Mr. Kim specializes in soil mechanics, forensic investigations, and geotechnical earthquake engineering. He has extensive experience in evaluation of geotechnical engineering design and failure analysis. He is an expert in seismic hazard analyses, non-linear analysis of structures using earthquake time histories, liquefaction evaluations, slope stability analyses, and foundation investigations. He has managed geotechnical investigations to provide recommendations for design as well as forensic investigations for litigation support. He has developed geotechnical recommendations for deep and shallow foundation systems, pavement design, remedial grading, shoring for deep excavations, and mitigation of expansive soils and landslides.

Mr. Kim has worked extensively with commercial, industrial, and government clients on a wide variety of geotechnical assignments. He has successfully managed numerous complex technical projects with budgets ranging up to several million dollars; he has a proven record of delivering his projects on time and within budget.

CHOC TOWER II EXPANSION PROJECT, ORANGE, CA. Principal Engineer for PSHA under the 2007 California Building Code. Optimized the foundation design by recommending a combined mat foundation and pile system to support the 7-story tower. Some portions were supported on piles to prevent surcharging of adjacent existing basement areas and to control differential settlement. The Tower II Expansion Project (South Tower) consists of a 416,000-square-foot, seven-story building with a basement, including appurtenant utilities and site work.

CITRUS VALLEY HEALTH PARTNERS, COVINA, CA. Project Manager for the geotechnical exploration to characterize engineering properties of onsite soils and identify geologic and seismic hazards that may impact the sites. Mr. Kim and the team provided document review, subsurface exploration, laboratory testing, geologic-seismic hazards evaluation, site-specific ground motion study, and engineering analyses.

SOUTH BUILDING AT HOAG MEMORIAL HOSPITAL PRESBYTERIAN, NEWPORT BEACH, CA. Developed and managed the geotechnical investigation and engineering support program for this base-isolated structure, which included the selection and scaling of 14 time histories per building code requirements. Probabilistic and deterministic response spectra were developed to establish the targets for scaling.

KAISER HOSPITAL ADDITIONS, ONTARIO, CA. Provided technical direction for analysis of ground motion and seismic hazards to help obtain review agency approval for this project, which included a new nursing tower and a central plant. The task included the selection and matching of 14 time histories per building code requirements, probabilistic and deterministic response spectra, and evaluation of seismic hazards.

DOWNEY REGIONAL MEDICAL CENTER, DOWNEY, CA. Mr. Kim assumed responsibility as principal-in-charge to procure and obtain review agency approval for the project. The task included the

development of a ground improvement program using vibro-replacement techniques (stone columns) to mitigate liquefaction hazard.

HENRY MAYO MEMORIAL HOSPITAL, NEWHALL, CA. Developed and managed the geotechnical investigation and geotechnical engineering support program for design and construction of various additions and improvements to the medical center.

SAN JUAN VA MEDICAL CENTER ADDITION, SAN JUAN, PUERTO RICO. Developed and managed the geotechnical earthquake engineering program for this project, which included development of probabilistic and deterministic response spectra and evaluation of seismic hazards (liquefaction, seismically-induced slope stability, lateral spreading, etc.).

SEISMIC UPGRADE OF ORIGINAL HOAG MEMORIAL HOSPITAL PRESBYTERIAN BUILDING, NEWPORT BEACH, CA. Developed and managed the geotechnical investigation and engineering support program for the retrofit of this structure, which required extensive analysis of soil-structure interaction to develop feasible alternatives for foundation underpinning and strengthening within confined spaces with severely limited access.

WOMEN'S PAVILION AT HOAG MEMORIAL HOSPITAL PRESBYTERIAN, NEWPORT BEACH, CA. Developed and managed the geotechnical investigation and engineering support program for this base-isolated structure, which included the selection and scaling of 14 time histories per building code requirements. Probabilistic and deterministic response spectra were developed to establish the targets for scaling.

TORRANCE MEMORIAL MEDICAL CENTER, TORRANCE, CA. Performed numerous geotechnical investigations for the design and construction of new facilities and for the seismic evaluation of existing facilities at the site.

WESTMINSTER POLICE DEPARTMENT HEADQUARTERS AND PARKING STRUCTURE, WESTMINSTER, CA. Project Principal and Geotechnical Engineer. Performed supplementary geotechnical investigations and indicator pile program to reduce pile foundation lengths from 75 to 55 feet for the proposed 3-story new police station building and 4-level parking structure at the site of the existing police department headquarters campus.

LOS ANGELES COUNTY DATA CENTER, RANCHO LOS AMIGOS NATIONAL REHABILITATION CENTER, DOWNEY, CA. Project Principal and Project Manager. Performed a comprehensive geotechnical investigation and geologic hazard evaluation for the proposed 46,000 square foot data center facility for the County of Los Angeles, which will consolidate data processing for nine County departments into a single location. The project was designed to be partially underground and to withstand increased seismic loading commensurate with a critical facility.

SAN DIEGO CONVENTION CENTER EXPANSION, SAN DIEGO, CA. Developed and managed the investigation and test pile program to develop the final design lengths and the installation program of foundation piles. The project included profiling the depth and thickness of a discrete bearing layer within stratified subsurface materials, conducting Pile Driver Analyzer measurements during the test pile program, and developing target depth contours to maximize axial capacity and to minimize pile lengths and pile driving effort.

DISNEY'S CALIFORNIA ADVENTURE, ANAHEIM, CA. Managed the geotechnical engineering services for the expansion of the amusement park. The expansion created an amusement park and resort including hotels, movie theaters, and retail establishments. Mr. Kim provided on-going consultation to Walt

Disney Imagineering for all aspects of geotechnical engineering, including shallow and deep foundations, tunnels, retaining structures, seismic design criteria, drainage, and earthwork.

JOE ROE, PG, CEG
Project Geologist

Education

- B.S. Geology, Cal State University Fullerton, 2000, Veteran United States Navy, Desert Storm

Professional Registrations

- California Certified Engineering Geologist – 2456
- California Professional Geologist - 7921
- Certified Nuclear Density Gauge Operator
- Radiation Safety Officer (RSO)
- Caltrans Certified CTM 125 Sampling Highway Materials & Products
- Caltrans Certified CTM 231 Relative Compaction of Soils & Aggregates by Nuclear Method
- Caltrans Certified CTM 375 In-Place Density & Relative Compaction of AC Pavement by Nuclear Method
- Certified Nuclear Density Gauge Operator for use with Troxler 3440 and CPN MC3, CME 75, 85 and 95 rigs used for soil sampling, drive tube and sand cone techniques.
- Member of SCGS, regular attendance at monthly meetings to discuss geologic issues pertaining to the construction and academic geologic environment.

Professional Summary

Mr. Roe has extensive experience managing and conducting field geotechnical investigations for various projects including slope stabilization, Alquist-Priolo fault investigations, mass grading, piles, caissons, asphalt paving, footings, utility backfills, drill logging, rock coring, test trenching, micro-tunneling, monitoring and pump well installations including forensic geotechnical and geologic investigations for litigation support. He has participated in many aspects of project development from project planning, investigation, construction services, and project management and business development.

He has worked extensively with local and State agencies to develop geotechnical recommendations for deep and shallow fill sites, remedial grading and mitigation of active faults, shear zones, landslides and debris flows.

Project Experience

- **Heritage Fields, Irvine, CA.** Project Geologist involved in planning and instituting geotechnical investigations for residential and commercial development over several thousand acre parcel formerly the El Toro Marine Air Base. Geologic mapping based on interpolation of subsurface conditions from several hundred borings in order to determine available sand deposits for mining. Analyzed lab data with respect to planned development in order to provide recommendations for earthwork construction. The project involved multiple field explorations, laboratory testing and geotechnical report preparation and avoidance of known and unknown US Navy landfill sites.

- **Great Wolf Lodge and Resort, Garden Grove, CA.** Senior Project geologist/Project Manager investigating a proposed 250 million dollar development that includes a 9-story hotel, conference center, restaurant, indoor and outdoor water park, and a multi-level at-grade parking structure. Our multiple geotechnical studies identified the significant design considerations for the project was the potential impact to on site utilities and building structures due to settlement of the compressible soils underlying the site. Evaluated the impact of settlement on the proposed development, identified ground improvement alternatives for settlement mitigations, and provided preliminary recommendations for site grading and other planned incidental improvements for the project that were not subject to the adverse effects of settlement.

Master-Planned Community

- **Whispering Hills, San Juan Capistrano, CA.** Senior Staff Geologist during massive hillside grading in a well-documented landslide complex adjacent to the Forester fault. Drilled 40 bucket augers, downhole logged and sampled bucket augers to depths of 120-200 feet for purposes of classifying numerous landslides, geological field mapping of excavations to determine suitable and unsuitable material left in place or to be removed during the grading operations. Communicated daily with engineers and superintendent to convey in field recommendations regarding removal and stabilization of constructed hillsides. Preliminary investigation data used in support of Environmental Impact Report (EIR).

- **Greater Tehachapi Area Specific Plan (GTASP), CA.** Project Geologist involved in research and collection of geologic and fault data over a 400 square mile area for the generation of the Specific Plan for the Tehachapi Area, Kern County, California. The County of Kern was tasked with updating planning and environmental information in this unincorporated Greater Tehachapi area. Involved in preparing a new program-level Greater Tehachapi Area Specific Plan (GTASP) that will rescind and consolidate the existing specific and other community plans in the area. This new Specific Plan will allow the County to identify and coordinate implementation strategies and policies for future land uses by balancing the competing social, economic, resource and environmental factors for future growth in the Greater Tehachapi area.

Forensics

- **Edgeridge Drive Embankment Stabilization, Hacienda Heights, (Unincorporated Los Angeles County), CA.** Project Manager/Geologist responsible for developing a field investigation to support recommendations for the stabilization of the existing Edgeridge Road embankment where a concrete retaining wall failed along the southerly and downslope edge of the roadway. Based on field observations the observed distress within the area of these existing concrete retaining walls was mostly surficial in nature, associated with erosion of colluvial materials on the slope face along the south edge of the active roadway, exposing roadway subgrade and a retaining wall foundation. It was determined that primarily grading and drainage improvements are required to reduce if not eliminate erosion. Recommendations to stabilize the embankment consisted of soldier piles with a spanning concrete wall face to support the road embankment between the soldier piles tied-back by “deadman” piles drilled on the north side of the road embankment, anchored by corrosion-resistant steel anchor cables.

- **Forensic Investigation California Water Service Company Easement, Diamondhead Lane, Rancho Palos Verdes, CA**-Senior Project Geologist planned and executed geotechnical investigation, summarized the findings from assessment and evaluation of a slope failure within the California Water Service Company (Cal-Water) easement. Used limited access rilling and hand dug test pits to identify failure plane and failure mechanisms. Made recommendations for removal and recompaction of landslide and debris flow material to stabilize utility lines and to repair slope to original conditions.

Industrial

- **Barstow Industrial Facility, Barstow, CA.** Project Manager/Geologist. The purpose of this study was to evaluate the potential of faulting onsite. Performed review of stereoscopic paired aerial photos of the site from the San Bernardino County Flood Control District, geological and State of California fault maps, verbal communication with the City of San Bernardino Geologist, performed a site visit to document the current site conditions and preparation of site reports presenting findings and conclusions as to the presence or absence of active faults postulated to cross the site.

- **J.H. Baxter Facility, Long Beach, CA.** Project Geologist responsible for planning and implementing an investigation for the 13-acre area intended for development of 142 cross-dock positions, 50 semi-tractor stalls, 402 trailer stalls, 412 auto stalls and an office building, maintenance shed and a guard booth totaling 10,400 square feet. Challenges were working with contaminated site soils that could not be removed. Recommendations consisted of use of geotextile fabrics to support the planned improvements thereby keeping disturbance of contaminated site soils to a minimum.

Institutional

- **Parking Structure III, California State University Los Angeles, CA.** Project Geologist for the geotechnical investigation performed in support of the design of the three-level concrete parking structure. Investigation included drilling borings in existing fill across a buried canyon in order to determine depths to bedrock. Recommendations included a two type foundation consisting of spread footings at grade in bedrock and deep caissons to support the structure across the pre-existing canyon. Field mapping during the project construction helped develop recommendations to mitigate seepage from the rock structure exposed in the cut walls by means of recommending additional drains and dewatering wells to accommodate nuisance water removal during wet years.

- **Athletic Facility, West Los Angeles Community College, Culver City, CA.** Project Geologist for geotechnical exploration. The site's split level, proposed design and undocumented fill, all presented challenges for the geotechnical recommendations. While the Athletic building, with a two-level basement, would require up to 20 feet of excavation, which would essentially remove the undocumented fill, the Fitness center an at-grade structure would require removal and compaction. Leighton recommendations for the foundations and site grading were based on the laboratory results from the field exploration which included hollow-stem auger borings and Cone Penetration Test (CPT) soundings.

Municipal Infrastructure

- **Mulholland Dam Monitoring Well Installation, Los Angeles, CA.** :Senior Project Geologist involved in the destruction of an existing monitoring well 82-D (MW 82-D) and installing a replacement monitoring well 2010-A (MW 2010-A) to 123 feet using a Myersburg Mobile B 53 mud rotary rig and recirculation of bentonite drilling fluid. Drilling mud and cuttings were stored in 55 gallon drums, analytically characterized and disposed of properly. Completed and filed a well completion report In accordance with Sections 13750 through 13755 (Division 7, Chapter 10, Article 3) of the California Water Code with the Department of Water Resources.

- **Numerous Alquist-Priolo Fault Investigations over active traces of Newport Inglewood, San Andreas, San Jacinto, Chicken Hill and Casa Loma Faults in Los Angeles, San Bernardino and Riverside Counties, CA.** Duties involved extensive field mapping at appropriate scales and interaction with appropriate agencies required for report submittal.

- **Ocean Trails Landslide, Palos Verdes, CA.** Senior Staff Field Geologist for slope stabilization and buildup of geosynthetic mechanically stabilized earth wall, geologic mapping, installation and monitoring of instrumentation array, including survey monuments and extensometers, slope inclinometers along perimeter and within Landslide "C" to monitor landslide movements. Installed hydraugers and monitoring wells to monitor subsurface water and drain the landslide. The project involved daily to weekly monitoring of an array of inclinometers, extensometers and monitoring wells during landslide removals and replacement of mechanically stabilized earth walls to repair the golf course. Project involved daily analysis and weekly reporting of current and changing conditions to city and county officials.

Schools- DSA

- **Beverly Hills High School, Beverly Hills, CA.** -Senior Project Geologist/ Project Manager involved in assessment of postulated faults across the Beverly Hills High School campus in response to the Century City Metrolink Tunnel study. Conducted several continuous east west core boring and cone penetrometer (CPT) transects to depths of 160 feet below ground surface to evaluate type and nature of subsurface stratigraphy along the West Beverly Hills Lineament (WBHL). Excavated overlapping fault trenches to depths of 15-20 feet in the dense urban environment along a Methane Buffer Zone. Coordinated field activities, logged core borings, provided detailed fault trench logging to investigate fault traces should they exist in order to evaluate their activity. Integrated pedochronolgic soil age dating techniques and optically stimulated luminescence (OSL) along with carbon analysis to provide ages of soils below the High School site. Additionally integrated the use of optical mineralogy to determine the origin of clays lining subsurface fractures in order to provide their origin, i.e. tectonic or illuviation in response to California Geological Survey (CGS) concerns as to the origin of clay lined fractures observed in the fault trenches. Submitted data to supplement two detailed responses to California Geological Survey resulting in all geologic issues being “adequately addressed”. This was a major hurtle for the District to overcome as the Leighton report refuted completely the geologic data presented by other consultants resulting a the project design to move forward as originally planned.

- **Malibu High School, Malibu, CA.** Senior Project Geologist implemented and conducted a geotechnical investigation to support design and construction of proposed renovations and additions to the existing campus. Investigation included use of hollow stem auger borings, shallow test pits, infiltration testing to support percolation devices for draining the Olympic sized pool on a weekly basis. Project involved multiple agency reviews ultimately gaining acceptance from CGS and DSA for the projects to move forward.

Transportation

- **Loma Ridge State Route 241-Landslide Repair, Orange, CA.**. Project Geologist involved in detailed slope mapping during excavation of several million yards of La Vida Formation bedrock over a 9 month period in order to provide hillside buttress stabilization in response to activation of a paleo landslide threatening a major state route out of Orange County. Managed contractor activities and continuously mapped field exposures daily during excavation. Field activities consisted of mapping bedrock, confirming elimination of disturbed bedrock and approving subgrade for placement of structurally controlled fill to overseeing installation of multiple tiered sub drainage and back drainage systems to provide adequate passive dewatering of the mechanically buttressed 300 foot high hillside adjacent to the northbound State Highway 241. Communicated daily with contractors and engineers from multiple municipalities and state agencies in order to provide updated geologic cross sections for slope stability analyses.

- **California High Speed Rail, Los Angeles – Orange County Segment.** Project Geologist involved in the collection and presentation of geologic data for the proposed 30-mile rail alignment from Los Angeles Union Station to the Anaheim Station. Collected data for the study area was defined by the following key issues: topography; geology; soils; landslide hazards; surface fault ruptures; ground shaking; liquefaction, other ground failure, seismically induced landslides; tsunami, seiches, dam failure inundation; subsurface gas hazards; mineral resources; oil and natural gas resources; paleontological resources; width of study area; at-grade sections; tunnel and cut-and-cover sections; cut and fill sections; and aerial sections. The alignment travels through 14 cities in Los Angeles and Orange counties, and unincorporated areas of Los Angeles County.

Water Infrastructure

- **Santa Ana Regional Interceptor (SARI Line), Yorba Linda, CA.** Project Geologist involved in Hydrogeologic and Geotechnical Investigation to support design and construction of a 3-mile Sanitary Trunk Sewer line along the Santa Ana River that conveys raw sewage and brine (wastewater from agriculture, commercial and other sources) from the Inland Empire to the OCSD treatment plant in Fountain Valley. Investigation consisted of interaction and acquisition of permits from multiple governing agencies such as Orange County Flood Control District, Orange County Harbors Beaches and Parks, Caltrans, State of California State Parks, Regional Water Quality Control Board for the Santa Ana Region. Investigation included drilling and logging of multiple borings along the 3 mile segment and installation and development of multiple monitoring and pumping wells in performance of aquifer testing for construction dewatering purposes. Determined aquifer and soil characteristics for shoring and constructability purposes. Conducted additional investigations in support of tunnel design and to delineate areas along the tunnel crown that had experienced piping and settlement within a major roadway due to issues tunneling through loose alluvial soils. Identified areas for a compaction grouting program to be instituted by the tunneling contractor.

- **Nohl Canyon Reservoir, City of Anaheim, CA.** Project Geologist involved in planning and instituting investigations in a documented landslide complex to evaluate subsurface conditions for planned addition of a 10-million-gallon tank. Project involved installation of an array of inclinometers as well as monitoring well installation and design to establish baseline conditions prior to construction. Project involved monthly monitoring of existing piezometers as well as newly installed instrumentation, data analysis and report preparation. Responsibilities during construction included extensive field mapping of bedrock exposures during grading in order to collect geotechnical data used in slope stability analysis. Daily communication with engineers, client, and multiple superintendents on the job. Evaluated and approved stability excavations, oversaw installation of extensive sub and backdrain systems during grading operations.

- **Rawlings Reservoir, City of Tustin, CA.** Project Manager/Project Geologist. Project consists of replacing existing 4.2 million-gallon (MG) water reservoir with two 3-MG concrete circular water tanks. Made recommendation to provide temporary shoring wall to protect the north and east sides of the site prior to demolition of the existing tank. Project consisted of multiple styles of drilling using hollow stem augers, limited access rigs due to restricted access and bucket auger and downhole logging to better define the subsurface conditions prior to construction. Main geotechnical issues consisted of failure of existing reservoir and attempted lining repairs (by others); expansive soils and retaining wall failures in the past; slope stability and proposed cut excavations; "Shear zone" and localized shallow groundwater in the ravine draining to the site footprint.

JOHN ANSON FORD THEATRES PROJECT
2580 Cahuenga Boulevard East
Hollywood, CA 90068

Project Introduction and Description

Introduction:

The John Anson Ford Theatres is a historic, open air amphitheatre that is located in the Cahuenga Pass and built into the Hollywood Hills. Opened in 1931, it is one of the oldest performing arts venues in Los Angeles that is still in use today. The Ford Theatres are owned and operated by the County of Los Angeles.

This Hydrology-Water Quality Technical Report has been prepared to provide a summary of existing and proposed water resource conditions as well as to provide an evaluation of how the proposed Ford Theatres project may impact future conditions. The intent is to determine potential impacts the proposed project will have on water resource conditions per the California Environmental Quality Act (CEQA)[1].

The report summarizes construction techniques, Best Management Practices (BMPs), permit requirements, and construction monitoring that will be implemented to minimized impacts to hydrology and water quality.

Project Location and Overview of Existing Conditions:

The project site comprises an approximately 32-acre County of Los Angeles regional park, located at 2580 Cahuenga Boulevard East within the City of Los Angeles, California. The area surrounding the project site includes a mix of residential uses and open space. The vicinity map located in Appendix 'A' shows the location of the project site.

Project Description:

The project site comprises approximately 32-acres of which approximately 3.5 acres is comprised of existing, impervious area. This includes the historic amphitheatre which has a footprint of roughly 0.5 acres.

The proposed project will disturb portions of the existing 3.5-acres of existing development, as well as expand into undeveloped parts of the site for a total impervious area of 4.46-acres.p This proposed work will consist of the following activities: removal of existing buildings, concrete structures, retaining

[1] http://ceres.ca.gov/ceqa/

walls, concrete sidewalks and pavement areas, as well as landscaping areas and trees; grading activities including fill to provide final graded surface and new subterranean buildings; installation of new storm drainage systems, sewer lines, and domestic water, and fire service lines; construction of new concrete sidewalks, pavement areas and hardscaping; and construction of parking structures and buildings with new stage area as well as new adjacent landscaping and hardscaping.

For the pre and post development hydrology, the 32.0 acre site was broken into respective tributary areas based on their drainage pattern. Each tributary area has a high point, collector point, and a critical path that connects the two. The flow rate (Q) and volume (V) was calculated for both, see Appendix E.

For both the pre and post development conditions, Subareas 'H' and 'I' (pre development) as well as 'O' and 'P' (post development) include portions of the neighboring site since their respective critical paths crossover from the adjacent site. This additional run-on area of 5.9 acres has been included into the calculated areas, which is the reason for the 37.9 total acres calculated.

JOHN ANSON FORD THEATRES PROJECT
2580 Cahuenga Boulevard East
Hollywood, CA 90068

State and Local Regulations

Construction Stormwater Permitting:

According to the State Water Resources Control Board (SWRCB)'s Division of Water Quality, the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, this project is subject to the general permit and therefore requires a Storm Water Pollution Prevention Plan (SWPPP) report.[2] This is because the proposed construction or demolition activity, including, but not limited to: clearing, grading, grubbing, excavation, or any other activity results in a land disturbance of equal to or greater than one acre.

As a part of this SWPPP, the owner must submit a Notice of Intent (NOI) to the SWRCB prior to commencement of construction and the report must be prepared and implemented at the project site. Any amendments must be made as needed.

The Los Angeles Regional Water Quality Control Board (RWQCB) has the regulatory authority to review compliance of this permit for the project's region. In addition, the project will be subject to the Los Angeles County Municipal Waste Discharge Requirements for Storm Water and Urban Runoff Discharges.[3] This permit applies to all municipal discharges of storm water and non-storm water by the Los Angeles County Flood Control District and 84 incorporated cities within the coastal watersheds of Los Angeles County, including the city that this project is located in. This permit requires all permittees to ensure construction projects incorporate measures into project plans to reduce or eliminate stormwater impacts. These measures include, but are not limited to: retaining sediments generated on the project site by the use of Best Management Practices (BMPs), retaining construction-related materials, wastes, spills, and residues on-site, containing stormwater runoff from the site, containing non-stormwater runoff from construction activities, and limiting erosion around the site by implementing BMPs. These practices will be identified in the SWPPP.

In addition, the project will be required to comply with the County of Los Angeles' Green Building Standards Code, Title 31, Section 4.106.4 Low Impact Development (LID), and NPDES permit[4]. This project triggers the NPDES report since it is a project that falls under the category of "industrial/commercial developments with one acre of more of impervious surface area."[5]

[2] National Pollutant Discharge Elimination System (NPDES) General Permit Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Order No. 2009-009-DWQ, NPDES No. CAS000002
[3] Order No. R4-2012-0175, NPDES Permit No. CAS004001 Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watersheds of Los Angeles County, Except those Discharges Originating from the City of Long Beach MS4.
[4] http://file.lacounty.gov/bos/supdocs/57378.pdf
[5] http://www.lastormwater.org/green-la/standard-urban-stormwater-mitigation-plan/

The County of Los Angeles states that under the NPDES permit (LACBC Section 106.4.3), proposed developments are required to prohibit the discharge of pollutants from the property. Preventing these pollutants from entering stormwater discharge systems are accomplished by the implementation and maintenance of post-construction Best Management Practices (BMPs). See “Impact Analysis” section for more information on the regulations and the BMPs required for compliance.

JOHN ANSON FORD THEATRE
2580 Cahuenga Boulevard East
Hollywood, CA 90068

Existing Conditions

The John Anson Ford Theatres site is located within the City of Los Angeles, in the Cahuenga Pass and nestled into the Hollywood Hills. The site extends along a hillside with a base elevation of roughly 509 feet, up to elevations as high as roughly 851 feet. The ridgeline for the hill dissects the property so that a majority of the site slopes towards Cahuenga Boulevard to the west, while other portions of the site, slope into private properties to the east. To the north-east of the project is the Hollywood Reservoir but since it is divided by the hillside and at a lower elevation than the ridgeline, it has a different tributary area than the project.

As described above, the existing site consists of a historic amphitheatre, a series of plazas, office building, and asphalt parking/access roads. The total imperviousness of the pre-development condition is roughly 3.5 acres (11% impervious ratio), with the remaining portions of the site being landscaping and undeveloped hillside.

According to the Geotechnical Report, project number 10296.001, dated September 10, 2013 by Leighton Consulting, Inc., there is bedrock that underlines the existing amphitheatre and adjacent structures/retaining walls. Around the ampitheatre are hillside slopes that are inclined from 50-65 degrees and consist of exposed, severely weathered basald bedrock with thick accumulations of colluvium forming on the slopes. In other portions of the site, the upper 3 to 5 feet of soil consists primarily of colluvial sediments in the form of angular sands and gravel sized basal rock fragments that are intermixed with organic debris from hillside vegetation.

The existing site was split into fourteen (14) tributary (sub) areas based on their runoff collection points, see Appendix F – Hydrology Plans.

Generally, the project site slopes towards Cahuenga Boulevard but there is an existing hilltop ridgeline that divides the site into two watersheds. Sub-areas ‘A’ through ‘I’ follow the drainage pattern of sheet flowing towards Cahuenga and are collected by a series of storm drain inlets but resurface through the use of curb drains and bubbler catch basins. This runoff was calculated to be 76.3 cubic feet per second (cfs) and makes it’s way via surface flow along Cahuenga to a series of existing storm drain mains that are owned by the City of Los Angeles.

Sub-areas ‘J’, ‘K’, ‘L’, ‘M’, and ‘N’, were divided by existing ridgelines which divert runoff opposite of the proposed construction. These areas are entirely undeveloped and will remain undeveloped after construction. The runoff for these combined sub-areas was calculated to be 43.6 cfs.

The total flow rate (Q) for the entire existing site was found to be 119.9 cfs, while the total collected volume (V) was 381,586 cubic feet (cf).

Flooding:

Flood hazard area information can be found via Federal Emergency Management Agency (FEMA) and is shown on FIRM Map 06037C1605F.

The John Anson Ford Theatres project is designated as flood hazard area – Zone X, which per the Legend is defined as "Areas determined to be outside the 0.2% annual chance floodplain." This means that the site is not located with a 100-year floodplain, however adjacent to the project site is the Hollywood Reservoir and the reservoir is considered to be within a 100-year floodplain. Based on the topography of the project site and its surrounding area, the reservoir has a runoff direction that is opposite of the project site so even if the reservoice were to flood, it should have less than significant impact on the project, pending an extremely high water level.

Existing Storm Drain System:

As described above, the majority of the project site slopes towards Cahuenga Boulevard where the site's runoff sheet flows into the street via a series of bubbler catch basins and curb drains. The existing flow for a 50-year storm was calculated as being 76.3 cfs, which enters into the existing City of Los Angeles storm drain main via curb-opening catch basins in Cahuenga Boulevard. Per City of Los Angeles plan, D-19081, the existing storm drain main, adjacent to the project site, was built in 1975 and varies from a 27" to a 39" pipe. This storm drain main flows to the south-west and eventually makes it's way to Ballona Creek and then to the Pacific Ocean, see below. The Ballona Creek is listed on the California State's list of impaired waterbodies where the pollutant standards are not met.[6]

Best Management Practices (BMPs):

The existing site does not have any BMP's but per the local jurisdiction's requirements, the proposed work will require a National Pollutant Discharge Elimination System (NPDES) report with corresponding BMP's to filter and retain the project's runoff on-site. See "Impact Analysis" section for more information.

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined.

ZONE AE Base Flood Elevations determined.

ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.

ZONE AR Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.

ZONE A99 Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.

ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.

ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

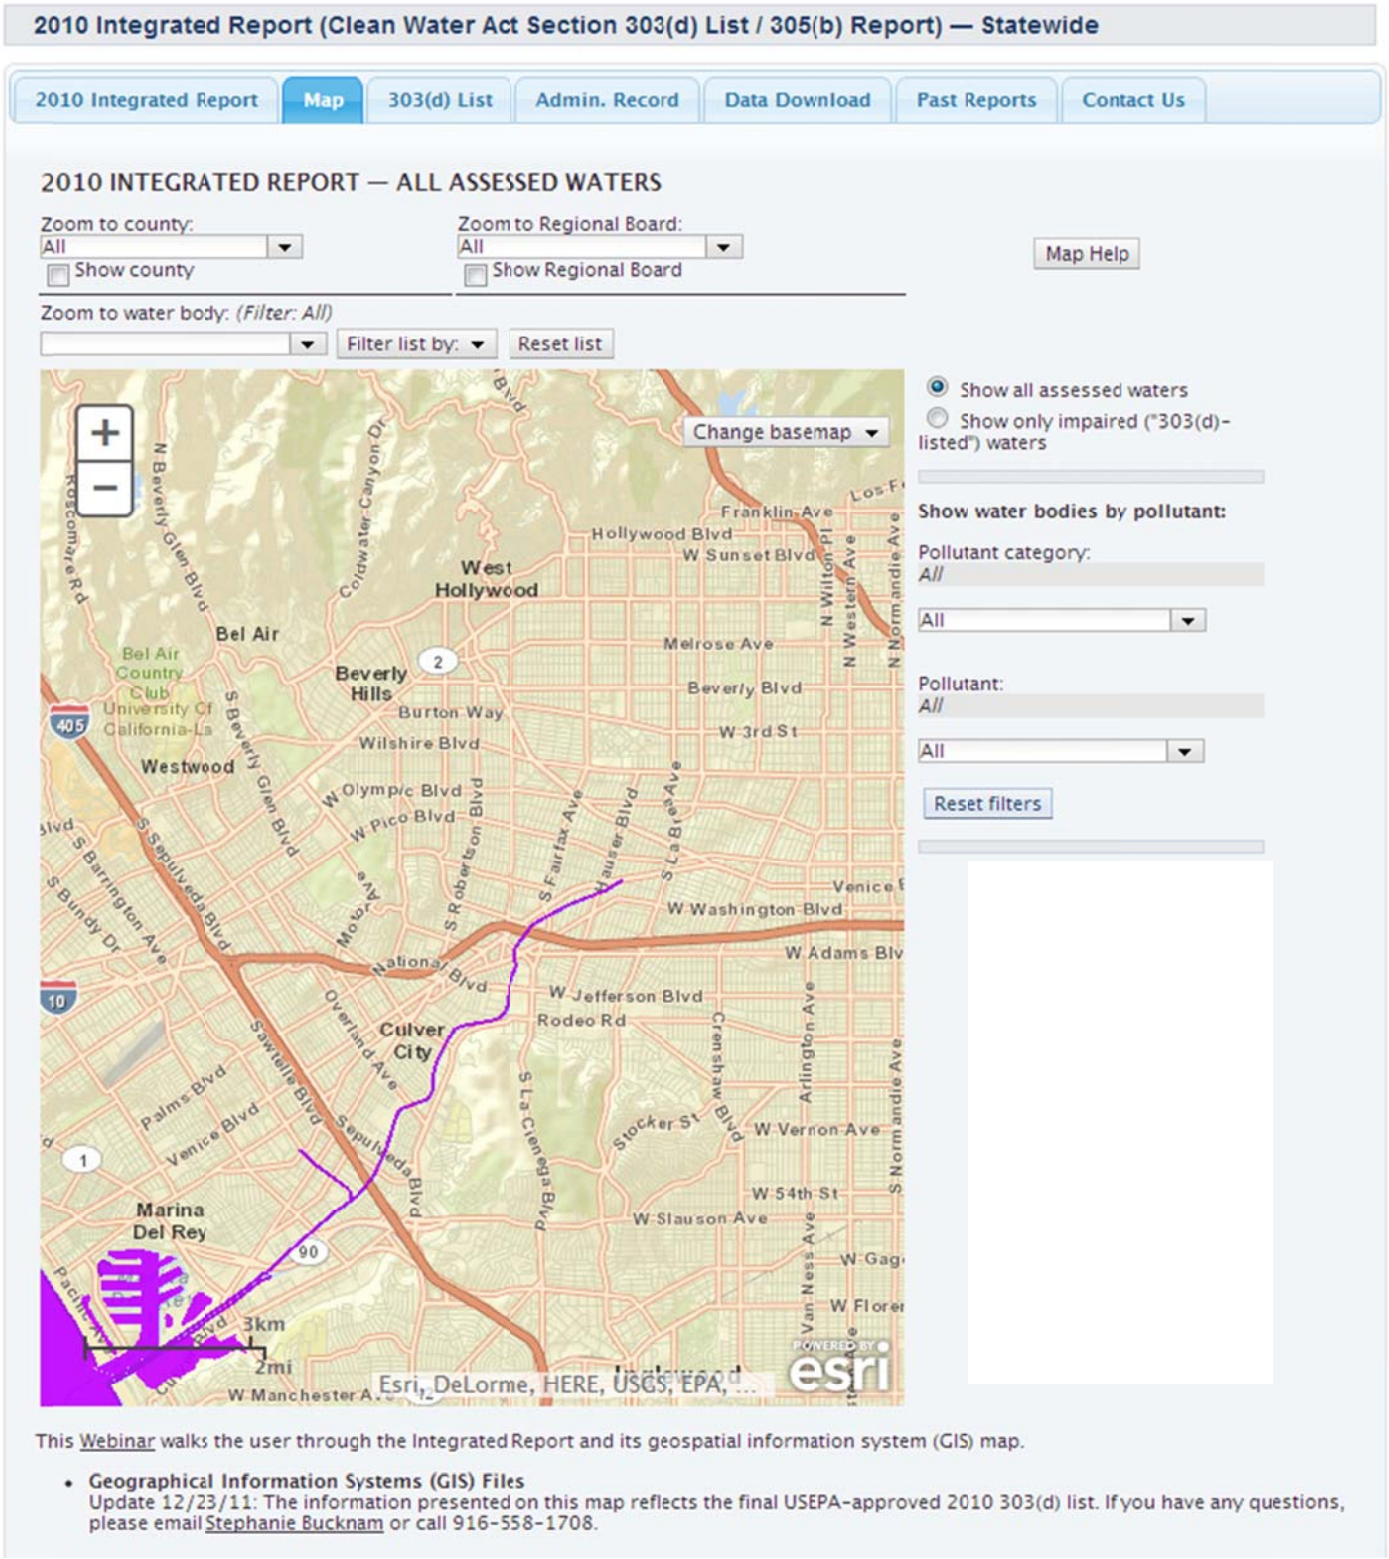
Ballona Creek[7]:



[7] Information provided by the State Water Resources Control Board: Impaired Water Bodies
http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml?wbid=CAR405130001998091814230 2

Proposed Conditions:

As described above, the project would maintain the historic amphitheatre and corresponding plaza and would also expand the site's amenities by constructing new theatre expansions, parking structures, plazas, offices, commercial buildings, central utility plant(s), as well series of walk paths and access roads.

The proposed improvements increase the overall footprint of impervious area on-site and therefore increase the amount of stormwater flow and volume, as shown in the post-development hydrology calculations. The imperviousness of the post-development condition is roughly 4.15 acres (13% impervious ratio), compared to the 3.5 acres (11% impervious ratio) for the existing condition.

Stormwater Runoff and Erosion Control Management:

To comply with SWRCB requirements, a SWPPP report will be prepared prior to construction of the project. During construction, BMPs stated in the SWPPP will be implemented to address and manage stormwater runoff and erosion control.

Best Management Practices – Erosion Control:

During construction, the proposed project will include standard Best Management Practices (BMP's) consistent with the California Stormwater Quality Association (CASQA) handbook for erosion control[8]. These practices will minimize soil, wind, runoff, erosion, and other construction-related pollutions during construction. The required BMP's will be included in the SWPPP.

To control erosion and stormwater runoff, construction activities will be scheduled to minimize the amount of time that soil is exposed. Also, BMP's such as silt fences, fiber rolls, gravel or sand bags, and other sediment barriers will be installed around the perimeter of construction activity as necessary to prevent run-on and run-off from the site. BMPs will also have to address locations of stockpiles and disturbed slopes. The timing/phasing of the installation of these BMPs will be stated in the SWPPP.

Storm drain inlets encountered in or around the project scope will be protected with BMPs such as fiber rolls, gravel bag berms, sandbag barriers, or a combination of. This is to prevent construction influenced sediment from entering into the storm drain system.

[8] https://www.casqa.org/

Hydrology Results:

All storm water runoff will be collected on-site through a series of planter drains, catch basins, area drains, deck drains, roof drains, etc. This collected runoff will then be sent to the adjacent City of Los Angeles storm drain main under Cahuenga Blvd. Water flow rate calculations are prepared for this project and are included in Appendix E. The Los Angeles County Department of Public Works 2006 methodology was used.

The proposed site was split into twenty one (21) tributary areas based on their runoff collection points, see Appendix F – Hydrology Plans. The total flow rate, Q was found to be 123.44 cfs, while the total collected volume, V was 392,476 cf. This increase in Q and V is due to the increase in imperviousness.

Like with the pre-development condition, sub-areas 'Q', 'R', 'S', 'T', and 'U', are divided by existing ridgelines which divert runoff opposite of the proposed construction. These areas are entirely undeveloped and will remain undeveloped after construction.

The flow rate, Q increased from 75.98 cfs to 79.49 cfs in the pre to post-development conditions and this was expected due to various site changes, including the increase in impervious area from 3.5 acres to 4.15 acres, respectively.

As shown on the post-development Hydrology Plan – H2, see Appendix F, due to the increase in site improvements and impervious areas, the number of subareas were expanded from nine to sixteen. Each subarea represents a tributary area where the runoff will be contained and collected. The increase in the number of collection points, along with improvements in the site's storm drain system, allows for proper handling of the increase in the post-development runoff flow rate and volume.

LID/NPDES Requirements:

Per the County of Los Angeles requirements, "all development projects equal to 1 acre or greater of disturbed area and adding more than 10,000 square feet of impervious area" must comply with its NPDES requirements. This means that the project must control its site's runoff through the use of BMPs for infiltration, bioretention, and/or rainfall harvesting. The project must also retain the 0.75-inch, 24-hour rain event volume on-site. The total disturbed area of the John Anson Ford Theatre project is 5.04 acres.

Best Management Practices – Water Quality:

Based on the County of Los Angeles Hydrology manual, the amount of runoff volume that will have to be retained for this total disturbed area is roughly 12,600 cf. Since the surrounding soil is layered with bedrock, infiltration will be difficult. The remaining options would be bioretention, through the use of underground retention tanks, detaining the water through use of tanks, or rainwater harvesting, which will require tanks and pumps to reuse the water for irrigation. These on-site BMPs will need to be addressed during the planning phases on the proposed project.

A list of other potential BMPs can be found in the County of Los Angeles LID Manual[9].

The proposed site has the ability to add new storm drain connections to the public main. This would reduce runoff from the site and allow all excess filtered water to go directly in the storm drain main rather than via surface flow.

In-terms of water quality impact, the proposed project will have little to no impact to its surroundings because of the use of BMPs to meet NPDES requirements. Erosion and stormwater runoff from construction related items will be filtered and contained on-site. Any overflow will have the same watershed and drainage pattern as the existing conditions.

MOLLENHAUER

Grant Kai, PE, LEED AP, QSD/QSP
Senior Project Manager

Education

University of California, Los Angeles
Bachelor of Science, Civil Engineering

Professional Experience and Credentials

Mr. Kai is a senior project manager in the civil engineering group of Mollenhauer's Los Angeles office. During his tenure at Mollenhauer, Mr. Kai responsibilities have increased in a natural and logical progression to allow him to fulfill his desire to serve the firm's clients in the area of project management, utility design and precise grading.

Relevant Projects Experience

Recent projects of note for which Mr. Kai has served as project manager are as follows:

- Burbank Water and Power Magnolia Service/Control Building–LEED Platinum Certified
  Burbank, CA
  Design of grading, paving drainage and utilities for Service Center/Warehouse and adjacent structure. $11.8 million construction cost.

- Palm Desert Sheriff's Station- LEED Gold Certified
  Palm Desert, CA
  Developed a previously vacant 10-acre site located in Palm Desert into a sheriff station complete with roadways and parking lot improvements. Prepared all site grading and utility (domestic water, fire water, sewer and storm drain) plans as well as a large Best Management Practice infiltration system. Prepared the LEED submittal for the civil engineering aspects of the project.

- Martin Luther King Jr. Medical Center Ancillary – LEED Gold Certified
  Los Angeles, CA
  Design of grading, paving drainage and utilities for the New Pediatrics and Trauma Center. The design included the realignment of a fire water line and storm drain lines to clear the site for this 5 story with basement seismic tower constructed in two phases. $173.4 million construction cost.

- El Cariso Community Regional Park Gym / Community Center – LEED Silver Certified
  Sylmar, CA
  Design-Build Los Angeles County project consisting of 16,000 square foot includes a gymnasium, classroom, multipurpose room, office area, restrooms, full kitchen and exterior surface parking lot. $10 million construction cost.

Professional Registrations

- State of California Professional Engineer License No. 73252
- Leadership in Energy and Environmental Design Accredited Professionals (LEED AP)
- Qualified SWPPP Developer (QSD) and Practitioner (QSP)

Robert J. Poppe
Senior Project Manager

Education

University of Oklahoma, School of Environmental Design
California State University, Los Angeles, Computer Technology

Professional Experience and Credentials

Mr. Poppe has over 28 years of experience in all aspects of Civil Engineering Design and Management. He has served as the Senior Project Manager for numerous multi-million dollar projects ranging from flagship OSHPD hospital and medical facilities, governmental projects including police, fire and sheriff's facilities, senior housing projects, mixed-use housing and retail centers, professional and collegiate sports arenas and fields, education projects ranging from elementary school projects, school site rehabilitations and high school campuses.

Mr. Poppe has extensive Civil Engineering experience in all areas of site development including grading, paving as well as utility design and storm water management and mitigation designs. In addition, he has designed and managed street plan projects for numerous local city and county agencies and acts as a mentor to the younger engineers in the firm in utilizing the numerous aspects of AutoCAD as it relates to the civil engineering profession.

Recent Projects of Note

Recent completed projects of note for which Mr. Poppe has served as the senior project manager are as follows:

- Kaiser Ontario Valley Medical Center
  A new $550 million medical center located on a 27-acre campus included a new 386,000-square foot hospital, service building expansion and a new HSB hospital support building. This green projects civil designs provided several stages of storm water filtration and retention on site with creative bio-swales and retention ponds that were incorporated into the campus landscaping and architecture.

- University of Southern California, Galen Center
  This 10,258 seat, $147 million collegiate multipurpose arena and athletic facility on the campus of USC was one of the first facilities in Los Angeles to incorporate stormwater filtering measures and was awarded the Engineering Project of the Year by the Los Angeles Council of Engineers and Scientists.

- Los Angeles Dodgers 2013 and 2014 Stadium Renovations
  Stadium and site improvements were designed and implemented within an extremely tight off-season schedule that concluded each year's developments by opening day. Improvements included stadium additions, site grading renovations, LID stormwater mitigation features.

PROFESSIONAL EXPERIENCE

Amir Yazdanniyaz has 29 years experience consulting in California and throughout the United States as well Hong Kong, and the United Kingdom. During his career, Mr. Yazdanniyaz has demonstrated experience in all aspects of building acoustics, noise control, environmental assessment, and transportation analysis. In addition, he has developed a particular expertise in designing noise and vibration control measures for building services mechanical equipment.

Mr. Yazdanniyaz has managed numerous environmental noise impact studies involving complex noise issues. He has participated in public presentations of noise assessment documents on behalf of community groups, facility owners and environmental consultants. In addition, Mr. Yazdanniyaz has managed noise impact studies for various types of mixed-use/hotels developments throughout Southern California.

REPRESENTATIVE PROJECTS

- Convention and Event Center, Los Angles, California – Technical noise study for a proposed 72,000-seat multi-purpose Event Center (Farmers Field), renovation/construction of approx. 500,000 square feet of convention spaces, and parking structures.
- Wilshire Grand Redevelopment EIR, Los Angeles, California – Technical noise impact study for the proposed mixed-used development, including office spaces, hotel and residential uses.
- USC Development Plan EIR, Los Angeles, California – Technical noise impact analysis for the proposed development, including academic and university uses, commercial/retails, hotel and residential uses.
- The Village at Westfield Topanga EIR, Los Angeles, California - Noise impact analysis for a mixed-use commercial/hotel development, including shopping and dining, hotel, and community/cultural center.

Subject: Re: Ford Theatres Project - Request for Fire Services Information

Laura

Here are my answers for the Ford Theater project

Fire flow is set at 4K GPM with 20 psi residual pressure
Water demands will be evaluated at the plan check phase of construction

Closest station is FS 76, 3111 Cahuenga, 1 mile away
Engine and BLS
6 FF full time
6:41 average response time
ALS 494
BLS 498
FIRE 321

Next closest station is FS 27 1327 n Cole at 1.7 miles
Task force, two ambulances, and a battalion chief
15 firefighters 24:7
5:04 av response time in 2011
ALS runs-3657
BLS runs-2477
Fires-1267

Next closest station FS 41 1439 Gardner at 2.1 miles away
Engine, one ALS ambulance, one BLS ambulance
8 full time firefighters
5:45 av response time
ALS runs-2226
BLS runs-1448
Fires-1071

First in maps found at http://navigatela.lacity.org/common/mapgallery/pdf/fire_dept/lafd_sta8x11.pdf

The LAFD Deployment Plan has been in place since mid 2011
We strive to reach all EMS incidents within 5 minutes 90% of the time
Our goal is to reach all fires within 5:20 90% of the time

There are no changes planned in the near future for Battalion 5

COUNTY OF LOS ANGELES

SHERIFF'S DEPARTMENT

A Tradition of Service Since 1850

DATE: June 6, 2014

OFFICE CORRESPONDENCE FILE NO.

FROM: HOLLY M. PEREZ, CAPTAIN
PARKS BUREAU

TO: GARY TSE, DIRECTOR
FACILIITES PLANNING BUREAU

SUBJECT: AMENDMENT TO REQUEST FOR SHERIFF SERVICE INFORMATION FOR THE FORD THEATRES PROJECT

This memorandum serves as an amendment for Parks Bureau's original Environmental Impact and Request for Sheriff Service Information reports pertaining to the Ford Theatre project.

In both the Environmental Impact and Request for Sheriff Service project reports authored on March 4, and March 20, 2014, Parks Bureau submitted the following hardscape proposal as a recommendation to reduce the potential for criminal activities at the Ford Theatre site:

- The proposed Project should include perimeter fencing to discourage non-patrons from entering the facility during events at the facility, thereby reducing the potential for crimes of opportunity. Perimeter fencing will also signify to patrons that they should not wander into the hills above the facility during events, and will discourage trespassing by transients during non-event hours.

A follow-up review of the proposed project site has revealed a perimeter fence would not be feasible based on the topography and acreage, nor would it provide any additional security or reduction in crime as initially assessed. Therefore, Parks Bureau formally requests the fencing proposals be removed from its initial Environmental Impact and Request for Sheriff Service reports.

Parks Bureau's reassessment of the project site and venue provides for and adds the following security recommendation:

- During the hours of operation when patrons are in attendance, the proposed project site and venue should adequately staff private security and law enforcement personnel based on the following considerations; hours of the event, type of event and population density anticipated. All of

these factors will determine the ratio of onsite security recommended by Parks Bureau.

Should you have any questions regarding this matter and amendments, please feel free to contact me or Lieutenant Erik D. Ruble at (310) 845-0070.

Los Angeles, California 90045

Dear Ms. Eyestone-Jones:

RESPONSE TO REQUEST FOR SHERIFF SERVICE INFORMATION
FORD THEATRES PROJECT

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to submit the following responses to your February 14, 2014, Request for Sheriff Service Information (Request) for the Ford Theatres Project (Project). The proposed Project would enhance existing facilities at the proposed Project site to create a multi-use cultural and recreational center open daily for a wide variety of users. The Request seeks information regarding law enforcement services provided by the Department to the proposed Project site.

The proposed Project site is located within the service area of the Department's Parks Bureau (PKB). Accordingly, responses to your Request were prepared by PKB Captain Holly M. Perez (see attached correspondence, dated March 20, 2014). Information provided by PKB may be used in the environmental impact report to be prepared for the proposed Project. Any information taken from PKB's response must be properly cited if used in the report.

Should you have any questions of the Department regarding this matter, please contact Lester Miyoshi, of my staff, at (626) 300-3012. You may also contact Mr. Miyoshi, via email, at Lhmiyosh@lasd.org.

Sincerely,

JOHN L. SCOTT, SHERIFF

PARKS BUREAU

TO: GARY TSE, DIRECTOR
FACILIITES PLANNING BUREAU

SUBJECT: **REQUEST FOR SHERIFF SERVICE INFORMATION FOR THE FORD THEATRES PROJECT**

The following information is provided by Parks Bureau/South Zone (PKB South) in response to a Request for Sheriff Service Information, dated February 14, 2014, from Matrix Environmental (Matrix). Matrix is preparing an Environmental Impact Report (EIR) for the Ford Theatres Project (Project). The proposed Project is located at 2580 Cahuenga Boulevard East, in the City of Los Angeles. The proposed Project will demolish certain existing on-site structures, rehabilitate and enhance the existing Ford Amphitheatre, and construct 96,300 net new square feet of associated facilities (theatres, offices, restaurant, plaza/marketplace, transit center, parking structure, and various other amenities) within the 32-acre site.

1. **Sheriff Station(s) and/or other facilities providing sheriff protection services to the Project site.**

   The Department's Parks Bureau (PKB) provides law enforcement services to 177 County facilities (parks, lakes, golf courses, special event venues, etc.), including the Project site. For internal management and administrative purposes, PKB distributes these facilities within three zones: North, South, and East. The Project site is located within the South Zone. PKB South offices are located at PKB headquarters (12910 S. Athens Way, Los Angeles, CA 90061). The PKB South Zone generally extends as far north as the Hollywood Bowl/Ford Amphitheatre, and is bounded by the coastline on the west, and County lines on the south and east. The PKB South Zone contains 38 parks, nine golf courses, and two specialty venues. PKB also maintains satellite offices in Whittier Narrows (East Zone) and Castaic Lake (North Zone).

2. **Staffing and equipment for each police station/facility serving the Project site (e.g., patrol cars, total full-time and part-time staff, number of officers on 24-hr. duty, etc.).**

PKB is currently staffed by 152 sworn deputies and 56 civilian employees, of which 32 deputies and eleven security officers and two civilians are assigned to PKB South. Law enforcement services provided by PKB personnel are delivered by patrol deputies, a Special Problems Unit, Detective Bureau, a Lake Operations Unit, a Mounted Enforcement Detail, and an Off-Road Enforcement Detail. PKB personnel deploy various motor vehicles, non-motorized vehicles, watercraft, and specially-trained horses, during routine patrol operations. For security reasons, PKB will not disclose detailed information regarding patrol shifts, personnel per shift, or the specific types of equipment deployed for law enforcement purposes.

3. **Population served for each sheriff station/facility serving the Project site and boundaries of service area/division.**

   Zero. PKB South provides law enforcement services to certain County parks located within the South Zone. These County parks do not include any residential development.

4. **Special service teams (i.e., SWAT and K-9) available within the division and sheriff stations.**

   In addition to resources described in Item #2, above, special service teams maintained by the Department (and available to PKB on an as-needed basis) include Aero Bureau, Emergency Operations Bureau, Special Enforcement Bureau, Canine Services Bureau, and Mountain Rescue. These specially-trained groups are equipped to respond to various unique assignments including tactical planning, arson/explosives, hazardous materials, biological weapons, criminal terrorism, natural disasters, man-made catastrophes, and search and rescue operations.

5. **A general overview of the department's emergency response system (i.e., dispatch system, standard procedures and protocols, etc.).**

   PKB South patrol deputies respond to incidents they observe while on-site, and, if necessary, may request assistance from additional PKB deputies via radio communication. However, if PKB South is not on-site when an incident occurs, calls for service are received by either Parks Bureau Dispatch Center or the Los Angeles Police Department (LAPD). Calls received by LAPD will be forwarded to the Parks Bureau Dispatch Center and then dispatched to PKB South to the Project site for response. Via existing mutual aid agreement, LAPD can assist the Department by providing additional resources to the Project site in the event of an emergency. For large-scale emergencies, the Department is equipped to coordinate, manage, or support the emergent response of multi-jurisdictional personnel and equipment to assist all law enforcement agencies within and beyond the County.

6. **Most recent data on associated response times for Part I Crime, Part II Crime, and Noncriminal incidents for the station/facility serving the Project area.**

   The Project site comprises the Department's Reporting District (RD) 8394. The most recent crime data for RD 8394 is as follows (Year/Part I/Part II): 2014 – 0/0 (to-date); 2013 - 1/2; 2012 - 0/2; 2011 - 0/1; 2010 - 3/0. Please note that Reporting District 8394 is surrounded in its entirety by LAPD's service area. Accordingly, please consult with LAPD for crime statistics for areas surrounding the Project site.

7. **Planned improvements to the sheriff protection facilities in the service area of the Project site (i.e., expansion, new facilities, additional staffing, etc.), if applicable.**

   PKB South is not aware of any approved proposal to expand existing facilities, construct new facilities, or increase staffing.

8. **Any special sheriff protection requirements due to the specific attributes of the Project.**

   Based on the limited amount of Project-related details and information available at this time, PKB South is not aware of any special police protection requirements or measures that are necessary due to Project location or other attribute. PKB South will review this matter further as additional Project-related details and information are developed and received. However, on March 12, 2014, the Department submitted review comments on an Initial Study and Notice of Preparation of a Draft Environmental Impact Report prepared for the Project to the Department of Parks and Recreation. The review comments were prepared by PKB, and included the following hardscape recommendations to reduce the potential for criminal activities at the Project site, and to assist law enforcement efforts when investigating crimes that occur therein:

   - The proposed Project should include perimeter fencing to discourage non-patrons from entering the facility during events at the facility, thereby reducing the potential for crimes of opportunity. Perimeter fencing will also signify to patrons that they should not wander into the hills above the facility during events, and will discourage trespassing by transients during non-event hours.
   - The proposed Project should be equipped with high definition surveillance cameras throughout. If cost prohibitive, such cameras should be limited to strategic locations along pedestrian pathways, gathering areas, and at driveways on Cahuenga Boulevard. The camera system should allow law enforcement agencies to view live feed remotely, should be equipped with

a hard drive capable of storing video for 15 days (minimum), and should be capable of transferring video to disc or USB storage devices.

- Proposed public restrooms should be configured such that entrances are oriented towards the main event area or other high-visibility areas. The restrooms should be secured during non-event hours to prevent vandalism, theft, and use by transients who may reside in the hills above the facility.
- The proposed parking structure should be well-lit and equipped with high definition surveillance cameras. Points of entry and egress should be equipped with traffic control devices, and a parking lot attendant should be employed during events at the facility.
- The hiking trail should be signed to advise users that it is closed at night, and that camping and smoking are strictly prohibited. The trail itself should be well-marked to prevent users from getting lost, and the brush next to the trail should be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas should not be built along the trail, because transients tend to establish campsites at such facilities. If necessary, such facilities should be provided at trail heads only, because the provision of adequate security at those locations is more feasible.
- The construction site should be protected by security personnel; surveillance cameras, adequate lighting, and perimeter fencing should be installed; large mounds of dirt/debris/building materials and fence covers/screens should be avoided because they block sightlines into and through the site by security personnel and PB South patrol deputies; to the extent possible, equipment and building materials should be removed or secured during non-construction hours.

Thank you for including PKB South in the environmental review process for the proposed Project. Should you have any questions of the Station regarding this matter, please feel free to contact me or Lieutenant Kevin C. Hannigan at (310) 965-8659.

LOS ANGELES POLICE DEPARTMENT

Ms. Stephanie Eyestone-Jones
President
Matrix Environmental
6701 Center Drive West, Suite 900
Los Angeles, California 90045

Dear Ms. Eyestone-Jones:

The proposed Ford Theatres Project involves the Los Angeles Police Department's Hollywood Area. A project of this size would have a minimal impact on police services in the Hollywood Area. The Department is available to advise you on crime prevention features appropriate for the design of the property involved in this project. The Department strongly recommends that the developers contact Crime Prevention personnel, at (213) 486-6000 regarding these features.

Upon completion of the project, you are encouraged to provide the Hollywood Area commanding officer with a diagram of each portion of the property. The diagram should include access routes and any additional information that might facilitate police response.

Should you have any questions regarding this response, please contact Officer Leonid Tsap, Community Relations Section, Media Relations and Community Affairs Group, at (213) 486-6000.

Very truly yours,

ANDREW J. SMITH, Commander
Commanding Officer
Media Relations and Community Affairs Group

Enclosures

HOLLYWOOD AREA

The proposed Ford Theatres Project is located in Hollywood Area, Reporting District (RD) 615. Hollywood Area covers 13.34 square miles. Hollywood Area Station is located at 1358 Wilcox Avenue, Los Angeles, California (323) 972-2971.

The service boundaries of Hollywood Area are as follows: Mulholland Drive, Griffith Park Boundary to the North, Los Angeles City Boundary, Melrose Avenue to the South, Normandie Avenue, Griffith Park Boundary to the East and Los Angeles City Boundary to the West.

The boundaries for RD 615 inclusively are as follows: North Hollywood Area to the North, Hollywood Freeway to the South, Barham Boulevard to the West and Montlake and Ledgewood Drive to the East.

The average response time to emergency calls for service in Hollywood Area during 2013 was 5.0 minutes. This response time is below the citywide average that was 5.9 minutes during 2013 and the seven minute response time that is a set standard. There are approximately 354 sworn officers and 16 civilian support staff deployed at Hollywood Area.

There were 65 crimes per 1000 persons in Hollywood in 2013. Individual RD crime statistics, population and crimes per 1000 persons are listed on the attached RD information sheets.

Chapter 1
Introduction

This study presents the traffic impact analysis for the proposed improvements to the John Anson Ford Theatres (Project) located in the County of Los Angeles near the Hollywood community of the City of Los Angeles (City). The methodology and base assumptions used in the analysis were established in conjunction with the County of Los Angeles Department of Public Works (LACDPW) and the Los Angeles Department of Transportation (LADOT).

PROJECT LOCATION

The Ford Theatres are located at 2580 Cahuenga Boulevard East, east of the 101 freeway between Cahuenga Terrace and Lakeridge Road approximately six miles northwest of downtown Los Angeles (the Project Site). The Project Site comprises an approximately 32-acre County of Los Angeles regional park. Access to the Project Site is currently provided via four driveways along the east side Cahuenga Boulevard East.

The area surrounding the Project Site includes a mix of residential uses and open space. The uses north, south and east of the Project Site are separated from the developed areas of the Project Site by open spaces areas and the steep topography formed by the canyon setting. The Hollywood Bowl is also located southwest of the Project Site, across Cahuenga Boulevard East, Cahuenga Boulevard West and the US 101 (Hollywood Freeway). It should be noted that the Hollywood Bowl comprises approximately 70 acres and includes an Amphitheatre with a seating capacity of approximately 17,376, four surface parking lots and a valet parking area, 15 picnic areas, concession services, box offices, a museum, and other visitor shops and amenities.

EXISTING SITE CONDITIONS

The Ford Theatres, some of the oldest performing arts venues in Los Angeles, are owned by the County of Los Angeles and operated through a three-way partnership between the County of Los Angeles Department of Parks and Recreation, the County of Los Angeles Arts Commission, and The Ford Theatre Foundation. The Project Site currently contains the existing Ford Theatres facility, which includes an approximately 1,200-seatAmphitheatre[1] with related support spaces and ancillary facilities including projection booth and control rooms, concession building, box office, plaza and picnic areas, production offices and backstage facilities for performers, an indoor venue ([Inside] The Ford) with approximately 87 seats located below the Amphitheatre seating, and a former motel building with approximately 10,500 square feet (sf) that is currently used as office space for the Arts Commission, Department of Parks and Recreation, and Ford Theatre Foundation (approximately 20 employees), as well as Los Angeles Philharmonic (approximately 140 employees). The Project Site also includes a cell tower and associated structures, as well as other facility support spaces such as storage and maintenance areas and restrooms located throughout. The remaining portions of the Project Site are comprised of surface parking areas and undeveloped open space. The Project Site also includes non-designated user-created hiking trails in the hills behind the Amphitheatre and around a cross that is not part of the Project Site.

During performances, the Project Site currently provides parking for approximately 350-380 vehicles in a stacked parking configuration. Surface parking areas comprised of both asphalt and dirt areas are located along Cahuenga Boulevard East (the north parking lot and the south parking lot), as well as adjacent to the secondary entrance at the Amphitheatre level. During events, parking is also available at the Universal City/Studio City Metro Red Line Station, where a shuttle is provided to and from the Project. The stacked parking configuration is very inefficient from both a patron experience and operational standpoint. For example, patrons must wait for vehicles parked in front of them to move in order to exit the parking areas. A detailed description of the observed pre-event loading and parking operations is provided in Appendix A. The Hollywood Bowl also uses the existing parking facilities during non-event days or during low attendance events at the Ford Theatres.

[1] It should be noted that after commencement of this traffic study and collection of traffic counts, the old seats within the Amphitheatre were replaced, which resulted in the loss of four seats. Therefore, the Amphitheatre currently contains 1,196 seats. The 1,196-seat Amphitheatre will be maintained as part of the Project.

As mentioned, access to the Project Site is provided via four driveways along the east side of Cahuenga Boulevard East. The driveway at Cahuenga Boulevard East & Pilgrimage Bridge provides primary access to the Project Site. During events, this driveway is used for patrons entering by passenger vehicle and for shuttle access from the Universal City/Studio City Metro Red Line Station. During non-event times, this driveway serves as the main ingress and egress point for employees and vendors. The northernmost driveway, located north of the intersection of Cahuenga Boulevard East & Pilgrimage Bridge, is primarily used for egress after events and is occasionally used for overflow stacked parking. The two southern driveways, located south of the intersection of Cahuenga Boulevard East & Pilgrimage Bridge, are primarily used for egress from the southern surface parking lot after events.

The internal roadway that leads from Pilgrimage Bridge to the secondary entrance at the Amphitheatre level serves as the performer entrance to the lower level Amphitheatre support spaces, as well as providing access for shuttle and vehicular loading and unloading, trash pickup, media truck parking, and fire truck staging.

Pedestrian access to the Project Site is available from several locations along Cahuenga Boulevard East, including via the four existing driveways, as well as a walkway located in front of the former motel building. Within the Project Site, pedestrian access to the Amphitheatre is available from the main entrance located at the bottom of Edison Plaza, adjacent to the box office, and from the secondary entrance located at the Amphitheatre level.

The Ford Theatres currently hosts an average of approximately 184 events throughout the year, including 84 events within the Amphitheatre from May through October and approximately 100 events within the [Inside] The Ford theatre from November through April. An average of approximately 50,640 people attend events within the Amphitheatre during the May through October event season and approximately 4,000 people attend events within the [Inside] The Ford theatre throughout the November through April event season, for a total annual attendance of approximately 54,640 people. During the event seasons, the hours of operation are 8:00 AM to 11:00 PM, daily.

APPROVED AMPHITHEATRE IMPROVEMENTS

In September 2013, the County of Los Angeles prepared a Notice of Exemption pursuant to California Environmental Quality Act (CEQA) Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the rehabilitation of portions of the existing Amphitheatre. The improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. Implementation of these improvements will address long-deferred maintenance and needed repairs, mitigation of water infiltration, provision of slope stabilization, and provide enhanced theatrical infrastructure and performer amenities.

PROJECT DESCRIPTION

The Project is proposed to enhance existing facilities and provide for new artistic programming opportunities that together would stimulate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility to a multi-use cultural and recreational center. The Project includes the rehabilitation of portions of the existing Amphitheatre and the development of new buildings and outdoor plaza areas. These improvements, which would be developed in several phases as funding permits, include a 299- seat theatre, a multi-purpose flex space, a restaurant, office spaces, and enhanced parking facilities and visitor amenities. The Project also provides for the renovation of exterior landscape areas and enhanced vehicle and pedestrian circulation. An approximately three-quarter mile hiking trail located between two trailheads along the north and south ends of the Project Site is also proposed. Further, a new Transit Center will be constructed to accommodate shuttle and valet loading and unloading.

The Project is comprised of the following components:

- Amphitheatre Rehabilitation Improvements-includes rehabilitation of portions of the existing Amphitheatre
- The Ford Terrace, which includes office space and lower-level concessions area and a raised plaza deck above a service level

- The Ford Plaza, which is set atop a new parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities
- The Transit Center, which would include a designated area for bus and valet drop-off, a new parking structure, and a multi-purpose flex space (Flex Space) that could accommodate approximately 99 seats
- A three-quarter mile hiking trail, approximately four feet in width, with trail terminations at the north and south parking structures within the Transit Center and Ford Plaza, respectively

In total, the Project will have three Theatres/spaces; with an increase of 311 theatre seats over existing conditions. The Project includes 13,660 sf of additional office space for a total of 24,160 sf, and a 5,400 sf quality restaurant. The Project also includes other support and ancillary facilities, such as box offices, museum/gallery for The Ford Theatres, shops, visitor amenities, projection booth and control room, outdoor areas, backstage spaces, etc. Parking will primarily be provided in two new parking garages, Parking Structure 1 (south) and Parking Structure 2 (north) that provide approximately 500 parking spaces in a self-park configuration.

Figure 1 shows the site plan of the proposed Project.

Access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some configuration and circulation modifications. To facilitate access and circulation within the Transit Center, the Project proposes to add a fifth driveway on Cahuenga Boulevard East just north of the Pilgrimage Bridge that will serve as an exit-only driveway for the Transit Center. The proposed driveway would provide right-turn-only egress from the Transit Center and the parking structure.

The driveway at Cahuenga Boulevard East & Pilgrimage Bridge, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. The northernmost driveway, which is currently used primarily for egress after events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from Parking Structure 2. The southern driveways would be maintained in their existing locations with the southernmost driveway providing ingress to the south Parking Structure 1 and the other driveway providing egress. Ingress and egress to the south parking structure would also be provided from the main entrance.

Within the Project Site, pedestrian access to the Amphitheatre would continue to be provided at the main entrance. In addition, new pedestrian pathways would be provided for access to the new areas. The secondary entrance at the Amphitheatre level would be modified to form the Service Court, which would provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access. The Project would also include bicycle amenities.

Project operations would include theatre programming that consists of cultural, entertainment, and educational programs. . Overall, implementation of the Project would result in approximately 47,550 net new sf of new facilities and approximately 48,750 net new sf of outdoor plaza areas within the Project Site. It is estimated that with the new event spaces as part of the Project, the number of annual events may increase to approximately 331 events and the number of annual attendees may increase to approximately 93,725 people. A summary of events and attendance is provided in Appendix A. The hours of operation at The Ford Theatres would continue to be from 8:00 AM to 11:00 PM daily. It is anticipated that existing Los Angeles County Parks and Recreation, County Arts Commission and Ford Theatre Foundation staffing within the Project Site would increase by 85 employees. The approximately 140 Los Angeles Philharmonic employees currently housed on site will be relocated and will no longer be accommodated within the office portion of the Project. However, it is envisioned that other Arts Commission employees (or other County-related staff/employees) may be relocated to the Project Site as part of the Project in place of the Los Angeles Philharmonic employees that will be removed. The number of employees that may be relocated to the site would not exceed the existing number of employees on site (i.e., 140 Los Angeles Philharmonic employees).

