in Figure IV.G-3, while the Project Site generally slopes toward Cahuenga Boulevard East, there is an existing hilltop ridgeline that divides the drainage areas away from Cahuenga Boulevard East. Specifically, runoff from drainage areas A through I sheet flows west toward Cahuenga Boulevard East where it is collected by a series of storm drain inlets. Runoff from drainage areas A through I is discharged at a rate of 76.3 cubic feet per second (cfs). Runoff from drainage areas J through N flows east toward the undeveloped hillsides, away from Cahuenga Boulevard East. The runoff from drainage areas J through N was estimated to discharge at a rate of 43.6 cfs. The total runoff flow rate from drainage areas A through N was calculated as 119.9 cfs and the total collected volume was measured at 381,586 cubic feet.[5]

The existing 32-acre Project Site is approximately 11 percent impervious surfaces including buildings and impervious pavements for pedestrian and vehicular circulation. The remaining 89 percent of the existing Project Site is pervious surfaces consisting of landscaped areas and undeveloped hillsides.

[5] *The calculated flow rate is the amount of flow that occurs, spread across the Project Site, during a 50-year storm event. The calculated volume is the amount of runoff that is collected from all drainage areas during a 50-year storm event.*

(2) Surface Water Quality

(a) Regional

As discussed above, the Project Site is located within the Santa Monica Bay Watershed Management Area of the Los Angeles Basin, which includes several subwatershed areas. The Project Site is specifically located within the Ballona Creek Subwatershed. As previously described, the Project Site ultimately drains to the Santa Monica Bay via a network of City and County storm drains within the Ballona Creek Subwatershed.

(i) Beneficial Uses of the Ballona Creek Subwatershed

According to the LARWQCB Santa Monica Bay Watershed Report, almost every beneficial use defined in the Basin Plan is identified in water bodies within the Santa Monica Bay Watershed Management Area.[6] Specifically, 20 beneficial uses for surface waters and 4 beneficial uses for ground waters in the Santa Monica Bay Watershed Management Area are designated in the Basin Plan. The existing and potential beneficial uses for the waters within the Ballona Creek Subwatershed, where surface water flows from the Project Site ultimately discharge, include municipal and domestic supply; navigation; water contact and non-contact water recreation; commercial and sport fishing; warm freshwater habitat; estuarine habitat; wetland habitat; marine habitat; wildlife habitat; rare, threatened, or endangered species habitat; migration of aquatic organisms; spawning, reproduction, and/or early development; and shellfish harvesting.

(ii) Impairments and TMDLs in the Ballona Creek Subwatershed

Pursuant to Section 303(d) of the federal Clean Water Act, the State and RWQCBs identify impaired bodies of water that do not meet water quality standards and prioritizes and schedules them for development of TMDLs. A TMDL specifies the maximum amount of a pollutant that a water body can receive and still meet water quality standards. Those facilities and activities that are discharging into the water body, collectively, must not exceed the TMDL. The USEPA approved the most recent Section 303(d) list in November 2010.[7] The 2010 303(d) list indicates impairment in the Ballona Creek Subwatershed due to cadmium, coliform bacteria, copper, cyanide, lead, selenium, toxicity, trash, viruses, zinc, chlordane, DDT, lead, polycyclic aromatic hydrocarbons, polychlorinated biphenyls,

sediment toxicity, shellfish harvesting advisory, silver, zinc, exotic vegetation, habitat alterations, hydromodification, and reduced tidal flushing.[8]

(b) Local

In general, urban stormwater runoff occurs during and shortly following precipitation events. The volume of water ultimately directed into the drainage system depends on such things as the intensity and duration of the rainstorm and soil moisture. In addition to sediment, contaminants that may be found in stormwater from developed areas include trash, bacteria, metals, nutrients, and potentially, organics and pesticides. The source of contaminants is diffuse and includes all areas where precipitation falls, as well as the air it falls through. Therefore, contaminants on roads, maintenance areas, parking lots, and building tops, which are not usually contained in dry weather discharges, may be carried with rainfall drainage into the drainage system. The City has installed catch basins to capture debris before entering the storm drain system. In addition, the City conducts routine street cleaning operations as well as periodic cleaning and maintenance of catch basins to reduce stormwater pollution within the City.

(c) On-Site

While the Project Site currently does not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces such as building roof areas and pavements, there are a range of non-structural BMPs and environmental water quality policies that are currently used at the Project Site to minimize the impact of pollutant sources. These include general housekeeping practices such as regular trash collection and street sweeping; proper storage of hazardous materials and wastes; and substituting environmentally friendly products for environmentally hazardous products, such as soaps, solvents, and pesticides. In addition, stormwater runoff from existing pervious surfaces is naturally treated to some extent by existing vegetation and the absorptive properties of the existing soils. Based on the existing operations within the Project Site, the on-site runoff likely contains the following pollutants of concern: sediment, nutrients, pesticides, metals, pathogens, and oil and grease.

(3) Groundwater Hydrology

(a) Regional

Groundwater use for domestic water supply is a major beneficial use of groundwater basins in Los Angeles County. The City of Los Angeles overlies the Los Angeles Coastal

[8] *Ibid.*

Plain Groundwater Basin. As shown in Figure IV.G-4 on page IV.G-15, the Los Angeles Coastal Plain Groundwater Basin comprises the Hollywood, Santa Monica, Central, and West Coast Basins. Groundwater flow in the Los Angeles Coastal Plain Groundwater Basin is generally south-southwesterly and may be restricted by natural geological features. Replenishment of groundwater basins occurs mainly by percolation of precipitation throughout the region via permeable surfaces, spreading grounds, and groundwater migration from adjacent basins, as well as injection wells designed to pump freshwater along specific seawater barriers to prevent the intrusion of salt water.

(b) Local

The Project Site is not located within the groundwater basins in the Los Angeles Coastal Plain Groundwater Basin. As shown in Figure IV.G-5 on page IV.G-16, the Project Site is specifically situated between the Hollywood Basin and the boundaries of the Upper Los Angeles River Area Basin.

(c) On-Site

As discussed in the Geotechnical Reports, including in Appendix H, of this Draft EIR, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater is not expected to be encountered within the Project Site. In addition, groundwater was not encountered during recent on-site explorations conducted. Furthermore, there are no groundwater production wells or public water supply wells within the Project Site or in the vicinity of the Project Site.

(4) Groundwater Quality

In general, due to historical activities and practices, groundwater quality in the City of Los Angeles has been substantially degraded. The degradation of regional groundwater is a result of seepage into the subsurface of fertilizers and pesticides from agricultural uses, nitrogen and pathogenic bacteria from septic tanks, and various hazardous substances from leaking aboveground and underground storage tanks and industrial-type operations.

(5) Flood Zone

Based on the Federal Emergency Management Agency Flood Insurance Rate Map for the Project Site, the Project Site is not located within a 100-year flood zone. The Project Site is specifically designated as flood hazard area—Zone X, which is defined as "areas determined to be outside the 0.2 percent annual chance floodplain." In addition, while the Hollywood Reservoir located northeast of the Project Site is considered to be within a 100-year floodplain, the Hollywood Reservoir is separated from the Project Site by surrounding hillsides which are at a lower elevation than the ridgeline within the Project

Site. Drainage captured below the Hollywood Reservoir flows down Weid Canyon rather than toward the Project Site.

3. Environmental Impacts

a. Methodology

The analysis of potential impacts to surface water hydrology, surface water quality, and groundwater is based on the Hydrology and Water Quality Report prepared by Mollenhauer (March 2014). This report is provided in Appendix I of this Draft EIR.

(1) Surface Water Hydrology

The surface water hydrology analysis included below evaluates the change in surface water runoff patterns and quantity for the Project Site associated with the Project and the impact of these changes on the existing downstream stormwater system. To determine the ability of the existing storm drain infrastructure to accommodate any changes in runoff flows associated with the Project, potential flows from each drainage area during a 50-year frequency design storm event was evaluated.

As part of its Hydrology Manual, the Los Angeles County Department of Public Works developed a time of concentration calculator, Tc Calculator,[9] to automate time of concentration, peak runoff rate, and total volume calculations. The Tc Calculator was used to calculate the stormwater peak runoff flow rate for the Project Site with implementation of the Project by evaluating the changes within the individual drainage areas.

(2) Surface Water Quality

The analysis of surface water quality impacts identifies the types of pollutants associated with construction and operation of the Project and considers their potential effects on surface water quality.

(3) Groundwater

The analysis of the Project's potential impacts associated with groundwater was based on a review of existing groundwater conditions and groundwater uses and an evaluation of the potential impacts for construction and operation of the Project to affect

[9] *The time of concentration (Tc) is defined as the time it takes for rain in the most hydrologically remote part of the basin area to reach the outlet.*

those uses and groundwater quality. Construction and operational activities evaluated include any potential dewatering activities during construction; changes in groundwater recharge based on proposed land use changes; infiltration capacity of the underlying soil; permanent dewatering; potential soil or shallow groundwater exposure to construction materials, wastes, or spilled materials, handling and storage of hazardous materials; and any potential groundwater remediation activities.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts associated with hydrology and water quality would be significant if the Project would:

- Violate any water quality standards or waste discharge requirements;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted);
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site;
- Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- Otherwise substantially degrade water quality;
- Place housing within a 100-year flood plain as mapped on federal Flood Hazard Boundary or Flood Insurance Rate Maps or other flood hazard delineation maps;
- Place within a 100-year flood plain structures which would impede or redirect flood flows;
- Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam;
- Inundation by seiche, tsunami, or mudflow; or

- Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

As evaluated in the Initial Study prepared for the Project, provided in Appendix A of this Draft EIR, the Project does not propose the development of residential uses and the Project Site is not located within a 100-year flood plain as mapped by the Federal Emergency Management Agency. As such, the Project would not place housing within a 100-year flood plain or place structures that would impede or redirect flood flows within a 100-year flood plain. Therefore, no significant impact would occur regarding 100-year flood plains hazards, and no further discussion of these issues is necessary.

The potential for flooding as a result of the failure of a levee or dam is discussed in Section IV.F, Geology and Soils, of this Draft EIR. As described therein, the Project Site is not located within a potential inundation area associated with the Hollywood Reservoir. In addition, it is noted that the Mulholland Dam, which impounds the Hollywood Reservoir, is continually monitored by the Army Corp of Engineers to guard against the threat of dam failure. It is also noted that current design practices, dam review, and modification or total reconstruction of existing dams are intended to ensure that all dams are capable of withstanding the maximum earthquake for that particular site. Therefore, the potential for the Project Site to be inundated as a result of dam failure is considered low.

The potential for seiches, tsunamis, and mudflows to occur within the Project Site is also evaluated in Section IV.F, Geology and Soils, of this Draft EIR. As discussed therein, based on the proximity of the Hollywood Reservoir to the Project Site and the location and varying elevations between the Project Site and the Hollywood Reservoir, the seiche risk at the Project Site is considered low. In addition, the Project Site is not mapped as a tsunami inundation area. Therefore, the Project Site would not be affected by a seiche or tsunami. With regard to the potential for mudflows, also known as debris flows, as provided in Section IV.F, Geology and Soils, of this Draft EIR, the Project Site would attain sufficient stability with minor surficial grading and the incorporation of slope reinforcement measures, including removal of loose slope materials, repair of the existing damaged crib wall, and installation of retaining walls. In addition, for protection against potential future rockfalls, the Geotechnical Reports recommend installation of flexible barriers. Therefore, with implementation of the recommended features and measures into the design and construction of the Project, the Project would not expose people or structures to potential substantial adverse effects related to landslides or slope failures.

c. Project Design Features

Project Design Feature G-1: Prior to the issuance of a grading permit, the Applicant shall provide evidence to the County of Los Angeles Department of Public Works, as appropriate, that a Notice of Intent has been filed with the State Water Resources Control Board for coverage under the Construction General Permit and a certification that a Stormwater Pollution Prevention Plan has been prepared. Such evidence would consist of a copy of the Notice of Intent stamped by the State Water Resources Control Board or Los Angeles Regional Water Quality Control Board, or a letter from either agency stating that the Notice of Intent has been filed. The Stormwater Pollution Prevention Plan would include a menu of Best Management Practices to be selected and implemented based on the phase of construction and the weather conditions to effectively manage stormwater runoff and control erosion. Best Management Practices to be implemented as part of the Project could include, but not be limited to, the following:

- Erosion Control BMPs to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of disturbance, stabilizing disturbed areas, and protecting slopes/channels;
- Sediment Control BMPs, which are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping sediments on-site and controlling the site boundaries;
- Wind Erosion Control BMPs, which consist of applying water to prevent or minimize dust nuisance;
- Tracking Control BMPs, which consist of preventing or reducing the tracking of sediment off-site by vehicles leaving the construction area. These BMPs include street sweeping and vacuuming. The construction site would have a stabilized construction entrance to prevent off-site tracking of sediment and debris;
- Non-Stormwater Management BMPs, which are also referred to as “good housekeeping practices” involve keeping a clean, orderly construction site; and
- Waste Management and Materials Pollution Control BMPs consist of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into

stormwater runoff or discharges through the proper management of construction waste.

Project Design Feature G-2: Prior to issuance of a building permit, the Applicant shall prepare and submit for review and approval a Low Impact Development Plan that would include Best Management Practices and demonstrate compliance with Low Impact Development Ordinance requirements to the Los Angeles County Department of Public Works, Building and Safety, as applicable. Specific Best Management Practices to be implemented as part of the Low Impact Development Plan for the Project to manage post-construction stormwater runoff would include, but not be limited to, the following:

- Installation of catch basins, planter drains, and building roof drain downspouts throughout the Project Site to collect roof and site runoff and direct stormwater away from structures and to potential infiltration systems.[10]
- Installation of filter inserts to catch basins to improve the quality of stormwater runoff from the Project Site.
- Promote evapotranspiration and infiltration, and the use of native and/or drought tolerant plants
- Promote bioretention through the use of underground retention tanks and/or rainwater harvesting;
- Design material storage areas and loading docks within structures or enclosures to prevent leaks or spills of pollutants from entering the storm drain system;
- Design post-construction structural or treatment control BMPs to infiltrate stormwater runoff. Stormwater treatment facilities and systems would be designed to meet the requirements of the LID Ordinance.

[10] *Infiltration refers to the physical process of percolation, or downward seepage, of water through a soil's pore space. As water infiltrates, the natural filtration, adsorption, and biological decomposition properties of soils, plant roots, and micro-organisms work to remove pollutants prior to the water recharging the underlying groundwater. Infiltration BMPs include infiltration basins, infiltration trenches, infiltration galleries, bioretention without an underdrain, dry wells, and permeable pavement. Infiltration can provide multiple benefits, including pollutant removal, peak flow control, groundwater recharge, and flood control.*

d. Analysis of Project Impacts

(1) Construction

(a) Surface Water Hydrology and Water Quality

Construction of the Project would require onsite demolition, grading, and excavation activities. Such construction activities would have the potential to temporarily alter existing drainage patterns and flows within the Project Site by exposing the underlying soils and making the Project Site temporarily more permeable. Exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, construction activities such as earth moving, maintenance/operation of construction equipment, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. Onsite watering activities to reduce airborne dust could also contribute to pollutant loading in runoff. The main pollutant of concern during construction would be sediment or soil particles that would become detached by water and wind. However, as the construction site would be greater than one acre, Project construction activities would be regulated per the NPDES Construction General Permit.

In accordance with the requirements of the Construction General Permit, the Project would implement a SWPPP that would specify BMPs to be used during construction to manage runoff flows and erosion and prevent pollution. In addition, construction activities would be scheduled to minimize the amount of time soil is exposed to further control erosion and stormwater runoff. BMPs would also be provided to target pollutants of concern and be designed to reduce runoff and pollutant levels in runoff during construction. Further, implementation of BMPs such as sandbag barriers and other sediment barriers would serve to maintain the existing drainage flow paths and discharge points during construction.

Through compliance with all NPDES Construction General Permit requirements, including the preparation and implementation of a SWPPP, implementation of BMPs, and compliance with applicable County grading regulations, construction of the Project would not violate any water quality standards; substantially alter the existing drainage pattern of the Project Site and surrounding area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site; create or contribute runoff water which would exceed the capacity of the existing stormwater drainage system or provide substantial additional sources of polluted runoff and otherwise substantially degrade water quality. In addition, Project construction would not require or result in the construction of new stormwater drainage facilities which could cause significant environmental effects. As such, impacts to surface water hydrology and water quality during construction would be less than significant.

(b) Groundwater

As described above, no water supply wells are located at the Project Site or within 1 mile of the Project Site that could be impacted by construction, nor would the Project include the construction of water supply wells. In addition, as noted above, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater is not expected to be encountered within the Project Site. Furthermore, groundwater was not encountered during recent on-site explorations conducted within the Project Site. Accordingly, it is not expected that groundwater would be encountered during construction that would require temporary or permanent dewatering operations. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. Additionally, compliance with all applicable federal, State, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. As such, Project construction would not result in a significant impact with regard to groundwater.

(2) Operation

(a) Surface Water Hydrology

As described above, the Project Site is currently covered by approximately 11 percent impervious surfaces, including buildings and impervious pavements for pedestrian and vehicular circulation. The remaining 89 percent of the existing Project Site is pervious surfaces consisting of landscaped areas and undeveloped hillsides. With implementation of the Project, the amount of impervious area would increase from approximately 11 percent to 13 percent. Accordingly, Project development would increase the amount of stormwater flow and volume. In addition, with the construction of new buildings, some of the existing drainage areas would be divided into additional drainage areas. Specifically, development of the Project would change existing drainage areas by bisecting existing tributary flows. As shown in Figure IV.G-6 on page IV.G-24, with development of the Project, the Project Site would be divided into 21 drainage areas (identified herein as drainage areas A through U) based on their runoff collection points compared to the 14 drainage areas under existing conditions.

Drainage areas A through P would flow toward Cahuenga Boulevard East and into the City of Los Angeles storm drain system with a flow rate of 79.8 cfs. Tributary areas Q through U would be divided by existing ridgelines that divert runoff east and away from

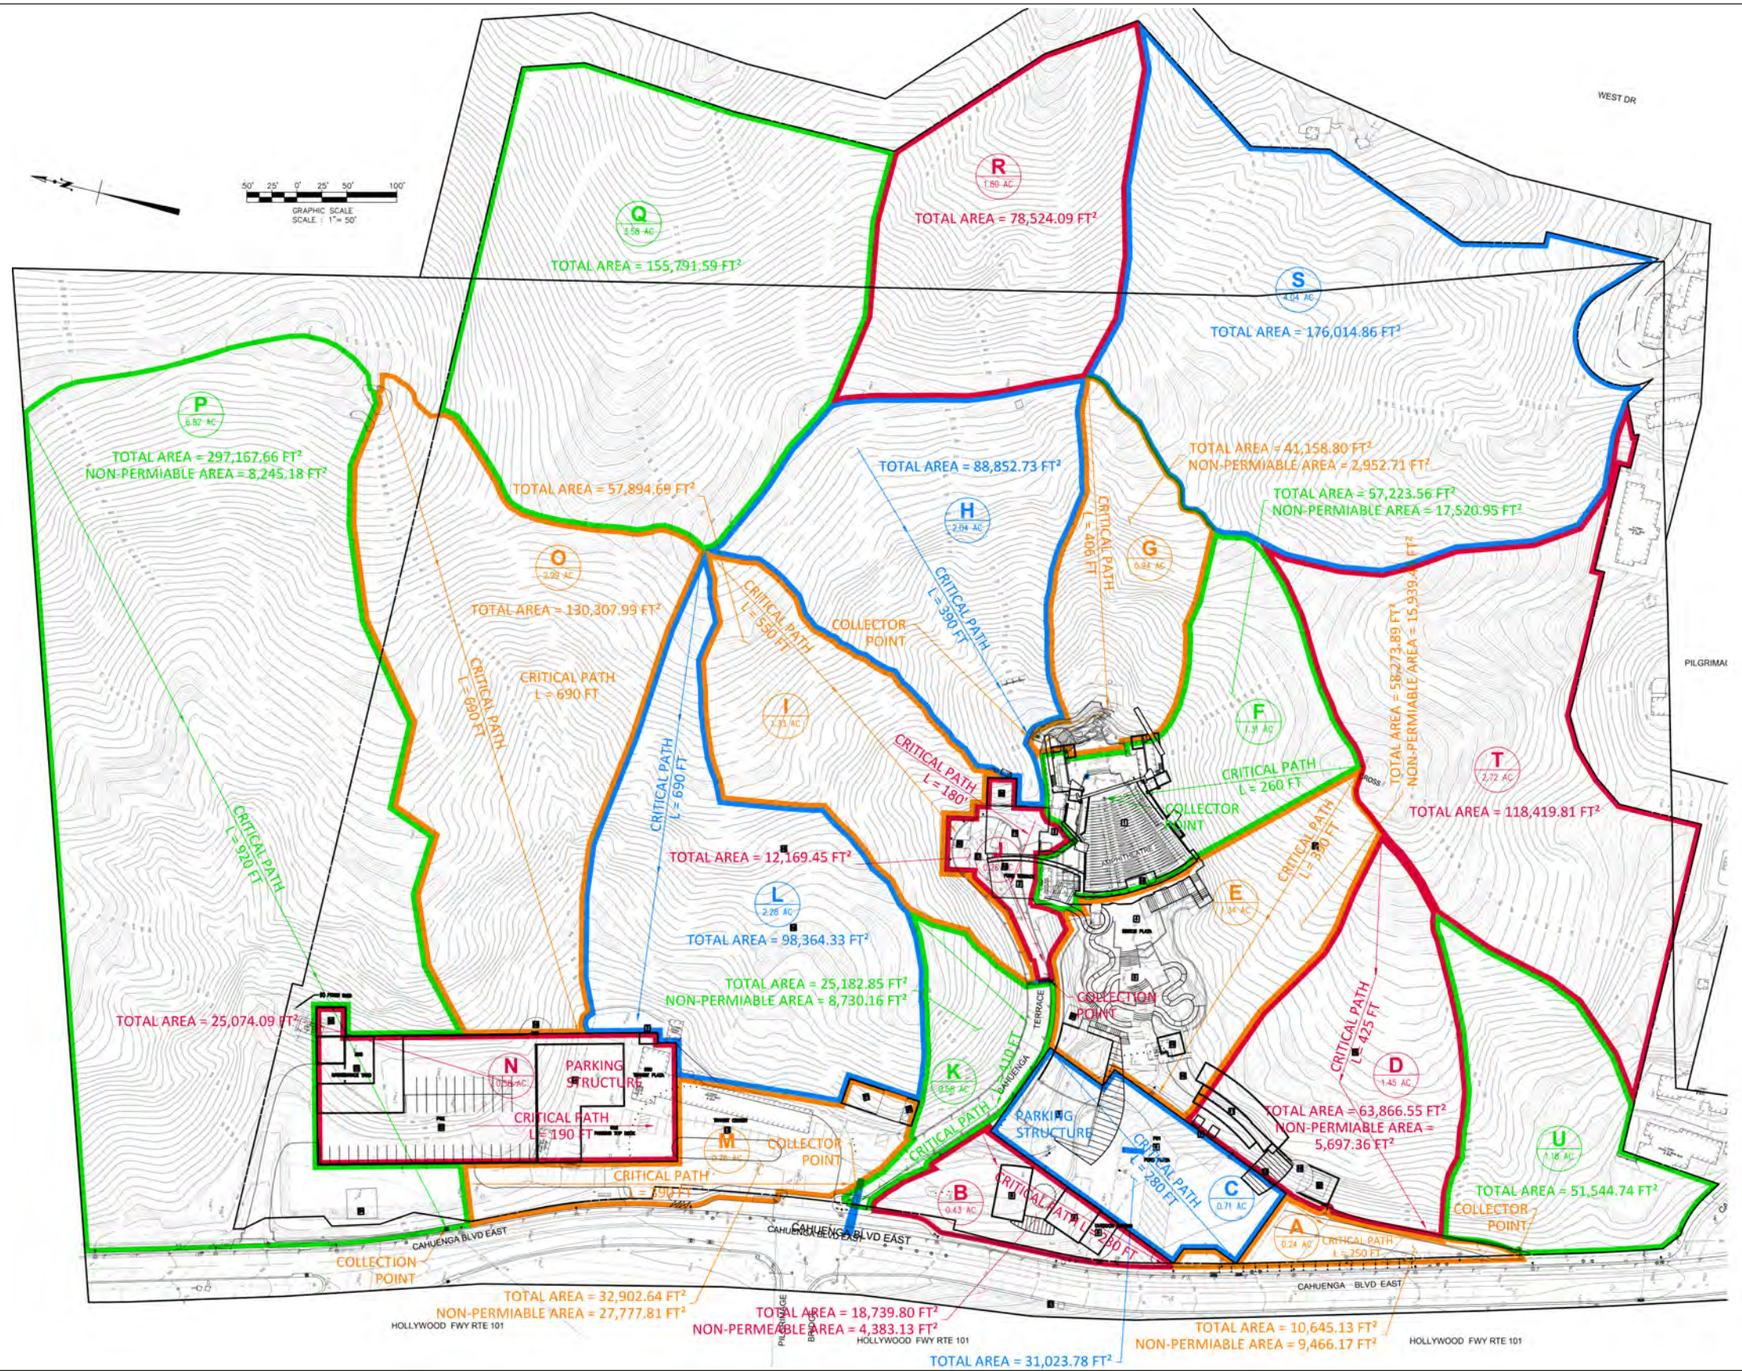

Figure IV.G-6
Proposed Project Site Hydrology

Source: Levin & Associates Architects and Mollenhauer Group, 2014.

Cahuenga Boulevard. Tributary subareas Q through U are entirely undeveloped and would remain undeveloped after implementation of the Project. The flow rate for these subareas would remain the same as the existing flow rate for existing tributary subareas J through N with a flow rate of 43.6 cfs. As summarized in Table IV.G-1 on page IV.G-26, with Project development, the total flow rate for the Project Site would increase from 119.92 cfs to 123.44 cfs and the total collected volume would increase from 381,586 cf to 392,476 cf. Although the runoff volume would increase as a result of an increase in impervious area, in accordance with NPDES and County requirements as set forth in Project Design Feature G-2 above, a Low Impact Development Plan would be prepared and implemented for the Project that would specify BMPs to promote bioretention or other functions to detain water onsite to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County Department of Public Works. Therefore, with compliance with regulatory requirements, the Project would not substantially alter the existing drainage pattern of the site or area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site, and would not create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, or require the construction of new stormwater drainage facilities. As such, operation of the Project would result in a less-than-significant impact on surface water hydrology.

(b) Surface Water Quality

As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. As previously described, as part of the NPDES and County requirements, a Low Impact Development Plan would be prepared for the Project which would outline the stormwater treatment measures or post-construction BMPs required to control pollutants of concern associated with storm events up to the 0.75-inch precipitation level. BMPs would include source control and treatment control BMPs to remove pollutants from stormwater discharges. As described above, the Project Site currently does not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces. Therefore, implementation of BMPs to capture and naturally filter stormwater from the Project Site would result in an improvement in surface water quality runoff from the Project Site compared to existing conditions. Therefore, with compliance with NPDES and County requirements which would require the implementation of BMPs that would serve to improve runoff from the Project Site, operation of the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality. Thus, operational impacts on surface water quality would be less than significant.

Table IV.G-1
Comparison of Tributary Acreage and Runoff—Existing and Proposed

	Tributary Acreage[a]	Flow Rate[b] (cfs)	Volume[c] (cf)
Existing	37.90	119.92	381,586
Proposed	37.89	123.44	392,476
Net Effect	(>1%)	2.9%	2.9%

[a] *Acreage changes are due to grading.*

[b] *The calculated flow rate is the amount of flow that occurs, spread across the site, during a 50-year storm event*

[c] *The calculated volume is the amount of runoff that is collected from all tributary areas during a 50-year storm event*

Source: Mollenhauer, 2014.

(c) Groundwater

The percolation of precipitation that falls on pervious surfaces is variable, dependent upon the soil type, condition of the soil, vegetative cover, and other factors. Implementation of the Project would include both the addition and removal of impervious surfaces throughout the Project Site boundary. Currently, the Project Site is approximately 11 percent impervious surfaces and 89 percent pervious surfaces. As described above, implementation of the Project would increase impervious surfaces to approximately 13 percent. However, as discussed in the Hydrology and Water Quality Report, the soils underlying the Project Site are not conducive to infiltration as they are underlain by bedrock. Notwithstanding, no water supply wells are located within the Project Site or within 1 mile of the Project Site and, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater does not occur within the Project Site. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. As such, operation of the Project would not result in significant impacts to groundwater.

4. Cumulative Impacts

a. Surface Water Hydrology and Water Quality

The geographic context for the cumulative impact analysis on surface water hydrology and water quality is the Santa Monica Bay Watershed. The Project in conjunction with the cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) through 2020 would cumulatively increase stormwater runoff flows and could possibly increase the amount of pollutants potentially resulting in cumulative impacts to surface water hydrology and water quality. However, as with the Project, cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) would be subject to NPDES and local requirements, including implementation of SWPPPs, SUSMPs, and Low Impact Development Plans with appropriate BMPs to manage stormwater runoff and water quality during construction and operation. Furthermore, the local jurisdiction would review each future development project on a case-by-case basis to ensure sufficient local and regional drainage capacity is available to accommodate stormwater runoff. Therefore, with compliance with applicable laws, rules and regulations, cumulative impacts on surface water hydrology and water quality would be less than significant.

b. Groundwater

Cumulative groundwater hydrology impacts could result from the overall use of groundwater basins located in proximity to the Project Site and the related projects. In addition, interruptions to existing injection or supply wells or designated spreading grounds would have the potential to affect groundwater levels. As described above, no water supply wells, spreading grounds, or injection wells are located within a 1-mile radius of the Project Site. In addition, Project development would not involve the temporary or permanent extraction of groundwater from the Project Site or otherwise use the groundwater. Furthermore, while implementation of the Project would result in an increase in impervious surface area, per County requirements, the Project would implement BMPs to capture the first flush or first 0.75 inch of rainfall for any storm event and offset the potential reduction in percolation resulting from Project development. However, development of the related projects could result in changes in impervious surface area within their respective project sites which would decrease the potential for groundwater recharge. As the related projects are located in a highly urbanized area, any reduction in groundwater recharge due to the overall net change in impervious area within the related project sites would be minimal in the context of the regional groundwater basin. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated, as defined in the California Code of

Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. As with the Project, the related projects would be unlikely to cause or increase groundwater contamination because compliance with existing statutes and regulations would similarly prevent the related projects from affecting or expanding any potential areas affected by contamination, or increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated. Therefore, cumulative impacts to groundwater would be less than significant.

5. Mitigation Measures

The Project would result in less than significant impacts to surface water hydrology, water quality, and groundwater during construction and operation. No mitigation measures would be required.

6. Conclusion

Impacts to surface water hydrology, water quality, and groundwater would be less than significant.

IV. Environmental Impact Analysis
H. Land Use and Planning

1. Introduction

This section addresses the consistency of the Project with local and regional land use plans and policies. As described throughout this Draft EIR, while the Project Site is located within the City of Los Angeles (City), the Ford Theatres are owned and operated by the County of Los Angeles (County). Accordingly, development of the Project Site is governed by the County General Plan and the Los Angeles County Code. Notwithstanding, in accordance with City consultation procedures, a consistency analysis with relevant policies of the City General Plan is also provided herein.

2. Environmental Setting

a. Regulatory Framework

(1) County of Los Angeles

(a) County of Los Angeles General Plan

The County General Plan was approved by the Los Angeles County Board of Supervisors in November 1980. The County General Plan contains a number of elements that address specific issues and establish various goals, policies, and objectives that pertain to the County as a whole. These General Plan elements, several of which were updated or amended between 1987 and 2008, guide the County's land use policies. The County is in the process of updating its General Plan, and a Draft General Plan, which focuses on the unincorporated areas of the County and does not include the Project Site, has been issued. The following adopted General Plan elements are applicable to the Project: General Goals and Policies; Conservation and Open Space; Land Use; Transportation; Water and Waste Management; and Safety. Each of these General Plan elements are described below. The policies within each of these elements that are applicable to the Project are listed in Table IV.H-1 on page IV.H-15 in the analysis of impacts below.

The General Goals and Policies Chapter of the County General Plan outlines broad goals and policies applicable on a County-wide level.

The Conservation and Open Space Element sets policy direction for the open space-related resources in the County. These resources include land and water areas devoted to recreation, scenic beauty, conservation, and the use of natural resources. To protect areas of significant natural resources, the Conservation and Open Space Element recommends the retention of non-urban or open space areas. The Conservation and Open Space Element also has goals to protect sites of historical, archaeological, scenic, and scientific value.

The Land Use Element sets forth policies for the general location, distribution, and intensity of land use. The Land Use Element serves as a tool for coordinating future development within both the private and public sectors. The Land Use Element also reinforces General Plan policies for conserving natural and ecological resources and protecting County residents from natural hazards through careful management of development in sensitive areas.

The Transportation Element of the County General Plan sets forth policies for the continued development of a comprehensive transportation system for Los Angeles County. The Transportation Element concurs with the policy positions of the Los Angeles County Metropolitan Transit Authority (Metro) and the Southern California Association of Governments (SCAG) on the need for the continued development and construction of a comprehensive public transportation system. The Transportation Element also reflects the location of existing and future transit corridors. Key features of the Transportation Element are the Transportation Plan, Highway Plan, and Bikeway Plan, as well as the associated Transportation Policy Map and the Highway Policy Map. These policy maps depict the existing transportation system and identify needed additions and improvements, in accordance with the General Plan's growth and development policies.

The Water and Waste Management Element addresses water resources and their availability and identifies standards and guidelines for their distribution and conservation. The Water and Waste Management Element also addresses solid waste management, landfill operation, and recycling opportunities critical to the County, as well as issues relating to flood control, aquifer replenishment, sewerage, and water reclamation systems.

The Safety Element represents the long-range emergency response plan for the County and addresses the protection of people from unreasonable risks associated with natural disasters. It seeks to reduce future loss of life, injuries, and socioeconomic disruption from other safety issues, including the management of hazardous materials. The Safety Element addresses the following issues: seismic hazards, geologic hazards, wildland and urban fires, management of hazardous materials, emergency response resources, and safety-oriented research.

(b) Los Angeles County Code

The Los Angeles County Planning and Zoning Code (Chapter 22 of the Los Angeles County Code) regulates development of unincorporated areas of the County through land use designations and development standards regarding allowable uses, density, height, and design. Although the Project Site is located within the City of Los Angeles, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements and compliance with City land use and zoning designations would not be required, as discussed further below.

(c) Los Angeles County Hillside Requirements

A variety of hillside requirements apply throughout Los Angeles County. Within the adopted General Plan, Appendix A of the Land Use Element provides Hillside Management/Performance Review procedures for non-residential development projects in hillside areas. The review process is intended to ensure site suitability, public safety, and resource protection, and protect scenic and open lands. Among the uses permitted in hillside areas are industrial, limited commercial, and "certain research, development, and product testing facilities requiring the seclusion afforded by hillside terrain," as well as various agricultural, mineral extraction, and utility uses.