As a Project design feature, the start times of simultaneous events to be held in the Amphitheatre and 299-seat theatre on weekday evenings (e.g., after 6:00 PM) will be staggered by a minimum of 45 minutes in order to separate the arrival patterns of each theatre's patrons. This condition has been reflected in the traffic analysis of weekday evening conditions included in this study. The Project also includes preparation and implementation of a Parking and Traffic Management Plan (PTMP) to minimize the effect of parking and traffic on the surrounding street system. The PTMP includes measures such as defining travel routes, as well as operational and scheduling measures, to further reduce and manage parking and traffic at The Ford Theatres for both event days and non-event days. The PTMP is further described in Chapter 9 of this traffic impact report.

The Project would be implemented in several phases as funding becomes available and may be completed as early as 2020.

ORGANIZATION OF REPORT

This report is divided into 13 chapters, including this introduction. Chapter 2 describes the methodology used to analyze intersection operating characteristics and assess significant traffic impacts. Chapter 3 describes the existing circulation system, traffic volumes, and traffic conditions in the Study Area. The methodologies used to forecast future background traffic volumes are described and applied in Chapter 4. Chapter 5 describes the methodology used to forecast Project traffic within the Study Area, and Chapter 6 assesses intersection operating conditions of the existing street system after completion of the Project. Chapter 7 assesses intersection operating conditions in the future after completion of the Project. Chapter 8 identifies traffic impacts caused by the Project under existing and future conditions at buildout. Chapter 9 describes the Parking and Traffic Management Plan. Chapter 10 presents the regional Congestion Management Program analysis. Site access and internal circulation are evaluated in Chapter 11. Chapter 12 describes the existing and proposed parking operations and Chapter 13 presents the construction impact analysis. The appendices contain supporting documentation and assumptions and details of the technical analyses presented herein.

FIGURE 1

Chapter 2
Traffic Impact Analysis Methodology

This chapter describes the various traffic scenarios analyzed, the methodologies used for assessing intersection and street segment operating conditions, and significant traffic impact criteria for the jurisdictions overseeing the analysis.

TRAFFIC ANALYSIS SCENARIOS

Attendance levels for The Ford Theatres programs can vary depending on the time of the year and the nature of the program/event. For example, programs may range from a small meeting to an event that utilizes both the Amphitheatre and smaller Theatres. To evaluate the worst case scenario of operations, this traffic study analysis represents an event that utilizes the maximum seating capacity of the Theatres. Weekday and Saturday "pre-event" peak hour conditions were analyzed, as they represent the time periods preceding a large evening program in the Theatres (e.g., sold-out large concert, etc.) The traffic analysis includes weekday AM and PM commuter peak hour conditions, as well as weekday evening and weekend midday and evening event conditions.

STUDY SCOPE AND ANALYSIS CONDITIONS

The Project is in the County of Los Angeles, which requires that traffic studies follow the criteria contained in LACDPW's *Traffic Impact Analysis Report Guidelines* (Jan 1, 1997). However, since all of the study intersections are in within City of Los Angeles jurisdiction, based on direction from LACDPW staff, this traffic study follows LADOT's *Traffic Study Policies and Procedures* (May 2012), which establishes the guidelines for determining the appropriate traffic analysis for a project, analysis methodologies, significance thresholds, etc. As required by Traffic Study Policies and Procedures, the traffic analysis focused on weekday and weekend peak hours (i.e., the time

periods in which congestion is at its greatest levels), which generally corresponds to the highest hour on a weekday during the morning and afternoon commuter periods and the midday peak hour on a weekend. In addition, as previously noted, analysis of the weekday and weekend evening "pre-event" peak hour was also prepared. The scope of analysis for this study was developed in consultation with LACDPW and LADOT staff. The base assumptions and technical methodologies (i.e., trip generation, study locations, analysis methodology, etc.) were identified as part of the study approach and were reviewed and approved by LACDPW staff.

The traffic impact study evaluates the potential for impacts caused by the Project on the street system surrounding the Project site. Consistent with *Traffic Study Policies and Procedures,* the following analysis conditions are analyzed for the Project:

- Existing Conditions – The analysis of existing traffic conditions provides a basis for the assessment of existing plus project and future traffic conditions. The Existing Conditions analysis includes a description of key area streets and highways, traffic volumes, and operating conditions at the time the Notice of Preparation (NOP) was issued.

  To identify the weekday morning and afternoon commuter peak hours, the weekend midday peak hour, as well as the weekday and weekend "pre-event" peak hours for each intersection, intersection turning movement counts for typical weekday morning (7:00 AM to 10:00 AM), weekday afternoon (4:00 PM to 6:00 PM) and weekday evening (6:00 PM to 9:00 PM), Saturday midday (11:00 AM to 1:00 PM), and Saturday evening (6:00 PM to 9:00 PM) peak periods were collected in September 2013 when The Ford Theatres and Hollywood Bowl amphitheatres were both holding events. Fieldwork (lane configurations, signal phasing, parking restrictions, etc.) for the analyzed intersections was collected in late 2013.

- Existing Plus Project Conditions – CEQA, LACDPW and LADOT require an evaluation of project traffic impacts on the existing environment as part of traffic impact analyses. This analysis evaluates the potential project-related traffic impacts as compared to existing conditions.

- Future Without Project Conditions (2020) – This analysis projects the future traffic growth and intersection operating conditions that could be expected as a result of regional growth and related projects in the vicinity of the Project Site by year 2020. The Future without Project traffic conditions are projected by adding ambient traffic growth (compound 1% per year) and traffic from related projects to existing conditions. This analysis provides the conditions by which project impacts are evaluated at full buildout.

- Future Plus Project Conditions (2020) – This analysis identifies the potential incremental impacts of the project at full buildout, prior to mitigation, on projected future traffic operating conditions by adding the net project-generated traffic to the Future without Project traffic forecasts (year 2020).

INTERSECTION LEVEL OF SERVICE METHODOLOGY

Signalized Intersections

Intersections under the jurisdiction of the City were evaluated using the Critical Movement Analysis (CMA) methodology, which determines volume-to-capacity (V/C) ratios on a critical movement basis. The overall intersection V/C ratio is subsequently assigned a level of service (LOS) value to describe intersection operations. The CMA methodology was implemented using LADOT's Calcadb Lite spreadsheet application to analyze intersection operating conditions. LOS is a qualitative measure used to describe traffic flow conditions. Table 1 presents a description of the LOS categories, which range from excellent, nearly free-flow traffic at LOS A to stop-and-go conditions at LOS F.

The City's Automated Traffic Surveillance and Control (ATSAC) and Adaptive Traffic Control System (ATCS) control all of the signalized study intersections. In accordance with standard LADOT procedures, a capacity increase of 10% (0.10 V/C adjustment) was applied to reflect the benefits of ATSAC and ATCS control at these intersections, as further described in the following paragraphs.

The ATSAC)system represents an advanced system in computer control of traffic signals. It was first put into operation in June 1984 in the Coliseum area of the City of Los Angeles to anticipate the expected increase in traffic due to the Summer Olympic Games, and has since been expanded to other parts of the City. The advantages of ATSAC-controlled traffic signals are substantial, including real-time adjustment of signal timing plans to reflect changing traffic conditions, identification of unusual traffic conditions caused by incidents, the ability to implement special purpose short-term signal timing changes in response to incidents, and the ability to identify signal equipment malfunctions quickly. LADOT estimates that implementation of this system improves intersection capacity by an average of 7%.

ATCS is a computer-based traffic signal control program that provides fully responsive traffic signal control based on real-time traffic conditions. It automatically adjusts and optimizes traffic signal timing in response to current traffic demands on the entire signal network such that the number of stops and the amount of delay is minimized along with improved traffic signal coordination throughout the network. LADOT estimates that implementation of this system

improves intersection capacity by an additional 3% over those operating under the ATSAC system alone.

Unsignalized Intersections

Unsignalized intersections were analyzed using the Highway Capacity Manual (HCM) stop-controlled methodology and HCM unsignalized methodology. These methods quantify the intersection operations in terms of average vehicular delay in seconds. Consistent with LADOT's traffic study guidelines, it was determined that unsignalized intersections would be assessed for signalization according to the following criteria:

1. Is the intersection projected to operate at LOS E or F during the analyzed peak hours with Project implementation?
2. Does the Project add traffic to the intersection?
3. If Nos. 1 and 2 are met, then the intersection should be evaluated for installation of a traffic signal.

The determination that an unsignalized intersection meets the criteria of a traffic signal warrant does not in itself require the installation of a signal. Rather, the decision on whether a traffic signal should be installed is made by the governing jurisdictions taking into consideration other factors such as distance to adjacent signalized intersections and interruption to traffic flow along the major street.

IMPACT CRITERIA AND SIGNIFICANCE THRESHOLDS

The significance of the potential impacts of Project generated traffic at each study intersection was determined using criteria identified in *Traffic Study Policies and Procedures* (City criteria) and *Traffic Impact Analysis Report Guidelines* (County criteria).

Both the City and the County's Sliding Scale Method for calculating the level of impact due to traffic generated by a proposed project, a significant transportation impact is determined based on the criteria presented below:

Intersection Significance Thresholds

Intersection Conditions with Project Traffic		Project-Related Increase in V/C Ratio Equal To or Greater Than
LOS	V/C Ratio	
C	0.701 - 0.800	0.04
D	0.801 - 0.900	0.02
E or F	> 0.900	0.01

The relative impact of the added traffic volumes to be generated by the Project was evaluated based on analysis of operating conditions at the study intersections, with and without the Project. Using these criteria, for example, a project would not have a significant impact at an intersection if it is operating at LOS C after the addition of project traffic and the incremental change in the V/C ratio is less than 0.040. If the intersection, however, is operating at LOS F after the addition of project traffic and the incremental change in the V/C ratio is 0.010 or greater, the project would be considered to have a significant impact. A project is not considered to have a significant impact if the intersection is projected to operate at LOS A or B after the addition of project traffic, regardless of the volume of traffic added to the intersection or the incremental change in the V/C ratio. In general, according to the significant impact criteria, the higher the V/C ratio, the lower the amount of project traffic that can be added before causing a significant impact.

As required by *Traffic Study Policies and Procedures,* the Project's impacts were evaluated against the Existing and Future (2020) traffic conditions. The following discussion details the capacity analysis procedures utilized to evaluate the V/C relationships and LOS characteristics at each study intersection.

CONGESTION MANAGEMENT PROGRAM ANALYSIS

The Congestion Management Program (CMP) is a State-mandated program that serves as the monitoring and analytical basis for transportation funding decisions in the County made through the Regional Transportation Improvement Program (RTIP) and State Transportation Improvement Program (STIP) processes. The CMP requires that a Traffic Impact Analysis (TIA) be performed for all CMP arterial monitoring intersections where a project would add 50 or more trips during either the morning or afternoon weekday peak hours and all mainline freeway monitoring locations

An analysis of operating conditions at all CMP arterial and freeway monitoring stations that may be impacted by the Project was performed, as detailed in Chapter 10, in accordance with the TIA guidelines referenced in *2010 Congestion Management Program for Los Angeles County* (Los Angeles County Metropolitan Transportation Authority [Metro], 2010).

ADDITIONAL REVIEW AND ANALYSIS

In addition to the various intersection analysis scenarios and the CMP analysis discussed above, this study includes a review of various other features and conditions related to the proposed Project. These include a review of Project access and circulation and an analysis of potential traffic impacts associated with the Project's construction. An analysis of the unsignalized intersections and a detailed analysis of facilities under the jurisdiction of the California Department of Transportation (Caltrans) are provided in the appendices.

TABLE 1
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS

Level of Service	V□C Ratio	Definition
A	0.000 - 0.600	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	0.601 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

Chapter 3
Existing Conditions

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the Project Study Area. The existing conditions analysis relevant to this study includes an assessment of the existing street system, an analysis of traffic volumes and current operating conditions, and an analysis of the existing public transit service.

STUDY AREA

The Study Area includes a geographic area approximately two miles (north-south) by approximately one-half mile (east-west). This Study Area was established in consultation with LACDPW and LADOT and by reviewing the existing intersection/corridor operations, Project peak hour vehicle trip generation, the anticipated distribution of Project vehicular trips, and the potential impacts of Project traffic.

A traffic analysis study area generally comprises those locations with the greatest potential to experience significant traffic impacts due to the Project as defined by the lead agency. In the traffic engineering practice, a study area generally includes those intersections that are:

1. Immediately adjacent or in close proximity to the project site
2. In the vicinity of the project site that are documented to have current or projected future adverse operational issues
3. In the vicinity of the project site that are forecast to experience a relatively greater percentage of project-related vehicular turning movements (e.g., at freeway ramp intersections)

The Project Study Area was designed to ensure that all potentially significantly impacted intersections, prior to any mitigation, were analyzed, and the boundary of the Study Area was extended, as necessary, to confirm that there were no significant impacts at or outside the boundary of the Study Area.

A total of eight intersections in the Study Area were identified during the scoping process for detailed analysis of the above conditions. Figure 2 illustrates the location of the Site in relation to the surrounding street system and the analyzed intersections. The intersections selected for evaluation are:

1. Cahuenga Boulevard West & Barham Boulevard
2. Cahuenga Boulevard East & Barham Boulevard
3. Cahuenga Boulevard West & Pilgrimage Bridge (unsignalized)
4. Cahuenga Boulevard East & Pilgrimage Bridge
5. Highland Avenue/Cahuenga Boulevard West & Hollywood Bowl Road/US-101 Southbound On-Ramp
6. US-101 Northbound Off-Ramp & North Cahuenga Boulevard
7. Highland Avenue & Odin Avenue
8. North Cahuenga Boulevard & Odin Avenue

EXISTING STREET SYSTEM

The existing street system in the Study Area consists of a regional roadway system including freeways, arterials and collector and local streets. The secondary arterials, collectors, and selected local streets in the Study Area offer sub-regional and local access and circulation opportunities. These transportation facilities generally provide two to six travel lanes and usually allow parking on either side of the street. Typically, the speed limits range between 25 and 40 miles per hour (mph) on the principal and secondary arterials, collector, and local streets.

Street classifications are designated in the *City of Los Angeles Transportation Element of the General Plan* ("General Plan") (Los Angeles Department of City Planning, 1999). The available facilities in the Study Area are defined by the following:

- Freeways are high-volume/high-speed roadways with limited access provided by interchanges that carry regional traffic through and do not provide local access to adjacent land uses.

- Arterial Streets are major streets that serve through traffic, as well as provide access to major commercial activity centers. Arterials are divided into three categories: Major Class Highway I, Major Class Highway II, and Secondary Highway.
    - Major Highway Class I has an average daily traffic (ADT) of more than 50,000.
    - Major Highway Class II is typically located one mile apart in a grid system, with an ADT of 30,000 to 50,000.
    - Secondary Highway supplements the through-traffic characteristics of major highways and typically located one mile apart midway between major highways, with an ADT of 20,000 to 30,000.

- Collector Streets are intended to assist local traffic flow to major and secondary highways and should be located at no greater than one-quarter mile intervals between major or secondary highways in a grid system, if practical, with an ADT of up to 10,000.

- Local Streets provide circulation for local adjacent neighborhoods and do not typically serve commercial uses. Local streets provide connections to collector streets, which in turn, connect to the greater street network.

Primary regional access to the Project Site is provided by US-101. The major arterials providing regional and sub-regional access to the Project vicinity include Cahuenga Boulevard East and Cahuenga Boulevard West. The following is a brief description of the major streets in the Study Area:

Freeways

- US-101 –US-101 generally runs in the north-south direction and is located directly west of the Project Site. In the vicinity of the Study Area, US-101 provides four to six lanes in each direction. Access to and from US-101 is available via interchanges at Cahuenga Boulevard East and Cahuenga Boulevard West.

Roadways

- Cahuenga Boulevard East – Cahuenga Boulevard East is a designated Local Street that runs in the northwest-southeast direction and is located adjacent to the Project Site. It provides two travel lanes and left-turn lanes at study intersections. Parking is generally not permitted. The posted speed limit is 40 mph.

- Cahuenga Boulevard West – Cahuenga Boulevard West is a designated Major Class Highway II that runs in the northwest-southeast direction and is located west of the Project Site. It provides three to four travel lanes, one to two in each direction, and left-turn lanes at intersections. Parking is generally not permitted. The posted speed limit is 40 mph.

- North Cahuenga Boulevard– North Cahuenga Boulevard is a designated Major Highway Class II that runs in the northwest-southeast direction and is located south of the Project Site. It provides four travel lanes, two in each direction, and left-turn lanes at intersections. Parking is generally provided along both sides of the street. The posted speed limit is 40 mph.

- Barham Boulevard – Barham Boulevard is a designated Major Highway Class II that runs in the northeast-southwest direction and is located northwest of the Project Site. It provides four to five travel lanes, two to three in each direction, and left-turn lanes at intersections. Parking is available on the east side of the street with peak hour restrictions. The posted speed limit is 35 mph.

- Highland Avenue – Highland Avenue is a designated modified Major Highway Class II that runs in the north-south direction and is located southwest of the Project Site. It provides six travel lanes, three in each direction, and left-turn lanes at intersections. Parking is generally not permitted within the vicinity of the Project Site. The posted speed limit is 40 mph.

- Pilgrimage Bridge – Pilgrimage Bridge is an east-west roadway that connects Cahuenga Boulevard West and Cahuenga Boulevard East near the Project Site. It provides access to the Project Site with two travel lanes, one in each direction. Parking is not permitted. The posted speed limit is 35 mph.

- Odin Avenue – Odin Avenue is a designated Major Highway Class II that runs in the northeast-southwest direction and is located south of the Project Site. It provides four travel lanes, two in each direction, and left-turn lanes at intersections. Parking is not permitted. The posted speed limit is 40 mph.

The existing lane configurations at the analyzed intersections are provided in Figure 3.

EXISTING TRANSIT SYSTEM

The Project area is served by bus lines operated by Metro and LADOT. Bus transit service in the Project vicinity is available along the following:

- Cahuenga Boulevard East
- Cahuenga Boulevard West
- North Cahuenga Boulevard
- Odin Avenue
- Highland Avenue
- Barham Boulevard
- US-101

Figure 4 illustrates the existing transit service in the Study Area. Table 2 summarizes the various transit lines operating in the Study Area for each of the service providers in the region, the type of service (peak vs. off-peak, express vs. local), and frequency of service. The following provides a brief description of the rail and bus lines providing service in the Project vicinity:

- Metro Red Line – The Red Line travels underground east-west on Hollywood Boulevard in the vicinity of the Project Site with average headways of 10 minutes during the morning and afternoon peak hours. The line travels from downtown Los Angeles to North Hollywood and provides service to downtown Los Angeles, Hollywood, and Universal City.

- Metro Local Line 222 – Line 222 travels north-south on Cahuenga Boulevard in the vicinity of the Project Site with average headways of 47 minutes during the morning peak hours and 37 minutes during the afternoon peak hours. The line travels from downtown Sun Valley to Hollywood via Hollywood Way, Barham Boulevard and Cahuenga Boulevard.

- Metro Local Line 156 – Line 156 travels north-south on Cahuenga Boulevard in the vicinity of the Project Site with average headways of 31 minutes during the morning peak hours and 34 minutes during the afternoon peak hours. The line travels from Van Nuys to Hollywood through North Hollywood and Studio City.

- LADOT Commuter Express 422 – Commuter Express 422 travels north-south on US Route 101 in the vicinity of the Project Site with average headways of 20 minutes during the morning peak hours and 24 minutes during the afternoon peak hours. The line travels from Thousand Oaks to downtown Los Angeles in the morning and from downtown Los Angeles to Thousand Oaks in the evening through US Route 101.

BICYCLE AND PEDESTRIAN NETWORK

Existing Bicycle System

Based on *2010 Bicycle Plan, A Component of the City of Los Angeles Transportation Element*, (Los Angeles Department of City Planning, adopted March 1, 2011), the existing bicycle system in the Study Area consists of a limited coverage of bicycle lanes (Class II) and bicycle routes (Class III). Bicycle lanes are a component of street design with dedicated striping, separating vehicular traffic from bicycle traffic. These facilities offer a safer environment for both cyclists and motorists. Bicycle routes are identified as bicycle-friendly streets where motorists and cyclists share the roadway and there is no dedicated striping of a bicycle lane. Bicycle routes are preferably located on collector and lower volume arterial streets.

Within the Study Area, bicycle lanes are provided on North Cahuenga Boulevard between Odin Avenue and Yucca Street. There are two streets designated as bicycle routes: Odin Avenue between Highland Avenue and North Cahuenga Boulevard and Wilcox Avenue south of North Cahuenga Boulevard.

Existing Pedestrian Facilities

The sidewalks that serve as routes to the Project Site are limited and do not provide proper connectivity and adequate widths for a comfortable and safe pedestrian environment throughout the Project vicinity. Sidewalks are provided along the east side of Cahuenga Boulevard East along the Project Site's property frontage; however, they terminate to the north of the site. Extending south from the Project Site, a narrow sidewalk/parkway area is provided along the east side of Cahuenga Boulevard East that provides connectivity to the neighborhoods to the south. The sidewalks provide limited connectivity to pedestrian crossings at intersections within the Study Area.

Generally, the signalized intersections in the area provide marked pedestrian crossings and include, the study signalized intersections provide pedestrian phasing, crosswalk striping, and Americans with Disabilities Act (ADA) wheelchair ramps.

It should be noted that the signalized intersection located immediately adjacent to the Project Site (Cahuenga Boulevard East & Pilgrimage Bridge) does not currently provide marked crosswalks across Cahuenga Boulevard East (north and south legs of the intersection) or Pilgrimage Bridge. Therefore, pedestrian connectivity to the Project Site via Pilgrimage Bridge to and from areas west of Cahuenga Boulevard East is deficient.

EXISTING TRAFFIC VOLUMES AND LEVELS OF SERVICE

This section presents the existing peak hour turning movement traffic volumes for the intersections analyzed in the study, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each intersection indicating V/C ratios and LOS.

Existing Traffic Volumes

In order to cover both the peak hours of adjacent street traffic and the event peak hours intersection turning movement counts were conducted at the eight study area intersections during the typical weekday morning commuter peak period (7:00 AM to 10:00 AM), weekday afternoon commuter/evening peak period (5:00 PM to 9:00 PM), Saturday midday peak (11:00 AM to 1:00 PM), and Saturday evening peak (6:00 PM to 9:00 PM) in September 2013 when both The Ford Theatres and Hollywood Bowl were holding events. The existing weekday, weekday event, and Saturday intersection traffic volumes are illustrated in Figures 5A, 5B, and 5C, respectively. The summary data worksheets of turning movement counts at the study intersections are provided in Appendix B.

The traffic volumes illustrated in Figures 5A, 5B, and 5C were analyzed using the CMA methodology described above to determine the existing operating conditions at the analyzed intersections. The calculation is expressed in a V/C ratio for critical movements where the volumes at the intersection are compared to the capacity of the intersection.

Existing Intersection Levels of Service

Table 3 summarizes the existing weekday morning, weekday afternoon, weekday event, Saturday midday event, and Saturday evening event peak hour V/C ratio and the corresponding LOS for each of the analyzed intersections.

As summarized in Table 3, the following intersections are operating at LOS E or LOS F during at least one of the five peak study periods:

- Int. 1: Cahuenga Boulevard West & Barham Boulevard (LOS E – Weekday AM/Weekday Event)
- Int. 2: Cahuenga Boulevard East & Barham Boulevard (LOS F – Weekday AM, LOS E – Weekday Event)
- Int. 5: Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp (LOS E – Weekday AM/Weekday PM/Weekday Event)

The LOS calculation worksheets are provided in Appendix C.

Chapter 4

Future without Project Traffic Conditions

Estimates of future cumulative traffic conditions both with and without the Project were developed to evaluate the potential impacts of the Project on the local street system. This discussion details the assumptions used to develop the Future 2020 conditions without the Project.

In order to develop the Future without Project traffic conditions (Year 2020), the existing traffic volumes were factored upward by a compounded 1% annual ambient growth rate to approximate future traffic volumes. In addition to this ambient growth, background and other related projects/cumulative development traffic were also added to estimate the Future without Project (2020) traffic conditions.

CEQA GUIDELINES REGARDING FUTURE TRAFFIC CONDITIONS

The forecast of Future without Project conditions was prepared in accordance with procedures outlined in Section 15130 of *Guidelines for Implementation of the California Environmental Quality Act*, *Chapter 3, Title 14, California Code of Regulations* (California Natural Resources Agency, amended July 27, 2007)*(CEQA Guidelines)*. Specifically, *CEQA Guidelines* provides two options for developing the cumulative traffic volume forecast:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> (B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency."

Accordingly, the traffic analysis provides a highly conservative estimate of Future without Project traffic volumes as it incorporates both the "A" and "B" options outlined in the *CEQA Guidelines* for purposes of developing the forecast.

FUTURE WITHOUT PROJECT TRAFFIC VOLUMES

The existing plus ambient growth traffic volumes were combined with the related project volumes to form the Future without Project (2020) conditions. This scenario forms the basis of the evaluation of Project impacts in the Future plus Project (2020) conditions.

Ambient Traffic Growth

Existing traffic is expected to increase as a result of regional growth and development. Based on historical trends and the City of Los Angeles guidelines and procedures, an ambient growth factor of 1% per year compounding was used to adjust the existing traffic volumes to reflect the effects of regional growth and development by the year 2020.

Related Projects

In accordance with requirements in *CEQA Guidelines*, this study considered the effects of the Project in relation to other developments either proposed, approved, or under construction in the Study Area. These development proposals (called related projects) are projected to be implemented in the Project vicinity prior to the buildout date of the Project. With this information, the potential impact of the proposed Project can be evaluated within the context of the cumulative impact of all ongoing development.

The list of related projects is based on information provided by the Department of City Planning and LADOT. The related projects,which are generally located within a one and one-half mile radius of the Project site, are detailed in Table 4. The locations of these related projects are shown in Figure 6, while Figures 7A, 7B, and 7C depict the traffic volumes associated with these

related projects at the study intersections for weekdays, weekday events, and Saturdays, respectively.

It should be noted that other projects were considered during the development of the list of related projects to be included as part of the traffic analysis. Other considered projects included the Paramount Studios Master Plan and the NBC Universal Evolution Plan, which have anticipated buildout years of 2038 and 2030, respectively. Thus, substantial construction will not be completed by the 2020 buildout year of the Project. Other projects such as small expansions, re-use, and small residential projects that are not anticipated to generate a significant amount of traffic that would affect the study intersections were considered, although not listed. These projects are accounted for in the application of the ambient growth rate described above.

The development of estimated traffic volumes added to the Study Area as a result of related projects involves the use of a three-step process: trip generation, trip distribution, and traffic assignment.

Trip Generation. Trip generation estimates for the related projects were provided by LADOT and were calculated using a combination of previous study findings and the trip generation rates contained in *Trip Generation, 9th Edition* (Institute of Transportation Engineers, 2012). The forecast related projects trip generation is shown in Table 4. These projections are conservative in that they do not in every case account for either the existing uses to be removed or the likely use of other travel modes (transit, walk, etc.) In order to include related project traffic in the background of all study scenarios, it was assumed the weekday PM peak hour trip generation also occurs during the weekday event peak hour and that the Saturday midday peak hour trip generation also occurs during the Saturday event peak hour.

Trip Distribution. The geographic distribution of the traffic generated by the related projects is dependent on several factors. These factors include the type and density of the proposed land uses, the geographic distribution of population from which the employees/residents and potential patrons of the proposed developments are drawn, and the location of these projects in relation to the surrounding street system. These factors are considered along with logical travel routes through the street system to develop a reasonable pattern of trip distribution.

Traffic Assignment. The trip generation estimates for the related projects were assigned to the local street system using the trip distribution pattern described above. These volumes were then added to the existing traffic volumes after adjustment for ambient growth through the projected buildout year of 2020. These volumes represent the Future without Project conditions (i.e., existing traffic volumes, ambient traffic growth, and related project traffic). The resulting Future without Project peak hour traffic volumes are illustrated in Figures 8A, 8B, and 8C for weekdays, weekday events, and Saturdays, respectively.

Future Roadway Improvements. Based on discussions with the City, there are no future roadway improvements (either programmed improvements or other mitigation for other recently approved developments) in the Study Area that are anticipated to be fully funded and constructed prior to the buildout of the Project (i.e., 2020). Although future improvements are being planned for the area (e.g., Barham Bridge improvement project, freeway ramp improvements), no future roadway improvements were included as part of the future conditions analyses, so as to provide a conservative analysis.

Future Bicycle System. The future bicycle system in the Study Area will be expanded to create a more integrated network, as proposed in the *2010 Bicycle Plan*. The three components of the bicycle network include the Backbone, the Neighborhood Network and the Green Network. Class II bicycle lanes will be added to high volume corridors to from the Backbone of the network, while in-road bikeways in lower volume and collector streets will form the Neighborhood Network through the implementation of Class III bicycle routes and bicycle-friendly streets. The Green Network consists of dedicated bike paths that connect the City's open spaces. In the Project vicinity, bicycle lanes along Cahuenga Boulevard East, Cahuenga Boulevard West, and North Cahuenga Boulevard are envisioned as part of the *2010 Bicycle Plan*. However, none of these proposed bicycle facilities are definitively scheduled for implementation, and they are not expected prior to Project completion in year 2020.

INTERSECTION OPERATIONS

Future Without Project Intersection Levels of Service

Table 5 summarizes the intersection analysis of the Future without Project traffic conditions. As summarized in Table 5, the following intersections are anticipated to operate at LOS E or LOS F during one of the analyzed peak hours in the Future without Project condition:

- Int. 1: Cahuenga Boulevard West & Barham Boulevard (LOS F – Weekday AM/Weekday PM/Weekday Event)
- Int. 2: Cahuenga Boulevard East & Barham Boulevard (LOS F – Weekday AM/Weekday Event, LOS E – Weekday PM)
- Int 5: Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp (LOS F – Weekday AM/Weekday PM/Weekday Event/Saturday Evening Event, LOS E – Saturday Midday Event)
- Int 6: US-101 Northbound Off-Ramp & North Cahuenga Boulevard (LOS E – Weekday PM)

The LOS calculation worksheets are provided in Appendix C.

Chapter 5
Project Trip Generation and Distribution

Trip generation estimates, trip distribution patterns and trip assignments were prepared for the proposed Project. These components form the basis of the Project's traffic impact analysis.

PROJECT TRAFFIC VOLUMES

The first step of the forecasting process is trip generation, which estimates the total arriving and departing traffic volumes on a peak hour and daily basis by applying the appropriate vehicle trip generation equations or rates to the amount of Project development.

The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound Project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the Study Area. Localized routes of travel through the Study Area are developed based on existing traffic patterns and relative travel times on various corridors.

The third step of the forecasting process is traffic assignment. This involves applying the traffic generated by the Project (the trip generation) to the intersections and street segments in the Study Area according to the projected trip distribution patterns. These traffic volumes can then be added to existing or future background conditions to represent traffic volumes once the Project is complete.

With the forecasting process complete and Project traffic assignments developed, the impact of the proposed Project is isolated by comparing operational (i.e., LOS) conditions at the selected key intersections using existing and expected future traffic volumes without and with forecast Project traffic. The need for site-specific and/or cumulative local area traffic improvements can then be evaluated and the significance of the Project's impacts identified.

Project Trip Generation

The typical resource utilized in determining the number of trips generated by a project is *Trip Generation, 9th Edition*, which provides trip generation rates for a wide variety of land uses based on surveys across the nation. However, the use and operational characteristics of the Project are not similar to the available land use categories provided in *Trip Generation, 9th Edition.* Therefore, trips generated by the Project were conservatively estimated based on the anticipated unique operational characteristics of The Ford Theatres (i.e., attendance levels, anticipated visitor arrival and departure patterns during weekdays and weekends, events, educational, and other programming, employees, etc.) The number of trips expected to be generated by the typical land use components of the Project (e.g., restaurant use) was estimated using rates published in *Trip Generation, 9th Edition.* Trip generation for the office uses is based on the number of existing and proposed employees and conservatively assumes an average vehicle ridership (AVR) of 1.0 per employee vehicle. Trip generation for the Theatre spaces was calculated based on site-specific empirical data, which is summarized in Appendix D. The trip generation associated with the Theatres also reflects the Project condition that start times of simultaneous events in the Amphitheatre and 299-seat theatre on weekday evenings (e.g., after 6:00 PM) will be staggered by a minimum of 45 minutes in order to separate the arrival patterns of each theatre's patrons. Table 6 summarizes the trip generation rates for the proposed Project components.

Trip Generation Assumptions

The trip generation forecasts associated with the Project is based on information provided by The Ford Theatres, and County staff (i.e., the Project's land use components, attendance figures, anticipated visitor arrival and departure patterns, events, and other programming, etc.) The trip generation associated with the Project is based on the following assumptions and calculations found in Appendix D, as well as the following considerations:

- It is recognized that subsequent to the commencement of this traffic study, the old seats in the Amphitheatre were replaced, which resulted in a loss of four seats. Thus, the existing Amphitheatre provides 1,196 seats. However, for purposes of this traffic analysis, approximately 1,200 seats were assumed, which results in a conservative analysis.

- The number of seats in the Amphitheatre will be maintained as part of the Project. The maximum capacity is 1,598 attendees, which represents sold out seats in all three Theatres (1,200 seat Amphitheatre, 299-seat theatre and Flex Space with up to 99 seats).

- The start times of simultaneous events to be held in the Amphitheatre and 299-seat theatre on weekday evenings (e.g., after 6:00 PM) will be staggered by a minimum of 45 minutes in order to separate the arrival patterns of each theatre's patrons.

- Theatre trip generation rates and in/out distribution based on traffic counts and attendance levels at The Ford Theatres on Friday, September 6, 2013 and Saturday, September 7, 2013.

- Peak hours used for analysis are as follows:

    - AM Peak Hour – busiest one hour between 7:00 AM and 10:00 AM (the commuter peak period)

    - PM Peak Hour – busiest one hour between 4:00 PM and 6:00 PM (the commuter peak period)

    - Weekday Event Peak Hour – one hour preceding the event (7:00 PM to 8:00 PM for an 8:00 PM event)

    - Saturday Midday Event Peak Hour – one hour preceding the event (11:00 AM to 12:00 PM for a 12:00 PM event)

    - Saturday Evening Event Peak Hour – one hour preceding the event (7:00 PM to 8:00 PM for an 8:00 PM event)

- A Theatre event will generally start around 8:00 PM for evening shows and 12:00 PM for midday shows, with attendees generally arriving within the one hour prior to the event (i.e., 7:00 PM or 11:00 AM).

- Shuttle service connecting The Ford Theatres with the Universal City/Studio City Metro Red Line Station will be continued and enhanced with the Transit Center as part of the Project. Although the Project will continue to provide shuttle service, no additional reductions to account for attendees arriving via transit were assumed.

- Event staff (e.g., security, event, public relations, etc.) are anticipated to arrive several hours prior to the event. For the purposes of this analysis, event staff were assumed to arrive one hour prior to the event start time and are included in the peak hour trip rate calculated in Appendix D.

- To provide a conservative analysis, employees are anticipated to travel to the site via a single occupant vehicle (AVR of 1.0 person/per car). Accordingly, no additional reductions for employee carpooling, transit, or travel by non-automobile means (e.g., bicycle, walk, etc.) were considered in the trip generation forecast.

- Based on information provided by the County, 85 employees will be on site, including 50 Ford Theatre employees (on site 8:00 AM to 5:00 PM) and 35 County Parks & Recreation

employees who arrive and depart outside of the weekday commuter peak periods (arrive by 6:00 AM, depart before 4:00 PM).

- Up to 140 employees may be relocated to the Project Site in place of the existing 140 Los Angeles Philharmonic employees that will be removed as part of the Project. Although the number of employees from other County Departments (e.g., Arts Commission) that are envisioned be relocated to the site is anticipated to be less, the traffic study assumes 140 employees will remain on site so as to provide a conservative analysis.

- Based on information provided in the CARS Report, it is envisioned that the hiking trail will accommodate approximately 100 hikers per day, with approximately 5% weekday commuter peak hours usage and 10% Saturday midday peak hour usage.

- The restaurant uses will primarily support The Ford Theatres during events, but will be open to the public at other times. Thus, a 50% internal capture reduction was applied to account for the patrons also attending an event at The Ford Theatres, as well as a 15% transit reduction to account for visitors and employees that may use transit, based on the improved Transit Center and continued presence of a shuttle to/from the Universal City/Studio City Metro Red Line Station.

TRIP GENERATION SUMMARY

As described, the Project proposes to add 311 Theatre seats, a 5,400 sf restaurant, and approximately 30 new regular shift employees in 13,660 sf of additional office space to the existing development. Table 7 provides a summary of the trip generation estimates for the Project.

As shown in Table 7, the Project is anticipated to generate 35 net new trips during the weekday AM peak hour, 60 net new trips during the weekday PM peak hour, 18 net new trips during the weekday event peak hour, 92 net new trips during the Saturday midday event peak hour, and 92 net new trips during the Saturday evening event peak hour.

Project Trip Distribution

Project traffic volumes both entering and exiting the Project site have been distributed and assigned to the local street system based on the location of nearby residential, entertainment and employment centers and characteristics of the street system. The Project has access to/from Cahuenga Boulevard East via four existing driveways and one proposed driveway.

Project Trip Assignment

Project traffic was assigned to the surrounding street system based on splits found in the traffic counts resulting in the following external distribution patterns: approximately 50% of the traffic was assigned to/from the north and 50% was assigned to/from the south. Approximately 60% of the traffic will utilize US-101 to/from the Project Site. The distribution of Project traffic through the study intersections is illustrated in Figure 9 for both weekdays and Saturdays. The trip distribution pattern was applied to the trip generation to develop the Project-only traffic assignments, as illustrated in Figures 10A, 10B, and 10C for weekdays, weekday events, and Saturdays, respectively.

	PM	1.00 /per employee[8]	0%	100%
Hiking Trail[9]	AM	0.05 /per daily hiker	75%	25%
	PM	0.05 /per daily hiker	25%	75%
	Saturday Midday	0.10 /per daiily hiker	50%	50%

Notes:

sf = square feet

Rates per *Trip Generation, 9th Edition* (Institute of Transportation Engineers, 2012) except where noted

[1]Trip generation rates and in/out distribution based on traffic counts and attendance levels on Friday, September 6, 2013 and Saturday, September 7, 2013. The Amphitheatre currently provides 1,196 seats. Previously the Amphitheatre provided approximately 1,200 seats, however, replacement of the old seats in the Amphitheatre by the Ford Theatres resulted in a loss of 4 seats. For purposes of providing a conservative analysis, the Amphitheater was assumed to have a total of approximately 1,200 seats.

[2]PM peak hour generally represents the busiest one hour between 4:00 PM and 6:00 PM (i.e. the commuter peak period)

[3]Weekday Event peak hour generally represents the one hour preceding the start of the event (e.g. 7:00-8:00 PM for an 8:00 PM event)

[4]Saturday Event peak hour generally represents the one hour preceding the start of the event.

[5]Saturday midday trip generation rates estimated based on 1/2 Saturday evening trip generation rates

[6]Based on information provided by Ford Theatre as part of the Project a total of 85 employees will be on-site, including 50 Ford Theatre employees (8:00 AM to 5:00 PM) and 35 Parks & Recreation employees that arrive and depart outside of the commuter peak periods (arrive by 6:00 AM, depart before 4:00 PM). It should be noted that the employee numbers are overly conservative as they do not account for the existing 140 LA Phil employees that will be replaced with other County employees relocated to the site with the Project.

[7]AM peak hour generally represents the busiest one hour between 7:00 AM and 10:00 AM (i.e., the commuter peak period)

[8]Assumes a conservative employee AVR of 1.00 employees per vehicle, which does not account for reductions for carpooling, transit or travel by non-automobile means (e.g., bicycle, walk, etc.).

[9]Based on *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park* (Community Arts Resources, Inc., October 2012) that projects 100 hikers per day and an estimated 5% weekday peak and 10% Saturday midday peak hour usage

Notes:

[1]Ford Theatre traffic volumes during the Weekday PM Peak Hour includes staff (e.g., employees, setup crews, production managers, etc.) trips associated with operations of the theatres (Amphitheatre, 299-seat theatre, & multi-purpose flex space)

[2]Weekday Evening Event Peak Hour reflects the Project Design Feature staggering of event start times between Amphitheatre and 299-seat theatre by a minimum of 45 minutes. Thus, a total of 1,299 seats is included for the weekday evening event peak hour analysis representing full occupancy of Amphitheatre and multi-purpose flex space (1,200 + 99 seats)

[3]The restaurant uses will primarily support the Ford Theatres, but will be open to the public. Thus, an internal capture credit was applied to account for patrons also attending an event at the Ford Theatres.

[4]Transit reduction to account for patrons and emplyees that may use transit, based on the improved Transit Plaza and continued presence of a shuttle to/from the Universal City/Studio City Metro Red Line Station.

[5]Based on information provided by Ford Theatre as part of the Project a total of 85 employees will be on-site, including 50 Ford Theatre employees (8:00 AM to 5:00 PM) and 35 Parks & Recreation employees that arrive and depart outside of the commuter peak periods (arrive by 6:00 AM, depart before 4:00 PM). It should be noted that the employee numbers are overly conservative as they do not account for the existing 140 LA Phil employees that will be replaced by other County employees relocated onsite with the Project.

Chapter 6
Existing Plus Project Conditions

This chapter describes the results of the analysis measuring the impact of Project traffic on the existing environment.

TRAFFIC VOLUMES

Existing Plus Project Traffic Volumes

The combined Existing plus Project traffic volumes illustrated in Figures 11A, 11B, and 11C for weekdays, weekday events, and Saturdays, respectively, were compared against the Existing conditions analysis to identify any potential traffic impacts as a result of the Project. These volumes are the result of the Project being constructed, to full buildout, without any ambient or related project traffic growth.

INTERSECTION OPERATIONS

Existing Plus Project Intersection Levels of Service

Table 8 shows the results of the Existing plus Project analysis at the study intersections. As shown in Table 8, the following intersections operate at LOS E or LOS F during at least one of the analyzed peak hours:

- Int. 1: Cahuenga Boulevard West & Barham Boulevard (LOS E – Weekday AM/Weekday Event)
- Int. 2: Cahuenga Boulevard East & Barham Boulevard (LOS F – Weekday AM, LOS E – Weekday Event)
- Int. 5: Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp (LOS E – Weekday AM/Weekday PM/Weekday Event)

The LOS calculation worksheets are provided in Appendix C.

Chapter 7
Future with Project Conditions

This chapter describes the results of the analysis measuring the impact of Project traffic on the future environment. The planning horizon for this analysis is the year 2020, corresponding with the anticipated buildout year of the Project, and all future background traffic growth (i.e., ambient growth and related project traffic) is assumed in this analysis.

TRAFFIC VOLUMES

Future Plus Project Traffic Volumes

The Project-only traffic volumes described in Chapter 5 and shown in Figures 10A, 10B, and 10C were added to the Future without Project traffic volumes shown in Figures 8A, 8B, and 8C. The resulting Future with Project peak hour traffic volumes are illustrated in Figures 12A, 12B, and 12C for weekdays, weekday events, and Saturdays, respectively. These volumes are the sum of the existing traffic volumes, ambient growth, related project traffic, and Project-only traffic. They represent Future with Project conditions, i.e., future conditions after the development of the Project in the year 2020.

INTERSECTION OPERATIONS

Future Plus Project (2020) Intersection LOS

The addition of Project traffic to the Future without Project traffic volumes result in the Future plus Project traffic volumes illustrated in Figures 12A, 12B, and 12C. These volumes were analyzed at each intersection and the results are summarized in Table 9.

As shown in Table 9, the following intersections operate at LOS E or LOS F during one of the peak hours analyzed:

- Int 1: Cahuenga Boulevard West & Barham Boulevard (LOS F – Weekday AM/Weekday PM/Weekday Event)
- Int. 2: Cahuenga Boulevard East & Barham Boulevard (LOS F – Weekday AM/Weekday Event, LOS E – Weekday PM)
- Int. 5: Highland Avenue & Hollywood Bowl Road/US-101 Southbound On-Ramp (LOS F – Weekday AM/Weekday PM/Weekday Event/Saturday Evening Event, LOS E – Saturday Midday Event)
- Int. 6: US-101 Northbound Off-Ramp & North Cahuenga Boulevard (LOS F – Weekday PM)

The LOS calculation worksheets are provided in Appendix C.

Chapter 8
Traffic Impact Analysis

The relative impact of the added Project traffic volumes during the peak hours was evaluated based on analysis of both existing and future operating conditions at the study intersections without and with the Project. The previously discussed significance criteria and thresholds outlined in Chapter 2 were used to determine the significance of a traffic impact caused by the Project on the study intersections. An evaluation of the unsignalized intersection is provided in Appendix E. A detailed analysis of facilities under Caltrans jurisdiction is provided in Appendix F.

EXISTING PLUS PROJECT CONDITIONS

LOS summaries under Existing plus Project conditions for the study intersections during the weekday AM and PM commuter and event peak hours, as well as the Saturday midday event and evening event peak hours are shown in Table 8. As shown, application of the City's significant impact criteria to the Existing plus Project scenario indicates that although minor increases in the V/C ratio are the result of Project traffic, no significant impacts result from Project traffic at signalized intersections and no mitigation is required.

FUTURE WITH PROJECT CONDITIONS

LOS summaries under Future plus Project conditions for the study intersections during the weekday AM, PM, and event peak hours as well as the Saturday midday event and evening event peak hours are shown in Table 9. As shown, application of the City's significant impact criteria to the Future plus Project scenario indicates that although minor increases in the V/C ratio are the result of Project traffic, no significant impacts result from Project traffic at signalized intersections and no mitigation is required.

Chapter 9
Parking and Traffic Management

As a Project design feature, the start times of simultaneous events to be held in the Amphitheatre and 299-seat theatre on weekday evenings (e.g., after 6:00 PM) will be staggered by a minimum of 45 minutes in order to separate the arrival patterns of each theatre's patrons. This condition has been reflected in the traffic analysis of weekday evening conditions included in this study. With implementation of this condition, the Project's impacts on the study intersections are anticipated to be less than significant. Thus, no mitigation measures are required.

The Project also includes preparation and implementation of a PTMP to minimize the effect of parking and traffic on the surrounding street system. The PTMP includes parking and traffic management measures, operational measures, transportation demand management (TDM) measures, etc., to further reduce and manage parking and traffic at The Ford Theatres for both event days and non-event days, to the extent feasible.

PARKING AND TRAFFIC MANAGEMENT PLAN

A PTMP would be implemented to minimize potential parking and traffic related-impacts on the surrounding street system to the extent feasible. Components of the plan include parking and traffic event management measures such as directional signage, operational/scheduling measures, identification of additional parking supplies, etc. The PTMP would also include a selection of parking and traffic management strategies, which are intended to effectively manage and direct event related parking and traffic associated with a Theatre event on weekdays and weekends. The PTMP strategies may include, but not necessarily be limited to, the following:

- Provide directions and location maps with the parking options available for visitors in website postings, real time mobile applications, marketing, notification and media materials, etc.

- Post directions and maps showing truck routes for deliveries, construction vehicles, and other trucks.

- Encourage alternate travel options (transit and shuttle service) in event-related marketing/media information.

- Manage the use of all parking spaces in the on-site parking garages to maximize parking efficiency and avoid underutilization of parking spaces.

- Identify locations for bus drop-off/pick-up and staging.

- Provide valet assist parking in the parking garages to maximize parking circulation and capacity where possible during large events.

- Require employees and staff to park within designated areas.

The PTMP would also encompass TDM strategies that would encourage visitors and employees to reduce vehicular traffic on the adjacent streets during the peak hours and parking demand by promoting carpooling and non-auto travel through pedestrian-friendly designs and orientation that facilitates transit use. Although Project traffic could be further reduced with implementation of TDM strategies, no additional trip reductions were assumed for the purposes of this analysis.

The TDM strategies may include the following:

- Carpool promotions and support
- Bicycle amenities (bicycle racks, lockers, etc.)
- Flexible or alternative work schedules and programs
- Transit incentives (e.g., discounted transit passes)
- Parking incentives for carpools and vanpools

Chapter 10

Congestion Management Program Analysis

CMP ANALYSIS

The CMP requires that, when a TIA is prepared for a project, traffic and transit impact analyses be conducted for select regional facilities based on the amount of project traffic expected to use these facilities. The analyses were conducted in accordance with the procedures outlined in the CMP Appendix D, "Guidelines for CMP Transportation Impact Analysis."

CMP SIGNIFICANT TRAFFIC IMPACT CRITERIA

The CMP guidelines state that a CMP freeway analysis must be conducted if 150 or more trips attributable to the proposed development are added to a mainline freeway monitoring location in either direction during the weekday morning or afternoon commuter peak hours. Similarly, a CMP arterial monitoring station analysis must be conducted if 50 or more peak hour project trips are added to a CMP arterial monitoring station during the weekday morning or afternoon commuter peak hours.

A significant project-related CMP impact would be identified if the CMP facility is projected to operate at LOS F (V/C > 1.00) and if the project traffic causes an incremental change in the V/C ratio of 0.02 or greater. The proposed development would not be considered to have a regionally significant impact, regardless of the increase in V/C ratio, if the analyzed facility is projected to operate at LOS E or better after the addition of the Project traffic.

CMP FREEWAY ANALYSIS

Based on the Project trip generation estimates shown in Table 7, the Project is expected to generate approximately 35 trips in the weekday AM peak hour, approximately 60 trips in the weekday PM peak hour, approximately 18 trips in the weekday event peak hour, approximately 92 trips in the Saturday midday event peak hour, and approximately 92 trips in the Saturday evening event peak hour. According to the Project trip distribution illustrated in Figures 10A, 10B, and 10C, there would be fewer than 150 AM or PM peak hour trips distributed to the freeways in the Project area; therefore, the Project's CMP freeway impacts are considered to be less than significant and no further analysis is required.

CMP ARTERIAL MONITORING STATION ANALYSIS

The CMP arterial monitoring stations closest to the Project site include the intersections of:

- Santa Monica Boulevard & Highland Avenue, approximately one and one-half miles south of the Project site
- Cahuenga Boulevard & Lankershim Boulevard, approximately two and one-quarter miles northwest of the Project site

According to the Project trip distribution illustrated in Figures 10A, 10B, and 10C, there would be nominal Project trips traveling past the monitoring stations at Santa Monica Boulevard & Highland Avenue and Cahuenga Boulevard & Lankershim Boulevard. It is estimated that there would be fewer than five trips added to each of these arterial monitoring stations during both the weekday morning and afternoon peak hours. Therefore, the Project's CMP arterial impacts are considered to be less than significant, and no further analysis is required on these arterial monitoring stations.

REGIONAL TRANSIT IMPACT ANALYSIS

Section B.8.4 of the CMP provides a methodology for estimating the number of transit trips expected to result from a proposed project based on the number of vehicle trips. This methodology assumes AVR factor of 1.4 in order to estimate the number of person trips to and

from the project and then provides guidance regarding the percentage of person trips assigned to public transit based on the type of land use and the proximity to transit service. The CMP guidelines estimate that approximately 3.5% of total Project person trips may use public transit to travel to and from the Project Site based on the type of use of the Project.

As shown in Table 7, prior to mitigation, the Project is anticipated to generate approximately 35 weekday morning peak hour trips and 60 weekday afternoon peak hour trips. Assuming an AVR of 1.4, the Project's vehicle trips result in an estimated increase of 49 person trips during the weekday morning peak hour and 84 person trips during the afternoon peak hour. Using the 3.5% mode split suggested in the CMP, the Project would generate approximately three net new transit trips in the weekday morning peak hour and two net new transit trips in the weekday afternoon peak hour.

As detailed in Chapter 3, the Study Area is served by numerous established transit routes. Distribution of the transit trips to these lines would result in less than one new transit user for each transit line during the peak hours. The total available capacity of the transit lines within the Study Area during the morning and afternoon peak hours is anticipated to more than accommodate the few net additional trips during morning and afternoon peak hours. Therefore, impacts on existing or future transit services in the Study Area are anticipated to be minimal and less than significant.

Chapter 11

Project Site Access and Internal Circulation

This Chapter summarizes the site access and internal circulation of the Project.

EXISTING SITE ACCESS AND INTERNAL CIRCULATION

As mentioned, access to the Project Site is provided via four driveways along the east side of Cahuenga Boulevard East. The driveway at Cahuenga Boulevard East & Pilgrimage Bridge provides primary access to the Project Site. During events, this driveway is used for patrons entering by passenger vehicle and for shuttle access from the Universal City/Studio City Metro Red Line Station. During non-event times, this driveway serves as the main ingress and egress point for employees and vendors. This driveway is signalized and accommodates full access (i.e., both left-turn and right-turn ingress and egress turning movements).

The northernmost driveway, located approximately 550 feet north of the intersection of Cahuenga Boulevard East & Pilgrimage Bridge, is primarily used for egress after events and is occasionally used for overflow stacked parking. At this driveway, Cahuenga Boulevard East is a one-way northbound street; therefore, this driveway accommodates right-turn ingress and egress turning movements only (left turns are prohibited).

The two southern driveways, located approximately 300 feet and 650 feet south of the intersection of Cahuenga Boulevard East & Pilgrimage Bridge, are primarily used for access to and from the southern surface parking lot during events. These driveways are generally closed during on non-event days/periods.

During events, the surface parking areas operate in a stacked parking configuration. Further description of traffic and parking conditions observed during an event is provided in Appendix A.

PROPOSED SITE ACCESS AND CIRCULATION

Vehicles

Access to the Project Site would continue to be available via the four existing driveways along the east side of Cahuenga Boulevard East with some configuration and circulation modifications.

To facilitate access and circulation within the Transit Center, the Project proposes to add a fifth driveway on Cahuenga Boulevard East, to be located 150 feet north of Pilgrimage Bridge, that would serve as an exit-only driveway for the Transit Center. The proposed driveway would provide right-turn-only egress from the Transit Center and Parking Structure 2.

The driveway at Cahuenga Boulevard East & Pilgrimage Bridge, which currently provides primary access to the Project Site, would be maintained in its existing location and configuration. This driveway would provide access for the parking structures, internal roadways, and Transit Center, and will continue to accommodate both left-turn and right-turn ingress and egress turning movements.

The northernmost driveway, which is currently used primarily for egress after events, would be reconfigured internally to provide direct access to the proposed maintenance facility and allow egress from Parking Structure 2. This driveway would continue to accommodate right turns in and out only.

The southern driveways would be maintained in their existing locations with the southernmost driveway providing ingress to Parking Structure 1 and the other driveway providing egress. Ingress and egress to Parking Structure 1 would also be provided from the main entrance.

The internal roadway that leads from Pilgrimage Bridge to the upper gate area would serve as the performer entrance to the lower level Amphitheatre support spaces, as well as providing access for shuttle and vehicular loading and unloading, trash pickup, media truck parking, and fire truck access.

Pedestrians and Bicycles

Sidewalks are currently provided on the east side (Project side) of Cahuenga Boulevard East between the north end of the Project Site and the Study Area limit to the south. Within the Project Site, pedestrian access to the Amphitheatre would continue to be provided at the main gate. In addition, new pedestrian pathways would be provided for access to the new areas. The upper gate area would be modified to provide a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup as well as fire department access.

Visitors arriving by bicycle would have the same access opportunities as pedestrian visitors. The Project would also include bicycle amenities (e.g., bicycle parking and bicycle-friendly amenities) located throughout.

Transit Center

The Ford Theatre-sponsored shuttles, providing service between the Project Site and the Universal City/Studio City Metro Red Line Station, would continue to be provided as part of the Project. The Transit Center includes a designated area for bus and valet drop-off. Circulation through the Transit Center would operate in a counterclockwise pattern, with ingress via the primary access at Cahuenga Boulevard East & Pilgrimage Bridge and egress via the new driveway located to the north.

Chapter 12
Parking Analysis

This chapter summarizes the assessment of parking, including the existing and future parking supply, parking demand characteristics, and parking management measures.

EXISTING PARKING SUPPLY AND OPERATIONS

Surface parking areas comprised of both asphalt and dirt are located along Cahuenga Boulevard East (the north parking lot and the south parking lot), as well as near the upper gate. On non-event days and times, parking for employees is accommodated within the surface parking areas. During events, the Project Site currently provides parking for approximately 350-380 vehicles in a stacked parking configuration to support the existing Amphitheatre and [Inside] The Ford Theatre. During events, a shuttle is provided to and from the Ford Theatres from the Universal City/Studio City Metro Red Line Station. The stacked parking configuration on site is very inefficient from both a patron experience and operational standpoint. For example, patrons must wait for vehicles parked in front of them to move in order to exit the parking areas. A detailed description of the observed pre-event loading and parking operations is provided in Appendix A.

FUTURE PARKING SUPPLY

The Project is designed to improve existing services and facilities on the Project Site and is envisioned to update and enhance the overall experiences at The Ford for visitors, patrons, staff and others. As such, the parking demand characteristics and usage of on-site parking spaces at The Ford during non-event and event days will be similar with the development of the Project. In total, the Project will have approximately 311 additional theatre seats as compared to existing conditions. The Project includes 13,660 sf of additional office space, for a total of 24,160 sf, and

a 5,400 sf quality restaurant. Parking will primarily be provided in two new parking garages, Parking Structure 1 (south) and Parking Structure 2 (north), which provide approximately 500 striped parking spaces in a self-park configuration. Additional vehicles can be accommodated on site with use of attendant/valet stacked parking operations. The proposed parking garages, including self-park configurations, will improve parking efficiencies, as well as patron experience, by reducing the need for stacked parking throughout the Project Site for every event.

Generally, the following types of parking spaces will be accommodated depending on the time of day and anticipated operating conditions (e.g., event attendance):

- Patron Self-Parking
- Employee Self-Parking
- Employee/Patron Attendant/Valet Stacked Parking

Patron Self-Parking consists of sections of the on-site parking lot and garages that will be available for patrons of the Theatres to park their own vehicles without assistance from valets or parking attendants. The proposed parking garages will provide approximately 500 spaces in an on-site self-park configuration that can be used by patrons or employees with completion of the Project.

Employee Self-Parking consists of sections of the on-site parking lot and garages that will be available for employees (both the Theatres and restaurant) to park their own vehicles without assistance from valets or parking attendants. The proposed parking garages will provide approximately 500 spaces in an on-site self-park configuration that can be used by patrons or employees with completion of the Project.

Employee/Patron Attendant/Valet Stacked Parking consists of sections of the on-site parking lots and garages that will be utilized for stacked parking spaces. With the assistance of parking lot attendants, employees and patrons may stack park their vehicles in the least desirable portion of the on-site parking areas, so as to maximize utilization of the available on-site parking spaces. It is conservatively estimated that a net increase of 75 vehicles (representing approximately 15% increase in supply) may be accommodated on site with attendant/valet stacked parking.

PARKING DEMAND

Attendance levels and parking demands of the Project will fluctuate depending on the activities, programs and events held, as well as by time of the year (e.g., holidays), day of the week (weekday and weekend), and time of day. Therefore, an assessment of parking demand was prepared for several potential Project operational conditions, including variation in attendance levels. The peak parking demand for the Project was evaluated based on a combination of the unique operational characteristics, including attendance levels, anticipated visitor arrival and departure patterns, events, and other programming, etc., empirical data from the existing Ford Theatre operations, industry-wide parking demand rates, AVR rates, mode split, and internal capture, as well as attendance and employee data, etc. Parking demands were based on attendance and number of employees. The parking demand reflects the time in the season when total attendance is at its highest levels, when the Amphitheatre is in operation. Parking demand during other times of the year when the Amphitheatre is not in use would be less.

For purposes of this parking analysis, adjustments consistent with the trip generation forecast and traffic analysis were considered to account for mode split (e.g., arriving by transit, walk, bicycle, etc.), as well as internal capture (e.g., between the restaurant and Theatres). So as to provide a conservative analysis, and consistent with the trip generation forecast, other employees (e.g., Ford, Arts Commission, Parks and Recreation, etc.) were assumed to arrive in a single-occupant vehicle.

Table 10 presents the peak parking demand for operations on non-event days when the office employees (e.g., Arts Commission, Parks and Recreation, etc.) and restaurant patrons and employees, as well as hikers, are expected to be on site. It is assumed that all restaurant patrons would be on site simultaneously. This results in a peak parking demand of 291 spaces on a non-event day.

Table 11 presents the peak parking demand for event conditions with an attendance level of up to 1,100 patrons/seats in a combination of the Theatres, along with the associated employees and restaurant use. Consistent with the trip generation forecast, adjustments were considered to account for mode split, as well as internal capture between the restaurant and Theatres. This results in a peak parking demand of 427 spaces.

Table 12 presents peak parking demand for event conditions based on an attendance of 1,101 to 1,300 patrons in a combination of the Theatres, along with associated employees and restaurant use. Consistent with the trip generation forecast, adjustments were considered to account for mode split, as well as internal capture between the restaurant and Theatres. This results in a peak parking demand of 484 parking spaces.

Table 13 presents peak parking demand for event conditions based on an attendance of 1,301 or more patrons, which represents a sold out condition (Amphitheatre + 299-seat Theatre + 99 seat multi-purpose flex space), along with associated employees and restaurant use. Consistent with the trip generation forecast, adjustments were considered to account for mode split, as well as internal capture between the restaurant and Theatres. This results in a peak parking demand of 568 parking spaces.

Parking demand for the different operational conditions of the Project will be accommodated through the use of the on-site parking facilities, operational measures to increase parking supply within the existing site (i.e., attendant/stacked parking), employee parking management, and continued use of the shuttles from the Universal City/Studio City Metro Red Line Station for patrons and employees. As described in the following section, a PTMP will be implemented to manage peak parking demands for operations on non-event and event conditions.

The strategies to satisfy on-site parking demand of the Project for the various operational scenarios are detailed in Table 14. As shown, parking for non-event conditions can be accommodated within the on-site parking supply in a self-park configuration. For event conditions with attendance up to 1,300 patrons, parking can be accommodated within the on-site parking supply in a self-park configuration. Attendant/stacked on-site parking will be required on event days with attendance of 1,301 or more patrons in the Theatres.

Table 14 summarizes how the parking demand of each operational scenario could be accommodated within the on-site parking supply with the strategies outlined as part of the PTMP. These strategies may include self-park spaces, use of attendant/stacked parking on site as required, as well as continued use of shuttle service from Universal City/Studio City Metro Red Line Station for patrons and employees. The total parking supply will be managed through the PTMP so that the parking demands are met throughout the day for weekday and weekend conditions for various event attendance levels and operations. The PTMP reflects the use of

the available parking supply for both non-event and event conditions. Thus, the parking demand is fully accommodated for each of the operational scenarios. As such, with implementation of the PTMP, parking impacts are determined to be less than significant.

PTMP

Parking management measures are recommended and incorporated as part of the Project to minimize parking-related impacts on the surrounding neighborhood, manage parking demands, and improve parking efficiencies at The Ford for both non-event and event conditions. These measures are included in the PTMP, outlined in Chapter 9.

As previously described, parking demand is highly influenced by weather and the programming and scheduling of events, as well as the anticipated attendance levels on any given day. One or more parking demand management measures will be implemented based on the type of day (i.e., event days, non-event days, etc.), anticipated attendance levels and the nature of the events (e.g., attendance, scheduling, arrival and departure patterns, parking demand, etc.) The parking demand management measures would be structured so as to maximize the use of the on-site parking areas, and continued use of the shuttle to the Universal City/Studio City Metro Red Line Station.

The PTMP management strategies also include employee transportation demand management measures (e.g., transit incentives, employee carpooling programs, etc.), attendant/valet parking, employee parking programs (e.g., designated employee parking areas), parking guide signs, updated parking technological measures, patron ticketing controls, etc. The total parking supply will be managed so that the parking demands are met throughout the day for various operational conditions that may occur on either weekdays or weekends. The strategies to accommodate the peak parking demands for the various operational scenarios include self-park spaces, use of attendant/stacked parking on site, and continued use of shuttle services from Universal City/Studio City Metro Red Line Station for patrons and employees.

TABLE 10
PEAK PARKING DEMAND
Non-Event Conditions[1]

Land Use	Attendance/Employees		Parking Demand Rate		Peak Parking Demand
Employees[2]	225	employees	1	per employee[3]	225
Restaurant					
Employees	16	employees	1	per employee[4]	16
Patrons	150	exclusive patrons[5]	1	per 3 patrons[4]	50
				Less Shuttle/Transit Usage (15%)[6]	*(10)*
Hikers	10	hikers[7]	1	per hiker[7]	10
				Total Parking Demand	**291**

Notes:

[1]Non-Event conditions refers to periods when the office and restaurant uses are in operation, with no events in the Theatres

[2]Based on information provided by the County, number of employees include 85 employees (Ford Theatre, Parks and Recreation, etc.) and up to 140 employees that may be relocated to the site in place of the existing LA Philharmonic employees.

[3]To provide a conservative analysis, a parking demand rate of one space per employee is assumed (AVR of 1.0) which does not account for employee carpooling, transit, or travel by non-automobile means (e.g., bicycle, walk, etc).

[4]Based on *Shared Parking, 2nd Edition* (ULI/ICSC, 2005) rates for employee and patron parking demand and a 5,400 sf restuarant

[5]Number of restaurant patrons without an event in the Theatres based on information provided in *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park* (Community Arts Resources, Inc., October 2012) and the assumption that the restaurant uses will be open to the public.

[6]Transit credit to account for restaurant patrons and employees that may use transit, based on the improved Transit Center and adjacent transit service.

[7]Peak parking based on 10 hikers during peak hour consistent with the trip generation forecast. Assumes 100 hikers per day based on information provided in *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park* (Community Arts Resources, Inc., October 2012). To provide a conservative analysis, a parking demand rate of one space per hiker is assumed. (AVR of 1.0) which does not account for hiker carpooling, transit, or travel by non-automobile means (e.g., bicycle, walk, etc).

TABLE 11
PEAK PARKING DEMAND
Event Conditions (with Up To 1,100 Patrons)[1]

Land Use	Attendance/Employees	Parking Demand Rate	Peak Parking Demand
Theatres	1,100 seats	1 per 3 seats[2]	367
Employees[3]	95 employees	1 per employee[4]	95
Restaurant			
Employees	16 employees	1 per employee[5]	16
Restaurant	75 exclusive patrons[6]	1 per 3 patrons[7]	25
		Less Shuttle/Transit Usage (15%)[8]	*(75)*
		Total Peak Parking Demand	**427**

Notes:

[1]Includes event conditions that have combined use of up to 1,100 seats in the Theatres (Amphitheatre, 299-seat Theatre and 99-Seat Flex Space).

[2]Based on an AVR of 3.0 patrons per vehicle, which is consistent with the trip generation rates confirmed through traffic counts at The Ford. This parking rate assumes the continuation of the shuttle to/from the Universal City/Studio City Metro Red Line Station.

[3]Employees reflect event staff (e.g., security, event, ushers, public relations, etc.)

[4]To provide a conservative analysis, a parking demand rate of one space per employee is assumed (AVR of 1.0) which does not account for employee carpooling, transit, or travel by non-automobile means (e.g., bicycle, walk, etc).

[5]Based on *Shared Parking, 2nd Edition* (ULI/ICSC, 2005) rates for employee and patron parking demand and a 5,400 sf restuarant

[6] Based on information provided in *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park* (Community Arts Resources, Inc., October 2012).

[7]The restaurant use will primarily support the Ford Theatres, but will be open to the public. Thus, the number of patrons reflect a 50% internal capture reduction to account for the restaurant patrons also attending an event in the Theatres.

[8]Shuttle/Transit reduction to account for patrons and employees that are ainticipated use the shuttle service to and from the Metro Red Line Station, as well as adjacent tranist service, both of which will be enhanced with the proposed Transit Center.

TABLE 12
PEAK PARKING DEMAND
Event Conditions (1,101 To 1,300 Patrons)[1]

Land Use	Attendance/Employees	Parking Demand Rate	Peak Parking Demand
Theatres	1,300 seats	1 per 3 seats[2]	433
Employees[3]	95 employees	1 per employee[4]	95
Restaurant			
Employees	16 employees	1 per employee[5]	16
Restaurant	75 exclusive patrons[6]	1 per 3 patrons[7]	25
		Less Shuttle/Transit Usage (15%)[8]	*(85)*
		Total Peak Parking Demand	**484**

Notes:

[1]Includes event conditions that have combined use of up to 1,100 seats in the Theatres (Amphitheatre, 299-seat Theatre and 99-Seat Flex Space).

[2]Based on an AVR of 3.0 patrons per vehicle, which is consistent with the trip generation rates confirmed through traffic counts at The Ford. This parking rate assumes the continuation of the shuttle to/from the Universal City/Studio City Metro Red Line Station.

[3]Employees reflect event staff (e.g., security, event, ushers, public relations, etc.)

[4]To provide a conservative analysis, a parking demand rate of one space per employee is assumed (AVR of 1.0) which does not account for employee carpooling, transit, or travel by non-automobile means (e.g., bicycle, walk, etc).

[5]Based on *Shared Parking, 2nd Edition* (ULI/ICSC, 2005) rates for employee and patron parking demand and a 5,400 sf restuarant

[6] Based on information provided in *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park* (Community Arts Resources, Inc., October 2012).

[7]The restaurant use will primarily support the Ford Theatres, but will be open to the public. Thus, the number of patrons reflect a 50% internal capture reduction to account for the restaurant patrons also attending an event in the Theatres.

[8]Shuttle/Transit reduction to account for patrons and employees that are ainticipated use the shuttle service to and from the Metro Red Line Station, as well as adjacent tranist service, both of which will be enhanced with the proposed Transit Center.

TABLE 13
PEAK PARKING DEMAND
Event Conditions (1,301)[1]

Land Use	Attendance Employees	Parking Demand Rate	Peak Parking Demand
Theatres	1598 seats	1 per 3 seats[2]	533
Employees[3]	95 employees	1 per employee[4]	95
Restaurant			
Employees	16 employees	1 per employee[5]	16
Restaurant	75 exclusive patrons[6]	1 per 3 patrons[7]	25
		Less Shuttle/Transit Usage (15%)[8]	*(100)*
		Total Peak Parking Demand	**568**

Notes:

[1]Includes event conditions that have combined use of 1,301 or more seats in the Theatres (Amphitheatre, 299-seat Theatre and 99-Seat Flex Space). This represents a sold-out condition, with all of the seats in the Theatres occupied. The number of seats reflects approximately 1,200 seats in the Amphitheatre so as to provide a conservative analysis.

[2]Based on an AVR of 3.0 patrons per vehicle, which is consistent with the trip generation rates confirmed through traffic counts at The Ford. This parking rate assumes the continuation of the shuttle to/from the Universal City/Studio City Metro Red Line Station.

[3]Employees reflect event staff (e.g., security, event, ushers, public relations, etc.)

[4]To provide a conservative analysis, a parking demand rate of one space per employee is assumed (AVR of 1.0) which does not account for employee carpooling, transit, or travel by non-automobile means (e.g., bicycle, walk, etc).

[5]Based on *Shared Parking, 2nd Edition* (ULI/ICSC, 2005) rates for employee and patron parking demand and a 5,400 sf restuarant

[6] Based on information provided in *The Ford, Transformed: Realizing the Potential of Ford Theatres County Regional Park* (Community Arts Resources, Inc., October 2012).

[7]The restaurant use will primarily support the Ford Theatres, but will be open to the public. Thus, the number of patrons reflect a 50% internal capture reduction to account for the restaurant patrons also attending an event in the Theatres.

[8]Shuttle/Transit reduction to account for patrons and employees that are ainticipated use the shuttle service to and from the Metro Red Line Station, as well as adjacent tranist service, both of which will be enhanced with the proposed Transit Center.

TABLE 14
PEAK PARKING DEMAND STRATEGIES

Operational Conditions	Peak On-Site Parking Demand	Parking Strategies - Spaces Available		Parking Demand Met
		Patron□Employee On-Site Self-Park	On-Site Stacked Parking[1]	
Non-Event	291	500		Yes
Event (Up to 1,100 Patrons)	427	500		Yes
Event (1,101 to 1,300 Patrons)	484	500		Yes
Event (1,301 - 1,598 Patrons)	568	500	75	Yes

Notes:
Event conditions include the continued operation of a shuttle for employees and patrons to/from the Universal City/Studio City Metro Red Line Station to The Ford.
[1]It is estimated that the Project Site can accommodate appproximately 75 additional vehicles through the use of attendant/valet operated stacked parking both within the parking garages (e.g., in the parking aisles) or other designated areas within the site.

Chapter 13

Construction Impact Analysis

This chapter summarizes the construction schedule and construction impact analysis for the Project. The analysis relates to the temporary impacts that may result from the construction activities of the Project, which may include safety, operational, or capacity impacts.

TYPES OF CONSTRUCTION IMPACTS

The factors used to determine the significance of a project's impacts involve the likelihood and extent to which an impact might occur, the potential inconvenience caused to a population, and consideration for public safety. Potential traffic impacts from construction activities could be expected to occur as a result of the following types of activities:

- Increases in truck traffic associated with export of fill materials and delivery of construction materials
- Increases in automobile traffic associated with construction workers traveling to and from the site
- Reductions in existing street capacity or on-street parking from temporary lane closures necessary for the construction of roadway improvements, utility relocation, and drainage facilities
- Blocking existing vehicle or pedestrian access to other parcels fronting street

The impact of construction truck traffic (including haul trucks) would be a lessening of the capacities of access streets and haul routes due to the slower movements and larger turning radii of trucks.

PROPOSED CONSTRUCTION SCHEDULE

For purposes of analyzing the worst case scenario associated with construction, the Project was assumed to be completed in one phase. However, it is recognized that the Project is likely to be constructed over time, as funding allows and to keep The Ford Theatres operating during the event season. Construction of the Project is anticipated to be completed as early as 2020. The anticipated construction phases include site clearing, grading and excavation, and construction of new buildings, plaza, and landscape areas.

CONSTRUCTION WORKERS

Construction worker traffic impacts depends on the number of construction workers employed during various construction phases, as well as the travel mode and travel time of the workers. In general, the hours of construction typically require workers to be on site before the weekday morning commuter peak period and allow them to leave before or after the afternoon commuter peak period (i.e., arrive at the site prior to 7:00 AM and depart before 4:00 PM or after 6:00 PM). Therefore, most, if not all, of the construction worker trips would occur outside of the typical weekday commuter or weekend midday peak periods.

The estimated number of construction workers each day depending on the phase of construction (e.g., demolition, grading, building construction, etc.) is anticipated to range between approximately 10 and 100 workers. Assuming some level of carpooling among the construction workers, an AVR of 1.135 persons per vehicle was applied, as provided in *CEQA Air Quality Handbook* (South Coast Air Quality Management District, 1993). Thus, during the construction phase with the largest number of workers (e.g., building construction), the estimated number of daily trips due to 100 construction workers is approximately 176 (88 inbound and 88 outbound trips), with all of these trips occurring outside of the peak hours.

During construction, adequate parking for construction workers would be provided within the boundaries of the Project Site. Restrictions against workers parking in the public right-of-way in the vicinity of (or adjacent to) the Project Site will be identified as part of the Construction Management Plan. Construction parking may require use of on-site parking areas for materials storage and truck staging. However, construction schedules, storage and staging, and the

provisions for parking spaces for construction workers will be planned so as to minimize the reduction in parking to The Ford Theatres staff and patrons. Therefore, Project construction would result in a less than significant impact with regard to the availability of parking spaces.

PROPOSED TRUCK ACTIVITY

Haul Trucks

During the course of the combined excavation, demolition, and other construction activities, it is estimated that a total of approximately 107,094 cubic yards (CY) of material would be exported to various landfills likely located in the Cities of Irwindale, Whittier, and Santa Maria. It is anticipated that 12-14 CY dirt trucks would be used to export the soil. With approximately 720 CY of export per day, a total of 64 truck trips per day is anticipated associated with excavation and demolition. Thus, up to 64 daily haul trips (32 inbound, 32 outbound) are forecast to occur during the excavation and demolition periods, with approximately 14 trips per hour (seven inbound, seven outbound), assuming haul truck trips would occur uniformly over an five-hour period.

A Haul Truck Route program will be required as part of the County's permitting process. The truck haul routes would comply with the approved truck routes designated within the City and County of Los Angeles. Outbound traffic would travel northbound on Cahuenga Boulevard East to US-101 and inbound traffic would travel northbound on Cahuenga Boulevard East from US-101.

Delivery Trucks

Project construction would also require delivery of construction materials. An average of between less than 10 and 30 daily delivery truck trips to the Project Site are envisioned depending on the construction phase. The phase with the largest number of deliveries is anticipated to occur during the building construction phase, with approximately 30 daily delivery trips (15 inbound, 15 outbound) are envisioned, which corresponds to approximately six trips

per hour (three inbound, three outbound), assuming delivery truck trips would occur uniformly over a five-hour period.

Passenger Car Equivalent Trips

Assuming a passenger car equivalency (PCE) factor of 2.0, the 64 off-site haul trucks and 30 delivery trucks would be equivalent to 94 passenger car trips per day. *Transportation Research Circular No. 212, Interim Materials on Highway Capacity* (Transportation Research Board, 1980) defines PCE for a vehicle as the number of through moving passenger cars to which it is equivalent based on the vehicle's headway and delay-creating effects. Table 8 of *Transportation Research Circular No. 212* and Exhibit 16.7 of the *2000 Highway Capacity Manual* (Transportation Research Board, 2000) suggest a PCE of 2.0 for trucks.

POTENTIAL IMPACTS OF CONSTRUCTION TRAFFIC

As described above, Project construction at its most intense phases is expected to generate approximately 176 daily worker trips and 94 PCE daily truck trips, which account for off-site hauling and deliveries, most of which are anticipated to occur during off-peak hours. Because a majority of construction traffic would occur during off-peak hours, Project construction is not expected to cause a significant traffic impact at any of the analyzed intersections. In order to minimize the effect of construction-related traffic on the surrounding street system, all construction workers, haul trucks and delivery trucks would be prohibited from parking, staging, or queuing along the adjacent public streets. With implementation of a Construction Management Plan, construction traffic impacts at study intersections would be less than significant.

POTENTIAL IMPACTS ON ACCESS, TRANSIT, AND PARKING

Construction activities are expected to be primarily contained within the Project Site boundaries and would generally not affect the adjacent street access, transit or parking in the area. The adjacent bus stop and route along Cahuenga Boulevard East will be maintained during

construction to the extent feasible. Thus, temporary loss of bus stops or rerouting of bus lines is not anticipated. Project construction is not expected to create hazards for roadway travelers, bus riders, or parkers, so long as commonly practiced safety procedures for construction are followed. Such procedures and other measures (e.g., to address temporary traffic control, lane closures, sidewalk closures, relocation of bus stops, etc.) have been incorporated into the Construction Management Plan. With implementation of the Construction Management Plan, construction-related impacts are anticipated to be less than significant.

CONSTRUCTION MANAGEMENT PLAN

A detailed Construction Management Plan, including street closure information, detour plans, haul routes, and staging plans, would be prepared and submitted to the County for review and approval. The Construction Management Plan would formalize how construction would be carried out and identify specific actions that would be required to reduce effects on the surrounding community. The Construction Management Plan shall be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site, and should include the following elements as appropriate:

- Prohibition of construction worker parking on adjacent residential streets
- Prohibition of construction equipment or material deliveries within the public right-of-way
- Provisions for temporary traffic control during all construction activities adjacent to public right-of-way to improve traffic flow on public roadways (e.g., flag person)
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets
- Construction-related vehicles shall not park on surrounding public streets
- Provisions of safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers as appropriate
- Provisions to accommodate the equipment storage and truck staging on site
- Scheduling of construction-related deliveries, haul trips, etc., so as to occur outside the commuter peak hours to the extent feasible
- Obtaining the required permits for truck haul routes from the City prior to issuance of any permit for the Project

Event Observations

Observations were conducted at the Ford Theatre on a weekday and weekend to document the traffic and parking operations, management, circulation patterns, etc. for an event. The following provides a summary of the observations conducted on Friday and Saturday, September 6 and 7, 2013. It should be noted that both the Ford Theatre and Hollywood Bowl were holding events on these days.

PARKING LAYOUT

The Ford Theatre consists of several surface parking areas throughout the site. For purposes of documenting observations conducted at the site, the site was separated into seven parking areas and four driveways, numbered 1-7 and 1-4, respectively, in Figure A-1. Parking Lots 1, 3, 4, and 5 are used for general stacked parking, Parking Lot 2 is used for short-term parking, Parking Lot 6 is used for disabled parking, and Parking Lot 7 is used for producer/performer parking. The main driveway at Cahuenga Boulevard East & Pilgrimage Bridge (Driveway 1) is open for entry before events; all driveways are open for exit after events.

STACKED PARKING OPERATIONS

General Parking

Parking Lot 1 is the first lot filled during an event. As vehicles enter from Driveway 1, there are two to four attendants who are able to collect payment from two vehicles at a time, side-by-side, as shown in Exhibits 1-2. After payment, the vehicles are directed toward Parking Lot 1 and park in a stacked parking configuration until full.

Exhibit 1

Exhibit 2

PARKING LAYOUT

FIGURE
A-1

After Parking Lot 1 is full, the attendants direct vehicles north toward Parking Lots 4 and 5. There are two to four attendants who are able to collect payment from two vehicles at a time, side-by-side, as shown in Exhibit 3. After payment, the vehicles are directed to Parking Lot 5 and, when Parking Lot 5 is full, to Parking Lot 4.

Exhibit 3

Disabled Parking

Disabled parking is provided in Parking Lots 3 and 6. Initially, vehicles needing disabled parking are directed toward the six parking spaces in Parking Lot 6. Once those spaces are filled, vehicles are directed to Parking Lot 3.

PARKING LOT OPERATIONS

General parking is provided in Parking Lots 1, 2, 4, 5, and 7, all of which accommodate vehicles in a stacked parking configuration. Disabled parking is accommodated in Parking Lots 3 and 6. Parking lots are carefully and specifically loaded until the site reaches capacity. For general patron parking, vehicles are stacked beginning in Parking Lot 1, then Parking Lot 5, then Parking Lot 4. For disabled parking, vehicles are parked beginning in parking Lot 6, then in

Parking Lot 3. Producer and performer parking is accommodated in Parking Lot 7. Further description of the vehicular circulation and parking operations for the parking lots is provided in the following paragraphs.

Parking Lot 1

Vehicles are loaded into Parking Lot 1 beginning from the north end of the lot to the south end, until the final row of vehicles is parked. As vehicles enter Parking Lot 1, the attendants direct them to toward the north end of the lot (with the vehicles facing north) along the west side of the parking lot first (Exhibit 4). The space immediately in front of Driveway 3 is left open to allow for circulation upon exiting.

Exhibit 4

Once the main portion of the parking lot is filled, the attendants start directing the vehicles to the south end of the lot to accommodate a final row of vehicles facing toward Driveway 3 (Exhibit 5).

Exhibit 5

At the end of the event, the vehicles are able to drive straight out of Driveways 2 and 3 to exit onto Cahuenga Boulevard East. Once the southern portion of Parking Lot 1 is full, attendants direct the vehicles to the north end of the lot, in front of the main Theatre entrance, with vehicles parked facing west (Exhibit 6). The area directly in front of Driveway 2 is left open to allow enough space for the Ford Theatre shuttle to exit.

Exhibit 6

Parking Lot 2

Parking Lot 2 provides very limited parking in an unpaved and unmarked area. Vehicles are parked in the dirt areas under the trees on the sides of the driveway leading up to the main theatre entrance and Parking Lot 1 (Exhibit 7).

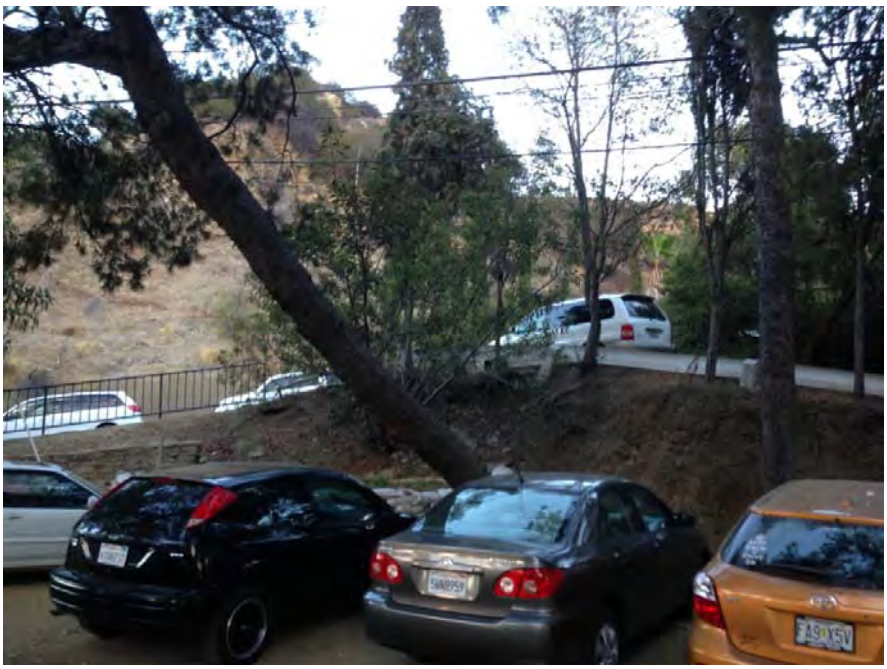

Exhibit 7

Parking Lot 3

Parking Lot 3 accommodates disabled parking and is accessed directly from Driveway 1 throughout the night. This lot also accommodates some employee parking in a stacked configuration at the north end of the lot, as well as in front of the office building.

When Parking Lot 6 is full, attendants direct vehicles needing disabled parking to park in Parking Lot 3, in a stacked parking configuration. Vehicles are parked beginning along the west side of the parking lot (Cahuenga Boulevard East side) facing Driveway 1 (Exhibit 8).

Exhibit 8

There is stacked parking for employees/show producers at the north end of the lot (Exhibit 9).

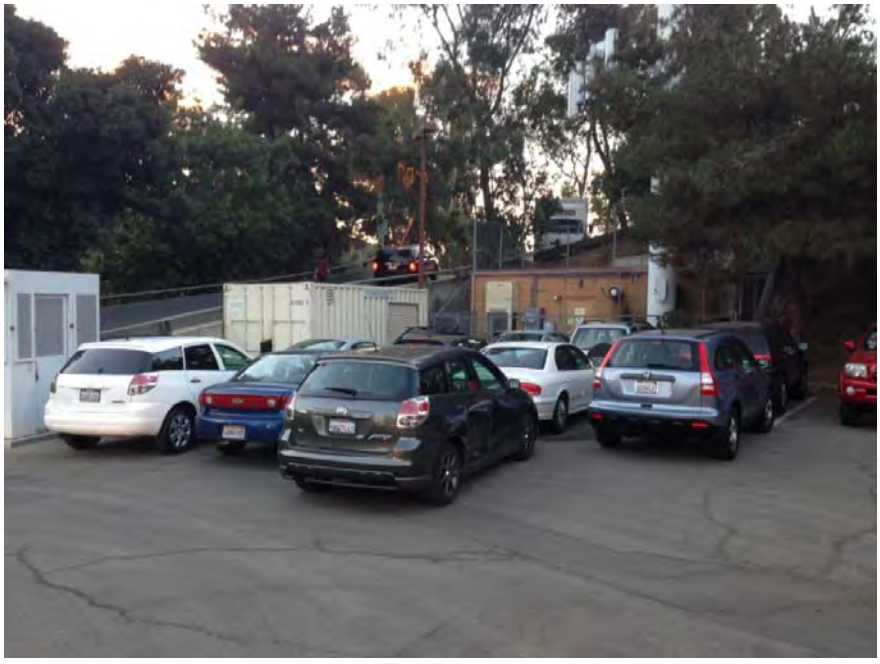

Exhibit 9

The area located immediately south of the Driveway 1 is also used to park a limited number of vehicles (Exhibit 10).

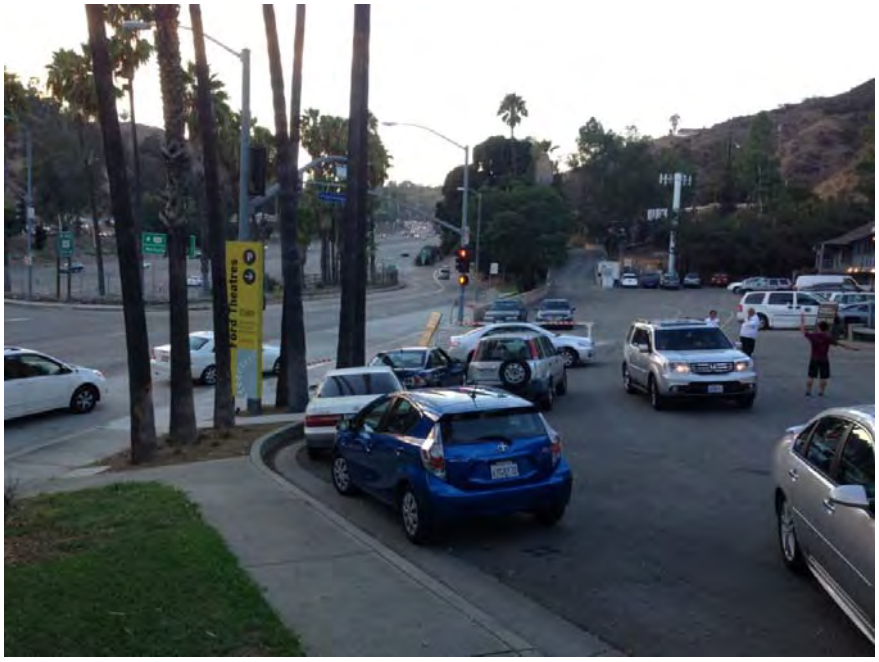

Exhibit 10

Parking Lots 4 and 5

After Parking Lot 1 is full, Parking Lots 4 and 5 are filled. Vehicles are loaded into Parking Lot 5 beginning from the south end of the lot to the north end, until full. Vehicles are directed to circulate toward the north end of the lot then turn around toward the south such that vehicles are facing south. The last row of vehicles entering Parking Lot 5 park facing north (Exhibit 11).

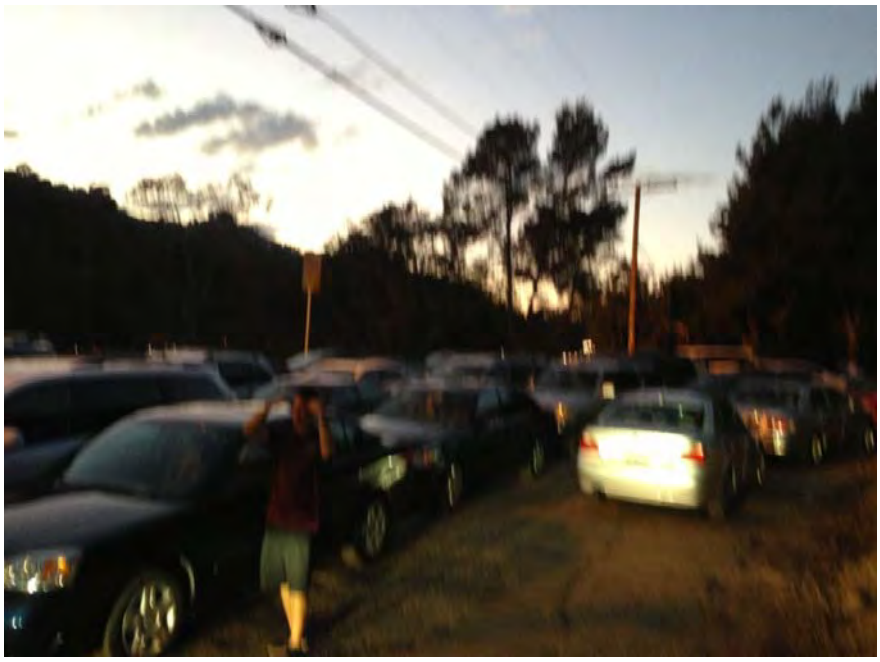

Exhibit 11

Once Parking Lot 5 is full, vehicles are directed to Parking Lot 4, where they park facing south (Exhibits 12 and 13).

Exhibit 12

Exhibit 13

The last vehicles are parked along Driveway 4 facing west and are able to proceed straight onto Cahuenga Boulevard East after the show (Exhibit 14).

Exhibit 14

Parking Lot 6

The first vehicles to arrive that need disabled parking are directed to Parking Lot 6, which is located at the top of the hill north of the Amphitheatre and contains six disabled parking spaces. The cul-de-sac at the easterly terminus, provides a turn-around area for vehicles (Exhibit 15).

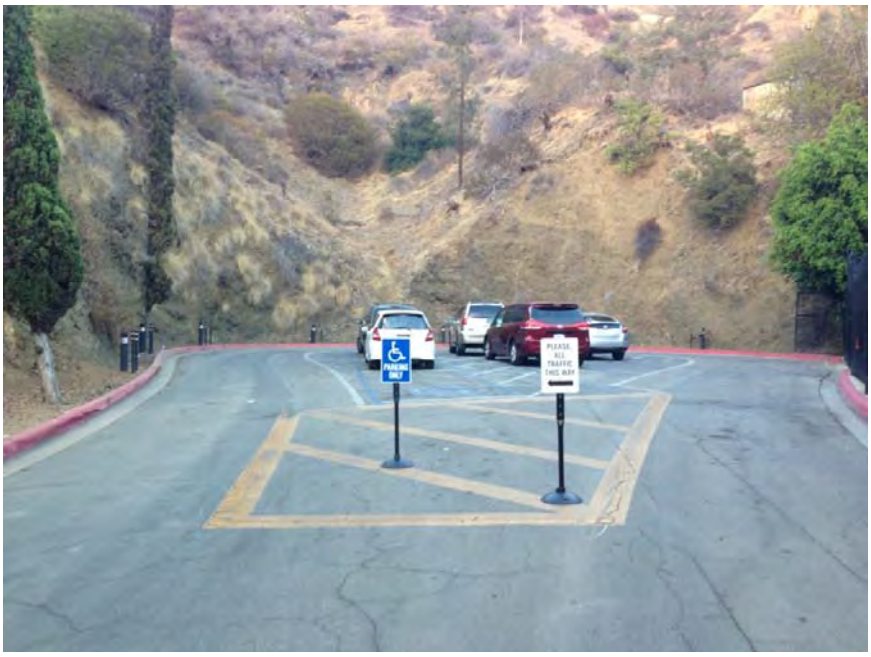

Exhibit 15

Parking Lot 7

Performers and producers park within Parking Lot 7, which is the parking area along the north side of the internal roadway that extends between Driveway 1 and Parking Lot 6. Vehicles travel east along the internal roadway, turn around at the cul-de-sac around Parking Lot 6, then travel west to parallel park along the curb (Exhibit 16).

Exhibit 16

SHUTTLE

Shuttle service is provided between the Ford Theatre and the Universal City/Studio City Metro Red Line Station. The shuttle enters through Driveway 1. If there are disabled passengers, the shuttle drives to Parking Lot 6 for unloading of those passengers. If no disabled entry is required, the shuttle drives to the theatre main entrance for drop-off (Exhibit 17). After drop-off, the shuttle exits from Driveway 2 onto Cahuenga Boulevard East.

Exhibit 17

OTHER OBSERVATIONS

During the observations, some vehicles attempted to stop at the main theatre entrance to drop-off passengers. Due to the limited space at the entrance, this resulted in some queuing for the vehicles traveling to Parking Lot 1 (Exhibit 18).

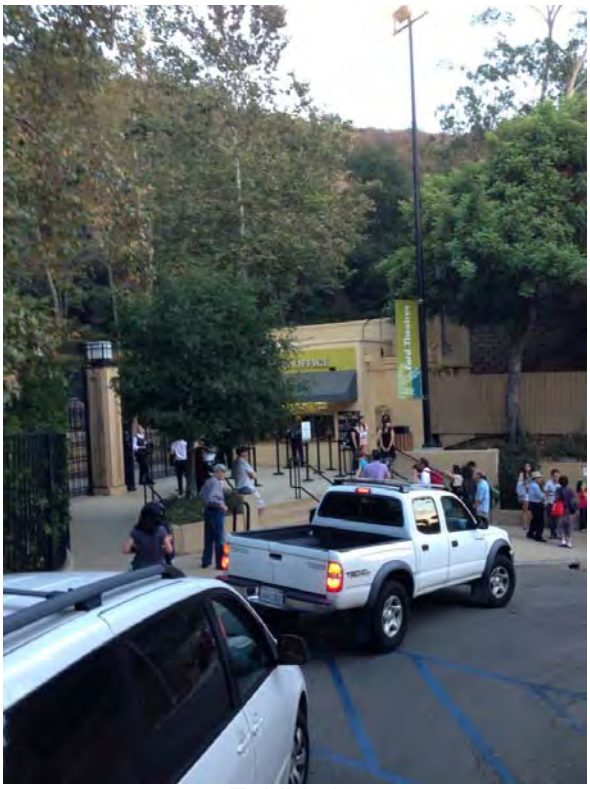

Exhibit 18

School bus drop-off was accommodated at the existing Metro bus stop on Cahuenga Boulevard East just north of Driveway 1 (Exhibit 19).

Exhibit 19

There are no pedestrian walkways or sidewalks that connect Parking Lots 4 and 5 to the Amphitheater. As such patrons were observed maneuvering around entering vehicles entering to make their way to the theatre (Exhibit 20).

Appendix E

Analysis of Unsignalized Intersection

Appendix E
Analysis of Unsignalized Intersections

As described in Chapter 1, the unsignalized study intersection (Int. 3: Cahuenga Boulevard West & Pilgrimage Bridge) was analyzed for the Existing plus Project and Future with Project scenarios based on the Los Angeles Department of Transportation's (LADOT's) *Traffic Study Policies and Procedures* (May 2012). The traffic volumes and lane configurations assumed in this analysis are consistent with those presented in the traffic study.

INTERSECTION SIGNIFICANT IMPACT CRITERIA

The unsignalized intersections were analyzed using the *2010 Highway Capacity Manual,* (Transportation Research Board, 2010) (HCM) stop-controlled and unsignalized methodologies. These methods quantify the intersection operations in terms of average vehicular delay in seconds. As required by *Traffic Study Policies and Procedures*, it was determined that unsignalized intersections would be assessed for signalization if, based on the estimated delay, the resultant LOS is LOS E or F in the Future with Project conditions.

The determination that an unsignalized intersection meets the criteria of a traffic signal warrant does not in itself require the installation of a signal. Rather, the decision whether a traffic signal should be installed is made by the governing jurisdictions, taking into consideration factors such as distance to adjacent signalized intersections and interruption to traffic flow along the major street.

As detailed in Chapter 3, one unsignalized intersection within the Study Area was analyzed. Table E-1 presents the HCM analysis for Existing plus Project conditions and Table E-2 presents the same results for Future with Project (Year 2020) conditions. The worksheets for this analysis are provided in the Attachment.

As shown in Tables E-1 and E-2, the unsignalized intersection of Cahuenga Boulevard West & Pilgrimage Bridge is projected to operate at LOS A during all five peak hours under either Existing plus Project conditions or Future with Project conditions.

Thus, the criterion is not met and no further analysis is required for this intersection. As such, impacts are anticipated to be less than significant in the Existing and Future conditions with the Project.

SIGNAL WARRANT ANALYSIS

Although the unsignalized intersection would not operate at LOS E or F during the peak hours, a signal warrant analysis was conducted to provide further information. The signal warrant analsyis was prepared based on guidelines set forth in *Manual of Policies and Procedures* and the *California Manual on Uniform Traffic Control Devices* (California Department of Transportation, 2012) (California MUTCD).

Methodology

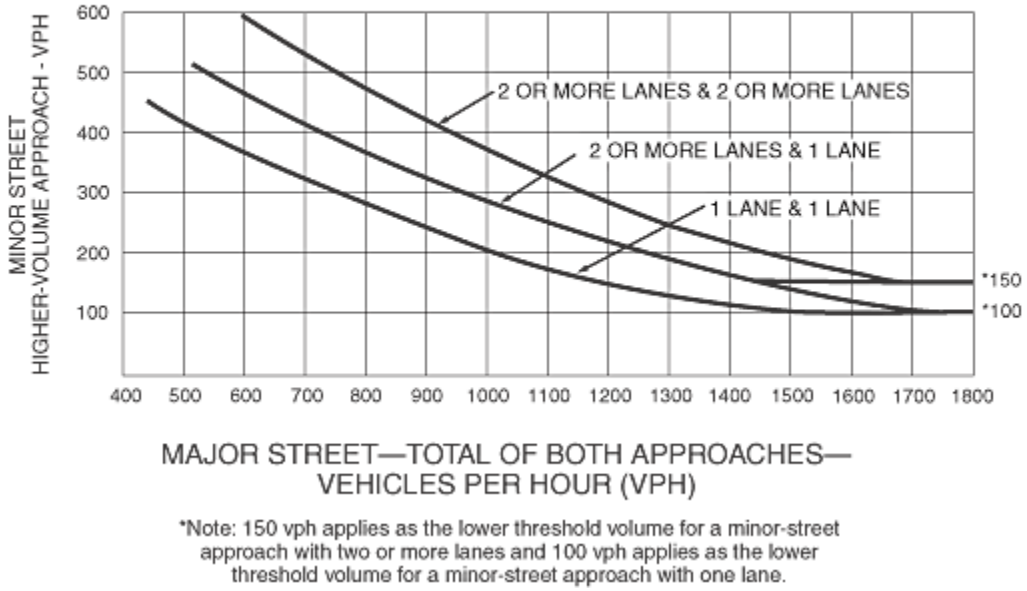
California MUTCD includes methodologies for eight vehicle signal warrants. Section 353 of *Manual of Policies and Procedures* includes three additional pedestrian warrants used exclusively by the City of Los Angeles. Installation of a traffic signal may be considered if at least one of these warrants is met and an engineering study indicates that the installation of a traffic signal would improve the overall safety and/or operation of the intersection.

For this analysis, Warrant 3: Peak-Hour Vehicular Volume was evaluated. The following methodology, as quoted from the California MUTCD, was used to evaluate the signal warrant at the unsignalized intersection:

> ***Warrant 3, Peak-Hour Vehicular Volume Warrant***
>
> *Signal Warrant 3 is intended for use at a location where traffic conditions are such that for a minimum of 1 hour of an average day, the minor-street traffic suffers undue delay when entering or crossing the major street. Combined volumes for both approaches of the major street are included while only the volume from the higher minor street*

approach is included. At an intersection with a high volume of left-turn traffic from the major street, the analysis may include the major street left-turn volumes plus the minor street approach volume as the total "minor street" volume. The warrant is satisfied if traffic volumes for any one hour of an average day exceed the plotted lines shown in the following figure.

Figure 4C-3. Warrant 3, Peak Hour



*Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold volume for a minor-street approach with one lane.

As stated in *Manual of Policies and Procedures*, the right-turning traffic that is delayed less than 45 seconds under stop sign control would likely turn on a red signal and would not benefit from a traffic signal and was, therefore, subtracted from the total minor street volume, when appropriate.

Analysis

The California MUTCD methodology for Signal Warrant 3 was applied to the unsignalized study intersection. The traffic signal analysis was based on the peak hour traffic volumes under Existing (Figures 5A-5C), Future without Project (Figures 8A-8C), Existing with Project (Figures 11A-11C), and Future with Project (Figures 12A-12C) conditions. Based on a review of the traffic volumes for Existing, Future without Project, Existing with Project and Future with Project conditions, the traffic volume on the minor street approach (i.e., westbound Pilgrimage Bridge) is less than the minimum (lower threshold) volume of 100 vehicles per hour.

Therefore, Signal Warrant 3 is not met under any of the analyzed conditions for any of the peak hours.

Appendix F

Caltrans Analysis

Appendix F

Caltrans Analysis

Based on the requirements of *Agreement between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* ("Agreement") (California Department of Transportation [Caltrans] and the Los Angeles Department of Transportation, October 2013), a freeway impact analysis utilizing *Guide for the Preparation of Traffic Impact Studies* (Caltrans, December 2002) (Caltrans TIS Guidelines), is required should a project meet the following criteria:

- The project's peak hour trips would result in a 1% or more increase to the freeway mainline capacity of a freeway segment operating at level of service (LOS) E or F (based on a assumed capacity of 2,000 vehicles per hour per lane [vphpl])
- The project's peak hour trips would result in a 2% or more increase to the freeway mainline capacity of a freeway segment operating at LOS D (based on a assumed capacity of 2,000 vphpl)
- The project's peak hour trips would result in a 1% or more increase to the capacity of a freeway off-ramp operating at LOS E or F (based on an assumed ramp capacity of 1,500 vphpl)
- The project's peak hour trips would result in a 2% or more increase to the capacity of a freeway off-ramp operating at LOS D (based on an assumed capacity of 1,500 vphpl)

While the Project does not meet the screening criteria listed above, as detailed below, a supplemental analysis of Caltrans facilities was prepared to provide further information to the decision makers. As mentioned in Chapter 1, a total of nine intersections were analyzed as part of this study. Of the nine study intersections, two are located at freeway ramp locations and, thus, also fall under Caltrans jurisdiction. This chapter analyzes ramps, as well as freeway segments within the Study Area, in accordance with Caltrans TIS Guidelines.

TRAFFIC VOLUMES

The Caltrans analyses used the Project trip generation estimates shown in Table 7 and the trip distribution patterns shown in Figure 9. Existing traffic volumes were collected from Caltrans' published traffic volume data for freeway segments and ramps and the peak period traffic counts shown in Figures 5A to 5C. Traffic growth in the Study Area between years 2014 and 2020 (Project buildout) was projected for freeway facilities using the same methodology as described in Chapter 3 for study intersections. The future infrastructure was assumed to be the same as present-day conditions.

CALTRANS ANALYSIS SCREENING PROCESS

Three freeway segments (US 101 south of Cahuenga Boulevard, south of Barham Boulevard, and south of Highland Avenue) and one freeway off-ramp (US 101 Northbound Off-Ramp to Cahuenga Boulevard North) were selected for the screening process described above based on the Agreement, as well as distribution of Project traffic on those facilities:

Freeway Segment Screening

Table F-1 summarizes the hourly capacity, existing peak hour traffic volumes, and Project traffic volumes for the freeway segments during the AM and PM peak hours. US 101 provides four to five travel lanes in each direction at the three freeway segments, and therefore has a capacity of 8,000 to 10,000 vehicles per hour (vph) in each direction, based on a lane capacity of 2,000 vphpl.

As shown in Table F-1, US 101 south of Barham Boulevard operates at level of service (LOS) D in the northbound direction during both the AM and PM peak hours and US 101 south of Highland Avenue operates at LOS F in the northbound direction during both the AM and PM peak hours and LOS D in the southbound direction during the PM peak hour. Based on the criteria listed above, the Project would not add enough traffic to either of the freeway segments operating at LOS D or worse to trigger a full impact analysis of Caltrans facilities.

Freeway Off-Ramp Screening

Table F-2 summarizes the hourly capacity, existing peak hour traffic volumes, and Project traffic volumes for the off-ramp during the AM and PM peak hours. The off-ramp provides a single lane for a capacity of 1,500 vph, and operates at LOS A during both the AM and PM peak hours. Therefore, the freeway off-ramp screening criteria are not met.

Results of Screening Process

As shown in Tables F-1 and F-2, the screening criteria are not met by the Project for the freeway segments or the freeway off-ramp. However, in recognizance that the Project is located is close proximity to US 101, evaluation of the Caltrans facilities was conducted according to the Caltrans TIS Guidelines.

METHODOLOGY AND ANALYSIS SCENARIOS

Caltrans TIS Guidelines outline the analysis methodology that should be used in evaluating Caltrans facilities. The Caltrans TIS Guidelines require the latest version of the Highway Capacity Manual (*2010 Highway Capacity Manual,* Transportation Research Board, 2010) (HCM) be used as the basis of the transportation analysis.

The analysis presented in this section was conducted for the following scenarios:

- Existing Conditions (year 2014)
- Existing Plus Project Conditions (year 2014)
- Future without Project Conditions (year 2020)
- Future with Project Conditions (year 2020)

The year 2020 analysis coincides with the proposed Project buildout year.

Specific incremental criteria by which to measure a significant impact on intersections or freeway mainline segments is not included in Caltrans TIS Guidelines.

2010 Congestion Management Program for Los Angeles County (Los Angeles County Metropolitan Transportation Authority, 2010) ("CMP") identifies significance criteria for the identification of potential traffic impacts on State facilities. The CMP criteria have been used recently by the City of Los Angeles in other traffic impact analyses conducted for major projects[1]. Based on CMP criteria, a traffic impact is identified at an intersection if it operates at LOS F and the project-related incremental increase the volume-to-capacity (V/C) ratio of 0.02 or greater.

FREEWAY MAINLINE SEGMENT ANALYSIS

Operating conditions on freeway mainline segments were classified by LOS based on the measured flow compared to the estimated capacity of that section of the freeway. Capacity is calculated by multiplying the lane capacity by the number of lanes in each segment. The lane capacities are conservatively assumed to be 2,000 vphpl. Auxiliary lanes were not assumed to add capacity to the freeway segments.

Table F-3 summarizes the Existing and Existing Plus Project conditions for year 2014 for the morning and afternoon peak hours, and show the incremental change in density-to-capacity (D/C) ratio that can be attributed to the Project. As shown, the Project would not result in a significant impact at freeway segments under the Existing Plus Project conditions.

Table F-4 summarizes the Future without Project and Future with Project conditions for the Project opening year 2020 for the morning and afternoon peak hours, and show the incremental change in D/C ratio that can be attributed to the Project. As shown, the Project would not result in a significant impact at freeway segments under the Future with Project (year 2020) conditions.

[1] Other studies that have used CMP impact criteria for Caltrans facilities include *Transportation Study for the NBC Universal Evolution Plan Environmental Impact Report* (Gibson Transportation Consulting, Inc. and Raju Associates, Inc., March 2010) and *Transportation Study for the Century City Center Project* (Gibson Transportation Consulting, Inc., September 2012), among others.

FREEWAY RAMPS

As mentioned above, two of the study intersections are also freeway ramp locations and, thus, also fall under Caltrans jurisdiction. This analysis was conducted for the year 2020 for the impact analysis.

On-Ramps

Caltrans has established a maximum capacity of 900 vphpl for on-ramps. An on-ramp is considered to be oversaturated or failing if the existing or future peak hour traffic on the ramp exceeds 900 vphpl. Analysis of the on-ramps was conducted for Existing, Future without Project, and Future with Project conditions.

The results of this analysis are provided in Table F-5. As shown, the US-101 Southbound On-Ramp from Highland Avenue does not exceed the Caltrans standard under Existing, Future without Project, or Future with Project conditions. Therefore, based on Caltrans' criteria, the Project would not result in significant impacts at any Study Area on-ramps.

Off-Ramps

For off-ramps, Caltrans defines a significant impact if the peak hour traffic queue length (85^{th} percentile as determined by HCM methodology) on the ramp exceeds the storage length and results in queues backing into the mainline. The vehicle storage capacity was measured between freeway mainline and the intersection. This included the approach lanes at the intersection, as well as the ramp itself. The HCM methodology calculates the queue length for each approach lane.

Analysis of the off-ramps was conducted for Existing, Future without Project, and Future with Project conditions. Results of this analysis are provided in Table F-6. A Level (1) impact, which does not require mitigation, is identified if the queue length exceeds the storage length of any individual approach lane (e.g., left turn lane on the ramp). A Level (2) impact is identified if the projected queue would result in stopped vehicles backing up onto the freeway mainline.

Based on the Level (2) impact criteria, no off-ramp is exceeding the Caltrans standard under Existing, Future without Project, or Future with Project conditions. As shown in Table F-6, none of the queue lengths at the off-ramps exceeds the available storage space under any of the analyzed conditions. Therefore, the Project would not result in a significant impact to any of the analyzed off-ramps.

RAMP INTERSECTIONS

Caltrans requires that all intersections of ramps with the city street system be analyzed with the HCM methodology. Each intersection of a ramp with a city street (two study intersections in total) was evaluated using the HCM methodology and the worksheets for each of these analyses are provided in the Attachment. The HCM methodology was used to evaluate the overall performance of the intersections by measuring the average delay in seconds per vehicle. Table F-7 provides a description of the LOS categories. Table F-8 summarizes the delay calculations for the study intersections for Existing, Existing with Project, Future without Project, and Future with Project conditions. As shown in the Table F-8, both study intersections with freeway ramps will operate at LOS A under all conditions and scenarios.

Therefore, the Project would not result in a significant impact to any of the analyzed ramp intersections.

EXPERTISE

Traffic Engineering

Directed Central Business District traffic studies in Culver City, Glendale, Long Beach, Los Angeles, Santa Monica, and Santa Rosa, California; Carson City, Las Vegas, and Reno, Nevada; Boise, Idaho; Bellevue, Washington; Phoenix and Tucson, Arizona. Led office and industrial park traffic planning in Century City, El Segundo, Glendale, Irvine, Long Beach, Los Angeles, Mountain View, Pasadena, Redwood City, Riverside, San Francisco, Santa Clara, Sunnyvale, Thousand Oaks, and Universal City, California; and Reno and Stead, Nevada.

Directed campus traffic planning for California State University, Chico; California State University, Long Beach; California State University, Northridge; East Los Angeles College; Los Angeles Trade Technical College; Marymount College; Oakland University in Rochester, Michigan; Pasadena City College; San Jose State University; University of Arizona; University of California, Los Angeles West Campus; University of Illinois, Chicago Circle Campus; University of Redlands; University of Southern California (University Park and Health Sciences campuses); and West Los Angeles College. Directed pedestrian, bicycle, and school safety studies in Arcadia, Culver City, Cupertino, Glendale, Lawndale, Los Angeles, Moorpark, Newhall, Palo Alto, Pasadena, San Fernando, San Marino, Santa Barbara, and South Pasadena, California; Glendale, Arizona; and Reno, Nevada.

Directed traffic and transit studies for new and expanded shopping centers in Anaheim, Arcadia, Arroyo Grande, Burbank, Carlsbad, Chino, Concord, Culver City, Cupertino, Escondido, Fairfield, Glendale, Irvine, Larkspur, Los Angeles, Manhattan Beach, Marina del Rey, Monterey, Moreno Valley, Newark, North Hollywood, Oakland, Pasadena, Pleasanton, Redondo Beach, Redwood City, Riverside, San Diego, San Francisco, San Jose, San Mateo, Santa Clara, Santa Clarita, Santa Monica, Santa Rosa, Saratoga, Sonoma, Sunnyvale, and Thousand Oaks, California; Glendale, Paradise Valley, Phoenix, Tempe, and Tucson, Arizona; Las Vegas and Reno, Nevada; Portland, Oregon; Bellevue, Olympia, Renton and Tacoma, Washington; and Anchorage, Alaska.

Directed traffic signal timing/phasing analyses in Anaheim, Arcadia, Lawndale, Redwood City, San Francisco, San Jose, Santa Clara, and South Pasadena, California; Phoenix and Tucson, Arizona; and Carson City and Reno, Nevada. Led traffic signal system analyses in Culver City, Los Gatos, San Mateo, Santa Monica and Santa Rosa, California; Reno, Nevada; and Bellevue, Washington.

Transportation Planning

Served as the joint venture team project director on the Los Angeles Community Plan Revision Program, which developed updated specific plans for the 35 planning areas in the City of Los Angeles. Directed the transportation planning team in the development of the Los Angeles Downtown Strategic Plan.

Directed long-range transportation planning for new towns or large-scale multi-use developments in Anaheim, Chula Vista, Los Angeles, Long Beach, Playa Vista, Redwood City, Richmond, San Ramon, and Santa Monica, California; Shenandoah, Georgia; and Erin Mills and Meadowvale in Toronto, Ontario, Canada. Directed area wide transportation planning studies in Irvine, Mountain View, Riverside, San Bernardino County, and Santa Clarita, California; and San Juan, Puerto Rico; and thoroughfare and general plan updates in Hollywood, Long Beach, Los Angeles, Malibu, Morgan Hill, Pasadena, and Riverside, California.

Patrick A. Gibson, P.E., PTOE
President

Parking

Directed over 50 downtown parking studies, including the Downtown San Jose Parking Management Plan, Downtown Pomona Parking Management Plan, and downtown parking studies for Beverly Hills, Brea, Buena Park, Fullerton, Long Beach, Los Gatos, Pasadena, San Diego, Temecula, and Whittier, California.

Conducted parking needs, feasibility, and functional design studies, as well as numerous shared parking and parking financial analyses, in downtown Los Angeles, Anaheim, Arcadia, Culver City, Glendale, Hollywood, Huntington Beach, Irvine, Long Beach, Los Gatos, Monrovia, Pasadena, Pomona, San Diego, San Francisco, Santa Ana, Santa Barbara, Santa Monica, Santa Rosa, Tustin, and West Hollywood, California; Phoenix and Tucson, Arizona; Reno, Nevada; Boise, Idaho; Tacoma, Washington; and Honolulu, Hawaii.

Prepared parking studies for universities, stadia, new and expanded regional shopping centers and retail/entertainment centers throughout the United States.

Theme Park and Visitor Event Center Parking and Transportation Planning

Directed parking and transportation/traffic portions of the entitlement process and assisted in the implementation of transportation improvements for the Disneyland Resort expansion in Anaheim, California. Conducted traffic and parking analyses for Downtown Disney at Disney World in Orlando, Florida and for LEGOLAND in Carlsbad, California. Directed parking analyses for Club Disney in Thousand Oaks, California and The Huntington Library Education and Visitors Center in San Marino, California. Analyzed parking and traffic issues for long-range plan scenarios for Universal Studios in Hollywood and in Southeast Asia. Directed traffic studies for Great America theme parks. Directed the analysis of transportation and parking planning and the development of design alternatives for Huangguoshu Falls in Guizhou Province, China, and both an Entertainment District complex and the Dubailand World theme parks in Dubai, UAE.

Directed transportation and parking plans for the STAPLES Center in downtown Los Angeles, Anaheim Stadium, the Rose Bowl, University of Arizona Stadium, Arizona Cardinals NFL Stadium, Phoenix Coyotes NHL Arena, the Arrowhead Pond of Anaheim, Long Beach Aquarium of the Pacific, the Queen Mary, the Long Beach Convention Center, and the Los Angeles Convention Center.

Mixed-Use Projects

Prepared the traffic, parking, and transportation demand management programs for large, mixed-use developments for Universal Studios Hollywood, Hollywood & Highland, Paramount Pictures Studios, LAX Northside Project, and Village at Westfield Topanga, in Los Angeles; Second + PCH in Long Beach; Millenia Town Center in Chula Vista; Parsons Headquarters in Pasadena; Disney | ABC's Golden Oak Ranch in Los Angeles County; and One Paseo in Carmel Valley, San Diego.

Transit Planning

Currently working with the San Bernardino Associated Governments and the University of Redlands on the design of a light rail station at the University. Directed light rail transit corridor studies in the San Gabriel Valley and San Diego, and transit development programs in Del Mar, Irvine, San Diego, and Santa Cruz, California and Reno, Nevada. Conducted transit terminal studies in Anaheim, Long Beach, Los Angeles, Pasadena, Sacramento, San Diego, and San Jose, California.

Patrick A. Gibson, P.E., PTOE
President

Land Use Planning

Conducted citywide growth management studies in Moorpark, Oceanside, and San Clemente, California.

Teaching

Teaches the transportation engineering classes at the University of California, Los Angeles and East Los Angeles College and has been a guest lecturer for the University of Southern California; California Polytechnic University, Pomona; California State University, Los Angeles; University of California, Berkeley; San Jose State University; and the Northwestern University Traffic Institute.

Sarah M. Drobis, P.E.
Principal Associate

EXPERTISE

Traffic Engineering

Directed complex transportation planning studies for a wide variety of public and private projects throughout Southern California, with particular expertise in the preparation of transportation analysis to support the environmental review process required by CEQA as well as entitlement processing efforts. Managed numerous traffic studies that involve traffic impact analysis, transit analysis, construction analysis, site access/internal circulation reviews, and Congestion Management Program analysis. Developed comprehensive mitigation and transportation improvement programs for retail, residential, mixed-use and medical development projects as well as schools, universities and churches.

Representative projects include The Huntington Library and Visitors Center, the University of Southern California Health Sciences Campus Beautification Project, Disney Golden Oak Ranch, The Gardens Casino, Hollywood Central Park Project, Wildwood Schools, Highland-Selma mixed-use project, The Citadel shopping Center, Hyatt Place El Segundo, Lakewood Mall, Marina Marketplace, Irwindale Materials Recovery Facility and Transfer Station, Wildflower Green Energy Farm, and the Rialto Renewable Energy Center. Other projects include the Americana at Brand shopping center, Madame Tussauds Wax Museum, Pasadena Conference Center, Hahamongna Watershed Park Annex, Valley Presbyterian Medical Office Building, numerous Costco locations in various jurisdictions, and several residential and mixed-use projects in Hollywood and West Hollywood.

Transportation Planning

Directed numerous traffic studies including site access/internal circulation planning for both public and private development projects throughout California. Expertise also includes operational analyses, access and circulation planning for various travel modes (vehicular, pedestrian, truck, transit, etc.), sight distance analysis, transportation master planning, regional travel demand modeling, corridor studies, signal warrant analyses, development of trip generation models and traffic simulation modeling.

Managed the preparation of transportation planning studies and parking plans, as well as the implementation of transportation improvements, for mixed-use, commercial, residential, and institutional development projects. Key projects include the Memphis Aerotropolis: Airport City Master Plan in Memphis, Tennessee and a large scale traffic congestion improvement program for Los Angeles and surrounding areas. Other current projects include The Ford Theatres, AMPAS Academy Museum of Motion Pictures, NBC Universal, Oakwood Secondary School, and Manhattan Village Shopping Center. Recently completed projects include the University of Southern California Health Sciences Campus Master Plan, The Huntington Library Education and Visitors Center, the University of Redlands Master Plan and Light Rail Station Study, and the Wilshire Boulevard Temple Master Plan. Other projects include The Getty Center, Yamashiro Property, Stephen S. Wise Temple, Leo Baeck Temple, Green Dot Charter Schools and Pacific Charter Schools in numerous jurisdictions.

Sarah M. Drobis, P.E.
Principal Associate

Parking

Managed numerous parking studies and shared parking demand analyses for various commercial, residential and mixed-use developments. Directed parking accumulation and utilization surveys, review and documentation of existing parking demand, identification of peak parking demand, forecasts of future parking demand, review of published parking demand ratios, preparation of shared parking demand analyses, and public hearing representation of the studies.

Managed or assisted on several parking needs, feasibility, and functional design studies, as well as numerous shared parking, parking management plans, neighborhood intrusion, and parking financial analyses throughout Southern California.

Developed parking management plans for the Discovery Science Center, AMPAS Academy Museum of Motion Pictures, The Gardens Casino, The Ford Theatres, Brea Marketplace, Uptown Whittier, University of Southern California Health Sciences Campus, University of West Los Angeles, Marina Marketplace, and various locations for Jamboree Housing Corporation. Other projects include Valencia Town Center, The Citadel Outlets, Pasadena Playhouse Plaza, The Alhambra Campus, Granada Village, St. Monica Catholic Church, Westlake Shopping Center, the Inland Empire Center Expansion, various Abode Communities properties, and 24-Hour Fitness locations in numerous jurisdictions.

EXPERTISE

Traffic Engineering

Served as the project engineer for a variety of traffic impact, sight distance, parking, and speed survey studies for proposed and existing developments in Los Angeles, Imperial, Orange and San Diego Counties. These projects required coordination and production of transportation analysis reports involving field data collection, data analysis, and impact mitigation.

Key projects include transportation studies for Manhattan Village Shopping Center, The Ford Theatres, The Citadel Outlets, and Disney | ABC at its Burbank and Golden Oak properties. Other projects include a large scale traffic congestion improvement program for Los Angeles and the analysis of a potential light rail station for the University of Redlands.

Conducted transportation studies for Westfield's shopping center expansions at Santa Anita, Carlsbad, University Towne Centre and North County. Analyzed traffic impacts for fast food restaurants in Santee, a sporting goods store in Anaheim, and the relocation of MV-22 Osprey to MCAS-Miramar/MCAS-Camp Pendleton/MCAS-El Toro project for the US Navy.

Parking Circulation

Prepared parking studies for The Gardens Casino in Hawaiian Gardens, Fallbrook Center in Los Angeles, and numerous projects in Hollywood and Downtown Los Angeles. Prepared a neighborhood protection plan for the Beverlywood community to prevent neighborhood intrusion.

Served as the project engineer on numerous parking and internal circulation studies for commercial and residential projects, including the parking lot redesign for Irvine Spectrum and residential parking permit studies for public streets in the Cortez Hill and Little Italy neighborhoods of Downtown San Diego. Conducted a financial feasibility study for the Park-It-On-Market garage in Downtown San Diego, which included an hourly count of the entire Downtown parking scenario (all on- and off-street parking spaces from Little Italy to the Gaslamp District) on multiple days.

Transportation Design

Conducted sight distance and curve analyses, speed surveys, traffic calming studies, and traffic control equipment testing and verification, including design reports to verify existing roadway conditions meet government approved standards. Assisted with the red light camera installation verification for the City of San Diego, comparing field measurements to the design drawings to verify the accuracy of the loop detector position and yellow light length.

JOHN ANSON FORD THEATRES PROJECT
2580 Cahuenga Boulevard East
Hollywood, CA 90068

Project Introduction and Description

Introduction:

The John Anson Ford Theatres is a historic, open air amphitheater that is located in the Cahuenga Pass and built into the Hollywood Hills. Opened in 1931, it is one of the oldest performing arts venues in Los Angeles that is still in use today. The Ford Theatres are owned and operated by the County of Los Angeles.

This report summarizes current water use, future water demands, sources and short-term construction activity related water usage.

Project Location and Overview of Existing Conditions:

The project site comprises an approximately 32-acre County of Los Angeles regional park, located at 2580 Cahuenga Boulevard East within the City of Los Angeles, California. The area surrounding the project site includes a mix of residential uses and open space. The vicinity map located in Appendix 'A' shows the location of the project site.

Project Description:

The project site includes an approximately 3.5 acre portion of existing, developed area. This includes the historic amphitheater which has a footprint of roughly 0.5 acres.

The proposed project will develop portions of the existing 3.5 acres of existing improvements, as well as expand into undeveloped parts of the site for a total developed area of 4.15 acres. This proposed work will consist of the following activities: removal of existing buildings, concrete structures, retaining walls, concrete sidewalks and pavement areas, as well as landscaping areas and trees; grading activities including fill to provide final graded surface and new subterranean buildings; installation of new storm drainage systems, sewer lines, and domestic water, and fire service lines; construction of new concrete sidewalks, pavement areas and hardscaping; and construction of parking structures and buildings with new stage area as well as new adjacent landscaping and hardscaping.

JOHN ANSON FORD THEATRES PROJECT
2580 Cahuenga Boulevard East
Hollywood, CA 90068

Water System and Supply Study

Existing Conditions:

The site is situated within the City of Los Angeles and receives its domestic and fire water supplies from the municipal water supply that is operated by the City of Los Angeles, Department of Water and Power, (LADWP).

The LADWP sources its water mainly from the Sierra Nevada via the Los Angeles Aqueduct and from the Metropolitan Water District of Southern California via the California Aqueduct. The LADWP also sources 11% of their water from local groundwater.

The existing project site consumes an estimated peak usage of 6,529 gallons of water per day (GPD).

The theaters water service is supplied via an 8" LADWP water main in Cahuenga Blvd East from a 4" lateral and meter. The existing water lines are assumed to be in deteriorated condition due to their age. Based on an LADWP Service Advisory Report (SAR), see Appendix C, the existing line has a fire flow of 1750 GPM at a residual pressure of 72 PSI in-front of the site.

No record of the location and route of the existing domestic water line has been discovered for this project so it has not been mapped beyond the two known ends of the water line. This water system will be upgraded in stages with the progression of the planned development phases.

No on-site private water wells are known of, the LADWP is the sole source of water for the theater.

Existing landscaping is irrigated. The irrigation system for the recently renovated theater entrance is maintained in good order and is operational. The back of stage hillside irrigation systems is in need of repair and upgrades.

Existing Fire Service:

The site does not have a dedicated separate fire service meter, supply line or on-site fire hydrants.

Regulatory Framework:

Title 20 and Title 24 info here…

Senate Bill 610 info here……

Project Impacts:

The total future build out of the site per the master plan will increase water demand from the current 6,529 GPD to an estimated 17,470 GPD. The realistic water usage will be significantly reduced by the use of efficient fixtures throughout the project.

- Historic Amphitheater: 1,196 seats x 5 gallons per day (GPD) per person = 5,980 GPD.
- Restaurant: 13 employees x 20 GPD/employee = 260 GPD ; estimate 500 meals per day x 12 gallons per meal = 6,000 GPD.
- 299 Seat Theater: 299 x 5 GPD = 1,495 GPD.
- Plaza Office and Amenities: Training Room – 66 people x 5 GPD/person = 330 GPD ; Office – 120 employees x 20 GPD/employee = 2,400 GPD.
- Flex Space/ Rehearsal Hall: 99 seats (event) x 5 GPD/person = 495 GPD.
- Maintenance Area: 27 employees x 20 GPD/employee = 540 GPD.

The total estimate per 2010 California Plumbing code = 17,470 GPD. However this code table has not changed for at least 15 to 20 years and most water fixtures have reduced flow rates by 50% over this period of time. It is not unrealistic to use 50% of this for a total flow of 8,735 GPD.

The LADWP has reviewed the total project build out and has provided a will serve letter to the owners stating that the project will be sufficiently supplied with water subject to the rules and conditions of the LADWP, see Appendix B.

Fixture Recommendations:
The future Master Plan build out of the site will utilize the latest code required water conserving fixtures for all fixture installations; this includes new installations and replacements. By replacing existing low efficiency fixtures and with new low-flow type fixtures there will be a reduction in calculated demand from the municipal water supply.

Construction Activity Water Usage:
Existing off-site hydrants fronting the site will be used to fill water tanks for construction uses. Water will be used during construction, excavation and grading activities. It is estimated that 650,000 to 800,000 gallons of water will be used during the construction.

System Improvements:
As each phase of the master plan is implemented, the entire existing water system will be replaced in stages as well. The end result will be an entirely new water system, both domestic and fire service, to meet the increased demands and serviceability.

New Fire Service:
Up to 4 new fire hydrants are to be installed on-site to supplement two existing public hydrants fronting the site, pending fire department review and approval. As each phase of the master plan is implemented, hydrants will be added in stages as well. It has been determined by the design engineers, civil and plumbing, that the existing municipal water supply has insufficient pressure to supply new hydrants due to low available pressure and the site elevation rise from the points of connection.

The Los Angeles City Fire Department has asked for a total flow of 4,000 GPM provided to the site and 1,500 GPM at any two intermediate fire hydrant locations. As stated in the "Existing Conditions" above, the existing 8" water main under Cahuenga Boulevard is only capable of 1,750 GPM.

To accommodate the Fire Department's required 4,000 GPM, the *project proposes to relocate one existing gate valve, separating the existing 8" high and 8" low pressure water systems, southerly and making two new connections to the high pressure side of the existing water main. The existing water connection on the south side of the side will remain in service as well.* See Appendix D for a map of the extent of proposed water main improvements.

Booster pump(s) will also be required for all proposed hydrants to meet the minimum flow rate and pressure requirements around the project site. The master plan fire system is to be a dedicated separate fire service line with no shared connections to the domestic supply lines.

Landscaping Irrigation Improvements:

The landscape water use conservation requirements included in the local Municipal Code as per California Government Code Section 65591, the Water Conservation in Landscaping Act are met through the following provisions:

- Existing and proposed planting have been selected as either a native or climate adapted species that has low watering requirements and is drought tolerant.
- Plantings are arranged in groups and located to support each species ideal habit.
- The irrigation system is modeled with hydro zones to most effectively response to the specific location of the site and maximizes water efficiencies.
- Stormwater run-off and erosion is minimized through plantings, planter walls, and forms of terracing.
- A soil test of the existing conditions and management plan will improve the soil conditions and allocate the appropriate amendments within planting areas.

Groundwater:

The underlying site geology is mainly impervious bedrock formations with little to no significant percolation or infiltration to affect any groundwater sources. There are no wells or plans to draw groundwater for use of the project. The master plan project will fall under the LID and SUSMP requirements for stormwater mitigation measures, as dictated by the State of California. This will reduce surface runoff pollutants and volumes to mitigate any off-site ground water impact.

Dear Mr. Kai:

Subject: Water Availability
Address: 2580 Cahuenga Boulevard
APN 5577-025-904

This is in reply to your request for a statement regarding water availability for the above property. The subject property can be supplied with water from the Municipal System, subject to the Water System Rules of the Los Angeles Department of Water and Power (LADWP) and subject to all conditions as set by the LADWP.

Should you require additional information, please contact Ms. Fujiki at (213) 367-1306. Correspondence may be addressed to P.O. Box 51111, Room 1425, Los Angeles, California 90051-5700.

Sincerely,

Hugo A. Torres

Robert J. Poppe
Senior Project Manager

Education

University of Oklahoma, School of Environmental Design
California State University, Los Angeles, Computer Technology

Professional Experience and Credentials

Mr. Poppe has over 28 years of experience in all aspects of Civil Engineering Design and Management. He has served as the Senior Project Manager for numerous multi-million dollar projects ranging from flagship OSHPD hospital and medical facilities, governmental projects including police, fire and sheriff's facilities, senior housing projects, mixed-use housing and retail centers, professional and collegiate sports arenas and fields, education projects ranging from elementary school projects, school site rehabilitations and high school campuses.

Mr. Poppe has extensive Civil Engineering experience in all areas of site development including grading, paving as well as utility design and storm water management and mitigation designs. In addition, he has designed and managed street plan projects for numerous local city and county agencies and acts as a mentor to the younger engineers in the firm in utilizing the numerous aspects of AutoCAD as it relates to the civil engineering profession.

Recent Projects of Note

Recent completed projects of note for which Mr. Poppe has served as the senior project manager are as follows:

- Kaiser Ontario Valley Medical Center
  A new $550 million medical center located on a 27-acre campus included a new 386,000-square foot hospital, service building expansion and a new HSB hospital support building. This green projects civil designs provided several stages of storm water filtration and retention on site with creative bio-swales and retention ponds that were incorporated into the campus landscaping and architecture.

- University of Southern California, Galen Center
  This 10,258 seat, $147 million collegiate multipurpose arena and athletic facility on the campus of USC was one of the first facilities in Los Angeles to incorporate stormwater filtering measures and was awarded the Engineering Project of the Year by the Los Angeles Council of Engineers and Scientists.

- Los Angeles Dodgers 2013 and 2014 Stadium Renovations
  Stadium and site improvements were designed and implemented within an extremely tight off-season schedule that concluded each year's developments by opening day. Improvements included stadium additions, site grading renovations, LID stormwater mitigation features.

MOLLENHAUER

Grant Kai, PE, LEED AP, QSD/QSP
Senior Project Manager

Education

University of California, Los Angeles
Bachelor of Science, Civil Engineering

Professional Experience and Credentials

Mr. Kai is a senior project manager in the civil engineering group of Mollenhauer's Los Angeles office. During his tenure at Mollenhauer, Mr. Kai responsibilities have increased in a natural and logical progression to allow him to fulfill his desire to serve the firm's clients in the area of project management, utility design and precise grading.

Relevant Projects Experience

Recent projects of note for which Mr. Kai has served as project manager are as follows:

- Burbank Water and Power Magnolia Service/Control Building–LEED Platinum Certified
  Burbank, CA
  Design of grading, paving drainage and utilities for Service Center/Warehouse and adjacent structure. $11.8 million construction cost.

- Palm Desert Sheriff's Station- LEED Gold Certified
  Palm Desert, CA
  Developed a previously vacant 10-acre site located in Palm Desert into a sheriff station complete with roadways and parking lot improvements. Prepared all site grading and utility (domestic water, fire water, sewer and storm drain) plans as well as a large Best Management Practice infiltration system. Prepared the LEED submittal for the civil engineering aspects of the project.

- Martin Luther King Jr. Medical Center Ancillary – LEED Gold Certified
  Los Angeles, CA
  Design of grading, paving drainage and utilities for the New Pediatrics and Trauma Center. The design included the realignment of a fire water line and storm drain lines to clear the site for this 5 story with basement seismic tower constructed in two phases. $173.4 million construction cost.

- El Cariso Community Regional Park Gym / Community Center – LEED Silver Certified
  Sylmar, CA
  Design-Build Los Angeles County project consisting of 16,000 square foot includes a gymnasium, classroom, multipurpose room, office area, restrooms, full kitchen and exterior surface parking lot. $10 million construction cost.