(2) City of Los Angeles

(a) City of Los Angeles General Plan

The City General Plan is a policy document originally adopted in 1974 that serves as a comprehensive, long-term plan for future development. The City General Plan sets forth goals, objectives and programs to guide land use policies and to meet the existing and future needs of the community. The City General Plan consists of a series of documents which includes the seven State-mandated elements: Land Use, Transportation, Noise, Safety, Housing, Open Space, and Conservation. In addition, the City's General Plan includes elements addressing Air Quality, Historic Preservation and Cultural Resources, Infrastructure Systems, Public Facilities and Services, and the Citywide General Plan Framework Element. The Land Use Element comprises 35 local area plans known as Community Plans that guide land use at the local level. The Project Site is located within the boundaries of the Hollywood Community Plan area.

The City General Plan Elements relevant to the Project include: General Plan Framework; Land Use (Hollywood Community Plan); Conservation; and Open Space. A brief description of each of these elements is provided below. In addition, a list of relevant policies from the relevant elements of the City General Plan and a consistency analysis of

the Project with these policies is provided in Table IV.H-2 on page IV.H-26 in the impact analysis below.

(i) Los Angeles General Plan Framework Element

The City of Los Angeles General Plan Framework Element (General Plan Framework), adopted in December 1996 and readopted in August 2001, sets forth general guidance regarding land use issues for the entire City and defines Citywide policies. The policies are organized by chapters that address land use, housing, urban form and neighborhood design, open space and conservation, economic development, transportation, and infrastructure and public services.

(ii) Hollywood Community Plan and Update

The Project Site is located within the Hollywood Community Plan area. Adopted on December 13, 1988, the specific purpose of the Community Plan is to promote an arrangement of land use, circulation, and services that encourages and contributes to the economic, social and physical health, safety, welfare, and convenience of the Hollywood Community within the larger framework of the City. In addition, the Community Plan serves to guide the development, betterment, and change of the community to meet existing and anticipated needs and conditions, as well as to balance growth and stability, reflect economic potentials and limits, land development and other trends, and to protect investment to the extent reasonable and feasible. The Hollywood Community Plan designates the Project Site for Public Facilities.

An update to the Hollywood Community Plan (Community Plan Update) was adopted by the City Council on June 19, 2012 (Ordinance No. 182,173). The Community Plan Update includes General Plan land use designation amendments and zone and height district changes for the Community Plan area that went into effect on August 6, 2012. The Community Plan Update did not result in any changes to the zoning or land use designations on the Project Site. The Project Site continues to be designated for Public Facilities by the Community Plan Update. However, the Community Plan Update, and its environmental review process, was subsequently challenged in court. The Los Angeles Superior Court issued a tentative decision to rescind the Community Plan Update and further court action is anticipated. In the interim, the City has revived the Hollywood Community Plan and the zoning ordinances that existed immediately prior to adoption of the Community Plan Update.

The Community Plan Update was developed to set a new direction for the future of Hollywood.[1] A wide range of planning topics, including land use and housing, parks and open space, urban design, mobility, arts and culture, and history, are addressed. In particular, the Community Plan Update is intended to focus growth and promote mixed-use development around transit hubs, reinforce Hollywood's role as a media and entertainment employment center, provide for mobility options, establish new lower height limits, protect hillsides from over-development, promote streetscape plans and implement new street standards, expand Historic Preservation Districts, regulate the scale and design of development, establish urban design guidelines, fund a nexus study to establish trip fees and finance regional mobility improvements, and promote pedestrian-oriented design overlays.[2] The Community Plan Update also contains an Urban Design Guidelines chapter, which includes policies that establish baseline design guidelines for Hollywood. The goal of the Urban Design Guidelines is to guide the physical development of the Community Plan area effectively in order to enhance the experience of all individuals who live, work, or visit in the area.

(iii) Conservation Element

The Conservation Element primarily addresses preservation, conservation, protection, and enhancement of the City's natural resources, including agricultural lands; animal keeping uses, nurseries, and crop gardens; endangered species; equine areas; protection from erosion; fisheries; forests; habitat areas; mineral resources; fossil fuels; and water. The Conservation Element also has goals to protect sites of cultural, historical, archaeological, paleontological, and scenic value.

(iv) Open Space Element

The Open Space Element provides goals, objectives, and policies for the preservation of open space resources in the City. These resources include open space which is free of structures and buildings and/or is natural in character and provides opportunities for recreation and education; preserves scenic, cultural or historic values; conserves or preserves natural resources or ecologically important areas; provides or preserves lands for managed production of natural resources; protects or provides for the public health and safety; enhances the economic base of the City; preserves or creates community scale and identity; and buffers or defines activity areas.

(b) Los Angeles Municipal Code

Chapter 1 of the City of Los Angeles Municipal Code contains the City's Planning and Zoning Code. The Planning and Zoning Code sets forth development standards and regulations for the City's designated land use zones. As set forth in the LAMC, the Project Site is zoned [Q]PF-1XL-H (Qualified Public Facilities, Height District 1XL, Hillside Area). In accordance with the LAMC, uses permitted within the PF zone include farming and nurseries, public parking facilities, fire stations and police stations, government buildings, structures, offices and service facilities including maintenance yards, public libraries, post offices, public health facilities, and public elementary and secondary schools. Buildings or structures within Height District 1XL may not exceed two stories nor shall the highest point of the roof of any building or structure exceed 30 feet in height.

(c) Mulholland Scenic Parkway Specific Plan

The Mulholland Scenic Parkway Specific Plan was adopted on May 13, 1992, as part of the City's General Plan in order to protect the views and natural character of Mulholland Drive along the crest of the Santa Monica Mountains. A buffer area including and paralleling much of Mulholland Drive has been designated as the Mulholland Scenic Parkway. The Mulholland Scenic Parkway Specific Plan prescribes numerous special regulations that address site use, building design, and construction procedures for all projects located within the Mulholland Scenic Parkway. The Specific Plan designates a 500-foot buffer from the right-of-way along both sides of Mulholland Drive as the Inner Corridor of the Specific Plan area. The area extending 0.5 miles from the Mulholland Drive right-of-way, excluding the Inner Corridor, is designated as the Outer Corridor of the Specific Plan area. The Specific Plan also designates an Institutional Use Corridor (within the Inner Corridor), which provides for uses such as schools, churches, and accessory buildings.[3] A portion of the Project Site lies within the Outer Corridor of the Specific Plan. The Specific Plan specifies a height limit of 40 feet for buildings located within the Outer Corridor. The Specific Plan also sets forth grading provisions and environmental protection measures regarding prominent ridges, streams, parklands, oak trees, and archaeological and paleontological resources. However, as previously noted, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements and compliance with City land use provisions is not required.

[3] *The Institutional Use Corridor extends from the centerline of Corda Drive on the west to the centerline of Roscomare Road on the east, excluding the San Diego Freeway.*

(3) Regional

Regional land use plans that govern the Project Site and surrounding area include the Southern California Association of Governments' (SCAG) 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012–2035 RTP/SCS), Growth Vision Report, and Regional Comprehensive Plan (RCP); the Los Angeles County Congestion Management Program, administered by the Los Angeles County Metropolitan Transportation Authority (Metro), which regulates regional traffic issues; and the South Coast Air Quality Management District's (SCAQMD) Air Quality Management Plan (AQMP), which addresses attainment of State and federal ambient air quality standards throughout the South Coast Air Basin (Basin).

(a) SCAG Regional Transportation Plan/Sustainable Communities Strategy

SCAG is the federally designated metropolitan planning organization for six Southern California counties, including the County of Los Angeles. SCAG is mandated to create plans for transportation, growth management, hazardous waste management, and air quality. On April 4, 2012, the SCAG Regional Council adopted the 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, the mission of which is "leadership, vision and progress which promote economic growth, personal well-being, and livable communities for all Southern Californians."[4] In contrast to previous versions of the RTP, the new plan places a greater emphasis on sustainability and integrated planning and identifies mobility, economy, and sustainability as the three principles most critical to the future of the region. As part of this new approach, the 2012–2035 RTP/SCS establishes commitments to: reduce emissions from transportation sources in order to comply with Senate Bill (SB) 375; improve public health; and meet the National Ambient Air Quality Standards. Accordingly, within its 2012–2035 RTP/SCS, SCAG has identified regional goals that reflect a balanced approach to transportation planning and decision-making. These goals are intended to link the issue of mobility with the promotion of economic development, protection of the environment, reductions in energy consumption, the creation of transportation-friendly development patterns, and encouragement of fair and equitable access to residents affected by socio-economic, geographic and commercial limitations. In support of these goals, the 2012–2035 RTP/SCS establishes High-Quality Transit Areas, which are described as generally walkable transit villages or corridors that are within one half-mile of a well-serviced transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours.[5] Local jurisdictions are encouraged to focus housing and employment growth within High-Quality Transit Areas. While the Project

---

[4] *SCAG 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, p. viii, available at http://rtpscs.scag.ca.gov/Pages/2012-2035-RTP-SCS.aspx, accessed April 29, 2014.*

[5] *Ibid, p. 114.*

Site itself is not located within a High-Quality Transit Area, the Hollywood Freeway and other nearby areas are within a High-Quality Transit Area.[6] Nonetheless, several of the regional goals and guiding policies established in the 2012–2035 RTP/SCS are applicable to the Project, as discussed in Table IV.H-3 on page IV.H-36 in the impact analysis below.

(b) SCAG Growth Vision Report

In an effort to maintain the region's prosperity, continue to expand its economy, house its residents affordably, and protect its environmental setting as a whole, SCAG has collaborated with interdependent sub-regions, counties, cities, communities, and neighborhoods in a process referred to by SCAG as Southern California Compass, which resulted in the development of a shared Compass Growth Vision for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. SCAG began Compass in 2002, spearheaded by the Growth Visioning Subcommittee, which consists of civic leaders from throughout the region. The shared regional vision sought to address issues such as congestion and housing availability, which may threaten the region's livability.

The underlying goal of the growth visioning effort is to make the SCAG region a better place to live, work, and play for all residents regardless of race, ethnicity or income. To organize the strategies for improving the quality of life in the SCAG region, a series of principles was established by the Growth Vision Subcommittee. These goals are contained in the Growth Vision Report. The four principles are intended to promote and maximize regional mobility, livability, prosperity and sustainability. Decisions regarding growth, transportation, land use, and economic development should support and be guided by these principles. Specific policy and planning strategies also are provided as a way to achieve each of the principles. The Project's consistency with applicable goals of the Growth Vision is provided in Table IV.H-3 on page IV.H-36 in the impact analysis below.

(c) SCAG Regional Comprehensive Plan

SCAG has also prepared and issued the 2008 Regional Comprehensive Plan in response to SCAG's Regional Council directive in the 2002 Strategic Plan to define solutions to interrelated housing, traffic, water, air quality, and other regional challenges.[7] The Regional Comprehensive Plan is an advisory document that describes future conditions if current trends continue, defines a vision for a healthier region, and recommends an Action Plan with a target year of 2035. The Regional Comprehensive Plan may be voluntarily used by local jurisdictions in developing local plans and addressing local

---

[6] *Ibid, Exhibit 4.9: High-Quality Transit Areas (HQTA) SCAG Region, p. 136.*

[7] *SCAG, 2008 Regional Comprehensive Plan, www.scag.ca.gov/rcp/pdf/finalrcp/f2008RCP_ExecSum.pdf, accessed April 29, 2014.*

issues of regional significance. The plan incorporates principles and goals of the Compass Blueprint Growth Vision and includes nine chapters addressing land use and housing, transportation, air quality, energy, open space, water, solid waste, economy, and security and emergency preparedness. The action plans contained in the Regional Comprehensive Plan provide a series of recommended near-term policies that developers and key stakeholders should consider for implementation, as well as potential policies for consideration by local jurisdictions and agencies when conducting project review.

The 2008 Regional Comprehensive Plan replaced the SCAG's 1996 Regional Comprehensive Plan and Guide for use in SCAG's Intergovernmental Review process. SCAG's Community, Economic and Human Development Committee and the Regional Council took action to accept the Regional Comprehensive Plan, which now serves as an advisory document for local governments in the SCAG region for their information and voluntary use in developing local plans and addressing local issues of regional significance. However, as indicated by SCAG, because of its advisory nature, the Regional Comprehensive Plan is not used in SCAG's Intergovernmental Review process. Rather, SCAG reviews new regional projects based on consistency with the 2012–2035 RTP/SCS and Compass Growth Vision.[8]

The Project's consistency with applicable goals and policies of the RCP is analyzed in Table IV.H-4 on page IV.H-40 in the impact analysis below.

(d) SCAQMD Air Quality Management Plan

The SCAQMD was established in 1977 pursuant to the Lewis-Presley Air Quality Management Act. The SCAQMD is responsible for bringing air quality in the South Coast Air Basin into conformity with federal and State air pollution standards. The SCAQMD is also responsible for monitoring ambient air pollution levels throughout the Basin and for developing and implementing attainment strategies to ensure that future emissions will be within federal and State standards. The 2012 Air Quality Management Plan incorporates the latest scientific and technological information and planning assumptions, including SCAG's 2012–2035 RTP/SCS and updated emission inventory methodologies for various source categories. The 2012 Air Quality Management Plan also includes the new and changing federal requirements, implementation of new technology measures, and the continued development of economically sound, flexible compliance approaches. The Air Quality Management Plan provides policies and measures to guide responsible agencies in

[8] *Prior to publication of the 2008 Regional Transportation Plan, projects considered to be regionally significant based on the SCAG criteria were required to provide an analysis of consistency with the 1996 Regional Comprehensive Plan and Guide goals and policies. However, SCAG now considers the Regional Comprehensive Plan and Guide superseded by the 2012–2035 RTP/SCS.*

achieving federal standards for healthful air quality in the Air Basin and incorporates a comprehensive strategy aimed at controlling pollution from all sources. Further discussion of the Air Quality Management Plan can be found in Section IV.B, Air Quality, of this Draft EIR.

(e) Metro Congestion Management Program

The Los Angeles County Metropolitan Transportation Authority administers the Congestion Management Program, a State-mandated program designed to provide comprehensive long-range traffic planning on a regional basis. Adopted by the Metro Board on October 28, 2010, the 2010 Congestion Management Program includes a hierarchy of highways and roadways with minimum level of service standards, transit standards, a trip reduction and travel demand management element, a program to analyze the impacts of local land use decisions on the regional transportation system, a seven-year capital improvement program, and a County-wide computer model used to evaluate traffic congestion and recommend relief strategies and actions. The Congestion Management Program guidelines call for evaluation of designated roadway intersections to which a project could add 50 or more trips during either the A.M. or P.M. peak hour. The guidelines also require evaluation of freeway segments to which a project could add 150 or more trips in each direction during peak hours. Refer to Section IV.K, Traffic, Access, and Parking, of this Draft EIR for further discussion regarding the Congestion Management Program.

b. Existing Conditions

(1) Project Site

As provided in Section II, Project Description, of this Draft EIR, the approximately 32-acre Project Site currently includes the open-air 1,196-seat Amphitheatre with support spaces (i.e., dressing rooms, performer restrooms, green room) below; an 860-square-foot projection booth and control room located above and to the rear of the Amphitheatre seating; an indoor venue located below the Amphitheatre providing approximately 87 seats referred to as [Inside] the Ford; a two-story, approximately 320-square-foot concessions building; a 365-square-foot box office; a plaza referred to as Edison Plaza and a picnic area; surface parking areas; and a former 10,500-square-foot motel building currently used as staff offices for the Ford Theatre Foundation, Los Angeles County Arts Commission, and the Los Angeles Philharmonic.

The Project Site also includes one cell tower and associated structures along the northwest portion of the Project Site and an additional cell tower along the northwestern property boundary. Other facility support spaces, such as storage and maintenance areas and restrooms, are also located throughout the Project Site. The existing buildings on the Project Site comprise a total of approximately 35,811 square feet, while the outdoor plaza

areas comprise approximately 3,580 square feet. Overall, approximately 3.5 acres of the 32-acre Project Site comprises developed area, including the existing structures described above and asphalt-paved surface parking areas. The remaining areas (approximately 28.5 acres) are comprised of undeveloped open space. Landscaping is provided along driveways, surface parking areas, and pedestrian pathways. Additionally, while there are no designated hiking trails within the Project Site, there are existing user-created trails in the hills behind the Amphitheatre and around a cross that is not part of Project Site. These user-created trails are not recognized as official trails.

The topography of the Project Site is widely varied from moderately sloping surface parking areas along the western portion of the Project Site to steep hillsides that are vegetated primarily with chaparral and scattered trees along the northern, southern, and eastern portions of the Project Site. Based on the varying topography of the Project Site, the buildings and structures within the Project Site similarly feature varying heights ranging from approximately 15 feet from adjacent grade (approximately 547 feet above sea level) to approximately 62 feet from adjacent grade (approximately 574 feet above sea level).

The Ford Theatres currently hosts approximately 184 events, including 84 events within the Amphitheatre from May through October and approximately 100 events within the [Inside] the Ford from November through April. Approximately 50,640 people attend events within the Amphitheatre during the May through October event season and approximately 4,000 people attend events within the November through April event season for a total event season attendance of approximately 54,640 people. During the event season, the hours of operation for the Ford Theatres are from 8:00 A.M. to 11:00 P.M., Monday through Sunday. During events, approximately 350 to 380 stacked parking spaces are available within the Project Site. Parking is also available at the Universal City/Studio City Metro Red Line Station where a shuttle is provided to and from the Ford Theatres. The Hollywood Bowl also utilizes the existing parking facilities at the Ford Theatres during non-event days or during low-attendance events at the Ford Theatres.

In September 2013, the County of Los Angeles Chief Executive Office prepared a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the restoration and rehabilitation of portions of the existing Amphitheatre. These improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. Of the improvements proposed, the removal of the exterior paint to provide water-resistant surfaces is currently underway.

(2) Surrounding Area

As shown in the aerial photograph provided in Figure II-X in Section II, Project Description, of this Draft EIR, the area surrounding the Project Site includes a mix of residential uses and open space. The Project Site is specifically bounded by 4-story multi-family residential buildings and open space associated with the Hollywood Reservoir to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The uses surrounding the Project Site to the north, east, and south are separated from the developed areas of the Project Site by open space areas and steep intervening ridgelines, with no direct line of sight to or from the developed areas of the Project Site. The Hollywood Bowl, also a County-owned historically significant cultural destination, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.

3. Environmental Impacts

a. Methodology

The analysis of potential land use impacts considers the consistency of the Project with adopted plans, policies, and ordinances that regulate land use on the Project Site. The determination of consistency with relevant land use policies and ordinances is based upon a review of the previously identified planning documents that regulate land use or guide land use decisions pertaining to the Project Site. CEQA Guidelines, Title 14 California Code of Regulations (CEQA Guidelines) Section 15125(d) requires an EIR to discuss inconsistencies with applicable plans and evaluate whether a project is inconsistent with such plans. Projects are considered consistent with General Plan provisions and general SCAG policies if they are compatible with the general intent of the plans and would not preclude the attainment of their primary goals.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts associated with land use and planning would be significant if the Project would:

- Physically divide an established community;
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or

- Conflict with any applicable habitat conservation plan or natural community conservation plan.

As discussed in the Initial Study prepared for the Project, provided in Appendix A of this Draft EIR, implementation of the Project would not physically divide an established community. Specifically, as described above, the residential uses surrounding the Project Site to the north, east, and south are separated from the developed areas of the Project Site by open space areas and steep intervening ridgelines, with no direct line of sight to or from the developed areas of the Project Site. As illustrated in the conceptual site plans provided in Section II, Project Description, of this Draft EIR, the Project would develop new structures and landscaping that would be primarily concentrated along the northwest and southwest portions of the Project Site, within areas of the Project Site that are primarily developed. As such, with implementation of the Project, the uses surrounding the Project Site to the north, east, and south would continue to be separated from the developed areas of the Project Site by open space areas and steep intervening ridgelines. In addition, the proposed hiking trail would be a continuation of the Project Site's natural, open space areas and, as shown in the conceptual site plans provided in Section II, Project Description, of this Draft EIR, would also be separated from the surrounding uses by intervening open space. Furthermore, all proposed development would occur within the boundaries of the Project Site as it currently exists and would not physically alter surrounding parcels or properties. The Project would also not physically divide an established community by creating new streets or by blocking or changing the existing street grid pattern. The Project has been designed to contain vehicle and shuttle queuing within the Project Site and expand on-site parking to better accommodate parking demand. As also discussed in the Initial Study, according to the California Department of Fish and Wildlife California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the Project Site. Thus, the Project would not conflict with the provisions of an adopted habitat conservation plan or natural community conservation plan. As such, no further analysis of these issues is necessary.

c. Project Design Features

A complete description of the Project and associated development characteristics is provided in Section II, Project Description, of this Draft EIR. No specific project design features beyond the project improvements discussed in Section II, Project Description, of this Draft EIR are proposed with regard to land use.

d. Analysis of Project Impacts

(1) Consistency with Local Plans and Applicable Policies

(a) County of Los Angeles General Plan

General Plan goals and policies that are applicable to the Project and an analysis of the Project's consistency with these policies are provided in Table IV.H-1 on page IV.H-15.

As detailed in Table IV.H-1, the Project would support policies of the County's General Plan, General Goals and Policies Chapter regarding the preservation of open space areas and cultural resources, encouraging cultural and social diversity, and environmental sustainability. Specifically, by rehabilitating the existing Amphitheatre and providing additional performing arts facilities and restaurant and recreational uses, the Project would continue the County's mission to operate the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. In addition, as the proposed improvements would be integrated within the topography of the Project Site and grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site, the Project Site would continue to comprise mostly undeveloped open space upon implementation of the Project. Specifically, with Project implementation, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space. Further, the Project is designed to complement the existing historic character of the Ford Theatres and would not involve the removal of any primary character-defining features of the Ford Theatres. Project development would also involve the use of renewable and recyclable construction materials and, with implementation of the Project, on-site recycling would be enhanced.

The Project would also support various policies of the Conservation and Open Space Element by incorporating a variety of sustainability features, including LEED Certification, and maximizing the preservation of the Project Site's existing open space areas, thus maintaining the natural and scenic character of the area. In addition, as the Project Site currently does not have structural BMPs for the filtration and treatment of stormwater runoff, implementation of the BMPs proposed as part of the Project would result in an improvement in surface water quality runoff from the Project Site, thereby preserving water quality. The Project would further coordinate with the County and City Fire Departments and implement recommended guidelines regarding wildland fire prevention. Additionally, the Project would support policies regarding the establishment of recreational opportunities within the County's open space areas by providing a hiking trail within the Project Site.

Table IV.H-1
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
General Goals and Policies	
Policy 4: Encourage cultural and social diversity and the preservation of the cultural heritage of Los Angeles County.	**Consistent.** As described in Section II, Project Description, of this Draft EIR, the mission of the Los Angeles County Arts Commission is to operate the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. The Ford Theatre Foundation, in partnership with the Los Angeles County Arts Commission and the Department of Parks and Recreation, supports programs that nurture artists, arts organizations and community, providing a gateway for the people of greater Los Angeles to discover and appreciate cultures of their region and the world.
Policy 9: Direct urban development and revitalization efforts to protect natural and man-made amenities and to avoid severe hazard areas, such as flood prone areas, active fault zones, steep hillsides, landslide areas and fire hazard areas.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings within the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space. The Project would also incorporate measures to address the Project Site's location within a landslide hazard area, liquefaction susceptibility zone, and a fire hazard zone in accordance with existing regulatory requirements.
Policy 10: Protect areas that have significant natural resources and scenic values, including significant ecological areas, the coastal zone and prime agricultural lands.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings within the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Policy 11: Protect cultural heritage resources.	**Consistent.** The Project is designed to complement the existing historic character of the Ford Theatres and to be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings. In addition, as discussed in Section IV.E, Cultural Resources, of this Draft EIR, the Project would not involve the removal of any primary character-defining features of the historic Amphitheatre. Further, in the event archaeological and paleontological resources are discovered, work in the area would cease and deposits would be treated in accordance with regulatory requirements.
Policy 13: Conserve the available supply of	**Consistent.** As discussed in Section IV.G, Hydrology and

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
water and protect water quality.	Water Quality, of this Draft EIR, implementation of the Storm Water Pollution Prevention Plan (SWPPP), Low Impact Development Plan, and associated best management practices (BMPs) would reduce or eliminate the discharge of potential pollutants from stormwater runoff to the maximum extent practicable during the construction and operation phases of the Project. In addition, as discussed in Section IV.L.1, Utilities and Service Systems—Water, of this Draft EIR, the Project will implement a variety of water conservation features to reduce the Project's water demand.
Policy 14: Restore and protect air quality through the control of industrial and vehicular emissions, improved land use management, energy conservation and transportation planning.	**Consistent.** As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, development of the Project would implement project design features that would reduce vehicular trips, reduce vehicle miles traveled, and encourage use of alternative modes of transportation, including the continued use of shuttles to and from the Universal City/Studio City Metro Red Line Station. The Project Site is also conveniently located adjacent to a Metro bus stop and a major thoroughfare, Cahuenga Boulevard, and the Hollywood Freeway, thereby reducing vehicle miles traveled and associated vehicular emissions. The Project would also minimize regional air quality impacts from new development by conserving energy through the use of highly efficient electric and HVAC equipment (housed in the proposed central plant) and introducing building design and construction that achieve LEED Certification for the proposed buildings.
Policy 15: Promote more effective recycling and reuse of resources, especially those that are nonrenewable.	**Consistent.** Project development would involve the use of renewable and recyclable construction materials. In addition, with implementation of the Project, on-site recycling would be enhanced.
Policy 16: Stress the development of community parks particularly in areas of the greatest deficiency, and take advantage of opportunities to preserve large natural and scenic areas.	**Consistent.** Refer to General Goals and Policies, Policy 9 above.
Policy 29: Encourage the development of ethnic community theme centers that would preserve and enhance cultural diversity.	**Consistent.** Refer to General Goals and Policies, Policy 4 above.
Policy 37: Promote the preservation and enhancement of landmarks, sites, and areas of cultural, historical, archaeological and urban design significance.	**Consistent.** Refer to General Goals and Policies, Policy 4 and Policy 11 above.
Policy 38: Protect and enhance the visual uniqueness of natural edges and encourage	**Consistent.** As discussed above, the Project would preserve the Project Site's natural elements by integrating new

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
superior design of major entryways.	buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. The Project would also enhance the main entryway to the Ford Theatres by relocating the existing primary Ford Theatres sign along Cahuenga Boulevard East to the main entryway at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance.
Conservation and Open Space Element	
Policy 1: Actively support strict air quality regulations for mobile and stationary sources, and continued research to improve air quality. Promote vanpooling and improved public transportation.	**Consistent.** The Project would support air quality regulations by reducing emissions to the maximum extent practicable. The Project would also promote the use of alternative modes of transportation.
Policy 2: Support the conservation of energy and encourage the development and utilization of new energy sources including geothermal, thermal waste, solar, wind and ocean-related sources.	**Consistent.** The Project would incorporate a variety of sustainability features that would reduce energy usage. Such features would include introducing a sustainable building design and construction that achieve LEED Certification for the new buildings. The Project would also incorporate relevant sustainability features set forth in the County's Green Building, Low Impact Development, and Drought-Tolerant Landscaping ordinances.
Policy 4: Protect groundwater recharge and watershed areas, conserve storm and reclaimed water, and promote water conservation programs.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, the soils underlying the Project Site are not conducive to infiltration as they are underlain by bedrock. Notwithstanding, surface water infiltration would be promoted within the Project Site through a variety of BMPs, including the installation of catch basins and planter drains. The Project will also implement a variety of water conservation features to reduce the Project's water demand, including use of high-efficiency toilets, high-efficiency urinals or waterless urinals, and low-flow restroom faucets. In addition, the Project would incorporate drought-tolerant landscaping.
Policy 5: Encourage the maintenance, management and improvement of the quality of imported domestic water, groundwater supplies, natural runoff and ocean water.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater of this Draft EIR, implementation of the SWPPP, Low Impact Development Plan, and associated BMPs would reduce or eliminate the discharge of potential pollutants from stormwater runoff to the maximum extent practicable during the construction and operation phases of the Project. More specifically, implementation of the BMPs would ensure the quality of stormwater runoff leaving the

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
	Project Site would meet all regulatory standards.
Policy 13: Encourage open space easements and dedications as a means of meeting scenic, recreational, and conservation needs.	**Consistent.** While the Project would not include an open space easement, the Project would establish a natural, public hiking trail to enhance passive recreational opportunities within the Project Site and experience the natural landscape and views of surrounding iconic landmarks. In addition, the Project has been intentionally designed to minimize building footprints to maximize the preservation of the open space areas of the Project Site, and upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Policy 16: Substantially retain the integrity and natural grade elevations of significant natural ridgelines and prominent landforms that form the Valley's skyline backdrop.	**Consistent.** Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Ford Theatres. No designated significant ridgelines are identified within the Project Site. Also, upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Policy 17: Protect cultural heritage resources, including historical, archaeological, paleontological and geological sites, and significant architectural structures.	**Consistent.** Refer to General Goals and Policies, Policy 11 above.
Policy 21: Restrict urban development in areas subject to seismic and geologic hazards.	**Consistent.** As discussed in Section IV.F, Geology and Soils, of this Draft EIR, the Project Site does not contain any known active faults and is not within an Alquist-Priolo Earthquake Fault Zone. In addition, the Project would be designed and constructed in accordance with California and Los Angeles County Building Code requirements, as well as the project design features and recommendations set forth in the Geotechnical Report to address other potential geologic hazards within the Project Site including liquefaction and landslides.
Policy 22: Restrict urban development in flood prone areas, and thus avoid major new flood control works. Maintain natural watershed processes by regulating development in tributary watersheds. Minimize increased runoff, erosion, and siltation of streambeds that would limit the uses of streams and water bodies for recreation and other beneficial water-related uses.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, the Project Site is not within a flood hazard area. Furthermore, in accordance with National Pollutant Discharge Elimination System (NPDES) permit requirements, the Project would have a Low Impact Development Plan in place during the operational life of the Project. The Low Impact Development Plan would include BMPs to promote bioretention or other functions to detain water onsite that would serve to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
	Department of Public Works.
Policy 24: Manage development in hillside areas to protect their natural and scenic character and to reduce risks from fire, flood, mudslides, erosion, and landslides.	**Consistent.** With respect to the protection of the natural and scenic character of the Project Site, see General Goals and Policies, Policy 9 above. With respect to reducing erosion, see Conservation and Open Space Policy 22 above. To reduce risks from fire, a Fuel Modification Plan would be implemented, as detailed in Section IV.J.1, Public Services—Fire Protection. All plantings would be in accordance with the County's Fuel Modification Plan Guidelines. Appropriate Fire Department access would also be provided throughout the Project Site during both construction and operation. Additionally, the Project would comply with the County Fire Department's adopted programs directed at wildland fire prevention. In addition, as described in Section IV.F, Geology and Soils, of this Draft EIR, the Project would include slope reinforcement measures such as the removal of loose slope materials and installation of retaining walls and flexible barriers to manage potential landslides.
Policy 27: Provide low intensity outdoor recreation in areas of scenic and ecological value compatible with protection of these natural resources.	**Consistent.** Refer to Conservation and Open Space, Policy 13 above.
Policy 30: Develop a system of bikeways, scenic highways, and riding and hiking trails; link recreational facilities where possible.	**Consistent.** Refer to Conservation and Open Space, Policy 13 above.
Land Use Element	
Objective 1: To foster compatible land use arrangements that contribute to reduced energy consumption and improved air quality.	**Consistent.** Refer to General Goals and Policies, Policy 14 above.
Policy 7: Assure that new development is compatible with the natural and manmade environment by implementing appropriate locational controls and high quality design standards.	**Consistent.** As described in Section II, Project Description, of this Draft EIR, the proposed improvements would be designed to complement the existing historic character of the Ford Theatres and to be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings. The Project would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity by avoiding any substantial adverse change in the significance of an historic resource. New buildings would also be integrated with the topography of the Project Site. In addition, a variety of native and drought-tolerant plant material would be used to enhance and complement the existing plant material on the hillside.