Professional Registrations

www.levinarch.com

FROM: Kenneth Lucci, Lucci & Associates

SUBJECT: Ford Theater – Electrical Loads

Per your request, please find our "best guess" Electrical Demand Loads for the Ford Theatres Project to support the EIR. The existing peak load at the Theater Area is 180 KW at present per LADWP.

1. Ford Theater Stage, Lower Levels, Back-of-House, Support Areas, Theatrical Lighting, A/V systems for main building - 550 KW
2. Emergency Power for the Project Area Support - 225 KW
3. Chiller Plant – 275 KW
4. Theater 299 seat – 295 KW
5. Main Plaza and Parking – 190 KW
6. Box Office, Rest Rooms, Conference Room and Offices – 125 KW
7. Restaurant – 200 KW
8. Rehearsal Hall – 150 KW
9. Parking #2 – 95 KW
10. Existing lower level office building - 40 KW

These are Peak KW levels and are not KWH numbers. The KW Peak levels are the maximum power in KW consumed during a year period and are used to base the size of the transformers and feeders providing power to the facilities.

Hopefully this answers your questions.

Mark Alcalde the current President of The Sullivan Partnership, Inc. began his career in mechanical engineering 30 years ago working as an air conditioning designer for various firms in the Los Angeles area. Mark joined The Sullivan Partnership, Inc. as a project engineer in 1988 and has served as Project Engineer on many jobs including commercial buildings, educational facilities, large private residences and government projects.

In 1993 Mr. Alcalde became a registered professional mechanical engineer in the State of California and is currently also registered in Nevada.

Mr. Alcalde is a LEED's accredited professional.

Mr. Alcalde attended College at California State Polytechnic University, Pomona.

He is a member of the following Professional Organizations:

American Society of Heating, Refrigeration and Air Conditioning Engineers.

American Society of Plumbing Engineers.

Association of Energy Engineers.

Toastmasters International

WILL SERVE

December 13, 2013

Mr. Grant Kai
316 W. 2nd St., Fifth Floor
Los Angeles, CA 90012

Dear Mr. Kai:

2580 E. Cahuenga Boulevard
John Anson Ford Theatre
Project No. P257221

This is in response to your letter dated December 9, 2013 regarding electric service for the proposed project at the above address.

Electric service is available and will be provided in accordance with the Los Angeles Department of Water and Power Rules and Regulations. The estimated power requirement for this proposed project is part of the total load growth forecast for the City and has been taken into account in the planned growth of the power system.

If you have any questions regarding this matter, please call Mrs. Dzenita Mehic at (213) 367-6082.

Sincerely,

Darrell Miller /LN

RE: Will Serve Letter Request for – Job ID# 43-2013-12-00025: 2850 Cahuenga Blvd., Los Angeles

Dear Mr. Tran:

Thank you for inquiring about the availability of natural gas service for your project. We are pleased to inform you that Southern California Gas Company (SoCalGas) has facilities in the area where the above named project is being proposed. The service would be in accordance with SoCalGas' policies and extension rules on file with the California Public Utilities Commission (Commission) at the time contractual arrangements are made.

This letter should not be considered a contractual commitment to serve the proposed project, and is only provided for informational purposes only. The availability of natural gas service is based upon natural gas supply conditions and is subject to changes in law or regulation. As a public utility, SoCalGas is under the jurisdiction of the Commission and certain federal regulatory agencies, and gas service will be provided in accordance with the rules and regulations in effect at the time service is provided. Natural gas service is also subject to environmental regulations, which could affect the construction of a main or service line extension (for example, if hazardous wastes were encountered in the process of installing the line). Applicable regulations will be determined once a contract with SoCalGas is executed.

If you need assistance choosing the appropriate gas equipment for your project, or would like to discuss the most effective applications of energy efficiency techniques, please contact our area Service Center at 800-427-2200.

Thank you again for choosing clean, reliable, and safe natural gas, your best energy value.

Sincerely,

Zakee Singleton

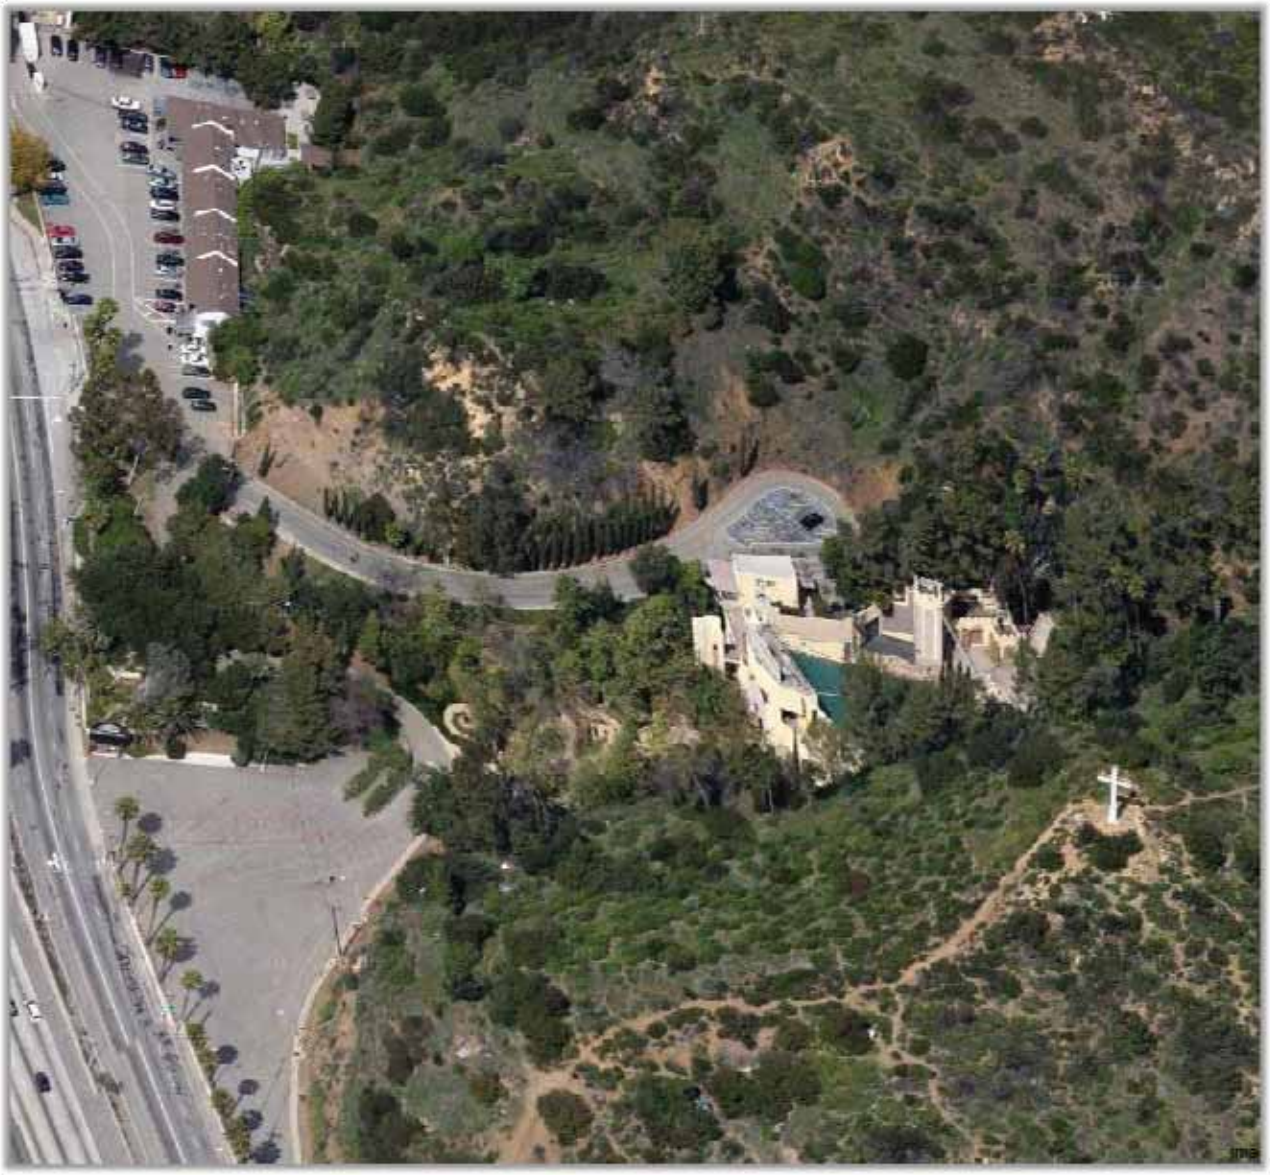
COMMUNITY ARTS RESOURCES, INC.

The Ford, Transformed

Realizing the Potential of Ford Theatres County Regional Park



Researched and prepared by Community Arts Resources

October 2012

Table of Contents

Executive Summary

The 45 hilly acres of the Cahuenga Pass where Ford Theatres County Regional Park is located spark the imagination. Christine Wetherill Stevenson found the landscape a spiritual place and in 1920 built an outdoor amphitheatre for her religious play. The L.A. County Arts Commission, which assumed operation of the Ford Amphitheatre in 1992, saw the site as a place where County arts groups from all cultural communities could find a major stage and residents from throughout the region could discover homegrown art. In 2012 there is a new vision: The John Anson Ford Theatres Master Plan transforms Ford Theatres County Regional Park from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users and uses.

Today, on average, the Ford presents over 180 performances throughout the year, including its commercial rental business in addition to partnership presentations, and attracts more than 50,000 patrons that mirror the diverse demographic makeup of the County and come from nearly all its zip codes. It is a rare, if not singular achievement for a performing arts center to attract such a broad representation of residents.

Beyond the art presented and the audience that enjoys it, the Ford possesses considerable assets. The historic architecture, views of the starry evening sky and the natural backdrop of the amphitheatre stage are signature features of the Ford. The park is ideally located for a cultural and recreational destination, in the center of the County just off the 101 freeway, one of the busiest thoroughfares in the region.

Currently, the Ford faces numerous challenges in serving residents. It's difficult to find and enter the Ford because it has no street presence on Cahuenga Boulevard East. Once parked, patrons have to wend their way to the box office through entering traffic. The same audience members who praise the beauty of the site and the caliber of performances complain about the stacked parking and concessions. Stacked parking is necessary to accommodate the maximum number of cars on the site, but does not allow patrons to come and go freely and make post-performance events impossible. The Ford's lack of kitchen facilities, equipment and concession space limits the range and quality of the food and beverage offerings.

The arts groups and producers have very limited rehearsal time at the Ford because the stages, which are heavily booked, are the only places to rehearse. The outdoor and indoor theatres cannot be used at the same time because of sound bleed-through. The amphitheatre stage needs to be reconfigured to allow for better drainage, create an even surface and reduce the angle of the rake. Amphitheatre seating, light and sound need to be upgraded to compete with other venues and allow partner arts groups to raise production standards for their shows. The Ford, like the region as a whole, needs an indoor mid-size theatre to accommodate arts groups and producers whose shows are not appropriate for the 1200-outdoor amphitheatre or are seeking to graduate from 99-seat venues without risking a jump to 1000 seats or more. The Ford staff is spread out in several locations across the site making communication difficult.

This Community Arts Resources report examines the wide regional reach of the Ford and its potential for vastly expanding the amount of cultural programming it can offer, tripling its audience base and fully establishing its county-wide identity as a recreational destination. This assessment builds on the Ford Theatres Master Plan developed by Levin & Associates, a firm

with a wealth of experience rehabilitating historic sites including the Griffith Observatory and Los Angeles City Hall.

The plan, informed by research with stakeholders and users, activates the entire Ford site, enabling year round activity seven days a week. It concentrates on three functional areas:

1) the **outdoor amphitheatre** with a **new theatre plaza** just to the north with a large concession area and space for picnicking, pre- and post-show events such as receptions and family participatory activities

2) the **Ford entryway plaza** incorporating a **150-seat flagship restaurant** with a kitchen to support all food service on the site, a **new 299-seat theatre**, a new **two-story office building** for staff, picnicking and landscape areas. The plaza, highly visible from Cahuenga Blvd. East, would sit atop a **three-level, non-stacked parking structure**.

3) the new **transit plaza** at the north end of the site accommodates **bus and patron drop off** and a **non-stacked parking structure** with a **new 99-seat flex space** for rehearsals, small performances and other activities on its lower level

A **.75 mile hiking trail** offering unparalleled 360- views of the Los Angeles region would also be created.

While cost estimates for the overall project have not yet been developed, the CEO has outlined a ramp-up plan designed to accommodate construction, maintain a public presence for the Ford while it is closed and prepare for the reopening of the new Ford. Construction on a limited scale will be done in winter 2012-13 and 2013-14, permitting summer seasons to be staged in the amphitheatre in 2013 and 2014. In fall 2014 the Ford would close for 18 months for major construction and off-site programming would be presented in 2015-16. The Ford would reopen in June 2016.

The new Ford, offering more activity spaces and programming, is projected to attract more than 150,000 users annually, tripling the current 54,640. The number of events is estimated to increase by 80% from 184 to more than 330. This year-round, arts and recreation center open daily will require an annual County operating budget of $8 million, up from the current $1.3 million, as well as increases in earned revenue and the addition of new revenue streams. Even though earned revenue is expected to increase, that revenue, currently a small part of the Ford's budget, will not offset the increased costs of operation to any significant degree. In order to fulfill the promise of the vision of the expanded Ford Theatres complex the County's ongoing contribution to Ford operations will be required as a matter of policy.

To effectively program and operate the expanded Ford Theatres facility, an expansion of staffing and budget resources will be necessary. The staff is projected to increase from 15 to 40 to create an organizational structure to stabilize and sustain annual operations. Budget increases are also projected in the categories of marketing, equipment repair and replacement, facility maintenance and campus security. The Ford Theatre Foundation will continue to play a crucial role in supporting operations and programming, raising funds for the Ford's diversity, educational and outreach initiatives, but also working toward building a robust operating endowment that will provide annual and long-term program support for the Ford Theatres.

With expanded programming and a beautiful, amenity-rich campus attracting audiences and artists alike, the Ford will be poised to become a new kind of arts center that not only enriches the lives of County residents through cultural and recreational experiences but also strengthens regional arts organizations and producers, and forges mutually beneficial bonds with communities. A historic venue will become an energy center whose impact will radiate across the County.

Imagining a Day in the (Future) Life of the Ford

Picture the plan above coming alive with activity on a Saturday in August 2016. It would look something like this:

7:00 a.m. The first hikers hit the Ford trail.

9:00 a.m. Kids learn how to fashion Mexican clay sun ornaments in the new Theatre Plaza next to the amphitheatre.

10:00 a.m. Kids and parents keep time with Mexican folk musicians and dancers performing the family show in the amphitheatre.

10:00 a.m. Hip hop dancers hone their moves for an upcoming amphitheatre performance in the new flex space.

11:00 a.m. Kids and parents meet Big!World!Fun! artists in the new Theatre Plaza next to the amphitheatre.

11:30 a.m. Family show attendees and park visitors buy food in the grab and go market place and picnic or lunch in the new restaurant, relax on the new Ford Plaza or hike.

1:00 p.m. Attendees for 2:00 p.m. workshop performance in the new 299-seat theatre gather on Ford Plaza to relax, chat, grab a bite.

2:00 p.m. Actors developing a new play give a workshop performance in the 299-seat space. Audience members give their feedback following the performance.

5:00 p.m. Ticket holders for the evening show start to arrive for picnicking and dining.

6:00 p.m. Patrons take Jamaican Creole dance lessons on the Theatre Plaza.

8:00 p.m. Los Angeles-based reggae band stages show celebrating release of new album in the amphitheatre.

10:30 p.m. Jamaican community organization hosts post-show party/fundraiser in the restaurant.

Now contrast the above scenario with an actual Saturday from August 2012:

9:00 a.m. Kids and parents make Korean hand drums on Edison Plaza before a Big!World!Fun! family show

10:00 a.m. Families enjoy folk dances of Korea and China, Japanese taiko drumming in Ford Amphitheatre

11:00 a.m. Kids meet Big!World!Fun! artists on Edison Plaza, take pictures

12:00 p.m. Staff closes the theatre until the evening show

6:00 p.m. Staff opens the gates so patrons can begin to picnic in the Ford entryway

8:00 p.m. Patrons get into the rhythms of the tango show in the amphitheatre

The journey from current reality to an even more expansive and inclusive future is achievable. This report is a road map for getting there.

Building on a Mission

The Los Angeles County Arts Commission fosters excellence, diversity, vitality, understanding and accessibility of the arts in Los Angeles County. The Arts Commission provides leadership in cultural services for the County, including information and resources for the community, artists, educators, arts organizations and municipalities.

When the Arts Commission took over operation of the Ford in 1992 it looked to its mission, stated above, for guidance.

The commission decided not to compete with other County presenting organizations such as UCLA that bring name artists from across the globe. Instead it chose to concentrate on strengthening County-based arts organizations and producers. The Arts Commission launched an innovative presenting model, the Ford Partnership Program, that nurtures regional arts organizations and puts them in a position to grow and benefit from exposure in a major venue.

The commission's purview is County-wide and, from the beginning it looked at the Ford in this perspective. Many theatres do not think this way. The rule of thumb for theatres is that the majority of a venue's patrons live within a 20 to 30-minute drive. The Arts Commission's constituents – grantees, those who attend technical assistance workshops, Holiday Celebration and Free Concerts performers, school districts that are part of the arts education program, artists who are commissioned to create public art – come from throughout the County. The commission invited arts groups and producers from all over the region to apply to the Ford and bring their core audiences with them.

The Partnership Program Strengthens the County Arts Infrastructure

The Partnership Program was the key element in creating a new profile for the Ford, starting with the 1993 Ford Amphitheatre Summer Season.

Almost all performing arts facilities function as presenters — they curate and select performing groups, pay them a fee to perform, do all promotion and keep the revenue minus the artist fees and other costs of presenting. In the Ford Partnership Program the emphasis is on developing relationships with L.A. County-based arts groups and producers, honing their presenting skills, and helping them to reach new audiences by staging professional productions as part of a coherent performance season, at an attractive, high profile facility.

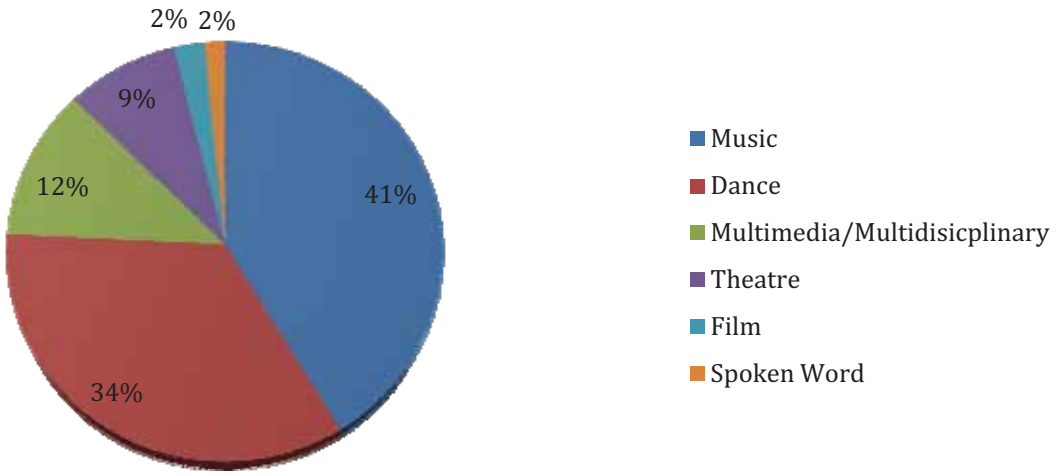
At Ford marketing workshops experienced partners provide advice to new partners.

The arts groups and producers for Ford seasons are chosen through a competitive application process. The Arts Commission selects the strongest applications based on artistic excellence; suitability of proposed work for the 1,200-seat Ford Amphitheatre; demonstrated financial, administrative and producing capabilities; realistic marketing

and production plans and budgets and how the proposal will contribute to a diverse, interesting and stimulating season that reflects the County's population. The Arts Commission provides the amphitheatre space; a tech package of light, sound and projection equipment; event services including box office and house management; a season marketing campaign and technical assistance from the marketing, box office and production staffs. Partner artists provide their productions and bring their audiences to the Ford. Ticket revenues are split, with the lion's share going to the partner artists.

Since the Ford summer season of 1993, the first under the aegis of the Arts Commission, 176 different Los Angeles County-based arts organizations have participated in the Partnership Program. A close look at the 128 groups from the last eight seasons, 2005-12 indicates the variety of Ford offerings. The groups represented the disciplines of music, dance, multimedia/multidisciplinary, theatre, film and spoken word. The chart below illustrates the breakdown of the last six seasons of partners by discipline. Cultural affiliations of partners from this time period are included on page 17 and a list of 2005-2012 partners are included in Appendix A.

Disciplines Represented by Ford Partner Organizations, 2005-2012



Disciplines	# Partners
Music	53
Dance	44
Multimedia/Multidisicplinary	15
Theatre	11
Film	3
Spoken Word	2

The case studies of six partners, detailed in Appendix B, demonstrate how these groups have benefitted from the partnership experience.

For **Grandeza Mexicana Folk Ballet Company**, whose core audience is described as "100% Mexican folklorico fans," mostly lower income families and children, the partnership has had an impact on new audience development. President Erica Bawek cited the opportunity to be in the same brochure with an Italian electronica band and felt strongly that the company was part of a larger family of shared audiences. The company's 2011 Ford Amphitheatre performance was featured on the KCET series, "Live @ the Ford."

Allison Tanaka, co-director of **Culture Shock L.A.,** a hip hop dance company, finds that being a Ford partner provides a seal of approval. "Being part of the Ford season has given us greater legitimacy as an arts organization and helps break stereotypes about our art form."

Ted Benito, principal partner of the production organization **PAE Live!,** which presents primarily Filipino-American and Asian/Pacific Islander artists, lauds the technical assistance provided by Ford staff. "The atmosphere they create, you could never find that elsewhere… It takes so much pressure off." Commenting on the production team, he indicated that "the staff came in with the attitude of 'Let's work together, let's build a show together. Tell us what you need and we'll give you our two cents, and we'll make it work.'" This results, he feels, in everyone performing at the level expected by the Ford: "It raises the bar…"

Artistic Director Tim Wright of **Circle X Theater Company** credits the Ford with revitalizing his organization, which he describes as "on the verge of collapse" when it was accepted into the Winter Partnership Program at [Inside] the Ford. He notes that the support offered by the program is invaluable, and that small, emerging theater companies usually do not have much in the way of resources, stating, "We needed a lot of guidance and hand-holding." He cited especially the assistance with box office, front of house operations, press relations, marketing support and production expertise. "They have our back." he commented.

The Ford Theatre Foundation Extends the Ford into the Community

The Ford looks continually to extend its reach in the County. The Ford Theatre Foundation, a non-profit organization, supports the Ford's programming through fundraising and complements that programming through a series of outreach initiatives:

- **Community Bridges** connects artists and audiences through a wide range of live performing events held in parks and community centers throughout Los Angeles.

- **J.A.M. (Jazzed and Motivated) Sessions** nurtures the artistic development of both youth and adults and invites active participation in music, dance and the creation of art alongside professional local artists.

- **Big!World!Fun!** provides the opportunity for Los Angeles families to enjoy high caliber performing arts presentations at affordable prices: the events are free for children and $5 for adults.

Young audiences enjoy crafts before a Big!World!Fun! performance.

Several years after the launching of the Partnership Program, the Arts Commission compared the demographics of the County with the makeup of the audiences and arts groups on the Ford season roster and found disparities. At the time, Latinos comprised 37.8% of the County's population but only 15% of the Ford's audience. Starting in 2002 the Ford launched a number of programming, marketing and outreach and initiatives to address the disparities.

The Foundation's **Latino Arts/Audience Initiative** (2002) and an **Asian/Pacific Islander Arts/Audience Initiative** (2006) closed this gap. The Foundation used an advisory panel representing a cross section of cultures and later community liaisons with knowledge of and connections with specific cultural communities to identify candidates for the Partnership Program and help them with the application process. The Foundation also held a series of informal, small scale events to become acquainted with, entertain and educate targeted groups about the Ford and its opportunities.

The **Youth Residencies** program has been another means by which Community Bridges accomplishes its mission. This program provides access through exposure and education to the performing arts for underserved families in the Latino, African-American and Asian Pacific Islander communities of Los Angeles. Qualified Ford performers conduct a series of performance-based classes in their discipline for students and families who are also provided with free tickets and transportation to attend Ford Amphitheatre performances. In 2012 the residencies had a banner year, collaborating with 16 organizations to reach 2,283 people, including 1,063 youths. The cultural orientation of the organizations included African-American, Native American, Causasian, Chinese, Filipino, Japanese, Latino, Korean, Pacific Islander and Vietnamese. (For more detail on Youth Residencies, see Appendix C.)

Youth residency participant performs at [Inside] the Ford.

Drum circle J.A.M. Session at East Los Angeles Civic Center.

2012 was the largest for **J.A.M. Sessions** as well. A grant from Metabolic Studio made it possible to extend these free, popular participatory activities beyond the Ford to five satellite locations, one in each County supervisorial district. Making community connections at each of the sites was key to attracting participants to the total of 40 (8 in each district) J.A.M.s.

The Community J.A.M.s provide a model for off-site programming when the Ford is closed during the major construction phase of realizing the master plan.

In 2013 and 2014, through funding allocated by Supervisor Zev Yaroslavsky's office, the Foundation will produce the Signature Series, which pairs name arts groups with L.A.-based groups to generate new audiences and cultivate new funding sources for the Ford. This series will also lay the groundwork for some of the programming envisioned for the expanded campus after completion of the master plan and will raise funds to support the stability and longevity of Ford operations.

The Ford Partnership Program, based on the mission of the Arts Commission, is a presenting template unique in the region, if not the country, in its emphasis on nurturing arts groups and producers and embracing wholeheartedly the diversity of the region. The experience of the program and the activities of the Ford Theatre Foundation have given the Ford a deep knowledge of the arts presenting landscape and what patrons, arts groups and producers need and expect.

Other Assets

Ford Theatres receives overwhelming positive reviews on Yelp – 4.5 out of possible 5.0 based on 101 reviews - for its programming and ambiance.

> *"I think I found my new favorite music venue. Great location, gorgeous, outdoor, intimate, and just plain easy."*
>
> *"This is a great music venue with fantastic acoustics and an intimate feel."*
>
> *"Oh man this place is AWESOME. The venue itself is nestled in the hills, surrounded by trees and rocks, under the open sky. Gorgeous."*

The Ford is so popular on Yelp that the organization chose the Ford as one of a handful of L.A. area sites for their "100 Days of Summer" promotion. In May 2012 Yelp partnered with the Ford to co-host a party for 250 "Yelp Elite," individuals who review regularly on Yelp. The Yelp track record is only one indicator of the emotional response the Ford stirs in visitors.

The Beauty and Magic of the Site

The historic architecture, views to the starry evening sky and the natural backdrop of the amphitheatre stage are signature features of the Ford.

A summer concert at the Ford. *Photo: Paul Antico*

Author Christine Wetherill Stevenson, the heiress to the Pittsburgh Paint fortune, believed the site's rugged beauty would provide a dramatic outdoor setting for her *Pilgrimage Play* based on the life of Christ and she built the outdoor amphitheatre, called the Pilgrimage Theatre, to house it. The theatre, befitting the *Pilgrimage Play*'s subject, was designed in the style of ancient Judaic architecture to resemble the gates of Jerusalem. Architecturally, the Ford is unique.

The site has continued to cast its magical spell on visitors even though it is a stone's throw from the 101 freeway and the noise and congestion of Hollywood. Members of the Icelandic rock band Sigur Ros,

performing at the Ford in 2001, said that the atmosphere reminded them of the churches where they began their career. One of the Ford's "super subscribers," who comes to several events in both indoor and outdoor theatres each year, noted in an interview for the Ford Web site, "The thing I like most about the Ford is the experience of walking up the hill — the fountain, the picnic area and the rusticness of it. The approach puts you in a terrific mood for art… I'm not selling the (Hollywood) Bowl short, but, at the Bowl, you're in the audience looking at a manmade structure. At the Ford, you're sitting in a manmade structure looking at the hillside. It's a completely different feeling."

L.A. County Arts Legacy

The Ford is intertwined with the history and public support of the arts in the County. The building of the Pilgrimage Theatre in 1920, one year before the development of the Hollywood Bowl, marked the beginning of the Cahuenga Pass as a cultural mecca. In 1976 the theatre was named after L.A. County Supervisor John Anson Ford (1883-1983) to honor his significant support of the arts, including helping to found the L.A. County Arts Commission and encouraging the Board of Supervisors to support the building of the Music Center, among many other achievements.

Former L.A. County Supervisor Ed Edelman led the revival of the theatre in the 1990s. An amateur cellist, Supervisor Edelman and some musician friends performed on the amphitheatre stage for the L.A. Philharmonic's Ernest Fleischmann to persuade him – successfully – to start a summer chamber music series at the Ford. Before the Arts Commission took over the operation of the theatre, the supervisor's office sponsored a series of events there. It was Supervisor Edelman who made possible the creation of the Ford Amphitheatre Season (originally called "Summer Nights at the Ford") under the Arts Commission in 1993 and later obtained funding for capital improvements to the facility. The County named the amphitheatre stage in his honor.

Supervisor Edelman testing the Ford's acoustics with a chamber music quartet.

Welcoming All Cultures and All Audiences

One of the first things the Arts Commission discovered when it began to program seasons at the Ford was that it was a neutral site, not associated with a particular kind of patron. People from all communities felt comfortable going to the Ford. This factor, combined with a non-traditional presenting model in which generating earned income is secondary to fulfilling the Arts Commission's public service mission, enabled the theatre to be responsive to demographic changes earlier than the presenting field in general.

Diverse families enjoy performances at the Ford.

Since the Arts Commission took over operations of the Ford, demographics in Los Angeles County have shifted rapidly. US Census Bureau reports show that from 1990 to 2010 (below) the white ethnic majority that created so many of the mid-century, Eurocentric cultural institutions declined drastically. In its place, the Hispanic/Latino population has grown 40% since 1990 and has become the largest ethnic population in Los Angeles County. The Asian/ Pacific Islander population is the fastest growing demographic group in Los Angeles County: since 1990, their numbers have increased by nearly 49%.

Los Angeles County Census Statistics- Racial/Ethnic Demographics

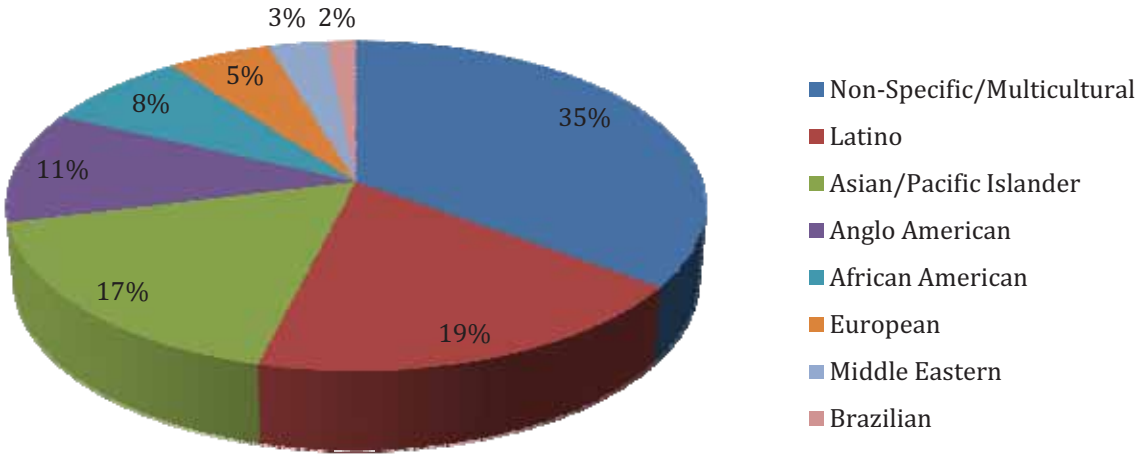
Ethnic Group	2010 Census		2000 Census		1990 Census	
	Population	Percentage	Population	Percentage	Population	Percentage
Total Population	9,818,605	100.00%	9,519,338	100.00%	8,863,164	100.00%
White	2,728,321	27.79%	2,959,614	31.09%	3,618,850	40.83%
Hispanic/Latino	4,687,889	47.74%	4,242,213	44.56%	3,351,242	37.81%
Asian/Pacific Islander	1,348,135	13.73%	1,147,834	12.05%	907,810	10.24%
African American	815,086	8.30%	901,472	9.47%	934,776	10.55%
American Indian/Alaskan Native	18,886	0.19%	25,609	0.27%	29,159	0.33%
Other	25,367	0.26%	19,935	0.21%	21,327	0.24%
Two or More Races*	194,921	1.99%	222,661	2.34%	-	-

*2000 marked the first Census that individuals could identify themselves as bellowing to two or more ethnic groups.

The Ford has been able to reflect these changing demographics in its programming and take risks when other organizations continued to present Eurocentric performing arts and events featuring well known, popular artists out of fear that culturally specific programming could not yet be supported by the marketplace. As noted in the Partnership Program section of "Building

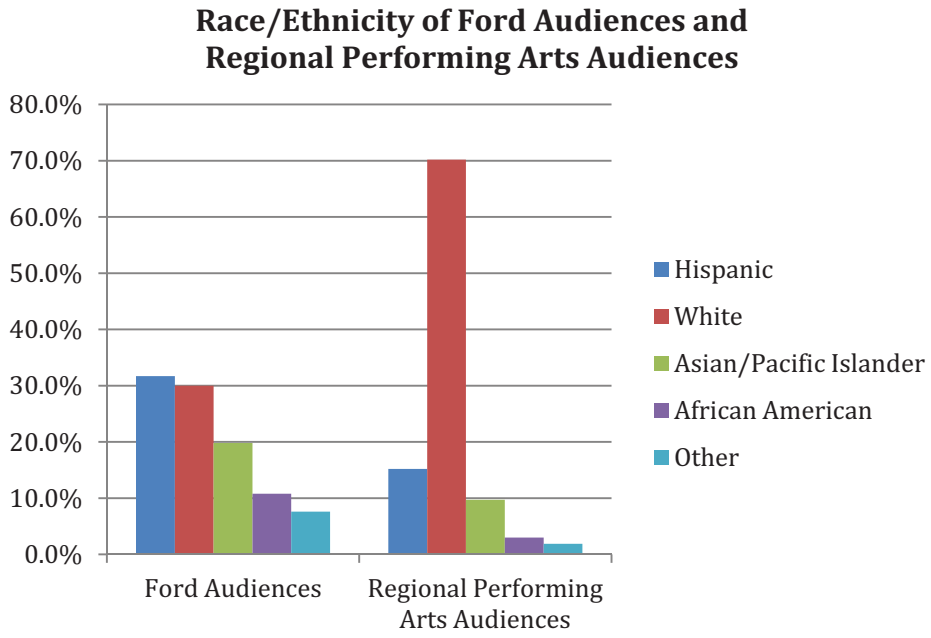
on a Mission" above, the Ford has co-presented art forms with roots all over the globe since 1993. Because it sources its presentations directly from the diverse communities it serves and represents, the Ford has been very successful in developing culturally specific audiences and becoming a home for all cultures. The Ford has led the way in programming that is now emulated by presenters across the state and country. The Ford gives equal opportunity and access to the arts in the same way that public libraries and parks give equal opportunity and access to information and recreation. The cultural traditions and affiliations of Ford partners from the last eight years of partnership programming are illustrated below.

Cultural Affiliations of Ford Partner Organizations, 2005-2012



Cultural Affiliation	# Partners
Non-Specific/Multicultural	45
Latino	24
Asian/Pacific Islander	22
Anglo American	14
African American	10
European	7
Middle Eastern	4
Brazilian	2

Audience demographics are similarly diverse and reflect the Ford's role as a venue that shares its stage with all communities of Los Angeles County. The Ford's demographics, assessed through audience surveying during the 2012 summer season, are compared below with the most recent available demographic data aggregated by Target Resource Group for audiences of 113 performing arts organizations in Los Angeles County. This comparison illustrates the success of the programming model and audience development and outreach initiatives the Ford has implemented over the past two decades.

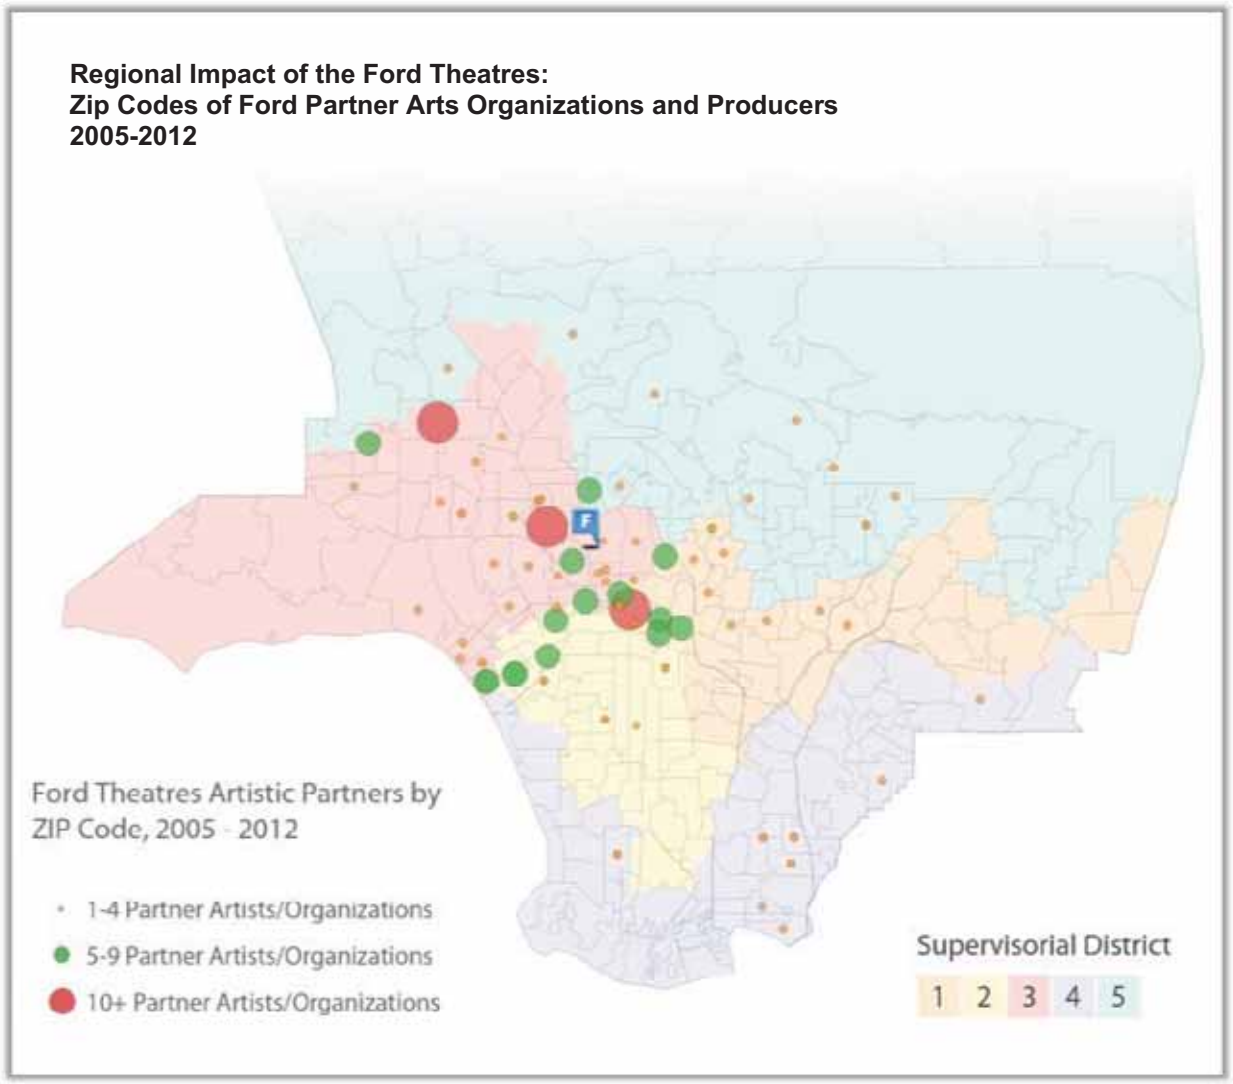


Audience Race/Ethnicity	Ford Audiences	Regional Performing Arts Audiences
Hispanic	31.7%	15.2%
White	30.0%	70.2%
Asian/Pacific Islander	19.8%	9.7%
African American	10.8%	3.0%
Other	7.6%	1.9%

Regional Scope

Ford programming touches every supervisorial district in Los Angeles County. Geographic distance is not a barrier for either partner artists or their audiences. As can be seen in the following graphics, over the last eight years, Partnership Program participants have hailed from distances as far as 30 miles away and audiences have traveled from nearly every zip code in Los Angeles County.

Regional Impact of the Ford Theatres:
Zip Codes of Ford Partner Arts Organizations and Producers
2005-2012



Utilizing the marketing support that the Ford provides, partner artists have been extremely successful in bringing their communities to experience their shows at the Ford. Audiences are willing to make the long drive to the Ford to support their community artists in what is usually their biggest, most ambitious program of the year. By leveraging already existing relationships between artists and their audiences, the Ford has broken the 20 to 30-minute drive radius that typically dictates the geographic area in which audiences are willing to travel for performing arts events. Through the Ford Theatre Foundation's Community Bridges outreach and J.A.M. Session programs in satellite locations, the Ford expects to expand both its partner and audience base in future years.

The Challenges

Since 1993, the County has made $6.1 million in capital improvements to the Ford to meet modern safety, access and performance standards. Although helpful, these are stopgap measures and do not overcome the most significant obstacles to making the Ford useful to more and a greater variety of County residents.

Patron Needs

Ford audiences, as expressed in their online post-performance surveys, like their Ford Theatre experience – with two exceptions: stacked parking and concessions offerings and service. The Ford is also hard to identify from the street and challenging to navigate once patrons enter.

Non-Stacked Parking and Car Traffic Flow – Stacked parking is the #1 complaint in audience surveys (averaging 20% of all negative comments 2009-12). To accommodate the maximum number of parked cars, stacked parking is utilized in all three parking lots - one to the south of the theatres and two to the north. Stacked parking does not permit patrons to stay for post-event receptions nor to come and go during all day festivals. Personal emergencies of those in stacked parking are especially problematic.

Higher Quality and More Varied Concessions – The quality and service of concessions is the #2 complaint in audience surveys (averaging 12% of all negative comments 2009-12). The concessions areas are under-sized, under-equipped and unable to successfully serve the patrons during a 15-minute intermission, especially if the 1200-seat amphitheatre is sold out. The lack of facilities to actually cook and prepare food limits the range of offerings. There are no facilities for pre- or post-show events that can be separated from the general audience.

Greater Street Visibility – Except for glimpses of the facade from a distance, the Ford Theatres structure is hidden in a canyon and not visible from Cahuenga Boulevard. The speed of traffic on Cahuenga Boulevard East makes entry and exit to the site difficult and dangerous. There is no obvious arrival and entry point other than the parking lot. Visitors must find their way through the lot to the box office. The

only site identification is an electronic sign south of the main entrance off Cahuenga Boulevard East, which can be seen only by northbound traffic, and standard freeway exit signs. What people see from the street and the 101 freeway conveys no sense of place and identity.

Easier Site Navigation for Patrons –The two north parking lots have no dedicated pedestrian connection to the amphitheatre; pedestrians headed toward the theatre from those lots have to dodge entering traffic. ADA parking, immediately to the north of the Ford Amphitheatre, is limited (6 spaces) and is accessed by a road also used for fire department access, artist loading and unloading, trash pick up and media truck parking. The County has done as much as possible to date to make the historic facility ADA compliant but implementation of the master plan can make the facility fully compliant, enabling all patrons to move from their cars to the box office.

Partner/Production Needs

Ability to use more than one theatre at the same time – The existing [Inside] the Ford is not acoustically separated from the amphitheatre making their concurrent use impossible.

Allow for post-performance events – Because of stacked parking, it is not possible to hold post-performance events such as receptions, fundraisers or audience feedback sessions.

Rehearsal Space –The stage of the amphitheatre and of [Inside] the Ford are the only spaces for rehearsal and their availability is very limited because of the heavy performance schedule. Also, groups performing in the outdoor amphitheatre can rehearse only at night because stage lighting can't be operated during daylight hours and it is typically too hot to use the stage during the day in the summer. Lack of rehearsal time in the amphitheatre is particularly challenging for dance companies as the stage is an unusual configuration not duplicated elsewhere.

Improved Amphitheatre Seating, Stage, Audio Visual and Theatrical Lighting Infrastructure - Because the seats are drilled into the amphitheatre floor, there is water leakage to the areas beneath the theatre. The stage needs to be reconfigured to allow for better drainage, create an even surface and reduce the angle of the rake. The lighting and sound systems need to be upgraded to meet higher production standards.

County Arts Infrastructure Needs

Mid-Size Theatre – There is a scarcity of theatres in the region with a seating capacity of 299. This size is right for art forms such as contemporary dance or traditional arts from cultures like those of Thailand or Senegal that are not familiar to the general audience. A 299-seat theatre can also provide a stepping stone for theatrical productions that have received strong critical notices in 99-seat venues but can't make the high risk jump to a 1,000-seat venue.

Dance Is a Challenged Art Form in the Region - Dance in particular is in critical need of support in Los Angeles County. The dance ecology is exceedingly fragile, and it needs a consistent, safe and welcoming environment with low- to no-cost, accessible rehearsal and performance space.

Administrative Needs

Coherent Office Space to Accommodate Operational Personnel – Currently Ford staff is spread out in several locations across the site and are physically separated from the rest of the Arts Commission staff located in downtown L.A. Bringing all Arts Commission staff together in one location would improve communications and efficiency.

The Answer

"The time has come to devise the kind of comprehensive strategy to guide the Ford's development that only a master plan can provide. The County has invested $6.1 million in capital improvements to the Ford over the past two decades. These have greatly enhanced the visitor experience there, but at the same time they've only been piecemeal solutions to upgrade a facility originally built in 1920. The Ford needs to envision how to maximize its services to patrons in the long term."
– L.A. County Supervisor Zev Yaroslavsky

Zev Yaroslavsky, who succeeded Ed Edelman as supervisor for the Third District, home to the Ford, is responsible for key developments at the site. He was a vital player in securing County funds for the construction of the new Ford entryway in 2000. In 2006 he established an endowment fund for the Ford, donating $250,000 from Third District office funds to the Ford Theatre Foundation. In 2010 Supervisor Zev Yaroslavsky provided $350,000 in Third District Capital Improvement funds to support the development of a master plan to envision the future of the Ford.

Through a competitive process Levin & Associates Architects were selected to develop the plan. The firm, headed by Brenda A. Levin, FAIA, came to the project with a wealth of experience in revitalizing and enhancing historic sites. Levin worked on similar rehabilitation projects, including the Griffith Observatory Renovation, Frank Lloyd Wright's Hollyhock House, the Bradbury Building and Los Angeles City Hall Restoration.

Levin & Associates engaged a team of consultants to work on the project. The consultants' fields of expertise include landscape architecture, engineering, theatres, acoustics and audio visual, transportation, historic preservation and cost estimating.

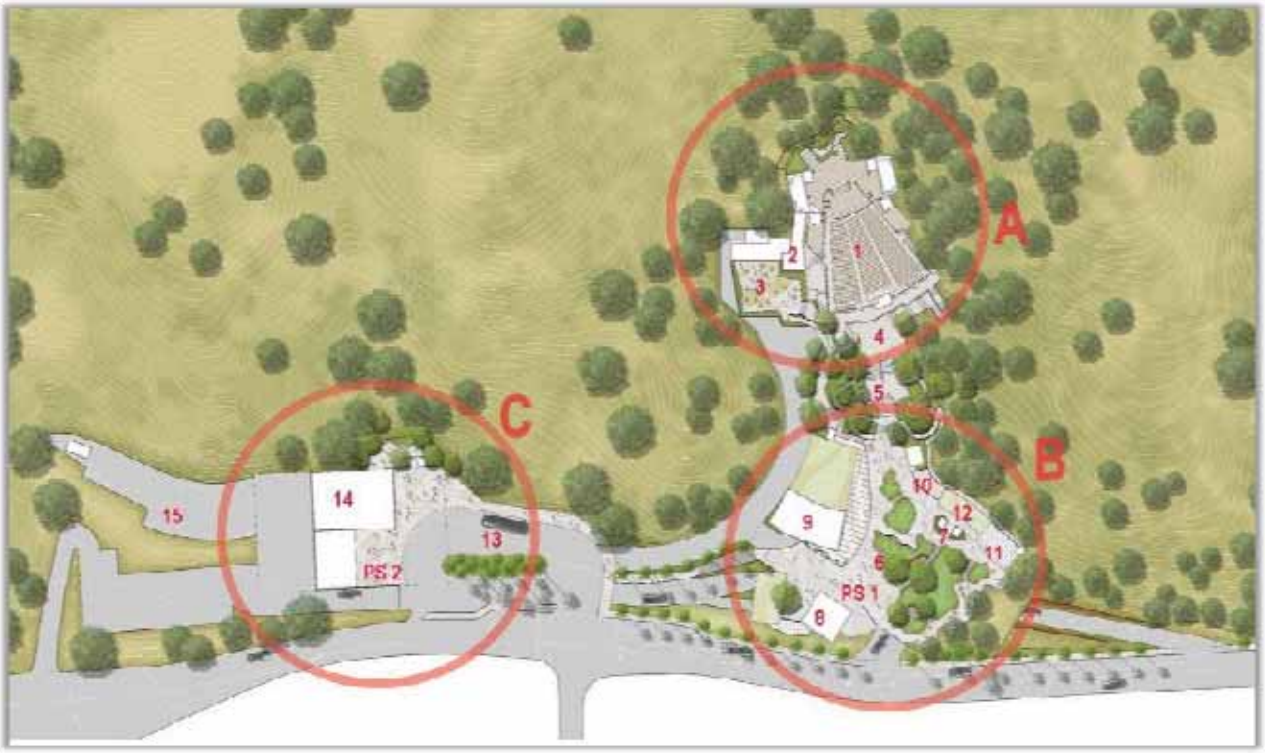
Ford stakeholders discuss (above) and present (below) facility needs and priorities.

Research from Users

Levin & Associates and its consultant team developed two workshops to engage the stakeholders for their input. Participants included performers, producers, donors, patrons, staff, partner organizations, L.A. County Arts Commissioners, County officials and members of the Los Angeles theatre community. Participants supported the concept of reinvesting in the theatres and, without exception, emphasized the need to restore the historic amphitheatre as a high priority. In addition, it became apparent that to reach a larger community, encourage more theatrical partnerships and maintain a diverse audience, a plan for the development of the whole campus was needed.

The New Vision for the Site

The master plan is designed to fully activate the entire Ford site, enabling year-round activity, seven days a week. The plan concentrates on three functional areas shown in the below aerial schematic.



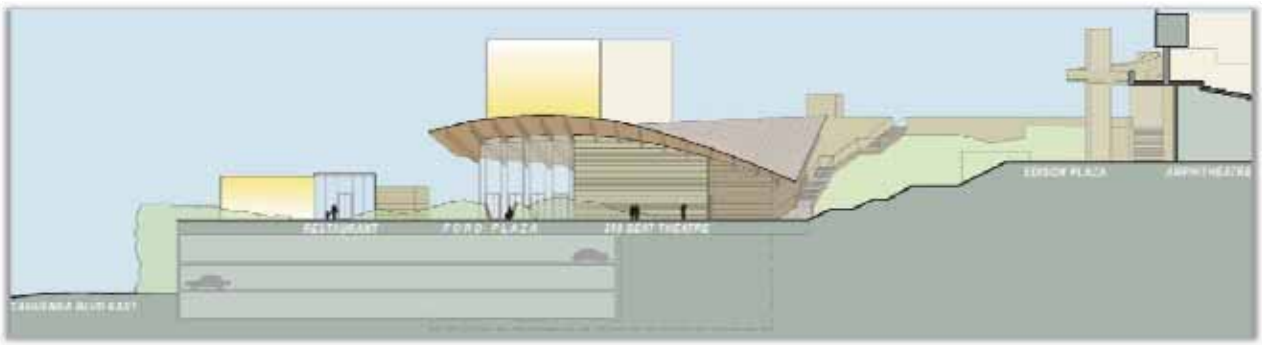
Ford Amphitheatre and Adjacent Areas (area A)

- The outdoor amphitheatre (1) would be upgraded with new seating, audio visual and theatrical lighting systems.
- A new theatre plaza (3), to the north of the amphitheatre, would accommodate more spacious concessions and serve as an area for private pre- and post-show receptions and audience participatory activities.
- A new marketplace concessions area (4) featuring pre-packaged food and drink would be installed adjacent to the existing Edison Plaza.

The Ford Plaza – the New Entryway (area B)

Set atop a new three-level, non-stacked, parking structure (PS 1), The Ford Plaza, accessed by elevator from the below grade parking or from the transit plaza (see below), will be the gathering and meeting place for the site. The plaza features

- a new 150-seat flagship restaurant (8) with a kitchen sized to support not only the restaurant but all food service for the site including picnic boxes, the marketplace, amphitheatre concessions on the theatre plaza and catering/receptions.
- a new 299-seat theatre,(9)
- a new two-story office building containing Ford Theatres box office (10) and staff offices (11) on the second floor and conference/work areas on the first level facing the plaza
- picnicking and landscape areas



Area B- Section looking north through main plaza and existing stairway to Amphitheatre.

The Transit Plaza (area C)
At the north end of the site, the new transit plaza (13) accommodates

- bus and patron drop off
- a new 99-seat flex space (14) on the lower level of the north parking structure (PS 2)
- routing of traffic to the two new, non-stacked parking structures

In addition to these areas, there would also be a .**75 mile hiking trail** that lies between trailheads at the north and south ends of the park area. The trail, details of which are included in Appendix E, will offer unparalleled 360-degree views of the Los Angeles region and landmarks including downtown Los Angeles, the Hollywood Sign, the Hollywood Reservoir, Hollywood Bowl and Griffith Observatory.

A .75 mile hiking trail will be a scenic addition to the County's trail system.

The New Vision for Users

Visible, Easily Accessible Green Space Destination in Hollywood – As shown in the image above, the new Ford plaza, especially the new 299-seat theatre and flagship 150-seat restaurant, gives the Ford a major street presence for the first time, while the landscaping of the plaza, echoing the hills behind, makes it clear that the Ford is a green space. The hiking trail, whose trailhead markers will be on Cahuenga Boulevard East., is another invitation to discover the park.

The entrance to the parking structure below the Ford Plaza and the Transit Plaza farther north on Cahuenga Boulevard. would be evident from the street. Pedestrian routes from parking areas to activity centers would be clearly marked and traffic-free.

A Lifelong Learning Center – The new Ford provides more space, both outdoors and indoors, to engage the public in events other than performances. The theatre plaza adjacent to the amphitheatre as well as the 299-seat space and the 99 to 150-seat flex space could be used for the free participatory J.A.M. Sessions, Big!World!Fun! family series (free for children, $5 for adults) pre-show activities and post-show meet and greet with the performers. These activities would be especially important in cultivating new audiences because, since they are no or low cost, they will often be a patron's first Ford experience. Pre- and post-event lectures and conversations can help build relationships with patrons; the new Ford provides more spaces for both and, with non-stacked parking, would make post-event activities possible for the first time.

A State-of-the-Art Historic Outdoor Amphitheatre – The 1200-seat amphitheatre would remain the centerpiece of the Ford. Upgrading the lighting, sound and projections systems and completely renovating house seating, while preserving the space's historic character, would give arts groups and producers the ability to deliver higher quality production values, make the amphitheatre more attractive to potential renters and take audience enjoyment to a new level of sophistication.

A Home for Festivals and Series – Ford partners have included groups such as the Los Angeles Film Festival and Angel City Jazz Festival that include presentations in other venues in the region in addition to evening presentations in the Ford Amphitheatre. The new Ford would make it possible for such entities to have all their festival events at the Ford, including performances and screenings in spaces smaller than the amphitheatre, free lectures, receptions and post-show panels and audience feedback sessions. The new Ford may also inspire new festivals such as one devoted to celebrating regional dance.

Greater Variety of Programming to Attract New Audiences - Each year when the Ford receives applications for its summer Partnership Program, the selection panel inevitably encounters proposals that are intriguing from an artistic point of view but are rejected because they are not right for the 1200-seat amphitheatre. The most common reasons for this are that the applicant has no producing experience in larger performance spaces, the event is not seen to its best advantage in an outdoor setting or is experimental in nature and needs to blossom in an intimate space. The 299-seat theatre and 90 to 150-seat flex space would provide sites for such offerings. Bluegrass is a good example of musical genre which has a small but loyal following in L.A. Bluegrass shows in the amphitheatre have drawn only 300-400, yet every year some patrons ask for more bluegrass offerings. East Indian classical dance has been proposed for the amphitheatre, but the subtleties of hand gestures, facial expressions and head movements are much better appreciated in a smaller space. The Ford has been approached by established artists who want to go in a new direction but the Ford currently doesn't have the right-sized place for them to experiment, get feedback and develop new material. The 299-seat theatre and 90 to 150-seat flex space would provide sites for these kinds of offerings.

It would be possible to operate both these spaces, as well as the amphitheatre, simultaneously, expanding the number of offerings available to the public. This is a key factor in projecting an 80% increase in number of events and a tripling of the current number of facility users.

Enhanced Support for Dance and Theatre in the County - The 299-seat theatre would provide a place for theatrical productions that have been hits in 99-seat venues but have reached the limits of financial success in those small venues. Ford staff would be able to provide resources – primarily technical assistance in the production and marketing areas - to help small theatre companies, who tend to run very lean, transition to a run in a state-of-the-art mid-size theatre and expose their work to audiences beyond their current demographic/geographic reach.

The 299-seat theatre as well as the flex space could become valuable resources for the dance community and open opportunities for collaboration. The mid-size theatre could be home to a dance series alternating with theatre presentations. The idea of the Ford collaborating with Glorya Kaufman Presents Dance at the Music Center, pairing County dance companies with national or international touring companies presented at the Music Center, is under discussion. This partnering would yield opportunities for joint rehearsals and other performance and educational projects, enriching regional dance.

Space for Rehearsals and Intimate Events – Arts groups are always challenged to find rehearsal space. The flex space, featuring a stage area of the same dimensions as the amphitheatre, will enable arts groups to rehearse on the Ford site. Since the space can also accommodate 90 to 150 spectators, it could be used for small scale performances and rehearsals open to the public or invited groups. This flex space also would provide an informal environment for interactive events designed to bring audiences in close contact with working artists such as workshops, readings and youth and educational activities.

Making the Vision a Reality

This report outlines a five-year operational and staffing ramp-up plan that will accommodate construction, maintain a public presence for the Ford while it is closed and prepare for the opening of the new Ford.

Construction Schedule

Construction on a limited scale will be done in winter 2012-13 and 2013-14, permitting summer seasons to be staged in the amphitheatre in 2013 and 2014. In fall 2014 the Ford would close for 18 months for major construction and off-site programming will be presented in 2015-16. The Ford would reopen in June 2016.

Off-site Programming While the Ford Is Closed

The major construction period when the Ford would be dark offers an exciting opportunity to further develop programming in satellite locations throughout the County. In summer 2012 the Ford's free, participatory J.A.M. (Jazzed and Motivated) Sessions were extended to five satellite locations, one in each County supervisorial district, funded by a grant from Metabolic Studio, a project of the Annenberg Foundation. A public presence for the Ford would be vital during construction. The ramp-up plan includes morphing the J.A.M.s into "Free Community Events" that incorporate music concerts and other presentations in addition to participatory sessions. These events would deepen community relationships and build visibility for the Ford and the County both before and after master plan implementation.

Preparing for the Re-Opening

To effectively program and operate the expanded Ford Theatres facility, an expansion of staffing and budget resources will be necessary to create an organizational structure to stabilize and sustain annual operations. The proposed staffing plan gradually increases County positions during key periods to ensure not only that the expanded grounds and facilities have been completed and equipped for the grand opening in June 2016, but that the first season of programming is developed, marketed and ready for sale to the public. County positions will be added in the areas of finance, facility operations, programming, outreach, fundraising, information technology and marketing. Budget increases are projected in the categories of administration/operations, information technology, maintenance and replacement of theatrical equipment, production supplies, security, and facility maintenance.

The Ford Theatre Foundation would continue to play a crucial role in supporting operations and programming, raising funds for the Ford's diversity, educational, and outreach initiatives, and would also work toward building a robust operating endowment that would provide annual and long-term program support for the Ford Theatres.

What It Will Take

The new Ford, offering more activity spaces and programming, is projected to attract 152,875 users annually, tripling the current 54,640. The number of events is estimated to increase by 80% from 184 to 331. (Please see Appendix E for details on these estimates.) The expansion of the Ford to a year-round, arts and recreation center open daily will require an annual County operating budget of nearly $7.6 million up from the current $1.3 million as well as increases in earned revenue and the addition of new revenue streams. Details of this budget projection are contained in Appendices F through M and the narrative that follows.

The Ford operation is mission-driven. It invests in the County's diverse artistic and audience communities by supporting the work of local arts groups and producers and creating an accessible and welcoming space for all County residents. As a result, the Ford cannot be self-sustaining from its earned revenues. Even though earned revenue is expected to increase from greater use of the facility, that revenue, currently a small part of the Ford's budget, will not offset the increased costs of operation to any significant degree. This is usually the case with major cultural institutions: they are significantly dependent on contributed income for stable operations. In order to fulfill the promise of the vision of the expanded Ford Theatres complex the County's ongoing contribution to Ford operations will be required as a matter of policy.

The Ford Theatre Foundation plans to launch an endowment campaign as part of the ramp-up for the new Ford. An increased endowment has the potential to provide an annual revenue stream to augment the County's investment in the Ford's central operations and programming.

Significant Areas of Increased Expense

Staffing – Staff is key to the success of the Ford Partnership Program, especially given the vital nurturing component of the program. The County currently employs a staff of approximately 15 full-time employees for the Ford, 13 devoted to programming and operations and 2 responsible for care and maintenance of the physical structure. To successfully meet the needs of L.A. County arts groups, producers, audiences and communities engaged in Ford activities, the program and operations staff will need to grow to a total of 40 employees, including additions to the following divisions:

- *Programming*: Expansion of the partnership model to new initiatives in new spaces will require more program staff to increase community and artist outreach and ensure that the Ford maintains a high standard of presentation in all its activities.
- *Operations and Productions*: With a tri-fold increase in the number of users of the Ford and the addition of vendors to accommodate visitor needs (parking, concessions/restaurant, security), additional staff will be required to ensure efficient operation of the facility.
- *Seasonal event and production crew*: The increase in the number of events will require additional hourly staff and crew to serve patrons and run production elements for shows.
- *Marketing*: The increased number of events and kinds of usage (picnicking, private events, hiking, restaurant, leisure etc.) will necessitate more positions to adequately

market the facility as an arts and recreational destination and keep County residents informed about myriad opportunities at the facility.

- *Facilities*: The increased usable square footage of the Ford campus, greater number of structures and new publicly accessible hiking trails will require a staff of approximately 21 Parks and Recreation employees to care for the grounds, buildings and systems infrastructure.

According to budget projections, the annual staffing cost will increase from $1,506,250 to $5,857,695.

Marketing Expenses - Introducing the new Ford to the public will require a major publicity and marketing campaign that not only focuses on the Ford Amphitheatre's re-opening and 2016 summer season, but draws attention to the Ford Theatres as a new cultural and recreational destination with an array of opportunities and amenities for the public. The expanded annual schedule of 160 events means increased costs for advertising, printed materials, postage and design, publicity, Web site and electronic communications services. New amenities such as the flagship restaurant, hiking trails, non-stacked parking and Ford Plaza public space will also require robust public information.

Equipment Repair and Replacement - An often overlooked aspect of building and operating a performing arts space is regular maintenance and replacement of theatrical equipment. Outfitting the amphitheatre, 299-seat and 99-seat flex spaces with electrical, lighting, and audio systems, control boards, and projection equipment will require initial investment. The cost report prepared as part of the Levin & Associates Master Plan estimates approximately $3.8 million to purchase systems and equipment appropriate for all spaces. While this is a one-time cost, regular equipment replacement must be built into the annual budget cycle.

Similar to computers and common office machinery (copy machines, printers, etc.), theatrical systems wear with use; they also become outdated as technology is developed and improved. Expense projections include a replacement cycle similar to the County's method for funding computer replacement. As illustrated in Appendix F, a five-year amortization schedule would allocate funding for partial replacement of theatrical equipment each year. Costs for equipment repair and replacement would be partially offset through a facility usage fee applied to ticket sales.

Facility Maintenance - Facility maintenance expenses are chiefly funded through the Los Angeles County Department of Parks and Recreation with support from the Arts Commission's service and supply budget. For the past three years, Parks and Recreation has expensed an average of $110,000 for services and supplies annually and the Arts Commission's budget allocates another $36,000 annually for services such as elevator and fountain maintenance, pest control and trash pickup. Leading up to reopening, a major ramp up will be needed to purchase equipment and supplies and secure services to prepare the campus for re-opening. Facility maintenance cost is difficult to project at this point as it is reliant on the design of the new facility, i.e. number and size of water features and planted areas, types of building materials used, number of users, etc. However, approximating that the square footage of the facility will triple (not including parking lot facilities), projections triple the facility maintenance budget.

Campus Security –The Ford currently uses contracted security services through the Los Angeles County Sheriff 's Department only for amphitheatre events with challenging audience

logistics. However, the expansion of the campus and number of visitors using the facility will likely necessitate the addition of 24/7 campus security to monitor employee and public safety, prevent theft and vandalism, and provide immediate response to emergencies. In preliminary conversations, a representative from the Los Angeles County Sheriff's Department forecast that two security officers in three shifts be stationed at the Ford, costing approximately $689,000 per year. This deployment may fluctuate depending on the cycle of seasonal activity but is used as a base figure.

Earned Revenue

Event Revenue - Revenue driven by partner events, rentals and ticket sales is projected to increase from $615,000 to nearly $1 million. This increase would be due to additional rental opportunities of the added performance structures and increased ticketed activity. As is the case today, a large portion of ticket sales will be returned to artist organizations through the Ford's revenue sharing partnership model.

Facility Usage Fee - As a way to offset the expense of annual maintenance and replacement of theatre equipment a proposed facility usage fee would apply to all ticket purchases for Ford events. This is common practice of performing arts facilities and ensures that there is a revenue stream available to keep equipment in working order. The proposed revenue assumes an average fee of $1 per ticket purchased.

Concessions Revenue – Ford Theatre concessions have been operated through vendor Crumble Catering, Inc. since 1994. The caterer provides food for purchase at all events at the Ford Theatres and also provides a majority of the catering services for receptions at the Ford. The Ford retains 15% to 20% of the gross revenue generated, approximately $25,000 in 2012-13.

Addition of a 150-seat restaurant, marketplace and new picnicking areas will allow major enhancements to be made to concessions offerings. Restaurant and concessions operations would be contracted to a restaurant facility on a long-term basis, similar to the model of operations in effect for the Los Angeles County Center for the Performing Arts (Music Center) and Patina Group. Patina Group has a 20-year contract to handle all food service related operations at the Music Center; the contract term is intended to help Patina amortize both the venture risk and the considerable costs of having built out the restaurant infrastructure. The Music Center receives percentages of all Patina Group revenues based on a multi-tiered sliding scale (ranging from 7% for restaurant sales to 14% collected from liquor sales and theatre concessions). Patina Group also pays 1% of gross receipts to the Music Center as a use fee.

Projections assume a similar operation, scaled to the size of the Ford, in which a contracted restaurateur would bear the expense of building out the restaurant and concessions facilities to suit its operations and branding, would operate the restaurant and all concessions activities and pay a use fee and sales percentage. Using the same revenue ratio used by the Music Center, $1.00 per ticketed patron, an annual revenue stream of approximately $90,000 is budgeted.

This projection is conservative and only based on concessions activities related to events. It doesn't project variables like restaurant and liquor volumes, percentages for catered events, casual concessions during the daytime on the Ford Plaza or lunch business. If successful as a

cultural and recreational destination, revenues from the concessions contract could be significantly higher than the estimate.

Parking Revenue - Parking lots at the Ford Theatres are currently operated and managed by the L.A. Philharmonic through its lease contract with Los Angeles County for programming and operating the Hollywood Bowl with all parking revenue being retained by the L.A. Philharmonic. It is essential that the operation be returned to the County, not only for the revenue that it will generate, but also to ensure that parking services are scheduled and priced in a way that ensures successful operation of the Ford Theatres complex.

After reviewing event related parking needs and anticipated non-event related use of the site by daytime hikers, restaurant-goers and picnickers, the parking services team of the Los Angeles County Internal Services Department (ISD) projects an annual revenue estimate of $256,000 if rates are averaged at $10 per car.

The addition of two parking structures as proposed in the facilities master plan will bring with it staffing and maintenance expenses. ISD's preliminary recommendation is to contract with, and pay a maintenance and operations fee to a County-approved parking operator. A revenue sharing model in which the parking vendor retains a percentage of parking revenues would reduce the annual maintenance costs. Based on the projected number of events and this contract arrangement, parking operations would cost approximately $107,000 each year. Expenses should be fully offset by revenues. While these estimates are based on expected audience capacities, a thorough parking study will need to be conducted to determine appropriate parking rates and further refine operating estimates.

Arts Commission Staff and Lease Savings -The expansion of the Ford and construction of office space will provide a valuable opportunity to realize ongoing savings in the annual budget for the Arts Commission if the entire organization is housed on the new campus. Currently, offices for the Arts Commission are leased in the City of Hope building in downtown Los Angeles. Office space for 30 Arts Commission employees and contractors costs nearly $300,000 each year (including parking, utilities and rent). Migrating Arts Commission employees to the new site would result in significant savings for the County, $3 million over 10 years, and would result in programmatic benefit to the division as a whole. Staff location on a single site would improve communication between divisions and create opportunities for additional program collaboration and sharing of skill sets.

The Role of the Ford Theatre Foundation

With implementation of the master plan, the Ford Theatre Foundation will continue to support programming activities, but will also work toward building a robust operating endowment that will provide annual and long-term program support for the Ford Theatres. The 2013 and 2014 Signature Series productions will increase visibility of the Ford Theatres and create opportunities for the Foundation to cultivate major donors.

Development Successes and Opportunities - As the fundraising entity for the Ford Theatres, the Foundation currently raises between $350,000 and $500,000 per year primarily from corporate, government, and foundation grants. According to the Cultural Data Project, a national project of the Pew Charitable Trust which has been aggregating staff, budget and program

information from nonprofit arts organizations since 2004, the Ford Theatre Foundation raises 52% more from corporate, foundation and government sources than other arts organizations with similar budgets. Grant revenue is projected to increase year after year as Foundation staff targets new giving sources.

Historically, the Ford has faced challenges in raising funds from individual donors as the makeup of its season is not conducive to attracting a consistent donor base: each event at the Ford is produced by a different partner which brings its own community audience. Often times these audiences are already invested in the work of the producing partner as it speaks to their own cultural affiliations. However, the Ford is currently implementing an incentive program to attract entry-level donors and development staff is strategizing ways to attract potential individual donors that support the Ford's mission. It is expected that these strategies will lead to a steady increase in the Foundation's contributions from individuals.

The Endowment, Major Donors, and Long-Term Annual Support - Currently, the Ford Theatre Foundation has an endowment of $250,000. Income from the endowment can offset operational expenses for the Foundation or be reinvested to increase endowment principal. During the five-year ramp up to fully expanded operations at the Ford, the Foundation would launch a major gift campaign to grow the endowment that has the potential to provide a significant annual revenue stream to support the Foundation's central operations and programs. While a development feasibility study would be necessary to determine a realistic campaign goal (the cost of which is estimated at between $20.000 and $30,000), current projections are based on a $5 million goal. If the Ford Theatre Foundation reinvests annual endowment interest and Signature Series event revenue and meets its $5 million goal by 2016, it would realize approximately $283,000 (or 5%) in interest income annually, which would be used to offset the Ford's general operating and staffing expenses, This annual contribution may be more if the Foundation's development feasibility study determines that a larger endowment campaign goal is realistic.

Benefits of the New Ford: Greater Opportunity for County Residents, Arts Groups and Producers

The new Ford will be greater than the sum of its considerable parts. The sheer volume of users and activity it will generate is the intangible element that will spark continued growth of audience and attract new collaborators and new public and private funding. The beautiful, amenity-rich campus will be a new kind of arts center that not only enriches the lives of County residents through cultural and recreational experiences but also strengthens regional arts organizations and producers, and forges mutually beneficial bonds with communities. The historic venue will become an energy center whose impact will radiate across the County.

PARTNER PROFILES

One of the best ways to understand and illustrate the role of Ford Theatres and how it has functioned in the local performing arts landscape is to let Ford Partners speak for themselves. The following pages include portraits of six Ford Partner organizations, based on March 2012 interviews with Partner senior staff. These organizations were selected to represent a diversity of cultural and artistic disciplines and to show longitudinal impact of the Partnership program as each has participated in the Ford Partnership Program between 3 and 7 seasons.

A number of common themes emerged through the interviews with Ford Partners. Without exception, the staff at the Ford received the highest possible marks for professionalism, collegiality and expertise. The resources and support offered through the Partnership program are “invaluable” and “not available anywhere else.” It was expressed many times that the main objective of everyone involved with the Ford programs — from the outset of the Partnership process — was the ultimate success of the Partners, not just the success of the night’s performance.

Even more importantly, many of the principals interviewed expressed this idea: the Ford Partnership “raises the bar” for their own group and for all organizations in the region. The extraordinary venue — its history, intimacy, physical setting and name recognition — is one of the exceptional gifts of the partnership program. The chance to work at the Ford legitimizes the Partner organizations and, especially if the Partners are working within an ethnic, traditional or folkloric idiom, presenting at the Ford legitimizes the art form in the eyes of the arts community and audiences. The Ford represents “unparalleled opportunity” to present Partners’ works at the highest possible level, with the mentoring of forward-thinking, supportive staff.

The profiles will highlight the following organizations that have benefitted from the technical assistance and support offered by the Ford Partnership Programs:

- A *folklórico* company has honed every aspect of its artistic and organizational skill set.
- A *hip-hop troupe* has been instilled with confidence and had their art form validated.
- A young *theater company* on the verge of going under has found a permanent facility and become an award-winning and highly regarded innovator.
- An eclectic *jazz festival* has grown its audience to fill venues even larger than the Amphitheatre.
- A *Brazilian dance company* has found a home in a beautiful natural setting which compliments their work, rooted in nature.
- A *cultural festival* producer has learned important marketing skills and feels part of a presenting family.

Grandeza Mexicana Folk Ballet Company

"The Ford is the most important venue for our company; there is nothing else out there like it."

— Erica Bawek, President

Mission: To perpetuate and showcase the splendor of Mexican folk dance, and to cultivate and promote public awareness and an appreciation of this rich and diverse cultural heritage.

Erica Bawek and Jose Vences (Artistic Director) founded Grandeza Mexicana in 2003, but have worked together for over 20 years. Ms. Bawek's title is President, an unpaid position, but she essentially functions as the Executive Director. The company's first performance as a Ford Partner was in 2006, and they have partnered every year since then except one, when they participated in the "Big!World!Fun!"series at the Ford.

Ms. Bawek reports that the Ford Partnership application process gets easier every year. The Ford staff is extremely responsive, via online messaging and phone calls, to assist with the application process. When asked if the partnership has an impact on new audience development , she reported that this is the most important reason to continue the relationship with the Ford.

Grandeza Mexicana's core audience is described as "100% Mexican *folklórico* fans," mostly lower income families and children. However, this year was a major step forward in diversifying their audience; she cited the opportunity to be on the same brochure with an Italian electronica band and felt strongly that the company was part of a larger family of shared audiences.

She mentioned the importance of the oversight that the Ford staff provides in reviewing the company's marketing plan with advice on how it could be expanded. The staff also fine-tuned the publicity plan and provided guidance in interacting with local media outlets. On the production side, Ms. Bawek praised the Ford production staff, who were helpful in suggesting low-cost solutions to production challenges, asking questions such as "how can we support you?" and "what do you want to say

artistically?" "They give me such good tools to use as a producer," she noted. "Other theatres do not ask for this level of marketing plan or artistic goals. Any other place would be a shot in the dark."

Overall, Ms. Bawek observed that the Ford Amphitheatre is "such an important part of the L.A. arts community, and a voice for regional artists."

Web site: www.grandezamexicana.org

The 2011 Grandeza Mexicana Folk Ballet production was featured on KCET as part of the "Live @ the Ford" program co-produced by KCET and the Los Angeles County Arts Commission. The episode can be viewed at: http://www.kcet.org/shows/live_at_the_ford/ruta-del-norte/

Culture Shock L.A.

"Being part of the Ford season has given us greater legitimacy as an arts organization, and helps break stereotypes about our art form."

— Allison Tanaka, Co-Director

Mission: To use urban dance forms to engage traditionally underserved populations in the arts, to present these forms with the same dedication and artistry given to classical dance styles, and promote the positive attributes of the hip-hop culture by teaching self-worth, dignity and respect through training in the visual and performing arts.

Culture Shock L.A. is the Los Angeles arm of Culture Shock Dance Troupes, a network of nonprofit dance companies organized in 1993 to bring urban dance forms into thprofessional dance arena. Culture Shock L.A. is a mainly volunteer organization, "very grassroots," according to Allison Tanaka. The company's season averages one show at the Ford and one to two other self-produced shows; for the last three years the Ford performance has been their primary focus.

Now in their fifth year as a Ford Partner, Ms. Tanaka reports that the experience has meant the difference between success and failure for the company. "We were so scared at the beginning. Really, our first year was terrible," she said. "The staff at the Ford was so patient, helpful and nurturing. They went over everything with us after that first awful show. Now it runs like clockwork."

Culture Shock L.A.'s core audience was initially friends and family and the hip-hop dance community, but Ms. Tanaka feels that the partnership has definitely expanded this core, reporting that "our attendance level at the Ford is the now the bar we set for company." In addition, the partnership has expanded the company's perspective. In the beginning, she says, "we had no knowledge or tools to market ourselves." Over subsequent seasons at the Ford, she notes, their production quality has risen dramatically through the program requirements, referrals (lighting designers, publicists, etc.), feedback on press releases and encouragement.

She spoke definitively about the "sustainability" her company has developed as a result of the partnership. In one example, she mentioned that the confidence they gained from the Ford experience has enabled them to pitch their show to other venues. Culture Shock L.A. presented at a recent California Presenters conference, resulting in an invitation to perform this April 2012 at the George Nakano Theatre (the black box space at the Torrance Cultural Arts Center). She also referred to sustainability when describing Culture Shock L.A.'s local J.A.M. Sessions and teaching workshops, which she says have been "priceless for the community."

The most valuable aspects about being at the Ford, she reports, are the learning experience, the increased marketing capacity, improved production values, heightened artistic values, and a more robust administrative capacity. "All this," she notes, "is because of the amazing Ford staff." In addition, the venue itself confers important legitimacy. "People say, 'If they're at the Ford, they must be good,' and they perceive us more as artists."

Web site: http://cultureshockla.org/

Circle X Theater Company

"The Ford has been our security blanket — their investment is in seeing us succeed."
— Tim Wright, Artistic Director

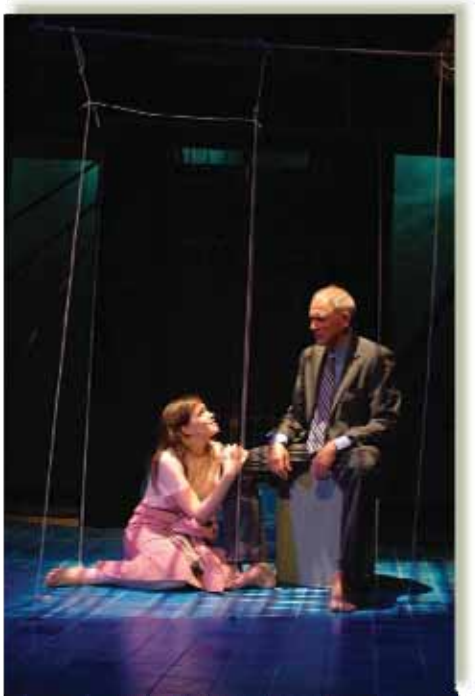
Mission: Circle X Theatre Co. is a not-for-profit ensemble of artists dedicated to highly provocative, boldly theatrical productions of new and rarely-seen plays and the development of new works for the stage. Circle X believes in imagination over budget, adrenaline over inertia, irreverence over convention and excellence over all.

Circle X was founded in 1996 by seven artists with a common desire to create an artistic home in Los Angeles, with an emphasis on innovation in play selection, design, performance, direction, administration. Tim Wright has been the company's Artistic Director since 2004. The play at the Ford in Winter 2012, NAKED BEFORE GOD, was the seventh Ford Partnership production; four productions were presented as part of the Ensemble Theatre Collective's [INSIDE] the Ford residency, three have been part of the Winter Partnership Series.

Though Circle X had eight years under their belt before coming to the Ford, they were "on the verge of collapse" at the time of the [INSIDE] residency. Mr. Wright reports that this opportunity initiated critical momentum for the company, which resulted in consistently improving organizational health, increased visibility and critical acclaim.

Because Circle X was nomadic during its early years, its core audience during that time was “the typically hard-core group of people in their twenties and thirties” who are interested in newer, more adventurous theater. However, the productions at the Ford have seen a “huge increase in attendance,” according to Mr. Wright, attracting older audiences and more professionals. The company is currently adding yet another core audience demographic since establishing a permanent home at the Atwater Village Theatre, with outreach to the local Armenian community.

According to Tim Wright, the Ford Partnership “revitalized the company.” He notes that the support offered by the program is invaluable, and that small, emerging theater companies usually do not have much in the way of resources, stating that “we needed a lot of guidance and hand-holding.” He cited especially the assistance with box office, front of house operations, press relations, marketing support, and production expertise. “They have our back,” he commented, “and want to keep the art onstage.”



Mr. Wright is certain that this revitalization at a crucial moment is what enabled the company to ultimately find a permanent space, and go on to garner an impressive array of awards, including 18 LA Weekly Awards and 43 nominations; 4 Ovation awards and 23 nominations; 10 LA Drama Critics Circle awards and 19 nominations; 15 Garland awards; the Ted Schmitt award from the LA Drama Critics Circle; and one GLAAD Outstanding LA Theatre Nomination. Among many individual productions singled out for praise, THE BROTHERS KARAMAZOV won a record-breaking seven Los Angeles Drama Critics' Circle awards for the 2006 season. In addition, the opportunity to network with other theater professionals through the Ford Partnership led in a very direct way to the Atwater Village Theatre opportunity.

Angel City Arts

> *"At the Ford, the lines of communication are always open. I still don't know how they do it — the relationships are so personal."*
>
> — Rocco Somazzi, Creative Director

Mission: Angel City Arts is dedicated to presenting, commissioning, recording, and teaching the performing arts in Los Angeles. ACA presents innovative music through the Angel City Jazz Festival, and regular concert events through the Angel City Composer Series, which provides composer support through commissions and recordings of new works. Educational programs include the Angel City Music Experience — workshops and master classes at all educational levels with an emphasis on presenting creative music in the public schools.

Rocco Somazzi founded Angel City Arts five years ago as a vehicle for presenting concerts and festivals with an eclectic programming roster focusing on music but including some multimedia work. Presenting as Angel City Jazz Festival, the Ford Amphitheatre has been the primary festival location for the past three years. During the first year of the festival, there were two performance days at the Ford; now the Amphitheatre is the festival's flagship event. This year Angel City will also perform at LACMA, REDCAT, the Broad Stage, and Royce Hall; the latter venue is especially noteworthy because it has a larger seating capacity than the Ford, which Angel City is able to fill.

Angel City Arts' core audience does not fall into specific demographic or geographic areas; instead, the core audience is made up of individuals with a special connection to music — composers, arrangers, instrumentalists, serious musicians, filmmakers, writers, artists with a

passion for music — from students to very famous musicians and from ages 15 to 80. The common ground is a drive to experience creative expression. Mr. Somazzi confirms that this audience has grown as a result of the Ford Partnership. "It took a lot of work, expanding every year, but the move to the Ford was the first step. The marketing structure made the difference."

"The Ford Partnership program is unique in that the staff is there to help you. They go through every aspect and tool," he comments. "They introduce each staff member and explain what he or she does, emphasizing that they are there to help, but that you are responsible."

Even though Rocco Somazzi had a great deal of production experience, the productions still improved with the Ford's support. "We didn't have to worry — they take care of everything on the production side."

When asked about the most important features of being a Ford partner, Mr. Somazzi said that in addition to the marketing and production assistance, it is the venue itself. "The sound, the intimacy, the recognition value. People like to go there. It's a magical venue."

Web site: http://www.angelcityarts.org

Viver Brasil

"The Ford was our school. What we learned at the Ford is that we have to be excellent."
— Linda Yudin, Founding Artistic Director

Mission: Viver Brasil is committed to increasing awareness of the rich history of Afro-Brazilian dance and music through performances and residencies in elementary and high schools through school assemblies, interactive dance and music workshops and professional development opportunities for classroom teachers. Viver Brasil's arts education programs are also available at the college and university level and include dance and music workshops, setting choreography on student ensembles, and lectures on Afro-Brazilian culture and history.

Viver Brasil was founded in 1997 by co-artistic directors Linda Yudin and Luiz Badaró, and is an award- winning dance company rooted in the traditional and contemporary forms and techniques of Salvador, Bahia, Brazil. The partnership at the Ford Amphitheatre began in 2003, when, Ms. Yudin reports, they were "shocked" to have a sold-out performance. It proved, she says, that the company could produce. Having completed eight consecutive seasons there, the Ford has "become our home."

Ms. Yudin describes the numerous ways in which the Ford Partnership has benefitted Viver Brasil. "The Ford has warmly and openly supported dance in L.A.," she notes. "Being at the Ford has helped us find ways to be better administratively, to brand our art form, and to hone our artistic vision."

Viver Brasil's core audience reflects the diverse palette of Los Angeles, and includes, according to Ms. Yudin, all ethnicities. The core audience also reflects the company's community dance classes and includes many college students and seniors. Viver Brasil has, she believes, developed new audiences as a result of being at the Ford, reporting that people now bring their friends to performances.

Everything about the Ford Partnership has been outstanding, she notes, especially the marketing support. "They think creatively about how to develop new audiences and how to tailor the marketing plans," she states. "We have used what we learned at the Ford at other performing venues."

On the production side, she particularly cites the value of working with the sound engineer "because we are so loud." However, she also noted an example of critical feedback on pushing artistic boundaries. "At one point we wanted to expand to multimedia, but weren't sure if we were could handle it. The Ford Production Manager said, 'It's OK not to do it if you're not ready.' It's so important to get it right and they do."

Ms. Yudin spoke about the ways in which the Ford partnership has allowed the company "time to create big work." Viver Brasil has mounted three touring shows in the last four years, and developed several full-length shows. In addition, they have broadened their vision to consider how to take the work developed for the Ford stage and translate it to a proscenium setting. That said, Ms. Yudin again noted that the company feels so deeply at home at the Ford. "Our work is about nature," she observes, "so the Amphitheatre's beautiful natural setting is just perfect."

Web site: www.viverbrasil.com

PAE Live!

"The atmosphere they create, you could never find that elsewhere. The Ford brings marketing resources to the table that a producer can only dream of. It takes so much pressure off."

— Ted Benito, Principal Partner

Mission: The mission of PAE LIVE! is to produce, promote and present the talents of Filipino-American and Asian/Pacific Islander-American artists in all entertainment genres — concerts, live events, television, movies and documentaries, publications, theater, and through online/Internet platforms.

PAE LIVE! was founded about 10 years ago when Ted Benito perceived the need for someone to showcase Filipino-American artists. The group has participated in the summer Partnership at the Ford since 2009, presenting the popular "AlohaFest!"; the 2011-12 season was their first as a winter partner.

Mr. Benito reports that the company's core audience depends on the type of show, but generally represents Asian and Pacific Island communities. Geographically, the core audience is very diverse but mostly in enclaves such as Anaheim, Carson, San Pedro, the San Fernando Valley, Glendale, Eagle Rock and Valencia. He feels strongly that the company is both expanding its existing audience base and also attracting audiences not typically interested in the genre. For example, AlohaFest! and TAIKOPROJECT, another Ford partner, were able to create cross-promotional opportunities. The Partnership with the Ford is, according to Mr. Benito, "a Godsend. And we complement each other. One performing group that I brought to the Ford was then used for the County's Holiday Celebration at the Dorothy Chandler Pavilion."

Mr. Benito adds that his company has learned much from the staff and fellow producers, noting

that “it’s like a collective.” He had high praise for the marketing staff’s strong social media component. “The staff is on the cutting edge, ahead of the mainstream. “I didn’t even know what a hashtag was when we started.”

Their winter partnership show, ”The Romance of Magno Rubio,” sold out 11 performances and was notable for alternating performances in English and Tagalog — the first time a play has been performed in both languages in this way. The play went on to win two L.A. Weekly awards for Best Direction and Best Choreography.

Commenting on the production team, Mr. Benito indicated that “the staff came in with the attitude of ‘Let’s work together, let’s build a show together. Tell us what you need and we’ll give you our two cents, and we’ll make it work.’ Everybody is phenomenal. It’s like a family — ‘welcome to the fold.’”

This results, he feels, in everyone performing at the level expected by the Ford; “it raises the bar. Each cog in the wheel of the entire Ford organization meshes so that everything runs so smoothly. Who wouldn’t want to work at the Ford?”

JOHN ANSON FORD AMPHITHEATRE
PROPOSED INTERNAL HIKING TRAIL

PROPOSED PROJECT DESCRIPTION:

The John Anson Ford Theater (JAFT) Trail Project is a proposed .75 mile hiking trail that lies between two (2) trail head areas on either side of the theater and reaches into existing natural areas in the Master Plan area. The proposed trail would utilize some user-established informal trails in excellent hiking terrain that offers unparalleled 360-degree views of the Los Angeles region and landmarks including downtown Los Angeles, Hollywood Hills and the reservoir.

Trail width shall be approximately 7'-10' per LACO-DPR "Natural Trail Classification"*. Trailheads shall be a maximum of 1000 sq. ft. each.

TRAIL/TRAILHEAD/SCENIC REST AREAS DEVELOPMENT COMPONENTS:

- Clearing, grading, leveling and compaction necessary to modify or create new trail or trailhead surface, scenic view rest area(s) or profile and/or pad;
- Construct retaining or "sutter" walls (where required);
- Install drainage control infrastructure and erosion control prevention measures;
- Install decomposed granite surfacing, edging and stabilizer (select areas);
- Install protective gates, fencing and/or railings (where required);
- Construct stairs and/or ramps (where necessary);
- Install trail identification, regulatory and interpretive signage;
- Construct entry monuments at trailheads;
- Install temporary irrigation;
- Install shade trees and landscape;
- Revegetation of native landscape where required;
- Install temporary erosion control measures;
- Install temporary fencing to protect revegetation areas or "spider" trails;
- Install security-solar lighting at trailheads;
- Construct shade shelters at trailheads and select rest areas;
- Install water drinking fountain(s);
- Install or construct benches;
- Install waste dispensers; and/or
- Install or construct all required or necessary infrastructure and utilities to support above.

***Project will be in conformance with Los Angeles County Trails Manual**

Operations Pro Forma

RAMP UP AND EXPANSION OF FORD THEATRE OPERATIONS

To effectively program and operate the expanded Ford Theatres facility, an expansion of staffing and budget resources will be necessary. This section will detail a five-year ramp up which will take the Ford from its current staffing and budget levels to what will be necessary to effectively operate the expanded facility and implement programming to benefit the constituents of Los Angeles County.

The Ford Theatres operates with resources from the County, the Ford Theatre Foundation, and the Department of Parks and Recreation. Each of these entities maintains its own staff and budget — but all programs and facility operations are overseen by the Arts Commission Executive Director and the Managing Director of the Ford. For the purposes of this analysis the Arts Commission and Parks and Recreation Department budgets have been consolidated to show total County costs. Because the Ford Theatre Foundation is a separate entity from the County and its financials must be maintained independently, its operating budget ramp-up is separate from the County budget.

Appendix G details income and expenditures for the next five years of operation of the Ford Theatres and illustrates projected financial impact through first stages of construction to the opening of the completed facility as envisioned by the Levin & Associates Master Plan document. This section summarizes major income and expense items and how and why they are expected to change over five years as the Ford Facility and Operations Master Plans are implemented.

Note: This pro forma attempts to project a preliminary operating budget for the expanded Ford Theatres complex based on expected future programming and facility needs. However, there are many unknown variables that could significantly impact these projections. Additional operating cost analyses, soft-cost estimates, construction timelines, and staff re-location plans will be needed to generate a more complete and accurate picture of the final costs to the County for the full expansion and operation of the proposed campus.

CONSTRUCTION AND PROGRAM SCHEDULE

The five-year ramp up commences in the current fiscal year 2012-13, during which the first phase of Master Plan construction will begin. During the winter months (October through April) the Ford will be closed for construction associated with improvements to the facility funded through the first $7.5 million appropriation as approved by the Board of Supervisors at the July 3, 2012 board meeting. Planned improvements include reconstruction of the Ford Theatre stage, repair and waterproofing the audience seating area, and improvements to the Ford's technical infrastructure. To accommodate these construction activities the Ford's Winter Partnership Program has been cancelled and income and expenditures associated with that program have been removed.

Year 1 (FY 2012-13) construction activities are expected to be completed in April 2013 in time to resume event operations from May through October. At the close of the 2013 summer season, the Ford will again close to accommodate more improvements in the winter months. Projects are yet to be determined, but may include reconstruction of the sound baffle, addition of picnic and reception space, conversion of the 87-seat [Inside] the Ford Theatre into a concessions marketplace, and/or reconfiguration of the interior of the theatre to expand dressing rooms, green room, production, and storage spaces. Construction again would end in April 2014 in time to resume event operations from May through October 2014.

Immediately following the end of the 2014 summer season, it is anticipated that the entire Ford campus would be closed while construction on the new parking facilities, office space, restaurant, 299-seat theatre and rehearsal hall is in process. This phase of construction is expected to last for approximately 18 months, during which the Ford will go through a major transition period in programming and staffing. Although the physical facility will be closed, the Ford will take programming “on-the-road.” Off-site programming is an essential part of the Ford’s overall strategy: it will keep the Ford brand active and provide important opportunities to engage and develop audiences and inform the public of the major expansion of the Ford Theatres. Additionally, targeted outreach in under-represented communities via off-site programming will continue the Ford’s work in building diversity in, and access to, the arts. This relationship building will position the Ford to identify and develop culturally diverse producers, arts organizations, and audiences for future seasons. Off-site programming will take the place of the Ford’s Summer Partnership Program in 2015. (Reference *Program Integration* below for programming details).

Construction will continue into Year 4 of the ramp-up. During FY 2015-16, the Ford will be preparing for the grand opening of the new campus scheduled for June 2016. During this year, while producing off-site programming, the Arts Commission will ramp up the staff and equipment necessary to program and open the expanded campus. (Please see sections below to read more detailed summaries of changes in staffing, income, and expenditures during the ramp-up period.) Year 5 reflects the first complete fiscal year of operations at the expanded Ford Theatres.

PROGRAM AND OPERATING EXPENSES: PROJECTIONS AND CONSIDERATIONS

This section will review projected operational expenses during the five-year ramp up to Ford campus expansion. Each operational expense line item in Exhibit A will be discussed below. (Note: Some significant expenses such as office furniture and facility fixtures are not included in this pro forma as they are expected to be budgeted as part of the construction soft costs. This pro forma focuses on ongoing operating expenses that will impact the annual budget for the Ford Theatres.)

Los Angeles County Staff (Lines 4, 5 and 12)

The proposed staffing plan gradually increases County positions during key periods to ensure not only that the expanded grounds and facilities have been completed and equipped for the grand opening in June 2016, but that the first season of programming is developed, marketed, and ready for sale to the public.

Currently the Ford employs a staff of approximately fifteen full-time employees (see Appendix I for current organizational chart); five employees are County positions through the Arts Commission, two are County positions through Parks and Recreation, and the remaining positions are a mix of Foundation-funded staff and contractors. Due to this patchwork of employee types, there are inconsistencies in salary and benefit schedules, and the sustainability of central operations is an issue the organization faces. Additionally, with the exception of occasional cost of living increases, the County's General Fund allocation for the Ford has not increased in over 10 years. In 2009, a number of allocated positions were eliminated from the Ford's budget requiring the Arts Commission to reallocate the Ford's internal program budget to maintain staff. Due to this reduction and a current General Fund allocation that, when adjusted for inflation is less than its FY 2000-01 allocation, the Ford is running an operational deficit; even without the physical or programmatic expansion, it is projected that the Ford's Special Fund (which operates as a holding account for earned revenue- line 55) will be depleted by the end of Year 2 and that the Ford will require an additional allocation from the County to ensure that community services remain intact.

The proposed staffing plan provides an opportunity to correct inconsistencies in employee classifications and create an organizational structure to stabilize and sustain annual operations at the expanded facility. A sheet detailing the staff ramp-up over the next five years is included as Appendix H and an organizational chart reflecting full staff expansion in Year 5 is included as Appendix J. Consistent with the Chief Executive Office's policy for budgeting, each position in the ramp up has been budgeted at the top salary step and employee benefits are calculated at 42% of the top step salary. These are draft employee classifications that would be subject to review by the CEO's classification division.

Year 1 (FY 2012-13) reflects the County positions that are currently in place at the Ford. In Year 2 (2013-14) three existing contracted positions would transition into County employee positions as the first step in moving existing staff into a consistent County employee structure (as contractor positions are transitioned into County employee positions, their corresponding allocation in the Full-time Contractor Staff line item- line 12- will reduce). Transition of the **Associate Program Manager** and **Assistant Ticketing Services Manager** contractor positions into County positions would reinstate two previously allocated County positions that were eliminated during budget curtailments in FY 2009-2010. These positions will also provide the core operational support that will sustain current operations while management prepares the Ford for the major facility and programmatic expansion. The addition of a **Productions Marketing Manager** as a new County position will sustain season marketing activities and allow the Ford to begin creating and implementing a comprehensive marketing campaign that will rebrand the Ford Theatre's campus and advertise its reopening as a cultural and recreational

destination projected to attract at least three times the current number of annual visitors. A **Grounds Maintenance Worker I** would also be added to clean and maintain the amphitheatre and grounds during and after the planned construction in the winter months, which will generate debris that will need to be cleaned before the 2014 season opening.

In Year 3 (FY 2014-15), nine County employee positions would be added, including key staff to support construction, including the following:

Finance Manager to oversee program budgets and track expenses related to Master Plan construction and general operations.

Facilities Operations Manager to become familiar with the infrastructure of the built campus and begin planning with necessary County departments and vendors (ISD, Sherriff, restaurateur, etc.) to ensure that parking, security, concessions, and other services are secured and integrated upon the facility's grand opening.

Staff Assistant to the Parks Superintendent to provide assistance in coordinating with the Parks and Recreation Department during construction and ensure that the existing facility and plantings are maintained and cleaned during the construction process.

Key program staff would also be added including a **Director of Programming** and **Outreach Manager** who would immediately begin the work of scouting, community outreach, and developing the inaugural season of Ford programming. Since the Ford's Partnership Program model is based on community building and technical assistance for emerging organizations, the process of season planning requires a longer timeline than does the traditional presenting model. It is essential to start these positions just before the start of the construction period to ensure adequate time is given to lay the groundwork for program development.

Two existing contracted marketing positions, the **E-Communications Coordinator** and **Marketing Assistant**, would transition into County positions during Year 3. These positions will be essential to support marketing efforts, not only for the off-site programming replacing the Partnership Program in 2015, but also to provide support as the Arts Commission begins to develop the marketing and branding plan for the new Ford campus and oversees publicity during the Master Plan construction. This work would need to start in Year 3 to allow adequate time to develop long-lasting materials, graphics, and copy to establish the Ford as a major cultural and recreational destination in Los Angeles County. Due to the closure of the Amphitheatre for 18 months, earned revenue in Years 3 and 4 would be dramatically reduced and would not be adequate to continue funding contracted positions from year to year. Therefore, it is proposed that these positions be funded for the long term through the County staffing allocation to the Arts Commission.

Finally, two development positions would be integrated into permanent County staff. A **Director of Development** and **Grants Development Associate** would manage core fundraising activities and campaigns that would focus on leveraging Master Plan construction to attract new donors and develop the Ford Theatre Foundation endowment. Please see *Contributed Income and the Ford Theatre Foundation Ramp-Up* on page 16, for further discussion of the role of the

Ford Theatre Foundation and the planned use of endowment interest income to offset annual staffing costs.

The last month of Year 4, June 2016 will mark the grand opening of the Ford's campus- therefore, starting in July of 2015, nearly all remaining County positions necessary for operations and programming would be added to the Ford staffing plan. Two of these positions- one Program Assistant and the Assistant Ticketing Services Manager- would be the final positions to transfer from contractor to County employee status, therefore eliminating the full-time contractor staff line item in Year 4 (Line 12). Additional positions include:

Finance Assistant to support the Budget Manager, track income and expenses, generate settlements for all events, and process payroll for hourly seasonal employees.

Two **Program Assistants** to support the administrative office in processing and coordinating program applications and event contracts, assist in facilitating commercial and community rentals, and support self-produced events.

Information Technology Associate to provide IT support to staff, set-up computers, maintain servers, research and advise on technology related projects and program initiatives, and oversee maintenance of all Web sites.

Associate Program Manager to support the Director of Programming, scout and outreach to local arts organizations and producers and support implementation of the 299-seat theatre programming.

Two **Marketing Associates** to support event marketing efforts for the expanded calendar, provide technical assistance to amphitheatre and 299-seat partners and manage media development related to all events.

Scheduling Manager to support the Facilities Operations Manager, manage the Ford calendar to avoid scheduling conflicts and liaise with the administrative unit to facilitate and schedule commercial and community rentals.

Assistant Event Services Manager to support the Event Services Manager and coordinate staffing, vendor services, and resources for the non-technical needs of each event. This position will split evening event coverage with the Event Services Manager and House Managers to ensure that management staff is present during all evening event activities.

Production Personnel (5) to manage sound, lighting, and technical services for all Ford events. Of these production staff, technical production personnel (including the Master Electrician and Sound Engineer) would be full-time staff who primarily would be assigned to run shows at the Ford Theatre. These positions are currently held by part-time hourly staff.

Parks and Recreation Staff (17) to maintain the grounds and built structures on the expanded campus. Staffing projections were developed by Parks and Recreation staff based on comparisons to staffing at the Hollywood Bowl. The Master Plan currently proposes the construction of four large buildings (some with green roofs), a planted plaza, water features, and

hiking trail, each of which will need to be adequately maintained and serviced. The expanded, year-round calendar of events and increased number of visitors will require regularly scheduled custodial and grounds maintenance work. Staff would be needed to be added gradually as sections of the campus are completed and to prepared for the grand opening. This plan does not include maintenance and staffing for the parking structures, which is discussed further on page 10.

Year 5 reflects the staffing budget for the first full year of operations at the expanded Ford. In this year, additional assistant staff positions would be hired to further support each unit as the facility hits full operational capacity, including a **Receptionist Office Assistant**, **Associate Program Manager**, **Assistant Ticketing Services Manager**, two **House Managers** to manage event staff, volunteers, and customer service for all event spaces, and three **Production Assistants** to provide sound and lighting services in all production spaces. Adequate Arts Commission and Parks staff to operate the expanded facility is projected to total 61 employees.

Seasonal Staff (Line 8 and 9)

Seasonal staff includes hourly production personnel, ushers, and box office associates that are hired on a part-time or seasonal basis for season ramp-ups and staff events, as well as event specific security engaged through an approved Los Angeles County Sherriff Department security vendor. Seasonal staff (not including security staff) is hired through a contracted payroll company which charges fees and taxes that are approximately 25% of staff wages. Security staff costs are charged directly to the Arts Commission by the Sherriff's Department. Currently, annual seasonal staff for Amphitheatre shows is budgeted at $318,000 with a corresponding taxes/fees cost of $79,500. A portion of these expenses are charged back to producers via tech/crew labor charges (line 43). Labor expenses remain level in Year 2 as the number of shows presented at the Ford is not expected to change. The reduced number of shows in Year 3 due to the start of construction will also reduce the expected labor costs in that year. In Year 4, seasonal staff includes not only the event staff for the inaugural month of operations, it also includes a significant number of production staff that will be needed to hang lights, load-in sound equipment, and test all technical systems to outfit and prepare the theatre spaces for performances. When the theatre is operating at full capacity, seasonal staff expenses are projected to increase to approximately $483,000 to meet production and event service needs for the expanded schedule and additional performance spaces.

Full-time Contractor Staff (Line 12)

Please see staffing discussion beginning on page 3. The expenses associated with full-time contractor staff will decrease year by year as these positions are transitioned into County positions.

Marketing (Line 13)

The Ford's marketing budget is currently used to promote the Ford's summer season as a whole, as well as the individual events of each partnership program producer. All costs related to the creation of marketing materials including design services, printing, postage and

distribution, are contained in this line item as well as the production of multi-media content, Web site improvements, advertising and publicity services. Years 1 and 2 reflect marketing expense budgets based on current numbers for promoting the Ford's summer season. In Year 3, even though the theatre will be closed for construction, the Ford's marketing expenses would be increased slightly in order to effectively market the expansion of the Ford's off-site programming, to manage publicity around the Master Plan construction, to generate public interest in the opening of the new campus, and to begin developing branding concepts for the expanded facility.

In Year 4, the Ford's marketing team would embark on a major publicity and marketing campaign that not only focuses on the Ford Amphitheatre's re-opening and 2016 summer season, but draws attention to the Ford Theatres as a new cultural and recreational destination. The marketing plan would publicize the grand opening of the restaurant and 299-seat theatre, including its projected calendar of 160 annual events. To accomplish this, the Ford's marketing budget would require a nearly four-fold increase from current levels which, in addition to increasing allowances for design, printed materials, postage, and publicity services needed for the expanded programming schedule, would allow the purchase of printed and media advertising. It would also enable the marketing staff to create branded evergreen materials required to market the new Ford amenities, raise the overall profile of the Ford and attract new users to the facility. The marketing budget is expected to stay level in Year 5 as the Ford completes its first season marketing campaign and begins planning for and executing marketing campaigns for future seasons.

Partner Revenue Share (Line 14 and 50)

Partner revenue share represents the ticket sales revenue that is returned back to partners at the time of settlement and is calculated as the gross ticket revenues received by the Ford's Box Office (not including consignment revenue which is held by the producing partner and does not route through the Ford Box Office) for events minus event production crew costs, partner license fee, consignment ticket sales, and other event charges. This is the backbone of the partnership model, the shared risk and reward partnership that the producer and the Arts Commission enter to present the amphitheatre season. The projection for the expanded Artist Revenue Share reflects a major increase from current operations, due to the increase in events and ticket sales as a result of the addition of the 299-seat theatre (see *Event Revenue* on page 12 for more information about projected event revenue). The Ford is also exploring the use of production technology that could be utilized to reduce crew costs to partners, ultimately enhancing their shows and making producing for emerging companies more affordable (i.e. moving lights and virtual lighting design that could allow producers to digitally focus lights, eliminating the need for an evening lighting hang with production personnel).

Ford Television Broadcasts (Line 15)

Each year, the Arts Commission utilizes funds allocated from the Los Angeles County Cable TV Franchise Fund to record, edit, and broadcast performances at the Ford. During years that the Ford is closed for construction, this allocation may be used to record and broadcast select off-site Ford programming. This expense is fully offset by revenues (line 37) and expected to

remain flat unless further augmented by the Cable TV Franchise Fund. With additional programming in the 299-seat theatre and technical renovations made to the amphitheatre, there may be additional opportunities to expand broadcasting activities in the future, an option that might be explored with the County Cable Channel division which oversees the Cable TV Franchise Fund budget.

Administration/Operations (Line 16) and Information Technology (Line 17)

Administrative expenses include general office supplies, office equipment leases, ticket stock, and miscellaneous operations supplies. This line item is projected to increase in direct relationship to increases in staffing. In Year 5, with staffing approximately tripled, this line item is projected to triple as well.

Information technology includes maintenance and hosting of the Ford's ticketing system and venue management system. Projections included in the pro forma are estimated based on current per user charges for hosting and maintenance. Current expenses are included in Year 1 and 2. In Year 3, while closed for construction, the Ford plans to transition into a new, more robust ticketing software system that will improve the user experience and allow for more complete integration of social marketing tools and development modules. The start-up costs of this system will depend on the software selected; however, preliminary research estimates that full implementation may cost up to $100,000. Use of the Ford's venue management system will continue in Year 3 to coordinate off-site productions and track finances and will incur costs of approximately $18,000 in support and maintenance fees. Years 4 and 5 reflect estimated ticketing and venue management system support and maintenance fees for the expanded users and ticketing and event needs at the Ford.

Production Supplies (Line 18) and Chargebacks (Line 19 and 45)

Production supplies include production expendables such as lamps, gels, tape, and common repairs for microphones, walkie-talkies, and backstage intercom systems. This line item is expected to remain flat in Year 1 and Year 2 as operations will remain largely the same. This amount will be reduced in Year 3 to account for the closing of the Ford for the 2015 summer season. In Year 4, the production supply budget will increase as the production division installs sounds and lighting systems in the new spaces, re-hangs amphitheatre lighting and speakers, and equips itself for the season opening. In Year 5, the production supply budget is projected to double from current levels to reflect the increased number of events and spaces in use.

Production chargebacks are Ford budget expenses that are charged back in full to producing partners, including expenses for piano tuning, film projection, and advertising in media outlets with which the Ford negotiates group discounts. While the budget is expected to fluctuate with the number of shows produced at the Ford, these expenses are fully reimbursed by producers (line 45) and therefore do not affect the Ford's budget overall.

Equipment Repair/Replacement Schedule (Line 20)

An often overlooked aspect of building and operating a performing arts space is regular maintenance and replacement of theatrical equipment. Outfitting the Amphitheatre, 299-seat, and 99-seat spaces with electrical, lighting, and audio systems, control boards, and projection equipment will require a considerable investment. The cost report prepared as part of the Levin & Associates Master Plan estimates approximately $3.8 million to purchase systems and equipment appropriate for all spaces. While this is a one-time cost, regular equipment replacement must be built into the annual budget cycle. Similar to computers and common office machinery (copy machines, printers, etc.), theatrical systems wear with use; they also become outdated as technology is developed and improved. This pro forma recommends inclusion of a replacement cycle similar to the County's method for funding computer replacement.

As illustrated in Appendix L, a five year amortization schedule would allocate funding for partial replacement of theatrical equipment each year. This schedule will first become active for the amphitheatre equipment as it will be the first performance space to receive equipment upgrades in FY 2012-13. Equipment is expected to be installed in Year 1, be used for two summer seasons, stored during major construction, and reinstalled in Year 4 for the re-opening. In Year 5, amphitheatre equipment replacement would commence and be budgeted for each subsequent year. The 299-seat theatre and 99-seat flex space would be outfitted in FY 2015-16 (Year 4); the equipment would be in use for the first two seasons and then enter the ongoing replacement schedule in Year 7, FY 2018-19. Costs for equipment repair and replacement would be partially off-set through a facility usage fee applied to ticket sales (line 49) and discussed on page 13.

Facility Maintenance (Line 21)

Facility maintenance expenses are chiefly funded through the Los Angeles County Department of Parks and Recreation with support from the Ford's service and supply budget. For the past three years, Parks and Recreation has expensed an average of $110,000 for services and supplies annually and the Arts Commission's budget allocates another $36,000 annually for services such as elevator and fountain maintenance, pest control and trash pickup. Years 1 and 2 have facility maintenance allocations at current levels. In Year 3, due to the closure of the facility immediately after the end of the 2014 summer season, this amount is projected to be reduced by half. In Year 4, while the facility would only be opened at the end of the year, a major ramp up will be needed to purchase equipment and supplies and secure services to prepare the campus for re-opening. Facility maintenance cost is difficult to project as it is reliant on the design of the new facility, i.e. number and size of water features and planted areas, types of building materials used, number of users, etc. However, approximating that the square footage of the facility will triple (not including parking lot facilities), the pro forma triples the facility maintenance budget in Years 4 and 5, and assumes that facilities maintenance expenses in Year 4 will go chiefly toward initial purchase of maintenance equipment to outfit the maintenance division and prepare for the opening, and Year 5 expenses will go toward facility maintenance while operating at full capacity.

Signature Series Productions (Line 22)

The Ford will embark on a new program in the 2013 summer season, a “Signature Series” of events featuring high profile touring artists performing with local artists of the highest artistic quality. Through its partnership programs, the Ford has built strong relationships with diverse communities of all backgrounds. However, Ford audiences are primarily drawn to events through the efforts of producing partner organizations or commercial promoters. A self-produced and high-profile series will boost awareness and recognition of the Ford as a first-class performance facility, provide a platform to spotlight the work of the Ford, and develop a base of support for the services it provides to diverse artist and audience communities. This series will also lay the groundwork for some of the programming the Arts Commission envisions for the expanded campus after completion of the Master Plan: pairing touring artists with Los Angeles County-based performers in ways that highlight the talent of local artists and provides them with opportunities to work with and learn from nationally and internationally recognized artists.

Signature Series Productions line item (22) includes all expenses associated with the Ford’s self-produced high profile concerts series. Funding to produce two events in 2013 and three events in 2014 has been allocated through the Third District office and is included in line 36.

Legal Counsel (Line 25)

Legal counsel refers to the use of the County’s retained entertainment counsel to review contracts and documents related to performances, events, and media broadcasting. The amount budgeted in Year 1 reflects current needs. In Year 2 and 3, this line item is increased as the Ford will likely need to engage the services of entertainment counsel to review agreements and assist and advise on negotiations with performing arts unions (primarily Equity) regarding the new 299-seat theatre programming. In Years 4 and 5, fewer expenses are projected as counsel chiefly will be used to review and advise on the creation of performance and broadcast-related contract templates. However, due to the increased number of events and more opportunities to attract television and movie location rentals, this budget is estimated to double from current levels.

Campus Security (Line 26)

The Ford Theatre currently only uses contracted security services through the Los Angeles County Sherriff Department for amphitheatre events with challenging audience logistics. These costs are included as part of the Seasonal Staff line item. However, the expansion of the campus and number of visitors using the facility will likely necessitate the addition of 24/7 campus security to monitor employee and public safety, prevent theft and vandalism, and provide immediate response to security emergencies.

In preliminary conversations, a representative from the Los Angeles County Sheriff’s Department suggested that at least two security officers be stationed at the Ford at all times. Three shifts of two officers would be required to achieve 24/7 coverage, at a cost of approximately $689,000 per year according to the Sheriff Department’s cost model. This deployment may fluctuate depending on the cycle of seasonal activity but is used as a base figure for this pro forma. In Year 4, this amount is prorated for 2 months of security services leading up to the Ford grand opening.

Parking Lot Operator (Lines 27)

The addition of two parking structures as proposed in the facilities Master Plan will bring with it staffing and maintenance expenses. Projected operating costs (and revenues, discussed in *Parking Revenue* on page 15) were generated in consultation with the Parking Division of the Los Angeles County Internal Services Department. The preliminary recommendation is to contract with and pay a maintenance and operations fee to a County approved parking operator. A revenue sharing model in which the parking vendor retains a percentage of parking revenues would help reduce the annual maintenance fee charged to the Ford. Based on the projected number of events and this contract arrangement, parking operations would cost approximately $107,000 each year. This amount is reflected in the Parking Lot Operator line item (line 28) in Year 5; in Year 4, this budget is prorated to three months of operations costs to account for two months of preparation to the Ford re-opening and one month of full operations. Of course, parking revenues will also be realized by the County for parking operations. ISD Parking Division also projects a revenue of approximately $256,000 (line 52) if parking fees are set at $10 per car. ISD Parking Division's preliminary pro forma is included as Appendix M; while these estimates are based on expected audience capacities, a thorough parking study will need to be conducted to determine appropriate parking rates and further refine operating estimates.

Contingency (Line 29)

This pro forma includes a contingency line item calculated at ten percent of total expenses each year. While expense and revenue projections have been carefully considered, there are many unknowns associated with a large operational expansion; a contingency line item will provide a safety net for the Ford should expenses exceed what has been estimated in this pro forma.

REVENUES: PROJECTIONS AND NEW OPPORTUNITIES

Earned revenue is an important and diversified component of the Ford's operational budget. However, it is and will remain a small percentage of the financial resources necessary to run the facility. The Ford's programming model takes a social service approach: rather than raising maximum revenues by catering to affluent communities, the Ford's programming is democratic and at its core, invests in the County's diverse artistic and audience communities by supporting the work of local arts organizations and producers and creating an accessible and welcoming space for all County residents. As a result, the Ford will not be self-sustaining from its earned revenues. This is not unusual, as all major cultural institutions are significantly dependent on contributed income for stable operations. In order to fulfill the promise of the vision and mission of the expanded Ford Theatres complex the County's ongoing contribution to Ford operations will be required as a matter of policy.

This pro forma assumes that approximately 85% of the available calendar is geared toward the Ford's mission-driven programming and 15% is toward rental activity. If mission-driven programming is reduced, it is possible that earned revenue could be increased, although this re-appropriation of program time would reduce the number of the arts organizations that are supported through the Partnership program.

Intrafund Transfers (Line 36 and 37)

Intrafund transfers related to the Signature Series Productions and allocations for Live @ the Ford television programming from the Cable TV Franchise Fund are included here and correspond to their related expenses in lines 15 and 22.

Event Revenue

Revenue earned through event operations is an important, though limited component of the Ford's annual budget. The Ford's partnership model and revenue sharing model, in which a small percentage of ticket revenues is retained by the Ford and the remaining is paid back to the partner producers, creates a steady, though small stream of income which somewhat offsets the costs of event staff and general operating and marketing expenses. Including other revenue sources such as amphitheatre rentals, labor charges for technical crew, stage equipment rental fees, event and reception space fees, box office charges, and concessions and ticket revenue, the Ford is expected to raise $640,000 in Fiscal Year 2012-13, comparable to previous years of operation. Of this amount, approximately $201,000 will be paid back to partners as their netted ticket sales. Current earned revenue is reflected in Year 1 (FY 2012-13) of the five year ramp-up and is not expected to change in Year 2 (FY 2013-14) as a similar number of events is anticipated.

In Year 3 (FY 2014-15), the amphitheatre would earn revenue for events taking place from July through October and would then close for 18 months, eliminating event revenue for the entire summer season of May through October of 2015. In Year 4 (FY 2015-16) only one month of event revenue would be realized in June when the expanded campus opens. Due to this limited earning potential and the simultaneous expansion of Ford staff and expenses related to the launch of the new campus, an increased County General Fund allocation would be necessary to meet the needs of the expanded Ford programming and operations.

Year 5 (FY 2016-17) represents the anticipated earned revenues of the fully expanded and operating Ford Theatres. Increases in the following areas are expected:

Rental Revenue (Line 40): As a percentage of the total budget, expected revenue through rentals is modest due to limited inventory: projected programming would utilize a majority of calendar dates for performances and rehearsals, leaving a limited selection of dates available for private rentals. The Ford expects to secure 15 to 20 amphitheatre rentals as it has in past years, representing approximately $70,000 in revenue. While the 299-seat theatre would be available for rent, the facility is expected to be heavily programmed and therefore have limited days available for outside productions. Fifteen rental days for this space are projected and budgeted at $22,500 ($1,500 per day). The 99-seat flex space would be utilized primarily by partner producers to rehearse and develop work for the Ford stages. Limited rentals could be accommodated as allowed by the calendar and are budgeted at approximately $20,000 (25 events at $500 per day and 150 rental hours at $50 per hour).

Amphitheatre Partner License Fees (Line 41): An increase in partner license fees is expected and is tied to expected increases in attendance as a result of enhanced audience amenities at the Ford and additional marketing resources. With a more robust marketing team to generate public interest in the facility expansion, attract a larger audience to the historic amphitheatre as a cultural and tourist destination, and provide more targeted technical assistance to partners to market their individual events, the Ford expects to increase overall attendance for its partnership shows and the resulting license fees. In the past two years, the Ford has grossed between $75,000 and $85,000 in Partnership License Fees. A projected increase to $90,000 is conservative and could be more based on projected success of the Ford Partner shows.

299-Seat Theatre Partner License Fees (Line 42): The 299-seat theatre will generate a new stream of revenue for the expanded campus. Gross ticket revenue for the 160 anticipated dance and theatre performances in this space is conservatively estimated at $526,240 (averaging 55% attendance and a $20 ticket price which accounts for student and group discounts), resulting in an annual revenue share of approximately $53,000 (if using a 12/88% average revenue split which is the current average for Amphitheatre Partnership Shows).

Tech/Crew Labor Charges (Line 43), Stage Equipment Rentals (Line 44), Production Chargebacks (Line 45): This revenue results from charges made to partnership and renting producers for crew costs and equipment rentals for amphitheatre events. This amount will increase and decrease based on the number of events and their specific technical needs and offsets seasonal production staff and labor and production chargeback expenses.

Event Service Charges (Line 46): Revenues received for event services, such as reception space fees, are expected to increase significantly with the added amenities available at the expanded facility. With the proposed improvements to the Ford's concessions services and availability of more picnic and reception spaces on the new plaza, in the existing artist entrance area, and inside the 99-seat flex space, it is expected that these spaces will be utilized regularly both by producing artists (for openings, donor events, VIP receptions, etc.) and by the public (for group picnics, corporate events, and meetings). While it is difficult to project the frequency of usage for these spaces, $30,000 is conservatively projected in the budget and is based on an estimate of approximately 30 annual reception space rentals at $500 per day (large VIP or donor events and receptions blocking off large areas of picnic space or using the 99-seat flex space) and 100 small group rentals (reserved areas for smaller pre-show dinners, meetings, etc.) at $150 per reservation.

Producer Box Office Fees and Patron Ticketing Fees (Lines 47 and 48): Increases in these categories are expected based on the increased numbers of patrons and events. Producer box office fees are ticket printing charges paid by partner and renting producers when tickets are taken out of the box office on consignment. This revenue stream currently yields approximately $6,000 each year and with the additional events projected at the Ford in the first full year of operations, is expected to double. Patron ticket fees are handling fees charged directly to patrons for partnership productions (ticketing for rental events is usually handled by the renting producer and is not routed through the Ford's box office) and average approximately $.30 per paid ticket. With the expanded facility and operations, paid tickets to partnership events are

projected to increase from 40,000 to 66,000 annually, translating to an increase in ticket service fees from $12,000 to $20,000.

Facility Usage Fee (Line 49): As a way to off-set the expense of annual maintenance and replacement of theatre equipment (See *Equipment Repair/Replacement Schedule* on page 8) a facility usage fee is proposed that would be charged to all ticket purchases for Ford events. This is common practice amongst performing arts facilities and ensures that there is a revenue stream available to keep equipment in working order. The proposed revenue assumes (similar to the concessions revenue estimate below) an average fee of $1 per ticket purchased.

Partner Revenue Share (Line 50): See *Partner Revenue Share* on page 7.

Concessions Revenue (Line 51)

Ford Theatre concessions have been operated through vendor Crumble Catering, Inc. since 1994. Crumble Catering, Inc. provides food for purchase at all events at the Ford Theatres and also provides a majority of the catering services for receptions at the Ford. The Ford retains 15% to 20% of the gross revenue generated by Crumble Catering, Inc. which will be approximately $25,000 in FY 2012-13. This amount is $8,000 to $10,000 higher than concessions revenue in past years: Ford Theatre management has recently strategized with Crumble to maximize revenues by streamlining the concessions menu, enhancing box dinner purchase options through the Ford Box Office, creating more accessible menu options for patrons with a lower-price point, and installing updated registers to handle credit card purchases at every station. Concessions revenue is directly tied to event activities and without expanding the number of events taking place at the Ford, concessions revenue will not likely change significantly until the campus expansion creates new revenue opportunities in Years 4 and 5.

Addition of a restaurant, marketplace, and new picnicking areas will allow major enhancements to be made to concessions offerings. Restaurant and concessions operations would likely be contracted to a restaurant facility on a long-term basis, similar to the model of operations in effect for the Los Angeles County Center for the Performing Arts (Music Center) and the Patina Group the terms of which, according to Music Center Executive Vice President and Chief Operating Officer Howard Sherman, are representative of the industry. The Music Center has a twenty year contract with the Patina Group, which handles all food service related operations at the Music Center. The long-term contract is intended to help Patina Group amortize both the venture risk and the considerable costs of having built out the restaurant infrastructure at the Music Center. The Music Center receives percentages of all Patina Group revenues based on a multi-tiered sliding scale (ranging from 7% for restaurant sales to 14% collected from liquor sales and theatre concessions). Patina Group also pays 1% of gross receipts to the Music Center as a use fee. The Music Center derives a significant revenue stream from this contract--$800,000 to $1,200,000 annually—which roughly translates to approximately $1.00 per ticketed patron each year.

This pro forma assumes a similar operation, scaled to the size of the Ford, in which a contracted restaurateur would bear the expense of building out the restaurant and concessions facilities to

suit its operations and branding, would operate the restaurant and all concessions activities, and pay a use fee and sales percentage to the County via the Ford Theatres. Using the same revenue ratio used by the Music Center of $1.00 per ticketed patron, an annual revenue stream of approximately $90,000 is budgeted. However, this projection is conservative and only based on concessions activities related to events. It doesn't project variables like restaurant and liquor volumes, or percentages for catered events — especially the casual concessions during the daytime on the Ford Plaza, or the lunch business at the Plaza restaurant. One goal of the expanded Ford is to create a County-wide destination, including the creation of a destination restaurant. The Ford location is geographically favorable to such a destination as it is located on one of the busiest thoroughfares in Los Angeles County, adjacent to Hollywood, the Hollywood Bowl and motion picture studios, and will include a public park and hiking trail. If successful, revenues from the concessions contract could be significantly higher than the pro forma estimate.

Parking Revenue (Line 52)

Revenue projections were developed in consultation with Parking Division of the Los Angeles County Internal Services Department. After reviewing event related parking needs and anticipated non-event related use of the site by daytime hikers, restaurant-goers, and picnickers, the parking services team projects a preliminary annual revenue estimate in Year 5 of $256,000 if rates are averaged at $10 per car. Projected revenue in Year 4 is prorated to account for the one month of parking revenue expected during the Ford's grand opening in the last period of the fiscal year. See *Parking Lot Operator* on page 10 for discussion of parking lot operation expenses.

It is important to note that the parking lots at the Ford Theatres are currently operated and managed by the L.A. Philharmonic through its lease contract with Los Angeles County for programming and operating the Hollywood Bowl with all parking revenue being retained by the L.A. Philharmonic. It is essential that the operation be returned to the County, not only for the revenue that it will generate, but also to ensure that parking services are scheduled and priced in a way that is most advantageous for the successful operation of the Ford Theatres complex. Increased attendance and the transformation of the site into a cultural and recreational campus attracting many different kinds of users (audiences, diners, hikers, tourists, and leisure-seekers) will require a detailed parking schema that must be tailored to accommodate the needs of the Ford and its many diverse visitors.

Other Revenue Sources (Lines 55 and 56)

The Ford Theatre Development Fund (line 55) is a deposit account which receives the Ford's earned revenue as it is realized. Expenses related to event operations are paid through this fund and, for seasons when ticket sales are particularly successful and the Ford earns more than it spends, the Development Fund also acts as a holding account that can be used as a safety net to maintain operations during periods of financial downturn. As discussed in *Los Angeles County Staff* on page 3, due to budget reductions that have affected the Ford's funding allocations, the Ford is running a structural operational deficit and is spending down its Development Fund at an unsustainable rate. Even without the physical or programmatic

expansion, it is projected that this fund will be depleted by the end of Year 2. This pro forma includes use of the Ford Theatre Development Fund to bridge the funding gap in the current fiscal year, but proposes that additional County funding becomes active in Year 2 to prevent full depletion of this safety net.

The Foundation Endowment Contribution (line 56) includes the interest income that is projected to come into the Ford's operating budget annually from the Ford Theatre Foundation's endowment starting in Year 5 as discussed in detail in *The Endowment, Major Donors, and Long-term Annual Support* on page 18.

Savings: Arts Commission Staff and Lease Savings (Line 61)

The expansion of the Ford and construction of office space will provide a valuable opportunity to realize ongoing savings in the annual budget for the Arts Commission if the entire organization is housed on the new campus. Currently, offices for the Arts Commission are leased in the City of Hope building in downtown Los Angeles. Office space for 30 Arts Commission employees and contractors costs nearly $300,000 each year (including parking, utilities, and rent). Migrating Arts Commission employees to the new site would result in significant savings for the County ($3 million over 10 years) and would result in programmatic benefit to the division as a whole. Staff location on a single site would improve communication between divisions and create opportunities for additional program collaboration and sharing of skill sets. Proximity will foster a fuller understanding of each division's work, initiatives, and operations and could contribute greatly to the development of the Arts Commission's programs.

ADJUSTED NET COUNTY COST (LINE 62)

The Adjusted Net County Cost (Net County Cost after the lease savings adjustment described above) is the total estimated cost to the County for the operational expansion of the Ford Theatres complex. Lines 65 through 69 detail the projected breakdown of the Adjusted NCC over the five-year ramp up. In Year 1, a substantial funding gap is made up with savings in the Ford Theatre Development Fund. However, in subsequent years, County General Fund allocations for the Ford are would increase to support fully expanded operations. The Parks & Recreation facility maintenance allocation (line 66) would remain at current levels in Years 1 and 2, decrease in Year 3 as the grounds are closed for major construction and then increase in Year 4 to fully offset projected expenses in line 21 (see *Facility Maintenance* on page 9). Staffing allocations in the Arts Commission and Parks & Recreation (lines 67 and 68) would increase as County positions are added each year. The Adjusted NCC also includes General Fund allocations for the Free Community Events Program that would be added beginning in Year 2 (line 69).

CONTRIBUTED INCOME AND THE FORD THEATRE FOUNDATION RAMP-UP

The Ford Theatre Foundation will continue to play a crucial role in supporting the operation and programming of the Ford Theatres. As a separate non-profit entity, the Foundation raises funds which support the Ford's Community Bridges diversity, educational, and outreach initiatives, the Big!World!Fun! summer family program and its own participatory J.A.M. Session series. With implementation of the Master Plan, the Ford Theatre Foundation will continue to support programming activities, but will also work toward building a robust operating endowment for the Ford Theatre Foundation that will provide annual and long-term program support for the Ford Theatres. The 2013 and 2014 Ford Signature Series productions will increase visibility of the Ford Theatres and create opportunities for the Foundation to cultivate major donors so that when construction is announced it will be strategically positioned to leverage public interest in the project and secure major gifts to support the stability and longevity of Ford operations. The Ford Theatre Foundation five-year budget is included in Appendix K and discussed in the sections below.

Ford Theatre Foundation Income- Development Successes and Opportunities

As the fundraising entity for the Ford Theatres, the Foundation currently raises between $350,000 and $500,000 per year from corporate, government, and foundation grants (line 2). The Foundation's major fundraising success to date has been its grant-writing efforts to corporations, foundations, and government agencies- the majority of financial support comes from these sources. According to the Cultural Data Project, a national project of the Pew Charitable Trust which has been aggregating staff, budget and program information from non-profit arts organizations since 2004, the Ford Theatre Foundation raises 52% more from corporate, foundation, and government sources than other arts organizations with similar budgets. The reduced grants revenue between Year 1 and Year 2 is due to the expiration of a one-time grant of $150,000 from Metabolic Studio which supported the expansion of the J.A.M. Sessions series to community sites around Los Angeles County. However, grant revenue is projected to increase year after year as Foundation staff begins to target new giving sources.

Historically, the Ford has faced challenges in raising funds from individual donors as the makeup of its season is not conducive to attracting a consistent donor base: each event at the Ford is produced by a different partner who brings their own community audience. Often times these audiences are already invested in the work of the producing partner as it speaks to their own cultural affiliations. However, the Ford is currently implementing an incentive program to attract entry-level donors and development staff is strategizing ways to attract potential individual donors that support the Ford's mission. It is expected that developing new donor programs will lead to a steady increase in the Foundation's Individual Donor income line (line 3), especially in the first two years of these initiatives.

Another source of revenue is generated through the Foundation's fiscal receivership activities (lines 4 and 5). The Foundation's 501(c)3 status allows it to receive funds on behalf of government and private organizations from supporters that can only distribute contributions to non-profit organizations. The Foundation charges an average fee of 5% to receive and manage these funds. Although the fiscal receivership funds pass through the organization (line 17), the percentage retained by the Foundation provides additional operational support. The Los

Angeles County Arts Commission Arts Education division is the largest organization for which the Ford Theatre Foundation receives funds and with the anticipated success of their fundraising efforts alone, the revenue generated through this source is expected to consistently rise over time.

The Foundation also earns revenue through ticket sales for its Big!World!Fun! family series (line 6) and income from the Ford store (line 7), a kiosk which sells Ford merchandise (the purchase cost of which is represented in line 19) and event merchandise for partner and rental artists of which the Ford takes 15% to 20%. Due to the consistent programming expected in Years 1, 2, and 3 these revenue sources are expected to stay level. In Year 4 (2014), these sources will be zeroed out while the Ford is closed and no events are produced in the amphitheatre. In Year 5, the Ford would re-launch and expand its Family Programming to take advantage of the additional stages and performance spaces available, leading to a projected tripling of its ticket income. The Ford store will also resume its activities and with the additional events and enhancements to merchandising, a doubling of income is anticipated.

Over the next five years, the Foundation would also receive significant revenue through its management of construction activities related to the Master Plan (line 8). Through a funding agreement approved by the Los Angeles County Board of Supervisors at their July 3, 2012 Board Meeting, the Foundation is currently acting as the fiscal agent for all contracting and construction activities associated with the major repairs and renovations that have been approved in the amphitheatre space in Year 1. The cost of this project is $7.5 million, of which the Foundation is receiving a 1% management fee to offset operational expenses. In addition to this fee, the Foundation is also managing contracts for the construction project manager and planning consultants for which is it receiving another $20,000 management fee. In Year 2, if another 1% fee for managing a $10 million repair and renovation project is approved, this would yield a fee of $100,000. With approval to move forward with the Master Plan construction, the Foundation would also expect to receive a 1% administrative fee for the remainder of the planned construction, which is currently estimated at an additional $72.5 million. This administration fee would be realized over three years and utilized to manage construction and off-set the costs of executing a major gifts and endowment campaign that would capitalize on the facility expansion.

The Endowment, Major Donors, and Long-Term Annual Support

Currently, the Ford Theatre Foundation has an endowment of $250,000 which provides annual interest income between 3% and 5%. This income can offset operational expenses for the Foundation or be reinvested to increase endowment principal (line 9). During the five-year ramp up to fully expanded operations at the Ford, the Foundation would be launching a major gift and endowment campaign which has the potential to provide a significant annual revenue stream to support the Foundation's central operations and program fundraising. While a development feasibility study would be necessary to determine a realistic campaign goal (the cost of which is estimated at between $20k and $30k), this pro forma estimates a $5 million goal. Without a full feasibility study and development plan, it is difficult to project when major contributions to the campaign would be realized; however this pro forma includes an estimated endowment growth

trajectory in Appendix K. If the Ford reinvests annual endowment interest and Signature Series event revenue and meets its $5 million goal by Year 5, it would expect to realize approximately $283,000 (or 5%) in interest income annually, which would be used to offset the Ford's general operating and staffing expenses, as reflected in line 56 of the County's five year ramp up budget, Appendix G. This annual contribution may be more if the Foundation's development feasibility study determines that a larger endowment campaign goal is realistic.

Ford Theatre Foundation Expenses- Operations, Programs, Development

Revenues earned by the Foundation will be used to support its program and operations activities both on the Ford campus and in communities around Los Angeles County. This work has played an important role in building the cultural diversity of the Ford's partnership programs and creating a performing arts space that welcomes all County residents. This section will review projected operational expenses during the five-year ramp up to Ford campus expansion.

Staffing (Line 14)

During the five year ramp up, Ford Theatre Foundation staffing structure would undergo changes to prepare for its fundraising and program expansion. Currently, as reflected in Year 1, Foundation staff includes a half-time Operations Manager who splits time between the Foundation and the County (which covers the other half of this salary), an Outreach Manager for the Community Bridges initiatives, a Director of Development who oversees all fundraising activities, and a part-time Executive Director and Managing Director who foster relationships with donors, provide organizational direction, and oversee day-to-day Foundation operations. All of these positions are currently supported through the Foundation's fundraising and earned income. In Year 3, as discussed in the County staff ramp-up plan, the Operations Manager, Outreach Manager, and Director of Development will transition to County positions. This transition will provide a bridge to keep core program and development operations intact while the Foundation focuses its efforts on a major endowment campaign, the interest of which would return to the County's budget to offset general operating expenses. Additional Foundation staff positions (County "N" positions funded through Foundation revenues) would also be added to support the endowment campaign, including an Individual Giving Development Associate and Development Assistant. This level of staffing will continue through Year 5 when the Foundation is expected to achieve its campaign goal at which time ongoing staffing needs will be re-assessed based on the Foundation's program operations and earned revenue.