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
Policy 8: Protect the character of residential neighborhoods by preventing the intrusion of incompatible uses that would cause environmental degradation such as excessive noise, noxious fumes, glare, shadowing, and traffic.	**Consistent.** With Project implementation, off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space. As discussed in this Draft EIR, Project operations would have little impact in terms of noise or light spillover onto off-site areas. Similarly, all traffic impacts would be less than significant. For further discussion refer to Section IV.I, Noise; Section IV.B, Air Quality; Section IV.A, Aesthetics, Views, Light, and Glare; and Section IV.K, Traffic, Access and Parking, of this Draft EIR.
Policy 14: Establish and implement regulatory controls that ensure compatibility of development adjacent to or within major public open space and recreation areas including National Forests, the National Recreation Area, and State and regional parks.	**Consistent.** Refer to General Goals and Policies, Policy 9 and Land Use Policy 7 above.
Policy 20: Establish land use controls that afford effective protection for significant ecological and habitat resources, and lands of major scenic value.	**Consistent.** Refer to General Goals and Policies, Policy 9 above.
Policy 24: Promote compatible land use arrangements that reduce reliance on the private automobile in order to minimize related social, economic and environmental costs.	**Consistent.** Refer to General Goals and Policies, Policy 14, above.
Policy 25: Promote land use arrangements that will maximize energy conservation.	**Consistent.** Refer to Conservation and Open Space Policy 2 above.
Policy 27: Provide a land use mix at the countywide, areawide and community levels based on projected need and supported by evaluation of social, economic and environmental impacts.	**Consistent.** The Project would include a mix of uses within the Project Site, including additional performing arts and rehearsal spaces that would be supported by office and restaurant uses. The Project would also expand recreational opportunities within the Project Site by providing a hiking trail. Implementation of the Project would meet existing critical program needs of the regional arts ecosystem and would provide additional passive recreational opportunities within the region. With the proposed improvements, the County would further support the work of County artists and arts organizations and would expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community. In addition, as evaluated throughout this Draft EIR, implementation of the Project would not result in impacts which would be significant and unavoidable.
Policy 28: Ensure continuing opportunity for	**Consistent.** As part of the environmental review process, a

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
citizen involvement in the land-use decision making process.	public Scoping Meeting was held regarding the Project on February 18, 2014 in order to solicit public input regarding the Project and its potential impacts. This Draft EIR is being circulated for a 45-day public review and comment period as mandated by CEQA (State CEQA Guidelines Section 15105). During the public review period, written comments concerning the adequacy of the document may be submitted by interested public agencies and members of the public to the County of Los Angeles.
Policy 29: Improve the land use decision-making process by closely monitoring and evaluating the cumulative impacts of individual projects and by modernizing development regulations.	**Consistent.** The cumulative impacts of the Project combined with 27 related projects, or known development projects that are either proposed, approved, or under construction in the vicinity of the Project Site, are analyzed within each of the environmental impact sections throughout this Draft EIR.
Transportation Element	
Policy 19: Support traffic-operation improvements for improved flow of vehicles.	**Consistent.** The Project proposes a new signal at the southern driveway that would provide egress from the south parking structure to allow for safer left turns from the driveway to Cahuenga Boulevard East. In addition, to facilitate access and circulation within the proposed Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The northernmost driveway, which is currently used primarily for egress at the end of events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from the north parking structure. The proposed driveway between the northernmost driveway and the main entrance would provide right-turn only egress from the Transit Center and the parking structure.
Policy 20: Encourage greater use of public transit to special-purpose centers and recreational facilities.	**Consistent.** With implementation of the Project, use of public transit would be encouraged by continuing to promote parking at the Universal City/Studio City Metro Red Line Station where a shuttle would continue to be provided to and from the Ford Theatres during evening events.
Policy 22: Avoid or minimize the adverse impacts upon people, businesses and communities caused by development of transportation facilities.	**Consistent.** As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, appropriate project design features would be implemented to reduce traffic impacts to a less than significant level.
Policy 26: Encourage the efficient use and conservation of energy used in transportation.	**Consistent.** As discussed in Section IV.K, Traffic, Access, and Parking, the Project would include a number of project design features designed to encourage efficiency and conservation, including the provision of information on transportation alternatives in event-related marketing/media

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
	information and managing the use of all parking spaces onsite to maximize parking efficiency and avoid underutilization of parking spaces. In addition, the Project would include an on-site circulation system design that reduces vehicle idling and queuing.
Policy 30: Provide transportation facilities that will improve the safety, security and dependability of all transportation modes, provide for seismic safety and be effective in emergency situations.	**Consistent.** Included in the Project are vehicular circulation and queuing improvements, including a Transit Center that would provide on-site queuing for vehicles and shuttles. In addition, at the driveway providing egress from the south parking structure, the Project proposes a new signal to allow for safer left turns from the driveway to Cahuenga Boulevard East. As part of the Project, on-site pedestrian circulation would also be improved by eliminating the pedestrian-vehicular conflicts associated with stacked parking within the existing surface parking areas.
Water and Waste Management Element	
Policy 8: Promote solid waste technology, including source reduction, to reduce dependence on sanitary landfills.	**Consistent.** Refer to General Goals and Policies, Policy 15 above.
Policy 13: Program water and sewer service extensions to be consistent with General Plan policies and to mitigate situations that pose immediate health and safety hazards.	**Consistent.** The proposed off-site water and sewer line improvements would meet all applicable regulatory requirements set forth by the County and the City.
Policy 17: Protect public health and prevent pollution of groundwater through the use of whatever alternative is necessary.	**Consistent.** Refer to Conservation and Open Space Policy 5, above.
Policy 18: Provide protection for groundwater recharge areas to ensure water quality and quantity.	**Consistent.** Refer to Conservation and Open Space Policy 4 and Policy 5, above.
Policy 19: Avoid or mitigate threats to pollution of the ocean, drainage ways, lakes, and groundwater reserves.	**Consistent.** Refer to Conservation and Open Space Policy 5, above.
Policy 22: Design water and waste management systems which enhance the appearance of the neighborhoods in which they are located and minimize negative environmental impacts.	**Consistent.** The proposed off-site utility improvements would be located within existing road rights-of-way where conditions are either developed or disturbed by paved streets and/or existing development. Other than limited aboveground infrastructure such as a booster pump, the utility improvements would involve underground pipelines that would not be visible following installation and repaving of the roadways.
Policy 23: Facilitate the recycling of wastes such as metal, glass, paper, and textiles.	**Consistent.** As part of the Project, readily accessible areas around the Project Site for the deposit, storage, and collection of non-hazardous materials for recycling would be provided.

Table IV.H-1 (Continued)
Project Consistency with the Los Angeles County General Plan

Goal/Objective/Policy	Analysis of Project Consistency
Policy 25: Encourage development and application of water conservation, including recovery and reuse of storm and waste water.	**Consistent.** See Conservation and Open Space Policy 4, above.
Safety Element	
Policy 17: Continue efforts to reduce all fire hazards, with special emphasis on reducing hazards associated with older buildings, multistory structures, and fire-prone industrial facilities; and maintain an adequate fire prevention capability in all areas.	**Consistent.** Refer to Conservation and Open Space Policy 24, above.
Policy 18: Expand and improve vegetation management efforts in wildland fire hazard areas.	**Consistent.** Refer to Conservation and Open Space Policy 24, above.
Policy 19: Promote improved watershed management practices to reduce the risk of damaging runoff and debris movement into urban areas.	**Consistent.** Refer to Conservation and Open Space Policy 22, above.
Policy 21: Promote the safe transportation of hazardous materials.	**Consistent.** As discussed in the Initial Study prepared for the Project, included as Appendix A of this Draft EIR, all potentially hazardous materials would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations.
Policy 25: Promote greater public awareness and understanding of safety hazards and emergency preparedness and response procedures.	**Consistent.** In accordance with regulatory requirements, the Applicant would submit to the County and City Fire Departments, as applicable, an emergency response and/or evacuation plan, as appropriate, for operation of the Project. The emergency response plan could include, but not be limited to, the following: mapping of evacuation routes for vehicles and pedestrians, and the location of the nearest hospital and fire departments.
Policy 26: Promote the development of community/neighborhood and workplace self-help and disaster relief groups to improve the effectiveness of local emergency response, light search and rescue, and emergency medical care.	**Consistent.** Refer to Safety Policy 25, above.
Source: Los Angeles County General Plan, November 1980; Matrix Environmental, 2014.	

With regards to the Land Use Element, the Project would support compatibility with the existing development of the Project Site and the preservation of surrounding uses and

open space. Specifically, the proposed improvements would be designed to complement the existing historic character of the Ford Theatres and would be compatible with the massing, size, scale, and architectural features of the existing Amphitheatre, thereby protecting its historic integrity. Also, as previously described, new buildings would be integrated within the topography of the Project Site, primarily within already developed areas, thereby maximizing the preservation of the open space areas of the Project Site. In addition, with implementation of the Project, off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space.

The Project would further support policies of the Transportation Element. In particular, the Project would provide a new traffic signal to allow for safer left turns from the southern (egress) driveway to Cahuenga Boulevard East; provide one new driveway between the northernmost driveway and the main entrance to facilitate access and circulation with the proposed Transit Center; and reconfigure the northernmost driveway to provide vehicles with direct access to the proposed maintenance facility and allow egress from the north parking structure, thereby improving the flow of vehicles within and adjacent to the Project Site. The Project would also encourage use of public transit by continuing to promote parking at the Universal City/Studio City Metro Red Line Station where a shuttle would continue to be provided to and from the Ford Theatres during evening events.

Additionally, with the implementation of the sustainability features proposed as part of the Project, including design features to achieve LEED Certification, and the provision of necessary utility improvements, the Project would support applicable policies of the Water and Waste Management Element.

The Project would also support policies of the Safety Element. Specifically, the Project would coordinate with the County and City Fire Departments and implement recommended guidelines regarding wildland fire prevention to reduce fire hazards. In addition, the County would coordinate with the County and City Fire Departments to develop an emergency response and/or evacuation plan, as appropriate. Further, as described in the Geotechnical Report provided in Appendix H of this Draft EIR, the Project would include improvements to prevent potential damage resulting from runoff and debris movement from hillside areas.

Overall, as summarized above and detailed in Table IV.H-1 on page IV.H-15, the Project would be generally consistent with the intent and applicable policies of the County General Plan.

(b) Los Angeles County Code

The Los Angeles County Planning and Zoning Code regulates development of unincorporated areas of the County through land use designations and development standards regarding allowable uses, density, height, and design. As the Project Site is not located within an unincorporated area of the County, land use and zoning designations have not been established by the County for the Project Site. However, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements. The Project Site is located within the City of Los Angeles and is zoned per the City of Los Angeles Municipal Code. While not required, a discussion of the City of Los Angeles Municipal Code, as it relates to the Project Site, is provided below.

(c) City of Los Angeles General Plan

As previously described, development of the Project Site is governed by the County General Plan and the Los Angeles County Code. Notwithstanding, in accordance with City consultation procedures, a consistency analysis with relevant policies of the City General Plan is provided herein. City General Plan goals and policies that are relevant to the Project and an analysis of the Project's consistency with these policies are provided in Table IV.H-2 on page IV.H-26.

As described in Table IV.H-2, with the creation of a 0.75-mile hiking trail within the Project Site, the Project would support policies of the General Plan Framework Land Use Chapter regarding the establishment of new open space opportunities to serve the needs of existing and future residents. In addition, as off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Land Use Chapter regarding preservation of and compatibility with the scale and character of the City's residential neighborhoods. The Project would further promote and enhance pedestrian activity through the creation of 45,000 square feet of plaza areas that could be used as picnic and community space.

The Project would also be consistent with the relevant objectives and policies of the General Plan Framework's Urban Form and Neighborhood Design Chapter. Specifically, the Project would contribute to the development and improvement of community facilities by providing new and enhanced performing arts facilities and a hiking trail, which would serve to meet the performing arts and recreational needs at a City- and County-wide level. The Project would also incorporate various elements to promote individual and community safety including coordinating with the County of Los Angeles Sheriff's Department and the Los Angeles Police Department, as appropriate, regarding crime prevention features to be

Table IV.H-2
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
General Plan Framework	
Land Use Chapter	
Policy 3.1.3: Identify areas for the establishment of new open space opportunities to serve the needs of existing and future residents. These opportunities may include a citywide linear network of parklands and trails, neighborhood parks, and urban open spaces.	**Consistent.** The Project would establish a natural, public hiking trail to enhance passive recreational opportunities within the Project Site and create an opportunity to experience the natural landscape and views of surrounding iconic landmarks. In addition, the Project has been intentionally designed to minimize building footprints to maximize the preservation of the open space areas of the Project Site, and upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Objective 3.3: Accommodate projected population and employment growth within the City and each community plan area and plan for the provision of adequate supporting transportation and utility infrastructure and public services.	**Consistent.** The Project Site is located in an urbanized portion of the City on a site that is currently developed. As such, the Project would be served by the existing utility and transportation infrastructure currently serving the on-site uses, with upgrades and extensions as necessary. In addition, the Project would be served by existing fire and police stations.
Goal 3B: Preservation of the City's stable single-family residential neighborhoods. **Objective 3.5:** Ensure that the character and scale of stable single-family residential neighborhoods is maintained, allowing for infill development provided that it is compatible with and maintains the scale and character of existing development.	**Consistent.** With Project implementation, off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space.
Goal 3L: Districts that promote pedestrian activity and provide a quality experience for the City's residents. **Objective 3.16:** Accommodate land uses, locate and design buildings, and implement streetscape amenities that enhance pedestrian activity.	**Consistent.** Within the Ford Plaza, the Project would provide a plaza deck that would serve as the primary gathering space for the Ford Theatres. The plaza deck would create approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides. In addition, landscaping proposed along Cahuenga Boulevard East would berm up to cover the exposed areas of the parking structure, thereby bringing the park-like setting of the Ford Theatres to the Cahuenga Boulevard East street edge. The various components of the Project would also be connected via pedestrian walkways throughout the Project Site.
Urban Form and Neighborhood Design Chapter	
Objective 5.4: Encourage the development of community facilities and improvements that are based on need within the centers and reinforce or define those centers and the neighborhoods they	**Consistent.** The Project would contribute to the development and improvement of community facilities through the development of new performing arts facilities and a hiking trail that would serve to meet

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
serve.	performing arts and recreational needs on a City- and County-wide basis.
Policy 5.8.4: Encourage that signage be designed to be integrated with the architectural character of the buildings and convey a visually attractive character.	**Consistent.** Project signage would include various identity signs including a central identity sign. The identity signs may include the existing Ford Theatres sign along Cahuenga Boulevard East, which would be relocated to the main entrance at Cahuenga Boulevard East and Pilgrimage Bridge. Alternatively, a new marquee sign that would be double-sided with LED screens on both sides could be provided along Cahuenga Boulevard East at the main entrance. The Project would also include internally illuminated graphic signs along the façades of the new theatre, the north parking structure, and the restaurant. In addition, a large sign identifying the Ford Theatres would be placed along the proposed sound wall. This sign is anticipated to be illuminated. Monitors that would be used for a variety of purposes such as publicizing events, promoting the available food services, assisting in wayfinding, and for broadcasting sold-out events may also be provided in the plaza areas and other public spaces throughout the Project Site. The Project would also include interpretive signage along the proposed hiking trail and throughout the Project Site to provide information about the history of the Ford Theatres, Ford programs and local flora and fauna. Wayfinding signs would also be located throughout the Project Site, including at parking structure entrances and elevators. As such, the signage proposed would be designed to be integrated with the architecture of the buildings and would be compatible with the character of the surrounding uses.
Objective 5.9: Encourage proper design and effective use of the built environment to help increase personal safety at all times of the day. **Policy 5.9.1:** Facilitate observation and natural surveillance through improved development standards which provide for common areas, adequate lighting, clear definition of outdoor spaces, attractive fencing, use of landscaping as a natural barrier, secure storage areas, good visual connections between residential, commercial, or public environments and grouping activity functions such as child care or recreation areas.	**Consistent.** Per consultation with the County of Los Angeles Sheriff's Department and Los Angeles Police Department, the Project would incorporate various elements to promote individual and community safety as set forth in the project design features included in Section IV.J.2, Public Services—Police Protection, of this Draft EIR. Such features could include surveillance cameras, adequate lighting within parking areas, and signage.
Open Space and Conservation Chapter	
Objective 6.1: Protect the City's natural settings from the encroachment of urban development,	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region.	the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Objective 6.2: Maximize the use of the City's existing open space network and recreation facilities by enhancing those facilities and providing connections, particularly from targeted growth areas, to the existing regional and community open space system.	**Consistent.** Refer to General Plan Framework Policy 3.1.3 above.
Objective 6.3: Ensure that open space is managed to minimize environmental risks to the public.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, the Project Site is not within a flood hazard area. In addition, as described in Section IV.F, Geology and Soils, of this Draft EIR, the Project would be designed and constructed in accordance with California and Los Angeles County Building Code requirements, as well as the project design features and recommendations set forth in the Geotechnical Report to address potential geologic hazards within the Project Site including liquefaction and landslides. Further, to reduce risks from fire, a Fuel Modification Plan would be implemented, as detailed in Section IV.J.1, Public Services—Fire Protection, of this Draft EIR. Appropriate Fire Department access would also be provided throughout the Project site during both construction and operation. Additionally, the Project would comply with the County Fire Department's adopted programs directed at wildland fire prevention.
Policy 6.3.1: Preserve flood plains, landslide areas, and steep terrain areas as open space, wherever possible, to minimize the risk to public safety.	**Consistent.** As discussed in Section IV.G, Hydrology and Water Quality, of this Draft EIR, the Project Site is not within a flood hazard area. In addition, the majority of the open space areas designated within a landslide hazard area would remain as open space with implementation of the Project.
Policy 6.4.1: Encourage and seek to provide for usable open space and recreational facilities that are distributed throughout the City.	**Consistent.** Refer to General Plan Framework Policy 3.1.3 above.
Policy 6.4.8: Maximize the use of existing public open space resources at the neighborhood scale and seek new opportunities for private development to enhance the open space resources of the neighborhoods.	**Consistent.** Refer to General Plan Framework Policy 3.1.3 above.

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
b. Encourage the improvement of open space, both on public and private property, as opportunities arise. Such places may include the dedication of "unbuildable" areas or sites that may serve as green space, or pathways and connections that may be improved to serve as neighborhood landscape and recreation amenities.	
Infrastructure and Public Services Chapter	
Policy 9.3.1: Reduce the amount of hazardous substances and the total amount of flow entering the wastewater system.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, implementation of the SWPPP, Low Impact Development Plan, and associated BMPs would reduce or eliminate the discharge of potential pollutants from stormwater runoff to the maximum extent practicable during the construction and operation phases of the Project. In addition, in accordance with County NPDES permit requirements, the Project would be required to have a Low Impact Development Plan in place during the operational life of the Project. The Low Impact Development Plan would include BMPs to promote bioretention or other functions to detain water onsite that would serve to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County Department of Public Works.
Goal 9B: A stormwater management program that minimizes flood hazards and protects water quality by employing watershed-based approaches that balance environmental, economic and engineering considerations.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, the Project Site is not within a flood hazard area. As previously described, implementation of the SWPPP, Low Impact Development Plan, and associated BMPs would reduce or eliminate the discharge of potential pollutants from stormwater runoff to the maximum extent practicable during the construction and operation phases of the Project.
Objective 9.6: Pursue effective and efficient approaches to reducing stormwater runoff and protecting water quality.	**Consistent.** Refer to General Plan Framework Policy 9.3.1, above.
Policy 9.9.8: Design projects located in hillside areas so as to maintain the City's ability to suppress wildfires.	**Consistent.** To reduce risks from fire, a Fuel Modification Plan would be implemented, as detailed in Section IV.J.1, Public Services—Fire Protection, of this Draft EIR. All plantings would be in accordance with the County's Fuel Modification Plan Guidelines. Appropriate Fire Department access would also be provided throughout the Project Site during both construction and

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
	operation. Additionally, the Project would comply with the County Fire Department's adopted programs directed at wildland fire prevention.
GOAL 9P: Appropriate lighting required to (1) provide for nighttime vision, visibility, and safety needs on streets, sidewalks, parking lots, transportation, recreation, security, ornamental, and other outdoor locations; (2) provide appropriate and desirable regulation of architectural and informational lighting such as building facade lighting or advertising lighting; and (3) protect and preserve the nighttime environment, views, driver visibility, and otherwise minimize or prevent light pollution, light trespass, and glare.	**Consistent.** The Project would feature illuminated building façades on the north parking structure, the new theatre, the restaurant, and the proposed sound wall. In addition, the Project would include exterior lighting along vehicular and pedestrian pathways and at the upper level of the north parking structure for security and wayfinding purposes. Accent lighting to highlight architectural features, landscape elements, and the Project's signage would also be incorporated. The Project would also include lighting throughout the plaza areas. Further, the Project would include new theatrical lighting within the Amphitheatre. As discussed in Section IV.A, Aesthetics, Views, Light, and Glare, of this Draft EIR, in accordance with Project Design Feature A-3 included therein, Project lighting, where applicable, would incorporate shielding and aiming to prevent glare and light spill and the upward emition of light and Project lighting would not exceed 2 foot-candles outside of the Project Site boundary. In addition, there are no residential properties or other sensitive uses immediately surrounding the Project Site, and any light emanating from the proposed Project lighting would likely be contained within the Project Site. Also, lighting associated with the proposed theatrical lighting would be consistent with the existing lighting within the Amphitheatre.
Hollywood Community Plan	
Objective 7: To encourage the preservation of open space consistent with property rights when privately owned and to promote the preservation of views, natural, character and topography of mountainous parts of the Community for the enjoyment of both local residents and persons throughout the Los Angeles region.	**Consistent.** Refer to General Plan Framework Objective 6.1 above.
Recreation and Parks	
Policy 3: That existing recreational sites and facilities be upgraded through site improvements, rehabilitation and reuse of sound structures, and replacement of obsolete structures, as funds become available.	**Consistent.** As described in Section II, Project Description, of this Draft EIR, the Project would involve the rehabilitation of portions of the existing Amphitheatre and the development of new facilities and outdoor plaza areas to enhance the existing Ford Theatres.
Conservation Element	
Protect important cultural and historical sites and resources for historical, cultural, research, and	**Consistent.** The Project is designed to complement the existing historic character of the Ford Theatres and to

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
community educational purposes.	be consistent with the Secretary of the Interior Standards for Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings. In addition, as discussed in Section IV.E, Cultural Resources, of this Draft EIR, the Project would not involve the removal of any primary character-defining features of the Ford Theatres. Further, in the event archaeological and paleontological resources are discovered, work in the area would cease and deposits would be treated in accordance with regulatory requirements.
Protect and promote the restoration, to the greatest extent practical, of sensitive plant and animal species and their habitats.	**Consistent.** As discussed in Section IV.D, Biological Resources, of this Draft EIR, a variety of sensitive plant and wildlife species were observed within the Project Site. With implementation of mitigation measures promoting the protection of these species within the Project Site, potential impacts to onsite sensitive plant and wildlife species would be less than significant.
Continue to identify significant habitat areas, corridors and buffers and to take measures to protect, enhance and/or restore them. Continue to protect, restore and/or enhance habitat areas, linkages and corridor segments, to the greatest extent practical, within city owned or managed sites.	**Consistent.** As described in Section IV.D, Biological Resources, of this Draft EIR, there are no regional wildlife movement corridors within or near the Project Site. In addition, the Project Site is not within a designated regional wildlife linkage area. Notwithstanding, Project development would occur primarily within the already developed portions of the Project Site and, upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space. In addition, the proposed trail alignment would utilize some existing user-created informal trails to minimize disturbance of the natural hillsides.
Protect important natural habitats and scenic sites outside the city which are owned by the city or are impacted by city facilities.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Protect and reinforce natural and scenic vistas as irreplaceable resources and for the aesthetic enjoyment of present and future generations.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
	of the 32-acre Project Site would comprise undeveloped open space.
Open Space Element	
To conserve unique natural features, scenic areas, cultural and appropriate historical monuments for the benefit and enjoyment of the public.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Further, as discussed in Section IV.E, Cultural Resources, of this Draft EIR, the Project would not involve the removal of any primary character-defining features of the Ford Theatres. The Project would also be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity by avoiding any substantial adverse change in the significance of an historic resource.
To provide access, where appropriate, to open space lands.	**Consistent.** As part of the Project, an approximately 0.75-mile hiking trail would be provided with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The hours of operation for use of the trail would observe standard park hours of sunrise to sunset. In addition, within the Ford Plaza, the Project would provide a plaza deck that would serve as the primary gathering space for the Ford Theatres. The plaza deck would create approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides.
To emphasize the importance of, and to preserve open space and natural features in private and public development.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space.
Alteration of drainage patterns shall be minimized in the development of any land in mountain areas.	**Consistent.** As discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, since Project development would primarily occur within the areas of the Project Site already disturbed, the Project would not alter drainage patterns within the open space areas of the Project Site.
Cultural and historical monuments located on	**Consistent.** As discussed in Section IV.E, Cultural

Table IV.H-2 (Continued)
Project Consistency with the City of Los Angeles General Plan

Goal/Objective/Policy	Analysis of Project Consistency
open space lands shall be preserved.	Resources, of this Draft EIR, the Project would not involve the removal of any primary character-defining features of the Amphitheatre. The Project would also be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity by avoiding any substantial adverse change in the significance of an historic resource.

Source: City of Los Angeles General Plan; Matrix Environmental, 2014.

incorporated into the design of the Project such as providing proper lighting within the parking structures to reduce areas of concealment and lighting of building entries and pedestrian walkways to provide for pedestrian orientation.

Additionally, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Open Space and Conservation Chapter, which guides the provision, management, and conservation of the City's public open space resources. In particular, with Project implementation, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space. In addition, the Project has been designed to maximize the preservation of the Project Site's natural elements by integrating new buildings within the topography of the Project. Further, as detailed in Section IV.F, Geology and Soils and Section IV.J.1, Public Services—Fire Protection, of this Draft EIR, the Project would include various project design features to reduce potential hazards associated with the Project Site's location, thereby supporting the objective to manage open space to minimize environmental risks to the public.

The Project would also be generally consistent with the relevant goals, objectives, and policies of the General Plan Framework's Infrastructure and Public Services Chapter, which calls for monitoring service demands and forecasting the future need for infrastructure improvements, maintaining an adequate system/service to support the needs of population and employment, and implementing techniques that reduce demands on utility infrastructure or services, where appropriate. As discussed in Section IV.L, Utilities and Service Systems, of this Draft EIR, there would be adequate supplies and infrastructure capacity to serve the water and energy demands of the Project. In addition, as discussed in Section IV.J, Public Services, of this Draft EIR, fire and police protection services and facilities would be able to adequately serve the Project's demand for these services. Further, with the implementation of BMPs such as installation of catch basins

and planter drains throughout the Project Site to collect roof and site runoff, the Project would support the objective to pursue effective and efficient approaches to reducing stormwater runoff and protect water quality.

As previously discussed, the Hollywood Community Plan and Hollywood Community Plan Update designates the Project Site for Public Facilities. Continued use of the Project Site as a public regional park and performing arts center would be consistent with this land use designation. The Project would also be consistent with the general intent of the Hollywood Community Plan and Hollywood Community Plan Update to preserve open space and enhance existing recreational sites. Specifically, as previously described, the Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site and, upon implementation of the Project, the Project Site would comprise mostly undeveloped open space. Further, the Project would involve the rehabilitation of portions of the existing Amphitheatre and the development of new performing arts and recreational facilities and outdoor plaza areas to enhance the existing Ford Theatres.

Lastly, with the preservation of the existing historic character of the Ford Theatres as well as the Project Site's natural elements and undeveloped open space areas, the Project would support the goals, objectives, and policies of the City General Plan Conservation and Open Space Elements to protect cultural and historical sites and scenic areas.

In summary, the Project would be generally consistent with relevant policies of the City General Plan.

(d) Los Angeles Municipal Code

As previously noted, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements and compliance with City land use and zoning designations would not be required. Notwithstanding, with implementation of the Project, the Project Site would continue to be used as a public regional park and performing arts center. As such, the Project would be consistent with the zoning of the Project Site for Public Facilities. In addition, while some of the proposed buildings and structures would exceed 30 feet in height, the Project has been intentionally designed to be compatible with the massing, size, and scale of the existing structures.

(2) Consistency with Regional Plans

(a) SCAG Regional Transportation Plan/Sustainable Communities Strategy and Growth Vision Report

A detailed discussion of the Project's consistency with the applicable goals of SCAG's 2012–2035 RTP/SCS and Growth Vision Report is provided in Table IV.H-3 on page IV.H-36.

As described in Table IV.H-3, the Project would concentrate new development and employment opportunities near the Hollywood Freeway and the Cahuenga Pass transportation corridor, thereby minimizing vehicle trips and vehicle miles traveled. In addition, use of shuttles to transport patrons to and from the Universal City/Studio City Metro Red Line Station and the Ford Theatres during evening events would continue with implementation of the Project. The Project would also incorporate features to support and promote environmental sustainability by including design elements such as drought-tolerant landscapes, best management practices for water management on-site, high efficiency utilities and infrastructure, and continued and enhanced solid waste management policies.

The Project would also be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. Therefore, as demonstrated in Table IV.H-3, the Project would be generally consistent with SCAG's 2012–2035 RTP/SCS.

As provided in Table IV.H-3, the four principles within the Growth Vision Report are intended to promote and maximize regional mobility, livability, prosperity, and sustainability. As detailed in Table IV.H-3, the Project would focus development in an urbanized city within an established roadway network, adjacent to the Hollywood Freeway and the Cahuenga Pass. Furthermore, the Project would support and enhance the continued operation of the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. In addition, with operation of the Ford Theatres, the Ford Theatre Foundation, in partnership with the Los Angeles County Arts Commission and the Department of Parks and Recreation, supports programs that nurture artists, arts organizations and community, providing a gateway for the people of greater Los Angeles to discover and appreciate cultures of their region and the world. As described above, the Project would also incorporate features to support and promote environmental sustainability. Therefore, as demonstrated in Table IV.H-3, the Project would be generally consistent with SCAG's Growth Vision Report.

Table IV.H-3
Project Consistency with Applicable Goals of the Southern California Association of Governments' Regional Transportation Plan/Sustainable Communities Strategy and Compass Growth Vision

Goals and Principles	Project Consistency
Regional Transportation Plan/Sustainable Communities Strategy Goals	
Maximize mobility and accessibility for all people and goods in the region.	**Consistent.** The Project would enhance existing and provide new performing arts facilities and restaurant and recreational uses with convenient regional access via the Cahuenga Pass and the Hollywood Freeway. In addition, use of shuttles to transport patrons to and from the Universal City/Studio City Metro Red Line Station and the Ford Theatres during evening events would continue with implementation of the Project. Further, the Project would include circulation improvements to facilitate mobility and access within the Project Site.
Ensure travel safety and reliability for all people and goods in the region.	**Consistent.** The Project does not include any hazardous design features that could pose safety issues to travelers.
Preserve and ensure a sustainable regional transportation system.	**Consistent.** As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, Project impacts related to the Los Angeles County Congestion Management Plan, which serves as the monitoring and analytical basis for regional transportation funding decisions, would be less than significant.
Maximize the productivity of our transportation system.	**Consistent.** The Project would enhance existing and provide new performing arts facilities and restaurant and recreational uses adjacent to the Cahuenga Pass and the Hollywood Freeway. In addition, use of shuttles to transport patrons to and from the Universal City/Studio City Metro Red Line Station and the Ford Theatres during evening events would continue with implementation of the Project, thus facilitating access and mobility and improving the productivity of the transportation system.
Protect the environment and health of our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking).	**Consistent.** The Project would combine proposed performing arts facilities and restaurant and recreational uses with existing performing arts facilities, which would serve to reduce vehicle trips and vehicle miles travelled, thus contributing to a reduction in air pollutant emissions. The Project would also incorporate a variety of sustainability features that would reduce energy and water usage such as drought-tolerant landscapes, best management practices for water management on-site, and high efficiency utilities and infrastructure.
Encourage land use and growth patterns that facilitate transit and non-motorized transportation.	**Consistent.** The Project would enhance existing and provide new performing arts facilities and restaurant and recreational uses within the existing Ford Theatres, thereby concentrating a variety of uses within one site. In addition, use of shuttles to transport patrons to and

Table IV.H-3 (Continued)
Project Consistency with Applicable Goals of the Southern California Association of Governments' Regional Transportation Plan/Sustainable Communities Strategy and Compass Growth Vision

Goals and Principles	Project Consistency
	from the Universal City/Studio City Metro Red Line Station and the Ford Theatres during evening events would continue with implementation of the Project, thus encouraging use of transit.
Compass Growth Vision Principles	
Principle 1: Improve mobility for all residents	
Encourage transportation investments and land use decisions that are mutually supportive. Encourage transit-oriented development. Promote a variety of travel choices.	**Consistent.** The Project would enhance existing and provide new performing arts facilities and restaurant and recreational uses within the existing Ford Theatres, thereby concentrating a variety of uses within one site and in close proximity to regional access via the Cahuenga Pass and the Hollywood Freeway. In addition, use of shuttles to transport patrons to and from the Universal City/Studio City Metro Red Line Station and the Ford Theatres during evening events would continue with implementation of the Project, thus encouraging use of transit.
Locate new housing near existing jobs and new jobs near existing housing.	**Consistent.** Implementation of the Project would make available additional employment opportunities. Such opportunities would be provided within an existing urbanized area that contains a mix of uses including housing.
Principle 2: Foster livability in all communities	
Promote infill development and redevelopment to revitalize existing communities.	**Consistent.** The Project includes development of new performing arts facilities and restaurant and recreational uses within the existing Ford Theatres. These improvements would enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users.
Promote developments that provide a mix of uses.	**Consistent.** The Project would enhance existing and provide new performing arts facilities and restaurant and recreational uses within the existing Ford Theatres, thereby concentrating a variety of uses within one site
Promote "people scaled," pedestrian-friendly (walkable) communities.	**Consistent.** With Project implementation, on-site pedestrian activity would be improved by providing a plaza deck that would serve as the primary gathering space for the Ford Theatres. The plaza deck would create approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides. On-

Table IV.H-3 (Continued)
Project Consistency with Applicable Goals of the Southern California Association of Governments' Regional Transportation Plan/Sustainable Communities Strategy and Compass Growth Vision

Goals and Principles	Project Consistency
	site pedestrian activity would be further improved by enhancing existing parking operations with two new parking structures that would include pedestrian walkways to and from the parking structures and the various components of the Project. In addition, the Project would include a designated area for shuttles.
Support the preservation of stable, single-family neighborhoods.	**Consistent.** With Project implementation, off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space.
Principle 3: Enable prosperity for all people	
Support educational opportunities that promote balanced growth.	**Consistent.** The Project would support and enhance the continued operation of the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. In addition, with operation of the Ford Theatres, the Ford Theatre Foundation, in partnership with the Los Angeles County Arts Commission and the Department of Parks and Recreation, supports programs that nurture artists, arts organizations and community, providing a gateway for the people of greater Los Angeles to discover and appreciate cultures of their region and the world.
Ensure environmental justice regardless of race, ethnicity or income class.	**Consistent.** No aspect of Project development would result in a disproportionate impact to populations that are related to environmental justice issues.
Encourage civic engagement.	**Consistent.** The County's commitment to civic engagement is embedded in its mission to operate the Ford Theatres as a center that fosters the excellence, diversity, vitality, understanding, appreciation and accessibility of the performing arts in Los Angeles County. In addition, with operation of the Ford Theatres, the Ford Theatre Foundation, in partnership with the Los Angeles County Arts Commission and the Department of Parks and Recreation, supports programs that nurture artists, arts organizations and community, providing a gateway for the people of greater Los Angeles to discover and appreciate cultures of their region and the world. The Project would further the Ford Theatres' mission by providing new performing arts facilities that would be available to diverse communities throughout the region.

Table IV.H-3 (Continued)
Project Consistency with Applicable Goals of the Southern California Association of Governments' Regional Transportation Plan/Sustainable Communities Strategy and Compass Growth Vision

Goals and Principles	Project Consistency
Principle 4: Promote sustainability for future generations	
Preserve rural, agricultural, recreational and environmentally sensitive areas.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space. In addition, as part of the Project, an approximately 0.75-mile hiking trail would be provided with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively.
Focus development in urban centers and existing cities.	**Consistent.** The Project would focus development in an urbanized city.
Develop strategies to accommodate growth that uses resources efficiently, eliminates pollution and significantly reduces waste. Utilize "green" development techniques.	**Consistent.** The Project would incorporate features to support and promote environmental sustainability. Specifically, the new buildings and infrastructure would be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. The Project would also be designed to comply with all applicable state and local codes, including the County's Green Building Ordinance. The Project would feature sustainable design elements such as drought-tolerant landscapes, best management practices for water management on-site, high efficiency utilities and infrastructure, and continued and enhanced solid waste management policies.

Source: Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy and Growth Vision Report; Matrix Environmental, 2014.