Development/Campaign Expenses (Line 15)

Mirroring the ramp up of the Foundation's development campaign and staff over the next five years and utilizing the Master Plan administrative fee as a source of funds, the Development/Campaign Expenses line item is expected to increase significantly. Year 1 and 2 expenses are modest and may include development planning and major donor consultants, board hospitality, small donor events, and development of printed and digital collateral for donor outreach. In Year 3, 4, and 5 the Foundation will increase its donor outreach activities during the height of the endowment campaign to plan special outreach events, design, print and distribute

targeted donor outreach materials, and make preparations for grand opening receptions and donor recognition events.

Program Expense (Line 16)

Foundation program expenses are directly related to the grants raised to support Foundation programming. A Year 2 reduction in Program Expenses is associated with the expiration of Metabolic Studio one-time funds for the expansion of J.A.M. Sessions in community sites around Los Angeles County. In Year 2, the Foundation will return to its previous year's average program expenses. However, in Years 3, 4, and 5, program expenses are expected to increase as the Foundation expands its own JAM Sessions series (augmenting, not replacing, the County's off-site programming) and develops new programs for the expanded facility, such as additional family events for the 299-seat theatre and 99-seat flex space, and community programs for the new public plaza. Programming expenses will be supported directly through foundation, corporate, and government grants to the Ford Theatre Foundation.

Administration and Contingency (Lines 18 and 20)

Foundation administrative costs are expected to increase each year as additional staff are hired in the development ramp up and as the amount of money managed and invested by the Foundation increases. If fundraising expectations are not met, the contingency enables annual operations to continue as planned and may be reinvested back into Foundation accounts.

NOTES:

(1) Parking wil be at two proposed lots which provide a total of 500 unstacked or 700 stacked parking spaces.
(2) Assumes 60% attendance at amphitheatre, small theatre, & rehearsal hall
(3) Assumes 2.5 people per vehicle and 80% of vehicles use on-site parking
(4) Restaurant may opt to cover a portion of patrons parking via validation and be billed. Adjusted by 50% for performance nexus
(5) Recreational vistors would be allowed to park up to 2 hours free in rear lot only.
(6) Staff (est 80), production (20), and Artists will be able to use limited space key card area. Else pay parking rate.
(7) LA City tax rate is currently 10%
(8) Credit Cards fees via TTC Bank of America agreement. Current avg rate is 2.68% Assumes 30% of transactions usage
(9) Prop A Board Contract
(10) Varies based on Revenues. Established revenue streams to cover costs. Current rate is 21%. Insufficent revenue at $5 rate for revenue share
(11) Cost for Parking automation equipment assumed to be included in capital budget.

September 2014

TABLE OF CONTENTS

1.0. Introduction

1.1 Certification

The County of Los Angeles (County) Board of Supervisors hereby certifies and finds the Environmental Impact Report (EIR) for the Ford Theatres Project (Project), County of Los Angeles, California, State Clearinghouse Number 2014021013, has been completed in compliance with the California Environmental Quality Act (CEQA) and the CEQA Guidelines (California Code of Regulations, Title 14, Sections 15000, et seq.). The EIR for the Project consists of the following documents: June 2014 Draft EIR Volume 1 through Volume 4, including supporting Technical Appendices to the Draft EIR; and the August 2014 Final EIR, which includes an Executive Summary, Corrections and Additions to the Draft EIR, Responses to Comments on the Draft EIR, and the Mitigation Monitoring and Reporting Program (MMRP).

The County of Los Angeles Board of Supervisors has received, reviewed, and considered the information contained in the EIR, all hearings, and submissions of testimony from officials representing the County, as well as from other agencies, organizations, and private individuals with a particular vested interest in the Project. Having received, reviewed, and considered the foregoing information, and recommendations of the County staff, as well as any and all other information in the record, and herein, the County of Los Angeles Board of Supervisors hereby makes findings pursuant to and in accordance with Section 21081 of the Public Resources Code and CEQA Guidelines Sections 15090 and 15091 as presented herein.

1.2 Project Description

1.2.1 Project Location and Surrounding Uses

The Project Site comprises an approximately 32-acre County of Los Angeles regional park within the Hollywood Hills located approximately 6 miles northwest of downtown Los Angeles and approximately 12 miles east of the Pacific Ocean. Primary regional access is provided by US-101 (Hollywood Freeway), which runs north-south west of the Project Site. The major arterials providing regional and sub-regional access to the Project Site vicinity include Cahuenga Boulevard, Highland Avenue, and Franklin Avenue.

The area surrounding the Project Site includes a mix of residential uses and open space. Specifically, the Project Site is bounded by 4-story multi-family residential buildings and open space to the north, single- and multi-family residential uses to the east and south, and Cahuenga Boulevard to the west. The uses north, south, and east of the Project Site are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site. The Hollywood Bowl, also a County-owned historically significant cultural destination, is located southwest of the Project Site across Cahuenga Boulevard and the Hollywood Freeway.

1.2.2 Overview of Proposed Development

The Ford Theatres Project is proposed to enhance existing facilities and provide for new artistic programming opportunities that together would activate the Project Site and transform the existing Ford Theatres from a single-use performing arts facility open primarily on weekends to a multi-use cultural and recreational center open daily for a wide variety of users. The Project is comprised of the following primary components: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and plaza deck featuring a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, an event space, and a maintenance facility; and (5) a 0.75-mile hiking trail. A more detailed discussion of the proposed improvements is provided below.

(a) Amphitheatre Rehabilitation Improvements

Within the Amphitheatre, the Project would replace the existing approximately 860-square-foot projection booth and control room located to the rear and above the Amphitheatre seating with a new 800-square-foot projection booth and control room. Existing lighting positions along the back of the Amphitheatre would also be removed and replaced with an upgraded lighting platform that would be integrated within a new sound wall proposed along the rear of the Amphitheatre. The proposed sound wall could measure up to 48 feet in height. In addition, a retractable shade structure would provide cover for the Amphitheatre during day time performances.

(b) Ford Terrace

North of the Amphitheatre, the existing circular driveway and disabled parking adjacent to the secondary entrance would be modified to accommodate a dedicated artist performance entry and provide for a two-story office and concessions building and an

approximately 3,750-square-foot plaza, collectively referred to as the Ford Terrace. The two-story building would include approximately 2,500 square feet of office space in one level above an approximately 2,500-square-foot concessions area at the first level. To the west of the two-story building would be a raised plaza deck that would serve pre- and post performance concessions, private receptions, and intermission concessions. Beneath the plaza, the modified driveway would form a service level referred to as the Service Court providing a loading dock and stage loading area to serve events and general facility maintenance such as trash and recycling pickup, as well as fire department access. An approximately 1,570-square-foot workshop to support performances would also be provided within the Service Court adjacent to the loading dock. To provide for these improvements, the Project would require removal of the existing two-story approximately 320-square-foot concessions building located adjacent to the secondary entrance. Disabled parking currently located adjacent to the secondary entrance would be accommodated within the parking structures proposed as part of the Project.

In addition, the existing approximately 1,895-square-foot, 87-seat [Inside] the Ford located at the lower level of the Amphitheatre and the associated lighting, stage, and theatrical amenities would be repurposed as a self-serve food marketplace area and provide space for storage. New ADA-accessible restrooms would also be provided at the lower level.

(c) Ford Plaza

West of the Amphitheatre, generally within the existing south surface parking area, the Project proposes the Ford Plaza. The Ford Plaza would include a three-level parking structure, which would provide approximately 250 parking spaces. A plaza deck providing approximately 45,000 square feet of outdoor plaza areas would be created above the parking structure. As part of the Ford Plaza, the existing 365-square-foot box-office would be repurposed as a museum/gallery for the Ford Theatres and just west of the existing box office an approximately 560-square-foot box office would be constructed. In addition, a three-story building providing approximately 17,600 square feet of office uses and approximately 1,200 square feet of shops/visitor amenities would be located adjacent to the new box office. At the southern boundary of the Ford Plaza, an approximately 1,000-square-foot conference room would be built to support the adjacent office space. Adjacent to the conference room would be an outdoor area that could accommodate small informal performances, musical entertainment, and/or overflow/support monitors to view events occurring within the indoor venues. North of these uses within the Ford Plaza would be an approximately 3,900-square-foot, 150-seat restaurant that would include a 1,300-square-foot kitchen/bar and a 2,600-square-foot indoor seating area. An approximately 1,000-square-foot outdoor seating area would also be included. East of the restaurant, an indoor performance venue comprised of approximately 8,000 square feet and including 299 seats would be provided. This facility would feature acoustic treatments, a proscenium

stage and full theatrical lighting and rigging that would be able to accommodate multi-disciplinary performances. Backstage spaces within the new venue would include performer restrooms, dressing rooms, and a prep area for special events.

(d) Transit Center

A Transit Center consisting of a bus/van loading and unloading zone, a three-level parking structure referred to as the north parking structure, a rehearsal and event space referred to as the Flex Space, and a maintenance area would be constructed along the northwestern extent of the Project Site. Specifically, upon entering the Ford Theatres from the existing primary access at the intersection of Cahuenga Boulevard East and Pilgrimage Bridge, the Transit Center would provide a staging area for buses to load and unload. From this area, vehicles would also be directed south to the parking structure within the Ford Plaza or north to the three-level parking structure proposed within the Transit Center. The north parking structure would provide approximately 250 parking spaces. Approximately 8,300-square-foot Flex Space would be constructed at the lowest level of the parking structure. The Flex Space would provide approximately 99 retractable seats and would include full theatrical lighting, performer restrooms, dressing rooms, and a prep area for special events. A plaza area referred to as the Transit Plaza would also be located below the parking structure. At the upper deck of the parking structure, an approximately 6,300-square-foot maintenance area consisting of office, storage, garage, and yard areas would be provided. To provide for these improvements, the Project would require removal of the existing two-story approximately 10,500-square-foot former motel building currently used as office space for Ford Theatre Foundation, Los Angeles County Arts Commission, and Los Angeles Philharmonic staff.

(e) Hiking Trail

The Project would also include a 0.75-mile ridgeline trail with trail terminations at the north and south parking structures within the Transit Center and the Ford Plaza, respectively. The trail would be approximately four feet in width and would feature natural-type fencing as well as “sutter wall” style retaining walls, where required or necessary, and cut-in granite steps where areas of steep terrain are proposed. Hand-railing may also be provided at the steps. The trail alignment may utilize portions of existing user-established informal trails. The hours of operation for use of the trail would observe standard park hours of sunrise to sunset.

Overall, implementation of the Project would result in approximately 47,550 net new square feet of new facilities and approximately 48,750 net new square feet of outdoor plaza areas within the Project Site.

1.3 Discretionary Actions

Discretionary Project approvals from the County of Los Angeles Board of Supervisors will be necessary for the Ford Theatres Foundation to implement the Project.

1.4 Project Purpose and Objectives

Section 15124(b) of the California Environmental Quality Act (CEQA) Guidelines states that the project description shall contain "a statement of the objectives sought by the proposed project." Section 15124(b) of the CEQA Guidelines further states that "the statement of objectives should include the underlying purpose of the project." The underlying purpose of the Project is to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource. The Project's specific objectives are as follows:

Historic Rehabilitation of the Amphitheatre

- Preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County.

- Provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination.

Additional Artist and Patron Site Enhancements

- Support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences.

- Repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

- Enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress.

- Further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

- Create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures.

- Enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views of surrounding iconic landmarks from a formal trail within the park boundary.

- Mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre.

- Provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre.

- Provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community.

- Provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

1.5 CEQA Process

The Project, as defined above, was reviewed by the County of Los Angeles, serving as Lead Agency, in accordance with the requirements of CEQA. An Initial Study was prepared for the Project in accordance with CEQA Guidelines Sections 15060 and 15063

and, in compliance with CEQA Guidelines Section 15082, a Notice of Preparation (NOP) was prepared and distributed on February 7, 2014 to the State Clearinghouse, Office of Planning and Research, responsible agencies, adjacent cities and counties, other interested parties, and owners and occupants within a 1,000-foot radius of the Project Site. The NOP identified specific areas where the Project could have adverse environmental effects and determined that an EIR would need to be prepared to document these effects. The NOP was circulated for a 30-day review period starting on February 7, 2014, and ending on March 11, 2014. In addition, a public scoping meeting was conducted on February 18, 2014. The County reviewed and considered the written comments received in response to the NOP, and subsequently prepared a Draft EIR for the Project. Copies of the written comments submitted to the County in response to the NOP are included in Appendix A of the Draft EIR.

The County determined through the Initial Study that the Project would not have the potential to cause significant impacts related to agriculture and forest resources, hazards and hazardous materials, mineral resources, population and housing, some public services (including schools, parks, and libraries), recreation, and some utilities and service systems (including wastewater and solid waste).

The County determined through the Initial Study the potential for significant impacts in the following environmental issue areas would be evaluated in the Draft EIR:

- Aesthetics (including views, light, and glare)
- Air Quality
- Greenhouse Gas Emissions
- Biological Resources
- Cultural Resources (including historic resources, and archaeological and paleontological resources)
- Geology and Soils
- Hydrology and Surface Water Quality (including groundwater)
- Land Use and Planning
- Noise
- Public Services (including fire protection and police protection)
- Traffic, Access, and Parking

- Utilities and Service Systems (including water and energy)

The Draft EIR for the Project, which is incorporated herein by reference in full, was prepared pursuant to CEQA and agency guidelines. The Draft EIR evaluated in detail the potential environmental effects of the Project, identified feasible mitigation measures, and analyzed the effects of three alternatives to the Project, as described below. A Notice of Availability of the Draft EIR was prepared and distributed on June 23, 2014 to the State Clearinghouse, Office of Planning and Research, responsible agencies, individual and agency commenters on the NOP, scoping meeting attendees, adjacent cities and counties, other interested parties, and owners and occupants within a 1,000-foot radius of the Project Site. The Draft EIR was made available for review on the Los Angeles County Department of Parks and Recreation website. In addition, copies of the Draft EIR were made available for review at the following three libraries: Los Angeles Central Library; Frances Howard Goldwyn Hollywood Regional Branch Library; and Will & Ariel Durant Library, and the Los Angeles County Department of Parks and Recreation. In accordance with CEQA Guidelines Section 15105, the Draft EIR was circulated for a 45-day public review period beginning on June 23, 2014 and ending on August 8, 2014. The County Department of Parks and Recreation received a total of 28 written comment letters on the Draft EIR. Copies of the written comment letters received on the Draft EIR are included in Appendix FEIR-1 of the Final EIR.

The Final EIR for the Project, prepared September 2014, is hereby incorporated by reference in full. The Final EIR includes written responses to all comments received on the Draft EIR during the public review. The Final EIR was made available for review on the Los Angeles County Department of Parks and Recreation website and at the Los Angeles County Department of Parks and Recreation. Pursuant to CEQA Guidelines Section 15088(b), responses were sent to all public agencies that commented on the Draft EIR at least 10 days prior to the scheduled consideration of the certification of the Final EIR.

1.6 Recirculation of an EIR

CEQA Guidelines Section 15088.5 requires that the lead agency recirculate an EIR when significant new information is added to the EIR after public notice of its availability has previously been given but prior to its certification. "Significant new information" requiring recirculation includes, for example, a disclosure showing that:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented;

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance;

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it; or

(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR. A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record.

As discussed above, the County evaluated comments on environmental issues received from persons who reviewed the Draft EIR. In accordance with CEQA, the County prepared written responses describing the disposition of significant environmental issues raised. The Final EIR provides adequate, good faith and reasoned responses to the comments. The County reviewed the comments received and responses thereto and has determined that neither the comments received nor the responses to such comments add significant new information regarding environmental impacts to the Draft EIR. The County has studied all the comments on the Draft EIR and the Responses to Comments contained in the Final EIR. The County finds that none of the comments to the Draft EIR contain substantial evidence that the Draft EIR is inadequate, failed to disclose a significant environmental impact, or failed to identify a feasible mitigation or alternative that would substantially reduce or avoid the significant impacts of the Project. The Lead Agency has based its actions on full appraisal of all viewpoints, including all comments received up to the date of adoption of these findings, concerning the environmental impacts identified and analyzed in the EIR. Responses to Comments comply with CEQA and are directly responsive to the comments received on the Draft EIR.

Section II, Corrections and Additions, of the Final EIR documents changes to the Draft EIR. Having reviewed the information contained in the Draft EIR and the Final EIR and in the administrative record, as well as the requirements of CEQA and the CEQA Guidelines regarding recirculation of Draft EIRs, the County Board of Supervisors finds that there are no new significant impacts, substantial increase in the severity of a previously disclosed impact, significant information in the record of proceedings or other criteria under CEQA that would require recirculation of the EIR, or preparation of a supplemental or subsequent EIR. Specifically, the County finds that:

- The Final EIR provides substantial evidence that the changes to the Draft EIR do not result in new significant impacts and do not warrant circulation of the Draft EIR.

- Section III, Responses to Comments, of the Final EIR fully considered and responded to comments claiming that the Project would have significant impacts or more severe impacts not disclosed in the Draft EIR. The Responses to Comments include substantial evidence that none of these comments provided substantial evidence that the Project would result in changed circumstances, significant new information, considerably different mitigation measures, or new or more severe significant impacts than what was discussed in the Draft EIR.

2.0 CEQA Findings

Section 21081 of the California Public Resources Code and Section 15091 of the CEQA Guidelines require a public agency, prior to approving a project, to identify the significant impacts of the project and make one or more of three possible findings for each of the significant impacts.

- The first possible finding is that "changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR." (CEQA Guidelines Section 15091 (a)(1)).

- The second possible finding is that "such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency." (CEQA Guidelines Section 15091(a)(2)).

- The third possible finding is that "specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible, the mitigation measures or project alternatives identified in the final EIR." (CEQA Guidelines Section 15091(a)(3)).

The County of Los Angeles served as the Lead Agency under CEQA with respect to the Final EIR. In approving the Project and making these findings, the County of Los Angeles Board of Supervisors has considered all of the information in the administrative record of proceedings, including but not limited to: staff reports, all public comments received both written and verbal, and the Final EIR. On the basis of all of the foregoing information, the County of Los Angeles Board of Supervisors finds:

1. Pursuant to Public Resources Code Section 21081(a)(1), that changes or alterations have been required in, or incorporated into, the Project which mitigate or avoid the significant effects on the environment as identified in the EIR; and

2. Pursuant to State CEQA Guidelines Section 15091(a)(1), that changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effects as identified in the EIR; and

3. The EIR has been completed in compliance with CEQA and is adequate under CEQA for approval of the actions necessary to implement the Project and all other County permits, entitlements, and discretionary approvals for the Project; and

4. Project alternatives that substantially reduce or avoid the Project's significant environmental impacts are rejected as infeasible, for the reasons set forth in Section 6.0 below.

3.0 Environmental Impacts Found Not to Be Significant or Found to Be Less Than Significant After Mitigation in the Initial Study

An Initial Study was completed for the Project in February 2014. On the basis of the Initial Study, the County determined that no further analysis was required for the following impact areas for the reasons set forth below and in the Initial Study. On the basis of the Initial Study and the EIR, the County has determined that there is no substantial evidence that the Project would result in any potentially significant impacts in the environmental subject areas presented below. to the Initial Study for the Project is provided in Appendix A of the Draft EIR.

3.1 Aesthetics—Damage to Scenic Resources within a Scenic Highway

No designated scenic highways are located in the vicinity of the Project Site. As such, the Project would not damage any scenic resources within a designated State scenic highway. No impacts would occur and no mitigation measures are required. Therefore, no impacts to scenic resources within designated scenic highway would occur.

3.2 Agriculture and Forest Resources

The Project Site does not contain any agricultural or forest uses, nor are any agricultural or forest uses located in the vicinity of the Project Site. Thus, development of the Project would not convert any farmland or forest land to non-agricultural or non-forest use. No impacts would occur, and no mitigation measures would be required.

3.3 Air Quality—Odors

No objectionable odors are anticipated as a result of either construction or operation of the Project. The Project would be constructed using conventional building materials typical of construction projects of a similar type and size. Any odors that may be generated during construction would be localized and temporary in nature and would not be sufficient

to affect a substantial number of people or result in a nuisance as defined by SCAQMD Rule 402. In addition, trash receptacles would be contained, located, and maintained in a manner that promotes odor control and, no substantially adverse odor impacts are anticipated. Thus, impacts with regard to odors would be less than significant, and no mitigation measures would be required.

3.4 Biological Resources

3.4.1 Federally Protected Wetlands

The Project Site is located within a canyon setting where there are no known federally protected waters or wetlands, as defined by Section 404 of the Clean Water Act. Therefore, the Project would have no significant impact on federally protected wetlands.

3.4.2 Conflict with the provisions of an adopted Habitat Conservation Plan

According to the California Department of Fish and Wildlife California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the Project Site. Thus, the Project would not conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved habitat conservation plan. No impacts would occur, and no mitigation measures would be required.

3.5 Geology and Soils

3.5.1 Fault Rupture

The closest active fault to the Project Site is the Hollywood Fault, which is located approximately 0.4 mile south of the Project Site. As such, the Project Site is not within a currently established Alquist–Priolo Earthquake Fault Zone for surface fault rupture hazards. Therefore, potential impacts would be less than significant.

3.5.2 Capacity to Support On-Site Wastewater Treatment Systems

The Project Site is located within a community served by existing sewer infrastructure. Therefore, wastewater generated by the Project would be accommodated via connections to the existing sewage infrastructure located in the Project area. As such, the Project would not require the use of septic tanks or alternative wastewater disposal systems. Thus, the Project would not result in impacts related to the ability of soils to support septic tanks or alternative wastewater disposal systems.

3.6 Hazard and Hazardous Materials

3.6.1 Hazardous Material Use

During construction and operation of the Project, all potentially hazardous materials would be used, stored, and disposed of in accordance with manufacturers' recommendations and guidelines, as well as with applicable federal, State, and local regulations. In addition, any asbestos, lead-based paint, and polychlorinated biphenyls found on-site would be removed and disposed of in accordance with applicable regulatory requirements prior to renovation and demolition. Therefore, the Project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials; through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment; or from being located on a site which is included on a list of hazardous materials sites. In addition, the Project Site is not located within, and therefore would not, emit hazardous emissions or handle hazardous materials within 0.25-mile of a school.

3.6.2 Airport Safety Provisions

The Project Site is not located within 2 miles of an airport or within an airport planning area. Therefore, no impacts would occur, and no mitigation measures would be required.

3.6.3 Emergency Response Plan

Limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day, which could potentially require temporary lane closures and affect emergency access. In accordance with Mitigation Measure Hazards-1, below, a construction traffic management plan would be implemented during construction to ensure that adequate and safe access remains available to the Project Site. As part of this plan, provisions for temporary traffic control would be provided during all construction activities along public rights-of-way to improve traffic flow on public roadways (e.g., flaggers). In addition, designated truck queuing, equipment staging, and construction worker parking areas would be provided. Thus, with implementation of Mitigation Measure Hazards-1, potential impacts associated with emergency access during construction would be less than significant.

During operation, access and parking would continue to be implemented and monitored to ensure that emergency access is available within the Project Site and vicinity.

Mitigation Measures

Mitigation Measure Hazards-1: Prior to the start of construction, the Applicant shall prepare and implement a construction management plan to the satisfaction of the Los Angeles County Department of Public Works and in consultation with the City of Los Angeles Department of Transportation. Features of the construction management plan may include, but shall not be limited to, the following:

- Maintaining emergency access to and within the vicinity of the Project Site;
- Limiting potential lane closures to off-peak travel periods, to the extent feasible;
- Scheduling receipt of construction materials during non-peak travel periods, to the extent possible;
- Prohibiting parking by construction workers on adjacent streets and directing construction workers to park on-site or other designated parking areas; and
- Using flag persons to control traffic movement during the ingress and egress of trucks and heavy equipment from the Project Site and/or temporary lane closures.

Finding

The County adopts the first possible finding, which states that "changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR [Initial Study]." (Guidelines Section 15091 (a)(1)).

3.7 Hydrology and Water Quality—100-Year Flood Hazard Area

The Project Site is not located within a 100-year flood plain, as mapped by the Federal Emergency Management Agency (FEMA). Specifically, the Project Site is located in FEMA's Zone X, which is defined as areas of 0.2 percent annual chance flood; areas of one percent annual chance flood with average depths of less than one foot or with drainage areas less than 1 square mile; and protected by levees from one percent annual chance flood. As such, the Project would not place housing within a 100-year flood plain. Therefore, no impacts would occur, and no mitigation measures would be required.

3.8 Land Use and Planning

3.8.1 Physically Divide an Established Community

The Project Site is comprised of a County regional park that includes the existing Ford Theatres. The majority of the uses surrounding the Project Site are separated from the developed areas of the Project Site by open space areas and the steep topography formed by the canyon setting of the Project Site. In addition, all proposed development would occur within the boundaries of the Project Site as it currently exists and would not physically alter surrounding parcels or properties. Therefore, the Project would not physically divide an established community.

3.8.2 Habitat and Conservation Plans

According to the California Department of Fish and Wildlife California Regional Conservation Plans Map, no Habitat Conservation Plans have been developed for any areas within the Project Site. Thus, the Project would not conflict with the provisions of an adopted habitat conservation plan or natural community conservation plan.

3.9 Mineral Resources

The Project Site is a regional park that includes the existing Ford Theatres. The Project Site is not a designated mineral resource area. In addition, no mineral extraction operations currently occur on the Project Site. Furthermore, many of the areas to be developed are already developed with surface parking areas and ornamental landscaping. As such, the Project would not result in the loss of availability of a mineral resource that would be of value to the region or the state.

3.10 Noise—Airport Noise

The Project Site is not within 2 miles of an airport, in an airport land use plan area, or in the vicinity of a private airstrip. Therefore, no impacts would occur with regard to airport noise.

3.11 Population and Housing

No housing currently exists on the Project Site. Therefore, the Project would not result in the displacement of existing housing or people. In addition, as the Project would not result in the construction of any residential units, the Project would not directly contribute to population growth.

While construction of the Project would create temporary construction-related jobs, given that the work requirements of most construction projects are highly specialized so that construction workers remain at a job site only for the time in which their specific skills are needed, Project-related construction workers would not be anticipated to relocate their household's place of residence as a consequence of working on the Project. Therefore, no new permanent residents would be generated during construction of the Project.

With regard to operation of the Project, the Project itself would generate approximately 85 net new employees within the Project Site. It is possible that some of these jobs would be filled by persons moving into the surrounding area, thereby generating a demand for housing. However, it is anticipated that much of this demand would be filled by then-existing vacancies in the housing market. Therefore, the potential indirect population growth associated with Project employees who may relocate their place of residence is not anticipated to be substantial. As such, the Project would not result in a notable increase in demand for new housing, and any new demand, should it occur, would be minor in the context of forecasted growth for the City of Los Angeles or the Hollywood Community. Furthermore, as the Project would be located in a generally developed area with an established network of roads and other urban infrastructure, it would not require the extension of such infrastructure in a manner that would indirectly induce substantial population growth. Therefore, impacts to population and housing would be less than significant, and no mitigation measures would be required.

3.12 Public Services

3.12.1 Schools

The Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in a direct increase in the number of students within the service area of the Los Angeles Unified School District (LAUSD). In addition, any potential impact on public school facilities resulting from the potential for the approximately 85 new employees generated by the Project to relocate to the Project area and generate a need for additional public school facilities would represent a small percentage of LAUSD's total K–12 student enrollment. As such, the Project would not result in the need for new or altered school facilities. Therefore, impacts to schools would be less than significant, and no mitigation measures would be required.

3.12.2 Parks

The Project Site comprises an approximately 32-acre County of Los Angeles regional park. The proposed improvements under the Project would enhance existing facilities and provide for new artistic programming opportunities that together would

transform the existing Ford Theatres from a single-use performing arts facility to a multi-use cultural and recreational center. In addition, the Project would include an approximately 0.75-mile hiking trail located between two trailheads along the north and south ends of the Project Site. The proposed improvements would increase the recreational facilities available on-site. Therefore, the Project would result in a beneficial impact on parks and recreational facilities.

Furthermore, the Project does not propose the development of residential uses. Therefore, implementation of the Project would not result in on-site residents who would utilize nearby parks and/or recreational facilities. While the Project itself would generate approximately 85 new employees within the Project Site, it is anticipated that any recreational use by these employees would occur on-site. Therefore, no impacts with regards to parks would occur and no mitigation measures would be required.

3.12.3 Other Governmental Facilities

As the Project does not include residential development, which typically generates demand for library services, the Project is not anticipated to cause an increase in the community population that would exceed the service capacity of the Frances Howard Goldwyn–Hollywood Regional Branch Library. In addition, as Project employees would be more likely to use library facilities near their homes during non-work hours, such Project employees would generate minimal demand for library services. As such, impacts with respect to library services would be less than significant. In addition, during construction and operation of the Project, roads would continue to be utilized to access the Project Site.

3.13 Recreation

The Project would result in a beneficial impact on recreational facilities by providing improvements to an existing County regional park. In addition, it is anticipated that any recreational use by Project employees would occur on-site. Thus, the Project would not increase the use of existing off-site neighborhood and regional parks or other recreational facilities such that a substantial physical deterioration of the facility would occur or be accelerated.

3.14 Transportation/Traffic

3.14.1 Air Traffic Patterns

The Project Site is not located within the vicinity of a public or private airport or planning boundary of any airport land use plan. With implementation of the Project, building heights would range from approximately 15 feet to 67.5 feet in height, as

measured from adjacent grade, with elevations ranging from 515 feet to 610 feet above sea level. As such, the structures proposed by the Project would not increase or change air traffic patterns or increase levels of risk with respect to air traffic. Therefore, no impacts would occur, and no mitigation measures would be required.

3.14.2 Hazardous Design Features

The roadways adjacent to the Project Site are part of the urban roadway network and contain no sharp curves or dangerous intersections. In addition, no sharp curves or dangerous intersections would be created by the Project. Furthermore, access to the Project Site would be designed and constructed in accordance with regulatory requirements. Therefore, impacts would be less than significant and no mitigation measures would be required.

3.14.3 Emergency Access

Limited off-site construction activities may occur in adjacent street rights-of-way during certain periods of the day, which could potentially require temporary lane closures and affect emergency access. In accordance with Mitigation Measure Hazards-1 set forth in Section 2.6.3 Emergency Response Plan, above, a construction traffic management plan would be implemented during construction to ensure that adequate and safe access remains available to the Project Site. As part of this plan, provisions for temporary traffic control would be provided during all construction activities along public rights-of-way to improve traffic flow on public roadways (e.g., flaggers). In addition, designated truck queuing, equipment staging, and construction worker parking areas would be provided. Thus, with implementation of Mitigation Measure Hazards-1, potential impacts associated with emergency access during construction would be less than significant.

During operation, access and parking would continue to be implemented and monitored to ensure that emergency access is available within the Project Site and vicinity.

Based on the above, with implementation of Mitigation Measure Hazards-1, the Project would not result in inadequate emergency access.

Finding

The County adopts the first possible finding, which states that “changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR [Initial Study].” (Guidelines Section 15091 (a)(1)).

3.15 Utilities and Service Systems

3.15.1 Wastewater Generation

The wastewater generated by the Project would be typical of office and restaurant uses and performance/event venues. No industrial discharge into the wastewater system would occur. Wastewater generated during operation of the Project would be collected and discharged into existing sewer mains and conveyed to the Hyperion Treatment Plant, which has an available treatment capacity of approximately 88 mgd. As the Hyperion Treatment Plant has sufficient capacity and is in compliance with the State's wastewater treatment requirements, the Project would not exceed the wastewater treatment requirements of the Regional Water Quality Control Board. The Project-generated wastewater would be accommodated by the existing capacity of the Hyperion Treatment Plant, and a less than significant impact with regard to wastewater treatment would occur.

Based on the Sewer Capacity Availability Request processed by the City of Los Angeles Department of Public Works, Bureau of Sanitation and included as Appendix IS-2 of the Initial Study, the Project-generated wastewater would be accommodated by the existing capacity of the Hyperion Treatment Plant, and a less than significant impact would occur. Thus, the Project's additional wastewater flows would not substantially or incrementally exceed the future scheduled capacity of any treatment plant.

3.15.2 Wastewater Infrastructure

Sewer service for the Project would be provided utilizing new or existing on-site sewer connections to the existing 8-inch/10-inch sewer main under Cahuenga Boulevard East. Project-related sanitary sewer connections and on-site infrastructure would be designed and constructed in accordance with applicable City of Los Angeles Bureau of Sanitation and California Plumbing Code standards. Based on the current approximate flow levels and design capacities in the sewer system and the Project's estimated wastewater flow, the City of Los Angeles Department of Public Works, Bureau of Sanitation determined that the existing sanitary sewer line on Cahuenga Boulevard East would have an adequate capacity to accommodate the additional infrastructure demand created by the Project. No upgrades to existing sewer mains would be required. Therefore, the existing wastewater infrastructure would have adequate capacity to accommodate the Project's net increase in wastewater and impacts with respect to wastewater infrastructure would be less than significant.

3.15.3 Solid Waste

Construction of the Project would involve demolition, site grading/preparation, and building construction activities. These activities would generate construction and demolition wastes (e.g., wood, concrete, asphalt, cardboard, brick, glass, plastic, and metal) that would be recycled or collected by private waste haulers contracted by the Applicant and taken for disposal at the County's inert landfills. It is anticipated that construction of the Project would generate a total of approximately 156,700 tons of construction-related waste. The amount of construction and debris waste generated by construction of the Project would represent approximately 0.2 percent of the existing remaining disposal capacity of 64,125,859 tons for the unclassified landfill in Los Angeles County that has solid waste facility permits. Thus, the total amount of construction and demolition waste generated by the Project would represent a fraction of the remaining capacity at the unclassified landfill in Los Angeles County.

Based on solid waste generation factors provided by CalRecycle and its June 2006 Targeted Statewide Waste Characterization Study, operation of the Project would generate approximately 156.26 tons per year (0.43 tpd) of solid waste, resulting in a net increase of approximately 74.5 tons per year (100.20 tpd) of solid waste when compared with existing conditions. The estimated solid waste increase generated by the Project would represent approximately 0.00007 percent of the estimated annual remaining disposal capacity and 0.001 percent of the remaining daily disposal capacity of Class III Landfills open to the Project. The waste generation factors utilized do not account for recycling or other waste diversion measures, and, as such, this estimated amount of solid waste calculated to be generated by the Project is conservative.

Based on the above, the landfills that serve the Project Site would have adequate capacity to accept the solid waste that would be generated by construction and operation of the Project. Impacts would be less than significant, and no mitigation measures would be required.

Further, the Project would be consistent with the applicable regulations associated with solid waste and would promote compliance with AB 939 by providing clearly marked, source-sorted receptacles to facilitate recycling. The Applicant would also enhance recycling on-site through a recycling program that would focus on items such as paper, cardboard, glass, aluminum, plastic, and cooking oils. Since the Project would comply with federal, State, and local statutes and regulations related to solid waste, no significant impacts would occur and no mitigation measures would be required.

3.16 Cumulative Effects

3.16.1 Agriculture and Forest Resources

The Project Site does not contain any agricultural or forest uses, nor are any agricultural or forest uses located in the vicinity of the Project Site. Thus, development of the Project would not convert any farmland or forest land to non-agricultural or non-forest use. As such, the Project would have no impact to agriculture or forest resources and, therefore, could not combine with other projects to result in cumulative impacts to agriculture and forest resources.

3.16.2 Hazards and Hazardous Materials

The Project would not result in potential impacts associated with hazards and hazardous materials. As none of the related projects are immediately adjacent to the Project Site, cumulative impacts associated with hazards and hazardous materials would not occur.

3.16.3 Mineral Resources

The Project would not result in the loss of availability of a mineral resource that would be of value to the region or the state. Therefore, the Project would have no impact to mineral resources and, as such, could not combine with other projects to result in cumulative impacts to mineral resources.

3.16.4 Population and Housing

As the Project would not result in the construction of any residential units, the Project would not directly contribute to population growth. Therefore, the Project's incremental contribution to potential cumulative impacts to population and housing would not be cumulatively considerable and cumulative impacts associated with population and housing would not occur.

3.16.5 Public Services (Schools, Parks, and Library Services)

The Project does not propose the development of residential uses and, thus, would not directly contribute to population growth within the Project Site area or an associated direct demand for schools, parks, or library services. Therefore, the Project's incremental contribution to potential cumulative impacts to schools, parks, and libraries would not be cumulatively considerable and cumulative impacts associated with schools, parks, and libraries would not occur.

3.16.6 Recreation

The Project would result in a beneficial impact on recreational facilities by providing improvements to an existing County regional park. Further, the Project does not propose the development of residential uses and, thus, would not directly contribute to population growth within the Project Site area or an associated direct demand for parks services. Therefore, the Project's incremental contribution to potential cumulative impacts to recreation would not be cumulatively considerable and cumulative impacts would not occur.

3.16.7 Utilities and Services

(a) Wastewater

The Project's increase in average daily wastewater generation plus the future Hyperion Service Area flows of approximately 492.3 mgd would result in a total cumulative wastewater flow of approximately 494.7 mgd. Based on the existing and future capacity of the Hyperion Service Area of approximately 550 mgd, the Hyperion Service Area is expected to have adequate capacity to accommodate the cumulative wastewater flows of approximately 494.7 mgd. Therefore, cumulative impacts on the wastewater treatment systems would be less than significant. Further, as with the Project, new development projects occurring in the Project vicinity would be required to coordinate with the City of Los Angeles Bureau of Sanitation via a sewer capacity availability request to determine adequate sewer capacity. Therefore, cumulative impacts on the City's wastewater infrastructure would be less than significant.

(b) Solid Waste

The demand for solid waste facilities would represent a small fraction of the landfill capacity available to the County of Los Angeles. In addition, as set forth in the 2012 Annual Report, the County of Los Angeles projects that adequate landfill capacity will be available to serve the County, including projected growth in the County through 2027. Thus, cumulative solid waste impacts would be less than significant.

4.0 Project Design Features

Following is a list of the project design features incorporated into the Project's impact analyses.

4.1 Aesthetics, Views, Light, and Glare

Project Design Feature A-1: During construction, lighting shall be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary.

Project Design Feature A-2: Project lighting shall incorporate shielding and aiming to prevent glare, light spill, and the upward emition of light and shall not exceed 2 foot-candles outside of the Project Site boundary.

Project Design Feature A-3: Exterior windows, glass, and metal used on building surfaces shall be non-reflective or treated with a standard low-reflective or non-reflective glazing.

4.2 Air Quality

No specific project design features are proposed with regard to air quality.

4.3 Greenhouse Gas Emissions

No specific project design features are proposed with regard to greenhouse gas emissions.

4.4 Biological Resources

No specific project design features are proposed with regard to biological resources.

4.5 Cultural Resources

No specific project design features are proposed with respect to cultural resources.

4.6 Geology and Soils

Project Design Feature F-1: Prior to the issuance of a grading permit(s), the Applicant shall submit to the County of Los Angeles Department of Public Works for review and approval a final design-level geotechnical investigation report that complies with all applicable State and local code requirements based on final Project designs prepared by a registered civil engineer and certified engineering geologist. The geotechnical investigation report shall include recommendations for the specific building locations and design including those pertaining to site preparation, fills and compaction, foundations, etc. The geotechnical investigation report shall be prepared to the written satisfaction of the Los Angeles Department of Public Works—Building and Safety Division.

Project Design Feature F-2: Project design and construction shall comply with all applicable current building codes and standards, including those established by the California Geological Survey's "Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication No. 117;" the Uniform Building Code as adopted by the County of Los Angeles; State and County laws, ordinances and Code requirements; and the recommendations set forth in a final geotechnical investigation(s).

4.7 Hydrology, Surface Water Quality, and Water Quality

Project Design Feature G-1: Prior to the issuance of a grading permit, the Applicant shall provide evidence to the County of Los Angeles Department of Public Works, as appropriate, that a Notice of Intent has been filed with the State Water Resources Control Board for coverage under the Construction General Permit and a certification that a Stormwater Pollution Prevention Plan has been prepared. Such evidence would consist of a copy of the Notice of Intent stamped by the State Water Resources Control Board or Los Angeles Regional Water Quality Control Board, or a letter from either agency stating that the Notice of Intent has been filed. The Stormwater Pollution Prevention Plan would include a menu of Best Management Practices to be selected and implemented based on the phase of construction and the weather conditions to effectively manage stormwater runoff and control erosion. Best Management Practices to be implemented as part of the Project could include, but not be limited to, the following:

- Erosion Control BMPs to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of

disturbance, stabilizing disturbed areas, and protecting slopes/channels;

- Sediment Control BMPs, which are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping sediments on-site and controlling the site boundaries;
- Wind Erosion Control BMPs, which consist of applying water to prevent or minimize dust nuisance;
- Tracking Control BMPs, which consist of preventing or reducing the tracking of sediment off-site by vehicles leaving the construction area. These BMPs include street sweeping and vacuuming. The construction site would have a stabilized construction entrance to prevent off-site tracking of sediment and debris;
- Non-Stormwater Management BMPs, which are also referred to as "good housekeeping practices" involve keeping a clean, orderly construction site; and
- Waste Management and Materials Pollution Control BMPs consist of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater runoff or discharges through the proper management of construction waste.

Project Design Feature G-2: Prior to issuance of a building permit, the Applicant shall prepare and submit for review and approval a Low Impact Development Plan that would include Best Management Practices and demonstrate compliance with Low Impact Development Ordinance requirements to the Los Angeles County Department of Public Works, Building and Safety, as applicable. Specific Best Management Practices to be implemented as part of the Low Impact Development Plan for the Project to manage post-construction stormwater runoff would include, but not be limited to, the following:

- Installation of catch basins, planter drains, and building roof drain downspouts throughout the Project Site to collect roof and site runoff and direct stormwater away from structures and to potential infiltration systems.
- Installation of filter inserts to catch basins to improve the quality of stormwater runoff from the Project Site.
- Promote evapotranspiration and infiltration, and the use of native and/or drought tolerant plants

- Promote bioretention through the use of underground retention tanks and/or rainwater harvesting;
- Design material storage areas and loading docks within structures or enclosures to prevent leaks or spills of pollutants from entering the storm drain system;
- Design post-construction structural or treatment control BMPs to infiltrate stormwater runoff. Stormwater treatment facilities and systems would be designed to meet the requirements of the LID Ordinance.

4.8 Land Use

No specific project design features are proposed with regard to land use.

4.9 Noise

Project Design Feature I-1: Project-related outdoor mechanical equipment shall be designed to meet the County's Noise Ordinance.

Project Design Feature I-2: The design of the Project amplified sound system for the Amphitheater shall include the sound level regulator programmed to a maximum sound level of 95 dBA, as measured in "slow" response, at the house mixer locations.

Project Design Feature I-3: The building structure for the 299-seat theatre and the Flex Space shall provide a minimum 25 dBA indoor to outdoor noise reduction.

4.10 Public Services—Fire Protection

Project Design Feature J.1-1: A final fuel modification plan shall be prepared for the Project for review and approval by the County of Los Angeles Fire Department Fuel Modification Unit. The fuel modification plan shall include 30 foot and 200 foot buffer zones from all new structures. The 30 foot buffer zone shall provide for replanting of low-growing, irrigated drought-tolerant plant material as a means to prevent erosion and transition to the native character of the Project Site. The 200 foot buffer zone shall provide for seasonal clearing of brush and, as needed, pruning of trees to reduce the amount of potential plant material that could fuel a fire.

Project Design Feature J.1-2: Fire department access shall be provided to within 150 feet of building openings. The final design of the access driveways and internal roadways shall be coordinated with the County Fire Department and LAFD, as applicable. The proposed

circular, fire department turn-around shall be a pumper truck-sized turn-around.

Project Design Feature J.1-3: The Project shall provide automatic fire sprinkler systems, approved by the County Fire Department, within all of the new buildings. With installation of fire sprinkler systems within all of the new buildings, the required fire flow shall be 4,000 gallons per minute with a residual pressure of 20 pounds per square inch, or a reduced fire flow as determined by the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

Project Design Feature J.1-4: To accommodate the required fire flow, the Project shall provide two connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East, or other necessary improvements as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project.

Project Design Feature J.1-5: The Project shall provide fire hydrants within the Project Site as coordinated with the County Fire Department and LAFD. Booster pumps shall be provided for all proposed fire hydrants to meet the minimum fire flow rate and pressure requirements of the Project.

Project Design Feature J.1-6: The proposed fire system shall be a dedicated separate fire service system with no shared connections to the domestic supply lines.

4.11 Public Services—Police Protection

Project Design Feature J.2-1: During construction, the Applicant shall implement temporary security measures including, but not limited to, on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction area. Large mounds of dirt/debris/building materials and fence covers/screens shall be avoided. Equipment and building materials shall be removed or secured during non-construction hours.

Project Design Feature J.2-2: During operation, the Applicant shall implement security measures including, but not limited to:

- High-definition surveillance cameras. The cameras shall be placed along pedestrian pathways, gathering areas, and at driveways on Cahuenga Boulevard East. The camera system shall allow law enforcement agencies to view live feed remotely, shall be equipped with a hard drive capable of storing video for 15 days, and shall be capable of transferring video to disc or USB storage devices.

- Configure proposed public restrooms such that entrances are oriented towards the main event area or other high-visibility areas. The restrooms shall be secured after hours to prevent vandalism, theft, and use by transients.
- Adequate lighting and high definition surveillance cameras within the parking structures. Points of entry and egress shall be equipped with traffic control devices, and a parking lot attendant shall be employed during events.
- Signage along the hiking trail advising users that the trail is closed at night and that camping and smoking are strictly prohibited. The trail shall also be well-marked to prevent users from getting lost and the brush next to the trail shall be cut short to prevent people from hiding or concealing illicit materials. Restrooms, drinking fountains, and picnic/rest areas shall not be built along the trail.

Project Design Feature J.2-3: Upon completion of the Project, the Applicant shall provide the Los Angeles Police Department Hollywood Area commanding officer with a diagram of each portion of the property. The diagram shall include access routes and additional information that might facilitate police response.

4.12 Traffic, Access, and Parking

Project Design Feature K-1: Construction Management Plan

The Ford Theatre Foundation shall prepare a construction traffic management plan, including haul routes and staging plans, as necessary and satisfactory to the County. The construction traffic management plan would be based on the nature and timing of the specific construction activities and shall include the following elements as appropriate:

- Prohibition of construction worker parking and other construction-related vehicles on adjacent residential streets.
- Provisions to prohibit construction equipment or material deliveries within the public right-of-way.
- Provisions for temporary traffic control during all construction activities adjacent to public rights-of-way to improve traffic flow on public roadways (e.g., flag persons).
- Scheduling of construction activities to reduce the effect on traffic flow on surrounding arterial streets.

- Provisions of safety precautions for pedestrians and bicyclists through such measures as alternate routing and protection barriers, as appropriate.
- Provisions to accommodate the equipment storage and truck staging on-site.
- Scheduling of construction-related deliveries, haul trips, etc., so as to occur outside of the commuter peak hours to the extent feasible.
- Obtaining the required permits for truck haul routes from the City prior to issuance of any permit for the Project.

Project Design Feature K-2: The Ford Theatres shall stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons.

Project Design Feature K-3: Parking and Traffic Management Plan

The Ford Theatre Foundation shall prepare a Parking and Traffic Management Plan including parking and traffic management measures and transportation demand management strategies. The Parking and Traffic Management Plan could include, but not be limited to, the following:

- Provide directions and location maps with the parking options available for visitors in web postings, real time mobile applications, marketing, notification and media materials, etc.
- Post directions and maps showing truck routes for deliveries, construction vehicles, and other trucks.
- Encourage alternate travel options (transit and shuttle service) for visitors in event-related marketing/media information.
- Manage the use of all parking spaces in the on-site parking garages to maximize parking efficiency and avoid underutilization of parking spaces.
- Identify locations for bus drop-off/pick-up and staging.
- Provide valet assist parking in at least one parking garage to maximize parking circulation and capacity where possible during large events.
- Require employees and staff to park within designated areas.
- Implement Transportation Demand Management strategies for employees to reduce trips during the congested periods and travel via other modes besides driving alone (e.g., carpooling,

flexible or alternative work schedules, transit incentives, parking incentives for carpools and vanpools, etc.)

- Provide bicycle amenities (bicycle racks, lockers, etc.).

4.13 Utilities and Service Systems—Water

Project Design Feature L.1-1: The Project shall install new on-site water connections, where necessary, to distribute water within the Project Site.

Project Design Feature L.1-2: The Project shall implement water conservation features, including, but not limited to: high-efficiency toilets and urinals, auto lavatory faucets, use of "tankless" or "on demand" water heaters, drought-tolerant planting, minimal irrigation system, use of permeable surfaces, weather-based irrigation controller with rain shutoff, use of a separate water meter (or sub meter), flow sensor, and master valve shutoff for irrigated landscape areas.

4.14 Utilities and Service Systems—Energy and Energy Conservation

No specific project design are proposed with regard to energy and energy conservation.

5.0 Environmental Impacts Found Not to Be Significant or Found to Be Less Than Significant After Mitigation in the EIR

On the basis of the EIR, the County has determined that there is no substantial evidence that the Project would result in any potentially significant Project and/or cumulative impacts for the environmental subject areas presented below. In addition, on the basis of the EIR, the County finds that, based on substantial evidence, mitigation measures described in the EIR will reduce potentially significant impacts identified for certain environmental impact categories provided below to a less than significant level. In accordance with CEQA Guidelines Section 15091, where potentially significant impacts are identified, one of the findings listed in Section 2.0, CEQA Findings, above, is provided.

5.1 Aesthetics, Views, Light, and Glare

The Draft EIR analyzed potential impacts regarding aesthetics, views, light, and glare in Section IV.A, Aesthetics, Views, Light, and Glare, of the Draft EIR.

5.1.1 Aesthetics

(a) Construction Impacts

The removal of on-site structures, surface parking areas, and landscaping would not cause the loss of unique visual resources (i.e., the surrounding hillsides and historic Amphitheatre) or prominent existing features that contribute positively to the existing visual character and quality of the Project Site. As such, the Project's construction activities would not substantially degrade the existing visual character of the Project Site or the surrounding area. Therefore, aesthetics impacts associated with construction would be less than significant.

(b) Operational Impacts

The Project would provide new performing arts and support facilities that would be consistent with and build on the existing uses on the Project Site and in the surrounding community. Implementation of the Project would result in the removal of the existing former motel building currently used as office space; the projection booth and control room,

which is not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; the concessions building, which is also not a primary character-defining feature of the historic Amphitheatre and is not visible from off-site public vantages; and surface parking areas and landscaping. The Project would develop new structures and landscaping that would be primarily confined to areas of the Project Site that have already been developed.

While the presence of new development would invariably alter the aesthetic character of the Project Site, the Project would employ a cohesive site design in part by ensuring architectural compatibility and integration with the surrounding environment. The Project would also rehabilitate the existing historic Amphitheatre and would not result in the removal or alteration of existing features that contribute positively to the visual character of the Project Site and surrounding area. Overall, the new construction would be differentiated from the existing development that would remain and would be compatible with the massing, size, scale, and architectural features of the Amphitheatre, thereby protecting its historic integrity. Similarly, Project grading would be designed to retain the integrity and natural grade elevations of the landforms that influence the visual quality of the Project Site. As such, the Project would not substantially degrade the existing visual character or quality of the Project Site or surrounding area. Impacts related to aesthetics would be less than significant.

5.1.2 Views

Overall, while Project implementation would modify existing public views along Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway, the proposed structures would not dominate the viewshed along Cahuenga Boulevard. Rather, the Project has been intentionally designed to minimize the building footprints and remain primarily within the developed areas of the Project Site so as to preserve the natural setting of the Project Site. Accordingly, public views of the Project Site would continue to feature a semi-urban environment with a background of rolling hills, pockets of trees, and landscaping. Thus, the Project would not have a substantial adverse effect on a scenic vista, and view impacts would be less than significant.

5.1.3 Light

(a) Construction Impacts

Substantial lighting is not anticipated during construction within the Project Site as most construction activities would occur during daylight hours. However, the Project may include lighting for construction activities occurring in the early evening during the winter season. Outdoor lighting sources such as floodlights, spot lights, and/or headlights associated with construction equipment and hauling trucks would typically accompany

construction activities during this period. To the extent evening construction includes artificial light sources, such use would be temporary and would cease upon completion of proposed Project construction. Further, construction-related illumination would be used for safety and security purposes only. Additionally, as set forth in Project Design Feature A-1, construction lighting would be shielded and/or aimed so that no direct beam illumination would fall outside of the Project Site boundary. Construction lighting, while potentially bright, would be highly focused on the particular area undergoing work. Therefore, given that the majority of construction activities for the Project would be primarily confined to areas of the Project Site that have already been developed, which are separated from residential uses to the north, east, and south by open space and intervening topography, the surrounding uses would not be anticipated to be substantially affected by construction lighting. Thus, light impacts associated with proposed construction activities would be less than significant.

(b) Operational Impacts

Lighting associated with the proposed light boxes would be the most distinguishable light source as viewed from Cahuenga Boulevard, Pilgrimage Bridge, and the Hollywood Freeway. However, as illustrated, the light boxes would not feature so prominently such that the light boxes would emanate light that would be inconsistent with the existing light sources in the vicinity of the Project Site. In addition, there are no residential properties or other sensitive uses immediately surrounding the Project Site, and any light emanating from the proposed Project lighting would be directed within the Project Site. Further, lighting associated with the proposed theatrical lighting would be consistent with the existing lighting within the Amphitheatre. Also, in accordance with Project Design Feature A-2, Project lighting, where applicable, would incorporate shielding and aiming to prevent glare and light spill and the upward emition of light and Project lighting would not exceed 2 foot-candles outside of the Project Site boundary. Therefore, due to the types of proposed lighting and measures employed to minimize light pollution, the Project would not create a new source of substantial light that would adversely affect day or nighttime views in the area. Thus, impacts related to Project lighting would be less than significant.

5.1.4 Glare

(a) Construction Impacts

Daytime glare could potentially accompany construction activities if reflective construction materials were positioned in highly visible locations where the reflection of sunlight could occur. However, any glare would be highly transitory and short-term, given the movement of construction equipment and materials within the construction area and the temporary nature of construction activities within each area of the Project Site. In addition, large, flat surfaces that are usually required to generate substantial glare are not typically

an element of construction activities. Furthermore, the potential for nighttime glare associated with construction is unlikely as most construction activities would occur during the day, and any construction activities occurring in the early evening during the winter season would be limited and temporary. As such, the Project would not result in a significant impact related to construction glare.

(b) Operational Impacts

Building materials for the Project would likely include plaster, concrete, metal panels, fritted glass, and cement board. In accordance with Project Design Feature A-3, exterior windows, glass, and metal used on building surfaces would be non-reflective or treated with a standard low-reflective or non-reflective glazing. As such, sunlight reflected from the surfaces of proposed structures would not be expected to generate substantial daylight glare. The replacement of existing surface parking areas with structured parking would also reduce the potential for daytime glare from windows of parked vehicles. Overall, the Project would not create a new source of substantial glare which would adversely affect day or nighttime views. Therefore, glare impacts would be less than significant.

5.1.5 Cumulative Impacts

(a) Aesthetics

None of the related projects are located sufficiently close to the Project Site to enter the same field of view as the Project. Specifically, the nearest related project (Related Project No. 22) to the Project Site is located approximately 0.8 mile southwest of the Project Site. Therefore, given its location and distance from the Project Site and intervening development, Related Project No. 22 would not be within the same field of view as the Project. Notwithstanding, similar to the Project, future developments would be expected to occur in accordance with adopted plans, regulations, and guidelines, such as height limits, density, and setback requirements, and would be reviewed by the County or City to ensure consistency with adopted guidelines and standards that relate to aesthetics. Further, many of the related projects in the area represent infill development that is not expected to be out of scale or character with the existing visual environment, as ensured through the County's and the City's environmental review processes. Therefore, cumulative impacts relative to aesthetics would be less than significant.

(b) Views

Based on the distance of the related projects and intervening development, none of the related projects would affect views along Cahuenga Boulevard in the area of the Project Site or block views of the hillsides surrounding the Project Site. As such, future development in the Project area would not be expected to cumulatively obstruct public

views of valued visual resources within and in the immediate vicinity of the Project Site and cumulative impacts relative to views would be less than significant.

(c) Light

Development of the Project, as well as the other related projects in the area, would introduce new or expanded sources of artificial light. Consequently, ambient light levels in the Hollywood area may increase overall. However, given the proximity of the related projects to the Project Site, the additional artificial light sources introduced by these projects would not significantly alter the existing lighting environment that currently exists in the immediate Project area. In addition, each of the related projects would be required to comply with regulatory requirements which address light spill and brightness. As a result, cumulative impacts relative to light would be less than significant.

(d) Glare

With regard to glare, only related development immediately adjacent to Project structures would have the potential to create glare that could collectively pose impacts affecting a given off-site use, property, or activity. Due to the distance of the related projects from the Project Site, it is unlikely that glare could have a combined effect from a particular vantage point. In addition, it is anticipated that the related projects in the vicinity of the Project Site would be subject to discretionary review to ensure that building materials to be used would not create significant sources of glare. Further, since the Project's glare impacts would be less than significant, the Project would not contribute to any cumulative increase in glare in combination with the related projects. As such, cumulative glare impacts would be less than significant.

Mitigation Measures

Impact related to aesthetics, views, light, and glare would be less than significant. No mitigation measures would be necessary.

5.2 Air Quality

The Draft EIR analyzed potential impacts regarding air quality in Section IV.B, Air Quality, of the Draft EIR. Supporting technical analyses are included in Appendix C, Air Quality Worksheets, of the Draft EIR.

5.2.1 Construction Impacts

(a) Regional Construction Impacts

Construction of the Project has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and construction activities. Mobile source emissions, primarily NOX, would result from the use of construction equipment such as dozers, loaders, and cranes. During the finishing phase of a building, paving operations and the application of architectural coatings (e.g., paints) and other building materials would potentially release VOCs. The Project's maximum regional emissions associated with construction would not exceed any of the daily significance thresholds set forth by the South Coast Air Quality Management District (SCAQMD). Therefore, regional emissions during construction of the Project would result in a less than significant air quality impact.

(b) Localized Construction Impacts

Maximum localized construction emissions for off-site sensitive receptors would not exceed any of the SCAQMD-recommended localized screening thresholds. Therefore, localized emissions during construction of the Project would result in a less than significant air quality impact.

(c) Toxic Air Contaminants

The greatest potential for toxic air contaminant (TAC) emissions during construction would be from diesel particulate emissions associated with heavy equipment operations during grading and excavation activities. Because the construction schedule estimates that the phases which require the most heavy-duty diesel vehicle usage, such as site grading/excavation, would last for a short duration (e.g., approximately six months), construction of the Project would not result in a substantial, long-term (i.e., 70-year) source of TAC emissions. In addition, there would be no residual emissions or corresponding individual cancer risk after construction. As such, Project-related TAC impacts during construction would be less than significant.

(d) Odors

During construction of the Project, activities associated with the operation of diesel-powered construction equipment, asphalt paving operations, and the application of architectural coatings and solvents may produce perceptible odors. The Project would comply with applicable regulatory requirements regarding construction activities and odors.

With compliance with applicable rules and regulations, impacts associated with objectionable odors during Project construction would be less than significant.

5.2.2 Operational Impacts

(a) Regional Operational Impacts

Regional emissions resulting from operation of the Project would not exceed any of the SCAQMD's daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

An analysis of daily operational emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The analysis shows that the net overall operational emissions associated with the Project under existing conditions (2014) would be higher than the estimated emissions at Project build-out (2020). This increase is exclusively a function of the change in default CalEEMod emission factors from 2020 to 2014 (i.e., vehicular fleet mix is cleaner in subsequent years as a result of cleaner newer vehicles). As with the Project build-out (2020) analysis year, the Project (2014) analysis would not exceed any of the established SCAQMD daily regional operational thresholds. Therefore, air quality impacts from Project operational emissions would be less than significant.

(b) Localized Operational Impacts

Operation of the Project would not introduce any major new sources of air pollution within the Project Site. As such, on-site operational emissions would not exceed any of the localized significance thresholds.

An analysis of daily operational on-site emissions of existing conditions without the Project versus with the Project (2014) was also conducted. The analysis shows that the net overall operational on-site emissions associated with the Project under existing conditions (2014) would be similar to the estimated emissions during Project build-out (2020). As with the Project build-out (2020) analysis year, on-site operational emissions under existing conditions would not exceed any of the localized significance thresholds. Therefore, localized impacts from on-site emission sources would be less than significant.

In addition, the Project would not cause any new or exacerbate any existing CO hotspots, and, as a result, impacts related to localized mobile-source CO emissions would be less than significant.

(c) Toxic Air Contaminants

The primary sources of potential air toxics associated with Project operations include diesel particulate matter from delivery trucks (e.g., truck traffic on local streets and idling on adjacent streets). Although there would be an increase in the total Project Site square footage and presumably a slight increase in the number of delivery trucks, compliance with applicable rules and regulations would substantially limit potential emissions from deliveries. As such, the Project would not be considered a substantial source of diesel particulate matter and potential air toxic contaminant impacts would be less than significant.

Typical sources of acutely and chronically hazardous TACs include industrial manufacturing processes (e.g., chrome plating, electrical manufacturing, petroleum refinery). The Project would not include these types of potential industrial manufacturing process sources. As such, the Project would not release substantial amounts of TACs, and no significant impact on human health would occur.

(d) Odors

The Project does not include any uses identified by the SCAQMD as being associated with odors. However, the Project does include a restaurant which would have the potential to emit odors through cooking and charbroilers. The Project would minimize the release of odors from the proposed restaurant with odor reducing equipment as necessary. Garbage collection areas for the Project would also be covered and situated away from the property line and sensitive uses. Good housekeeping practices would be sufficient to prevent objectionable odors from garbage collection areas. Therefore, potential odor impacts would be less than significant.

5.2.3 SCAQMD CEQA Air Quality Handbook Policy Analysis

Project development would not have a significant short-term or long-term impact on the region's ability to meet State and federal air quality standards. Also, the Project would be consistent with the goals and policies of the AQMP for the control of fugitive dust. The Project's long-term influence would also be consistent with the goals and policies of the AQMP. Therefore, the Project is considered consistent with the SCAQMD's AQMP.

5.2.4 Cumulative Impacts

(a) Construction Impacts

According to the SCAQMD, individual construction projects that exceed the SCAQMD's recommended daily thresholds for project-specific impacts would cause a

cumulatively considerable increase in emissions for those pollutants for which the Air Basin is in non-attainment. Construction-related daily emissions at the Project Site would not exceed any of the SCAQMD's regional or localized significance thresholds. Thus, the Project's contribution to cumulative construction-related regional emissions would not be cumulatively considerable and therefore would be less than significant. Construction of the Project also would have a less-than-significant impact with regard to localized emissions. Therefore, the Project's contribution to cumulative air quality impacts due to localized emissions would also not be cumulatively considerable and therefore would be less than significant.

Similar to the Project, the greatest potential for TAC emissions at each related project would generally involve diesel particulate emissions associated with heavy equipment operations during demolition and grading/excavation activities. Construction activities at each related project would not result in a long-term (i.e., 70-year) substantial source of TAC emissions. Additionally, the SCAQMD CEQA guidance does not require a health risk assessment for short-term construction emissions. It is therefore not meaningful to evaluate long-term cancer impacts from construction activities which occur over relatively short durations. As such, cumulative toxic emission impacts during construction would be less than significant.

Also similar to the Project, via mandatory compliance with SCAQMD Rules, it is anticipated that construction activities or materials used in the construction of the related projects would not create objectionable odors. Thus, odor impacts from the related projects are anticipated to be less than significant individually, as well as cumulatively in conjunction with the Project.

(b) Operational Impacts

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. Operational emissions from the Project would not exceed any of the SCAQMD's regional or localized significance thresholds during Project build-out (2020) or under existing conditions (2014). Therefore, the emissions of non-attainment pollutants and precursors generated by Project operation would not be cumulatively considerable.

With respect to TAC emissions, neither the Project nor any of the related projects (which are largely residential, retail/commercial, and office uses), would represent a substantial source of TAC emissions, which are typically associated with large-scale industrial, manufacturing, and transportation hub facilities. As such, cumulative TAC emissions during long-term operations would be less than significant. In addition, the

Project would not result in any substantial sources of TACs that have been identified by the California Air Resources Board's Land Use Guidelines, and thus, would not contribute to a cumulatively considerable impact.

With respect to potential odor impacts, neither the Project nor any of the related projects (which are primarily residential, retail, and office uses) have a high potential to generate odor impacts. Thus, potential odor impacts from related projects are anticipated to be less than significant. The Project would not result in odor impacts, and, thus, would not contribute to a cumulative odor impact.

Mitigation Measures

Project-level and cumulative impacts with regard to air quality would be less than significant. Therefore, no mitigation measures are required.

5.3 Greenhouse Gas Emissions

The Draft EIR analyzed potential impacts regarding greenhouse gas emissions in Section IV.C, Greenhouse Gas Emissions, of the Draft EIR. Supporting technical analyses are included in Appendix D, Greenhouse Gas Emissions Worksheets, of the Draft EIR.

5.3.1 Project Impacts

Construction emissions are typically associated with demolition, site preparation, excavation, grading, and construction-related equipment and vehicular activity. Construction of the Project is estimated to generate a total of 1,442 metric tons of CO_2e. As recommended by the SCAQMD, the total GHG construction emissions were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the Project's annual GHG emissions inventory.

The GHG emissions for the Project taking into consideration implementation of project design features included throughout the Project's Draft EIR, the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates demonstrates that the Project has incorporated sustainability design features to reduce vehicle miles traveled and the Project's potential impact with respect to GHG emissions. The Project's GHG emissions reduction of 16.4 percent compared to the "business as usual" (BAU) scenario constitutes an equivalent or larger break from BAU than has been determined by CARB to be necessary to meet AB 32's goals (i.e., 16 percent reduction). Therefore, the Project would not have a significant

impact on the environment due to its GHG emissions. In addition, the Project would be consistent with CARB's *Climate Change Scoping Plan* for the implementation of AB 32 and would comply with the County of Los Angeles Green Building Standards. Therefore, the Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

5.3.2 Cumulative Impacts

Although the Project is expected to emit GHGs, the emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. A project's GHG emissions typically would be very small in comparison to state or global GHG emissions and, consequently, they would, in isolation, have no significant direct impact on climate change. Overall, implementation of project design features included throughout the Project's Draft EIR, compliance with the requirements set forth in the County of Los Angeles Green Building Standards Code, and full implementation of current State mandates would contribute to GHG reductions. These reductions represent a reduction from BAU and support State goals for GHG emissions reduction. As such, the Project would support State goals for GHG emissions reduction and be consistent with AB 32. The Project also would comply with the County of Los Angeles Green Building Standards, which emphasizes improving energy conservation and energy efficiency, increasing renewable energy generation, and changing transportation and land use patterns to reduce auto dependence. The related projects would also be anticipated to comply with many of the same emissions reduction goals and objectives as the Project. In the absence of adopted standards and established significance thresholds, and given the Project's consistency with State, regional, and local GHG emission reduction goals and objectives, the Project's impacts are concluded to be less than significant and not cumulatively considerable.

Mitigation Measures

Impacts related to greenhouse gas emissions would be less than significant, and no mitigation measures are required.

5.4 Biological Resources

The Draft EIR analyzed potential impacts to biological resources in Section IV.D, Biological Resources, of the Draft EIR. Supporting technical analyses are included in Appendix B, Tree Survey, and Appendix E, Biological Resource Assessment, of the Draft EIR.

5.4.1 Potential Vegetation Community Impacts

No special-status plant communities are located in the Biological Study Area (BSA). Native plant communities that occur in the study area include chaparral scrub, which is common in undeveloped areas of southern California. As this native plant community is not listed as a special-status plant community, potential impacts to existing plant communities associated with the Project would be less than significant and no mitigation measures are required.