(b) Regional Comprehensive Plan

A detailed discussion of the Project's consistency with the applicable goals of the Regional Comprehensive Plan is provided in Table IV.H-4 on page IV.H-40. As shown therein, the Project would be generally consistent with and would help to support the applicable goals and policies of the Regional Comprehensive Plan. In particular, the Project would promote goals of the Regional Comprehensive Plan by providing a mix of uses within one site conveniently situated adjacent to the Cahuenga Pass and the Hollywood Freeway. In addition, the Project would enhance pedestrian accessibility

Table IV.H-4
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
Land Use and Housing	
Goal: Successfully integrate land and transportation planning and achieve land use and housing sustainability by implementing Compass Blueprint and 2% Strategy:[9] • Focusing growth in existing and emerging centers and along major transportation corridors. • Creating significant areas of mixed-use development and walkable, "people-scaled" communities. • Providing new housing opportunities, with building types and locations that respond to the region's changing demographics. • Targeting growth in housing, employment and commercial development within walking distance of existing and planned transit stations. • Injecting new life into under-used areas by creating vibrant new business districts, redeveloping old buildings and building new businesses and housing on vacant lots. • Preserving existing, stable, single-family neighborhoods. • Protecting important open space, environmentally sensitive areas and agricultural lands from development.	**Consistent.** The Project would enhance existing and provide new performing arts facilities and restaurant and recreational uses within the existing Ford Theatres, thereby providing a mix of uses within one site conveniently situated adjacent to the Cahuenga Pass and the Hollywood Freeway. In addition, use of shuttles to transport patrons to and from the Universal City/Studio City Metro Red Line Station and the Ford Theatres during evening events would continue with implementation of the Project. Further, the Project is designed to enhance pedestrian accessibility throughout the Project Site by creating approximately 45,000 square feet of outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides. On-site pedestrian activity would be further improved by enhancing existing parking operations with two new parking structures that would include pedestrian walkways to and from the parking structures and the various components of the Project. The Project would also support the preservation of open space and the existing residential uses by maintaining the undeveloped hillsides, which buffer the surrounding residential uses from the developed areas of the Project Site.
Policy LU-6.2: Developers and local governments should integrate green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program.	**Consistent.** The Project would incorporate features to support and promote environmental sustainability. Specifically, the new buildings and infrastructure would be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. The Project would also be designed to comply with all applicable state and local codes, including the County's Green Building Ordinance. The Project would feature sustainable design elements such as drought-tolerant landscapes, best management practices for water management on-site, high efficiency

[9] *SCAG's 2004 Growth Vision Report identified 2% Strategy Opportunity Areas, which represented areas of the region that were targeted for growth, where projects, plans, and policies consistent with the Compass Blueprint principles would best serve the goals of the Growth Vision. According to SCAG staff, the 2% Strategy Opportunity Areas were superseded by the High-Quality Transit Areas identified in the 2012–2035 RTP/SCS. (Source: telephone communication with Ping Chang, Program Manager at SCAG, September 17, 2013.) The Project Site is not located within a designated High-Quality Transit Area.*

Table IV.H-4 (Continued)
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
	utilities and infrastructure, and continued and enhanced solid waste management policies.
Open Space and Habitat	
Goal: Enhance the region's parks, trails and community open space infrastructure to support the aesthetic, recreational and quality-of-life needs, providing the highest level of service to our growing region by: • Creating new community open space that is interconnected, accessible, equitably distributed, provides public health benefits, and meets the changing and diverse needs of communities; • Improving existing community open space through urban forestry and other programs that provide environmental benefits.	**Consistent.** The Project would preserve the Project Site's natural elements by integrating new buildings with the topography of the Project Site. In addition, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. Upon implementation of the Project, approximately 27.7 acres of the 32-acre Project Site would comprise undeveloped open space. In addition, as part of the Project, an approximately 0.75-mile hiking trail would be provided. The proposed trail would observe standard park hours of sunrise to sunset.
Policy OSC-10: Developers and local governments should promote infill development and redevelopment to revitalize existing communities.	**Consistent.** The Project represents both infill development and redevelopment. The Project includes rehabilitation of the Amphitheatre and the development of new performing arts, restaurant, and recreational uses within the existing Project Site. The proposed improvements would provide additional performing arts and recreational opportunities to the local community and the region.
Policy OSC-11: Developers should incorporate and local governments should include land use principles, such as green building, that use resources efficiently, eliminate pollution and significantly reduce waste into their projects, zoning codes and other implementation mechanisms.	**Consistent.** The new buildings and infrastructure would be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. The Project would also be designed to comply with all applicable state and local codes, including the County's Green Building Ordinance. New construction would feature sustainable design elements such as drought-tolerant landscapes, best management practices for water management on-site, and high efficiency utilities and infrastructures. Construction of the Project would utilize recyclable materials to the extent feasible and, with implementation of the Project, on-site recycling would also be enhanced.
Policy OSC-12: Developers and local governments should promote water-efficient land use and development.	**Consistent.** The Project would implement a variety of water conservation features including, but not limited to, the use of high efficiency irrigation systems, centralized and weather-responsive irrigation controls, water efficient landscaping, and high efficiency plumbing fixtures.

Table IV.H-4 (Continued)
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
Water	
Policy WA-11: Developers and local governments should encourage urban development and land uses to make greater use of existing and upgraded facilities prior to incurring new infrastructure costs.	**Consistent.** As discussed in Section IV.L.1, Utilities and Service Systems—Water, of this Draft EIR, in consultation with the City of Los Angeles Department of Water and Power, it was determined that the existing water infrastructure would not be able to accommodate the Project. As such, as part of the Project, two new connections would be provided to the high pressure water main in Cahuenga Boulevard East.
Policy WA-12: Developers and local governments should reduce exterior uses of water in public areas, and should promote reduced use in private homes and businesses, by shifting to drought-tolerant native landscape plants (xeriscaping), using weather-based irrigation systems, educating other public agencies about water use, and installing related water pricing incentives.	**Consistent.** The Project would implement a variety of water conservation features including, but not limited to, the use of high efficiency irrigation systems, centralized and weather-responsive irrigation controls, water efficient landscaping, and high efficiency plumbing fixtures.
Policy WA-27: Developers and local governments should maximize pervious surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. New impervious surfaces should be minimized to the greatest extent possible, including the use of in-lieu fees and off-site mitigation.	**Consistent.** The Project has been designed to minimize building footprints and maximize the preservation of the open space areas of the Project Site. Accordingly, the Project would result in a minimal increase in impervious surfaces (from 11 percent to 13 percent). In addition, as discussed in Section IV.G, Hydrology, Water Quality, and Groundwater, of this Draft EIR, the Project would implement BMPs to promote biorentention through the use of catch basins and planter drains to detain water onsite.
Policy WA-32: Developers and local governments should pursue water management practices that avoid energy waste and create energy savings/supplies.	**Consistent.** The Project would implement a variety of water conservation features including, but not limited to, the use of high efficiency irrigation systems, centralized and weather-responsive irrigation controls, water efficient landscaping, and high efficiency plumbing fixtures.
Energy	
Policy EN-8: Developers should incorporate and local governments should include the following land use principles that use resources efficiently, eliminate pollution and significantly reduce waste into their projects, zoning codes and other implementation mechanisms: • Mixed-use residential and commercial development that is connected with public transportation and utilizes existing infrastructure. • Land use and planning strategies to increase	**Consistent.** The Project would concentrate new development and employment opportunities with convenient regional access via the Cahuenga Pass and the Hollywood Freeway. In addition, with implementation of the Project, use of transit would be encouraged through the continued operation of shuttles to and from the Universal City/Studio City Metro Red Line Station. Further, the Project would use existing utility infrastructure maintained by the Los Angeles Department of Water and Power, the Southern California Gas Company, and the Los Angeles Department of Public Works.

Table IV.H-4 (Continued)
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
biking and walking trips.	
Policy EN-10: Developers and local governments should integrate green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. Energy saving measures that should be explored for new and remodeled buildings include: • Using energy efficient materials in building design, construction, rehabilitation, and retrofit • Encouraging new development to exceed Title 24 energy efficiency requirements. • Developing Cool Communities measures including tree planting and light-colored roofs. These measures focus on reducing ambient heat, which reduces energy consumption related to air conditioning and other cooling equipment. • Utilizing efficient commercial/residential space and water heaters: This could include the advertisement of existing and/or development of additional incentives for energy efficient appliance purchases to reduce excess energy use and save money. Federal tax incentives are provided online at www.energystar.gov/index.cfm?c=Products.pr_tax_credits. • Encouraging landscaping that requires no additional irrigation: utilizing native, drought-tolerant plants can reduce water usage up to 60 percent compared to traditional lawns. • Encouraging combined heat and power (CHP), also known as cogeneration, in all buildings. • Encouraging neighborhood energy systems, which allow communities to generate their own electricity • Orienting streets and buildings for best solar access. • Encouraging buildings to obtain at least 20 percent of their electric load from renewable energy.	**Consistent.** Green building measures are implemented at the local level via the County's Green Building Ordinance. As previously described, the new buildings and infrastructure would be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. The Project would also be designed to comply with all applicable state and local codes, including the County's Green Building Ordinance and Title 24. The Project would feature sustainable design elements such as drought-tolerant landscapes, best management practices for water management on-site, and high efficiency utilities and infrastructures.

Table IV.H-4 (Continued)
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
Policy EN-11: Developers and local governments should submit projected electricity and natural gas demand calculations to the local electricity or natural gas provider, for any project anticipated to require substantial utility consumption. Any infrastructure improvements necessary for project construction should be completed according to the specifications of the energy provider.	**Consistent.** The LADWP and the Southern California Gas Company were consulted during the preparation of this Draft EIR. The estimated electricity and natural gas demands submitted to LADWP and the Southern California Gas Company are provided in Appendix N of this Draft EIR. All infrastructure improvements necessary for Project construction would be completed in accordance with the specifications of the LADWP and the Southern California Gas Company.
Policy EN-14: Developers and local governments should explore programs to reduce single occupancy vehicle trips such as telecommuting, ridesharing, alternative work schedules, and parking cash-outs.	**Consistent.** As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, development of the Project would implement project design features that would reduce vehicular trips, reduce vehicle miles traveled, and encourage use of alternative modes of transportation, including the continued use of shuttles to and from the Universal City/Studio City Metro Red Line Station. The Project Site is also conveniently located adjacent to a Metro bus stop and a major thoroughfare, Cahuenga Boulevard, and the Hollywood Freeway, thereby reducing vehicle miles traveled and associated vehicular emissions.
Air Quality	
Goal: Reduce emissions of criteria pollutants to attain federal air quality standards by prescribed dates and state ambient air quality standards as soon as practicable.	**Consistent.** As discussed in Section IV.B, Air Quality, of this Draft EIR, Project development would not have a significant long-term impact on the region's ability to meet State and federal air quality standards. The Project would comply with SCAQMD Rule 403 and would be consistent with the goals and policies of the AQMP for the control of fugitive dust.
Goal: Reverse current trends in greenhouse gas emissions to support sustainability goals for energy, water supply, agriculture, and other resource areas.	**Consistent.** The Project would incorporate sustainability design features to reduce vehicle miles traveled and to reduce potential impacts with respect to greenhouse gas emissions such as drought-tolerant landscapes, best management practices for water management on-site, and high efficiency utilities and infrastructures. Implementation of the project design features would result in a net decrease in greenhouse gas emissions that represents a substantial break from "business as usual."
Goal: Minimize land uses that increase the risk of adverse air pollution-related health impacts from exposure to toxic air contaminants, particulates (PM_{10}, $PM_{2.5}$, ultrafine), and carbon monoxide.	**Consistent.** As discussed in Section IV.B, Air Quality, of this Draft EIR, the Project would not result in significant air quality impacts with regard to regional and localized emissions during construction and operation of the Project.
Goal: Expand green building practices to reduce	**Consistent.** As previously described, the Project would

Table IV.H-4 (Continued)
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
energy-related emissions from developments to increase economic benefits to business and residents.	be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. The Project would also be designed to comply with all applicable state and local codes, including the County's Green Building Ordinance. New construction would feature sustainable design elements such as drought-tolerant landscapes, best management practices for water management on-site, and high efficiency utilities and infrastructures.
Solid Waste	
Policy SW-14: Developers and local governments should integrate green building measures into project design and zoning including, but not limited to, those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. Construction reduction measures to be explored for new and remodeled buildings include: • Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities. • An ordinance that requires the inclusion of a waste management plan that promotes maximum C&D diversion. • Source reduction through: (1) use of building materials that are more durable and easier to repair and maintain; (2) design to generate less scrap material through dimensional planning; (3) increased recycled content; (4) use of reclaimed building materials; and (5) use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.). • Reuse of existing building structure and shell in renovation projects. • Building lifetime waste reduction measures that should be explored for new and remodeled buildings include: • Development of indoor recycling program and space. • Design for deconstruction. • Design for flexibility through use of moveable walls, raised floors, modular furniture, moveable	**Consistent.** As described above, new buildings and infrastructure would be designed to be environmentally sustainable and to achieve LEED Certification or equivalent green building standards. The Project would also be designed to comply with all applicable state and local codes, including the County's Green Building Ordinance. New construction would feature sustainable design elements such as drought-tolerant landscapes, best management practices for water management on-site, and high efficiency utilities and infrastructures. Non-hazardous demolition and construction debris generated from the construction of new Project buildings would also be recycled and/or salvaged for reuse. In addition, the County would continue and enhance existing solid waste features within the Project Site, such as recycling, to reduce the volume of waste to landfill during operation.

Table IV.H-4 (Continued)
Project Consistency with the Southern California Association of Governments' Regional Comprehensive Plan

Goals and Policies	Project Consistency
task lighting and other reusable components.	
Transportation	
Goal: A more efficient transportation system that reduces and better manages vehicle activity.	**Consistent.** As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, development of the Project would implement project design features that would reduce vehicular trips, reduce vehicle miles traveled, and encourage use of alternative modes of transportation, including the continued use of shuttles to and from the Universal City/Studio City Metro Red Line Station. The Project Site is also conveniently located adjacent to a Metro bus stop and a major thoroughfare, Cahuenga Boulevard, and the Hollywood Freeway, thereby reducing vehicle miles traveled and associated vehicular emissions. As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, with implementation of project design features, traffic impacts would be less than significant.
Security and Emergency Preparedness	
Goal: Prevent, protect, respond to, and recover from major human-caused or natural events in order to minimize the threat and impact to lives, property, the transportation network and the regional economy.	**Consistent.** Existing emergency response and evacuation plans would be updated and/or new plans created, as appropriate, to address operation of the Project. Therefore, no adverse impacts to emergency response or emergency evacuation plans are anticipated.

Source: Southern California Association of Governments Regional Comprehensive Plan; Matrix Environmental, 2014.

would not have a significant long-term impact on the region's ability to meet State and federal air quality standards. The Project would comply with SCAQMD Rule 403 and would implement all feasible mitigation measures for control of respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and nitrogen oxides (NO_X). Also, the Project would be consistent with the goals and policies of the Air Quality Management Plan for control of fugitive dust. The Project's long-term influence would also be consistent with the goals and policies of the Air Quality Management Plan and is, therefore, considered consistent with the SCAQMD's Air Quality Management Plan.

(d) Metro Congestion Management Program

As discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, the Project would not conflict with the Congestion Management Program as it would not result

throughout the Project Site by creating outdoor plaza areas that would be used as picnic and community space and provide visitors with views of the surrounding hillsides. On-site pedestrian activity would be further improved by enhancing existing parking operations with two new parking structures that would include pedestrian walkways to and from the parking structures and the various components of the Project. The Project would also support the preservation of open space and the existing residential uses by maintaining the undeveloped hillsides, which buffer the surrounding residential uses from the developed areas of the Project Site. Further, the Project would promote environmental sustainability. Therefore, as the Project would be consistent the general intent of the Regional Comprehensive Plan, the Project's impact regarding consistency with the Regional Comprehensive Plan would be less than significant.

(c) South Coast Air Quality Management District Air Quality Management Plan

Section IV.B, Air Quality, of this Draft EIR, provides an analysis of the Project's consistency with the Air Quality Management Plan. As discussed therein, the determination of Air Quality Management Plan consistency is primarily concerned with the long-term influence of the Project on air quality in the Air Basin. Project development in significant impacts to the nearby Congestion Management Program intersections or freeway monitoring locations.

(3) Conclusion Regarding Impacts Relative to Land Use Consistency

Based on the analysis provided above, the Project would be generally consistent with the adopted County and City General Plans and with relevant environmental policies in other applicable plans. As such, the Project's impacts related to land use consistency would be less than significant.

4. Cumulative Impacts

Future growth through 2020 (the Project's buildout year) as a result of related projects and general ambient growth would have the potential to alter the existing land use environment due to infill development at increased densities, conversions of vacant land to new development, and/or conversions of land uses. However, future development projects would be subject to existing zoning and land use designations as well as environmental review by the County or City. Therefore, such future projects are not expected to fundamentally alter the existing land use relationships in the community.

As described in Section III, Environmental Setting, of this Draft EIR, a total of 27 related projects were identified within the Project area. The related projects consist of

residential, office, mixed-use, commercial, retail, and institutional uses within areas that, on a general basis, are already developed with such uses. As such, these related projects would occur as urban infill within the context of existing land use patterns and would not be expected to substantially alter those patterns. As illustrated in Figure III-1 in Section III, Environmental Setting, of this Draft EIR, the closest related project to the Project Site is Related Project No. 22, located approximately 0.8-mile southwest of the Project Site. Related Project No. 22 involves the development of a new 100-room hotel. Given its distance from the Project Site and intervening land uses, Related Project No. 22 would not combine with the Project to create any incompatibility with surrounding land uses. Additionally, as the Project would be compatible with existing surrounding land uses and would be generally consistent with applicable land use plans and policies, the Project would not contribute to significant cumulative land use compatibility or consistency impacts. The balance of the related projects would not cause cumulative land use impacts due to distance and/or existing intervening development. As such, cumulative impacts with regard to land use would be less than significant.

5. Mitigation Measures

Based on the above analysis, the Project would be generally consistent with applicable land use plans, policies, and regulations. Thus, no mitigation measures would be required.

6. Conclusion

Impacts related to land use would be less than significant.

IV. Environmental Impact Analysis

I. Noise

1. Introduction

This section analyzes the potential noise and vibration impacts associated with the Project. Specifically, the analysis describes the existing noise environment within the Project area, estimates future noise and vibration levels at surrounding sensitive land uses resulting from construction and operation of the Project, identifies the potential for significant impacts, and provides mitigation measures to address significant impacts. In addition, an analysis of potential cumulative noise and vibration impacts is also provided. Noise calculation worksheets prepared by Acoustical Engineering Services (AES) are included in Appendix J of this Draft EIR.

2. Environmental Setting

a. Noise and Vibration Fundamentals

(1) Noise

(a) Fundamentals of Sound and Environmental Noise

Noise is commonly defined as sound that is undesirable because it interferes with speech communication and hearing, causes sleep disturbance, or is otherwise annoying (unwanted sound). The decibel (dB) is a conventional unit for measuring the amplitude of sound as it accounts for the large variations in sound pressure amplitude and reflects the way people perceive changes in sound amplitude.[1] Human hearing is not equally sensitive to sound at all frequencies. Therefore, to approximate this human frequency-dependent response, the A-weighted filtering system is used to adjust measured sound levels (dBA). The term "A-weighted" refers to filtering the noise signal in a manner that corresponds to the way the human ear perceives sound. Examples of various sound levels in different environments are shown in Table IV.I-1 on page IV.I-2.

---

[1] *All sound levels measured in decibel (dB) in this study are relative to $2x10^{-5}$ N/m^2.*

Table IV.I-1
Typical Noise Levels

Common Outdoor Activities	Noise Levels (dBA)	Common Indoor Activities
	110	Rock Band
Jet Fly-Over at 1000 feet		
	100	
Gas Lawn Mower at 3 feet		
	90	
Diesel Truck at 50 feet at 50 mph		Food Blender at 3 feet
	80	Garbage Disposal at 3 feet
Noisy Urban Area, Daytime		
Gas Lawn Mower at 100 feet	**70**	Vacuum Cleaner at 10 feet
Commercial Area		Normal Speech at 3 feet
Heavy Traffic at 300 feet	**60**	
		Large Business Office
Quiet Urban Daytime	**50**	Dishwasher Next Room
Quiet Urban Nighttime	**40**	Theater, Large Conference Room (background)
Quiet Suburban Nighttime

Quiet Rural Nighttime		Bedroom at Night, Concert Hall (background)
	20	
		Broadcast/Recording Studio
	10	
	0	

Source: Caltrans, Technical Noise Supplement (TeNS), Table 2-5, 2009.

People commonly judge the relative magnitude of sound sensation using subjective terms such as "loudness" or "noisiness." A change in sound level of 3 dB is considered "just perceptible," a change in sound level of 5 dB is considered "clearly noticeable," and a change (increase) of 10 dB is typically recognized as "twice as loud."[2]

(b) Outdoor Sound Propagation

In an outdoor environment, sound energy attenuates through the air as a function of distance. Such attenuation is called "distance loss" or "geometric spreading," and is based on the type of source configuration (i.e., a point source, or a line source). The rate of sound attenuation for a point source, such as a piece of mechanical or electrical equipment

[2] *Bies & Hansen, Engineering Noise Control, Table 2.1, 1988.*

(e.g., air conditioner or bull dozer), is 6 dBA per doubling of distance from the noise source to the receptor at acoustically "hard" sites and at a rate of 7.5 dBA at acoustically "soft" sites.[3] For example, an outdoor condenser fan that generates a sound level of 60 dBA at a distance of 50 feet from a point source at an acoustically hard site would attenuate to 54 dBA at a distance of 100 feet from the point source and attenuate to 48 dBA at 200 feet from the point source. The rate of sound attenuation for a line source, such as a constant flow of traffic on a roadway, is 3 dBA and 4.5 dBA per doubling of distance from the point source to the receptor for hard and soft sites, respectively.[4]

In addition, structures (e.g., buildings and solid walls) and natural topography (e.g., hills and berms) that obstruct the line of sight between a noise source and a receptor further reduce the noise level if the receptor is located within the "shadow" of the obstruction, such as behind a sound wall. This type of sound attenuation is known as "barrier insertion loss." If a receptor is located behind the wall but still has a view of the source (i.e., the line of sight is not fully blocked), some barrier insertion loss would still occur, but to a lesser extent. Additionally, a receptor located on the same side of the wall as a noise source may actually experience an increase in the perceived noise level as the wall reflects noise back to the receptor, thereby compounding the noise. Noise barriers can provide noise level reductions ranging from approximately 5 dBA (where the barrier just breaks the line of sight between the source and receiver) to an upper range of 20 dBA with a more substantial barrier.[5] Additionally, structures with closed windows can further attenuate exterior noise by a minimum of 25 dBA to 30 dBA.[6]

(c) Environmental Noise Descriptors

Several rating scales have been developed to analyze the adverse effect of community noise on people. Since environmental noise fluctuates over time, these scales consider that the effect of noise is dependent upon the total acoustical energy content, as well as the time and duration of occurrence. The most frequently used noise descriptors are summarized below.

---

[3] *U.S. Department of Transportation, Federal Highway Administration, Highway Noise Fundamentals, (Springfield, Virginia: U.S. Department of Transportation, Federal Highway Administration, September 1980), p. 97. A "hard" or reflective site does not provide any excess ground-effect attenuation and is characteristic of asphalt, concrete, and very hard packed soils. An acoustically "soft" or absorptive site is characteristic of normal earth and most ground with vegetation.*

[4] *Caltrans, Technical Noise Supplement (TeNS), Chapter 2.1.4.1, 2009.*

[5] *Ibid.*

[6] *Transportation Research Board, National Research Council, Highway Noise: A Design Guide for Highway Engineers, National Cooperative Highway Research Program Report 117.*

Equivalent Sound Level (L_{eq}). L_{eq} is a measurement of the acoustic energy content of noise averaged over a specified time period. Thus, the L_{eq} of a time-varying sound and that of a steady sound are the same if they deliver the same amount of energy to the receptor's ear during exposure. L_{eq} for one-hour periods, during the daytime or nighttime hours, and 24-hour periods are commonly used in environmental assessments. For evaluating community impacts, this rating scale does not vary, regardless of whether the noise occurs during day or night.

Maximum Sound Level (L_{max}). L_{max} represents the maximum sound level measured during a measurement period.

Statistical Sound Level (L_n). L_n is a statistical description of the sound level that is exceeded over some fraction of a given period of time. For example, the L_{50} noise level represents the noise level that is exceeded 50 percent of the time. Half the time the noise level exceeds this level and half the time the noise level is less than this level. This level is also representative of the level that is exceeded 30 minutes in an hour. Similarly, the L_8 and L_{25} represent the noise levels that are exceeded 8 and 25 percent of the time, respectively, or for 5 and 15 minutes during a 1-hour period, respectively. The County of Los Angeles noise limits are provided in terms of statistical sound levels.

Community Noise Equivalent Level (CNEL). CNEL is the time average of all A-weighted sound levels for a 24-hour period with a 10 dBA adjustment (upward) added to the sound levels that occur between the hours of 10:00 P.M. and 7:00 A.M. (nighttime), and a 5 dBA adjustment (upward) added to the sound levels which occur between the hours of 7:00 P.M. and 10:00 P.M. (evening). These penalties attempt to account for increased human sensitivity to noise during the nighttime and evening periods, particularly where sleep is the most probable activity. CNEL has been adopted by the State of California to define the community noise environment for development of the community noise element of a General Plan and is also used by the City for land use planning and to describe noise impacts in the *L.A. CEQA Thresholds Guide*.[7]

(2) Ground-Borne Vibration

Vibration is commonly defined as an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. The peak particle velocity (PPV) or the root-mean square (RMS) velocity is usually used to describe vibration amplitudes. PPV is defined as the maximum instantaneous peak of the vibration signal and is typically used for evaluating potential

[7] *State of California, General Plan Guidelines, 2003.*

building damage.[8] The RMS velocity is defined as the square-root of the average of the squared amplitude of the vibration signal and is typically more suitable for evaluating human response to ground-borne vibration.[9] The RMS vibration velocity level can be presented in inch per second or in VdB (a decibel unit referenced to 1 micro-inch per second).[10] Ground-borne vibration generated by man-made activities (e.g., road traffic, construction operations) typically weakens with greater horizontal distance away from the source of the vibration.

b. Regulatory Framework

Various government agencies have established noise regulations and policies to protect citizens from potential hearing damage and other adverse effects associated with noise and ground-borne vibration. An overview of the State, County and City regulations and policies that are relevant to construction and operation of the Project is provided below.

While the Project Site is located within the City of Los Angeles, the Ford Theatres are owned and operated by the County of Los Angeles. Accordingly, development of the Project Site is governed by the Los Angeles County Code. Noise-sensitive receptors adjacent to the Project Site, however, are within the City of Los Angeles. This analysis reviews both County and City regulations and assesses Project noise impacts in light of whichever is the more restrictive of the applicable policies and regulations from the County of Los Angeles and the City of Los Angeles. This means that noise impacts will be determined to be less than significant only if both County and City methodology determine impacts to be less than significant.

(1) Applicable State Noise Standards

The State of California has adopted noise compatibility guidelines for general land use planning. The types of land uses addressed by the State standards and the acceptable noise categories for each land use are included in the *State of California General Plan Guidelines,* which is published and updated by the *Governor's Office of Planning and Research*. The level of acceptability of the noise environment is dependent

---

[8] *Vibration levels used in this study are described in terms peak particle velocity level in the unit of inches per second.*

[9] *Federal Transit Administration (FTA), "Transit Noise and Vibration Impact Assessment," Section 7.1.2, May 2006.*

[10] *VdB (velocity level in decibel) = 20 x Log (V / V_{ref}), where V is the RMS velocity amplitude in micro-inch per second and V_{ref} is the reference velocity amplitude of $1x10^{-6}$ inch per second (1 micro-inch per second). All vibration levels described in decibel (VdB) in this study are RMS and referenced to 1 micro-inch per second.*

upon the activity associated with the particular land use. Table IV.I-2 on page IV.I-7 provides the exterior noise standard associated with various land uses, as described by the State of California land use compatibility for community noise environment.

(2) County of Los Angeles Noise Standards

(a) Los Angeles County General Plan

Refer to Section IV.H, Land Use, of this Draft EIR for a listing of the General Plan policies that are applicable to noise. As discussed in the General Plan policy consistency analysis provided therein, the Project would be consistent with the applicable General Plan polices related to noise.

(b) County of Los Angeles Noise Control Ordinance

The Noise Control Ordinance of the County of Los Angeles (County Noise Ordinance Section 12.08.010, *et seq.*, of the Los Angeles County Code) identifies exterior noise standards for any source of sound, as well as specific exemptions for exterior noise sources. The primary components of the County Noise Ordinance are described below.

The County Noise Ordinance provides maximum exterior noise level standards for four general noise zones and establishes maximum exterior noise levels for each zone. These noise zones are:

1. Noise-Sensitive Areas—Noise-sensitive zones are designated by the County Health Officer.

2. Residential Properties—This category includes all types of residential developments and properties subject to residential zoning.

3. Commercial Properties—This category includes all types of commercial developments and also includes properties subject to commercial zoning classifications.

4. Industrial Properties—This category includes all properties developed with manufacturing uses and industrial zoning.

For each of these zones, the County Noise Ordinance states that exterior operational noise levels caused by Project-related on-site fixed sources (i.e., point noise sources) shall not exceed the levels identified in Table IV.I-3 on page IV.I-8, or the ambient noise level, whichever is greater, when the ambient noise level is determined

Table IV.I-2
Land Use Compatibility for Community Noise Exposure

Land Use	Community Exposure Level, CNEL (dBA)			
	Normally Acceptable	**Conditionally Acceptable**	**Normally Unacceptable**	**Clearly Unacceptable**
Residential: Low-Density Single-Family, Duplex, Mobile Homes	50 to 60	55 to 70	70 to 75	Above 75
Residential: Multi-Family	50 to 65	60 to 70	70 to 75	Above 75
Transient Lodging: Motels, Hotels	50 to 65	60 to 70	70 to 80	Above 80
Schools, Libraries, Churches, Hospitals, Nursing Homes	50 to 70	60 to 70	70 to 80	Above 80
Auditoriums, Concert Halls, Amphitheaters	—	50 to 70	—	Above 65
Sports Arena, Outdoor Spectator Sports	—	50 to 75	—	Above 70
Playgrounds, Neighborhood Parks	50 to 70	—	67 to 75	Above 72
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50 to 75	—	70 to 80	Above 80
Office Buildings, Business Commercial and Professional	50 to 70	67 to 77	Above 75	—
Industrial, Manufacturing, Utilities, Agriculture	50 to 75	70 to 80	Above 75	—

Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

Clearly Unacceptable: New construction or development should generally not be undertaken.

Source: Office of Planning and Research, State of California General Plan Guidelines, October 2003.

without the noise source operating.[11] These standards are based on the duration of the noise. Thus, the louder the noise, the shorter the duration that such noise can last. To define these specific durations of noise, the noise metrics used include L_{50}, L_{25}, $L_{8.3}$, $L_{1.7}$, and L_{max}. These metrics are based upon a 1-hour timeframe and indicate exceedances of

[11] *Ambient noise level is the existing background noise level at the time of measurement or prediction.*

Table IV.I-3
County of Los Angeles Exterior Noise Standards

Noise Zone	Designated Noise Zone Land Use (Receptor Property)	Time Interval	Exterior Noise Levels,[a] dBA
I	Noise-Sensitive Area[b]	Anytime	45
II	Residential Properties	10:00 P.M. to 7:00 A.M. 7:00 A.M. to 10:00 P.M.	45 50
III	Commercial Properties	10:00 P.M. to 7:00 A.M. 7:00 A.M. to 10:00 P.M.	55 60
IV	Industrial Properties	Anytime	70

[a] *This Table is used by the County to develop noise standards based on the duration of the noise source. These standards are described below.*

***Standard No. 1** shall be the exterior noise level which may not be exceeded for a cumulative period of more than 30 minutes in any hour. Standard No. 1 shall be the applicable noise level; or, if the ambient L_{50} exceeds the forgoing level, then the ambient L_{50} becomes the exterior noise level for Standard No. 1.*

***Standard No. 2** shall be the exterior noise level which may not be exceeded for a cumulative period of more than 15 minutes in any hour. Standard No. 2 shall be the applicable noise level from Standard 1 plus 5 dBA; or, if the ambient L_{25} exceeds the forgoing level, then the ambient L_{25} becomes the exterior noise level for Standard No. 2*

***Standard No. 3** shall be the exterior noise level which may not be exceeded for a cumulative period of more than five minutes in any hour. Standard No. 3 shall be the applicable noise level from Standard 1 plus 10 dBA; or, if the ambient $LB_{8.3}$ exceeds the forgoing level, then the ambient $L_{8.3}$ becomes the exterior noise level for Standard No. 3.*

***Standard No. 4** shall be the exterior noise level which may not be exceeded for a cumulative period of more than one minute in any hour. Standard No. 4 shall be the applicable noise level from Standard 1 plus 15 dBA, or, if the ambient $L_{1.7}$ exceeds the forgoing level, then the ambient $L_{1.7}$ becomes the exterior noise level for Standard No. 4.*

***Standard No. 5** shall be the exterior noise level which may not be exceeded for any period of time. Standard No. 4 shall be the applicable noise level from Standard 1 plus 20 dBA; or, if the ambient L_0 exceeds the forgoing level, then the ambient L_0 becomes the exterior noise level for Standard No. 4.*

[b] *Not defined in the County Noise ordinance. To be designated by the County Health Officer.*

Source: County of Los Angeles Ordinance No. 11743, Section 12.08.390

50, 25, 8.3, and 1.7 percent of the time, plus the maximum sound level during that time period.

The County Noise Ordinance identifies specific restrictions regarding construction noise. Pursuant to the County Noise Ordinance, the operation of equipment used in construction, drilling, repair, alteration or demolition work is prohibited between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays if such noise would create a noise

disturbance across a residential or commercial real-property line.[12] The County Noise Ordinance further states the contractor must conduct construction activities in such a manner that the maximum noise levels at the affected buildings will not exceed those listed in Table IV.I-4 on page IV.I-10. All mobile and stationary internal-combustion-powered equipment and machinery are also required to be equipped with suitable exhaust and air-intake silencers in proper working order.

The Los Angeles County Code also provides exemptions from the construction standards set forth under Chapter 12.12 of the County Code. Specifically, Section 12.12.050 of the Los Angeles County Code provides an exemption for construction work performed with the County Engineer's permission if the County Engineer can make the finding that: 1) the work proposed to be done is effected with a public interest; 2) that hardship, injustice or unreasonable delay would result from the interruption of construction activities; or 3) that the building or structure involved is devoted or intended to be devoted to a use immediately incident to public defense. In addition, Section 12.12.060 of the Los Angeles County Code exempts construction work by public utilities that are subject to the jurisdiction of the Public Utilities Commission where such work is necessary for the preservation of life or property, and where such necessity makes it necessary to construct, repair or excavate during prohibited hours.