5.4.2 Potential Regulatory Status Plant Species Impacts

The Project would include rehabilitation of portions of the existing Amphitheatre and development of new structures, including improvements to the exterior landscape and development of a hiking trail. Construction along the proposed hiking trail and within the existing landscaped areas would require vegetation removal. In addition, on a yearly basis, vegetation would be thinned up to 200 feet from all new structures in an effort to reduce fire risk in the area. Such activities could directly or indirectly impact identified special-status plant species that occur within the BSA. With implementation of Mitigation Measures D-1 and D-2, potentially significant impacts to special-status plant species associated with the Project would be reduced to a less than significant level.

5.4.3 Potential Regulatory Status Wildlife Species Impacts

(a) Construction

(i) Regulatory Status Bird Species

The coastal California gnatcatcher is identified as a species of concern by the California Department of Fish and Wildlife and would have the potential to occur in the BSA as the chaparral and sage scrub communities located in the BSA are suitable habitats for the coastal California gnatcatcher. While the potential for the coastal California gnatcatcher to occur in the BSA during construction is considered low, absence cannot be confirmed without additional surveys. As such, the Project could result in potentially significant direct impacts to the coastal California gnatcatcher. In addition, as this species is non-migratory, construction activities could result in indirect impacts on coastal California gnatcatcher species through noise disturbance and vegetation removal if they were to be in the BSA during construction. Annual vegetation thinning required out to 200 feet from all new structures would also reduce habitat for coastal California gnatcatcher. Implementation of Mitigation Measure D-3 would reduce potential impacts to a less than significant level.

Migratory birds and raptors also have the potential to occur in the BSA given the large areas of trees, vegetation, and buildings that could create the potential for migratory birds and raptors to nest. Construction activities could result in impacts on nesting birds through noise disturbance and vegetation removal if they were in the BSA during construction. Implementation of Mitigation Measure D-4 would reduce potentially significant impacts to migratory birds to a less than significant level.

(ii) Regulatory Status Small Mammal Species

The BSA includes undisturbed habitat that could be impacted as a result of construction activities. Sensitive wildlife species with the potential to occur within this habitat includes the coast horned lizard *(Phrynosoma blainvillii)* and the San Diego desert woodrat *(Neotoma lepida intermedia)*, both of which are considered species of concern by CDFW. Construction activities, including noise disturbance and vegetation removal could impact these species if they are present within the BSA during Project construction. With implementation of Mitigation Measure D-5, potential impacts to wildlife species would be reduced to a less than significant level.

(iii) Regulatory Status Bat Species

Four bat species have been identified with the potential to occur within the BSA. All species are identified as species of concern by the California Department of Fish and Wildlife with the exception of the hoary bat, which has a state rank of "S4." The BSA includes large trees, vegetation, and buildings that could provide roosting habitats for bats. Construction activities would result in noise disturbance and vegetation removal that could impact the bats if they are present during construction. Implementation of Mitigation Measures D-6 and D-7 would reduce potential impacts to bats to a less than significant level.

(b) Operation

Implementation of the Project would increase lighting, noise, and human activity within the Project Site, which could potentially deter wildlife occurring within the BSA from the area and reduce their ability to forage. In addition, the development of the proposed hiking trail would increase the risk for wildlife-human interactions within the Project Site. Furthermore, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path and reduce further disturbance of the hillside may prevent wildlife access to foraging areas and reduce their ability to move through the area. With implementation of Mitigation Measures D-8 through D-10, potential impacts to wildlife species during operation of the Project would be reduced to a less than significant level.

5.4.4 Oak Tree Impacts

During the tree survey conducted for the Project, one coast live oak was identified for removal as part of the previously approved Amphitheatre improvements and four coast live oak trees have been identified for potential relocation. The oak tree previously contemplated for removal as part of the approved Amphitheatre improvements measured 4 inches in trunk diameter at 4.5 feet above mean natural grade. The remaining oak trees proposed to be relocated within the Project Site measured 8, 10, 12, and 14 inches in trunk diameter at 4.5 feet above mean natural grade. In accordance with the Los Angeles County Oak Tree Ordinance, a permit would be required for the removal or relocation of oak trees measuring 8 inches in trunk diameter or greater. As such, a permit would be required for the relocation of the four oak trees. As these trees are proposed to be relocated within the Project Site, the Project would not result in the permanent loss of protected trees and potential impacts to oak trees would be less than significant. Mitigation Measure D-11, provided below, would ensure the relocation of the oak trees is consistent with the Los Angeles County Oak Tree Ordinance. Mitigation Measure D-11 further outlines the procedures to be followed should the oak trees be protected in place.

5.4.5 Regional Connectivity/Wildlife Movement

There are no regional wildlife movement corridors within or adjacent to the Project Site. In addition, the BSA is not within a designated regional wildlife linkage area identified in the Los Angeles County General Plan. Development of the Project would occur primarily within the already developed portions of the Project Site and, upon implementation of the Project, the Project Site would remain mostly undeveloped hillsides. As such, the Project would not be expected to result in an increased barrier to local wildlife movement. In addition, the proposed trail alignment would generally follow the alignment of existing user-created trails, which potential wildlife in the area would already be accustomed to. Furthermore, while implementation of the proposed hiking trail would increase human activity in the hillside areas, wildlife movement typically occurs during nighttime when access to the hiking trail would not be permitted. Additionally, in accordance with Mitigation Measure D-9 provided below, the fencing proposed to be installed along the lower trail alignments to keep people on the designated walking path would be designed to be lower in height with openings between posts and rails to allow wildlife to pass over or through the fence. Therefore, the Project is not anticipated to negatively impact wildlife movement within the open space areas of the Project Site and the open space areas to the north and east of the Project Site. Impacts with regard to wildlife movement would be less than significant and no mitigation measures would be required.

5.4.6 Fire Hazard Areas

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist within the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. Fires within the Project Site could result in potential impacts on existing vegetation communities, special status species, and wildlife if a fire were to spread beyond the developed areas of the Project. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, impacts with respect to wildfire risk would be less than significant.

5.4.7 Cumulative Impacts

The related projects include mostly infill developments that contain limited native vegetation or suitable habitats for wildlife species. Due to their generally developed/disturbed nature and lack of native vegetation and habitats, the related project sites do not contribute to the long-term sustainability of natural communities and, therefore, would not have a significant impact on biological resources on a cumulative basis In addition, as with the Project, any potential impacts to biological resources resulting from development of the related projects would likely be subject to mitigation as part of the environmental review process, thereby avoiding or minimizing potential impacts to biological resources. Therefore, the Project in combination with the related projects would not result in significant cumulative impacts to biological resources.

As previously discussed, the Project would not have a significant adverse effect on any designated regional wildlife movement corridors as there are no regional wildlife movement corridors within or adjacent to the Project Site. Based on the location of the related projects within highly urbanized areas and the proximity of the related projects to large expanses of open space, the related project sites do not provide the type of environment that would attract wildlife to those sites or use those sites to reach nearby open space areas where such wildlife are known to exist. Therefore, the Project in

combination with the related projects would not result in significant cumulative impacts with regards to wildlife movement.

Mitigation Measures

Special-Status Plant Species

Mitigation Measure D-1: Prior to construction, a qualified botanist shall conduct rare plant surveys throughout the Project area. In the event special status species are found during surveys, avoidance measures shall be implemented based on the recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented, in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Surveys shall be conducted during the appropriate blooming period to the extent feasible. If surveys cannot be conducted within the appropriate blooming period, or if the presence for any species cannot be ruled out for any other reason, avoidance measures shall be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

Mitigation Measure D-2: If it is determined that special status plants would be directly impacted as a result of the Project, an on- or off-site restoration plan shall be prepared by a qualified botanist, in coordination with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.

The restoration plan shall be implemented prior to the completion of the Project. The plan shall include the following: receiver locations; number of plants to be replanted and the methods of replanting; maintenance and monitoring requirements; and measures necessary for the establishment of self-sustaining populations in suitable open space areas to ensure the long-term survivability of the species in the vicinity.

Annual monitoring for at least five (5) years shall be required to ensure no-net-loss of acres of habitat for the species. The acreage ratio of lost special-status plant species habitat to habitat replaced shall be coordinated with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable, but shall be no less than 1:1.

Coastal California Gnatcatcher

Mitigation Measure D-3: Within a year prior to construction, protocol level surveys for the coastal California gnatcatcher shall be conducted within 300 feet of suitable habitat by a qualified biologist/ornithologist according to the United States Fish and Wildlife Service survey guidelines. The surveys shall include, at a minimum, a thorough examination of all suitable habitat within the Project area and vicinity for the coastal California gnatcatcher or its sign. The final survey methodology shall be determined in coordination with the United States Fish and Wildlife Service. A summary report shall be prepared upon completion of these activities and submitted to the United States Fish and Wildlife Service.

If, following protocol level surveys, no gnatcatchers are detected, but construction is delayed more than one year, additional surveys may be required, at the discretion of the United States Fish and Wildlife Service, to ensure that no gnatcatchers have moved into the area. If evidence of the coastal California gnatcatcher is found within the Project area during surveys, consultation with the United States Fish and Wildlife Service shall be conducted, and any requirements of the regulatory agencies regarding protection of the species shall be implemented.

Migratory Birds and Raptors

Mitigation Measure D-4: The following measures shall be implemented during construction to minimize impacts on nesting birds and raptors:

a. Construction in areas that include trees, vegetation, or buildings that may provide nesting habitats for bird and raptors shall be reduced to the maximum extent feasible.

b. Trimming and removal of vegetation and trees shall be minimized and performed outside of the nesting season (February 15 to September 15) to the extent feasible.

c. In the event trimming or removal of vegetation and trees must be conducted during the nesting season, nesting bird surveys shall be completed by a qualified biologist no more than 48 hours prior to trimming or clearing activities to determine if nesting birds are within the affected vegetation. Nesting bird surveys shall be repeated if trimming or removal activities are suspended for five days or more.

d. In the event construction is scheduled during bird nesting season, nesting bird surveys shall be completed no more than 48 hours prior to construction to determine if nesting birds, raptors, or active nests are in or within 500 feet of the construction area.

Surveys shall be repeated if construction activities are suspended for five (5) days or more.

e. In the event nesting birds or raptors are found in the construction area, appropriate buffers (typically 300 feet for songbirds and up to 500 feet for raptors) shall be implemented, in coordination with the California Department of Fish and Wildlife, to ensure that nesting birds and active nests are not harmed. Buffers shall include fencing or other barriers around the nests to prevent any access to these areas and shall remain in place until birds have fledged and/or is no longer active, as determined through coordination with the California Department of Fish and Wildlife.

Special-Status and General Wildlife Species

Mitigation Measure D-5: A qualified biologist shall complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more. If any wildlife species are identified, appropriate measures shall be developed and implemented to avoid impacts on these wildlife species, in consultation with resource agencies as applicable.

Bats

Mitigation Measure D-6: To the extent feasible, tree and building removal shall be scheduled during the non-breeding and active season for bats (typically October and November). Prior to construction, surveys shall be conducted by a qualified bat specialist to identify the presence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in cavities in the area, either in trees or in structures, shall be safely evicted under the direction of a bat specialist and under consultation with the California Department of Fish and Wildlife.

Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the California Department of Fish and Wildlife shall be installed and maintained to prevent bats from roosting in these cavities prior to and during construction. A summary report shall be prepared upon completion of these activities and submitted to the California Department of Fish and Wildlife.

Pre-construction bat surveys shall be conducted by a qualified bat specialist no more than seven (7) days prior to the removal of any trees within the Project area to confirm that exclusionary measures have been successful and there are not bats within the construction

area. If no roosting bats are detected, no further surveys are required provided the tree removal is conducted within seven (7) days. If removal is delayed more than seven (7) days, additional surveys shall be conducted no more than seven (7) days prior to tree removal to ensure that no bats have moved into the area.

Mitigation Measure D-7: Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in the Project area. In the event a maternal colony of bats is found in the construction area, the California Department of Fish and Wildlife shall be consulted, and no work shall be conducted within 100 feet of the roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the California Department of Fish and Wildlife. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No clearing and grubbing shall be authorized adjacent to the site. Combustion equipment, such as generators, pumps, and vehicles, shall not to be parked nor operated under or adjacent to the roosting site. Construction personnel shall not enter into areas beneath the colony, especially during the evening exodus.

General Wildlife Species

Mitigation Measure D-8: Amphitheatre lighting shall be designed to focus downward on the developed areas of the Project area and minimize light spillover onto adjacent open space areas.

Mitigation Measure D-9: Fencing associated with the proposed hiking trail shall be designed to be low in height with openings between posts and rails to allow the movement of wildlife to pass over or through the fence.

Mitigation Measure D-10: Trash receptacles that are not accessible to wildlife shall be used along the proposed hiking trail and within open areas of the Project Site to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. Signage shall also be place along the trail to encourage hikers to stay within the designated trail boundary.

Oak Trees

Mitigation Measure D-11: The following measures shall be implemented to minimize impacts on oak trees:

a. Oak trees measuring eight (8) inches or more in diameter at four and one-half (4.5) feet above mean natural grade shall be protected in place unless specifically permitted by the County of Los Angeles through the Los Angeles County Tree Ordinance.

b. Prior to construction, protection fencing shall be installed outside of the drip line of an oak tree to be protected in place during construction to minimize damage from equipment storage, debris dumping, parking, etc. within oak tree protected zones.

c. Oak trees that are relocated shall be done so in a manner consistent with the Los Angeles County Oak Tree Ordinance.

Finding

The County adopts the first possible finding, which states that "changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR." (Guidelines Section 15091 (a)(1)).

5.5 Cultural Resources

The Draft EIR analyzed potential impacts to cultural resources in Section IV.E, Cultural Resources, of the Draft EIR. Supporting technical information is provided in Appendix F, Historic Resources Report, and Appendix G, Archaeological and Paleontological Resources Records Searches, of the Draft EIR.

5.5.1 Historical Resources

(a) Potential Impacts Related to Previously Approved Amphitheatre Improvements

In September 2013, the County of Los Angeles prepared and approved a Notice of Exemption pursuant to CEQA Guidelines, Article 19, Section 15331, Historical Resource Restoration/Rehabilitation (Class 31) for the rehabilitation of portions of the existing Amphitheatre consistent with the Secretary of Interior Standards for the Treatment of Historic Properties. These improvements will include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. These improvements were documented independently to be in compliance with the Class 31 exemption for historic resource rehabilitation consistent with the Secretary of Interior's Standards. Therefore, no significant impacts with regards to historic resources would occur as a result of implementation of the previously approved Amphitheatre improvements.

(b) Potential Impacts Related to Other Improvements

Overall, impacts with regards to historic resources associated with the Project have the potential to be significant as the specific design details of the Project have not been

finalized. However, with implementation of Mitigation Measure E-1, provided below, such impacts would be reduced to a less than significant level.

5.5.2 Archaeological Resources

The results of the records search indicate there are no known archaeological sites or isolates located within a 0.5-mile radius of the Project Site or within the Project Site. While the majority of the Project would be developed within areas that have been subject to disturbance in the past, some portions of the Project would extend to previously undisturbed areas. As such, there is the possibility that archaeological resources could be discovered. With implementation of Mitigation Measures E-2 and E-3, provided below, potential impacts related to archaeological resources would be reduced to a less-than-significant level.

5.5.3 Paleontological Resources

As described in the paleontological records search, excavations in the igneous rocks exposed in much of the Project Site would not uncover any recognizable fossils. However, excavations in the Topanga Formation deposits intercalated with the igneous rocks may encounter significant vertebrate fossils. Therefore, the potential exists for paleontological resources to be uncovered during construction activities and impacts associated with paleontological resources could be potentially significant. With implementation of Mitigation Measure E-4, any potential impacts related to paleontological resources would be reduced to a less than significant level.

5.5.4 Cumulative Impacts

As previously evaluated, potential impacts to historic resources associated with the Project would be less than significant with implementation of Mitigation Measure E-1. Additionally, based on the unique use and features of the Project Site as well as the area of the related projects, it is not expected that the related projects would impact historic resources of the same character (based on context, building type, evaluation, and designation) as that which is present within the Project Site. In addition, due to the distance of the related projects to the Project Site, the closest of which is approximately 0.8 mile from the Project Site (Related Project No. 22), the related projects are not anticipated to impact the historic features within the Project Site. Therefore, cumulative impacts on historic resources would be less than significant.

As discussed above, potential impacts to archaeological and paleontological resources associated with the Project would be less than significant with implementation of Mitigation Measures E-2 through E-4. With regard to potential cumulative impacts related

to archaeological and paleontological resources, the related projects area is urbanized and has been disturbed and developed over time. As with the Project, in the event that archaeological and paleontological resources are uncovered, each related project would be required to comply with applicable regulatory requirements. In addition, as part of the environmental review processes for the related projects, it is expected that mitigation measures would be established as necessary to address the potential for uncovering archaeological and paleontological resources. Thus, cumulative impacts associated with archaeological and paleontological resources would be less than significant.

Mitigation Measures

Mitigation Measure E-1: To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.

Mitigation Measure E-2: If a unique archaeological resource is discovered during Project construction activities, work in the area shall cease and deposits shall be treated by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61 in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. In addition, if it is determined that an archaeological site is a historical resource, the provisions of Section 21084.1 of the Public Resources Code and CEQA Guidelines Section 15064.5 shall be implemented.

Mitigation Measure E-3: If human remains are encountered during construction, work in the affected area and the immediate vicinity shall be halted immediately. The construction manager at the Project Site shall be contacted, and shall notify the County Coroner. If the County Coroner determines the remains to be Native American, the archaeologist and Native American monitor shall then be contacted, if they are not on-site at the time, as well as the responsible lead agency of the discovery, who in turn shall notify the Native American Heritage Commission. Disposition of the human remains and any associated grave goods shall be in accordance with California Health and Safety Code Section 7050.5 and Public Resources Code Sections 5097.91 and 5097.98, as amended. The archaeologist and the Native American monitor, with the concurrence of the County, shall determine the area of potential impact and the timing when construction activities can resume.

Mitigation Measure E-4: A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur. The frequency of inspections shall be based on consultation with the paleontologist and shall depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If paleontological materials are encountered, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed material to facilitate evaluation and, if necessary, salvage. The paleontologist shall assess the discovered material(s) and prepare a survey, study or report evaluating the impact. The paleontologist's survey, study or report shall contain a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Applicant shall comply with the recommendations of the evaluating paleontologist, as contained in the survey, study or report, and a copy of the paleontological survey, study or report shall be submitted to the Los Angeles County Natural History Museum and the Los Angeles County Department of Parks and Recreation. Ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the satisfaction of the paleontologist.

Mitigation Measure E-5: The Project shall include preparation of a Historic Structures Report by a historic preservation professional meeting the Secretary of the Interior's Professional Qualification Standards. The Historic Structures Report shall be prepared in compliance with National Park Service Preservation Brief No. 43: The Preparation and Use of Historic Structures Report. Pursuant to National Park Service Preservation Brief No. 43, the Historic Structures Report shall include recommendations for the treatment of the character-defining features as well as guidance for complying with the Standards. The Historic Structures Report shall also include additional information about the history and physical features of the property. Preparation of the Historic Structures Report shall commence by the first quarter of 2015.

Finding

The County adopts the first possible finding, which states that "changes or alterations have been required in, or incorporated into, the project which avoid or

substantially lessen the significant environmental effect as identified in the final EIR." (Guidelines Section 15091 (a)(1)).

5.6 Geology and Soils

The Draft EIR analyzed potential impacts regarding geology and soils in Section IV.F, Geology and Soils, of the Draft EIR. Supporting technical analyses are included in Appendix H, Geotechnical Reports, of the Draft EIR.

5.6.1 Strong Seismic Ground Shaking

As with any new development in the State of California, Project building design and construction would be required to conform to the current seismic design provisions of the California Building Code to minimize potential seismic impacts. In addition, construction of the Project would be required to adhere to the seismic safety requirements contained in the Los Angeles County Building Code. The Project would also be required to comply with the site plan review and permitting requirements of the County of Los Angeles Department of Public Works, Building and Safety Division, including the recommendations provided in site-specific geotechnical reports subject to Building and Safety Division's review and approval, as reflected in Project Design Feature F-1 and Project Design Feature F-2. Compliance with regulatory requirements and implementation of project design features would ensure Project construction adheres to the seismic safety requirements contained in the State and County Building Codes and that site-specific engineering recommendations are implemented in accordance with a design-level geotechnical investigation. Therefore, the Project would not expose people or structures to potential substantial adverse effects associated with seismic ground shaking, and impacts would be less than significant.

5.6.2 Liquefaction and Lateral Spreading

Portions of the Project Site are located within an area that has been identified by the State as being potentially susceptible to liquefaction. Given the Project Site's location within an area potentially susceptible to liquefaction, significant impacts with regard to liquefaction and lateral spreading could occur. Accordingly, Mitigation Measure F-1, provided below, would require that Project construction involve a combination of ground modification (remedial grading) and/or structural enhancements that would address potential liquefaction hazards. In addition, Project construction would adhere to the seismic safety requirements contained in the California and County Building Codes applicable to liquefaction and lateral spreading. With compliance with regulatory requirements and incorporation of the recommended structural enhancements into the design and construction of the Project, the Project would not expose people or structures to potential

substantial adverse effects related to liquefaction and lateral spreading, and potential impacts would be reduced to a less than significant level.

5.6.3 Landslides and Slope Stability

Based on the Seismic Hazard Zone Map for the Hollywood Quadrangle, a portion of the Project Site is located within an area that has been identified by the State as being susceptible to seismically-induced landslides. Based on the site-specific conditions observed as part of the geotechnical investigations, the Project Site is primarily susceptible to shallow landslide events such as debris flows and rockfalls associated with the natural slopes of the Project Site. As such, the Project could result in potentially significant impacts with regard to landslides and slope stability. The results of the stability analyses indicate the Project Site would attain sufficient stability with minor surficial grading and the incorporation of slope reinforcement measures as specified in Mitigation Measure F-2. In addition, for protection against potential future rockfalls, Mitigation Measure F-2 also includes the installation of flexible barriers. Therefore, with implementation of Mitigation Measure F-2, the Project would not expose people or structures to potential substantial adverse effects related to landslides or slope failures, and impacts would be less than significant.

5.6.4 Erosion

Sedimentation and erosion could potentially occur as a result of exposed soils during Project construction. However, construction activities would occur in accordance with erosion control requirements, including grading and dust control measures, imposed by the County pursuant to grading permit regulations. In addition, as part of the Storm Water Pollution Prevention Plan, Best Management Practices would be implemented during construction to reduce sedimentation and erosion levels to the maximum extent possible. The Project also would comply with South Coast Air Quality Management District Rule 403, which requires the implementation of best available fugitive dust control measures during active construction periods capable of generating fugitive dust emissions. With compliance with regulatory requirements and implementation of appropriate Best Management Practices, impacts with respect to soil erosion and the loss of topsoil associated with Project construction would be less than significant.

Project operations could result in a limited degree of soil erosion from vegetated areas. However, the Project would be required to have a Low Impact Development Plan in place during the operational life of the Project in compliance with National Pollutant Discharge Elimination System permit requirements. The Low Impact Development Plan would include Best Management Practices which would reduce on-site erosion from vegetated areas within the Project Site. With compliance with these regulatory

requirements, impacts with respect to sedimentation and erosion during operation would be less than significant.

5.6.5 Corrosive Soils

Corrosion testing performed suggests the soils within the Project Site could be corrosive to concrete and ferrous metals. Corrosion testing would be performed, as required by the County Building Code, and final recommendations for concrete would be made in accordance with the latest California Building Code requirements. With compliance with all regulatory requirements and implementation of the recommendations set forth in the Geotechnical Reports as well as any subsequent recommendations, as applicable, impacts related to corrosion would be less than significant.

5.6.6 Cumulative Impacts

Cumulative growth through 2020 (inclusive of the 27 related projects) would expose a greater number of people to seismic and other secondary hazards. However, as with the Project, related projects and other future development projects in the area would be subject to established guidelines and regulations pertaining to building design and seismic safety, including those set forth in the California Building Code and Los Angeles County Building Code (or City of Los Angeles Building Code requirements, as appropriate). Therefore, with adherence to such regulations, cumulative impacts with regard to geology and soils would be less than significant.

Mitigation Measures

Mitigation Measure F-1: Project grading shall include a combination of ground modification and/or structural enhancements in areas subject to liquefaction to reduce the risk to an acceptable level (as defined by the California Geological Survey in Special Publication 117a, Chapter 2). Ground modification shall consist of the removal and replacement of undocumented fill with engineered fill. Subsequently, foundations shall be supported on conventional shallow footing See our previous comment. Mitigation measures should be as per approved plans and Chapter 20.87 of the C systems established on engineered fill or undisturbed bedrock.

Mitigation Measure F-2: In order to minimize, capture, and manage debris flows and rockfalls, the Project shall incorporate a combination of the following measures:

- Remove and recompact loose surficial material and remove rock fall accumulations;

- Construct storm drain and catch basins in swales above proposed retaining walls to provide an outlet for rainfall runoff and to catch eroded materials. Regular maintenance of catch basins to remove eroded materials shall be performed to preserve the basin and drain functionality;
- Install retaining walls; and
- Install flexible barriers or anchored mesh net.

Finding

The County adopts the first possible finding, which states that "changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR." (Guidelines Section 15091 (a)(1)).

5.7 Hydrology, Surface Water Quality, and Groundwater

The Draft EIR analyzed potential impacts regarding hydrology, surface water quality, and groundwater in Section IV.G, Hydrology, Surface Water Quality, and Groundwater, of the Draft EIR. Supporting technical analyses are included in Appendix I, Hydrology and Water Quality Report, of the Draft EIR.

5.7.1 Construction Impacts

(a) Surface Water Hydrology and Water Quality

Construction of the Project would require onsite demolition, grading, and excavation activities. Such construction activities would have the potential to temporarily alter existing drainage patterns and flows within the Project Site by exposing the underlying soils and making the Project Site temporarily more permeable. Exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, construction activities such as earth moving, maintenance/operation of construction equipment, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff. Onsite watering activities to reduce airborne dust could also contribute to pollutant loading in runoff. The main pollutant of concern during construction would be sediment or soil particles that would become detached by water and wind. In accordance with the requirements of the Construction General Permit, the Project would implement a Storm Water Pollution Prevention Plan that would specify best management practices (BMPs) to be used during construction to manage runoff flows and erosion and prevent pollution. BMPs would also be provided to target pollutants of concern and be designed to reduce runoff and pollutant levels in runoff during construction.

Further, implementation of BMPs such as sandbag barriers and other sediment barriers would serve to maintain the existing drainage flow paths and discharge points during construction.

Through compliance with all NPDES Construction General Permit requirements, including the preparation and implementation of a Storm Water Pollution Prevention Plan, implementation of BMPs, and compliance with applicable County grading regulations, construction of the Project would not violate any water quality standards; substantially alter the existing drainage pattern of the Project Site and surrounding area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site; create or contribute runoff water which would exceed the capacity of the existing stormwater drainage system or provide substantial additional sources of polluted runoff and otherwise substantially degrade water quality. In addition, Project construction would not require or result in the construction of new stormwater drainage facilities which could cause significant environmental effects. As such, impacts to surface water hydrology and water quality during construction would be less than significant.

(b) Groundwater

No water supply wells are located at the Project Site or within 1 mile of the Project Site that could be impacted by construction, nor would the Project include the construction of water supply wells. In addition, as noted above, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater is not expected to be encountered within the Project Site. Furthermore, groundwater was not encountered during recent on-site explorations conducted within the Project Site. Accordingly, it is not expected that groundwater would be encountered during construction that would require temporary or permanent dewatering operations. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Additionally, compliance with all applicable federal, State, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater. As such, Project construction would not result in a significant impact with regard to groundwater.

5.7.2 Operational Impacts

(a) Surface Water Hydrology

With implementation of the Project, the amount of impervious area would increase from approximately 11 percent to 13 percent. Accordingly, Project development would increase the amount of stormwater flow and volume. In addition, development of the

Project would change existing drainage areas by bisecting existing tributary flows. With Project development, the total flow rate for the Project Site would increase from 119.92 cubic feet per second to 123.44 cubic feet per second and the total collected volume would increase from 381,586 cubic feet to 392,476 cubic feet. Although the runoff volume would increase as a result of an increase in impervious area, in accordance with NPDES and County requirements as set forth in Project Design Feature G-2, a Low Impact Development Plan would be prepared and implemented for the Project that would specify BMPs to promote bioretention or other functions to detain water onsite to manage post-construction stormwater runoff associated with a 0.75-inch, 24-hour storm event. In addition, the design runoff would be managed so as not to exceed the recommended and allowable runoff flows determined by the Los Angeles County Department of Public Works. Therefore, with compliance with regulatory requirements, the Project would not substantially alter the existing drainage pattern of the site or area or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or flooding on- or off-site, and would not create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, or require the construction of new stormwater drainage facilities. As such, operation of the Project would result in a less-than-significant impact on surface water hydrology.

(b) Surface Water Quality

As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. As part of the NPDES and County requirements, a Low Impact Development Plan would be prepared for the Project which would outline the stormwater treatment measures or post-construction BMPs required to control pollutants of concern associated with storm events up to the 0.75-inch precipitation level. BMPs would include source control and treatment control BMPs to remove pollutants from stormwater discharges. As the Project Site currently does not have structural BMPs for the treatment of stormwater runoff from the existing impervious surfaces, implementation of BMPs to capture and naturally filter stormwater from the Project Site would result in an improvement in surface water quality runoff from the Project Site compared to existing conditions. Therefore, with compliance with NPDES and County requirements which would require the implementation of BMPs that would serve to improve runoff from the Project Site, operation of the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality. Thus, operational impacts on surface water quality would be less than significant.

(c) Groundwater

As discussed in the Hydrology and Water Quality Report, the soils underlying the Project Site are not conducive to infiltration as they are underlain by bedrock. Notwithstanding, no water supply wells are located within the Project Site or within 1 mile of the Project Site and, due to the relatively high topographical relief and the exposed or shallow bedrock throughout the majority of the Project Site, shallow groundwater does not occur within the Project Site. Therefore, Project development would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination. As such, operation of the Project would not result in significant impacts to groundwater.

5.7.3 Cumulative Impacts

(a) Surface Water Hydrology and Water Quality

The Project in conjunction with the cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) through 2020 would cumulatively increase stormwater runoff flows and could possibly increase the amount of pollutants potentially resulting in cumulative impacts to surface water hydrology and water quality. However, as with the Project, cumulative growth in the Santa Monica Bay Watershed (inclusive of the related projects) would be subject to NPDES and local requirements, including implementation of Storm Water Pollution Prevention Plans, Standard Urban Stormwater Mitigation Plans, and Low Impact Development Plans with appropriate BMPs to manage stormwater runoff and water quality during construction and operation. Furthermore, the local jurisdiction would review each future development project on a case-by-case basis to ensure sufficient local and regional drainage capacity is available to accommodate stormwater runoff. Therefore, with compliance with applicable laws, rules and regulations, cumulative impacts on surface water hydrology and water quality would be less than significant.

(b) Groundwater

As described above, no water supply wells, spreading grounds, or injection wells are located within a 1-mile radius of the Project Site. In addition, Project development would not involve the temporary or permanent extraction of groundwater from the Project Site or otherwise use the groundwater. Furthermore, while implementation of the Project would result in an increase in impervious surface area, per County requirements, the Project would implement BMPs to capture the first flush or first 0.75-inch of rainfall for any storm event and offset the potential reduction in percolation resulting from Project development.

However, development of the related projects could result in changes in impervious surface area within their respective project sites which would decrease the potential for groundwater recharge. As the related projects are located in a highly urbanized area, any reduction in groundwater recharge due to the overall net change in impervious area within the related project sites would be minimal in the context of the regional groundwater basin. Additionally, compliance with all applicable existing regulations at the Project Site would prevent the Project from affecting or expanding any potential areas affected by contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. As with the Project, the related projects would be unlikely to cause or increase groundwater contamination because compliance with existing statutes and regulations would similarly prevent the related projects from affecting or expanding any potential areas affected by contamination, or increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated. Therefore, cumulative impacts to groundwater would be less than significant.

Mitigation Measures

The Project would result in less than significant impacts to surface water hydrology, water quality, and groundwater during construction and operation. No mitigation measures would be required.

5.8 Land Use

The Draft EIR analyzed potential impacts regarding land use in Section IV.H, Land Use, of the Draft EIR.

5.8.1 Consistency with Local and Regional Plans and Applicable Policies

The Project would support policies of the County's General Plan, General Goals and Policies Chapter regarding the preservation of open space areas and cultural resources, encouraging cultural and social diversity, and environmental sustainability. The Project would also support various policies of the Conservation and Open Space Element by incorporating a variety of sustainability features and maximizing the preservation of the Project Site's existing open space areas, thus maintaining the natural and scenic character of the area. With regards to the Land Use Element, the Project would support compatibility with the existing development of the Project Site and the preservation of surrounding uses and open space. The Project would further support policies of the Transportation Element by providing a new traffic signal to allow for safer left turns from the southern (egress)

driveway to Cahuenga Boulevard East; providing one new driveway between the northernmost driveway and the main entrance to facilitate access and circulation with the proposed Transit Center; and reconfiguring the northernmost driveway to provide vehicles with direct access to the proposed maintenance facility and allow egress from the north parking structure, thereby improving the flow of vehicles within and adjacent to the Project Site. The Project would also encourage use of public transit by continuing to promote parking at the Universal City/Studio City Metro Red Line Station where a shuttle would continue to be provided to and from the Ford Theatres during evening events. Additionally, with the implementation of water conservation features and the provision of necessary utility improvements, the Project would support applicable policies of the Water and Waste Management Element. The Project would also support policies of the Safety Element and would coordinate with the County and City Fire Departments and implement recommended guidelines regarding wildland fire prevention to reduce fire hazards. Overall, the Project would be generally consistent with the intent and applicable policies of the County General Plan.

While development of the Project Site is governed by the County General Plan and the Los Angeles County Code, a consistency analysis with relevant policies of the City General Plan was also conducted. Further, the Project would support policies of the General Plan Framework Land Use Chapter regarding the establishment of new open space opportunities to serve the needs of existing and future residents. In addition, as off-site residential uses would continue to be buffered from proposed on-site development by existing intervening undeveloped open space, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Land Use Chapter regarding preservation of and compatibility with the scale and character of the City's residential neighborhoods. The Project would also be consistent with the relevant objectives and policies of the General Plan Framework's Urban Form and Neighborhood Design Chapter through the development and improvement of community facilities which would serve to meet the performing arts and recreational needs at a City- and County-wide level. Additionally, with the conservation of the majority of the Project Site's open space areas, the Project would be consistent with the goals, objectives, and policies of the General Plan Framework's Open Space and Conservation Chapter, which guides the provision, management, and conservation of the City's public open space resources. The Project would also provide for necessary infrastructure improvements and would therefore be generally consistent with the relevant goals, objectives, and policies of the General Plan Framework's Infrastructure and Public Services Chapter. Furthermore, with the continued use of the Project Site as a public regional park and performing arts center, the Project would be consistent with the Project Site's land use designation as a public facility as set forth by the Hollywood Community Plan and Hollywood Community Plan Update. In summary, the Project would be generally consistent with relevant policies of the City General Plan.

With regard to zoning, the Los Angeles County Planning and Zoning Code regulates development of unincorporated areas of the County through land use designations and development standards regarding allowable uses, density, height, and design. As the Project Site is not located within an unincorporated area of the County, land use and zoning designations have not been established by the County for the Project Site. However, since the Project Site is owned and operated by the County, the Project would be built in accordance with Los Angeles County Code building design requirements. The Project Site is located within the City of Los Angeles and is zoned per the City of Los Angeles Municipal Code. With implementation of the Project, the Project Site would continue to be used as a public regional park and performing arts center. As such, the Project would be consistent with the City of Los Angeles zoning of the Project Site for Public Facilities. In addition, while some of the proposed buildings and structures would exceed 30 feet in height, the Project has been intentionally designed to be compatible with the massing, size, and scale of the existing structures.

The Project would be generally consistent with the Southern California Association of Governments' 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy, Growth Vision Report, and Regional Comprehensive Plan. Additionally, as Project development would not have a significant long-term impact on the region's ability to meet State and federal air quality standards. The Project would therefore be consistent with the goals and policies of the SCAQMD's Air Quality Management Plan. Further, the Project would not conflict with the Congestion Management Program as it would not result in significant impacts to the nearby Congestion Management Program intersections or freeway monitoring locations.

Based on the analysis provided above, the Project would be generally consistent with the adopted County and City General Plans and with relevant environmental policies in other applicable plans. As such, the Project's impacts related to land use consistency would be less than significant.

5.8.2 Cumulative Impacts

Future growth through 2020 (the Project's buildout year) as a result of related projects and general ambient growth would have the potential to alter the existing land use environment due to infill development at increased densities, conversions of vacant land to new development, and/or conversions of land uses. However, future development projects would be subject to existing zoning and land use designations as well as environmental review by the County or City. Therefore, such future projects are not expected to fundamentally alter the existing land use relationships in the community.

The closest related project to the Project Site is Related Project No. 22, located approximately 0.8 mile southwest of the Project Site. Given its distance from the Project Site and intervening land uses, Related Project No. 22 would not combine with the Project to create any incompatibility with surrounding land uses. Additionally, as the Project would be compatible with existing surrounding land uses and would be generally consistent with applicable land use plans and policies, the Project would not contribute to significant cumulative land use compatibility or consistency impacts. The balance of the related projects would not cause cumulative land use impacts due to distance and/or existing intervening development. As such, cumulative impacts with regard to land use would be less than significant.

Mitigation Measures

The Project would be generally consistent with applicable land use plans, policies, and regulations and no significant impacts with regard to land use would occur. Thus, no mitigation measures would be required.

5.9 Noise

The Draft EIR analyzed potential impacts regarding noise in Section IV.I, Noise, of the Draft EIR. Supporting technical data is included in Appendix I, Noise Worksheets, of the Draft EIR.

5.9.1 Construction Noise

(a) On-Site Construction Noise

Noise impacts from Project construction activities occurring within or adjacent to the Project Site would be a function of the noise generated by construction equipment, the location of the equipment, the timing and duration of the noise-generating construction activities, and the relative distance to noise sensitive receptors. Construction activities would generally include demolition, grading and excavation, and building construction. Each stage of construction would involve the use of various types of construction equipment and would, therefore, have its own distinct noise characteristics. Noise from construction equipment would generate both steady-state and episodic noise that could be heard within and adjacent to the Project Site. The estimated construction noise levels at the nearest off-site receptors R1, R2 and R4 would be well below the existing daytime ambient noise levels. At receptor R3, the estimated construction-related noise levels would be consistent with the lowest measured ambient noise levels. The estimated construction-related noise levels would be below the Project significance threshold. Therefore, noise impacts associated with the Project's on-site construction activities would be less than

significant. However, Mitigation Measures I-1 and I-2, provided below, would further reduce noise levels within the Project Site.

(b) Off-Site Construction Traffic Noise

The major noise sources associated with off-site construction trucks would be associated with haul and delivery trucks. Based on an eight-hour workday and a uniform distribution of trips, there would be a maximum of 12 truck trips per hour during the peak construction period. The noise level generated by haul trucks during the peak construction period would be well below the existing daytime ambient noise level at the noise sensitive receptors along the haul routes. Therefore, noise impacts from off-site construction traffic would be less than significant.

5.9.2 Construction Vibration

Project construction activities would generate ground-borne vibration during site demolition and excavation/grading activities when heavy construction equipment, such as large bulldozers, would be used. Vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. The estimated vibration velocity levels (from all construction equipment) would be well below the significance thresholds. Therefore, vibration impacts associated with potential building damage to off-site building structures during construction activities would be less than significant.

With regard to potential building damage to the on-site historic Amphitheatre, vibration velocities from typical heavy construction equipment operations that would be used during construction of the Project would range from 0.003 to 0.210 PPV at 25 feet from the equipment. Therefore, on-site vibration impacts associated with building damage could be significant. With implementation of Mitigation Measure I-3, which would require that construction activities in close proximity (within approximately 20 feet) of the existing Amphitheatre structure utilize smaller equipment, such as a small bulldozer and handheld compactors, vibration levels would be reduced to less than 0.12 PPV. Therefore, with implementation of Mitigation Measure I-3, potential on-site vibration impacts with respect to building damage would be reduced to less than significant.

Relative to potential human annoyance impacts associated with the generation of on-site vibration, the estimated ground-borne vibration levels from construction equipment would be below the significance threshold for human annoyance at all off-site sensitive receptors. Therefore, on-site vibration impacts on human annoyance during construction would be less than significant.

Haul trucks during construction would generate ground-borne vibration as they travel along the Project designated haul routes. Thus, an analysis of potential vibration impacts associated with building damage and human annoyance from ground-borne vibration along the local haul route was conducted. Based on FTA data, the vibration generated by a typical truck would be approximately 63 VdB (0.006 PPV) at a distance of 50 feet from the truck. At the shortest distance between haul trucks and sensitive receptors, haul/delivery trucks would be approximately 10 feet from nearby sensitive receptors along Cahuenga Boulevard East. Vibration levels generated by the haul trucks at this distance would be 0.063 PPV, which would be well below the building damage threshold of 0.2 PPV for the residential buildings along Cahuenga Boulevard East. In addition, vibration levels generated by Project construction trucks along the haul routes would be similar to the existing truck traffic already traveling on the same roads. Therefore, potential impacts associated with vibration from delivery/haul trucks traveling along the designated haul routes would be less than significant.

5.9.3 Operational Noise

(a) On-Site Stationary Noise Sources

(i) Mechanical Equipment

As part of the Project, new mechanical equipment would be located in various locations throughout the Project Site. Although operation of this equipment would generate noise, Project Design Feature I-1 would ensure compliance with the County's Noise Ordinance, which would limit noise from mechanical equipment from exceeding the ambient noise levels on the premises of other occupied properties. In addition, as the Project's mechanical equipment would be designed to minimize noise to on-site uses and patrons, noise levels to off-site receptors from mechanical equipment would be further reduced. Therefore, noise impacts from mechanical equipment would be less than significant.

(ii) Outdoor Areas

The Project includes two outdoor plazas at the Ford Terrace, the Transit Plaza, and Ford Plaza. In addition, the Project would include a restaurant located at the Ford Plaza that would feature an outdoor seating area with an amplified sound system. In accordance with the County's Noise Ordinance, the amplified sound system would be designed so as not to exceed a maximum noise level of 90 dBA (L_{eq}) at the restaurant outdoor seating area. Overall, the estimated noise levels from the plaza areas would not exceed the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from outdoor spaces would be less than significant.

(iii) Transportation Facilities

Sources of noise within the parking structures would primarily include car movements (i.e., engine noise), doors opening, people talking, and intermittent car alarms. The Project would also introduce a new Transit Center at the north parking structure that would include a staging area for buses to load and unload. It is anticipated that there would be up to 10 buses loading/unloading at the Transit Center at any given time. The estimated noise levels from the parking structures and the Transit Center would be below the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from the parking structures and Transit Center operations would be less than significant.

(iv) Performance Spaces

The analysis for the performance spaces accounted for audience cheering as well as an amplified sound system. As specified by Project Design Feature I-2, the proposed amplified sound system for the Amphitheatre would be designed to generate a maximum sound level of 95 dBA (L_{eq}) at as measured in "slow" response at the house mixer location. Similarly, the assumed sound levels generated by the amplified sound system inside the 299 seat theater and the 99 seat Flex Space would be approximately 95 dBA (L_{eq}). In addition, in accordance with Project Design Feature I-3, the building structure of the 299-seat theatre and the Flex Space would be designed to provide a minimum 25 dBA noise reduction. The estimated noise levels from the performance spaces would be well below the ambient noise levels at receptors R2 and R4. The estimated noise levels from the Amphitheatre amplified sound systems at receptors R1 and R3 would be approximately 0.5 dBA and 2.7 dBA higher than the existing ambient noise levels. However, the measured ambient noise levels do not include the existing Amphitheatre operation-related activities, which would result in higher ambient noise levels due to noise generated from performances within the Amphitheatre. It is further noted that the noise levels from the new 299-seat theatre and Flex Space would be contained within the building structures and are estimated to be well below the existing ambient noise levels. Therefore, the noise levels from the performance spaces including the new facilities would be similar to existing conditions with the Amphitheatre being in operation. As such, noise impacts from the performance spaces would be less than significant.

(v) Loading Dock/Trash Collection Areas

The Project would include a new Service Court, which would include a new loading dock and trash/recycling areas. Based on measured noise levels from typical loading dock facilities, delivery trucks (while idling at the loading dock) could generate noise levels of approximately 71 dBA (L_{eq}) at a distance of 50 feet from the noise source. In addition, trash compactors would generate noise levels of approximately 66 dBA (L_{eq}) at a distance of 50 feet. The estimated noise levels from the loading dock/trash collection areas would

be well below the existing ambient noise levels at the off-site receptors. Therefore, noise impacts from loading dock/trash collection operations would be less than significant.

(b) Off-Site Traffic (Mobile Sources)

(i) Future plus Project

Future roadway noise levels were calculated along 11 off-site roadway segments in the vicinity of the Project Site. The calculated CNEL levels overestimate noise levels as they are calculated in front of the roadways and do not account for the presence of any physical sound barriers or intervening structures. The Project would result in a maximum increase of 0.2 dBA (peak-hour L_{eq} and 24-CNEL) in traffic-related noise levels along Odin Avenue during both the weekday and weekend. The estimated noise increase due to Project-related traffic would be well below the 3 dBA significance threshold. Therefore, off-site traffic noise impacts associated with future plus Project conditions would be less than significant.

(ii) Existing plus Project

An additional analysis was conducted to determine the potential noise impacts based on the increase in noise levels due to Project-related traffic compared with the existing baseline traffic noise conditions. The maximum Project-related traffic noise increase would be 0.2 dBA CNEL along Odin Avenue. The estimated increase in off-site traffic noise levels would be below the 3-dBA CNEL significance threshold. Therefore, off-site traffic noise impacts associated with the existing plus Project traffic conditions would be less than significant.

(c) Composite Noise Level Impacts from Project Operations

In addition to considering the potential noise impacts to neighboring noise-sensitive receptors from each specific off-site and on-site noise source, an evaluation of the potential composite noise level increase (i.e., noise levels from all noise sources combined) at the analyzed sensitive receptor locations was also performed. The Project would result in an increase of 1.0 dBA at Location R3 up to 1.4 dBA at Location R1. No noise increase is anticipated at receptor Locations R2 and R4. The estimated increases in noise levels due to Project operation would be below the 3 dBA CNEL significance threshold. Therefore, composite noise level impacts due to the Project operations would be less than significant.

5.9.4 Cumulative Impacts

(a) Construction Noise and Vibration

Noise from construction of development projects is typically localized and has the potential to affect areas within 500 feet from the construction site. Thus, noise from construction activities for two projects within 1,000 feet of each other can contribute to a cumulative noise impact for receptors located midway between the two construction sites. The nearest related project is Related Project No. 22 (a hotel development at 1841 Highland Avenue), which is approximately 0.8 mile from the Project Site. Other related projects are located further from the Project Site. Due to the distance attenuation and intervening buildings between the related projects, cumulative noise impacts from construction activities would be less than significant.

Additionally, as ground-borne vibration decreases rapidly with distance, potential vibration impacts due to construction activities are generally limited to buildings/structures that are located in close proximity of the construction site (i.e., within 50 feet). As indicated above, the nearest related project is approximately 0.8 mile from the Project Site. Therefore, due to the rapid attenuation characteristics of ground-borne vibration, there is no potential for a cumulative construction impact with respect to ground-borne vibration.

(b) Operational Noise

Due to provisions set forth in the LAMC that limit stationary source noise from items such as roof-top mechanical equipment, noise levels would be less than significant at the property line for each related project. In addition, with implementation of regulatory requirements and proposed Project design features, noise impacts associated with operations within the Project Site would be less than significant. Based on the distance of the related projects from the Project Site and the noise levels associated with the Project, cumulative stationary source noise impacts associated with operation of the Project and related projects would be less than significant.

The Project and other related development in the area would produce traffic volumes (off-site mobile sources) that would generate roadway noise. Cumulative traffic volumes during a typical weekday would result in a maximum increase of 1.9 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. During a typical weekend, the maximum cumulative traffic noise increase would be 2.5 dBA along Cahuenga Boulevard, between Pilgrimage Bridge and Hollywood Bowl Road. At all other analyzed roadway segments, the increase in cumulative traffic noise would be lower. Thus, the cumulative traffic noise increase would be below the 3 dBA significance threshold. Therefore, cumulative noise impacts due to off-site mobile noise sources

associated with the Project, future growth, and related projects would be less than significant.

Mitigation Measures

Mitigation Measure I-1: Power construction equipment (including combustion engines), fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards). All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated.

Mitigation Measure I-2: Project construction shall not include the use of driven pile systems.

Mitigation Measure I-3: Contractor shall utilize smaller construction equipment, such as, small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure.

Finding

The County adopts the first possible finding, which states that "changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR." (Guidelines Section 15091 (a)(1)).

5.10 Public Services—Fire Protection

The Draft EIR analyzed potential impacts regarding fire protection in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR. Supporting information is included in Appendix K, Correspondence from Public Service Providers, of the Draft EIR.

5.10.1 Construction Impacts

Project construction could temporarily increase the demand for fire protection and emergency medical services within the Project Site as construction activities could potentially expose combustible materials such as wood, plastics, sawdust, covers and coatings, to sources of ignition from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings, and lighted cigarettes. In compliance with Occupational Safety and Health Administration and Fire and Building Code requirements, construction managers and supervisory personnel would be trained in emergency response and fire safety operations, including the monitoring and management of life safety systems and facilities, and maintaining fire suppression equipment such as fire

extinguishers on-site. Additionally, the Project would comply with County requirements to ensure brush clearance and other applicable measures are followed to reduce the likelihood of fire spreading through the surrounding undeveloped hillsides. Therefore, construction impacts on fire protection and emergency medical services would be less than significant.

Emergency access for City Fire Department vehicles within the Project Site and the surrounding vicinity could also be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from the Project Site, and construction worker traffic. However, the Project would implement a Construction Management Plan during construction of the Project, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure emergency access to the Project Site and vicinity is maintained. In addition, construction worker and haul truck trips would generally occur outside the typical weekday commuter morning and afternoon peak periods. Further, emergency vehicles would utilize emergency sirens to clear a path of travel or drive in opposing traffic lanes to avoid heavy traffic. As such, impacts related to emergency access would be less than significant.

5.10.2 Operational Impacts

(a) Facilities and Equipment

The Project does not include the development of any new residential uses and, as such, would not increase the permanent residential population within the service area of Fire Station No. 76. However, the Project would generate an increase in the daytime population at the Project Site associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. As such, the Project's increase in the population within the Project Site would increase the demand for LAFD fire protection and emergency medical services. However, as indicated by the LAFD, no changes are currently proposed within Battalion 5, which includes the fire station that services the Project Site. In addition, the Project would incorporate building design features that comply with County and City fire safety requirements, as applicable, including, but not limited to, use of fire-resistant building materials where appropriate, smoke detection and fire alarm systems, automatic sprinkler systems, and portable fire extinguishers. Further, as set forth in Project Design Feature J.1-1, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required. Implementation of a fuel modification plan would serve to provide adequate defensible space around all potentially combustible structures within a fire environment. Compliance with applicable regulatory requirements would ensure that adequate fire prevention features would be provided that would reduce the demand for firefighting services.

Therefore, based on the type of development proposed and the availability of existing LAFD facilities, impacts with regard to LAFD facilities and equipment associated with the Project would be less than significant.

(b) Response Distance and Emergency Access

Section 57.507.3.3 of the Los Angeles Municipal Code sets forth a response distance for industrial and commercial uses of 1 mile from fire stations with an engine company and 1.5 miles from fire stations with a truck company. Fire Station No. 76 is located approximately 1 mile northwest of the Project Site and is equipped with one engine and one ambulance. Therefore, the Project would be located within the required emergency response distance. In addition, upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. Furthermore, the Project would incorporate specific access recommendations provided by the County Fire Department and LAFD as set forth in Project Design Feature J.1-2. Additionally, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest disaster route along Highland Avenue. The drivers of emergency vehicles also normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and LAFD. Therefore, Project-related traffic is not anticipated to impair the LAFD from responding to emergencies at the Project Site or the surrounding area. Impacts with regard to response distance and emergency access would be less than significant.

(c) Fire Flow

With implementation of a fire sprinkler system within all of the buildings proposed as set forth in Project Design Feature J.1-3, the required fire flow set forth by the County Fire Department would be 4,000 gallons per minute (gpm) at a pressure of 20 psi. This preliminary fire flow may be reduced as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project. Domestic and fire water service is currently provided from a 4-inch water service lateral line that connects to an 8-inch LADWP water main located in Cahuenga Boulevard East. The water main can provide approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include the installation of two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East, or other necessary improvements to accommodate the ultimate fire flow set forth during the building permit process, as provided in Project Design Feature J.1-4. In addition, the Project would include the installation of four private fire hydrants on-site and, as set forth in

Project Design Feature J.1-5, booster pumps would be required for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. As provided in Project Design Feature J.1-6, the enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. With construction of the necessary onsite fire water system improvements as coordinated with the County Fire Department, LAFD, and LADWP, the Project would meet the fire flow requirements set forth by the County Fire Department and LAFD. Therefore, impacts regarding fire flow would be less than significant.

(d) Wildfire Risk

Given the Project Site's location and surrounding undeveloped hillsides, the potential for fire hazards would exist near the Project Site due to the presence of brush, increased human activity, and the potential for fires due to accidents or arson-related causes. However, due to the Project Site's location within a Very High Fire Hazard Severity Zone, the Project would be required to comply with all applicable City and County requirements regarding construction, access, water mains, fire hydrants, fire flows, and brush clearance for this zone. In addition, as previously described, the Project would implement a fuel modification plan that would identify buffer zones for the planting of specific vegetation and areas where routine landscape maintenance is required so as to create adequate defensible space around all potentially combustible structures. Routine landscape maintenance would be conducted in accordance with the County Fire Department's Fuel Modification Plan Guidelines and would include pruning; removal of plant litter, dead plants, and unwanted species; and regular inspection and repair of the irrigation system. Through compliance with applicable City and County requirements regarding wildfire risks, as well as approval and implementation of a fuel modification plan, implementation of the Project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. Impacts with respect to wildfire risk would be less than significant.

5.10.3 Cumulative Impacts

A number of the identified related projects and ambient growth projections fall within the service areas of Fire Station Nos. 76, 27, and 41. Several of the related projects include residential uses, which would increase the residential population of Fire Station No. 76, the "first-in" station for the Project Site, as well the secondary fire stations available to provide service to the Project Site. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population of the area and thus also increase the demand on fire services. In conjunction with the Project, this growth would cumulatively generate the need for additional fire protection services. However, similar to the Project, the related projects and all other future development projects would be subject to discretionary review by the LAFD to ensure that

sufficient fire safety and hazards measures are implemented to reduce potential impacts to fire protection and emergency medical services. Furthermore, each related project would be required to comply with regulatory requirements related to fire safety, access, and fire flow.

Additionally, LAFD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, trucks and engines, ambulances, other special apparatuses, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Therefore, cumulative impacts on fire protection and emergency medical services would be less than significant.

Mitigation Measures

Project-level and cumulative impacts with regard to fire protection and emergency medical services would be less than significant. Therefore, no mitigation measures are required.

5.11 Public Services—Police Protection

The Draft EIR analyzed potential impacts regarding police protection in Section IV.J.2, Public Services—Police Protection, of the Draft EIR. Supporting information is included in Appendix K, Correspondence from Public Service Providers, of the Draft EIR.

5.11.1 Construction Impacts

Construction sites can be sources of nuisances and hazards, inviting theft and vandalism. When not properly secured, construction sites can contribute to a temporary increased demand for police protection services. Pursuant to Project Design Feature J.2-1, in consultation with the County of Los Angeles Sheriff's Department Parks Bureau, the Project would include the implementation of temporary security measures during construction, which could include on-site security personnel, surveillance cameras, adequate lighting, and perimeter fencing around the construction areas. In addition, equipment and building materials would be removed or secured during non-construction hours. With implementation of these measures, potential impacts associated with theft and vandalism during construction activities would be less than significant.

Emergency access for LASD and LAPD vehicles within the Project Site and the surrounding vicinity could be impacted by Project construction activities due to temporary lane closures, utility line construction, and the generation of traffic as a result of construction equipment movement, hauling of soil and construction materials to and from

the Project Site, and construction worker traffic. It is noted however that the construction-related traffic generated by the Project would not significantly impact LASD or LAPD response times within the Project vicinity since the drivers of police vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. In addition, most, if not all, of the construction worker and haul truck trips would occur outside the typical weekday commuter morning and afternoon peak periods, reducing the potential for traffic-related conflicts. The Project would also implement a Construction Management Plan during Project construction, wherein traffic management personnel and appropriate signage would be employed as necessary to ensure adequate and safe access to the Project Site and vicinity is maintained. With implementation of the project design features, including the Construction Management Plan, construction of the Project would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services during Project construction would be less than significant.

5.11.2 Operational Impacts

The Project does not include the development of any residential uses and, as such, would not increase the permanent residential population within the service area of the Parks Bureau South Zone or the Hollywood Community Police Station. However, the Project would generate a daytime population associated with employees and users of the hiking trail and restaurant as well as an increase in the population associated with events. The County currently operates an alarm system which is monitored by the LASD. In addition, security guards for events and overnight security shifts are currently contracted by the LASD. In consultation with LASD, these existing security and safety features would be continued and enhanced pursuant to Project Design Feature J.2-2. According to the LASD, implementation of the features set forth in Project Design Feature J.2-2 would serve to reduce the potential for criminal activities and assist law enforcement efforts. In addition, based on a preliminary review of the proposed improvements, the LAPD indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. The LAPD has also indicated that upon completion of the Project, the Applicant shall provide the LAPD Hollywood area commanding office with a diagram of each portion of the property, including access routes. Implementation of this project design feature would facilitate LAPD response. Therefore, the Project would not result in a demand for additional services that would exceed the capability of the LASD or the LAPD to serve the Project Site and impacts would be less than significant.

With respect to emergency access to the Project Site during Project operations, Project development would result in a less than significant impact on access and local

traffic conditions (i.e., nearby intersections). Therefore, the additional traffic generated by the Project would not significantly impact emergency vehicle access or response times for either the LASD or LAPD.

Based on the above, with implementation of the project design features, Project operation would not generate a demand for additional police protection services that would substantially exceed the capability of the LASD and LAPD to serve the Project Site and result in the need for new police protection facilities. Therefore, impacts on police protection services during Project operation would be less than significant.

5.11.3 Cumulative Impacts

The geographic context for the cumulative impact analysis is the service area of the LASD's Parks Bureau South Zone and the LAPD's Hollywood Community Police Station. The Project in conjunction with identified related projects and forecasted growth through 2020 (i.e., the Project's buildout year) within these service areas would cumulatively increase the demand for police protection. All of the identified related projects fall within the service boundaries of the Hollywood Community Police Station service area. Notwithstanding, as previously described, the LASD's Parks Bureau provides law enforcement services to County facilities, including parks, lakes, golf courses, and special event venues. The related projects do not include the development of such uses. As such, the Project in combination with the related projects would not contribute to a cumulative increase in the demand for LASD Parks Bureau police protection services. Therefore, cumulative impacts on LASD Parks Bureau police protection services would be less than significant.

With regard to the LAPD, several of the related projects include residential uses, which would increase the permanent residential population within the Hollywood Community Police Station service area. In addition, the related projects would involve an increase in retail, restaurant, hotel, and office uses, which would increase the daytime population in the area. Along with other anticipated growth through 2020, this would further increase the demand for police protection services. The Project would not develop residential units, and thus would not generate a residential population. Therefore, the Project would not contribute to a cumulative increase in the residential service population of the Hollywood Community Police Station. In addition, as previously discussed, based on a review of the Project, the LAPD has indicated that the Project, due to its size, would have a minimal impact on police services provided by the Hollywood Community Police Station. Therefore, the Project's contribution to the cumulative demand for police protection services provided by the LAPD would not be cumulatively considerable. Additionally, as with the Project, each related project would be subject to the City's routine construction permitting process, which includes a review by the LAPD to ensure that sufficient security

measures are implemented to reduce potential impacts to police protection services. Furthermore, the LAPD would continue to monitor population growth and land development throughout the City and identify additional resource needs including staffing, equipment, vehicles, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Through the City's regular budgeting efforts, the LAPD's resource needs would be identified and monies allocated according to the priorities at the time. Based on the above, the Project's contribution to cumulative impacts to police protection services would not be cumulatively considerable and, as such, cumulative impacts on police protection services would be less than significant.

Mitigation Measures

Project-level and cumulative impacts with regard to police protection services would be less than significant. Therefore, no mitigation measures are required.

5.12 Traffic, Access, and Parking

The Draft EIR analyzed potential impacts regarding traffic, access, and parking in Section IV.K Traffic, Access, and Parking, of the Draft EIR. Supporting technical analyses are included in Appendix L, Traffic Study, of the Draft EIR.

In consultation with the County of Los Angeles Department of Public Works, it was determined that the Traffic Study for the Project be prepared in accordance with the City of Los Angeles Department of Transportation's (LADOT) Traffic Study Policies and Procedures. LADOT's Traffic Study Policies and Procedures establish the guidelines for determining the appropriate traffic analysis for a project, analysis methodologies, and significance thresholds. The scope of analysis included in the Traffic Study was developed in consultation with both the County of Los Angeles Department of Public Works and LADOT staff. In addition, the base assumptions and technical methodologies (i.e., trip generation, study locations, analysis methodology, etc.) were identified as part of the Traffic Study approach and were reviewed and approved by County of Los Angeles Department of Public Works staff.

The traffic analysis summarized below includes the implementation project design features listed above in Section 4.0, Project Design Features, including a construction management plan and parking and traffic management plan. Further, Project Design Feature K-2 specifically requires that the Ford Theatres shall stagger the start times of simultaneous events to be held in the Amphitheatre and the 299-seat theatre on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons. Incorporation of these project design features would avoid potentially significant traffic impacts.

5.12.1 Traffic

(a) Construction Impacts

During the most intense construction phase, it is anticipated that construction activities would generate approximately 176 daily construction worker trips. In addition, based on a passenger car equivalency factor of 2.0, the 64 haul truck trips per day and the 30 daily delivery truck trips would be equivalent to 188 passenger car trips per day. Therefore, Project construction could generate a total of approximately 364 trips per day based on the construction phase. However, given the typical construction hours the Project would comply with, the majority of these trips would occur during off-peak hours. As such, Project construction would not be expected to result in a significant impact at any of the analyzed intersections. In addition, the Project would include implementation of a Construction Management Plan to minimize the amount and effect of construction traffic. As outlined in Project Design Feature K-1, the Construction Management Plan would prohibit construction workers, haul trucks and delivery trucks from parking, staging, or queuing along the surrounding residential streets.

(b) Operational Impacts

(i) Existing with Project Intersection Conditions

Based on the traffic analysis for Existing with Project Conditions, five of the eight intersections are projected to operate at LOS D or better during the analyzed periods. The remaining three intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these three intersections are the same intersections currently operating at LOS E or F under Existing Conditions. The addition of Project traffic to the study intersections would not exceed applicable significance thresholds. Therefore, the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Existing with Project Conditions.

(ii) Future (Year 2020) with Project Intersection Conditions

Based on the traffic analysis for Future (Year 2020) with Project Conditions, four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. It is noted that these four intersections are the same intersections projected to operate at LOS E or F under Future Conditions (without the Project). Similar to the Existing with Project Conditions scenario, Project traffic would contribute a small increase in the V/C ratios at most study intersections. Therefore, the Project would not result in a significant impact at any of the study intersections during the analyzed periods under Future with Project Conditions.

5.12.2 Congestion Management Program

(a) CMP Freeway Analysis

Based on the distribution of traffic in the vicinity of the Project Site, approximately 60 percent of the Project traffic was assigned to/from the US-101 and the Project Site. According to the trip generation estimates, the Project is expected to generate approximately 35 net new trips in the weekday A.M. peak hour, approximately 60 net new trips in the weekday P.M. peak hour, approximately 18 net new trips in the weekday evening peak hour, approximately 92 net new trips in the Saturday midday peak hour, and approximately 92 net new trips in the Saturday evening peak hour. The Project would add fewer than 150 trips in either direction during the weekday morning and afternoon peak hours. Therefore, no CMP impact would occur and no additional analysis of freeway segments is required per the CMP criteria.

(b) CMP Arterial Monitoring Stations

The CMP arterial monitoring stations closest to the Project Site are located at intersections of Santa Monica Boulevard & Highland Avenue and Cahuenga Boulevard & Lankershim Boulevard. Based on the Project trip generation and trip distribution patterns, the Project is estimated to add fewer than five trips to each of the arterial monitoring stations during the morning and afternoon peak hours. Therefore, the Project would not add more than 50 vehicle trips during the morning and afternoon peak hours at CMP arterial monitoring stations. Therefore, the Project's CMP arterial impacts are considered to be less than significant, and no further analysis is required.

(c) CMP Transit Analysis

(i) Construction

Project construction would not require the relocation or removal of the existing Metro transit stop adjacent to the Project Site or other transit stops in the vicinity of the Project Site. As such, Project development would not result in significant impacts on transit access.

(ii) Operation

Based on Metro's CMP methodology for estimating transit trips, the Project would generate an estimated increase in transit riders of approximately three net new transit trips in the weekday morning peak hour and two net new transit trips in the weekday afternoon peak hour. The study area is served by numerous established transit routes, including the Metro Red Line, two Metro bus lines, and one LADOT bus line. Distribution of the Project transit trips to the transit routes available in the area would result in less than one new

transit user for each transit line during the peak hours. Consequently, the total available capacity of the transit lines within the study area during the morning and afternoon peak hours is anticipated to more than accommodate the limited net additional trips during the morning and afternoon peak periods. Therefore, Project impacts on existing or future transit services in the study area would be less than significant.

5.12.3 Access and Circulation

(a) Emergency Access

(i) Construction

Construction activities for the Project would be concentrated within the Project Site with limited off-site activities for implementation of any necessary utility improvements. As outlined in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls, including provisions to prohibit construction equipment or material deliveries within the public right-of-way and the use of flag persons to improve traffic flow. Implementation of such provisions would ensure adequate emergency access to residences adjacent to the Project Site. In addition, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, access to the Project Site would continue to be available during construction of the Project. Thus, any potential emergency access impacts from Project-related construction would be less than significant.

(ii) Operation

Upon implementation of the Project, access to the Project Site would continue to be available via the four existing driveways along the eastside of Cahuenga Boulevard East with improved internal configuration and circular modifications to accommodate the Project. In addition, the Project would incorporate specific emergency access recommendations provided by the County Fire Department and the City of Los Angeles Fire Department as set forth in Project Design Feature J.1-2 included below. Furthermore, traffic generated by the Project would not result in significant impacts to Project area intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Notwithstanding, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Further, the Project would be designed in accordance with emergency vehicle access, clearance, and staging recommendations set forth by the County Fire Department and the City of Los Angeles Fire Department. Therefore, the Project would not result in inadequate emergency access and impacts would be less than significant.

(b) Bicycle and Pedestrian Access

(i) Construction

Construction of the Project would primarily be contained within the boundaries of the Project Site and would not affect the adjacent street system. In addition, as outlined in Project Design Feature K-1, a Construction Management Plan would be implemented during construction to provide for temporary traffic controls and address any temporary lane or sidewalk closures, if necessary. Thus, any potential access impacts from Project-related construction would be less than significant.

(ii) Operation

Existing pedestrian facilities would remain with implementation of the Project. As such, pedestrian access to the Project Site would continue to be available from the sidewalks currently provided along Cahuenga Boulevard East. In addition, as part of the Project, on-site pedestrian circulation would be improved by accommodating parking within two new parking structures and providing designated pedestrian pathways to and from the parking structures and the on-site uses, thereby eliminating the pedestrian-vehicular conflicts associated with a stacked parking configuration. With the implementation of the Transit Center and modifications to the driveways described above, the Project would also improve access and circulation for vehicles and shuttles.

Bicycle lanes in the study area currently exist on North Cahuenga Boulevard between Odin Avenue and Yucca Street. In addition, there are two streets designated as bicycle routes: Odin Avenue between Highland Avenue and North Cahuenga Boulevard and Wilcox Avenue south of North Cahuenga Boulevard. As these facilities do not cross the access locations to the Project Site, the Project would not affect existing designated bicycle lanes and routes in the study area. Notwithstanding, the existing sidewalks, access driveways, and lane configurations would be maintained with the Project. In addition, the Project would include bicycle amenities (e.g., bicycle parking and bicycle-friendly amenities) located throughout the Project Site.

In summary, the Project would not decrease the performance or safety of the existing circulation system and no significant impacts with regard to pedestrian and bicycle facilities are expected to result due to the design or placement of Project access points.