(3) City of Los Angeles Noise Regulations

Chapter XI of the LAMC (Noise Regulation) establishes acceptable ambient sound levels to regulate intrusive noises (e.g., stationary mechanical equipment and vehicles other than those traveling on public streets) within specific land use zones and provides procedures and criteria for the measurement of the sound level of noise sources. These procedures recognize and account for differences in the perceived level of different types of noise and/or noise sources. In accordance with the Noise Regulation, a noise level increase from certain regulated noise sources of 5 dBA over the existing or presumed ambient noise level at an adjacent property line is considered a violation of the Noise Regulation. The 5-dBA increase above ambient is applicable to City-regulated noise sources (e.g., mechanical equipment) and it is applicable any time of the day.[13]

The Noise Regulation states that the baseline ambient noise shall be the actual measured ambient noise level or the City's presumed ambient noise level, whichever is

---

[12] *County of Los Angeles Ordinance No. 11743, codified in Los Angeles County Code Section 12.08.440. Noise disturbance is defined in Los Angeles County Code Section 12.08.230 as "an alleged intrusive noise which violates an applicable noise standard as set forth in this chapter." The County Health Officer has the authority to define and determine the extent of a noise disturbance on a case-by-case basis.*

[13] *Los Angeles Municipal Code, Chapter XI, Section 112.02.*

Table IV.I-4
County of Los Angeles Construction Noise Limits

	Noise Limits, dBA (L_{eq})		
	Single-Family Residential	**Multi-Family Residential**	**Commercial**[a]
Residential Structures			
Mobile Equipment: Maximum noise levels for nonscheduled, intermittent, short-term operation (less than 10 days) of mobile equipment			
Daily, except Sundays and legal holidays, 7:00 A.M. to 8:00 P.M.	75	80	85
Daily, 8:00 P.M. to 7:00 A.M. and all day Sunday and legal holidays	60	64	70
Stationary Equipment: Maximum noise levels for repetitively scheduled and relatively long-term operation (periods of 10 days or more) of stationary equipment			
Daily, except Sundays and legal holidays, 7:00 A.M. to 8:00 P.M.	60	65	70
Daily, 8:00 P.M. to 7:00 A.M. and all day Sunday and legal holidays	50	55	60
		All Structures	
Business Structures			
Mobile Equipment: Maximum noise levels for nonscheduled, intermittent, short-term operation of mobile equipment			
Daily, including Sundays and legal holidays, all hours		85

greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes, L_{eq} (15-minute). The Noise Regulation indicates that in cases where the actual measured ambient conditions are not known, the City's presumed daytime (7:00 A.M. to 10:00 P.M.) and nighttime (10:00 P.M. to 7:00 A.M.) ambient noise levels defined in Section 111.03 of the LAMC should be used. The City's presumed ambient noise levels for specific land use zones are set forth in the LAMC Section 111.03 and are provided in Table IV.I-5 on page IV.I-11. As indicated therein, for residential-zoned areas,

Table IV.I-5
City of Los Angeles Presumed Ambient Noise Levels

Zone	Daytime (7 A.M. to 10 P.M.) dBA (L_{eq})	Nighttime (10 P.M. to 7 A.M.) dBA (L_{eq})
Residential, School, Hospitals, Hotels	50	40
Commercial	60	55
Manufacturing (M1, MR1 and MR2)	60	55
Heavy Manufacturing (M2 and M3)	65	65

Source: City of Los Angeles Municipal Code, Section 111.03.

the presumed ambient noise level is 50 dBA during the daytime and 40 dBA during the nighttime. As further discussed below, the measured existing ambient noise levels in the vicinity of the Project Site exceed these presumed ambient noise levels.

To account for people's increased tolerance for short-duration noise events, the Noise Regulation provides a 5 dBA allowance for noise sources occurring more than 5 minutes but less than 15 minutes in any one-hour period (for a total of 10 dBA above the ambient), and an additional 5 dBA allowance (total of 15 dBA above the ambient) for noise sources occurring 5 minutes or less in any 1-hour period. These additional allowances for short-duration noise sources are applicable to noise sources occurring between the hours of 7:00 A.M. and 10:00 P.M. (daytime hours). Furthermore, the Noise Regulation provides a reduction of 5 dBA for steady high-pitched noise or repeated impulsive noises.[14, 15]

In addition, the City's Noise Regulation Section 112.05 sets a maximum noise level from construction equipment (powered equipment or powered hand tools) operating between the hours of 7:00 A.M. and 10:00 P.M., in any residential zone of the City or within 500 feet thereof, of 75 dBA, measured at a distance of 50 feet from the source, unless compliance with this limitation is technically infeasible.[16] Section 41.40 of the LAMC prohibits construction noise that disturbs persons occupying sleeping quarters in any

[14] *Los Angeles Municipal Code, Chapter XI, Article I, Section 111.02-(b).*

[15] *Impulsive sound as defined in the LAMC Section 111.01-(e) is sound of short duration, usually less than one second, with an abrupt onset and rapid decay. Examples of impulsive sound shall include, but are not limited to, explosion, musical base drum beats, or the discharge of firearms.*

[16] *In accordance with the City of Los Angeles Noise Ordinances, "technically feasible" means that the established noise limitations can be complied with at a project site, with the use of mufflers, shields, sound barriers, and/or other noise reduction devices or techniques employed during the operation of equipment.*

dwelling, hotel, or apartment or other place of residence between the hours of 9:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. and after 6:00 P.M. on Saturday, and at any time on Sunday or City-observed holidays. Construction hours may be extended with approval from the Executive Director of the Board of Police Commissioners.

4) Ground-Borne Vibration

Available guidelines from the FTA are utilized to assess impacts due to ground-borne vibration. The FTA has published a technical manual titled, "Transit Noise and Vibration Impacts Assessment," which provides ground-borne vibration impact criteria with respect to building damage during construction activities.[17] As discussed above, building vibration damage is measured in PPV described in the unit of inches per second. Table IV.I-6 on page IV.I-13 provides the FTA vibration criteria applicable to construction activities. According to FTA guidelines, a vibration criterion of 0.20 PPV should be considered as the significant impact level for non-engineered timber and masonry buildings. Structures or buildings constructed of reinforced concrete, steel, or timber, have a vibration damage criterion of 0.50 PPV pursuant to the FTA guidelines.

In addition to the FTA Construction Vibration Impact Criteria for Building Damage, the FTA guidance manual also provides vibration criteria for human annoyance for various uses. These criteria were established primarily for rapid transit (rail) projects and, as indicated in Table IV.I-7 on page IV.I-14, are based on the frequency of vibration events. Specific criteria are provided for three land use categories: (1) Vibration Category 1—High Sensitivity; (2) Vibration Category 2—Residential; and (3) Vibration Category 3—Institutional.

c. Existing Conditions

The predominant source of noise in the vicinity of the Project Site is vehicular traffic on adjacent roadways, particularly Cahuenga Boulevard and the nearby U.S. 101 Freeway. Within the Project Site, noise sources include operation of the Amphitheatre and outdoor plaza areas as well as use of the surface parking areas.

(1) Noise-Sensitive Receptors

Some land uses are considered more sensitive to intrusive noise than others based on the types of activities typically involved at the receptor location. The *L.A. CEQA Thresholds Guide* states that residences, transient lodgings, schools, libraries, churches,

[17] *FTA, "Transit Noise and Vibration Impact Assessment," May 2006*

Table IV.I-6
Federal Transit Administration Construction Vibration Impact Criteria for Building Damage

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: Federal Transit Administration, 2006.

hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds, and parks are generally more sensitive to noise than are commercial and industrial land uses.[18]

Based on a review of the land uses in the Project area, a total of four off-site noise receptor locations were selected to represent noise sensitive uses in the Project area. As discussed below, noise measurements were conducted at these locations, in addition to one on-site location, to establish baseline noise conditions in the Project area. The five noise measurement locations are shown on Figure IV.I-1 on page IV.I-15 and described in Table IV.I-8 on page IV.I-16.

(2) Ambient Noise Levels

To establish baseline noise conditions, existing ambient noise levels were monitored at the four representative off-site receptor locations in the vicinity of the Project Site and the one on-site location, as shown on Figure IV.I-1. The baseline noise monitoring program was conducted on February 19 to February 20, 2014 using a Quest Technologies Model 2900 Integrating/Logging Sound Level Meter.[19] Two 15-minute measurements were conducted at three of the off-site receptor locations during daytime and nighttime hours. A 24-hour measurement was conducted at the off-site receptor location R3 (the Hollywood Bowl) and at the Project Site (receptor R5). Furthermore, a 15-minute measurement is a reasonable duration for sampling ambient noise levels where street traffic is the dominant source (typical of urban environments), as traffic noise generally does not vary significantly within an hour.

[18] *City of Los Angeles, L.A. CEQA Thresholds Guide, p. I.1-3.*

[19] *This sound meter meets and exceeds the minimum industry standard performance requirements for "Type 2" standard instruments as defined in the American National Standard Institute (ANSI) S1.4. It also meets the requirement specified in Section 111.01(l) of the LAMC that instruments be "Type S2A" standard instruments or better. The sound meter was calibrated and operated according to the manufacturer's written specifications.*

Table IV.I-7
Federal Transit Administration Vibration Impact Criteria for Human Annoyance

Land Use Category	Ground-Borne Vibration Impacts Levels, VdB		
	Frequent Events[a]	Occasional Events[a]	Infrequent Events[c]
Category 1: Building where vibration would interfere with interior operations	65[d]	65[d]	65[d]
Category 2: Residences and buildings where people normally sleep	72	75	80
Category 3: Institutional land uses with primarily daytime uses	75	78	83

[a] *"Frequent Events" are defined as more than 70 vibration events of the same source per day.*

[b] *"Occasional Events" are defined as between 30 and 70 vibration events of the same source per day.*

[c] *"Infrequent Events" are defined as fewer than 30 vibration events of the same source per day.*

[d] *This criterion limit is based on the levels that are acceptable for most moderately sensitive equipment such as optical microscopes.*

Source: Federal Transit Administration, 2006.

Table IV.I-9 on page IV.I-17 provides a summary of the ambient noise measurements taken at the five receptor locations. Based on field observations, the ambient noise at the measurement locations is dominated by local traffic and other typical urban noises. As indicated in Table IV.I-9, the existing daytime ambient noise levels at the four off-site locations ranged from 50.0 dBA (L_{eq}) at Location R3 to 75.9 dBA (L_{eq}) at Location R4, while the measured nighttime ambient noise levels ranged from 46.7 dBA (L_{eq}) at Location R3 to 75.9 dBA (L_{eq}) at Location R4. The existing ambient noise levels at off-site residential locations are above the City's presumed daytime and nighttime ambient noise standards of 50 dBA (L_{eq}) and 45 dBA (L_{eq}) for residential uses, respectively, as presented above in Table IV.I-5 on page IV.I-11. Therefore, the measured existing ambient noise levels are used as the baseline conditions for the purposes of determining Project impacts. The measured existing ambient noise level at the Project Site ranged from 65.1 dBA (L_{eq}) to 70.9 dBA (L_{eq}), with a 24-hour average sound level of 74.8 dBA CNEL.

In addition to the ambient noise measurements in the vicinity of the Project Site, the existing traffic noise on local roadways in the surrounding areas were calculated to quantify the 24-hour CNEL noise levels using information provided by the Project's traffic study.[20] Eleven (11) roadway segments were selected for the existing noise analysis, based on

[20] *Gibson Transportation Consulting, Inc., Transportation Study for the Ford Theatres Project, March 2014. See Appendix L of this Draft EIR.*

Figure IV.I-1
Noise Monitoring Locations

[a] *Distances are estimated using Google Earth.*

Source: Acoustical Engineering Services (AES), 2014.

proximity to noise sensitive uses along the roadway segments and potential increases in traffic volume from the Project. Traffic noise levels were calculated using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM) and traffic volume data from the Project's Transportation Study.[21] The TNM traffic noise prediction model calculates the hourly L_{eq} noise levels based on specific information including the hourly traffic volume, vehicle type mix, vehicle speed, and lateral distance between the noise receptor and the roadway. To calculate the 24-hour CNEL levels, the hourly L_{eq} levels were calculated during daytime hours (7:00 A.M. to 7:00 P.M.), evening hours (7:00 P.M. to 10:00 P.M.), and nighttime hours (10:00 P.M. to 7:00 A.M.).

The traffic noise prediction model calculates the 24-hour CNEL noise levels based on specific information including Average Daily Traffic Volume (ADT); percentages of day, evening, and nighttime traffic volumes relative to ADT; vehicle speed; and distance between the noise receptor and the roadway. Vehicle mix/distribution information used in the noise calculations is shown in Table IV.I-10 on page IV.I-18.

Table IV.I-11 on page IV.I-19 provides the calculated traffic noise levels for the analyzed local roadway segments based on existing traffic volumes. Traffic noise levels were calculated for the commuter peak hour, the peak hour preceding an on-site event,

[21] *Ibid.*

Table IV.I-9
Existing Ambient Noise Levels

Receptor Location	Noise-Sensitive Land Use	Measured Noise Levels, L_{eq} (dBA)		CNEL (24-Hour)
		Daytime Hours (7:00 A.M.–10:00 P.M.)	Nighttime Hours (10:00 P.M.–7:00 A.M.)	
R1	Residential	51.3	50.9	55.7[a]
R2	Residential	75.3	75.3	80.0[a]
R3	Amphitheater	50.0–57.3	46.7–55.1	59.3
R4	Residential	75.9	75.9	80.6[a]
R5	Project Site	66.9–70.2	65.1–70.9	74.8

Source: AES, 2014.

and a 24-hour period for both a weekday and weekend. As shown therein, the existing CNEL due to surface street traffic volumes ranges from 65.6 dBA CNEL along Odin Avenue (south of Cahuenga Boulevard North) to 75.6 dBA CNEL along Highland Boulevard (south of Odin Avenue) during a weekday. The existing traffic noise levels during a weekend day ranges from 63.6 dBA CNEL along Odin Avenue (south of Cahuenga Boulevard North) to 74.8 dBA CNEL along Highland Boulevard (south of Odin Avenue). Currently, the existing traffic related noise levels along Odin Avenue fall within the conditionally acceptable noise levels for multi-family residential uses (i.e., 60 to 70 dBA CNEL). The existing traffic noise levels along Cahuenga Boulevard North, Cahuenga Boulevard East, Barham Boulevard, and Highland Boulevard (between Hollywood Bowl Road and Odin Avenue) fall within the normally unacceptable noise levels for residential uses (i.e., between 70 and 75 dBA CNEL).

(3) Existing Ground-Borne Vibration Levels

Based on field observations, the primary source of existing ground-borne vibration in the Project vicinity is vehicular travel (i.e., automobiles, refuse trucks, delivery trucks, construction trucks, school buses, and transit buses) on local roadways. According to the FTA technical study "Federal Transit Administration: Transit Noise and Vibration Impacts Assessments," typical road traffic-induced vibration levels are unlikely to be perceptible by people. Specifically, the FTA study reports that "[i]t is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads."[22] Trucks and buses typically generate ground-borne vibration velocity levels of approximately

[22] *Federal Transit Administration (FTA), "Transit Noise and Vibration Impact Assessment," Page 7-1, 2006.*

Table IV.I-10
Vehicle Mix for Traffic Noise Model

Vehicle Type	Percent of Average Daily Traffic (ADT), %			Total Percent of ADT per Vehicle Type
	Daytime Hours (7 A.M.–7 P.M.)	Evening Hours (7 P.M.–10 P.M.)	Nighttime Hours (10 P.M.–7 A.M.)	
Automobile	77.6	9.7	9.7	97.0
Medium Truck[a]	1.6	0.2	0.2	2.0
Heavy Truck[b]	0.8	0.1	0.1	1.0
Total	80.0	10.0	10.0	100.0

Source: AES, 2014.

63 VdB at a distance of 50 feet, and these levels could reach 72 VdB when trucks and buses pass over bumps in the road. Per FTA, 75 VdB is the dividing line between barely perceptible and distinctly perceptible.[23] Therefore, it is expected that the existing ground vibration environment in the vicinity of the Project Site would be below the perceptible level.

3. Project Impacts

a. Methodology

(1) On-Site Construction Activities

Construction noise impacts due to on-site construction activities were evaluated by calculating the Project's construction-related noise level at representative sensitive receptor locations and comparing these Project construction-related noise levels to the existing ambient noise levels (i.e., noise levels without construction noise from the Project). Construction noise associated with the Project was analyzed based on the Project's potential construction equipment inventory, construction durations, and construction schedule. The construction noise model for the Project is based on construction equipment noise levels as published by Federal Highway Administration (FHWA) "Roadway Construction Noise Model (FHWA 2006)."[24] The ambient noise levels at surrounding

[23] *FTA, "Transit Noise and Vibration Impact Assessment," Figure 10-1, May 2006.*

[24] *The reference noise levels for construction equipment from the FHWA are based on measurements of newer construction equipment (published in 2006), rather than the noise levels from the Environmental Protection Agency report referenced in the* L.A. CEQA Thresholds Guide *(published in 1971).*

sensitive receptor locations were based on field measurement data (see Table IV.I-9 on page IV.I-17). The construction noise levels were then calculated for sensitive receptor locations based on the standard point source noise-distance attenuation factor of 6.0 dBA for each doubling of distance. Additional noise attenuations were assigned to receptor locations where the line of sight to the Project Site was interrupted by the presence of intervening structures.

(2) Off-Site Construction Haul Trucks

Project-related off-site construction haul trucks noise impacts were analyzed using the FHWA's TNM computer noise model. The TNM is the current Caltrans standard computer noise model for traffic noise studies. The model allows for the input of roadway, noise receivers, and sound barriers, if applicable. The construction-related off-site truck volumes were obtained from the Project's construction traffic analysis (refer to Section IV.K, Traffic, Access, and Parking, of this Draft EIR). The TNM noise model calculates the hourly L_{eq} noise levels generated by construction-related haul trucks. Noise impacts were determined by comparing the predicted noise level with that of the existing ambient noise levels along the Project's haul route.

(3) On-Site Stationary Noise Sources (Operation)

On-site stationary point-source noise impacts were evaluated by identifying the noise levels that would be generated by the Project, calculating the noise level from each noise source at the surrounding sensitive receptor property line locations, and comparing such noise levels to ambient noise levels to determine significance. The maximum allowable noise emission level from the on-site noise sources (e.g., outdoor mechanical equipment, amplified sound system, outdoor spaces, and parking facilities) was calculated based on typical sources levels and the maximum sound level permitted by the County.

(4) Off-Site Roadway Noise (Operation)

As discussed in Section 2.c, Existing Conditions, above, off-site roadway noise was analyzed using the FHWA TNM model and traffic data from the Project's traffic study. Roadway noise conditions without the Project were calculated and compared to noise levels that would occur with implementation of the Project to determine Project noise impacts.

(5) Construction Vibration

Ground-borne vibration impacts due to Project construction activities were evaluated by identifying potential vibration sources (i.e., construction equipment), estimating the

vibration levels at the potentially affected receptor, and comparing with the Project significance thresholds, as described below.

(6) Operational Vibration

The primary sources of vibration associated with operation of the Project would include passenger vehicle circulation within the proposed parking structures, which would be similar to the existing vibration levels at the existing surface parking lots. The Project would also include a new central plant, emergency generator, and typical commercial-grade air ventilation system (mounted at the roof level), which would incorporate vibration attenuation mounts (to reduce the vibration transmission to the building). Typically, ground-borne vibration attenuates rapidly as a function of distance from the vibration source. Therefore, Project operations would not increase the existing vibration levels in the immediate vicinity of the Project Site, and as such, vibration impacts associated with Project operations would be less than significant. Accordingly, the ground-borne vibration analysis presented in this report is limited to Project-related construction activities.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impactswith regard to noise would be significant if the Project would result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels;
- A substantial permanent increase in ambient noise levels in the vicinity of the project above levels existing without the project;
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels; or
- For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels.

(1) Construction Noise

The analysis of construction noise was conducted based on the use of the more restrictive thresholds or limitations established between the City of Los Angeles *L.A. CEQA Thresholds Guide* and the County's Noise Ordinance. The City's threshold for construction noise lasting more than 10 days is 5 dBA above the ambient, whereas the County's construction noise limit is 60 dBA at residential uses. Thus, the more restrictive threshold or limit would depend on the existing ambient noise levels. Specifically, if the existing ambient noise level at the sensitive receptor is higher than 60 dBA, the County's noise limit (i.e., 60 dBA) would be more restrictive than the City's limit (ambient plus 5 dBA). However, if the existing ambient noise level at the sensitive receptor is less than 55 dBA, the City's limit (e.g., ambient of 54 dBA plus 5 dBA is equal to 59 dBA) is more restrictive than the County's limit (60 dBA). In addition to the allowable construction noise levels, the City and County also have limitations regarding hours for construction activities. The City limits construction activities between the hours of 7 A.M. to 9 P.M. (within 500 feet of a residential use), while the County limits daytime construction limits from 7 A.M. to 8 P.M. Based on these facts, the following thresholds have been utilized in determining significant impacts associated with construction activities:

- Construction activities would exceed the ambient noise levels by 5 dBA at noise-sensitive receptors with an existing ambient noise level of less than 55 dBA (L_{eq}); or

- Construction activities would exceed 60 dBA (L_{eq}) at noise-sensitive receptors with an existing ambient level between 55 and 65 dBA (L_{eq}); or

- Construction activities would exceed the ambient noise levels at noise-sensitive receptors with an existing ambient level greater than 65 dBA (L_{eq}).

(2) Construction Vibration

Neither the City nor the County has a significance threshold to assess vibration impacts with respect to building damage during construction. Thus, based on FTA guidance, impacts relative to ground-borne vibration associated with potential building damage would be considered significant if any of the following future events were to occur:

- Project construction activities cause ground-borne vibration levels to exceed 0.5 PPV at the nearest off-site reinforced-concrete, steel or timber building.

- Project construction activities cause ground-borne vibration levels to exceed 0.3 PPV at the nearest off-site engineered concrete and masonry building.

- Project construction activities cause ground-borne vibration levels to exceed 0.2 PPV at the nearest off-site non-engineered timber and masonry building.

- Project construction activities cause ground-borne vibration levels to exceed 0.12 PPV at buildings that are extremely susceptible to vibration damage, such as historic buildings.

With respect to human annoyance, the County has a vibration limit of 0.01 inch/second, which is equal to 80 VdB. However, the vibration limit as provided by the FTA guidelines is 72 VdB, which is more stringent than the County's limit. Therefore, using the more stringent limit, construction vibration impacts associated with human annoyance would be significant if the following were to occur:

- Project construction activities cause ground-borne vibration levels to exceed 72 VdB at the off-site sensitive uses.

(3) Operational Noise

In the context of the above questions from Appendix G of the CEQA Guidelines, the thresholds of significance for the Project's on-site operational noise sources are based on the County's Noise Ordinance (i.e., not to exceed the ambient), which are more stringent than the City's Noise Ordinance (i.e., increase the ambient by 5 dBA). Neither the City nor the County Noise Ordinances are applicable to the off-site traffic traveling on public roads. Therefore the following thresholds provided in the *L.A. CEQA Threshold Guides*, are used for off-site roadway noise impacts:

- Project off-site noise sources (i.e., roadway traffic noise) cause the ambient noise levels measured at the property line of affected noise-sensitive uses to increase by 3 dBA in CNEL to or within the "normally unacceptable" or "clearly unacceptable" category (see Table IV.I-2 on page IV.I-7 for a description of these categories); or

- Project off-site noise sources cause the ambient noise levels measured at the property line of affected noise-sensitive uses to increase by 5 dBA in CNEL or greater; or

- Project on-site (i.e., non-roadway) noise sources such as outdoor building mechanical/electrical equipment, outdoor activities, or parking facilities generate noise levels that would exceed the ambient noise level (L_{eq}) at noise sensitive receptors.

As discussed in the Initial Study prepared for the Project, which is included in Appendix A of this Draft EIR, the Project is not located within an airport land use plan or

within 2 miles of a public or private airport, or within the vicinity of a private airstrip. Therefore, the Project would not expose people residing or working in the Project area to excessive noise levels associated with a public or private airport or a private airstrip. As such, no further analysis of airport operation-related noise is necessary.

c. Project Design Features

The Project includes the following Project Design Features related to Project operations:

Project Design Feature I-1: Project-related outdoor mechanical equipment shall be designed to meet the County's Noise Ordinance.

Project Design Feature I-2: The design of the project amplified sound system for the Amphitheater shall include the sound level regulator programmed to a maximum sound level of 95 dBA, as measured in "slow" response, at the house mixer locations.

Project Design Feature I-3: The building structure for the 299-seat theatre and the Flex Space shall provide a minimum 25 dBA indoor to outdoor noise reduction.

d. Analysis of Project Impacts

(1) Construction Noise

Project construction is anticipated to occur over several phases and may be completed as early as 2020. Construction of the Project would include demolition of several existing structures and surface parking areas, grading and excavation, and construction of new structures and related infrastructure. It is estimated that approximately 107,094 cubic yards of export would be required for the Project.

(a) On-Site Construction Noise

Noise impacts from Project construction activities occurring within the Project Site would be a function of the noise generated by construction equipment, the location of the equipment, the timing and duration of the noise-generating construction activities, and the relative distance to noise sensitive receptors. Construction activities would generally include demolition, grading and excavation, and building construction. Each stage of construction would involve the use of various types of construction equipment and would, therefore, have its own distinct noise characteristics. Demolition generally involves the use of backhoes, front-end loaders, and heavy-duty trucks. Grading and excavation typically requires the use of earth moving equipment, such as excavators, front-end loaders, and heavy-duty trucks. Building construction typically involves the use of cranes, forklifts,

concrete trucks, and delivery trucks. Noise from construction equipment would generate both steady-state and episodic noise that could be heard within and adjacent to the Project Site.

Individual pieces of construction equipment that would be used for Project construction produce maximum noise levels (L_{max}) of 74 dBA to 90 dBA at a reference distance of 50 feet from the noise source, as shown in Table IV.I-12 on page IV.I-27. These maximum noise levels would occur when equipment is operating under full power conditions (i.e., the equipment engine at maximum speed). However, equipment used on construction sites often operates under less than full power conditions, or part power. To more accurately characterize construction-period noise levels, the average (Hourly L_{eq}) noise level associated with each construction stage is calculated based on the quantity, type, and usage factors for each type of equipment that would be used during each construction stage.[25] These noise levels are typically associated with multiple pieces of equipment operating simultaneously.

Table IV.I-13 on page IV.I-28 provides the estimated construction noise levels for various construction stages at the off-site noise sensitive receptors. The estimated noise levels represent the worst-case scenario in which all construction equipment was assumed to operate simultaneously and was assumed to be located at the construction area nearest to the affected receptors. These assumptions represent the worst-case noise scenario as construction activities would typically be spread out throughout the entire site further away from the affected receptors. As indicated in Table IV.I-13, the estimated construction noise levels at the nearest off-site receptors R1, R2 and R4 would be well below the existing daytime ambient noise levels. At receptor R3, the estimated construction-related noise levels would be consistent with the lowest measured ambient noise levels. The estimated construction-related noise levels would be below the Project significance threshold. Therefore, noise impacts associated with the Project's on-site construction activities would be less than significant.

(b) Off-Site Construction Noise

In addition to on-site construction noise sources, materials delivery, concrete mix, haul trucks, and construction worker vehicles would require access to the Project Site during the construction phase. The major noise sources associated with off-site construction trucks would be associated with haul and delivery trucks. Construction trucks

[25] *Pursuant to the FHWA Roadway Construction Noise Model User's Guide, 2005, the usage factor is the percentage of time during a construction noise operation that a piece of construction is operating at full power.*

Table IV.I-12
Construction Equipment Noise Levels

Equipment	Estimated Usage Factor[a] %	Typical Noise Level at 50 feet from Equipment, dBA (L_{max})
Air Compressor	40	78
Cement and Mortar Mixer	50	80
Concrete Mixer Truck	40	79
Concrete Saw	20	90
Crane	16	81
Drill Rig	20	84
Forklift	10	75
Generator	50	81
Grader	40	85
Dump/Haul Truck	40	76
Excavator	40	81
Paver	50	77
Pump	50	81
Roller	20	80
Rubber Tired Loader	40	79
Tractor/Loader/Backhoe	40	80
Delivery Truck	40	74
Welders	40	74

would generally access the Project Site from the US-101. Inbound traffic would travel northbound on Cahuenga Boulevard East from the US-101 to the Project Site. Outbound traffic would travel northbound on Cahuenga Boulevard East to the US-101.

The peak period with the highest number of construction trucks (haul and delivery trucks) would occur during the combined site grading/excavation/building construction phase. During this peak period, there would be a maximum of 64 haul and 28 delivery coming to and leaving the Project Site (equal to 92 haul truck trips) per day. There would also be haul trucks and delivery trucks during other construction phases of the Project. However, the level of construction-related truck activity during the other phases would be lower with a maximum of 6 to 16 delivery/haul trucks per day. Therefore, to present a worst-case analysis, the analysis of off-site construction truck traffic noise impacts is based on the haul truck trips during a maximum worst-case day during the peak construction

Table IV.I-13
Construction Noise Impacts

Off-Site Receptor Location	Approximate Linear Distance from Receptor to Project Construction Area (feet)	Estimated Construction Noise Levels by Construction Phases L_{eq} (dBA)				Measured Ambient Noise Levels, L_{eq} (dBA)	Significance Threshold,[a] L_{eq} (dBA)	Significant Impact?
		Demolition	Grading/ Excavation	Building Foundation/ Construction	Landscape			
R1	675	43.4	40.9	40.9	39.1	51.3	56.3	No

Source: AES, 2014.

phase. Based on an eight-hour workday and a uniform distribution of trips, there would be a maximum of 12 truck trips per hour during the peak construction period. Table IV.I-14 on page IV.I-30 presents the estimated construction-related haul truck noise levels along the proposed haul routes with noise sensitive receptors. As indicated on Table IV.I-14, the noise level generated by haul trucks would be well below the existing daytime ambient noise level at the noise sensitive receptors along the haul routes. Therefore, noise impacts from off-site construction traffic would be less than significant.

(2) Construction Vibration

Construction activities can generate varying degrees of ground vibration, depending on the construction procedures and the type of construction equipment used. The operation of construction equipment generates vibrations that spread through the ground and diminish in amplitude with distance from the source. The effect on buildings located in the vicinity of the construction site often varies depending on soil type, ground strata, and construction characteristics of the receptor buildings. The results from vibration can range from no perceptible effects at the lowest vibration levels to low rumbling sounds and perceptible vibration at moderate levels. However, ground-borne vibrations from construction activities rarely reach levels that damage structures. Project construction activities would generate ground-borne vibration during site demolition and excavation/ grading activities when heavy construction equipment, such as large bulldozers, would be used. The FTA has published standard vibration velocities for various construction equipment operations. The typical vibration levels (in terms of inch-per-second Peak Particle Velocity, PPV) at a reference distance of 25 feet for construction equipment anticipated to be used during Project construction are listed in Table IV.I-15 on page IV.I-30.[26] Also included in Table IV.I-15 are the estimated vibration velocity levels at the nearest off-site structures to the Project construction area. As indicated in Table IV.I-15, vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. The estimated vibration velocity levels (from all construction equipment) would be well below the Project significance thresholds. Therefore, vibration impacts associated with potential building damage to off-site building structures during construction activities would be less than significant.

The existing on-site Amphitheatre is a historic structure. As discussed above, the appropriate significance threshold for older buildings that are susceptible to building damage is 0.12 PPV. Vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to

0.210 PPV at 25 feet from the equipment. Therefore, potential vibration impacts from building damage could be significant. With implementation of Mitigation Measure I-3 provided below, which would require that construction activities in close proximity (within approximately 20 feet) of the existing Amphitheatre structure utilize smaller equipment, such as a small bulldozer and handheld compactors, vibration levels would be reduced to

less than 0.12 PPV.. Therefore, with implementation of this mitigation measure, potential vibration impacts with respect to building damage would be reduced to less than significant.

Table IV.I-16 on page IV.I-32 provides the estimated vibration levels relative to human annoyance due to construction equipment at the off-site sensitive uses. As indicated in Table IV.I-16, the estimated ground-borne vibration levels from construction equipment would be below the significance threshold for human annoyance at all off-site sensitive receptors. Therefore, vibration impacts on human annoyance during the construction period would be less than significant.

Haul trucks during construction would generate ground-borne vibration as they travel along the Project designated haul routes. Thus, an analysis of potential vibration impacts associated with building damage from ground-borne vibration along the local haul route was conducted. Based on FTA data, the vibration generated by a typical truck would be approximately 63 VdB (0.006 PPV) at a distance of 50 feet from the truck.[27] At the shortest distance between haul trucks and sensitive receptors, haul/delivery trucks would be approximately 10 feet from nearby sensitive receptors along Cahuenga Boulevard East

(between the 101 Freeway northbound off-ramp and the Project Site). Vibration levels generated by the haul trucks at this distance would be 0.063 PPV, which would be well below the building damage threshold of 0.2 PPV for the residential buildings along Cahuenga Boulevard East. In addition, vibration levels generated by Project construction trucks along the haul routes would be similar to the existing truck traffic (e.g., delivery and trash collection trucks) already traveling on the same roads. Therefore, potential impacts associated with vibration from delivery/haul trucks traveling along the designated haul routes would be less than significant.

(3) Operational Noise

This section provides a discussion of potential operational noise impacts on nearby noise-sensitive receptors. Specific operational noise sources addressed herein include on-site stationary noise sources, which consist of outdoor mechanical equipment (e.g., HVAC ventilation system and exhaust fans), activities associated with the outdoor spaces and parking facilities, and off-site mobile (roadway traffic) noise sources.

(a) On-Site Stationary Noise Sources

(i) Mechanical Equipment

As part of the Project, new mechanical equipment (e.g., HVAC ventilation equipment and exhaust fans) would be located in various locations throughout the Project Site. Although operation of this equipment would generate noise, Project Design Feature I-1, provided above would ensure compliance with the County's Noise Ordinance, which would limit noise from mechanical equipment from exceeding the ambient noise levels on the premises of other occupied properties. In addition, as the Project's mechanical equipment would be designed to minimize noise to on-site uses and patrons, noise levels to off-site receptors from mechanical equipment would be further reduced. Therefore, noise impacts from mechanical equipment would be less than significant.

(ii) Outdoor Areas

The Project includes three outdoor plazas including the Ford Terrace, the Transit Plaza, and the Ford Plaza. For the noise analysis, it was estimated that up to 200 people could gather at the Ford Terrace, up to 250 people could gather at the Transit Plaza/Flex Space gathering area, and up to 1,200 people could gather at the Ford Plaza. To evaluate noise from these areas, reference noise levels of 75 dBA and 71 dBA L_{eq} at a distance of

3.3 feet were used to represent males and females speaking in a loud voice, respectively.[28] It was assumed that up to 50 percent of the people (half of which would be male and the other half female) would be talking at the same time. In addition, the Project would include a restaurant located at the Ford Plaza that would include an outdoor seating area with an amplified sound system. In order to comply with the County's Noise Ordinance, the amplified sound system at the restaurant outdoor seating area would be designed so as not to exceed a maximum noise level of 90 dBA (L_{eq}) at the restaurant outdoor seating area. Table IV.I-17 on page IV.I-34 presents the estimated noise levels from the outdoor areas at the off-site sensitive receptors. As indicated in Table IV.I-17, the estimated noise levels at all off-site locations would not exceed the existing ambient noise levels. Therefore, noise impacts from outdoor spaces would be less than significant.

(iii) Transportation Facilities

The Project includes two new three-level parking structures that would generally be located within the existing north and south surface parking areas that would be removed as part of the Project. Sources of noise within the parking structures would primarily include car movements (i.e., engine noise), doors opening, people talking, and intermittent car alarms. The Project would also introduce a new Transit Center at the north parking structure that would include a staging area for buses to load and unload. It is anticipated that there would be up to 10 buses loading/unloading at the Transit Center at any given time. Table IV.I-18 on page IV.I-35 presents the estimated noise levels from parking and transit areas at the off-site sensitive receptors. As indicated in Table IV.I-18, the estimated noise levels at all off-site locations would be below the existing ambient noise levels. Therefore, noise impacts from the parking structures and the transit center operations would be less than significant.

(iv) Performance Spaces

The proposed improvements to the existing Amphitheatre include a new 800 square-foot projection booth and control room, a new sound wall (up to 48 feet in height) along the rear of the Amphitheatre, and a retractable shade structure that would provide cover for the Amphitheatre during day time performances. The new sound wall would provide shielding of the freeway noise for the Amphitheatre. In addition, the sound wall would also provide shielding of the Amphitheatre sound system to the exterior. Although the proposed sound wall could be as high as 48 feet, which would provide substantial sound attenuation, to provide a conservative analysis, a sound wall height of 27 feet was used as this is the lowest height the sound wall could be. The Project also includes two new performance

venues including a 299 seat indoor theater located at the Ford Plaza and a Flex Space that would provide for a 99 seat indoor theater. The analysis for the performance spaces accounted for audience cheering as well as an amplified sound system. For the audience cheering source, noise levels of 88 dBA and 85 dBA (L_{eq} at a distance of 3.3 feet distance for males and females, respectively were used.[29] As specified by Project Design Feature I-2, the proposed amplified sound system for the Amphitheatre would be designed to generate a maximum sound level of 95 dBA (L_{eq}) at as measured in "slow" response at the house mixer location). Similarly, the assumed sound levels generated by the amplified sound system inside the 299 seat theater and the 99 seat Flex Space would be approximately 95 dBA (L_{eq}). In addition, in accordance with Project Design Feature I-3, the building structure of the 299-seat theatre and the Flex Space would be designed to provide a minimum 25 dBA noise reduction.

Table IV.I-19 on page IV.I-36 presents the estimated noise levels from the performance spaces at the off-site sensitive receptors. Noise levels from the Amphitheatre are estimated to be similar to the existing conditions, as the size, types of programs and

Source: AES, 2014.

seating capacity would remain similar to existing conditions. In addition, the sound system for the Amphitheatre would be design to limit the sound output from the speakers to 95 dBA at the house mixer location, similar to existing conditions. As indicated in Table IV.I-19 on page IV.I-36, the estimated noise levels from the performance spaces would be well below the ambient noise levels at receptors R2 and R4. The estimated noise levels from the Amphitheatre amplified sound systems at receptors R1 and R3 would be approximately 0.5 dBA and 2.7 dBA higher than the existing ambient noise levels. However, the measured ambient noise levels do not include the existing Amphitheatre operation-related activities, which would result in higher ambient noise levels due to noise generated from performances within the Amphitheatre. It is further noted that the noise levels from the new 299-seat theatre and Flex Space would be contained within the building structures and are estimated to be well below the existing ambient noise levels. Therefore, the noise levels from the performance spaces including the new facilities would be similar to existing conditions with the Amphitheatre being in operation. As such, noise impacts from the performance spaces would be less than significant.

(v) Loading Dock/Trash Collection Areas

The Project would include a new Service Court, which would include a new loading dock and trash/recycling areas. Based on measured noise levels from typical loading dock facilities, delivery trucks (while idling at the loading dock) could generate noise levels of approximately 71 dBA (L_{eq}) at a distance of 50 feet from the noise source. In addition, trash compactors would generate noise levels of approximately 66 dBA (L_{eq}) at a distance

Table IV.I-19
Estimated Noise Levels from Performance Spaces

Receptor Location	Existing Nighttime Ambient Noise Levels, dBA (L_{eq})	Estimated Noise Levels from the Performance Spaces, dBA (L_{eq})				Significance Threshold[b]	Significant Impact?

of 50 feet. Table IV.I-20 on page IV.I-37 presents the estimated noise levels from the loading dock/trash collection areas at the off-site sensitive receptors. As indicated in Table IV.I-20, the estimated noise levels from the loading dock/trash collection areas at all off-site locations would be well below the existing ambient noise levels. Therefore, noise impacts from loading dock/trash collection operations would be less than significant.

(b) Off-Site Traffic (Mobile Sources)

(i) Future plus Project

Future roadway noise levels were calculated along 11 off-site roadway segments in the vicinity of the Project Site. The off-site roadway noise levels were calculated using the traffic data provided in the Project's traffic study. As discussed in the traffic study, the Project is expected to generate 35 net new trips during the weekday A.M. peak hour, 60 net new trips during the weekday P.M. peak hour, 117 net new trips during the weekday event peak hour, 92 net new trips during the Saturday midday event peak hour, and 92 net new trips during the Saturday evening event peak hour.

Table IV.I-20

Source: AES, 2014.

The off-site traffic noise impacts for a typical weekday and weekend day are presented in Table IV.I-21 and Table IV.I-22 on pages IV.I-38 and IV.I-40), respectively. The calculated CNEL levels overestimate noise levels as they are calculated in front of the roadways and do not account for the presence of any physical sound barriers or intervening structures. As shown therein, the Project would result in a maximum increase of 0.2 dBA (peak-hour L_{eq} and 24-CNEL) in traffic-related noise levels along Odin Avenue during both the weekday and weekend. The estimated noise increase due to Project-related traffic would be well below the 3 dBA significance threshold. Therefore, off-site traffic noise impacts associated with future plus Project conditions would be less than significant.

(ii) Existing plus Project

The analysis of off-site traffic noise impacts above was based on the incremental increase in traffic noise levels attributable to future with Project conditions as compared to future without Project conditions. Additional analysis was made to determine the potential noise impacts based on the increase in noise levels due to Project-related traffic compared with the existing baseline traffic noise conditions.

Table IV.I-23 and Table IV.I-24 on pages IV.I-42 and IV.I-44 present the off-site traffic noise impacts as compared with existing conditions, for a typical weekday and weekend day. As indicated therein, the maximum Project-related traffic noise increase would be 0.2 dBA CNEL along Odin Avenue. The estimated increase in off-site traffic noise levels would be below the 3-dBA CNEL significance threshold. Therefore, off-site traffic noise impacts associated with the existing plus Project traffic conditions would be less than significant.

(c) Composite Noise Level Impacts from Project Operations

In addition to considering the potential noise impacts to neighboring noise-sensitive receptors from each specific off-site and on-site noise source (i.e., traffic, mechanical equipment, outdoor areas, performance spaces, and parking facilities), an evaluation of the potential composite noise level increase (i.e., noise levels from all noise sources combined) at the analyzed sensitive receptor locations was also performed. Table IV.I-25 on page IV.I-47 presents the estimated composite noise levels in terms of CNEL at the off-site sensitive receptors. As indicated in Table IV.I-25, the Project would result in an increase of 1.0 dBA (at Location R3) to 1.4 dBA (at Location R1) at the off-site receptors in the vicinity of the Project Site. No noise increase is anticipated at Locations R2 and R4. The estimated increases in noise levels due to Project operation would be below the 3 dBA CNEL significance threshold. Therefore, composite noise level impacts due to the Project operations would be less than significant.

4. Cumulative Impacts

a. Construction Noise and Vibration

A total of 27 related projects have been identified in the vicinity of the Project Site. Noise from construction of development projects is typically localized and has the potential to affect areas within 500 feet from the construction site. Thus, noise from construction activities for two projects within 1,000 feet of each other can contribute to a cumulative noise impact for receptors located midway between the two construction sites. The nearest related project is the Related Project No. 22 (a hotel development at 1841 Highland Avenue), which is approximately 0.8 mile from the Project Site. Other related projects are located further from the Project Site. Due to the distance attenuation and intervening buildings between the related projects, cumulative noise impacts from construction activities would be less than significant.

As previously discussed, ground-borne vibration decreases rapidly with distance. Potential vibration impacts due to construction activities are generally limited to buildings/structures that are located in close proximity of the construction site (i.e., within 50 feet). As indicated above, the nearest related project is approximately 0.8 mile from the Project. Therefore, due to the rapid attenuation characteristics of ground-borne vibration, there is no potential for a cumulative construction impact with respect to ground-borne vibration.

Table IV.I-25
Composite Noise Impacts

Receptor Location	Existing Ambient Noise Levels, CNEL (dBA)	Calculated Project-Related Noise Sources, CNEL (dBA)						Project Composite Noise Levels, CNEL (dBA)	Ambient plus Project Noise Levels, CNEL (dBA)	Increase in Noise Levels due to Project, CNEL (dBA)	Significant Impact?
		Traffic	Mechanical Equipment	Parking/ Transit Center	Outdoor Plazas/ Restaurant	Performance Spaces	Loading/ Trash Collection				
R1	55.7	36.1	32.7	28.4	41.3	50.8	15.1	51.4	57.1	1.4	No
R2	80.0	58.0	35.2	31.2	46.8	51.6	15.2	59.2	80.0	0.0	No
R3	59.3	45.1	32.0	27.9	42.6	52.0	28.1	53.3	60.3	1.0	No
R4	80.6	50.9	36.4	39.2	48.6	48.1	12.5	54.3	80.6	0.0	No

Source: AES, 2014.

b. Long-Term Operations

Due to provisions set forth in the LAMC that limit stationary source noise from items such as roof-top mechanical equipment, noise levels from these sources would be less than significant at the property line for each related project. In addition, with implementation of regulatory requirements and the proposed Project Design Features presented in this section, noise impacts associated with operations within the Project Site would be less than significant. Based on the distance of the related projects from the Project Site and the noise levels associated with the Project, cumulative stationary source noise impacts associated with operation of the Project and related projects would be less than significant.

The Project and other related development in the area would produce traffic volumes (off-site mobile sources) that would generate roadway noise. Cumulative noise impacts due to off-site traffic were analyzed by comparing the projected increase in traffic noise levels from existing conditions to future plus Project conditions to the applicable significance criteria. Future cumulative conditions include traffic volumes from future ambient growth, related projects, and the Project. The calculated traffic noise levels under existing and future plus Project conditions are presented in Table IV.I-26 on page IV.I-49 (for typical weekday) and in Table IV.I-27 on page IV.I-51 (for typical weekend). As shown therein, cumulative traffic volumes during a typical weekday would result in a maximum increase of 1.9 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. During a typical weekend, the maximum cumulative traffic noise increase would be 2.5 dBA (peak hour with event) along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. At all other analyzed roadway segments, the increase in cumulative traffic noise would be lower. Thus, the cumulative traffic noise increase would be below the 3 dBA significance threshold. Therefore, cumulative noise impacts due to off-site mobile noise sources associated with the Project, future growth, and related projects would be less than significant.

5. Mitigation Measures

a. Construction

Mitigation Measure I-1: Power construction equipment (including combustion engines), fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards). All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated.

Mitigation Measure I-2: Project construction shall not include the use of driven pile systems.

Mitigation Measure I-3: Contractor shall utilize smaller construction equipment, such as small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure.

b. Operation

As analyzed above, operation of the Project would result in less than significant. Therefore, no mitigation measures required.

6. Conclusion

a. Construction

Compliance with regulatory requirements and Implementation of the mitigation measures above would reduce noise and vibration impacts associated with Project construction to a less than significant level. As discussed above, cumulative construction noise and vibration impacts would also be less than significant.

b. Operation

Project-level and cumulative impacts with regard to operational noise would be less than significant.

IV. Environmental Impact Analysis

J.1 Public Services—Fire Protection

1. Introduction

This section provides an analysis of the Project's potential impacts on fire protection and emergency medical services. As described throughout this Draft EIR, while the Ford Theatres are owned and operated by the County of Los Angeles, the Project Site is located within the City of Los Angeles. Accordingly, the Project would be built in accordance with the County of Los Angeles Fire Department (County Fire Department) requirements and emergency fire protection and medical services for the Project Site would be provided by the City of Los Angeles Fire Department (LAFD). The analysis provided herein describes existing fire protection and emergency medical services in the Project vicinity and addresses service capacity, fire flow requirements, emergency response times, emergency access, and the ability of the LAFD to provide adequate fire protection services based on current equipment and staffing levels. The analysis is based, in part, on information provided by the LAFD, which is included in Appendix K of this Draft EIR, and the County Fire Department as well the *Water System and Supply Study* prepared for the Project by Mollenhauer in March 2014, which is included in Appendix M of this Draft EIR.

2. Environmental Setting

a. Regulatory Framework

(1) State

The California Building Code (California Code of Regulations, Title 24) is a compilation of building standards, including fire safety standards for new buildings, which are provided in the California Fire Code (California Code of Regulations, Title 24, Part 9). California Building Code standards are based on building standards that have been adopted by state agencies without change from a national model code; building standards based on a national model code that have been changed to address particular California conditions; and building standards authorized by the California legislature but not covered by the national model code. The 2013 edition of the California Building Code became effective on January 1, 2014 and incorporates by adoption the 2012 edition of the

International Building Code of the International Code Council, with California amendments.[1] The building standards in the California Building Code apply to all locations in California, except where more stringent standards have been adopted by State agencies and local governing bodies. The 2013 California Fire Code also went into effect on January 1, 2014.[2] Typical fire safety requirements of the California Fire Code include: the installation of fire sprinklers in all high-rise buildings; the establishment of fire resistance standards for fire doors, building materials, and particular types of construction; and the clearance of debris and vegetation within a prescribed distance from occupied structures within wildfire hazard areas. Also addressed are fire flow requirements, fire hydrant spacing, and access road specifications. Specific California Fire Code fire safety regulations have been incorporated by reference in both the Los Angeles County Code and the City of Los Angeles Municipal Code (LAMC), with local amendments.

In addition, Title 19 of the California Code of Regulations addresses public safety and includes State Fire Marshal requirements (California Code of Regulations, Title 19, Division 1), which incorporate general fire and panic safety standards. Included among these are specifications regarding fire department access and egress, fire alarms, emergency planning, and evacuation procedures.

(2) County of Los Angeles

(a) Los Angeles County General Plan

The current General Plan, adopted in 1980, includes relevant policies that focus on the coordination of fire fighting efforts and the reduction of fire hazards. Refer to Section IV.H, Land Use, of this Draft EIR for a listing of the General Plan policies that pertain to fire protection. As discussed in the General Plan policy consistency analysis provided therein, the Project would be consistent with the applicable General Plan polices related to fire protection.

(b) Los Angeles County Fire Code and Building Code

The Los Angeles County Fire Code (County Code, Title 32) and Building Code (County Code, Title 26) establish standards for the construction, design, and distribution of fire suppression facilities. The requirements address such issues as fire flow, minimum

---

[1] *California Building Commission, California Building Standards Code (Title 24, California Code of Regulations), http://www.bsc.ca.gov/codes.aspx, accessed March 17, 2014.*

[2] *California Fire Code, Title 24, https://law.resource.org/pub/us/code/bsc.ca.gov/gov.ca.bsc.2013.09.pdf, accessed March 17, 2014.*

distance to fire stations, and public and private fire hydrants. With respect to fire flows, water pressure, and hydrant spacing, the County Fire Code requirements vary based on land use, building size, density, and terrain. In addition, fire prevention issues addressed in the County Fire Code include the provision of access roads, adequate road widths, and clearance of brush around structures located in hillside areas that are considered wildland fire risk areas.

Specific requirements within wildland fire risk areas include preparation and implementation of fuel modification plans, which are required to be submitted to the Forestry Division of the County Fire Department for review and approval prior to the issuance of building permits. According to section 4902.1 of the County Fire Code, a fuel modification plan shall consist of a set of scaled plans that include a plot plan showing fuel modification zone(s) indicated with applicable assessment notes, a detailed landscape plan, and an irrigation plan. The fuel modification plan shall be prepared by a State licensed landscape architect, State licensed landscape contractor, a landscape designer, or an individual with expertise acceptable to the Forestry Division. As part of fuel modification plans, a fuel modification zone shall be identified. A fuel modification zone is a strip of land where combustible native or ornamental vegetation has been modified and/or partially or totally replaced with drought-tolerant, fire resistant plants. Fuel modification zones are strategically placed around developments as a buffer to open space or areas of natural vegetation to provide defensible space necessary for effective fire protection.[3]

(3) City of Los Angeles

(a) City of Los Angeles Charter

Section 520 of the Los Angeles City Charter states that the LAFD's duty is to control and extinguish injurious or dangerous fires and to remove that which is liable to cause those fires. It also requires the LAFD to enforce all ordinances and laws relating to the prevention or spread of fires, fire control, and fire hazards within the City, as well as to conduct fire investigations and protect lives and property in case of disaster or public calamity.

(b) Los Angeles General Plan Framework Element

The City of Los Angeles General Plan Framework Element (General Plan Framework), adopted in December 1996 and readopted in August 2001, sets forth general

[3] *County of Los Angeles Fire Department, Fuel Modification Plan Guidelines, Adopted January 1998, www.fire.lacounty.gov/Forestry/PDF/FuelModificationPlan.pdf, accessed March 17, 2014.*

guidance regarding land use issues for the entire City of Los Angeles and defines citywide policies regarding land use, including infrastructure and public services. Under the General Plan Framework, the City standard for response distance from a fire station is 1.5 miles.[4]

(c) City of Los Angeles General Plan Safety Element

The City's General Plan Safety Element, adopted on November 26, 1996, includes policies related to the City's response to hazards and natural disasters, including fires. In particular, the General Plan Safety Element sets forth requirements, procedures, and standards to facilitate effective fire suppression and emergency response capabilities. For example, Policy 2.1.6 requires the LAFD to revise regulations and procedures to include the establishment of minimum standards for the location and expansion of fire facilities based on fire flow, intensity and type of land use, life hazard, occupancy, and degree of hazard so as to provide adequate fire and emergency medical service response. In addition, the City of Los Angeles General Plan Safety Element designates disaster routes. The nearest designated disaster route to the Project Site is Highland Avenue, located approximately 0.2 mile west of the Project Site.[5]

(d) Los Angeles Municipal Code

The Fire Prevention and Protection Chapter of the City of Los Angeles Municipal Code sets forth regulatory requirements pertaining to the prevention of fires, the investigation of fires and life safety hazards, the elimination of fire and life safety hazards in any building or structure (including buildings under construction), the maintenance of fire protection equipment and systems, and the storage, use, and handling of hazardous materials.[6]

Section 57.507.3.3 of the LAMC states the maximum response distance for industrial and commercial uses, which includes the Project, from fire stations with an engine company is one mile and the maximum response distance from fire stations with a truck company is 1.5 miles. Where a response distance is greater than that which is allowable, all structures must be constructed with automatic fire sprinkler systems.

[5] *City of Los Angeles General Plan Safety Element, Exhibit H, adopted by the City Council, November 26, 1996.*

[6] *LAMC Article 7, Chapter V, Former Article 7 Repealed and Replaced by Ordinance Number 182,822, effective January 10, 2014, known as the Los Angeles Fire Code. This updated version of the Los Angeles Fire Code incorporates by reference portions of the 2013 edition of the California Fire Code and the 2012 edition of the International Fire Code.*

b. Existing Conditions

(1) Fire Protection Facilities, Services, and Response Times

As discussed above, fire protection and emergency medical services to the Project Site would be provided by LAFD. The LAFD serves as the City of Los Angeles' life safety agency with approximately 3,586 uniformed fire personnel, providing fire prevention, firefighting, emergency medical care, technical rescue, hazardous materials mitigation, disaster response, public education, and community services. There are 106 neighborhood fire stations strategically located across the LAFD's 471-square-mile jurisdiction. At any given time, a total of 1,104 firefighters, including 242 paramedics, are on 24-hour duty. In addition, the LAFD is supported by 353 technical and administrative personnel.[7]

As shown in Figure IV.J.1-1 on page IV.J.1-6, there are three LAFD fire stations located in the vicinity of the Project Site. The closest station to the Project Site is Fire Station No. 76, which is the designated "first in" station, located at 3111 Cahuenga Boulevard East, approximately one mile north of the Project Site.[8] As shown in Table IV.J.1-1 on page IV.J.1-7, Fire Station No. 76 consists of one fire engine, one basic life support (BLS) paramedic rescue ambulance and houses six full-time firefighters.[9] Secondary fire stations that serve the Project Site include Fire Station No. 27 located at 1327 North Cole Street, approximately 1.7 miles south of the Project Site and Fire Station No. 41 located at 1439 Gardner Street, approximately 2.1 miles southwest of the Project Site. As shown in Table IV.J.1-1, equipment at Fire Station No. 27 consists of one engine, one pump engine, one ladder truck, and two ambulances, and Fire Station No. 27 houses 15 firefighters and a battalion chief. Equipment at Fire Station No. 41 consists of one engine, one advance life support (ALS) ambulance, and one BLS ambulance and Fire Station No. 41 houses eight full-time firefighters.

As shown in Table IV.J.1-2 on page IV.J.1-8, Fire Station No. 76 has an average emergency response time of 6 minutes, 41 seconds. Fire Station No. 27 has an average emergency response time of 5 minutes, 4 seconds, and Fire Station No. 41 has an average emergency response time of 5 minutes, 45 seconds.

Los Angeles Fire Department Fire Stations Located in the Project Vicinity

Station No., Location, and Community Served	Distance from Project Site	Equipment	Staffing
Fire Station No. 76 3111 Cahuenga Boulevard East Cahuenga Pass	1 mile	• 1 Engine • 1 BLS Ambulance	• 6 full-time firefighters
Fire Station No. 27 1327 North Cole Avenue Hollywood	1.7 miles	• 1 Pump engine • 1 Engine • 1 Ladder Truck • 2 Ambulances	• 1 Battalion Chief • 15 Firefighters
Fire Station No. 41 1439 North Gardner Avenue Hollywood (Hills and Northwest)	2.1 miles	• 1 Engine • 2 Ambulances (BLS & ALS)	• 8 full-time Firefighters

Source: Email correspondence from Luke A. Milick, Captain I, LAFD, Hydrant and Access Unit, March 11, 2014. See Appendix K of this Draft EIR.

(2) Emergency Access

Access to the Project Site, including emergency access, is currently provided via four driveways along the east side of Cahuenga Boulevard East.

(3) Fire Water Infrastructure

The Los Angeles Department of Water and Power (LADWP) provides water for domestic and firefighting services to the Project Site. Domestic and fire water service to the Project Site is provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. Based on a Service Advisory Report coordinated between LADWP and the County Fire Department, included in Appendix K of this Draft EIR, the water main has a fire flow of 1,750 gallons per minute (gpm) at a residual pressure of 72 pounds per square inch (psi). The Project Site is served by two existing public fire hydrants located along the public sidewalk of Cahuenga Boulevard, west of the Project Site. Currently, the Project Site does not have a dedicated separate fire service meter, supply line, or on-site fire hydrants.

Table IV.J.1-2
Average Emergency Medical Service and Structure Fire Response Times[a]

Station	Average Response Time to (Minutes:Seconds)
Fire Station No. 76	6:41
Fire Station No. 27	5:04
Fire Station No. 41	5:45

[a] *The average time to respond to an emergency medical service and structure fire emergency call combined.*

Source: Email correspondence from Luke A. Milick, Captain I, LAFD, Hydrant and Access Unit, March 11, 2014. See Appendix K of this Draft EIR.

(4) Wildfire Risk

Due to unique fuel, terrain, and climatic conditions, brush fires are a major threat to life and property throughout the southern California region. Areas in the City and the County that are susceptible to wildfires include areas that lie within the urban/wildland interface. The Project Site is situated within the Hollywood Hills, surrounded by relatively steep, undeveloped hillsides. As such, the Project Site is located within a Very High Fire Hazard Severity Zone as identified by the City of Los Angeles.[10]

(5) Fiscal Year 2011-2012 LAFD Deployment Plan[11]

Economic conditions over the last several years have resulted in greatly reduced revenues for the City, resulting in cutbacks to City services. In Fiscal Year 2009, the City requested that the LAFD cut its budget by 30 percent. In response to this condition, the LAFD operated with reduced services, in a program called the Modified Coverage Plan. This plan was implemented as an urgent method of containing an unexpected and substantial budget shortfall. As of fiscal year 2011–2012, the LAFD replaced the Modified Coverage Plan with the new Deployment Plan. The Deployment Plan reduces the size of the LAFD due to economic conditions with the objective to create a more effective LAFD using modern technology. This realignment allowed the LAFD to suspend staffing for 7 light forces and 11 engines. However, these apparatuses have not been removed from

[10] *City of Los Angeles Department of City Planning, Zone Information and Map Access System (ZIMAS), Parcel Profile Report, http://zimas.lacity.org/, accessed March 17, 2014*

[11] *LAFD. The New LAFD Deployment Plan, http://lafd.org/community/136-spotlight-articles/416-the-new-lafd-deployment-plan, accessed April 9, 2013.*

service, and the staff from the 18 affected companies has been used to fill other vacant positions within the Department. Under the Deployment Plan, all fire stations have been kept open and since each fire station maintains a minimum of one fire suppression resource and one paramedic unit, response times are not anticipated to change. As such, under the Deployment Plan, LAFD strives to reach all emergency medical service incidents within an estimated 5-minute period ninety percent of the time.

3. Environmental Impacts

a. Methodology

Consultation with the County Fire Department and LAFD was conducted to determine the Project's effect on fire protection and emergency medical services. Fire service needs are dependent on the size of the service population and the geographic area served, the number and types of calls for service, and the characteristics of a project and its surrounding community. Impacts regarding fire services are evaluated by the County Fire Department and LAFD on a project-by project basis, taking into account a project's land use(s), fire protection needs, and whether the project site meets the recommended response time and distance requirements, as well as project design features that would reduce or increase the demand for fire protection services. Additionally, consideration is given to the project size and components, required fire-flow, fire hydrant sizing and placement standards, access, and potential to use or store hazardous materials on-site.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to fire protection would be significant if the Project would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services.

Additionally, based on Appendix G of the CEQA Guidelines, Project impacts with regard to hazards and hazardous materials associated with wildland fires would be significant if the Project would:

- Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

c. Project Design Features

The Project would incorporate building design features that comply with County and City of Los Angeles fire safety requirements, as applicable. Fire safety design features may include, but would not be limited to, the following: use of fire-resistant building materials where appropriate, smoke detection and fire alarm systems, automatic sprinkler systems, portable fire extinguishers, emergency exit signage in all buildings, and fuel modification/brush clearance. The following specific project design features would be included as part of the Project:

Project Design Feature J.1-1: A final fuel modification plan shall be prepared for the Project for review and approval by the County of Los Angeles Fire Department Fuel Modification Unit. The fuel modification plan shall include 30 foot and 200 foot buffer zones from all new structures. The 30 foot buffer zone shall provide for replanting of low-growing, irrigated drought-tolerant plant material as a means to prevent erosion and transition to the native character of the Project Site. The 200 foot buffer zone shall provide for seasonal clearing of brush and, as needed, pruning of trees to reduce the amount of potential plant material that could fuel a fire.

Project Design Feature J.1-2: Fire department access shall be provided to within 150 feet of building openings. The final design of the access driveways and internal roadways shall be coordinated with the County Fire Department and LAFD, as applicable. The proposed circular, fire department turn-around shall be a pumper truck-sized turn-around.

Project Design Feature J.1-3: The Project shall provide automatic fire sprinkler systems, approved by the County Fire Department, within all of the new buildings. With installation of fire sprinkler systems within all of the new buildings, the required fire flow shall be 4,000 gallons per minute with a residual pressure of 20 pounds per square inch.

Project Design Feature J.1-4: To accommodate the required fire flow, the Project shall provide two connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East.

Project Design Feature J.1-5: The Project shall provide fire hydrants within the Project Site as coordinated with the County Fire Department and LAFD. Booster pumps shall be provided for all proposed fire

hydrants to meet the minimum fire flow rate and pressure requirements of the Project.

Project Design Feature J.1-6: The proposed fire system shall be a dedicated separate fire service system with no shared connections to the domestic supply lines.

d. Analysis of Project Impacts

(1) Construction

Project construction could temporarily increase the demand for fire protection and emergency medical services within the Project Site as construction activities could potentially expose combustible materials such as wood, plastics, sawdust, covers and coatings, to sources of ignition from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings, and lighted cigarettes. In compliance with Occupational Safety and Health Administration and Fire and Building Code requirements, construction managers and supervisory personnel would be trained in emergency response and fire safety operations, including the monitoring and management of life safety systems and facilities, and maintaining fire suppression equipment such as fire extinguishers on-site. Additionally, the Project would comply with County requirements to ensure brush clearance and other applicable measures are followed to reduce the likelihood of fire spreading through the surrounding undeveloped hillsides. Therefore, construction impacts on fire protection and emergency medical services would be less than significant.

Emergency access for City Fire Department vehicles within the Project Site and the surrounding vicinity could also be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. As a result, Project construction activities could increase response time for emergency vehicles along Cahuenga Boulevard East and main connectors. However, as discussed in detail in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, the Project would implement a Construction Management Plan during construction of the Project, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure emergency access to the Project Site and vicinity is maintained. In addition, construction worker and haul truck trips would generally occur outside the typical weekday commuter morning and afternoon peak periods. Further, emergency vehicles would utilize emergency sirens to clear a path of travel or drive in opposing traffic lanes to avoid heavy traffic. As such, impacts related to emergency access would be less than significant.

(2) Operation

(a) Facilities and Equipment

As described in Section II, Project Description, of this Draft EIR, the Project includes the rehabilitation of portions of the existing Amphitheatre and the development of new performance and rehearsal, restaurant, and office uses. The Project does not include the development of any new residential uses and, as such, would not increase the permanent residential population within the service area of Fire Station No. 76. However, the Project would generate an increase in the daytime population associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. As such, the Project's increase in the population within the Project Site would increase the demand for LAFD fire protection and emergency medical services.

As provided in Appendix K of this Draft EIR, in order to adequately identify and assess the full range of the Project's potential impacts on fire protection services, early consultation with the County Fire Department and LAFD was conducted. As indicated by the LAFD, no changes are currently proposed within Battalion 5, which includes the fire station that services the Project Site.[12] In addition, the Project would incorporate building design features that comply with County and City fire safety requirements, as applicable, including, but not limited to, use of fire-resistant building materials where appropriate, smoke detection and fire alarm systems, automatic sprinkler systems, and portable fire extinguishers. Further, as set forth in Project Design Feature J.1-1 above, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required. All plantings would be in accordance with the Fuel Modification Plan Guidelines and would require Fire Department approval prior to installation, and undesirable plant species would be avoided except as permitted at specified distances from structures.[13] In addition, the County Fire Department would conduct annual inspections for brush clearance compliance, typically between April and June. A preliminary fuel modification plan has been prepared for the Project and is illustrated in Figure IV.J.1-2 on page IV.J.1-13. The final fuel modification plan would be submitted for review and approval to the County Fire Department Fuel Modification Unit. Implementation of a fuel modification plan would serve to provide adequate defensible space around all potentially combustible structures within a

---

[12] *Fire Station No. 76, the "first-in" station for the Project Site is located within Battalion 5. Battalion 5 includes a total of seven fire stations, including the secondary fire stations available to serve the Project Site (Fire Station Nos. 27 and 41).*

[13] *Undesirable plant species include chamise (Adenostoma fasciculatum), California sagebrush (Artemisia californica), buckwheat (Eriogonum fasciculatum), black sage (Salvia mellifera), cypress (Cupressus* *(Footnote continued on next page)*

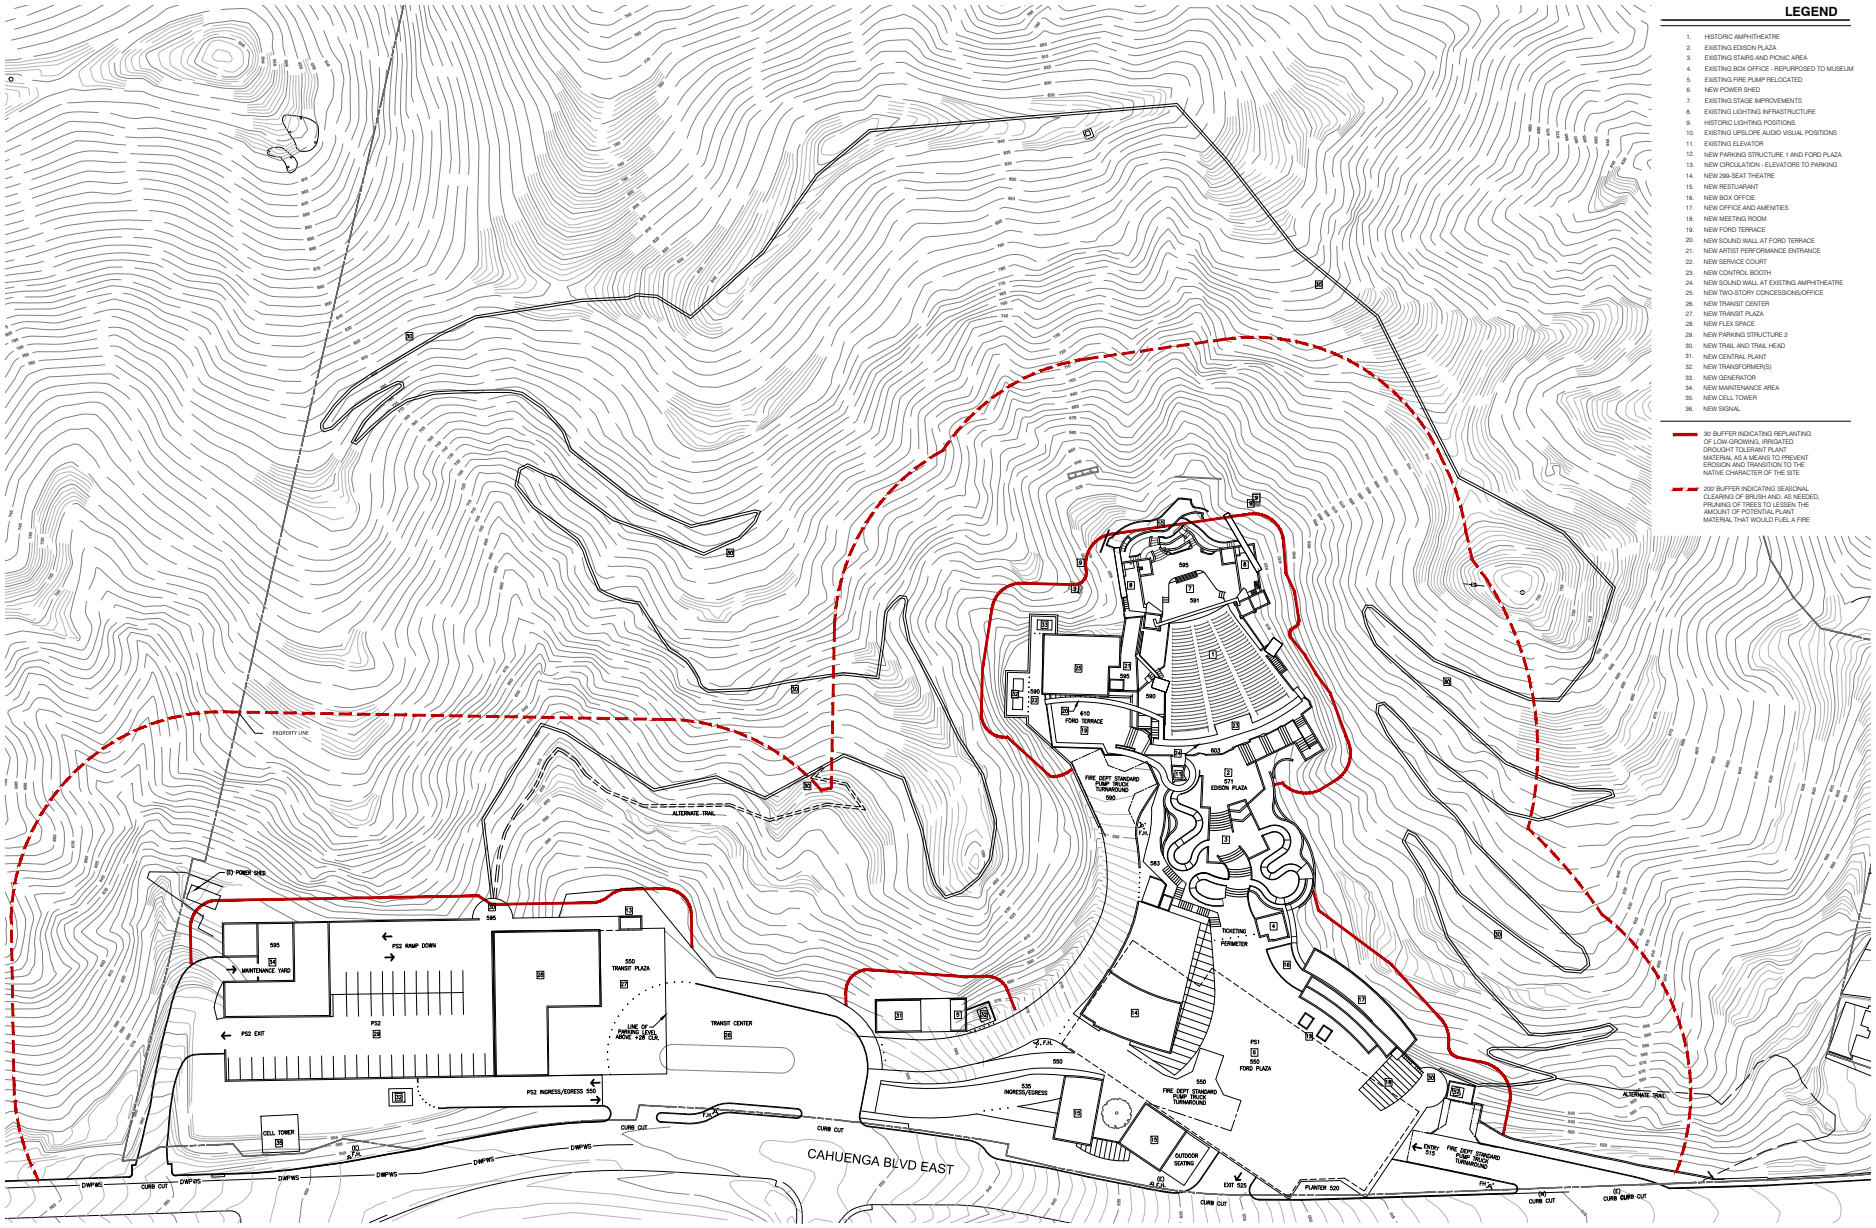

Figure IV.J.1-2
Preliminary Fuel Modification Plan

Source: Levin & Associates Architects, 2014.

fire environment. Compliance with applicable regulatory requirements would ensure that adequate fire prevention features would be provided that would reduce the demand for firefighting services. Therefore, based on the type of development proposed and the availability of existing LAFD facilities, impacts with regard to LAFD facilities and equipment associated with the Project would be less than significant

(b) Response Distance and Emergency Access

Pursuant to Section 57.507.3.3 of the LAMC, the required emergency response distance for industrial and commercial uses is one mile from fire stations with an engine company, and 1.5 miles from fire stations with a truck company. As previously discussed, Fire Station No. 76 is located approximately one mile northwest of the Project Site and is equipped with one engine and one ambulance. Therefore, the Project would be located within the required emergency response distance.