5.12.4 Parking

(a) Construction

During construction of the Project, parking for employees and construction workers would be provided on-site. In addition, the Construction Management Plan outlined in Project Design Feature K-1, would address and manage on-site parking for employees and construction workers within the Project Site. Therefore, Project construction would not result in a significant impact with regard to the availability of parking.

(b) Operation

An assessment of parking demand was conducted for several potential scenarios, including on a non-event day and during event days with varying attendance levels. The peak parking demand for the Project during the scenarios analyzed was estimated based on a combination of the Project's unique operational characteristics, including attendance levels, anticipated visitor arrival and departure patterns, empirical data from existing operations, industry-wide parking demand rates, average vehicle ridership rates, mode split (e.g., arriving by transit, walk, bicycle, etc.), internal capture (e.g., between the restaurant and the theatre uses), and employee data. As part of the Project, parking is proposed within two new parking structures, which are proposed to provide a total of 500 parking spaces (250 parking spaces in each structure). Parking within the parking structures could be expanded by approximately 75 spaces with the use of attendant assisted parking for a total of 575 parking spaces provided on-site. Additional parking at the Universal City/Studio City Metro Red Line Station would also continue to be available to accommodate the parking needs of the Project. Further, as outlined in Project Design Feature K-3, the Project would include implementation of a Parking and Traffic Management Plan to address the varying parking needs of the Project. The peak parking demands for the different operation conditions would be accommodated based on the number of parking spaces to be provided and with implementation of the strategies set forth in the Parking and Traffic Management Plan, including a combination of existing on-site parking facilities, operational measures to increase parking supply such as attendant-assisted parking, employee parking management, and continued use of the parking spaces and shuttle from the Universal City/Studio City Metro Red Line Station for employees and patrons. Therefore, a sufficient number of parking spaces would be available to serve the estimated peak parking demand during a non-event day and during the analyzed event day scenarios, and Project impacts with regard to parking would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

5.12.5 Summary of Impact Analysis

As provided by the analysis presented above, the Project would not result in significant impacts with regard to the local or regional transportation system, including intersections, highways, transit, and pedestrian and bicycle facilities. As such, the Project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, or conflict with an applicable congestion management program. In addition, the Project would not result in inadequate emergency access. Therefore, as demonstrated in the analysis above, impacts with regard to these topics would be less than significant.

5.12.6 Consistency with Regulatory Framework

As analyzed above, the Project would not result in significant impacts to public transit, bicycle, or pedestrian facilities and therefore would not decrease the performance or safety of such facilities. In addition, with implementation of the Project, the County would continue to promote several modes of transportation including walking, biking, or public transportation. Therefore, the Project would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities and such impacts would be less than significant.

5.12.7 Cumulative Impacts

(a) Traffic

(i) Construction

The related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, are not located in close proximity to the Project Site and may or may not be developed within the same construction schedule as the Project. In addition, as all of the related projects are located within the jurisdiction of LADOT, per standard City practice, the construction of large development projects would occur in accordance with project-specific construction management plans, as is the case with the Project. As the construction management plans are reviewed and approved by LADOT, it is anticipated that through this process, LADOT would coordinate construction activities among the related projects that would have the potential to result in cumulative intersection impacts. In addition, as analyzed above, the Project would not result in significant impacts at any of the intersections within the study area during construction. Further, implementation of the Construction Management Plan, as outlined in Project Design Feature K-1, would manage construction-related traffic in the study area. Thus, given the distance of the Project Site to the related Projects and the construction management plans that would be in place for the Project and the related projects, the Project's contribution to cumulative construction-

related traffic impacts would not be cumulatively considerable and cumulative impacts would be less than significant.

(ii) Operation

Implementation of the Project in conjunction with the related projects identified in Section III, Environmental Setting, of the Project's Draft EIR, and projected regional growth would increase the amount of traffic in the study area. The analysis of Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS. This analysis demonstrates that four of the eight study intersections are projected to operate at LOS D or better during the analyzed periods. The remaining four intersections are projected to operate at LOS E or F during one or more of the analyzed periods. The Project would not contribute to any significant impacts to these intersections and the Project's contribution to cumulative impacts would not be cumulatively considerable. As such, cumulative impacts would be less than significant.

(b) Congestion Management Program

The Project would not add more than 50 vehicle trips during the A.M. and P.M. peak hours at the CMP arterial monitoring stations nearest to the Project Site. In addition, the Project would add less than 150 trips along the nearest freeway segment serving the Project Site in either direction during either peak hour. Further, the Project would not result in significant impacts to public transit. Thus, no CMP impact would occur under the Project and, as a result, the Project's contribution to cumulative impacts would not be cumulatively considerable. Thus, the Project's cumulative impacts would be less than significant.

(c) Access and Circulation

(i) Emergency Access

As described above, the analysis of the Future (Year 2020) with Project Conditions reflects both Project-specific and future cumulative traffic impacts related to intersection LOS in the study area. This analysis concluded that the Project would result in less-than-significant impacts to study intersections, including intersections along the closest City-designated disaster route along Highland Avenue. Therefore, the Project's cumulative impacts would not be cumulative considerable. In addition, as with the Project, it is anticipated that related projects would continue to consult with the applicable Police and Fire departments regarding emergency access requirements and implement specific emergency access requirements. Additionally, the drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. Therefore, the Project's cumulative impacts to emergency would be less than significant.

(ii) Bicycle and Pedestrian Access

As provided above, Project impacts to bicycle and pedestrian access would be less than significant. Based on the proximity of the Project Site to the related projects, the closest of which is approximately 0.8 mile southwest of the Project Site, development of the Project in conjunction with the related projects would not be expected to impact any existing shared bicycle and pedestrian facilities. Additionally, as with the Project, the applicants of the related projects would be required to design and construct their projects in conformance with applicable standards regarding sight distance, sidewalks, crosswalks, and pedestrian movement controls. Therefore, cumulative impacts would be less than significant.

(d) Parking

The parking demand associated with the Project would not contribute to the cumulative demand for parking in the vicinity of the Project Site as a result of development of the Project and related projects. Specifically, the related projects are sufficiently separated from the Project Site such that they would not share parking supplies. Therefore, cumulative parking impacts would be less than significant. Additionally, because the Project would increase the number of parking spaces within the Project Site and enhance circulation and accessibility within the Project Site, it is anticipated that the Project would reduce the incentive for patrons to park on adjacent neighborhood streets.

Mitigation Measures

The Project would result in less than significant impacts to traffic, access, and parking. No mitigation measures would be required.

5.13 Utilities and Service Systems—Water

The Draft EIR analyzed potential impacts to water supply and infrastructure in Section IV.L.1, Utilities and Service Systems—Water, of the Draft EIR. See Appendix M, Water System and Supply Study, of the Draft EIR.

5.13.1 Construction

The amount of water used during construction would vary depending on the conditions of soils, weather, size of the construction site, and site-specific operations. It is estimated that a total of approximately 650,000 to 800,000 gallons of water could be used throughout construction of the Project. It is noted however that this increase in water demand associated with Project construction would be temporary in nature and would occur intermittently throughout construction as needed. In addition, as concluded in

LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years.

The Project would require construction of new, on-site water distribution lines to serve the proposed uses. Construction impacts associated with the installation of water distribution lines are expected to be confined to trenching in order to place the lines below surface. Further, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. In addition, prior to ground disturbance, Project contractors would coordinate with LADWP to identify the locations and depth of all lines. LADWP would also be notified in advance of proposed ground disturbance activities to avoid water lines and disruption of water service.

Based on the above, sufficient water supplies would be available to accommodate Project construction activities and, while the Project would require the construction of upgraded infrastructure facilities, the construction of such infrastructure improvements would not cause significant environmental effects. As such, construction-related impacts to water supply and infrastructure would be less than significant.

5.13.2 Operation

(a) Water Supply

It is estimated that the Project would have an average daily domestic water demand of approximately 17,470 gallons per day (gpd). When accounting for the existing total Project Site water demand of approximately 6,529 gpd, the Project would result in a net increase in average daily water demand of approximately 10,941 gpd. However, since development of the water demand rates from the California Plumbing Code used to calculate the Project's water demand, most water fixtures, including those that would be implemented as part of the Project, now have reduced flow rates by 50 percent. Therefore, when accounting for typical flow rates of existing water fixtures, the water demand of the Project is estimated to be approximately 5,471 gpd or approximately 6.13 acre-feet per year (assuming constant water use throughout the year). It is noted that the Project's estimated water demand is likely conservative as it does not account for additional water conservation features that would be implemented by the Project, including those required by the County as part of the County's Green Building Program. These water saving features, which could include updated landscaping and modern irrigation, would reduce the Project's net increase in water demand accordingly.

As concluded in LADWP's 2010 Urban Water Management Plan, projected water demand for the City would be met by the available supplies during an average year, single-dry year, and multiple-dry year through the year 2035, as well as the intervening years (i.e., 2020). The Project's estimated net increase in water demand of approximately 6.13 acre-feet per year would comprise approximately 0.0009 percent of the water demand for the City in 2020 during an average year, single-dry year, and multiple-dry year period. Therefore, the Project would be well within the available and projected water supplies for normal, single-dry, and multiple-dry years through the year 2035 and, as such, LADWP would be able to meet the water demand for the Project as well as existing and planned water demands of its future service area. Therefore, the Project's operation-related impacts on water supply would be less than significant.

(b) Water Infrastructure

Water service to the Project Site would continue to be supplied by LADWP for domestic and fire protection uses. While domestic water demand is typically the main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity.

With implementation of an approved automatic fire sprinkler system within all of the buildings proposed, the required fire flow would be 4,000 gpm at a pressure of 20 psi. This preliminary fire flow may be reduced as coordinated with the County Fire Department, LAFD, and LADWP during the building permit process for the Project. Based on pressure flow reports obtained from LADWP, the existing 8-inch LADWP water main in Cahuenga Boulevard East provides a flow of approximately 1,750 gpm at a residual pressure of 72 psi. To accommodate the required fire flow of 4,000 gpm, the Project would include two new connections to the existing 8-inch high pressure water main in Cahuenga Boulevard East. The Project may include other necessary improvements to accommodate the ultimate fire flow set forth during the building permit process. The Project would also include the installation of four private fire hydrants and provide booster pumps for all proposed hydrants to meet the minimum flow rate and pressure requirements around the Project Site. The enhanced fire system would be a dedicated separate fire service system with no shared connections to the domestic supply lines. The Project would also provide new, on-site water distribution lines to serve the proposed uses.

With implementation of the necessary water infrastructure improvements as coordinated with the County Fire Department, LAFD, and LADWP, the Project would not exceed the available capacity within the distribution infrastructure that would serve the Project Site. Therefore, the Project would not result in operation-related impacts to water infrastructure and impacts would be less than significant.

5.13.3 Cumulative Impacts

(a) Water Supply

The 2010 Urban Water Management Plan prepared by LADWP accounts for existing development within the City, as well as projected growth through the year 2035 based on demographic growth projections in the Southern California Association of Governments' 2008 Regional Transportation Plan. Additionally, under the provisions of Senate Bill 610, LADWP is required to prepare a comprehensive water supply assessment for every new development "project" (as defined by Section 10912 of the Water Code) within its service area that reaches certain thresholds. The types of projects that are subject to the requirements of SB 610 tend to be larger projects that may or may not have been included within the growth projections of the 2010 Urban Water Management Plan. The water supply assessment for such projects would evaluate the quality and reliability of existing and projected water supplies, as well as alternative sources of water supply and measures to secure alternative sources if needed. Continued efforts by LADWP to secure the reliability of water supplies in the future, combined with project-specific requirements to conduct analyses to ensure the availability of sufficient water supply to meet demand are expected to continue through 2020 (the Project's buildout year) and beyond. Based on LADWP's 2010 Urban Water Management Plan water demand projections through 2035 and the service area reliability assessment conducted by the LADWP, LADWP determined that it would be able to reliably provide water to its customers through the year 2035. As such, LADWP would be able to meet the water demand for the Project and the related projects.

Compliance of the Project with regulatory requirements that promote water conservation such as the County's Green Building Program, as well as Assembly Bill 32, that would also assist in assuring that adequate water supply is available on a cumulative basis.

Based on the above, it is anticipated that LADWP would be able to supply the demands of the Project, the related projects, and future growth through 2020 and beyond. Therefore, cumulative impacts on water supply would be less than significant

(b) Water Infrastructure

The geographic context for the cumulative impact analysis on water infrastructure is the vicinity of the Project Site. Development of the Project and future new development in the vicinity of the Project Site would cumulatively increase demands on the existing water infrastructure system. However, new development projects would be subject to LADWP review (or applicable jurisdiction) to assure that the existing public utility facilities would be adequate to meet the domestic and fire water demands of each project, and individual

projects would be subject to LADWP requirements regarding infrastructure improvements needed to meet respective water demands, flow and pressure requirements, etc. Furthermore, LADWP, Los Angeles Department of Public Works, and the Los Angeles Fire Department would conduct ongoing evaluations to ensure facilities are adequate. Therefore, cumulative impacts on the water infrastructure system would be less than significant.

Mitigation Measures

As the Project would have a less than significant impact on water supply and water infrastructure during construction and operation, mitigation measures are not required.

5.14 Utilities and Service Systems—Energy

The Draft EIR analyzed potential impacts regarding energy in Section IV.L.2, Utilities and Service Systems—Energy and Energy Conservation, of the Draft EIR. Supporting technical analyses are included in Appendix N, Electricity and Natural Gas Estimates and Will Serve Letters, of the Draft EIR.

5.14.1 Energy Demand

(a) Construction

(i) Electricity

Electricity consumption during Project construction would vary throughout Project construction based on the construction activity (i.e., grading, building construction, etc.). However, the electricity consumption that would occur due to Project construction activities would be offset by the reduction in electricity consumption resulting from the demolition of existing uses and would be temporary in nature.

Electrical service for the Project is proposed to be provided via underground utility lines. Alternatively, electrical service for the Project may be provided via approximately 15 to 17 overhead electrical poles that would be installed along Cahuenga Boulevard East. In addition, temporary electrical poles could be installed within the Project Site until full buildout of the Project. Additionally, during construction of the Project, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. Overall, demolition and construction activities would require limited electricity consumption and would not be expected to have any adverse impact on available electricity supplies and infrastructure. Therefore, construction-related impacts to electricity supply and infrastructure would be less than significant.

(ii) Natural Gas

Construction of the Project, including new buildings and facilities, typically would not involve the consumption of natural gas. Thus, there would be no demand generated by construction. The Project would, however, involve installation of new natural gas connections to serve the Project Site. Since the Project is located in an area already served by existing natural gas infrastructure, the Project would likely not require extensive infrastructure improvements to serve the Project Site. Construction impacts associated with the installation of natural gas connections are expected to be confined to trenching in order to place the lines below surface. As previously discussed, a Construction Management Plan would be implemented to ensure that adequate and safe access remains available within and near the Project Site during construction activities. In addition, prior to ground disturbance, Project contractors would notify and coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service. Therefore, construction-related impacts to natural gas supply and infrastructure would be less than significant.

(b) Operation

(i) Electricity

Project operations would increase the existing demand for electricity. Based on the electricity demand estimates, the Project's peak electricity demand would be approximately 2,105 KW of electricity per year. When accounting for the existing electricity usage of the former motel building, which would be removed as part of the Project, the Project's net peak electricity demand would be reduced to 2,065 KW per year. The estimated electrical consumption is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features. LADWP forecasts that in the 2020-2021 fiscal year, the annual electricity sold within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW. The Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Therefore, it is anticipated that LADWP's existing and planned electricity capacity and electricity supplies would be sufficient to support the Project's demand. In addition, LADWP has indicated that electric service to meet the Project is available and would be provided in accordance with LADWP's Rules and Regulations. While the availability of electricity is dependent upon adequate generating capacity and fuel supplies, the estimated power requirement for the Project is part of the total load growth forecast for the City and has been taken into account in the planned growth of the City's power system. Thus, operational impacts associated with the Project's consumption of electricity would be less than significant.

(ii) Natural Gas

Operation of the Project would result in an increase in the consumption of natural gas for the heating of spaces and water, and cooking at the proposed restaurant. Based on the natural gas demand estimates, the Project's natural gas demand is estimated to be approximately 8,500 cubic feet per hour. This estimated natural gas demand is a conservative estimate and does not factor in reductions in consumption from the implementation of energy conservation features. In addition, as existing natural gas usage associated with the former motel building is unknown, the Project's estimated natural gas demand does not account for existing natural gas usage within the former motel building, which would be removed as part of the Project.

Based on the Project's estimated yearly natural gas consumption of 496,400 Therms per year, the Project would account for approximately 0.007 percent of the forecast for the 2020 natural gas consumption throughout SoCalGas' planning area. Given the limited percentage of total demand represented by the Project, SoCalGas' planned demand forecasts likely account for Project development. In addition, SoCalGas has indicated that natural gas facilities are available in the area of the Project Site. Further, the Project would incorporate compliance measures to address applicable energy regulations and requirements. As such, operational impacts associated with the consumption of natural gas would be less than significant.

5.14.2 Energy Conservation

Green building design and construction practices would be implemented as part of the Project in compliance with the County's Green Building Ordinance. Accordingly, the Project would incorporate the County's Green Building Standards, including compliance with the California Energy Code. Design features that could be implemented would include, but not be limited to, light colored or "cool" roofs, efficient lighting and lighting control systems, energy-efficient heating and cooling systems and controls. In addition, the Project would incorporate a variety of water conservation features that would also promote energy conservation. Further, as part of the Project, the County would continue to promote the use of alternative modes of transportation by providing shuttles to and from the Universal City/Studio City Metro Red Line Station, thereby reducing energy usage associated with additional Project vehicles. Overall, the Project would be designed and constructed in accordance with state and local green building standards that would serve to reduce the energy demand of the Project. Additionally, based on the above, the Project's energy demand would be within the existing and planned electricity and natural gas capacities of LADWP and SoCalGas, respectively. Therefore, development of the Project would not cause wasteful, inefficient, and unnecessary consumption of energy and would be consistent with the intent of Appendix F of the CEQA Guidelines.

5.14.3 Cumulative Impacts

(a) Electricity

The Project in conjunction with forecasted 2020 growth in LADWP's service area would increase electricity consumption and thus, would cumulatively increase the need for additional electricity supplies and infrastructure capacity. LADWP forecasts that in the 2020-2021 fiscal year, electricity consumption within its service area would increase to 22,888 GWh with a peak demand of 5,532 MW. Future cumulative growth expected during this period within LADWP's service area is accounted for in this forecast. As discussed above, Project-related net annual peak electricity consumption would represent approximately 0.04 percent of the forecasted electricity peak demand in 2020. Based on this small percentage, the Project's contribution to the cumulative electricity demand would not be substantial. In addition, based on the types of uses proposed by the related projects, it is anticipated that the related projects would similarly comprise a limited percentage of the forecasted total electricity demand within LADWP's service area in 2020. Further, as future electrical demand estimates factor in cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, within LADWP's service area. Although the Project, related projects, and other future development would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for LADWP's service area. Additionally, like the Project, related projects would be expected to incorporate energy conservation features, comply with applicable regulations including the City's and County's Green Building Ordinance, and incorporate mitigation measures, as necessary. Accordingly, the Project's contribution to cumulative impacts related to electricity consumption would be less than significant.

Electricity infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by LADWP are ongoing. It is expected that LADWP would continue to expand delivery capacity as needed to meet demand increases within its service area. Development projects, inclusive of the related projects, within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as necessary. As such, cumulative impacts with respect to electricity infrastructure would be less than significant.

(b) Natural Gas

Buildout of the Project, related projects, and other future development projects in SoCalGas' service area is expected to increase natural gas consumption and thus cumulatively increase the need for additional natural gas supplies and infrastructure capacity. The California Energy Commission estimates natural gas consumption within

SoCalGas' planning area will increase to 7,263 million Therms in 2020 (Project buildout year). Future 2020 cumulative growth within SoCalGas' service area is accounted for in this forecast. As previously indicated, the Project's annual natural gas usage would represent approximately 0.007 percent of the forecasted total consumption in 2020. It is anticipated that given the type of developments proposed by the related projects, the related projects would similarly comprise a limited percentage of the forecasted total consumption within SoCalGas' service area in 2020. Further, as future natural gas demand estimates factor in cumulative growth, the demand forecasts likely account for Project development and other future development, including the related projects, in SoCalGas' service area. Although related projects would result in the irreversible use of renewable and non-renewable electricity resources which would limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for SoCalGas' service area. Furthermore, like the Project, the related projects and any other future development would be expected to incorporate energy conservation features, comply with applicable regulations including the County's Green Building Ordinance, and incorporate mitigation measures, as necessary, to address natural gas demands. Accordingly, the Project's contribution to cumulative impacts related to natural gas would be less than significant.

Natural gas infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SoCalGas occur as needed. It is expected that SoCalGas' would continue to expand delivery capacity if necessary to meet demand increases within its service area. Development projects within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as appropriate. As such, cumulative impacts with respect to natural gas infrastructure would be less than significant.

Mitigation Measures

As discussed above, the Project's impacts on energy and energy conservation would be less than significant. As such, no mitigation measures would be required.

6.0 Environmental Impacts Found to Be Significant and Unavoidable After Mitigation

The Board has determined, based on the Final EIR, that after implementation of mitigation measures, the Project will not have a significant and unavoidable impact on any of the environmental resources analyzed in the EIR. Therefore, a Statement of Overriding Considerations is not required. (CEQA Guidelines Section 15093.)

7.0 Project Alternatives

CEQA requires that an EIR analyze a reasonable range of feasible alternatives that could substantially reduce or avoid the significant impacts of a project while also meeting the project's basic objectives. An EIR must identify ways to substantially reduce or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1). As evaluated in Section IV, Environmental Impact Analysis, of the Draft EIR and summarized above, implementation of the Project would not result in significant impacts to any of the environmental issues evaluated in the Draft EIR which could not be reduced with compliance with regulatory requirements and the implementation of project design features and mitigation measures. Accordingly, the identification of alternatives to the Project was based, in part, on comments received during the Notice of Preparation scoping and public consultation period and the objectives established for the Project (listed in Section II, Project Description, of this Draft EIR). The following alternatives to the Project were selected for analysis in the Draft EIR:

- Alternative 1: No Project/No Build
- Alternative 2: Reduced Project
- Alternative 3: Simultaneous Event Schedules

Each of these alternatives is described further below.

As set forth in CEQA Guidelines Section 15126.6(c), an EIR should identify any alternatives that were considered for analysis but rejected as infeasible and briefly explain the reasons for their rejection. According to the CEQA Guidelines, among the factors that may be used to eliminate an alternative from detailed consideration is the alternative's failure to meet most of the basic project objectives, the alternative's infeasibility, or the alternative's inability to avoid significant environmental impacts. Alternatives to the Project that have been considered and rejected as infeasible are also described below.

7.1 Alternatives Considered and Rejected

- **Alternative Site:** To meet the Project's underlying purpose to enhance on-site programs, expand opportunities for diverse County residents to come together, and ensure the future of the existing Amphitheatre as an active and relevant

historic resource, the County has identified improvements that are needed to transform the existing Ford Theatres into a multi-use cultural and recreational destination while addressing existing critical program needs of the regional arts ecosystem. Accordingly, the objectives of the Project are closely tied to the concept of improving existing conditions on the Project Site by creating a cohesive and integrated multi-use cultural and recreational destination with enhanced and new technologically advanced performing arts facilities with supporting uses and creating recreational opportunities.

As described in Section II, Project Description, of this Draft EIR, the Project Site is currently developed with an historic Amphitheatre and already operates as a performing arts venue. In addition, the 32-acre Project Site is also already a designated County regional park, which is comprised primarily of undeveloped open space. As such, the development of the proposed improvements within the existing Project Site would be consistent with and would complement and enhance the existing setting and uses within the Project Site. Therefore, given the Project Site's unique location and the unavailability of large expanses of land such as the Project Site within Los Angeles County, it is not reasonable to assume that a property of the same size and character that is developed with a large theatre would be available for the County to acquire. In addition, since the County owns the existing property, the County does not incur any land acquisition costs. Furthermore, since one of the key objectives of the Project is to provide an on-site natural progression of appropriately-sized rehearsal and performing arts spaces which can be used at the same time, development of the Project on an alternative site could also require construction of a large theatre similar to the existing on-site Amphitheatre in addition to the Project components so that a natural progression of theatre spaces are all provided in one location. As such, development of the Project on an alternative site would likely result in greater impacts compared to the Project. Additionally, one of the key components of the underlying purpose of the Project is to ensure the future of the existing on-site Amphitheatre as an active and relevant historic resource. As the proposed Amphitheatre rehabilitation improvements are limited to the Project Site, development of the Project on an alternative site would not achieve the underlying purpose or the basic Project objectives related to enhancing the existing Project Site and preserving the historic integrity of the existing Amphitheatre.

Based on the above, an alternative site is not considered feasible as it would fail to achieve the underlying purpose of the Project and the basic Project objectives. In addition, development at an alternative site likely would not reduce any of the Project's already less than significant impacts. Further, it is not expected that the County can reasonably acquire, control, or have access to an alternative site within Los Angeles that would provide for the uses contemplated for the Project. Thus, in accordance with Section 15126.6(f) of the State CEQA Guidelines, this alternative was rejected from further consideration.

- **Improved Parking Only:** This Alternative assumes the existing facilities would be maintained and the two existing surface parking areas along Cahuenga Boulevard East would be replaced by two parking structures providing a combined 500 spaces. This Alternative was suggested during the Notice of Preparation scoping and public consultation period.

  While this Alternative would reduce some of the Project's already less than significant impacts, similar to the No Project/No Build Alternative analyzed below, this Alternative would be expected to result in greater impacts with regard to surface water quality and groundwater quality. Specifically, this Alternative would not implement the Project's Best Management Practices, such as catch basins and planter drains, which would result in an improvement in surface water quality runoff from the Project Site as the Project Site currently does not have BMPs in place for the treatment of stormwater runoff from the existing impervious surfaces. Therefore, while significant impacts to surface water quality would not occur under this Alternative, impacts would be greater than those of the Project. In addition, without the development of any of the performing arts facilities, offices, restaurant, hiking trail, and other supporting uses, this Alternative would not realize the underlying purpose of the Project to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource. Similarly, this Alternative would not support the objectives of the Project regarding rehabilitation of the Amphitheatre and artist and patron enhancements. Therefore, an alternative that only implements the parking proposed as part of the Project is not considered feasible as it would fail to achieve the underlying purpose and basic Project objectives. Thus, in accordance with Section 15126.6(f) of the State CEQA Guidelines, this alternative was rejected from further consideration.

7.2 Alternative 1: No Project/No Build Alternative

7.2.1 Alternative Description

Alternative 1, the No Project/No Build Alternative assumes the Project would not be approved and the existing environment would be maintained, with the exception of the previously approved Amphitheatre improvements and other on-going routine interior and exterior maintenance improvements. The previously approved Amphitheatre improvements will provide for hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. The previously approved Amphitheatre improvements will occur internal to the Project Site, within the boundaries of the existing

Amphitheatre. This Alternative would not result in any changes to the existing operations at the Ford Theatres. The site plan under this Alternative would resemble existing conditions, as illustrated in Figure II-2 in Section II, Project Description of the Project's Draft EIR.

7.2.2 Comparison of Impacts

Impacts to aesthetics, views, light, and glare; air quality; greenhouse gas emissions; biological resources; historical, archaeological, and paleontological resources; geology and soils; hydrology, surface water quality during construction, groundwater hydrology and groundwater quality during construction; land use and planning; noise; fire and police protection; traffic, access, and parking; and water and energy would be reduced as compared to the Project. However, impacts with regard to surface water quality and groundwater quality during operation would be greater than the Project.

7.2.3 Relationship of the Alternative to Project Objectives

No new development would be introduced on the Project Site under Alternative 1, and the existing uses on the Project Site would continue to operate as they do currently. However, as with the Project, this Alternative would include implementation of the previously approved Amphitheatre improvements. The previously approved Amphitheatre improvements would include hillside stabilization, stage reconstruction, disabled access and code compliance improvements, theatrical systems infrastructure improvements, and mechanical and electrical systems upgrades. Implementation of these improvements would address long deferred maintenance and needed repairs, mitigation of water infiltration, provision of slope stabilization, and improvements to the theatrical infrastructure and performer amenities. As such, Alternative 1 would meet the Project's objective to preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County. In addition, as the previously approved Amphitheatre improvements would occur within the boundaries of the existing Amphitheatre, Alternative 1 would also meet the Project objective to provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site. While this Alternative would include theatrical systems infrastructure improvements as part of the previously approved Amphitheatre improvements, Alternative 1 would not provide for the additional Amphitheatre rehabilitation improvements proposed as part of the Project. Therefore, this Alternative would not meet the following objective to the same extent as the Project: provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants

while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination.

Additionally, as Alternative 1 would not include the development of any new facilities, this Alternative would not meet the Project's objectives regarding additional artist and patron enhancements. Specifically, without the development of the 299-seat theatre and the Flex Space proposed under the Project, this Alternative would not meet the objective to support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences. Similarly, Alternative 1 would not achieve the Project objective to repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County. Furthermore, since Alternative 1 would not include the development of new plaza areas or the proposed restaurant and structured parking, this Alternative would not support the following Project objectives: enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress; and further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

Alternative 1 would also not develop a Transit Center or include pedestrian and vehicular circulation improvements and, as such, would not achieve the objective to create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures. In addition, as this Alternative does not propose a hiking trail, Alternative 1 would not meet the Project objective to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views or surrounding iconic landmarks from a formal trail within the park boundary. Further, since this Alternative would not include the installation of an enhanced sound wall, Alternative 1 would also not support the objective to mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre. Additionally, without development of the Ford Terrace, Alternative 1 would

not provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre. Lastly, Alternative 1 would not construct any of the proposed offices and, as such, would not support the objective to provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community.

Overall, Alternative 1, the No Project/No Build Alternative, would not meet most of the Project objectives, nor would it meet the Project's underlying purpose to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource.

7.2.4 Conclusion

While Alternative 1, the No Project/No Build Alternative would reduce most of the less than significant impacts occurring under the Project, Alternative 1 would result in greater (but less than significant) impacts to surface water quality and groundwater quality. In addition, Alternative 1, the No Project/No Build Alternative would not meet most of the objectives established for the Project.

Finding

The County adopts the third possible finding, which states that "specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible, the mitigation measures or project alternatives identified in the final EIR." (CEQA Guidelines Section 15091(a)(3)).

7.3 Alternative 2: Reduced Project Alternative

7.3.1 Alternative Description

The Reduced Project Alternative would develop the Project Site similar to the Project and would include the same components as the Project as follows: rehabilitation of certain portions of the existing Amphitheatre, the Ford Terrace, the Ford Plaza, the Transit Center, and a 0.75-mile hiking trail. However, the Reduced Project Alternative would not include development of the 299-seat theatre within the Ford Plaza. In addition, under this Alternative, the 99-seat Flex Space proposed within the Transit Center would be relocated

to the area of the 299-seat theatre as proposed by the Project. With the relocation of the Flex Space from the Transit Center to the Ford Plaza under this Alternative, the footprint of the Transit Center would be reduced but would continue to feature a designated area for bus and valet drop-off, a three-level parking structure, and a maintenance facility. All other components and features of the Project as described in Section II, Project Description, of the Project's Draft EIR would be maintained under the Reduced Project Alternative. Further, under Alternative 2, building heights and architectural features would be similar to the building heights and architectural features of the Project.

Overall, implementation of this Alternative would result in approximately 39,550 net new square feet compared to the Project's approximately 47,550 net new square feet of development. As such, this Alternative would reduce the proposed net new development by approximately 8,000 square feet or approximately 17 percent. Additionally, this Alternative would provide for 12 net new seats within the Project Site in comparison to the Project's 311 net new seats. In addition, while this Alternative would not provide the 299-seat theatre, the number of annual events and attendees would increase but would be reduced when compared to the Project.

7.3.2 Comparison of Impacts

The Reduced Project Alternative would reduce the Project's impacts with regard to aesthetics, light, and glare; air quality; greenhouse gas emission; surface water quality and groundwater quality; noise; public services; traffic, access, and parking; and utilities and service systems. However, as with the Project, such impacts would remain less than significant when compared to the applicable significance thresholds. Impacts associated with views; biological resources; cultural resources; geology and soils; surface water hydrology and groundwater hydrology; and land use and planning would be similar to those of the Project.

7.3.3 Relationship of the Alternative to Project Objectives

With implementation of the previously approved Amphitheatre improvements as well as the Amphitheatre rehabilitation improvements proposed as part of the Project, the Reduced Project Alternative would meet the Project's objective to preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County. Similarly, this Alternative would support the objective to provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres

and its canyon park setting as a public cultural and recreational destination. Furthermore, since the Reduced Project would include the development of new plaza areas, the proposed restaurant, and structured parking, this Alternative would realize the following Project objectives: enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress; and further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

The Reduced Project Alternative would also develop a Transit Center and include pedestrian and vehicular circulation improvements and, as such, would achieve the objective to create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures. In addition, as this Alternative would include a hiking trail, Alternative 2 would meet the Project objective to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views or surrounding iconic landmarks from a formal trail within the park boundary. Further, since the Reduced Project Alternative would include the installation of an enhanced sound wall, Alternative 2 would also support the objective to mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre. Additionally, with development of the Ford Terrace, the Reduced Project Alternative would provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre. Alternative 2 would further include development of the proposed offices and, as such, would support the objective to provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community. The Reduced Project Alternative would also disturb the same general area as the Project and, as such, Alternative 2 would meet the Project objective to provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

However, without the development of the 299-seat theatre proposed under the Project, the Reduced Project Alternative would not fully meet the objective to support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences. Similarly, the Reduced Project Alternative would only partially

meet the Project objective to repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

Overall, Alternative 2, the Reduced Project Alternative, would meet most of the Project objectives and would partially meet the remaining objectives. However, without providing a key component of the Project, the Reduced Project Alternative would not achieve the Project's underlying purpose to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic resource.

7.3.4 Conclusion

While Alternative 2, the Reduced Project Alternative, would reduce some of the Project's less than significant impacts, without the development of the proposed 299-seat theatre, Alternative 2, the Reduced Project Alternative would not meet the underlying purpose and key objectives of the Project.

Finding

The County adopts the third possible finding, which states that "specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible, the mitigation measures or project alternatives identified in the final EIR." (CEQA Guidelines Section 15091(a)(3)).

7.4 Alternative 3: Simultaneous Event Schedules Alternative

7.4.1 Alternative Description

The Simultaneous Event Schedules Alternative would include the development of the same components as the Project but with long term flexibility in the scheduling of events within the Amphitheatre and proposed 299-seat theatre. Specifically, under Alternative 3, events held in the Amphitheatre, the 299-seat theatre, and the Flex Space

would be able to have simultaneous events with concurrent start times whereas under the Project, events held in the Amphitheatre and the 299-seat theatre shall stagger the start times of simultaneous events on weekday evenings after 6:00 P.M. by a minimum of 45 minutes so as to separate the arrival patterns of each theatre's patrons and avoid potentially significant traffic impacts. As with the Project, Alternative 3 would comprise the following: (1) rehabilitation of certain portions of the existing Amphitheatre; (2) the Ford Terrace, which would include a two-story structure with one level of office space and lower-level concessions area and a raised plaza deck above a service level; (3) the Ford Plaza, which would be set atop a new three-level parking structure and would feature a restaurant, a 299-seat theatre, a new box office, a conference room, and offices and visitor amenities; (4) the Transit Center, which would include a designated area for bus and valet drop-off, a new three-level parking structure, 99-seat Flex Space, and maintenance facility; and (5) a 0.75-mile hiking trail. These components would be developed within the Project Site in the same manner as proposed under the Project described in Section II, Project Description, of the Project's Draft EIR. The estimated increases in annual events and attendance projected to occur under the Project would also remain under this Alternative.

7.4.2 Comparison of Impacts

The impacts of Alternative 3 would be similar to the Project for all environmental issues except traffic. Specifically, impacts associated with aesthetics, views, light, and glare; air quality; greenhouse gas emissions; biological resources; cultural resources; geology and soils; hydrology, surface water quality, and groundwater; land use and planning; noise; public services; and utilities and service systems would be similar under this Alternative when compared with the Project. However, as Alternative 3 would provide for simultaneous events with concurrent start times within the Amphitheatre and the proposed 299-seat theatre, which would create a significant traffic impact at Intersection No. 6: US-101 Northbound Off-Ramp & Cahuenga Boulevard North during a weekday event, impacts regarding intersection levels of service would be greater under this Alternative as compared to the Project.

7.4.3 Relationship of the Alternative to Project Objectives

The types and amounts of uses proposed under Alternative 3 would be the same as under the Project. As such, this Alternative would meet the Project's underlying purpose to enhance on-site programs that support the work of County of Los Angeles artists and arts organizations by offering programs that meet the specialized needs of a broader cross section of the regional arts community, including emerging theatre, dance, and music ensembles and multi-disciplinary collaborations; to expand opportunities for diverse County residents to come together by creating new spaces and programs that better serve the community; and to ensure the future of the Amphitheatre as an active and relevant historic

resource. This Alternative would also achieve the Project objectives that support this underlying purpose.

Specifically, with implementation of the previously approved Amphitheatre improvements as well as the Amphitheatre rehabilitation improvements proposed as part of the Project, Alternative 3 would meet the Project's objective to preserve the historic integrity of the Amphitheatre by providing improvements necessary to respond to damage from water intrusion, soil erosion, and structural decay, and ensure its future viability as a cultural and historical resource for the communities of Los Angeles County. Similarly, this Alternative would support the objective to provide operational improvements for the historic outdoor Amphitheatre that includes modern technical infrastructure and performing arts technology and amenities to support world class theatrical and cultural experiences for patrons and program participants while providing improved access to the Ford Theatres and its canyon park setting as a public cultural and recreational destination. Additionally, as Alternative 3 would include the development of the proposed facilities, this Alternative would meet the objective to support the development of Los Angeles County-based artists, arts organizations and arts producers that represent diverse performing arts genres, disciplines, and communities by providing an on-site natural progression of appropriately-sized enclosed rehearsal and performing arts spaces which can be used at the same time to expand creative capacity, create new work, and increase audiences. Similarly, Alternative 3 would achieve the Project objective to repurpose the areas of the Ford Theatres currently used for on-grade parking to meet existing critical program needs of the regional arts ecosystem, including a much needed mid-size theatre space and low- to no-cost, accessible flexible spaces for rehearsals and performances year-round for artists, particularly dance and theatre groups, which do not have sufficient right-sized rehearsal and performance spaces in Los Angeles County.

Furthermore, since Alternative 3 would include the development of new plaza areas, the proposed restaurant, and structured parking, this Alternative would support the following Project objectives: enhance patron pre-show and post-show experience by providing plaza areas and support functions for meeting, dining and picnicking, while enabling visits of variable lengths by the creation of non-stacked parking to ease ingress and egress; and further the Ford's capacity for community building by creating new small and medium interstitial spaces and opportunities for artists, audiences, and the public to interact, dialogue, and find meaning and expression through the arts on the Project Site.

Alternative 3 would also develop a Transit Center and include pedestrian and vehicular circulation improvements and, as such, would achieve the objective to create pedestrian and vehicular circulation access that is integrated with a transit center and sufficient on-site parking so as to provide for improved and safer patron arrival and departures. In addition, as this Alternative would include a hiking trail, Alternative 3 would

meet the Project objective to enhance the Ford Theatres' role as a County Regional Park by increasing public access to the entire site, integrating passive recreational opportunities, and encouraging visitors to experience the natural landscape and views or surrounding iconic landmarks from a formal trail within the park boundary. Further, since Alternative 3 would include the installation of an enhanced sound wall, this Alternative would also support the objective to mitigate noise pollution from the adjacent Hollywood Freeway to provide a more pastoral experience focused on the stage and preserve audience views of the natural landscaped canyon from inside the Amphitheatre. Additionally, with development of the Ford Terrace, the Alternative 3 would provide for improved operation and maintenance relating to stage logistics including set loading and unloading and set staging areas in close proximity to the Amphitheatre. Alternative 3 would further include development of the proposed offices and, as such, would support the objective to provide on-site accessible modern office space to accommodate daily personnel and improve communication and interaction of staff with the arts community. This Alternative would also disturb the same general area as the Project and, as such, Alternative 3 would meet the Project objective to provide site improvements that are focused on areas of the site that have been previously developed and preserve the canyon setting of the Project Site.

7.3.4 Conclusion

Alternative 3, the Simultaneous Event Schedules Alternative, would meet the Project's objectives. However, Alternative 3 would result in greater impacts compared to the Project. As such, Alternative 3 would not be feasible.

7.5 Environmental Superior Alternative

Implementation of the Project would not result in significant and unavoidable impacts with regard to the environmental issues evaluated in the Draft EIR. Notwithstanding, of the alternatives analyzed in this Draft EIR, Alternative 1, the No Project/No Build Alternative is considered the Environmentally Superior Alternative as it would reduce most of the less than significant impacts occurring under the Project. However, Alternative 1 would result in greater (but less than significant) impacts to surface water quality and groundwater quality. In addition, as indicated above, this Alternative would not meet most of the objectives established for the Project.

In accordance with the CEQA Guidelines requirement to identify an Environmentally Superior Alternative other than the No Project Alternative, a comparative evaluation of the remaining alternatives indicates that Alternative 2, the Reduced Project Alternative, would be the Environmentally Superior Alternative. Alternative 2 would reduce more of the Project impacts, although they are below significant levels, compared to Alternative 3.

However, as described above, without the development of the proposed 299-seat theatre, this Alternative would not meet the underlying purpose of the Project.

8.0 Other CEQA Considerations

8.1 Growth Inducing Impacts

Section 15126.2(d) of the CEQA Guidelines requires that growth-inducing impacts of a project be considered in a Draft EIR. Growth-inducing impacts are characteristics of a project that could directly or indirectly foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment. According to the CEQA Guidelines, such projects include those that would remove obstacles to population growth (e.g., a major expansion of a waste water treatment plant that, for example, may allow for more construction in service areas). In addition, as set forth in the CEQA Guidelines, increases in the population may tax existing community service facilities, thus requiring construction of new facilities that could cause significant environmental effects. The CEQA Guidelines also require a discussion of the characteristics of projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. Finally, the CEQA Guidelines state that it must not be assumed that growth in an area is necessarily beneficial, detrimental, or of little significance to the environment.

As discussed in the Initial Study prepared for the Project, which is provided in Appendix A of the Draft EIR, the Project would not include the development of residential uses. Therefore, the Project would not directly induce population growth within the Project area. In addition, while the Project would create temporary construction-related jobs, the work requirements of most construction projects are highly specialized such that construction workers remain at a job site only for the time in which their specific skills are needed to complete a particular phase of the construction process. Therefore, Project-related construction workers would not be anticipated to relocate their household's place of residence as a consequence of working on the Project, and, as such, no new permanent residences in the vicinity of the Project Site would be generated during construction of the Project. Further, while the Project would increase existing County Arts Commission, County Department of Parks and Recreation, and Ford Theatre Foundation staffing within the Project Site by 85 employees, the existing 140 Los Angeles Philharmonic employees within the Project Site would be relocated off-site to other existing facilities. With the relocation of these employees, the Project would result in an overall net decrease in employees on-site. Thus, the Project would not indirectly induce population growth as a result of employment opportunities within the Project Site.

With regard to infrastructure-induced population growth, the proposed roadway improvement including the installation of a new signal at the Project Site driveway providing egress from the south parking structure is intended to improve access and allow for safer left turns from the driveway to Cahuenga Boulevard East. This improvement would not open any large undeveloped areas for new use. Utility and other infrastructure upgrades are also intended to meet Project-related demand. Specifically, any new water and wastewater connections and electrical and natural gas infrastructure have been designed to provide for the Project and would not generate substantial capacity that would induce growth. In conclusion, the Project is not expected to indirectly induce population growth through the construction of infrastructure.

8.2 Significant Irreversible Environmental Changes

In accordance with Section 15126.2(c) of the CEQA Guidelines, an EIR is required to evaluate significant irreversible environmental changes that would be caused by implementation of a project. During construction and operation, the Project would necessarily consume non-renewable resources and resources that are effectively non-renewable due to their long regeneration time. The Project would require a commitment of non-renewable and renewable resources that would include: (1) building materials; (2) water; and (3) energy resources. The Project's use of these resources is discussed below in addition to a discussion regarding potential environmental hazards.

8.2.1 Building Materials

During construction, the Project would consume non-renewable resources that would include the following building materials: certain types of lumber and other forest products; aggregate materials used in concrete and asphalt, such as sand, gravel and stone; metals, such as steel, copper, and lead; and petrochemical construction materials, such as plastics. In accordance with the County's Green Building Ordinance, during construction of the Project, a minimum of 65 percent of the non-hazardous construction and demolition debris would be recycled and/or salvaged for reuse. Thus, the consumption of non-renewable building materials, such as lumber, aggregate materials, and plastics, would be reduced. In addition, as described in Section II, Project Description, of this Draft EIR, existing waste reduction and recycling practices would continue and would be enhanced with implementation of the Project.

8.2.2 Water

Water, which is a limited, slowly renewable resource, also would be consumed during Project construction. Given the temporary nature of construction activities, demolition and construction activities would require minimal water demand and are not

anticipated to have any adverse impact on available water supplies and infrastructure. In addition, the Project's operational water demand would be within the projected water supplies for normal, single-dry, and multiple-dry years, and the City of Los Angeles Department of Water and Power would be able to meet the water demand for the Project in addition to the existing and planned water demands of its future service area. Furthermore, pursuant to Project Design Feature L.1-2, the Project would implement a variety of water conservation features including, but not limited to, high-efficiency plumbing fixtures, the use of water efficiency landscaping, and native/adapted/drought-tolerant plants. Thus, while Project operation would result in the irreversible consumption of water, the Project would not result in a significant impact related to water supply or infrastructure.

8.2.3 Energy Resources

Fossil fuels, such as diesel, gasoline, and oil, would be consumed to power construction vehicles and equipment and for the generation of electricity. Electricity consumption during Project construction would vary based on the construction activity (i.e., grading, building construction, etc.). Given the nature of construction activities, the consumption of fossil fuels for energy use would occur on a temporary basis. In addition, any electricity consumption that would occur due to Project construction activities would be somewhat offset by the reduction in electricity consumption resulting from the demolition of some of the existing uses within the Project Site.

Fossil fuels for electricity, natural gas, and transportation would also be consumed during operation of the Project. As non-renewable fossil fuels would represent the primary energy source during Project operations, the existing finite supplies of these resources would be incrementally reduced. Further, the Project's estimated increase in electricity and natural gas demand would be within the anticipated service capabilities of LADWP and the Southern California Gas Company, respectively. The Project would also comply with Title 24 of the California Code of Regulations, which sets forth the Building Energy Efficiency Standards to limit the amount of energy consumed by the Project. Furthermore, the Project would be designed and constructed to achieve the equivalent of LEED™ certification, at minimum, and would comply with the County's Green Building ordinance, which would also service to minimize the amount of energy consumed by the Project. Therefore, energy would not be used in a wasteful manner and long-term impacts associated with the consumption of fossil fuels would not be significant.

8.2.4 Environmental Hazards

Construction of the Project would involve the temporary use of typical, although potentially hazardous materials, including vehicle fuels, oils, transmission fluids, paints, adhesives, cleaning solvents, surface coatings, and other acidic or alkaline solutions that

would require special handling, transport, and disposal. In addition, operation of the Project would involve the routine use and handling of potentially hazardous materials typical of those used for a multi-use cultural and recreational center, including cleaning solvents for custodial maintenance of the buildings, and pesticides for landscaping. However, all potentially hazardous materials would be contained, stored, and used in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations. Any associated risk would be reduced to a less than significant level through compliance with these standards and regulations. Similarly, demolition activities would comply with regulatory requirements to ensure asbestos, lead-based paints, and polychlorinated biphenyls are not released into the environment. Overall, the analysis concluded that there are no known recognized environmental conditions on-site that have the potential to result in significant hazards impacts. In addition, compliance with regulations and standards would serve to protect against a significant and irreversible environmental change that could result from the accidental release of hazardous materials.

8.2.5 Conclusion

Based on the above, Project construction and operation would require the irretrievable commitment of slowly renewable, and non-renewable resources, which would limit the availability of these resources and the Project Site for future generations or for other uses. However, the consumption of such resources would not be considered substantial and would be consistent with regional and local growth forecasts and development goals for the area. The loss of such resources would not be highly accelerated when compared to existing conditions and such resources would not be used in a wasteful manner. Therefore, although irreversible environmental changes would result from the Project, such changes are concluded to be less than significant.

9.0 Mitigation Monitoring and Reporting Program

The Draft EIR identified recommended mitigation measures where appropriate to avoid or to mitigate potential impacts to the environment to a level that would be less than significant. Pursuant to Section 21081.6 of the Public Resources Code, the County of Los Angeles Board of Supervisors, in adopting these Findings, also adopts the Mitigation Monitoring and Reporting Program (MMRP) for the Ford Theatres Project. The MMRP is designed to monitor implementation of the mitigation measures required for the Project.

The Project Applicant will be responsible for implementing all mitigation measures unless otherwise noted. The Applicant shall also be obligated to provide certification, as required, to the appropriate monitoring agency and the appropriate enforcement agency that compliance with the required mitigation measure has been implemented. The County's existing planning, engineering, review, and inspection processes will be used as the basic foundation for the MMRP procedures and will also serve to provide the documentation for the reporting program.

The County of Los Angeles Board of Supervisors hereby finds that the Mitigation Monitoring and Reporting Program meets the requirements of Public Resources Code Section 21081.6 by providing for the implementation and monitoring of Project conditions intended to mitigate the potential environmental effects of the Project.

10.0 Consideration of Record and Independent Judgment

In approving the Project, the County Board of Supervisors has reviewed and considered the Draft EIR, Final EIR, and all technical appendices, and all other pertinent evidence in the record of proceedings.

The Applicant's consultants prepared the screencheck versions of the Draft EIR, Final EIR, and technical studies. All such materials and all other materials related to the EIR were extensively reviewed and, where appropriate, modified by the County. As such, the Board of Supervisors finds that the Draft EIR, Final EIR, technical studies, and all other related materials reflect the independent judgment and analysis of the Lead Agency.

11.0 Substantial Evidence

The County Board of Supervisors finds and declares that substantial evidence for each and every finding made herein is contained in the Draft EIR, Final EIR, technical studies, and other CEQA-related materials, the administrative record, staff reports, information provided by the Applicant, each and all of which are incorporated herein by this reference. Moreover, the County Board of Supervisors finds that where more than one reason exists for any finding, each reason independently supports such finding, and that any reason in support of a given finding individually constitutes a sufficient basis for that finding.

12.0 Relationship of Findings to Project and EIR

While these Findings are based on the most current information available, the project description has evolved over time and may continue to evolve as the Project is further considered by decision-makers through the approval process. While this may give rise to apparent inconsistencies between the EIR, on the one hand, and these Findings, on the other, the Project has and will continue to remain within the maximum development program analyzed in the EIR.

13.0 Custodian of Records

The custodian of the documents or other material which constitute the record of proceedings on which these findings are based is the Los Angeles County Department of Parks and Recreation, Planning Division, 510 South Vermont Avenue, Room 201, Los Angeles, California 90020.

Attachment 3

COUNTY OF LOS ANGELES DEPARTMENT OF PARKS AND RECREATION

FORD THEATRES PROJECT
Mitigation Monitoring and Reporting Program
State Clearinghouse No. 2014021013

Prepared for
County of Los Angeles Department of Parks and Recreation
510 South Vermont Avenue, Room 201
Los Angeles, California 90020

Prepared by
Matrix Environmental

Los Angeles, California 90045

September 2014

1. Introduction

The California Environmental Quality Act (CEQA) requires a lead agency that approves a project for which an Environmental Impact Report or Mitigated Negative Declaration has been prepared to "adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects" (CEQA Guidelines Section 15097). An Environmental Impact Report (EIR) has been prepared for the Project to address the potential environmental impacts of the Project. Where appropriate, the EIR includes mitigation measures to avoid or substantially lessen the significant environmental impacts associated with the Project. This Mitigation Monitoring and Reporting Program (MMRP) prepared for the Project is designed to monitor implementation of these mitigation measures. This MMRP has been prepared in compliance with the requirements of CEQA, Public Resources Code Section 21081.6, and Section 15097 of the CEQA Guidelines. This MMRP describes the procedures the Ford Theatre Foundation, as the Project Applicant, shall use to implement the mitigation measures adopted in connection with the approval of the Project and the methods of monitoring and reporting on such actions. "Monitoring" is generally an ongoing or periodic process of project oversight. "Reporting" generally consists of a written compliance review that is presented to the decision making body or authorized staff person. For this MMRP, the County of Los Angeles is the Lead Agency for the Project. This MMRP would be adopted by the County of Los Angeles Board of Supervisors.

2. Purpose

It is the intent of this MMRP to:

1. Verify compliance with the required mitigation measures of the EIR;
2. Provide a methodology to document compliance with the required mitigation;
3. Provide a record and status of mitigation requirements;
4. Identify monitoring and enforcement agencies;
5. Establish and clarify administrative procedures for the clearance of mitigation measures;

6. Establish the frequency and duration of monitoring and reporting; and

7. Utilize the existing agency review processes wherever feasible.

3. Administrative Procedures and Enforcement

This MMRP shall be in place throughout all phases of the Project. The Ford Theatre Foundation, as the entity responsible for implementing the mitigation measures, shall be obligated to provide documentation concerning implementation of the mitigation measures to the appropriate monitoring agency as provided for herein.

Table 1 below lists each required mitigation measure for the Project and identifies the following:

- Responsible Implementation Party—the entity responsible for the implementation of mitigation measures.
- Monitoring Phase—The phase of the Project during which the mitigation measure shall be monitored.
- Monitoring Agency—The agency to which reports involving feasibility, compliance, implementation, and development are made.

As evaluated in the Draft EIR, Project impacts related to certain environmental topics were determined to be less than significant. Therefore, no mitigation measures were identified in the Draft EIR for those environmental issues. Table 1 below lists only those environmental topics for which mitigation measures were identified in the Draft EIR.

4. Program Modification

After review and approval of the final MMRP by the Lead Agency, minor changes and modifications to the MMRP are permitted, but can only be made by the Applicant or its successor subject to the approval by the County of Los Angeles. The Lead Agency, in conjunction with any appropriate agencies or departments, will determine the adequacy of any proposed change or modification. The flexibility is necessary in light of the proto-typical nature of the MMRP, and the need to protect the environment with a workable program. No changes will be permitted unless the MMRP continues to satisfy the requirements of CEQA, as determined by the Lead Agency.

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
BIOLOGICAL RESOURCES			
Mitigation Measure D-1: Prior to construction, a qualified botanist shall conduct rare plant surveys throughout the Project area. In the event special status species are found during surveys, avoidance measures shall be implemented based on the recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented, in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable. Surveys shall be conducted during the appropriate blooming period to the extent feasible. If surveys cannot be conducted within the appropriate blooming period, or if the presence for any species cannot be ruled out for any other reason, avoidance measures shall be implemented based on recommendations of a qualified botanist. If avoidance is not feasible, appropriate mitigation shall be developed and implemented in consultation with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable.	Ford Theatre Foundation	Pre-Construction	Los Angeles County Department of Parks and Recreation; United States Fish and Wildlife Service and/or California Department of Fish and Wildlife, as applicable
Mitigation Measure D-2: If it is determined that special status plants would be directly impacted as a result of the Project, an on- or off-site restoration plan shall be prepared by a qualified botanist, in coordination with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable. The restoration plan shall be implemented prior to the completion of the Project. The plan shall include the	Ford Theatre Foundation	Pre-Construction; Operation	Los Angeles County Department of Parks and Recreation; United States Fish and Wildlife Service and/or California Department of Fish and Wildlife, as applicable

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
following: receiver locations; number of plants to be replanted and the methods of replanting; maintenance and monitoring requirements; and measures necessary for the establishment of self-sustaining populations in suitable open space areas to ensure the long-term survivability of the species in the vicinity. Annual monitoring for at least five (5) years shall be required to ensure no-net-loss of acres of habitat for the species. The acreage ratio of lost special-status plant species habitat to habitat replaced shall be coordinated with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, as applicable, but shall be no less than 1:1.			
Mitigation Measure D-3: Within a year prior to construction, protocol level surveys for the coastal California gnatcatcher shall be conducted within 300 feet of suitable habitat by a qualified biologist/ornithologist according to the United States Fish and Wildlife Service survey guidelines. The surveys shall include, at a minimum, a thorough examination of all suitable habitats within the Project area and vicinity for the coastal California gnatcatcher or its sign. The final survey methodology shall be determined in coordination with the United States Fish and Wildlife Service. A summary report shall be prepared upon completion of these activities and submitted to the United States Fish and Wildlife Service. If, following protocol level surveys, no gnatcatchers are detected, but construction is delayed more than one year, additional surveys may be required, at the discretion of the	Ford Theatre Foundation	Pre-Construction	County of Los Angeles Department of Parks and Recreation, United States Fish and Wildlife Service

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
United States Fish and Wildlife Service, to ensure that no gnatcatchers have moved into the area. If evidence of the coastal California gnatcatcher is found within the Project area during surveys, consultation with the United States Fish and Wildlife Service shall be conducted, and any requirements of the regulatory agencies regarding protection of the species shall be implemented.			
Mitigation Measure D-4: The following measures shall be implemented during construction to minimize impacts on nesting birds and raptors: a. Construction in areas that include trees, vegetation, or buildings that may provide nesting habitats for bird and raptors shall be reduced to the maximum extent feasible. b. Trimming and removal of vegetation and trees shall be minimized and performed outside of the nesting season (February 15 to September 15) to the extent feasible. c. In the event trimming or removal of vegetation and trees must be conducted during the nesting season, nesting bird surveys shall be completed by a qualified biologist no more than 48 hours prior to trimming or clearing activities to determine if nesting birds are within the affected vegetation. Nesting bird surveys shall be repeated if trimming or removal activities are suspended for five days or more. d. In the event construction is scheduled during bird nesting season, nesting bird surveys shall be	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation; California Department of Fish and Wildlife, as applicable

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
completed no more than 48 hours prior to construction to determine if nesting birds, raptors, or active nests are in or within 500 feet of the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more. e. In the event nesting birds or raptors are found in the construction area, appropriate buffers (typically 300 feet for songbirds and up to 500 feet for raptors) shall be implemented, in coordination with the California Department of Fish and Wildlife, to ensure that nesting birds and active nests are not harmed. Buffers shall include fencing or other barriers around the nests to prevent any access to these areas and shall remain in place until birds have fledged and/or is no longer active, as determined through coordination with the California Department of Fish and Wildlife.			
Mitigation Measure D-5: A qualified biologist shall complete pre-construction surveys no more than 48 hours prior to construction to determine the presence or absence of wildlife in the construction area. Surveys shall be repeated if construction activities are suspended for five (5) days or more. If any wildlife species are identified, appropriate measures shall be developed and implemented to avoid impacts on these wildlife species, in consultation with resource agencies as applicable.	Ford Theatre Foundation	Pre-Construction	Los Angeles County Department of Parks and Recreation; California Department of Fish and Wildlife, as applicable

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
Mitigation Measure D-6: To the extent feasible, tree and building removal shall be scheduled during the non-breeding and active season for bats (typically October and November). Prior to construction, surveys shall be conducted by a qualified bat specialist to identify the presence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in cavities in the area, either in trees or in structures, shall be safely evicted under the direction of a bat specialist and under consultation with the California Department of Fish and Wildlife. Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the California Department of Fish and Wildlife shall be installed and maintained to prevent bats from roosting in these cavities prior to and during construction. A summary report shall be prepared upon completion of these activities and submitted to the California Department of Fish and Wildlife. Pre-construction bat surveys shall be conducted by a qualified bat specialist no more than seven (7) days prior to the removal of any trees within the Project area to confirm that exclusionary measures have been successful and there are not bats within the construction area. If no roosting bats are detected, no further surveys are required provided the tree removal is conducted within seven (7) days. If removal is delayed more than seven (7) days, additional surveys shall be conducted no more than seven (7) days prior to tree removal to ensure that no bats have	Ford Theatre Foundation	Pre-Construction	Los Angeles County Department of Parks and Recreation; California Department of Fish and Wildlife, as applicable

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
moved into the area.			
Mitigation Measure D-7: Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in the Project area. In the event a maternal colony of bats is found in the construction area, the California Department of Fish and Wildlife shall be consulted, and no work shall be conducted within 100 feet of the roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the California Department of Fish and Wildlife. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No clearing and grubbing shall be authorized adjacent to the site. Combustion equipment, such as generators, pumps, and vehicles, shall not to be parked nor operated under or adjacent to the roosting site. Construction personnel shall not enter into areas beneath the colony, especially during the evening exodus.	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation; California Department of Fish and Wildlife, as applicable
Mitigation Measure D-8: Amphitheatre lighting shall be designed to focus downward on the developed areas of the Project area and minimize light spillover onto adjacent open space areas.	Ford Theatre Foundation	Pre-Construction; Operation	Los Angeles County Department of Parks and Recreation
Mitigation Measure D-9: Fencing associated with the proposed hiking trail shall be designed to be low in height with openings between posts and rails to allow the movement of wildlife to pass over or through the fence.	Ford Theatre Foundation/ Los Angeles County Department of Parks and Recreation	Operation	Los Angeles County Department of Parks and Recreation

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
Mitigation Measure D-10: Trash receptacles that are not accessible to wildlife shall be used along the proposed hiking trail and within open areas of the Project Site to discourage wildlife from entering the area and reduce the potential for wildlife-human interaction. Signage shall also be place along the trail to encourage hikers to stay within the designated trail boundary.	Ford Theatre Foundation	Operation	Los Angeles County Department of Parks and Recreation
Mitigation Measure D-11: The following measures shall be implemented to minimize impacts on oak trees: a. Oak trees measuring eight (8) inches or more in diameter at four and one-half (4.5) feet above mean natural grade shall be protected in place unless otherwise specifically permitted by the County of Los Angeles b. Prior to construction, protection fencing shall be installed outside of the drip line of an oak tree to be protected in place during construction to minimize damage from equipment storage, debris dumping, parking, etc. within oak tree protected zones. c. Oak trees that are relocated shall be done so in a manner consistent with the Los Angeles County Oak Tree Ordinance.	Ford Theatre Foundation	Pre-Construction; Construction	Los Angeles County Department of Parks and Recreation; Los Angeles County Fire Department, as needed
CULTURAL RESOURCES			
Mitigation Measure E-1: To ensure that the Project is consistent with the Standards and prior to the issuance of building permits for new construction, the final architectural plans shall be reviewed and approved by a qualified professional who satisfies the Secretary of the Interior's	Ford Theatre Foundation	Prior to issuance of building permits	Los Angeles County Department of Parks and Recreation

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61.			
Mitigation Measure E-2: If a unique archaeological resource is discovered during Project construction activities, work in the area shall cease and deposits shall be treated by a qualified professional who satisfies the Secretary of the Interior's Professional Qualification Standards for History, Architectural History, or Architecture, pursuant to 36 CFR 61 in accordance with applicable federal, State, and local guidelines, including those set forth in California Public Resources Code Section 21083.2. In addition, if it is determined that an archaeological site is a historical resource, the provisions of Section 21084.1 of the Public Resources Code and CEQA Guidelines Section 15064.5 shall be implemented.	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation
Mitigation Measure E-3: If human remains are encountered during construction, work in the affected area and the immediate vicinity shall be halted immediately. The construction manager at the Project Site shall be contacted, and shall notify the County Coroner. If the County Coroner determines the remains to be Native American, the archaeologist and Native American monitor shall then be contacted, if they are not on-site at the time, as well as the responsible lead agency of the discovery, who in turn shall notify the Native American Heritage Commission. Disposition of the human remains and any associated grave goods shall be in accordance with California Health and Safety Code Section 7050.5 and	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
Public Resources Code Sections 5097.91 and 5097.98, as amended. The archaeologist and the Native American monitor, with the concurrence of the County, shall determine the area of potential impact and the timing when construction activities can resume.			
Mitigation Measure E-4: A qualified paleontologist shall be retained to perform periodic inspections of excavation and grading activities of the Project Site where excavations into the Topanga Formation may occur. The frequency of inspections shall be based on consultation with the paleontologist and shall depend on the rate of excavation and grading activities, the materials being excavated, and if found, the abundance and type of fossils encountered. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. If paleontological materials are encountered, the paleontologist shall be allowed to temporarily divert or redirect grading and excavation activities in the area of the exposed material to facilitate evaluation and, if necessary, salvage. The paleontologist shall assess the discovered material(s) and prepare a survey, study or report evaluating the impact. The paleontologist's survey, study or report shall contain a recommendation(s), if necessary, for the preservation, conservation, or relocation of the resource, as appropriate. The Applicant shall comply with the recommendations of the evaluating paleontologist, as contained in the survey, study or report, and a copy of the paleontological survey, study or report shall be submitted	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation, Los Angeles County Natural History Museum

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
to the Los Angeles County Natural History Museum and the Los Angeles County Department of Parks and Recreation. Ground-disturbing activities may resume once the paleontologist's recommendations have been implemented to the satisfaction of the paleontologist.			
Mitigation Measure E-5: The Project shall include preparation of a Historic Structures Report by a historic preservation professional meeting the Secretary of the Interior's Professional Qualification Standards. The Historic Structures Report shall be prepared in compliance with National Park Service Preservation Brief No. 43: The Preparation and Use of Historic Structures Report. Pursuant to National Park Service Preservation Brief No. 43, the Historic Structures Report shall include recommendations for the treatment of the character-defining features as well as guidance for complying with the Standards. The Historic Structures Report shall also include additional information about the history and physical features of the property. Preparation of the Historic Structures Report shall commence by the first quarter of 2015.	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation
GEOLOGY AND SOILS			
Mitigation Measure F-1: Project grading shall include a combination of ground modification and/or structural enhancements in areas subject to liquefaction to reduce the risk to an acceptable level (as defined by the California Geological Survey in Special Publication 117a, Chapter 2). Ground modification shall consist of the removal and	Ford Theatre Foundation	Pre-Construction; Construction	Los Angeles County Department of Parks and Recreation

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
replacement of undocumented fill with engineered fill. Subsequently, foundations shall be supported on conventional shallow footing systems established on engineered fill or undisturbed bedrock.			
Mitigation Measure F-2: In order to minimize, capture, and manage debris flows and rock falls, the Project shall incorporate a combination of the following measures: • Remove and recompact loose surficial material and remove rock fall accumulations; • Construct storm drain and catch basins in swales above proposed retaining walls to provide an outlet for rainfall runoff and to catch eroded materials. Regular maintenance of catch basins to remove eroded materials shall be performed to preserve the basin and drain functionality; • Install retaining walls; and • Install flexible barriers or anchored mesh net.	Ford Theatre Foundation	Pre-Construction; Construction	Los Angeles County Department of Parks and Recreation
NOISE			
Mitigation Measure I-1: Power construction equipment (including combustion engines), fixed and mobile, shall be equipped with state-of-the-art noise shielding and muffling devices (consistent with manufacturers' standards). All equipment shall be properly maintained to assure that no additional noise, due to worn or improperly maintained parts would be generated.	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation

Table 1
Mitigation Monitoring and Reporting Program for the Ford Theatres Project

Mitigation Measure	Responsible Implementation Party	Monitoring Phase	Monitoring Agency
Mitigation Measure I-2: Project construction shall not include the use of driven pile systems.	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation
Mitigation Measure I-3: Contractor shall utilize smaller construction equipment, such as small bulldozer and hand held compactors, when construction occurs within 20 feet of the existing Amphitheatre structure.	Ford Theatre Foundation	Construction	Los Angeles County Department of Parks and Recreation
HAZARDS AND HAZARDOUS MATERIALS			
Mitigation Measure Hazards-1: Prior to the start of construction, the Applicant shall prepare and implement a construction management plan to the satisfaction of the Los Angeles County Department of Public Works and in consultation with the City of Los Angeles Department of Transportation. Features of the construction management plan may include, but shall not be limited to, the following: • Maintaining emergency access to and within the vicinity of the Project Site; • Limiting potential lane closures to off-peak travel periods, to the extent feasible; • Scheduling receipt of construction materials during non-peak travel periods, to the extent possible; • Prohibiting parking by construction workers on adjacent streets and directing construction workers to park on-site or other designated parking areas; and • Using flag persons to control traffic movement	Ford Theatre Foundation	Pre-Construction	Los Angeles County Department of Parks and Recreation