As described in Section II, Project Description, of this Draft EIR, upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. Specifically, to facilitate access and circulation within the proposed Transit Center, the Project includes one new driveway between the northernmost driveway and the main entrance at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge. The existing circular driveway at the upper gate would also be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access. In addition, the Project would incorporate specific access recommendations provided by the County Fire Department and LAFD as set forth in Project Design Feature J.1-2 above. Project-related traffic would have the potential to increase emergency vehicle response times to the Project Site and surrounding properties due to travel time delays caused by traffic. However, as discussed in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest disaster route along Highland Avenue. Further, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and LAFD. Therefore, Project-related traffic is not anticipated to impair the LAFD from responding to emergencies at the Project Site or the surrounding area. Impacts with regard to response distance and emergency access would be less than significant.

(c) Fire Flow

As discussed in Section IV.L.1, Utilities and Service Systems—Water, of this Draft EIR, of this Draft EIR, domestic and fire water service to the Project Site would continue to be supplied by LADWP. As described in Section II, Project Description, of this Draft EIR, infrastructure improvements related to fire service would include installation of four onsite fire hydrants, illustrated in Figure IV.J.1-3 on page IV.J.1-16.

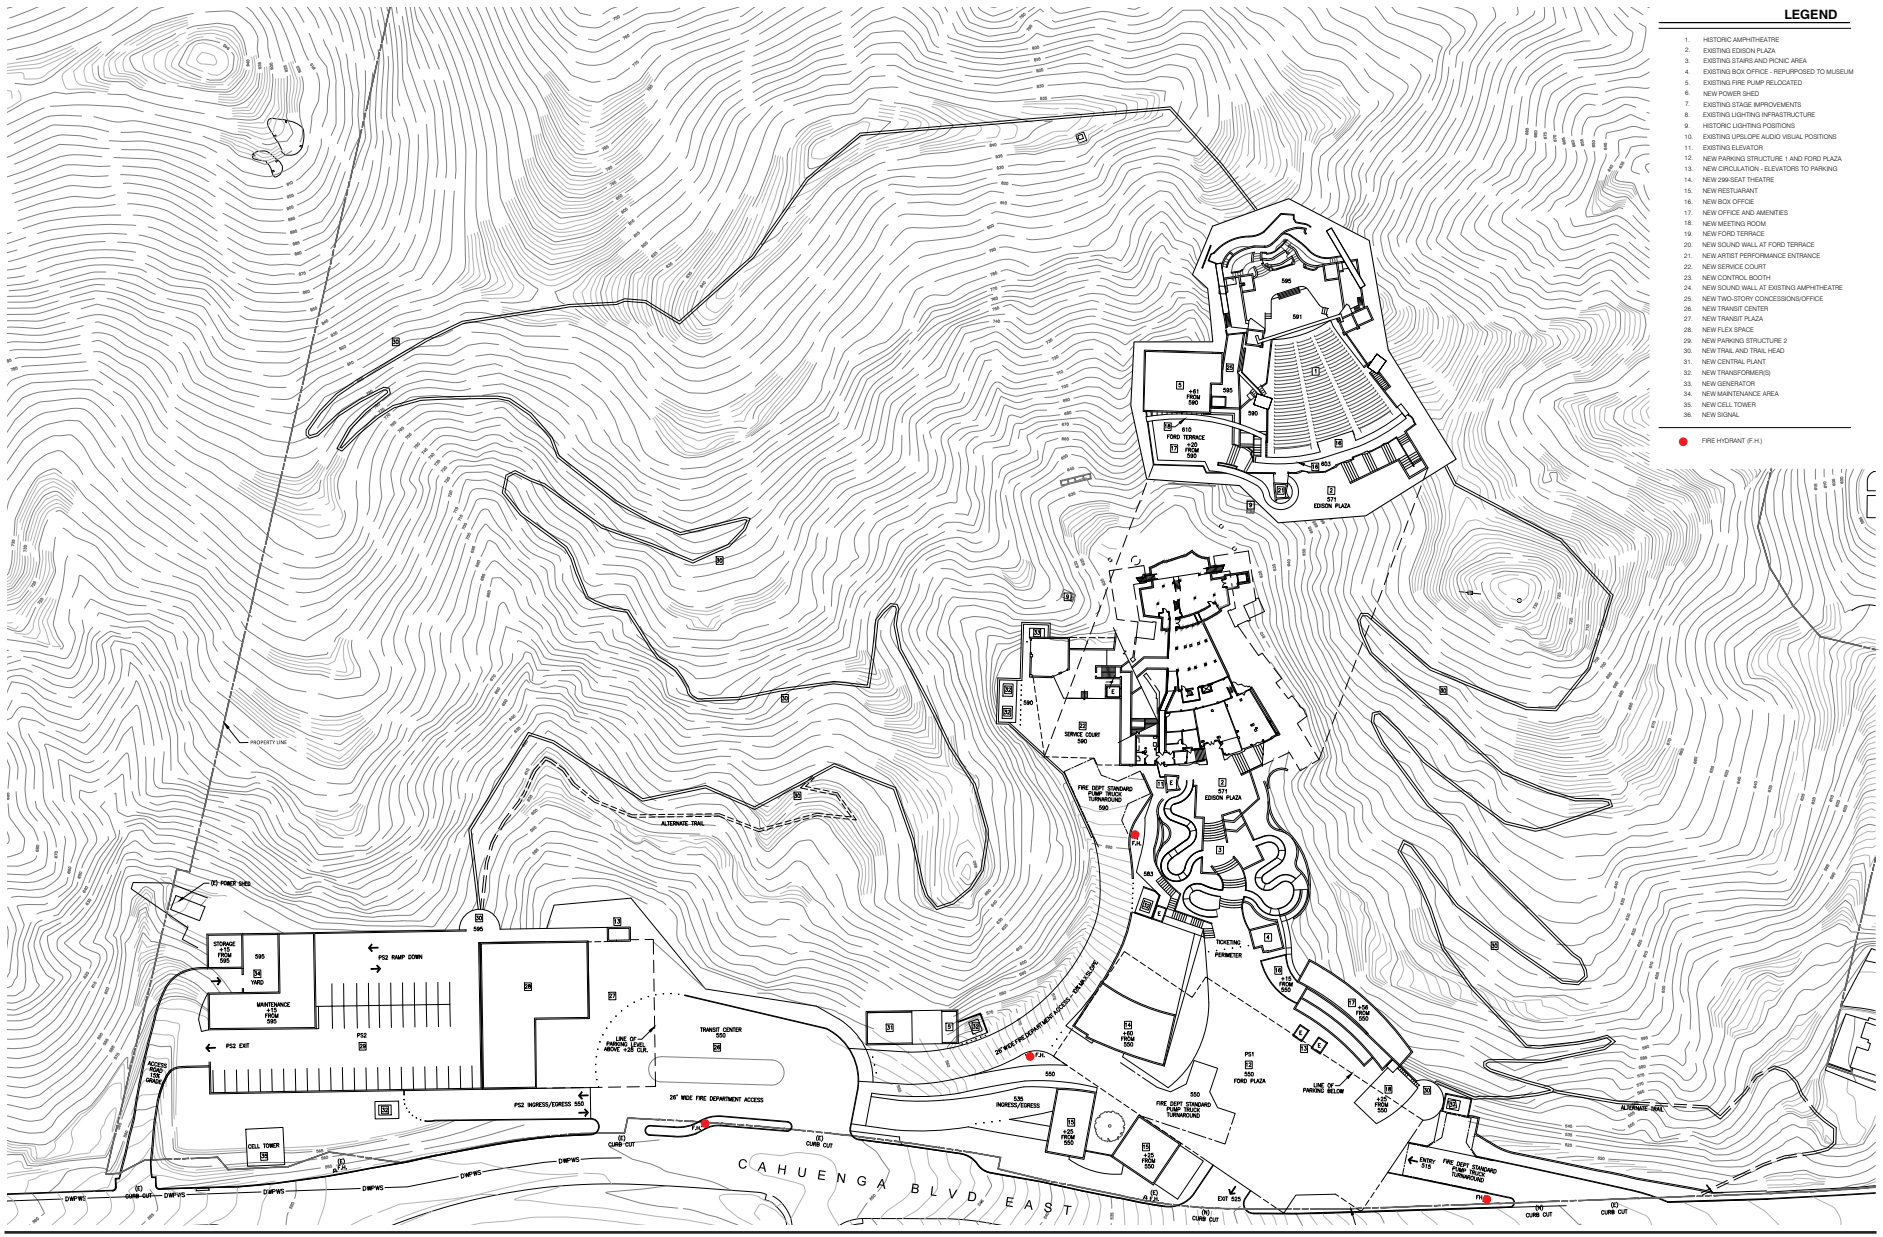
As provided in Appendix K of this Draft EIR, with implementation of a fire sprinkler system within all of the buildings proposed as set forth in Project Design Feature J.1-3, the required fire flow set forth by the County Fire Department would be 4,000 gpm at a pressure of 20 psi.

As previously described, domestic and fire water service is currently provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. The water main can provide approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include the installation of two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East as provided in Project Design Feature J.1-4 above. In addition, the Project would include the installation of four private fire hydrants on-site and, as set forth in Project Design Feature J.1-5 above, booster pumps would be required for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. As provided in Project Design Feature J.1-6, the enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines.

With construction of the proposed onsite fire water system improvements, the Project would meet the fire flow requirements set forth by the County Fire Department and LAFD. Therefore, impacts regarding fire flow would be less than significant.

(d) Wildfire Risk

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist near the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, as previously described, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to



matrix environmental

Figure IV.J.1-3
Proposed On-Site Fire Hydrant Locations

Source: Levin & Associates Architects, 2014.

create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, implementation of the Project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. Impacts with respect to wildfire risk would be less than significant.

(e) Conclusion

Based on the above, Project operation would not require the addition of a new fire station or the expansion, consolidation, or relocation of an existing fire station in order to maintain service. Therefore, impacts to fire protection and emergency medical services during Project operation would be less than significant.

4. Cumulative Impacts

As identified in Section III, Environmental Setting, of this Draft EIR, cumulative growth in the greater Project area through 2020 includes 27 related projects located in the Project vicinity as well as general ambient growth projected to occur. These related projects include retail/commercial, residential, office, and hotel uses, among others. A number of the identified related projects and ambient growth projections fall within the service areas of Fire Station Nos. 76, 27, and 41. Several of the related projects include residential uses, which would increase the residential population of Fire Station No. 76, the "first-in" station for the Project Site, as well the secondary fire stations available to provide service to the Project Site. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population of the area and thus also increase the demand on fire services. In conjunction with the Project, this growth would cumulatively generate the need for additional fire protection services. However, similar to the Project, the related projects and all other future development projects would be subject to discretionary review by the LAFD to ensure that sufficient fire safety and hazards measures are implemented to reduce potential impacts to fire protection and emergency medical services. Furthermore, each related project would be required to comply with regulatory requirements related to fire safety, access, and fire flow.

Additionally, LAFD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, trucks and engines, ambulances, other special apparatuses, and possibly station expansions or new station construction that may become necessary to achieve the

desired level of service. Therefore, cumulative impacts on fire protection and emergency medical services would be less than significant.

5. Mitigation Measures

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant. Therefore, no mitigation measures are required.

6. Conclusion

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant.

IV. Environmental Impact Analysis
J.2 Public Services—Police Protection

1. Introduction

This section describes existing police protection services within the Project area and provides an analysis of the Project's potential impacts on these services. As a County regional park, the County of Los Angeles Sheriff's Department (LASD) Parks Bureau provides primary police protection services to the Project Site. In addition, as the Project Site is located within the City of Los Angeles, the City of Los Angeles Police Department (LAPD) also provides police protection services to the Project Site. The analysis provided herein focuses on the LASD and LAPD facilities that serve the Project Site and the ability of those agencies to provide adequate police protection services to serve the Project. The analysis is based on information provided by the LASD and the LAPD, which is included in Appendix K of this Draft EIR.

2. Environmental Setting

a. Regulatory Framework

(1) County of Los Angeles

(a) Los Angeles County General Plan

The Safety Element of the General Plan, adopted in 1980, does not include any policies specifically pertaining to sheriff protection, but rather addresses public services in general. In addition, the Safety Element includes a number of policies addressing emergency response, preparedness, and recovery. The Safety Element identifies the LASD as one of several agencies responsible for disaster planning programs.

(b) Los Angeles County Code

Law enforcement regulations and the powers and duties of the Sheriff's Department are outlined in Chapter 2.34 of the Los Angeles County Code.

(2) City of Los Angeles

(a) City of Los Angeles General Plan Framework Element

The City of Los Angeles General Plan Framework Element (General Plan Framework), adopted in December 1996 and readopted in August 2001, sets forth general guidance regarding land use issues for the entire City of Los Angeles and defines citywide policies regarding land use, including infrastructure and public services. Presently, the LAPD operates under a Computer Statistics (COMPSTAT) Plus program that implements the General Plan Framework goal of assembling statistical population and crime data to determine necessary crime prevention actions. The COMPSTAT system implements a multi-layer approach to police protection services through statistical and geographical information system analysis of growing trends in crime through its specialized crime control model. COMPSTAT Plus represents an enhanced application of the COMPSTAT principles of inspection and accountability, as well as the use of more in-depth auditing methods, mentorship, and close collaboration.[1]

(b) City of Los Angeles Charter and Administrative and Municipal Codes

The law enforcement regulations and the powers and duties of the LAPD are outlined in the City of Los Angeles Charter Article V, Section 570; the City of Los Angeles Administrative Code, Chapter 11, Section 22.240; and the Los Angeles Municipal Code (LAMC), Chapter 5, Article 2. Article V, Section 570 of the City Charter gives the power and the duty to the LAPD to enforce the penal provisions of the Charter and City ordinances, as well as State and Federal law. The Charter also gives responsibility to the officers of the LAPD to act as peace officers, as defined by State law, and the power and duty to protect lives and property in case of a disaster or public calamity.

(c) Design Out Crime Guidelines

The City of Los Angeles has recently implemented the "Design Out Crime" program, which uses the techniques of Crime Prevention Through Environmental Design (CPTED). The LAPD's Crime Prevention Unit consults with private developers to incorporate CPTED techniques into projects, and the LAPD participates in the City's Permit Processing Network, an inter-agency task force that reviews complex development projects. CPTED includes the following three key concepts:

---

[1] *City of Los Angeles Police Department, COMPSTAT Plus, www.lapdonline.org/inside_the_lapd/content_basic_view/6364, accessed April 11, 2014.*

- Natural surveillance: The placement of physical features, activities, and people in a way that maximizes visibility.
- Natural access control: Restricting or encouraging people to come into a space through the placement of entrances, exits, fencing, landscaping, and lighting.
- Territorial reinforcement: The use of physical attributes to define ownership and separate public and private space.

The LASD also promotes the implementation of CPTED.

b. Existing Conditions

(1) Los Angeles County Sheriff's Department

As a County park facility, the Project Site is located within the service area of the LASD's Parks Bureau, which provides law enforcement services to 177 County facilities (i.e., parks, lakes, golf courses, special event venues, etc.). Law enforcement services provided by the Parks Bureau are delivered by patrol deputies, a Special Problems Unit, Detective Bureau, a Lake Operations Unit, a Mounted Enforcement Detail, and an Off-Road Enforcement Detail. Parks Bureau personnel deploy various motor vehicles, non-motorized vehicles, watercraft, and specially-trained horses during routine patrol operations. In addition, special service teams maintained by LASD are available to the Parks Bureau on an as-need basis, including the Aero Bureau, Emergency Operations Bureau, Special Enforcement Bureau, Canine Services Bureau, and Mountain Rescue. The specially-trained groups are equipped to respond to various unique assignments including tactical planning, arson/explosives, hazardous materials, biological weapons, criminal terrorism, natural disasters, man-made catastrophes, and search and rescue operations. The Parks Bureau is currently staffed by 152 sworn deputies and 56 civilian employees.

The Parks Bureau is divided into three zones: North, South, and East. The Project Site is located within the South Zone (Parks Bureau South). The Parks Bureau South Zone generally extends as far north as the Hollywood Bowl and Ford Theatres, and is bounded by the coastline on the west, and County lines on the south and east. The Parks Bureau South Zone contains 38 parks, nine golf courses, and two specialty venues. Parks Bureau South offices are located at 12910 South Athens Way in the City of Los Angeles. The nearest Parks Bureau office is located at 2101 North Highland Avenue in Hollywood, approximately 0.5 miles south of the Project Site, as shown in Figure IV.J.2-1 on page IV.J.2-4. Currently, 32 deputies, 11 security officers, and two civilians are assigned to the Parks Bureau South Zone. Parks Bureau South provides law enforcement services to

matrix environmental

Figure IV.J.2-1
Loation of Police Protection Services Serving the Project Site

Source: Google Earth Pro, 2014.

County parks within the South Zone and does not include any residential uses. As such, Parks Bureau South does not serve a residential population.

Parks Bureau South patrol deputies respond to incidents while on-site and, if necessary, may request assistance from additional Parks Bureau deputies via radio communication. In the event Parks Bureau South patrol deputies are not on-site when an incident occurs, emergency calls for service are received by either the Parks Bureau Dispatch Center or the LAPD. Calls received by the LAPD are forwarded to the Parks Bureau Dispatch Center and then dispatched to Parks Bureau South for response. Via an existing mutual aid agreement, LAPD can assist the LASD by providing additional resources to the Project Site in the event of an emergency. For large-scale emergencies, LASD is equipped to coordinate, manage, or support the emergent response of multi-jurisdictional personnel and equipment to assist all law enforcement agencies within and beyond the County. Within the Project Site, the County currently operates an alarm system which is monitored by the LASD. Security guards for events and overnight security shifts are currently contracted by LASD.

Within LASD's service area, smaller geographic units referred to as Reporting Districts are used to assist in compiling statistical data. The Project Site is located within LASD's Reporting District 8394. Table IV.J.2-1 on page IV.J.2-6 summarizes the most recent crime data for Reporting District 8394.

(2) Los Angeles Police Department

For the purposes of providing police protection services, the LAPD is divided into four bureaus: the Central, West, South, and Valley Bureaus. The four bureaus are further divided into 21 service areas and serviced by the LAPD's 21 community police stations.[2] Within each service area, smaller geographic units referred to as Reporting Districts are used for resource deployment purposes as well as to assist in compiling statistical data.

The LAPD also includes a variety of support systems including the Direct Support Division, Special Operations, Municipal Division, Special Weapons and Tactics, K-9, and Mounted Units. All geographic divisions of the Department are fully and consistently staffed according to existing needs. The determination of staffing needs is predicated upon the analysis of crime data, population density, and other specific demographic variables. As of April 2014, the departmental staffing resources within the LAPD included 9,882

[2] *City of Los Angeles Police Department, Media Relations Handbook, 2007-2008.*

Table IV.J.2-1
Reporting District 8394 Crime Data

Year	Part I	Part II
2010	3	0
2011	0	1
2012	0	2
2013	1	2
2014 (to date)	0	0

[a] *Based on the Federal Bureau of Investigation Uniform Crime Reporting Program, Part I offenses include murder and non-negligent homicide, forcible rape, robbery, aggravated assault, burglary, motor vehicle theft, larceny-theft, and arson.*

[b] *Based on the Federal Bureau of Investigation Uniform Crime Reporting Program, examples of Part II offenses include minor assault, forgery, fraud, vandalism, etc.*

Source: Written correspondence from Holly M. Perez, Captain, Parks Bureau, Los Angeles County Sheriff's Department, March 20, 2014.

sworn-in officers. Based on a total City population of 3,792,621, the LAPD currently has an officer to population ratio of 2.61 officers for every 1,000 residents.[3]

The Project Site is located in the West Bureau service area, which covers a territory of approximately 124 square miles with a population of 840,000 residents.[4] The West Bureau oversees operations in the Hollywood, Wilshire, Pacific, Olympic, and West Los Angeles service areas, as well as the West Traffic Division, which includes the neighborhoods of Pacific Palisades, Westwood, Century City, Venice, Hancock Park, and Miracle Mile. The West Bureau is bordered to the north by Forest Lawn Drive, to the east by Normandie Boulevard, to the south by El Segundo Boulevard, and to the west by the Pacific Ocean.[5]

Within the West Bureau Service Area, the Project Site is served by the Hollywood Community Police Station located at 1358 Wilcox Avenue, approximately 1.5 miles south of

[3] *City of Los Angeles Police Department, COMPSTAT Citywide Profile 03/09/14 – 04/05/14, www.lapdonline.org/assets/pdf/cityprof.pdf, accessed April 11, 2014.*

[4] *City of Los Angeles Police Department, About West Bureau,www.lapdonline.org/west_bureau/content_basic_view/1869, accessed March 20, 2014.*

[5] *Ibid.*

the Project Site, as shown in Figure IV.J.2-1 on page IV.J.2-4. The Hollywood Community Police Station service area covers approximately 13.34 square miles with general service boundaries of Mulholland Drive and Griffith Park boundary to the north, the Los Angeles City boundary and Melrose Avenue to the south, Normandie Avenue and Griffith Park boundary to the east, and the City of Los Angeles City boundary to the west. There are approximately 354 sworn officers and 16 civilian support staff deployed within the Hollywood Community Police Station service area.[6] Based on the residential service population of approximately 128,418 persons within the LAPD's Hollywood Community service area, the officer to resident ratio is approximately 2.76 officers per 1,000 residents. Thus, the officer to resident ratio is somewhat higher than the citywide ratio of 2.61 officers per 1,000 residents.

The Project Site is located within Reporting District 615 of the Hollywood Community Police Station service area boundaries. The general service boundaries of Reporting District 615 are North Hollywood to the north, Hollywood Freeway to the south, Barham Boulevard to the west, and Montlake and Ledgewood Drive to the east. A comparison of the Hollywood Community Police Station service area and citywide data regarding crimes is provided in Table IV.J.2-2 on page IV.J.2-8. As shown therein, in 2013, there were approximately 65 crimes per 1,000 residents in the Hollywood area and approximately 50 crimes per 1,000 residents citywide.

Table IV.J.2-3 on page IV.J.2-9 provides a breakdown of the 2013 crime statistics for Reporting District 615, the Hollywood Community Police Station service area, and citywide. In 2013, Reporting District 615 reported 94 crimes, the Hollywood Community Police Station service area reported 8,309 crimes, and 187,749 crimes were reported citywide. Based on the number of officers deployed within the Hollywood Community Police Station service area, the crimes per officer ratio in 2013 was approximately 23.5 crimes per officer in comparison to the citywide ratio of 19.0 crimes per officer. Although the Hollywood Community Police Station service area had more crimes per officer compared to the citywide ratio, the average response time to emergency calls for service in the Hollywood Community Police Station service area during 2013 was 5.0 minutes as compared with the citywide average of 5.9 minutes.[7]

3. Project Impacts

a. Methodology

Potential impacts on police protection services were evaluated based on the ability of existing and planned LASD and LAPD staffing, equipment, and facilities to meet the additional demand for police protection services potentially associated with implementation of the Project. The following factors were taken into consideration in performing the impact analysis: the effects of the Project on calls for service, levels of service, and response times; and the need for additional deputies and police officers, associated equipment, and facility space. The analysis also considers the ability of the Project's planned security features to reduce demands on police protection services.

b. Thresholds of Significance

Based on Appendix G of the CEQA Guidelines, Project impacts with regard to police protection would be significant if the Project would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection services.

c. Project Design Features

The following specific project design features would be included as part of the Project:

Table IV.J.2-3
Los Angeles Police Department 2013 Crime Data

Types of Crime	Reporting District 615	Hollywood Area	Citywide
Murder	0	7	251
Rape	0	50	665
Robbery	1	380	7,861
Aggravated Assault	0	295	7,592
Burglary	13	373	15,572
Larceny	43	2,863	55,120
Vehicle Theft	8	420	14,112
Other Assault	7	1,519	30,818
Forgery/ Counterfeit	0	98	2,683
Fraud	9	586	12,788
Embezzlement	0	13	726
Vandalism	11	815	17,971
Weapon	0	51	1,135
Pimping/Pandering	0	4	66
Other Sex Offense	0	99	2,833
Against Family Children	0	16	515
Disorderly Conduct	0	18	345
Vagrancy	0	172	1,677
All Other Violations	2	530	15,019
TOTAL	**94**	**8,309**	**187,749**

Source: Written correspondence from Leonid A. Tsap, Officer, Community Relations Section, Crime Prevention Unit, Los Angeles Police Department, April 10, 2014.

Project Design Feature J.2-1: During construction, the Applicant shall implement temporary security measures including, but not limited to, on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction area. Large mounds of dirt/debris/building materials and fence covers/screens shall be avoided. Equipment and building materials shall be removed or secured during non-construction hours.

Project Design Feature J.2-2: During operation, the Applicant shall implement security measures including, but not limited to:

- High-definition surveillance cameras. The cameras shall be placed along pedestrian pathways, gathering areas, and at driveways on Cahuenga Boulevard East. The camera system shall allow law enforcement agencies to view live feed remotely,

shall be equipped with a hard drive capable of storing video for 15 days, and shall be capable of transferring video to disc or USB storage devices.

- Configure proposed public restrooms such that entrances are oriented towards the main event area or other high-visibility areas. The restrooms shall be secured after hours to prevent vandalism, theft, and use by transients.
- Adequate lighting and high definition surveillance cameras within the parking structures. Points of entry and egress shall be equipped with traffic control devices, and a parking lot attendant shall be employed during events.
- Signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail shall also be well-marked to prevent users from getting lost and the brush next to the trail shall be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas shall not be built along the trail.

Project Design Feature J.2-3: Upon completion of the Project, the Applicant shall provide the Los Angeles Police Department Hollywood Area commanding officer with a diagram of each portion of the property. The diagram shall include access routes and additional information that might facilitate police response.

d. Analysis of Project Impacts

(1) Construction

Construction sites can be sources of nuisances and hazards, inviting theft and vandalism. When not properly secured, construction sites can contribute to a temporary increased demand for police protection services. Pursuant to Project Design Feature J.2-1 above, in consultation with the LASD Parks Bureau, the Project Applicant would implement temporary security measures during construction, which could include on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction area. In addition, equipment and building materials would be removed or secured during non-construction hours. With implementation of these measures, potential impacts associated with theft and vandalism during construction activities would be less than significant.

Additionally, Project-related construction activities within the surrounding roadways could potentially impact the provision of LASD and LAPD police protection services in the

vicinity of the Project Site. Emergency access for LASD and LAPD vehicles within the Project Site and the surrounding vicinity could also be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. As a result, Project-related construction activities could increase the response time for police vehicles due to travel time delays caused by traffic along Cahuenga Boulevard East and main connectors. It is noted however that the construction-related traffic generated by the Project would not significantly impact LASD or LAPD response times within the Project vicinity since the drivers of police vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, as discussed in detail in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, most, if not all, of the construction worker and haul truck trips would occur outside the typical weekday commuter morning and afternoon peak periods, reducing the potential for traffic-related conflicts. Furthermore, pursuant to Project Design Feature K-1, the Project would implement a Construction Management Plan during Project construction, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure adequate and safe access to the Project Site and vicinity is maintained. As described in detail in Section IV.K, Traffic, Access, and Parking, of this Draft EIR, features of the Construction Management Plan may include prohibition of construction worker parking on adjacent residential streets, scheduling construction activities to reduce the effect on traffic flow, and provisions to accommodate the equipment storage and truck staging on-site.

With implementation of the project design features, including the Construction Management Plan, construction of the Project would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services during Project construction would be less than significant.

(2) Operation

The Project does not include the development of any residential uses and, as such, would not increase the permanent residential population within the service area of the Parks Bureau South Zone or the Hollywood Community Police Station. However, the Project would generate a daytime population associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. As described in Section II, Project Description, of this Draft EIR, to accommodate the increase in programming, it is anticipated that existing staffing within the Project Site would increase from approximately 20 employees to up to 105 employees or an increase of

approximately 85 employees. While the relocation of the existing 140 Los Angeles Philharmonic employees would result in an overall net decrease of employees on-site, the Project would result in an estimated 100 people associated with the hiking trail and approximately 75 people who would visit the restaurant on a daily basis.[8] In addition, the Project would generate a net increase of 311 seats. As such, the Project's daytime and event population could increase the demand for police protection services.

As described above, the County currently operates an alarm system which is monitored by the LASD. In addition, security guards for events and overnight security shifts are currently contracted by the LASD. In consultation with LASD, these existing security and safety features would be continued and enhanced pursuant to Project Design Feature J.2-2, above. According to the LASD, implementation of the features set forth in Project Design Feature J.2-2 would serve to reduce the potential for criminal activities and assist law enforcement efforts.[9] In addition, based on a preliminary review of the proposed improvements, the LAPD indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station.[10] The LAPD has also indicated that upon completion of the Project, the Applicant shall provide the LAPD Hollywood area commanding office with a diagram of each portion of the property, including access routes. Implementation of this feature provided above in Project Design Feature J.2-3 would facilitate LAPD response. Therefore, the Project would not result in a demand for additional services that would exceed the capability of the LASD or the LAPD to serve the Project Site and impacts would be less than significant.

With respect to emergency access to the Project Site during Project operations, the analysis provided in Section IV.K, Traffic, Access, and Parking, of this Draft EIR demonstrates that Project development would result in a less than significant impact on access and local traffic conditions (i.e., nearby intersections). Although additional traffic generated by the Project could potentially cause delays in law enforcement response times, the additional traffic would not significantly impact emergency vehicle access or response times for either the LASD or LAPD.

Based on the above, with implementation of the project design features, Project operation would not generate a demand for additional police protection services that would

---

[8] *Community Arts Resources Inc. The Ford, Transformed, Realizing the Potential of Ford Theatres County Regional Park, October 2012. Refer to Appendix K of this Draft EIR.*

[9] *Written correspondence from Captain Holly M. Perez, County of Los Angeles Sheriff's Department, Parks Bureau, March 20, 2014. Refer to Appendix K of this Draft EIR.*

[10] *Written correspondence from Andrew J. Smith, Commanding Officer, Los Angeles Police Department, April 10, 2014. Refer to Appendix K of this Draft EIR.*

substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services provide during Project operation would be less than significant.

4. Cumulative Impacts

The geographic context for the cumulative impact analysis is the service area of the LASD's Parks Bureau South Zone and the LAPD's Hollywood Community Police Station. The Project in conjunction with identified related projects and forecasted growth through 2020 (i.e., the Project's buildout year) within these service areas would cumulatively increase the demand for police protection. Section III, Environmental Settings, of this Draft EIR identifies 27 related projects that are anticipated to be developed within the Project vicinity. All of the related projects identified fall within the service boundaries of the Hollywood Community Police Station service area. Notwithstanding, as previously described, the LASD's Parks Bureau provides law enforcement services to County facilities, including parks, lakes, golf courses, and special event venues. The related projects do not include the development of such uses. As such, the Project in combination with the related projects would not contribute to a cumulative increase in the demand for LASD Parks Bureau police protection services. Therefore, cumulative impacts on LASD Parks Bureau police protection services would be less than significant.

With regard to the LAPD, several of the related projects include residential uses, which would increase the permanent residential population within the Hollywood Community Police Station service area. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population in the area. Along with other anticipated growth through 2020, this would further increase the demand for police protection services. The Project would not develop residential units, and thus would not generate a residential population. Therefore, the Project would not contribute to a cumulative increase in the residential service population of the Hollywood Community Police Station. In addition, as previously discussed, based on a review of the Project, the LAPD has indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. Therefore, the Project's contribution to the cumulative demand for police protection services provided by the LAPD would not be cumulatively considerable. Additionally, as with the Project, each related project would be subject to the City's routine construction permitting process, which includes a review by the LAPD to ensure that sufficient security measures are implemented to reduce potential impacts to police protection services. Furthermore, the LAPD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, vehicles, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Through the City's regular budgeting

efforts, the LAPD's resource needs would be identified and monies allocated according to the priorities at the time. Based on the above, the Project's contribution to cumulative impacts to police protection services would not be cumulatively considerable and, as such, cumulative impacts on police protection services would be less than significant.

5. Mitigation Measures

Project-level and cumulative impacts with regard to police protection services would be less than significant. Therefore, no mitigation measures are required.

6. Conclusion

Project-level and cumulative impacts with regard to police protection services would be less than significant.

IV. Environmental Impact Analysis

K. Traffic, Access, and Parking

1. Introduction

This section analyzes the Project's potential impacts with regard to traffic, access, and parking. The analysis is based on the *Transportation Study for The Ford Theatres Project* (Traffic Study) prepared by Gibson Transportation Consulting Inc. (June 2014) included as Appendix L of this Draft EIR. As described throughout this Draft EIR, the Project Site is located within the City of Los Angeles (City) and is owned and operated by the County of Los Angeles (County). Accordingly, the scope of analysis for the Traffic Study was developed in consultation with and reviewed by both the Los Angeles County Department of Public Works (LACDPW) and the Los Angeles Department of Transportation (LADOT).

The Traffic Study prepared for the Project and summarized herein assessed existing traffic conditions and analyzed potential Project-generated traffic impacts on the street system surrounding the Project Site at Project buildout (2020). The following traffic scenarios have been analyzed:

- Existing Conditions—The analysis of existing traffic conditions includes a description of the street system serving the Project, existing traffic volumes, and an assessment of current operating conditions.

- Existing with Project Conditions—This analysis provides an assessment of the operating conditions of the street system under existing conditions with the addition of Project-generated traffic.

- Future (Year 2020) Conditions—This analysis projects future traffic growth and the operating conditions of the transportation network that could be expected as a result of regional growth and related projects in the vicinity of the Project Site by the year 2020, but without the Project. This analysis provides the future conditions by which Project impacts are evaluated at full buildout.

- Future (Year 2020) with Project Conditions—This analysis provides an assessment of the operating conditions of the street system under future conditions with the addition of Project-generated traffic.

The above scenarios were evaluated based on the weekday A.M. and weekday P.M. commuter peak periods and pre-event weekday and weekend peak hour conditions (presented as weekday evening, weekend midday, and weekend evening), as described in further detail below.

2. Environmental Setting

a. Regulatory Framework

(1) Regional

(a) Congestion Management Program

The Congestion Management Program (CMP) is a State-mandated program enacted by the state legislature to address the increasing concern that urban congestion is affecting the economic vitality of the State and diminishing the quality of life in some communities. Within Los Angeles County, the Los Angeles County Metropolitan Transportation Authority (Metro) is responsible for planning and managing vehicular congestion and coordinating regional transportation policies. On October 28, 2010, the Metro Board adopted the 2010 CMP. The CMP is intended to address vehicular congestion relief by linking land use, transportation and air quality decisions.

The CMP requires that a Traffic Impact Analysis be performed for all CMP arterial monitoring intersections where a project would add 50 or more trips during either the morning or afternoon weekday peak hours and all CMP mainline freeway monitoring locations where a project would add 150 or more trips (in either direction) during the morning or afternoon weekday peak hours. The analysis of potential impacts to the CMP arterial and freeway monitoring stations was performed in accordance with the Traffic Impact Analysis guidelines referenced in the CMP. The CMP also requires that a transit system analysis be performed to determine whether a project adds transit riders in numbers that exceed the capacity of the transit system.

(b) Southern California Association of Government's 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy

The 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012–2035 RTP/SCS) presents a long-term vision for the region's transportation system. Specific goals within the 2012–2035 RTP/SCS are intended to link the issue of mobility with the promotion of economic development, protection of the environment, reductions in energy consumption, the creation of transportation-friendly development patterns, and encouragement of fair and equitable access to residents affected by socio-economic, geographic and commercial limitations. The 2012–2035 RTP/SCS places a greater

emphasis on sustainability and integrated planning compared to previous versions of the RTP and identifies mobility, economy, and sustainability as the three principles most critical to the future of the region. As part of this new approach, the 2012–2035 RTP/SCS establishes commitments to: reduce emissions from transportation sources in order to comply with Senate Bill (SB) 375; improve public health; and meet the National Ambient Air Quality Standards. Refer to Section IV.H, Land Use, of this Draft EIR for a discussion of the Project's consistency with the 2012–2035 RTP/SCS.

(2) Local

As previously described, while the Project Site is located within the City of Los Angeles, the Ford Theatres property is owned and operated by the County of Los Angeles. As such, development of the Project Site is governed by the County General Plan and the Los Angeles County Code. Notwithstanding, as the street system surrounding the Project Site is within the jurisdiction of the City of Los Angeles and in accordance with City consultation procedures, a discussion of the City General Plan Transportation Chapter and the Los Angeles Municipal Code also is provided below.

(a) County of Los Angeles General Plan

The Transportation Element of the County General Plan sets forth policies for the continued development of a comprehensive transportation system for Los Angeles County. The Transportation Element concurs with the policy positions of the Los Angeles County Metropolitan Transit Authority (Metro) and the Southern California Association of Governments (SCAG) on the need for the continued development and construction of a comprehensive public transportation system. The Transportation Element also reflects the location of existing and future transit corridors. Key features of the Transportation Element are the Transportation Plan, Highway Plan, and Bikeway Plan, as well as the associated Transportation Policy Map and the Highway Policy Map. These policy maps depict the existing transportation system and identify needed additions and improvements, in accordance with the General Plan's growth and development policies. Refer to Section IV.H, Land Use, of this Draft EIR for a listing of the General Plan policies that pertain to traffic, access, and parking. As discussed therein, the Project would be consistent with the applicable General Plan polices related to traffic, access, and parking.

(b) Los Angeles County Code

With regard to construction traffic, Section 12.08.440 of the Los Angeles County Code prohibits noise-generating construction activities between the hours of 7:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, and anytime on Sundays or legal holidays in the absence of certain emergencies.

(c) City of Los Angeles General Plan

The primary goals of the Transportation Chapter of the General Plan Framework are to provide adequate accessibility to commerce, work opportunities, and essential services, and to maintain acceptable levels of mobility for all those who live, work, travel, or move goods in the City. The Transportation Chapter is implemented through the Transportation Element of the General Plan. In February 2014, the City released a Public Review Draft of the Mobility Plan 2035, which is a proposed update to the General Plan's Transportation Element. Please refer to Section IV.H, Land Use, of this Draft EIR for a discussion of the Project's consistency with relevant policies of the Transportation Chapter of the General Plan Framework.

(d) City of Los Angeles Municipal Code

Section 41.40 of the Los Angeles Municipal Code limits construction activities to the hours from 7:00 A.M. to 9:00 P.M. on weekdays and from 8:00 A.M. to 6:00 P.M. on Saturdays and national holidays. No construction is permitted on Sundays. Construction activity hours may be extended, including on Sundays, with written permission of the Board of Police Commissioners through its Executive Director.

b. Existing Conditions

For purposes of the Project's transportation analysis, the study area encompasses a geographic area approximately two miles (north-south) by approximately one-half mile (east-west). Major arterials serving the study area include Cahuenga Boulevard East, Cahuenga Boulevard West, Highland Avenue, and Barham Boulevard. Primary regional access to and from the study area is provided by the Hollywood Freeway (US-101) adjacent to the Project Site. The streets in the study area are under the jurisdiction of the City of Los Angeles and freeways in the study area are under the jurisdiction of the California Department of Transportation (Caltrans). The local roadway system and other transportation facilities serving the Project Site are described in more detail below.

(1) Streets

- Cahuenga Boulevard East is a local street that runs northwest-southeast. It is located adjacent to the Project Site and provides two travel lanes and left-turn lanes at study intersections. Parking is generally not permitted. The posted speed limit is 40 miles per hour (mph).

- Cahuenga Boulevard West is a Major Class Highway II that runs northwest-southeast. It is located west of the Project Site and provides three to four travel lanes, one to two in each direction, and left-turn lanes at intersections. Parking is generally not permitted. The posted speed limit is 40 mph.

- North Cahuenga Boulevard is a Major Highway Class II that runs northwest-southeast. It is located south of the Project Site and provides four travel lanes, two in each direction, and left-turn lanes at intersections. Parking is generally provided along both sides of the street. The posted speed limit is 40 mph.

- Barham Boulevard is a Major Highway Class II that runs northeast-southwest. It is located northwest of the Project Site and provides four to five travel lanes, two to three in each direction, and left-turn lanes at intersections. Parking is available on the east side of the street with peak hour restrictions. The posted speed limit is 35 mph.

- Highland Avenue is a modified Major Highway Class II that runs north-south. It is located southwest of the Project Site and provides six travel lanes, three in each direction, and left-turn lanes at intersections. Parking is generally not permitted within the vicinity of the Project Site. The posted speed limit is 40 mph.

- Pilgrimage Bridge is an east-west roadway that connects Cahuenga Boulevard West and Cahuenga Boulevard East near the Project Site. It provides access to the Project Site with two travel lanes, one in each direction. Parking is not permitted. The posted speed limit is 35 mph.

- Odin Avenue is a Major Highway Class II that runs northeast-southwest. It is located south of the Project Site and provides four travel lanes, two in each direction, and left-turn lanes at intersections. Parking is not permitted. The posted speed limit is 40 mph.

(2) Regional Transportation System

(a) Freeways

- Hollywood Freeway (US-101) generally runs north-south. It is located directly west of the Project Site and, in the study area, it provides four to six lanes in each direction. Access to and from the Hollywood Freeway is available via interchanges at Cahuenga Boulevard East and Cahuenga Boulevard West.

(b) Public Transit

The general study area is served by Metro bus and rail service and LADOT buses. Bus transit service in the vicinity of the Project Site is available along Cahuenga Boulevard East, Cahuenga Boulevard West, North Cahuenga Boulevard, Odin Avenue, Highland Avenue, Barham Boulevard, and the Hollywood Freeway. The following public transit lines provide service in the Project area:

- Metro Red Line travels underground east-west on Hollywood Boulevard in the vicinity of the Project Site with average headways of 10 minutes during the

morning and afternoon peak hours. The line travels from downtown Los Angeles to North Hollywood and provides service to downtown Los Angeles, Hollywood, and Universal City. The Metro Red Line also provides direct connections to the Metro light rail system including the Metro Blue and Gold lines, and to the Metrolink regional commuter rail system.

- Metro Local Line 222 travels north-south on Cahuenga Boulevard in the vicinity of the Project Site with average headways of 47 minutes during the morning peak hours and 37 minutes during the afternoon peak hours. Line 222 travels from downtown Sun Valley to Hollywood via Hollywood Way, Barham Boulevard, and Cahuenga Boulevard.

- Metro Local Line 156 travels north-south on Cahuenga Boulevard in the vicinity of the Project Site with average headways of 31 minutes during the morning peak hours and 34 minutes during the afternoon peak hours. Line 156 travels from Van Nuys to Hollywood through North Hollywood and Studio City.

- LADOT Commuter Express 422 travels north-south on the Hollywood Freeway in the vicinity of the Project Site with average headways of 20 minutes during the morning peak hours and 24 minutes during the afternoon peak hours. Commuter Express 422 travels from Thousand Oaks to downtown Los Angeles in the morning and from downtown Los Angeles to Thousand Oaks in the evening through the Hollywood Freeway.

(c) Congestion Management Program Facilities

As described above, the Hollywood Freeway (US-101) is located directly west of the Project Site. In addition, two CMP arterial monitoring stations are located in close proximity to the Project Site. The closest CMP arterial monitoring station is located approximately one and half-miles south of the Project Site at the intersection of Santa Monica Boulevard and Highland Avenue. Another CMP arterial monitoring station is located at the intersection of Cahuenga Boulevard and Lankershim Boulevard, approximately two and one-quarter miles northwest of the Project Site.

(3) Access and Circulation

Access to the Project Site is available via four driveways along the east side of Cahuenga Boulevard East. Principal access to the Project Site is provided from the driveway at Pilgrimage Bridge and Cahuenga Boulevard East. During events, this driveway is used for patrons accessing the Project Site via passenger vehicle and for shuttle access from the Universal City/Studio City Metro Red Line Station. During non-event times, this driveway serves as the main ingress and egress point for employees and vendors. The northernmost driveway, located north of the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, is primarily used for egress at the end of events and

is occasionally used for overflow stacked parking. The southern driveways, located south of the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, are primarily used for egress at the end of events. During events, the internal roadway that leads from Pilgrimage Bridge to the circular driveway at the secondary entrance at the Amphitheatre level serves as the performer entrance to the lower level Amphitheatre support spaces, shuttle and vehicular loading and unloading, and Americans with Disabilities Act (ADA) parking and media truck parking. The circular driveway also provides access for trash pickup and fire truck staging.

Pedestrian access to the Project Site is available from several locations along Cahuenga Boulevard East, including via the four driveways described as well as a walkway located in front of the former motel. Within the Project Site, pedestrian access to the Amphitheatre is available from the main entrance located at the bottom of Edison Plaza, adjacent to the box office, and from a secondary entrance located at the Amphitheatre level, adjacent to the circular driveway.

(4) Pedestrian and Bicycle Facilities

(a) Pedestrian Facilities

Off-site pedestrian facilities in the vicinity of the Project Site are limited and do not provide proper connectivity and adequate widths for a comfortable and safe pedestrian environment. Specifically, sidewalks provided on the east side of Cahuenga Boulevard East, in front of the Project Site, are narrow and terminate just north of the main driveway at Cahuenga Boulevard East and Pilgrimage Bridge. In addition, extending south from the main driveway, a narrow sidewalk continues that provides connectivity to the neighborhoods to the south. Further, the signalized intersection at Cahuenga Boulevard East and Pilgrimage Bridge, which provides primary access to the Project Site, does not provide marked crosswalks across Cahuenga Boulevard East or Pilgrimage Bridge. Therefore, pedestrian connectivity to the Project Site via Pilgrimage Bridge to and from areas west of Cahuenga Boulevard East is deficient. Generally, in the overall study area, sidewalks provide limited connectivity to pedestrian crossings at intersections. The signalized intersections in the study area provide marked pedestrian crossings, pedestrian phasing, crosswalk striping, and ADA wheelchair ramps.

(b) Bicycle Facilities

Based on the 2010 Bicycle Plan, adopted by the City of Los Angeles Department of City Planning on March 1, 2011, the existing bicycle system in the study area consists of a limited coverage of bicycle lanes (Class II) and bicycle routes (Class III). Bicycle lanes are dedicated lanes for bicycles and are separated from vehicular traffic with street striping. Bicycle routes are identified as bicycle-friendly streets where motorists and cyclists share

the roadway and there is no dedicated striping of a bicycle lane. Bicycle routes are preferred on collector and lower volume arterial streets. In the study area, bicycle lanes currently exist on North Cahuenga Boulevard between Odin Avenue and Yucca Street. Within the study area, there are two streets designated as bicycle routes: Odin Avenue between Highland Avenue and North Cahuenga Boulevard and Wilcox Avenue south of North Cahuenga Boulevard.

(5) Parking

The Project Site includes three surface parking areas comprised of both asphalt and dirt areas. Two surface parking lots, referred to herein as the north parking lot and the south parking lot, are located along Cahuenga Boulevard East. A third surface parking lot, providing ADA parking spaces, is located adjacent to the secondary entrance at the Amphitheatre level. On non-event days and times, parking for employees and visitors is accommodated within the surface parking areas throughout the Project Site. During events, the surface parking areas within the Project Site can accommodate approximately 350 to 380 vehicles in a stacked parking configuration. During events, additional parking is available off-site at the Universal City/Studio City Metro Red Line Station where a shuttle is provided to and from the station parking and the Project Site. As detailed in the Traffic Study, observed pre-event loading and parking operations conditions indicate that the stacked parking configuration requires patrons to wait for vehicles parked in front of them to move in order to exit the parking areas, thereby contributing to an inefficient parking system from both a patron experience and operational standpoint. Observed conditions during pre-event loading and parking operations are detailed in Appendix A of the Traffic Study included as Appendix L of this Draft EIR.

3. Approach and Methodology

As previously noted, while the Ford Theatres are owned and operated by the County of Los Angeles, the street system surrounding the Project Site, including the study intersections, are within the jurisdiction of the City of Los Angeles. In consultation with the County of Los Angeles Department of Public Works, it was determined that the Traffic Study for the Project be prepared in accordance with the City of Los Angeles Department of Transportation's Traffic Study Policies and Procedures (May 2012). LADOT's Traffic Study Policies and Procedures establish the guidelines for determining the appropriate traffic analysis for a project, analysis methodologies, and significance thresholds. The scope of analysis included in the Traffic Study was developed in consultation with both the LACDPW and LADOT staff. In addition, the base assumptions and technical methodologies (i.e., trip generation, study locations, analysis methodology, etc.) were identified as part of the Traffic Study approach and were reviewed and approved by LACDPW staff.

a. Study Intersections

The study area, as described above, includes a total of eight intersections, which are located along the primary access routes to and from the Project Site and are those locations expected to be most directly impacted by Project traffic. The eight intersections analyzed are illustrated in Figure IV.K-1 on page IV.K-10 and are as follows:

1. Cahuenga Boulevard West & Barham Boulevard
2. Cahuenga Boulevard East & Barham Boulevard
3. Cahuenga Boulevard West & Pilgrimage Bridge (unsignalized)
4. Cahuenga Boulevard East & Pilgrimage Bridge
5. Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp
6. US-101 Northbound Off-Ramp & North Cahuenga Boulevard
7. Highland Avenue & Odin Avenue
8. North Cahuenga Boulevard & Odin Avenue

b. Level of Service Methodology

As required by the LADOT's Traffic Study Policies and Procedures, existing and future operations for the signalized study intersections were analyzed using the Critical Movement Analysis (CMA) method of intersection capacity calculation. The CMA methodology determines the peak-hour intersection volume-to-capacity (V/C) ratio by comparing existing traffic volumes to standard per-lane street capacities. The V/C ratio is then used to determine the corresponding level of service (LOS) value. LOS is a qualitative measure used to describe the condition of traffic flow on the street system, ranging from excellent conditions at LOS A to overloaded conditions at LOS F. Table IV.K-1 on page IV.K-11 defines the range of V/C ratios and their corresponding LOS grades for signalized intersections.

Unsignalized intersections are analyzed using the *Highway Capacity Manual* (HCM) Two-Way Stop Controlled methodology and HCM unsignalized methodology. These methodologies determine the average vehicle delay of the worst approach during the peak hour to find the corresponding LOS, as defined below in Table IV.K-2 on page IV.K-12. Per the traffic study guidelines from the LADOT, a signal warrant analysis was also conducted.

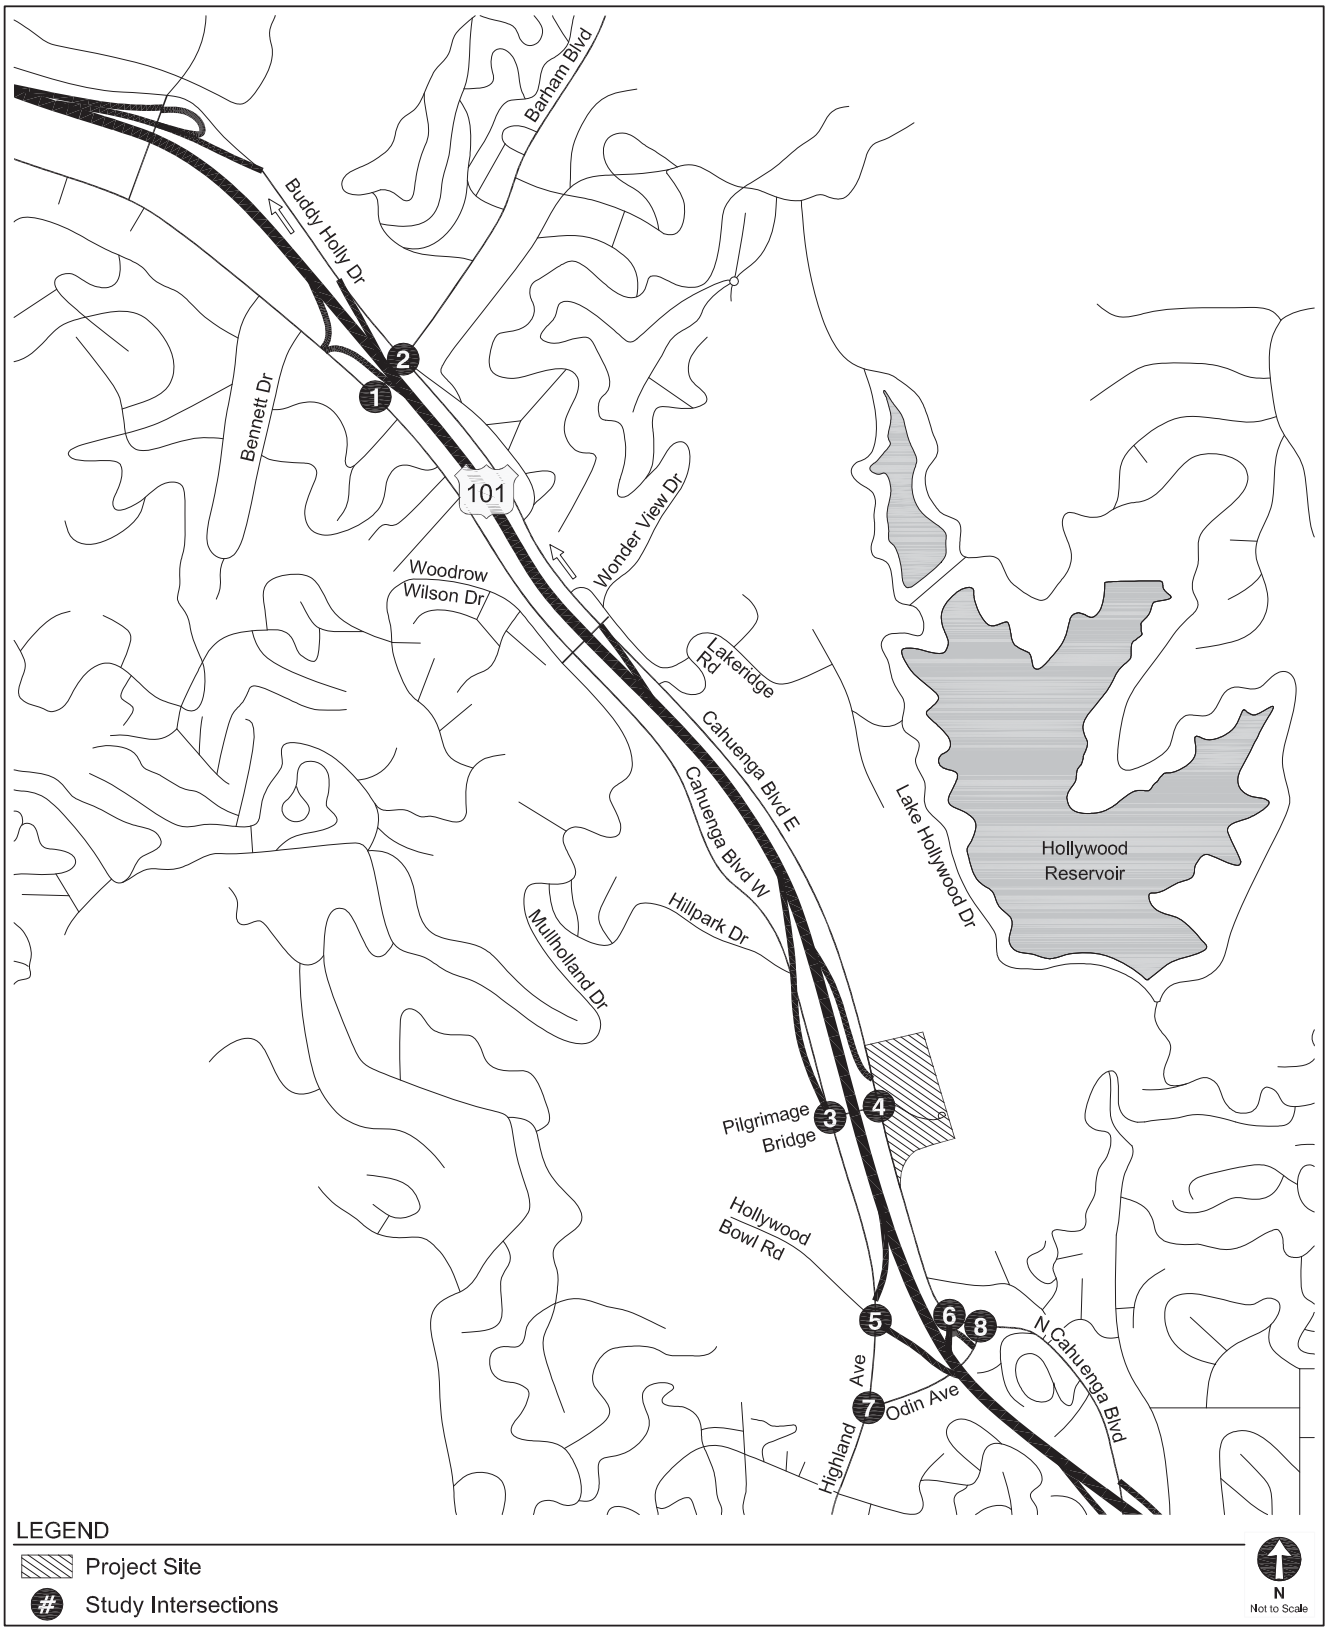

Figure IV.K-1
Study Area and Analyzed Intersections

Source: Gibson Transportation Consulting, Inc., 2014.

Table IV.K-1
Level of Service Definitions for Signalized Intersections

Level of Service	*Intersection Capacity Utilization*	*Definition*
A	*0.000–0.600*	*EXCELLENT. No Vehicle waits longer than one red light and no approach phase is fully used.*
B	*0.601–0.700*	*VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.*
C	*0.701–0.800*	*GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.*
D	*0.801–0.900*	*FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.*
E	*0.901–1.000*	*POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.*
F	*> 1.000*	*FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.*

Source: Transportation Research Circular No. 212, Interim Materials on Highway Capacity, Transportation Research Board, 1980.

c. Computer Traffic Signal Control

The City of Los Angeles currently operates a computerized traffic control system called ATSAC (Automated Traffic Surveillance and Control) which is a centralized control system that provides for the coordination of traffic signal timing to maximize the street capacities and to minimize traffic delays on City streets. LADOT estimates that implementation of this system improves intersection capacity by an average of seven percent. In addition to ATSAC, the City also implements ATCS (Adaptive Traffic Control System) in some areas. ATCS uses enhanced surveillance and control technologies to adapt traffic signal timings to respond to actual traffic conditions on the ground to further improve the effectiveness of the ATSAC system by minimizing the number of stops and the amount of delay with improved traffic signal coordination throughout the network. LADOT estimates that implementation of this system improves intersection capacity by an additional three percent over those operating under the ATSAC system alone.

Table IV.K-2
Level of Service Definitions for Unsignalized Intersections

Level of Service	Average Total Delay
A	≤ 10.0
B	≥ 10.0 and ≤ 15.0
C	≥ 15.0 and ≤ 25.0
D	≥ 25.0 and ≤ 35.0
E	≥ 35.0 and ≤ 50.0
F	≥ 50.0

Source: Transportation Research Board, Highway Capacity Manual, Special Report 209, *2000.*

The City's ATSAC and ATCS control all of the signalized study intersections (Intersections 1, 2, and 4 through 8). Intersection No. 3 at Cahuenga Boulevard West & Pilgrimage Bridge is unsignalized and, as such, does not operate under the City's ATSAC and ATCS control. In accordance with standard LADOT procedures, a capacity increase of 10 percent (0.10 V/C adjustment) was applied at Intersections 1, 2, and 4 through 8 to reflect the intersection capacity benefits of ATCS and ATSAC at these intersections.

d. Scenarios Analyzed

As previously discussed, the Traffic Study evaluated the following scenarios: Existing Conditions; Existing with Project Conditions; Future (Year 2020) Conditions; and Future (Year 2020) with Project Conditions. Each of the four scenarios and the peak periods that were considered for the analysis are further discussed below:

(1) Existing Conditions

Intersection turning movement counts were conducted at the eight study area intersections in September 2013 when both the Ford Theatres and Hollywood Bowl were holding events. As required by LADOT's *Traffic Study Policies and Procedures*, the traffic analysis focused on the weekday and weekend peak hours (i.e., the time periods in which congestion is at its greatest levels), which generally corresponds to the highest hour on a weekday during the morning and afternoon commuter periods and the midday peak hour on a weekend. In addition, as the attendance and traffic volumes associated with the Ford Theatres is highest during evening events, an analysis of the weekday and weekend evening pre-event peak period was also conducted. Consistent with LADOT's guidelines, to identify the peak hours for each intersection, the traffic counts were collected during the following periods:

- Weekday morning commuter peak period between 7:00 A.M. to 10:00 A.M.;
- Weekday afternoon commuter peak period between 4:00 P.M. to 6:00 P.M.;
- Weekday evening (pre-event) peak period between 6:00 P.M. to 9:00 P.M.;
- Saturday midday peak period between 11:00 A.M. to 1:00 P.M.; and
- Saturday evening (pre-event) peak period between 6:00 P.M. to 9:00 P.M.

Existing intersection traffic volumes and summary data worksheets of turning movement counts at the study intersections are identified in Figure 5A, Figure 5B, and Figure 5C of the Traffic Study included as Appendix L of this Draft EIR.

(2) Existing with Project Conditions

Existing with Project Conditions measures transportation impacts of the Project on the existing environment and reflects traffic generated as a result of the Project without accounting for the potential ambient growth in traffic or traffic growth from related projects.

(a) Trip Generation

Trip generation estimates are typically based on trip generation rates identified for various land use types in the *Trip Generation, 9th Edition* manual developed by the Institute of Transportation Engineers (ITE). Traffic Study Policies and Procedures guidelines for Los Angeles indicate that for unique developments or land uses for which ITE trip-generation rates are unavailable or based on a few studies, an alternative to ITE trip-generation rates is appropriate. Currently, there is not an ITE land use category that corresponds well to the unique use and operational characteristics of the Ford Theatres. Consequently, the trips generated by the Project were conservatively estimated based on specific information provided by the Ford Theatre Foundation and County staff with regard to the anticipated unique operational characteristics of the Ford Theatres (i.e., attendance levels; anticipated visitor arrival and departure patterns during weekdays and weekends; events, educational, and other programming; employees, etc.). The number of trips expected to be generated by the typical land use components of the Project (e.g., restaurant use) was estimated using rates published in the *Trip Generation, 9th Edition* by ITE. Trip generation for the office uses is based on the number of existing and proposed employees and conservatively assumes an average vehicle ridership (AVR) of 1.0 per employee vehicle. Detailed assumptions and information regarding the Project trip generation estimates is provided in the Traffic Study included as Appendix L of this Draft EIR.

(b) Trip Distribution and Traffic Assignment

The geographic distribution of trips generated by the Project is dependent on characteristics of the street system serving the Project Site, the level of accessibility of routes to and from the Project Site, the locations of nearby residential, entertainment and employment centers, existing intersection traffic volumes, Project Site ingress/egress availability based on the proposed site access and circulation scheme, the location of the existing and proposed driveways, anticipated visitor arrival and departure information provided by the Ford Theatres, as well as the traffic counts conducted at the site driveways. Based on these considerations, traffic both entering and exiting the Project Site was assigned to the surrounding street system based on the following general distribution pattern: approximately 50 percent to/from the north; approximately 50 percent to/from the south; and approximately 60 percent to/from the US-101.

(3) Future (Year 2020) Conditions

The traffic volumes projected for the future (Year 2020) without Project scenario consider the expected changes in traffic over existing conditions from two primary sources: ambient growth in the existing traffic volumes due to the effects of overall regional growth and development outside the study area; and traffic generated by specific development projects in, or in the vicinity of, the study area. The change in traffic volumes as a result of improvements to the street network was also considered. These factors used to predict Future (Year 2020) Conditions are described below.

(a) Ambient Growth

Based on historical trends and LADOT's *Traffic Study Policies and Procedures*, an ambient growth factor of one percent per year compounded was applied to the traffic volumes under the Existing Conditions to reflect the effects of regional growth and development by the year 2020.

(b) Related Projects

As discussed in Section III, Environmental Setting, of this Draft EIR, in consultation with the Department of City Planning and LADOT, a total of 27 related projects have been identified in relation to the Project by way of location and development completion dates.

(i) Trip Generation

Trip generation estimates for the related projects were provided by LADOT and were calculated using a combination of previous study findings and the trip generation rates contained in *Trip Generation, 9th Edition*. The trip generation projections are conservative,

or higher than can be reasonably expected, since they do not, in every case, account for either the existing uses that may be removed or the possible use of non-motorized travel modes (transit, walk, etc).

(ii) Trip Distribution and Traffic Assignment

The geographic distribution of the traffic generated by the related projects is dependent on several factors, including the type and density of the proposed land uses, the geographic distribution of population from which employees/residents and potential patrons of proposed developments may be drawn, and the location of these projects in relation to the surrounding street system. These factors are considered along with logical travel routes through the street system to develop a pattern of trip distribution. Using the above trip-generation and trip-distribution patterns, traffic generated by the related projects was assigned to the street network.

(c) Future Infrastructure Improvements

Programmed improvements to the street network in the study area were also considered in estimating the traffic volumes for the future (Year 2020) without Project scenario and are described as follows:

- Roadway Improvements—Based on discussions with LADOT, there are no future roadway improvements (either programmed improvements or as mitigation for other approved developments) in the study area that are anticipated to be fully funded and constructed prior to Project buildout (2020). In addition, while future improvements are being planned for the study area, such as the Barham Bridge improvement project and freeway ramp improvements, no future roadway improvements were included as part of the future base scenario in order to provide a conservative, or "worst case", analysis of intersection operations.

- Bicycle System—The future bicycle system in the study area would be expanded to create a more integrated network, as proposed in the City's *2010 Bicycle Plan*. In the vicinity of the Project Site, the *2010 Bicycle Plan* envisions bicycle lanes along Cahuenga Boulevard East, Cahuenga Boulevard West, and North Cahuenga Boulevard. However, none of these proposed bicycle facilities are definitively scheduled for implementation, and they are not expected to be fully built prior to Project completion.

(4) Future (Year 2020) with Project Conditions

The methodologies described above represent the Future without Project Conditions scenario. To develop the Future with Project Conditions scenario, the Project traffic volumes were added to the future without Project Conditions scenario traffic projections.

e. Congestion Management Program

(1) CMP Freeway Analysis

The potential impacts of the Project on CMP monitoring locations were analyzed in accordance with the Transportation Impact Analysis procedures outlined for the Los Angeles County CMP analysis. The freeway system analysis determines if project-generated trips would exceed the CMP thresholds requiring additional analysis of CMP freeway or intersection locations.

(2) CMP Transit Analysis
